One exchange of emails typical of those now classified because they contain "foreign government information" involved Mr. McDonough, Ms. Rice and her deputy at the time, Rosemary A. DiCarlo, and the Palestinian effort in September 2011 to be recognized as a state by the United Nations.

The exchange included eight separate emails, all sent on unclassified networks. Of those, six were redacted almost completely when the State Department released them in January.

According to the subject line and what information does appear, the three discussed deliberations between the United Nations secretary general, Ban Ki-moon, and the Palestinian president, Mahmoud Abbas, as well as Ms. Rice's discussion with the Palestinian representative at the United Nations, Riyad H. Mansour, on the bid for statehood -- all instances of "foreign government information."

The chain of emails eventually encompassed 16 officials, including political appointees and career diplomats, and was ultimately forwarded to Mrs. Clinton's inbox by Jake Sullivan, her deputy then and now the senior policy adviser for her election campaign.

Philip H. Gordon, an assistant secretary of state under Mrs. Clinton, said, "If all these respected, senior foreign service officers and experienced ambassadors are sending these emails, then this issue is not about how Hillary Clinton managed her email, but how the State Department communicates in the 21st century."

Mr. Gordon, later a special assistant to the president for the Middle East, wrote more than 40 emails that were redacted on the grounds that they contained classified information.

Mrs. Clinton herself wrote, responded to or forwarded 96 emails that have been classified in part, including one that is classified secret; 46 of those contained the "foreign government information" that the department's letter addressed.

There are, to be sure, other emails that do not fall into the category of "foreign government information," and some raise questions about the sort of information senior officials sent in unclassified emails.

In 18 emails, for example, information has been classified on the grounds that it identifies C.I.A. officials, including two instances that are now considered "secret."

One of those was a seemingly benign photo opportunity listed on Mrs. Clinton's daily schedule, with the person who gave her a daily intelligence briefing, making it obvious that the person was an agency employee.

That email was originally released as "confidential" but upgraded to "secret," probably reflecting that the person holds an undercover position now.

Another exchange involving the C.I.A. came the day after David H. Petraeus resigned as the agency's director in November 2012. Mr. Brennan, then still at the White House, sent an email -- detailing the provisions for Mr. Petraeus's personal security following his surprise resignation -- to Thomas E. Donilon, Mr. Obama's national security adviser. Mr. Donilon then forwarded it to Mrs. Clinton.

"Madam Secretary -- Attached is an update on the security for Dave P.," he wrote. The entirety of Mr. Brennan's note has now been redacted and classified as "confidential" on the grounds that it involves "vulnerabilities or capabilities of systems, installations, infrastructures, projects, plans, or protection services relating to the national security."

Mr. Petraeus ultimately pleaded guilty to a misdemeanor for keeping highly classified information in eight black notebooks he kept in his home, including such details as the names of covert officers and programs, and sharing them with his biographer and lover.

A spokesman at the C.I.A., Ryan Trapani, said in a statement that Mr. Brennan had believed that the information he sent in the email was unclassified.

"When operating in a position like he was at the White House, officials often have to make spot judgments about whether information is classified or not," he wrote.

"In most cases, the determinations are correct, but in some situations, another agency may consider certain information classified that the author does not."

The Hill
19 months before deadline, lawmakers draw battle lines on spying powers
Tuesday, 10 May 2016
Byline: Julian Hattem

Washington - Members of Congress are starting to put down markers in a major battle over U.S. spying powers that it expected to drag on for more than a year.
The early action appears to reflect an effort by leading Republicans and national security hawks to get out in front of privacy advocates who want to restrict the National Security Agency's power to collect reams of data about foreigners suspected of being spies, terrorists or other targets.

Information about an unknown number of U.S. residents is also included in sweeps authorized by Section 702 of the Foreign Intelligence Surveillance Act.

The law must be renewed by December 2017, but the Senate Judiciary Committee on Tuesday held a hearing on the issue 19 months before that deadline.

"I'd like to begin a conversation about it well in advance of that reauthorization," Chairman Chuck Grassley (R-Iowa) said at the start of Tuesday's hearing.

Recent terror attacks in Paris, Brussels and San Bernardino, Calif., he said, "underscore that one of the responsibilities of our government is to ensure that those who protect us every day, including the intelligence community, have the tools to keep us safe."

The law undergirds high-profile spying activities such as the PRISM and Upstream programs, but many of the details about its use remain in the shadows.

"We're still missing a lot of facts about Section 702 implementation," Sen. Patrick Leahy (D-Vt.), the committee's ranking member, said on Tuesday.

"It sweeps up a sizable amount of information about Americans who are communicating with foreigners," he added. "Despite these concerns about Americans' communications being swept up, we still do not know how much of our data is collected under this authority."

Despite repeated requests from Capitol Hill, intelligence officials have given no estimates of the number of Americans whose communications are caught up in warrantless government searches targeting foreigners. Because of the global nature of the internet, privacy advocates have warned that the number could be high.

Director of National Intelligence James Clapper has bristled at calls to estimate how many U.S. residents have their data swept up by the program, saying it would be difficult to calculate.

Leahy and a small handful of Democrats appeared open to modifications requiring officials to obtain a warrant before searching for data on citizens.

But any effort at reform appears primed to run into stiff opposition from lawmakers in both parties, given the broad consensus about the importance of the data gathering for combating terrorism.

"The question to me is do we want to somehow limit ourselves in terms of access to foreign intelligence in a way that could make us less safe?" asked John Cornyn (Texas), the No. 2 Senate Republican, rhetorically. "That's an important conversation to have, but I'm pretty clear on where I come down."

Lawmakers wondered on Tuesday whether implementing new warrant requirements could rebuild "walls" between U.S. surveillance agencies similar to those blamed, in part, for failing to prevent the 9/11 attacks.

And erring too far on the side of individual privacy might keep intelligence officials from finding important information, Cornyn warned. He pointed to examples in which al Qaeda operatives have used words like "wedding" and "marriage" as code words during a terror plots.

"In our zeal to protect love letters, we don't want to protect terrorists who might use code words to escape scrutiny by the intelligence community," he warned.

Sen. Dianne Feinstein (D-Calif.), the vice chairwoman of the Intelligence Committee, said that if anything, the government should be more forthcoming about the ways in which Section 702 is used.

"Those of us who meet two afternoons a week and go over intelligence ... see the value of this program," said Feinstein, referring to the Intelligence Committee's biweekly meetings. "But I think the general public does not."

"I really think it is lawful and well-balanced," she said.

"In my view, it's only intelligence, lawfully collected, that's able to prevent another attack in this country."

The Intercept
Hackers Attempt to Hold Capitol Hill Data for Ransom
Wednesday, 11 May 2016
Byline: Jenna McLaughlin

Washington - The House is under attack by hackers hoping to infiltrate congressional computers, encrypt their contents, and then force users to pay a ransom to get their access back.
"In the past 48 hours, the House Information Security Office has seen an increase of attacks on the House Network using third party, web-based mail applications such as YahooMail, Gmail," the House's Technology Service Desk wrote in an email to House staffers on April 30.

According to the email obtained by The Intercept, the hacked emails impersonate familiar people and invite staffers to download an attachment laced with malware--what's known as a "phishing" attack.

"When a user clicks on the link in the attack e-mail, the malware encrypts all files on that computer, including shared files, making them unusable until a 'ransom' is paid," the email said.

But House administrative offices refused to say how many if any attacks have been successful, what sort of data may have been affected, or how much has been paid in ransom, if anything.

"The potential for ransomware attacks the House faces is similar to any large organization," a spokesman for the Chief Administrative Officer of the House wrote in a statement to The Intercept. "The House recognizes the importance of taking steps to employ a cyber security plan to protect our infrastructure, and we constantly work to improve training and education for all House users."

A lockdown on parts of the House internet network--from WiFi to Ethernet--remains ongoing.

Access to both YahooMail and Google Cloud services hosted by Google's appspot.com appear to be completely blocked on the House's network, according to Ted Henderson, a former Hill staffer and founder of two social-network applications designed for Capitol Hill communication: Cloakroom and Capitol Bells. It's unclear if both blockages, not just Yahoo's, are related to the ransomware attacks.

Henderson says his several thousand users cannot post to the social networks inside the House office buildings. The way Cloakroom works, you're normally able to log-in either anonymously simply by using Capitol Hill Wi-Fi or with your staff email address. The Senate office buildings don't appear to be affected.

"This is the first time I've seen this happen at a scale like this in five years," Henderson wrote The Intercept in an email.

In recent months, several lawmakers have penned letters asking the Obama administration how it's dealing with the problem of ransomware--a type of attack more than two dozen government agencies have admitted to confronting in the past as well.

Now that Congress itself is the target, security researchers are hopeful the issue will draw more national attention. "What you're seeing in Congress is just part of what's happening," Markus Jakobsson, founder of "Zapfraud", a scam email detection service, and an expert on phishing attacks told The Intercept. "This will hopefully bring some awareness to decision makers...once they start [going after Congress], there will be changes."

Ransomware attacks take many forms. Some hackers have managed to infect entire websites with malware.

It's not clear whether the current spate of attacks on the House network were targeted, or whether House users just happened to find themselves among the ever-growing number of victims.

Ransomware is a major and growing threat to security. Just the day before the House emailed its staff about the attacks, the FBI published a press release titled "Incidents of Ransomware on the Rise," warning that "hospitals, school districts, state and local governments, law enforcement agencies, small businesses, large businesses" are all under increasing threat of being hacked and ransomed.

Nonprofit healthcare organization Health Information Trust Alliance warned in April that more than half of 30 hospitals it surveyed were infected with malware--most of it ransomware. Los Angeles hospital Hollywood Presbyterian paid $17,000 to recover its data in March.

Police departments have also been victims of ransomware attacks, sometimes forced to pay up to recover everything. One police chief compared the extortion to "what felt like terrorist threats."

It's not at all clear how to solve the problem, though researchers have come up with some solutions and recommendations. "This is something that the technical community is still struggling with getting a firm grip on," Jakobsson said.

He suggests Congress install several levels of filters to detect possible spam and scams, backup their data, and launch awareness campaigns to alert people to the reality of the problem. "The problem of social engineering is so vast that you can't just do one and hope that's enough," he said.

Motherboard (Vice)
Encryption Gets in The Way of 75% of Cases, Europol Chief Says
Tuesday, 10 May 2016
Byline: Joseph Cox

New York - In the US, police and prosecutors continue to say encryption--the use of math to protect data from outside eyes, including those of the government--presents a significant barrier to solving crimes or following leads.
Now, on the other side of the Atlantic, the head of Europe's law enforcement body is saying that encryption is an issue in the vast majority of cases the agency sees.

"Encryption dilemma must be solved soon. Real problem in 75% of all Europol cases," Rob Wainwright, director of Europol, tweeted on Sunday.

The tweet came in response to an op-ed written by John Naughton, a professor from the Open University, and published by the Guardian, that said an opportunity for more permanently addressing law enforcement's concerns around encryption had been lost during the FBI and Apple legal fight in San Bernardino.

It is not clear what sort of encryption Wainwright was referring to; be that message encryption to secure communications, or hard-drive encryption that protects data stored on devices, which was the issue at hand in the recent Apple case.

When asked about it, Claire Georges from Europol's corporate communications answered broadly about technologies used by criminals, citing encryption, anonymisation tools such as Tor, and even implied that virtual currencies such as bitcoin are part of the problem.

"The use of anonymisation and encryption technologies is widening and is key issue for law enforcement in all criminal areas," she told Motherboard in an email.

"Technology in general is used not only by cybercriminals, but also by drug dealers, child sexual offenders and other criminals involved in different illegal activities. Encryption is commonly used in secure communications and is becoming a standard protection feature in many products, such as e-wallets for virtual currencies."

Georges also pointed to Europol's Internet Organised Crime Threat Assessment (iOCTA) from 2014, which reads "The use of anonymisation tools is ubiquitous amongst the cyber underground."

Responding to a question of whether backdoors are an avenue for law enforcement, Wainwright wrote in another tweet that "back doors not the solution but regulated front door access. Finding how is key question."

Security experts say any sort of "front door," even if designed only for law enforcement, would be vulnerable to exploitation from hackers and malicious actors, undermining the security of all devices that used it.

Encryption, in some cases, may present an issue for law enforcement. But lumping message and hard-drive encryption, along with technologies such as Tor, all into the same basket is not helpful for anyone; as each requires a unique response, all balancing privacy, security, and access for police.

The Guardian (London)
Court refuses request to force alleged hacker to divulge passwords
Tuesday, 10 May 2016
Byline: Jamie Grierson, Diane Taylor

London - An alleged hacker fighting extradition to the US will not have to give the passwords for his encrypted computers to British law enforcement officers, following a landmark legal ruling.

Lauri Love, a 31- year-old computer scientist, has been accused of stealing "massive quantities" of sensitive data from US Federal Reserve and Nasa computers. His lawyers say he faces up to 99 years in prison if found guilty in the US.

The National Crime Agency (NCA) raided Love's family home in Stradishall, Suffolk, in October 2013, seizing encrypted computers and hard drives. No charges were brought against him in Britain and Love is suing the NCA for the return of six items of encrypted hardware, which he says contain his entire digital life.

The NCA applied to the courts to force Love to hand over his passwords before it returns the computers but this was rejected by a judge on Tuesday.

Speaking to the Guardian, Love called on governments around the world to set aside differences with activists and hackers and to work together to improve global computer security.

"The US government is conducting a war against information activists like me," he said. "This kind of thing is a distraction from what is really important - keeping the world secure. I am offering a 'third way' where governments and hackers work together and bridge the divide. Governments should be making the most of the talent that computer hackers have to try to work together to solve the problems of computer lack of security.

"If someone hacks into your computer they can take over your life and your identity. We are more and more reliant on computer security for security for ourselves."

Love said there was a lot of distrust of governments from activists as a result of scandals involving surveillance and undercover policing. "We have to put our differences aside," he urged. "What we really need to do is sit round the table together and start to have a conversation."

Love said the past few years of interactions with the police and US authorities had taken an enormous personal toll on both him and his family. "I spent two years in an acute and crippling state of mental distress," he said. "I developed eczema and had a lot of difficulty sleeping. Now I am feeling recovered enough to continue studying for my electrical engineering degree and have my finals coming up."

District judge Nina Tempia refused the NCA's application at Westminster magistrates court on Tuesday, saying that to do so would "circumvent specific legislation that has been passed in order to deal with the disclosure sought".

Speaking outside court after the ruling, Love said he was happy with the result and accused the NCA of trying to undermine protections safeguarding individuals' property.

"It is a victory, although it is a more an avoidance of disaster," he said. "It retains the status quo, which means there has to be safeguards before you force people to undermine their security."

His lawyer, Karen Todner, of Kaim Todner, said the ruling was right. "The case raised important issues of principle in relation to the right to respect for private life and right to enjoyment of property and the use of the court's case management powers.

"A decision in the NCA's favour would have set a worrying precedent for future investigations of this nature and the protection of these important human rights."

Love was arrested on 15 July 2015 on behalf of the US government, which had issued several indictments and corresponding extradition warrants.

The FBI and US Department of Justice allege that Love was involved in hacking into various government agencies, including the US army, Nasa, the Federal Reserve and the Environmental Protection Agency. His extradition hearing will be held on 28 and 29 June.

Outside court, Love said he was scared at the prospect of being sent to the US for criminal prosecution. "It is the worst thing I could imagine happening to me. I have to get on with my work and my studies, I can't afford to be stressed or depressed or anxious about it."

Love's case has echoes of the FBI and Apple dispute in the US. In 2015 and 2016, Apple received, and objected to or challenged, at least 11 orders issued by US district courts which sought to compel the firm to extract data, such as contacts, photos and calls from locked iPhones.

The most well-known instance was in February 2016, when the FBI wanted Apple to create and electronically sign new software that would enable the FBI to unlock an iPhone recovered from one of the shooters in the December 2015 terrorist attack in San Bernardino, California.

The government ultimately said it had found a third party able to assist in unlocking the iPhone and withdrew its request.

Columbia Journalism Review
Snowden interview: Why the media isn't doing its job
Wednesday, 11 May 2016
Byline: Emily Bell
Section: Interview

Interview - The Tow Center for Digital Journalism's Emily Bell spoke to Edward Snowden over a secure channel about his experiences working with journalists and his perspective on the shifting media world. This is an excerpt of that conversation, conducted in December 2015.
Emily Bell: Can you tell us about your interactions with journalists and the press?

Edward Snowden: One of the most challenging things about the changing nature of the public's relationship to media and the government's relationship to media is that media has never been stronger than it is now. At the same time, the press is less willing to use that sort of power and influence because of its increasing commercialization. There was this tradition that the media culture we had inherited from early broadcasts was intended to be a public service. Increasingly we've lost that, not simply in fact, but in ideal, particularly due to the 24-hour news cycle.

We see this routinely even at organizations like The New York Times. The Intercept recently published The Drone Papers, which was an extraordinary act of public service on the part of a whistleblower within the government to get the public information that's absolutely vital about things that we should have known more than a decade ago. These are things that we really need to know to be able to analyze and assess policies. But this was denied to us, so we get one journalistic institution that breaks the story, they manage to get the information out there. But the majors--specifically The New York Times-- don't actually run the story, they ignore it completely. This was so extraordinary that the public editor, Margaret Sullivan, had to get involved to investigate why they suppressed such a newsworthy story. It's a credit to the Times that they have a public editor, but it's frightening that there's such a clear need for one.

In the UK, when The Guardian was breaking the NSA story, we saw that if there is a competitive role in the media environment, if there's money on the line, reputation, potential awards, anything that has material value that would benefit the competition, even if it would simultaneously benefit the public, the institutions are becoming less willing to serve the public to the detriment of themselves. This is typically exercised through the editors. This is something that maybe always existed, but we don't remember it as always existing. Culturally, we don't like to think of it as having always existed. There are things that we need to know, things that are valuable for us, but we are not allowed to know, because The Telegraph or the Times or any other paper in London decides that because this is somebody else's exclusive, we're not going to report it. Instead, we'll try to "counter-narrative" it. We'll simply go to the government and ask them to make any statement at all, and we will unquestioningly write it down and publish it, because that's content that's exclusive to us. Regardless of the fact that it's much less valuable, much less substantial than actual documented facts that we can base policy discussions on. We've seemingly entered a world where editors are making decisions about what stories to run based on if it'll give oxygen to a competitor, rather than if it's news.

I would love to hear your thoughts on this, because while I do interact with media, I'm an outsider. You know media. As somebody who has worked in these cultures, do you see the same thing? Sort of the Fox News effect, where facts matter less?

Bell: It's a fascinating question. When you look at Donald Trump, there's a problem when you have a press which finds it important to report what has happened, without a prism of some sort of evaluation on it. That's the Trump problem, right? He says thousands of Muslims were celebrating in the streets of New Jersey after 9/11 and it's demonstrably not true. It's not even a quantification issue, it's just not

true. Yet, it dominates the news cycle, and he dominates the TV, and you see nothing changing in the polls--or, rather, him becoming more popular.

There are two things I think here, one of which is not new. I completely agree with you about how the economic dynamics have actually produced, bad journalism. One of the interesting things which I think is hopeful about American journalism is that within the last 10 years there's been a break between this relationship, which is the free market, which says you can't do good journalism unless you make a profit, into intellectually understanding that really good journalism not only sometimes won't make a profit, but is almost never going to be anything other than unprofitable.

I think your acts and disclosures are really interesting in that it's a really expensive story to do, and it is not the kind of story that advertisers want to stand next to. Actually people didn't want to pay to read them. Post hoc they'll say, we like The Guardian; we're going to support their work. So I agree with you that there's been a disjuncture between facts and how they are projected. I would like to think it's going to get better.

You're on Twitter now. You're becoming a much more rounded out public persona, and lots of people have seen Citizenfour. You've gone from being this source persona, to being more actively engaged with Freedom of the Press Foundation, and also having your own publishing stream through a social media company. The press no longer has to be the aperture for you. How do you see that?

Snowden: Today, you have people directly reaching an audience through tools like Twitter, and I have about 1.7 million followers right now (this number reflects the number of Twitter followers Snowden had in December 2015). These are people, theoretically, that you can reach, that you can send a message to. Whether it's a hundred people or a million people, individuals can build audiences to speak with directly. This is actually one of the ways that you've seen new media actors, and actually malicious actors, exploit what are perceived as new vulnerabilities in media control of the narrative, for example Donald Trump.

At the same time these strategies still don't work [...] for changing views and persuading people on a larger scope. Now this same thing applies to me. The director of the FBI can make a false statement, or some kind of misleading claim in congressional testimony. I can fact-check and I can say this is inaccurate. Unless some entity with a larger audience, for example, an established institution of journalism, sees that themselves, the value of these sorts of statements is still fairly minimal. They are following these new streams of information, then reporting out on those streams. This is why I think we see such a large interplay and valuable interactions that are emerging from these new media self-publication Twitter-type services and the generation of stories and the journalist user base of Twitter.

If you look at the membership of Twitter in terms of the influence and impact that people have, there are a lot of celebrities out there on Twitter, but really they're just trying to maintain an image, promote a band, be topical, remind people that they exist. They're not typically effecting any change, or having any kind of influence, other than the directly commercial one.

Bell: Let's think about it in terms of your role in changing the world, which is presenting these new facts. There was a section of the technology press and the intelligence press who, at the time of the leaks, said we already know this, except it's hidden in plain sight. Yet, a year after you made the disclosures, there was a broad shift of public perception about surveillance technologies. That may recede, and probably post-Paris, it is receding a little bit. Are you frustrated that there isn't more long-term impact? Do you feel the world has not changed quickly enough?

Snowden: I actually don't feel that. I'm really optimistic about how things have gone, and I'm staggered by how much more impact there's been as a result of these revelations than I initially presumed. I'm famous for telling Alan Rusbridger that it would be a three-day story. You're sort of alluding to this idea that people don't really care, or that nothing has really changed. We've heard this in a number of different ways, but I think it actually has changed in a substantial way.

Now when we talk about the technical press, or the national security press, and you say, this is nothing new, we knew about this, a lot of this comes down to prestige, to the same kind of signaling where they have to indicate we have expertise, we knew this was going on. In many cases they actually did not. The difference is, they knew the capabilities existed.

This is, I think, what underlies why the leaks had such an impact. Some people say stories about the mass collection of internet records and metadata were published in 2006. There was a warrantless wiretapping story in The New York Times as well. Why didn't they have the same sort of transformative impact? This is because there's a fundamental difference when it comes down to the actionability of information between knowledge of capability, the allegation that the capability could be used, and the fact that it is being used. Now what happened in 2013 is we transformed the public debate from allegation to fact. The distance between allegation and fact, at times, makes all the difference in the world.

That, for me, is what defines the best kind of journalism. This is one of the things that is really underappreciated about what happened in 2013. A lot of people laud me as the sole actor, like I'm this amazing figure who did this. I personally see myself as having a quite minor role. I was the mechanism of revelation for a very narrow topic of governments. It's not really about surveillance, it's about what the public understands--how much control the public has over the programs and policies of its governments. If we don't know what our government really does, if we don't know the powers that authorities are claiming for themselves, or arrogating to themselves, in secret, we can't really be said to be holding the leash of government at all.

One of the things that's really missed is the fact that as valuable and important as the reporting that came out of the primary archive of material has been, there's an extraordinarily large, and also very valuable amount of disclosure that was actually forced from the government, because they were so back-footed by the aggressive nature of the reporting. There were stories being reported that showed

how they had abused these capabilities, how intrusive they were, the fact that they had broken the law in many cases, or had violated the Constitution.

When the government is shown in a most public way, particularly for a president who campaigned on the idea of curtailing this sort of activity, to have continued those policies, in many cases expanded them in ways contrary to what the public would expect, they have to come up with some defense. So in the first weeks, we got rhetorical defenses where they went, nobody's listening to your phone calls. That wasn't really compelling. Then they went, "It's just metadata." Actually that worked for quite some time, even though it's not true. By adding complexity, they reduced participation. It is still difficult for the average person in the street to understand that metadata, in many cases, is actually more revealing and more dangerous than the content of your phone calls. But stories kept coming. Then they went, well alright, even if it is "just metadata," it's still unconstitutional activity, so how do we justify it? Then they go--well they are lawful in this context, or that context.

They suddenly needed to make a case for lawfulness, and that meant the government had to disclose court orders that the journalists themselves did not have access to, that I did not have access to, that no one in the NSA at all had access to, because they were bounded in a completely different agency, in the Department of Justice.

This, again, is where you're moving from suspicion, from allegation, to factualizing things. Now of course, because these are political responses, each of them was intentionally misleading. The government wants to show itself in the best possible light. But even self- interested disclosures can still be valuable, so long as they're based on facts. They're filling in a piece of the puzzle, which may provide the final string that another journalist, working independently somewhere else, may need. It unlocks that page of the book, fills in the page they didn't have, and that completes the story. I think that is something that has not been appreciated, and it was driven entirely by journalists doing follow- up.

There's another idea that you mentioned: that I'm more engaged with the press than I was previously. This is very true. I quite openly in 2013 took the position that this is not about me, I don't want to be the face of the argument. I said that I don't want to correct the record of government officials, even though I could, even though I knew they were making misleading statements. We're seeing in the current electoral circus that whatever someone says becomes the story, becomes the claim, becomes the allegation. It gets into credibility politics where they're going, oh, you know, well, Donald Trump said it, it can't be true. All of the terrible things he says put aside, there's always the possibility that he does say something that is true. But, because it's coming from him, it will be analyzed and assessed in a different light. Now that's not to say that it shouldn't be, but it was my opinion that there was no question that I was going to be subject to a demonization campaign. They actually recorded me on camera saying this before I revealed my identity. I predicted they were going to charge me under the Espionage Act, I predicted they were going to say I helped terrorists, blood on my hands, all of that stuff. It did come to pass. This was not a staggering work of genius on my part, it's just common sense, this is how it always works in the case of prominent whistleblowers. It was because of this that we needed other voices, we needed the media to make the argument.

Because of the nature of the abuse of classification authorities in the United States, there is no one that's ever held a security clearance who's actually able to make these arguments. Modern media institutions prefer never to use their institutional voice to factualize a claim in a reported story, they want to point to somebody else. They want to say this expert said, or this official said, and keep themselves out of it. But in my mind, journalism must recognize that sometimes it takes the institutional weight to assess the claims that are publicly available, and to make a determination on that basis, then put the argument forth to whoever the person under suspicion is at the time, for example, the government in this case, and go--look, all of the evidence says you were doing this. You say that's not the case, but why should we believe you? Is there any reason that we should not say this?

This is something that institutions today are loath to do because it's regarded as advocacy. They don't want to be in the position of having to referee what is and is not fact. Instead they want to play these "both sides games" where they say, instead we'll just print allegations, we'll print claims from both sides, we'll print their demonstrations of evidence, but we won't actually involve ourselves in it.

Because of this, I went the first six months without giving an interview. It wasn't until December 2013 that I gave my first interview to Barton Gellman of The Washington Post. In this intervening period my hope was that some other individual would come forth on the political side, and would become the face of this movement. But more directly I thought it would inspire some reflection in the media institutions to think about what their role was. I think they did a fairly good job, particularly for it being unprecedented, particularly for it being a segment in which the press has been, at least in the last 15 years, extremely reluctant to express any kind of skepticism regarding government claims at all. If it involved the word "terrorism," these were facts that wouldn't be challenged. If the government said, look, this is secret for a reason, this is classified for a reason, journalists would leave it at that. Again, this isn't to beat up on The New York Times, but when we look at the warrantless wiretapping story that was ready to be published in October of an election year, that [election] was decided by the smallest margin in a presidential election, at least in modern history. It's hard to believe that had that story been published, it would not have changed the course of that election.

Bell: Former Times Executive Editor Jill Abramson has said her paper definitely made mistakes, "I wish we had not withheld stories." What you're saying certainly resonates with what I know and understand of the recent history of the US press, which is that national security concerns post-9/11 really did alter the relationship of reporting, particularly with administration and authority in this country. What we know about drone programs comes from reporting, some of it comes from the story which The Intercept got hold of, and Jeremy Scahill's reporting on it, which has been incredibly important. But a great deal of it has also come from the ground level. The fact that we were aware at all that drones were blowing up villages, killing civilians, crossing borders where they were not supposed to be really comes from people who would report from the ground.

Something interesting has definitely happened in the last three years, which makes me think about what you are telling us about how the NSA operates. We're seeing a much closer relationship now between

journalism and technology and mass communication technology than we've ever seen before. People are now completely reliant on Facebook. Some of that is a commercial movement in the US, but you also have activists and journalists being regularly tortured or killed in, say, Bangladesh, where it's really impossible to operate a free press, but they are using these tools. It is almost like the American public media now is Facebook. I wonder how you think about this? It's such a recent development.

Snowden: One of the biggest issues is that we have many more publishers competing for a finite, shrinking amount of attention span that's available. This is why we have the rise of these sort of hybrid publications, like a BuzzFeed, that create just an enormous amount of trash and cruft. They're doing AB testing and using scientific principles. Their content is specifically engineered to be more attention getting, even though they have no public value at all. They have no news value at all. Like here's 10 pictures of kittens that are so adorable. But then they develop a news line within the institution, and the idea is that they can drive traffic with this one line of stories, theoretically, and then get people to go over onto the other side.

Someone's going to exploit this; if it's not going to be BuzzFeed, it's going to be somebody else. This isn't a criticism of any particular model, but the idea here is that the first click, that first link is actually consuming attention. The more we read about a certain thing, that's actually reshaping our brains. Everything that we interact with, it has an impact on us, it has an influence, it leaves memories, ideas, sort of memetic expressions that we then carry around with us that shape what we look for in the future, and that are directing our development.

Bell: Yes, well that's the coming singularity between the creation of journalism and large-scale technology platforms, which are not intrinsically journalistic. In other words, they don't have a primary purpose.

Snowden: They don't have a journalistic role, it's a reportorial role.

Bell: Well, it's a commercial role, right? So when you came to Glenn and The Guardian, there wasn't a hesitation in knowing the primary role of the organization is to get that story to the outside world as securely and quickly as possible, avoiding prior restraint, protecting a source.

Is source protection even possible now? You were extremely prescient in thinking there's no point in protecting yourself.

Snowden: I have an unfair advantage.

Bell: You do, but still, that's a big change from 20 years ago.

Snowden: This is something that we saw contemporary examples of in the public record in 2013. It was the James Rosen case where we saw the Department of Justice, and government more broadly, was

abusing its powers to demand blanket records of email and call data, and the AP case where phone records for calls that were made from the bureaus of journalism were seized.

That by itself is suddenly chilling, because the traditional work of journalism, the traditional culture, where the journalist would just call their contact and say, hey, let's talk, suddenly becomes incriminating. But more seriously, if the individual in question, the government employee who is working with a journalist to report some issue of public interest, if this individual has gone so far to commit an act of journalism, suddenly they can be discovered trivially if they're not aware of this.

I didn't have that insight at the time I was trying to come forward because I had no relationship with journalists. I had never talked to a journalist in any substantive capacity. So, instead I simply thought about the adversarial relationship that I had inherited from my work as an intelligence officer, working for the CIA and the NSA. Everything is a secret and you've got two different kinds of cover. You've got cover for status, which is: You're overseas, you're living as a diplomat because you have to explain why you're there. You can't just say, oh, yeah, I work for the CIA. But you also have a different kind of cover which is what's called cover for action. Where you're not going to live in the region for a long time, you may just be in a building and you have to explain why you're walking through there, you need some kind of pretext. This kind of trade-craft unfortunately is becoming more necessary in the reportorial process. Journalists need to know this, sources need to know this. At any given time, if you were pulled over by a police officer and they want to search your phone or something like that, you might need to explain the presence of an application. This is particularly true if you're in a country like Bangladesh. I have heard that they're now looking for the presence of VPN [virtual private network software] for avoiding censorship locks and being able to access uncontrolled news networks as evidence of opposition, allegiance, that could get you in real trouble in these areas of the world.

At the time of the leaks I was simply thinking, alright the government--and this isn't a single government now--we're actually talking about the Five Eyes intelligence alliance [the United States, the United Kingdom, New Zealand, Australia, Canada] forming a pan-continental super-state in this context of sharing, they're going to lose their minds over this. Some institutions in, for example, the UK, can levy D notices, they can say, look, you can't publish that, or you should not publish that. In the United States it's not actually certain that the government would not try to exercise prior restraint in slightly different ways, or that they wouldn't charge journalists as accomplices in some kind of criminality to interfere with the reporting without actually going after the institutions themselves, single out individuals. We have seen this in court documents before. This was the James Rosen case, where the DOJ had named him as sort of an accessory--they said he was a co-conspirator. So the idea I thought about here was that we need institutions working beyond borders in multiple jurisdictions simply to complicate it legally to the point that the journalists could play games, legally and journalistically more effectively and more quickly than the government could play legalistic games to interfere with them.

Bell: Right, but that's kind of what happened with the reporting of the story.

Snowden: And in ways that I didn't even predict, because who could imagine the way a story like that would actually get out of hand and go even further: Glenn Greenwald living in Brazil, writing for a US institution for that branch, but headquartered in the UK, The Washington Post providing the institutional clout and saying, look, this is a real story, these aren't just crazy leftists arguing about this, and Der Spiegel in Germany with Laura [Poitras]. It simply represented a system that I did not believe could be overcome before the story could be put out. By the time the government could get their ducks in a row and try to interfere with it, that would itself become the story.

Bell: You're actually giving a sophisticated analysis of much of what's happened to both reporting practice and media structures. As you say, you had no prior interactions with journalists. I think one of the reasons the press warmed to you was because you put faith in journalists, weirdly. You went in thinking I think I can trust these people, not just with your life, but with a huge responsibility. Then you spent an enormous amount of time, particularly with Glenn, Laura, and Ewen [MacAskill] in those hotel rooms. What was that reverse frisking process like as you were getting to know them? My experience is as people get closer to the press, they often like it less. Why would you trust journalists?

Snowden: This gets into the larger question--how did you feel about journalists, what was the process of becoming acquainted with them? There's both a political response and a practical response. Specifically about Glenn, I believe very strongly that there's no more important quality for a journalist than independence. That's independence of perspective, and particularly skepticism of claims. The more powerful the institution, the more skeptical one should be. There's an argument that was put forth by an earlier journalist, I.F. Stone: "All governments are run by liars and nothing they say should be believed." In my experience, this is absolutely a fact. I've met with Daniel Ellsberg and spoken about this, and it comports with his experience as well. He would be briefing the Secretary of Defense on the airplane, and then when the Secretary of Defense would disembark right down the eight steps of the plane and shake hands with the press, he would say something that he knew was absolutely false and was completely contrary to what they had just said in the meeting [inside the place] because that was his role. That was his job, his duty, his responsibility as a member of that institution.

Now Glenn Greenwald, if we think about him as an archetype, really represents the purest form of that. I would argue that despite the failings of any journalist in one way or another, if they have that independence of perspective, they have the greatest capacity for reporting that a journalist can attain. Ultimately, no matter how brilliant you are, no matter how charismatic you are, no matter how perfect or absolute your sourcing is, or your access, if you simply take the claims of institutions that have the most privilege that they must protect, at face value, and you're willing to sort of repeat them, all of those other things that are working in your favor in the final calculus amount to nothing because you're missing the fundamentals.

There was the broader question of what it's like working with these journalists and going through that process. There is the argument that I was naïve. In fact, that's one of the most common criticisms about me today--that I am too naïve, that I have too much faith in the government, that I have too much faith in the press. I don't see that as a weakness. I am naïve, but I think that idealism is critical to achieving

change, ultimately not of policy, but of culture, right? Because we can change this or that law, we can change this or that policy or program, but at the end of the day, it's the values of the people in these institutions that are producing these policies or programs. It's the values of the people who are sitting at the desk with the blank page in Microsoft Office, or whatever journalists are using now.

Bell: I hope they're not using Microsoft Office, but you never know.

Snowden: They have the blank page ...

Bell: They have the blank page, exactly.

Snowden: In their content management system, or whatever. How is that individual going to approach this collection of facts in the next week, in the next month, in the next year, in the next decade? What will the professor in the journalism school say in their lecture that will impart these values, again, sort of memetically into the next cohort of reporters? If we do not win on that, we have lost comprehensively. More fundamentally, people say, why did you trust the press, given their failures? Given the fact that I was, in fact, quite famous for criticizing the press.

Bell: If they had done their job, you would be at home now.

Snowden: Yeah, I would still be living quite comfortably in Hawaii.

Bell: Which is not so bad, when you put it that way.

Snowden: People ask how could you do this, why would you do this? How could you trust a journalist that you knew had no training at all in operational security to keep your identity safe because if they screw up, you're going to jail. The answer was that that was actually what I was expecting. I never expected to make it out of Hawaii. I was going to try my best, but my ultimate goal was simply to get this information back in the hands of the public. I felt that the only way that could be done meaningfully was through the press. If we can't have faith in the press, if we can't sort of take that leap of faith and either be served well by them, or underserved and have the press fail, we've already lost. You cannot have an open society without open communication. Ultimately, the test of open communication is a free press. If they can't look for information, if they can't contest the government's control of information, and ultimately print information--not just about government, but also about corporate interests, that has a deleterious impact on the preferences of power, on the prerogatives of power. You may have something, but I would argue it's not the traditional American democracy that I believed in.

So the idea here was that I could take these risks because I already expected to bear the costs. I expected the end of the road was a cliff. This is actually illustrated quite well in Citizenfour because it shows that there was absolutely no plan at all for the day after.

The planning to get to the point of working with the journalists, of transmitting this information, of explaining, contextualizing--it was obsessively detailed, because it had to be. Beyond that, the risks were my own. They weren't for the journalists. They could do everything else. That was by design as well, because if the journalists had done anything shady--for example, if I had stayed in place at the NSA as a source and they had asked me for this document, and that document, it could have undermined the independence, the credibility of the process, and actually brought risks upon them that could have led to new constraints upon journalism.

Bell: So nothing you experienced in the room with the team, or what happened after, made you question or reevaluate journalism?

Snowden: I didn't say that. Actually working more closely with the journalists has radically reshaped my understanding of journalism, and that continues through to today. I think you would agree that anybody who's worked in the news industry, either directly or even peripherally, has seen journalists-- or, more directly, editors--who are terrified, who hold back a story, who don't want to publish a detail, who want to wait for the lawyers, who are concerned with liability.

You also have journalists who go out on their own and they publish details which actually are damaging, directly to personal safety. There were details published by at least one of the journalists that were discussing communication methods that I was still actively using, that previously had been secret. But the journalists didn't even forewarn me, so suddenly I had to change all of my methods on the fly. Which worked out OK because I had the capabilities to do that, but dangerous.

Bell: When did that happen?

Snowden: This was at the height of public interest, basically. The idea here is that a journalist ultimately, and particularly a certain class of journalist, they don't owe any allegiance to their source, right? They don't write the story in line with what the sources desires, they don't go about their publication schedule to benefit, or to detriment, in theory, the source at all. There are strong arguments that that's the way it should be: public knowledge of the truth is more important than the risks that knowledge creates for a few. But at the same time, when a journalist is reporting on something like a classified program implicating one of the government's sources, you see an incredibly high standard of care applied to make sure they can't be blamed if something goes wrong down the road after publication. The journalists will go, well we'll hold back this detail from that story reporting on classified documents, because if we name this government official it might expose them to some harm, or it might get this program shut down, or even if it might cause them to have to rearrange the deck chairs in the operations in some far away country.

That's just being careful, right? But ask yourself--should journalists be just as careful when the one facing the blowback of a particular detail is their own source? In my experience, the answer does not seem to be as obvious as you might expect.

Bell: Do you foresee a world where someone won't have to be a whistleblower in order to reveal the kinds of documents that you revealed? What kinds of internal mechanisms would that require on behalf of the government? What would that look like in the future?

Snowden: That's a really interesting philosophical question. It doesn't come down to technical mechanisms, that comes down to culture. We've seen in the EU a number of reports from parliamentary bodies, from the Council of Europe, that said we need to protect whistleblowers, in particular national security whistleblowers. In the national context no country really wants to pass a law that allows individuals rightly, or wrongly, to embarrass the government. But can we provide an international framework for this? One would argue, particularly when espionage laws are being used to prosecute people, they already exist. That's why espionage, for example, is considered a political offense, because it's just a political crime, as they say. That's a fairly weak defense, or fairly weak justification, for not reforming whistleblower laws. Particularly when, throughout Western Europe they're going, yeah, we like this guy, he did a good thing. But if he shows up on the doorstep we're going to ship him back immediately, regardless of whether it's unlawful, just because the US is going to retaliate against us. It's extraordinary that the top members of German government have said this on the record--that it's realpolitik; it's about power, rather than principle.

Now how we can fix this? I think a lot of it comes down to culture, and we need a press that's more willing and actually eager to criticize government than they are today. Even though we've got a number of good institutions that do that, or that want to do that, it needs a uniform culture. The only counterargument the government has made against national security whistleblowing, and many other things that embarrassed them in the past, is that well, it could cause some risk, we could go dark, they could have blood on their hands.

Why do they have different ground rules in the context of national security journalism?

We see that not just in the United States, but in France, Germany, the UK, in every Western country, and of course, in every more authoritarian country by comparison they are embracing the idea of state secrets, of classifications, or saying, you can't know this, you can't know that.

We call ourselves private citizens, and we refer to elected representatives as public officials, because we're supposed to know everything about them and their activities. At the same time, they're supposed to know nothing about us, because they wield all the power, and we hold all of the vulnerability. Yet increasingly, that's becoming inverted, where they are the private officials, and we are the public citizens. We're increasingly monitored and tracked and reported, quantified and known and influenced, at the same time that they're getting themselves off and becoming less reachable and also less accountable.

Bell: But Ed, when you talk about this in those terms, you make it sound as though you see this as a progression. Certainly there was a sharp increase, as you demonstrated, in overreach of oversight post-9/11. Is it a continuum?

It felt from the outside as though America, post-9/11, for understandable reasons, it was almost like a sort of national psychosis. If you grew up in Europe, there were regular terrorist acts in almost every country after the Second World War, though not on the same scale, until there was a brief, five-year period of respite, weirdly running up to about 2001. Then the nature of the terrorism changed. To some extent, that narrative is predictable. You talk about it as an ever increasing problem. With the Freedom Act in 2015, the press identified this as a significant moment where the temperature had changed. You don't sound like you really think that. You sound as though you think that this public/private secrecy, spying, is an increasing continuum. So how does that change? Particularly in the current political climate where post-Paris and other terrorist attacks we've already seen arguments for breaking encryption.

Snowden: I don't think they are actually contradictory views to hold. I think what we're talking about are the natural inclinations of power and vice, what we can do to restrain it, to maintain a free society. So when we think about where things have gone in the USA Freedom Act, and when we look back at the 1970s, it was even worse in terms of the level of comfort that the government had that it could engage in abuses and get away with them. One of the most important legacies of 2013 is not anything that was necessarily published, but it was the impact of the publication on the culture of government. It was a confirmation coming quite quickly in the wake of the WikiLeaks stories, which were equally important in this regard. That said, secrecy will not hold forever. If you authorize a policy that is clearly contrary to law, you will eventually have to explain that.

The question is, can you keep it under wraps long enough to get out of the administration, and hopefully for it to be out of the egregious sort of thing where you'll lose an election as a result. We see the delta between the periods of time that successive administrations can keep a secret is actually diminishing--the secrets are becoming public at an accelerated pace. This is a beneficial thing. This is the same in the context of terrorism.

There is an interesting idea--when you were saying it's sort of weird that the US has what you described as a collective psychosis in the wake of 9/11 given that European countries have been facing terrorist attacks routinely. The US had actually been facing the same thing, and actually one would argue, experienced similarly high-impact attacks, for example, the Oklahoma City bombing, where a Federal building was destroyed by a single individual or one actor.

Bell: What do you think about the relationship between governments asking Facebook and other communications platforms to help fight ISIS?

Snowden: Should we basically deputize companies to become the policy enforcers of the world? When you put it in that context suddenly it becomes clear that this is not really a good idea, particularly because terrorism does not have a strong definition that's internationally recognized. If Facebook says, we will take down any post from anybody who the government says is a terrorist, as long as it comes from this government, suddenly they have to do that for the other government. The Chinese allegations of who is and who is not a terrorist are going to look radically different than what the FBI's are going to

be. But if the companies try to be selective about them, say, well, we're only going to do this for one government, they immediately lose access to the markets of the other ones. So that doesn't work, and that's not a position companies want to be in.

However, even if they could do this, there are already policies in place for them to do that. If Facebook gets a notification that says this is a terrorist thing, they take it down. It's not like this is a particularly difficult or burdensome review when it comes to violence.

The distinction is the government is trying to say, now we want them to start cracking down on radical speech. Should private companies be who we as society are reliant upon to bound the limits of public conversations? And this goes beyond borders now. I think that's an extraordinarily dangerous precedent to be embracing, and, in turn, irresponsible for American leaders to be championing.

The real solutions here are much more likely to be in terms of entirely new institutions that bound the way law enforcement works, moving us away from the point of military conflict, secret conflict, and into simply public policing.

There's no reason why we could not have an international counter-terrorism force that actually has universal jurisdiction. I mean universal in terms of fact, as opposed to actual law.

Canadian Press
IBM and universities join forces in battle against cybercrime
Wednesday, 11 May 2016

Ottawa - IBM wants its Watson computer system to learn how to fight cybercrime and it's asking eight leading universities, including three in Canada, for help. Watson - IBM's question answering computer system - was originally designed to compete (and win) on the television quiz show Jeopardy, but the technology has since been used on other problem-solving projects.
Now IBM is launching Watson for Cyber-security - a cloud-based version of their cognitive technology - that will be trained over the next year to examine threats of cybercrime.

Caleb Barlow, vice-president of IBM Security, said it is becoming increasingly difficult for security staffto deal with the growing number of cyber threats.

"Your average enterprise is dealing with 200,000 incidents a day that they've got to dig through. Human beings simply cannot look at all of that data," he said.

"Combine that with the fact we have a major skill shortage in the security industry - around 1.5 million jobs by 2020 - and even if we could fill all those jobs we still can't get through the data as it continues to grow."

Barlow said experts are doing a good job to examine cyber threats, but their work often ends up in various forms such as reports, blogs and presentations and in numbers too large for others to read and remember.

That's where Watson comes in.

Students at the eight universities, including the University of New Brunswick, University of Ottawa and the University of Waterloo, will put the information in a form the computer can understand and help train the system to use that information to examine cyber threats.

"The more information that Watson has, the better reasoning it can provide and therefore in some cases the better prediction it can provide," said Ali Ghorbani, dean of the faculty of computer science at the University of New Brunswick in Fredericton.

The students will input about 15,000 security documents per month during the year-long project, starting this fall.

"Our students are getting involved in a real-world cyber-security project with a global company. Not only will they increase their knowledge, but also create a relationship with IBM for future collaborations - either jobs for our students or more research and development projects with IBM," Ghorbani said.

He said IBM is hoping that not only will Watson be able to provide early warnings of potential attacks, it will also do it fast.

Barlow said IBM opened its entire threat intelligence database to the world a year ago, and invited people to develop applications to work with their QRadar software.

That software was developed by Q1 Labs, developed in turn at the University of New Brunswick, and purchased more than four years ago by IBM.

He said by getting information out to security staffaround the world, cybercrime may become less lucrative for organized crime.

"We start changing the dynamic for the bad guys because it's not worth investing $100,000 or more in that new attack you've got if it's only going to be viable for a few minutes before we find it and tell the rest of the world," Barlow said.

Air Canada employees told to seek extra ID from kids even after feds' screening directive
Wednesday, 11 May 2016
Byline: Shanifa Nasser

Ottawa - A passport, a school ID card or even an Aeroplan number are among the pieces of identification Air Canada employees were instructed to obtain from children, even as the federal public safety minister said additional security screening was not required for people under 18.
Screenshots of documents taken by an Air Canada employee in January, sent to CBC News show the airline carrier issued a directive to employees stating children are not subject to extra screening measures, but goes on to list numerous such steps to clear what is known as the "deemed high profile" or DHP list. CBC News agreed to protect the employee's identity because of concerns of job termination.

"Children are not subject to extra screening under the Transport Canada Secure Air Travel Act (SATA) and Passenger Protect Program; however, until a passenger has been seen by an Airport agent, we cannot confirm their identity and date of birth," the screenshot says.

The revelations come just after the Minister Goodale announced that Canada and the U.S. set up a working group to help prevent false-positives for children matching names on no-fly lists.

The no-fly list is generated by the government, but "piggybacked onto the computer systems of the airlines. It's not an interactive system," he said Tuesday, admitting changes to the problem of false security-list matches won't be quick or easy.

By contrast, the American system is entirely government run and is entirely interactive, Goodale said.

"You've got to change the entire database."

In a statement, Air Canada representative Peter Fitzpatrick told CBC News it is a legal requirement that all passengers be vetted against watch lists, adding that children whose names are similar to a flagged name are "uniquely identified and cleared."

Employees are "instructed to use an Aeroplan number because it is a unique identifier (unlike a birthday because people share birth dates and the information can sometimes be entered incorrectly,)" Fitzpatrick said.

But to Toronto-area Khadija Cajee, whose six-year-old son, Adam Ahmed, nearly missed an Air Canada flight to Boston last year because his name showed up on the DHP list, an Aeroplan number makes little sense.

"I can log on as Bugs Bunny and get an Aeroplan number. It's not a foolproof government identification. It's a loyalty program," Cajee said.

Since Ahmed's case made headlines, more than 40 other parents have come forward through social media and other means, with the same complaint.

Cajee, meanwhile, has found herself the unwitting liaison for the group #NoFlyListKids and the government.

One of those mothers, based in Kamloops, said on Tuesday that Air Canada employees have recommended she change her baby's name to bypass the delays.

"I wasn't happy with that," Faaria Siddiqui told CBC News. "How do we know if we change his name it won't be on the list or the name we choose won't be on list?"

Reuters
SWIFT rejects Bangladeshi claims over $81 million cyber heist
Wednesday, 11 May 2016

Dhaka - SWIFT has rejected allegations by officials in Bangladesh that technicians with the global messaging system made the nation's central bank more vulnerable to hacking before an $81 million cyber heist in February.
The comments were in response to a Reuters story that cited Bangladeshi police and a central bank official as saying that SWIFT technicians introduced security holes into the bank's network while connecting SWIFT to Bangladesh's first real-time gross settlement (RTGS) system.

"SWIFT was not responsible for any of the issues cited by the officials, or party to the related decisions," the Brussels-based bank-owned cooperative said in a statement posted on its website on Monday.

"As a SWIFT user like any other, Bangladesh Bank is responsible for the security of its own systems interfacing with the SWIFT network and their related environment - starting with basic password protection practices - in much the same way as they are responsible for their other internal security considerations," the statement said.

But Bangladesh's main police investigator maintained there were loopholes in the way SWIFT carried out the integration of its network with the RTGS platform that left the central bank's computer systems vulnerable to hackers.

Mohammad Shah Alam, the head of the Criminal Investigation Department of the Bangladesh Police, said the probe had identified specific deviations from set procedures that compromised Bangladesh Bank's security. "We stand by our investigation," he said in response to the comments by SWIFT.

But he added he did not want to engage in a debate and urged greater international cooperation to identify the culprits behind one of the world's biggest cyber thefts.

Reuters has not been able to independently verify the allegations by Bangladeshi officials about the SWIFT technicians.

US investigators suspect the involvement of employees of the Bangladesh Bank in helping the hackers breach the systems, the Wall Street Journal said, quoting people familiar with the matter.

It said the Federal Bureau of Investigation had found evidence that at least one bank employee acted as an accomplice but there could be more who assisted the hackers in navigating around Bangladesh Bank's computer systems.

Bangladesh Police said they have been looking for inside involvement in the heist from the beginning of the probe, but no evidence has turned up against anyone.

Investigators say they think there was some level of local facilitation in the attack on the central bank's computers but haven't identified it as yet. "If the FBI has uncovered evidence, they should share with us," a police officer said.

The revelations came ahead of a meeting on Tuesday in Basel, Switzerland, where Bangladesh Bank officials have said their governor and a lawyer appointed by the bank would discuss recovery of about $81 million stolen by hackers with the head of the Federal Reserve Bank of New York and a senior executive from SWIFT.

The money was stolen from Bangladesh Bank's account at the New York Fed through fraudulent transfer orders sent on the SWIFT system.

SWIFT's statement said it "looks forward to the meeting with Bangladesh Bank and New York Federal Reserve Bank officials in Basel on 10th May, when the bank's security issues and these baseless allegations will be discussed."

Bangladesh Bank officials have said they believed SWIFT, and the New York Fed, bear some responsibility for the February cyber heist.

Gulf News
Banks to face growing challenge on data security
Wednesday, 11 May 2016
Byline: Babu Das Augustine

Dubai - In the context of rising cases of data breaches across regional financial institutions, KPMG expects the UAE based banks to face growing challenges from hackers and other malicious actors. "In November 2015, we surveyed a broad range of KPMG clients in the UAE to better understand their cyber security arrangements and their level of preparedness to respond to a cyber-attack. What we learned clearly showed that many organizations in the UAE -- including financial institutions -- continue to struggle in a number of different areas," said Cristian Carstoiu, Director, Management Consulting.

The survey showed that many UAE organisations find it difficult to develop an adequate investment case to recruit the right level of expertise and to implement appropriate security technologies, even against a backdrop of increasing concern over cyber security attacks in the region.

"We believe many organisations in the UAE need to improve their emergency response and contingency plans in order to appropriately respond to, and recover from, a cyber breach. Organisations in the UAE also need to better understand their threat profile: who, when and why they are likely to be targeted," said Carstoiu.

The study also said that many boards in the UAE -- where the ultimate responsibility for cyber security lies -- do not have a comprehensive or accurate view of their cyber risks, often because threat intelligence and cyber monitoring have been inconsistently implemented.

Global Times
Activist's cyber hunt violates moral codes
Wednesday, 11 May 2016
Section: editorial

Internet activist Wen Yunchao on Sunday launched a cyber manhunt on Twitter aimed at five experts and technical personnel who helped improve China's Great Firewall. Wen encouraged Net users to find out whether the five, four of whom are professors and postgraduate students from a university in Nanjing, have any personal issues or are engaged in academic corruption.
Wen is a radical political dissident, who was disciplined many times at his Chinese university for various reasons. After he began his studies in the US in 2009, he gradually became a democracy activist against the Chinese political system.

Wen often voices aggressive opinions over freedom of speech and judicial justice. But the manhunt he initiated is a far cry from his philosophy.

These cyber manhunts go severely against cyber ethics, and for a number of reasons are violations of the law. However, it is unfortunate that Twitter has done nothing about it after the case was reported by some Western media. Imagine if Edward Snowden called for a cyber manhunt against all the designers of the US surveillance program PRISM on social networks, would Twitter still be so indifferent?

Certain dissidents have totally lost their moral bottom line nowadays. They flatter themselves that they stand on the moral high ground. Assuming that they did everything for a just cause, they think they can thus trample on ordinary people's codes of conduct.

Every country is responsible for its own cyber management. Technical inventions by a few researchers do not have any political nature.

Yet Wen attacked those technical workers online because of objections to the Chinese firewall. Such paranoia is familiar to us.

No matter how many grudges one has over social governance, he cannot publicly infringe on the rights of others like Wen has done. Otherwise, the entire society will fall into chaos.

After some dissidents fled to the US and other Western countries, they have not only had "more freedom" to express their political views, but also showed the dark side in their humanity. They seem to be so anxious to witness great disorder in China in no time. There is no telling whether their behavior stems from their own issues or the influence of the anti-China forces in the US.

That these malcontented dissidents living abroad, who are losers in life, are washed out by China's reform and opening-up is amusing and thought-provoking.

Smart tech set to revolutionize airports
Wednesday, 11 May 2016
Byline: Staff Report

Dubai - The 16th edition of the Airport Show, currently under way at the Dubai International Convention and Exhibition Centre with over 300 exhibitors from 55 countries, has been utilised as a platform to showcase technologies and innovative solutions by multi-national and regional companies.
Some of the prominent technology devices that are being showcased include the Intelligent Trolley and Trolley Security Scanner by Denmark-based Exruptive, an associate company of Dubai-based emaratech, airport runway cleaning systems by US-based Cyclone Technology, Smart Tray cargo and baggage handling systems by Siemens, driverless shuttle by Navya ARMA and the latest face recognition technology by Rockwell Collins.

The Intelligent Trolley will act as a passenger's personal guide through the airport. It can be used to power personal devices, act as a real-time way finding device in the airport via an interactive 3D-map. For flight and gate information, the device updates information on a real-time basis and keeps the passenger updated.

"We are extremely pleased with the response from trade visitors. There have been invitations to visit many airports," said Morten Pankoke, chief operating officer of Exruptive.

Rockwell Collins'face recognition technology captures a traveller's identity using biometrics and matches it with the passenger's passport and boarding pass information.

Dr Ian Bache PMP, technical pre-sales director, Arinc Airports Information Management Services, Rockwell Collins, said: "Airports are always looking to automate passenger processing while maintaining the highest security levels. We offer tailor-made solutions which can be configured with airport identity management solutions. Many airports in this region are showing interest in these technologies." US-based Cyclone Technology has displayed an ultra high water pressure system, The Cyclone 4006, which cleans airport runways and apron surfaces more effectively and in less time than other methods. The patented cleaning and recovery head cleans and removes rubber and paint build-up without damage to the surface.

Siemens is showcasing its latest baggage handling systems, prominent among them is 'smart tray' or SmartTilter, Siemens' solution for the dynamic tilting of tray conveyors, which help get baggage to its destination as quickly as possible.

Navya ARMA introduced a 100 per cent electric and intelligent driverless shuttle which can transport up to 15 passengers and safely drive up to 45 km/h. Navya, the French company which has conceptualised and manufactured the vehicle, is keen on introducing the shuttle at airports across the Middle East region.

The National (UAE)
Beijing postpones implementing new e-commerce regulations

Wednesday, 11 May 2016
Byline: Saibal Dasgupta

Beijing - In a rare move, China today held back implementation of new regulations that were passed last month on goods imported from overseas markets using e-commerce platforms. The government said it will now make adjustments to the rules before they are brought in.
The decision indicated that Beijing is going through a process of rethinking over the use of the internet for a variety of business and security-related functions.

On Monday, the government ordered Beijing's Baidu, one of the world's largest search engines, to revamp its vast business spanning several countries. The cyber administration of China asked the Nasdaq-listed Baidu to formulate a new and more credible algorithm and restrict the amount of promotional content by May 31.

These developments have taken place against the backdrop of the government drafting and finalising three different laws on cybersecurity and new counter terrorism laws. Foreign companies and industry lobby groups are worried that the proposed regulations may impinge on their privacy and force them to share "sensitive intellectual property" with the government in the name of "national security".

"Foreign companies feel they are vulnerable towards potential scrutiny and even attacks by Chinese authorities," Yun Sun, a senior associate with the East Asia programme at the Washington think tank Stimson Center, told The National today.

She said the new laws make foreign companies vulnerable towards potential scrutiny or even potential investigation by Chinese authorities. "This reduces the security level for these companies and their products, and also threatens the credibility for their operations in the global market," she said.

Beijing says the new laws have mainly been brought to deal with the threat of terrorism from militants involved in the East Turkmenistan movement in western China's Xinjiang province, and the enhanced global fears after the recent terrorist attacks in parts of Europe and Egypt. The Xinjiang-based militants have attacked targets in Beijing and Kunming cities besides carrying out bomb attacks in the western province in recent years.

"The government's main objective is to fight terrorist using the cyber space to further their activities. But it also wants to control data flow. It is this aspect that would hurt businesses," Ada Wang, a legal counsel and compliance officer with TUVRheinland, said yesterday.

"The new laws will not just affect foreign companies. It would also hamper Chinese companies operating overseas because the government does not want sensitive date to leave the country," she said. Indeed, the rules make it obligatory for companies to use specified infrastructure, and ensure that their websites are hosted in satellites hovering over China, and not in foreign locations.

Other Chinese experts and businessmen see it differently. "There will be a new phase for internet development in China," said Xiong Huang, a researcher at Communication University of China, said listening to the Chinese president Xi Jinping talk about the importance of internet security at a conference in Beijing last month.

Following the event, Jack Ma, the founder and chairman of China's giant e-commerce company Alibaba Group, said: "This is the first high-profile meeting in the internet field for our country. Not only does the meeting show how much China values the internet as a national strategy, but the country has a quite high level in both practice and theory on the development of the internet. I'm firm about the internet development in China after the speech."

What the regulations might do is force more foreign companies to enter into joint ventures with local enterprises to make sure they do not cross the line and attract the wrath of the authorities empowered with the new legislation.

The laws cover all businesses engaged in transmission of data via cyber space. The regulations state that companies are expected to: assist authorities in unravelling complicated data whenever required; use data infrastructure that is based in China; use encryption technology before transmitting data outside China; never generate or use data in any manner that would affect the country's national security; disallow any person, groups or organisation to use their internet platforms to disseminate propaganda against Chinese political systems, or instigate the local population against government authorities.

One of the implications of the new law is that it will involve additional costs to build secure internet infrastructure and hire legal services to deal with compliance issue. This is partly because the new law is vague about compliance requirements, and not specifically pinpointed, an analysts said.

Companies based in Hong Kong will now be treated as offshore enterprises, and treated as foreign firms under these laws. This can be a bothersome to foreign companies because many of them are registered in Hong Kong, and not in mainland China.

One analyst, who declined to be named, said that the rules are not meant to target foreign companies. "They have merely come in the way of these laws because they impose a wide range of restrictions on the use of internet, and flow of data," he said.

New York Times
Sensitive Email Routinely Sent as Unclassified
Wednesday, 11 May 2016
Byline: Steven Lee Myers

Washington - On the morning of March 13, 2011, the assistant secretary of state for Near Eastern affairs, Jeffrey D. Feltman, wrote an urgent email to more than two dozen colleagues informing them

that Saudi Arabia and the United Arab Emirates were sending troops into Bahrain to put down antigovernment protests there.
Mr. Feltman's email prompted a string of 10 replies and forwards over the next 24 hours, including to Secretary of State Hillary Clinton, as the Obama administration debated what was happening and how to respond.

The chain contained information now declared classified, including portions of messages written by Mr. Feltman; the former ambassador in Kuwait, Deborah K. Jones; and the current director of the Central Intelligence Agency, John O. Brennan.

The top administration officials discussed the Bahrain situation on unclassified government computer networks, except for Mrs. Clinton, who used a private email server while serving as secretary of state.

Her server is now the subject of an F.B.I. investigation, which is likely to conclude in the next month, about whether classified information was mishandled.

Whatever the disposition of the investigation, the discussion of troops to Bahrain reveals how routinely sensitive information is emailed on unclassified government servers, reflecting what many officials describe as diplomacy in the age of the Internet, especially in urgent, fast-developing situations.

A review of the 30,322 emails from Mrs. Clinton's private server that the State Department has made public under the Freedom of Information Act provide an extensive record of how such sensitive information often looped throughout President Obama's foreign policy apparatus on unclassified systems, from embassies to the United Nations to the White House.

The senders included Denis R. McDonough, currently the White House chief of staff and previously the deputy national security adviser, and Susan E. Rice, the former American representative at the United Nations who is now Mr. Obama's national security adviser.

Many of the emails were sent over the State Department's unclassified system, state.gov, which is considered secure but not at the level of the State Department's system for emailing classified information.

At the State Department, the Pentagon and the White House, among other agencies, officials have two systems for email, one for classified messages and one for more routine business. They are nicknamed the "high side" and the "low side."

Mrs. Clinton's private server -- set up in her home in Westchester County, N.Y. -- was assumed to be even less secure than the State Department's "low side," although the unclassified servers at some government agencies have been hacked in recent years.

One result of Mrs. Clinton's decision to maintain a private server is that it has put State Department officials on the defensive about their use of state.gov for some business that might be considered classified.

Of the 30,322 emails made public, 2,028 have had portions redacted and are now classified at the lowest level of classification, "confidential."

Nearly three-quarters of those emails were classified because they contained what is called "foreign government information" -- a vast category of information, gathered through conversations and meetings with foreign counterparts that are the fundamentals of diplomacy, but which had to be protected when the emails were released.

Last week, in an apparent attempt to dispel criticism that many of the emails were improperly sent, a top State Department official argued in a letter to three Senate Democrats that the nation's diplomats and officials were in fact allowed to send "foreign government information" through the government's unclassified computer systems.

"Department officials of necessity routinely receive such information through unclassified channels," said the letter, dated May 2 and written by the assistant secretary of state for legislative affairs, Julia Frifield.

"For example, diplomats engage in meetings with counterparts in open settings, have phone calls with foreign contacts over unsecure lines, and email with and about foreign counterparts via unclassified systems."

The letter went on to say that using "foreign government information" in unclassified emails "does not amount to mishandling the information."

The State Department, unlike some other federal agencies, does not have the authority to redact that category of information even if it is required to release documents under the Freedom of Information Act.

Thus, the only way the State Department could withhold "foreign government information" in the emails being released under court order was to classify it, according to the letter.

The letter was a reply to one sent in March to Senators Patrick J. Leahy of Vermont, Thomas R. Carper of Delaware and Dianne Feinstein of California. A copy was given to The New York Times by a government official who believed the classification of the emails was unfairly implicating diplomats and other officials conducting diplomacy in the modern era.

Of the 30,322 emails, the F.B.I.'s investigation has focused on a smaller number, including 22 that the C.I.A. insisted contained information classified "top secret."

Those emails have not been released, even with redactions, because they include material classified at the highest levels, known as "top secret/SAP," according to a letter from the inspector general of the nation's intelligence agencies, I. Charles McCullough III.

That designation refers to "special access programs," which are among the nation's most guarded secrets. The emails are said to include references to, among other things, the C.I.A.'s program to hunt and kill suspected terrorists with armed drones in Pakistan.

An additional 65 emails, which have been released, have had portions redacted because they included information classified at the level of "secret."

One exchange of emails typical of those now classified because they contain "foreign government information" involved Mr. McDonough, Ms. Rice and her deputy at the time, Rosemary A. DiCarlo, and the Palestinian effort in September 2011 to be recognized as a state by the United Nations.

The exchange included eight separate emails, all sent on unclassified networks. Of those, six were redacted almost completely when the State Department released them in January.

According to the subject line and what information does appear, the three discussed deliberations between the United Nations secretary general, Ban Ki-moon, and the Palestinian president, Mahmoud Abbas, as well as Ms. Rice's discussion with the Palestinian representative at the United Nations, Riyad H. Mansour, on the bid for statehood -- all instances of "foreign government information."

The chain of emails eventually encompassed 16 officials, including political appointees and career diplomats, and was ultimately forwarded to Mrs. Clinton's inbox by Jake Sullivan, her deputy then and now the senior policy adviser for her election campaign.

Philip H. Gordon, an assistant secretary of state under Mrs. Clinton, said, "If all these respected, senior foreign service officers and experienced ambassadors are sending these emails, then this issue is not about how Hillary Clinton managed her email, but how the State Department communicates in the 21st century."

Mr. Gordon, later a special assistant to the president for the Middle East, wrote more than 40 emails that were redacted on the grounds that they contained classified information.

Mrs. Clinton herself wrote, responded to or forwarded 96 emails that have been classified in part, including one that is classified secret; 46 of those contained the "foreign government information" that the department's letter addressed.

There are, to be sure, other emails that do not fall into the category of "foreign government information," and some raise questions about the sort of information senior officials sent in unclassified emails.

In 18 emails, for example, information has been classified on the grounds that it identifies C.I.A. officials, including two instances that are now considered "secret."

One of those was a seemingly benign photo opportunity listed on Mrs. Clinton's daily schedule, with the person who gave her a daily intelligence briefing, making it obvious that the person was an agency employee.

That email was originally released as "confidential" but upgraded to "secret," probably reflecting that the person holds an undercover position now.

Another exchange involving the C.I.A. came the day after David H. Petraeus resigned as the agency's director in November 2012. Mr. Brennan, then still at the White House, sent an email -- detailing the provisions for Mr. Petraeus's personal security following his surprise resignation -- to Thomas E. Donilon, Mr. Obama's national security adviser. Mr. Donilon then forwarded it to Mrs. Clinton.

"Madam Secretary -- Attached is an update on the security for Dave P.," he wrote. The entirety of Mr. Brennan's note has now been redacted and classified as "confidential" on the grounds that it involves "vulnerabilities or capabilities of systems, installations, infrastructures, projects, plans, or protection services relating to the national security."

Mr. Petraeus ultimately pleaded guilty to a misdemeanor for keeping highly classified information in eight black notebooks he kept in his home, including such details as the names of covert officers and programs, and sharing them with his biographer and lover.

A spokesman at the C.I.A., Ryan Trapani, said in a statement that Mr. Brennan had believed that the information he sent in the email was unclassified.

"When operating in a position like he was at the White House, officials often have to make spot judgments about whether information is classified or not," he wrote.

"In most cases, the determinations are correct, but in some situations, another agency may consider certain information classified that the author does not."

The Hill
19 months before deadline, lawmakers draw battle lines on spying powers
Tuesday, 10 May 2016
Byline: Julian Hattem

Washington - Members of Congress are starting to put down markers in a major battle over U.S. spying powers that it expected to drag on for more than a year.
The early action appears to reflect an effort by leading Republicans and national security hawks to get out in front of privacy advocates who want to restrict the National Security Agency's power to collect reams of data about foreigners suspected of being spies, terrorists or other targets.

Information about an unknown number of U.S. residents is also included in sweeps authorized by Section 702 of the Foreign Intelligence Surveillance Act.

The law must be renewed by December 2017, but the Senate Judiciary Committee on Tuesday held a hearing on the issue 19 months before that deadline.

"I'd like to begin a conversation about it well in advance of that reauthorization," Chairman Chuck Grassley (R-Iowa) said at the start of Tuesday's hearing.

Recent terror attacks in Paris, Brussels and San Bernardino, Calif., he said, "underscore that one of the responsibilities of our government is to ensure that those who protect us every day, including the intelligence community, have the tools to keep us safe."

The law undergirds high-profile spying activities such as the PRISM and Upstream programs, but many of the details about its use remain in the shadows.

"We're still missing a lot of facts about Section 702 implementation," Sen. Patrick Leahy (D-Vt.), the committee's ranking member, said on Tuesday.

"It sweeps up a sizable amount of information about Americans who are communicating with foreigners," he added. "Despite these concerns about Americans' communications being swept up, we still do not know how much of our data is collected under this authority."

Despite repeated requests from Capitol Hill, intelligence officials have given no estimates of the number of Americans whose communications are caught up in warrantless government searches targeting foreigners. Because of the global nature of the internet, privacy advocates have warned that the number could be high.

Director of National Intelligence James Clapper has bristled at calls to estimate how many U.S. residents have their data swept up by the program, saying it would be difficult to calculate.

Leahy and a small handful of Democrats appeared open to modifications requiring officials to obtain a warrant before searching for data on citizens.

But any effort at reform appears primed to run into stiff opposition from lawmakers in both parties, given the broad consensus about the importance of the data gathering for combating terrorism.

"The question to me is do we want to somehow limit ourselves in terms of access to foreign intelligence in a way that could make us less safe?" asked John Cornyn (Texas), the No. 2 Senate Republican, rhetorically. "That's an important conversation to have, but I'm pretty clear on where I come down."

Lawmakers wondered on Tuesday whether implementing new warrant requirements could rebuild "walls" between U.S. surveillance agencies similar to those blamed, in part, for failing to prevent the 9/11 attacks.

And erring too far on the side of individual privacy might keep intelligence officials from finding important information, Cornyn warned. He pointed to examples in which al Qaeda operatives have used words like "wedding" and "marriage" as code words during a terror plots.

"In our zeal to protect love letters, we don't want to protect terrorists who might use code words to escape scrutiny by the intelligence community," he warned.

Sen. Dianne Feinstein (D-Calif.), the vice chairwoman of the Intelligence Committee, said that if anything, the government should be more forthcoming about the ways in which Section 702 is used.

"Those of us who meet two afternoons a week and go over intelligence ... see the value of this program," said Feinstein, referring to the Intelligence Committee's biweekly meetings. "But I think the general public does not."

"I really think it is lawful and well-balanced," she said.

"In my view, it's only intelligence, lawfully collected, that's able to prevent another attack in this country."

The Intercept
Hackers Attempt to Hold Capitol Hill Data for Ransom
Wednesday, 11 May 2016
Byline: Jenna McLaughlin

Washington - The House is under attack by hackers hoping to infiltrate congressional computers, encrypt their contents, and then force users to pay a ransom to get their access back.
"In the past 48 hours, the House Information Security Office has seen an increase of attacks on the House Network using third party, web-based mail applications such as YahooMail, Gmail," the House's Technology Service Desk wrote in an email to House staffers on April 30.

According to the email obtained by The Intercept, the hacked emails impersonate familiar people and invite staffers to download an attachment laced with malware--what's known as a "phishing" attack.

"When a user clicks on the link in the attack e-mail, the malware encrypts all files on that computer, including shared files, making them unusable until a 'ransom' is paid," the email said.

But House administrative offices refused to say how many if any attacks have been successful, what sort of data may have been affected, or how much has been paid in ransom, if anything.

"The potential for ransomware attacks the House faces is similar to any large organization," a spokesman for the Chief Administrative Officer of the House wrote in a statement to The Intercept. "The House recognizes the importance of taking steps to employ a cyber security plan to protect our infrastructure, and we constantly work to improve training and education for all House users."

A lockdown on parts of the House internet network--from WiFi to Ethernet--remains ongoing.

Access to both YahooMail and Google Cloud services hosted by Google's appspot.com appear to be completely blocked on the House's network, according to Ted Henderson, a former Hill staffer and founder of two social-network applications designed for Capitol Hill communication: Cloakroom and Capitol Bells. It's unclear if both blockages, not just Yahoo's, are related to the ransomware attacks.

Henderson says his several thousand users cannot post to the social networks inside the House office buildings. The way Cloakroom works, you're normally able to log-in either anonymously simply by using Capitol Hill Wi-Fi or with your staff email address. The Senate office buildings don't appear to be affected.

"This is the first time I've seen this happen at a scale like this in five years," Henderson wrote The Intercept in an email.

In recent months, several lawmakers have penned letters asking the Obama administration how it's dealing with the problem of ransomware--a type of attack more than two dozen government agencies have admitted to confronting in the past as well.

Now that Congress itself is the target, security researchers are hopeful the issue will draw more national attention. "What you're seeing in Congress is just part of what's happening," Markus Jakobsson, founder of "Zapfraud", a scam email detection service, and an expert on phishing attacks told The Intercept. "This will hopefully bring some awareness to decision makers...once they start [going after Congress], there will be changes."

Ransomware attacks take many forms. Some hackers have managed to infect entire websites with malware.

It's not clear whether the current spate of attacks on the House network were targeted, or whether House users just happened to find themselves among the ever-growing number of victims.

Ransomware is a major and growing threat to security. Just the day before the House emailed its staff about the attacks, the FBI published a press release titled "Incidents of Ransomware on the Rise," warning that "hospitals, school districts, state and local governments, law enforcement agencies, small businesses, large businesses" are all under increasing threat of being hacked and ransomed.

Nonprofit healthcare organization Health Information Trust Alliance warned in April that more than half of 30 hospitals it surveyed were infected with malware--most of it ransomware. Los Angeles hospital Hollywood Presbyterian paid $17,000 to recover its data in March.

Police departments have also been victims of ransomware attacks, sometimes forced to pay up to recover everything. One police chief compared the extortion to "what felt like terrorist threats."

It's not at all clear how to solve the problem, though researchers have come up with some solutions and recommendations. "This is something that the technical community is still struggling with getting a firm grip on," Jakobsson said.

He suggests Congress install several levels of filters to detect possible spam and scams, backup their data, and launch awareness campaigns to alert people to the reality of the problem. "The problem of social engineering is so vast that you can't just do one and hope that's enough," he said.

Motherboard (Vice)
Encryption Gets in The Way of 75% of Cases, Europol Chief Says
Tuesday, 10 May 2016
Byline: Joseph Cox

New York - In the US, police and prosecutors continue to say encryption--the use of math to protect data from outside eyes, including those of the government--presents a significant barrier to solving crimes or following leads.
Now, on the other side of the Atlantic, the head of Europe's law enforcement body is saying that encryption is an issue in the vast majority of cases the agency sees.

"Encryption dilemma must be solved soon. Real problem in 75% of all Europol cases," Rob Wainwright, director of Europol, tweeted on Sunday.

The tweet came in response to an op-ed written by John Naughton, a professor from the Open University, and published by the Guardian, that said an opportunity for more permanently addressing law enforcement's concerns around encryption had been lost during the FBI and Apple legal fight in San Bernardino.

It is not clear what sort of encryption Wainwright was referring to; be that message encryption to secure communications, or hard-drive encryption that protects data stored on devices, which was the issue at hand in the recent Apple case.

When asked about it, Claire Georges from Europol's corporate communications answered broadly about technologies used by criminals, citing encryption, anonymisation tools such as Tor, and even implied that virtual currencies such as bitcoin are part of the problem.

"The use of anonymisation and encryption technologies is widening and is key issue for law enforcement in all criminal areas," she told Motherboard in an email.

"Technology in general is used not only by cybercriminals, but also by drug dealers, child sexual offenders and other criminals involved in different illegal activities. Encryption is commonly used in secure communications and is becoming a standard protection feature in many products, such as e-wallets for virtual currencies."

Georges also pointed to Europol's Internet Organised Crime Threat Assessment (iOCTA) from 2014, which reads "The use of anonymisation tools is ubiquitous amongst the cyber underground."

Responding to a question of whether backdoors are an avenue for law enforcement, Wainwright wrote in another tweet that "back doors not the solution but regulated front door access. Finding how is key question."

Security experts say any sort of "front door," even if designed only for law enforcement, would be vulnerable to exploitation from hackers and malicious actors, undermining the security of all devices that used it.

Encryption, in some cases, may present an issue for law enforcement. But lumping message and hard-drive encryption, along with technologies such as Tor, all into the same basket is not helpful for anyone; as each requires a unique response, all balancing privacy, security, and access for police.

The Guardian (London)
Court refuses request to force alleged hacker to divulge passwords
Tuesday, 10 May 2016
Byline: Jamie Grierson, Diane Taylor

London - An alleged hacker fighting extradition to the US will not have to give the passwords for his encrypted computers to British law enforcement officers, following a landmark legal ruling.

Lauri Love, a 31- year-old computer scientist, has been accused of stealing "massive quantities" of sensitive data from US Federal Reserve and Nasa computers. His lawyers say he faces up to 99 years in prison if found guilty in the US.

The National Crime Agency (NCA) raided Love's family home in Stradishall, Suffolk, in October 2013, seizing encrypted computers and hard drives. No charges were brought against him in Britain and Love is suing the NCA for the return of six items of encrypted hardware, which he says contain his entire digital life.

The NCA applied to the courts to force Love to hand over his passwords before it returns the computers but this was rejected by a judge on Tuesday.

Speaking to the Guardian, Love called on governments around the world to set aside differences with activists and hackers and to work together to improve global computer security.

"The US government is conducting a war against information activists like me," he said. "This kind of thing is a distraction from what is really important - keeping the world secure. I am offering a 'third way' where governments and hackers work together and bridge the divide. Governments should be making the most of the talent that computer hackers have to try to work together to solve the problems of computer lack of security.

"If someone hacks into your computer they can take over your life and your identity. We are more and more reliant on computer security for security for ourselves."

Love said there was a lot of distrust of governments from activists as a result of scandals involving surveillance and undercover policing. "We have to put our differences aside," he urged. "What we really need to do is sit round the table together and start to have a conversation."

Love said the past few years of interactions with the police and US authorities had taken an enormous personal toll on both him and his family. "I spent two years in an acute and crippling state of mental distress," he said. "I developed eczema and had a lot of difficulty sleeping. Now I am feeling recovered enough to continue studying for my electrical engineering degree and have my finals coming up."

District judge Nina Tempia refused the NCA's application at Westminster magistrates court on Tuesday, saying that to do so would "circumvent specific legislation that has been passed in order to deal with the disclosure sought".

Speaking outside court after the ruling, Love said he was happy with the result and accused the NCA of trying to undermine protections safeguarding individuals' property.

"It is a victory, although it is a more an avoidance of disaster," he said. "It retains the status quo, which means there has to be safeguards before you force people to undermine their security."

His lawyer, Karen Todner, of Kaim Todner, said the ruling was right. "The case raised important issues of principle in relation to the right to respect for private life and right to enjoyment of property and the use of the court's case management powers.

"A decision in the NCA's favour would have set a worrying precedent for future investigations of this nature and the protection of these important human rights."

Love was arrested on 15 July 2015 on behalf of the US government, which had issued several indictments and corresponding extradition warrants.

The FBI and US Department of Justice allege that Love was involved in hacking into various government agencies, including the US army, Nasa, the Federal Reserve and the Environmental Protection Agency. His extradition hearing will be held on 28 and 29 June.

Outside court, Love said he was scared at the prospect of being sent to the US for criminal prosecution. "It is the worst thing I could imagine happening to me. I have to get on with my work and my studies, I can't afford to be stressed or depressed or anxious about it."

Love's case has echoes of the FBI and Apple dispute in the US. In 2015 and 2016, Apple received, and objected to or challenged, at least 11 orders issued by US district courts which sought to compel the firm to extract data, such as contacts, photos and calls from locked iPhones.

The most well-known instance was in February 2016, when the FBI wanted Apple to create and electronically sign new software that would enable the FBI to unlock an iPhone recovered from one of the shooters in the December 2015 terrorist attack in San Bernardino, California.

The government ultimately said it had found a third party able to assist in unlocking the iPhone and withdrew its request.

Columbia Journalism Review
Snowden interview: Why the media isn't doing its job
Wednesday, 11 May 2016
Byline: Emily Bell
Section: Interview

Interview - The Tow Center for Digital Journalism's Emily Bell spoke to Edward Snowden over a secure channel about his experiences working with journalists and his perspective on the shifting media world. This is an excerpt of that conversation, conducted in December 2015.
Emily Bell: Can you tell us about your interactions with journalists and the press?

Edward Snowden: One of the most challenging things about the changing nature of the public's relationship to media and the government's relationship to media is that media has never been stronger than it is now. At the same time, the press is less willing to use that sort of power and influence because of its increasing commercialization. There was this tradition that the media culture we had inherited from early broadcasts was intended to be a public service. Increasingly we've lost that, not simply in fact, but in ideal, particularly due to the 24-hour news cycle.

We see this routinely even at organizations like The New York Times. The Intercept recently published The Drone Papers, which was an extraordinary act of public service on the part of a whistleblower within the government to get the public information that's absolutely vital about things that we should have known more than a decade ago. These are things that we really need to know to be able to analyze and assess policies. But this was denied to us, so we get one journalistic institution that breaks the story, they manage to get the information out there. But the majors--specifically The New York Times-- don't actually run the story, they ignore it completely. This was so extraordinary that the public editor, Margaret Sullivan, had to get involved to investigate why they suppressed such a newsworthy story. It's a credit to the Times that they have a public editor, but it's frightening that there's such a clear need for one.

In the UK, when The Guardian was breaking the NSA story, we saw that if there is a competitive role in the media environment, if there's money on the line, reputation, potential awards, anything that has material value that would benefit the competition, even if it would simultaneously benefit the public, the institutions are becoming less willing to serve the public to the detriment of themselves. This is typically exercised through the editors. This is something that maybe always existed, but we don't remember it as always existing. Culturally, we don't like to think of it as having always existed. There are things that we need to know, things that are valuable for us, but we are not allowed to know, because The Telegraph or the Times or any other paper in London decides that because this is somebody else's exclusive, we're not going to report it. Instead, we'll try to "counter-narrative" it. We'll simply go to the government and ask them to make any statement at all, and we will unquestioningly write it down and publish it, because that's content that's exclusive to us. Regardless of the fact that it's much less valuable, much less substantial than actual documented facts that we can base policy discussions on. We've seemingly entered a world where editors are making decisions about what stories to run based on if it'll give oxygen to a competitor, rather than if it's news.

I would love to hear your thoughts on this, because while I do interact with media, I'm an outsider. You know media. As somebody who has worked in these cultures, do you see the same thing? Sort of the Fox News effect, where facts matter less?

Bell: It's a fascinating question. When you look at Donald Trump, there's a problem when you have a press which finds it important to report what has happened, without a prism of some sort of evaluation on it. That's the Trump problem, right? He says thousands of Muslims were celebrating in the streets of New Jersey after 9/11 and it's demonstrably not true. It's not even a quantification issue, it's just not

true. Yet, it dominates the news cycle, and he dominates the TV, and you see nothing changing in the polls--or, rather, him becoming more popular.

There are two things I think here, one of which is not new. I completely agree with you about how the economic dynamics have actually produced, bad journalism. One of the interesting things which I think is hopeful about American journalism is that within the last 10 years there's been a break between this relationship, which is the free market, which says you can't do good journalism unless you make a profit, into intellectually understanding that really good journalism not only sometimes won't make a profit, but is almost never going to be anything other than unprofitable.

I think your acts and disclosures are really interesting in that it's a really expensive story to do, and it is not the kind of story that advertisers want to stand next to. Actually people didn't want to pay to read them. Post hoc they'll say, we like The Guardian; we're going to support their work. So I agree with you that there's been a disjuncture between facts and how they are projected. I would like to think it's going to get better.

You're on Twitter now. You're becoming a much more rounded out public persona, and lots of people have seen Citizenfour. You've gone from being this source persona, to being more actively engaged with Freedom of the Press Foundation, and also having your own publishing stream through a social media company. The press no longer has to be the aperture for you. How do you see that?

Snowden: Today, you have people directly reaching an audience through tools like Twitter, and I have about 1.7 million followers right now (this number reflects the number of Twitter followers Snowden had in December 2015). These are people, theoretically, that you can reach, that you can send a message to. Whether it's a hundred people or a million people, individuals can build audiences to speak with directly. This is actually one of the ways that you've seen new media actors, and actually malicious actors, exploit what are perceived as new vulnerabilities in media control of the narrative, for example Donald Trump.

At the same time these strategies still don't work [...] for changing views and persuading people on a larger scope. Now this same thing applies to me. The director of the FBI can make a false statement, or some kind of misleading claim in congressional testimony. I can fact-check and I can say this is inaccurate. Unless some entity with a larger audience, for example, an established institution of journalism, sees that themselves, the value of these sorts of statements is still fairly minimal. They are following these new streams of information, then reporting out on those streams. This is why I think we see such a large interplay and valuable interactions that are emerging from these new media self-publication Twitter-type services and the generation of stories and the journalist user base of Twitter.

If you look at the membership of Twitter in terms of the influence and impact that people have, there are a lot of celebrities out there on Twitter, but really they're just trying to maintain an image, promote a band, be topical, remind people that they exist. They're not typically effecting any change, or having any kind of influence, other than the directly commercial one.

Bell: Let's think about it in terms of your role in changing the world, which is presenting these new facts. There was a section of the technology press and the intelligence press who, at the time of the leaks, said we already know this, except it's hidden in plain sight. Yet, a year after you made the disclosures, there was a broad shift of public perception about surveillance technologies. That may recede, and probably post-Paris, it is receding a little bit. Are you frustrated that there isn't more long-term impact? Do you feel the world has not changed quickly enough?

Snowden: I actually don't feel that. I'm really optimistic about how things have gone, and I'm staggered by how much more impact there's been as a result of these revelations than I initially presumed. I'm famous for telling Alan Rusbridger that it would be a three-day story. You're sort of alluding to this idea that people don't really care, or that nothing has really changed. We've heard this in a number of different ways, but I think it actually has changed in a substantial way.

Now when we talk about the technical press, or the national security press, and you say, this is nothing new, we knew about this, a lot of this comes down to prestige, to the same kind of signaling where they have to indicate we have expertise, we knew this was going on. In many cases they actually did not. The difference is, they knew the capabilities existed.

This is, I think, what underlies why the leaks had such an impact. Some people say stories about the mass collection of internet records and metadata were published in 2006. There was a warrantless wiretapping story in The New York Times as well. Why didn't they have the same sort of transformative impact? This is because there's a fundamental difference when it comes down to the actionability of information between knowledge of capability, the allegation that the capability could be used, and the fact that it is being used. Now what happened in 2013 is we transformed the public debate from allegation to fact. The distance between allegation and fact, at times, makes all the difference in the world.

That, for me, is what defines the best kind of journalism. This is one of the things that is really underappreciated about what happened in 2013. A lot of people laud me as the sole actor, like I'm this amazing figure who did this. I personally see myself as having a quite minor role. I was the mechanism of revelation for a very narrow topic of governments. It's not really about surveillance, it's about what the public understands--how much control the public has over the programs and policies of its governments. If we don't know what our government really does, if we don't know the powers that authorities are claiming for themselves, or arrogating to themselves, in secret, we can't really be said to be holding the leash of government at all.

One of the things that's really missed is the fact that as valuable and important as the reporting that came out of the primary archive of material has been, there's an extraordinarily large, and also very valuable amount of disclosure that was actually forced from the government, because they were so back-footed by the aggressive nature of the reporting. There were stories being reported that showed

how they had abused these capabilities, how intrusive they were, the fact that they had broken the law in many cases, or had violated the Constitution.

When the government is shown in a most public way, particularly for a president who campaigned on the idea of curtailing this sort of activity, to have continued those policies, in many cases expanded them in ways contrary to what the public would expect, they have to come up with some defense. So in the first weeks, we got rhetorical defenses where they went, nobody's listening to your phone calls. That wasn't really compelling. Then they went, "It's just metadata." Actually that worked for quite some time, even though it's not true. By adding complexity, they reduced participation. It is still difficult for the average person in the street to understand that metadata, in many cases, is actually more revealing and more dangerous than the content of your phone calls. But stories kept coming. Then they went, well alright, even if it is "just metadata," it's still unconstitutional activity, so how do we justify it? Then they go--well they are lawful in this context, or that context.

They suddenly needed to make a case for lawfulness, and that meant the government had to disclose court orders that the journalists themselves did not have access to, that I did not have access to, that no one in the NSA at all had access to, because they were bounded in a completely different agency, in the Department of Justice.

This, again, is where you're moving from suspicion, from allegation, to factualizing things. Now of course, because these are political responses, each of them was intentionally misleading. The government wants to show itself in the best possible light. But even self- interested disclosures can still be valuable, so long as they're based on facts. They're filling in a piece of the puzzle, which may provide the final string that another journalist, working independently somewhere else, may need. It unlocks that page of the book, fills in the page they didn't have, and that completes the story. I think that is something that has not been appreciated, and it was driven entirely by journalists doing follow- up.

There's another idea that you mentioned: that I'm more engaged with the press than I was previously. This is very true. I quite openly in 2013 took the position that this is not about me, I don't want to be the face of the argument. I said that I don't want to correct the record of government officials, even though I could, even though I knew they were making misleading statements. We're seeing in the current electoral circus that whatever someone says becomes the story, becomes the claim, becomes the allegation. It gets into credibility politics where they're going, oh, you know, well, Donald Trump said it, it can't be true. All of the terrible things he says put aside, there's always the possibility that he does say something that is true. But, because it's coming from him, it will be analyzed and assessed in a different light. Now that's not to say that it shouldn't be, but it was my opinion that there was no question that I was going to be subject to a demonization campaign. They actually recorded me on camera saying this before I revealed my identity. I predicted they were going to charge me under the Espionage Act, I predicted they were going to say I helped terrorists, blood on my hands, all of that stuff. It did come to pass. This was not a staggering work of genius on my part, it's just common sense, this is how it always works in the case of prominent whistleblowers. It was because of this that we needed other voices, we needed the media to make the argument.

Because of the nature of the abuse of classification authorities in the United States, there is no one that's ever held a security clearance who's actually able to make these arguments. Modern media institutions prefer never to use their institutional voice to factualize a claim in a reported story, they want to point to somebody else. They want to say this expert said, or this official said, and keep themselves out of it. But in my mind, journalism must recognize that sometimes it takes the institutional weight to assess the claims that are publicly available, and to make a determination on that basis, then put the argument forth to whoever the person under suspicion is at the time, for example, the government in this case, and go--look, all of the evidence says you were doing this. You say that's not the case, but why should we believe you? Is there any reason that we should not say this?

This is something that institutions today are loath to do because it's regarded as advocacy. They don't want to be in the position of having to referee what is and is not fact. Instead they want to play these "both sides games" where they say, instead we'll just print allegations, we'll print claims from both sides, we'll print their demonstrations of evidence, but we won't actually involve ourselves in it.

Because of this, I went the first six months without giving an interview. It wasn't until December 2013 that I gave my first interview to Barton Gellman of The Washington Post. In this intervening period my hope was that some other individual would come forth on the political side, and would become the face of this movement. But more directly I thought it would inspire some reflection in the media institutions to think about what their role was. I think they did a fairly good job, particularly for it being unprecedented, particularly for it being a segment in which the press has been, at least in the last 15 years, extremely reluctant to express any kind of skepticism regarding government claims at all. If it involved the word "terrorism," these were facts that wouldn't be challenged. If the government said, look, this is secret for a reason, this is classified for a reason, journalists would leave it at that. Again, this isn't to beat up on The New York Times, but when we look at the warrantless wiretapping story that was ready to be published in October of an election year, that [election] was decided by the smallest margin in a presidential election, at least in modern history. It's hard to believe that had that story been published, it would not have changed the course of that election.

Bell: Former Times Executive Editor Jill Abramson has said her paper definitely made mistakes, "I wish we had not withheld stories." What you're saying certainly resonates with what I know and understand of the recent history of the US press, which is that national security concerns post-9/11 really did alter the relationship of reporting, particularly with administration and authority in this country. What we know about drone programs comes from reporting, some of it comes from the story which The Intercept got hold of, and Jeremy Scahill's reporting on it, which has been incredibly important. But a great deal of it has also come from the ground level. The fact that we were aware at all that drones were blowing up villages, killing civilians, crossing borders where they were not supposed to be really comes from people who would report from the ground.

Something interesting has definitely happened in the last three years, which makes me think about what you are telling us about how the NSA operates. We're seeing a much closer relationship now between

journalism and technology and mass communication technology than we've ever seen before. People are now completely reliant on Facebook. Some of that is a commercial movement in the US, but you also have activists and journalists being regularly tortured or killed in, say, Bangladesh, where it's really impossible to operate a free press, but they are using these tools. It is almost like the American public media now is Facebook. I wonder how you think about this? It's such a recent development.

Snowden: One of the biggest issues is that we have many more publishers competing for a finite, shrinking amount of attention span that's available. This is why we have the rise of these sort of hybrid publications, like a BuzzFeed, that create just an enormous amount of trash and cruft. They're doing AB testing and using scientific principles. Their content is specifically engineered to be more attention getting, even though they have no public value at all. They have no news value at all. Like here's 10 pictures of kittens that are so adorable. But then they develop a news line within the institution, and the idea is that they can drive traffic with this one line of stories, theoretically, and then get people to go over onto the other side.

Someone's going to exploit this; if it's not going to be BuzzFeed, it's going to be somebody else. This isn't a criticism of any particular model, but the idea here is that the first click, that first link is actually consuming attention. The more we read about a certain thing, that's actually reshaping our brains. Everything that we interact with, it has an impact on us, it has an influence, it leaves memories, ideas, sort of memetic expressions that we then carry around with us that shape what we look for in the future, and that are directing our development.

Bell: Yes, well that's the coming singularity between the creation of journalism and large-scale technology platforms, which are not intrinsically journalistic. In other words, they don't have a primary purpose.

Snowden: They don't have a journalistic role, it's a reportorial role.

Bell: Well, it's a commercial role, right? So when you came to Glenn and The Guardian, there wasn't a hesitation in knowing the primary role of the organization is to get that story to the outside world as securely and quickly as possible, avoiding prior restraint, protecting a source.

Is source protection even possible now? You were extremely prescient in thinking there's no point in protecting yourself.

Snowden: I have an unfair advantage.

Bell: You do, but still, that's a big change from 20 years ago.

Snowden: This is something that we saw contemporary examples of in the public record in 2013. It was the James Rosen case where we saw the Department of Justice, and government more broadly, was

abusing its powers to demand blanket records of email and call data, and the AP case where phone records for calls that were made from the bureaus of journalism were seized.

That by itself is suddenly chilling, because the traditional work of journalism, the traditional culture, where the journalist would just call their contact and say, hey, let's talk, suddenly becomes incriminating. But more seriously, if the individual in question, the government employee who is working with a journalist to report some issue of public interest, if this individual has gone so far to commit an act of journalism, suddenly they can be discovered trivially if they're not aware of this.

I didn't have that insight at the time I was trying to come forward because I had no relationship with journalists. I had never talked to a journalist in any substantive capacity. So, instead I simply thought about the adversarial relationship that I had inherited from my work as an intelligence officer, working for the CIA and the NSA. Everything is a secret and you've got two different kinds of cover. You've got cover for status, which is: You're overseas, you're living as a diplomat because you have to explain why you're there. You can't just say, oh, yeah, I work for the CIA. But you also have a different kind of cover which is what's called cover for action. Where you're not going to live in the region for a long time, you may just be in a building and you have to explain why you're walking through there, you need some kind of pretext. This kind of trade-craft unfortunately is becoming more necessary in the reportorial process. Journalists need to know this, sources need to know this. At any given time, if you were pulled over by a police officer and they want to search your phone or something like that, you might need to explain the presence of an application. This is particularly true if you're in a country like Bangladesh. I have heard that they're now looking for the presence of VPN [virtual private network software] for avoiding censorship locks and being able to access uncontrolled news networks as evidence of opposition, allegiance, that could get you in real trouble in these areas of the world.

At the time of the leaks I was simply thinking, alright the government--and this isn't a single government now--we're actually talking about the Five Eyes intelligence alliance [the United States, the United Kingdom, New Zealand, Australia, Canada] forming a pan-continental super-state in this context of sharing, they're going to lose their minds over this. Some institutions in, for example, the UK, can levy D notices, they can say, look, you can't publish that, or you should not publish that. In the United States it's not actually certain that the government would not try to exercise prior restraint in slightly different ways, or that they wouldn't charge journalists as accomplices in some kind of criminality to interfere with the reporting without actually going after the institutions themselves, single out individuals. We have seen this in court documents before. This was the James Rosen case, where the DOJ had named him as sort of an accessory--they said he was a co-conspirator. So the idea I thought about here was that we need institutions working beyond borders in multiple jurisdictions simply to complicate it legally to the point that the journalists could play games, legally and journalistically more effectively and more quickly than the government could play legalistic games to interfere with them.

Bell: Right, but that's kind of what happened with the reporting of the story.

Snowden: And in ways that I didn't even predict, because who could imagine the way a story like that would actually get out of hand and go even further: Glenn Greenwald living in Brazil, writing for a US institution for that branch, but headquartered in the UK, The Washington Post providing the institutional clout and saying, look, this is a real story, these aren't just crazy leftists arguing about this, and Der Spiegel in Germany with Laura [Poitras]. It simply represented a system that I did not believe could be overcome before the story could be put out. By the time the government could get their ducks in a row and try to interfere with it, that would itself become the story.

Bell: You're actually giving a sophisticated analysis of much of what's happened to both reporting practice and media structures. As you say, you had no prior interactions with journalists. I think one of the reasons the press warmed to you was because you put faith in journalists, weirdly. You went in thinking I think I can trust these people, not just with your life, but with a huge responsibility. Then you spent an enormous amount of time, particularly with Glenn, Laura, and Ewen [MacAskill] in those hotel rooms. What was that reverse frisking process like as you were getting to know them? My experience is as people get closer to the press, they often like it less. Why would you trust journalists?

Snowden: This gets into the larger question--how did you feel about journalists, what was the process of becoming acquainted with them? There's both a political response and a practical response. Specifically about Glenn, I believe very strongly that there's no more important quality for a journalist than independence. That's independence of perspective, and particularly skepticism of claims. The more powerful the institution, the more skeptical one should be. There's an argument that was put forth by an earlier journalist, I.F. Stone: "All governments are run by liars and nothing they say should be believed." In my experience, this is absolutely a fact. I've met with Daniel Ellsberg and spoken about this, and it comports with his experience as well. He would be briefing the Secretary of Defense on the airplane, and then when the Secretary of Defense would disembark right down the eight steps of the plane and shake hands with the press, he would say something that he knew was absolutely false and was completely contrary to what they had just said in the meeting [inside the place] because that was his role. That was his job, his duty, his responsibility as a member of that institution.

Now Glenn Greenwald, if we think about him as an archetype, really represents the purest form of that. I would argue that despite the failings of any journalist in one way or another, if they have that independence of perspective, they have the greatest capacity for reporting that a journalist can attain. Ultimately, no matter how brilliant you are, no matter how charismatic you are, no matter how perfect or absolute your sourcing is, or your access, if you simply take the claims of institutions that have the most privilege that they must protect, at face value, and you're willing to sort of repeat them, all of those other things that are working in your favor in the final calculus amount to nothing because you're missing the fundamentals.

There was the broader question of what it's like working with these journalists and going through that process. There is the argument that I was naïve. In fact, that's one of the most common criticisms about me today--that I am too naïve, that I have too much faith in the government, that I have too much faith in the press. I don't see that as a weakness. I am naïve, but I think that idealism is critical to achieving

change, ultimately not of policy, but of culture, right? Because we can change this or that law, we can change this or that policy or program, but at the end of the day, it's the values of the people in these institutions that are producing these policies or programs. It's the values of the people who are sitting at the desk with the blank page in Microsoft Office, or whatever journalists are using now.

Bell: I hope they're not using Microsoft Office, but you never know.

Snowden: They have the blank page ...

Bell: They have the blank page, exactly.

Snowden: In their content management system, or whatever. How is that individual going to approach this collection of facts in the next week, in the next month, in the next year, in the next decade? What will the professor in the journalism school say in their lecture that will impart these values, again, sort of memetically into the next cohort of reporters? If we do not win on that, we have lost comprehensively. More fundamentally, people say, why did you trust the press, given their failures? Given the fact that I was, in fact, quite famous for criticizing the press.

Bell: If they had done their job, you would be at home now.

Snowden: Yeah, I would still be living quite comfortably in Hawaii.

Bell: Which is not so bad, when you put it that way.

Snowden: People ask how could you do this, why would you do this? How could you trust a journalist that you knew had no training at all in operational security to keep your identity safe because if they screw up, you're going to jail. The answer was that that was actually what I was expecting. I never expected to make it out of Hawaii. I was going to try my best, but my ultimate goal was simply to get this information back in the hands of the public. I felt that the only way that could be done meaningfully was through the press. If we can't have faith in the press, if we can't sort of take that leap of faith and either be served well by them, or underserved and have the press fail, we've already lost. You cannot have an open society without open communication. Ultimately, the test of open communication is a free press. If they can't look for information, if they can't contest the government's control of information, and ultimately print information--not just about government, but also about corporate interests, that has a deleterious impact on the preferences of power, on the prerogatives of power. You may have something, but I would argue it's not the traditional American democracy that I believed in.

So the idea here was that I could take these risks because I already expected to bear the costs. I expected the end of the road was a cliff. This is actually illustrated quite well in Citizenfour because it shows that there was absolutely no plan at all for the day after.

The planning to get to the point of working with the journalists, of transmitting this information, of explaining, contextualizing--it was obsessively detailed, because it had to be. Beyond that, the risks were my own. They weren't for the journalists. They could do everything else. That was by design as well, because if the journalists had done anything shady--for example, if I had stayed in place at the NSA as a source and they had asked me for this document, and that document, it could have undermined the independence, the credibility of the process, and actually brought risks upon them that could have led to new constraints upon journalism.

Bell: So nothing you experienced in the room with the team, or what happened after, made you question or reevaluate journalism?

Snowden: I didn't say that. Actually working more closely with the journalists has radically reshaped my understanding of journalism, and that continues through to today. I think you would agree that anybody who's worked in the news industry, either directly or even peripherally, has seen journalists-- or, more directly, editors--who are terrified, who hold back a story, who don't want to publish a detail, who want to wait for the lawyers, who are concerned with liability.

You also have journalists who go out on their own and they publish details which actually are damaging, directly to personal safety. There were details published by at least one of the journalists that were discussing communication methods that I was still actively using, that previously had been secret. But the journalists didn't even forewarn me, so suddenly I had to change all of my methods on the fly. Which worked out OK because I had the capabilities to do that, but dangerous.

Bell: When did that happen?

Snowden: This was at the height of public interest, basically. The idea here is that a journalist ultimately, and particularly a certain class of journalist, they don't owe any allegiance to their source, right? They don't write the story in line with what the sources desires, they don't go about their publication schedule to benefit, or to detriment, in theory, the source at all. There are strong arguments that that's the way it should be: public knowledge of the truth is more important than the risks that knowledge creates for a few. But at the same time, when a journalist is reporting on something like a classified program implicating one of the government's sources, you see an incredibly high standard of care applied to make sure they can't be blamed if something goes wrong down the road after publication. The journalists will go, well we'll hold back this detail from that story reporting on classified documents, because if we name this government official it might expose them to some harm, or it might get this program shut down, or even if it might cause them to have to rearrange the deck chairs in the operations in some far away country.

That's just being careful, right? But ask yourself--should journalists be just as careful when the one facing the blowback of a particular detail is their own source? In my experience, the answer does not seem to be as obvious as you might expect.

Bell: Do you foresee a world where someone won't have to be a whistleblower in order to reveal the kinds of documents that you revealed? What kinds of internal mechanisms would that require on behalf of the government? What would that look like in the future?

Snowden: That's a really interesting philosophical question. It doesn't come down to technical mechanisms, that comes down to culture. We've seen in the EU a number of reports from parliamentary bodies, from the Council of Europe, that said we need to protect whistleblowers, in particular national security whistleblowers. In the national context no country really wants to pass a law that allows individuals rightly, or wrongly, to embarrass the government. But can we provide an international framework for this? One would argue, particularly when espionage laws are being used to prosecute people, they already exist. That's why espionage, for example, is considered a political offense, because it's just a political crime, as they say. That's a fairly weak defense, or fairly weak justification, for not reforming whistleblower laws. Particularly when, throughout Western Europe they're going, yeah, we like this guy, he did a good thing. But if he shows up on the doorstep we're going to ship him back immediately, regardless of whether it's unlawful, just because the US is going to retaliate against us. It's extraordinary that the top members of German government have said this on the record--that it's realpolitik; it's about power, rather than principle.

Now how we can fix this? I think a lot of it comes down to culture, and we need a press that's more willing and actually eager to criticize government than they are today. Even though we've got a number of good institutions that do that, or that want to do that, it needs a uniform culture. The only counterargument the government has made against national security whistleblowing, and many other things that embarrassed them in the past, is that well, it could cause some risk, we could go dark, they could have blood on their hands.

Why do they have different ground rules in the context of national security journalism?

We see that not just in the United States, but in France, Germany, the UK, in every Western country, and of course, in every more authoritarian country by comparison they are embracing the idea of state secrets, of classifications, or saying, you can't know this, you can't know that.

We call ourselves private citizens, and we refer to elected representatives as public officials, because we're supposed to know everything about them and their activities. At the same time, they're supposed to know nothing about us, because they wield all the power, and we hold all of the vulnerability. Yet increasingly, that's becoming inverted, where they are the private officials, and we are the public citizens. We're increasingly monitored and tracked and reported, quantified and known and influenced, at the same time that they're getting themselves off and becoming less reachable and also less accountable.

Bell: But Ed, when you talk about this in those terms, you make it sound as though you see this as a progression. Certainly there was a sharp increase, as you demonstrated, in overreach of oversight post-9/11. Is it a continuum?

It felt from the outside as though America, post-9/11, for understandable reasons, it was almost like a sort of national psychosis. If you grew up in Europe, there were regular terrorist acts in almost every country after the Second World War, though not on the same scale, until there was a brief, five-year period of respite, weirdly running up to about 2001. Then the nature of the terrorism changed. To some extent, that narrative is predictable. You talk about it as an ever increasing problem. With the Freedom Act in 2015, the press identified this as a significant moment where the temperature had changed. You don't sound like you really think that. You sound as though you think that this public/private secrecy, spying, is an increasing continuum. So how does that change? Particularly in the current political climate where post-Paris and other terrorist attacks we've already seen arguments for breaking encryption.

Snowden: I don't think they are actually contradictory views to hold. I think what we're talking about are the natural inclinations of power and vice, what we can do to restrain it, to maintain a free society. So when we think about where things have gone in the USA Freedom Act, and when we look back at the 1970s, it was even worse in terms of the level of comfort that the government had that it could engage in abuses and get away with them. One of the most important legacies of 2013 is not anything that was necessarily published, but it was the impact of the publication on the culture of government. It was a confirmation coming quite quickly in the wake of the WikiLeaks stories, which were equally important in this regard. That said, secrecy will not hold forever. If you authorize a policy that is clearly contrary to law, you will eventually have to explain that.

The question is, can you keep it under wraps long enough to get out of the administration, and hopefully for it to be out of the egregious sort of thing where you'll lose an election as a result. We see the delta between the periods of time that successive administrations can keep a secret is actually diminishing--the secrets are becoming public at an accelerated pace. This is a beneficial thing. This is the same in the context of terrorism.

There is an interesting idea--when you were saying it's sort of weird that the US has what you described as a collective psychosis in the wake of 9/11 given that European countries have been facing terrorist attacks routinely. The US had actually been facing the same thing, and actually one would argue, experienced similarly high-impact attacks, for example, the Oklahoma City bombing, where a Federal building was destroyed by a single individual or one actor.

Bell: What do you think about the relationship between governments asking Facebook and other communications platforms to help fight ISIS?

Snowden: Should we basically deputize companies to become the policy enforcers of the world? When you put it in that context suddenly it becomes clear that this is not really a good idea, particularly because terrorism does not have a strong definition that's internationally recognized. If Facebook says, we will take down any post from anybody who the government says is a terrorist, as long as it comes from this government, suddenly they have to do that for the other government. The Chinese allegations of who is and who is not a terrorist are going to look radically different than what the FBI's are going to

be. But if the companies try to be selective about them, say, well, we're only going to do this for one government, they immediately lose access to the markets of the other ones. So that doesn't work, and that's not a position companies want to be in.

However, even if they could do this, there are already policies in place for them to do that. If Facebook gets a notification that says this is a terrorist thing, they take it down. It's not like this is a particularly difficult or burdensome review when it comes to violence.

The distinction is the government is trying to say, now we want them to start cracking down on radical speech. Should private companies be who we as society are reliant upon to bound the limits of public conversations? And this goes beyond borders now. I think that's an extraordinarily dangerous precedent to be embracing, and, in turn, irresponsible for American leaders to be championing.

The real solutions here are much more likely to be in terms of entirely new institutions that bound the way law enforcement works, moving us away from the point of military conflict, secret conflict, and into simply public policing.

There's no reason why we could not have an international counter-terrorism force that actually has universal jurisdiction. I mean universal in terms of fact, as opposed to actual law.

Samsung likely to countersue Huawei in U.S. in July: watchers

Friday, 27 May 2016

Byline: Staff reporter

Seoul - South Korean top tech giant Samsung Electronics Co. is likely to file a countersuit against Huawei Technologies Co. with a U.S. court in July, industry watchers here said Friday, after the Chinese company launched lawsuits claiming Samsung's infringement of its patents.

Earlier this week, Huawei brought two suits against the world's top smartphone maker with a U.S. federal court in California and the Chinese city of Shenzhen, seeking financial compensation for the alleged unlicensed use of 4G technology.

Industry watchers forecast that Samsung will take the counteraction sometime as early as July, since it usually takes at least two months to review a complaint in patent infringement battles.

"A Samsung- Huawei suit is likely to proceed slowly as the two sides are likely to pursue negotiations outside of the court after judging several circumstances," an industry watcher said.

Huawei, the world's third-largest smartphone maker, claimed Samsung and its affiliates gained huge profits by using the firm's technology without its permission.

Industry watchers further forecast that this will take a different course than an earlier patent battle between Samsung and its U.S. rival Apple Inc.

Samsung filed a countersuit against Apple in April 21, 2011, just four days after Apple first launched a patent infringement suit with the U.S. federal court of the Northern District of California. Soon, Samsung filed multiple suits in different countries, including South Korea, Japan and Germany.

"It will be very different from a Samsung-Apple suit, which was very spectacle," the watcher said.

Experts further forecast that there is very slim chance that Samsung may take legal action here or in other countries since more than half of Huawei phones are sold in the Chinese market.

The latest lawsuit highlights the rise of Asian competitors as technology creators and possible patent wars between tech firms.

Samsung sold 81.18 million smartphone units around the globe in the first quarter of this year, taking up 23.2 percent of the total, followed by Apple with 14.8 percent and Huawei with 8.3 percent.

Kim Jong-un orders users of Chinese cell phones to be punished: source

Friday, 27 May 2016

Byline: Staff reporter

Seoul - North Korean leader Kim Jong-un has instructed North Koreans using Chinese mobile phones to be punished for treason in order to fend off defections and internal information leaks to the outside world, a Seoul- based news outlet specializing in North Korea reported Friday.

"Kim Jong-un recently issued an order to treat people using Chinese cell phones like betrayers who conspire with South Koreans," the Daily NK quoted its source in the communist country's North Hamkyong Province as saying.

Agents from the North's state security ministry are eavesdropping on mobile phone communications made in areas bordering China 24 hours a day by mobilizing wiretapping equipment, military trucks and motor bikes, the source said.

The atmosphere in the border area is very tense as the security authorities continuously threaten to execute those who communicate with South Korea via mobile phones, according to the source.

The North issued a similar order to thoroughly crack down on the use of Chinese cell phones in January 2014.

'More cybersecurity awareness needed' as challenges grow

Friday, 27 May 2016

Byline: Li Yang

Chengdu - China must raise people's overall awareness of cybersecurity and strengthen research and development of core technology in the sector to better address mounting challenges, top Chinese network security experts said at a conference in Chengdu, Sichuan province, on Thursday.

The 13th China Cyberspace Security Annual Conference, hosted by the National Computer Network Emergency Response Technical Coordination Center of China, covered a range of cyberspace topics, including security threat intelligence, cybersecurity talent development, security vulnerabilities and mobile internet and data security.

About 900 people from institutes, the government and domestic and foreign enterprises attended the three-day event, which started on Tuesday.

According to the 2015 China Internet Network Security Report, which the center issued during the conference, the center received 126,916 reports on network security incidents from home and abroad last year, an increase of 126 percent from 2014.

The three main targets of cyberattacks in China are government departments, financial agencies and basic telecommunication enterprises, the report said. The most common network security concerns are webpage counterfeiting and security vulnerabilities, it added.

Huang Chengqing, director of the center, said that the security capabilities of the cloud platform and big data in China will face big challenges this year. Equipment involved in the Internet of Thing swill face more security threats, and network fraud and racketeering in China will become more rampant this year, Huang predicted.

In the past year, the security protection level of China's basic telecommunication network improved, and so did its domain name system's ability to resist server attacks, the report said.

"But China's industrial internet faces harsher security challenges, and the advanced persistent threat to China's important information system became more severe last year," said Wu Jianping, an academician in computer science at the Chinese Academy of Engineering.

According to the report, the security condition of China's public internet is generally stable, and the security of the main telecommunication operators has improved. But the number of personal information leaks rose, it said.

'Digital swatting' may be behind worldwide school bomb threats, including one in Edmonton

Friday, 27 May 2016

Byline: Paige Parsons

Edmonton - A bomb threat called into an Edmonton high school Wednesday was one of many that triggered emergencies at schools across the world this week.

Two schools in Alberta and two in Saskatchewan were among those that received phone threats of explosives being present in school buildings, and police forces in Alberta are exploring the possibility of a link between the threats.

The Edmonton Police Service (EPS) and Red Deer RCMP are working together to investigate whether the threat originated from the same individual or group, EPS spokesman Scott Pattison said Thursday.

"The investigation is ongoing, though the practice of digital swatting, which is what is alleged to have happened (Wednesday), takes time and is sometimes difficult to source," Pattison said.

Swatting is the practice of falsely reporting a serious incident or crime, in hopes of triggering an emergency response, possibly by a heavily armed SWAT team, as they are called in the United States.

Students and staff at Edmonton's Jasper Place High School, 8950 163 St., were evacuated Wednesday morning, following a phone message around 9:55 a.m. An investigation by city police determined the school was safe and classes resumed around 12:30 p.m.

Hunting Hills High School in Red Deer was also evacuated following a phoned-in bomb threat Wednesday about 9:45 a.m., 10 minutes earlier than the call to Jasper Place High School.

A release from Red Deer Public Schools identified the call as a pre-recording similar to those made to other schools internationally, but Red Deer RCMP Cpl. Karyn Kay said the school staff member who took the call couldn't confirm the threat was indeed a recording. Kay said RCMP have not confirmed a link between the call to Hunting Hills and threats to other schools.

"The RCMP can't speculate or link these files without a level of proof, and at this time we don't have that proof," Kay said.

Two schools in Saskatchewan also received pre- recorded bomb threats Wednesday morning. Jack MacKenzie Elementary in Regina and Silverspring School in Saskatoon were both searched, but nothing unusual was found.

The Canadian Security Intelligence Service said Thursday it does not comment on specific investigations, but said it works with law enforcement across Canada on public safety matters when it is required.

The threats to Canadian schools are similar to dozens of recent threats made via robocalls to schools in the United States and the United Kingdom.

Asked about a connection between calls made to Canadian and American schools, the U.S. Federal Bureau of Investigation would only address incidents in the United States.

"We are aware of recent bomb threats at various schools in different states, and we remain in touch with our law enforcement partners to provide assistance if needed. As always, we encourage the public to remain vigilant and to promptly report suspicious activities which could represent a threat to public safety," FBI spokeswoman Carol Cratty said.

Since Monday, it's estimated that about 85 schools in the United States and the United Kingdom have taken precautionary measures as a result of receiving recorded threats. The majority of the evacuations took place in the United States, with schools being evacuated in Colorado, Utah, Delaware, Minnesota, New Hampshire and Wisconsin. British media outlets also reported evacuations across the United Kingdom early this week.

Threats were made against American elementary, middle and high schools, with some schools choosing to continue classes and others to put buildings on lockdown rather than evacuate. Some schools resumed classes after sweeps by authorities failed to turn up explosives or other threats.

Some American officials described the threats as automated or robotic and at least two -- at Lakewood High School outside Denver and at Ben Franklin Elementary School in Rochester, Minn. -- came in just

before noon local time. Also in Minnesota, Forest Lake Elementary in the city of Forest Lake was evacuated after getting a bomb-threat call around 12:15 p.m.

GCSB to lose $6M

Friday, 27 May 2016

Wellington - The Government Communications Security Bureau's budget has been cut by $6.3m, down from $143.5m in 2015/16 to $137.2m in 2016/17. However, the spy agency is in line for a significant boost the following year, to $152.9m - though how the money will be spent remains a mystery. Budget papers setting out the estimates for Vote Communications Security and Intelligence do not provide any details of the GCSB's spending plans. (Full Report)

Secret Text in Senate Bill Would Give FBI Warrantless Access to Email Records

Friday, 27 May 2016

Byline: Jenna McLaughlin

Washington - A provision snuck into the still-secret text of the Senate's annual intelligence authorization would give the FBI the ability to demand individuals' email data and possibly web-surfing history from their service providers without a warrant and in complete secrecy.

If passed, the change would expand the reach of the FBI's already highly controversial national security letters. The FBI is currently allowed to get certain types of information with NSLs -- most commonly, information about the name, address, and call data associated with a phone number or details about a bank account.

Since a 2008 Justice Department legal opinion, the FBI has not been allowed to use NSLs to demand "electronic communication transactional records," such as email subject lines and other metadata, or URLs visited.

The spy bill passed the Senate Intelligence Committee on Tuesday, with the provision in it. The lone no vote came from Sen. Ron Wyden, D-Ore., who wrote in a statement that one of the bill's provisions "would allow any FBI field office to demand email records without a court order, a major expansion of federal surveillance powers."

Wyden did not disclose exactly what the provision would allow, but his spokesperson suggested it might go beyond email records to things like web-surfing histories and other information about online behavior. "Senator Wyden is concerned it could be read that way," Keith Chu said.

It's unclear how or when the provision was added, although Sens. Richard Burr, R-N.C., -- the committee's chairman -- and Tom Cotton, R-Ark., have both offered bills in the past that would address what the FBI calls a gap and privacy advocates consider a serious threat to civil liberties.

"At this point, it should go without saying that the information the FBI wants to include in the statue is extremely revealing -- URLs, for example, may reveal the content of a website that users have visited, their location, and so on," Andrew Crocker, staff attorney for the Electronic Frontier Foundation, wrote in an email to The Intercept.

"And it's particularly sneaky because this bill is debated behind closed doors," Robyn Greene, policy counsel at the Open Technology Institute, said in an interview.

In February, FBI Director James Comey testified during a Senate Intelligence Committee hearing on worldwide threats that the FBI's inability to get email records with NSLs was a "typo" -- and that fixing it was one of the FBI's top legislative priorities.

Greene warned at the time: "Unless we push back against Comey now, before you know it, the long slow push for an [electronic communication transactional records] fix may just be unstoppable."

The FBI used to think that it was, in fact, allowed to get email records with NSLs, and did so routinely until the Justice Department under George W. Bush told the bureau that it had interpreted its powers overly broadly.

Ever since, the FBI has tried to get that power and has been rejected, including during negotiations over the USA Freedom Act.

The FBI's power to issue NSLs is actually derived from the Electronic Communications Privacy Act -- a 1986 law that Congress is currently working to update to incorporate more protections for electronic communications -- not fewer. The House unanimously passed the Email Privacy Act in late April, while the Senate is due to vote on its version this week.

Sen. John Cornyn, R-Texas, is expected to offer an amendment that would mirror the provision in the intelligence bill.

Privacy advocates warn that adding it to the broadly supported reform effort would backfire.

"If [the provision] is added to ECPA, it'll kill the bill," Gabe Rottman, deputy director of the Center for Democracy and Technology's freedom, security, and technology project, wrote in an email to The Intercept. "If it passes independently, it'll create a gaping loophole. Either way, it's a big problem and a massive expansion of government surveillance authority."

NSLs have a particularly controversial history. In 2008, Justice Department Inspector General Glenn Fine blasted the FBI for using NSLs supported by weak evidence and documentation to collect information on Americans, some of which "implicated the target's First Amendment rights."

"NSLs have a sordid history. They've been abused in a number of ways, including ... targeting of journalists and ... use to collect an essentially unbounded amount of information," Crocker wrote.

One thing that makes them particularly easy to abuse is that recipients of NSLs are subject to a gag order that forbids them from revealing the letters' existence to anyone, much less the public.

7. USA Today

ACLU joins privacy fight against feds

Friday, 27 May 2016

Byline: Marco della Cava

Washington - Microsoft got an ally in its lawsuit against the Justice Department on Thursday.

The American Civil Liberties Union has filed a motion to join Microsoft's effort to challenge Justice Department gag orders that prevent the tech company from telling customers when the government has ordered it to turn over data.

The ACLU is a Microsoft customer. Microsoft filed its lawsuit in April, one of a number of legal challenges the Redmond, Wash., company has mounted against growing law enforcement requests for its cloud-based consumer data.

"A basic promise of our Constitution is that the government must notify you at some point when it searches or seizes your private information," said Alex Abdo, a senior staff attorney with the ACLU Speech, Privacy and Technology Project. "Notice serves as a crucial check on executive power, and it has been a regular and constitutionally required feature of searches and seizures since the nation's founding."

Microsoft spokesman David Cuddy said the company "appreciates the support from the ACLU and many others in the business, legal and policy communities who are concerned about secrecy becoming the norm rather than the exception."

Requests from law enforcement agencies for access to users' personal information routinely flood tech companies that store vast amounts of data in the cloud. Massive data centers run by Microsoft, Amazon and other big tech companies allow businesses and individuals to access email, photos and other content from multiple devices, wherever they are.

Law enforcement officials say that access to such data is critical to fighting crime and terrorism.

Using the Electronic Communications Privacy Act, the U.S. government is increasingly targeting such data, according to Microsoft, which says the government has mandated secrecy in 2,576 instances over the past 18 months. People would know if the government went through their filing cabinet or their hard drive but are unaware when their privacy in the cloud is intruded upon, they argue.

The 1986 law was written before the Web was born and long before Americans started storing so much of their personal communications on the Internet.

Microsoft alleges the Electronic Communications Privacy Act violates users' Fourth Amendment right that a search be reasonable and Microsoft's First Amendment right to talk to its users.

"Notably and even surprisingly, 1,752 of these secrecy orders, or 68% of the total, contained no fixed end date at all. This means that we effectively are prohibited forever from telling our customers that the government has obtained their data," Microsoft chief legal officer Brad Smith wrote in an April blog post when the suit was announced.

Pentagon does not rule out hitting new Taliban leader

Friday, 27 May 2016

Byline: Lalit K Jha

Washington - Not ruling out the possibility of targeting the new Taliban leader if needed, the Pentagon Thursday hoped that the new leadership would pursue a path of peaceful resolution with the Afghan Government.

"Right now, as you know, we carried out a strike against a Taliban leader who had plotted against the United States forces and had led a group that carried out attacks against U.S. forces. And we will continue to do whatever we need to do to protect our forces," the Pentagon Press Secretary, Peter Cook, told reporters at a news conference.

He was being asked of the Pentagon trying to kill the new Taliban leader, who was appointed this week after its last leader Mullah Mansour was killed in an US air strike on Saturday.

The responsible thing for the Taliban leadership to do at this point would be to pursue a pathway to a peaceful resolution with the unity government in Afghanistan, Cook said in response to a question.

"That would be the responsible thing to do, because the Afghan forces with the support of the United States, our partners there, are going to continue to improve and show more skills and capabilities," he said.

"And they're going to continue to be able to work towards ultimately securing the country on their own. That's the ultimate goal here. They're going to have our support in the process. So the wise thing for the

Taliban leadership to do would be to factor that into their decision-making and choose a different path. We will wait to see what they do," Cook said.

In the meantime, the United States is going to do everything we can to support the Afghan forces, to continue to bolster those forces, to make them more capable, more able to defend themselves, to defend the country.

"We've talked about the aviation assets that are now coming online; the training that continues for Afghan forces. This is a difficult situation and this does present an opportunity for the Taliban to chart a new path should they choose to do so. Well wait to see if they do the responsible thing," Cook said.

9. New York Times

Hillary Clinton Addresses Email Questions Again

Friday, 27 May 2016

Byline: Thomas Kaplan, Amy Chozick

Las Vegas - Unable to shake what has become a lingering distraction for her campaign, Hillary Clinton on Thursday played down a report from the State Department's inspector general that criticized her use of a private email server while she was secretary of state.

In an interview with ABC News, Mrs. Clinton repeated her concession that using the private email server was a mistake. But she suggested that voters had more important issues to consider when making up their minds between her and the presumptive Republican presidential nominee, Donald J. Trump.

"As I've said many times, if I could go back, I would do it differently," Mrs. Clinton said. "I know people have concerns about this. I understand that. But I think voters are going to be looking at the full picture of what I have to offer, my life and my service, and the full threat that Donald Trump offers our country."

The inspector general's report presented to Congress on Wednesday said that Mrs. Clinton had not sought or received permission to use the private email server. The report also said that, through her lawyers, Mrs. Clinton declined to be interviewed by the inspector general.

The report gave new ammunition to Mr. Trump and threatened to bolster the perception already held by a majority of voters, according to polling, that Mrs. Clinton is not trustworthy.

In the interview, Mrs. Clinton gave little ground over the email issue, asserting that the report "makes clear that personal email use was the practice for other secretaries of state."

Asked if using private email was an error of judgment, she responded: "Well, it was allowed. And the rules have been clarified since I left about the practice."

She added, "Having said that, I have said many times, it was a mistake."

Mrs. Clinton reiterated that argument in a phone interview with CNN on Thursday afternoon. "I thought it was allowed," she told Wolf Blitzer. Asked why she declined to be interviewed for the review, Mrs. Clinton said, "I'd already said everything I could on this matter."

In both interviews, she cited her 11-hour testimony to a House committee investigating the Sept. 11, 2012, attack on the United States mission in Benghazi, Libya, when extensive questions about her private email use came up. But unlike the Benghazi committee, an effort led by congressional Republicans, the State Department report was not partisan, a detail not lost on Mr. Trump.

"This is not a Republican group or a conservative group," he said in an interview on Wednesday. "This is a group that is much more to her liking."

Mr. Trump repeated his criticism of Mrs. Clinton at a news conference on Thursday, while Mrs. Clinton used her interviews to call her likely Republican rival "an unqualified loose cannon."

"President Obama came out of meetings with our closest allies in the world and reported that they are quote 'rattled' by the threat Donald Trump represents," Mrs. Clinton said on CNN.

The interviews came as Mrs. Clinton spoke here on Thursday at a conference for the United Food and Commercial Workers International Union, which endorsed her in January. Later in the afternoon, she returned to California to hold a pair of rallies ahead of the California primary on June 7. After Mrs. Clinton previously led by double digits, a poll released Wednesday night showed her in a tight race with Senator Bernie Sanders.

"I really don't pay a lot of attention to polls because they are usually, and increasingly, all over the place," Mrs. Clinton said on CNN when asked about the tightening race in California. "We are already insurmountably ahead" in the race for the 2,383 delegates needed to clinch the nomination, she added.

Government still holding on to 5 years of NSA phone-snooping metadata

Friday, 27 May 2016

Byline: Stephen Dinan

Washington - The National Security Agency's phone-snooping program ended six months ago this Saturday, but the government is still holding on to the mountain of data it piled up over the previous five years, worrying civil liberties advocates who say it's time to start expunging the legally questionable information.

Government officials say they no longer access the information, but the intelligence community's past behavior has some civil libertarians skeptical of those assurances. And the mere existence of the data,

which includes the time, duration and numbers involved in phone calls, worries critics who say there's no reason for it to be sitting under government control.

The intelligence community, though, says its hands are tied -- chiefly by the very same advocates who are demanding that most of the data be expunged.

Some of those groups are helping pursue lawsuits seeking damages from the government's snooping program, and courts have ordered all of the data to be preserved. That means the NSA can't purge the information, even though it says it wants to.

"We take seriously the public's concerns about the government's retention of bulk telephony metadata collected under the now-terminated bulk metadata program," said Timothy Barrett, spokesman for the Office of the Director of National Intelligence. "Retention of this data is necessary to comply with preservation obligations in civil litigation challenging that program, including court orders entered in two of those cases."

The phone records program began under President George W. Bush and was kept in place by President Obama, based on powers claimed under the Patriot Act's "business records" provision. The NSA demanded that phone companies turn over their records of calls, which were then stored in government databanks for five years.

Analysts queried the data when they had a number they believed associated with terrorism, and could pursue up to three "hops," meaning they could see check numbers associated with the initial lead, all the numbers associated with that set and then all the numbers associated with the second set.

Former government contractor Edward Snowden revealed the program's existence in 2013, spawning a massive public backlash that forced Congress to curtail the program. Lawmakers passed the USA Freedom Act last year, giving the NSA 180 days to shut down its own database and instead rely on private companies to keep the data, which the government could query under more strict circumstances.

The program expired on Nov. 28, and the government was to dispose of its data.

But the administration got an order from the Foreign Intelligence Surveillance Court allowing it to preserve all of the data, arguing that the government needs it to fight the 10 court cases challenging the defunct program.

The Electronic Frontier Foundation, which is assisting the plaintiffs in several of the key cases, said the government should find a way to get rid of most of the data.

"Talks are continuing about a plan under which the government would destroy the phone records -- including those still lingering in its various databases -- while ensuring that the courts can still consider our challenge to 14 years of NSA telephone records collection from millions of innocent Americans," said EFF Civil Liberties Director David Greene.

But government attorneys say it's impossible to cull the data to just the 10 ongoing cases. Indeed, the attorneys won't even acknowledge what records they have or which phone carriers they have targeted -- creating a legal morass.

The government is not holding on to only the metadata, but it also still has everything it derived from the data -- the information it turned up in the "hops" when it investigated suspects' phone numbers.

Mr. Barrett, the intelligence office spokesman, said they plan to expunge the query data once they are free to get rid of the metadata itself, with "narrow exceptions" laid out in a November order from the secret court.

The court order suggests those exceptions could be broad. The court said the government can retain "information derived from the metadata that has been previously disseminated," as well as "select query results generated that formed the basis of such disseminations."

Patrick C. Toomey, a staff attorney at the American Civil Liberties Union, said limits must be imposed.

"The government should purge the call records it collected illegally, including the results of its queries, and should retain only the data necessary to comply with its legal obligations," he said.

But he said that's not enough. "The NSA continues to search and store Americans' private information in vast quantities under other spying programs, all without ever obtaining a warrant," he said.

Not all of those challenging the NSA want the data expunged.

Larry Klayman, a conservative lawyer who won his case against the NSA in federal district court in Washington, says the data are needed so he can win a massive settlement from the administration.

"We basically want to show what it is that they have control over, and have had access to, to make our claim to damages," he said.

Mr. Klayman also doesn't trust the NSA to expunge the data even if it's ordered to.

"To me it's irrelevant, any kind of agreement you reach with them," he said. "I want them to preserve all of it because I know even if they say they're purging it, they're not going to."

He said the only acceptable solution is to have the federal judge in his case, Judge Richard J. Leon, oversee the NSA's activities going forward.

11. New York Times

Clinton Wasn't Adept at Using a Computer for Email, an Inquiry Is Told

Friday, 27 May 2016

Byline: Eric Lichtblau, Steven Lee Myers

Washington - Hillary Clinton and her advisers have offered a series of explanations over the last year for her decision to use a private email server as secretary of state, a decision that she said again on Thursday had been "a mistake."

She did not want the inconvenience of carrying two phones, Mrs. Clinton said initially. She did not want a government account that might pull in nonwork matters, she said later. Or perhaps, an adviser has said, she simply did not want Republican lawmakers rifling through her personal emails.

Yet another explanation emerged Thursday: She was not comfortable with using a computer to read email.

Lewis A. Lukens, a former State Department administrative official, said in a sworn deposition last week that after Mrs. Clinton became secretary of state in 2009, he had proposed accommodating her by setting up a desktop computer in her office that would not be connected to the department's system. That would have allowed her to send and receive email on a personal account, Mr. Lukens said in the deposition, which he gave as part of a lawsuit brought by Judicial Watch, a conservative legal advocacy group. The group released a transcript of the deposition on Thursday.

But that idea was abandoned, Mr. Lukens testified, after an aide to the secretary told him that Mrs. Clinton was "very comfortable checking her emails on a BlackBerry, but she's not adept or not used to checking her emails on a desktop."

His explanation will not be the last word. Nor will a highly critical report that came out Wednesday from the State Department's inspector general, which challenged many of the explanations Mrs. Clinton and her supporters have offered over the past year.

While the report said that Mrs. Clinton had never been authorized to set up a private email server and that her decision to use one had compromised security at the department she ran, it left a number of questions unanswered. One was why she had decided to use her own server, and ultimately risk damage to her political career, in the first place.

And it raised new questions, including why Mrs. Clinton had declined to speak with the investigators who prepared the report.

Asked about that decision in an interview with ABC News on Thursday, Mrs. Clinton said only that she had already testified for 11 hours before the select House committee investigating the attacks in Benghazi, Libya, in 2012, and that she had offered repeatedly to speak with the F.B.I.

"I have talked about this for many, many months," she said.

She sounded exasperated by her inability to move past the controversy and defended her actions as common practice at the State Department, even as she again acknowledged that the private server had been a mistake.

"As I've said many times, if I could go back, I would do it differently," she said. "I know people have concerns about this. I understand that, but I think voters are going to be looking at the full picture of what I have to offer, my life and my service."

Mrs. Clinton said once again that the arrangement had been "allowed" at the time, though the inspector general's report said that she had not sought permission and that it would not have been granted because of security concerns.

She also said that her use of a nonofficial email address had been "widely known," though the report said the extent of her use had not been known beyond a small number of officials who were privy to her private accounts.

At the State Department on Thursday, a spokesman, Mark C. Toner, faced repeated questions about why the department had not done more to ensure that Mrs. Clinton's email arrangement complied with department rules and federal laws. "There was only a partial understanding of how much Secretary Clinton relied on personal email, and we just did not have a complete picture," he said.

According to the inspector general's report, two records information officials in the department raised concerns as early as 2010 that emails sent and received on Mrs. Clinton's server might contain information that should be preserved under federal law.

Their superior told them that the arrangement had been reviewed and approved, though the inspector general found "no evidence" that this had happened. The supervisor told them their job was to support the secretary and "instructed the staff never to speak of the secretary's personal email system again."

The report did not name the supervisor, but several people with knowledge of the episode identified him as John Bentel, the former director of information resource management in the State Department's Executive Secretariat office. Randall J. Turk, a lawyer for Mr. Bentel, declined to comment Thursday.

Senator Charles E. Grassley, the Iowa Republican who is chairman of the Senate Judiciary Committee, mentioned Mr. Bentel's role in remarks Thursday on the Senate floor, and complained that Mr. Bentel had refused a request to speak with the committee.

"Good and honest employees just trying to do their job were told to shut up and sit down," Mr. Grassley said. "Concerns about the secretary's email system being out of compliance with federal record-keeping laws were swept under the rug."

He also said Mr. Bentel had warned Mrs. Clinton that any emails that passed through the State Department's systems would be subject to disclosure under the Freedom of Information Act.

For Mrs. Clinton, the biggest obstacle to getting past the email controversy is the F.B.I., which has not yet completed its criminal investigation to determine whether any laws were broken in the handling of classified material or other matters relating to the emails. Mrs. Clinton is expected to be interviewed as part of the investigation, but it is not clear when that will happen.

The investigation could drag past the Democratic National Convention this summer and what is expected to be the kickoff to Mrs. Clinton's general-election campaign against Donald J. Trump. In the meantime, depositions will continue in the Judicial Watch suit. Cheryl D. Mills, a longtime confidante of Mrs. Clinton who was her counselor at the State Department, is scheduled to testify on Friday, and at least a half-dozen other former officials are scheduled to follow.

America shut down the original NSA because 'gentlemen do not read each other's mail'

Friday, 27 May 2016

Byline: Paul Szoldra

Baltimore - The precursor to the National Security Agency was shut down because the Secretary of State at the time believed that "gentlemen do not read each other's mail."

It's an interesting anecdote we were reminded of during a visit to the NSA's public museum in Maryland, where it has an exhibit on the so-called "Black Chamber" founded in 1919 by Herbert O. Yardley.

Officially known as The Cipher Bureau, it was America's first peacetime organization dedicated to code breaking. Located in New York City and disguised behind a public-facing commercial code company, its existence was a highly-secret affair that was jointly funded by the State Department and the US Army.

Throughout the 1920's, the bureau cracked thousands of diplomatic messages. Most notably, it intercepted and deciphered the communications of Great Britain and Japan during the Washington Naval Conference in 1921.

"Yardley's team had a major success when it broke the Japanese diplomatic code and learned of the Japanese government's instructions to its ambassadors," an Army historical feature notes. "Naturally, knowing the lowest naval ratio the Japanese were willing to accept put the US in a powerful negotiating position."

But the peace throughout the 1920's meant there was less to intercept, and its budget was continually reduced. Then its time came to a close soon after President Herbert Hoover came into office. Initially, Yardley didn't let new Secretary of State Henry Stimson know about his code-making chamber for a few months.

As James Bamford wrote in "The Puzzle Palace":

Then in May, after Yardley had deciphered a new group of Japanese messages, he decided the time had come to share the dark secret with the man who was paying the bills, and a few selected translations were laid on the Secretary's desk.

Stimson's reaction was immediate and violent. Branding the Black Chamber highly illegal, he at once directed that all its State Department funds be cut off. Since the Chamber was now getting almost its entire support from the State Department, that mean instant doom.

Dealing with ambassadors from friendly nations, Stimson saw interception of those communications as quite disrespectful. "Gentlemen do not read each other's mail," he wrote in his memoirs.

That attitude didn't hold for long, of course. The codebreaking was back in full swing during World War II and beyond, and even at present, the NSA targets friendly and foe embassies alike. The confirmation of that fact set off a firestorm of criticism from allies after it was revealed by ex-NSA contractor Edward Snowden.

Still, it was Yardley who had the last laugh.

Out of a job in the midst of the Great Depression, Yardley wrote a tell-all memoir of his time secretly breaking codes, called "The American Black Chamber." The NSA's museum described its being published because of a "loophole" in the law, but in reality, there was absolutely no legal precedent to stop the book from coming out.

Though the US government certainly tried. As Bamford notes, it considered prosecution or outright suppression of the book, but ultimately these avenues were rejected since there was no legal standing to go on.

It was published in 1931. A law that closed the "loophole" and prevented any further secrets from being revealed was passed two years later.

Bill would expand FBI's warrantless access to online records, senators warn

Friday, 27 May 2016

Byline: Spencer Ackerman

New York - Two US senators have warned that a new bill would vastly expand the FBI's warrantless access to Americans' online records.

Although the text of the 2017 intelligence authorization bill is not yet available to the public, two members of the Senate intelligence committee have said the bill could expand the remit of a nonjudicial subpoena called a National Security Letter (NSLs) to acquire Americans' email records, chat or messaging accounts, account login records, browser histories and social- media service usage.

While NSLs typically apply to phone or banking records and email addresses, the bill, which cleared the Senate intelligence panel on Tuesday by a 14-1 vote, appears to change the scope of the longstanding term "electronic communications transaction records".

Senator Ron Wyden criticized the change as a sweeping expansion of warrantless surveillance.

"While this bill does not clearly define 'electronic communication transaction records', this term could easily be read to encompass records of whom individuals exchange emails with and when, as well as their login history, IP addresses, and internet browsing history," Wyden, a Democrat from Oregon who voted against the bill, told the Guardian.

Wyden's colleague on the panel, Democrat Martin Heinrich of New Mexico, said in a Thursday statement that the measure represents "a massive expansion of government surveillance that lacks independent oversight and potentially gives the FBI access to Americans' email and browser histories with little more than the approval of a manager in the field".

Heinrich voted for the bill because of its other provisions. His office said he would seek to remove the NSL expansion when it comes to the Senate floor.

"The FBI has not made a convincing case that it needs any process other than the one that already exists, especially one that freely allows the FBI access to law-abiding Americans' emails and web activity," Henrich said.

Obscure before the 9/11 attacks, the FBI has come to rely significantly on NSLs, which come exclusively from the executive branch, and not with a judge's approval. They are served not to the targets of investigation but to communications providers or banks, and come with gag orders preventing the recipient from disclosing anything about them.

A 2014 panel advising Barack Obama on surveillance found the FBI typically issues an average of 60 NSLs each day, or 21,900 annually, up from 8,500 in 2000. The office of the director of national intelligence and the justice department recently reported that the FBI issued 12,870 NSLs in 2015, representing 48,642 warrantless requests for information.

Last year, a recipient of an NSL won a decade-long fight to disclose aspects of the subpoena his web-hosting company received. The NSL served to Nicholas Merrill in 2004 included demands for cellular location information and "any other information which you consider to be an electronic communication transactional record" - an indication that the phraseology in the fiscal 2017 intelligence bill has direct NSL precedent.

In Senate testimony earlier this year, FBI Director James Comey said that a "typo" in a 1993 statute concerning electronic communications transaction records was leading "some companies" to resist providing the FBI with "ordinary transaction records that we can get in most contexts with a non-court order". He called a legislative fix a high legislative priority for the bureau.

A statement released by the Senate panel's leadership, Republican Richard Burr of North Carolina and Democrat Dianne Feinstein of California, after the bill passed the committee on Tuesday did not include information on the bill's changes to the NSL scope.

Burr spokeswoman Rebecca Watkins indicated a public version bill would be released as early as next week.

"Committee members have three working days to submit supplemental, minority, or additional views to the committee. The resulting report will be made public after member comments are compiled, as has been consistently the process for the Senate intelligence committee," Watkins told the Guardian.

North Korea Linked to Digital Attacks on Global Banks

Friday, 27 May 2016

Byline: Nicole Perlroth, Michael Corkery

San Francisco - Security researchers have tied the recent spate of digital breaches on Asian banks to North Korea, in what they say appears to be the first known case of a nation using digital attacks for financial gain.

In three recent attacks on banks, researchers working for the digital security firm Symantec said, the thieves deployed a rare piece of code that had been seen in only two previous cases: the hacking attack at Sony Pictures in December 2014 and attacks on banks and media companies in South Korea in 2013. Government officials in the United States and South Korea have blamed those attacks on North Korea, though they have not provided independent verification.

On Thursday, the Symantec researchers said they had uncovered evidence linking an attack at a bank in the Philippines last October with attacks on Tien Phong Bank in Vietnam in December and one in February on the central bank of Bangladesh that resulted in the theft of more than $81 million.

"If you believe North Korea was behind those attacks, then the bank attacks were also the work of North Korea," said Eric Chien, a security researcher at Symantec, who found that identical code was used across all three attacks.

"We've never seen an attack where a nation- state has gone in and stolen money," Mr. Chien added. "This is a first."

The attacks have raised alarms in the global banking industry because the thieves gained access to Swift, a Brussels-based banking consortium that runs what is considered the world's most secure payment messaging system. Swift's system is used by 11,000 banks and companies to move money from one country to another -- one reason that it is a tempting target for criminals.

Swift has warned publicly that the attacks are part of a broad coordinated assault on banks, though it has not assigned blame. It has also emphasized that it was the banks' connection points to its network -- and not the core Swift messaging network itself -- that the attackers were able to breach. Also,

American bankers have noted that the security lapses all occurred at banks in third-world countries, which may give some comfort to banking customers in the United States.

Security researchers and American government officials have tied thousands of attacks to nations in the past. They have linked the United States and Israel to an attack that destroyed Iranian centrifuges, and the Chinese military and contractors to attacks that stole military and trade secrets from thousands of foreign entities.

But the latest spate of attacks on banks in Bangladesh and Southeast Asia would be the first time, security researchers say, that a nation has used malicious code to steal purely for financial profit.

The idea that Pyongyang had turned to digital theft would not be surprising. North Korea's economy has been ravaged by sanctions, food shortages and other deprivations. Pyongyang does not publish economic data, but estimates have put North Korea's gross domestic product between $12 billion and $40 billion, tiny when compared with South Korea's economic output of more than $1.4 trillion.

In the attack at Bangladesh's central bank in February, the thieves tried to transfer $1 billion in funds from an account at the Federal Reserve Bank of New York. Fed officials became suspicious of the some of requested transfers and released only $81 million to accounts in the Philippines.

"If you presume it's North Korea, $1 billion is almost 10 percent of their G.D.P.," Mr. Chien said. "This is not small change for them."

Symantec researchers said it was possible that the bank in the Philippines containing the North Korean code was also involved in the Bangladesh bank scheme and the attempted breach on the Vietnamese bank. The researchers would not identify the Philippines bank and did not say whether the thieves had been successful in transferring funds. Researchers were able to confirm only that the attackers had managed to breach the bank and install identical code strings on the bank's computer systems -- the same code that they discovered in Bangladesh, Vietnam and the two previous attacks at Sony in 2014 and South Korea in 2013.

Mr. Chien noted that the attackers not only used identical numbers but wrote the code in the same, unusual sequence across all three attacks.

Mr. Chien said the evidence pointed to all three attacks being the work of the "Lazarus Group," a name his team gave to the attackers behind the Sony and South Korean attacks.

Officials have pointed to North Korea's threat of "merciless countermeasures" against Sony if the studio released "The Interview," a movie by Seth Rogen and Evan Goldberg that made fun of North Korea and includes a fictional assassination of its leader. F.B.I. analysts also note critical mistakes North Korean hackers made, such as logging into their attack servers from known North Korean Internet addresses and even logging into both their Facebook account and Sony's servers from the same computers.

In the months since evidence of the attacks involving the Swift network started to emerge, investigators have been looking for commonalities at numerous other potential breaches. It remains unclear whether

these breaches are connected to the ones in Bangladesh and Vietnam, but they too have occurred in or around Southeast Asia.

There is no evidence to date that the thieves have gone after large American or European banks, though new possible attacks are being reported weekly. Last week, evidence emerged that Banco del Austro, an Ecuadorean bank, was infiltrated by hackers who were also able to sneak onto the Swift network. The thieves transferred several million dollars to accounts around the world, according to a lawsuit the bank filed in federal court in the United States against Wells Fargo, which facilitated one of the transfers.

Researchers have yet to unearth any of the code used in the Ecuador attack, but banking analysts say it is probably no coincidence that these attacks are happening in the developing world, where security measures tend not to be as tight as they are in financial hubs like New York and London.

Swift has issued numerous warnings in recent weeks urging banks to step up their security protocols. Analysts worry that the breaches could have a chilling effect on global finance; larger banks may become reluctant or even refuse to transact with smaller banks in the developing world unless they can have assurances that their networks have not been compromised by thieves and malware.

At a conference on Tuesday in Brussels, Swift's chief executive, Gottfried Leibbrandt, said the recent attacks could do far more damage than breaches on retailers and telephone companies, which he said suffer largely reputational and legal hits.

"Banks that are compromised like this can be put out of business," Mr. Leibbrandt said.

North Korea has long been known for creative attempts to generate badly needed hard currency. In the last decade, United States government officials accused North Korea of counterfeiting $100 bills, which were known as "superdollars" or "supernotes" because the fakes were nearly flawless. The Federal Reserve began thwarting that effort by circulating a new $100 bill over the last three years that makes counterfeiting nearly impossible: The redesigned $100 is easier to authenticate and harder to replicate.

"North Korea is hurting for money," said Herb Lin, the senior research scholar for cyberpolicy and security at Stanford University's Center for International Security and Cooperation and a fellow at Stanford's Hoover Institution. "They've been cut out of the financial system because of sanctions. They had been among the best counterfeiters in the world, and only recently have they been stymied in the counterfeiting of superdollars. If it's true that we've cut them off from that, then it's not at all surprising that they would turn to something else."

Push for encryption law falters despite Apple case spotlight

Friday, 27 May 2016

Byline: Multiple reporters

Washington - After a rampage that left 14 people dead in San Bernardino, key U.S. lawmakers pledged to seek a law requiring technology companies to give law enforcement agencies a "back door" to encrypted communications and electronic devices, such as the iPhone used by one of the shooters.

Now, only months later, much of the support is gone, and the push for legislation dead, according to sources in congressional offices, the administration and the tech sector.

Draft legislation that Senators Richard Burr and Dianne Feinstein, the Republican and Democratic leaders of the Intelligence Committee, had circulated weeks ago likely will not be introduced this year and, even if it were, would stand no chance of advancing, the sources said.

Key among the problems was the lack of White House support for legislation in spite of a high-profile court showdown between the Justice Department and Apple Inc over the suspect iPhone, according to Congressional and Obama Administration officials and outside observers.

"They've dropped anchor and taken down the sail," former NSA and CIA director Michael Hayden said.

For years, the Justice Department lobbied unsuccessfully for a way to unmask suspects who "go dark," or evade detection through coded communications in locked devices.

When the Federal Bureau of Investigation took Apple to court in February to try to open the iPhone in its investigation of the San Bernardino slayings, the cause gained traction in Washington. The political landscape had shifted - or so it seemed.

The short life of the push for legislation illustrates the intractable nature of the debate over digital surveillance and encryption, which has been raging in one form or another since the 1990s.

Tech companies, backed by civil liberties groups, insist that building law enforcement access into phones and other devices would undermine security for everyone-including the U.S. government itself.

Law enforcement agencies maintain they need a way to monitor phone calls, emails and text messages, along with access to encrypted data. Polls show the public is split on whether the government should have access to all digital data.

The legal battle between the FBI and Apple briefly united many around the idea that Congress - not the courts - should decide the issue. But the consensus was fleeting.

Feinstein's Democratic colleagues on the Intelligence Committee - along with some key Republicans - backed away. The House never got on board.

The CIA and NSA were ambivalent, according to several current and former intelligence officials, in part because officials in the agencies feared any new law would interfere with their own encryption efforts.

Even supporters worried that if a bill were introduced but failed, it would give Apple and other tech companies another weapon to use in future court battles.

Burr had said repeatedly that legislation was imminent.

But last week, he and Feinstein told Reuters there was no timeline for the bill. Feinstein said she planned to talk to more tech stakeholders, and Burr said, "be patient."

In the meantime, tech companies have accelerated encryption efforts in the wake of the Apple case. The court showdown ended with a whimper when the FBI said it had found a way to get into the phone, and subsequently conceded privately it had found nothing of value.

THE FBI GOES TO BATTLE

A week after the San Bernardino attack, Burr told Reuters passing encryption legislation was urgent because "if we don't, we will be reading about terrorist attacks on a more frequent basis."

FBI Director James Comey told the Senate Intelligence Committee soon after that encryption was "overwhelmingly affecting" the investigation of murders, drug trafficking and child pornography.

A week later, the Justice Department persuaded a judge to issue a sweeping order demanding Apple write software to open an iPhone used by San Bernardino suspect Sayeed Farook, who died in a shootout with law enforcement.

Apple fought back, arguing, among other things, that only Congressional legislation could authorize what the court was demanding. Many saw the Justice Department's move as a way to bring pressure on Congress to act.

President Obama appeared to tacitly support Comey's court fight and the idea that there should be limits on criminal suspects' ability to hide behind encryption. But even as the drive for legislation seemed to be gaining momentum, consensus was dissipating.

Senator Lindsey Graham, an influential Republican, withdrew support in a sudden about-face.

"I was all with you until I actually started getting briefed by the people in the intel community," Graham told Attorney General Loretta Lynch during a hearing in March. "I'm a person that's been moved by the arguments of the precedent we set and the damage we may be doing to our own national security."

On the Democratic side, Senator Ron Wyden vowed to filibuster what he called a "dangerous proposal," that "would leave Americans more vulnerable to stalkers, identity thieves, foreign hackers and criminals."

Senator Mark Warner advanced a competing bill to form a commission to study the issue.

A half dozen people familiar with the White House deliberations said they were hamstrung by a long-standing split within the Obama Administration, pitting Comey and the DOJ against technology advisors and other agencies including the Commerce and State Departments.

They also said there was reluctance to take on the tech industry in an election year.

16. The Register (UK)

More than half of people on UK counter-terror biometrics databases are innocent

Thursday, 26 May 2016

Byline: Alexander J. Martin

London - A new report from the UK's independent biometrics commissioner has revealed that more than half of people on British counter- terrorism databases are innocent, more than a thousand more than previously thought.

The commissioner has revised upwards his figures on fingerprint and DNA profile retention, stating that 53 per cent of the 9,600 individuals on counter-terrorism databases have never been convicted of a crime, and not just 7,800 people as was previously thought.

The extent to which police in the UK have been exploiting counter-terrorism laws to keep innocent suspects' biometric details on file is now understood to be much greater, following the new report's publication at the Home Secretary's request.

Biometrics commissioner Alastair MacGregor QC's 20-page report, published today, provides an update to his annual report from 2015, revising some of the key figures. It reveals even more police misuse of National Security Determinations (NSDs) than previously raised in his 119-page report for 2015.

Today's report was rushed out (alongside many others) ahead of purdah* for the EU referendum.

Last year MacGregor reported that the police were holding onto the biometric data of 6,500 and 7,800 subjects of counter- terrorism investigations in 2013 and 2015 respectively, many of whom have never been charged with an offence. Those numbers, along with previous figures, have now been increased.

He wrote: "It now appears that those figures were incorrect and that the true figures as at 31 October 2013 and 31 October 2015 were 8,300 and 9,600 respectively."

4,500 - 53 per cent - of these records, which were being held on counter-terror databases, related to individuals who "had never been convicted of a recordable offence".

Despite the time limits on the retention of fingerprints and DNA profiles in the cases of uncharged suspects, as established by the Protection of Freedoms Act 2012, which also established the biometrics commissioner's role, chief police officers are, in exceptional circumstances, allowed to make a NSD to retain this material for longer. These decisions must be examined by the commissioner, however.

MacGregor reported that 217 applications for NSDs had been made by 31 October 2015, with 117 being approved internally by police and forwarded to him as biometrics commissioner. In turn, he approved just 73 of these requests because several were made outside the permitted time limits, while others had been approved by police officers too junior to legally do so.

He added: "At the date of my 2015 Report it was my understanding that it was possible that NSDs would have been applied for in about 45 of the cases that were at that time thought to have expired by 31 October 2015, it is now my understanding that applications for NSDs would undoubtedly have been made in at least 108 of the cases that had in fact expired by 31 March 2016 and that the actual figure might well have been appreciably larger."

This is the last report that MacGregor, the first person appointed to the role, will write as biometrics commissioner because his two-year term, which was extended until 31 May so he could complete his additional report, is all but over. No decision has yet been made on his replacement.

17. Pajhwok Afghan News

Afghan war may not escalate with Hibatullah succession: NATO

Friday, 27 May 2016

Byline: Navid Ahmad Barekzai

Kabul - NATO's Resolute Support Mission (RS) in Afghanistan on Thursday said it did not expect the war in Afghanistan would escalate with the election of Taliban's new leadership.

Brig. Gen. Charles Cleveland, RS spokesman, told a press conference here that Mullah Akhtar Mohammad Mansour was targeted because he was a direct threat to Afghan and coalition forces and he was against peace in the country.

Five days ago, Mansour was targeted by US drones while returning from Iran in the Balochistan province of Pakistan.

On the appointment of Mullah Hibatullah Akhunzada as Taliban's new supreme commander, Cleveland said "the Taliban leadership has two options which are to continue killing innocent people or to join the peace process."

However, he was optimistic about future, saying "it is expected that Mullah Hibat would choose the peace option."

Choosing peace could introduce the Taliban leader as a personality of peace and could also prevent his supporters from dying, he said.

Taliban should realize that they could not win the war and would face defeat, he declared.

The NATO official said the Afghan ground and air forces had improved during the past year and had many achievements.

By choosing offensive state, the Afghan forces could dismantle the plans of terrorists, he said, adding terrorists have been defeated once again in northern Afghanistan and now attention was being paid to southern provinces.

The Taliban have also no courage to fight face to face against Afghan security forces, he concluded.

18. Gulf News

Region lacks resources to fight hackers

Friday, 27 May 2016

Byline: Scott Shuey

Dubai - There may be a silver lining to the recent increase in cyber attacks in the Middle East, according to Wael Mohammad, the president and COO of digital security firm TrendMicro.

The obvious, although also worrisome, way to look at the recent attacks, such as the recent release of customers information following the hacking of Qatar National Bank, is that regional financial institutions are now viewed as both worth the effort and attention of potential hackers.

"I honest believe it's good news, because 10 years ago ... they used to use Middle Eastern sites as an examples of how they could penetrate and nobody was home. There was nothing to actually get," he said.

The fact that attacks are now taking place indicates a number of things for the Middle East, says Mohamed, who is based in Texas but was in Dubai on Wednesday.

"Number one is that there is something valuable to actually be taken, which means that digitalisation and online dependence is higher than it once was. That's important," he said.

However, the attacks also mean that there is now a substantial amount of computer talent in the Middle East, though most of it does not come with the practical experience or pedigree that most people in the computer industry would include on a CV. That's an issue not just in the Middle East but across emerging markets.

"This is the challenge and opportunity in this region. The skill and knowledge that exist that is not fully utilised is an opportunity," he said.

This opportunity exists across emerging markets, he said, but for it to be fully utilised, "institutions and mindsets need to change."

However, the growing rise in technology fluency is also being coupled with another kind of fluency -- fluency in Arabic. And while that too might sound like a good thing for the Arab world, it is instead translating into an increase in Arabic-language specific attacks.

Cyber attackers have used English, French or Russian as their primary language of attack. These attacks were not technical attacks, but email-based attacks (called phishing attacks) meant to trick a users into revealing their password or other information, which a hacker could use to access a system. Early attacks in Arabic were often so bad -- in terms of the language -- that they failed. Fluency in Arabic has now improved to the point that recipients are falling victim at a higher rate than before.

"Now there are bots that speak Arabic," Mohammad says. "[We are seeing] email that is designed in an Arabic context and all of sudden is fair more damaging that it ever was." Bots are third-party internet applications that can be used for a number of tasks, including simulating conversations.

This means that security company can no longer simply be software vendors in the Middle East, he says. Mohamed says sales of software in the Middle East have doubled over the past two years and will likely double again. Attacks in the Middle East have been growing, but despite the amount of raw talent available, there are a lack of resources, both for TrendMicro and customers in the region, to implement the security.

"I have a lot of customers who are saying 'give me the resources to do the work.' That's not scalable. I'm not in the business of providing professional services," he says.

This has created a vacuum of security resources that "is massive and needs to be filled eventually."

It World Canada
Canada should be prepared for "unprecedented" levels of cyber risk, warns ex-CSIS official
Thursday, 02 June 2016
Byline: Cindy Baker

If you think that $500 billion in worldwide cyber crime is a problem now, brace yourself. It's about to get even more intense, said speakers Tuesday at a panel discussion at the Tech Day on Parliament Hill, organized by TechConnex and Northof41.
"I've never seen it at this velocity and level of complexity in my 30 years in security," said Ray Boisvert, the president and CEO of I-Sec Integrated Strategies and a senior associate at communications firm Hill & Knowlton Strategies.

Boisvert should know. He's also the former assistant director for intelligence at the Canadian Security Intelligence Service (CSIS). He noted that technology trends are a contributing factor in the escalating level of cyber threats. The proliferation of devices, the Internet of Things (IoT), virtualization and the growth in data are overwhelming our defences, he said. As well, there are increasing opportunities for email cyber fraud based on information collected from social media.

Cyber Crime -- By the Numbers

Boisvert presented a current snapshot of the impact of cyber crime. He said that 600 million people have been affected, often through the theft of personal identity or a blackmail computer lockdown scheme. "It's a traumatic event that you never want to go through," he said.

For businesses, 74 per cent have been compromised by cyber events. The health care sector is heavily targeted, Boisvert said, with 81 cent of its executives admitting to a network breach.

The tech industry should pay attention to the fact that 90 per cent of executives say they can't read a cyber security report, he added. This needs to be addressed given that it can take an average of $1 million and five days to recover from a cyber event.

At its root, Boisvert said, "the advantage is in the hands of the attacker." Insider facilitation is a big problem, sometimes deliberate, but also by the unwitting employee who clicks on a suspicious link. However, the most significant threats are by organized crime groups. "It's a low-risk, high-yield approach. The Internet has been bountiful for them," he said.

Playbook Priorities

Prevention is the first priority to combat cyber threats, said Boisvert, given that about 80% of malware is low level and can be prevented from entering your network. It's also important to focus on early detection because the average dwell time is over 200 days, a long time for someone to be sitting on your network, he warned.

Panel members outlined three priority areas.

The skills shortage is an important issue, said Tyson Macaulay, chief security strategist and vice president of security Services at Fortinet. He pointed to the recent attacks reported by the global bank transfer co-operative, SWIFT, where hackers targeted banks in countries with acute skills shortages. Automated solutions could help fill that void, he noted.

We need to use data analytics to identify serious threats inside a network, said Patrick Patterson, President and CEO of Carillon Information Security. "If you look back at well known hacks," he said, "People were drowning in alerts. The question is to determine what's important." Analytics can be used, in real time, to sort through massive amounts of data to identify abnormal behaviour in the network.

Raising the bar in the use of credentials has to be a priority, said Grant Woodward, Public Safety and Defence Specialist at SAS. "We can make social engineering harder by eliminating the use of usernames and passwords in Canada," he said. Woodward suggested other approaches should be adopted, such as two-factor authentication, the U.S. standard (FIPS 201), and attribute-based access controls.

The Role of Government

The Government has been responding in a coordinated way, according to Erin O'Toole, the Conservative Member of Parliament for Durham. But, he stressed that "vital partnerships" will be a critical area for the new Government. "For Canadians, there is more impact on our lives if there are disruptions in our financial services or critical infrastructure," O'Toole said.

The Government also needs to examine recent regulatory changes in Europe and the U.S., said Patterson. Canada needs to ensure that it is keeping pace so that businesses are not put in a disadvantaged position.

While the rapid growth in cyber attacks is a serious threat, the panelists also noted that there are significant business opportunities for innovative approaches to deal with the problem. "All of us would agree that it will affect our future prosperity as a nation," said Boisvert.

Globe and Mail
Spy agency shared Canadians' data for years with allies
Thursday, 02 June 2016
Byline: Colin Freeze

A federal spy agency inadvertently shared logs of Canadians' phone calls and Internet exchanges with intelligence allies such as the United States for years, a newly disclosed report says.

The revelation that the Communications Security Establishment compromised Canadians' privacy while sharing clandestinely captured data appears in a confidential watchdog's report obtained by The Globe and Mail from court filings related to a lawsuit against the Canadian government.

The report said software that was supposed to remove identifying information on Canadians from material CSE captured during international surveillance operations had failed. This meant that Canada's intelligence allies received data that Canadian laws say they should not see.

The 2015 report puts in sharper focus the spy agency's struggles to protect Canadians from foreign threats while also safeguarding individual citizens' privacy. The problem was first revealed publicly in January by Defence Minister Harjit Sajjan and CSE officials.

The confidential report was written by Jean-Pierre Plouffe, a retired Quebec judge who heads the Office of the CSE Commissioner, the spy agency's watchdog agency.

In it, he suggests the unlawful seepage of Canadians' phone and Internet records to foreign intelligence agencies could date back to the mid-2000s, and that the overall amount of compromised material is unclear.

Given this, Mr. Plouffe is urging Parliament to pass laws spelling out how it wants the spy agency to function. "As CSE's collection posture has strengthened ... the volume of metadata collected has increased considerably," Mr. Plouffe writes in his 2015 report.

He urged federal politicians to give clearer direction on surveillance.

"Metadata" are logs of communications without the content of the conversation. The watchdog's report reveals that, during its international spying, CSE has been capturing phone logs and sharing them with allies since 2005. Internet logs have been shared since 2009.

In 2014, CSE suspended sharing both sorts of records when it realized its automated systems had failed to scrub out what it calls the "Canadian identifying information" that turned up in the wider mix. Mr. Plouffe, who has the last word on such matters, eventually ruled that although CSE's system failures were inadvertent, they violated the Privacy Act and National Defence Act.

CSE is part of the world's most powerful spying alliance. Since the 1940s, the "Five Eyes" - electronic-espionage agencies in the United States, the United Kingdom, Canada, Australia and New Zealand - have been working closely together. The collective's members cannot eavesdrop on their own citizens, but their governments have relaxed their rules covering telecommunications trails - metadata - in the hopes it could help the Five Eyes track al-Qaeda terrorists.

Metadata collected and shared on a massive, global scale can show intelligence analysts who is talking to who, even when the contents of the underlying conversations are unknown.

Parliament passed a law in 2001 giving CSE increased latitude to collect data, subject to orders from defence ministers that spell out what it can and cannot do. The Globe reported in 2013 that both Liberal and Conservative governments have since signed such metadata ministerial directives.

The 2015 watchdog's report reproduces one of these directives. "CSE may search any metadata acquired" to help track "a foreign individual, state organization, terrorist group, or other such entities," the directive says. It adds: "CSE will share metadata ... with international allies to maximize" surveillance capabilities, but "Canada's allies shall not be granted access to metadata known to be associated with Canadians located anywhere."

But CSE cannot guarantee it can avoid capturing Canadian telecommunications trails. On Wednesday, a director-general with the agency, Scott Millar, attested to this fact in a Federal Court proceeding related to the lawsuit. He said that while CSE does sometimes collect metadata on Canadians, this is a "very rare occurrence."

Just how CSE collects metadata is a state secret, but it is known that it is gathered in huge volumes indiscriminately.

In his 2015 report, Mr. Plouffe says CSE "metadata is acquired without having gone through a targeting selection process."

Only after the initial collection do CSE analysts seek to "minimize" privacy violations by scrubbing out Canadian identifying information, the report says.

The agency refers to this as "minimization."

The report reveals that CSE refers to the phone logs it collects as "Dialled Number Recognition" (DNR) metadata. The agency started sharing such material with Five Eyes allies in 2005, thinking it had devised ways to automatically strike out telling portions of any Canadian phone numbers that turned up.

Then, starting two years ago, CSE discovered that "DNR metadata was not being minimized properly," according to the watchdog report. Mr. Plouffe added: "CSE is unable to determine how many systems were impacted and for how long."

CSE calls the Internet logs it collects "Digital Network Intelligence" (DNI) metadata, and this material can consist of e-mail addresses and Internet protocol addresses that indicate who is communicating to who.

A scrubbing system was developed for that material as well - but this, too, failed. "DNI metadata was being shared with [Five Eyes] Second Parties ... with minimization applied to Canadian e-mail address fields, but no minimization applied to Canadian IP address fields," Mr. Plouffe writes.

He adds that "CSE was under the impression that minimization was taking place, when in fact it was not."

The spy agency suspended sharing when the problems were discovered in 2014, and apparently have not resumed it.

If CSE is to return to exchanging such information, the report said, the Liberal government will likely have to enshrine in law how it wants CSE to reconcile individual privacy and security imperatives.

"I am recommending to the Minister of National Defence that the National Defence Act be amended in order to clarify CSE's authority to collect, use, retain, share and disclose metadata," Mr. Plouffe wrote in a letter to the Minister of National Defence last fall.

Records show Mr. Sajjan has since replied to say he accepted recommendations - but he did not commit to introduce new laws or directives.

Chinese cyber spies hack Taiwan ruling party: security firm
Thursday, 02 June 2016

Beijing - Mainland hackers were likely to be behind an attack on the website of Taiwan's ruling party, a US-based security firm said Thursday, as the island warns of growing cyber threats.
Cross-strait relations have turned increasingly frosty since Taiwan's new president Tsai Ing-wen of the China-sceptic Democratic Progressive Party (DPP) won elections in January and took office last month, with Beijing wary the new government may seek independence.

Taiwan has been self-ruling since the two sides split in 1949 after a civil war -- but China still sees it as part of its territory.

The party's website came under attack in early April, redirecting visitors to a fake website, California-based FireEye said in a statement Thursday.

The tactic is one often used by Chinese hackers, it said.

Administrators fixed the problem the next day but the website was compromised again a few days later, suggesting the site is being monitored, according to the statement.

"FireEye believes this operation likely reflects continued efforts by China-based cyber espionage operators to collect intelligence related to the DPP as it moves Taiwan away from pro-mainland China policies," it said.

The government has raised concerns that its websites frequently fall prey to Chinese hackers.

Taiwan's Ministry of Transportation and Communication said in a report to a legislative committee last month that the scale of cyber attacks on Taiwan is "near warfare."

It added the most active hackers are from the mainland and had infiltrated the island's systems including defence, air traffic, and communication.

The defence ministry says it will establish a "cyber army", one of the policies put forward by Tsai during her presidential campaign.

A "Fourth Service" should be formed along with army, navy, and air force to protect "national digital territory," according to the DPP's proposal.

However, the DPP played down the findings of the new FireEye report and said it was not currently seeing "unusual hacking activities".

"The DPP has always put great importance on cyber safety," spokesman Wang Min-sheng told AFP.

Wang added that the party is not in contact with FireEye and that the security firm had been monitoring its website independently.

Wall Street Journal
Congress Opens Inquiry Into Cyberheist
Thursday, 02 June 2016
Byline: Kate Davidson

Washington - A congressional panel is seeking more details related to the $101 million cyberheist from the Bangladeshi central bank's account at the Federal Reserve Bank of New York earlier this year. The chairman of the House Committee on Science, Space and Technology has asked New York Fed officials to brief the committee on its handling of the security breach. It also requested documents related to the New York Fed's oversight of the secure interbank messaging system known as Swift, which the hackers used to submit fraudulent payment orders of nearly $1 billion.

The thieves spirited $101 million out of Bangladesh Bank's account in February before the requests raised red flags at the New York Fed.

Officials were able to stop payment on one of the fraudulent orders, but the bulk of the remaining $81 million ultimately ended up with at least one casino and two gambling-junket operators in the Philippines, according to the Philippines's Anti-Money Laundering Council.

"In light of the recent cyberattacks on our global financial systems, the committee believes it is imperative to receive information from the NY Fed about its response, its oversight of SWIFT, the status of the investigation and any remedial steps taken to address vulnerabilities," Chairman Lamar Smith (R., Texas) said in a May 31 letter to New York Fed President William Dudley. The committee is requesting the documents be turned over by June 14.

Mr. Smith isn't the first lawmaker to raise concerns about the breach.

Rep. Carolyn Maloney, a New York Democrat and member of the House Financial Services Committee, sent a letter in March asking for more information.

"What is especially thought-provoking here is that stops and recalls on these transfers weren't issued for days after initial doubts were raised," Ms. Maloney said in April.

The New York Fed has defended its procedures for fund transfers, which are intended to prevent dollars from being transferred to individuals or firms that have been placed under sanctions and "are not designed to protect our customers from an unauthorized transfer," Thomas Baxter, the bank's head lawyer, said in a letter to Ms. Maloney.

News of Mr. Smith's letter followed a Reuters report Wednesday on cybersecurity threats at the Federal Reserve in Washington.

Computers used by the central bank were breached more than 50 times from 2011 to 2015, according to cybersecurity reports issued by the Fed.

The security reports, obtained by Reuters through a Freedom of Information Act request and provided to The Wall Street Journal, didn't show who was behind the attacks, if funds were stolen or whether sensitive information was accessed.

The disclosures cover only those security breaches affecting the Fed's Board of Governors, as the Fed's regional reserve banks aren't subject to FOIA. Of the 310 security reports issued by the Fed, 140 disclosed hacking attempts, Reuters reported.

"As with other government agencies, the Federal Reserve is a target for cyberattacks," a Fed spokesman said in a statement on the Reuters report. "However, our security program and processes for detecting and countering attacks are robust and our critical operations have never been affected."

Wall Street Journal
China's Huawei Is Coy On Ties to Israeli Firm
Thursday, 02 June 2016
Byline: Orr Hirschauge

Tel Aviv - Huawei Technologies Co., the Chinese telecommunications firm that has barreled into emerging markets around the world, has been cautious about its footprint here.
For the past seven years, Huawei has been developing technologies, some potentially sensitive, through a locally registered company called Toga Networks Ltd., according to former and current employees of both companies.

At Toga, Israeli engineers are developing a range of software and equipment related to networking, storage and information security, including encryption, said former and current employees of the company. Toga is also developing tools that can help telecommunication providers examine data moving through their routers. This so-called deep-packet inspection technology is typically used to prioritize traffic, such as phone calls over emails, but it can also identify individuals who surf specific websites or use certain keywords in emails.

The work here comes against a backdrop of intense U.S. scrutiny over Israeli technology transfers to China, and concern that some products developed here could be used to eavesdrop on global internet and telecom users.

While Toga hasn't advertised its links to Huawei, it doesn't exactly hide the relationship. Several patents submitted by Huawei since 2013, some relating to the deep-packet inspection algorithms, have Toga employees listed as inventors, according to a former Toga employee and public patent records.

Also, Toga is identified as a unit of Huawei by Israeli government documents, Israeli officials, and current and former Toga employees.

"Toga Networks is a private company. It doesn't provide to the public any information concerning either its business activities or its connections with clients," Toga said in an emailed response.

Huawei said Toga Networks isn't a subsidiary of the company, but that it collaborates with research partners. "Huawei believes open innovation is the key to the development of the industry, so we cooperate with local partners to better leverage local talents and offer the most innovative and leading solutions to customers all over the world," a company spokesman said in an email.

The tech company rejected the idea of opening an official research center here because an Israeli arm was seen as limiting the company's business outreach to Arab countries, according to current and former employees.

Huawei's networking equipment has been effectively shut out of the U.S. market following a 2012 congressional report which cited concerns that it could be used for Chinese espionage. The company has disputed such claims.

Further, the increasing involvement of Chinese companies in the development of sensitive technology inside Israel has raised some concerns in U.S. security circles, according to a former Israeli official familiar with the matter. The U.S. Department of Defense declined to comment.

Several high-profile Chinese companies such as Alibaba Group Holding Ltd, Baidu Inc. and Xiaomi Corp. have built links with Israel's technology sector in recent years. The firms, over the years, have invested in Israel-based venture funds and startups.

Avi Hasson, the chief scientist at the Israeli Ministry of Economy, said that the ministry wants to encourage further involvement of Chinese entities in the local industry.

"We view favorably the influx of Chinese investments in the Israeli technology industry. Asian markets are part of the future of this industry, and it is almost impossible to sell in these markets without a local partner," Mr. Hasson said in an email.

The worries around the influx of "nontraditional investors" like the Chinese in Israel center on access to technologies that can be applied for military uses, says Oded Eran, a senior researcher fellow at Israel's Institute for National Security Studies and a former deputy director general of the Israeli Ministry of Foreign Affairs. Companies that employ veterans of technological units in the Israeli army, such as unit 8200 -- the country's equivalent of the National Security Agency -- are one point of access to such technologies, Mr. Oded said.

"These veterans go and work for commercial companies but there are no walls in their mind separating what they did in military service from what they do in civilian life," he added.

The U.S. and Israel have clashed over technology transfers to China before. In 2000, the U.S. stopped Israel from selling China an advanced airborne warning system called Phalcon, leading to a diplomatic rift between Israel and China. In 2004, the Pentagon stepped in again, attempting to block the return of several Israeli-made unmanned combat aerial vehicles China had sent to Israel for maintenance and possible upgrades.

Reuters
Fed records show dozens of cybersecurity breaches
Wednesday, 01 June 2016

Washington - The U.S. Federal Reserve detected more than 50 cyber breaches between 2011 and 2015, with several incidents described internally as "espionage," according to Fed records.
The central bank's staff suspected hackers or spies in many of the incidents, the records show. The Fed's computer systems play a critical role in global banking and hold confidential information on discussions about monetary policy that drives financial markets.

The cybersecurity reports, obtained by Reuters through a Freedom of Information Act request, were heavily redacted by Fed officials to keep secret the central bank's security procedures.

The Fed declined to comment, and the redacted records do not say who hacked the bank's systems or whether they accessed sensitive information or stole money.

"Hacking is a major threat to the stability of the financial system. This data shows why," said James Lewis, a cybersecurity expert at the Center for Strategic and International Studies, a Washington think tank. Lewis reviewed the files at the request of Reuters.

The records represent only a slice of all cyber attacks on the Fed because they include only cases involving the Washington- based Board of Governors, a federal agency that is subject to public records laws. Reuters did not have access to reports by local cybersecurity teams at the central bank's 12 privately owned regional branches.

The disclosure of breaches at the Fed comes at a time when cybersecurity at central banks worldwide is under scrutiny after hackers stole $81 million from a Bank Bangladesh account at the New York Fed.

Cyber thieves have targeted large financial institutions around the world, including America's largest bank JPMorgan, as well as smaller players like Ecuador's Banco del Austro and Vietnam's Tien Phong Bank.

Hacking attempts were cited in 140 of the 310 reports provided by the Fed's board. In some reports, the incidents were not classified in any way.

In eight information breaches between 2011 and 2013 - a time when the Fed's trading desk was buying massive amounts of bonds - Fed staff wrote that the cases involved "malicious code," referring to software used by hackers.

Four hacking incidents in 2012 were considered acts of "espionage," according to the records. Information was disclosed in at least two of those incidents, according to the records. In the other two incidents, the records did not indicate whether there was a breach.

In all, the Fed's national team of cybersecurity experts, which operates mostly out of New Jersey, identified 51 cases of "information disclosure" involving the Fed's board. Separate reports showed a local team at the board registered four such incidents.

The cases of information disclosure can refer to a range of ways unauthorized people see Fed information, from hacking attacks to Fed emails sent to the wrong recipients, according to two former Fed cybersecurity staffers who spoke on condition of anonymity.

The former employees said that cyber attacks on the Fed are about as common as at other large financial institutions.

It was unclear if the espionage incidents involved foreign governments, as has been suspected in some hacks of federal agencies. Beginning in 2014, for instance, hackers stole more than 21 million background check records from the federal Office of Personnel Management, and U.S. officials attributed the breach to the Chinese government, an accusation denied by Beijing.

TARGET FOR SPYING

Security analysts said foreign governments could stand to gain from inside Fed information. China and Russia, for instance, are major players in the $13.8 trillion federal debt market where Fed policy plays a big role in setting interest rates.

"Obviously that makes it a very clear (hacking) target for other nation states," said Ari Schwartz, a former top cybersecurity adviser at the White House who is now with the law firm Venable.

U.S. prosecutors in March accused hackers associated with Iran's government of attacking dozens of U.S. banks.

In the records obtained by Reuters, espionage might also refer to spying by private companies, or even individuals such British activist Lauri Love, who is accused of infiltrating a server at a regional Fed branch in October 2012. Love stole names, e-mail addresses, and phone numbers of Fed computer system users, according to a federal indictment.

The redacted reports obtained by Reuters do not mention Love or any other hacker by name.

The records point to breaches during a sensitive period for the Fed, which was ramping up aid for the struggling U.S. economy by buying massive quantities of U.S. government debt and mortgage-backed securities.

In 2010 and 2011, the Fed went on a $600 billion bond-buying spree that lowered interest rates and made bonds more expensive. It restarted purchases in September 2012 and expanded them up in December of that year.

The Fed cybersecurity records did not indicate whether hackers accessed sensitive information on the timing or amounts of bond purchases or used it for financial gain.

UP ALL NIGHT

The Fed's national cybersecurity team - the National Incident Response Team, or NIRT - created 263 of the incident reports obtained by Reuters.

NIRT operates in a fortress-like building in East Rutherford, New Jersey that also processes millions of dollars in cash everyday as part of the central bank's duty to keep the financial system running, according to the New York Fed's website. The unit provides support to the local cybersecurity teams at the Fed's Board and regional banks, which process more than $3 trillion in payments every day.

The NIRT handles "higher impact" cases, according to a 2013 report by the Board of Governor's Office of Inspector General.

One of the two former NIRT employees interviewed by Reuters described being on a team that once worked around the clock for five-straight days to patch software hackers had used to gain access to Fed systems in an attempt to obtain passwords. The former employee worked through several of those nights, taking naps at a desk in the office.

In that case, Fed security staff found no signs that sensitive information had been disclosed, the former employee said. Information about future interest rate policy discussions is isolated from other Fed networks and is more difficult for hackers to access, the former NIRT worker said.

But the Fed was under constant assault, much like any large company, the former employee said, and was "compromised frequently."

An internal watchdog has criticized the central bank for cybersecurity shortcomings. A 2015 audit by the Fed board's Office of Inspector General found the board was not adequately scanning databases for vulnerabilities or putting enough restrictions on system access.

"There is heightened risk of unauthorized disclosure and inappropriate use of sensitive board information," according to the audit released in November.

The Guardian (London)
Snooper's charter: Teresa May makes concessions
Wednesday, 01 June 2016
Byline: Alan Travis

London - The home secretary, Theresa May, has made further concessions on the snooper's charter, including on the key issue of privacy, before a Commons battle over the bill next week.
The concessions, intended to meet concerns raised by the parliamentary intelligence and security committee (ISC) as well as by Labour, Liberal Democrat and backbench Tory critics, include the introduction of a privacy clause designed to ensure that the new mass surveillance powers are not authorised in situations where less intrusive means could be used.

The two-day Commons report stage of the investigatory powers bill, which will extend the powers of the security services, is scheduled for Monday and Tuesday next week. It will be the last substantive piece of parliamentary business before the EU referendum in three weeks' time.

The home secretary's concessions also cover protection for journalists, the Wilson doctrine on shielding MPs from snooping, and the retention and use of "bulk personal datasets" such as medical records.

The ISC, chaired by the former Conservative attorney general Dominic Grieve, and parliament's joint human rights committee, chaired by the former Labour cabinet minister Harriet Harman, have also tabled amendments to the bill demanding much tougher safeguards preventing the powers from being abused.

The ISC in particular demanded that privacy protections should be made an overarching part of the bill.

The bill not only enshrines in law the bulk data collection and mass computer and phone-hacking operations carried out by GCHQ, which were revealed by the whistleblower Edward Snowden in 2013, but also extends the security services' powers to track everyone's web history by introducing internet connection records that can be stored for 12 months and that can be accessed by the police and security services.

The new Home Office concessions include:

. Privacy: a new clause that makes clear that warrants and other authorisations should not be granted where the information could reasonably be obtained by less intrusive means. The clause makes explicit the implicit privacy safeguards in the bill and puts "beyond doubt" that there will be severe penalties for those who deliberately misuse the powers.

. Protection for journalists: clarification that the judicial commissioner will be required to consider 'the overriding public interest' when authorising the use of communications data to identify a journalist's sources.

. Wilson doctrine: prime minister must give explicit approval for law enforcement agencies to hack into MPs' phones and computer as well as to access their communications data.

. Bulk personal datasets and medical records: the legal test needed to retain and examine these highly personal records is to be raised to "exceptional and compelling" cases only.

A Home Office spokesperson said: "We have always been clear that we will listen to the constructive views of politicians from all sides of the House to ensure the passage of this important bill. We have said the government will be bringing forward amendments at report stage and are willing to consider amendments that are in the interest of both improving the bill and of demonstrating the necessity of the powers it contains."

Labour has already secured from May a commitment to an independent review of the operational case for bulk personal data collection and hacking powers by Britain's watchdog on terrorism laws, David Anderson, and protection from surveillance for legitimate trade union activities.

However, Labour intends to press for further changes, including stronger safeguards in five areas: privacy, using internet connection records only in serious crime cases, toughening rules on the judicial authorisation of intercept warrants, stronger safeguards on the use of medical records and other bulk datasets, and protections for legal and journalistic confidentiality.

The Liberal Democrats, who could prove influential when the bill reaches the Lords, have tabled amendments that would remove "internet connection records" - tracking everyone's web use - from the bill and that would ensure that people who are the targets of unlawful surveillance are told what data of theirs has been accessed so they can seek redress.

The Liberal Democrats' home affairs spokesman, Alistair Carmichael, said the ISC told May to go away and rewrite the bill to include a dedicated section on privacy: "Instead she re-labelled the title 'General Protections' to 'General Privacy Protections', a one-word aesthetic addition that fools no one. That is why the Liberal Democrats will continue to fight, both in the Commons and Lords, for privacy to form the backbone of this legislation.

"Theresa May's concession allowing for an independent review into bulk powers is welcome but this goes nowhere near far enough. Too many of the proposals in the bill are vaguely drafted and disproportionate; for example, we are clear that proposals to collect and store everyone's web histories for 12 months has to go. We should be equipping our police and security services with the resources they need, not drowning them in data," he said.

Haaretz
Sirin Labs Unveils Smartphone With $14,000 Price Tag
Thursday, 02 June 2016
Byline: Eliran Rubin

Jerusalem - How much is your mobile privacy worth to you? If it's at least $14,000, Sirin Labs, the Switzerland-based startup backed by Israeli technology entrepreneur Moshe Hogeg, has the phone for you.
The company's Solarin smartphone, unveiled on Tuesday in London, comes in four models with a starting price of 9,500 pounds ($13,766) not including value-added tax. For now, it is available only at the company's store in London's Mayfair and at Harrods.

Inside a case made of "Black Carbon Leather with Titanium," the phone sports 2,500 components, including anti-cyberattack software supplied by the company Zimperium; encryption technology from KoolSpan, speeds of 450 megabits per second of downlink and up to 150 uplink speeds and a 23.8-megapixel camera.

Two years in the making at research and development offices in Lund, Sweden, and Tel Aviv, the phone is "aimed at the international business person who carries a lot of sensitive information but doesn't want to compromise on usability, quality or design," Sirin said.

Sirin Labs had been operating in stealth mode until a month ago, when Hogeg revealed that he and other investors, who include Kazakh businessman Kenges Rakishev and Chinese internet company Renren, had put $72 million into the company, which was formed three years ago.

"Cyber attacks are endemic across the globe. This trend is on the increase. Just one attack can severely harm reputations and finances. Solarin is pioneering new, uncompromising privacy measures to provide customers with greater confidence and the reassurance necessary to handle business-critical information," Tal Cohen, Sirin's CEO and cofounder, said in a statement.

Hogeg told the technology website TechCrunch that the phone's security features were so powerful that to prevent abuse by criminals and terrorists, it would only be sold to people who are identified with their passports. He said the company was preparing a list of countries that the phone won't be sold to.

The Solarin phone is being offered as an alternative to mass-market smartphones like the iPhone for business people who want to protect confidential information. After Apple's high-profile standoff with the U.S. government over encryption, Sirin Labs' timing for a highly secure alternative is good. In addition, the secure phone market has had no dominant player since Blackberry left in 2013.

Pajhwok Afghan News
MoI rejects Taliban's access to biometric system
Thursday, 02 June 2016
Byline: Ajmal Kakar

Kabul - The Ministry of Interior on Wednesday rejected as baseless claims that the Taliban had gained access to 'biometric' system to identify their opponents.
After recent kidnapping of passengers in northern Kunduz province, some reports emerged that the Taliban had gained access to the biometric system in the province and it was rumored the insurgents could identify security personnel travelling on highways especially on the Northern Highway.

A statement from the Ministry of Interior said after investigation into the reports, the MoI could satisfy people that there were no such things happening and all such claims were untrue.

The ministry said the rumours were just part of the enemy's propaganda and was a psychological war against the Afghan security forces.

It said the biometric system, the ministry is using to register identities of police members and access criminal records, was completely secure and under control.

The insurgents in no way could gain access to the system to identify police officials and no insurgent group was able to do so, the statement added.

However, Lt. Gen Shir Aziz Kamawal, the 808th Spinghar Zone commander in the northeast, told Pajhwok Afghan News that according to passengers freed from the Taliban, the group had gained access to the system and identified passengers using it.

The MoI in its statement said the biometric system has two parts --- central and local. The central part is located in Kabul, which can be only accessed by some specific officials and the other in provinces does not have any possible way to identify registered identities through it, the statement said.

"If the system in an emergency situation faces any kind of problem, the central biometric system deactivates all local systems in provinces after which it cannot be used or accessed," it added.

Fars News Agency
Iranian Defense Minister Unveils 3 New Technological Achievements
Thursday, 02 June 2016

Tehran - Iranian Defense Minister Brigadier General Hossein Dehqan unveiled three new home-made technological achievements in Tehran on Wednesday.
The achievements include 1-MW national GPS system, robotic vacuum plasma coating and vacuum arc remelting furnace which have all been designed and built by Iranian researchers at Malek-e Ashtar University.

Elaborating on the new achievements, General Dehqan said that the 1-MW national GPS system is a reliable substitute for the GPS which can be used in critical conditions.

Also, the robotic vacuum plasma coating is one of the laboratorial equipment used in different research processes, turbines and jet engines that has the capability to resist high temperatures, he added.

General Dehqan also said that the vacuum arc remelting furnace can be used for melting and purification of titanium, remelting the super alloys and special steels and can be operated both manually and automatically.

In a relevant development in February, General Dehqan unveiled 4 products of the defense industry and inaugurated the production line of a key medicine that fights the effects of chemical elements.

The new achievements included 'Pars Kam' detector system that tracks chemical substances dangerous to health, a new system that can detect explosives and drugs, anti-strike and explosion-proof polymer coatings, a new generation of NBC protective clothes based on Travagzin membranes, as well as the production line of Obidoxime chloride medicine that fixes the effects of chemical substances on the body.

Speaking to reporters, Dehqan said the defense ministry will continue to design, invent and produce modern equipment and products for protection of its armed forces.

Also in February, the defense ministry had also unveiled 7 national geographic projects.

The projects included a remote defense lab - national spectral sensing, first unmanned smart hydrography Fajr 1 (Dawn 1), coastal development of Makran, production line of digital marine maps, digital geomorphology maps, magnetic marine measuring systems, climate database, and geographic data production line using drone images.

Minister Dehqan said, "The Fajr 1 hydrography is a remote control system, able to transmit data and image, GPS, measure depths, advance multibeam systems, and side scan sonar and radar data."

On the applications of digital maps of geomorphology system, he said they can be used in scientific and research projects, as well as in geography, environment, construction, development, agriculture, defense logistics, civil defense, and military affairs.

According to Dehqan, the database on climate will be used for military and defense purposes, including in tarmacs, military drills, and troop deployments.

China takes note of media reports that Huawei faces U.S. probe on N. Korea exports
Friday, 03 June 2016

Beijing - China's foreign ministry said Friday that it took note of U.S. media reports that Huawei Technologies Co., a Chinese telecom equipment maker, is facing a U.S. probe over its exports to North Korea, Cuba, Iran and Syria.
The U.S. Department of Commerce has ordered Huawei's U.S. units to clarify whether the Chinese company exported goods containing American technology to the rogue nations, The New York Times reported.

"I have noted relevant reports," China's foreign ministry spokeswoman Hua Chunying told reporters.

Hua did not elaborate further, citing Huawei's statement, which was reported by U.S. media, that the Chinese company has "abided by local laws and regulations."

The U.S. media reports came days before U.S. Secretary of State John Kerry and Treasury Secretary Jacob Lew arrive in Beijing for annual meetings on strategic and economic issues with senior Chinese officials.

Sputnik
Le Canada a partagé des données sur ses citoyens avec ses alliés
Thursday, 02 June 2016
Byline: Journaliste maison

Ottawa - Selon un rapport de 2015 sur la protection des données personnelles au Canada, les services secrets canadiens ont créé un risque de divulgation de données personnelles des citoyens canadiens dans le cadre de leur coopération avec les services secrets américains, britanniques, australiens et néo-zélandais.
Le Centre de la sécurité des télécommunications (CST), un service de renseignement canadien, a fourni des métadonnées sur les entretiens téléphoniques et les messages en ligne des Canadiens à des services de renseignement étrangers depuis le début des années 2000, a annoncé le journal canadien The Globe and Mail.

Les logiciels du CST, chargés de supprimer automatiquement les informations d'identification obtenues dans le cadre d'opérations de renseignement internationales, n'arrivaient pas à accomplir leur mission, ressort-il d'un rapport de Jean-Pierre Plouffe, commissaire du CST cité par le journal.

Cela signifie que des services secrets étrangers ont reçu ces informations en violation des lois canadiennes sur la défense nationale et sur la protection de la vie privée. Le nombre précis des métadonnées ainsi transférées reste inconnu, selon M.Plouffe.

Le commissaire a appelé le parlement canadien à adopter des lois réglementant les devoirs des services secrets dans ce domaine et à mieux définir les mesures de contrôle puisque les services de renseignement avaient récemment intensifié la collecte d'informations sensibles.

Les métadonnées servent à décrire d'autres données sans préciser leur contenu.

Selon le rapport, le CST partage des métadonnées sur les entretiens téléphoniques avec ses alliés étrangers depuis 2005 et sur les adresses électroniques et adresses IP depuis 2009. Le transfert des métadonnées a été suspendu en 2014, après que le CST a appris que les systèmes automatiques ne supprimaient pas toutes "les informations d'identification canadiennes".

Le CSE, qui fait partie d'une grande alliance de renseignement surnommée "Five eyes" ("les cinq yeux"), collabore avec la NSA américaine, le GCHQ britannique, l'ASD australien et le GCSB néo-zélandais depuis les années 1940.

Il a décidé d'espionner les citoyens canadiens dans l'espoir de traquer les terroristes d'Al-Qaïda en 2011. Dans cette optique, le parlement canadien a adopté en 2011 une loi modifiant les normes de collecte des métadonnées et le gouvernement a adopté un règlement permettant au CST de collecter des métadonnées pour surveiller des ressortissants étrangers, des organisations publiques, des groupes terroristes et d'autres structures.

Un responsable du CSE, Scott Millar, a reconnu mercredi que le CST ne pouvait pas éviter la collecte de données d'identification canadiennes, mais qu'il ne le faisait pas souvent.

Selon la loi, le CST partage ses métadonnées avec ses alliés internationaux pour élargir le potentiel des services secrets, mais les alliés du Canada ne peuvent pas obtenir les informations concernant les Canadiens où qu'ils se trouvent.

Palestinian Sentenced to Year in Prison for 'Facebook Incitement'
Friday, 03 June 2016
Byline: Jack Khoury

Jerusalem - A Bethlehem resident was sentenced Thursday to one year in prison after he was convicted of incitement in his Facebook posts.
Kusai Issa, 22, posted messages encouraging and supporting terror activities, according to the charge sheet presented against him at the Ofer military court.

The posts were made on October 4-8, at the beginning of the violence wave, under the name "Shahid [martyr] in waiting," according to the charges.

In one case Issa was charged for posting a photo of one of the assailants, which garnered praise from his Facebook friends. The next day he put up a clip captioned: "The clip is more than amazing and shows how a freedom fighter kills four Zionist soldiers with a knife," according to the indictment.

On October 7 Issa is charged with posting: "The youngsters confronting the occupation, put your shirts under your trousers because the mista'arvim [members of IDF counterterrorism units dressed as Palestinians] put it outside their trousers to hide the gun - post this and defend our nation's youngsters."

Issa was arrested last October and has been in custody since. His verdict was handed down as part of a plea bargain, under which he is also required to pay a 2,000-shekel fine.

Issa's attorney, Mohammed Shahin of the Palestinian Prisoners Club, said the military prosecution presented his various posts and said they won much support and were shared by many.

Shahin said the prosecution first demanded a 15-month prison term, among other things because Issa's posts had 18,000 followers and therefore, according to the prosecution, his influence was great.

Shahin said these offenses carry a sentence of eight months to two years, according to the posts' circulation.

On Thursday morning police arrested Bassam Safadi, an Arab journalist from the north of the country and an Iranian television reporter, on suspicion of publishing "support for a terrorist organization and incitement to violence or terror." The Nazareth Magistrate's Court extended his custody to Sunday.

The Iranian Al-Alam channel that Safadi, 43, works for reported his arrest and claimed he had broadcast numerous reports about Israel's conduct in the Golan Heights, including what he called "gas stealing from the Syrian Golan."

Safadi's wife said police and troops came to their home late at night and arrested her husband, confiscating a large amount of equipment, including telephones.

Times of Israel
After slew of cyber-strikes, BDS movement points finger at Israel
Friday, 03 June 2016

Jerusalem - The international movement calling for a boycott against Israel said Thursday its website was repeatedly attacked earlier this year, and raised suspicions that Israel was behind the attacks.

The BDS (boycott, divestment and sanctions) movement released a report Thursday showing that its main website suffered six attacks in February and March. The denial of service attacks, which work by flooding a target website with bogus traffic, knocked out the BDS website for several hours at a time.

The report, compiled by nonprofit online security service eQualit.ie, said the attacks had a level of "sophistication and commitment" it normally does not see. It also noted that an unidentified Israeli human rights group had been attacked at the same time, indicating there was a "common adversary."

Assigning responsibility for cyber-attacks is notoriously difficult and the report didn't speculate on who might be behind the rogue traffic.

In a statement, the BDS movement said the "advanced technology used in the attacks and the size of the botnets involved may show that Israel was directly involved" but it offered no hard evidence.

Israeli cyber- security expert Gilad Yoshi said such attacks do not cause serious damage, adding it was unlikely a government was behind them. "These are not high- level attacks," said Yoshi, an expert at the electronic defense training company CyberGym.

BDS calls for boycotts, sanctions and divestment from Israel in what it calls a nonviolent struggle against occupation. Israel says BDS's goal is to destroy the country, and it has identified the movement as a serious threat.

Jerusalem has earmarked funds for Israeli tech companies for digital initiatives aimed at gathering intelligence on activist groups and countering their efforts.

Initiatives are largely being kept covert. Participants at one recent invite-only forum, held on the sidelines of a cyber technology conference, repeatedly stood up to remind people that journalists were in the room.

Israel's Ministry of Strategic Affairs, which is spearheading the government's battle against BDS, was reviewing Thursday's report and had no immediate comment.

Khaleej Times
Cybersecurity top priority of UAE government
Friday, 03 June 2016
Byline: Sandhya D'Mello

Dubai - What is the point in feeling safe when your house is locked but your window is open? Or is it safe when you locked the house and slipped the key under the doormat? Or can you outsmart hackers by simply having a very predictable password - 123456 - to your device controlled security?

These anecdotes will make one ponder that nowadays when we are constantly hooked in cyberworld, security not only becomes prime concern but inevitable to track best solutions to live safe and that is exactly the top priority of the UAE government towards its residents.

"The UAE is extremely conscious about the cybersecurity being offered to its residents as it globally evolves to be among the top smart cities in the world," Faisal Al Bannai, chief executive officer of DarkMatter told Khaleej Times in an exclusive interview.

DarkMatter is a UAE headquartered company that is transforming the cybersecurity landscape by providing a complete range of state-of-the- art services and solutions to government and commercial clients. Its end-to- end expertise extends to: governance, risk and compliance; cyber network defence; managed security services; secure communications; infrastructure and system integration; smart solutions; agile and innovative.

"Cybersecurity needs to be viewed as collective measure at corporate levels as companies not only need to invest more but invest in a smart way so as to get maximum benefit to ensure they stay protected. Higher connectivity only means higher vulnerability and hence companies need to be extra prudent as to where they are investing in terms of boosting their safety."

Most employees use their devices for their personal use and the same is used for their corporate needs giving rise to massive vulnerability issues.

"Cybersecurity now stands at the centre of further progress of the modern, electronic-based global economy. Pro-activity and a holistic approach to cybersecurity has never been more important as it is critical now," added Al Bannai. "Buying few pieces of hardware and firewalls means nothing, its like staying in home safely with doors open."

Cybersecurity is not only a local but a global concern and in a day where we all need to stay connected it makes the world shrink. The security needs in US may not differ much from any other developed or developing country the issues remain more or less same.

The company's CEO strongly recommends that security needs to cover end to end points covering policies, hardware to monitoring and implementation of the solutions and many entities are yet on learning curve.

The cybersecurity is dominated by large entities either US or Europe headquartered and this made it inevitable for DarkMatter to not only set up its operations here but bring global pool of talent to UAE headquarters and position itself as global player.

"We are currently developing our own IP, product development and research and development centres that are already developing products for next generation which will be out by 2017. The aim is to support the vision of His Highness Shaikh Mohammed bin Rashid Al Maktoum, Vice-President and Prime

Minister of the UAE and Ruler of Dubai, to build the nation which is known for innovation and the one which can develop its own IP - Internet Protocol.

Currently with 150 extremely talented and specialised staff serve the company and by the end of the year this number can be seen reaching 600. The company will launch products in first-half of 2017, which will see technologies, patents, IP developed from the UAE and competing in global markets. The company is all set to announce series of peer-to-peer partnerships in current and next year targeting over 300 per cent growth in 2016," said Al Bannai.

The regional network security spend in a GCC-wide sector set to grow from $340 million to $1 billion by 2018, according to a Frost & Sullivan.

The international cybersecurity firm headquartered in the UAE, has found that 48 per cent of respondents to its DarkMatter Cyber Security Poll said their organisations do not have a senior management executive assigned to oversee cybersecurity, while 46 per cent of respondents said their organisations did not have a board-level representative responsible for cybersecurity.

The statistics are extracted from a poll conducted by DarkMatter during the Gulf Information Security Expo & Conference 2016 held in Dubai, at which the company was the Cyber Security Innovation Partner. DarkMatter was able to poll the answers of over 200 information and communication technology visitors present at the event, with the aim of the exercise being to identify attitudes held by enlightened ICT professionals towards the role of cybersecurity in modern, highly digitised economies, and the state of their organisations' cyber threat resilience.

The poll identified that 23 per cent of respondents believe that their organisations have been victim to an internal cybersecurity breach, while 32 per cent believe their organisations have fallen victim to an external attack.

This suggests external threats pose a greater threat to organisations' digital assets than internal ones, with a further poll result indicating 46 per cent of respondents believe cybersecurity breaches are most often the result of human factors.

Saudi Gazette
Al-Watan newspaper confirms website hacked
Friday, 03 June 2016
Byline: Staff Report

Abha - Al-Watan newspaper confirmed that its website had been hacked and false statements attributed to Crown Prince Muhammad Bin Naif, deputy premier and minister of interior, were posted on the website, Saudi Press Agency said.

In a statement, the newspaper said the hacker posted false statements, which he attributed to the Crown Prince. These statements are baseless and untrue. The daily stressed that the reader would not be deceived by such lies and fabricated statements, as the daily relies for its official news on what is transmitted by the official Saudi Press Agency (SPA).

The website was hacked on Thursday (June 2) at 9.20 a.m. by a hostile group from outside the Kingdom. They were able to control the website for some time. During this period, they were able to publish fabricated stories including statements attributed to Crown Prince Muhammad Bin Naif on Decisive Storm. Thanks to Allah, specialists in the newspaper were able to restore the website and begin investigations in coordination with the authorities concerned.

Al-Watan said it will publish full details of this crime, aside from what it mentioned on the social media about the hacking, when it occurred and on the false stories posted on the website.

Al-Watan newspaper said its constant stand towards the issues of the region, its full support for the state's policy and exposing those who are lying in wait to undermine the Kingdom's security have aroused the anger of those who harbor hatred against the Kingdom and are the enemies of the nation.

Therefore, they tried to hack the newspaper's website. This will only increase the determination of the daily to defend the security of the nation and citizen and expose the external conspiracies aimed at shaking the security of the Kingdom and the whole region.

Canadian Press
'Loss of faith' from spy allies possible if Canada proceeds with court disclosure: CSE official
Friday, 03 June 2016
Byline: Jim Bronskill

Ottawa - Close allies will curb or even halt the flow of intelligence to the Communications Security Establishment if the electronic spy agency is forced to spill its closely guarded secrets in open court, argues a senior CSE official.
In turn, that could dry up the flow of "quality information necessary to ensure the safety and protection of Canadians and Canadian interests," says Scott Millar, director general of strategic policy and planning at CSE.

Millar's warning comes in an affidavit filed in a legal tug-of-war between the federal government and a civil liberties watchdog over what CSE must disclose in court.

The British Columbia Civil Liberties Association is suing the national surveillance agency, claiming it breaches the constitutional rights of Canadians by intercepting their private communications.

The organization filed the lawsuit almost three years ago in the Supreme Court of British Columbia. But an initial phase of the legal saga played out this week in Federal Court in Ottawa with cross-examination of witnesses over disclosure of federal records in the broader case.

The Ottawa-based CSE uses highly advanced technology to intercept, sort and analyze foreign communications for morsels of intelligence interest to the federal government. It is a member of the Five Eyes intelligence alliance that also includes the United States, Britain, Australia and New Zealand.

A federal watchdog declared earlier this year that the spy agency broke privacy laws by sharing information about Canadians with foreign partners.

Certain types of metadata containing Canadian identity information were not being properly "minimized" - stripped of potentially revealing details - before being shared with the CSE's four key foreign partners.

Metadata is information associated with a communication - such as a telephone number or email address - but not the message itself. Still, privacy advocates argue it can be highly revealing.

CSE's activities are shrouded in secrecy, says Grace Pastine, the civil liberties association's litigation director.

"CSE is required to have policies in place to protect the privacy of Canadians, but it has not provided the details of those policies to Canadians," she said in a statement. "We're calling on the federal government to state clearly who it is watching, what is being collected, what is being shared with foreign governments and how it is handling Canadians' private communications and information."

In his affidavit, Millar says if CSE is forced to reveal sensitive material provided to it by a Five Eyes agency, or related to the alliance's processes, it is very likely to be damaging.

"Damaging trust and respect through disclosure of information against the expressed wishes of one or more of our Five Eyes partners would have a detrimental effect on future collaborative efforts, consequently harming not only the interests of Canada, but also those of our closest partners."

The federal Liberals have expressed concerns about CSE, committing during the election campaign to limit the agency's power by requiring a warrant to engage in the surveillance of Canadians, the civil liberties association noted.

However, to date, the government continues to oppose the lawsuit.

Globe and Mail Online
The 'top secret' surveillance directives

Friday, 03 June 2016

Ottawa - In 2013, the British Columbia Civil Liberties Association sued the federal government, alleging that a Canadian spy agency's indiscriminate surveillance violated citizens' constitutional rights against illegal search and seizure.
While that allegation is unproven, the BCCLA has been forcing into the public domain disclosures from Communications Security Establishment, the highly secretive "signals intelligence" agency conducting such surveillance. But now, the federal government is fighting to move the case behind closed doors.

To get a sense of what's at stake, swipe back and forth on the following document, known as the CSE "metadata ministerial directive." This 2011 executive order effectively gave a legal green light to CSE surveillance.

The version on the left is what was released to The Globe following an Access to Information request. The version on right is a much more illuminating document, disclosed in court filings as part of the BCCLA lawsuit.

Jakarta Post
Cyberattacks in Indonesia rising at alarming rate
Friday, 03 June 2016
Byline: News Desk

Jakarta - Indonesia is in a cyberattack emergency amid a growing number of attacks over the past few years on account of a lack of cybersecurity, officials said on Friday.
Cyberattacks in Indonesia rose 33 per cent in 2015 from the previous year, Coordinating Political, Legal and Security Affairs Minister Luhut B. Pandjaitan said. From the figure, 54.5 per cent of the attacks were aimed at e-commerce-related websites, he said, adding that most of the attacks caused the systems to stop working.

"Indonesia experiences many cyberattacks every day and we don't have coordinated cyberdefence yet," he said in his office as reported by Antara news agency.

The government is setting up a National Cyber Agency to tackle cyber-related issues and also as part of its national policy on information technology defence.

National cyberspace desk head at the Office of the Coordinating Political, Legal and Security Affairs Minister, Agus Barnas, said the plan for the agency establishment had been initiated in January last year during the tenure of former coordinating minister Tedjo Edhy Wibowo.

However, there is detailed plan in place yet on when the National Cyber Agency will be officiated, Agus said.

"Various issues have been raised related to whether we need the new agency," he said without giving further details.

Indonesia is ranked second among countries where cyberattacks are launched and is the most prone to cyberattacks, according to data from the office of the coordinating minister.

"The most alarming fact is that in 2015 there was a fourfold increase in cybercrimes from 2014. The cybercrimes did not come from overseas, [the attacks] came from Indonesia with also domestic targets," Agus said as quoted by Antara.

Furthermore, Bank Indonesia also recorded an increase in cybercrimes, in the form of network misuse, with a rise of 66.7 per cent in 2015. The network misuse in financial transaction crimes were aimed at stealing financial data as well as passwords for logins, Agus said.

There were also cases of financial data manipulation, especially related to electronic transactions and the use of electronic payment systems, he added.

The office of the coordinating minister's cyberspace desk has conducted a thorough study from 2013 to assess the technical, legal and institutional sectors of cybercrimes.

The desk has also mapped the sectors and the authorities of government offices in managing cyber-related issues, which include cyberdefence, cybercrime, cyberinteligence, cybersecurity, cyberresilience and cyberdiplomacy.

New York Times
U.S. Subpoenas Huawei Over Its Dealings in Iran and North Korea
Friday, 03 June 2016
Byline: Paul Mozur

Hong Kong - Huawei Technologies has become China's most successful international technology company, in part by tapping markets as varied as Britain, India and Kenya.
But it also moved into markets like Syria, where American officials have imposed limits on sales of technology that could be used to commit human rights abuses, and into Iran, where sanctions have only recently been eased. And its presence in such countries is now coming under greater scrutiny.

The United States Commerce Department is demanding that the company, based in the south China city of Shenzhen, turn over all information regarding the export or re-export of American technology to Cuba, Iran, North Korea, Sudan and Syria, according to a subpoena sent to Huawei and viewed by The New York Times. The subpoena is part of an investigation into whether Huawei broke United States export controls.

Sent to Huawei's American headquarters in the Dallas suburb of Plano, the subpoena called for Huawei to turn over information related to shipments to those countries over the past five years. It also sought evidence of shipments to the countries indirectly through front or shell companies. The subpoena directed company officials to testify last month in Irving, Tex., or to provide information before then; it was not clear whether the meeting took place.

Huawei has not been accused of wrongdoing. In a statement, the company said it was committed to complying with laws and regulations where it operated. The document, which was issued by the Commerce Department office that investigates export violations, is an administrative subpoena, meaning it does not indicate a criminal investigation.

Still, the scrutiny over Huawei's dealings with those countries is emblematic of growing discord between the United States and China over control of global communications technology. It also illustrates how technology companies from both countries have been pulled into the high-stakes geopolitical contest over cybersecurity and the global management of the internet.

If the investigation finds that Huawei was acting counter to United States national security or foreign policy interests, it could limit the company's access to crucial American-made components and other tech products. Given Huawei's size and reach, that could affect the development of cellular networks and other large-scale technology infrastructure projects across the world.

"We do not comment with regard to ongoing investigations," a Commerce Department spokesman said.

The subpoena was issued after the United States briefly blocked in March sales of American technology to Huawei's smaller Chinese rival, ZTE, over similar concerns. As part of their move against ZTE, American officials released internal ZTE documents that showed the Chinese company used a rival's business efforts in those countries as a model. While the rival was not named in the documents, its description matched Huawei.

With the new investigation into Huawei, the United States is going after a much larger target. In 2014, Huawei reported revenue of about $60 billion, about four times that of ZTE. Depending on the measure, it ranks with Ericsson of Sweden as the world's largest supplier of the base stations and other equipment that make mobile telecommunications systems run.

Though the subpoena did not indicate whether any actions would be taken against Huawei, any major United States step to block the sales of American tech equipment to Huawei would have major implications for telecom networks across the world. Many of Huawei's products use American components or work with American technology.

Huawei has long benefited from access to easy credit from China's state-run lenders as it has expanded into areas where China seeks influence. But the company has drawn skepticism in the United States,

where officials have put an effective block on selling its telecom infrastructure equipment. China has used the move as a justification to push back against the market dominance of American companies like Cisco, IBM and Qualcomm in China.

Disclosures by the former American intelligence contractor Edward J. Snowden revealed that as the United States publicly raised concerns about the security of Huawei products, the United States National Security Agency was busy working to tunnel its own backdoor access into Huawei equipment and to snoop on Huawei's communications to look for links to the Chinese military.

Huawei has not shied from agreements that could draw criticism. In September, it signed a deal with Syria's Communications and Technology Ministry to help the country develop its communications networks.

Huawei's business in Iran has fallen under American criticism in the past. In 2011, Huawei said in a statement that it would voluntarily restrict the growth of its business in Iran. A year later, six American lawmakers wrote a letter to the State Department, calling for an investigation into whether Huawei was violating sanctions on Iran. Recently, the Congressional Research Service released a report that said that companies like Huawei appeared to have fulfilled pledges not to sell technology for blocking telecommunications in 2014.

Computer Weekly
MPs' private emails are routinely accessed by GCHQ
Thursday, 02 June 2016
Byline: Duncan Campbell, Bill Goodwin

London - GCHQ and the US National Security Agency (NSA) have access to intercepted emails sent and received by all members of the UK Parliament and peers, including with their constituents, a Computer Weekly investigation has established.
The intelligence agency in Cheltenham has been able to harvest traffic details of all parliamentary emails, including details of the sender, recipient and subject matter, for at least three years. As a result, details of private email correspondence between MPs and constituents are being collected by GCHQ as a matter of routine.

GCHQ documents classified above top secret, released by NSA whistleblower Edward Snowden, also reveal that the spy agency has the capability to scan the content of parliamentary emails for "keywords" through an established cyber defence network that is connected to commercial software used to filter spam emails from MPs' inboxes.

The disclosures, which come as the House of Commons prepares for the Third Reading of the government's controversial Investigatory Powers Bill on Monday 6 June, raise new questions over the sweeping powers to be granted in the bill to police and the security services.

The controversial decision by Parliament to replace its internal email and desktop office software with Microsoft's Office 365 service in 2014, means that parliamentary data and documents constantly pass in and out of the UK to Microsoft's datacentres in Dublin and the Netherlands, across the backbone of the internet.

Because files and emails leave the UK's borders in this way, they are automatically accessible to GCHQ's bulk interception system, Tempora. According to previously published Snowden documents, Tempora uses "probes" on commercial optical fibre cables crossing the Irish Sea and English Channel to harvest data.

Under existing law, GCHQ is permitted automatically to store datasets containing details of the senders, recipients and headings of all emails in and out of the UK, including internal UK-to-UK messages.

Computer Weekly has carried out a forensic analysis of hundreds of emails sent to the magazine or the writers from parliamentary email addresses, using "header" information within the emails to trace the route of the emails.

The study showed that most of the mail messages (65%) were routed internationally, through Dublin and the Netherlands. About one-third were relayed by Microsoft's new London datacentre. Cloud providers, such as Microsoft, use load-sharing procedures to distribute emails and data to more than one datacentre.

Every message also contained references to having been passed through clusters of scanning computers connected to GCHQ and located in the UK, France and Germany.

The NSA's Prism system offers access to all parliamentary documents and email through Microsoft Office 365 software, as a result of secret directives given to Microsoft under controversial US 2008 surveillance laws. The directives were implemented at the same time as Microsoft was selling its cloud system, Office 365, to the Houses of Parliament.

Since concerns were raised about the NSA's ability to access data stored by US technology companies, Microsoft has been rushing to build two new UK datacentres.

MPs' communications have been partially protected from interception for over 40 years under the "Wilson Doctrine", introduced by the former prime minister Harold Wilson in 1968. But this offered no protection to communications that leave the UK's borders, which are subject to automatic bulk collection by GCHQ.

"The House of Commons administration has serious questions to answer," according to former Home Office minister and Conservative MP David Davis. "On whose authority was 'consent' granted to view

members' emails? How did they manage to obtain that consent from every one of the 650 members whose constituents' confidentiality is affected?

"The government too has questions to answer as to why it did not explain this when asked on many occasions about the effect of the Wilson Doctrine," he added.

"The government should also make it clear to parliament the extent to which scanning of all mail by a US-controlled company has made Parliamentary communications vulnerable to agencies of a foreign power, namely the American NSA."

Labour deputy leader Tom Watson MP told Computer Weekly: "This will shock many of my parliamentary colleagues and provides a further illustration of why it is right for the government to give additional protections in law to MPs, lawyers and journalists. Theresa May has the opportunity to do this during the passage of the IP Bill in Parliament."

"There is no doubt that MPs, by virtue of their work, are more likely to be targeted by the UK's enemies. It is understandable that our security services want to takes steps to protect them, but any and all measures they introduce must be based on consent," he added.

SNP spokesperson Gavin Newlands MP said: "The SNP share the concerns that have been expressed over the partial removal of protection offered to privileged correspondence. It is of the upmost importance to any modern democracy that parliamentarians are able to communicate with constituents and advisers in complete confidence."

The MP's comments came as the home secretary, Theresa May, made last-minute concessions on the Investigatory Powers Bill to strengthen the Wilson Doctrine.

Under revisions announced on 1 June, the prime minister must in future give explicit approval for law enforcement agencies to hack into MP's computers and phones or to access their communications data.

Computer Weekly's investigation also confirmed that MPs' incoming and outgoing emails are automatically scanned through a network run by MessageLabs, a subsidiary of another US corporation, Symantec, which has been contracted by Parliament to provide services including spam filtering and malware detection.

MessageLabs provides GCHQ with direct access to parliamentary emails, through a secret cyber security network called Haruspex, according to GCHQ's "Cyber Defence Operations" legal policy instructions disclosed by Edward Snowden. The scanning system has been in operation for at least a decade. The documents reveal that Haruspex has been extended beyond "the detection, analysis and prevention of network-based attacks" against government computer systems, to allow it to be used to report other activities, provided they are in the interests of "national security" - a concept the government has refused to define.

Members of the Scottish National Party and Labour Party, who have scrutinised the Investigatory Powers Bill, have criticised the government for misusing "national security" to justify surveillance operations against trade unionists and critics of the police.

The MessageLabs scanning system, used on all emails to and from Parliament, can be programmed to detect keywords as well as to look for malicious attachments or spam. MPs and peers have not been told about the MessageLabs system, nor specifically asked for permission for their emails to be scanned in this way.

Computer Weekly put a series of questions to Symantec, the US corporation that supplies the MessageLabs service, about the role of MessageLabs in Parliament and its links to Haruspex. A spokesperson said: "Symantec has legal non-disclosure agreements with all of our customers and, as a result, cannot discuss specific cases."

Parliament began the path to an updated IT system that ultimately left MPs' emails and documents exposed to greater risks of surveillance from the UK and US intelligence services in May 2013.

Joan Miller, then the director of Parliamentary ICT (PICT), told the House of Lords management board: "Office 365 had a slightly higher risk relating to data sovereignty, but Microsoft's and the House's lawyers...felt that the chance of the risk materialising was low."

Less than a month later the Guardian revealed the Snowden document leak and the existence of the NSA's Prism programme, which requires US companies, including Microsoft, to build systems to allow the NSA and the FBI to access, on-demand, their customers' messages and files, including documents held in cloud datacentres.

Within a week, Miller told Parliament's management board that "PICT had reviewed its advice on data sovereignty and cloud computing following news stories about PRISM and was content that the risk was unchanged."

"We didn't think there was no risk, we thought it was a low risk [in 2013]," she told Computer Weekly. Asked if "UK parliamentary data may end up being requisitioned by the NSA", she said: "We did consider that, yes."

Miller, who retired as director of parliamentary IT in 2014, told Computer Weekly that Microsoft claimed to have doubts over the legality of the secret orders issued by the US government to obtain data under Prism and would be prepared to challenge it in court.

Microsoft is currently fighting a US federal court order to hand over customer email data stored in its Dublin datacentre in connection with an investigation into drugs trafficking. "It is taking legal action

against the US government, after being served 2,576 secret legal demands in a year, effectively silencing Microsoft from speaking to customers about warrants or other legal processes affecting their data."

Microsoft's president and chief legal officer, Brad Smith, visited Parliament in person to offer reassurances over the sovereignty of parliamentary data, as negotiations over Office 365 were underway, Miller revealed.

In 2014, then leader of the House of Commons William Hague was forced to reassure MPs about the security of their emails after an MP raised concerns that US authorities could gain access to Microsoft's European datacentres.

Miller said she also received reassurances that GCHQ would not abuse its access to monitor MPs' communications, which might include emails to MPs from constituents passing on sensitive information or blowing the whistle on wrong-doing or corruption.

"GCHQ is quite clear, every time I have spoken to them, that they follow the law. It would not be lawful for them to look at those emails. That sounds a bit naive, I don't think it is," she said. MPs are concerned that current laws place no restriction on the use of interception, when this is allegedly carried out with "consent".

At the same time as Microsoft was negotiating the sale of Office 365 to Parliament, the supplier was arranging for its cloud storage system, then called SkyDrive, to be connected to Prism, to allow the US to obtain foreign intelligence, documents from Edward Snowden revealed.

An NSA information bulletin, dated 7 March 2013 and marked "Top Secret - No Foreign Dissemination", boasted that Microsoft's SkyDrive system had been open to full NSA inspection, including Word, PowerPoint and Excel files.

"Fundamentally, the decision to move to [Office] 365 sits on the sensitivity of the data that we were looking at and the risk that we felt, and combining those together, but the business decision was that it was an acceptable risk," said Miller.

Miller told Computer Weekly that she believed MPs would have been made aware of security risks, and asked to agree to the interception. She said, having retired, she could not refer to any current documents.

Computer Weekly has obtained copied of the 2015 "acceptable use" agreement for parliamentary digital services and signed by MPs and peers, and also the 2015 Members' Handbook. Neither document warns MPs that their incoming and outgoing mails are scanned for keywords by the US-owned MessageLabs network that has links to the intelligence services.

All MPs are given a "parliament.uk" email address, although many also use private email addresses for non-parliamentary work. MPs and peers contacted by Computer Weekly said they had not been told about the potential security risks of using parliamentary email and the Office 365 system.

A Microsoft spokesperson declined to comment to Computer Weekly, saying only: "Due to client confidentiality, Microsoft does not disclose the terms of any of our customer agreements."

Global Times
Illegal mapping 'serious' in western China
Friday, 03 June 2016
Byline: Li Ruohan

Beijing - Illegal mapping is a "serious" problem in remote areas of western China, according to five annual announcements on typical illegal mapping practices released by the National Administration of Surveying, Mapping and Geoinformation (NASG).
Most of those areas are underprivileged and lack sufficient mapping information, and they are often targeted by espionage because many key national defense and military facilities are stationed there, Zhao Kangning, former deputy director of China's National Administration of Global Navigation Satellite Systems and Applications, told the Global Times.

The disclosure of detailed geographic information related to defense or military facilities leaves them open to threats of attack, as many modern military devices are capable of conducting long-range precise attacks, military experts previously told the Global Times.

According to NASG, the most frequent unlawful actions are unauthorized mapping and the processing or printing of "problematic maps," which contain information that is wrong or that is classified to protect national security, China's National Defense News reported Wednesday.

Of the seven examples of illegal mapping cases revealed by the NASG in April, three involved unauthorized mapping, including an April 2015 case in which six Taiwanese illegally entered a closed military area in Hami, Northwest China's Xinjiang Uyghur Autonomous Region to collect geographic information.

One of the Taiwanese was fined 30,000 yuan ($4,560) after he was found to have used GPS receivers in the mainland to collect 35,207 sets of geographic coordinates from seven provinces and cities since 2009, according to the NASG's announcement.

China's National Defense News reported that the illegal obtainment of geographic information by overseas organizations and individuals is common, particularly in Xinjiang, Northwest China's Shaanxi Province, Northeast China's Liaoning Province and Northeast China's Jilin province.

"Shaanxi has captured many overseas individuals that conducted illegal mapping in recent years, and illegal mapping is on the rise," a Shaanxi Administration of Surveying, Mapping and Geoinformation official told the newspaper.

The official claimed that many foreigners and associates of foreign organizations pretend to travel, investigate water resources, hike or conduct archaeological studies in order to target national defense projects and military facilities.

A Japanese national was deported in 2011 after being caught illegally surveying and mapping in Shaanxi Province. The government of Yunnan Province also investigated Coca- Cola for illegally mapping part of the province using electronic devices in 2013, according to previous reports.

Xu Yitian, an expert at the National University of Defense Technology, was quoted by the newspaper as saying that the leaks of geographic information and cases of illegal mapping that have occurred in recent years were mainly due to a lack of national autonomy over the collection, supervision and application of data needed for mapping.

According to the NASG report, domestically produced geographic information technologies and equipment account for over 50 percent of those available in China, but the long way to go to realize autonomous control presents a potential danger that cannot be overlooked.

Reuters
Bangladesh Bank heist perpetrators may never be identified
Tuesday, 07 June 2016

Dhaka - A former top US intelligence official on cyber security has warned that government investigators may never be able to ascertain who carried out a cyber heist that led to the theft of $81 million from Bangladesh's central bank in February.
Sean Kanuck, who was the most senior official in charge of cyber security at the Office of the Director of National Intelligence for five years until mid-May, told Reuters that there had been no official determination on who committed the cyber heist, one of the biggest ever.

"They may never be able to make one," Kanuck said on the sidelines of the annual Shangri-La Dialogue, Asia's premier security forum, held at the weekend in Singapore. He said he had some knowledge of the case but was not directly involved in the probe.

Investigations into the heist are being coordinated by the US Federal Bureau of Investigation. The authorities in Bangladesh, the Philippines and some other countries are also carrying out inquiries.

The hackers stole money from Bangladesh Bank's account at the New York Federal Reserve. One fraudulent transfer to a Sri Lankan entity was reversed, but four transfers for a combined $81 million went to the Philippines and wound up being laundered through casinos and casino agents there.

Most of the money remains missing. Kanuck said that he believed either an extremely sophisticated criminal group or a rogue nation carried out the theft.

BAE Systems has said malware used to erase the tracks of hackers in the Bangladesh Bank heist was similar to code used to attack Sony Corp in 2014, a strike blamed by the FBI on North Korea.

"We have actually seen criminal enterprises that were able to bring together a range of capabilities, ranging from insider access to credentials, going through to people who were willing to go physically remove money from ATMs," said Kanuck.

"There is a black market for different capabilities and you can actually assemble a team like in Ocean's 11," he said, referring to the Hollywood movie about a crime syndicate robbing Las Vegas casinos.

"On the other side of the table, you have a growing number of nation-states developing very broad capabilities to do different kinds of operations," Kanuck said. "The water is very muddy, it's very complex."

Such states could be seeking to undermine the credibility of a central bank, or looking for hard currency funds, Kanuck added.

But Kanuck warned of deceptive signals from those involved in such a heist. "An analyst or an investigator would need to consider that nation states may try to make their activity look like it's the work of criminals," he said.

"And criminals might also try to make their activity look like it's the work of nation-states or even ideologically motivated cyber actors."

Gulf News
UAE face growing cyber security risk
Tuesday, 07 June 2016
Byline: Cleofe Maceda

Dubai - Given the vast number of virtual payment and banking options, UAE consumers are increasingly going online to shop and transact with their bank. Recent data show that more than half of residents in the country access the internet to make purchases alone.
But while you might think that buying clothes on the internet or swiping your credit card at a coffee shop is now more secure than ever, think again. According to security experts, cyber criminals are becoming aggressive in finding ways to access your personal data in order to steal your money.

Mohammed Abukhater, regional director for Middle East and Africa at FireEye, a payment and cyber security intelligence company, cautioned that with the proliferation of mobile devices and expansion of banking services, banks and other financial organisations in the GCC are facing the biggest threat these days.

"Online banking services and online shopping portals, as well as credit cards and debit cards, are potentially at risk," Abukhater told Gulf News. "Organisations would be well-advised to think ahead and have a strong cyber defence infrastructure in place to combat a new wave of threats by a new generation of savvy attackers."

There haven't been any major security breaches reported publicly by financial institutions in the UAE, but this doesn't mean consumers have not lost any money to cyber criminals. "This doesn't mean that there haven't been financially damaging attacks in the GCC," said Abukhater.

"Around the world, bank breaches often go unreported to regulators and the wider public because the losses are not deemed material. That doesn't mean they're not a significant problem."

According to Norton by Symantec, at least 2 million residents in the country reported having experienced cybercrime in one year and lost Dh4.9 billion in the process.

The Gulf Cooperation Council region is considered an energy powerhouse and it has established itself as a hub for finance, aviation, retail, tourism and real estate. This makes the region attractive to cyber criminals.

"This has made entities and governments in the region an enticing target for myriad cyberattackers and threat groups, who often go after financial resources, intellectual property and crippling critical infrastructure, " said Abukhater. "Geopolitics are also another factor behind the region drawing the attention of cyber attackers."

The Online Shopping Behaviour study released by MasterCard in 2015 showed that a growing number of consumers is relying on the internet for their shopping needs. Most people go online to buy air tickets, book hotels and get the latest gadgets and clothes.

"Online is quickly becoming the norm for more shoppers in the UAE due to the high level of awareness amongst consumers about the convenience, speed and safety of their transactions," said Aaron Oliver, head of emerging payments for Middle East and Africa at MasterCard.

The Hindustan Times
Now, mobile apps come under Cyberdome scanner to check malware threats
Tuesday, 07 June 2016

Kozhikode - Beware of mobile apps. Kerala Police's Cyberdome has launched a thorough screening of the apps after it was found that Pakistan's ISI has been uploading malwares in apps to steal vital information from the smartphones which are downloading it.
Generally an alert has been issued among the senior officers in the police, defence and other security agencies to be wary of such apps as downloading of such apps will compromise the data and information stored in phone, emails and other folders. "We are aware of the development and Cyberdome is scanning such apps hosted by ISI to spy on security agencies," said Thiruvananthapuram Range Inspector General Manoj Abraham, who is the nodal officer of the Cyderdome.

As per a Ministry of Home Affairs (MHA) report, Pakistan intelligence agencies are spying on Indian security forces by sending malwares in gaming, music, video and entertainment apps. The apps so far detected include game app-Top Gun, music app-mpjunkie, video app-vdjunky and entertainment app-talking frog.

According to cyber wing officers, though Google has been taking action to remove such apps from the store, a few malwares continue to evade surveillance and infect the apps. Recently, Google removed 13 apps from Play Store following alerts from cyber security agencies.

Officers warn that the users should download apps only from trusted sources as the malwares in the apps would automatically download programmes in the phone which will get all the data stored in the

phone mainly targetting emails, phone banking apps and contacts. Installing anti-virus and scanning the phones is the only way to ensure security of the data.

What to do if your device gets infected with malware? Put the device in safe mode, remove its administrator status and then uninstall the app. Also go for factory reset to clear the infection.

The Register (UK)
The Fog of Cyberwar: Now theft and sabotage instead of just spying
Tuesday, 07 June 2016
Byline: John Leyden

London - Cyber-conflict between nations has entered a new phase with a switch from espionage to sabotage and theft, according to infosec guru Mikko Hyppönen.
The BlackEnergy-related attacks on the electricity grid last December and the more recent attack on at least four international banks have upped the ante in the sphere of cyber-conflict, according to F?Secure's chief research officer.

Russia and North Korea, respectively, are the chief suspects in the two campaigns. Hyppönen said the attacks mark an escalation in a "cyber arms race" which he compares to the Cold War nuclear arms race.

"We've switched from cyber-espionage to offensive cyber action," Hyppönen told El Reg. "The cyber arms race is just beginning and it's going to get much worse."

"Ukraine was a game changer: the first offensive cyber action. The SWIFT attacks were about stealing money rather than secrets," he added.

Hackers tried to steal $1bn through the SWIFT attacks and successfully robbed $81m from funds held by the biggest victim, the central bank of Bangladesh.

"This tells us how desperate North Korea is," according to Hyppönen.

Hyppönen said that in some way, the cyber arms race might be more dangerous than previous arms races. We knew who had nuclear warheads and how many, but we don't know who has the biggest cyber capability.

US, Israel, Russia in that order probably have the greatest offensive capability in cyberspace, but we don't know the abilities of other nations, according to Hyppönen. Worse yet there's no deterrence, and hacking or planting malware on enemy systems can be both effective and cheap.

"When someone used a B-52 to drop bombs, the victim knew pretty well where it came from, but cyber attacks give an adversary deniability," according to Hyppönen.

International law experts have worked hard to put together a Geneva convention for cyberconflict, in the shape of the Tallinn Manual. Hyppönen praised these efforts as "ground-breaking," while cautioning that they've yet to be tested practically.

Many experts describe the infamous Student worm of 2010 as the first cyber weapon and the attacks on Estonia in 2007 as the first conflict. For Hyppönen, however, we ain't seen nothing yet.

The Intercept
Facing Data Deluge, Secret U.K. Spying Report Warned of Intelligence Failure
Tuesday, 07 June 2016
Byline: Ryan Gallagher

Washington - A secret report warned that British spies may have put lives at risk because their surveillance systems were sweeping up more data than could be analyzed, leading them to miss clues to possible security threats.
The concern was sent to top British government officials in an explosive classified document, which outlined methods being developed by the United Kingdom's domestic intelligence agency to covertly monitor internet communications.

The Security Service, also known as MI5, had become the "principal collector and exploiter" of digital communications within the U.K., the eight-page report noted, but the agency's surveillance capabilities had "grown significantly over the last few years."

MI5 "can currently collect (whether itself or through partners ...) significantly more than it is able to exploit fully," the report warned. "This creates a real risk of 'intelligence failure' i.e. from the Service being unable to access potentially life-saving intelligence from data that it has already collected."

A draft copy of the report, obtained by The Intercept from National Security Agency whistleblower Edward Snowden, is marked with the classification "U.K. Secret" and dated February 12, 2010. It was prepared by British spy agency officials to brief the government's Cabinet Office and Treasury Department about the U.K.'s surveillance capabilities.

Notably, three years after the report was authored, two Islamic extremists killed and attempted to decapitate a British soldier, Lee Rigby, on a London street. An investigation into the incident found that the two perpetrators were well- known to MI5, but the agency had missed significant warning signs about the men, including records of phone calls one of them had made to an al Qaeda- affiliated radical in Yemen, and an online message in which the same individual had discussed in graphic detail his intention to murder a soldier.

The new revelations raise questions about whether problems sifting through the troves of data collected by British spies may have been a factor in the failure to prevent the Rigby killing. But they are also of broader relevance to an ongoing debate in the U.K. about surveillance. In recent months, the British government has been trying to pass a new law, the Investigatory Powers Bill, which would grant MI5 and other agencies access to more data.

Silkie Carlo, a policy officer at the London-based human rights group Liberty, told The Intercept that the details contained in the secret report highlighted the need for a comprehensive independent review of the proposed new surveillance powers.

"Intelligence whistleblowers have warned that the agencies are drowning in data -- and now we have it confirmed from the heart of the U.K. government," Carlo said. "If our agencies have risked missing 'life-saving intelligence' by collecting 'significantly' more data than they can analyze, how can they justify casting the net yet wider in the toxic Investigatory Powers Bill?"

The British government's Home Office, which handles media requests related to MI5, declined to comment for this story.

"Lack of staff and tools"

The leaked report outlines efforts by British agencies to conduct both "large- scale" and "small-scale" eavesdropping of domestic communications within the U.K. It focuses primarily on an MI5 program called DIGINT, or digital intelligence, which was aimed at transforming the agency's ability to covertly monitor internet communications.

DIGINT was established for counterterrorism purposes, and "more generally for wider national security purposes," the report said. The program was described as being focused on "the activities of key investigative targets, and on those exploitation activities that will drive greatest investigative benefits with respect to U.K. domestic threats."

The amount of data being collected, however, proved difficult for MI5 to handle. In March 2010, in another secret report, concerns were reiterated about the agency's difficulties processing the material it was harvesting. "There is an imbalance between collection and exploitation capabilities, resulting in a failure to make effective use of some of the intelligence collected today," the report noted. "With the exception of the highest priority investigations, a lack of staff and tools means that investigators are presented with raw and unfiltered DIGINT data. Frequently, this material is not fully assessed because of the significant time required to review it."

The problem was not unique to MI5.

Many of the agency's larger-scale surveillance operations were being conducted in coordination with the National Technical Assistance Centre, a unit of the electronic eavesdropping agency Government Communications Headquarters, better known as GCHQ.

The Centre plays a vital but little-known role. One of its main functions is to act as a kind of intermediary, managing the highly sensitive data-sharing relationships that exist among British telecommunications companies and law enforcement and spy agencies.

Perhaps the most important program the Centre helps deliver is code-named PRESTON, which covertly intercepts phone calls, text messages, and internet data sent or received by people or organizations in the U.K. who have been named as surveillance targets on warrants signed off by a government minister.

A top-secret 2009 study found that, in one six-month period, the PRESTON program had intercepted more than 5 million communications. Remarkably, 97 percent of the calls, messages, and data it had collected were found to have been "not viewed" by the authorities.

The authors of the study were alarmed because PRESTON was supposedly focused on known suspects, and yet most of the communications it was monitoring appeared to be getting ignored -- meaning crucial intelligence could have been missed.

"Only a small proportion of the Preston Traffic is viewed," they noted. "This is of concern as the collection is all warranted."

"Politically contentious"

For most of the last decade, successive British governments have attempted to obtain more surveillance powers, but their efforts have met with public opposition and ultimately failed. The present government's effort to push through a sweeping surveillance law -- the Investigatory Powers Bill -- is currently being considered by the Parliament.

Documents provided by Snowden show that the U.K.'s intelligence and security agencies have wanted to obtain new powers to store domestic data about internet communications to address the "growing range of services available to internet users." This reflects the position that has been adopted publicly in recent years by the government, which has argued that expanded internet surveillance is necessary to keep up with changes in technology.

However, the Snowden documents also reveal a more candid internal assessment of the need for bolstered spy laws and shine light on major aspects of the U.K.'s existing surveillance apparatus that government and security officials have not publicly acknowledged in their pursuit of the new powers.

In one document dated from 2012, GCHQ stated that it was "not dependent" on a new surveillance law coming into force, presumably due to the extensive capabilities already at its disposal. GCHQ added that

new powers were of greater importance to the U.K.'s law enforcement agencies, which were facing "a significant decline" in ability to intercept communications due to people increasingly using internet services -- as opposed to conventional landlines and cellphones -- to talk or exchange messages.

But passing a new surveillance law would be a "politically contentious [and] technically complex" process, GCHQ said in the document. In the meantime, therefore, it devised something of a workaround by creating a secret stop-gap surveillance solution for law enforcement officials.

As part of a program named MILKWHITE, GCHQ made some of its huge troves of metadata about people's online activities accessible to MI5, London's Metropolitan Police, the tax agency Her Majesty's Revenue and Customs, the Serious Organized Crime Agency (now merged into the National Crime Agency), the Police Service of Northern Ireland, and an obscure Scotland-based surveillance unit called the Scottish Recording Centre.

Metadata reveals information about communications -- such as the sender and recipient of an email, or the phone numbers someone called and at what time -- but not the written content of the message or the audio of the call. GCHQ's definition of metadata is broad and also encompasses location data that can be used to track people's movements, login passwords, and website browsing histories, as The Intercept has previously revealed.

The MILKWHITE program was developed as early as September 2009, and it seems to have been operational under both the Labour and the Conservative-Liberal Democrat governments of that period. One of its purposes was to allow law enforcement agencies and MI5 to sift through the troves of metadata to discover internet "selectors" for their surveillance targets -- meaning unique identifiers, such as a username or IP address, that can be used to home in on and monitor a person's online activities.

GCHQ focuses primarily on intercepting foreign communications that are "external" to the U.K. But in the process of doing so -- by tapping into international cables that carry phone calls and internet traffic between countries -- the agency vacuums up large quantities of data on British calls, emails, and web browsing habits, too. It is this British data -- some of which appears to have been made accessible through MILKWHITE -- that would be of most interest to MI5, police, and tax officers, as it is their role to conduct "internal" investigations within the U.K.

A GCHQ document dated from late 2010 indicated that MILKWHITE was storing data about people's usage of smartphone chat apps like WhatsApp and Viber, instant messenger services such as Jabber, and social networking websites, including Facebook, MySpace, and LinkedIn. Access to the data was provided to law enforcement through an "internet data unit" hosted by the Serious Organized Crime Agency and it was accessible to tax investigators through what one GCHQ document described as established "business as usual" channels.

By March 2011, GCHQ noted that there was "increasing customer demand" for the service offered by MILKWHITE and the agency planned to grow its capacity, seeking £20.8 million ($30.6 million) to update the program's "advanced analytics" capabilities and to maintain its "bulk" storage of metadata records. "Bulk" is a term GCHQ uses to refer to large troves of data that are not focused on individual targets; rather, they include millions and in some cases billions of records about ordinary people's communications and internet activity.

Carlo, the policy analyst with Liberty, said the revelations about MILKWHITE suggested members of Parliament had been misled about how so-called bulk data is handled. "While MPs have been told that bulk powers have been used only by the intelligence community, it now appears it has been 'business as usual' for the tax man to access mass internet data for years," she said. "This vindicates the warnings of security experts and the call by opposition parties for an urgent, independent review of bulk powers. The compromise review recently announced is a poor substitute and without the time and technical expertise, will struggle to address this issue of national importance."

GCHQ declined to answer questions for this story. A spokesperson for the agency said in a statement: "It is long-standing policy that we do not comment on intelligence matters. Furthermore, all of GCHQ's work is carried out in accordance with a strict legal and policy framework, which ensures that our activities are authorized, necessary and proportionate, and that there is rigorous oversight, including from the Secretary of State, the Interception and Intelligence Services Commissioners and the Parliamentary Intelligence and Security Committee. All our operational processes rigorously support this position. In addition, the U.K.'s interception regime is entirely compatible with the European Convention on Human Rights."

USA Today
Power execs rebuff Koppel claims of eventual attack on U.S. grid
Tuesday, 07 June 2016
Byline: Bill Loveless

Washington - Eight months after veteran broadcast journalist Ted Koppel published a book predicting a devastating cyberattack on the U.S. power grid, leaders of the utility industry are sounding off over what they say is an exaggerated claim.
"We're speaking out on it now because we think there is an important story to tell," Scott Aaronson, the managing director for cyber and infrastructure security at the Edison Electric Institute, said last week at a briefing for reporters. "If it's only going to be the movie- script scenarios, then I can understand why customers might lose confidence."

What Aaronson and others in the utility industry are taking issue with is a warning by Koppel in his bestselling book, Lights Out: A Cyberattack, A Nation Unprepared, Surviving the Aftermath.

According to Koppel, who anchored the ABC news program Nightline from 1980 to 2005, the U.S. is likely to eventually suffer a cyberattack on its grid that could leave millions of Americans in the dark, short of water and food, and generally desperate for months.

The risk is considerable, Koppel claims, because the U.S. government and the utility industry are ill prepared to fend off such an assault by foreign adversaries and to help the nation recover from it.

Not so, Aaronson told reporters.

"Part of what we want to do is interject a little bit of sanity and engineering and thoughtfulness into what can quickly devolve into a bit of a hysterical discussion," he said at the Washington headquarters of EEI, the trade association for investor-owned electric utilities.

As he did at recent House and Senate hearings on cybersecurity, Aaronson ticked off a number of steps taken by utilities and the government to address the threat, including standards requiring stepped-up protective measures and carrying penalties of up to $1 million per violation per day.

Moreover, utilities are increasingly coordinating to share information and expertise and to test their preparedness, including a drill conducted last fall by the industry's North American Electric Reliability Corporation, in which 4,400 participants from the industry and governments in the U.S., Canada and Mexico simulated coordinated cyber and physical attacks on the grid.

In the event of an incursion that disables electric infrastructure, power providers are expanding programs to share transformers and other equipment and replace damaged equipment relatively quickly, Aaronson said.

"I disagree with the premise that we would be in a situation where we would have to deal with a months-long outage that would require people to shelter in place," he said.

As a sign of that resiliency, Aaronson recalled an attack on Pacific Gas & Electric's Metcalf substation south of San Jose in 2013 by unidentified snipers. The attack left 17 of the facility's 21 transformers destroyed and caused $15 million in damage.

"The lights didn't even blink in San Francisco and Silicon Valley," he said, adding that the substation was back in service in just over a month. Nevertheless, Koppel remains unpersuaded by the industry's criticism of his book.

"It is surely only a matter of time before a terrorist group, unrestrained by any geopolitical interests, acquires the capability to attack one of our power grids," he testified at a Senate hearing in May where Aaronson also appeared.

There's no dispute in the industry or the government that hackers want to disrupt power supplies and cause havoc in the U.S. In fact, the National Security Agency has acknowledged that "cyber intrusions" on control systems for the grid have increased, though none has caused a blackout.

But what Aaronson and his colleagues in the utility sector are trying to convey more now than before is that while there will always be room for improvement in addressing the risk, it isn't going unattended.

"You've got to be a little sensitive about how much you talk about it publicly," said Philip Moeller, EEI's senior vice president of energy delivery and a former member of the Federal Energy Regulatory Commission, who joined Aaronson at the press briefing.

"Particularly in the aftermath of Metcalf, we didn't want copycat attacks, which are much more likely to happen once it's in the headlines. But just because we don't talk about it doesn't mean a lot isn't being done."

Washington Free Beacon
Cybercom Trains for Infrastructure Attack as Power Companies Play Down Threat to Grid
Monday, 06 June 2016
Byline: Bill Gertz

Column - The U.S. Cyber Command will conduct large-scale military exercises this week simulating cyber attacks against critical U.S. infrastructure, and the war games will highlight the growing threat posed by foreign states capable of crippling the electrical grid and financial networks through digital attacks.
The exercise, known as Cyber Guard 16, is the latest annual war game involving scores of military personnel and civilians at the Fort Meade-based command. Other players will include officials from the Pentagon, FBI, Homeland Security Department, and private industry.

"Cyber Guard offers a fascinating, realistic (but not predictive) scenario of a cyber attack of significant consequence on U.S. critical infrastructure," Maj. Gen. Paul Nakasone, head of the command's National Mission Force, said last week.

Nakasone, whose mission team is tasked with defending military networks, also is in charge of the military unit that would be called in to counter and respond to a cyber attack on elements of critical infrastructure.

The month-long exercise is an example of both interagency security cooperation as well as working with private sector stakeholders in dealing with cyber threats, he told Federal News Radio in an online chat.

A command spokesman declined to provide details on the Cyber Guard exercise and referred questions to a fact sheet produce for last year's version. The exercise ends June 29. Last year, 100 organizations

from government, academia, industry, and allied nations took part at the Joint Staff Suffolk Complex, a high-security war-gaming facility in Suffolk, Va.

The command's cyber warfare game comes amid concerns that the federal government is not doing enough to protect the electrical grid, arguably the most critical of the 16 different elements of critical infrastructure, as most other elements require electricity to operate.

Currently, the federal government is relying on a private consortium of companies that appears to be playing down threats to the power grid from cyber and other attacks.

The non-profit North American Electric Reliability Corporation is the official organization designated by the federal government to be in charge of setting security standards for electrical networks. It is responsible for making sure electrical owners and operators of the bulk power system are taking the steps needed to protect the lattice of power companies stretching throughout the United States, Canada, and Baja California, Mexico.

The private regulatory authority was given the task of setting grid security standards by the Federal Energy Regulatory Commission, or FERC. Testimony before the commission last week reveals that current industry standards for reporting cyber security incidents are allowing power companies to game the system to underreport potential attacks.

In 2014, for example, the non-profit corporation reported only three cyber security incidents, and a draft of the forthcoming annual reliability report is said to report zero incidents.

The consortium's low numbers conflict sharply with those of the Department of Homeland Security's Industrial Control Systems Cyber Emergency Readiness Team that monitors infrastructure cyber incidents.

According to the DHS group, 46 cyber security incidents were reported in 2015, and 79 were reported the year before that. The department did not differentiate which energy sectors were involved in the cyber incidents but it is likely electric companies were among the targets in the numerous incidents.

Incidents involving electricity companies have included hacks into smart meters to steal power, failure in control systems that forced power plants to shut down, and malicious software that disabled safety monitoring systems.

"Clearly there is a gap in [North American Electric Reliability Corporation] cyber security incident reporting; this gap should be addressed by more stringent FERC-mandated reporting standards," said Tom Popik with the Foundation for Resilient Society, a group that advocates for better grid security.

In April, Cybercom commander Adm. Mike Rogers voiced doubts about whether the command could help the country from multiple cyber attacks against the electrical power grid.

The danger was highlighted by the first known successful cyber attack against a nation's power grid in December. Following the attack, which targeted Ukraine, the FBI in March began briefing American electric power companies on the threat to the U.S. power grid.

"We have the skills. The challenge for us at the moment is one of capacity," Rogers said, noting a current shortage of skilled people could hamper efforts "if we had multiple events simultaneously."

Rogers noted that the electrical power industry and a couple of others in charge of critical infrastructure are resisting efforts to bolster cyber defenses since doing so would require rate increases.

That seems to be one factor motivating the North American Electric Reliability Corporation to undercount in its reporting of cyber incidents.

A congressional General Accountability Office report states that since 2011 the Federal Energy Regulatory Commission has not been checking private electric companies to ensure they are complying with voluntary cyber security standards. The report recommended that the commission begin conducting periodic evaluations of security compliance. "However, FERC has not implemented this recommendation," the GAO said in November.

"As they become increasingly reliant on computerized technologies, the electricity industry's systems and networks are susceptible to an evolving array of cyber-based threats," the report said.

The problem is not simply potential increased costs for cyber security by electric companies. Opposition within private industry to tightening cyber security of electric grid control networks also is the result of concerns over the large operational costs involved in shutting down power systems to hunt for and remove malicious software.

The dangers to the nation's electric security are too great and protecting the most critical of infrastructures is too important. The Federal Energy Regulatory Commission should require power companies to invest in better cyber security--before a major cyber attack turns out the lights.

Washington Post
FBI wants access to Internet browser history without a warrant in terrorism and spy cases
Tuesday, 07 June 2016
Byline: Ellen Nakashima

Washington - The Obama administration is seeking to amend surveillance law to give the FBI explicit authority to access a person's Internet browser history and other electronic data without a warrant in terrorism and spy cases.

The administration made a similar effort six years ago but dropped it after concerns were raised by privacy advocates and the tech industry.

FBI Director James B. Comey has characterized the legislation as a fix to "a typo" in the Electronic Communications Privacy Act, which he says has led some tech firms to refuse to provide data that Congress intended them to provide.

But tech firms and privacy advocates say the bureau is seeking an expansion of surveillance powers that infringes on Americans' privacy.

Now, at the FBI's request, some lawmakers are advancing legislation that would allow the bureau to obtain "electronic communication transactional records" using an administrative subpoena known as a national security letter. An NSL can be issued by the special agent in charge of a bureau field office without a judge's approval.

Such records may include a person's Internet protocol address and how much time a person spends on a given site. But they don't include content, such as the text of an e-mail or Google search queries. There's also a limit to how much visibility the bureau would have into which part of a website a person had visited. For instance, according to the bureau, if the person went to any part of The Washington Post's website, law enforcement would see only washingtonpost.com -- nothing more specific.

Comey said that making this change to the law is the bureau's top legislative priority this year.

The inability to obtain the data with an NSL "affects our work in a very, very big and practical way," he told the Senate Intelligence Committee in February.

The Senate panel recently voted out an authorization bill with the NSL amendment. The Senate Judiciary Committee this week is considering a similar provision introduced by Sen. John Cornyn (R-Texas) as an amendment to ECPA, a law governing domestic surveillance.

Cornyn said that what he characterized as a "scrivener's error" in the law is "needlessly hamstringing our counterintelligence and counterterrorism efforts."

But privacy groups and tech firms are again warning that the expansion of power would erode civil-liberties protections.

The fix the FBI seeks would "dramatically expand the ability of the FBI to get sensitive information about users' online activities without oversight," said a coalition of privacy and civil society groups and industry organizations in a letter sent to the Hill Monday.

The new categories of information that could be collected using an NSL "would paint an incredibly intimate picture" of a person's life, said the letter, signed by the American Civil Liberties Union, Amnesty

International USA, the Computer & Communications Industry Association, Google, Facebook and Yahoo, among others. For example, a person's browsing history, location information and certain email data could reveal details about a person's political affiliation, medical conditions, religion and movements throughout the day, they said.

In addition, the NSL would come with a gag order preventing the company from disclosing it had a received a government request, said Neema Singh Guliani, ACLU legislative counsel. The letter noted that over the past 10 years, the FBI has issued more than 300,000 NSLs, most of which had gag orders. "That's the perfect storm of more information gathered, less transparency and no accountability," Gulani said.

But a law passed last year, the USA Freedom Act, requires the Justice Department to review gag orders periodically to assess whether they are still justified.

The amendment being considered Thursday by the Judiciary Committee is part of a broader effort by lawmakers to update ECPA to require law enforcement to get a warrant for all email content, regardless of whether it is one day or one year old.

Privacy groups and tech companies support the broader ECPA update, versions of which some lawmakers have sought for years.

But the groups and tech organizations in their letter said that if the ECPA bill includes the NSL provision, they will pull their support.

A November 2008 opinion from the Justice Department's Office of Legal Counsel made clear that ECPA allows the FBI to obtain with an NSL only four types of basic subscriber information from Internet companies: name, address, length of service and telephone bill records. There is no reference in the law to browser history, for instance. The opinion said the four existing categories were "exhaustive."

The FBI's Office of General Counsel, however, has argued that electronic communication transactional records are the functional equivalent of telephone billing records. To eliminate any uncertainty, the FBI wants the law to explicitly cover such data.

Sens. Patrick J. Leahy (D- Vt.), the ranking minority-party member on the Judiciary Committee, and Mike Lee (R-Utah), a committee member, oppose the Cornyn amendment. They say they will push for a clean version of the ECPA update similar to a bill passed by the House earlier this year.

What is ransomware?
Ransomware is a type of hostile computer program known as malware that blocks users from some or all of the data in their computer systems. The more advanced form of ransomware is known as crypto-ransomware, which encrypts computer files such as documents, pictures and music, allowing the attacker to demand a ransom in exchange for the necessary decrypt key to unlock the data.

How does ransomware get in?

There are a variety of ways in which ransomware can break into an individual's personal computer or mobile phone, or into a company or organization's computer system. Ransomware can infiltrate with the simple click on a link contained in a mass e-mail to employees of a company. In one documented incident, employees received fake invoices from a well-known ride-sharing service suggesting that huge fees were owed. All it took was one click from a panicky staffer to infect the whole system.

If proper security precautions are not in place or the ransomware is not detected in time, it installs itself and begins encrypting data.

Three years ago, ransomware infected Android mobile devices by posing as an anti-virus program that had discovered "critical threats," according to a report by U.S. cybersecurity think tank Institute for Critical Infrastructure Technology. Victims were coerced into paying for a fake software licence. Another method involved the mimicking of an adult website application; once installed, the app flashed a law-enforcement warning and demanded a $500 (U.S.) fine to unlock the device.

How prevalent is it?

Individuals, companies, public institutions - including hospitals, schools, churches and law-enforcement agencies - law firms and financial institutions are increasingly being targeted. Critical services such as fire, police and hospitals make easy targets.

The Institute for Critical Infrastructure Technology report says 2016 is shaping up to be "the year ransomware will wreak havoc on America's critical infrastructure community."

Ransomware is increasingly popular among cyberattackers because it is a "volume business." It's simple, relatively anonymous and fast. Some people will pay, some will not pay, so what. With a wide enough set of targets, there is enough upside for these types of attacks to generate a steady revenue stream," said Brian Contos, vicepresident and chief security strategist at Securonix, a security analytics firm.

Recent victims include the University of Calgary, Kansas Heart Hospital in Wichita, Hollywood Presbyterian Medical Center in Los Angeles and MedStar Health in Washington.

Network service provider Infoblox says there was a 35-fold increase in observations of ransomware-related websites in the first quarter of 2016. The FBI recently disclosed that ransomware victims in the United States reported costs of $209-million in the first quarter of 2016, up dramatically from $24-million for all of 2015, according to Infoblox.

And that doesn't include all the unreported cases.

Canada last month announced a major co-operative effort with the United States, Britain, Australia and New Zealand to use their secretive electronic-intelligence-gathering assets to go after cybercriminals. The Canadian Cyber Incident Response Centre (CCIRC) is aware of 1,762 cybersecurity-related incidents last year, including thefts of intellectual property from foreign governments and a significant rise in the use of ransomware.

What can be done to guard against attack?

There is no foolproof way to prevent attack, but measures to minimize the risk include regularly updating anti-virus software and computer firewalls; backing up files based on the 3-2-1 rule (three backup copies located on two different computer platforms with one backup located on a separate and isolated disc drive); and ensuring employees know the dangers of potentially disruptive e- mails and hyperlinks.

"Tight security measures, upto-date software, user best practices and clean, protected backup data" are fundamental, Infoblox says.

What action can be taken in the event of an attack?

Institutions often find they have no choice but to pay the ransom to get their data back. Some companies and organizations have even been stocking up on bitcoins, an anonymous and untraceable digital currency, in the event they are targeted and need to pay up.

But some cybersecurity experts and law-enforcement officials say paying the ransom only encourages and emboldens cybercriminals.

Hollywood Presbyterian reportedly tried to thwart its attackers by switching to paper medical records and forms, but ended up paying the equivalent of about $17,000 in bitcoins to get its locked systems back up.

In some cases, a one-time payment isn't enough. "Unfortunately, even when organizations have paid up, attackers have been known to ask for more money, said Chris Mayers, chief security architect at Citrix Systems Inc. in London.

It World Canada
Some Canadian firms still think they won't be targets of cyber attacks, conference told
Thursday, 09 June 2016
Byline: Howard Solomon

Many Canadian organizations - particularly small ones - still wrongly think they aren't in the sights of cyber attackers, says a major provider of business connectivity to small and medium businesses. "There's a sense of safety" that isn't justified, Stewart Cawthray, general manager of network security for Rogers Communications' enterprise business unit, told the annual Canadian Telecom Summit in Toronto on Tuesday.

Speaking on a panel on cyber security, Cawthray said corporate awareness of the threat is good among large organizations. Medium sized firms are where large ones were five years ago, he added in terms of investing in security technology.

Still, he noted that some customers still say 'We're not the target,' Yet studies suggest 54 per cent of Canadian organizations have suffered a breach.

Perhaps he suggested, it's because there are few reported breaches here. That will change, he predicted, when the mandatory data breach reporting law comes into effect for firms covered under the federal Personal Information Protection and Electronic Documents Act (PIPEDA).

Ottawa is now consulting with the private sector on disclosure regulations, but they aren't expected to come into law until next year.

But several panellists also spoke of the importance of organizations getting over the shame of admitting they've been breached. Cawthray argued that organizations can be respected by the public if they face up to a problem and explain what is being done to reduce the risk of another breach. Om the other hand trying to hide a breach ends up losing customer trust.

(By coincidence the University of Calgary acknowledged this week it had to pay $20,000 after being struck last month by ransomware.)

And while some noted that large organizations such as Home Depot and Target have survived huge data breaches, panel moderator Scott Jones, assistant deputy minister for IT security at the Communications Security Establishment, charged with protecting sensitive federal data as well as being the country's electronic spy agency, cited research that half of small companies suffering a breach don't survive.

The session also got a small peek into the operations of the Communications Security Establishment (CSE) when Jones said his department blocks 100 million malicious acts a day.

On the other hand, Jones said "at the end of the day you'll never win because the actors are very diverse," ranging from nation states to script kiddies who have access to a wide range of tools that can hide their behaviour. At the moment , he conceded, all of the advantage is with attackers.

There was no shortage of advice on what has to be done. Kellman Meghu, Toronto-based head of data centre virtualization at Check Point Software, warned that "we're not solving a technology problem. We're solving a people problem. There's no accounting for what people will do when attacking. So the appraoch (by enterprises) that ' We're secure because we're protected.'.makes for great marketing but they still have to manage their risks

"One thing I fear from a marketing perspective is is we (vendors) try to sell it off as easier than it is, and I think we need to be honest with customers: This is not easy, it's hard. It's not going to get easier but it's not something we can ignore. We need to step up and do the work and use the tools for what they really are, not try to market them as a magic box. This is an ongoing thing has to be part of the infrastructure."

Unfortunately, according to Darren Anstee, chief security technologist at Arbor Networks, many organizations are still talking about reducing the cost of security. "I very much wish it was about the value of security to the business, how it can differentiate the business, how it applies to various frameworks."

The conversation has to change from a technology discussion to one of business outcomes, said Cawthray. Security has to be something organizations just do as part of normal operations, that it's a risk management problem. Then technology decisions are more business-oriented.

The culture of organizations has to change, agreed Jennifer Blatnick, vice-president of cloud and enterprise product marketing at Juniper Networks. But, she added, when her firm surveys customers it finds security is still an afterthought. -- and the proof is security is only 10 per cent of IT budgets. "Why wouldn't you spend 100 per cent of your budget to protect 100 per cent of your budget?"

Meghu also suggested that user awareness training is a waste. "Trying to teach someone what a bad Web site is, forget it." More important, he said, is teaching developers to write secure code.

There was also discussion on security in an era when organizations are increasingly moving to cloud computing. That means securing data -- whether through encryption or tokenization or other techniques is vital, Cawthray said. Regardless of whether it's in the cloud or on-premise, he added "if we have well-protected data it can live on insecure infrastructure and still operate."

Gulf News
Millions of dirhams lost to IT security breaches in Middle East
Thursday, 09 June 2016
Byline: Cleofe Maceda

Dubai - Companies in the Middle East are incurring millions of dirhams in financial losses due to cyber security breaches.
Over the last five years, organisations in the region incurred a total financial loss of approximately $1,493,590 (Dh5.4 million) after hackers broke into "system perimeters" in an attempt to steal passwords, customer data and other sensitive information from corporate databases.

The annual Data Security Confidence Index, released by Gemalto on Wednesday, showed that companies spent about $35,232,000 to fix the intrusion.

"Data breaches include loss of passwords and personal data," Sebastien Pavie, regional director for Middle East and North Africa, identity and data protection, at Gemalto, told Gulf News.

Businesses, as a result, suffered from delays in getting products and services to the market (56 per cent; decreased customer confidence (38 per cent) and the loss of a new or incremental business opportunity (32 per cent). Companies affected are based in the UAE, Saudi Arabia and other parts of the Middle East.

Those targeted by hackers and lost more than $1 million in the process include companies operating in the financial sector (8 per cent), manufacturing (8 per cent), private health (8 per cent), public (8 per cent) and utilities (8 per cent) industries, among others.

The biggest proportion of affected organisations (25 per cent) are in the telecommunications sector, while 16 per cent are in retail and 16 per cent in business and professional services. "This research shows that there is indeed a big divide between perception and reality when it comes to the effectiveness of perimeter security," said Pavie.

"The days of breach prevention are over, yet many IT organizations continue to rely on perimeter security as the foundation of their security strategies. The new reality is that IT professionals need to shift their mindset from breach prevention to breach acceptance and focus more on securing the breach by protecting the data itself and the users accessing the data."

According to the research findings, 58 per cent of IT decision makers said they would adjust their strategies as a result of high-profile data breaches and allocate more spending to data security (encryption, fraud detection and/or key management).

More than half (52 per cent) said they had increased spending on perimeter security and believe that their current investments are going to the right security technologies.

Despite the increased focus on perimeter security, the findings show the reality many organisations face when it comes to preventing data breaches.

All organizations surveyed in the Middle East (100 per cent of them) said their companies experienced a breach at some time over the past five years. This suggests that organisations have not made significant improvements in reducing the number of data breaches despite increased investments in perimeter security.

"While companies are confident in the amount of spending and where they are spending it, it's clear the security protocols they are employing are not living up to expectations," said Privie.

"While protecting the perimeter is important, organisations need to come to the realisation that they need a layered approach to security in the event the perimeter is breached. By employing tools such as end-to-end encryption and two-factor authentication across the network and the cloud, they can protect the whole organisation and, most importantly, the data," concluded Pavie.

Agence France Presse
Singapore to block Internet access for government workstations within a year
Thursday, 09 June 2016

Singapore - Singapore confirmed Wednesday it would cut off internet access for government work stations within a year for security reasons, a surprise move in one of the world's most wired countries. The decision will not disrupt government operations, the Infocomm Development Authority (IDA) said after local daily The Straits Times reported that some 100,000 computers would be affected.

"We have started to separate Internet access from the work stations of a selected group of public service officers, and will do so for the rest of the public service officers progressively over a one-year period," the IDA said in a written reply to AFP queries.

Industry sources said the measure was aimed at preventing cyber attacks as well as the spread of malware that might enter the government email network thought Internet-enabled work stations.

Singapore is one of the world's most Internet-savvy societies, offering broadband speeds envied by many.

A wide range of government services are available online, including registering for marriage, filing complaints to the police and video consultations with doctors.

Government services will not be disrupted by the security measures, sources familiar with the plan said.

The Straits Times said public servants would still have access to the internet on their personal devices such as tablets and smartphones.

Dedicated Internet- linked terminals will be issued to civil servants who need them for work, the newspaper added.

The IDA said the government regularly reviews measures to make its network more secure. "There are alternatives for Internet access and the work that officers need to do, does not change."

Singapore announced in 2014 it was stepping up IT security measures following attacks on a section of the prime minister's website, as well the website of the presidential residence.

Times of India
Chinese hackers may have stolen government info: Experts
Thursday, 09 June 2016
Byline: Siddharth Tadepalli

Hyderabad - Chinese cyber espionage group Danti may have breached computers of top-ranking bureaucrats in Delhi and elsewhere, according to cyber security company Kaspersky Labs.
While department of electronics and information technology (DeitY) officials admitted a "big" cyber-attack, they refused to divulge details, saying the probe was sensitive. But, an official source, reacting to the report, said there was indeed a breach in a few computers in the Union Cabinet secretariat, but it has been plugged now.

"It was identified during an investigation and requisite steps were taken immediately," the source said, adding "opportunities for misuse" exist in such attacks. "However, this did not seem to be a serious threat," the official said.

According to Kaspersky Labs, one of the world's top cyber- security companies, Danti possibly breached dozens of computers that are used by Cabinet-rank officials in the national capital. Speaking to TOI over the phone from Mumbai, Kaspersky LabsSoutheast Asia managing director Altaf Halde said, "We've been following a trail of malware that was used to siphon away sensitive information from government computers.

"Our team tracked the malware strain to computers used by Cabinet secretariat of the Indian central government. These hackers have a special focus on diplomatic entities. We presume they may already have full access to internal networks in the Indian government," Halde said. He said it delivers the malware through spear-phishing emails and comments written in Mandarin, but in order to attract the attention of potential victims, the email addresses are in the names of several high-ranking government officials.

Once a victim, in this case a bureaucrat, opens the mail, the Danti backdoor is installed and sensitive data is siphoned off from the infected computer. Kaspersky said they tracked several such malicious emails to Indian embassies in Hungary, Denmark and Colombia, which were targeted by Danti. "In the case of the Indian embassy in Hungary, it looks like the original message was forwarded from the embassy to the Indian IT security team in the MEA," Halde added. Experts said they've come across similar complaints and will probe whether it is the handiwork of Danti group.

Khaleej Times
Middle East firms lost $1 million in data breaches in last five years
Thursday, 09 June 2016
Byline: Staff Report

Dubai - Middle Eastern organisations have incurred a total financial loss of approximately $1,493,590 over the last five years due to system perimeter breaches, findings of the third annual Data Security Confidence Index released by Gemalto have found.
The average cost of detecting and fixing these breaches was $35,232,000. Despite the increasing number of data breaches and more than 3.9 billion data records worldwide being lost or stolen since 2013, organisations continue to believe that basic perimeter security technologies are effective.

"This research shows that there is a big divide between perception and reality when it comes to the effectiveness of perimeter security," said Sebastien Pavie, regional director for the Mena region, identity and data protection at Gemalto.

"Many IT organisations continue to rely on perimeter security as the foundation of their security strategies. The new reality is that IT professionals need to shift their mindset from breach prevention to breach acceptance and focus more on securing the breach by protecting the data itself and the users accessing the data."

Of the 1,100 IT decision makers surveyed worldwide, 50 were based in the Middle East. Of these respondents, 94 per cent said their perimeter security systems such as firewall, IDPS, AV, content filtering and anomaly detection were effective at keeping unauthorised users out of their network.

Despite this, 54 per cent said they have suffered from a perimeter security system breach in the past 12 months. Furthermore, 60 per cent believe unauthorised users can access their network, and 36 per cent said unauthorised users could access their entire network in the event of a data breach.

Despite the increased focus on perimeter security, the findings show the reality many organisations face when it comes to preventing data breaches.

All organisations surveyed in the Middle East - 100 per cent of them - said they experienced a breach at some time over the past five years. This suggests that organisations have not made significant

improvements in reducing the number of data breaches despite increased investments in perimeter security.

London Times
Computers will crack our toughest codes, spies admit
Thursday, 09 June 2016
Byline: Tom Whipple

London - Britain's top code breaker is preparing for the day when almost all internet encryption will be rendered useless thanks to a computing advance that may also lead to a mass release of secret correspondence across the globe.
Robert Hannigan, the head of GCHQ, said that the arrival of powerful quantum computers, which some believe could be viable in a decade, will undermine encryption, the "foundation of internet security".

Senior scientists have also warned that the advance will not only mean that the way we encode data will have to change but that vast caches of western encrypted data from past decades will suddenly be accessible by Russia and China -- and vice versa.

While messages between embassies and the Foreign Office often use different proprietary systems, a significant proportion of previously encrypted commercial secrets, private correspondence and government data may become readable.

"The whole of the cryptographic world has been worrying about this and how to make things safe," he said.

Mr Hannigan, the first serving head of GCHQ to answer questions at The Times Cheltenham Science Festival, added: "It's our job to make sure we are starting to plan to protect government secrets, machines and power grids now against the arrival of serious quantum computing. That could be ten to twenty years off. We just don't know."

Most internet security works on the basis of "public key cryptography", which involves encrypting data using a large number that is itself the multiple of two very large prime numbers. The method was invented at GCHQ.

Anyone trying to decrypt a message must be able to find out what those prime numbers are from their multiple. To do so is not possible using a conven-tional computer. Quantum computers will change that. Rather than using a binary system, quantum computers harness the behaviour of subatomic particles, which can exist in many different states at the same time, vastly multiplying the computing power available. Governments and universities are rushing to develop quantum computers. One of the biggest British collaborations is at Oxford but there are also teams at Bristol and Cambridge. Whoever succeeds first will be able to read uncracked messages from friends and foes alike.

Since he took over as head of GCHQ Mr Hannigan has worked to open it up, including recently giving The Times access to the organisation's Cheltenham headquarters. Appearing at a public event to answer audience questions is part of that process.

Mr Hannigan also talked about the fallout from one of the most serious breaches of recent years, the intelligence leaks by Edward Snowden. The files may have resulted in deaths. He said terrorists who were being tracked before the disclosures suddenly vanished. "Who knows what they went on to do?" Mr Hannigan said that GCHQ was working on techniques to hit hackers over the internet. These powers would be important as the spread of internetenabled devices meant that more of our society was becoming exposed.

Motherboard (Vice)
One of the World's Largest Botnets Has Vanished
Wednesday, 08 June 2016
Byline: Jospeh Cox

New York - With no warning, one of the world's largest criminal botnets--a massive collection of computers used to launch attacks--has disappeared. Researchers have reported huge drops in traffic for two of the most popular pieces of malware which rely on it.
"We can only tell that the Dridex and Locky spam campaigns stopped since June 1 in our observation. We cannot confirm how the botnet was brought down yet," Sarah Coutermarsh, a spokesperson for cybersecurity company FireEye, told Motherboard in an email.

Dridex is a piece of malware typically used to empty bank accounts, while Locky is a particularly widespread form of ransomware, which encrypts a victim's files until they pay a hefty bounty in bitcoin. The two campaigns have been linked in the past.

It's not clear what exactly will happen to Locky victims now that its infrastructure has seemingly gone offline. There's a chance that those infected with the ransomware may be unable to successfully pay the criminals and have their files unlocked.

Back when Locky was launched in February of this year, security researcher Kevin Beaumont wrote, "The deployment of Locky was a masterpiece of criminality-- the infrastructure is highly developed, it was tested in the wild on a small scale on Monday (ransomware beta testing, basically), and the ransomware is translated into many languages. In short, this was well planned."

In October 2015, the FBI, UK's National Crime Agency and other law enforcement agencies disrupted the Dridex malware, but that didn't stop it.

After the botnet, called Necurs, vanished, Beaumont told Motherboard in a Twitter message, "We've seen a huge decrease in malicious traffic since. Locky has completely disappeared," and added that no new command and control servers-- which hackers use to keep tabs on and direct their botnet--have popped up since. Beaumont claimed Necurs was the world's largest botnet.

There is only circumstantial evidence that may point to why the botnet has vanished. On June 1, the same day FireEye and Beaumont reported a large dip in malicious traffic, Russia's FSB security service said it had arrested a gang of around 50 hackers, Reuters reported. Those hackers had stolen over 1.7 billion roubles ($25.33 million) from Russian institutions and banks, and used a trojan called Lurk.

Group-IB, a Russian cybersecurity firm that works with law enforcement, doesn't think there's a link with the arrests though.

"We don't see any connection between Necurs Botnet going down and recent arrests in Russia. The arrests of 50 hackers were made in connection to the Lurk group, and that particular group only targeted Russian and Ukrainian banks in their fraudulent activity," Nikolay Grunin, PR manager for Group-IB told Motherboard in an email.

For the time being, why exactly Necurs disappeared remains a mystery.

Fars News Agency
Drones to Play More Active Role in IRGC Navy Operations
Thursday, 09 June 2016

Tehran - Commander of the Islamic Revolution Guards Corps Navy Rear Admiral Ali Fadavi announced IRGC's plans to increase drone missions in its naval operations.
"Drones comprise the fifth pillar of the IRGC Navy considering their combat and operational power," Fadavi said after visiting the IRGC Navy's Drone Command Center on Wednesday.

"Drones can find their place within the framework of the IRGC Navy's definitions of naval power which are different from the normal definitions in the world," he added.

Elsewhere, Fadavi underlined that Iran's power and capabilities are deterring the enemies from attacking Iran, and said, "Our main enemy is the Americans and not certain weak and little countries."

The IRGC Aerospace force enjoys high capabilities and has taken wide strides in building different home-made aircraft, including drones.

The Islamic Republic has so far unveiled various domestically produced drones, including Ababil, Fotros, Hazem, Karrar (long range attack drone), Mohajer, Sarir, Shahed 129, Yasir and Zohal.

IRGC Lieutenant Commander Brigadier General Hossein Salami said last year that the IRGC has developed a drone technology which has empowered its radar-evading pilotless aircraft to fly 3,000km nonstop for reconnaissance and combat missions.

"Our defensive achievements and tests have grown so much that we avoid releasing reports about them in order not to prevail a security atmosphere in the society," Salami said in Tehran.

Noting that Iran which one day merely test-fired short-range missiles is now in possession of high-precision long-range missiles, he said, "Today, our drones' 3,000-km operational range and their ability to carry out offensive operations is no more surprising to us."

Salami also said Iran rejects many arms sales proposals from foreign manufacturers as it can build more advanced weapons and equipment.

Associated Press
Experts: Clinton emails could have compromised CIA names
Wednesday, 08 June 2016
Byline: Staff report

Washington - The names of CIA personnel could have been compromised not only by hackers who may have penetrated Hillary Clinton's private computer server or the State Department system, but also by the release itself of tens of thousands of her emails, security experts say.
Clinton, the presumptive Democratic presidential nominee, turned over to the State Department 55,000 emails from her private server that were sent or received when she was secretary of state. Some contained information that has since been deemed classified, and those were redacted for public release with notations for the reason of the censorship.

At least 47 of the emails contain the notation "B3 CIA PERS/ORG," which indicates the material referred to CIA personnel or matters related to the agency. And because both Clinton's server and the State Department systems were vulnerable to hacking, the perpetrators could have those original emails, and now the publicly released, redacted versions showing exactly which sections refer to CIA personnel.

"Start with the entirely plausible view that foreign intelligence services discovered and rifled Hillary Clinton's server," said Stewart Baker, a Washington lawyer who spent more than three years as an assistant secretary of the Homeland Security Department and is former legal counsel for the National Security Agency.

If so, those infiltrators would have copies of all her emails with the names not flagged as being linked to the agency.

In the process of publicly releasing the emails, however, classification experts seem to have inadvertently provided a key to anyone who has the originals. By redacting names associated with the CIA and using the "B3 CIA PERS/ORG" exemption as the reason, "Presto -- the CIA names just fall off the page," Baker said.

The CIA declined to comment.

A U.S. official said the risk of the names of CIA personnel being revealed in this way is "theoretical and probably remains so at this time." The official, who did not have the authority to publicly address the matter, spoke on condition of anonymity and would not elaborate.

Steven Aftergood, who directs the Federation of American Scientists' Project on Government Secrecy, said even if any identities were revealed, they might be the names of analysts or midlevel administrators, not undercover operatives.

"I don't think there's any particular vulnerability here," Aftergood said.

Clinton has acknowledged that the email server, set up in the basement of her New York home, was a mistake. But she says she never sent or received anything that was marked classified at the time of transmission. Clinton, who was secretary of state from 2009 to 2013, insists the personal server she used was never actually breached.

The AP discovered last year that Clinton's private server was directly connected to the internet in ways that made it more vulnerable to hackers. A recent State Department inspector general's report indicated the server was temporarily unplugged by a Clinton aide at one point during attacks by hackers, but her campaign has said there's no evidence the server was hacked.

In each year from 2011 to 2014, the State Department's poor cybersecurity was identified by its inspector general as a "significant deficiency" that put the department's information at risk. Another State Department inspector general report revealed that hacking attempts forced Clinton off her private email at one point in 2011.

Then in 2014, the State Department's unclassified email system was breached by hackers with links to Russia. They stole an unspecified number of emails. The hack was so deep that State's email system had to be cut off from the internet while experts worked to eliminate the infestation.

Baker points out another instance where Clinton's server might have been hacked.

A March 2, 2009, email warned against State Department officials using Blackberries. Eric Boswell, assistant secretary of state, says the "vulnerabilities and risks associated with the use of Blackberries ... considerably outweigh their convenience."

Nine days later, another email states that Clinton approached Boswell and says she "gets" the risk. The email also said: "Her attention was drawn to the sentence that indicates we (the diplomatic security office officials) have intelligence concerning this vulnerability during her recent trip to Asia."

Clinton traveled to China, Indonesia, Japan and South Korea in February 2009.

Times of India
Doors open for India to military logistics, cutting-edge weaponry
Thursday, 09 June 2016
Byline: Rajat Pandit

New Delhi - Doors are now being yanked open for Indian armed forces to extend their operational reach in the critical Asia Pacific region and beyond with logistical help from the US, as also acquire some cutting-edge military products like the Predator surveillance and armed drones after joining the Missile Technology Control Regime (MTCR).
These, in effect, were the key takeaways in the defence sector from the flurry of announcements made after the Modi-Obama meet in Washington on Tuesday. The bilateral Logistics Exchange Memorandum of Agreement (LEMOA), which will now be inked after finalisation of its text, envisages Indian and American militaries providing logistics support, refuelling and berthing facilities to each other's warships and aircraft on an equal-value exchange basis seamlessly.

The LEMOA will give the US forces regular access to Indian military bases, which has led to some criticism about India surrendering its traditional strategic autonomy. But, as reported by TOI earlier, the pact will also allow Indian forces access to US bases ranging from Djibouti (Horn of Africa) and Diego Garcia (central Indian Ocean) to Guam (western Pacific) and Subic Bay (the Philippines).

The LEMOA basically revolves around "functional arr- angements" for exercises, joint trainings, port calls and HADR (humanitarian assist- ance and disaster relief) operations. Defence minister Manohar Parrikar and top officials have stressed the pact will not lead to any permanent stationing of US troops on Indian soil. India will also have the right to refuse logistical support for any US military action.

India's quest to acquire armed HALE (high-altitude, long endurance) drones or UAVs (unmanned aerial vehicles) as well as some key space technologies, in turn, will now become easier after joining the 34-member MTCR, which prevents proliferation of missiles and UAVs over the range of 300-km. India has been in talks with the US for acquiring Predator/Avenger drones, which have been used extensively in the Af-Pak region to take out terrorists with their deadly Hellfire missiles, for quite some time but not being an MTCR member was a major hurdle in the way till now.

Apart from the launch of the bilateral maritime security dialogue, the conclusion of a technical arrangement for sharing of commercial 'White Shipping' information between India and the US is another step towards promoting overall maritime domain awareness. India, incidentally, is trying to

finalise such pacts with over 25 countries from the African east coast to the western Pacific to strengthen maritime security from conventional as well as unconventional threats.

Categorisation of India as a 'Major Defence Partner' by the US on Tuesday is also a step forward, which will help process Indian applications faster through the American bureaucracy and control regulations. But it's still not enough to meet the aspirations of India, which has given arms co- ntracts worth over $13 billion to the US over the last decade.

ISIS kill list names '39 Brits' as terror targets its supporters should 'follow' and 'avenge for Muslims' (Canada)
Thursday, 09 June 2016
Byline: Stephen Jones

London - A pro-terrorist hacking group published and shared their addresses and email contact details on a secretive messaging app service - and urged to 'kill them strongly'
A pro- ISIS hacking group have published a list of names - including 39 Brits - as fresh terror targets on a chilling 'kill list'.

The United Cyber Caliphate (UCC) shared the full list of 8,318 people including their addresses and email contact details on a secretive messaging app service.

It urged its supporters to "follow" those listed - and "kill them strongly to take revenge for Muslims".

An image it attached to the posts declared: "All world can't stop Islamic State" - and talked of 'Ghosts' and a 'Caliphate Cyber Army' - together with a picture of a lone, masked and armed soldier wandering a battlefield.

It is one of the longest kill lists any ISIS-affiliated group has distributed to date - but the believed to be the first the group has issued to contain details of non-US citizens.

It is not known if the 39 Brits named are military or government workers - or people in the public eye like royalty or celebrities.

The list - written in both English and Arabic - was uncovered by the media group Vocativ which specialises in investigating the hidden side of the web. It discovered it on a messaging app service called Telegram on Monday night.

It said most of the names and the accompanying addresses listed "appear to belong to people in the United States, Australia, and Canada".

The numbers of people listed in each country were:

USA - 7,848

Canada - 312

Australia - 69

UK - 39

The rest of the people listed are reported to be from a variety of nations including: Belgium, Brazil, China, Estonia, France, Germany, Greece, Guatemala, Indonesia, Ireland, Israel, Italy, Jamaica, New Zealand, Trinidad and Tobago, South Korea and Sweden.

Read more: 'ISIS terrorists kidnap' terrified actress in sick TV prank that leaves her in tears

Vocativ last night refused to share further details of those named on the list.

Searches on the Telegram service on Wednesday failed to uncover any list - suggesting it had since been removed.

It is not clear if any of the information published was already available in the public domain or if it had been passed on to relevant authorities.

UCC has previously been criticised for 'taking credit for others' work' in a recent study by data and intelligence specialists Flashpoint.

An article in The Wall Street Journal last month claimed authorities were at odds over whether the lists pose an actual threat or are merely scare tactics.

Mirror Online has contacted the Home Office for comment.

Vocativ.com (US)
New ISIS 'Kill' List Claims To Target Thousands Of Americans (Canada)
Thursday, 09 June 2016
Byline: Gilad Shiloach

New York - A pro-ISIS "hacking" group calling itself the United Cyber Caliphate distributed its latest "kill" list this week. The group claims the list includes names, addresses, and email addresses belonging to 8,318 people, making it one of the longest target lists ISIS-affiliated groups have distributed.

In a post Vocativ uncovered on the messaging app Telegram that was written in both English and Arabic, the United Cyber Caliphate called on its supporters to "follow" those listed and "kill them strongly to take revenge for Muslims."

Most of the names and the accompanying addresses listed appear to belong to people in the United States, Australia, and Canada. Out of 7,848 people identified as being in the U.S. alone, 1,445 were listed as having addresses in California, 643 in Florida, 341 in Washington, 333 in Texas, 331 in Illinois, and 290 in New York. Another 312 names and addresses allegedly belong to people in Canada, while 69 allegedly belong to people in Australia. Another 39 are affiliated with the U.K. and the rest are listed with addresses in Belgium, Brazil, China, Estonia, France, Germany, Greece, Guatemala, Indonesia, Ireland, Israel, Italy, Jamaica, New Zealand, South Korea, Sweden and Trinidad and Tobago.

It is unclear, however, if the list, posted on Telegram on Monday, includes any new information or details that weren't already accessible online. It's also unclear why the specific names and addresses outlined were selected, and whether or not they're in some way related. The group that posted the directory is also dubious. A recent study by Flashpoint, an intelligence firm, showed that the United Cyber Caliphate--a merger of pro- ISIS groups--is incompetent when it comes to hacking. Their highest-profile "hack" involved taking credit for others' work, according to the study.

But the latest list shows how ISIS-linked groups claiming to be hackers persist with what has become a well-known--even if potentially superficial--tactic: posting "kill" lists calling on ISIS loyalists to attack everyone from Minnesota cops to State Department employees and ordinary Americans. Counterterrorism officials have been at odds over whether such lists are simply efforts to instill fear or instead truly threaten those listed, The Wall Street Journal reported.

The United Cyber Caliphate also published satellite images on its Telegram channel showing U.S air bases around the world on Monday. The same images can be found on Google Earth.

London Daily Telegraph
Terrorist groups acquiring the cyber capability to bring major cities to a standstill, warns GCHQ chief
Wednesday, 08 June 2016
Byline: Henry Bodkin

London - Terrorists and rogue states are gaining the capability to bring a major city to a standstill with the click of a button, the Director of GCHQ has warned.
In a rare public appearance, Robert Hannigan said the risk to cities like London would increase as more physical objects, such as cars and household appliances, are connected online - the so-called "internet of things".

Speaking at the Cheltenham Science festival, the intelligence chief warned that nation states were currently developing the kind of cyber programmes that could attack the UK, but that terrorist groups were also looking to take advantage of the technology.

"At some stage they will get the capability," he said.

"There are certainly states and groups with the intent to do it, terrorist groups, for example, who have no threshold when it comes to the loss of life.

"We're not quite there yet, but as the world becomes ever more connected that will become a greater risk."

Speaking as the controversial Investigatory Powers Bill passed its third reading in the House of Commons, Mr Hannigan also defended the surveillance of internet activity by the intelligence services, saying seven attacks against the UK had been foiled in the last 18 months due to bulk data analysis.

Pakistan Dawn
Seven Indian embassy websites hacked by group claiming Pakistan 'support'
Friday, 10 June 2016

Islamabad - Hackers claiming to be from Pakistan defaced websites of seven Indian embassies, high commissions, and consulates in various countries with pro-Pakistan Army slogans on Wednesday.
In an email sent to journalists, the hackers claimed to target Indian missions in Ankara, Athens, and Mexico City.

Missions in Sao Paulo, Brazil and Bucharest, Romania as well as Dushanbe, Tajikistan and South Africa's Pretoria were also defaced by the hackers referring to themselves as "Romantic" and "Intruder".

A screenshot of the Embassy of India in Athens' hacked website. The text defacing the sites of Dushanbe, Ankara and Athens read brief, jarring phrases such as "Don't Be Panic", "We Rock and U Shock", "Pakistan Zindabad", and "Feel the Power of Pakistan".

When Dawn.com attempted to access the seven sites, only Athens, Dushanbe, and Ankara seemed to be defaced, while the others appeared to be restored. A representative from the Indian High Commission in Islamabad declined to comment on the issue.

Cross-border hacking attacks have been sporadic yet common since at least 1998. The Lahore High Court's website has been hacked twice by Indian hackers recently, while Pakistani hackers have attacked National Institute of Technology (NIT) Raipur's website.

Jakarta Post
Indonesian Cyber Agency to Curb Rampant Cyber Attacks
Friday, 10 June 2016
Byline: News Desk

Jakarta - Lacking adequate cyber security, Indonesia is in a state of emergency following increasing incidents of cyber attacks mostly from within the country.
Indonesia is ranked second among countries where cyber attacks are launched and is the most prone to them, according to the office of the coordinating minister for political, legal and security affairs. Last year, the country had witnessed a fourfold increase in cybercrimes from 2014.

Cyber attacks in Indonesia rose 33 percent in 2015 compared to the previous year, Coordinating Political, Legal and Security Affairs Minister Luhut B. Pandjaitan stated recently.

In 2013, the quarterly State of the Internet Report by Akamai Technologies revealed that Indonesia had seen a massive increase in the number of cybercrimes and hacking attacks, so much so that Indonesia had pushed China out of the top spot for the Q2 2013 period.

Prevalence of cybercrimes and hacking in Indonesia was partially attributed to its lack of laws governing such crimes, the report said.

Meanwhile, Minister Pandjaitan believes that the country is in dire need of an agency that can coordinate on matters related to cyber defense.

Therefore, the government plans to set up a national cyber agency that will soon function as a coordinator for the country's cyber security. One of the agency's tasks would be to prepare a Bill on cyber security.

The agency would be formed based on a presidential decree and have a coordinating function, Air Vice Marshal Agus Ruchyan Barnas, chairman of the National Cyber Information Security and Resilience Desk of the Coordinating Ministry of Political, Legal and Security Affairs, said recently.

The agency would act as a coordinator for synergy, execution, and synchronization on everything related to cyber issues, without overstepping on the authority of other relevant institutions, he said. The desk has identified six cyber security categories.

The first category is Cyber Defense under the authority of the defense ministry and the defense forces based on the law on defense and the government regulation on State Territorial Spatial in their role as state defense.

The second category is Cyber Crime under the authority of the National Police and the Attorney Generals Office in their role in maintaining community and public orders.

The third category is Cyber Intelligence under the authority of the National Intelligence Agency (BIN) and the State Encryption Institution (Lemsaneg) in the roles such as early detection, early warning, and information security.

The fourth category is Cyber Security, which is under the authority of the communication and informatics ministry and the home affairs ministry in their roles and public service and demographic administration providers.

The fifth category is Cyber Resilience, which is under the authority of the political, legal and security affairs and the National Resilience Council (Wantanas) in coordination, synchronization, control, and defense roles.

The sixth category is Cyber Diplomacy, which is under the foreign ministry in its diplomatic role function.

Discussions on the plan to form the agency was held on January 6, 2015, by President Joko Widodo (Jokowi) and the cabinet secretary, the then Coordinating Minister for Political, Legal and Security

Affairs, Tedjo Edhy Purdijatno, Defense Minister Ryamizard Ryacudu, and Communication and Informatics Minister Rudiantara.

Cyber is a new space so it is normal if many institutions feel that they have the authority over the space and want to be a leading sector, according to him.

The BCN will not overlap with the authorities of other existing institutions, as it will have authorities not granted to any other institution.

"In line with a recommendation of the National Resilience Institute (Lemhannas), the BCN should become a regulator in managing, controlling, and coordinating cyber activities in Indonesia," he affirmed.

The Lemhannas had suggested the formation of BCN to the president through its study titled "Anticipation of Cyber Crime To Strengthen Security and Public Order for National Resilience," on August 19, 2014.

While conducting its coordinating tasks, the agency will not require a huge presence of personnel, he revealed. Relevant institutions will be accountable for the technical operations and implementation, he noted.

Indonesia is now in a state of cyber attack emergency due to the absence of a reliable instrument to offer protection against cyber attacks, he remarked.

Barnas expressed optimism that BCN would become a body that will boost cyber alertness and resilience in the country.

The vice marshal also believes that public awareness could minimize cyber threats and attacks, strengthen information resilience, and encourage information and knowledge sharing by establishing collaboration among various elements of the cyber sector, including academicians, and experts, as well as gray and white hackers.

Last year, the Jakarta Metropolitan police revealed that more and more international crime syndicates are using Indonesia as one of their bases for carrying out cybercrimes.

"Indonesia is no longer a destination for transnational crimes, but has slowly transformed into a hub for the operations of international crime syndicates," the Director of General Crime Investigation for the Jakarta Metropolitan Police Command, Senior Commissioner Krishna Murti, stated on Aug. 20, 2015.

He said several crime syndicates had entered Indonesia, organized their activities, rented places, and carried out criminal acts. "The criminals are recruited from China, and the main players are members of Yakuza, Japan," he revealed.

Murti drew this conclusion following a number of raids conducted on mostly young Chinese nationals, who were illegally residing in luxurious houses in Jakarta and were found to be equipped with various Internet-based and phone equipment.

On Aug. 20, 2015, for example, the Jakarta Metro Jaya Police detained 91 Chinese and Taiwanese nationals for allegedly committing transnational cybercrimes from Jakarta.

The Straits Times
Government e-services will not be affected by move to delink Internet access: Cyber Security Agency chief
Friday, 10 June 2016

Singapore - Government e-services will not be affected and public servants will still be able to respond to queries from citizens, said David Koh, chief executive of Singapore's Cyber Security Agency.
He was speaking to the media late Thursday (June 9) to address concerns from the public that government services would be affected following a decision to disallow Web surfing on the work computers of public servants from next May.

An online frenzy ensued after new broke on Wednesday that the 100,000 computers used by the public service would not have direct Internet access to keep work e-mail and shared documents safe.

Web surfing will still be allowed but only on employees' personal mobile devices. Non-sensitive e-mail can also be forwarded to personal accounts. Dedicated Internet terminals will be issued to those who need them for work..

Some criticised the Government for being backward while others made fun of the move memes such as a picture of a lady searching paper file cabinets as the way civil servants would work in the future.

Mr Koh spoke at length about why the Internet lockdown is necessary to keep citizen data safe. "Cyber security is key enabler for smart nation. We can't be a smart nation that is trusted and resilient if our systems are open and vulnerable," he said.

However, he said that Singapore is under constant attack by cyber criminals, gangs, hacktivists and even state actors.

So it is crucial to hive off Internet surfing to other machines that do not have access to the Government's internal networks and systems.

"This move of Internet surfing separation will significantly reduce the attack surface and make it harder for attackers to exploit our systems," he said. "As public servants, we have a duty and responsibility to protect the government and the citizens' information and data," he added.

The Straits Times
Government segregating secure systems, not cutting off Internet access for civil servants
Friday, 10 June 2016
Byline: Jeremy Au Yong

Washington - The move to stop web access on computers used by public servants is not an attempt to cut off the government from the Internet, but rather to segregate secure systems from activities like browsing, said Foreign Affairs Minister and Minister-In-Charge of the Smart Nation Initiative Vivian Balakrishnan in Washington on Thursday (June 9).
Responding to a question from The Straits Times about how to reconcile the recent move with the push to be a smart nation, Dr Balakrishnan said that the plan has occasionally been misconstrued as an attempt to shut off the government from the Internet. He stressed that the civil servants do need Internet access and will continue to have it.

"What we are really doing is not cutting off Internet access because, in fact, we all need Internet access on a daily basis in order to access information, in order to transact and in order to deliver information to our citizens," he said.

"So there is no possibility of cutting off ourselves from the Internet. What we are actually doing is segregating secure e-mail systems from other activities which you conduct on the Internet like browsing and transacting... Segregation is not the same as cutting off access."

The move is aimed at plugging potential leaks from work e-mail and shared documents amid heightened security threats.

The head of Singapore's Cyber Security Agency said that government e-services would not be affected and that public servants will still be able to respond to queries from citizens. He was speaking to reporters during a three-day working visit to the US capital.

The Straits Times reported on Wednesday that 100,000 public service computers will not have Internet access from next May. Web surfing can be done on employee's personal devices and dedicated Internet terminals will be issues to those who need them for work.

Dr Balakrishnan said the step was necessary in the name of cybersecurity and not incompatible with the idea of smart nation. "Cybersecurity is absolutely essential if we are to become a smart nation. You can't have electronic medical records, you can't have financial technology, you can't have large databases

with information that could be abused or misused, you can't afford a breach of privacy. So the way I look at it, cybersecurity is the flip side of the coin of being a smart nation," he said.

The foreign minister warned that the threat of cyber crime needed to be heeded. "Most people underestimate the dangers of breaches of our systems and the fact that there is a clear and present threat from espionage and criminal activity on the Internet. And the sooner people realise this and take steps, not just on the civil service but even individually to protect themselves, the better."

Prime Minister Lee Hsien Loong said on Thursday that the move was "absolutely necessary" to keep Government data secure. He added that he "locked down" from the Internet on his work computer at the beginning of the year. "It's a nuisance, it takes some getting used to, but you can do it."

Press Trust of India
With China on its mind, India set to export BrahMos cruise missile to Vietnam
Friday, 10 June 2016

New Delhi - India has stepped up efforts to sell an advanced cruise missile system to Vietnam and has at least 15 more markets in its sights, a push experts say reflects concerns in New Delhi about China's growing military assertiveness.
Selling the supersonic BrahMos missile , made by an Indo-Russian joint venture, would mark a shift for the world's biggest arms importer, as India seeks to send weapons the other way in order to shore up partners' defences and boost revenues.

The Narendra Modi government has ordered BrahMos Aerospace, which produces the missiles, to accelerate sales to a list of five countries topped by Vietnam, according to a government note viewed by Reuters and previously unreported. The others are Indonesia, South Africa, Chile and Brazil.

The Philippines is at the top of a second list of 11 nations including Malaysia, Thailand and United Arab Emirates, countries which had "expressed interest but need further discussions and analysis", the undated note added. A source familiar with the matter would only say the note was issued earlier this year.

New Delhi had been sitting on a 2011 request from Hanoi for the BrahMos for fear of angering China, which sees the weapon, reputed to be the world's fastest cruise missile with a top speed of up to three times the speed of sound, as destabilising.

Indonesia and the Philippines had also asked for the BrahMos, which has a range of 290km and can be fired from land, sea and submarine. An air-launched version is under testing.

Unlike Vietnam, the Philippines and Malaysia, India is not a party to territorial disputes in the South China Sea, a vital global trade route which China claims most of.

But India has an unsettled land border with China and in recent years has grown concerned over its powerful neighbour's expanding maritime presence in the Indian Ocean.

It has railed against China's military assistance to arch-rival Pakistan and privately fumed over Chinese submarines docking in Sri Lanka, just off the toe of India.

"Policymakers in Delhi were long constrained by the belief that advanced defence cooperation with Washington or Hanoi could provoke aggressive and undesirable responses from Beijing," said Jeff M Smith, director of Asian Security Programs at the American Foreign Policy Council in Washington.

"Prime Minister Modi and his team of advisers have essentially turned that thinking on its head, concluding that stronger defence relationships with the US, Japan, and Vietnam actually put India on stronger footing in its dealings with China."

India's export push comes as it emerges from decades of isolation over its nuclear arms programme. On June 7, India cleared all hurdles to become a member of the 34-member Missile Technology Control Regime (MTCR), a non-proliferation regime of which China is not a member. June 6 was the deadline for any member to object to a new entrant, and none had.

BrahMos's range means it falls short of the 300km limit set by the MTCR . India's accession to the MTCR may also strengthen its case for joining another non-proliferation body, the Nuclear Suppliers Group , a move China has effectively blocked. Both groups would give India greater access to research and technology.

BrahMos Aerospace, co-owned by the Indian and Russian governments, said discussions were underway with several countries on missile exports, but it was too early to be more specific. "Talks are going on, there will be a deal," said spokesman Praveen Pathak.

India is still a marginal player in global arms exports. The unit cost of the missile, fitted on Indian naval ships, is estimated at around $3 million.

India has been steadily building military ties with Vietnam and is supplying offshore patrol boats under a $100 million credit line, its biggest overseas military aid.

This week defence minister Manohar Parrikar held talks with his Vietnamese counterpart General Ngo Xuan Lich in Hanoi and both sides agreed to exchange information on commercial shipping as well as expand hydrographic cooperation, the Indian defence ministry said in a statement on Monday.

A source at the defence ministry said India was hoping to conclude negotiations on the supply of BrahMos to Vietnam by the end of the year.

The Indian government is also considering a proposal to offer Vietnam a battleship armed with the BrahMos missiles instead of just the missile battery, the source said.

"A frigate integrated with the BrahMos can play a decisive role, it can be a real deterrent in the South China Sea," the source said, adding New Delhi would have to expand the line of credit to cover the cost of the ship.

Indian warships are armed with configurations of eight or 16 BrahMos missiles each, while sets of two or four would go on smaller vessels.

A Russian official said exports of BrahMos to third countries was part of the founding agreement of the India-Russia joint venture. Only now India had armed its own military with the BrahMos was there capacity to consider exporting, he added.

Jerusalem Post
Why are terrorist groups allowed on Twitter?
Friday, 10 June 2016
Byline: Niv Elis

Jerusalem - News of the terrorist attack in Tel Aviv's Sarona Market had barely broken Wednesday night when Hamas leader Ismail Haniyeh took to Twitter to praise the slaughter.
"One of the #TelAviv bomber heroes. Mercy and light on the kindness of your soul," the former Hamas prime minister tweeted in Arabic at 10:45 p.m., alongside a picture of one of the attackers, shot in the street.

Haniyeh's Twitter account has been active since March 2012, and has 314,000 followers.

Khaled Mashaal, the group's leader, has had an account active since last May, now with 45,800 followers. The main Hamas Twitter page, active since October 2010, has 239,000 followers. It even has an English-language account to helpfully convey the organization's support of shooting innocents at a shopping center, dubbing it "a natural response to Israeli crimes."

What some Israeli counter- terrorism experts want to know is why Twitter, a US-based company, is not shutting down accounts belonging to organizations that the United States designates as terrorist groups.

"Essentially, the war against radical Islamic terror is occurring over social media," said Uzi Shaya, a former senior intelligence official. "So Twitter is facilitating terror, with full knowledge," he added.

Shaya admitted that the US government may lack legal support for shutting down social media pages for groups designated as terrorists, and says that legislation should be taken up to further the cause.

But Twitter, he noted, can act on its own. "Twitter is protected by a law of freedom of expression in the United States, but this is an absurd argument," he said.

Entities that are barred from opening a US bank account, he argues, should not be given a platform to spread their ideas through American companies. Beyond legal action, Twitter's own terms of service explicitly ban support for terrorism.

Accounts that "make threats of violence or promote violence, including threatening or promoting terrorism," may be suspended temporarily or permanently, the terms say. Further, they ban "hateful conduct," which includes promoting violence, attacking or threatening others on the basis of, among other thing, national origin or religious affiliation.

Twitter has acted on these problems in the past. In February, the company said that it had suspended 125,000 ISIS- linked accounts over the course of six months, that it was "horrified by the atrocities perpetrated by extremist groups," and that it condemned such behavior.

Indeed, it has also taken action against Hamas in the past, but unevenly. "There is not always a rhyme or reason," said Steve Stalinsky, the executive director of MEMRI, a group that monitors and translates extremist content from the Middle East with the aim of influencing US policy.

MEMRI, he said, has been monitoring jihadist and terrorist groups on Twitter for about 5 years, "and there's always been ebbs and flows on removing content.

"When we issued a report on the Kassam Brigades [the armed wing of Hamas], it was taken down right away. But then it came back," he said.

Twitter, which did not return requests for comment, said in its February blog post that it is working hard to identify and remove terrorist accounts, working with law enforcement, international bodies, foreign governments and NGOs to remove such pages.

"As many experts and other companies have noted, there is no 'magic algorithm' for identifying terrorist content on the Internet, so global online platforms are forced to make challenging judgment calls based on very limited information and guidance," the post said, alongside a vow to "aggressively enforce" the rules in the area.

But with the exception of the Izzadin Kassam Brigades, whose current account dates back 13 months, many of the current official Hamas pages have been around for years without interruption.

Shaya believes the company is still holding back on acting against Hamas pages. "It's not that they're hiding their identity. They're not. Terrorist organizations that are defined as terrorist organizations all over the world have pages on Twitter," he said.

When lawsuits linking terrorist social media accounts to specific attacks start rolling in, he suggested, the behavior might change, though legal experts believe such suits would face difficulties.

Still, Twitter's announcement on the ISIS account purge came just a month after Tamara Fields, an American woman who lost her husband to an ISIS attack, filed a lawsuit against the social media company.

Saudi Gazette
Accessing your internet browsing history is FBI's top legislative priority
Friday, 10 June 2016
Byline: Justin Yu

Undisclosed placeline - Tech firms and privacy groups are fighting back against an amendment that would give the FBI a top-level view of "electronic communication transactional records" (ECTRs) without the need for a warrant in terrorism and spy cases.
ECTRs include everything from the websites you've visited to how long you browsed a particular page. It's all up for grabs as part of an amendment to the Electronic Communications Privacy Act being considered this week by the Senate Judiciary Committee. The legislation would expand the government's ability to collect data using a National Security Letter, or NSL, which doesn't require a court order and typically includes a gag order saying the recipient cannot publicly acknowledge the letter.

FBI Director James Comey has said the amendment is needed to fix a typo in the ECPA that has hindered the bureau's ability to work in "a very, very big and practical way." As such, amending the existing surveillance laws has become a top priority for the FBI, Comey told a Senate Intelligence Committee in February

An FBI agent backed by an NSL could potentially "paint an incredibly intimate picture" of a person's life on the internet, said the American Civil Liberties Union in a letter sent Monday to lawmakers. Several privacy advocates and tech companies, including Facebook and Google, also signed the letter against the amendment.

Fars News Agency
Russian Fighter Jets Cut Off Terrorists' Communition Lines with Turkish Intelligence Agency
Friday, 10 June 2016

Tehran - The Russian air force targeted and destroyed the telecommunication towers in Northern Syria near the borders with Turkey and cut off the terrorists' internet and lines of communication with Turkey's MIT intelligence agency.

According to a report by al-Mayadeen news channel, the Russian warplanes smashed two telecommunication towers at the Syrian-Turkish borders, disconnecting the terrorists' contacts with the Turkish intelligence agency.

Other sources said the terrorists who have be caught off hand are now thinking of ways to reestablish their contacts with Turkey.

Earlier reports said that the European satellite operators give terrorists, specially the ISIL members, an opportunity to upload propaganda, exchange information and possibly even prepare terrorist attacks.

The ISIL members located in Syria and Iraq are gaining access to the Internet using opportunities offered by European satellite operators, Spiegel online wrote last year.

The communication is reported to be carried out via satellites of European companies Avanti Communications headquartered in the UK and Eutelsat in France.

According to the magazine, there are thousands of devices in Syria and Iraq, which enable terrorists to use the satellite Internet. Theoretically, everyone who wants to get online can do so only by using the satellite technology, as the telecommunications infrastructure in the country is destroyed.

However, for ordinary people living in the cities captured by the ISIL militants it is almost impossible. ISIL is controlling Internet access and prohibits private individuals from buying the required devices. Only members of the terrorist group have the right to use the Internet, others are being threatened with severe punishment. As reported by the magazine, the devices are being exported to Syria through Turkey.

Wall Street Journal
Not-Guilty Pleas in Hacking Case
Friday, 10 June 2016
Byline: Nicole Hong

New York - In their first U.S. court appearances, two Israeli men pleaded not guilty on Thursday to charges that they broke into computer networks of a dozen companies, including J.P. Morgan Chase & Co., to facilitate a global network of criminal activity.
Gery Shalon and Ziv Orenstein recently were extradited to the U.S. from Israel, where they had been in custody since their arrest last summer. At the time, a third defendant, Josh Aaron, had been at large. Mr. Aaron, a U.S. citizen, has since been arrested in Russia and is expected to be brought to the U.S., people familiar with the matter said.

Federal prosecutors accused the three men and their accomplices of carrying out data breaches at a dozen companies and turning the stolen information, including customers' email addresses and phone

numbers, into hundreds of millions of dollars. The hacking allegedly facilitated other crimes, including illegal internet casinos, pump-and-dump schemes, a payment-processing service for other criminals and an unlicensed bitcoin exchange.

Mr. Shalon's lawyer, Paul Shechtman, and Mr. Orenstein's lawyer, Alan Futerfas, didn't arranged for bail at Thursday's hearing in Manhattan federal court, so the two men will stay in federal custody.

Mr. Shechtman and Mr. Futerfas declined to comment. A lawyer for Mr. Aaron couldn't be identified.

In the alleged scheme, one of the biggest cyberattacks was against J.P. Morgan, the largest U.S. bank by assets, where the men stole the contact information of more than 83 million customers, according to officials.

Prosecutors also say the men orchestrated hacks into E*Trade Financial Corp., Scottrade Inc. and Dow Jones & Co., the parent of The Wall Street Journal.

Toronto Star
Why the meaningless hack attacks?
Friday, 10 June 2016
Byline: Vinay Menon

Analysis: Motivation guides all human behaviour.
For example, my wife often starts conversations with, "Can I ask you something?" Her true motivation is to tell me something. When she does, I listen and follow instructions because my motivation is to avoid sleeping in the shed.

We can extend the principle of core motivation to explain why members of groups often behave in similar ways: Politicians lie to snag votes. Marathoners run for the endorphin high. Firefighters risk their lives to rescue others. Birthday clowns are driven by a sadistic impulse to forever haunt our dreams.

As a species, I believe we are hard-wired to feel confused when not grasping where someone is coming from. It's a survival instinct. It's why we cross the street when a ruffian approaches or would freeze with disbelief if a car salesperson said, "Why don't we go to my office now so I can screw around with numbers and rip you off."

Donald Trump is a polarizing figure because his motivations are not clear.

Which brings us to the most baffling people in the universe right now: the rascals hacking into celebrity Twitter accounts for no apparent reason.

On Monday, Drake was hacked. On Tuesday, Lana Del Rey was hacked. This followed a spate of social media hijackings, including virtual violations of Katy Perry, Kylie Jenner, the NFL and Chelsea Handler.

As the Huffington Post noted: "It Appears Every Celebrity Twitter Account Is Being Hacked Right Now."

It does. But to what end?

Before we go any further, let me be clear: Hackers, I am not making fun of you. I'm not. Since I can barely recall my passwords - remind me to change my Star email to xd7wg43sasd+jgs68#?s after this column - I respect your ability to unearth ones you never created. So please do not steal my identity or pilfer my meagre RRSP or commandeer my texts unless you have time to send long overdue replies to distant relatives, in which case I'll give you the damn password.

I'm just trying to understand your motivation.

Consider what happened over the weekend, when multiple celebrity accounts were hacked. Someone gained access to Tame Impala's feed and sent out a fake bomb threat. Someone subverted Bon Iver and changed the handle to @ihavelegcancer. Someone assumed control of Keith Richards' account and used the opportunity to write: "i love killing people and blowing s--t up lmaooooo ima bomb..."

The person who slipped into Lana Del Rey's account fooled nobody with eyeball emoji, racist messages ("all muslims are terrorists"), dated conspiracies ("bush did 911") and sophomoric word play ("lana del GAY").

You have an audience of six million and this is your command performance?

Why not just cut-and-paste a knock-knock joke or dirty limerick?

This is hackneyed hacking and it's a hack at the heart of anyone who believes hacking should at least be a creative dark art. Come on, hackers. Use your new-found power to negotiate a ransom. Land a record deal. Set up a date with another celebrity. Say something so profound, it earns you a hefty book advance. Encourage your new followers to send over a pizza.

Do something.

The person who hacked Jenner's account was so tediously predictable with the impersonation - "I love being so famous with no talent" - Jenner barely yawned. She instead posted a clip on Snapchat and said, "So my Twitter was hacked and I don't really care. I'm just letting him have fun."

Now that is a slap in the face. It's like a carjacking that ends with the owner giving the pistol-pointing thief gas money and directions for the best possible getaway. And where is the fun in posting

scatological juvenilia or toothless barbs or death hoaxes for Jack Black or NFL commissioner Roger Goodell? What is the motivation? What is the higher purpose? What is the point?

Lately, it's like the hackers don't even know who they are pretending to be. The person who took over George Harrison's account this week encouraged the ex-Beatle to message him to regain access, unaware such an exchange would need to be routed through the Pearly Gates since Harrison died 15 years ago.

So what does the hacker do next? He apologizes.

They should all be sorry for wasting our time. We are exposed to enough dreck from real celebrities. The fake stuff should at least be enlightening.

Univ. of Calgary Pays Hacker After Ransomware Attack
Friday, 10 June 2016
Byline: Staff Writer

Calgary - The University of Calgary paid $20,000 Canadian dollars to restore access to its computer network after a ransomware attack paralyzed the campus May 28.
University officials paid the hacker June 7 and received a decryption key that is being used to restore faculty access to previously blocked online databases, including email servers.

Vice President of Finances and Services Linda Dalgetty says the university paid the hacker "because we do world-class research here and we did not want to be in a position that we had exhausted the option to get people's potential life work back in the future if they came today and said 'I'm encrypted, I can't get my files.' We did that solely so we could protect the quality and the nature of the information we generate at the university."

When university officials realized some network access was restricted, the IT department attempted to isolate the effects of the attack. CBC.ca reports that the decryption included a note confirming it was a ransomware attack.

The university also worked with Calgary Police Services, which continues investigating the attack, and consulted with various cybersecurity experts.

Although the full extent of the cyberattack has not been revealed, the university confirmed that email servers were affected. The attack made faculty and staff emails inaccessible, although university officials do not believe student emails were ever compromised.

Still, administrators initially advised students not to connect their computers to the school network.

After paying the hackers in bitcoin, administrators received a decryption key. The university confirmed that the decryption key works, but it has taken several days to decrypt all of their files.

Ransomware decryption keys can differ depending on what the hacker's intentions are and the type of malware used in the attack. Some decryption keys will fully restore access to a computer network automatically, but that doesn't appear to be the case at the University of Calgary.

Campus Safety magazine has reported on institutions paying a ransom only for the hackers to demand a second ransom. Other institutions have effectively responded to ransomware attacks and regained access to their network without paying a fee. Campus Safety has also looked at how seven different institutions handled ransomware attacks with varying levels of success.

Although there's significant uncertainty about the best way to respond to a ransomware attack (paying ransoms should be considered a last resort), cybersecurity experts seem to be in agreement that it's a growing threat that institutions need to prepare themselves for.

Ottawa Citizen
Local tech firm gets U.S. intelligence funds
Friday, 10 June 2016
Byline: Vito Pilieci

Ottawa - Computer security company Interset has attracted an undisclosed amount of investment from American venture capital firm In-Q- Tel, the organization that invests in firms and technology on behalf of the Central Intelligence Agency and the Federal Bureau of Investigation in the United States The major news comes a little over a year after the small, 60- employee company announced a $10-million round of financing, which it planned to use to improve its computer-security technologies and expand its operations.
The investment from In-Q-Tel is a major shot in the arm for the Ottawa firm, which can now say that it has received something akin to a seal of approval from some of the world's leading intelligence and security organizations.

"After a rigorous evaluation and due diligence process, Interset demonstrated how anomalous behaviours can be accurately surfaced and conveyed with actionable information, allowing government security experts to focus on mitigating risks and stopping attacks that may threaten our safety," said Dale Quayle, chief executive officer at Interset in a statement released Thursday. "U.S. intelligence and law-enforcement communities have long sought to protect critical data with an approach that surfaces attacks faster and more accurately, in a highly contextual, proactive way."

Originally incorporated in 2001 as GridIron Software, Interset has been bumping along various paths to the business it is today. The Ottawa company began life with a product that helped businesses use

networked computing and eventually evolved into FileTrek Software to help manage multiple computers across a network while tracking data that might be sent to cloud-computing servers.

Those earlier versions collected more than $16 million over the years, but Quayle realized that if he stripped away the noise, the company actually had a novel security product with little competition.

The company's expertise in tracking and monitoring large amounts of complex data led to a suite of security tools, which were eventually called the Interset Advanced Threat Detection Platform. The tools can be used to track an employee's data use across large corporate networks and set offalarm bells if someone tries to tamper with sensitive files without authorization. For example, an employee who regularly accesses a certain set of files every day would be flagged if they suddenly reached out for sensitive information on the network. The alarm could signal that the employee is stealing information or that their computer has been compromised. In the case that the employee was actually authorized to access the sensitive files, an investigation by corporate IT workers could be quickly dismissed. According to documents that were leaked online, Interset was invited to attend an In-Q-Telhosted "CEO Summit" in February. The annual event invites computer and network security firms to showcase their products in a bid to get noticed by the U.S. government. The event was attended by James Comey, director of the FBI, and Robert Work, U.S. deputy secretary of defence, among other prominent U.S. government officials.

Canberra Times
Students to form cyber militia and study hacks
Friday, 10 June 2016
Byline: Henry Belot

Canberra - Students at a Canberra university will form the future of a cyber security militia capable of defending national infrastructure and studying tactics of hacker armies in North Korea and Iran. UNSW Canberra professor Greg Austin, who has previously warned of glaring holes in Australia's cyber security policy, said many of his students were Australian Defence Force personnel and extremely capable.
"Australia is at a historic choice point when it comes to cyber defence," he said.
"We will have to build a cyber militia soon, and we need research and debate now on what that looks like. "We have found the students have a high level of capability and can work together to develop advanced policy ideas and we want to put them to the test." He said students would study "the hacker armies of Iran and North Korea, the tactics of Anonymous and WikiLeaks, and the development of cyber reserve forces in the UK, USA, Israel and Estonia".

Professor Austin, an executive with the Australian Centre for Cyber Security, said the coursework would produce graduates capable of working with the government of defence to protect infrastructure. "We need to think about a new form of organisation that is not a traditional part of the defence force,

but a halfway point between civilian life and the army reserve." Prime Minister Malcolm Turnbull launched a new $230 million strategy to bolster cyber security in April with an acknowledgement Australia was prepared to take offensive action to protect the national interest. The funding boost came after $400 million was allocated for staff with hacking experience at the Australian Signals Directorate and the announcement of 800 new intelligence and cyber roles within the Department of Defence.

"The Defence White Paper and the national cyber security strategy foreshadowed great leaps in technological advancement, but we are not quite hitting the mark when it comes to protecting our critical infrastructure or fighting cybercrime."

In the past six months, the computer system at the Bureau of Meteorology experienced a "massive breach", believed to have originated in China, and it was reported that 97 federal agencies were told to encrypt more data amid "hundreds" of attempted intrusions a month. Professor Austin said a national cyber security college was "urgently needed" and hoped his coursework would stimulate a conversation about a national curriculum.

But he has warned many Australians do not understand the risks cybercrime posed and, as a result, are unlikely to support large-scale investments by the government.

Police widen boy hacker case
Friday, 10 June 2016
Byline: Sean Fewster

Canberra - An Adelaide teenager already facing a maximum 10-year jail term for hacking three secure websites is now a suspect in other acts of cyber crime, a court has heard.
The case against the boy, 15, of Woodcroft, was expected to be resolved by way of a plea bargain in the Christies Beach Youth Court yesterday.

Instead, Brevet Sergeant Kimberly White, for SA Police, asked it be adjourned while detectives ran a further investigation into the boy's alleged online activities. "There are some other matters that detectives are investigating at the moment, and they may potentially lead to further charges being filed," she said.

"The defendant is not here ... his counsel assures me he is willing to attend court.

"But I ask the court to issue an arrest warrant to activate (if he does not attend) on the next occasion."
The boy, who cannot be identified under SA law, has yet to plead to three counts of unauthorised impairment of computer systems.

Under the terms of his bail, he is banned from using the internet for any reason. If convicted, he faces a maximum 10-year jail term.

Police have alleged the offences occurred at Reynella on March 10, and at Woodcroft on April 4 and 6 this year.

Court documents allege he "directly caused an unauthorised impairment of electronic communications, knowing the impairment was unauthorised, and caused inconvenience".

The boy's arrest followed a two-week battle by Adelaide-based internet service provider NuSkope to defend itself, Reynella East College and a government agency from cyber attack. The agency has not been named in court.

It is alleged the incident was one of Australia's largest-ever denial-of-service attacks - a hack in which a targeted website is flooded with data requests, causing it to crash.

It is alleged about 10,000 NuSkope customers were affected by the incident. The boy has insisted he meant no harm and staged the attack "simply to see if he could".

Yesterday, Sgt White said she had spoken to the boy's lawyer, James Caldicott, about the change in circumstances.

"There is a need for the prosecution to have time to investigate these further matters," she said. "He asked that he and his client's attendance be excused ... I don't oppose that, but I ask for the warrant." Magistrate Kym Boxall declined, saying the boy's bail conditions were sufficient, and adjourned the case until August.An SA Police spokeswoman told The Advertiser: "As a matter of normal policy, SA Police don't provide details about active investigations and nor do we comment about matters before the courts."

Gloucestershire Echo
Bill on GCHQ's intercept powers passes Commons vote with huge majority
Friday, 10 June 2016
Byline: Aled Thomas

Cheltenham - The Investigatory Powers Bill, which updates the regulation surrounding GCHQ's work come a step closer to becoming law this week.
MPS voted by an overwhelming majority to pass the bill on its third reading in the House of Commons, with labour MPs joining Conservatives to see the Bill pass the vote by 444 votes to 69

The proposals will now go to the House of Lords before returning to the Commons for the final vote and then Royal Assent.

But the government has promised a review by an David Anderson QC into how powers of 'bulk access' to internet data should be used, in a concession to Labour MPs to allow the bill to pass.

The bill seeks to update and formalise the powers of data access used by law enforcement and security and intelligence services including Cheltenham's GCHQ, the UK's signals intelligence (Sigint) authority.

It replaces the communications data Bill which was introduced by the Coalition government, but ditched when the Liberal Democrats refused to support what was criticised as a snooper's charter.

Security Minister at the Home Office, John Hays said: "We have always been clear that we will listen and respond to the constructive views of politicians from all sides of the House to ensure passage of this important bill. We have encouraged rigorous scrutiny and are willing to act in the interest of both improving the bill and demonstrating the necessity of the powers it contains."

Cheltenham MP Alex Chalk, who voted for the Bill at its third reading this week, had said in March after its second reading that it wasn't 'the finished article.'

But he said changes made to the Bill after the committee and report stage had improved it: "The Investigatory Powers Bill is arguably the most important piece of legislation for a decade. It is fundamentally about giving our intelligence agencies the tools they need to get on even terms with terrorists and serious criminals, enabling the authorities to foil plots before they cause carnage. It's vital because the current measures available to our agencies are confusing and out of date. They are analogue provisions in a digital age. This Bill is about restoring capabilities that have been lost, partly as a result of the Snowden leaks, and partly as a result of changes in the way people communicate.

"I was one of the critics of the Bill in its early stages. The early draft put too much power in the hands of one person, the Home Secretary, to decide on whether to authorise intrusive measures like equipment interference warrants. I wanted to see independent judges involved in the process. The Government listened. Now there is a vital 'double-lock' mechanism, which means that warrants issued by Theresa May will have to be reviewed by independent judicial commissioners, who can assess if they are fair. If not, they will be struck down. It's a vital safeguard for our liberty.

"I also said openly at the Second Reading stage (before the Bill goes into committee for line by line scrutiny) that the Bill needed further work in several areas. What has taken place in committee has been hugely impressive. Hundreds of amendments have been suggested and debated. Different parties have come together to work hard in the national interest to improve the legislation.

Mr Chalk added: "The key remaining issue is over whether the agencies should have powers to collect bulk data. They already have them of course. Now the Government has published a strong operational case for bulk powers alongside the Bill, giving unprecedented detail on why the agencies need their existing powers, and how they are used. The core argument in favour is that you can't sensibly find the

needle in the haystack (where the 'needle' might be the vital information you need to thwart an atrocity) unless you've got access to the haystack in the first place. But to address any last lingering vestige of concern, Theresa May (wisely in my view) agreed to establish an independent review to examine the operational case for these powers. It will be led by David Anderson QC, and it will report back on whether these powers really are necessary before the Bill reaches its final stages. All the parties have confidence in David Anderson, and so this step should provide real comfort to those who want to see the strongest possible case made.

"What it comes to is this: in light of the enormous progress that has been made, this Bill has been moulded into a world-leading code that will help keep our country safe, whilst protecting our essential liberties. That conclusion is widely held across the political spectrum, and is reflected in the fact that Conservatives, Labour, DUP, UUP and Independents all came together to vote for the IP Bill at Third Reading.

"It is perplexing and disappointing that the Lib Dems voted against this Bill. I'm afraid I think that was a profound misjudgement. The threat to our country is real and we need this legislation urgently. Obstructing it is a mistake."

Harmit Kambo, campaign manager for Privacy International, who has criticised the bill and the powers it gives to security agencies said the review by Mr Anderson was "long overdue" after "the government had repeatedly failed to justify to the public collecting and retaining data keeps us safe."

Wall Street Journal
Emails in Clinton Probe Dealt With Planned Drone Strikes
Friday, 10 June 2016
Byline: Adam Entous, Devlin Barrett

Washington - At the center of a criminal probe involving Hillary Clinton's handling of classified information is a series of emails between American diplomats in Islamabad and their superiors in Washington about whether to oppose specific drone strikes in Pakistan.
The 2011 and 2012 emails were sent via the "low side"--government slang for a computer system for unclassified matters--as part of a secret arrangement that gave the State Department more of a voice in whether a Central Intelligence Agency drone strike went ahead, according to congressional and law-enforcement officials briefed on the Federal Bureau of Investigation probe.

Some of the emails were then forwarded by Mrs. Clinton's aides to her personal email account, which routed them to a server she kept at her home in suburban New York when she was secretary of state, the officials said. Investigators have raised concerns that Mrs. Clinton's personal server was less secure than State Department systems.

The vaguely worded messages didn't mention the "CIA," "drones" or details about the militant targets, officials said.

The still-secret emails are a key part of the FBI investigation that has long dogged Mrs. Clinton's campaign, these officials said.

They were written within the often-narrow time frame in which State Department officials had to decide whether or not to object to drone strikes before the CIA pulled the trigger, the officials said.

Law-enforcement and intelligence officials said State Department deliberations about the covert CIA drone program should have been conducted over a more secure government computer system designed to handle classified information.

State Department officials told FBI investigators they communicated via the less-secure system on a few instances, according to congressional and law-enforcement officials. It happened when decisions about imminent strikes had to be relayed fast and the U.S. diplomats in Pakistan or Washington didn't have ready access to a more-secure system, either because it was night or they were traveling.

Emails sent over the low side sometimes were informal discussions that occurred in addition to more-formal notifications through secure communications, the officials said.

One such exchange came just before Christmas in 2011, when the U.S. ambassador sent a short, cryptic note to his boss indicating a drone strike was planned. That sparked a back- and-forth among Mrs. Clinton's senior advisers over the next few days, in which it was clear they were having the discussions in part because people were away from their offices for the holiday and didn't have access to a classified computer, officials said.

The CIA drone campaign, though widely reported in Pakistan, is treated as secret by the U.S. government. Under strict U.S. classification rules, U.S. officials have been barred from discussing strikes publicly and even privately outside of secure communications systems.

The State Department said in January that 22 emails on Mrs. Clinton's personal server at her home have been judged to contain top-secret information and aren't being publicly released. Many of them dealt with whether diplomats concurred or not with the CIA drone strikes, congressional and law-enforcement officials said.

Several law-enforcement officials said they don't expect any criminal charges to be filed as a result of the investigation, although a final review of the evidence will be made only after an expected FBI interview with Mrs. Clinton this summer.

One reason is that government workers at several agencies, including the departments of Defense, Justice and State, have occasionally resorted to the low-side system to give each other notice about sensitive but fast-moving events, according to one law-enforcement official.

When Mrs. Clinton has been asked about the possibility of being criminally charged over the email issue, she has repeatedly said "that is not going to happen." She has said it was a mistake to use a personal server for email but it was a decision she made as a matter of convenience.

Clinton campaign spokesman Brian Fallon said: "If these officials' descriptions are true, these emails were originated by career diplomats, and the sending of these types of emails was widespread within the government."

U.S. officials said there is no evidence Pakistani intelligence officials intercepted any of the low-side State Department emails or used them to protect militants.

State Department spokesman Mark Toner said the agency "is not going to speak to the content of documents, nor would we speak to any ongoing review."

The email issue has dogged Mrs. Clinton for more than a year. Despite her success in nailing down the Democratic presidential nomination, polls show many voters continue to doubt her truthfulness and integrity. Her campaign manager has acknowledged the email matter has hurt her.

Republican rival Donald Trump has attacked Mrs. Clinton repeatedly on the issue, calling her "Crooked Hillary," saying what she did was a crime and suggesting the Justice Department would let her off because it is run by Democrats.

Beyond the campaign implications, the investigation exposes the latest chapter in a power struggle that pits the enforcers of strict secrecy, including the FBI and CIA, against some officials at the State Department and other agencies who want a greater voice in the use of covert lethal force around the globe, because of the impact it has on broader U.S. policy goals.

In the case of Pakistan, U.S. diplomats found themselves in a difficult position.

Despite being treated as top secret by the CIA, the drone program has long been in the public domain in Pakistan. Television stations there go live with reports of each strike, undermining U.S. efforts to foster goodwill and cooperation against militants through billions of dollars in American aid.

Pakistani officials, while publicly opposing the drone program, secretly consented to the CIA campaign by clearing airspace in the militant- dense tribal areas along the Afghan border, according to former U.S. and Pakistani officials.

CIA and White House officials credit a sharp ramp-up in drone strikes early in Mr. Obama's presidency with battering al Qaeda's leadership in the Pakistani tribal areas and helping protect U.S. forces next door in Afghanistan. Targets have also included some of the Pakistan government's militant enemies.

In 2011, Pakistani officials began to push back in private against the drone program, raising questions for the U.S. over the extent to which the program still had their consent.

U.S. diplomats warned the CIA and White House they risked losing access to Pakistan's airspace unless more discretion was shown, said current and former officials. Within the administration, State Department and military officials argued that the CIA needed to be more "judicious" about when strikes were launched. They weren't challenging the spy agency's specific choice of targets, but mainly the timing of strikes.

The CIA initially chafed at the idea of giving the State Department more of a voice in the process. Under a compromise reached around the year 2011, CIA officers would notify their embassy counterparts in Islamabad when a strike in Pakistan was planned, so then-U.S. ambassador Cameron Munter or another senior diplomat could decide whether to "concur" or "non-concur." Mr. Munter declined to comment.

Diplomats in Islamabad would communicate the decision to their superiors in Washington. A main purpose was to give then-Secretary of State Clinton and her top aides a chance to consider whether she wanted to weigh in with the CIA director about a planned strike.

With the compromise, State Department-CIA tensions began to subside. Only once or twice during Mrs. Clinton's tenure at State did U.S. diplomats object to a planned CIA strike, according to congressional and law-enforcement officials familiar with the emails.

U.S. diplomats in Pakistan and Washington usually relayed and discussed their concur or non-concur decisions via the State Department's more-secure messaging system. But about a half-dozen times, when they were away from more-secure equipment, they improvised by sending emails on their smartphones about whether they backed an impending strike or not, the officials said.

The time available to the State Department to weigh in on a planned strike varied widely, from several days to as little as 20 or 30 minutes. "If a strike was imminent, it was futile to use the high side, which no one would see for seven hours," said one official.

Adding to those communications hurdles, U.S. intelligence officials privately objected to the State Department even using its high-side system. They wanted diplomats to use a still-more-secure system called the Joint Worldwide Intelligence Community Systems, or JWICs. State Department officials don't have ready access to that system, even in Washington. If drone-strike decisions were needed quickly, it wouldn't be an option, officials said.

Some officials chafed at pressure to send internal deliberations through intelligence channels, since they were discussing whether to push back against the CIA, congressional officials said.

The Wall Street Journal first reported on the State Department-CIA tug-of-war over the drone program in 2011.

Under pressure to address critics abroad, Mr. Obama pledged to increase the transparency of drone operations by shifting, as much as possible, control of drone programs around the world to the U.S. military instead of the CIA. An exception was made for Pakistan.

But even in Pakistan, Mr. Obama recently signaled a shift. The drone strike that killed Taliban leader Mullah Akhtar Mansour last month was conducted by the military, not the CIA, and the outcome was disclosed.

While the CIA still controls drones over the tribal areas of Pakistan near Afghanistan, the pace of strikes has declined dramatically in recent years. U.S. officials say there are fewer al Qaeda targets there now that the CIA can find.

Fars News Agency
ISIL Posts Online Target List Including British, American, Canadian, Australian Residents
Friday, 10 June 2016

Tehran - The ISIL hackers posted the full names and home addresses of around 8,000 "targets" and urged extremist sympathizers to "kill them strongly" in a chilling new online threat.
The list includes 39 British residents as well as 7,848 Americans, 312 Canadians and 69 Australians which it wants murdered "as revenge", Daily Express reported.

It is not known if the list, which was published in English and Arabic, consisted of new names or those featured in earlier kill lists posted by the warped online ISIL activists.

Hackers claiming to be from the 'Cyber Caliphate' also posted satellite images of US air bases on its Telegram account, but the same images could be found on Google Earth.

The United Cyber Caliphate has previously published similar lists, such as one in 2015 revealing the full names of 3,600 New York residents as well as their addresses underneath the headline: "We Want Them #Dead."

The twisted online fanatics also reportedly hacked into US State Department records last year and released private information about 43 employees it wanted executed.

In November 2015, the cyber terrorists leaked details of 54,000 Twitter accounts, including passwords, in a show of online power that sent shockwaves through social media.

According to a report by American intelligence firm Flashpoint, the United Cyber Caliphate was formed in April 2015 after a merger of several radical hacking groups.

But the report also revealed that the collective is "poorly organized". It is not known if there have already been any attacks on the individuals named on any of the terrorists' lists.

Dotcom, Assange warn of hacking

Sunday, 26 June 2016

Byline: Chris Zappone

Section: general

Canberra - Did Kim Dotcom warn the world the Democratic Party hacking was coming? Megaupload founder Kim Dotcom said last year he knew of information that would create an obstacle for Hillary Clinton's 2016 presidential election bid, explaining WikiLeaks' Julian Assange would prove a thorn in the side of the presumptive presidential candidate.
Last week a hacker going by the name Guccifer 2.0 released what appeared to be the Democratic Party's research on presumptive Republican nominee Donald Trump.

The hacker has since produced more reports with alleged information about Mrs Clinton's donors. Mr Assange, who reportedly holds the rest of the Democratic Party hack information, says more will soon be released.

When contacted about future data releases, WikiLeaks replied only: "We have a very big publishing year ahead." While hacks of US presidential campaigns have happened before, the prospect of hackers - especially ones backed by a foreign nation - dumping US election- related data during the campaign and for the global public's consumption is new.

It's significant that the Russian actions against US political targets were potentially tipped months earlier. In the shadowy world of the cyber competition, attributions of hacking is often as slow as seven months after they are discovered.Mr Dotcom's warning suggested evidence of such an attack was available months before the event was revealed. Guccifer 2.0 said his hacking effort had been under way for almost a year. Based on the nature and details of the attack, independent researchers in the US concluded the hack was conducted by a group linked to the Russian government.

Asked this week if the information Mr Assange claimed to have on Mrs Clinton's campaign came from Russian hacks, Mr Dotcom replied: "No comment." Earlier this month, Mr Assange said his site would provide enough evidence to indict Mrs Clinton. Although Mrs Clinton is the subject of investigations over her handling of emails, Mr Assange admitted it was unlikely the US Justice Department would indict her based on whatever information he had.

Mr Assange, who has lived at the Ecuadorian embassy in London since 2012 to avoid a series of extraditions that could have him tried in the US for his role in the Cablegate leak, is considered friendly to Russian interests. Mr Assange claims to have helped former NSA contractor Edward Snowden travel to Russia.

Reuters

Google, Facebook quietly move toward automatic blocking of extremist videos

Saturday, 25 June 2016

Section: general

San Francisco and Washington-- Some of the web's biggest destinations for watching videos have quietly started using automation to remove extremist content from their sites, according to two people familiar with the process.
The move is a major step forward for internet companies that are eager to eradicate violent propaganda from their sites and are under pressure to do so from governments around the world as attacks by extremists proliferate, from Syria to Belgium and the United States.

YouTube and Facebook are among the sites deploying systems to block or rapidly take down Islamic State videos and other similar material, the sources said.

The technology was originally developed to identify and remove copyright-protected content on video sites. It looks for hashes," a type of unique digital fingerprint that internet companies automatically assign to specific videos, allowing all content with matching fingerprints to be removed rapidly.

Such a system would catch attempts to repost content already identified as unacceptable, but would not automatically block videos that have not been seen before.

The companies would not confirm that they are using the method or talk about how it might be employed, but numerous people familiar with the technology said that posted videos could be checked against a database of banned content to identify new postings of, say, a beheading or a lecture inciting violence.

The two sources would not discuss how much human work goes into reviewing videos identified as matches or near-matches by the technology. They also would not say how videos in the databases were initially identified as extremist.

Use of the new technology is likely to be refined over time as internet companies continue to discuss the issue internally and with competitors and other interested parties.

In late April, amid pressure from U.S. President Barack Obama and other U.S. and European leaders concerned about online radicalization, internet companies including Alphabet Inc's YouTube, Twitter Inc, Facebook Inc and CloudFlare held a call to discuss options, including a content-blocking system put forward by the private Counter Extremism Project, according to one person on the call and three who were briefed on what was discussed.

The discussions underscored the central but difficult role some of the world's most influential companies now play in addressing issues such as terrorism, free speech and the lines between government and corporate authority.

None of the companies at this point has embraced the anti- extremist group's system, and they have typically been wary of outside intervention in how their sites should be policed.

It's a little bit different than copyright or child pornography, where things are very clearly illegal," said Seamus Hughes, deputy director of George Washington University's Program on Extremism.

Extremist content exists on a spectrum, Hughes said, and different web companies draw the line in different places.

Most have relied until now mainly on users to flag content that violates their terms of service, and many still do. Flagged material is then individually reviewed by human editors who delete postings found to be in violation.

The companies now using automation are not publicly discussing it, two sources said, in part out of concern that terrorists might learn how to manipulate their systems or that repressive regimes might insist the technology be used to censor opponents.

There's no upside in these companies talking about it," said Matthew Prince, chief executive of content distribution company CloudFlare. Why would they brag about censorship?"

The two people familiar with the still-evolving industry practice confirmed it to Reuters after the Counter Extremism Project publicly described its content-blocking system for the first time last week and urged the big internet companies to adopt it.

WARY OF OUTSIDE SOLUTION

The April call was led by Facebook's head of global policy management, Monika Bickert, sources with knowledge of the call said. On it, Facebook presented options for discussion, according to one participant, including the one proposed by the non-profit Counter Extremism Project.

The anti-extremism group was founded by, among others, Frances Townsend, who advised former president George W. Bush on homeland security, and Mark Wallace, who was deputy campaign manager for the Bush 2004 re-election campaign.

Three sources with knowledge of the April call said that companies expressed wariness of letting an outside group decide what defined unacceptable content.

Other alternatives raised on the call included establishing a new industry- controlled nonprofit or expanding an existing industry-controlled nonprofit. All the options discussed involved hashing technology.

The model for an industry-funded organization might be the nonprofit National Center for Missing and Exploited Children, which identifies known child pornography images using a system known as PhotoDNA. The system is licensed for free by Microsoft Corp.

Microsoft announced in May it was providing funding and technical support to Dartmouth College computer scientist Hany Farid, who works with the Counter Extremism Project and helped develop PhotoDNA, to develop a technology to help stakeholders identify copies of patently terrorist content."

Facebook's Bickert agreed with some of the concerns voiced during the call about the Counter Extremism Project's proposal, two people familiar with the events said. She declined to comment publicly on the call or on Facebook's efforts, except to note in a statement that Facebook is exploring with others in industry ways we can collaboratively work to remove content that violates our policies against terrorism."

In recent weeks, one source said, Facebook has sent out a survey to other companies soliciting their opinions on different options for industry collaboration on the issue.

William Fitzgerald, a spokesman for Alphabet's Google unit, which owns YouTube, also declined to comment on the call or about the company's automated efforts to police content.

A Twitter spokesman said the company was still evaluating the Counter Extremism Project's proposal and had not yet taken a position."

A former Google employee said people there had long debated what else besides thwarting copyright violations or sharing revenue with creators the company should do with its Content ID system. Google's system for content-matching is older and far more sophisticated than Facebook's, according to people familiar with both.

Lisa Monaco, senior adviser to the U.S. president on counterterrorism, said in a statement that the White House welcomed initiatives that seek to help companies better respond to the threat posed by terrorists' activities online.

The post Google, Facebook quietly move toward automatic blocking of extremist videos appeared first on Cyprus Mail.

Cybersecurity threat 'keeps us up at night,' says Hydro Ottawa CEO

Saturday, 25 June 2016

Byline: Staff Writer

Section: general

Ottawa- As the electricity grid becomes more and more connected to the internet, Hydro Ottawa says it's investing heavily to protect the system from cyber attacks.
"It's huge," said Hydro Ottawa CEO Bryce Conrad of cybersecurity. "It keeps us up at night."

Conrad described how someone sitting in a bedroom at a computer on the other side of the world can try to hack into a utility's information systems and do damaging things ? like take down a grid.

"There are lots of examples out there where this has come true."

And Conrad says he doesn't pretend it can't happen in Ottawa.

"We're a G7 capital, so we're not just Hydro Ottawa, we're the provider of electricity to a G7 capital. If you don't have electricity in the morning, you're not doing a whole lot," he added.

Connecting customers while preventing attacks

Cybersecurity is detailed as a risk facing the utility in the five-year strategy document that Hydro Ottawa tabled earlier this week at an Ottawa city council meeting.

The strategy describes an industry in the midst of transformation in which electricity systems are converging with, and are increasingly dependent on, information technology.

Hydro Ottawa anticipates big changes in the coming years ? from increased sales of electric cars to innovations that come from more customers being digitally connected to a smart grid, a system of resources to better manage consumption.

But having people, their homes, their appliances, and their vehicles connected to the internet all the time poses a security challenge for an electric utility like Hydro Ottawa.

"As we become more customer-centric, and give customers more tools to sort of manage these things, you're effectively opening up your system for your customers," said Conrad.

"What you're trying to do is open it up for them and keep the back door closed to someone who wants to do something nefarious."

Heavy investment in command and control centre

That's why Hydro Ottawa considers cybersecurity every time it buys a piece of software or technology, according to Conrad.

"We have to invest heavily in cybersecurity and making sure our systems, particularly our command and control systems, are as robust and protected as they possibly can be," he said.

The electricity industry gets together regularly to discuss best practices for protecting utilities from the threat of hacks emanating from terrorists, organized crime groups, or other foreign entities.

"I'll never say we're 100 per cent protected, but we're in pretty good shape."

ITAR-TASS World Service

State Duma adopts package of anti-terrorist bills

Saturday, 25 June 2016

Byline: Staff Writer

Section: general

Russia's State Duma on Friday adopted in the second and third, final reading a package of anti-terrorist bills proposed by lower house member Irina Yarovaya and upper house member Viktor Ozerov.

The initiatives sparked great public controversy and continued to be edited up to the last moment. Eventually the idea of terminating the Russian citizenship of those dual or multiple citizens who have committed terrorist crimes or proved to have been employed by foreign special services was dropped. Under the just- adopted version communication operators will be obliged to keep information about their subscribers' connections for a period of three years, and of the content transmitted, including videos, for six months. For the owners of messenger services and social networks these rules have been eased somewhat: they will be not allowed to delete information about the content transmitted and their users for twelve months, and not three years, contrary to the original version of the bill.

Messenger services, such as WhatsApp and Telegram will be fined up to one million rubles, should they refuse to disclose content at the request of the federal security service FSB.

Anti- sect amendments

A special group of amendments defines what "missionary activity" is and prohibits attempts to conduct it on behalf of religious associations whose aims contradict the law. The legislators banned missionary activities that violate public security and order, extremist actions, coercion into ruining families, and encroachments on the freedom of the person and rights and freedoms of citizens. A ban is imposed on missionary activities aimed at inducing suicide, at creating obstructions to getting mandatory education and at persuasion of individuals to refuse to perform their legally mandatory civic duties.

Missionary and preaching activities that breech legislation on the freedom of conscience and faith and on religious associations will be punishable with a fine of 5,000 rubles to 50,000 rubles ($77 to $7700) for individuals, and 100,000 rubles to 1,000,000 ($1,500 to $15,000). Foreign citizens will face expulsion from Russia. Under the new rules, all printed, audio and video content being distributed by a religious organization must have proper markings and bear the organization's full name.

Life sentence for international terrorism

The Criminal Code's list of crimes against peace and security of humanity was expanded to incorporate "international terrorism" and life imprisonment established as the maximum punishment. The minimum prison term for a terrorist attack will be increased from eight years to ten and from ten years to twelve (if the crime was committed by a group of persons or resulted in loss of human life).

The newly-adopted law contains a new, fuller definition of the financing of terrorism. It will be understood as "provision or raising of funds or provision of financial services with the awareness that they are meant for financing a terrorist organization, or plotting or committing terrorist crimes."

Public calls for terrorism or statements made in public in the Internet with the aim of excusing it will be punishable with a fine of up to 1,000,000 rubles ($15,000) or a prison term of five to seven years. Publicly expressed excuses are defined as "public statements to the effect the ideology and practices of terrorism are correct and worth supporting and following." Participation in a terrorist organization will

be punishable with prison terms of ten to twenty years (in contrast to the currently established ones of five to ten years).

Failure to report a terrorist attack

Failure to report preparations for terrorist crimes or committed terrorist crimes will entail a fine of up to 100,000 rubles ($15,000) or forced labor of up to twelve months or a twelve-month prison term. Failure to report preparations for a terrorist attack or a committed terrorist attack by one's spouse or close relative will not be punishable.

Minimum punishments

Punishments for organizing or participating in armed groups, including those abroad will be tightened. The maximum prison term for this offence is raised to five years. The Criminal Code is complemented with a new article establishing punishment for suborning into or recruitment for mass unrest. Such wrongdoing will be fined with 300,000 rubles to 700,000 rubles ($4,600 to $10,800) or a prison term of five to ten years.

Minimum punishments have been introduced under Article 282 of the Criminal Code (Incitement of Hatred or Humiliation of Human Dignity). The mildest punishment is set at three years and the maximum one, at six. Punishment for organizing an extremist organization or extremist community or financing extremist activities was tightened accordingly.

The age of accountability for terrorism is lowered to 14 years. The list of aggravating circumstances has been expanded to incorporate crimes committed in the context of an armed conflict or combat operations.

The amendments will take effect on July 20, 2016.

The Nation Multi

Military chiefs call for more robots for national security

Monday, 27 June 2016

Byline: Juthathip Lucksanawong

Section: general

Bangkok - The 26-kilogram, rectangular Portable Rescue Robot (PRR) stretched its manipulator arm, complete with a night vision camera, to surveil the area. With a wireless control system and two additional blades in front, the PRR showed off its ability to move freely in hostile terrain.
The display was performed in front of veteran military officers and weapons experts who met at a recent seminar on the development of military technology.

Mahanakorn University of Technology developed the robot, one of several robot prototypes that experts are collaboratively trying to develop to support national security missions. Using robots, especially for bomb retrieval missions, has long been considered by the Thai military.

Over the recent decade, Thailand has seen both the Southern insurgency and terrorism plaguing national security, said Sqn Leader Jiradett Kerdsri, director of data and communication division of the Defence Technology Institute (DTI).

"While insurgency and explosions are ongoing in the South, the dreadful bombing in August last year at Ratchaprasong intersection, the heart of Bangkok city, also irked state security," he said.

Such troubles affect the country's tourism, economy and trustworthiness, Jiradett said. "Foreign investors and tourists won't risk coming to a hazardous territory," he said.

It is essential, he added, for the DTI to select much-needed defence technology to be developed to serve the country's security goals.

Inventing bomb retrieval robots is part of the DTI's research plan initiated in 2009 to promote self-reliance in terms of national security and reduce the need to procure defence systems and equipment from other countries, said General Sompong Mukdaskul, DTI director-general.

Since its official establishment seven years ago, the DTI, under Ministry of Defence (MoD) oversight, has carried out five defence technology research plans focusing on rockets, unmanned aerial vehicles (UAVs), simulation technology, infantry fighting vehicles (IFVs), and military information and communication technology.

The DTI's prototypes in each category have been distributed to the three branches of the Armed Forces - Army, Navy and Air Force - and the police.

When the DTI began supplying defence forces with equipment and systems, Sompong found that each user had different technology requirements. To meet those requirements, the DTI needed to listen to what users required before research began, he added.

"Collecting feedback and comments from military and police authorities is the DTI's normal practice before and after each piece of defence equipment is unveiled," the director-general said.

The PRR's recent demonstration, and that of its robotic colleagues, in front of veteran officers and experts was part of that feedback process to fulfil the ambition to build sophisticated robots that can help to keep people safe in the field.

Air Force representatives told the seminar that the force needs robots that support remote operations with wireless and fibre optic control systems. The force has to patrol remote, inaccessible areas where land mines are a danger that could be mitigated by capable remote control robots, said Wing Commander Navin Vudhironnarith, deputy chief of the Air Force's Explosive Ordnance Disposal (EOD) force.

The robots also need to be lightweight with fire-suppression systems, including recoilless water jets, for safety, he added.

The Army, on the other hand, needs user-friendly robots with very high capabilities, said Colonel Krittipas Cruanate, chief of the Army's EOD.

"A single robot should not have all the functions. Some tasks do not need a full, heavy scanning system. Only reliable and enduring sensors and portable X-rays are necessary," he said

The colonel, who has seen numerous officers and ordinary people killed in bombings in the Southern violence, said robots are necessary because they could help to reduce fatalities explosive disposal missions. "If we'd had high-tech robotics to carry out deadly missions, people and authorities would not have died," he said.

To accomplish this new technological mission, participants agreed that academic institutions play a crucial role in developing new innovations because they act as centres of "know how" bringing together scholars and experts, Sompong said.

"Education institutions have performed tonnes of research but have no chance to apply their studies [in real situations]," he said.

The DTI director-general said he sees potential for knowledge transfers between these institutions and his agency.

"Their knowledge needs to be transferred and applied to the DTI's work. By doing this, they have an opportunity to further develop their technology and it saves time for us to conduct research on the robots," he said.

In addition to educational institutions, the industrial sector also has the potential to contribute to robotics projects.

To pioneer useful robots, industrial stakeholders need to get involved in terms of manufacturing, said Djitt Laowattana, lecturer at King Mongkut's University of Technology Thon Buri and founder and director of the Institute of Field Robotics (FIBO).

Djitt said industry is important because of its expertise in effectively managing resources in manufacturing and, especially, marketing and distribution.

The DTI knows how to invent technology but does not specialise in managing resources and budgets, he said. The government's support is required to entice the public sector to become more involved in robotics development, he added.

The government should catalyse the industry by introducing a "local materials" requirement to promote companies to use components available in the country, rather than imported ones, Djitt said, adding companies that utilise local materials should get government incentives. That would encourage others to adopt more technology and robotic components made in Thailand, he said.

When robots are produced and sold on a large scale, the lecturer said, the robotics industry would increasingly grow, leading innovators and manufacturers to become eager to help to produce defence systems contributing to national security.

"I just hope that future robots answer the needs of defence suppliers. [We should] not just launch [the idea] and then put it on a shelf after our lengthy discussion today," Sompong said. "And I just hope that the bomb retrieval robots will eventually be practical and meet international standards."

Press Trust of India

India to become full member of Missile Technology Control Regime

Monday, 27 June 2016

Section: general

New Delhi - In its first entry into any multilateral export control regime, India will today join the Missile Technology Control Regime (MTCR) as a full member, three days after it failed to get NSG membership due to stiff opposition from China and a few other countries.
"We applied for the membership of MTCR last year and all the procedural formalities have been completed. Tomorrow, Foreign Secretary S Jaishankar will sign the document of accession into MTCR in the presence of Ambassadors of France, Netherlands and Luxembourg," External Affairs Ministry spokesperson Vikas Swarup said.

Significantly, China, which stonewalled India's entry into the 48-nation Nuclear Suppliers Group (NSG) at the just- concluded Seoul plenary, is not a member of 34-nation MTCR.

Since its civil nuclear deal with the US, India has been trying to get into export control regimes like NSG, MTCR, the Australia Group and the Wassenaar Arrangement that regulate the conventional, nuclear, biological and chemicals weapons and technologies.

India's case in MTCR was opposed last year by Italy which is not happy with New Delhi over the marines dispute. However, after both marines, accused of murdering two fishermen off the Kerala coast in 2012, were allowed to return, the Italians have softened their opposition.

India's efforts to get into the MTCR also got a boost after it agreed to join the Hague Code of Conduct, dealing with the ballistic missile non- proliferation arrangement, earlier this month.

MTCR membership will enable India to buy high-end missile technology and also enhance its joint ventures with Russia.

The aim of the MTCR is to restrict the proliferation of missiles, complete rocket systems, unmanned air vehicles and related technology for those systems capable of carrying a 500 kilogramme payload for at least 300 kilometres, as well as systems intended for the delivery of weapons of mass destruction (WMD).

India to get access to almost 99% of U.S. defence technologies

Monday, 27 June 2016

Section: general

Washington - India will be the only country outside Washington's formal treaty allies that will gain access to almost 99 per cent of latest U.S.'s defence technologies after being recognised as a 'Major Defence Partner', a senior Obama administration official has said.
"India [now] enjoys access to [defence] technologies that is on a par with our treaty allies. That is a very unique status. India is the only other country that enjoys that status outside our formal treaty allies," the official told PTI explaining what 'Major Defence Partner' status means for India.

Early this month, after a meeting between U.S. President Barack Obama and Prime Minister Narendra Modi at the White House, the U.S., in a joint statement, recognised India as a 'Major Defence Partner'

"We were looking for something unique. This language you would not find in any arms transfer legislation or any of our existing policies. This is new guidance and new language that is intended to reflect the unique things that we have done with India under our defence partnership," the senior administration official said.

"This is intended to solidify the India-specific forward leaning policies for approval that the [U.S.] President and [Defence] Secretary [Ashton] Carter...and our export control system have implemented in the last eight years," the official said.

Under this recognition India would receive licence-free access to a wide range of dual-use technologies in conjunction with steps that New Delhi has committed to taking to advance its export control objectives.

Acknowledging that the impression in New Delhi was that India was not getting access to the kind of technology it needed from the U.S., the official said it was a constant source of discussion.

"[In reality], less than one per cent of all exports [requests] are denied [to India]. They are not denied because of India. They are denied because of global U.S. licencing policies. We do not share certain technologies with anybody in the world," the official asserted.

The perception in India that the denial of such technologies is reflective of India-U.S. relationship is far from the truth, the official has said.

According to the official, India being recognised as a "major defence partner puts it on par with our treaty allies." Inside the American bureaucratic system, such a recognition removes a number of major export control hurdles for India.

The category of 'Major Defence Partner' was created specifically for India, observed Ashley Tellis, of Carnegie Endowment for International Peace, a top American think-tank.

"It was meant to recognise that although India will not be an alliance partner of the United States, the administration seeks to treat it as such for purposes of giving it access to advanced technologies of the kind that are reserved for close US allies," Mr. Tellis told PTI.

"The U.S. expects that bilateral defence ties will only grow in the years ahead, that India and the United States will continue to work together especially regarding maritime security, that India will eventually be admitted to global non-proliferation regimes, and that it will sign the foundational agreements," he said in response to a question.

"As these developments materialise, India's access to U.S. technology will also increase, and the "major defence partner" moniker is intended to signal to both the outside world and to the U.S. bureaucracy

that oversees licensing that India is viewed as a unique collaborator and will be treated as such where access to advanced technologies are concerned," Mr. Tellis said.

Calling India a "Major Defence Partner" is "more a term of art than a technical designation", noted Richard M. Rossow, Wadhwani Chair in U.S. India Policy Studies at the Centre for Strategic and International Studies, another top American think-tank.

"It certainly captures what is emerging as a unique relationship, exhibited by programs such as the Defence Technology and Trade Initiative [DTTI] and the establishment of a dedicated 'India Rapid Reaction Cell' inside the Pentagon. Neither exists for a country other than India," he said.

"But the term 'Major Defence Partner' does not automatically trigger a specific process or program in the U.S. system. Our two countries are feeling their way around the contours of our defence relationship," Mr. Rossow told PTI.

"India desires advanced U.S. technology today, while the U.S. would like more clarity on the specific operations India may be willing to undertake in the future to contribute to regional security. It is a process that has seen great progress, which we hope will carry over into the next U.S. administration," Mr. Rossow said in response to a question.

Over the last one decade the defence trade between India and the U.S. has increased from being almost non-existent to more than $14 billion. This is expected to increase manifold as India embarks on a major defence modernisation drive.

Times of Israel

CyberArk eyes expansion in Asia

Monday, 27 June 2016

Byline: Shoshanna Solomon

Section: general

Jerusalem - Petah Tikva-based CyberArk, Israel's second-largest public cybersecurity company, plans to target the Asian and Latin American markets and mid-sized customers in the longer term to boost growth, Udi Mokady, president and chief executive officer of CyberArk, said in an interview.
Speaking with reporters last week at the sidelines of a cybersecurity conference in Tel Aviv, Mokady said enterprise customers are still the main focus of the company and CyberArk is still just "scratching the

surface" of the potential of these companies.But in the longer term the firm is also "looking at ways to address also the mid-market as part of our strategy."

CyberArk is a cybersecurity company that specializes in protecting "privileged accounts" on corporate servers. Privileged accounts are computer system user accounts that have extra privileges so that owners of those accounts can control important aspects of a server or network. Large computer systems, especially those that have been around for years, usually contain many such accounts that are no longer in use - either because they were set up specifically for certain no-longer relevant missions or because they belonged to former employees. These accounts are especially vulnerable to hacker accounts, as they aren't watched too closely.

CyberArk chokes off the possibility that privileged accounts will be abused by identifying and cutting off access to the accounts. The system sets up a policy on user accounts that forces users to change passwords on a regular basis, including dormant privileged accounts. In addition, the system sets up a "safe zone" for data to be managed when accessed from an account.

"We found that even though we were targeting enterprise, we got pull from mid-market -- universities, credit unions, law firms, things we weren't necessarily targeting, and so it shows us there is an opportunity and we are looking for ways to address that in 2017 and beyond," Mokady said in the interview. "Right now it is very much enterprise-focused."

The company, which held an initial public offering of shares on the Nasdaq in 2014, saw its shares surge as corporations flocked to buy security software amid higher levels of data breaches worldwide.

Today CyberArk, the largest Israeli public information security company in both revenue and in market capitalization, has more than 2,600 customers globally, of which more than 40% are Fortune 100 customers, according to data from a May 2016 presentation.

Revenues grew over 50 percent in 2014 and 2015, and in the first quarter of the year revenue jumped 43% to around $47 million compared to the same quarter a year earlier. Net income for the first quarter of 2016 rose to $4.3 million from $4.2 million in the same quarter in 2015. CyberArk in May forecast total revenue to rise by around 30% in 2016 to a range of $209 million to $211 million.

The company is also looking to increase its presence in the Asia Pacific, Mokady said. Last year the Americas accounted for 61% of its revenues while Europe, Middle East and Africa accounted for 31 percent. Just around 8% of sales were in Asia Pacific and Japan, according to the presentation. "We want to bring it much higher," Mokady said. "We want it to be toward the teens in the long term. The opportunity is tremendous." Latin America is also an opportunity for growth, he said. "They have the same problems, the same IT infrastructure, the same weaknesses."

Even as the company has posted strong results, its share price has has declined about 26% in the past year amid concerns that enterprise spending in cybersecurity software has started to slow, lackluster

results from peers and on worries about too-high valuations in the sector. The company has a market capitalization of about $1.61 billion, according to data compiled by Bloomberg.

CyberArk's share decline spurred speculation in January that the company would become an acquisition target for Israel's Check Point Software Technologies Ltd.

Mokady shrugged off the possibility of a company sale even as he sees the possibility of some consolidation in the industry among the smaller companies. "CyberArk is a buyer," he said. "We are going for it and being acquisitive. Naturally in any step of the way we will do what is right for the shareholders. But left alone, we are building it big. "

The company has made two acquisitions, Viewfinity, Inc., a Waltham, Massachusetts-based provider of Windows privilege management and application control software, for $30.5 million in cash, and Israeli firm CyberIntel.

Acquisitions "is part of our growth strategy and we are very pleased with the first two," Mokady said. "There is appetite and willingness to do more but there is no pressure because we have such a huge organic opportunity."

Wall Street Journal

Russian Hack Said To Reach Beyond Democrats

Monday, 27 June 2016

Byline: Nicole Hong

Section: general

New York - The attack on the Democratic National Committee's computer network this past spring was part of a broader monthslong campaign by Russian hackers against groups with ties to U.S. politics, according to a new report.
Party officials and security researchers disclosed about two weeks ago that the DNC's system was compromised in April by two hacking groups with links to Russian intelligence services, one of the largest known breaches of a U.S. political organization.

On Sunday, cybersecurity firm SecureWorks Corp. concluded that one of the hacking groups, dubbed "Fancy Bear" in security circles, also targeted the emails of presumptive Democratic nominee Hillary

Clinton's campaign, as well as email accounts belonging to U.S.-based military spouses, political activists and journalists who wrote critically about Russia and others.

Over the past year or so, the hackers tried to penetrate nearly 4,000 individual email accounts, researchers said.

Researchers believe the hackers wanted access to email accounts as part of an intelligence-gathering operation, as opposed to stealing information for financial gain. In one tactic, the hackers sent out mass emails containing links that asked victims to reset their passwords.

Users at two dozen email addresses associated with the DNC and Mrs. Clinton's campaign clicked on the links, but SecureWorks says it is unclear whether information was accessed. Researchers previously said the hackers gained access to the DNC's chat systems and research files, including the party's opposition research on presumptive Republican nominee Donald Trump.

The DNC is "confident" that Russian government hackers were responsible for the breach and has "deployed the recommended technology" to secure their systems, said a senior DNC official.

A representative of the Russian government couldn't be reached for comment. In a previous statement, a Kremlin spokesman said: "I completely rule out the possibility of the government or government structures being involved in this."

A spokesman for the Clinton campaign didn't respond to a request for comment.

New York Magazine

I, Snowbot

Monday, 27 June 2016

Byline: Andrew Rice

Section: general

New York - Edward Snowden lay on his back in the rear of a Ford Escape, hidden from view and momentarily unconscious, as I drove him to the Whitney museum one recent morning to meet some friends from the art world. Along West Street, clotted with traffic near the memorial pools of the World Trade Center, a computerized voice from my iPhone issued directions via the GPS satellites above. Snowden's lawyer, Ben Wizner of the American Civil Liberties Union, was sitting shotgun, chattily

recapping his client's recent activities. For a fugitive wanted by the FBI for revealing classified spying programs who lives in an undisclosed location in Russia, Snowden was managing to maintain a rather busy schedule around Manhattan.
A couple nights earlier, at the New York Times building, Wizner had watched Snowden trounce Fareed Zakaria in a public debate over computer encryption. "He did Tribeca," the lawyer added, referring to a surprise appearance at the film festival, where Snowden had drawn gasps as he crossed the stage at an event called the Disruptive Innovation Awards. Wizner stopped himself mid- sentence, laughing at the absurdity of his pronoun choice: "He!" Behind us, Snowden stared blankly upward, his face bouncing beneath a sheet of Bubble Wrap as the car rattled over the cobblestones of the Meatpacking District.

Snowden's body might be confined to Moscow, but the former NSA computer specialist has hacked a work-around: a robot. If he wants to make his physical presence felt in the United States, he can connect to a wheeled contraption called a BeamPro, a flat-screen monitor that stands atop a pair of legs, five-foot-two in all, with a camera that acts as a swiveling Cyclops eye. Inevitably, people call it the "Snowbot." The avatar resides at the Manhattan offices of the ACLU, where it takes meetings and occasionally travels to speaking engagements. (You can Google pictures of the Snowbot posing with Sergey Brin at TED.) Undeniably, it's a gimmick: a tool in the campaign to advance Snowden's cause -- and his case for clemency -- by building his cultural and intellectual celebrity. But the technology is of real symbolic and practical use to Snowden, who hopes to prove that the internet can overcome the power of governments, the strictures of exile, and isolation. It all amounts to an unprecedented act of defiance, a genuine enemy of the state carousing in plain view.

We unloaded the Snowbot in front of the Whitney, where a small group had gathered to meet us for a private viewing of a multimedia exhibition by the filmmaker Laura Poitras. It was Poitras whom Snowden first contacted, anonymously, in 2013, referring to the existence of a surveillance system "whose reach is unlimited but whose safeguards are not." Their relationship resulted in explosive news articles and a documentary, Citizenfour -- work that won a Pulitzer and an Oscar and incited global outrage. But the disclosures came at a high price for their source. If Snowden couldn't come home, Poitras at least wanted him to share vicariously in the experience of her Whitney show, "Astro Noise," which took its name from an encrypted file of documents he had spirited out of the secret NSA site where he worked in Hawaii. So she had arranged a personal tour.

Outside an eighth-floor gallery, a crowd of Poitras's collaborators and Whitney curators clustered around the Snowbot as a white circle twirled on its monitor. Then, suddenly, the screen awoke and Snowden was there.

"Hey!" Wizner said, and the group erupted in awkward laughter. The famous fugitive was wearing a gray T-shirt, his face pallid and unshaven. (He calls himself "an indoor cat.") His voice sounded choppy, but some fiddling resolved the problem, and Poitras, soft-spoken and clad in black, made introductions. Snowden's preternaturally eloquent Hong Kong hotel-room encounter with Poitras and the Guardian journalists investigating his leaks formed the core of Citizenfour, but even some of those who worked on

the documentary had never met its protagonist. One of the cinematographers came forward and wrapped him in a hug.

"I don't have hands," Snowden apologized. "The most I can do is maybe ..."

He scooted forward.

Sitting in the same homemade studio he uses for his frequent speaking engagements, Snowden could control the robot's movements with his computer, maneuvering with uncanny agility, swiveling to make eye contact with people as they spoke to him.

Poitras began with the show's opening piece, a colorful array of prints that resembled modern abstracts but were actually found objects: visualizations of intercepted satellite signals that turned up in the vast trove of NSA documents. "The whole show, there's a lot of deep research that's going on behind it," she said. She led Snowden into a darkened gallery, where a spooky ambient soundscape was playing over video footage of a U.S. military interrogation. Momentarily disoriented, he careened into a bench. But Snowden quickly figured out how to navigate in the dark. When he came to parts of the exhibit that required complicated movements -- lying on a platform to take in the watchful night sky over Yemen, or craning to look at an NSA document through a slit in the wall -- the humans hoisted him into position.

"Wow, okay, I see it," Snowden said as one of Poitras's researchers held him up to view footage of a drone strike's aftermath. "This is a surreal experience for a number of reasons."

When the tour was over, Snowden held an impromptu discussion, likening his decision to become a dissident to a risky artistic choice. "There's always that moment where you step out and there's nothing underneath you," he said. "You hope that you can build that airplane on the way down, or if you don't, that the world will catch you. In my case, I've been falling ever since." Still, Snowden said he had no regrets. "I do have to say," he told Poitras, "that I will be forever grateful that you took me seriously."

As usual, though, when the questions turned to the details of his non-robotic existence, Snowden remained courteously evasive. "What's a day in the life now?" asked Nicholas Holmes, the Whitney's general counsel. "Do you go for walks in the park?"

"Well," the Snowbot replied, "I go for walks in the Whitney, apparently."

The idea that Snowden is still walking the American streets, virtually or otherwise, is infuriating to his former employers in the U.S.-intelligence community. Its leaders no longer make ominous jokes about wanting to put him on a drone kill list -- as former NSA and CIA director Michael Hayden did in 2013 -- but they still vilify him and maintain that he did real harm to America's safety and international standing. While Snowden's leaks revealed the NSA's controversial and possibly unconstitutional bulk collection of domestic internet traffic and telephone metadata, they also exposed technical details about many other classified activities, including overseas surveillance programs, secret diplomatic arrangements, and

operations targeting legitimate adversaries. The spy agencies warn that the public doesn't comprehend the degree of damage done to their protective capabilities, even as events like the Orlando nightclub massacre demonstrate the destructive reach of terrorist ideology. The fallout from Snowden's actions may have prompted a debate about security and privacy that even President Obama acknowledges "will make us stronger," but there has been no such reassessment, at least officially, of Snowden himself. He still faces charges of violating the federal Espionage Act, crimes that could carry a decades-long prison sentence.

When Snowden first revealed the NSA's surveillance -- and his own identity -- to the world three years ago this month, there was little reason to believe that he would be in a position to communicate much of anything in the future. The last person to leak classified information of such magnitude, Chelsea Manning, was sentenced to 35 years in prison. (Manning, who was held in solitary confinement while awaiting trial, has largely communicated to the public through letters.) Yet so far, to his own surprise, Snowden has managed to avoid the long arm of U.S. law enforcement by finding asylum in Russia. Leaving aside, at least for the moment, the ethics of his actions (and the internal contradictions of his residence in an authoritarian state ruled by a former KGB operative), Snowden's case is, in fact, a study in the boundless freedoms the internet enables. It has allowed him to become a champion of civil liberties and an adviser to the tech community -- which has lately become radicalized against surveillance -- and, in the process, the world's most famous privacy advocate. After he appeared on Twitter last September -- his first message was "Can you hear me now?" -- he quickly amassed some two million followers.

"I feel like we're sort of dancing around the leadership conversation," Snowden said to me recently as I sat with him at the ACLU offices. Over the past few months, we have encountered one another with some regularity, and while I can't claim to know him as a flesh-and-blood person, I've seen his intellect in its native habitat. He is at once exhaustively loquacious and reflexively self-protective, prone to hide behind smooth oratory. But occasionally, he has let down his guard and talked like a human being. "I'm able to actually have influence on the issues that I care about, the same influence I didn't have when I was sitting at the NSA," Snowden told me. He claims that many of his former colleagues would agree that the programs he exposed were wrongfully intrusive. "But they have no voice, they have no clout," he said. "One of the weirder things that's come out of this is the fact that I can actually occupy that role." Even as the White House and the intelligence chiefs brand him a criminal, he says, they are constantly forced to contend with his opinions. "They're saying they still don't like me -- tut-tut, very bad -- but they recognize that it was the right decision, that the public should have known about this."

Needless to say, it is initially disorienting to hear messages of usurpation emitted, with a touch of Daft Punk-ish reverb, from a $14,000 piece of electronic equipment. Upon meeting the Snowbot, people tend to become flustered -- there he is, that face you know, looking at you. That feeling, familiar to anyone who's spotted a celebrity in a coffee shop, is all the more strange when the celebrity is supposed to be banished to the other end of the Earth. And yet he is here, occupying the same physical space. The technology of "telepresence" feels different from talking to a computer screen; somehow, the fact that Snowden is standing in front of you, looking straight into your eyes, renders the experience less like

enhanced telephoning and more like primitive teleporting. Snowden sometimes tries to put people at ease by joking about his limitations, saying humans have nothing to fear from robots so long as we have stairs and Wi-Fi dead zones in elevators. Still, he is quite good at maneuvering on level ground, controlling the robot's movements with his keyboard like a gamer playing Minecraft. The eye contact, however, is an illusion--Snowden has learned to look straight into his computer's camera instead of focusing on the faces on his screen.

Here's the really odd thing, though: After a while, you stop noticing that he is a robot, just as you have learned to forget that the disembodied voice at your ear is a phone. Snowden sees this all the time, whether he is talking to audiences in auditoriums or holding meetings via videoconference. "There's always that initial friction, that moment where everybody's like, 'Wow, this is crazy,' but then it melts away," Snowden told me, and after that, "regardless of the fact that the FBI has a field office in New York, I can be hanging out in New York museums." The technology feels irresistible, inevitable. He's the first robot I ever met; I doubt he'll be the last.

Wizner, the head of the ACLU's Speech, Privacy, and Technology Project, says that Snowden asked him to do some research on telepresence in their first conversation, back when he was still very much on the lam. Now that his situation has stabilized -- at least for the time being -- he and Snowden's small coterie of advisers are discussing ways they might use it for a widening range of purposes. Glenn Greenwald, one of Snowden's original journalistic collaborators, jokingly talks about taking the Snowbot on the road. "I would love to let it loose in the parking lot of Fort Meade," where the NSA is headquartered, he said. "Or to randomly go into grocery stores." More seriously, Snowden's advisers are in discussions about a research fellowship at a major American university. Already, the Snowbot has twice taken road trips to Princeton University, where he has participated in wide-ranging discussions about the NSA's capabilities with a group of renowned academic computer-security experts, rolling up to cryptographers during coffee breaks and dutifully posing for selfies.

For larger gatherings, Snowden usually dispenses with the robot, addressing audiences from giant screens. (He often opens with an ironic reference to Big Brother.) He is scheduled to make more than 50 such appearances around the world this year, earning speaking fees that can reach more than $25,000 per appearance, though many speeches are pro bono. Besides allowing Snowden to make a good living, his virtual travels on the public- lecture circuit are part of a concerted campaign to situate him within a widening zone of political acceptability. "One of the things we were trying to do is to normalize him," says Greenwald. "Normalize his life, normalize his presence." In 2014, Snowden joined Poitras and Greenwald on the board of the Freedom of the Press Foundation, a San Francisco nonprofit, and last year he was elected chairman. It serves as a base for his advocacy and gives him access to a staff of technologists with whom he has been working on encryption projects, tools intended to allow journalists to communicate with "people that live in situations of threat" -- in other words, people like Snowden himself.

Through a network of intermediaries -- chief among them Wizner, who acts as his advocate, gatekeeper, and talent agent in the United States -- Snowden is able to establish contact with almost anyone he

desires to meet. "Ed's now getting a lot of people on the phone, and it's broadening his horizons," says the author Ron Suskind, who has spoken with him on several occasions and recently had him lecture to a class he and Lawrence Lessig were teaching at Harvard Law School. Snowden also recently spoke to Amal Clooney's law class at Columbia, starred in an episode of the Vice show on HBO, and published a manifesto on whistle-blowing on the Intercept, the website Poitras and Greenwald started with the billionaire Pierre Omidyar. And he has been maintaining his presence on Twitter, where he has been playfully talking up Oliver Stone's forthcoming film, Snowden, which will star Joseph Gordon-Levitt.

The biopic's September release date matches up with Wizner's timetable for mobilizing a clemency appeal to Obama. "We're going to make a very strong case between now and the end of this administration that this is one of those rare cases for which the pardon power exists," Wizner said. "It's not for when somebody didn't break the law. It's for when they did and there are extraordinary reasons for not enforcing the law against the person." He says that while no single event is likely to shift opinion in Washington, Snowden's activities work "in the aggregate" to further his cause.

One thing Snowden refuses to do, however, is apologize. If anything, the last three years have turned him more strident. Whereas he once espoused a fuzzy dorm-room libertarianism -- "some of it was kind of rudimentary," Greenwald recalls -- today he offers a more traditional leftist critique of the "deep state." On Twitter, he has been admiring of Bernie Sanders, acerbic about Hillary Clinton's foreign policy, and bitingly sarcastic about her handling of classified emails. In February, he tweeted: "2016: a choice between Donald Trump and Goldman Sachs." He sees himself as part of a hacktivist movement, and he took pride when the anonymous source behind the massive cache of offshore banking data known as the Panama Papers cited Snowden's example. In his Intercept essay, he called such leaking "an act of resistance."

WNYC recently staged a sold-out Friday-night event at the Brooklyn Academy of Music, not far from Fort Greene Park, where some artists surreptitiously erected a Snowden bust last year. At the appointed time, the fugitive appeared on a screen at the front of an ornate opera hall. It was around 2:30 a.m. in Moscow, but Snowden looked wide-awake, wearing an open-collared shirt and blazer and his customary stubble. "In an extraordinary and unpredictable way," he told the audience, "my own circumstances show there is a model that ensures that even if we're left without a state, we aren't left without a voice."

When Snowden went public, one of the first people he sought out was a historical antecedent: Daniel Ellsberg, the military analyst who leaked the Pentagon Papers. He, too, was briefly a fugitive and faced Espionage Act charges, until they were dropped because of the illegal retaliatory actions of President Nixon. Now 85, Ellsberg was eager to talk to Snowden and they connected over an encrypted chat program.

"I had the feeling that, as I suspected from the beginning, we really were kindred souls," Ellsberg told me.

Ellsberg, mindful of Manning's experience, advised Snowden to give up any thought of returning home. Snowden was inclined to agree. From the beginning, he had spoken fatalistically about the consequences of his actions. "All my options are bad," Snowden acknowledged in his first interview in Hong Kong, which was published in the Guardian. If the American government didn't grab him, the Chinese might, just to find out what he knew. He hinted that the CIA might even try to kill him, either directly or through an intermediary like a triad gang. "And that's a fear I'll live under for the rest of my life, however long that happens to be," Snowden said at the time.

"He didn't have a plan," says Wizner. Snowden assumed that he would probably be silenced in one way or another, so he worked with a sympathetic programmer in the United States to design a website, supportonlinerights.com, which was to contain a letter addressed to the public. But instead, he more or less got away with it. After a nervy flight and an agonizing five-week wait in limbo at the Moscow airport, he was granted temporary asylum in Russia by President Vladimir Putin. Photos soon appeared in the Russian media showing Snowden pushing a grocery cart and looking slyly over his shoulder on a riverboat ride. It was an uneasy deliverance, though, one seemingly subject to Putin's unpredictable geopolitical power considerations.

Snowden argues that he was put in Russia by the U.S. government, which canceled his passport while he was en route to Ecuador, trapping him in Moscow during a layover. But to critics, his dependence on Putin is discrediting. "I am not saying that he is a Russian spy, but he is in a tough spot," says journalist Fred Kaplan, author of the recent book Dark Territory: The Secret History of Cyber War. "He is in a position where, because of his captive status, he can't really say anything that terribly critical about his hosts, who happen to be some of the most sophisticated and intrusive cyberespionage hackers in the world." Many in the intelligence community darkly speculate about the nature of Snowden's accommodation with the FSB, the Russian security service, which is not renowned for its hospitality or respect for civil liberties.

Although Snowden acknowledges that he was approached by the FSB, he claims he has given them no information or assistance, and he vehemently denies he is anyone's puppet. He cheered the release of the Panama Papers, which contained voluminous evidence of corruption in Putin's inner circle. "I have called the Russian president a liar based on his statements on surveillance, in print, in the Guardian," he said with an uncharacteristic flash of annoyance, when I asked whether he felt any constraints in discussing Russia. "I have criticized Russia's laws on this, that, and the other. It's just frustrating to get the question because it's like, look, what do I have to do?"

Snowden seems determined to refute predictions that he would end up broken, like so many whistle-blowers before him, or drunk and disillusioned, like a stereotypical Cold War defector. (He has claimed that he drinks nothing but water.) "People think of Moscow as being hell on earth," he said during his Whitney visit. "But when you're actually there, you realize it's not that much different than other European cities. Their politics are wildly different, and of course really they're problematic in so many ways, but the normal people, they want the same things." He says he does his own shopping and takes

the metro. Family members come to visit. His longtime girlfriend, Lindsay Mills, reunited with him in Moscow and has posted Instagram snapshots of her life there.

Last year, before Halloween, Mills posted a Photoshopped picture that posed the couple in front of FBI headquarters, with Snowden costumed as the capped protagonist of Where's Waldo? As improbable as it may sound, he has told confidants that he doesn't think the U.S. government has managed to pin down his exact whereabouts. He says he has designed his new life around his unique "threat model," minimizing his vulnerability to tracking by giving up modern conveniences like carrying a phone. "He does not believe that he's shadowed all the time by the CIA," says Ellsberg, who has been in regular contact. "But he does believe that he is in the sights of the FSB all the time, partly to keep him safe." Snowden is most at ease when he's on the internet, an environment he feels he can control. As a former systems engineer, he has been able to construct back-end protections that allow him to feel confident that he can evade locational detection, even when he is using the internet like a civilian. He has sometimes chatted via video on Google Hangouts.

Snowden is more wary about in-person meetings, typically conducting them in hotels like the Metropol near Red Square. More than a year after they began speaking, Ellsberg finally had the opportunity to meet Snowden in person, when he visited Moscow with an informal goodwill delegation that also included the actor John Cusack and the leftist Indian author Arundhati Roy. At the appointed time, Snowden called and said to meet him in the lobby of their hotel. Cusack took the elevator downstairs, and Snowden surprised him by getting on at the fourth floor. When they returned to the room, Ellsberg greeted Snowden by saying, "I've been waiting 40 years for someone like you."

Two days of marathon bull sessions and room-service dining ensued. Ellsberg tried -- unsuccessfully -- to get confirmation of some long-held suspicions about the extent of the NSA's spying on Americans. Periodically, Snowden would point to the ceiling, to remind the room that others were probably listening. Cusack and Roy later recounted the conversation in a 13,000-word essay, writing that when the meeting was over, Ellsberg lay down "on John's bed, Christ-like, with his arms flung open, weeping for what the United States has turned into -- a country whose 'best people' must either go to prison or into exile."

The notion that Snowden has become, to some, a sort of mythic figure -- the Oracle of the Metropol -- is profoundly annoying to the people who actually hold the nation's intelligence secrets. "I'd love to see him come back to the U.S. and take his medicine," says Robert Litt, general counsel for the Office of the Director of National Intelligence, who has been deeply involved in both the legislative fallout from the NSA revelations and internal government discussions over the potential prosecution of Snowden. Litt says he sees the consequences of Snowden's actions on extremist message boards, which now exhort jihadis to use encryption. "It cannot be disputed," he told me, "that this has had immeasurable impact."

Snowden believes that officials like Litt are merely trying to scare the public into acquiescence. Last October, the two had a showdown of sorts when they spoke back-to-back at a conference at Bard College. "Each time we have an election, it's like another round of a game," Snowden told the students.

Using a livecasting program designed for gamers that allows him to project illustrations, he filled the auditorium screen with an image of George W. Bush shaking hands with Obama. "The policies of one president become the policies of another." Then he played a video clip of the cleric Anwar al-Awlaki's son, a 16-year-old American citizen killed by a drone strike in Yemen. He cited a leaked 2015 email in which Litt addressed the hostile legislative climate, recommending "keeping our options open" for a change "in the event of a terrorist attack or criminal event where strong encryption can be shown to have hindered law enforcement."

"Surveillance is ultimately not about safety," Snowden said. "Surveillance is about power. Surveillance is about control."

Litt opened his remarks by joking that he could sympathize with the act that went on Ed Sullivan after the Beatles. "I can hear the NSA's opinion any day," one student stage-whispered, as he and many others got up to head for the exits. Litt called after them, saying he was "disappointed" with the disdain "given that this is an academic environment." He then elaborated on the ominous sentiment expressed in his email.

"Every time something bad happens, the finger gets pointed at the intelligence community," Litt said. "There is a pendulum that swings back and forth, in terms of the public view of the intelligence community, between, 'You mean you're doing what?' and 'Why didn't you protect us?' And that's a pendulum that's going to swing again."

While much of Washington remains hostile to him, Snowden is far more hopeful about Silicon Valley and is increasingly focusing his efforts on influencing technology and the people who make it. "Like me, they grew up with this stuff," he told me. "They remember what the internet was like before everybody felt it was being watched."

The Snowden leak "was like a gut punch for people across Silicon Valley," says Chris Sacca, a venture capitalist who invested early in Twitter and Uber and who now appears on the television show Shark Tank. Sacca was personally friendly with Obama, raising large sums for his 2012 campaign, but was shocked when he discovered the extent of the NSA's spying and has since become a vocal Snowden supporter. Last November, Sacca did an admiring interview with Snowden at the Summit at Sea, an invite-only weekend of seminar talks and techno dancing aboard a cruise ship, which was attended by the likes of Eric Schmidt, chairman of Alphabet, and Travis Kalanick, CEO of Uber. "After fielding over an hour of tough questions," Sacca says, "he got a resounding standing ovation from the room."

Even as Snowden captivated the audience on the boat, though, terrorists were mounting a bloody coordinated attack in Paris. The pendulum was swinging back. At first, Wizner says, Snowden was shaken -- he worried that the attacks had wiped out all of his progress. Almost immediately, anonymous security sources blamed encryption for giving cover to the attackers. (Subsequent reports suggest they may have been more reliant on primitive tactics, like using burner phones.) "They dragged out all the old CIA directors, the line of disgrace, to suddenly try to reclaim a halo," Snowden told me. "It did look really

exploitative." For three weeks, he went quiet, posting just once to Twitter, quoting Nelson Mandela about triumphing over fear. Meanwhile, Syed Farook and Tashfeen Malik attacked in San Bernardino, and Trump called for a ban on Muslim immigration.

Wizner advised his client to be patient. Snowden sometimes says he thinks of his existence like a video game: a series of challenges that culminate in a final screen, where you either win or it's game over. But political outcomes are never so final -- it's an iterative process. In February, when Apple announced it was refusing to break into Farook's iPhone for the FBI, Snowden was suddenly scoring points again. ("The @FBI is creating a world where citizens rely on #Apple to defend their rights," he tweeted, "rather than the other way around.") In an open letter, Tim Cook, Apple's chief executive, talked the way Snowden does about privacy, encryption, and government "overreach." The next day, Snowden spoke at Johns Hopkins University, where hundreds of shivering students lined up to get into a packed auditorium. "This is a case that's not about San Bernardino at all; it's not a case that's about terrorism at all," Snowden warned. "It's about the precedent."

Litt believes that, besides giving information to enemies, Snowden's disclosures have also had a radicalizing effect in the private sector. "The technology and communications community has moved from a position of willingness to cooperate," he told me, "to an attitude that ranges from neutrality to outright hostility, which is an extremely bad thing." Recently, Snowden has been working with technical experts who are mobilizing to fortify the internet's weak spots, both through collaborations with academic researchers and back-channel conversations with employees at major tech companies.

In all of these conversations, Snowden is operating on the assumption that a truly private space on the internet could be easier to create than to legislate -- that it may be more fruitful to coax programmers to invent something that is difficult to hack than it would be to try to reshape the entire national-security bureaucracy so it stops trying. "I'm regularly interacting with some of the most respected technologists and cryptographers in the world," Snowden said. "I believe that there's actually a lot more influence that results from those sorts of conversations, because so much of technology is an expert game."

The aspect of the Snowden leaks that most outraged technology experts was not the NSA's communications surveillance but its efforts to undermine encryption, which had broad impacts on computer security. That news has "created a period of innovation" in encryption, says Moxie Marlinspike, the San Francisco-based security specialist who developed Signal, the messaging program that Snowden likes to use to communicate. Marlinspike has become friendly with Snowden, whom he met in Moscow, where they had a lengthy discussion about the trade- offs between security and usability. (Snowden is always seeing holes hackers can poke through; Marlinspike wants to make encryption accessible to laypeople.) In April, WhatsApp, which is owned by Facebook, announced that it had integrated the Signal protocol Marlinspike developed, allowing it to offer end-to-end encryption. Those sorts of technical decisions, like Apple's strengthened encryption standards, affect the privacy of millions of customers.

But Snowden is skeptical of the motives of tech companies. "Corporations aren't friends of the people, corporations are friends of money," he said. He prefers to collaborate with academics and hacktivists, some of whom are helping him with projects he is developing for the Freedom of the Press Foundation. It already manages SecureDrop, a system for anonymously leaking documents, and the nonprofit's technical staff is working with Snowden to develop other programs tailored to protect journalists and whistle-blowers. "His goal with us is to start designing and prototyping what the tools of the future will look like," says Trevor Timm, the foundation's executive director. One of Snowden's priorities, unsurprisingly, is improving the security of videoconferencing.

About once a week, the team meets on a beta-stage video platform, where they discuss the painstaking work of testing their technology, a probing process called "dogfooding." As a prime target for hacking attacks, Snowden is in a unique position to appreciate extreme-threat models. He often comes up with exotic problems to solve and is able to bring in outside minds for confidential consultations. "We're building small projects," Snowden says, but he can't help but see larger applications. He talks enthusiastically about virtual reality, which could soon supplant videoconferencing. "In five years this shit's going to blow your mind," Snowden told me. But he also sees potential dangers. "Suddenly, you've got every government in the world sitting in every meeting with you."

Snowden is especially concerned about the monitoring power of Facebook, which acquired Oculus VR, the virtual-reality headset maker, for $2 billion. "What if Facebook has a copy of every memory that you ever made with someone else in these closed spaces?" he asked rhetorically. "We need to have space to ourselves, where nobody's watching, nobody's recording what we're doing, nobody's analyzing, nobody's selling our experiences."

It is clear that in virtual reality, Snowden sees more than just a work tool. "Right now, the technology is not quite there, but this is the first step," the Snowbot told Peter Diamandis, the space entrepreneur and Singularity University co-founder, in an interview at this year's Consumer Electronics Show. "I have someone who is very close to me," Snowden explained, "who was the victim of a serious car accident, and because of that they can't travel." Virtual reality could bring them together. Or it could allow him to visit home for Thanksgiving, overcoming what he calls "the tyranny of distance."

More than one person told me that, after talking to Snowden for hours on end, they got the sense that he is lonely. His conversation is preoccupied with the theme of escape. He recently collaborated on a track with a French musician, delivering a spoken-word monologue on surveillance over an electronic beat, and recommended the title: "Exit."

Snowden sometimes says that although he lives in Russia, he does not expect to die there, and he told me he is optimistic that he will find a way out, somehow. Maybe some Scandinavian country will offer him asylum. Maybe he can work out some kind of deal -- whether outright clemency or a plea bargain -- with the Justice Department. Wizner has been working with Plato Cacheris, a well-connected Washington defense attorney, but so far, there have been no official signals that the Justice Department would be willing to offer the kind of lenient terms Snowden would accept. And a window may be

closing. He is unlikely to receive a more receptive hearing from Hillary Clinton, who has said he shouldn't be allowed to return without "facing the music." As for Donald Trump: He has called Snowden a "total traitor" and suggested he should be executed. "If I'm president," he predicted last year, "Putin says, 'Hey, boom -- you're gone.'?"

So the comparatively thoughtful Obama may be Snowden's best hope, but even Snowden's allies concede that they doubt the outgoing president has the inclination to offer a pardon. "There is an element of absurdity to it," Snowden told me. "More and more, we see the criticisms leveled toward this effort are really more about indignation than they are about concern for real harm." He says he would return and face the Espionage Act charges if he could argue to a jury that he acted in the public interest, but the law does not currently allow such a defense. "These people have been thinking about the law for so long that they have forgotten that the system is actually about justice," Snowden said. "They want to throw somebody in prison for the rest of his life for what even people around the White House now are recognizing our country needed to talk about."

Earlier this year, Snowden was buoyed by an invitation from an unexpected source. David Axelrod, the president's former top political strategist, asked him to appear at the institute he now runs at the University of Chicago. Beforehand, they had a video chat. "The president of the United States' closest advisers," Snowden told me later, "are now introducing me and sharing the stage with me in ways that aren't actually critical. I'm not saying this to build myself up. I'm talking about the recognition by even the people who have the largest incentives to delegitimize me as a person, that maybe we overreacted, maybe this is a legitimate conversation that we need to have."

Axelrod asked Geoffrey Stone, a liberal law professor who is friendly with Obama, to moderate the public talk. Stone is a member of the ACLU's National Advisory Council and the author of a book titled Top Secret: When Our Government Keeps Us in the Dark, but he also served on Obama's commission to review the NSA's surveillance programs, an experience that gave him access to classified information and a dim view of Snowden. "My view is that he cannot be granted clemency, because he did commit a criminal offense and it did considerable harm," Stone told me. "The people who are celebrating Snowden have no understanding of the harm, for the reason that the people in the intelligence world can't really explain the harm to them." Snowden considered Stone's position to be "an example of regulatory capture," proof of the seductive power of security clearances. Secret knowledge, Snowden says, "is a very intoxicating thing."

Still, Snowden was looking forward to the debate, if only because it illustrates his progress. Wizner, who considered the Axelrod relationship important to his future clemency push, attended the May event in person. "We've gone from the president saying 'We're not going to scramble jets for a 29-year-old hacker' to talking with the president's rabbi,'?" Wizner said backstage as event staff set up computers and projection equipment. "That's a good journey for us."

Axelrod shambled in, looking sleepy-eyed as always, as students filled the auditorium and Wizner texted last-minute instructions to his client over Signal. "Whatever you think about Edward Snowden and his

actions, and the adjectives range from traitor to hero," Axelrod said by way of introduction, "he has indisputably triggered a really vital public debate about how we strike a balance between civil liberties and security." He sat down in the front row as Snowden's bashful grin filled a large screen.

Snowden had already done one event that day, a cybersecurity conference in Zurich, and he seemed weary as Stone probed for logical weaknesses. The law professor asked when it was appropriate for "a relatively low-level official in the national-security realm to take it upon himself to decide that it is in the national interest to disclose the existence of programs that have been approved ... To decide for himself that 'I think they're wrong.'?" Snowden gave his usual homilies about the Constitution, whistle-blowing, and civil disobedience. "Do we want to create a precedent that dissidents should be volunteering themselves not for the 11 days in jail of Martin Luther King or the single night of Thoreau," he asked, "but 30 years or more in prison, for what is an act of public service?"

Stone pointed out that Congress could pass a law allowing defendants to make a whistle-blowing defense in Espionage Act cases but shows no signs of doing it. "You believe in democracy," Stone said. "But democracy doesn't agree with you." The professor jabbed and Snowden weaved, setting his jaw and taking swigs from a big plastic water bottle. But when the floor opened for questions, it was clear who had won the audience. One student after another got up to offer Snowden praise.

"Did you expect to become a celebrity in this way?" one asked.

"If you go back to June 2013," Snowden said, "I said, 'Look, guys, stop talking about me, talk about the NSA.'?" But he added, "Our biology, our brains, the way we relate to things, is about character stories. So they simply would not let me go."

Axelrod watched impassively, his fingers tented under his nose. The full effect of Snowden's performance did not become clear until a few weeks later, when Axelrod had Eric Holder -- the former attorney general, once Snowden's chief pursuer -- on his podcast, The Axe Files. Holder allowed that Snowden "actually performed a public service," while Axelrod calmly presented Snowden's arguments.

"I think there has to be a consequence for what he has done," Holder replied. "But I think, you know, in deciding what an appropriate sentence should be, I think a judge could take into account the usefulness of having had that national debate."

Holder's concession made international headlines. It didn't mean anything legally, but symbolically it spoke volumes. Political realities were starting to come into alignment with Snowden's virtual ones. From his computer in Moscow, Snowden tweeted:

2013: It's treason!

2014: Maybe not, but it was reckless

2015: Still, technically it was unlawful

2016: It was a public service but

Dotcom, Assange warn of hacking

Sunday, 26 June 2016

Byline: Chris Zappone

Section: general

Canberra - Did Kim Dotcom warn the world the Democratic Party hacking was coming? Megaupload founder Kim Dotcom said last year he knew of information that would create an obstacle for Hillary Clinton's 2016 presidential election bid, explaining WikiLeaks' Julian Assange would prove a thorn in the side of the presumptive presidential candidate.
Last week a hacker going by the name Guccifer 2.0 released what appeared to be the Democratic Party's research on presumptive Republican nominee Donald Trump.

The hacker has since produced more reports with alleged information about Mrs Clinton's donors. Mr Assange, who reportedly holds the rest of the Democratic Party hack information, says more will soon be released.

When contacted about future data releases, WikiLeaks replied only: "We have a very big publishing year ahead." While hacks of US presidential campaigns have happened before, the prospect of hackers - especially ones backed by a foreign nation - dumping US election- related data during the campaign and for the global public's consumption is new.

It's significant that the Russian actions against US political targets were potentially tipped months earlier. In the shadowy world of the cyber competition, attributions of hacking is often as slow as seven months after they are discovered.Mr Dotcom's warning suggested evidence of such an attack was available months before the event was revealed. Guccifer 2.0 said his hacking effort had been under way for almost a year. Based on the nature and details of the attack, independent researchers in the US concluded the hack was conducted by a group linked to the Russian government.

Asked this week if the information Mr Assange claimed to have on Mrs Clinton's campaign came from Russian hacks, Mr Dotcom replied: "No comment." Earlier this month, Mr Assange said his site would provide enough evidence to indict Mrs Clinton. Although Mrs Clinton is the subject of investigations over her handling of emails, Mr Assange admitted it was unlikely the US Justice Department would indict her based on whatever information he had.

Mr Assange, who has lived at the Ecuadorian embassy in London since 2012 to avoid a series of extraditions that could have him tried in the US for his role in the Cablegate leak, is considered friendly to Russian interests. Mr Assange claims to have helped former NSA contractor Edward Snowden travel to Russia.

Google, Facebook quietly move toward automatic blocking of extremist videos

Saturday, 25 June 2016

Section: general

San Francisco and Washington-- Some of the web's biggest destinations for watching videos have quietly started using automation to remove extremist content from their sites, according to two people familiar with the process.
The move is a major step forward for internet companies that are eager to eradicate violent propaganda from their sites and are under pressure to do so from governments around the world as attacks by extremists proliferate, from Syria to Belgium and the United States.

YouTube and Facebook are among the sites deploying systems to block or rapidly take down Islamic State videos and other similar material, the sources said.

The technology was originally developed to identify and remove copyright-protected content on video sites. It looks for hashes," a type of unique digital fingerprint that internet companies automatically assign to specific videos, allowing all content with matching fingerprints to be removed rapidly.

Such a system would catch attempts to repost content already identified as unacceptable, but would not automatically block videos that have not been seen before.

The companies would not confirm that they are using the method or talk about how it might be employed, but numerous people familiar with the technology said that posted videos could be checked against a database of banned content to identify new postings of, say, a beheading or a lecture inciting violence.

The two sources would not discuss how much human work goes into reviewing videos identified as matches or near-matches by the technology. They also would not say how videos in the databases were initially identified as extremist.

Use of the new technology is likely to be refined over time as internet companies continue to discuss the issue internally and with competitors and other interested parties.

In late April, amid pressure from U.S. President Barack Obama and other U.S. and European leaders concerned about online radicalization, internet companies including Alphabet Inc's YouTube, Twitter Inc, Facebook Inc and CloudFlare held a call to discuss options, including a content-blocking system put forward by the private Counter Extremism Project, according to one person on the call and three who were briefed on what was discussed.

The discussions underscored the central but difficult role some of the world's most influential companies now play in addressing issues such as terrorism, free speech and the lines between government and corporate authority.

None of the companies at this point has embraced the anti- extremist group's system, and they have typically been wary of outside intervention in how their sites should be policed.

It's a little bit different than copyright or child pornography, where things are very clearly illegal," said Seamus Hughes, deputy director of George Washington University's Program on Extremism.

Extremist content exists on a spectrum, Hughes said, and different web companies draw the line in different places.

Most have relied until now mainly on users to flag content that violates their terms of service, and many still do. Flagged material is then individually reviewed by human editors who delete postings found to be in violation.

The companies now using automation are not publicly discussing it, two sources said, in part out of concern that terrorists might learn how to manipulate their systems or that repressive regimes might insist the technology be used to censor opponents.

There's no upside in these companies talking about it," said Matthew Prince, chief executive of content distribution company CloudFlare. Why would they brag about censorship?"

The two people familiar with the still-evolving industry practice confirmed it to Reuters after the Counter Extremism Project publicly described its content-blocking system for the first time last week and urged the big internet companies to adopt it.

WARY OF OUTSIDE SOLUTION

The April call was led by Facebook's head of global policy management, Monika Bickert, sources with knowledge of the call said. On it, Facebook presented options for discussion, according to one participant, including the one proposed by the non-profit Counter Extremism Project.

The anti-extremism group was founded by, among others, Frances Townsend, who advised former president George W. Bush on homeland security, and Mark Wallace, who was deputy campaign manager for the Bush 2004 re-election campaign.

Three sources with knowledge of the April call said that companies expressed wariness of letting an outside group decide what defined unacceptable content.

Other alternatives raised on the call included establishing a new industry- controlled nonprofit or expanding an existing industry-controlled nonprofit. All the options discussed involved hashing technology.

The model for an industry-funded organization might be the nonprofit National Center for Missing and Exploited Children, which identifies known child pornography images using a system known as PhotoDNA. The system is licensed for free by Microsoft Corp.

Microsoft announced in May it was providing funding and technical support to Dartmouth College computer scientist Hany Farid, who works with the Counter Extremism Project and helped develop PhotoDNA, to develop a technology to help stakeholders identify copies of patently terrorist content."

Facebook's Bickert agreed with some of the concerns voiced during the call about the Counter Extremism Project's proposal, two people familiar with the events said. She declined to comment publicly on the call or on Facebook's efforts, except to note in a statement that Facebook is exploring with others in industry ways we can collaboratively work to remove content that violates our policies against terrorism."

In recent weeks, one source said, Facebook has sent out a survey to other companies soliciting their opinions on different options for industry collaboration on the issue.

William Fitzgerald, a spokesman for Alphabet's Google unit, which owns YouTube, also declined to comment on the call or about the company's automated efforts to police content.

A Twitter spokesman said the company was still evaluating the Counter Extremism Project's proposal and had not yet taken a position."

A former Google employee said people there had long debated what else besides thwarting copyright violations or sharing revenue with creators the company should do with its Content ID system. Google's system for content-matching is older and far more sophisticated than Facebook's, according to people familiar with both.

Lisa Monaco, senior adviser to the U.S. president on counterterrorism, said in a statement that the White House welcomed initiatives that seek to help companies better respond to the threat posed by terrorists' activities online.

The post Google, Facebook quietly move toward automatic blocking of extremist videos appeared first on Cyprus Mail.

Cybersecurity threat 'keeps us up at night,' says Hydro Ottawa CEO

Saturday, 25 June 2016

Byline: Staff Writer

Section: general

Ottawa- As the electricity grid becomes more and more connected to the internet, Hydro Ottawa says it's investing heavily to protect the system from cyber attacks.
"It's huge," said Hydro Ottawa CEO Bryce Conrad of cybersecurity. "It keeps us up at night."

Conrad described how someone sitting in a bedroom at a computer on the other side of the world can try to hack into a utility's information systems and do damaging things ? like take down a grid.

"There are lots of examples out there where this has come true."

And Conrad says he doesn't pretend it can't happen in Ottawa.

"We're a G7 capital, so we're not just Hydro Ottawa, we're the provider of electricity to a G7 capital. If you don't have electricity in the morning, you're not doing a whole lot," he added.

Connecting customers while preventing attacks

Cybersecurity is detailed as a risk facing the utility in the five-year strategy document that Hydro Ottawa tabled earlier this week at an Ottawa city council meeting.

The strategy describes an industry in the midst of transformation in which electricity systems are converging with, and are increasingly dependent on, information technology.

Hydro Ottawa anticipates big changes in the coming years ? from increased sales of electric cars to innovations that come from more customers being digitally connected to a smart grid, a system of resources to better manage consumption.

But having people, their homes, their appliances, and their vehicles connected to the internet all the time poses a security challenge for an electric utility like Hydro Ottawa.

"As we become more customer-centric, and give customers more tools to sort of manage these things, you're effectively opening up your system for your customers," said Conrad.

"What you're trying to do is open it up for them and keep the back door closed to someone who wants to do something nefarious."

Heavy investment in command and control centre

That's why Hydro Ottawa considers cybersecurity every time it buys a piece of software or technology, according to Conrad.

"We have to invest heavily in cybersecurity and making sure our systems, particularly our command and control systems, are as robust and protected as they possibly can be," he said.

The electricity industry gets together regularly to discuss best practices for protecting utilities from the threat of hacks emanating from terrorists, organized crime groups, or other foreign entities.

"I'll never say we're 100 per cent protected, but we're in pretty good shape."

ITAR-TASS World Service

State Duma adopts package of anti-terrorist bills

Saturday, 25 June 2016

Byline: Staff Writer

Section: general

Russia's State Duma on Friday adopted in the second and third, final reading a package of anti-terrorist bills proposed by lower house member Irina Yarovaya and upper house member Viktor Ozerov.

The initiatives sparked great public controversy and continued to be edited up to the last moment. Eventually the idea of terminating the Russian citizenship of those dual or multiple citizens who have committed terrorist crimes or proved to have been employed by foreign special services was dropped. Under the just- adopted version communication operators will be obliged to keep information about their subscribers' connections for a period of three years, and of the content transmitted, including videos, for six months. For the owners of messenger services and social networks these rules have been eased somewhat: they will be not allowed to delete information about the content transmitted and their users for twelve months, and not three years, contrary to the original version of the bill.

Messenger services, such as WhatsApp and Telegram will be fined up to one million rubles, should they refuse to disclose content at the request of the federal security service FSB.

Anti- sect amendments

A special group of amendments defines what "missionary activity" is and prohibits attempts to conduct it on behalf of religious associations whose aims contradict the law. The legislators banned missionary activities that violate public security and order, extremist actions, coercion into ruining families, and encroachments on the freedom of the person and rights and freedoms of citizens. A ban is imposed on missionary activities aimed at inducing suicide, at creating obstructions to getting mandatory education and at persuasion of individuals to refuse to perform their legally mandatory civic duties.

Missionary and preaching activities that breech legislation on the freedom of conscience and faith and on religious associations will be punishable with a fine of 5,000 rubles to 50,000 rubles ($77 to $7700) for individuals, and 100,000 rubles to 1,000,000 ($1,500 to $15,000). Foreign citizens will face expulsion from Russia. Under the new rules, all printed, audio and video content being distributed by a religious organization must have proper markings and bear the organization's full name.

Life sentence for international terrorism

The Criminal Code's list of crimes against peace and security of humanity was expanded to incorporate "international terrorism" and life imprisonment established as the maximum punishment. The minimum prison term for a terrorist attack will be increased from eight years to ten and from ten years to twelve (if the crime was committed by a group of persons or resulted in loss of human life).

The newly-adopted law contains a new, fuller definition of the financing of terrorism. It will be understood as "provision or raising of funds or provision of financial services with the awareness that they are meant for financing a terrorist organization, or plotting or committing terrorist crimes."

Public calls for terrorism or statements made in public in the Internet with the aim of excusing it will be punishable with a fine of up to 1,000,000 rubles ($15,000) or a prison term of five to seven years. Publicly expressed excuses are defined as "public statements to the effect the ideology and practices of terrorism are correct and worth supporting and following." Participation in a terrorist organization will

be punishable with prison terms of ten to twenty years (in contrast to the currently established ones of five to ten years).

Failure to report a terrorist attack

Failure to report preparations for terrorist crimes or committed terrorist crimes will entail a fine of up to 100,000 rubles ($15,000) or forced labor of up to twelve months or a twelve-month prison term. Failure to report preparations for a terrorist attack or a committed terrorist attack by one's spouse or close relative will not be punishable.

Minimum punishments

Punishments for organizing or participating in armed groups, including those abroad will be tightened. The maximum prison term for this offence is raised to five years. The Criminal Code is complemented with a new article establishing punishment for suborning into or recruitment for mass unrest. Such wrongdoing will be fined with 300,000 rubles to 700,000 rubles ($4,600 to $10,800) or a prison term of five to ten years.

Minimum punishments have been introduced under Article 282 of the Criminal Code (Incitement of Hatred or Humiliation of Human Dignity). The mildest punishment is set at three years and the maximum one, at six. Punishment for organizing an extremist organization or extremist community or financing extremist activities was tightened accordingly.

The age of accountability for terrorism is lowered to 14 years. The list of aggravating circumstances has been expanded to incorporate crimes committed in the context of an armed conflict or combat operations.

The amendments will take effect on July 20, 2016.

The Nation Multi

Military chiefs call for more robots for national security

Monday, 27 June 2016

Byline: Juthathip Lucksanawong

Section: general

Bangkok - The 26-kilogram, rectangular Portable Rescue Robot (PRR) stretched its manipulator arm, complete with a night vision camera, to surveil the area. With a wireless control system and two additional blades in front, the PRR showed off its ability to move freely in hostile terrain.
The display was performed in front of veteran military officers and weapons experts who met at a recent seminar on the development of military technology.

Mahanakorn University of Technology developed the robot, one of several robot prototypes that experts are collaboratively trying to develop to support national security missions. Using robots, especially for bomb retrieval missions, has long been considered by the Thai military.

Over the recent decade, Thailand has seen both the Southern insurgency and terrorism plaguing national security, said Sqn Leader Jiradett Kerdsri, director of data and communication division of the Defence Technology Institute (DTI).

"While insurgency and explosions are ongoing in the South, the dreadful bombing in August last year at Ratchaprasong intersection, the heart of Bangkok city, also irked state security," he said.

Such troubles affect the country's tourism, economy and trustworthiness, Jiradett said. "Foreign investors and tourists won't risk coming to a hazardous territory," he said.

It is essential, he added, for the DTI to select much-needed defence technology to be developed to serve the country's security goals.

Inventing bomb retrieval robots is part of the DTI's research plan initiated in 2009 to promote self-reliance in terms of national security and reduce the need to procure defence systems and equipment from other countries, said General Sompong Mukdaskul, DTI director-general.

Since its official establishment seven years ago, the DTI, under Ministry of Defence (MoD) oversight, has carried out five defence technology research plans focusing on rockets, unmanned aerial vehicles (UAVs), simulation technology, infantry fighting vehicles (IFVs), and military information and communication technology.

The DTI's prototypes in each category have been distributed to the three branches of the Armed Forces - Army, Navy and Air Force - and the police.

When the DTI began supplying defence forces with equipment and systems, Sompong found that each user had different technology requirements. To meet those requirements, the DTI needed to listen to what users required before research began, he added.

"Collecting feedback and comments from military and police authorities is the DTI's normal practice before and after each piece of defence equipment is unveiled," the director-general said.

The PRR's recent demonstration, and that of its robotic colleagues, in front of veteran officers and experts was part of that feedback process to fulfil the ambition to build sophisticated robots that can help to keep people safe in the field.

Air Force representatives told the seminar that the force needs robots that support remote operations with wireless and fibre optic control systems. The force has to patrol remote, inaccessible areas where land mines are a danger that could be mitigated by capable remote control robots, said Wing Commander Navin Vudhironnarith, deputy chief of the Air Force's Explosive Ordnance Disposal (EOD) force.

The robots also need to be lightweight with fire-suppression systems, including recoilless water jets, for safety, he added.

The Army, on the other hand, needs user-friendly robots with very high capabilities, said Colonel Krittipas Cruanate, chief of the Army's EOD.

"A single robot should not have all the functions. Some tasks do not need a full, heavy scanning system. Only reliable and enduring sensors and portable X-rays are necessary," he said

The colonel, who has seen numerous officers and ordinary people killed in bombings in the Southern violence, said robots are necessary because they could help to reduce fatalities explosive disposal missions. "If we'd had high-tech robotics to carry out deadly missions, people and authorities would not have died," he said.

To accomplish this new technological mission, participants agreed that academic institutions play a crucial role in developing new innovations because they act as centres of "know how" bringing together scholars and experts, Sompong said.

"Education institutions have performed tonnes of research but have no chance to apply their studies [in real situations]," he said.

The DTI director-general said he sees potential for knowledge transfers between these institutions and his agency.

"Their knowledge needs to be transferred and applied to the DTI's work. By doing this, they have an opportunity to further develop their technology and it saves time for us to conduct research on the robots," he said.

In addition to educational institutions, the industrial sector also has the potential to contribute to robotics projects.

To pioneer useful robots, industrial stakeholders need to get involved in terms of manufacturing, said Djitt Laowattana, lecturer at King Mongkut's University of Technology Thon Buri and founder and director of the Institute of Field Robotics (FIBO).

Djitt said industry is important because of its expertise in effectively managing resources in manufacturing and, especially, marketing and distribution.

The DTI knows how to invent technology but does not specialise in managing resources and budgets, he said. The government's support is required to entice the public sector to become more involved in robotics development, he added.

The government should catalyse the industry by introducing a "local materials" requirement to promote companies to use components available in the country, rather than imported ones, Djitt said, adding companies that utilise local materials should get government incentives. That would encourage others to adopt more technology and robotic components made in Thailand, he said.

When robots are produced and sold on a large scale, the lecturer said, the robotics industry would increasingly grow, leading innovators and manufacturers to become eager to help to produce defence systems contributing to national security.

"I just hope that future robots answer the needs of defence suppliers. [We should] not just launch [the idea] and then put it on a shelf after our lengthy discussion today," Sompong said. "And I just hope that the bomb retrieval robots will eventually be practical and meet international standards."

Press Trust of India

India to become full member of Missile Technology Control Regime

Monday, 27 June 2016

Section: general

New Delhi - In its first entry into any multilateral export control regime, India will today join the Missile Technology Control Regime (MTCR) as a full member, three days after it failed to get NSG membership due to stiff opposition from China and a few other countries.
"We applied for the membership of MTCR last year and all the procedural formalities have been completed. Tomorrow, Foreign Secretary S Jaishankar will sign the document of accession into MTCR in the presence of Ambassadors of France, Netherlands and Luxembourg," External Affairs Ministry spokesperson Vikas Swarup said.

Significantly, China, which stonewalled India's entry into the 48-nation Nuclear Suppliers Group (NSG) at the just- concluded Seoul plenary, is not a member of 34-nation MTCR.

Since its civil nuclear deal with the US, India has been trying to get into export control regimes like NSG, MTCR, the Australia Group and the Wassenaar Arrangement that regulate the conventional, nuclear, biological and chemicals weapons and technologies.

India's case in MTCR was opposed last year by Italy which is not happy with New Delhi over the marines dispute. However, after both marines, accused of murdering two fishermen off the Kerala coast in 2012, were allowed to return, the Italians have softened their opposition.

India's efforts to get into the MTCR also got a boost after it agreed to join the Hague Code of Conduct, dealing with the ballistic missile non- proliferation arrangement, earlier this month.

MTCR membership will enable India to buy high-end missile technology and also enhance its joint ventures with Russia.

The aim of the MTCR is to restrict the proliferation of missiles, complete rocket systems, unmanned air vehicles and related technology for those systems capable of carrying a 500 kilogramme payload for at least 300 kilometres, as well as systems intended for the delivery of weapons of mass destruction (WMD).

India to get access to almost 99% of U.S. defence technologies

Monday, 27 June 2016

Section: general

Washington - India will be the only country outside Washington's formal treaty allies that will gain access to almost 99 per cent of latest U.S.'s defence technologies after being recognised as a 'Major Defence Partner', a senior Obama administration official has said.
"India [now] enjoys access to [defence] technologies that is on a par with our treaty allies. That is a very unique status. India is the only other country that enjoys that status outside our formal treaty allies," the official told PTI explaining what 'Major Defence Partner' status means for India.

Early this month, after a meeting between U.S. President Barack Obama and Prime Minister Narendra Modi at the White House, the U.S., in a joint statement, recognised India as a 'Major Defence Partner'

"We were looking for something unique. This language you would not find in any arms transfer legislation or any of our existing policies. This is new guidance and new language that is intended to reflect the unique things that we have done with India under our defence partnership," the senior administration official said.

"This is intended to solidify the India-specific forward leaning policies for approval that the [U.S.] President and [Defence] Secretary [Ashton] Carter...and our export control system have implemented in the last eight years," the official said.

Under this recognition India would receive licence-free access to a wide range of dual-use technologies in conjunction with steps that New Delhi has committed to taking to advance its export control objectives.

Acknowledging that the impression in New Delhi was that India was not getting access to the kind of technology it needed from the U.S., the official said it was a constant source of discussion.

"[In reality], less than one per cent of all exports [requests] are denied [to India]. They are not denied because of India. They are denied because of global U.S. licencing policies. We do not share certain technologies with anybody in the world," the official asserted.

The perception in India that the denial of such technologies is reflective of India-U.S. relationship is far from the truth, the official has said.

According to the official, India being recognised as a "major defence partner puts it on par with our treaty allies." Inside the American bureaucratic system, such a recognition removes a number of major export control hurdles for India.

The category of 'Major Defence Partner' was created specifically for India, observed Ashley Tellis, of Carnegie Endowment for International Peace, a top American think-tank.

"It was meant to recognise that although India will not be an alliance partner of the United States, the administration seeks to treat it as such for purposes of giving it access to advanced technologies of the kind that are reserved for close US allies," Mr. Tellis told PTI.

"The U.S. expects that bilateral defence ties will only grow in the years ahead, that India and the United States will continue to work together especially regarding maritime security, that India will eventually be admitted to global non-proliferation regimes, and that it will sign the foundational agreements," he said in response to a question.

"As these developments materialise, India's access to U.S. technology will also increase, and the "major defence partner" moniker is intended to signal to both the outside world and to the U.S. bureaucracy

that oversees licensing that India is viewed as a unique collaborator and will be treated as such where access to advanced technologies are concerned," Mr. Tellis said.

Calling India a "Major Defence Partner" is "more a term of art than a technical designation", noted Richard M. Rossow, Wadhwani Chair in U.S. India Policy Studies at the Centre for Strategic and International Studies, another top American think-tank.

"It certainly captures what is emerging as a unique relationship, exhibited by programs such as the Defence Technology and Trade Initiative [DTTI] and the establishment of a dedicated 'India Rapid Reaction Cell' inside the Pentagon. Neither exists for a country other than India," he said.

"But the term 'Major Defence Partner' does not automatically trigger a specific process or program in the U.S. system. Our two countries are feeling their way around the contours of our defence relationship," Mr. Rossow told PTI.

"India desires advanced U.S. technology today, while the U.S. would like more clarity on the specific operations India may be willing to undertake in the future to contribute to regional security. It is a process that has seen great progress, which we hope will carry over into the next U.S. administration," Mr. Rossow said in response to a question.

Over the last one decade the defence trade between India and the U.S. has increased from being almost non-existent to more than $14 billion. This is expected to increase manifold as India embarks on a major defence modernisation drive.

Times of Israel

CyberArk eyes expansion in Asia

Monday, 27 June 2016

Byline: Shoshanna Solomon

Section: general

Jerusalem - Petah Tikva-based CyberArk, Israel's second-largest public cybersecurity company, plans to target the Asian and Latin American markets and mid-sized customers in the longer term to boost growth, Udi Mokady, president and chief executive officer of CyberArk, said in an interview.
Speaking with reporters last week at the sidelines of a cybersecurity conference in Tel Aviv, Mokady said enterprise customers are still the main focus of the company and CyberArk is still just "scratching the

surface" of the potential of these companies.But in the longer term the firm is also "looking at ways to address also the mid-market as part of our strategy."

CyberArk is a cybersecurity company that specializes in protecting "privileged accounts" on corporate servers. Privileged accounts are computer system user accounts that have extra privileges so that owners of those accounts can control important aspects of a server or network. Large computer systems, especially those that have been around for years, usually contain many such accounts that are no longer in use - either because they were set up specifically for certain no-longer relevant missions or because they belonged to former employees. These accounts are especially vulnerable to hacker accounts, as they aren't watched too closely.

CyberArk chokes off the possibility that privileged accounts will be abused by identifying and cutting off access to the accounts. The system sets up a policy on user accounts that forces users to change passwords on a regular basis, including dormant privileged accounts. In addition, the system sets up a "safe zone" for data to be managed when accessed from an account.

"We found that even though we were targeting enterprise, we got pull from mid-market -- universities, credit unions, law firms, things we weren't necessarily targeting, and so it shows us there is an opportunity and we are looking for ways to address that in 2017 and beyond," Mokady said in the interview. "Right now it is very much enterprise-focused."

The company, which held an initial public offering of shares on the Nasdaq in 2014, saw its shares surge as corporations flocked to buy security software amid higher levels of data breaches worldwide.

Today CyberArk, the largest Israeli public information security company in both revenue and in market capitalization, has more than 2,600 customers globally, of which more than 40% are Fortune 100 customers, according to data from a May 2016 presentation.

Revenues grew over 50 percent in 2014 and 2015, and in the first quarter of the year revenue jumped 43% to around $47 million compared to the same quarter a year earlier. Net income for the first quarter of 2016 rose to $4.3 million from $4.2 million in the same quarter in 2015. CyberArk in May forecast total revenue to rise by around 30% in 2016 to a range of $209 million to $211 million.

The company is also looking to increase its presence in the Asia Pacific, Mokady said. Last year the Americas accounted for 61% of its revenues while Europe, Middle East and Africa accounted for 31 percent. Just around 8% of sales were in Asia Pacific and Japan, according to the presentation. "We want to bring it much higher," Mokady said. "We want it to be toward the teens in the long term. The opportunity is tremendous." Latin America is also an opportunity for growth, he said. "They have the same problems, the same IT infrastructure, the same weaknesses."

Even as the company has posted strong results, its share price has has declined about 26% in the past year amid concerns that enterprise spending in cybersecurity software has started to slow, lackluster

results from peers and on worries about too-high valuations in the sector. The company has a market capitalization of about $1.61 billion, according to data compiled by Bloomberg.

CyberArk's share decline spurred speculation in January that the company would become an acquisition target for Israel's Check Point Software Technologies Ltd.

Mokady shrugged off the possibility of a company sale even as he sees the possibility of some consolidation in the industry among the smaller companies. "CyberArk is a buyer," he said. "We are going for it and being acquisitive. Naturally in any step of the way we will do what is right for the shareholders. But left alone, we are building it big. "

The company has made two acquisitions, Viewfinity, Inc., a Waltham, Massachusetts-based provider of Windows privilege management and application control software, for $30.5 million in cash, and Israeli firm CyberIntel.

Acquisitions "is part of our growth strategy and we are very pleased with the first two," Mokady said. "There is appetite and willingness to do more but there is no pressure because we have such a huge organic opportunity."

Wall Street Journal

Russian Hack Said To Reach Beyond Democrats

Monday, 27 June 2016

Byline: Nicole Hong

Section: general

New York - The attack on the Democratic National Committee's computer network this past spring was part of a broader monthslong campaign by Russian hackers against groups with ties to U.S. politics, according to a new report.
Party officials and security researchers disclosed about two weeks ago that the DNC's system was compromised in April by two hacking groups with links to Russian intelligence services, one of the largest known breaches of a U.S. political organization.

On Sunday, cybersecurity firm SecureWorks Corp. concluded that one of the hacking groups, dubbed "Fancy Bear" in security circles, also targeted the emails of presumptive Democratic nominee Hillary

Clinton's campaign, as well as email accounts belonging to U.S.-based military spouses, political activists and journalists who wrote critically about Russia and others.

Over the past year or so, the hackers tried to penetrate nearly 4,000 individual email accounts, researchers said.

Researchers believe the hackers wanted access to email accounts as part of an intelligence-gathering operation, as opposed to stealing information for financial gain. In one tactic, the hackers sent out mass emails containing links that asked victims to reset their passwords.

Users at two dozen email addresses associated with the DNC and Mrs. Clinton's campaign clicked on the links, but SecureWorks says it is unclear whether information was accessed. Researchers previously said the hackers gained access to the DNC's chat systems and research files, including the party's opposition research on presumptive Republican nominee Donald Trump.

The DNC is "confident" that Russian government hackers were responsible for the breach and has "deployed the recommended technology" to secure their systems, said a senior DNC official.

A representative of the Russian government couldn't be reached for comment. In a previous statement, a Kremlin spokesman said: "I completely rule out the possibility of the government or government structures being involved in this."

A spokesman for the Clinton campaign didn't respond to a request for comment.

New York Magazine

I, Snowbot

Monday, 27 June 2016

Byline: Andrew Rice

Section: general

New York - Edward Snowden lay on his back in the rear of a Ford Escape, hidden from view and momentarily unconscious, as I drove him to the Whitney museum one recent morning to meet some friends from the art world. Along West Street, clotted with traffic near the memorial pools of the World Trade Center, a computerized voice from my iPhone issued directions via the GPS satellites above. Snowden's lawyer, Ben Wizner of the American Civil Liberties Union, was sitting shotgun, chattily

recapping his client's recent activities. For a fugitive wanted by the FBI for revealing classified spying programs who lives in an undisclosed location in Russia, Snowden was managing to maintain a rather busy schedule around Manhattan.
A couple nights earlier, at the New York Times building, Wizner had watched Snowden trounce Fareed Zakaria in a public debate over computer encryption. "He did Tribeca," the lawyer added, referring to a surprise appearance at the film festival, where Snowden had drawn gasps as he crossed the stage at an event called the Disruptive Innovation Awards. Wizner stopped himself mid- sentence, laughing at the absurdity of his pronoun choice: "He!" Behind us, Snowden stared blankly upward, his face bouncing beneath a sheet of Bubble Wrap as the car rattled over the cobblestones of the Meatpacking District.

Snowden's body might be confined to Moscow, but the former NSA computer specialist has hacked a work-around: a robot. If he wants to make his physical presence felt in the United States, he can connect to a wheeled contraption called a BeamPro, a flat-screen monitor that stands atop a pair of legs, five-foot-two in all, with a camera that acts as a swiveling Cyclops eye. Inevitably, people call it the "Snowbot." The avatar resides at the Manhattan offices of the ACLU, where it takes meetings and occasionally travels to speaking engagements. (You can Google pictures of the Snowbot posing with Sergey Brin at TED.) Undeniably, it's a gimmick: a tool in the campaign to advance Snowden's cause -- and his case for clemency -- by building his cultural and intellectual celebrity. But the technology is of real symbolic and practical use to Snowden, who hopes to prove that the internet can overcome the power of governments, the strictures of exile, and isolation. It all amounts to an unprecedented act of defiance, a genuine enemy of the state carousing in plain view.

We unloaded the Snowbot in front of the Whitney, where a small group had gathered to meet us for a private viewing of a multimedia exhibition by the filmmaker Laura Poitras. It was Poitras whom Snowden first contacted, anonymously, in 2013, referring to the existence of a surveillance system "whose reach is unlimited but whose safeguards are not." Their relationship resulted in explosive news articles and a documentary, Citizenfour -- work that won a Pulitzer and an Oscar and incited global outrage. But the disclosures came at a high price for their source. If Snowden couldn't come home, Poitras at least wanted him to share vicariously in the experience of her Whitney show, "Astro Noise," which took its name from an encrypted file of documents he had spirited out of the secret NSA site where he worked in Hawaii. So she had arranged a personal tour.

Outside an eighth-floor gallery, a crowd of Poitras's collaborators and Whitney curators clustered around the Snowbot as a white circle twirled on its monitor. Then, suddenly, the screen awoke and Snowden was there.

"Hey!" Wizner said, and the group erupted in awkward laughter. The famous fugitive was wearing a gray T-shirt, his face pallid and unshaven. (He calls himself "an indoor cat.") His voice sounded choppy, but some fiddling resolved the problem, and Poitras, soft-spoken and clad in black, made introductions. Snowden's preternaturally eloquent Hong Kong hotel-room encounter with Poitras and the Guardian journalists investigating his leaks formed the core of Citizenfour, but even some of those who worked on

the documentary had never met its protagonist. One of the cinematographers came forward and wrapped him in a hug.

"I don't have hands," Snowden apologized. "The most I can do is maybe ..."

He scooted forward.

Sitting in the same homemade studio he uses for his frequent speaking engagements, Snowden could control the robot's movements with his computer, maneuvering with uncanny agility, swiveling to make eye contact with people as they spoke to him.

Poitras began with the show's opening piece, a colorful array of prints that resembled modern abstracts but were actually found objects: visualizations of intercepted satellite signals that turned up in the vast trove of NSA documents. "The whole show, there's a lot of deep research that's going on behind it," she said. She led Snowden into a darkened gallery, where a spooky ambient soundscape was playing over video footage of a U.S. military interrogation. Momentarily disoriented, he careened into a bench. But Snowden quickly figured out how to navigate in the dark. When he came to parts of the exhibit that required complicated movements -- lying on a platform to take in the watchful night sky over Yemen, or craning to look at an NSA document through a slit in the wall -- the humans hoisted him into position.

"Wow, okay, I see it," Snowden said as one of Poitras's researchers held him up to view footage of a drone strike's aftermath. "This is a surreal experience for a number of reasons."

When the tour was over, Snowden held an impromptu discussion, likening his decision to become a dissident to a risky artistic choice. "There's always that moment where you step out and there's nothing underneath you," he said. "You hope that you can build that airplane on the way down, or if you don't, that the world will catch you. In my case, I've been falling ever since." Still, Snowden said he had no regrets. "I do have to say," he told Poitras, "that I will be forever grateful that you took me seriously."

As usual, though, when the questions turned to the details of his non-robotic existence, Snowden remained courteously evasive. "What's a day in the life now?" asked Nicholas Holmes, the Whitney's general counsel. "Do you go for walks in the park?"

"Well," the Snowbot replied, "I go for walks in the Whitney, apparently."

The idea that Snowden is still walking the American streets, virtually or otherwise, is infuriating to his former employers in the U.S.-intelligence community. Its leaders no longer make ominous jokes about wanting to put him on a drone kill list -- as former NSA and CIA director Michael Hayden did in 2013 -- but they still vilify him and maintain that he did real harm to America's safety and international standing. While Snowden's leaks revealed the NSA's controversial and possibly unconstitutional bulk collection of domestic internet traffic and telephone metadata, they also exposed technical details about many other classified activities, including overseas surveillance programs, secret diplomatic arrangements, and

operations targeting legitimate adversaries. The spy agencies warn that the public doesn't comprehend the degree of damage done to their protective capabilities, even as events like the Orlando nightclub massacre demonstrate the destructive reach of terrorist ideology. The fallout from Snowden's actions may have prompted a debate about security and privacy that even President Obama acknowledges "will make us stronger," but there has been no such reassessment, at least officially, of Snowden himself. He still faces charges of violating the federal Espionage Act, crimes that could carry a decades-long prison sentence.

When Snowden first revealed the NSA's surveillance -- and his own identity -- to the world three years ago this month, there was little reason to believe that he would be in a position to communicate much of anything in the future. The last person to leak classified information of such magnitude, Chelsea Manning, was sentenced to 35 years in prison. (Manning, who was held in solitary confinement while awaiting trial, has largely communicated to the public through letters.) Yet so far, to his own surprise, Snowden has managed to avoid the long arm of U.S. law enforcement by finding asylum in Russia. Leaving aside, at least for the moment, the ethics of his actions (and the internal contradictions of his residence in an authoritarian state ruled by a former KGB operative), Snowden's case is, in fact, a study in the boundless freedoms the internet enables. It has allowed him to become a champion of civil liberties and an adviser to the tech community -- which has lately become radicalized against surveillance -- and, in the process, the world's most famous privacy advocate. After he appeared on Twitter last September -- his first message was "Can you hear me now?" -- he quickly amassed some two million followers.

"I feel like we're sort of dancing around the leadership conversation," Snowden said to me recently as I sat with him at the ACLU offices. Over the past few months, we have encountered one another with some regularity, and while I can't claim to know him as a flesh-and-blood person, I've seen his intellect in its native habitat. He is at once exhaustively loquacious and reflexively self-protective, prone to hide behind smooth oratory. But occasionally, he has let down his guard and talked like a human being. "I'm able to actually have influence on the issues that I care about, the same influence I didn't have when I was sitting at the NSA," Snowden told me. He claims that many of his former colleagues would agree that the programs he exposed were wrongfully intrusive. "But they have no voice, they have no clout," he said. "One of the weirder things that's come out of this is the fact that I can actually occupy that role." Even as the White House and the intelligence chiefs brand him a criminal, he says, they are constantly forced to contend with his opinions. "They're saying they still don't like me -- tut-tut, very bad -- but they recognize that it was the right decision, that the public should have known about this."

Needless to say, it is initially disorienting to hear messages of usurpation emitted, with a touch of Daft Punk-ish reverb, from a $14,000 piece of electronic equipment. Upon meeting the Snowbot, people tend to become flustered -- there he is, that face you know, looking at you. That feeling, familiar to anyone who's spotted a celebrity in a coffee shop, is all the more strange when the celebrity is supposed to be banished to the other end of the Earth. And yet he is here, occupying the same physical space. The technology of "telepresence" feels different from talking to a computer screen; somehow, the fact that Snowden is standing in front of you, looking straight into your eyes, renders the experience less like

enhanced telephoning and more like primitive teleporting. Snowden sometimes tries to put people at ease by joking about his limitations, saying humans have nothing to fear from robots so long as we have stairs and Wi-Fi dead zones in elevators. Still, he is quite good at maneuvering on level ground, controlling the robot's movements with his keyboard like a gamer playing Minecraft. The eye contact, however, is an illusion--Snowden has learned to look straight into his computer's camera instead of focusing on the faces on his screen.

Here's the really odd thing, though: After a while, you stop noticing that he is a robot, just as you have learned to forget that the disembodied voice at your ear is a phone. Snowden sees this all the time, whether he is talking to audiences in auditoriums or holding meetings via videoconference. "There's always that initial friction, that moment where everybody's like, 'Wow, this is crazy,' but then it melts away," Snowden told me, and after that, "regardless of the fact that the FBI has a field office in New York, I can be hanging out in New York museums." The technology feels irresistible, inevitable. He's the first robot I ever met; I doubt he'll be the last.

Wizner, the head of the ACLU's Speech, Privacy, and Technology Project, says that Snowden asked him to do some research on telepresence in their first conversation, back when he was still very much on the lam. Now that his situation has stabilized -- at least for the time being -- he and Snowden's small coterie of advisers are discussing ways they might use it for a widening range of purposes. Glenn Greenwald, one of Snowden's original journalistic collaborators, jokingly talks about taking the Snowbot on the road. "I would love to let it loose in the parking lot of Fort Meade," where the NSA is headquartered, he said. "Or to randomly go into grocery stores." More seriously, Snowden's advisers are in discussions about a research fellowship at a major American university. Already, the Snowbot has twice taken road trips to Princeton University, where he has participated in wide-ranging discussions about the NSA's capabilities with a group of renowned academic computer-security experts, rolling up to cryptographers during coffee breaks and dutifully posing for selfies.

For larger gatherings, Snowden usually dispenses with the robot, addressing audiences from giant screens. (He often opens with an ironic reference to Big Brother.) He is scheduled to make more than 50 such appearances around the world this year, earning speaking fees that can reach more than $25,000 per appearance, though many speeches are pro bono. Besides allowing Snowden to make a good living, his virtual travels on the public- lecture circuit are part of a concerted campaign to situate him within a widening zone of political acceptability. "One of the things we were trying to do is to normalize him," says Greenwald. "Normalize his life, normalize his presence." In 2014, Snowden joined Poitras and Greenwald on the board of the Freedom of the Press Foundation, a San Francisco nonprofit, and last year he was elected chairman. It serves as a base for his advocacy and gives him access to a staff of technologists with whom he has been working on encryption projects, tools intended to allow journalists to communicate with "people that live in situations of threat" -- in other words, people like Snowden himself.

Through a network of intermediaries -- chief among them Wizner, who acts as his advocate, gatekeeper, and talent agent in the United States -- Snowden is able to establish contact with almost anyone he

desires to meet. "Ed's now getting a lot of people on the phone, and it's broadening his horizons," says the author Ron Suskind, who has spoken with him on several occasions and recently had him lecture to a class he and Lawrence Lessig were teaching at Harvard Law School. Snowden also recently spoke to Amal Clooney's law class at Columbia, starred in an episode of the Vice show on HBO, and published a manifesto on whistle-blowing on the Intercept, the website Poitras and Greenwald started with the billionaire Pierre Omidyar. And he has been maintaining his presence on Twitter, where he has been playfully talking up Oliver Stone's forthcoming film, Snowden, which will star Joseph Gordon-Levitt.

The biopic's September release date matches up with Wizner's timetable for mobilizing a clemency appeal to Obama. "We're going to make a very strong case between now and the end of this administration that this is one of those rare cases for which the pardon power exists," Wizner said. "It's not for when somebody didn't break the law. It's for when they did and there are extraordinary reasons for not enforcing the law against the person." He says that while no single event is likely to shift opinion in Washington, Snowden's activities work "in the aggregate" to further his cause.

One thing Snowden refuses to do, however, is apologize. If anything, the last three years have turned him more strident. Whereas he once espoused a fuzzy dorm-room libertarianism -- "some of it was kind of rudimentary," Greenwald recalls -- today he offers a more traditional leftist critique of the "deep state." On Twitter, he has been admiring of Bernie Sanders, acerbic about Hillary Clinton's foreign policy, and bitingly sarcastic about her handling of classified emails. In February, he tweeted: "2016: a choice between Donald Trump and Goldman Sachs." He sees himself as part of a hacktivist movement, and he took pride when the anonymous source behind the massive cache of offshore banking data known as the Panama Papers cited Snowden's example. In his Intercept essay, he called such leaking "an act of resistance."

WNYC recently staged a sold-out Friday-night event at the Brooklyn Academy of Music, not far from Fort Greene Park, where some artists surreptitiously erected a Snowden bust last year. At the appointed time, the fugitive appeared on a screen at the front of an ornate opera hall. It was around 2:30 a.m. in Moscow, but Snowden looked wide-awake, wearing an open-collared shirt and blazer and his customary stubble. "In an extraordinary and unpredictable way," he told the audience, "my own circumstances show there is a model that ensures that even if we're left without a state, we aren't left without a voice."

When Snowden went public, one of the first people he sought out was a historical antecedent: Daniel Ellsberg, the military analyst who leaked the Pentagon Papers. He, too, was briefly a fugitive and faced Espionage Act charges, until they were dropped because of the illegal retaliatory actions of President Nixon. Now 85, Ellsberg was eager to talk to Snowden and they connected over an encrypted chat program.

"I had the feeling that, as I suspected from the beginning, we really were kindred souls," Ellsberg told me.

Ellsberg, mindful of Manning's experience, advised Snowden to give up any thought of returning home. Snowden was inclined to agree. From the beginning, he had spoken fatalistically about the consequences of his actions. "All my options are bad," Snowden acknowledged in his first interview in Hong Kong, which was published in the Guardian. If the American government didn't grab him, the Chinese might, just to find out what he knew. He hinted that the CIA might even try to kill him, either directly or through an intermediary like a triad gang. "And that's a fear I'll live under for the rest of my life, however long that happens to be," Snowden said at the time.

"He didn't have a plan," says Wizner. Snowden assumed that he would probably be silenced in one way or another, so he worked with a sympathetic programmer in the United States to design a website, supportonlinerights.com, which was to contain a letter addressed to the public. But instead, he more or less got away with it. After a nervy flight and an agonizing five-week wait in limbo at the Moscow airport, he was granted temporary asylum in Russia by President Vladimir Putin. Photos soon appeared in the Russian media showing Snowden pushing a grocery cart and looking slyly over his shoulder on a riverboat ride. It was an uneasy deliverance, though, one seemingly subject to Putin's unpredictable geopolitical power considerations.

Snowden argues that he was put in Russia by the U.S. government, which canceled his passport while he was en route to Ecuador, trapping him in Moscow during a layover. But to critics, his dependence on Putin is discrediting. "I am not saying that he is a Russian spy, but he is in a tough spot," says journalist Fred Kaplan, author of the recent book Dark Territory: The Secret History of Cyber War. "He is in a position where, because of his captive status, he can't really say anything that terribly critical about his hosts, who happen to be some of the most sophisticated and intrusive cyberespionage hackers in the world." Many in the intelligence community darkly speculate about the nature of Snowden's accommodation with the FSB, the Russian security service, which is not renowned for its hospitality or respect for civil liberties.

Although Snowden acknowledges that he was approached by the FSB, he claims he has given them no information or assistance, and he vehemently denies he is anyone's puppet. He cheered the release of the Panama Papers, which contained voluminous evidence of corruption in Putin's inner circle. "I have called the Russian president a liar based on his statements on surveillance, in print, in the Guardian," he said with an uncharacteristic flash of annoyance, when I asked whether he felt any constraints in discussing Russia. "I have criticized Russia's laws on this, that, and the other. It's just frustrating to get the question because it's like, look, what do I have to do?"

Snowden seems determined to refute predictions that he would end up broken, like so many whistle-blowers before him, or drunk and disillusioned, like a stereotypical Cold War defector. (He has claimed that he drinks nothing but water.) "People think of Moscow as being hell on earth," he said during his Whitney visit. "But when you're actually there, you realize it's not that much different than other European cities. Their politics are wildly different, and of course really they're problematic in so many ways, but the normal people, they want the same things." He says he does his own shopping and takes

the metro. Family members come to visit. His longtime girlfriend, Lindsay Mills, reunited with him in Moscow and has posted Instagram snapshots of her life there.

Last year, before Halloween, Mills posted a Photoshopped picture that posed the couple in front of FBI headquarters, with Snowden costumed as the capped protagonist of Where's Waldo? As improbable as it may sound, he has told confidants that he doesn't think the U.S. government has managed to pin down his exact whereabouts. He says he has designed his new life around his unique "threat model," minimizing his vulnerability to tracking by giving up modern conveniences like carrying a phone. "He does not believe that he's shadowed all the time by the CIA," says Ellsberg, who has been in regular contact. "But he does believe that he is in the sights of the FSB all the time, partly to keep him safe." Snowden is most at ease when he's on the internet, an environment he feels he can control. As a former systems engineer, he has been able to construct back-end protections that allow him to feel confident that he can evade locational detection, even when he is using the internet like a civilian. He has sometimes chatted via video on Google Hangouts.

Snowden is more wary about in-person meetings, typically conducting them in hotels like the Metropol near Red Square. More than a year after they began speaking, Ellsberg finally had the opportunity to meet Snowden in person, when he visited Moscow with an informal goodwill delegation that also included the actor John Cusack and the leftist Indian author Arundhati Roy. At the appointed time, Snowden called and said to meet him in the lobby of their hotel. Cusack took the elevator downstairs, and Snowden surprised him by getting on at the fourth floor. When they returned to the room, Ellsberg greeted Snowden by saying, "I've been waiting 40 years for someone like you."

Two days of marathon bull sessions and room-service dining ensued. Ellsberg tried -- unsuccessfully -- to get confirmation of some long-held suspicions about the extent of the NSA's spying on Americans. Periodically, Snowden would point to the ceiling, to remind the room that others were probably listening. Cusack and Roy later recounted the conversation in a 13,000-word essay, writing that when the meeting was over, Ellsberg lay down "on John's bed, Christ-like, with his arms flung open, weeping for what the United States has turned into -- a country whose 'best people' must either go to prison or into exile."

The notion that Snowden has become, to some, a sort of mythic figure -- the Oracle of the Metropol -- is profoundly annoying to the people who actually hold the nation's intelligence secrets. "I'd love to see him come back to the U.S. and take his medicine," says Robert Litt, general counsel for the Office of the Director of National Intelligence, who has been deeply involved in both the legislative fallout from the NSA revelations and internal government discussions over the potential prosecution of Snowden. Litt says he sees the consequences of Snowden's actions on extremist message boards, which now exhort jihadis to use encryption. "It cannot be disputed," he told me, "that this has had immeasurable impact."

Snowden believes that officials like Litt are merely trying to scare the public into acquiescence. Last October, the two had a showdown of sorts when they spoke back-to-back at a conference at Bard College. "Each time we have an election, it's like another round of a game," Snowden told the students.

Using a livecasting program designed for gamers that allows him to project illustrations, he filled the auditorium screen with an image of George W. Bush shaking hands with Obama. "The policies of one president become the policies of another." Then he played a video clip of the cleric Anwar al-Awlaki's son, a 16-year-old American citizen killed by a drone strike in Yemen. He cited a leaked 2015 email in which Litt addressed the hostile legislative climate, recommending "keeping our options open" for a change "in the event of a terrorist attack or criminal event where strong encryption can be shown to have hindered law enforcement."

"Surveillance is ultimately not about safety," Snowden said. "Surveillance is about power. Surveillance is about control."

Litt opened his remarks by joking that he could sympathize with the act that went on Ed Sullivan after the Beatles. "I can hear the NSA's opinion any day," one student stage-whispered, as he and many others got up to head for the exits. Litt called after them, saying he was "disappointed" with the disdain "given that this is an academic environment." He then elaborated on the ominous sentiment expressed in his email.

"Every time something bad happens, the finger gets pointed at the intelligence community," Litt said. "There is a pendulum that swings back and forth, in terms of the public view of the intelligence community, between, 'You mean you're doing what?' and 'Why didn't you protect us?' And that's a pendulum that's going to swing again."

While much of Washington remains hostile to him, Snowden is far more hopeful about Silicon Valley and is increasingly focusing his efforts on influencing technology and the people who make it. "Like me, they grew up with this stuff," he told me. "They remember what the internet was like before everybody felt it was being watched."

The Snowden leak "was like a gut punch for people across Silicon Valley," says Chris Sacca, a venture capitalist who invested early in Twitter and Uber and who now appears on the television show Shark Tank. Sacca was personally friendly with Obama, raising large sums for his 2012 campaign, but was shocked when he discovered the extent of the NSA's spying and has since become a vocal Snowden supporter. Last November, Sacca did an admiring interview with Snowden at the Summit at Sea, an invite-only weekend of seminar talks and techno dancing aboard a cruise ship, which was attended by the likes of Eric Schmidt, chairman of Alphabet, and Travis Kalanick, CEO of Uber. "After fielding over an hour of tough questions," Sacca says, "he got a resounding standing ovation from the room."

Even as Snowden captivated the audience on the boat, though, terrorists were mounting a bloody coordinated attack in Paris. The pendulum was swinging back. At first, Wizner says, Snowden was shaken -- he worried that the attacks had wiped out all of his progress. Almost immediately, anonymous security sources blamed encryption for giving cover to the attackers. (Subsequent reports suggest they may have been more reliant on primitive tactics, like using burner phones.) "They dragged out all the old CIA directors, the line of disgrace, to suddenly try to reclaim a halo," Snowden told me. "It did look really

exploitative." For three weeks, he went quiet, posting just once to Twitter, quoting Nelson Mandela about triumphing over fear. Meanwhile, Syed Farook and Tashfeen Malik attacked in San Bernardino, and Trump called for a ban on Muslim immigration.

Wizner advised his client to be patient. Snowden sometimes says he thinks of his existence like a video game: a series of challenges that culminate in a final screen, where you either win or it's game over. But political outcomes are never so final -- it's an iterative process. In February, when Apple announced it was refusing to break into Farook's iPhone for the FBI, Snowden was suddenly scoring points again. ("The @FBI is creating a world where citizens rely on #Apple to defend their rights," he tweeted, "rather than the other way around.") In an open letter, Tim Cook, Apple's chief executive, talked the way Snowden does about privacy, encryption, and government "overreach." The next day, Snowden spoke at Johns Hopkins University, where hundreds of shivering students lined up to get into a packed auditorium. "This is a case that's not about San Bernardino at all; it's not a case that's about terrorism at all," Snowden warned. "It's about the precedent."

Litt believes that, besides giving information to enemies, Snowden's disclosures have also had a radicalizing effect in the private sector. "The technology and communications community has moved from a position of willingness to cooperate," he told me, "to an attitude that ranges from neutrality to outright hostility, which is an extremely bad thing." Recently, Snowden has been working with technical experts who are mobilizing to fortify the internet's weak spots, both through collaborations with academic researchers and back-channel conversations with employees at major tech companies.

In all of these conversations, Snowden is operating on the assumption that a truly private space on the internet could be easier to create than to legislate -- that it may be more fruitful to coax programmers to invent something that is difficult to hack than it would be to try to reshape the entire national-security bureaucracy so it stops trying. "I'm regularly interacting with some of the most respected technologists and cryptographers in the world," Snowden said. "I believe that there's actually a lot more influence that results from those sorts of conversations, because so much of technology is an expert game."

The aspect of the Snowden leaks that most outraged technology experts was not the NSA's communications surveillance but its efforts to undermine encryption, which had broad impacts on computer security. That news has "created a period of innovation" in encryption, says Moxie Marlinspike, the San Francisco-based security specialist who developed Signal, the messaging program that Snowden likes to use to communicate. Marlinspike has become friendly with Snowden, whom he met in Moscow, where they had a lengthy discussion about the trade- offs between security and usability. (Snowden is always seeing holes hackers can poke through; Marlinspike wants to make encryption accessible to laypeople.) In April, WhatsApp, which is owned by Facebook, announced that it had integrated the Signal protocol Marlinspike developed, allowing it to offer end-to-end encryption. Those sorts of technical decisions, like Apple's strengthened encryption standards, affect the privacy of millions of customers.

But Snowden is skeptical of the motives of tech companies. "Corporations aren't friends of the people, corporations are friends of money," he said. He prefers to collaborate with academics and hacktivists, some of whom are helping him with projects he is developing for the Freedom of the Press Foundation. It already manages SecureDrop, a system for anonymously leaking documents, and the nonprofit's technical staff is working with Snowden to develop other programs tailored to protect journalists and whistle-blowers. "His goal with us is to start designing and prototyping what the tools of the future will look like," says Trevor Timm, the foundation's executive director. One of Snowden's priorities, unsurprisingly, is improving the security of videoconferencing.

About once a week, the team meets on a beta-stage video platform, where they discuss the painstaking work of testing their technology, a probing process called "dogfooding." As a prime target for hacking attacks, Snowden is in a unique position to appreciate extreme-threat models. He often comes up with exotic problems to solve and is able to bring in outside minds for confidential consultations. "We're building small projects," Snowden says, but he can't help but see larger applications. He talks enthusiastically about virtual reality, which could soon supplant videoconferencing. "In five years this shit's going to blow your mind," Snowden told me. But he also sees potential dangers. "Suddenly, you've got every government in the world sitting in every meeting with you."

Snowden is especially concerned about the monitoring power of Facebook, which acquired Oculus VR, the virtual-reality headset maker, for $2 billion. "What if Facebook has a copy of every memory that you ever made with someone else in these closed spaces?" he asked rhetorically. "We need to have space to ourselves, where nobody's watching, nobody's recording what we're doing, nobody's analyzing, nobody's selling our experiences."

It is clear that in virtual reality, Snowden sees more than just a work tool. "Right now, the technology is not quite there, but this is the first step," the Snowbot told Peter Diamandis, the space entrepreneur and Singularity University co-founder, in an interview at this year's Consumer Electronics Show. "I have someone who is very close to me," Snowden explained, "who was the victim of a serious car accident, and because of that they can't travel." Virtual reality could bring them together. Or it could allow him to visit home for Thanksgiving, overcoming what he calls "the tyranny of distance."

More than one person told me that, after talking to Snowden for hours on end, they got the sense that he is lonely. His conversation is preoccupied with the theme of escape. He recently collaborated on a track with a French musician, delivering a spoken-word monologue on surveillance over an electronic beat, and recommended the title: "Exit."

Snowden sometimes says that although he lives in Russia, he does not expect to die there, and he told me he is optimistic that he will find a way out, somehow. Maybe some Scandinavian country will offer him asylum. Maybe he can work out some kind of deal -- whether outright clemency or a plea bargain -- with the Justice Department. Wizner has been working with Plato Cacheris, a well-connected Washington defense attorney, but so far, there have been no official signals that the Justice Department would be willing to offer the kind of lenient terms Snowden would accept. And a window may be

closing. He is unlikely to receive a more receptive hearing from Hillary Clinton, who has said he shouldn't be allowed to return without "facing the music." As for Donald Trump: He has called Snowden a "total traitor" and suggested he should be executed. "If I'm president," he predicted last year, "Putin says, 'Hey, boom -- you're gone.'?"

So the comparatively thoughtful Obama may be Snowden's best hope, but even Snowden's allies concede that they doubt the outgoing president has the inclination to offer a pardon. "There is an element of absurdity to it," Snowden told me. "More and more, we see the criticisms leveled toward this effort are really more about indignation than they are about concern for real harm." He says he would return and face the Espionage Act charges if he could argue to a jury that he acted in the public interest, but the law does not currently allow such a defense. "These people have been thinking about the law for so long that they have forgotten that the system is actually about justice," Snowden said. "They want to throw somebody in prison for the rest of his life for what even people around the White House now are recognizing our country needed to talk about."

Earlier this year, Snowden was buoyed by an invitation from an unexpected source. David Axelrod, the president's former top political strategist, asked him to appear at the institute he now runs at the University of Chicago. Beforehand, they had a video chat. "The president of the United States' closest advisers," Snowden told me later, "are now introducing me and sharing the stage with me in ways that aren't actually critical. I'm not saying this to build myself up. I'm talking about the recognition by even the people who have the largest incentives to delegitimize me as a person, that maybe we overreacted, maybe this is a legitimate conversation that we need to have."

Axelrod asked Geoffrey Stone, a liberal law professor who is friendly with Obama, to moderate the public talk. Stone is a member of the ACLU's National Advisory Council and the author of a book titled Top Secret: When Our Government Keeps Us in the Dark, but he also served on Obama's commission to review the NSA's surveillance programs, an experience that gave him access to classified information and a dim view of Snowden. "My view is that he cannot be granted clemency, because he did commit a criminal offense and it did considerable harm," Stone told me. "The people who are celebrating Snowden have no understanding of the harm, for the reason that the people in the intelligence world can't really explain the harm to them." Snowden considered Stone's position to be "an example of regulatory capture," proof of the seductive power of security clearances. Secret knowledge, Snowden says, "is a very intoxicating thing."

Still, Snowden was looking forward to the debate, if only because it illustrates his progress. Wizner, who considered the Axelrod relationship important to his future clemency push, attended the May event in person. "We've gone from the president saying 'We're not going to scramble jets for a 29-year-old hacker' to talking with the president's rabbi,'?" Wizner said backstage as event staff set up computers and projection equipment. "That's a good journey for us."

Axelrod shambled in, looking sleepy-eyed as always, as students filled the auditorium and Wizner texted last-minute instructions to his client over Signal. "Whatever you think about Edward Snowden and his

actions, and the adjectives range from traitor to hero," Axelrod said by way of introduction, "he has indisputably triggered a really vital public debate about how we strike a balance between civil liberties and security." He sat down in the front row as Snowden's bashful grin filled a large screen.

Snowden had already done one event that day, a cybersecurity conference in Zurich, and he seemed weary as Stone probed for logical weaknesses. The law professor asked when it was appropriate for "a relatively low-level official in the national-security realm to take it upon himself to decide that it is in the national interest to disclose the existence of programs that have been approved ... To decide for himself that 'I think they're wrong.'?" Snowden gave his usual homilies about the Constitution, whistle-blowing, and civil disobedience. "Do we want to create a precedent that dissidents should be volunteering themselves not for the 11 days in jail of Martin Luther King or the single night of Thoreau," he asked, "but 30 years or more in prison, for what is an act of public service?"

Stone pointed out that Congress could pass a law allowing defendants to make a whistle-blowing defense in Espionage Act cases but shows no signs of doing it. "You believe in democracy," Stone said. "But democracy doesn't agree with you." The professor jabbed and Snowden weaved, setting his jaw and taking swigs from a big plastic water bottle. But when the floor opened for questions, it was clear who had won the audience. One student after another got up to offer Snowden praise.

"Did you expect to become a celebrity in this way?" one asked.

"If you go back to June 2013," Snowden said, "I said, 'Look, guys, stop talking about me, talk about the NSA.'?" But he added, "Our biology, our brains, the way we relate to things, is about character stories. So they simply would not let me go."

Axelrod watched impassively, his fingers tented under his nose. The full effect of Snowden's performance did not become clear until a few weeks later, when Axelrod had Eric Holder -- the former attorney general, once Snowden's chief pursuer -- on his podcast, The Axe Files. Holder allowed that Snowden "actually performed a public service," while Axelrod calmly presented Snowden's arguments.

"I think there has to be a consequence for what he has done," Holder replied. "But I think, you know, in deciding what an appropriate sentence should be, I think a judge could take into account the usefulness of having had that national debate."

Holder's concession made international headlines. It didn't mean anything legally, but symbolically it spoke volumes. Political realities were starting to come into alignment with Snowden's virtual ones. From his computer in Moscow, Snowden tweeted:

2013: It's treason!

2014: Maybe not, but it was reckless

2015: Still, technically it was unlawful

2016: It was a public service but

2017:

Montreal Gazette
Security specialists at forefront of cyber battle
Wednesday, 29 June 2016
Byline: Karen Seidman

Montreal - The huge "threat detection" screen at the front of the Montreal Cyber Intelligence Centre is ablaze with blinking lights, but none of the eight or so Deloitte employees manning the restricted centre seem particularly alarmed. Cyber attacks are routine for this gang of cybersecurity specialists, who try to keep the world safe from Internet thugs while hunkered down in their state-of-the art facility in downtown Montreal.
Another jumbo screen is monitoring brute-force logins as it keeps track of the "cyber kill chain" that aims to identify and prevent cyber intrusions. Despite the violent terminology casually shared between the co- workers, the room hidden behind a facial-recognition security system in the professional services firm's gleaming new downtown tower houses an unflappable team of hackers and risk experts hired to minimize casualties.

For there is no doubt about it, this is a modern-day war room in a cutting-edge battle that the general says we are losing. Badly.

That would be Robert Masse, leader of Deloitte's cyber risk services in Montreal and the incident response team across Canada, who spends his days trying to outsmart the increasingly sophisticated cyber criminals who are ready to pounce when they detect any vulnerabilities in the system.

"Companies are being attacked all the time," Masse said in an interview during a tour Tuesday which offered a glimpse into the workings of a cybersecurity centre. "We are really on the front lines of a cyber war."

The team he works with - about 70 in total across the three Canadian Cyber Intelligence Centres in Calgary, Montreal and Toronto - help companies monitor their systems for attacks 24/7. Deloitte has 15 such centres globally.

Vigilance is everything when the threat landscape and attack surface are so massive, as it is with the ubiquitous Internet, yet Deloitte's own research shows that only 36 per cent of businesses have effective procedures and technologies in place to protect critical assets.

"There are so many vulnerabilities that it's a free-for-all," Masse said. "People can't keep up with the sheer volume of attacks. We are losing the war."

One of the ways Deloitte helps companies protect themselves is by going into attack mode and launching advanced two- to threemonth campaigns to break into a company's system to reveal weaknesses. Their track record? One hundred per cent.

They won't ever use the word "foolproof" when discussing cybersecurity and who is vulnerable:

Banks, the U.S. National Security Agency, big business, small business, governments, everyone.

Attackers no longer even care about obtaining credit card information or other proprietary information in an attack; it's enough to get into a company's system, encrypt any operating information with ransomware and demand payment in Bitcoins. These ransomware attacks are reaching epidemic proportions, according to Masse, and affect both individuals and corporations in an important way.

And companies are quietly paying thousands of dollars to get their systems back up and running. Everyone is encouraged not to pay, but many have no choice. And the culprits do subsequently release the information because it's important to their business model; they even offer 24/7 customer service.

There are typically two kinds of attacks: a commodity attack or a targeted attack (increasingly popular, this is when attackers create a weaponized document, like an email that appears to come from a colleague but which allows an attacker to bypass the cybersecurity defences of a company once an attachment is opened).

Motives include financial gain, hacktivism for political or ideological purposes, and information for personal gain (like bringing down a competitor).

To show the hacker mentality, Deloitte consultant Sarantos Tsikinis detailed a commodity attack on a women's shoe and accessories company based on a real case they handled.

Using a botnet, a collection of many computers known as zombies, the attacker begins his reconnaissance, similar to checking every lock in a neighbourhood you might want to rob. He launches port scans to see which ports are open. When he finds a form on a login page, he knows many websites don't use form validation, which allows him to enter special characters that break the code and enable him to enter his own code.

That was the key left under the doormat.

"He can now interact directly with the web server and see data that is useful to him," said Tsikinis. It doesn't take much poking around before he finds a password and he can then generate a TCP connection which gives him entry through a back door.

Voila, there is a list of clients and their emails and passwords. Doesn't sound like much, but considering that the vast majority of people reuse their passwords (heck, Facebook founder Mark Zuckerberg was hacked because he did this) and the website had some 5 million users, it could be important. Masse can't stress enough that reused passwords are the premier vulnerability.

"This turns out to be a big breach and he gets all the credit card information, which he then sold," said Tsikinis.

What Deloitte offers its clients, he said, are the right barriers to slow down attackers and make it easier to thwart attacks.

Still, he and Masse emphasize that no business is immune. Masse calls it "asymmetrical warfare": the bad guys have to be right once, while the good guys have to be right 100 per cent of the time to defend themselves.

The Hindustan Times
Modi govt gets cracking on cyber espionage
Wednesday, 29 June 2016

New Delhi - It is not just sensitive data that cyber spies are looking to access but the possibility of terror groups using hackers to target vital security and infrastructure installations has spooked the security establishment.
Amid threats of hackers orchestrating attacks on nuclear or power stations, the government is for the first time framing a comprehensive policy to deal with cyber espionage and other threats related to it, highly placed sources in security establishment said.

The framework that explores the possibility of setting up a panel of experts who can work closely with the security establishment is the Prime Minister's Office.

Making changes in existing laws to keep pace with changing dynamics of the cyber threat is also being worked out.

Strengthening the cyber security workforce and upgrading infrastructure to combat the threat is part of the mechanism being planned.

"It requires inter- ministerial consulit's the biggest security challenge and the threat will only be more in days in future.

Sources say there is also a big jump in the alerts regarding hacking that are being shared with the Ministry of Home Affairs (MHA) as they have could have direct implications on national security.

Last month, a global cyber security firm that a cyber espionage group ' Suckfly' targeted high profile government and commercial organisations.

According to other reports another cyber spy group ' Danti' has access to Indian government organisations.

The PM has also suggested that countering the menace on the virtual world experts in the field have to be roped in at the earliest.

Later, this core team could involve officials on the grassroots level to be part of the team that focuses on the cyber space.

It needs to be worked out who will be the nodal body. The Intelligence Bureau and home ministry will definitely have an important role. It requires huge capital since top technology needs to be used," said a government official.

Sources in intelligence agencies currently dealing with cyber threats say Strengthening the cyber security workforce and upgrading infrastructure is part of the mechanism being planned

Experts to be roped in as part of specialised wing Infrastructure to be revamped Danger of cyber espionage increasing. Terror attacks through cyber space a possibility now The framework that explores the possibility of setting up a panel of experts who can work closely with the security establishment is being closely monitored by the Prime Minister's Office Strengthening the cyber security work force and upgrading infrastructure to combat the threat is part of the mechanism being planned.

South China Morning Post
New rules to control mainland app market
Wednesday, 29 June 2016
Byline: Nectar Gan and He Huifeng

Beijing - Internet authorities are tightening their grip on the rapidly growing app market, with new rules demanding that all app providers on the mainland adopt real-name registration for users and keep their user activity logs for 60 days.
The new rules from the Cyberspace Administration of China also aim to rein in excessive access of users' personal data by app -providers.

The new regulation applies to the provision of "information services through mobile internet apps as well as ... app store services on the Chinese mainland" . It is unclear if the new regulation would affect overseas users of Chinese apps.

The administration said the regulation, which will take effect from August 1, was introduced to curb the dissemination of "illegal information" and violations of users' rights through mobile apps.

"Lawbreakers exploit a handful of apps to disseminate violent, terrorist, obscene and pornographic information and rumours against the law," an unnamed CAC official said in a statement on the agency's website.

The administration estimated there were more than four million apps available through online stores on the mainland. According to research firm Analysys International, WeChat, QQ, Alipay, Taobao and Tencent Video were among the most popular last month in terms of number of -active users. Alibaba, which operates Alipay and Taobao, owns the South China Morning Post.

Under the new regulation, users will still be allowed to adopt a public alias but not before registering their real identities with the app providers. App providers must verify those identities by mobile phone numbers or other means.

Providers should issue warnings, restrict access, suspend updates or shut down accounts of users who publish "illegal information" and content.

App store operators, meanwhile, will be required to vet the apps' security and compliance with the law.

App providers will also need the explicit consent of users to gain access to their geographic -location and contact list, record video and audio through their mobile devices, or activate or bundle unnecessary functions with their services.

Beauty app founder Qi Shudan said the regulation would likely have a bigger impact on apps that had many commenters. "It will have little effect on apps of our kind that are only for business and commerce," Qi said.

A Guangzhou-based app operator, who refused to be named, said the rule on activity logs was a warning to "all internet users not to make improper comments on social or political issues because every word you type will be -recorded and handed in to the authorities".

"Many users like to comment on social and political news on live-streaming and news apps. Now they will need to think twice before making any comment that authorities could claim spurred public scares or rumours," he said.

"Such rules only put further limits on freedom of speech."

The authorities have ramped up online real-name registration since last year, implementing it for instant messaging services, Twitter-like microblogs, online forums and other websites.

On Monday, a controversial cybersecurity bill was also presented to the national legislature for a second reading.

Japan, U.S., S. Korea hold joint missile-tracking exercise in Hawaii (Canada)

Wednesday, 29 June 2016
Byline: Staff reporter

Washington - The naval forces of the United States, South Korea and Japan concluded an eight-day, trilateral missile-tracking exercise off Hawaii on Tuesday, amid continuing ballistic missile launches by North Korea that have increased tension in the Asia-Pacific region.
This year's "Pacific Dragon," the third since the biennial exercises began in 2012, "featured a coordinated live ballistic target tracking event where each nation's Aegis Ballistic Missile Defense System capabilities were tested and improved," the U.S. 3rd Fleet said in a press statement.

The exercise, which was held off the coast of Kauai island, partly involved the Japanese Maritime Self-Defense Force's Chokai, an Aegis destroyer with the capability to intercept ballistic missiles, and two South Korean destroyers with like capability.

"While there were no missiles fired, all participants strengthened interoperability, communication channels, data collection and capabilities assessments," the statement said.

It said they shared tactical data link information on the basis of a memorandum of understanding on sharing and safeguarding classified information on North Korea's nuclear and missile programs that was signed in December 2014.

During the exercise, North Korea carried out two test firings of its Musudan intermediate-range ballistic missile in violation of U.N. Security Council resolutions, claiming success after one of them flew 400 kilometers and reaching an altitude of more than 1,000 km.

The missile has a potential range of between 2,500 and 4,000 km, which would cover not only any target in Japan and South Korea, but could also even reach U.S. military bases on the Pacific island of Guam.

North Korea, through its official media, reacted angrily to the trilateral exercise, calling it a "provocation" and vowing to "bolster in a sustainable manner the capabilities for preemptive nuclear attack to pose a constant threat to the enemies."

The trilateral exercise came ahead of the Rim of the Pacific, or RIMPAC, exercise that starts Thursday and will last through Aug. 4, in and around the Hawaiian islands and southern California, involving the same three countries.

This year's RIMPAC, the world's largest international maritime exercise, also involves Australia, Britain, Brunei, Canada, Chile, Colombia, Denmark, France, Germany, India, Indonesia, Italy, Malaysia, Mexico, the Netherlands, New Zealand, Norway, China, Peru, the Philippines, Singapore, Thailand and Tonga.

Times of Israel

Israel to hold cybersecurity conference in Beverly Hills (Canada).
Wednesday, 29 June 2016
Byline: Shoshanna Solomon

Jerusalem - Cybertech, the organizer of Israel's largest cybersecurity conference, will hold its first event in Beverly Hills on Thursday, June 30, in partnership with Israel's Los Angeles consulate general and the City of Beverly Hills.
"In the face of new threats we encounter daily, individuals, organizations and states are required to produce innovative, unique solutions to strengthen the resilience of sensitive communication systems they rely on every day," Amir Rappaport, the chief executive of Cybertech, said in an emailed statement. "For this purpose, it is essential to be aware of the latest developments in the cyber defense market."

The collaboration between the City of Beverly Hills and Israel is a direct result of an agreement signed in 2014 by California Governor Edmund Brown and Israeli Prime Minister Benjamin Netanyahu for cooperation in projects and research.

The intention of the collaboration with the City of Beverly Hills is "to promote professional cooperation and trade partnerships in areas such as cybersecurity, water innovation, and public safety," the statement said.

"Israel is second only to the United States in global private investment in cybersecurity firms, with half a billion dollars flowing to the sector annually," David Siegel, consul general of Israel to the Southwest United States, said in the statement. "This conference will create new groundbreaking opportunities for both our countries."

Cybertech Beverly Hills will include panel discussions on cyber-crime investigations, financial technology, media and entertainment and critical infrastructure. The event will also hold an exhibition of new technologies from Israeli and US start-ups and companies, including Palo Alto Networks, CyberArk and Fortscale.

Cybertech has held cyber solutions events in Tel Aviv, Singapore and Toronto. Its Tel Aviv event, one of the largest in the field outside the US, has over 12,000 participants annually from over 50 countries, the statement said.

Voice of America
US Increasingly Focused on Social Media to Weigh Terror Threats
Wednesday, 29 June 2016
Byline: Chris Hannas

Washington - The United States government has become increasingly focused on the idea of examining social media posts in order to make determinations about who represents a security threat to the country.
The latest example is a proposal from the Customs and Border Protection arm of the Department of Homeland Security to ask foreign travelers to disclose information about their accounts on services like Facebook and Twitter.

It would appear as an optional question on the form people fill out either upon arrival or presubmit online with information such as their name, address, phone number and the names of countries they have visited since 2011. It would also only apply to travelers from the 38 countries allowed visa-free entry into the U.S.

"Collecting social media data will enhance the existing investigative process and provide DHS greater clarity and visibility to possible nefarious activity and connections by providing an additional tool set which analysts and investigators may use to better analyze and investigate the case," the proposal says.

Customs and Border Protection is asking the Office of Management and Budget for permission to add the question and says it would affect an estimated 24 million people. There is a 60-day comment period for the public to weigh in.

Meanwhile, members of Congress have been busy during their current session drafting bills involving examining social media posts for terror links.

Senator John McCain sponsored one of several bills that would require the Department of Homeland Security to look at internet activity and social media profiles of anyone applying for admission to the U.S.

"It is unacceptable that Congress has to legislate on this, and that it wasn't already the Department of Homeland Security's practice to take such commonsense steps when screening individuals entering this country," McCain said.

A bill from Senators Martin Heinrich and Jeff Flake specifies that DHS "may search open source information, including internet and social media postings, of an alien who applies for a visa to enter the United States."

"It should be crystal clear to those inside and outside of DHS that the agency has the authority to review publicly available social media posts when vetting visa applications," Flake said.

The proposals do not seem to address the accounts of anyone who has set their posts to be private.

"Reviewing the public social media posts of an individual seeking a U.S. visa is just common sense in the digital world we live in today," Heinrich said.

Senator Chuck Schumer has proposed a different tactic to alert authorities to potential terrorists. He wants to use the Justice Department's existing Rewards for Justice program to pay people who submit a tip about a social media post that leads to the arrest of someone planning an attack in the U.S.

"We are in a time when a terrorist a world away can corrupt a disaffected youth -- and with just a few posts or tweets, can push them to plan or carry out acts of terror," Schumer said. "We need the public's eyes to alert authorities if they see someone they know writing things they know spell trouble."

He wants the awards to range from $25,000 to $25 million.

In the House of Representatives, Congressman Stephen Fincher is focusing on keeping those serving time in federal prisons from becoming radicalized and posing a threat when they are released. His bill calls for anyone who wants to volunteer in the prisons to divulge their social media accounts as part of a background check for possible links to terrorism.

"Over the years, our federal prisons have become a breeding ground for radicalization," Fincher said. "By allowing volunteers to enter the system without first having to undergo a comprehensive background check, some of the most vulnerable members of society have become susceptible to radicalization."

Washington Free Beacon
State Department Report Says Chinese Cyber Attacks 'Ongoing'
Wednesday, 29 June 2016
Byline: Bill Gertz

Washington - Chinese cyber attacks against American firms are "ongoing" and the use of covert cyber tools and methods by Beijing hackers led to a statistical decline in cyber activities, according to an internal State Department security report.
The report by the State Department-led Overseas Security Advisory Council, or OSAC, a public-private partnership, challenges the findings of a recent study by the private cyber security firm FireEye that says the decline in the number of Chinese-origin cyber attacks indicated China has cut back from large-scale cyber attacks.

"While media reporting has emphasized this alleged decrease in malicious activity, cases of Chinese espionage campaigns against the U.S. private sector are ongoing," the report said, adding that "OSAC constituents should remain aware that China is still considered a highly capable and motivated cyber threat actor."

The three-page report highlighting ongoing Chinese cyber threats is a setback for White House efforts to portray President Obama's September 2015 deal with China to curb cyber economic espionage as a diplomatic breakthrough.

Since the deal, various private security firms offered differing assessments of whether China is curtailing large-scale cyber attacks, the report said.

The report notes that Chinese cyber attacks in 2015 were particularly damaging. "At a higher level, paramount attacks against various U.S. organizations continued in 2015 and Chinese hackers exceeded other nation-state actors for consistency, volume, and severity of cyber attacks during the past year," the report, dated June 27, says.

"This included intrusions into healthcare systems Anthem and Premera, and the Office of Personnel Management, collectively compromising the sensitive data of over 100 million U.S. citizens."

Until the OSAC report, senior U.S. intelligence officials have sought to hedge their conclusions about the September agreement, stating publicly that it is not clear whether China is curbing cyber intrusion activity.

According to the OSAC report, the large- scale attacks in 2015 "suggests some China-based hacking groups may have shifted their focus from data theft for economic gain to national security interests and personally identifiable information (PII)."

According to OSAC, Chinese cyber attacks also have been focused on "continuously leveraging U.S. network infrastructure for offensive operations."

"Actors have been observed using servers of small businesses in the U.S. to plan and execute attacks against manufacturing firms, financial organizations, and the technology sector," the report said.

Rick Fisher, a China specialist, said China's Communist Party leaders see no current positive or negative inducement to halting the use of cyberspace for global intelligence gathering that can be used to prepare attacks on cyber-electronic infrastructures.

"American verbal argument or political pressure is not going convince the [Chinese Communist Party] leadership to stop waging its global cyber war," said Fisher, a senior fellow at the International Assessment and Strategy Center.

"Washington has been trying to engage the Chinese on its cyber war for nearly 20 years and has basically gotten nowhere," he noted.

The FireEye report was based on a study of network intrusions and compromises from China-based cyber actors since mid-2014. It tracked 262 cases to Beijing hackers carried out in 26 countries. The majority of the attacks took place against U.S. information networks.

The targets included aerospace companies, healthcare providers, manufacturers, including those building semiconductors and chemical compounds, along with media, software, and technology firms.

"Chinese targeting (and in some cases, successful stealing) of data from various public and private sector organizations is assessed to serve military, security, and economic interests equally," the report says. "This ambiguity makes it difficult for analysts to characterize the objective of recent Chinese cyber espionage operations."

OSAC analysts said the attention given to the FireEye study is based in part on a sharp decrease in the number of detected cyber attacks compared to the larger number of cyber intrusions logged by researchers three years ago.

The apparent decline in Chinese cyber activities was attributed to the Justice Department's high-profile indictment of five PLA military hackers in 2014, and the September 2015 meeting between Obama and Chinese leader Xi Jinping when the informal accord was struck calling for both governments not to engage in or "knowingly support" cyber economic espionage.

"While interpreted by some as nothing more than a political maneuver, other analysts believe the 2015 agreement may have somewhat influenced the decrease in malicious intrusions conducted by China-based groups," the OSAC report said.

However, the cutback could be the result of FireEye's lack of visibility of more recent Chinese cyber activities or the computer forensic investigators' inability to detect new cyber attack methods used by the Chinese.

"Public exposures [of Chinese hacking] have prompted some observed China-based hacking groups to develop new tools and incorporate anti-detection techniques into their offensive cyber operations," the report said.

Contrasting FireEye's assessment of a decline, the OSAC report said multiple studies confirm that "China-based network intrusions are still ongoing, only a fraction of which may be detected by researchers."

The council report also said the cyber security firm CrowdStrike reported three weeks after the Obama-Xi agreement that China was continuing cyber attacks on U.S. organizations.

Most of the targeted companies were engaged in technology or the pharmaceutical industries, an indication the goal is theft of American intellectual property.

The CrowdStrike report concluded that the U.S.-China agreement was ineffective, and that if the Chinese government were abiding by the agreement it would have controlled the central group of Chinese hackers behind the continued attacks.

The decline of attacks seen in metrics has not diminished the threat, the OSAC report said, noting, "China remains a serious cyber threat actor to U.S. firms."

China's hacking community is made up of government and military hackers, those who engage in cyber attacks on a contract basis, so-called "hacktivists," and criminals.

The report said competing interests between the groups has made it difficult for analysts to determine if there is a "top-down direction" for Chinese cyber attacks. The various cyber actors also "may mask continued attempts of cyber espionage," the report noted.

The OSAC report warned American companies to remain up to date in understanding ongoing Chinese network compromises against both private and public entities.

"Employing multi-layered network defense and detection systems, maintaining regular updates, and mandating employee cyber threat awareness programs can help OSAC constituents defend against threats of cyber espionage, crime, and other malicious network activity," it said.

Fisher, the China specialist, said the United States will not dissuade China from aggressive cyber attacks until Beijing is made to pay a price for digital aggression.

An initial step would be for the United States and NATO members to join together in expelling all Chinese nationals studying abroad in the field of computer science. Another would be to embargo all Chinese computer hardware and software from those countries, Fisher suggested.

"Chinese electronic infrastructure leaders like Huawei and computer manufacturers like Lenovo have long been identified by U.S. government agencies as cyber espionage threats so the justification for such an embargo exists already," he said.

BBC News
CIA taps huge potential of digital technology
Wednesday, 29 June 2016
Byline: Gordon Corera

London - At CIA headquarters in Langley, the office of the director of digital innovation sits next to the agency's in-house museum filled with artefacts from its history.
Featuring heavily are gadgets such as early secret cameras and bugging devices that would not appear out of character in a Hollywood film.

The line-up makes the point that even though the CIA is an intelligence agency whose central mission has been to recruit people to provide secrets, technology has always had a crucial role.

Andrew Hallman - who runs the recently created Directorate of Digital Innovation - has the job of making sure that the new digital world works to the CIA's advantage rather than disadvantage.

A major focus of Mr Hallman's effort is to use data to provide insights into future crises - developing what has been called "anticipatory intelligence".

This means looking for ways in which technology can provide early warning of, say, unrest in a country.

"I think that's a big growth area for the intelligence community and one the Directorate of Digital Innovation is trying to promote," Mr Hallman says.

The volume and variety of data produced around the world has grown exponentially in recent years - a process about to accelerate as more and more items as well as people are connected up in the so-called internet of things.

The ambition is to take this wealth of data and combine it with analytical models fine-tuned with insights from social sciences to spot where an issue such as food scarcity might be emerging and might, in turn, lead to instability in a region.

This might also involve looking at social media to perform "sentiment analysis" that can help understand if the mood in a population is turning sour.

The idea would be to spot a major change, such as the so-called Arab spring, as early as possible and provide policymakers with the kind of advanced warning they often crave and which intelligence agencies are sometimes criticised (fairly or unfairly) for failing to deliver.

These are often the kind of events not susceptible to the traditional intelligence gathering spies normally carry out - the emergence of protest groups in the Middle East was not a secret locked in a safe or in the mind of a leader that could be stolen or enticed out.

But the techniques of big data, some believe, may offer answers.

Mr Hallman, crisp in both words and appearance, is careful to explain this will not provide a crystal ball that can predict "point events" - for instance that the breakdown of order will happen on a particular day - but, instead, will point to a social or economic system becoming more fragile than might be superficially apparent.

More broadly, the directorate aims to change the culture as well as the structure of the CIA - bringing in technology and integrating it into every part of the agency's work.

The CIA has 10 mission centres where analysts and operators work together on either parts of the world or issues (with centres for Africa, the Near East, Counterterrorism, and Weapons and Counter-proliferation).

Digital officers will integrate into these and bring with them expertise in cyber-techniques, data sciences and software development.

The aspiration is that where some new technological innovation is pioneered in one mission centre, the Directorate for Digital Innovation will see if it can be pushed out to other centres.

Developing expertise in open-source (publicly available) information is another priority - in the past this was something of a sideshow at an agency that focused on "secrets" - but such information can often help focus on what really is secret and what can be obtained by other means, especially as the definition of open source expands rapidly from the past, when it largely meant foreign news and media.

This might involve understanding how a group such as so-called Islamic State (IS) uses social media and working out what options there are to address it.

Data is also changing the sharp end of human intelligence.

The head of Britain's MI6, Alex Younger, has described a high-stakes arms race in technology.

Spy agencies can use data to improve the way they find the secrets and people they are after.

But foreign security services can also use data to track down intelligence officers and identify them, using the digital exhaust we all leave in our wake in the modern world (one reason for the neuralgic reaction within the US government to the cyber-theft of vetting information from the Office of Personnel Management last year, which could be used to identify spies).

This poses fundamental challenges to the old concepts of operating clandestinely and "undercover".

"It is an existential challenge, which we are looking at very closely," Mr Hallman says.

He stresses though that the issue of how far data enables or restricts spy agencies will ultimately depend on their ability to adapt.

"That's entirely on us and how aggressively we can pursue both avenues," he says.

Intelligence officers in the field will need to become much more technologically adept rather than relying on the kind of human wiles and guile so highly prized in the past.

"Operators have to figure a way to enable them both to operate clandestinely and have at their fingerprints with them the digital capability to extend their reach," says Mr Hallman.

Human intelligence and cyber-espionage are increasingly merging.

This means agencies such as the National Security Agency (which focuses on cyber-espionage) and CIA (which focuses on human intelligence) will need to work together much more, something the US intelligence community has sometimes struggled to do.

This new world of digitally enabled espionage will also require a different model of working with the private sector where cutting-edge technology is being developed (the private sector pioneers many of the big data analytics to try to extract value or sell advertising from the information they collect).

Previously, by the time a company brought in a product to meet a need at CIA, it might already be out of date.

"We used to try to make long strides to catch up with the state of the art," Mr Hallman says, "but we need instead to ride a crest of innovation."

The relationship with Silicon Valley, he acknowledges, has been affected by the allegations of former NSA contractor and whistle-blower Edward Snowden.

A business partner of Twitter recently said it would no longer provide services to the US intelligence community.

But Mr Hallman says the levels of suspicion are not uniform.

"There are a lot of great parties in Silicon Valley who understand our values well, but there are some sectors that do not understand the intelligence world," he says.

Part of his job is to change that.

"I'm an optimist - I think we will eventually build that trust," he says.

He points to the working relationship between the intelligence community and Amazon Web Services to provide cloud computing as an example of what the relationship could look like.

Back out in the corridor are historical examples of technology developed initially for espionage - early photocopiers and tiny Minox cameras - all once cutting-edge but now ubiquitous.

Now, spy agencies are learning that maintaining the edge on which they rely will require new ways of working.

New York Times
New Line on Customs Forms May Seek Social Media Data
Wednesday, 29 June 2016
Byline: Ron Nixon

Washington - The federal government has proposed adding a line to forms filled out by visitors to the United States that would ask them to voluntarily disclose their social media accounts, a step that it said would help in screening for ties to terrorism.
Visitors entering the country under the Visa Waiver Program, which allows citizens of some countries to visit up to 90 days without a visa, would not be required to list their social media accounts, and the forms would not ask for passwords. But Customs and Border Protection, which announced the proposal last week in the Federal Register, said the social media information would give it extra investigative tools.

"Collecting social media data will enhance the existing investigative process and provide D.H.S. greater clarity and visibility to possible nefarious activity," the border agency said, referring to the Department of Homeland Security, its parent organization.

The proposal comes after Congress passed legislation last year to add restrictions to the Visa Waiver Program. The legislation was a response to the November terrorist attacks in Paris, which led to fears that European-born or naturalized citizens with terrorist ties could enter the United States without being properly vetted.

Legislation pending in Congress would require the Department of Homeland Security to collect social media information from foreign visitors. The bills were spurred by the terrorist attack in San Bernardino, Calif., in December. The couple who carried out the assault had exchanged private messages online discussing their commitment to jihad and martyrdom, law enforcement officials said, but they did not post any public messages about their plans.

Representative Vern Buchanan, Republican of Florida, who has introduced one of the bills requiring social media information, called the Customs and Border Protection proposal "lame."

"Voluntary disclosure won't keep anyone safe," Mr. Buchanan said. "If we want to win on the digital battlefield, mandatory screening is required."

Mr. Buchanan's bill would direct the Department of Homeland Security to review all public records, including Facebook and other forms of social media, before admitting foreign travelers.

The department said that while it does not consistently examine social media accounts of applicants for visas or immigration, it has a list of nearly three dozen situations in which social media can be examined to screen applicants.

Four pilot projects are underway in the department to examine the use of social media among applicants for immigration benefits. One of the projects, which began in December and runs through this month, screens the social media accounts of applicants for so-called fiancé visas, the program under which one of the San Bernardino attackers entered the United States.

Fox News
Huge number of successful cyberattacks at one federal agency, report reveals
Wednesday, 29 June 2016
Byline: George Russell

Washington - In 2014, a single U.S. government agency was hit with a blizzard of more than 1,370 external attacks on its most vital computer systems, with three out of every eight incidents resulting in a loss of data, according to a new report by the watchdog Government Accountability Office, suggesting hackers have been far more successful at getting at sensitive government information than previously disclosed.
The highly besieged agency was not named in the report, which was given to government officials in May and made public last week. GAO officials declined to provide the name of the agency in response to an additional query from Fox News.

The eye-opening number of data leaks that resulted from the attacks - - 516 "incidents" in all -- is barely mentioned in the 94-page GAO report.

It is mostly buried in the fine print of an information diagram on page 24 of the wordy and technical document.

The fact that the data losses all came from one agency is mentioned only in a footnote to the diagram, and the extraordinary success rate of the attacks has to be calculated from figures speckled on the previous page.

Fox News calculations of the success rate and number of attacks were subsequently affirmed by GAO officials.

The specific nature and importance of the torrent of data losses was not revealed.

A one-page executive summary of the GAO report that is the most likely portion to be read by policymakers or the general public makes no mention of data losses, or of the high success rate of attacks that caused them, or of the focus of the attacks on a single agency.

The high rate of attacks and successes in 2014 has particular significance for U.S. cybersecurity, however.

It was 2014 when the Obama administration revealed one of the worst losses of cyber-information in history had taken place, with the theft of 4.2 million personnel files of past and former U.S. federal civil servants from its Office of Personnel Management (OPM) by China-based intruders.

That loss was subsequently expanded in revelations a month later by 21.5 million sensitive background files on federal civil servants and contractors, after another hack that year, also believed to come from China, removed the huge quantities of sensitive personal information from a private background-checking firm.

On its website, OPM customarily refers to the losses as coming from only two "separate but related incidents" -- a far cry from the triple-digit data loss numbers stashed away in the GAO report.

A Fox News query to the White House Office of Management and Budget, which oversees the effectiveness of cybersecurity across the federal system, yielded no additional information about the figures in the carefully-groomed GAO report.

The computer assault information, along with much of the other information in the GAO document, came from the self-reporting of a swarm of 24 U.S. federal agencies that responded to a survey asking, among other things, about their "high-impact" federal information systems and cyberattacks.

The GAO audit, which took place between February 2015 and May 2016, came at the request of a trio of U.S. senators: Ron Johnson, R-Wis., chairman of the Senate Homeland Security and Government Affairs Committee; Thomas Carper, D-Del., the committee ranking member; and Susan Collins, R-Maine.

According to the report, 18 federal agencies have such "high-impact" systems, defined dramatically but opaquely as those where "the loss of confidentiality, integrity, or availability can have a severe or catastrophic adverse effect on organizational operations, assets or individuals."

During 2014, only 11 of the 18 reported 2,267 cyberattacks on their "high-impact" facilities; another three failed to provide any specific numbers of such assaults.

Virtually all of the agencies designated "nations" -- meaning foreign ones -- as the most serious and frequently-occurring source of the threat.

The GAO report may be highly circumspect about the success of high- impact attacks, but it is far more forthright in noting that cross- government authorities it included in the audit -- including the Office of Personnel Management -- had lots of guidance on how to protect themselves, but even now are still not doing enough to make sure the guidance was followed.

It noted, among other things, that OPM and other agencies had not done well in tracking whether special security training for employees in sensitive roles had been carried out, and none of them had fully completed remedial plans to correct "identified weaknesses" in their high-impact systems security.

For its part, OPM pushed back in a rebuttal that other means than directly tracking the completion of training were more effective and appropriate, especially for contractors, a conclusion that the GAO report did not accept.

OPM also argued that it had made further improvements to its security controls after the GAO audit was done that were not included in the report. GAO's answer: The document "reflects the state of information security at the time of our review."

The fact is that the entire Obama administration is still in the throes of carrying out a sweeping revamp of cybersecurity strategy that, according to some critics, is still far from a coherent answer to the active and still growing cyber- threat.

The senators who sparked the latest report may soon be focusing on some of those shortcomings. They are preparing to look further into the issues raised in the GAO document, which include the muffled and unsettling question of those hundreds of data losses.

The Guardian (London)
Devon schoolboy admits hacking sites but denies airline bomb hoaxes
Tuesday, 28 June 2016
Byline: Steven Morris

London - A schoolboy from Devon launched cyber-attacks on websites across the globe as part of a campaign for animal rights, a court has heard.
Among the 16-year-old boy's targets were SeaWorld Orlando in Florida and a town in Japan where dolphin hunting takes place, Plymouth youth court was told.

The teenager, who was 15 at the time, targeted sites in Africa, Asia, Europe and North America, but he denied sending tweets to two airlines claiming bombs were on board their planes.

He admitted three charges of performing an act to hinder access to a programme under the Computer Misuse Act 1990. The offences relate to distributed denial of service attacks, which involve overwhelming a website with traffic, often taking it offline.

The boy denied two further charges of sending bomb hoaxes to American Airlines and Delta Air Lines. Wearing a grey suit and a tie, he sat next to his mother in court on Tuesday as a trial on those alleged offences began.

The district judge, Diane Baker, told the court the defendant was "a very intelligent young man" who could follow the case "far better than a lot of people in this courtroom".

Ben Samples, prosecuting, claimed the teenager tweeted bomb hoaxes to two US airlines on 13 February 2015. The tweets read: "One of those lovely Boeing airplanes has a nice tick tick tick. Hurry gentleman the clock is ticking." They decided there was no credible threat but the FBI was alerted and they referred the matter to the UK authorities.

British police traced the boy to his home in Plymouth and his laptop was seized from his bedroom, the court heard.

Giving evidence, the boy said he carried out cyber-attacks because he supports animal rights. He said he communicated with hackers but claimed he was just "messing around".

Denying the plane bomb hoaxes, he said: "I feel like I have been stitched up by I don't know who. I don't know why they have done this to me."

Asked by his lawyer, Ken Papenfus, what his general view was of bomb hoaxes, he replied: "It is a really easy way of getting into trouble. It just scares people like something is going to happen when it is not."

He originally admitted making the bomb hoaxes, believing he would get a caution, but told his parents when he left the police station that he did not make the threats. Of his confession, he said: "I was young and scared."

The judge will deliver her verdict on the bomb hoax charges next week.

The Intercept
The Hunter
Tuesday, 28 June 2016
Byline: Peter Maass

Washington - The message arrived at night and consisted of three words: "Good evening sir!"
The sender was a hacker who had written a series of provocative memos at the National Security Agency. His secret memos had explained -- with an earthy use of slang and emojis that was unusual for an operative of the largest eavesdropping organization in the world -- how the NSA breaks into the digital accounts of people who manage computer networks, and how it tries to unmask people who use Tor to browse the web anonymously. Outlining some of the NSA's most sensitive activities, the memos were leaked by Edward Snowden, and I had written about a few of them for The Intercept.

There is no Miss Manners for exchanging pleasantries with a man the government has trained to be the digital equivalent of a Navy SEAL. Though I had initiated the contact, I was wary of how he might respond. The hacker had publicly expressed a visceral dislike for Snowden and had accused The Intercept of jeopardizing lives by publishing classified information. One of his memos outlined the ways the NSA reroutes (or "shapes") the internet traffic of entire countries, and another memo was titled "I Hunt Sysadmins." I felt sure he could hack anyone's computer, including mine.

Good evening sir!

The only NSA workers the agency has permitted me to talk with are the ones in its public affairs office who tell me I cannot talk with anyone else. Thanks to the documents leaked by Snowden, however, I have been able to write about a few characters at the NSA.

There was, for instance, a novelist-turned-linguist who penned an ethics column for the NSA's in-house newsletter, and there was a mid-level manager who wrote an often zany advice column called "Ask Zelda!" But their classified writings, while revealing, could not tell me everything I wanted to know about the mindset of the men and women who spy on the world for the U.S. government.

I got lucky with the hacker, because he recently left the agency for the cybersecurity industry; it would be his choice to talk, not the NSA's. Fortunately, speaking out is his second nature. While working for the NSA, he had publicly written about his religious beliefs, and he was active on social media. So I replied to his greeting and we began an exchange of cordial messages. He agreed to a video chat that turned into a three-hour discussion sprawling from the ethics of surveillance to the downsides of home improvements and the difficulty of securing your laptop. "I suppose why I talk is partially a personal compulsion to not necessarily reconcile two sides or different viewpoints but to just try to be honest about the way things are," he told me. "Does that make sense?"

The hacker was at his home, wearing a dark hoodie that bore the name of one of his favorite heavy metal bands, Lamb of God. I agreed not to use his name in my story, so I'll just refer to him as the Lamb. I could see a dime-store bubble-gum machine behind him, a cat-scratching tree, and attractive wood beams in the ceiling. But his home was not a tranquil place. Workmen were doing renovations, so the noise of a buzz saw and hammering intruded, his wife called him on the phone, and I could hear the sound of barking. "Sorry, my cats are taunting my dog," he said, and later the animal in question, a black-and-white pit bull, jumped onto his lap and licked his face.

The Lamb wore a T-shirt under his hoodie and florid tattoos on his arms and smiled when I said, mostly in jest, that his unruly black beard made him look like a member of the Taliban, though without a turban. He looked very hacker, not very government.

When most of us think of hackers, we probably don't think of government hackers. It might even seem odd that hackers would want to work for the NSA -- and that the NSA would want to employ them. But the NSA employs legions of hackers, as do other agencies, including the FBI, CIA, DEA, DHS, and

Department of Defense. Additionally, there are large numbers of hackers in the corporate world, working for military contractors like Booz Allen, SAIC, and Palantir. The reason is elegantly simple: You cannot hack the world without hackers.

In popular shows and movies such as "Mr. Robot" and "The Matrix," hackers tend to be presented as unshaven geeks loosely connected to collectives like Anonymous, or to Romanian crime syndicates that steal credit cards by the millions, or they are teenagers who don't realize their online mischief will get them into a boatload of trouble when Mom finds out.

The stereotypes differ in many ways but share a trait: They are transgressive anti-authoritarians with low regard for social norms and laws. You would not expect these people to work for The Man, but they do, in droves. If you could poll every hacker in the U.S. and ask whe---ther they practice their trade in dark basements or on official payrolls, a large number would likely admit to having pension plans. Who knows, it could be the majority.

This may qualify as one of the quietest triumphs for the U.S. government since 9/11: It has co-opted the skills and ideals of a group of outsiders whose anti-establishment tilt was expressed two decades ago by Matt Damon during a famous scene in Good Will Hunting. Damon, playing a math genius being recruited by the NSA, launches into a scathing riff about the agency serving the interests of government and corporate evil rather than ordinary people. Sure, he could break a code for the NSA and reveal the location of a rebel group in North Africa or the Middle East, but the result would be a U.S. bombing attack in which "1,500 people that I never met, never had a problem with, get killed." He turns down the offer.

In recent years, two developments have helped make hacking for the government a lot more attractive than hacking for yourself. First, the Department of Justice has cracked down on freelance hacking, whether it be altruistic or malignant. If the DOJ doesn't like the way you hack, you are going to jail. Meanwhile, hackers have been warmly invited to deploy their transgressive impulses in service to the homeland, because the NSA and other federal agencies have turned themselves into licensed hives of breaking into other people's computers. For many, it's a techno sandbox of irresistible delights, according to Gabriella Coleman, a professor at McGill University who studies hackers. "The NSA is a very exciting place for hackers because you have unlimited resources, you have some of the best talent in the world, whether it's cryptographers or mathematicians or hackers," she said. "It is just too intellectually exciting not to go there."

Revealingly, one of the documents leaked by Snowden and published by The Intercept last year was a classified interview with a top NSA hacker (not the Lamb) who exulted that his job was awesome because "we do things that you can't do anywhere else in the country ... at least not legally. We are gainfully employed to hack computers owned by al-Qa'ida!" Asked about the kind of people he works with at the NSA, he replied, "Hackers, geeks, nerds ... There's an annual event for hackers in Las Vegas called DEF CON, and many of us attend. When there, we feel as though we are among our bretheren! [sic] We all have a similar mindset of wanting to tear things apart, to dig in, to see how things work."

In 2012, Gen. Keith Alexander, the NSA director at the time, even attended DEF CON wearing blue jeans and a black T-shirt that bore the logo of the Electronic Frontier Foundation, an anti-surveillance organization that is beloved by hackers and other good citizens of the world. To coincide with Alexander's visit, the NSA had created a special webpage to recruit the hackers at DEF CON. "If you have a few, shall we say, indiscretions in your past, don't be alarmed," the webpage stated. "You shouldn't automatically assume you won't be hired." Alexander's personal pitch was even more direct: "In this room right here is the talent we need."

If you are willing to become a patriot hacker, Uncle Sam wants you.

As s a teenager, the Lamb was a devout Christian who attended church two or three times a week, yet he also participated in online forums for Satanists and atheists. He wanted to learn what others believed and why they believed it, and he wanted to hear their responses to questions he raised. If his beliefs could not withstand challenges from opposing ones, they might not be worth keeping.

"As a Christian, I believe the Bible, and one of the things it says is if you seek the truth, you should find it," he told me. "If I started to come across facts that contradicted what I believed and contradicted the way that I thought about things, I had to be open to confronting them and determining how I would integrate them into my life and my thought system."

Before he became a hacker, the Lamb had the restless spirit of one. After high school, he attended a Christian university for a year but dropped out and joined the military as a linguist. He was assigned to the NSA, and although he told me his computer skills were modest at the time, he was intrigued by the mysteries inside the machines. "I started doing some basic computer training, like 'Oh, here's how computers talk to each other and network' and that sort of stuff," he said. "I enjoyed that far more than trying to maintain a language that I rarely used."

He devoured books on computers and experimented on his own time, using an application called Wireshark to see how network data was moving to and from his own computer. He picked up a bit of programming knowledge, and he asked agency veterans for tips. As he wrote in one of his memos, "If you want to learn crazy new things ... why not walk around NSA, find people in offices that do things you find interesting, and talk to them about how they do what they do."

Like Snowden, he did not need a formal education to succeed. Snowden, after all, dropped out of high school and mastered computers through self-education. As an NSA contractor, he rose to a position that gave him access to broad swaths of the agency's networks. While Snowden was a systems administrator, the Lamb became an expert in network analysis and was well-versed in the crucial trick of shaping traffic from one place to another -- for instance, sending it from an ISP in a foreign country to an NSA server.

The Lamb's work was important, but his memos are remarkably irreverent, even cocky. I've read a fair number of NSA documents, and not one contains as much hacker and internet lingo as his; he used

words like "skillz" and "internetz" and "ZOMG!" and phrases like "pwn the network" and "Dude! Map all the networks!!!" Some of what he wrote is just cheerily impudent, like the opening line of one memo: "Happy Friday my esteemed and valued intelligence Community colleagues!" Another memo began, "Welcome back, comrade!"

While poking gentle fun at the government hackers he worked with, the Lamb dismissed the amateur hackers on the outside. He identified himself and his highly trained colleagues at the NSA as a breed apart -- a superior breed, much in the way that soldiers look down on weekend paintballers. Perhaps this shouldn't be altogether surprising, because arrogance is one of the unfortunate hallmarks of the male-dominated hacker culture. At the NSA, this hubris can perhaps serve as an ethical lubricant that eases the task of hacking other people: They are not as special as you are, they do not have the magical powers you possess, they are targets first and humans second.

As the Lamb wrote in one of his memos, "When I first went to Blackhat/Defcon, it was with the wide-eyed anticipation of 'I'm going to go listen to all of the talks that I can, soak up all of the information possible, and become a supar-1337-haxxor.' What a let-down of an experience that was. You find the most interesting topics and briefings, wait in lines to get a seat, and find yourself straining your ears to listen to someone that has basically nothing new to say. Most of the talks get hyped up exponentially past any amount of substance they actually provide."

When I asked the Lamb where he was in the hierarchy of hackers at the NSA, he just smiled and said, "I got to the point where more people would ask me questions than I asked other people questions." He would not delve into the classified specifics of his job -- he despises Snowden for leaking classified information -- but I knew a lot through his memos.

Although network analysis, the Lamb's area of expertise, is interesting from a technical perspective, he was one step removed from the most challenging and menacing type of government hacking -- executing finely tuned attacks that infiltrate individual computers. Nonetheless, he offered this characterization of his NSA work: "They were just ridiculously cool projects that I'll never forget." One of the quandaries of technology is that "cool" does not necessarily mean "ethical." Surveillance tools that are regarded as breakthroughs can be used to spy on innocent people as well as terrorists. This is a key part of the debate on the NSA, the concern that its formidable powers are being used, or can be used, to undermine privacy, freedom, and democracy.

The Lamb's memos on cool ways to hunt sysadmins triggered a strong reaction when I wrote about them in 2014 with my colleague Ryan Gallagher. The memos explained how the NSA tracks down the email and Facebook accounts of systems administrators who oversee computer networks. After plundering their accounts, the NSA can impersonate the admins to get into their computer networks and pilfer the data flowing through them. As the Lamb wrote, "sys admins generally are not my end target. My end target is the extremist/terrorist or government official that happens to be using the network ... who better to target than the person that already has the 'keys to the kingdom'?"

Another of his NSA memos, "Network Shaping 101," used Yemen as a theoretical case study for secretly redirecting the entirety of a country's internet traffic to NSA servers. The presentation, consisting of a PowerPoint slideshow, was offbeat at times, with a reference to throwing confetti in the air when a hack worked and jokey lines like, "The following section could also be renamed the 'I'm pulling my hair out in the fetal position while screaming "Why didn't it work?!"' section." The Lamb also scribbled a hand-drawn diagram about network shaping that included a smiley face in the middle next to the phrase, "YEAH!!! MAKE DATA HAPPEN!" The diagram and slideshow were both classified as top secret.

His memos are boastful, even cackling. At the end of one of the sysadmin memos, the Lamb wrote, "Current mood: scheming," and at the end of another, "Current mood: devious." He also listed "juche-licious" as one of his moods, ironically referring to the official ideology of North Korea. Another memo he wrote, "Tracking Targets Through Proxies & Anonymizers," impishly noted that the use of identity-obscuring tools like Tor "generally makes for sad analysts" in the intelligence community; this was followed by a sad face emoji. The tone of his classified writing was consistent with some of his social media posts -- the Lamb's attitude, in public as well as in private, was often outspoken and brash.

What if the shoe was on the other foot, however? When I wrote about the sysadmin memos in 2014, I wondered how their author would feel if someone used the same devious rationale to hack his computer and his life. Nearly two years later, I had the chance to find out.

"If I turn the tables on you," I asked the Lamb, "and say, OK, you're a target for all kinds of people for all kinds of reasons. How do you feel about being a target and that kind of justification being used to justify getting all of your credentials and the keys to your kingdom?"

The Lamb smiled. "There is no real safe, sacred ground on the internet," he replied. "Whatever you do on the internet is an attack surface of some sort and is just something that you live with. Any time that I do something on the internet, yeah, that is on the back of my mind. Anyone from a script kiddie to some random hacker to some other foreign intelligence service, each with their different capabilities -- what could they be doing to me?"

He seemed to be putting the blame for NSA attacks on the victims -- if they were too dimwitted to protect themselves from hunters like him, it was their fault. "People don't want to think about being targets on the internet, in spite of the fact that at this point in the game, everybody is," he added. "Every country spies."

He was dead serious, no smiles any longer. "As much as we'd like to say we will all beat our swords into plowshares and become a peaceful people, it's not going to happen," he continued. "Intelligence agencies around the world are being asked questions by their governments, and government officials don't want to hear, 'That's hard to solve.' They just say, 'Can you solve this and can you get me the intel I'm asking for?' Which is nation agnostic, whether that's the NSA, the FSB, the PLA or whoever."

The Lamb's political ideology evoked the cold-blooded realpolitik of Henry Kissinger. There is the idyllic digital world we would like to live in, there is the dog-eat-dog digital world we actually live in -- and the Lamb, as I understood it, was intensely focused on winning in the latter.

"You know, the situation is what it is," he said. "There are protocols that were designed years ago before anybody had any care about security, because when they were developed, nobody was foreseeing that they would be taken advantage of. ... A lot of people on the internet seem to approach the problem [with the attitude of] 'I'm just going to walk naked outside of my house and hope that nobody looks at me.' From a security perspective, is that a good way to go about thinking? No, horrible ... There are good ways to be more secure on the internet. But do most people use Tor? No. Do most people use Signal? No. Do most people use insecure things that most people can hack? Yes. Is that a bash against the intelligence community that people use stuff that's easily exploitable? That's a hard argument for me to make."

But it wasn't a hard argument for me to make, so I tried. Back in the 1990s, in the early days of the web, the uses and hopes for the internet were thought to be joyous and non-commercial. The web would let us talk to one another and would decentralize power and revolutionize the world in good ways. Those were the years when the Lamb spent hours and hours in chatrooms with Satanists and atheists -- just the sort of connect-us-to- each-other activity that made everyone so excited about the future. At the time, few people thought the internet would become, as Bruce Schneier describes it, a surveillance platform. So I asked whether the Lamb felt conflicted, as Snowden did, working for an organization that turned the web further and further away from its original potential as a global platform for speaking and thinking freely.

He responded by noting that he is, by nature, a defiant type and attracted to hard problems. That's how, without a lot of formal instruction, he became an NSA hacker -- he was curious about how computers worked and he wanted to figure them out. "Technically challenging things are just inherently interesting to me," he said. "If you tell me, 'This can't be done,' I'm going to try and find a way to do it."

I mentioned that lots of people, including Snowden, are now working on the problem of how to make the internet more secure, yet he seemed to do the opposite at the NSA by trying to find ways to track and identify people who use Tor and other anonymizers. Would he consider working on the other side of things? He wouldn't rule it out, he said, but dismally suggested the game was over as far as having a liberating and safe internet, because our laptops and smartphones will betray us no matter what we do with them.

"There's the old adage that the only secure computer is one that is turned off, buried in a box ten feet underground, and never turned on," he said. "From a user perspective, someone trying to find holes by day and then just live on the internet by night, there's the expectation [that] if somebody wants to have access to your computer bad enough, they're going to get it. Whether that's an intelligence agency or a cybercrimes syndicate, whoever that is, it's probably going to happen."

The Lamb was comfortable with the side he joined in the surveillance wars, and this sets him apart from the most common stereotypes of the men and women who devote their lives to spying on others.

Spies who do nothing but eavesdrop, slipping into computers and conversations without a trace, have a reputation in popular culture of being troubled in ways that conventional spies are not. Think of Gene Hackman in The Conversation, or Ulrich Mühe in The Lives of Others -- these surveillers are haunted, as it seems they should be. Conventional spies are seen as journeying into hostile lands and committing heroic or devious acts; they are men and women of action, not thought. But the people who watch, listen, or hack are not as distracted by danger or adrenaline. They mostly labor in tranquility, in temperature-controlled offices without windows, risking bodily harm no worse than carpal tunnel syndrome, and they have an abundance of time to think about the lurking that is their occupation and the people on whom they practice it.

I have a bias against the watchers, I suppose. I have been concerned about the bureaucracies of surveillance since the 1980s, when I was a student in the Soviet Union and felt like hunted prey. The telephone in the dreary lobby of my dormitory on the banks of the Neva River in Leningrad (now St. Petersburg) was assumed to be bugged, and if the KGB's devices weren't working, the dezhurnaya who sat nearby was sure to be listening. This was my anti-surveillance Rosebud, I guess. When I visited Russian friends, I stayed silent as I walked in their ill-lit stairwells, so that the accent of my Russian would not give away the fact a foreigner was visiting them. The walls had ears. This was one of the great contrasts between the Soviet Union and America, where I could speak to my friends without worrying about the government listening.

The Soviet Union is long gone, but in 2016 we live under the specter of far more surveillance than anything the KGB could have dreamed of with its rudimentary bugs and fearful informers. Not just government surveillance -- law enforcement can easily obtain our phone and internet records with a warrant from the nearly always compliant courts -- but corporate surveillance, too. It's not just Google and Facebook that might know more details about our lives and friends than the KGB could have imagined in its most feverish dreams of information dominance, but even Zipcar and Amazon.

There are precautions one can take, and I did that with the Lamb. When we had our video chat, I used a computer that had been wiped clean of everything except its operating system and essential applications. Afterward, it was wiped clean again. My concern was that the Lamb might use the session to obtain data from or about the computer I was using; there are a lot of things he might have tried, if he was in a scheming mood. At the end of our three hours together, I mentioned to him that I had taken these precautions--and he approved.

"That's fair," he said. "I'm glad you have that appreciation. ... From a perspective of a journalist who has access to classified information, it would be remiss to think you're not a target of foreign intelligence services."

He was telling me the U.S. government should be the least of my worries. He was trying to help me.

Reuters
Chinese economic cyber-espionage is diminishing, says U.S. official
Tuesday, 28 June 2016
Byline: Staff report

Washington - U.S. Assistant Attorney General John Carlin said on Tuesday that Chinese hacking activity appears to have declined since the Chinese government vowed last September to stop supporting the hacking of U.S. trade secrets.
The assertion supports findings released earlier this month from cyber security firm FireEye that breaches attributed to China- based groups had plunged by 90 percent in the past two years.

"Generally, people have seen a change in activity," Carlin said at the Center for Strategic and International Studies think tank in Washington.

But "there is debate about how long lasting" the apparent reduction in activity will be, Carlin said, adding that the private sector and U.S. intelligence officers were likely better positioned to assess hacking trends.

Carlin said that agreements on hacking activity with China and among the Group of 20 nations, both announced last year, were important to developing uniform international cyber norms.

Certain countries, such as North Korea, continue to be a "difficult actor" on cyber issues, he said.

Le Monde
Poutine renforce son arsenal antiterroriste
Wednesday, 29 June 2016
Byline: Isabelle Mandraud

Moscou - Les opérateurs Internet et de téléphonie devront conserver tous les échanges pendant six mois
A une cadence effrénée avant l'interruption de l'été, les députés de la Douma, la chambre basse du Parlement russe, ont adopté deux lois antiterroristes controversées que le Conseil de la fédération, l'équivalent du Sénat, s'apprête à son tour à entériner mercredi 29 juin. " Notre pays et notre société en ont besoin " , a déjà prévenu sa présidente, Valentina Matvienko. Présenté comme une réponse à l'attentat d'octobre 2015 contre un charter russe au-dessus du Sinaï, qui avait entraîné la mort de 224 passagers et membres d'équipage, ce Patriot Act version russe soulève l'inquiétude des organisations des droits de l'homme.

Réfugié en Russie depuis deux ans, le lanceur d'alerte Edward Snowden a également dénoncé sur Twitter un arsenal " Big Brother " , " qui constitue une violation inapplicable et injustifiable des droits " . " La surveillance de masse ne fonctionne pas , insiste l'ex-consultant qui a fui les Etats-Unis après avoir révélé l'ampleur des opérations d'espionnage menées par les services de renseignement américains. Ce texte va coûter de l'argent et de la liberté à chaque Russe sans améliorer la sécurité. "

Le paquet de mesures adoptées vise notamment à renforcer la surveillance des réseaux de communication. Les fournisseurs de service téléphonique et d'accès Internet seront dans l'obligation de conserver sur leurs serveurs les métadonnées - les caractéristiques d'un échange ou d'une connexion, telles que l'heure ou la durée - pendant trois ans, ainsi que tous les messages, appels et communications des utilisateurs pendant six mois. Sur demande des services russes, ils devront également fournir l'accès aux messageries cryptées.

Les lois Iarovaia - du nom de la députée Irina Iarovaia, membre du parti au pouvoir Russie unie, qui a porté ces textes - alourdissent considérablement la législation existante sur bien d'autres points. L'âge de la responsabilité pénale est abaissé à 14 ans. La " non- dénonciation " de crimes - une disposition de l'époque soviétique remise au goût du jour - pourra être punie d'un an de prison. Des peines jusqu'à sept ans de détention sont également prévues pour " justification publique du terrorisme " , y compris sur Internet, mais aussi pour " rébellion armée " ou " actes extrémistes " .

Or, sous cette dernière qualification assez large, plusieurs internautes ont récemment été condamnés pour avoir simplement partagé des publications sur les réseaux sociaux. Encourager par ce même biais à prendre part à " des troubles de masse " pourra aussi valoir cinq à dix ans de prison. Enfin, la loi bannit " le prosélytisme, le prêche et la prière en dehors des institutions religieuses reconnues " .

" Sérieux coup aux libertés "In extremis, la dernière version adoptée à la Douma a exclu la déchéance de la nationalité pour les binationaux travaillant pour des organisations internationales, ou l'interdiction de quitter le territoire pour des auteurs de crimes. " Le retrait des mesures les plus scandaleuses a peut-être été conçu pour que le public pousse un soupir de soulagement, mais, même écrémée, la loi Iarovaia porte un sérieux coup à la liberté d'expression et aux autres libertés fondamentales des Russes " , s'alarme Tania Lokchina, la représentante de l'ONG Human Rights Watch à Moscou.

A l'unisson, les opérateurs Internet et de téléphonie fustigent des mesures de surveillance qu'ils jugent inapplicables et dont le coût les amènerait " au seuil de la survie " . " Si nous devions prendre en compte le stockage des données, nous ne serions plus en mesure de payer des impôts sur bénéfices pendant au moins cent ans " , affirme Dmitri Solodovnikov, un représentant de MTS, le plus important opérateur de téléphonie mobile en Russie, cité par le quotidien Kommersant . Les nouvelles lois antiterroristes, que Vladimir Poutine doit parapher pour leur mise en application, sont les dernières prévues avant les élections législatives organisées le 18 septembre.

US, Korea hold cybersecurity cooperation talks

Saturday, 02 July 2016

Seoul - The United States and Korea held cybersecurity talks to boost cooperation in a wide range of areas, including tackling cyber hacking and other crimes, the State Department said.

Christopher Painter, the department's coordinator for cyber issues, led the U.S. delegation in the fourth U.S.-Korea Bilateral Cyber Consultations. His team also included officials from the National Security Council, and the departments of justice, defense and homeland security, the department said in a statement.

Led by International Security Affairs Ambassador Shin Maeng-ho, Korea's interagency team included officials from the National Police Agency, the Justice Ministry and the Korea Internet and Security Agency, the department said.

The talks "affirmed the benefits of a whole-of-government approach" between the two countries on cyber policy and reinforced cooperation "on a wide range of cyber issues including cooperation on cybersecurity of critical infrastructure, capacity building, information sharing, research and development, military-to-military cyber cooperation, cybercrime, international security issues in cyberspace," it said.

The meeting also reaffirmed shared principles that support an open, interoperable, secure, and reliable cyberspace, the department said.

Loretta Lynch to Accept F.B.I. Recommendations in Clinton Email Inquiry

Saturday, 02 July 2016

Byline: Mark Landler

Washington - General Loretta E. Lynch, conceding that her airport meeting with former President Bill Clinton this week had cast a shadow over the federal investigation of Hillary Clinton's personal email account, said Friday that she would accept whatever recommendations career prosecutors and the F.B.I. director made about whether to bring charges in the case.

Ms. Lynch said she had decided this spring to defer to the recommendations of her staff and the F.B.I. because her status as a political appointee sitting in judgment on a politically charged case would raise questions of a conflict of interest. But the meeting with Mr. Clinton, she acknowledged, had deepened those questions, and she said she now felt compelled to explain publicly her reasoning to try to put the concerns to rest.

"People have a whole host of reasons to have questions about how we in government do our business," Ms. Lynch said at an Aspen Institute conference in Colorado. "My meeting on the plane with former President Clinton could give them another reason to have questions and concerns."

Though she insisted the 30-minute conversation was a purely social encounter, Ms. Lynch said, "I certainly wouldn't do it again."

The attorney general's response did little to quell a political tempest in Washington, with some Republicans calling for her to recuse herself from the case -- a step she said she was not going to take. Donald J. Trump, the presumptive Republican nominee, said the meeting had "opened up a Pandora's box." He cast doubt on whether it was entirely social, citing it as an example of how "the special interests are controlling your government."

For Democrats, already anxious about the political impact of the email investigation, the incident revived fears that Mr. Clinton could become a rogue actor in a campaign that has so far operated more smoothly than Mrs. Clinton's presidential bid in 2008.

Mr. Clinton, who was on a seven-state fund-raising swing for his wife, strode across the tarmac at the airport in Phoenix to greet Ms. Lynch after her plane landed there on Monday night. The attorney general joked that she should have acted more swiftly to keep him from boarding. Asked by a journalist to name one thing she wished her predecessor, Eric H. Holder Jr., had told her about her job, she replied, "Where the lock on the plane door was."

Still, Ms. Lynch said the episode was personally distressing because it stained the reputation of the Justice Department. "The fact that the meeting that I had is now casting a shadow over how people are going to view that work is something that I take seriously, and deeply and painfully," she said.

Even Ms. Lynch's explanation of how she planned to distance herself from the case -- without recusing herself -- required further clarification. "The case will be resolved by the team that's been working on it from the beginning," she said in Aspen. But a Justice Department spokeswoman, Melanie Newman, noted afterward that even if Ms. Lynch accepted the recommendation of her staff, she would be the one making the decision.

"She's the head of the department," Ms. Newman said, "and with that comes ultimate responsibility for any decision."

The White House declined to comment on Ms. Lynch's decision. President Obama "believes that this matter should be handled without regard to politics," the press secretary, Josh Earnest, said.

The F.B.I. is investigating whether Mrs. Clinton, her aides or anyone else broke the law by setting up a private email server for her to use as secretary of state. Internal investigators have concluded that the server was used to send classified information. For the Justice Department, the central question is whether the conduct met the legal standard for the crime of mishandling classified information.

Ms. Lynch, whom Mr. Clinton appointed to be a United States attorney in 1999, said that the meeting with the former president was unplanned and largely social, and did not touch on the email investigation.

"He said hello and we basically said hello, and congratulated him on his grandchildren, as people do," said Ms. Lynch, who was traveling with her husband. "That led to a conversation about those grandchildren."

For Mr. Clinton, who travels frequently by private jet, such airport socializing is common. Last month, he ran into Senator Orrin G. Hatch, the Utah Republican, after speaking at the funeral of Muhammad Ali in Louisville, Ky. The two chatted before their planes took off. He has also greeted Representative Paul D. Ryan, the House speaker, and Arnold Schwarzenegger, the former Republican governor of California, on the tarmac. And in Mobile, Ala., he chatted with Senator Ted Cruz, the Texas Republican who has called for Mrs. Clinton's imprisonment.

This meeting, however, created a particularly awkward situation for Ms. Lynch, a veteran prosecutor who was nominated from outside Washington's political circles. During her confirmation, her allies sought to contrast her with her predecessor, Mr. Holder, an outspoken liberal voice who clashed frequently with Republicans who accused him of politicizing the office.

Ms. Lynch's reassurance that she will not overrule her investigators is significant. When the F.B.I. sought to bring felony charges against David H. Petraeus, the former C.I.A. director, for mishandling classified information and lying about it, Mr. Holder stepped in and reduced the charge to a misdemeanor. That decision opened a deep -- and public -- rift.

Two other political appointees will review the findings of the email investigation before a final decision is made: John P. Carlin, the assistant attorney general for national security, and Deputy Attorney General Sally Yates. But both have also pledged to follow the recommendations of the career prosecutors and the F.B.I., Ms. Newman said.

The F.B.I. is expected to make a recommendation to the Justice Department in the coming weeks, though agents have yet to interview Mrs. Clinton. While some legal experts said they believed that criminal indictments in the case were unlikely, the investigation continues to cast a shadow over Mrs. Clinton's presidential campaign.

Beyond the day-to-day workings of the Justice Department, there is precedent for relying on career officials to make politically charged decisions. When the Justice Department was considering whether to recommend sanctions against former Bush administration lawyers who approved waterboarding, Mr.

Holder relied on his most senior career prosecutor to make the decision. No sanctions were recommended.

For Mrs. Clinton's presidential campaign, the incident in Phoenix resurrected questions about how the campaign would rein in her irrepressible husband.

With approval ratings among Democrats of over 60 percent, Mr. Clinton is one of his wife's most potent surrogates. He has traversed the country with a breakneck schedule, campaigning and raising money for Mrs. Clinton, traveling with a bare-bones staff and security detail.

Mr. Clinton and his chief of staff, Tina Flournoy, are in frequent contact with John D. Podesta, chairman of the Clinton campaign, and Robby Mook, the campaign manager. He often listens in on campaign conference calls from the family's home in Chappaqua, N.Y. But his unpredictable and sociable nature can also cause problems for his wife's candidacy.

David Axelrod, the former senior adviser to President Obama, said on Twitter that he took Mr. Clinton and Ms. Lynch "at their word" that they had not discussed the investigation, but added that it was "foolish to create such optics."

Senate says goodbye to the BlackBerry, at last

Saturday, 02 July 2016

Byline: Heather Caygle

Washington - The Senate is breaking up with BlackBerry, and it's for good this time.

The prehistoric smartphone, once a mainstay on Capitol Hill, will no longer be handed out to Senate staffers after the current supply runs out, according to a notice sent out Wednesday. Staffers were put on alert that since BlackBerry has decided to discontinue the device and there is a limited stock on the Hill, the chamber has no way to replenish the phones once they're gone.

"Once we have exhausted our current in-house stock, new device procurements will be limited, while supplies last, to warranty exchanges only," read a Sergeant at Arms note, first reported by Jim Swift.

While most Hill aides have long moved on to iPhones or Androids, there's a small, loyal band of staffers that just can't quit the dinosaur device.

Some Millennial Hill staffers may scoff at the sentimental attachment, but BlackBerry has proven its worth over the years. When an earthquake shook D.C. in 2011, BlackBerry messaging was the only service working while other carriers were overloaded and texts and calls wouldn't go through.

Currently, the Senate has a little more than 600 various BlackBerry models stockpiled, according to the Sergeant at Arms, and device support for current phones is expected to continue for the "foreseeable future."

Clinton, FBI meet in probe of email

Sunday, 03 July 2016

Byline: Matt Zapotosky, Anne Gearan

Washington - FBI agents interviewed Hillary Clinton for 3 1/2 hours Saturday morning - a signal that the investigation into her use of a private email account while she was secretary of state is drawing to a close.

Clinton campaign spokesman Nick Merrill said in a statement Saturday that Clinton "gave a voluntary interview this morning about her email arrangements while she was Secretary," and added, "She is pleased to have had the opportunity to assist the Department of Justice in bringing this review to a conclusion."

Asked if the interview, which took place at FBI headquarters, was businesslike and civil, Clinton told MSNBC that it was "both."

"It was something I had offered to do since last August," she said, according to a transcript provided by the network. "I've been eager to do it, and I was pleased to have the opportunity to assist the department in bringing its review to a conclusion."

As she has in the past, Clinton asserted that she "never received nor sent any material that was marked classified," although she said that some might have been retroactively branded classified during the process to prepare it for public release. She said she had "no knowledge" of the investigators' timeline.

The investigation is not over: Agents and prosecutors will now have to compare what the presumptive Democratic presidential nominee said Saturday to other evidence they have gathered, including from interviews with Clinton's aides. They will also have to analyze how the facts of the case apply to various laws that might have been violated.

But officials familiar with the probe and legal analysts have said a meeting with Clinton would be reserved for the end of the investigation.

"That's certainly a signal that they're wrapping things up," said Justin Shur, a former deputy chief of the Justice Department's public integrity section who is now in private practice at the MoloLamken firm.

A Justice Department spokesman declined to comment on the Clinton interview.

The past week has been tumultuous for Clinton and the government's investigation into whether her email system might have compromised classified information. On Monday, former president Bill Clinton had an impromptu meeting with U.S. Attorney General Loretta E. Lynch aboard Lynch's plane at an airport in Phoenix. Lynch asserted they did not discuss any pending investigations, but the conversation sparked an uproar - with some Republicans and Clinton rivals calling for a third party to be appointed to handle the case.

Referring to that meeting, Hillary Clinton told MSNBC that "hindsight is 20/20" and said her husband, like the attorney general, would probably not do it again.

On Friday, Lynch announced that she would accept recommendations from career prosecutors and FBI agents leading the probe - a decision that she said had been made before her meeting with Bill Clinton, but one that was surely meant to quiet criticism about the independence of the probe. While Lynch did not formally recuse herself from the investigation involving Hillary Clinton's email - saying that "would mean I wouldn't even be briefed on what the findings were" - she seemed to promise she would not veto whatever decision came from federal prosecutors handling the case.

It is not clear who precisely will be the ultimate decision-maker, if Lynch will serve as more of a rubber stamp. The attorney general said FBI Director James B. Comey would be among those involved.

The investigation is focused on whether classified information was mishandled because Clinton used a private email account when she was secretary of state. The State Department's inspector general has already issued a report highly critical of Clinton's email practices, asserting that she failed to seek legal approval to use a private server and that staffers would not have assented if they were asked. The inspector general also found that Clinton's email setup was "not an appropriate method" for preserving public records.

A Washington Post analysis of Clinton's publicly released correspondence found that Clinton wrote 104 emails that she sent using her private server while secretary of state that the government has since said contained classified information. But the review also found that using non- secure email systems to send sensitive information was widespread at the department and elsewhere in government and that Clinton's publicly released correspondence included classified emails written by about 300 other people inside and outside the government.

People familiar with the case have said previously that charges against Clinton seemed unlikely and that there was a particular void of evidence showing she intended to mishandle classified information, although they asserted investigators were still probing the matter aggressively. The interview with Clinton was always seen as critical. If the former secretary was untruthful with investigators, she could be charged with making false statements. That charge was contemplated in the case against retired Army general and former CIA director David H. Petraeus, although he ultimately pleaded guilty to a misdemeanor charge of mishandling classified information.

With the Republican and Democratic conventions looming later this month, timing has also become a complicating factor. Justice Department guidelines specifically warn prosecutors against selecting the timing of investigative steps for the purpose of affecting an election or helping a particular candidate or party.

Satellite imagery suggests China is secretly punishing North Korea

Saturday, 02 July 2016

Byline: Josh Rogin

Comment: Following North Korea's latest nuclear test, in January, trade over the China-North Korea border dropped dramatically, according to newly released satellite imagery. The revelation has led experts to conclude that Beijing has been quietly punishing Kim by cutting off the flow of funds to his regime.

There's no question that the China-North Korea relationship has been strained since Kim assumed power in 2011. Against Beijing's wishes, the young leader has revved up North Korea's pace of missile tests and detonated two nuclear devices, one in 2013 and then again this January. In 2013, Kim executed his uncle Jang Song Thaek, who had been China's main contact in Pyongyang.

After the latest nuclear explosion, which Pyongyang claimed was a hydrogen bomb, Secretary of State John F. Kerry publicly called on China to end "business as usual" with North Korea. Publicly, Beijing rejected being told by the United States how to handle its client state. Behind the scenes, it appears Beijing was doing just that.

"It is apparent that shortly after North Korea did the fourth nuclear test in January, China took unilateral measures to drastically curtail trade interaction along their border," said Victor Cha, director for Asian affairs at the National Security Council during the George W. Bush administration.

Cha, now at the Center for Strategic and International Studies (CSIS), led a team of researchers that procured and analyzed the new satellite imagery as part of their project Beyond Parallel, a website and database dedicated to demystifying what's going on inside the world's most secretive state. The project launched Thursday.

Cha's conclusion, that Beijing decided to punish North Korea after the nuclear test but didn't disclose that to the world, is backed up by anecdotal reports of Chinese officials telling Western interlocutors that President Xi Jinping had decided to "take action" against the Kim regime, behind the scenes, out of anger over the nuke test.

"It shows that China pursues things in their own way when it comes to North Korea, not because the U.S. or the U.N. tells them to," said Cha. "The good news is that they are squeezing them more than we were led to expect."

CSIS worked with imagery analysts at the commercial satellite firm DigitalGlobe to collect and examine satellite photos of several key trade-related areas on both sides of the China-North Korea border, including the Sinuiju railroad station and customs area on the North Korean side, the Dandong railroad station and customs area on the Chinese side, and the Sino-Korean Friendship Bridge that links the two countries.

They compared activity at the sites year over year, first by examining imagery from January and March of 2015 and then comparing that with imagery collected this February, just after the latest nuclear test. The images showed a "substantive reduction of economic activity on the Sino- North Korean border" as evidenced by a huge drop in the number of rail cars at the stations, trucks in customs areas, trucks on the bridge and undocked boats in the Yalu River.

At the Sinuiju rail station, most of the train cars appeared to be in storage early this year, with no engines attached to the freight cars. In the Sinuiju customs area, there were 111 trucks shown in the satellite image from January 2015, but in the February 2016 image, there were only five. On the Chinese side, there were 32 trucks spotted in the Dandong customs area in March 2015, but by this February there were only six.

Official trade data regarding North Korea is notoriously unreliable, and Cha said comprehensive data on economic activity over the China-North Korea border does not really exist. But his team has been briefing U.S. and South Korean government agencies on what they found, and he said both governments have shown interest in pursuing the research.

In March, China signed on to a new United Nations Security Council resolution imposing fresh sanctions on North Korea in response to the January nuclear test, showing that Beijing was in fact upset with Kim's actions. But the new data may show that Xi was much more upset than he let on and more than he wanted the rest of the world to know.

"The Chinese don't feel like they need to get credit for punishing North Korea and they don't want to be seen as [if] they are being pressured by the U.S. to do it," said Cha.

The question going forward is whether Chinese economic pressure on North Korea, which will surely hit at Kim's coffers, will compel the young ruler to think twice before his next dangerous provocation.

6. New York Times

F.B.I. Interviews Hillary Clinton Over Private Email Server

Sunday, 03 July 2016

Byline: Amy Chozick

Washington - The F.B.I. interviewed Hillary Clinton on Saturday morning for its investigation into whether she or her aides broke the law by corresponding through a private email server set up for her use as secretary of state, a controversy that has dogged her presidential campaign and provided fodder to her political rivals.

The voluntary interview, which took place over three and a half hours at F.B.I. headquarters in Washington, largely focused on the Justice Department's central question: Did the actions of Mrs. Clinton or her staff rise to the level of criminal mishandling of classified information?

It could take weeks or longer to reach a decision, but news that Mrs. Clinton, the Democratic Party's presumptive nominee, had been questioned in the J. Edgar Hoover Building three weeks before her party's convention quickly reverberated.

The Republican National Committee called the step "unprecedented," while Mrs. Clinton's expected opponent in the race for the White House, Donald J. Trump, wasted little time before weighing in.

"It is impossible for the FBI not to recommend criminal charges against Hillary Clinton," Mr. Trump wrote on Twitter on Saturday. "What she did was wrong!"

The interview had been weeks in the making as law enforcement officials and Mrs. Clinton's team coordinated schedules. Democrats also hoped that holding the interview on a holiday weekend might soften the anticipated storm. Shortly after the meeting, two black S.U.V.s were seen returning to Mrs. Clinton's house in the capital, but Mrs. Clinton herself stayed out of sight.

In a telephone interview with Chuck Todd on MSNBC after her meeting, Mrs. Clinton said: "I've been eager to do it, and I was pleased to have the opportunity to assist the department in bringing its review to a conclusion."

Accompanying Mrs. Clinton into the meeting were her lawyer David E. Kendall; Cheryl D. Mills and Heather Samuelson, longtime aides who are also lawyers; and two lawyers from Mr. Kendall's firm, Williams & Connolly, Katherine Turner and Amy Saharia.

Eight officials from the F.B.I. and the Department of Justice conducted the interview, according to a person who was familiar with the substance of the session but declined to be named because the meeting was private. This person characterized the meeting as "civil" and "businesslike."

Neither the campaign nor the F.B.I. would elaborate.

Although the interview on Saturday was an important step toward closure on the email issue, technical analysis of the material remains to be done and could stretch on for an indeterminate period.

The F.B.I. regularly interviews key figures before concluding an investigation, and such meetings are not an indication that it thinks the person broke the law.

While defense lawyers often advise clients against such interviews, Mrs. Clinton's campaign has been eager for her to cooperate, lest she give her opponents additional ammunition.

On Saturday, in a statement after the meeting, the Republican National Committee said that Mrs. Clinton "has just taken the unprecedented step of becoming the first major party presidential candidate to be interviewed by the F.B.I. as part of a criminal investigation surrounding her reckless conduct."

Mrs. Clinton has struggled to get beyond the issue, which came to light last year during a Republican-led congressional investigation into the aftermath of the Sept. 11, 2012, terrorist attack in Benghazi, Libya. More than 30,000 emails have since been made public.

After spending much of last summer insisting she did not need to apologize for keeping a private server in her home in Chappaqua, N.Y., because the practice was "allowed," Mrs. Clinton now frequently apologizes for the practice, saying it had been a "mistake."

The campaign has prioritized assisting the F.B.I., but it declined to cooperate with a State Department inspector general's audit of Mrs. Clinton's email practices.

Those findings, delivered to members of Congress in May, undermined some of Mrs. Clinton's initial statements defending her use of the server.

The report said there was "no evidence" that she had requested or received approval for the server, despite having "an obligation to discuss using her personal email account to conduct official business."

Federal law deems it a crime to "knowingly" mishandle classified information outside secure government channels or to permit the practice through "gross negligence."

None of the emails on Mrs. Clinton's private server were marked classified at the time they were sent or received, but the Central Intelligence Agency later determined that some contained material that would be considered "top secret."

Asked Saturday on MSNBC whether she had broken the law, Mrs. Clinton repeated her defense: "I never received nor sent any material that was marked classified."

There has been no indication that any sensitive information was compromised by Mrs. Clinton's use of a private server. But it has fed a perception that she was trying to hide information, and it has chipped away at data gauging Mrs. Clinton's trustworthiness. A Quinnipiac University poll released on Wednesday found that voters deemed Mr. Trump more honest and trustworthy than Mrs. Clinton, 45 percent to 37 percent.

"I have said that I'm going to continue to put forth my record, what I have stood for, do everything I can to earn the trust of the voters of our country," she told MSNBC when asked about being seen as less

trustworthy than Mr. Trump. "I know that's something that I'm going to keep working on, and I think that's, you know, a clear priority for me."

Mrs. Clinton's interview with the F.B.I. came amid controversy over a brief, unplanned meeting between her husband, former President Bill Clinton, and Attorney General Loretta E. Lynch, while both were at the Phoenix airport at the same time last week.

To avoid any appearance of political meddling, Ms. Lynch said on Friday that she would accept the recommendations of career prosecutors and the F.B.I. director on whether to bring charges in the matter. She said she had made that decision several months ago, before the criticism surrounding her meeting with Mr. Clinton.

She described the meeting as a casual conversation that did not touch on the investigation. But it added to Clinton campaign staff members' headaches over the email inquiry, which they had hoped to put behind them before the Democratic convention this month.

"I certainly wouldn't do it again," Ms. Lynch said of the meeting with the ex-president.

Find out what you need to know about the 2016 presidential race today, and get politics news updates via Facebook, Twitter and the First Draft newsletter.

Data encryption hampering police work

Saturday, 02 July 2016

Byline: Alex Boutilier

Toronto - The growing popularity of programs that protect online privacy is creating a barrier for police and security agencies' ability to intercept and use data, documents obtained by the Star suggest.

Officials warned Public Safety Minister Ralph Goodale in November that encryption - the ability to mask communications so only the intended recipients can make sense of the message - is hindering their ability to use online communications in investigations.

"Canadians are increasingly using mobile phone networks, the Internet and other electronic means to communicate and execute transactions with each other," read the documents, heavily censored and stamped "secret."

"This has led to a significant gap between the technologies available for criminal exploitation and our means to enforce Canada's laws and keep Canadians safe."

Once a fringe set of complicated tools, encryption technology has become more and more mainstream, particularly after the disclosures of NSA whistleblower Edward Snowden. Journalists use encrypted emails to protect sources, businesses use encryption to protect their customers' transactions, and governments use encryption to protect sensitive information.

Because a number of companies have moved to encryption by default, plenty of Canadians are using encrypted messaging without even knowing it. If you've sent a text on an iPhone, you've used encryption.

Despite perfectly legal and appropriate uses, however, law enforcement has generally focused the encryption debate on the perceived advantages the technology gives to criminals to plot or cover their tracks.

The Star requested an interview with Goodale to discuss these issues, but the minister was unavailable over the past two weeks. His office noted that the minister recently addressed the encryption debate in a speech at the University of Regina.

"We need a thoughtful discussion about the legal framework that applies to new technologies. On the issue of encryption, for example, is absolute privacy the only 'public good' that needs to be safeguarded, or is there a point at which criminal or terrorist investigations should be properly and lawfully assisted?" the minister's prepared remarks read.

"And if so, where?"

Officials also flagged a number of other issues to Goodale in the documents, including data retention. Canada does not have an overarching law that requires companies to retain data for a certain period, meaning evidence sought by police could already be gone by the time they get around to asking for it.

The fact that many companies keep their data on foreign servers presents jurisdictional challenges. And a recent Supreme Court decision requiring police to obtain a warrant for users' "basic subscriber information" - things like address, Internet Protocol address, or phone numbers - have led to police complaints about increased paperwork.

"The issues outlined above are multi-faceted and inherently complex," the documents note.

"While it is possible to consider each issue separately, any solution would need to look to all issues collectively . . . To date, some work has been done to develop and advance solutions to address the issues highlighted above, however certain solutions are much more advanced than others."

Christopher Parsons, a researcher with Citizen Lab at the University of Toronto, suggested that there's little the government can do to prevent encryption in an age where every iPhone or WhatsApp message provides a high level of security.

"I think that really where the government has to explain things is, (for one) how could it possibly compel third parties who operate outside of the country and have invested so much on privacy and security, what are they going to do? I guess they can try to block Apple and iMessage, but that's not going to work," Parsons said in an interview Friday.

"And, moreover, people are gaining an appreciation slowly what encryption means. So it means that if you're using (messaging client) WhatsApp, it's actually pretty secure now to send your credit card information . . . You can send a password securely. These aren't bad things."

Parsons also questioned framing the debate around criminals and terrorists, rather than ordinary folks trying to protect their privacy.

"The majority of communications that are conducted using encryption are going to be fully lawful. So that means that there's an immediate proportionality issue," Parsons said.

"When we start framing things as we need access to the content to catch the bad guys, it really depends on what we're trying to do . . . I'm inherently suspicious."

8. Globe and Mail

Maximum-security terrorism inmate looks for 'Future Miss' on the Web

Saturday, 02 July 2016

Byline: Colin Freeze

Ottawa - In 2004, an Ottawa man helped to build a bomb that was being assembled in hopes of blowing up a packed nightclub in Britain.

When he was caught by the Mounties on the cusp of his 25th birthday, he became notorious as the first al-Qaeda-inspired extremist convicted in Canada.

Momin Khawaja's crime had once been unheard of in Canada.

Now, terrorism is a charge laid relatively routinely. At 37 years old, he is a prisoner of Millhaven Institution, kept in its maximumsecurity wing and he has spent years secluded from the wider world.

But now Mr. Khawaja is writing that he wants to become engaged. "My Future Miss: ... I'm interested in finding a girl I may marry," he has posted on an Internet site. He adds that "I have a life sentence, but I won't be in jail forever."

The personal ad has been posted on Canadian Inmates Connect.com, a site that emerged as controversial a few years ago after sex killer Luka Magnotta used it to look for prospective partners.

Mr. Khawaja may be seeking a love match, but he is glossing over some details about his own past.

"I've never killed an innocent human being or harmed women and children in any way," he writes. While he admits that he is doing time for terrorism, he says he had his reasons. "My offences stem from moral and financial support of the anti- Western occupation insurgency in places such as Iraq and Afghanistan."

Contacted by telephone, Mr. Khawaja told The Globe and Mail that he had an intermediary post a profile he put on the Internet last summer. He has had a pen pal or two since, but no serious romantic prospects have emerged.

But he is undaunted. "I have turned 37 ... but my heart and mind still feel like I'm young," he said.

He said he likes his chances because he has been out to improve himself. For example, he is taking science classes from Laurentian University. He also said he is studying religion more deeply. "I memorized the entire Koran in Arabic and its recitation," he said during the interview. "And, apart from that, I've studied Arabic etymology and morphology."

He insisted that correctional officials and prison-approved preachers have been teaching him what they call a "counternarrative." That's basically the difference between a fanatical version of Islam and a well-intentioned one where "one can be a productive member of society in line with Canadian values," he said.

Besides, he said, he really has no idea what terrorists are thinking these days.

"I know and understand a lot of these groups, such as ISIS, are using radical extremist ideology," he said. But he added that the group has no appeal for him and that its propaganda would be completely unfamiliar to him.

Back then, he was a young software engineer who fixed computers for the federal government's foreign service bureaucracy, after he had grown up in the Ottawa suburb of Orleans playing street hockey.

He took to corresponding by e-mail with twentysomething Muslims in Britain who were also of Pakistani heritage. Outraged by the U.S.-led military invasions of Afghanistan and Iraq, the British suspects and Mr. Khawaja journeyed together to their families' homeland. They enlisted in a terrorist training camp in the remote regions of Pakistan and returned home intent on striking a blow against the West.

Scotland Yard spotted the British cell starting to assemble a bomb made up of 600 kilograms of ammonium-nitrate fertilizer.

Mr. Khawaja popped into the frame after a flight to Heathrow Airport, where he was met by the British ringleader, to whom he showed pictures of a prototype detonator he had built.

Arrested by the RCMP after returning to Canada, Mr. Khawaja went on trial for wanting to use his device - which he had dubbed "the Hi-Fi Digimonster - to help the British cell remotely set off explosions.

The evidence showed that the intended targets would have probably been inside a shopping mall, or a packed nightclub, in London. One conspirator was caught on a wiretap saying the nightclub was a good target because "no one can even turn around and say, 'Oh, they were innocent, these slags dancing around ...' " The British conspirators were caught red-handed building the bomb.

Mr. Khawaja insisted that no one ever clued him in about specific targets. He said he only ever envisioned bombs going off in Afghanistan. "There is no chance that, if I had known for sure, with certainty, it would be used in the streets of Britain, that I would have ever supplied it to them."

Mr. Khawaja spent years warehoused in Canada's version of a supermax prison, Quebec's Special Handling Unit, where human contact - even hugging a family member - is mostly forbidden.

This made moving to Millhaven last year feel liberating for him.

"Having open visits with my family, sitting at a table with my mother and father, ... these are opportunities I didn't have," he said.

Drone Strike Data Reveals Limits of Fighting Terrorists From Sky

Monday, 04 July 2016

Byline: Scott Shane

Washington - The promise of the armed drone has always been precision: The United States could kill just the small number of dangerous terrorists it wanted to kill, leaving nearby civilians unharmed.

But the Obama administration's unprecedented release last week of statistics on counterterrorism strikes underscored how much more complicated the results of the drone program have been.

It showed that even inside the government, there is no certainty about whom it has killed. And it highlighted the skepticism with which official American claims on targeted killing are viewed by human rights groups and independent experts, including those who believe the strikes have eliminated some very dangerous people.

"It's an important step -- it's an acknowledgment that transparency is needed," said Rachel Stohl, an author of two studies of the drone program and a senior associate at the Stimson Center, a research group in Washington. "But I don't feel like we have enough information to analyze whether this tactic is working and helping us achieve larger strategic aims."

More broadly, President Obama's move to open a window on the secret counterterrorism program takes place against a background of escalating jihadist violence that can be called up by a list of cities

that includes Paris; San Bernardino, Calif.; Brussels; Orlando, Fla.; Kabul, Afghanistan; Istanbul; Baghdad; and now Dhaka, Bangladesh.

Apart from the dispute over the number of civilian deaths, the notion that targeted drone strikes are an adequate answer to the terrorist threat appears increasingly threadbare.

"There's a massive failure of strategy," said Akbar S. Ahmed, a former Pakistani diplomat and the chairman of Islamic studies at American University in Washington. Drones have simply become one more element of the violence in countries like Pakistan and Yemen, not a way to reduce violence, he said.

Among young people attracted to jihadist ideology, "the line to blow yourself up remains horrifyingly long," he said. "That line should be getting shorter."

A senior Obama administration official, who spoke on the condition of anonymity to discuss the classified program, said the recent series of major terror attacks in urban areas had all been directed or inspired by the Islamic State.

The classified counterterrorism drone campaign, he said, has targeted other groups, notably Al Qaeda's old core in Pakistan, its branch in Yemen and the Shabab in Somalia. No attack in the West in the past year has been traced to those groups, suggesting that the strikes have been effective, he said. The drone strikes in Iraq, Syria and Afghanistan are, for the most part, carried out by the military in a separate program.

In Friday's release, the White House made public an executive order laying out policies to minimize civilian casualties in counterterrorism strikes and a plan to start making public the basic statistics on strikes each year.

At the same time, the Office of the Director of National Intelligence released the first official estimates of those killed during Mr. Obama's presidency in strikes outside the conventional wars in Iraq, Syria and Afghanistan. Though the announcement did not say so, the classified strikes took place in Libya, Pakistan, Somalia and Yemen, and the vast majority used missiles fired from unmanned drone aircraft, though a few used piloted jets or cruise missiles fired from the sea.

Since 2009, the government said, 473 strikes had killed between 2,372 and 2,581 combatants. They are defined as members of groups, like Al Qaeda and the Taliban, that are considered to be at war with the United States, or others posing a "continuing and imminent threat" to Americans.

In the most sharply debated statistics, the statement estimated that between 64 and 116 noncombatants had been killed. Officials said those numbers included both clearly innocent civilians and others for whom there was insufficient evidence to be sure they were combatants.

The numbers were far lower than previous estimates from the three independent organizations that track strikes based on news reports and other sources. The Long War Journal, whose estimates are lowest, counted 207 civilian deaths in Pakistan and Yemen alone. The security policy group New America

in Washington estimated a minimum of 216 in those two countries, and the London-based Bureau of Investigative Journalism estimated the civilian toll under Mr. Obama between 380 and 801.

With no breakdown by year or country, let alone a detailed strike-by-strike account, the Obama administration's new data was difficult to assess. For example, according to multiple studies by Human Rights Watch, Yemen's Parliament and others, an American cruise missile strike in Yemen on Dec. 17, 2009, killed 41 civilians, including 22 children and a dozen women. At least three more people were killed later after handling unexploded cluster munitions left from the strike.

If those 41 are included in the new official count, as appears likely, that would leave only 23 civilians killed in all other strikes since 2009 to reach the low-end American estimate of 64. By nearly all independent accounts, that number is implausibly low. Obama administration officials declined over the weekend to discuss any specific strikes or otherwise elaborate on the statistics.

Scott F. Murray, who retired from the Air Force as a colonel after 29 years, was a career intelligence officer involved in overseeing airstrikes in Iraq, Afghanistan and Syria. He said that while he had not been involved directly in the counterterrorist strikes outside those war zones, the civilian death estimates were "lower than I would have expected."

He said civilian deaths could result from multiple causes, including incomplete intelligence about the identities of people on the ground, equipment failure and human error.

Perhaps most often, Mr. Murray said, problems arise when civilians enter a target area before drone surveillance begins, or when a civilian suddenly enters the strike zone just before a strike.

"The night you choose to strike, it may be that the in- laws arrived earlier in the day or the children's birthday party is ongoing and you weren't watching when everyone arrived," Mr. Murray said. "Those are the things in war that drive you to drink. You never ever have perfect information."

Brandon Bryant, who worked on Air Force drone teams from 2006 to 2011 and has become an outspoken critic of the program, recalled one strike in 2007 targeting a local Taliban commander. As the Hellfire missile sped toward the small house, he said, a small child -- possibly frightened by the missile's sonic boom -- ran into the house and was killed.

"Those things are burned into my brain -- I can't really forget them," Mr. Bryant said. He added that he believed total civilian deaths were much higher than the administration's estimate because of officials' wishful thinking, rather than deliberate deception. "They're just deluding themselves about the impact," he said.

The senior administration official acknowledged the fear and frustration produced by the recent urban attacks and said Mr. Obama's strategy went far beyond drone strikes, incorporating the military battle against the Islamic State in Iraq and Syria, counter-messaging against jihadist groups, and support for allies facing the same enemies as the United States.

American officials strongly defend the necessity of targeted killing, and the president's executive order suggests that he believes the drone program will endure far beyond his presidency. But deaths from terrorism have risen sharply since 2011, according to the Global Terrorism Index, compiled annually by researchers, and there is worry inside and outside the government that the United States and its allies are winning battles but losing the ideological war.

Of particular concern is the possibility that the rash of attacks carried out in the name of the Islamic State is just the beginning -- not because the group is getting stronger but because it is getting weaker. As the United States and its allies uproot the Islamic State in Syria and Iraq, its supporters may turn to terrorism wherever they are, many terrorism experts believe. In most of those places, like the cities hit hardest in recent months, no drone strikes will be possible.

Cyber firm cautions mobile users against 'rogue' apps

Monday, 04 July 2016

Byline: Yuthika Bhargava

New Delhi - Cyber criminals are now turning to application stores, traditionally considered a safe destination for downloading mobile apps, to plant malware in phones.

Recently, cyber security solutions provider Symantec had detected an application on Google Play Store -- Beaver Gang Counter -- that masquerades as a score keeping app for a popular card game. However in reality, once installed on the device, this application secretly starts searching media files related to Viber. Once it finds them, it sends them to a remote server.

While applications are mostly verified before being published on the official Android store, some manage to slip past the store's upfront security checks.

"Viber is an extremely popular social media app with over 500 million installs on Google Play alone. The data stolen by the malware could be used for a number of nefarious purposes such as identity theft, blackmail, fraud, or pornography," Symantec said in a blogpost.

Symantec had alerted Google about this issue and in response they removed this app and developer from Google Play Store.

The discovery of this app, it added, demonstrated that having photos stolen from devices is also a risk Android users needed to be aware of. Some time ago, private photographs of some celebrities were leaked online, with reports suggesting that the attackers gained access to their Apple iCloud accounts.

"Mobile devices connect us to the world, storing our most personal and valuable information in digital form. However, this freedom complicates our security, and in fact mobile apps may present significant challenges to protecting our privacy. It might surprise you to learn that most threats to sensitive information on mobile devices are hidden in plain sight -- in apps," Ritesh Chopra, Country Manager, India, Norton by Symantec, said.

He added that many apps accessed or shared private, sensitive data without the users' knowledge or full understanding. Norton researchers recently found that globally, of the 10.8 million apps analysed by them, almost 3.3 million were classified as malware, a 230 per cent increase from 2014.

The study suggested that close to 40 per cent respondents granted permission to access their camera, bookmarks and browser history in exchange for free apps. "Thus, while apps are fun, boost your productivity and make your life easier, certain "rogue" apps can carry significant risks," Mr. Chopra added.

Meanwhile, a Google spokesperson said: "While we don't comment on specific apps, we can confirm that our policies are designed to provide a great experience for users and developers. That's why we remove apps from Google Play that violate those policies."

To stay protected from such mobile threats, Symantec recommends that users refrain from downloading apps from unfamiliar sites and install apps only from trusted sources. Besides, close attention should be paid to the permissions that apps request.

Users should avoid apps with a poor or non-existent reputation and any app that no one knows about should not be trusted. It is also important that mobile software, including anti-viruses are kept updated.

Earlier, Symantec had also found a bug in a popular local food and restaurant recommendation site Burrp, which ultimately allowed cyber criminals to take over users' system to encrypt files and later demand ransom to decrypt the same files. Most of the users who have been impacted by this attack are based in the U.S. and India.

Why the UAE needs more cyber-savvy people

Monday, 04 July 2016

Byline: Mariam M. Al Serkal

Dubai - UAE residents have to be more cyber-savvy when it comes to protecting their privacy online, recent research has revealed.

In a study carried out by Kaspersky Lab, experts discovered that while some UAE residents use extreme, but inadequate methods, the statistics show that other Internet users do not take the right precautions in protecting their information online. Some of these extreme methods even include hiding their devices from prying eyes.

David Emm, Principal Security Researcher from Kaspersky Lab said: "These findings demonstrate two extremes - one the one hand there are people who think they can keep their data safe by, for example, hiding their computers; but on the other hand there are still those who are simply not taking the necessary precautions online."

The research found that 25 per cent of Internet users in the UAE covered up their webcam, in an attempt to protect their privacy. Useful in itself, it is important to recognise that covering a webcam cannot prevent audio interception and protect users from being heard to by hackers or malicious groups.

"People need to become more cyber-savvy - with today's security solutions it's possible to protect yourself from cyberthreats, without having to go to the extreme lengths of hiding a computer," said Emm.

In addition, 17 per cent of those surveyed admitted that they try to avoid using popular websites like Google and Facebook because of the personal information they gather, despite the fact that it is normal practice for almost all websites to track users and collect some user data today.

Furthermore, only 23 per cent of Internet users in the UAE said they feel targeted online, and 23 per cent said that they do not think a security solution is necessary - raising questions about their online awareness and ability to protect themselves from harm.

Up to 31 per cent of people also said they tend to store sensitive data on devices that have no Internet access, mistakenly thinking that this will guarantee the protection of their data.

However, although this theory is grounded in logic, and is essential for securing backup data from the effects of a ransomware attack, even without an Internet connection it is possible for a device to be infected via a connected smartphone or USB stick.

What does the future of terrorists on Twitter, Facebook look like?

Monday, 04 July 2016

Byline: Yonah Jeremy Bob

Jerusalem - Social media services like Facebook and Twitter have been immune to lawsuits for incitement and the negative impact of terrorists using their services until now.

With Public Security Minister Gilad Erdan attacking social media more aggressively than ever and Facebook responding more directly than ever on Sunday - is that about to completely change? Maybe.

But the road ahead is unclear and even with some new strategies, it will be like navigating a legal minefield of defenses that can insulate the platforms from any liability.

Until now it has been a bit quieter for Twitter in the legal sphere, certainly as compared to Facebook, and even more so compared to Facebook regarding terror in Israel. Facebook has already been in the legal crosshairs, but Twitter less so.

On October 26, 20,000 Israelis, through the NGO Shurat Hadin, sued Facebook in New York state court alleging that the social media platform is intentionally disregarding the widespread incitement and calls for murder of Jews being posted on its web pages by Palestinians.

A 76 page list of plaintiffs contended that "Facebook's refusal to remove the flood of extremist videos, statements and cartoons being posted by Palestinians is encouraging imminent violence and fanning the flames of the terrorist attacks that have overwhelmed Israel in the past month," demanding it self-monitor and block incitement against Israel.

Originally and until he died from his wounds, the lead plaintiff was Israeli-American Richard Lankin, who was a passenger on a Jerusalem bus on October 13 when Palestinian terrorists from East Jerusalem,

The plaintiffs, who other than Lankin and a small number of other Israeli-Americans already actually hurt, had a debatable chance to sue from the start since they have not yet been harmed and are not citizens.

The complaint acknowledged that Facebook has established some rules concerning the content it will prohibit, but then alleges these are not sufficient to block the incitement to violence nor adequately enforced by the company.

Also, the complaint recognizes that "Facebook has taken down some of the most extreme calls to murder," but again complains that this was "only after they were reported by Israelis." That particular lawsuit did not go after Twitter, but it is noteworthy that in February, the social media platform said it had suspended 125,000 terror-related accounts over several months.

The plaintiffs argue that Facebook is "far from a neutral or passive social media platform and cannot claim it is a mere bulletin board for other parties' postings."

They note that Facebook "utilizes sophisticated algorithms to serve personalized ads, monitor users' activities and connect them to potential friends" and claims it "has the ability to monitor and block postings by extremists and terrorists urging violence just as it restricts pornography."

The complaint seeks to overturn past precedent protecting internet service companies from liability for third party postings, claiming that the way Facebook operates, intentionally or not, it functionally has an active involvement in the users' pages.

Shurat Hadin's Facebook lawsuit always had an uphill battle as Facebook has beaten a wide range of lawsuits (most not even related to Israel) against it dating back to at least 2009, using the US Communications Decency Act (CDA) of 1996 to insulate it as an interactive-computer-service provider from liability for speech by third-party users of its services.

What all of that means is that publishers of content get to decide whether to publish content, so it is fair to hold them accountable for that content.

Facebook's unbeatable defense has been that both it and the online message boards which preceded it, are just conduits without knowledge of what content is being posted. It says this should also free them for liability of the posting and for responsibility to remove content, certainly at least until it has been informed by others of a violation of its rules.

Originally, Shurat Hadin hoped and still hopes that it could overcome this defense by arguing Facebook is a more dangerous tool for terrorists than was previously known and that it has greater abilities to detect and remove terror content than it has admitted.

This would mean essentially telling courts that even if Facebook was seen as the same as message boards until now, that it is now used by terrorists in a much more threatening way and should be put in a unique category.

Second, they hoped to argue that Facebook's advances in algorithms and society's better understanding of these algorithms show that it actually has the ability to find and remove terrorists' posts. This would contradict what was believed to be limitations on its abilities or the abilities of message board providers and again be an opening for holding Facebook liable even if it and message boards were insulated from liability in the past.

But this was only the beginning of lawyers analyzing how social media works and where it could be vulnerable to lawsuits to pressure it to cut-off terrorists from using their services.

At the beginning, the focus by advocates trying to fight anti-Israel terrorists (as opposed to ISIS which by far has the largest terror presence on the web) use of social media was Facebook and not Twitter for a few reasons.

First Facebook is used more than Twitter for posting videos and for larger and longer posts, so the terror incitement on Facebook broke through into the public's consciousness far more. Videos are less common on Twitter and posts are limited to 140 characters.

Observers have said this was particularly true in Israel and with the Palestinians where Facebook is used far more by the general public, and Twitter is used by a much smaller group of journalists and public officials. While no study has been done, some believe that Facebook being the typical tool of average

Israelis and Palestinians, as opposed to Twitter, is even more pronounced in this region than it is in the US where a greater number of average people use Twitter.

But then Tamara Fields, wife of a private American military contractor killed by a terrorist in Jordan in November, Reynaldo Gonzalez, father of Nohemi Gonzalez, who was murdered by ISIS terrorists in Paris in November and Shurat Hadin made a discovery, or connected some new dots.

They asked: what if social media is not looked at merely as a general tool for incitement by posting videos? What if it is looked at as giving "material support" to terrorists under the US Anti-Terrorism Act?

Using this concept, if banks could be sued in the US merely for being conduits of terrorists funds, even without being involved in terror themselves, social media providers could be sued as conduits for transmitting messages for using both Facebook and also Twitter for allowing networking, recruiting and publishing newsletters from Hamas' and other groups' Twitter accounts.

Once this approach was taken, it was apparent that Twitter could be included as violating the US's ATA and maybe both Twitter and Facebook could be beaten in court with the argument that defenses in the past under the CDA were only meant to protect from general incitement lawsuits, not from more serious ATA terrorism claims.

Put differently, Shurat Hadin asked itself, if Hamas agents cannot open a bank account or physically enter the US because it is a terrorist group, why should it be able to use social media services of US-based companies like Facebook and Twitter?

The first to sue was Fields in January in in a US federal court in Northern California, with her case recently being dismissed. Gonzalez sued on June 14 also in California.

Shurat Hadin is planning to file its own Twitter lawsuit on behalf of the families of Taylor Force, a former US military veteran murdered during a terrorist stabbing spree in Jaffo in March, and others in the very near future.

It says it is filing a few weeks after the other lawsuit to seek a more favorable jurisdiction than California, seen as too friendly to Silicon Valley, and to more fully address some of the potential legal defenses Twitter may attempt.

The ATA idea may have a better chance of working to get around the CDA law which has insulated Facebook and Twitter from incitement lawsuits, especially because there has been a conceptual jump to view the social media platforms not merely as message boards for terrorists, but as providing concrete material logistical support.

On the other hand, there are a variety of debates going on in Israel, the US and elsewhere about passing new legislation to hold Facebook and Twitter to a greater level of accountability or to build cyberspace back-doors for the government to enter to hunt down terrorist activity.

The fact that they are only debates and have not yet become new laws suggests that the CDA may still be an absolute defense against lawsuits until a new law actually passes.

Moreover, whereas a new law sponsored by Justice Minister Ayelet Shaked and Public Security Minister Gilad Erdan targets the social media platforms and may have a real chance of passing, support for legislation in the US is nowhere near the level needed for anything big to happen in the near future.

This means that the current lawsuits may raise public pressure on Facebook and Twitter, but even with their new approach, their chances of success are low without new legislation.

13. Gulf News

Mideast oil and gas sector faces wider cyberattacks

Monday, 04 July 2016

Byline: Naushad K. Cherrayil

Dubai - Concerns about cybersecurity are particularly high within the oil and gas industry, which faces a far wider spectrum of threats that are potentially more severe in comparison to other key industries.

According to Repository of Industrial Security Incidents (RISI) data, cyberattacks against oil and gas organisations in the Middle East make up more than half of the recorded instances. In parallel, in the US or other Western countries, they make up less than 30 per cent of the recorded instances.

Katharina Rick, partner and managing director at Boston Consulting Group (BCG), said that the rate of cyberattacks targeting companies in the regional oil and gas sector is notably high, especially compared to global figures.

In recent years, there has been a growing prevalence of cyberattacks in the region.

Cybersecurity firm Symantec reported that Trojan Laziok, an aggressive malware program, had attempted to steal data from energy companies around the world, some based in the Middle East last year. Remarkably, 25 per cent of the attempted cyberattacks targeted companies in the UAE versus 10 per cent in both Saudi Arabia and Kuwait and five per cent in both Oman and Qatar.

The dangers posed by large-scale threats are significant, given the physically expansive infrastructure of oil and gas production and distribution. For instance, the ramifications of a successful cyberattack on an oil and gas company in the Middle East could carry grave implications on national security. In most countries in the region, the oil and gas sector is the main source of income for the government and accounts for 60 to 70 per cent of fiscal spending resources.

This, of course, raises three pivotal questions -- Why are oil and gas companies in the Middle East more vulnerable to attacks? How can organisations that have fallen victim to cyberattacks ensure a quick recovery? And what can they do to fend off future attackers?

The reality is, she said that in recent years, companies in the region have invested heavily in newer IT infrastructure and solutions -- including multiple mobile devices connected to the oil and gas companies' networks.

According to Jebin George, senior research analyst at research firm International Data Corporation, IT spending by Middle East oil and gas sector is expected to grow to $1.83 billion in 2016 compared to $1.77 billion in 2015.

"Given their widespread popularity and ability to store sensitive or confidential data, mobile devices are increasingly turning into an open frontier for cyberattacks. In the Middle East and Africa, the situation is especially dire considering the region's high mobile phone penetration rates," Rick said.

Independent market research company eMarketer predicts that over 789 million people in the Middle East and Africa will own at least one mobile phone in 2019 -- and it is fair to assume that they will be bringing their device to work.

"In this day and age, inadequate boundary protection is a strong point of vulnerability. It can make it difficult to detect nefarious activity and can create avenues that allow outside parties to interface with systems and devices that directly support a company's control processes. It can also provide an easy access route to industrial control systems -- as most communication protocols for measuring and control devices are not as well encrypted as those for business communication systems," she said.

Another critical point of vulnerability is information flow enforcement. If false data is fed into the system or information is "siphoned off", most companies would likely never know that for a fact -- it could even go completely undetected. There is wide speculation that the colossal malware attack on oil giant Saudi Aramco's systems in 2012 was actually a cover-up for earlier information flow breaches.

"Insufficient control of information flows can allow attackers to establish unsanctioned and damaging commands and controls with potentially severe consequences for the physical infrastructure, the value of national assets and personal safety and health," Rick said.

The potential points of attack are plenty. Transactions in the oil and gas arena are broad in scope and range from sensitive information on well sites to end-user consumption at the pumps.

She said that governments in the region, including those of Saudi Arabia and Qatar, have crafted multi-phased national cyber security strategies and developed related policies and frameworks, focusing specific attention on critical infrastructure and national interests.

Users warned of ransomware attacks

Monday, 04 July 2016

Byline: Abdul Basit

Dubai - There is no silver bullet when it comes to ransomware protection and it can only be tackled by a holistic, multi-layered approach, according to security solution provider Trend Micro.

Ransomware is a type of malware that prevents or limits users from accessing their system, either by locking the system's screen or by locking the users' files unless a ransom is paid.

Ransomware attacks have increased manifold during the past year. No one is immune to it, neither big nor small businesses. Even home users are not spared.

Trend Micro has blocked more than 100 million ransomware threats for their customers in the past six months alone, with 99 per cent of threats blocked from email and web traffic. Recognising the growth and impact of ransomware, the company has taken a holistic approach to defend customers against ransomware.

"Trend Micro is assessing the threat of ransomware and acting to protect against it," Trend Micro CEO Eva Chen said.

Trend Micro says ransomware readiness assessment helps businesses of all sizes understand vulnerabilities in their security posture and provides action that can be taken.

Ransomware removal tools help both consumers and businesses that have been impacted by ransomware to recover data.

"We understand this pervasive form of cyberattack can be debilitating to enterprises, regardless of size or industry, and can cause grave amounts of stress and costs to consumers. Trend Micro business and consumer products have been tuned to deliver the best protection against ransomware. Our ransomware recovery tools and phone hotlines leverage the threat expertise within Trend Micro to deliver always-on support and help customers to prepare for the possibility of an attack, or quickly if they've already been hit," Chen explained.

Trend Micro delivers enhanced visibility of how ransomware impacts an organisation - identifying ransomware delivered through email, malicious URLs, a network breach or server compromise. This enables incidents to be investigated and resolved more rapidly, and enables ransomware trends to be tracked over time so that an organisation's overall security posture can be improved.

"Trend Micro is offering stronger solutions to combat ransomware," said John Dickson, director of IT infrastructure, RNDC. "Offering an all-inclusive solution and custom hotline to any enterprise customer

or consumer dealing with ransomware along with upgrades to existing products will help further protect customers in this digital age."

Doug Cahill, senior analyst covering cybersecurity at ESG, said: "The bottom line is that it's more important than ever to have a multi-layered approach for enterprise security."

Cahill added: "Trend Micro offers a set of security controls to protect enterprises from ransomware, providing the visibility required to understand how they are being impacted and how they can respond to improve their security posture. Their knowledge of the complexity and sophistication of ransomware brings a level of expertise that helps organisations mitigate the risk associated with this threat."

Warning to online news sites on social media sources

Tuesday, 05 July 2016

The powerful internet censorship body has further tightened its grip on online news reports by warning all news or social network websites against publishing news without proper verification, according to state media reports.

The instruction, issued by the Cyberspace Administration of China, came only a few days after Xu Lin, formerly the deputy head of the organisation, replaced his boss, Lu Wei, as the top gatekeeper of internet affairs.No website is allowed to report public news without specifying the sources, or report news that quotes untrue originsCyberspace Administration of China.

Xu is seen as a key supporter of President Xi Jinping.

The cyberspace watchdog said online media could not report any news taken from social media websites without approval.

"All websites should bear the key responsibility to further streamline the course of reporting and publishing of news, and set up a sound internal monitoring mechanism among all mobile news portals [and] Weibo or WeChat," Xinhua reported the directive as saying.

"It is forbidden to use hearsay to create news or use conjecture and imagination to distort the facts," it said.

The report said a number of news portals, including 163.com, Sina.com, Qq.com, Ifeng.com and Caijing.com.cn had been punished and given warnings for fabricating news before distributing it, the report said, without giving any details about the penalty.

The government already exercises widespread controls over the internet, including blocking popular foreign websites such as Google and Facebook.

It says the measures are needed to ensure security in the face of rising threats, such as terrorism, and also to stop the spread of damaging rumours.

2. Washington Free Beacon

Obama's Green Policies Threaten America's Energy Security

Tuesday, 05 July 2016

Byline: Bill Gertz

Washington - The threat of a devastating cyber attack on the U.S. electrical grid is increasing due to the Obama administration's politically correct policies that spend vast sums on green and smart grid technologies while failing to secure power grids from cyber attack.

A report by the Manhattan Institute, a New York think tank, warns that the push to integrate wind and solar electrical power into the $6 trillion electric utility system has created new vulnerabilities that other nations could exploit in a future cyber war.

"Electric grids have always been vulnerable to natural hazards and malicious physical attacks," writes Mark Mills, a physicist and engineer who authored the Manhattan Institute report. "Now the U.S. faces a new risk- -cyber attacks--that could threaten public safety and greatly disrupt daily life."

The U.S. electrical power network is not made up of a single grid, but a complex web of eight regional "supergrids" linked to thousands of local grids. Under a drive for improved efficiency, government policymakers and regulators in recent years have spent tens of billions of dollars on so- called "smart grid" technology. But the efficiency drive has not been matched with new technology that will secure grids against cyber attacks.

Utility owners also have resisted improving cyber security over concerns doing so would increase operating costs and force unpopular rate hikes. Yet the failure to take steps now to deal with future threats could prove catastrophic.

The threat, according to the report, is not the current state of security but the future use of greener and smarter electric grids, interconnected and linked to the Internet. "These greener, smarter grids will involve a vast expansion of the Internet of Things that greatly increases the cyber attack surface available to malicious hackers and hostile nation-state entities," the report warns, adding that cyber attacks overall have risen 60 percent annually over the past six years and increasingly include the targeting of electric utilities.

A recent survey by Cisco Systems revealed that 70 percent of electric utility security managers suffered at least one security breach.

Unfortunately, Obama's liberal agenda forced government policymakers and regulators to promote green and smart grid technologies while spending relatively trivial amounts to secure those grids from cyber attacks.

"Greater grid cyber security in the future means that policymakers must rethink the deployment of green and smart grids until there are assurances that security technologies have caught up," the report recommends.

Part of the problem for grid security is that power networks are controlled by the private sector utilities. Government can and must provide intelligence and warning of cyber threats. But grid security is the

responsibility of industry and there is an urgent need for the private sector to do more to defend the country from a future devastating blackout.

Further, the government and electric companies appear to be playing down the danger, claiming cyber attacks are less likely than squirrels eating electrical cables, or tree limbs shorting out wires.

This attitude was reflected in a controversial Department of Homeland Security Report produced in January that concluded the threat of a damaging or disruptive cyber attack on the electric infrastructure was low. The study was an embarrassing reminder that the federal government is ill-prepared for future dangers. A month before the DHS report, Russian hackers took down portions of Ukraine's power grid in what has been called the first known cyber attack on an electricity infrastructure.

The problem of grid security has been made worse by the past seven years of administration policies that subordinated building up security against cyber attacks to integrating environmental technologies. The liberal worldview mistakenly has placed climate change as a greater national security threat than future cyber attacks from nation states.

According to the Manhattan report, wind and solar power will be unable to meet the country's 24/7 energy demands for the foreseeable future. Yet programs to develop these energy sources received over 75 percent of all new generating capacity, with some $150 billion invested by the federal government on green and smart grid programs. By contrast, the Energy Department spent $150 million on cyber security research and development.

Blackouts have occurred in the past, mainly after hurricanes. One non-natural disaster was the August 2003 blackout that affected New York City and the Northeast. That power outage put 50 million people in the dark for two days, and caused $6 billion in damage. The cause was a combination of a software glitch and human error that resulted in a localized power outage in Ohio cascading into a widespread regional power disruption.

According to the Manhattan Institute study, Lloyd's estimates that the damage from a worst-case cyber attack that causes a widespread blackout would cost between $250 billion and $1 trillion.

The coming danger will involve sophisticated nation state cyber attacks. U.S. Cyber Command chief Adm. Mike Rogers announced in March that it is a matter of "when, not if" a foreign power will attack critical U.S. infrastructures.

Peter Pry, a former CIA officer and grid security advocate, says the report correctly identified the contradiction between Obama administration's green agenda and the need to protect the nation's energy security.

"The 'war on coal' and other hydrocarbon sources of energy, and the Obama administration's environmental obstacles to development of nuclear power, is making the nation less safe," said Pry, executive director of the Task Force on National and Homeland Security.

Coal-fired electric plants and potentially nuclear power provide the country with the most resilient source of electric power. But the administration's push to phase them out and replace them with wind and solar energy generation is not only technologically unrealistic. It will reduce national electrical supplies at a time when demand is increasing sharply.

The result will be both increase costs for electric power and increase risks to national survival in the aftermath a major cyber attack.

"The increased risks to the national electric grid and national security by Obama's green agenda, driven by the alleged threat from climate change, is even more true for greater threats to the grid posed by natural and manmade electromagnetic pulse (EMP)," Pry said. "These threats and cyber are here and now, while climate change--if this scientifically dubious threat occurs at all--is in the future."

Mills, the Manhattan Institute researcher, told the Washington Free Beacon that cyber security "is the existential challenge of the Internet, but so far mainly about private info and financial data."

"Meanwhile, the so-called smarter grid and green power both require a vast increase of Internet connectivity bolted onto our electrical grids," he said. "What in the world makes green pundits think that rapidly expanding and exposing our critical grid infrastructure to the Internet is a good idea to rush into?"

Drone kills 30 Taliban, IS militants in Nangarhar

Tuesday, 05 July 2016

Byline: Zeerak Fahim

Jalalabad - Drone strikes killed 30 Islamic State and Taliban militants, including two key commanders, and injured another three Taliban fighters in eastern Nangarhar province, officials said on Monday.

Nangarhar police spokesman Hazrat Hussain Mashriqiwal told Pajhowk Afghan News the drone strikes took place last night in Achin, Momand Dara and Khogyani districts.

A Daesh commander named Sajid was among 19 others killed in the strikes in Achin's Pekha area, he said, adding the dead included some Pakistani rebels. He said Sajid had been spearheading a 50-member armed group.

The governor's spokesman, Attaullah Khogyani, said Sajid was a resident of Pakistan's Orakzai tribal region and he led the latest attacks in Kot district. He said dead included Sajid's nephew as well.

Sher Aqa Faqiri, the 201 Selab Military Corps spokesman, said the drone targeted hideouts of Daesh militants and destroyed their weapons and ammunition.

Officials said a Taliban commander Sabir Kuchi was killed along with nearly a dozen fighters in a drone strike in the Khogyani district. Another three were injured, they said.

Mashriqiwal said commander Sabir Kuchi was living in Kot district and he was considered among key Taliban commanders. Sabir had been involved in a series attacks, he said.

A resident of Khogyani district, Obaidullah, said Sabir Kuchi was travelling in a convoy of vehicles with his fighters when came under attack from the air. He said it was being rumoured that Sabir had been killed in the attack.

Montreal man charged with posting hate messages on social media, threatening Justin Trudeau

Tuesday, 05 July 2016

Byline: Paul Cherry

Montreal - A Verdun resident has been charged with posting hate messages on social media, while also uttering threats toward Prime Minister Justin Trudeau.

Jacques Roy, 47, appeared before a Quebec Court judge on Saturday after he turned himself in to the Montreal police on June 30, said Montreal police spokesperson Constable Jean-Pierre Brabant. Roy was released after agreeing to follow a series of conditions, and his case is scheduled to return to court on Oct. 3.

Brabant said the investigation began on March 26 after someone contacted the Montreal police and reported statements they had read on a social media page. The police investigated and found statements that were hateful toward Muslims, Islam and people from Syria. The author of the statements included Trudeau in some of what he posted, Brabant said.

An arrest warrant was issued on June 16 and the Montreal police were able to contact Roy for the first time last week. He agreed to turn himself in, with a lawyer, and was detained before he appeared in court.

The arrest warrant was made public at the Montreal courthouse over the weekend. In the warrant, Roy is accused of "encouraging hatred against an identifiable group." The charges are based on statements Roy allegedly made between Feb. 1 and March 26, in a manner "other than a private conversation." He is also accused of criminal harassment and uttering a threat toward Trudeau and "a member of his family" within the same time frame.

In February 2013, Roy was charged with assaulting a police officer. The charged was placed under a stay of proceedings the day after it was filed. On that same date, Roy pleaded guilty to willfully obstructing police in the execution of their duty. He was sentenced to one year of probation. Later on, in November 2013, Roy pleaded guilty to drug possession, and his sentence involved an unconditional discharge.

Companies must 'take the fight to the criminals' to tackle cybercrime

Tuesday, 05 July 2016

Byline: Rob Davies

London - British firms must "take the fight to the criminals" to prevent a rising tide of cyber-attacks by sophisticated organised crime gangs, according to a report.

In a joint report, telecoms group BT and consulting firm KPMG called on companies to address the "industrialisation of cybercrime", warning against the danger of overplaying the more high- profile threat of lone hackers.

The report warns that today's cybercriminal often works for complex operations akin to businesses, with human resources divisions and budgets for research and development.

Some are so sophisticated that they are able to hijack senior executives' email accounts and fake correspondence to convince junior company employees to approve transactions. In one such case, the scam led to one company agreeing to pay out $18.5m (£13.9m) to criminals in the Asia-Pacific region, BT and KPMG said, without identifying the company.

Businesses must work with law enforcement against such operations, the report said, and should consider launching their own pre-emptive attacks against cybercrime networks.

Mark Hughes, chief executive of cybercrime at BT, said it was vital that companies "take the fight to the criminals". "The industry is now in an arms race with professional criminal gangs and state entities with sophisticated tradecraft," he said.

"The twenty-first century cybercriminal is a ruthless and efficient entrepreneur supported by a highly developed and rapidly evolving black market. Businesses need to not only defend against cyber- attacks but also disrupt the criminal organisations that launch those attacks."

But Hughes said the industry's efforts to tackle the problem are being hampered by a lack of graduates with the right skills to work in cyberdefence. BT has identified cybersecurity as a huge potential growth area, with revenues from its cybersecurity division increasing at more than 10% a year.

In April, the telecoms giant announced plans to hire 900 people for its already 2,500-strong security team to cope with growing demand.

The BT-KPMG report found that while 97% of firms have suffered a cyber-attack, only a fifth of technology chiefs at those firms felt well enough equipped to deal with organised cybercrime.

The skills deficit persists despite the importance of cybersecurity to major corporations being underlined by several high-profile security breaches.

Broadband and telecoms provider TalkTalk lost more than 100,000 customers and faced a bill of at least £60m in the wake of a cyber-attack last year that saw thousands of users' data harvested.

Ashley Madison - a US dating website aimed at people looking for extra-marital affairs - was hit by an attack that saw thousands of users' dating profiles leaked online.

Wikileaks publishes Clinton war emails

Tuesday, 05 July 2016

Byline: Tom Devaney

Washington - WikiLeaks on Monday published more than 1,000 emails from Hillary Clinton's private server during her time as secretary of State about the Iraq War.

The website tweeted a link to 1,258 emails that Clinton, now the presumptive Democratic presidential nominee sent and received. They stem from a trove of emails released by State Department in February.

WikiLeaks combed through the emails to find all the messages that reference the Iraq War.

The development comes after WikiLeaks founder Julian Assange said last month the website had gathered "enough evidence" for the FBI to indict Clinton.

"We could proceed to an indictment, but if Loretta Lynch is the head of the [Department of Justice] in the United States, she's not going to indict Hillary Clinton," Assange told London- based ITV. "That's not possible that could happen."

What's Next for the U.S. and China in Cybersecurity

Tuesday, 05 July 2016

Byline: Staff report

Interview - It took the threat of sanctions and a flurry of last- minute negotiations to get China to sit down for serious talks about cybersecurity with the U.S. Now comes the hard part.

Chinese President Xi Jinping's announcement last fall that Beijing would stop state sponsorship of hacking for commercial gain caught many by surprise. By multiplerecentaccounts, China has stayed true to its word. But in the area military types increasingly refer to as the "fifth domain" -- after land, sea, air and space -- of warfare, a cloud of questions large and tiny still loom over relations between the world's great powers

One emerging expert on the uncertain business of cyberpolitics is Carnegie Endowment for International Peace researcher Tim Maurer, who visited Beijing in late June to meet with Chinese cybersecurity scholars. China Real Time picked Mr. Maurer's brain on next steps for the U.S. and China, Beijing's ambitions for managing the internet and the cybersecurity threat that worries him the most. Here are excerpts edited for length and clarity:

WSJ: After the agreement between Obama and Xi, what's the next cybersecurity question for the U.S. and China?

Tim Maurer; Now that we have an agreement, there's a bigger strategic discussion that will continue to play out around the future of the internet and the issue of sovereignty. Topics like cloud storage and the role that multinational companies play still need to be resolved, and we still haven't seen a resolution to some of the security issues, like backdoors and other supply-chain integrity questions, that were raised by [NSA leaker Edward] Snowden and are a concern for both countries.

China's ?is big on this idea of Internet sovereignty-that national borders and national laws should extend into cyberspace. What does Beijing have to do to overcome political opposition in the U.S. and other countries and make that a reality?

There's a trade-off involved for the Chinese government, I think, between security and growth.China in and of itself is a huge market and is capable of satisfying a lot of Chinese companies. But? for global companies like Alibaba, Huawei and ZTE, ?the biggest growth opportunities are probably beyond China. This notion of technological sovereignty implies certain changes to the internet at several layers -- whether it's physical infrastructure, applications or control of content -- that will increase the cost of doing business globally ?through the internet. If you look at G20 economies, the internet actually accounts for a larger share of the economy in China than in the U.S.

WSJ: Where do the U.S. and China stand on question of establishing norms of behavior in cyberspace?

Maurer: There are disagreements over definitions of terms like "international wrongful act" and how norms will apply in a military context, but the major tension is over whether there should be a treaty. Russia and China are pushing for one. The U.S. and other Western governments are pushing for voluntary norms instead.

WSJ: Why not have a treaty? What do voluntary norms accomplish?

Maurer: There's been a gradual trend away from treaties and conventions the past few decades. One concern is that you undermine international law when you create treaties that are ineffective. That doesn't mean you can't have one, but there are lots of technical issues around issues like verification and enforcement. How do you determine when a violation has taken place, and how do you punish it? With voluntary norms, the idea is to to develop a standards of acceptable behavior that state actors will adhere to because it's in their self-interest to be a part of the community, to maintain access to shared information and resources.

WSJ: What will it take to get everyone to agree?

Maurer: There's already been significant progress in the last two or three years. Some people say there won't be much more progress until there's a major cyberattack. I think something else that might create movement is a growing threat from nonstate actors, like cybercriminals or terrorists, which is already happening.

WSJ: When you survey the variety of cybersecurity threats out there, what is the biggest concern you have?

Maurer: Probably the biggest concern is with the integrity of data. The vast majority of hacking incidents so far have been relatively unsophisticated stealing of data, which is the low-hanging fruit. In most instances, that's because defenses are so bad -- including at the government level. But now you're starting to see increasingly sophisticated malware, and there's a concern about hackers not just stealing data, but altering it

We haven't seen a lot of these attacks yet, but they are hard to detect and the potential damage is quite large, particularly in the financial sector. Electrical grids are confined to individual countries, but financial markets are highly interconnected. Imagine what would happen if people started losing faith in the integrity of financial data. It could have a domino effect. This is one area where we think there is potential for cooperation between states like the U.S., China and Russia.

8. Business In Vancouver

Canadian companies are woefully behind when it comes to cyber security

Monday, 04 July 2016

Byline: Albert Van Santvoort

Vancouver - A survey of 2,200 companies across 18 countries has found that Canadian companies are among the least equipped to deal with cyber threats.

The study ranks 18 countries based on the per cent of businesses that are adopters of effective modern cyber security procedures and technology. On a list of 18 countries Canada was number 15, ahead of only the Netherlands, Japan and the United Arab Emirates.

"We're moving from theft, which is costly, to potential catastrophe. There are forces at play now that aren't satisfied with just stealing your money, they want to destroy your entity. You can either start taking these threats seriously, or start looking for a hole to crawl into. Ignorance is no longer bliss," said Steve Duplessie, founder and senior analyst at the computer consulting firm Enterprise Strategy Group, in a press release.

The technology market research firm Vanson Bourne was contracted by the data storage company EMC (NYSE:EMC) to conduct the study. Vanson Bourne surveyed 100 Canadian companies and found that the majority of companies were "laggards" when it comes to adopting appropriate cyber security technologies.

Vanson Bourne found that 52% of Canadian companies surveyed had experienced unplanned system downtime sometime over the last 12 months. On average the unplanned downtime cost Canadian companies $414,000.

The survey also found that 34% of respondents suffered data loss in the last 12 months, which cost companies an average of $799,000.

Out of the instances of data loss or system down time 29% were a result of a security breach.

"I think CEOs themselves don't understand the ramifications of having little or no security on the cyber side. There was a recent study in the states that said 90% of CEOs don't seem to feel cyber security is their responsibility, and of course they're dead wrong," said Dale Jackaman, president of Vancouver-based Amuleta Computer Security.

According to Jackaman, Canada is "dead last" when it comes to cyber security in the western world. Jackaman, who originally started Amuleta as a cyber security firm to help businesses, had to change his entire business model because of a lack of demand from Canadian companies.

I Spy: GCHQ reaches out to Mumsnet generation in new recruitment drive

Monday, 04 July 2016

Byline: Staff report

Scarborough - The director of GCHQ has announced a multi-million pound investment to transform a Yorkshire base into the North of England's training hub as the spy agency looks to recruit more middle-aged women from the Mumsnet generation.

The £42m package was outlined yesterday by Robert Hannigan, the director of the UK's Government Communications Headquarters, on a visit to its base on the outskirts of Scarborough.

The base is to be the training and skills hub of the northern network of GCHQ, the intelligence and security organisation which monitors radio and signals communications and protects against a wide range of threats, from terrorism and cyber crime to child sex exploitation and hacking.

Along with MI5 and MI6, there will be an emphasis on recruiting more women, especially those who middle-aged and also mid-career, dubbed "Jane Bonds", and the organisation has used Mumsnet for that purpose.

Of the £42m that is being invested in the next four years, £30m will go towards the base's infrastructure - modernising and improving the current environment - and £12m to skills training.

The current staff of about 200 will also be "upskilled".

During yesterday's visit, Mr Hannigan opened the Alan Turing Training and Innovation Centre (the ATTIC), a transformation of some of the existing main block into bright, airy training rooms.

Earlier, 94-year-old Sister Pamela Hussey cut the ribbon on a new museum showcasing the base's proud history.

Sister Hussey, who signed up to be a Wren in 1942, was a station operative during the Second World War, and was part of the team who intercepted radio messages from German U-boats.

Scarborough's role was fundamental in the conflict - the sinking of the Bismarck was down to messages which had been picked up at the North Yorkshire listening base.

In front of an audience of current staff and 30 or so guests, including dignitaries and GCHQ veterans, Mr Hannigan said the Scarborough base, since its inception early last century, had been one of the "collection sites - the crown jewels of intelligence gathering". The amazing work it had done throughout the last century, in two world wars and the Cold War, was continuing.

"We will not be able to face the threats and conflicts without the right skills and talents," he said. "We need to redress the balance to 50-50 (only 35 per cent of employees are women).

"We need people with the right aptitude, attitude and passion."

The surveillance organisation is now broadening its reach away from just graduates and it is also looking to recruit young school leavers into apprenticeships.

The Scarborough base already runs cyber summer schools aimed at young people who have an interest in science and technology.

Of the upcoming intake, which starts on July 11, there are 18 men and 14 women, reflecting a greater emphasis on recruiting both sexes.

The ATTIC Centre is named after the Second World War codebreaker who, after ground-breaking work by Polish mathematicians, cracked the Enigma code which had been developed by the Germans.

A short walk away from the new centre, the new "Y" Museum houses an Enigma machine and several other artefacts.

Sister Hussey, a nun since shortly after the war who now lives in a community in Harrogate, recalled about working in the underground bunker above which the museum now stands.

She said: "There were rows and rows of tables, the Wrens at one end, the sailors at the other, all with headphones on for hours and hours - but they used to throw paper planes at us.

"It was deadly serious work, though ... work which the spy organisation is hoping today's women will take up, for the country's sake."

Chinese man gets prison for his role in hacking plot (Canada)

Thursday, 14 July 2016

Byline: Matt Hamilton

Los Angeles - A Chinese national was sentenced Wednesday to nearly four years in prison for plotting with Chinese military officers to hack computers belonging to U.S. defense contractors such as Boeing Co. and obtain trade secrets involving designs of American military aircraft.

In addition to the prison term, U.S. District Judge Christina A. Snyder ordered Su Bin, a 51-year-old man who is also known as Stephen Subin and Stephen Su, to pay a $10,000 fine.

Bin, who operated an aviation and aerospace company in Canada, pleaded guilty March 23 to a federal conspiracy charge of gaining unauthorized access to a protected computer.

He was arrested in British Columbia in 2014, and he waived extradition to the U.S. in February 2016.

Starting in 2008 and continuing until 2014, Bin informed military officers in China about what sites to hack and which files to steal, and he advised his co-conspirators on which information was significant, according to the U.S. attorney's office in Los Angeles.

Bin did not get any money from the scheme, but he admitted that he entered into the plot in order to profit.

One of the companies targeted in the conspiracy was Chicago-based Boeing, whose computer servers in Orange County stored detailed files on the C-17 military aircraft. Bin admitted that sensitive military information was accessed on the servers and sent to China, according to a plea agreement filed in the Central District of California.

Bin and his co-conspirators also handled data related to the F-22 and F-35 fighter jets, both made by Lockheed Martin Corp., according to court papers.

As part of the conspiracy, Bin reviewed files and translated a technical flight test plan from English into Chinese. He and his co-conspirators also drafted and sent reports summarizing the information and technology gained from the hacking effort.

Prosecutors contended that although Bin may not have actually hacked American companies, he showed his conspirators which ones to target and what to pilfer.

"Su Bin's sentence is a just punishment for his admitted role in a conspiracy with hackers from the People's Liberation Army Air Force to illegally access and steal sensitive U.S. military information," said John P. Carlin, the assistant attorney general for national security.

Defense attorney Robert J. Anello asked the judge to impose a 30-month sentence, arguing that the offense "was an aberration in a lifetime of generosity and kindness."

Anello also told the judge that Bin would be "permanently saddled with this conviction" and pointed out that such a conviction would hamper his future efforts at doing business.

The lawyer wrote: "He is sorry for his actions."

2. Wall Street Journal

Power Grid Left Exposed to Sabotage

Thursday, 14 July 2016

Byline: Rebecca Smith

New York - An early morning passerby phoned in a report of two people with flashlights prowling inside the fence of an electrical substation in Bakersfield, Calif. Utility workers from Pacific Gas & Electric Co. later found cut transformer wires.

The following night, someone slashed wires to alarms and critical equipment at the substation, which serves 16,700 customers. A guard surprised one intruder, who fled. Police never learned the identities or motive of the burglars.

The Bakersfield attacks last year were among dozens of break-ins examined by The Wall Street Journal that show how, despite federal orders to secure the power grid, tens of thousands of substations are still vulnerable to saboteurs.

The U.S. electric system is in danger of widespread blackouts lasting days, weeks or longer through the destruction of sensitive, hard-to- replace equipment. Yet records are so spotty that no government agency can offer an accurate tally of substation attacks, whether for vandalism, theft or more nefarious purposes.

Most substations are unmanned and often protected chiefly by chain-link fences. Many have no electronic security, leaving attacks unnoticed until after the damage is done. Even if there are security cameras, they often prove worthless. In some cases, alarms are simply ignored.

The vulnerability of substations was revealed in a Journal account of a 2013 attack on PG&E's Metcalf facility near San Jose, Calif. Gunmen knocked out 17 transformers that help power Silicon Valley; a blackout was narrowly averted. The assailants were never caught.

The following year, the Federal Energy Regulatory Commission, which regulates the country's interstate power system, began requiring that utilities better protect any substation that could disable parts of the U.S. grid if attacked.

FERC's new rule, however, doesn't extend to tens of thousands of smaller substations, including Metcalf and the one in Bakersfield. Security experts say a simultaneous attack on several of these substations also could destabilize the grid and cause widespread blackouts.

Gerry Cauley, head of the North American Electric Reliability Corp., -- which writes standards for the grid -- was asked at a FERC hearing in June on grid security what kept him up at night. He said the prospect of "eight or 10 vans going to different sites and blowing things up." Recovery from a coordinated attack, he said, could take weeks or months.

The Metcalf substation, while undergoing security upgrades, was hit again in August 2014. Intruders cut through fences and burglarized equipment containers, triggering at least 14 alarms over four hours. Utility employees didn't call police or alert guards, who were stationed at the site, according to a state inquiry.

Three days after the break-in, Stephanie Douglas, PG&E's senior director of corporate security, sent a memo to the utility's president saying security was in a fail mode, and her department lacked clout and resources: She had 26 full-time jobs to protect 900 substations, as well gas pipelines and other utility assets.

Ms. Douglas, no longer with PG&E, declined an interview request. PG&E spokesman Matt Nauman said the utility has responded with a $200-million program that includes better security equipment, more training and hiring.

The sprawling U.S. electric system is regulated by government but mostly owned and operated by utility companies and grid operators that monitor electricity supply and demand every minute, every day. The system is always on -- and for years few thought anyone would try to turn it off.

The motive of most substation break-ins appears to be theft. Intruders and, potentially, terrorists also could be trying to hack into control systems through computer equipment in substations -- either to cause immediate damageor to gather information for later use.

"A substation is not an obvious target for criminals like a bank," said Joseph Weiss, a security consultant to utilities. "Common sense says they want to get into the electric system."

The U.S. power grid is like a giant puzzle that can be configured in different ways to deliver power where and when it is needed.

Major power sources -- gas-fired generators and nuclear-power plants, for example -- connect to substations that raise voltages to ferry electricity long distance over a network of power lines. At cities and other destinations, substations lower the voltage to safely deliver electricity to homes and businesses. Substation computers help grid operators control those electrical flows.

The grid was cobbled together during the electrification of the U.S. over the past 125 years. It is a fragile, interdependent system generally more vulnerable in summer when it is running closer to its limits. It is also at risk during low-demand periods, when power-plant operators and linemen perform maintenance. Fewer plants and transmission lines operating mean fewer options for delivering electricity during emergencies.

There is so much variability in the grid that what causes a catastrophe one day might not the next, which makes security issues complex. Small problems can quickly spiral out of control.

On Sept. 8, 2011, equipment problems and human error caused a large transmission line in Arizona to trip out of service. The grid is supposed to withstand the loss of any one line. On this day, electric current shifted to nearby lines and overloaded them; that overtaxed transformers at two small substations, which shut down defensively to prevent equipment damage, and disruptions spread.

San Diego was blacked out 11 minutes later. Traffic snarled. Flights were canceled. Raw sewage flowed into the ocean. Altogether, 2.7 million utility customers lost power in California, Arizona and Mexico.

Federal officials have long known about the vulnerability of electrical substations. A 1990 report from the federal Office of Technology Assessment warned that "virtually any region would suffer major, extended blackouts if more than three key substations were destroyed."

A 2012 report from the National Research Council of the National Academies of Sciences looked at different parts of the electric system and concluded that substations were "the most vulnerable to terrorist attack."

"We've known we had an issue for a long time and have been very slow to do anything about it," said M. Granger Morgan, a professor of engineering at Carnegie Mellon University who studied the San Diego blackout.

Security adviser James Holler said his company, Abidance Consulting, inspected nearly 1,000 substations over the past year for utilities in 14 states. "At least half had nothing but a padlock on the gate," he said. "No cameras. No motion sensors or alarms."

One utility lost a set of substation keys that were in a truck stolen for a joy ride. After the truck and keys were recovered, Mr. Holler said, the utility didn't change the substation locks.

Richard Donohoe, director of security for the consulting firm Black & Veatch, said the security departments of utility companies are often so low in the pecking order that "the rest of the organization ignores them half the time."

After the attack on the Metcalf substation, FERC required better protection for individual substations "that if rendered inoperable or damaged could result in widespread instability," or cascading blackouts in any of the three separate sections of the U.S. power grid.

That is a high bar. Utility experts aren't sure how many substations the new rules cover but estimate it is fewer than 350 out of approximately 55,000. They say more protections are needed at smaller substations that could trigger blackouts if attacked in combination.

The exact combinations depend on energy demand and the direction of electricity flow. In spring, for example, hydroelectric power plants send electricity from the Pacific Northwest to California. In winter, electricity flows in the opposite direction, mostly from gas-fired and nuclear power plants in California and Arizona.

One security-focused nonprofit group called the Foundation for Resilient Societies has called for an analysis of the impact of simultaneous attacks, both physical and cyber.

Thomas Popik, chairman of the group, told FERC in June that existing grid protections were inadequate and his group believed the grid was "a battlefield of the future" that required military-type defenses for key infrastructure.

Michael Bardee, director of the Office of Electric Reliability at FERC, said the agency could do more to study security vulnerabilities at the thousands of substations not covered by the new rule. FERC expects a progress report on the new rule later this year.

"Clearly, there's some sense that as events go on we may need to re-evaluate the applicability of this standard," Mr. Bardee said, and possibly expand its reach.

The Vermont Electric Power Co. approved a $12 million program to beef up security at 55 locations after substations were penetrated more than a dozen times by thieves stealing copper during break-ins from 2012 through early 2014.

"We haven't seen a theft in over a year," said Kerrick Johnson, a spokesman. The utility installed more secure fencing and better security cameras.

Most utilities are reluctant to spend money on security unless under government orders. They must justify their expenses to regulatory agencies to pass on the costs to ratepayers, said John Kassakian, an emeritus professor of electrical engineering at the Massachusetts Institute of Technology.

Security upgrades generally include cameras, lights and motion sensors, as well as password- controlled doors and gates that electronically monitor entries and exits. Terror threats, Mr. Kassakian said, probably seem less pressing than spending to comply with federal environmental rules.

Utilities don't always report attacks despite a legal requirement to notify the Energy Department within six hours of any event that could interrupt electricity or if a break-in targets security systems.

No utility has been fined for failing to comply as far as he knew, said David Ortiz, deputy assistant secretary at the Energy Department: "I don't have an enforcement team."

The Journal found nine substation break-ins over the past two years where theft wasn't the apparent motive. The tally and details of the break-ins were gleaned from interviews and public records requests. The count included attacks affecting the federally owned Liberty substation in Buckeye, Ariz.

The substation, about 35 miles west of Phoenix, is a critical link in the southwest power corridor, delivering electricity to heat homes in northwestern states during winter and cool buildings in the southwest during summer.

On Nov. 5, 2013, someone slashed fiber-optic cables that serve Liberty, as well as the larger Mead substation near Hoover Dam. It took workers about two hours to re-establish proper communications and normal controls.

Liberty is operated by the Western Area Power Administration, which controls 17,000 miles of high-voltage power lines used by utilities serving 40 million people in 15 states. If this system suffered a catastrophic failure, it would take down other utilities with it, experts said.

Alarms signaling trouble at Liberty began ringing at a utility operations center inPhoenix 13 days after the communications outage. Dozens of alarms sounded over two days before an electrician was dispatched.

The electrician expected a false alarm. Instead, he found the perimeter fence sliced open and the steel door to the control building "peeled back like a sardine can," said Keith Cloud, the utility's head of security.

The substation's computer cabinets were pried open. The substation's security cameras proved useless: eight of 10 were broken or pointed at the sky, Mr. Cloud said. Most had been out of operation for a year or more.

Two months later, on Jan. 30, 2014, Liberty was hit again. Two men with a satchel cut the gate lock and headed to the control building. They left after trying, unsuccessfully, to cut power to a security trailer outfitted with cameras and blinking lights, which were installed after the first break-in.

This time, Mr. Cloud said, utility officials found 16 of 18 security cameras had failed. Most were installed after the first break-in and hadn't been properly programmed. Investigators retrieved a single fuzzy video from a thermal-imaging camera.

Mark Gabriel, WAPA's administrator, said the utility has "taken steps to improve our physical security program and processes," including creating the security department in 2013 that Mr. Cloud now heads.

A federal audit faulted WAPA in April for violations of security regulations, including broken or obsolete equipment, lax control over keys to critical substations and failure to install intrusion-detection systems.

Mr. Gabriel said WAPA spends a couple of hundred million dollars on capital improvements annually, which includes money for security improvements. "The bigger story is how that break-in and others in the industry changed the thinking," he said.

Mr. Cloud said he has received about $300,000 for security upgrades at a handful of WAPA's 328 substations, including Liberty. To protect the system's 40 most important substations and control centers, he said, he needs $90 million: "I don't have the authority or budget to protect my substations."

46-month sentence for businessman who helped Chinese military hackers (Canada)

Thursday, 14 July 2016

Byline: Matt Zapotsky

Washington - A businessman who admitted helping Chinese military officers as they hacked into the computer systems of U.S. defense contractors and stole significant information was sentenced Wednesday to three years and 10 months in prison, authorities said.

Su Bin, 51, a Chinese national who also went by Stephen Su and Stephen Subin, had pleaded guilty earlier this year to conspiring to gain unauthorized access to a protected computer and to violating the Arms Export Control Act. He had been accused of participating in a years-long plot to steal military technical data -- including details related to Boeing's C-17 military transport plane and other fighter jets produced for the U.S. military -- for the Chinese government.

Su's plea marked a first for someone involved with a Chinese government campaign of economic cyberespionage. Assistant Attorney General for National Security John P. Carlin said his sentence was "just punishment" for his crimes.

"These activities have serious consequences for the national security of our country and the safety of the men and women of our armed services," Carlin said in a statement. "This prison sentence reinforces our commitment to ensure that hackers, regardless of state affiliation, are held accountable for their criminal conduct."

Su, the owner of a company called Lode Technology, was initially arrested in Canada in July 2014, and he ultimately waived extradition and consented to come to the United States in February. As a part of his plea, he admitted that he told his co-conspirators, who were military officers in China, what people, companies and technologies to target in their cyber-intrusions and that he translated some stolen data from English to Chinese. He said he did so because he wanted to profit from selling the information that was taken.

Federal prosecutors in recent months have been aggressive about bringing cybercrime cases against foreign nationals who might seem unlikely to ever appear in U.S. courts. In March, the Justice Department indicted seven hackers associated with the Iranian government in connection with crimes

that included attacking U.S. banks' public websites from late 2011 through May 2013 and breaking into a computer system at a small dam in Rye, N.Y., in an apparent attempt to disrupt its operation.

CSIS Twitter Account Aims To Make Agency 'More Accessible'

Thursday, 14 July 2016

Byline: Mohamed Omar

Toronto - The Canadian Security Intelligence Service, or CSIS as it's affectionately called, is now on Twitter.

On Wednesday, the agency posted its first tweet to the social network.

"Yes, we're on Twitter. Now it's your turn to follow us," it said, invoking the hilarious topic of surveillance.

Users responded to the tweet while keeping up with the knee- slapping tone set by the agency. (A response tweet: 'loving the completely chill attitude regarding your charter busting surveillance of citizens. GREAT COMEDY GUYS')

The Communications Security Establishment welcomed them to the site and offered some advice.

CSIS director Michel Coulombe said in a statement that the Twitter account is a "step" in strengthening dialogue between the service and Canadians.

"The Canadian Security Intelligence Service recognizes that a modern organization needs to communicate using modern means," he said.

"Speaking publicly on the nature of our work isn't always easy, but we want CSIS to be more accessible, and want to help the public understand more about our work."

Is CSIS' first tweet as good as the CIA's debut? We'll leave that for you to decide. (Just kidding, they probably already know!) (Full report).

5. Al Jazeera

US: Chinese national jailed over military hacking (Canada).

Thursday, 14 July 2016

Washington - A Chinese businessman who pleaded guilty to hacking sensitive US military information was sentenced to nearly four years in prison, prosecutors have said.

Su Bin, 51, was charged on Wednesday with taking part in a years-long scheme by Chinese military officers to hack into the computer networks of aircraft manufacturer Boeing and other major US defence contractors.

In addition to a 46-month prison term, a US District Court judge in Los Angeles ordered Su to pay a $10,000 fine.

"Su Bin's sentence is a just punishment for his admitted role in a conspiracy with hackers from the People's Liberation Army Air Force to illegally access and steal sensitive US military information," John Carlin, assistant attorney general for national security, said in a statement.

"Su assisted the Chinese military hackers in their efforts to illegally access and steal designs for cutting-edge military aircraft that are indispensable to our national defence," he said.

In an August 2014 indictment, prosecutors said that Su travelled to the United States at least 10 times between 2008 and 2014 and worked with two unidentified co-conspirators based in China to steal the data. He was arrested in Canada in 2014 and later consented to US extradition.

The trio were accused of stealing plans relating to the C- 17 military transport plane and F-22 and F-35 fighter jets, and attempting to sell them to Chinese companies.

According to prosecutors, in pleading guilty Su admitted sending emails to his co-conspirators telling them which people, companies and technologies to target with their hacking, and translating the stolen material from English to Chinese.

Su admitted taking part in the crime for financial gain, prosecutors said. The Chinese government has repeatedly denied any involvement in hacking.

Canada's e spies keep an eye on terrorists, foreign agents and 'The Good Wife'

Thursday, 14 July 2016

Byline: Jim Bronskill

Ottawa - It's among the most secretive agencies in Canada.

But one project officer at the Communications Security Establishment, the electronic spy service, was ``very excited'' about seeing the CSE portrayed in an April episode of the popular CBS television series ``The Good Wife.''

Internal emails obtained by The Canadian Press under the Access to Information Act reveal the drama about a Chicago law firm captured the attention of the CSE, which is usually preoccupied with monitoring terrorists and foreign agents.

``Just wanted to share something with you all,'' wrote the project officer, whose name was deleted for security reasons, the morning after the program aired.

``At our meeting last week we were talking about how nice it would be for TV shows to mention CSE ... well ... last night I was watching a show that I never watch, 'The Good Wife,' and CSE was mentioned about 2-3 times.

``I was very excited and thought it was funny that we were just talking about this.''

The episode took dedicated lawyers Alicia Florrick and Lucca Quinn to Toronto to help a whistleblower on the run from the U.S. National Security Agency, the CSE's American counterpart.

Much of the hour was devoted to clearly tongue-in-cheek references to Toronto as litter-free and the U.S. as a ``land of guns and gangs'' with inferior health care.

Surveillance of Florrick by the NSA added spooky intrigue to several instalments of the series, which ended its seven-year run in May. In Toronto, she and Quinn employ a little trickery to win safe haven for the American whistleblower.

The CSE comes across as a cubicle farm of tech- savvy young Canucks who, naturally, root for the Toronto Blue Jays.

The portrayal of the Canadian agency was fictional and ``done without input from CSE,'' said Ryan Foreman, a spokesman for the Ottawa-based spy service.

The project officer's comments stemmed from the CSE's increasing efforts to educate the public about the agency's ``vital work in helping protect Canadians and Canada's security,'' he said.

``In addition, as we are always looking to recruit the best and brightest to join our unique and talented workforce, more exposure through things like mentions in TV shows help further build awareness of CSE among potential job applicants.''

The agency has been thrust into the spotlight in recent years due to the disclosures about NSA surveillance, and some CSE operations, by real-life whistleblower Edward Snowden, a former U.S. spy contractor.

In turn, the CSE has tried to explain more about what it does, with obvious limits, to help shape public opinion.

Like the domestic Canadian Security Intelligence Service, the CSE even has a Twitter account. On Wednesday, the electronic spy service tweeted: ``It's nice when our vital work is noticed by Hollywood, but we're still holding out hope for a shout out in 'The Beachcombers.'''

It seems unlikely, unless the CSE has inside intelligence: the venerable Canadian show signed off in 1990.

7. Reuters

China likely hacked U.S. banking regulator: congressional report

Wednesday, 13 July 2016

Byline: Staff report

Washington - The Chinese government likely hacked computers at the Federal Deposit Insurance Corporation in 2010, 2011 and 2013 and employees at the U.S. banking regulator covered up the intrusions, according to a congressional report on Wednesday.

"Even the former Chairwoman's computer had been hacked by a foreign government, likely the Chinese," staff at the U.S. House of Representatives Committee on Science, Space and Technology said in the report.

The report was the latest example of how deeply Washington believes that Beijing has penetrated U.S. government computers. But while making the allegation that China was the culprit, the report does not provide specific evidence to support that conclusion.

China's embassy in Washington did not have immediate comment on the allegations. The FDIC, one of the United States' principal banking regulators that keeps confidential data on the biggest banks, did not have immediate comment.

The compromise of the FDIC computers had been previously reported in May and some lawmakers had mentioned China as a possible suspect, but the investigation for the first time cites an internal FDIC probe as pointing toward China.

It is often difficult to determine the identity of a malicious actor in cyberspace, although China is believed to have been behind a number of intrusions at other federal agencies in recent years.

The report follows accusations by the United States that China stole more than 21 million background check records from the federal Office of Personnel Management beginning in 2014.

China has long been a hacking adversary for the United States, although intelligence officials believe Beijing has decreased its hacking activity since signing a pledge with Washington last September to refrain from breaking into computer systems for the purposes of commercial espionage.

A source familiar with the FDIC's internal investigation said the areas of the regulator's network that were hacked suggested the intruders were seeking "economic intelligence."

The congressional staff report accused the FDIC of trying to cover up the hacks so as not to endanger the congressional approval of the regulator's chairman, Martin Gruenberg, who was nominated by President Barack Obama and confirmed by the U.S. Senate in November 2012. Gruenberg's predecessor, Sheila Bair, served in the post for five years until July 2011.

A witness interviewed by the staff said the FDIC's former chief information officer instructed employees not to disclose information about the foreign government's hack, the report said.

The witness said the hush order was to "avoid effecting the outcome of Chairman Gruenberg's confirmation by the U.S. Senate," according to the report. The report also provided details of data breaches in which FDIC employees leaving the regulator took sensitive documents with them.

The report said current officials at the FDIC have purposely concealed information about breaches that had been requested by Congress.

"The committee's interim report sheds light on the FDIC's lax cyber security efforts," said Lamar Smith, a Republican representative from Texas who chairs the House Science, Space and Technology Committee. "The FDIC's intent to evade congressional oversight is a serious offense."

Gruenberg is scheduled to testify on Thursday before the committee on the banking regulator's cyber security practices.

Canadian intelligence agency CSIS joins Twitter 'to be more accessible'

Thursday, 14 July 2016

Byline: Staff report

Ottawa - Canada's main spy agency joined Twitter on Wednesday, announcing in a cheeky flip of the script: "Now it's your turn to follow us."

Canadian Security Intelligence Service Director Michel Coulombe said in a statement the agency wanted the public to have a better understanding of what it does.

"Speaking publicly on the nature of our work isn't always easy, but we want CSIS to be more accessible," he said.

Canada's ruling Liberals ran on an election platform last year to increase government transparency and oversight of the country's spy agencies, which have been accused of being overly secretive.

The agency by Wednesday afternoon had 2,247 followers and was following 17 accounts including the U.S Federal Bureau of Investigation and the Central Intelligence Agency.

The new account, @csiscanada, was not the spy agency's first foray into social media.

At least two other accounts, @csiscareers and its French-language counterpart, @carriereauscrs, have been around since September 2013, although they tweeted mostly recruitment messages.

Canada's other spy agency, the Communications Security Establishment, is already on Twitter.

In 2014, the CIA joined Twitter with a similar tongue-in-cheek announcement: "We can neither confirm nor deny that this is our first tweet."

9. Aviation Week website

MI5 Warns of Transport Security Threat

Wednesday, 13 July 2016

Byline: Angus Batey

London - Technologies designed to reduce costs of major public building programs may offer terrorists an unprecedented reconnaissance capability, the Security Service (MI5) has warned.

BIM (building information modeling) systems became mandatory for all centrally procured public construction schemes in the UK from the beginning of April: yet BIM cannot be fully secured, and failure to appropriately restrict access could lead to non-vetted workers obtaining classified building-security data.

The case for using BIM is clear. If different structural, mechanical and electrical plans are superimposed for the first time when building is already underway, delays and cost increases are inevitable. BIM brings all the design data together in a virtual environment, allowing different trades to align plans before construction begins.

"The trouble is, the resultant model is the most fantastic hostile reconnaissance tool you could look for," 'Paul' (identities of Security Service staff are not made public), the head of cross-cutting security knowledge at the MI5-run Centre for Protection of National Infrastructure (CPNI), told the Counter-Terror Expo in London earlier this year.

"On one project we're advising on at the moment, some 80,000 people have unfettered access to every layer of the model," Paul says. "Not one of them has been security-cleared, and 160 don't even work for the project any more, but haven't been removed from the access privileges of the system. Some of them left under a cloud: and if you left under a cloud you might just have a grievance against your ex-employer to either steal data from the model or inject bad data which could completely compromise the construction."

Configuration of a project's BIM systems can eliminate some of the most worrying problems, but decisions need to be taken early, and by people with a thorough understanding of the security implications. This does not always happen.

"We found one (project) recently where, if I was a lectern supplier, I would be allowed into the BIM model to click on the lectern, see what the spec was, and see if I had one to offer," Paul says. "But with how that BIM model has been set up, because the lectern is touching the stage I can also get the stage details; because the stage is touching the floor I get the floor details; because the floor is touching the wall I get the wall details; and as the wall is touching the locking mechanism on the door I get to see the lock details. Remember: I'm a lectern supplier."

These problems appear to arise because managers may have a limited view of what constitutes a potential security risk. For example, cybersecurity will be part of a robust BIM implementation, but even the best cyber defenses will not, on their own, address all of a project's potential BIM-related security problems.

Major infrastructure programs, such as rail stations or airport terminals, are not classified in the traditional sense, but that does not mean that every aspect of their design is appropriate for public release. The CPNI advises projects on security measures including suitable blast-protection technologies and the projected effectiveness of physical barriers. Making such data public could enable an attacker to circumvent the protection.

"(With) an airport terminal building, the roof is visible on Google Earth, and you can walk past and photograph it - so I'm not that concerned about its security in the BIM model," Paul says. "You can go to Heathrow Terminal 5 and admire the structure - it's beautiful. But the blast counts behind it no-one really should know about, and all the baggage- handling and access to control systems I wouldn't want anyone to know about either."

The answer is to cultivate better understanding and management of security risks, which in turn means reassessing all the security implications when granting wide-ranging BIM access to participants in major infrastructure projects. The CPNI has worked with the British Standards Institute to publish what Paul calls "the fastest ever British Standard", Publicly Available Specification 1192-5, which sets out advice on embedding BIM security-mindedness across different disciplines (physical, digital, human) and throughout the supply chain. Adhering to the standard will require new ways of thinking - even entirely new career fields.

"There is no way of doing BIM securely - you can only do it in a security-minded way," Paul says. "It involves the appointment of a new role, which I think will become a burgeoning profession, called the Built Assets Security Manager, who has got to identify that this plus that is greater than the sum of its parts."

CSIS tries to show it can be more 'accessible' with new Twitter account: 'Now it's your turn to follow us'

Wednesday, 13 July 2016

Byline: Stewart Bell

Ottawa - Canada's intelligence service posted its first Tweet on Wednesday, joining the Central Intelligence Agency and other secretive government organizations that have ventured into social media.

"Now it's your turn to follow us," the Canadian Security Intelligence Service wrote on its new @CSISCanada account. The handle @CSIS was already taken by the Centre for Strategic and International Studies.

Among the first to follow CSIS was the CIA, which joined Twitter in 2014 with the post, "We can neither confirm nor deny that this is our first tweet." The @CIA account is heavy on history rather than actual intelligence.

While CSIS already had a Twitter account for job openings, the new one appears to be an attempt to demystify the agency to Canadians who are sometimes wary of what it does in the name of national security.

"Speaking publicly on the nature of our work isn't always easy, but we want CSIS to be more accessible, and want to help the public understand more about our work," Director Michel Coulombe said in a statement.

Canada's signal's intelligence agency, the Communications Security Establishment, which has been Tweeting since April, welcomed CSIS to Twitter with what it called "some neighborly advice: 'password' is never a good password."

11. CTV Edmonton

'Now it's your turn to follow us', CSIS launches Twitter account

Wednesday, 13 July 2016

Byline: Julia Parrish

Edmonton - After more than 30 years, the Canadian Security Intelligence Service (CSIS) launched their first public social media account Wednesday.

In a Tweet sent out just before 9 a.m. MT, the organization's first tweet was sent out.

(Tweet from CSIS Canada: 'Yes, we're on Twitter. Now it's your turn to follow us'.)

The organization also released a statement from Michel Coulombe, Director of CSIS, saying the service "recognizes that a modern organization needs to communicate using modern means."

"A key element of the organization's vision is to communicate our role to Canadians, so they may attain a better understanding of CSIS.

Coulombe's statement went on to say: "Speaking publicly about the nature of our work isn't always easy, but we want CSIS to be more accessible, and want to help the public understand more about our work. Joining Twitter is one step in strengthening the dialogue with Canadians."

The account's initial Tweet was met with some ribbing online, with some users questioning whether the account was real, and another government organization issued their own response.

The official account for the Communications Security Establishment welcomed CSIS to Twitter, and offered some cheeky advice.

(CSE Tweet: 'Welcome to Twitter! Allow us to offer some neighbourly advice: "password" is never a good password!')

The service was officially established on July 16, 1984.

12. CTV.CA

CSIS joins Twitter: 'Now it's your turn to follow us'

Wednesday, 13 July 2016

Byline: Josh Elliott

Toronto - Here's one of the worst-kept secrets in the country: Canada's spy agency is on Twitter.

The Canadian Security Intelligence Service sent out its first tweet on Wednesday, urging Canadians to follow its new social media account.

"Now it's your turn to follow us," the tweet said.

Director of CSIS Michel Coulombe called it a way to be "more proactive" in helping the public understand the agency's role in keeping Canadians safe.

"Speaking publicly on the nature of our work isn't always easy, but we want CSIS to be more accessible, and want to help the public understand more about our work," Coulombe said in a statement on the CSIS website. "Joining Twitter is one step in strengthening that dialogue with Canadians."

13. Saudi Gazette

Kingdom among top progressive states in IT

Thursday, 14 July 2016

Byline: Staff Report

Riyadh - Saudi Arabia advanced to 33rd rank among 139 countries classified by the World Economic Forum as the top progressive states in the field of information technology and communication.

The Ministry of Communications and Information Technology said in a statement on Wednesday that according to the annual report of the World Economic Forum (https://www.weforum.org/reports/the-global-information-technology-report- 2016), the Kingdom has advanced two ranks in 12 months to reach 33rd position among 139 countries in terms of readiness to contain diverse networks of information technology.

The Kingdom came in the 8th place globally in terms of the efficiency in the use of information technology and communication by government and official bodies in the implementation of their work, and the extent to improve the quality of government services for the population in the information technology field.

It came in the 9th place globally in terms of the extent of the government's success in promoting the use of information technology and communication.

The Kingdom also ranked 15th in terms of broadband subscriptions for mobile computers per 100 inhabitants. It ranked 17th in the production of electricity (kilowatt/hour/per capita), and ranked 18th in the index of the quality of services being provided by the government in the field of internet.

This index deals with assessing the implementation of the government for internet services projects.

"The government is leading the way to increased networked readiness, promoting ICTs in the country," said the report.

The Global Information Technology Report 2016 features the latest iteration of the Networked Readiness Index (NRI), which represents a key tool in assessing countries' preparedness to reap the benefits of emerging technologies and capitalize on the opportunities presented by the digital transformation and beyond.

More particularly, the report assesses the factors, policies, and institutions that enable a country to fully leverage information and communication technologies (ICTs) for increased prosperity and crystallizes them into a global ranking of networked readiness at the country level in the form of the NRI.

Countries are assessed over four categories of indicators: (1) the overall environment for technology use and creation (political, regulatory, business, and innovation); (2) networked readiness in terms of ICT infrastructure, affordability, and skills; (3) technology adoption/usage by the three groups of stakeholders (government, the private sector, and private individuals); and (4) the economic and social impact of the new technologies. Whenever relevant, the Index looks at what the different actors in society, both private and public, can do to contribute to the country's networked readiness.

Suivez les espions canadiens sur Twitter!

Wednesday, 13 July 2016

Byline: Journaliste maison

Ottawa - Le SCRS, l'agence canadienne de renseignement de sécurité, a souligné avec ironie le lancement de son compte Twitter en écrivant « Oui, on est sur Twitter. C'est maintenant à vous de nous suivre »...

?

Oui, on est sur Twitter. C'est maintenant à vous de nous suivre. https://t.co/dkaZg4b7OO

-- SCRS Canada (@scrscanada) 13 juillet 2016

Le Service canadien du renseignement de sécurité (SCRS) ou Canadian Security Intelligence Service en anglais (CSIS), est le principal service de renseignements du Canada.

Ses missions incluent le filtrage de sécurité, le terrorisme, la lutte à la prolifération des armes de destruction massive, l'espionnage et ingérence étrangère et les menaces pour la sécurité de l'information.

Le SCRS,dont les pouvoirs ont été accrus sous le règne des conservateurs, travaille à l'international en collaboration avec ses agences soeurs des États-Unis (CIA, FBI et NSA), de Grande-Bretagne (MI5), et d'Australie (les « five eyes »), ainsi que plusieurs autres pays.

Au plan national, le SCRS collabore avec le Commandement des Forces d'opérations spéciales du Canada (Forces canadiennes) et le Centre de la sécurité des télécommunications, tous deux sous le Ministère de la Défense nationale, ainsi qu,avec la avec la Gendarmerie royale du Canada, dont le ministère de tutelle est celui de la Sécurité publique.

Le directeur du Service canadien du renseignement de sécurité (SCRS), Michel Coulombe, en lançant le compte Twitter de l'agence, a déclaré « Le Service canadien du renseignement de sécurité reconnaît qu'une organisation moderne se doit de recourir à des moyens modernes pour communiquer. Un des éléments clés de la vision de l'organisation est de communiquer son rôle aux Canadiens pour qu'ils aient une meilleure compréhension de ses fonctions. »

Aix États-Unis, le compte Twitter de la CIA (Central Intelligence Agency), établi en 2014, a maintenant 1,43 Million d'abonnés qui suivent ainsi les activités de l'agence de renseignement américaine, et peuvent en outre poser des questions et obtenir des réponses.

« Il est primordial », a ajouté Michel Coulombe, »que le public comprenne le rôle souvent difficile que le SCRS joue pour assurer la sécurité du Canada et des Canadiens, et le SCRS doit s'efforcer de mieux l'en informer. Même s'il n'est pas toujours facile de parler publiquement de la nature du travail de ses employés, le SCRS veut être plus accessible et aider le public à mieux saisir son travail »

Et de conclure le patron de tous les espions canadiens en disant que « L'ouverture du compte Twitter est une des mesures prises pour renforcer le dialogue avec les Canadiens ».

Jakarta Post

Cyber Agency to be formed in August: Security Minister

Friday, 15 July 2016

Byline: News Desk

Section: general

Jakarta - The National Cyber Agency (BCN) is expected to be established in August 2016, Coordinating Minister for Political, Legal, and Security Affairs Luhut Binsar Pandjaitan stated.
"Probably, next month, the agency will be ready," Minister Pandjaitan said here, Thursday. The process of establishing the agency has reached its final stage, he added. The government had planned to set up the agency since 2015.

Earlier, Communication and Informatics Minister Rudiantara had stated that Minister Pandjaitan was coordinating to set up the agency.

The communication and informatics ministry has prepared the standardization process for the cyber agency in dealing with sectors, such as finance and banking, transportation, energy, and mineral resources. In the meantime, a cyber security expert recently said Indonesia urgently needs to establish the BCN.

Pratama Dahlian Persadha, former chairman of a team of the State Code Agency for Presidential Information Technology Security, said Indonesia was lagging behind neighboring countries, such as Malaysia and Singapore, in the area of cyber security.

"Singapore has already established a BCN since 2009, not to mention the United States, where President Obama has direct access to every matter related to cyber security," Pratama remarked.

Pratama, who is chairman of the Communication and Information System Security Research Center, said Indonesia is not like several European countries, with a small land territory and mono-ethnic nationality.

"Indonesia has several data on strategies and covert information, including about state secrets, which need to be safeguarded, to preserve the nation's pluralism and state integrity," he affirmed.

Currently, part of the data has been saved digitally. Without adequate protection, the data can become a potential threat, he pointed out.

"Later, the BCN's duty should be more than just to protect data. The main task of the BCN would be to secure Indonesia's cyberspace," he noted "The BCN should function on the similar lines as the armed forces in the cyber world," Pratama added.

Press Trust of India

Hafiz Saeed's Twitter account suspended

Friday, 15 July 2016

Section: general

New Delhi - The official Twitter account of Jamaat-ud-Dawa (JuD) chief Hafiz Saeed was suspended on Thursday.
The handle - @hafizsaeedlive was suspended by Twitter following complaints by Indian security agencies that it was being used to incite violence following the death of Kashmiri militant Burhan Wani in an encounter last week.

An accused in the 26/11 Mumbai attacks, Hafiz Saeed was seen earlier this week participating in a prayer meeting on Wani's death, along with Hizbul Mujahidren chief Syed Salahudeen.

On Wednesday night, Saeed launched an onslaught against India, following which the agencies approached Twitter to suspend his account.

Earlier too, Saeed's Twitter account was suspended following India's request. He created a new ID on Twitter in December 2015. Saeed reportedly has one more account which is maintained by his cyber team.

Arab News

'Spy tool' concerns as Pokémon mania grips Kingdom

Friday, 15 July 2016

Byline: Mohammed Al-Sulami

Section: general

Jeddah - As the global obsession with smartphone game Pokémon Go intensifies, many have taken to Twitter and social media sites to warn about the impact of the game on social life and the security of citizens and the country.
Pokémon Go works via GPS technology, using the phone camera to search for Pokémon characters and hunt them down.

While some claim the game could be a breach of privacy for users and their mobile phones, more serious concerns revolve around the possible threats to national security, as in the course of playing the game, sensitive sites, such as security buildings, houses of worship, foreigners' residential complexes, embassies, consulates and others may be photographed.

Many observers and commentators on social media warn that the game, like others, may also be penetrated by terrorist organizations who use it to contact youths and recruit them.

They are calling on authorities to closely examine such games and their potential danger to national security, as well as the possibility that they may become tools for terrorists, enemy countries or spy agencies wishing to collect data and information about sensitive locations.

Nayef Al-Subaie, an expert in technology, says the danger of these games is that they use live stream technology connected to the Internet and GPS, while those who play the game have limited understanding of where the stream is uploaded or what sites they may be led to during the game, "potentially embassies, consulates, military installations, oil refineries and our cities".

Such images may be used by foreign organizations, as was the case with the Baqeeq refinery, which was monitored by Al-Qaeda and attacked on Feb. 29, 2006, he said.

Naser Al-Qahtani, an electronic security expert, said these games can be easily accessed and used to spy on individuals, as well as infected with viruses. They can collect the largest possible amount of information and images from users around the world.

Information security experts have issued reminders that Saudi Arabia is constantly subjected to a large number of electronic attacks due to its special military, security and economic strength, which makes the game, and others of its kind, a cause for concern.

Hamed Al-Haddad, a citizen, says security authorities must intervene immediately to ban this game in the Kingdom until it is properly studied to identify any potential dangers, especially to society or the national security.

Other concerns about the game, says Masoud Al-Ali, are that it requests links to the users' personal information and e-mails, and its highly addictive nature causes users to lose touch with their surroundings and reality, and pay no attention to potential risks.

The game has caused global hysteria in the past few days, but it has yet to be introduced to the Arab markets. Saudis, however, were able to upload the game by using "proxies" and relocating to countries where the game already exists.

Some parents warn about the game, which pose potential hazards to their children because characters sometimes appear in dangerous places, such as the middle of a road or in suspicious sites. Some even hunt down the Pokémon characters using bicycles and cars, which may lead to accidents.

Ottawa Citizen

Aerospace firm owner sentenced for hacking

Friday, 15 July 2016

Byline: David Pugliese

Section: general

Ottawa - A Chinese man who ran an aerospace firm with offices in British Columbia has been sentenced to nearly four years in jail for stealing confidential information on a U.S. military transport aircraft and the F-35 stealth fighter.
Su Bin had pleaded guilty in federal court in Los Angeles to helping two Chinese military hackers. Among the targets of the hacking efforts was information on the U.S. F-22 and F-35 stealth fighters as well as Boeing's C-17 transport aircraft, which is also used by the Canadian Air Force.

In a plea agreement, Su admitted to conspiring with the two hackers in China to gain unauthorized access to computer networks in the U.S. between October 2008 and March 2014.

Su travelled to the U.S. on 10 occasions during that period, according to court documents.

He was arrested in Richmond, B.C., in June 2014 and a Canadian court ordered Su's extradition to the U.S. in September 2015.

The 51-year-old has been sentenced to three years and 10 months in jail. He was also fined $10,000.

Su, also known as Stephen Su and Steven Subin, is the owner of the aviation firm Lode Technology. Besides the office in Canada, it also had locations throughout China.

"Over the course of years, this defendant sought to undermine the national security of the United States by seeking out information that would benefit a foreign government and providing that country with information it had never before seen," U.S. prosecutor Eileen Decker said in a statement.

Su did not carry out the actual hacking, which was done by his two co-conspirators, both members of the People's Liberation Army in China.

Instead, Su's role was to identify technical data that the hackers could target, according to the charges filed by Decker.

Su also admitted translating the stolen information, which was then offered to Chinese aviation firms.

The theft of information on the C-17 aircraft made "important contributions to our national defence scientific research development," one of the Chinese military officers wrote in an email intercepted by the U.S.

Whistleblower Edward Snowden to keynote Toronto conference

Friday, 15 July 2016

Byline: Brian Jackson

Section: general

Toronto - The man that says he lives on the Internet will be the showcase speaker at SecTor, a Toronto-based security conference this year.
Edward Snowden, the former CIA employee and government contractor that leaked classified documents about a mass surveillance operation run by the National Security Administration (NSA), will be appearing at the conference via a video link from Russia, where he's been living under asylum since 2013. SecTor will be Snowden's first and only commercial conference appearance in North America this year, conference organizers say.

"Edward Snowden is not only one of the biggest names in cybersecurity, but his unique situation and cybersecurity experiences also make him one of the most important and influential," said SecTor co-

founder Brian Bourne in an email announcement. It's important to have him "appear in front of the Canadian IT community, so we engage and inspire today's security professionals and don't fall behind."

Snowden has been said to make his living off of speaking fees since fleeing the U.S. and leaking state secrets. Snowden's lawyer Ben Wizner once told the New York Times the fees can sometimes exceed $10,000 per appearance.

Snowden has also made appearances at conferences and gallery events via telepresence robot BeamPro, essentially a raised iPad on two wheels. He first used the robot at a TED talk in 2014.

Beyond NSA's clandestine mass surveillance operations that were leaked by Snowden, Canada's Communications Security Establishment (CSE) has also been the subject of some of his classified leaks. He's also said that Canada's intelligence gathering operations have the "weakest oversight" among western nations.

A Hollywood movie, directed by Oliver Stone and titled Snowden, is based the whistleblower's life and focuses on his choice to reveal state secrets.

SecTor begins in Toronto Oct. 17.

Globe and Mail

Man who stole military data sentenced

Friday, 15 July 2016

Byline: Mahnoor Yawar

Section: general

Ottawa - A Chinese citizen living in Vancouver who admitted helping Chinese military officers hack into the computer networks of U.S. defence contractors to steal classified information has been sentenced to 46 months in prison.
Su Bin, a 51-year-old multimillionaire businessman working in aviation, was convicted of participating in a years-long conspiracy to steal military technical data, including schematics related to Boeing's C-17 military transport plane as well as F-22s and F-35s.

According to a plea agreement released by U.S. prosecutors, Mr. Su admitted that he acted as a data scout to access sensitive military data on servers for U.S. defence contractors and sent relevant

information to China. He said he was motivated by the prospect of "commercial advantage and private financial gain."

In addition to the prison term, Mr. Su was ordered to pay a $10,000 (U.S.) fine by a District Court judge in Los Angeles for his part in the criminal hacking conspiracy, which took place from October, 2008, to March, 2014, while he resided in Canada with his family and took frequent trips across the border. In August, 2012, he bought a $2-million home in Richmond, B.C., with his wife.

"Su Bin's sentence is a just punishment for his admitted role in a conspiracy with hackers from the People's Liberation Army Air Force to illegally access and steal sensitive U.S. military information," John Carlin, the assistant attorney-general for U.S. National Security, said in a statement.

The sentencing is the first time the U.S. Department of Justice has highlighted allegations that Mr. Su and two co-conspirators e- mailed reports addressed to the headquarters for the Chinese People's Liberation Army, previously reported by The Globe and Mail in February.

The Globe also revealed that court filings in Canada described the co- conspirators as "Chinese military officers" who sent Mr. Su pictures of themselves with identifiable names and ranks. U.S. prosecutors have not charged or publicly identified these individuals.

Charges against Mr. Su were first announced in 2014, leading to his arrest in Canada on a U.S. warrant. He ultimately waived extradition to the United States, where he pleaded guilty to one count of conspiring to gain unauthorized access to a protected computer and to violate the Arms Export Control Act. As part of his plea deal, he negotiated a maximum five-year prison sentence with prosecutors.

When Mr. Su went to the United States, Canadian immigration authorities withdrew a bid launched to revoke his permanent resident status. Government officials could not be reached for comment on whether he will be authorized to return to Canada at the conclusion of his U.S. prison term.

Earlier this year, the Chinese government denied claims that a Canadian man detained in China was charged with espionage as retribution for proceedings against Mr. Su. Kevin Garratt and his wife, Julia, were arrested near the North Korean border, where they ran a coffee shop and did humanitarian work, weeks after Mr. Su's arrest in Vancouver. Ms. Garratt was released on bail in February, 2015, but has been barred from leaving the country or speaking to the media.

The Chinese government has repeatedly denied any involvement in hacking, but Mr. Su's cyber espionage efforts have been lauded by state-controlled media in China.

"On the secret battlefield without gunpowder, China needs special agents to gather secrets from the U.S. As for Su, be he recruited by the Chinese government or driven by economic benefits, we should give him credit for what he is doing for the country," said a March editorial in the Global Times, a publication with significant ties to the ruling Communist Party.

The editorial was headlined: "Su Bin deserves respect whether guilty or innocent."

From the dark web to the 'open' web: What happens to stolen data

Friday, 15 July 2016

Byline: Michael Kassner

Section: general

Riyadh - The online black market is becoming a well-oiled and lucrative machine, thanks to the massive amount of stolen data flowing through the underground.
In any data breach, it's particularly interesting to note the number of individuals whose personal information was compromised. Case in point, the title of Zack Whittaker's June 9, 2016 article on TechRepublic sister site ZDNet: A hacker claims to be selling millions of Twitter accounts.

He writes, "A Russian seller, who goes by the name Tessa88, claimed in an encrypted chat on Tuesday to have obtained the database, which includes email addresses (and sometimes two per person), usernames, and plain-text passwords."

As compelling as that is, Thomas J. Holt, an associate professor of criminal justice at Michigan State University, is far more curious about what happens to the stolen data after the breach occurs. Holt's interest hearkens back to 2014 when he and fellow researchers made an intensive study of the underground path of stolen credit card information.

Holt recently decided to augment that information in his commentary on The Conversation titled Buying and selling hacked passwords: How does it work? "What happens after a breach?" asks Holt in the article. "What does an attacker do with the information collected? And who wants it, anyway?" He begins to answer these questions by saying more often than not, stolen data is sold via online black markets.

In what might be a surprise to some, Holt believes those selling stolen data use underground web forums remarkably similar to above ground retailers like Amazon--buyers and sellers can even rate each other and review previous negotiations (more on this later). Holt points out some of the differences.

As for those interested in buying stolen data, that happens in one of two places. "Most of the black markets operate on the so-called 'open' web, on sites accessible like most websites, using conventional web browsers like Chrome or Firefox," writes Holt. "They sell credit and debit card account numbers, as well as other forms of data including medical information."

Holt continues, "A small but emerging number of markets operate on another portion of the internet called the 'dark' web. These sites are only accessible by using specialized encryption software and browser protocols that hide the location of users who participate in these sites, such as the free Tor service."

Due to the nature of the product, sellers make every effort to remain incognito when it comes to receiving payments. The internet has been a big help in this regard. "Sellers accept online payments through various electronic mechanisms, including Web Money, Yandex, and Bitcoin," explains Holt. "Some sellers even accept real-world payments via Western Union and MoneyGram, but they often charge additional fees to cover the costs of using intermediaries to transfer and receive hard currency."

Holt next mentions that payments are made up front, with the release of stolen data taking a few hours to a few days. And, paying up front is why buyers want to know how the underground market rates the seller. If a deal goes wrong, it is doubtful either party will be calling the authorities.

"The parties operate anonymously, but have usernames that stay the same from transaction to transaction, building up their reputations in the marketplace over time," adds Holt. "Posting reviews and feedback about purchase and sale experiences promotes trust and makes the marketplace more transparent."

Holt says those who buy stolen information on underground black markets try to make as much money as quickly as possible. The bad guys do that by: Engaging in money transfers to acquire cash Buying goods with stolen credit card numbers Holding people's internet accounts (i.e., social media logins) for ransom Using the data to craft more targeted attacks on victims Padding legitimate account reputations using fake followers

Holt estimates the criminal buyers were able to net between $1.7 million and $3.4 million USD from 141 purchases on underground markets. "These massive profits are likely a key reason these data breaches continue," mentions Holt. "There is a clear demand for personal information that can be used to facilitate cybercrime and a robust supply of sources."

Holt points out that if the rating systems could not be trusted, buyers would more than likely refrain from providing funds before receiving their purchase. "Some computer scientists have suggested the approach [rigging the rating system] could disrupt the data market without the need for arrests and traditional law enforcement methods," explains Holt.

As to the success of the underground black markets, as Holt said earlier, they will continue to be successful as long as there are products to sell, and that seems assured with headlines like this from ZDNet: LinkedIn user? Your data may be up for sale.

Iran Unveils Home-Made Hi-Tech Batteries for Military, Industrial Purposes

Friday, 15 July 2016

Section: general

Tehran - Iran on Wednesday unveiled 7 home-made hi-tech military and 19 industrial batteries in a ceremony participated by First Vice-President Eshaq Jahangiri and Defense Minister Brigadier General Hossein Dehqan.
During the ceremony held in Tehran today, also the production line of hi- tech MF batteries and a CHP power plant with the capability of electricity and heat-generation were inaugurated.

Also today, the Iranian defense ministry plant which produces lithium batteries started production of batteries for bicycles, electric motorcycles, mobile cell phone chargers and computers.

Last month, the Iranian defense ministry unveiled three other home-made technological achievements.

The achievements include 1-MW national GPS system, robotic vacuum plasma coating and vacuum arc remelting furnace which have all been designed and built by Iranian researchers at Malek-e Ashtar University.

Elaborating on the new achievements, General Dehqan said that the 1-MW national GPS system is a reliable substitute for the GPS which can be used in critical conditions.

Also, the robotic vacuum plasma coating is one of the laboratorial equipment used in different research processes, turbines and jet engines that has the capability to resist high temperatures, he added.

General Dehqan also said that the vacuum arc remelting furnace can be used for melting and purification of titanium, remelting the super alloys and special steels and can be operated both manually and automatically.

In a relevant development in February, General Dehqan unveiled 4 products of the defense industry and inaugurated the production line of a key medicine that fights the effects of chemical elements.

The new achievements included 'Pars Kam' detector system that tracks chemical substances dangerous to health, a new system that can detect explosives and drugs, anti-strike and explosion-proof polymer coatings, a new generation of NBC protective clothes based on Travagzin membranes, as well as the production line of Obidoxime chloride medicine that fixes the effects of chemical substances on the body.

Speaking to reporters, Dehqan said the defense ministry will continue to design, invent and produce modern equipment and products for protection of its armed forces.

Also in February, the defense ministry had also unveiled 7 national geographic projects.

The projects included a remote defense lab - national spectral sensing, first unmanned smart hydrography Fajr 1 (Dawn 1), coastal development of Makran, production line of digital marine maps, digital geomorphology maps, magnetic marine measuring systems, climate database, and geographic data production line using drone images.

Minister Dehqan said, "The Fajr 1 hydrography is a remote control system, able to transmit data and image, GPS, measure depths, advance multibeam systems, and side scan sonar and radar data."

On the applications of digital maps of geomorphology system, he said they can be used in scientific and research projects, as well as in geography, environment, construction, development, agriculture, defense logistics, civil defense, and military affairs.

According to Dehqan, the database on climate will be used for military and defense purposes, including in tarmacs, military drills, and troop deployments.

Toronto Star

Federal documents could mask the scope of actual surveillance activities

Friday, 15 July 2016

Byline: Alex Boutilier

Section: general

Ottawa - "Clear gaps" in how the federal government reports invasive surveillance practices may hide the true scope of police activities, according to documents prepared for Canada's privacy watchdog.

Although the number of authorized wiretaps has "plummeted" since 2002, a January briefing for Privacy Commissioner Daniel Therrien suggests those numbers may mask police surveillance practices.

"It would be erroneous to infer from the drop in overall warrants issued that surveillance is affecting fewer individuals," reads the document, obtained under access to information law.

"While federal authorities issued just over a hundred surveillance warrants last year (2014), they issued 792 notifications of surveillance to individuals previously targeted. From this, one can conclude more and more individuals are being named as targets in a warrant application.

"With a single warrant from the Federal Court (police) may list dozens of individuals for surveillance targeting."

Public Safety is required to issue a report each year about the number of warrants sought to put individuals under surveillance - "wiretap" warrants that allow police extraordinary powers to keep tabs on individuals.

But police aren't just bugging the phones of bad guys anymore. New technology allows law enforcement agencies to conduct surveillance on a much wider scale.

The documents note that the decline in warrants "must also be kept in perspective against" newer surveillance powers that don't have to be publicly reported, including production orders for account information, warrants for GPS location devices and requests for "metadata."

Canada has also seen confirmed uses of "Stingray" technology, a device, called an IMSI catcher, that simulates a cellphone tower to force any mobile device in the area to connect to it. A recent Vice News investigation reported the RCMP has used IMSI catchers in public places for more than a decade, citing court documents.

The Star requested an interview with both Therrien and Public Safety Minister Ralph Goodale for this article. Neither was available Wednesday or Thursday.

But in an emailed response to the Star, a spokesman for Goodale said the minister is open to changing the system.

"Reporting is an important component of Canada's system accountability for security agencies," Scott Bardsley wrote.

"We're open to consideration in this review (of national security oversight) of how to improve these elements to better achieve our two objectives (of) ensuring that our police and security agencies are being effective ... and safeguarding the values, rights and freedoms of Canadians in a plural, open, democratic society."

Lisa Austin, a law professor at the University of Toronto specializing in privacy issues, said calls globally for transparency about police surveillance have increased, not just for wiretap warrants, but for any extraordinary powers for law enforcement snooping.

But it's not about pitting privacy rights against cops legitimately trying to do their jobs, Austin added.

"It's not about preventing access to the information that the state needs to pursue law enforcement or national security," Austin said Wednesday.

"I dislike it when the debate is about privacy versus law enforcement ... because the law has never been that. It's always been about balancing and accountability."

104 Number of applications or renewals for surveillance warrants in 2014, the most recent year Public Safety has released data.

0 Number of applications not approved in Federal Court.

45 Number of surveillance requests for drug trafficking, the most frequent offence where surveillance is sought, compared to 30 for terrorism.

14 Number of police convictionsin cases where surveillance was deployed.

Surge in cyber sleuths

Friday, 15 July 2016

Byline: Lauren Ahwan

Section: general

Canberra - Students just halfway through their cyber security training are being snatched up by employers as the world struggles to meet the need for increased computer vigilance.
The demand for cyber security workers is expected to increase to six million globally by 2019, with a projected shortfall of 1.5 million workers, says the world's largest security software company Symantec.

University of NSW computer security, cybercrime and cyber terror associate professor Richard Buckland says employers are paying top dollar for workers - even those that are yet to complete their training. "At the moment, the shortage is so big that I don't think people need the piece of paper (qualification)," he says.

"I have (employers) coming up to me and saying, 'Give me your best students'. Well, I can't even give them my worst students because they all have jobs already and they're only in their second year (of a three or four year degree).

"Students who have just finished their first year are being snaffled up by the NSA (National Security Agency) or Google or Microsoft in the US.

"Some are working locally for the big banks." UNSW and the Commonwealth Bank recently launched a $1.6 million cyber security education and research centre, which includes a free online course that has already attracted 15,000 enrolments.

Box Hill Institute of TAFE offers a one-year Certificate IV in Cyber Security - believed to be the first vocational course in cyber security on offer in Australia.

Career changer Joseph Speziale, 31, is a marine engineer and one of the first to enrol in the vocational program."The thing I like most about cyber security is that it is not just limited to keeping your work computers safe - it's about making sure someone's phone won't do any damage, someone's laptop doesn't have a bug, but at the same time not restrict people from doing their job," he says.

NPR

NSA Boss Says U.S. Cyber Troops Are Nearly Ready

Friday, 15 July 2016

Byline: Victoria Mirian

Section: general

Washington - The director of the National Security Agency says his first few dedicated cyber troops will be operational by early fall but the nation can't wait for the full unit to be ready.
The military's Cyber Mission Force, which will eventually contain 6,200 people split into 133 teams, is the largest single unit dedicated to operating in computer networks. It's intended to both attack and defend computer systems around the world.

The U.S. Cyber Command ordered the creation of this dedicated cyber unit in 2012, and Adm. Michael Rogers, who is the director of the NSA and the Cyber Command, says the unit will reach what he called initial operating capability by Sept. 30.

"We find ourselves in a situation a little unusual in the military arena," Rogers told a crowd at the National Press Club Thursday. "As soon as we get a basic framework, we are deploying the teams and putting them against challenges."

Rogers likened it to sending a fighter squadron into action that only had five of its 24 aircraft. Because demand for cybersecurity exceeds capacity, Rogers said, the mission force will be put to work before the agency has time to finish building it.

He said he's trying to build the force, made up of both military personnel and civilians, even as his agency faces budget cuts. He said it'll be fully capable by Sept. 30, 2018.

"I just always feel like we're in a race to make sure we are generating capacity and capability, and that we are doing it faster than those who would attempt to do harm to us," Rogers said. "As you watch what opponents are doing, as I'm watching behaviors out on the net, it's almost visceral."

According to the Department of Defense, about half of the Cyber Mission Force teams will be assigned to protecting military networks from cyber intrusions. Another 20 percent will be dedicated to combat missions. About 10 percent will be assigned to national mission teams to protect the country's infrastructure, and the remaining fifth will be assigned to "support teams."

Rogers said he wants cyber to be integrated into the military and become a tool available to policymakers and operational commanders, as long as it's used legally. He said he's tried to stay mindful about the need to balance protecting the privacy and rights of individuals with the government's duty to protect citizens.

"I always tell [our workers], 'Don't ever forget that at the end, we're dealing with a choice that some human made on a keyboard somewhere else in the world,' " he said. "There was a man or woman on the other end of this."

SC Magazine

Maxthon browser vulnerable to Chinese cyberespionage and MitM attacks

Friday, 15 July 2016

Byline: Robert Abel

Section: general

New York - Researchers at Fidelis Cybersecurity and Poland-based Exatel found that the Maxthon browser sends sensitive data to a browser in Beijing and is prone to man-in-the-middle (MitM) attacks. The browser regularly sends a small encrypted file containing the user's entire browsing history, including Google searches, queries and a complete list of software installed on the user's computer, all without the prior authorization of the user, according to a recent report released by the firms.

The file is created as part of the Maxthon User Experience Improvement Program (UEIP), which is designed to understand users' needs to deliver better products and services. The program is supposed to be voluntary, but researchers found the information was being sent regardless of the user's decision to opt in or out of the program.

A Maxthon customer who opted out of the program noticed the file being sent and asked a representative on the company's official browser forum for clarification of the file's contents, to which the representative responded that the firm will "only collect basic data such as browser start condition and not the data that involves the user's privacy," according to screenshot of the conversation in the report.

"What adds irony to the whole matter, is that the creators of the browser inform on their website that it was created with the thought of ensuring security and privacy to the users in the light of scandals related to violation of the privacy by the American National Security Agency (NSA)," the report said.

Researchers said many users appear to be fond of the browser specifically because the creators don't share data with the NSA.

In addition, due to an error in the cryptographic architecture, the data which is transmitted may be intercepted and decrypted by any potential attacker, researchers said.

Using this information, if attackers obtained the user's email they could send a message, authenticated by its content, containing an attachment armed with a remote code execution exploit that could compromise the user's device, the report said.

The data collected could be analyzed for identifying targets based on the URLs users browse and applications on their devices which can be cross referenced with a vulnerability database to learn what sort of spearphishing attacks would work against them, Fidelis Cybersecurity Chief Security Officer Justin Harvey told SCMagazine.com via emailed comments.

"I personally believe it is possible that this information was being collected as a means of surveillance, for both foreign and domestic use cases," said Harvey.

Harvey also said that it's illegal to bypass the "Great Firewall" domestically in China and that people looking to use Facebook, Twitter, Google, or any other banned sites, need to use forbidden VPNs. The browser also provides a way for China to monitor citizens' Internet usage overseas, he added.

"Regardless of which network is being used, the way that the Maxthon browser is set up today, it will send their browsing history back to Maxthon's HQ," Harvey said. "How could the Chinese government not have access to this treasure trove of information?"

The browser is available for all major platforms in more than 50 languages and it is unclear how long Maxthon has been collecting this information.

New York Times

Limits on Privacy Board Face Challenge in Senate

Friday, 15 July 2016

Byline: Charlie Savage

Section: general

Washington - A leading Democrat in Congress is pushing back against an effort to impose new constraints on a civil liberties watchdog agency that investigates the nation's security programs. The agency, the Privacy and Civil Liberties Oversight Board, is a bipartisan five-member panel that Congress created after a recommendation by the commission that investigated the Sept. 11, 2001, terrorist attacks. Its members and staff have security clearances and a mandate to investigate government practices that affect individual rights.

The Senate and House intelligence committees have increasingly sought to impose new rules on the board's work, including a series of proposals in a pending intelligence authorization bill. But in a letter this week to Senate Intelligence Committee leaders, Senator Patrick J. Leahy, the top Democrat on the Judiciary Committee, demanded that the proposals be withdrawn.

Since the independent board began fully operating three years ago, it has produced a high-profile report about the once-secret National Security Agency program that collected bulk records of Americans'

phone calls. It called the program ineffective and illegal and said it should be shut down. Congress later did so by enacting the U.S.A. Freedom Act.

The oversight board also issued a report that brought to light new details about how the warrantless surveillance program authorized by the FISA Amendments Act worked. It is currently scrutinizing programs that operate under Executive Order 12333, which sets rules for espionage activities that Congress has left unregulated by statute.

In the letter, obtained by The New York Times, Mr. Leahy, Democrat of Vermont, described the provisions as "completely unacceptable" and "misguided." He deplored what he portrayed as an emerging pattern of efforts by the intelligence panels to undermine the oversight board's independence and authority. He also said any proposed changes to the board should go through the Judiciary Committee.

The dispute traces back to last spring, when the chairman of the oversight board at the time, David Medine, wrote an essay proposing that its mandate be broadened to also examine proposed targeted killing operations. In response, the two intelligence committees added a provision to the annual intelligence authorization law last year that barred the board from addressing covert activities.

The versions of this year's intelligence bill by the House and Senate committees would go further. For example, the Senate bill would limit the oversight board's jurisdiction to Americans' rights, not the privacy of foreigners.

That proposal comes at a time when the Obama administration has highlighted the privacy board's role in negotiations over a recently completed trans-Atlantic agreement for handling private data amid concern in Europe about using internet and technology companies based in America. Those concerns came after leaks by the former intelligence contractor Edward J. Snowden about National Security Agency surveillance programs.

In addition, the House version would change budgeting rules for the oversight board so that it would have to shut down if Congress did not act every year to reauthorize it to spend money. The versions in both chambers would require the board to tell the intelligence committees and the heads of intelligence agencies what it is investigating.

Mr. Medine, who stepped down as the board's chairman on July 1, said that the proposed changes were unwise in light of what was exposed by the Snowden leaks.

"The lesson from Snowden is how critical it is to have democratic debate and oversight of our intelligence community to give it credibility both nationally and internationally," he said. "Now we have the intelligence committees trying to undercut that and push the intelligence community back into the shadows again."

Senator Ron Wyden, Democrat of Oregon and an Intelligence Committee member, has also objected to provisions in the bill that would weaken the oversight board, as has a coalition of technology companies and privacy advocates.

The chairman of the Senate Intelligence Committee, Richard M. Burr, Republican of North Carolina, did not respond to a request for comment. But the chairman of the House Intelligence Committee, Representative Devin Nunes, Republican of California, pushed back.

"As is clear from the text of the bill, the Intelligence Authorization Act does not undermine Pclob in any way -- it simply establishes mechanisms to keep Congress fully informed of what the board is doing so Congress can exert proper oversight," Mr. Nunes said in a statement. Pclob is an acronym for Privacy and Civil Liberties Oversight Board.

He also portrayed the fear that Congress might not act each year to authorize the oversight board as "simply false," saying it could do so in a spending bill even if the annual intelligence authorization bill failed.

But Democratic leaders signaled openness to changing the bills. Senator Dianne Feinstein of California, the vice chairwoman of the Intelligence Committee, said in a statement, "We're aware of Senator Leahy's letter, and I'm happy to work with him to resolve his concerns." And Representative Adam B. Schiff of California, the top Democrat on the House Intelligence Committee, said he shared Mr. Leahy's concern.

Washington Free Beacon

State Department Farms Out Counter-ISIS Messaging Abroad

Thursday, 14 July 2016

Byline: Bill Gertz

Section: general

Washington - The State Department's latest effort to counter Islamic State propaganda and recruitment is relying on foreign states for strategic messaging, according to the department's public diplomacy official.
Richard A. Stengel, the undersecretary of state for public diplomacy, testified to Congress that the Obama administration believes other countries can better deal with terrorist information operations than the United States. He asserted that U.S. government propaganda is helping recruit terrorists.

"Our strategy is informed by a core insight: we are not always the best messengers for the message we want to deliver," Stengel told the House Foreign Affairs Committee on Wednesday. "Public statements from U.S. government officials condemning ISIL can easily be used by the enemy as a recruitment tool."

The latest approach to countering ISIS propaganda is the mission of the State Department's new Global Engagement Center, created in March.

The center replaced the troubled Center for Counterterrorism Communications earlier this year.

A six member panel of experts from the tech industry reviewed the operations of that center and concluded in December that the U.S. government should not be engaged in information operations against the Islamic terror group. The panel said it was concerned that the center lacked credibility in the Muslim world.

Critics contend that allowing foreign states, including Muslim majority countries, to take the lead in counter-terrorism messaging will result in promoting other forms of radical Islam, such as the Saudi variant known as Salafism, or the Egyptian-origin extremism of the Muslim Brotherhood.

President Obama in 2011 signed a secret directive that outlined U.S. policies to support the Muslim Brotherhood as an ideological alternative to al Qaeda, according to a State Department official.

Patrick S. Poole, a counterterrorism expert, criticized the State Department counter-ideology program as ineffective. The Center for Strategic Communications was a "disaster" and may have actually "legitimized terrorism," he said. Now, the new center has farmed out the mission to foreign states, Poole said.

"So basically we have foreign nationals running our information operations," Poole said. "It's an embarrassing testament to how ill-conceived and poorly executed the State Department's efforts have been under the Obama administration."

Stengel described the new counter-ISIS soft power initiative as "partner-driven messaging."

"Instead of direct messaging to potential ISIL sympathizers, much of our work focuses on supporting and empowering a global network of partners--from NGOs to foreign governments to religious leaders--who can act as more credible messengers to target audiences," he said.

Ultimately, Stengel said long-term success would result in a media environment "that does not require U.S. government messaging at all, because NGOs, local governments, partners, and credible voices are effectively drowning out ISIL's message of hate."

In the short term, the number of foreign fighters joining ISIS is declining sharply and media and social media activity by the terror group also has diminished.

A key focus is on what is called the Sawab Center, in Abu Dhabi in the United Arab Emirates, a Persian Gulf state, where U.S. officials work with Emiratis. So far nine social media campaigns using victims of terrorism and defectors to speak in favor of what Stengel said was "national pride."

The campaigns have averages of 125 million views on social media.

The Abu Dhabi center is being bolstered with similar "messaging centers" in Jordan, Nigeria, and Malaysia.

The center is using big data analytics to measure social media activity.

According to Stengel, anti-ISIS content online outnumbers pro-ISIS content by a ratio of six to one.

Under U.S. government prodding, Facebook and Twitter have been working to eliminate ISIS content and users from their services.

However, Stengel acknowledged that as terrorists are driven off of platforms like Twitter and Facebook, they are moving to new and more difficult to counter platforms, like Telegram, a cloud-based messaging and communications service that uses encryption.

Despite the signs of messaging progress, ISIS Islamic terror ideology is spreading to other parts of the world, Stengel said.

Committee Chairman Rep. Ed Royce, (R., Calif.) told the hearing the Internet is "awash" in ISIS propaganda, including gruesome videos of beheadings and other violent acts by ISIS terrorists.

Operating globally, ISIS operates a "virtual caliphate" to recruit members and propagandize.

"Using popular social media sites, ISIS can reach a global audience within seconds," Royce said.

Instead of urging fighters to travel to Syria and Iraq, ISIS is now telling overseas supporters to conduct attacks locally.

According to Royce, "more and more, the virtual caliphate is calling on its followers not to go to Syria, Iraq or Libya and take up arms--but to attack where they are at home. Orlando is a grim example of that."

An Islamic terrorist killed 49 people at an Orlando nightclub, pledging loyalty to the Islamic State during the attack.

ISIS had announced in June that the observance of Ramadan would be a time of global attacks in the United States and Europe. The Obama administration issued no warnings and took no additional security measures until after the Orlando shooting.

"Time is of the essence. If we don't come to grips with the virtual caliphate now, this struggle against Islamist terrorism will become more challenging by the day," Royce said.

Analysts say the Obama administration counter-ISIS ideology program has been hampered by the president's pro-Islam sympathies and his refusal to identify the threat from terrorism as based on radical Islam.

The president last month defended his reluctance to identify violent extremism as derived from Islam. "Calling a threat by a different name does not make it go away. This is a political distraction," he said.

However, other counterterrorism analysts say unless the nature of the terrorist threat is properly understood, efforts to defeat the threat will not be successful.

Under Obama foreign and security policies, Islamic terrorism has evolved from al Qaeda-style extremists conducting mass casualty attacks to more violent and deadly Islamic State- style attacks aimed at seizing and holding territory and then expanding both regional and globally.

Why the U.S. Pretends Drone Strikes Are Secret

Thursday, 14 July 2016

Byline: Eli Lake

Section: column

Column - One of the absurdities about the war on terror is that drone strikes are almost always highly classified by the U.S. government. It's hard to think of a more conspicuous state secret than a pilotless aircraft turning its target into a fireball. And yet, until recently, the Obama administration was reluctant to talk about this publicly in much detail.
This is starting to change. In May, President Barack Obama himself acknowledged the U.S. drone strike that killed Taliban leader Mullah Akhtar Mohammed Mansour. The acknowledgement was significant because he was killed in southwestern Pakistan, a country the U.S. does not consider an active combat

zone. Earlier this month, the White House released data for the first time on civilians it estimates have been killed in drone strikes outside of combat zones As one U.S. intelligence official told me Wednesday, the government is beginning to push the envelope on how much it can discuss about its drone strike operations in countries where the U.S. does not acknowledge the war it's fighting against al Qaeda and the Islamic State.

All of this openness at the end of Obama's second term is welcome. But it's fair to ask, what took so long? On Wednesday, CIA director John Brennan provided a part of this answer: The U.S. operates with the consent of governments where these strikes are happening. There's a catch though. "Sometimes these governments do not want to trumpet that cooperation and they want to keep it quiet," Brennan said. "But I will just caution people to think the United States just goes into airspace abroad without engaging with foreign governments."

We knew from sources like the diplomatic cables disclosed in 2010 by Wikileaks that some countries have acknowledged privately that they lie to their own populations about this issue. One such cable recorded Ali Abdullah Saleh, then president of Yemen, telling General David Petraeus, "We'll continue saying the bombs are ours, not yours."

Nonetheless, it's important Brennan went on the record about this. On the one hand, the request from foreign governments for this secrecy is understandable. None of these leaders would want to admit a super power was operating in his territory. This is particularly true in the Islamic world, where America and its drones are perceived by many as the tip of an imperial spear.

But Americans pay a price for this diplomatic discretion. It means an active American war in Libya, Pakistan, Somalia and Yemen is largely ignored in the public debate. When the U.S. finally does release its own information about these fields of battle, the delay raises suspicions. Many outside groups said the civilian casualty numbers released this month were too low to be believed.

Finally though, the U.S. does a disservice to the counterterrorism partners who requested the secrecy in the first place. The people in these countries know who is flying the drones. By pretending otherwise, their leaders forgo the chance to make the public case for U.S. airstrikes. Eventually that lie will catch up with even the most discreet dictators and threaten the quiet alliance that all this secrecy was supposed to protect in the first place.

CSIS joins Twitter, hilarity ensues
Wednesday, 20 July 2016

The Canadian Security Intelligence Service (CSIS) started up a Twitter account last week, and had a little fun with people with its first tweet.
"Yes, we're on Twitter. Now it's your turn to follow us," it told the Twitterverse.

Social media users responded with good humour, generally. Ian Adam asked CSIS through Twitter, "And if you follow back, should I be really, really nervous?"

Things got a little more serious as writer and marketing consultant Karen Geier, under the handle Happy L'il Tree, wrote, "loving the completely chill attitude regarding your charter busting surveillance of citizens. GREAT COMEDY GUYS."

CSIS also received a tweet from the Communications Security Establishment (CSE) Canada, which said, "Welcome to Twitter! Allow us to offer some neighbourly advice: 'password' is never a good password!"

The U.S. Central Intelligence Agency (CIA) became an early follower of CSIS on Twitter. When the CIA joined Twitter in 2014, it tweeted, "We can neither confirm nor deny that this is our first tweet."

Canadian Press
Electronic spy agency mum on foreign info-sharing that could lead to torture
Wednesday, 20 July 2016
Byline: Jim Bronskill

OTTAWA - Canada's electronic spy agency won't say how often it shares information that could lead to someone being tortured in an overseas prison.
The Communications Security Establishment - which monitors threats from foreign terrorists and spies - has censored documents that spell out the figures, even though the RCMP and Canadian Security Intelligence Service have revealed such numbers in the past.

The reticence prompted Amnesty International Canada to say "much greater transparency" is needed from the Ottawa-based CSE.

"At stake is Canada's compliance with crucial international human rights obligations to prevent torture and ill- treatment," said Alex Neve, Amnesty's Canadian secretary general.

The secretive CSE has been thrust into the national spotlight in recent years due to leaks by Edward Snowden, the former spy contractor who worked for the National Security Agency, CSE's American counterpart.

It is also among a handful of Canadian agencies, including the RCMP, CSIS, the Canada Border Services Agency and National Defence, bound by a government instruction that allows it to share information with foreign partners - even when it means someone could be abused as a result of that exchange.

Public Safety Minister Ralph Goodale said earlier this year the Liberals will review the "troubling set of issues" raised by the foreign-sharing policy, enacted by the previous Conservative government.

A four-page 2010 federal framework document says when there is a "substantial risk" that sending information to - or soliciting information from - a foreign agency would result in torture, the matter should be referred to the responsible deputy minister or agency head.

In deciding what to do, the agency head will consider factors including the threat to Canada's national security and the nature and imminence of the threat; the status of Canada's relationship with - and the human rights record of - the foreign agency; and the rationale for believing that sharing the information would lead to torture.

Records obtained by The Canadian Press under the Access to Information Act offer a glimpse into how the CSE handled such cases in the first three months of 2015.

The quarterly report to CSE Chief Greta Bossenmaier, labelled Top Secret and for Canadian Eyes Only, told her the number of cases that required a "mistreatment risk assessment" and the level of risk associated with passing the information to others.

But those details were deleted from the publicly released version of the document.

Under the rules for deciding whether to share, the greater the risk, the higher the level of approval required. When the risk of mistreatment is low, a manager can decide. When the risk is substantial and cannot be managed - for instance, by seeking assurances from the foreign agency that someone will not be harmed - then the CSE chief or the defence minister must make the call.

The report says there were "no known instances" of a recipient country's non-compliance with conditions attached to information-sharing during the three months. But little else was disclosed.

The CSE faces "unique considerations" it must weigh when discussing details of assessments, said Christopher Williams, a senior spokesman for the intelligence agency. "With this in mind, we are not able to release the specific number you have requested without risking revealing insight into our capabilities."

However, the number and content of such assessments are reviewed by the independent watchdog who keeps an eye on the CSE, said Williams.

In addition, none of the requests in the three-month period involved a Canadian, all green-lighted information-sharing requests got the nod "to help mitigate foreign security threats," and requests are approved only after a thorough review, he added.

Amnesty's Neve said that when Canada shares intelligence information, there is a very real risk of contributing to torture.

The assessments are the safeguard meant to ensure that does not happen, he said.

"For Canadians to have any confidence that is the case we do, at a minimum, need details of how many assessments are being conducted, the breakdown of requests that are approved and denied, and some general information that conveys the basis for the decisions that have been reached."

New York Times
WhatsApp Is Briefly Shut Down in Brazil for a Third Time
Wednesday, 20 July 2016
Byline: Vinod Sreeharsha

Rio de Janeiro - For months, authorities in Brazil have sought access to digital data from WhatsApp to aid in criminal investigations. WhatsApp has repeatedly resisted the requests.
On Tuesday, the same clash erupted again, for the third time in less than a year. A Brazilian judge in a state criminal court in Duque de Caxias, in Rio de Janeiro, ordered a nationwide shutdown of WhatsApp after the popular messaging service, which is owned by Facebook, did not turn over user data requested by authorities as part of a criminal investigation. A few hours later, Brazil's Supreme Court overturned the order.

Despite the brevity of the episode, the case is part of a broader debate worldwide about when law enforcement officials and governments should have access to the digital data kept by tech companies. Many of the companies, like Apple and Microsoft, have said they are unwilling to turn over such data to authorities because doing so would infringe on the privacy rights of their customers. But authorities have argued that they need the data for security reasons.

In Brazil, WhatsApp faced two previous shutdowns -- one last December, and another in May -- for not turning over digital information. Both of those bans were also quickly overturned on appeal by higher court judges. In March, a Facebook executive was briefly taken into custody for refusing to comply with similar orders to turn over information from WhatsApp.

In the court ruling on Tuesday that ordered WhatsApp to be shut down, Judge Daniela Barbosa Assumpção de Souza said in a court statement that WhatsApp "cannot be offered to more than 100 million Brazilians without complying with the laws of the country, while failing to comply with judicial orders and obstructing criminal investigations."

"Especially when that activity leads to large profits, it is not credible that the company's representatives cannot appear before the court in order to comply with judicial decisions," the judge said.

Several previous requests had been made to Facebook for data, according to the court statement. The company is being fined 50,000 reais per day, or about $15,387, until it complies. Judge Barbosa also requested the company be investigated for obstruction of justice.

WhatsApp has end- to-end encryption of its communications, which makes it difficult to give third parties access to messages.

"As we've said in the past, we cannot share information we don't have access to," WhatsApp said in a statement.

After the Supreme Court overturned the lower court's order, the company said, "The Supreme Court swiftly rejected today's block, finding that it was disproportionate and violated people's fundamental freedom of expression."

Still, while the Supreme Court ruling referred to WhatsApp's nationwide shutdown, it did not address the merits of whether judges can require companies to provide data, suggesting the larger issue is far from settled.

Jan Koum, WhatsApp's chief executive, said in a Facebook post before the court order was overturned that "millions of people are cut off from friends, loved ones, customers and colleagues today, simply because we are being asked for information we don't have."

Access Now, a digital rights group, also called the initial court ruling disproportionate.

Peter Micek, global policy and legal counsel for Access Now, said in a statement, "Encryption keeps us safe, and companies need encouragement, not penalties, for taking steps like WhatsApp's end-to-end encryption that protects our data."

Jakarta Post
Pokemon Go could be used to detect secret info, minister warns
Wednesday, 20 July 2016
Byline: Marguerite Afra Sapiie

Jakarta - Defense Minister Ryamizard Ryacudu has warned players of Pokeman Go that their games may be used to detect the secretive information by foreign countries through smartphone cameras.

All media, including augmented reality game Pokemon, are susceptible to being used as surveillance tools since they can detect intelligence information without the awareness of the gamers, the minister said on Monday.

"We have to be very careful. [Secretive information] can be leaked through any form of media and channel, including this Pokemon Go game," Ryamizard said on Monday.

With the advance of technology, Ryamizard said there were now tools that could overhear people's conversations from a distance of 50 meters, adding that smartphone-based games might have similar abilities.

Last week, a statement from the Military Intelligence Division (BAIS) Cyber Taskforce circulated among the media, saying that people should not pay Pokemon Go in strategic locations, especially within military bases, to avoid intelligence information being leaked.

When playing the game, the players are unconsciously collecting information at locations through photos and videos captured on their smartphones, and the information could be employed by foreign intelligence bodies, the statement said.

Saudi Gazette
Daesh websites push young Saudis to join terror network
Wednesday, 20 July 2016

Jeddah - Many suspected Saudi militants have subscribed to Daesh ideas of an Islamic caliphate and wanted to participate in jihad in Iraq and Syria but they have not joined the terror group yet, according to Abdul Monem Al-Moshaweh, chairman of Assakeena Campaign.
He said some of these youths have adopted the takfiri ideology, which brands those who do not agree with it as infidels. "They have expressed their desire to contribute toward realizing the Islamic khilafat and to support weak Muslim communities," Al-Moshaweh said.

Speaking to Makkah Arabic daily, Al- Moshaweh said many militants joined the terrorist group in order to find out the truth or just to experience the thrill of fighting. "They did not listen to anti-terrorism awareness programs and media campaigns," he pointed out.

Al-Moshaweh said terrorist groups have found it easy to recruit young Saudis who subscribe to extremist views and believe in violence through their social networking websites.

However, Al-Moshaweh pointed out that some of these militants were ready for dialogue and discussions and could renounce their extremist thoughts either partly or fully. "We have found that terrorist groups influence these youths and turn them to armed terrorists."

He said the Kingdom's security agencies have been successful in defeating terrorism by cutting the link between terrorist leaders and their sympathizers. The Assakeena Campaign has been successful in changing the mindset of militants and bringing them back to the mainstream as responsible citizens.

The campaign has conducted dialogues with young Saudi men and women to convince them to change from the terrorist path.

"Most of them are convinced and wanted to change, but they fear for their safety," he said. "Many of them were influenced by extremist ideology propagated through websites."

He said the preemptive efforts of security forces were pivotal in foiling many terrorist operations across the Kingdom. "The two terrorists who killed their mother in Riyadh were prepared to carry out any acts of violence anywhere in the Kingdom," Al-Moshaweh said.

"An individual who can kill his mother will not hesitate to commit any crime," he pointed out. "In 2016, like 2013, terrorist groups succeeded in recruiting a large number of youths who were not linked to any of the terror networks."

Al-Moshaweh said: "Some of these youths say they don't have any connection to Daesh or Al-Qaeda. At the same time, they share the thoughts and views of these groups."

He said Assakina has given answers to four difficult questions on how to combat terror, especially after the recent terrorist attacks in the Kingdom.

Saudi Gazette
Insider corporate data theft big threat to digital business
Wednesday, 20 July 2016
Byline: Staff Report

Riyadh - Insider data theft and malware attacks top the list of the most significant concerns for enterprise security executives, a new report from Accenture and HfS Research reveals. Of those surveyed, a majority (69 percent) of respondents experienced an attempted or successful theft or corruption of data by insiders during the prior 12 months, with media and technology organizations reporting the highest rate (77 percent). This insider risk will continue to be an issue, with security professionals' concerns over insider theft of corporate information alone rising by nearly two-thirds over the coming 12 to 18 months. Additionally, the research shows that a budget shortage for hiring cybersecurity talent and well-trained employees is hindering the ability of organizations to properly defend themselves against these attacks.
The survey, "The State of Cybersecurity and Digital Trust 2016", was conducted by HfS Research on behalf of Accenture. More than 200 C-level security executives and other IT professionals were polled across a range of geographies and vertical industry sectors. The survey examined the current and future

state of cybersecurity within the enterprise and the recommended steps to enable digital trust throughout the extended ecosystem. The findings indicate that there are significant gaps between talent supply and demand, a disconnect between security teams and management expectations, and considerable disparity between budget needs and actual budget realities.

"Our research paints a sobering picture. Security leaders believe threats are not going away, in fact they expect them to increase and hinder their ability to safeguard critical data and establish digital trust," said Kelly Bissell, senior managing director, Accenture Security. "At the same time, while organizations want to invest in advanced cyber technologies, they simply don't have enough budget to recruit or train skilled people to use that technology effectively. To better manage this security problem, businesses will need to work in tandem with the extended enterprise ecosystem - business units, partners, providers and end users - to create an environment of digital trust."

Despite having advanced technology solutions, nearly half of all respondents (48 percent) indicate they are either strongly or critically concerned about insider data theft and malware infections (42 percent) in the next 12 to 18 months. When asked about current funding and staffing levels some 42 percent of respondents said they need more budget for hiring cybersecurity professionals and for training. More than half (54 percent) of respondents also indicated that their current employees are underprepared to prevent security breaches and the numbers are only slightly better when it comes to detecting (47 percent) and responding (45 percent) to incidents.

The report identified five significant gaps disrupting the ability of enterprises to effectively prevent or mitigate well-organized and targeted cyber attacks, including:

. Talent: Thirty-one percent list either lack of training or staffing budget as their single biggest inhibitor to combating attacks.

. Technology: Firewalls and encryption top the list of the most important technologies to combat cyber threats, but the largest increase in deployments anticipated in the next 12 to 18 months are in the areas of cognitive computing and AI (31 percent) and data anonymization (25).

. Parity: An enterprise is only as secure as its least secure partner, yet only 35-57 percent of all enterprises said they assess ecosystem partners for cyber integrity and preparedness, with BPO partners being the least vetted and credit partners being the most vetted.

. Budget: Seventy percent cite a lack of, or inadequate, funding for either cybersecurity technology or security talent, including training.

. Management: While 54 percent of respondents agree or strongly agree that cybersecurity is an enabler of digital trust for consumers, 36 percent believe that their executive management considers cybersecurity an unnecessary cost.

"While the gaps we identified can be overcome, they do collectively underscore the need for an inherently different approach, one that includes more robust risk management measures and the development of digital trust," said Fred McClimans, research vice president, Digital Trust and Cybersecurity, HfS Research. "There is an important opportunity to address these gaps by rethinking how digital trust and security can be holistically woven into the enterprise fabric through the integration of automation and AI solutions as well as through business partnerships and processes."

Reuters
Europe eyes Israeli technology for spotting lone-wolf terrorists online
Wednesday, 20 July 2016

Tel Aviv - European powers are trying to develop better means for pre-emptively spotting "lone-wolf" militants from their online activities and are looking to Israeli-developed technologies, a senior EU security official said on Tuesday.
Last week's truck rampage in France and Monday's axe attack aboard a train in Germany have raised European concern about self-radicalized assailants who have little or no communications with militant groups that could be intercepted by spy agencies.

"How do you capture some signs of someone who has no contact with any organization, is just inspired and started expressing some kind of allegiance? I don't know. It's a challenge," EU Counter-Terrorism Coordinator Gilles de Kerchove told Reuters on the sidelines of a intelligence conference in Tel Aviv.

Internet companies asked to monitor their own platforms' content for material that might flag militants had begged off, De Kerchove said. He said they had argued that the information was too massive to sift through and contextualize, unlike pedophile pornography, for which there were automatic detectors.

"So maybe a human's intervention is needed. So you cannot just let the machine do it," De Kerchove said. But he said he hoped "we will soon find ways to be much more automated" in sifting through social networks. "That is why I am here," he said of his visit to Israel. "We know Israel has developed a lot of capability in cyber."

Beset by Palestinian street attacks, often by young individuals using rudimentary weapons and without links to armed factions, Israeli security agencies that once focused on "meta data", or information regarding suspects' communications patterns, have refocused on social media in hope of gaining advance warnings from private posts.

Israeli officials do not disclose how far the technology has come, but private experts say the methods are enough to provide often basic alerts regarding potential attackers, then require follow-up investigation.

"Nine out of 10 times, the terrorist has contacts with others who provide support or inspiration, so meta data still applies," said Haim Tomer, a former Mossad intelligence division chief turned security consultant.

When it comes to true lone wolves, even a valedictory Facebook message can often be picked up by Israel, he said.

"But in such cases, it would be a low-level 'green alert', meaning the person should be looked at further, whereas a 'red alert' would warrant instant action. That leaves the security services to decide how to handle matters," Tomer said.

As De Kerchove was at pains to make clear to the conference, European standards of civil rights, such as privacy, make the introduction of intrusive intelligence-gathering technologies in the public sphere and aggressive police follow-ups difficult.

While Israel's emergency laws give security services more leeway, its intelligence minister, Yisrael Katz, called for cooperation with Internet providers rather than state crackdowns. He cited, for example, the encryption provided by messaging platform WhatsApp which, he said, could be a new way for militants to communicate and evade detection.

"We will not block these services," Katz told the conference. "What is needed is an international organization, preferably headed by the United States, where shared (security) concerns need to be defined, characterized."

Moscow Times
Cybercriminals Steal $21M from Russian Banks in 12 Months
Tuesday, 19 July 2016
Byline: Staff report

Moscow - Cybercriminals have stolen 1.37 billion rubles ($22 million) from Russian banks since last May, Russia's Central Bank announced Tuesday.
The figures come from a report marking the first-year anniversary of the Central Bank's cyber-space monitoring service FinCERT, created specifically to prevent the spread of cybercrime.

FinCERT recorded 20 major cyber attacks on Russian banks from May 2015 to June 2016, with criminals attempting to steal a total of 2.87 billion rubles ($45 million.)

Phishing websites and fake SMS and email messages claiming to be from FinCERT formed the basis of many of the attacks, along with ATM theft.

Roughly 100 million rubles ($1.5 million) has been stolen through ATMs and point-of-sale terminals since November 2015, using such as card reading devices at payment points in restaurants and stores.

FinCERT representatives warned holders of the national Mir payment card last month that the cards may be vulnerable to cyber attacks. The card was introduced to cut Russia's reliance on foreign firms like Visa and MasterCard.

The Central Bank and Ministry of Finance have also proposed changes in federal laws which would allow them greater powers to combat individual cases of cybercrime, according to the report.

The Guardian (London)
Turkey blocks access to WikiLeaks after Erdogan party emails go online
Wednesday, 20 July 2016
Byline: Staff report

Istanbul - Turkey has blocked access to the WikiLeaks website, the telecoms watchdog has said, after nearly 300,000 emails from president Recep Tayyip Erdogan's ruling Justice and Development party (AKP) were put online as Ankara grapples with the aftermath of a failed military coup.
The emails date from 2010 to 6 July this year. Obtained before the attempted coup, the date of their publication was brought forward "in response to the government's post-coup purges", WikiLeaks said on its website, adding that the source of the emails was not connected to the coup plotters or to a rival political party or state.

Turkey's telecommunications communications board said an "administrative measure" had been taken against the website - the term it commonly uses when blocking access to sites. Turkey routinely uses internet shutdowns in response to political events, which critics and human rights advocates see as part of a broader attack on the media and freedom of expression.

About 50,000 soldiers, police, judges and teachers have been suspended or detained since the attempted coup at the weekend, and Turkey's western allies have expressed concern over the crackdown's reach.

On Wednesday, it was also announced that Turkish academics have been banned from travelling abroad until further notice, according to state-run broadcaster TRT.

The report, which provided no details about the ban, came a day after the board ordered the resignation of 1,577 deans at all universities across Turkey. In a separate move on Tuesday the education ministry also revoked the licences of 21,000 teachers working in private institutions.

The government has accused a US-based Muslim cleric, Fethullah Gülen, of masterminding the attempted coup, in which more than 230 people were killed. Gülen denies the accusation.

The Courier (Leamington Spa)
GCHQ and Leamington charity aim to inspire girls to take up a career in cyber security
Wednesday, 20 July 2016

Leamington Spa - National security experts at GCHQ are working with a Leamington charity to offer a free cyber security course for teenage girls this summer.
The Smallpeice Trust is running the CyberFirst Futures residential course with GCHQ at Birmingham University from August 1 to 4, during which participants will gain an insight into the next generation of cyber security tools. The course will also test their skills in dealing with modern and advanced cyber defence scenarios.

Open to 16 and 17-year-old girls, those taking part in the four-day course will work closely with experts from GCHQ, the Smallpeice Trust and academia, gaining an insight into the importance of cyber security and getting first-hand experience of defending against a cyber-attack.

Chris Ensor from GCHQ said: "We want to develop a diverse, continuous flow of people with the right skills and knowledge to help protect the UK against future cyber-attacks.

"The reality is that our cyber security will become even more important as technology develops and the internet becomes all pervasive.

"It makes sense that we look to inspire and encourage a generation of young people into a career in cyber security who have grown up with the internet as an integral part of their lives and who have an innate understanding of the power of technology."

The UK now earns nearly £2 billion in cyber security exports and according to the last report on the strategy in 2014, there are 750 companies signed up to the Cyber-security Information Sharing Partnership for Industry and Government (CiSP). This emerging sector is driving the need for new recruits with good science, technology, engineering and mathematics (STEM) skills.

Dr Kevin P Stenson, chief executive at the Smallpeice Trust, said: "We've worked with GCHQ for many years on individual cyber security courses for 13 to 14-year-olds, but given the projected growth of career opportunities in cyber security and as the risk of cybercrime increases, it is now the ideal time for a national programme aimed at 16 to 17-year-olds to start."

Lebanon Daily Star
Dismantling of Israeli-tied networks hampered probe
Wednesday, 20 July 2016
Byline: Staff Report

Beirut - The head of the Parliament's telecoms committee said Tuesday that investigations into Lebanon's Israeli-tied internet setups were hampered due to their impromper dismantling by the army. "We were informed by the army that the dismantling of the equipment before experts arrived resulted in an error," MP Hasan Fadlallah told reporters.

The matter of illegal internet setups came to light in March when Telecommunications Minister Boutros Harb announced the discovery of unlicensed, low-cost internet networks across the country. He said Israel was using these setups to spy on Lebanon.

Four illegal networks have been discovered so far, in the Dinnieh highlands in north Lebanon, and in Ouyoun al-Simane, Faqra and Zaarour in Mount Lebanon.

Fadlallah announced that the committee has agreed to invite Finance Minister Ali Hassan Khalil and the president of the committee of cases at the Justice Ministry to a session to discuss the amount of financial losses from the state budget because of the illegal internet scandal.

These providers were buying bandwidth from abroad and selling it in Lebanon below official rates.

Fadlallah said that State Prosecutor Samir Hammoud informed them that the illegal internet case to proceeding according to judicial mechanisms.

Harb also said that he has provided Hammoud with information he had requested from the state-owned telecoms company Ogero. "We have made sure that the information was sent to him," Harb said.

Ogero has been at the center of the unlicensed internet scandal, with eight people so far arrested in the case and many more charged in absentia.

Three top Ogero officials are being questioned over "negligence that led to squandering public funds and evading taxes by allowing some people to set up unlicensed internet in the country.

"We will not allow for the illegal internet file to be hidden. We want the investigations to reveal those involved and to be punished. The judiciary is doing its work based on the legal requirements," Harb added during the news conference.

Fadlallah said that the next session will take hold place on Aug. 17, adding that the committee will continue discussions until the case is concluded.

CBC News
DND at the back of the drone line despite contractor pitches
Thursday, 21 July 2016
Byline: Murray Brewster

A total of 16 companies have come forward to express interest in providing the Canadian military with drones, but more consultation is in the offing, and it's likely other federal departments will be using the technology well before it arrives at National Defence.
The Trudeau government started browsing the defence marketplace earlier this year, asking contractors for information about what kind of systems were out there, when they are available and potential program options.

The absence of the capability has come up in presentations submitted to the current defence policy review undertaken in the spring by the Liberals.

The consultation paper that kicked off public feedback noted unmanned systems -- regardless of whether they are in the air, on land or under the sea -- have become "integral to modern military operations."

It also says unmanned aerial systems have been used with "great effect" on operations, including by Canada when the previous Conservative government leased drones from the Israelis.

That lease was dropped after Canada ended its Kandahar combat mission, and since then, troops and sailors have only experimented with micro-drones. The latest involves the recent $14-million purchase for the navy of the small RQ-21A Blackjack, which launches via cable system.

The government consultation paper made clear that pilotless planes "offer several advantages that manned aircraft cannot provide."

Even still, a spokesman for Public Services and Procurement Canada says the military is a long way from committing to anything, or even issuing a request for proposals.

"The (Joint Unmanned Surveillance and Target Acquisition System) project team is analyzing the information gathered, and will use it to develop detailed cost estimates and planning documents to help inform available options for this program," said Nicolas Boucher in an email.

It's conceivable that other federal departments will be operating drones before the military.

Last spring, Transport Canada issued a tender call for an unmanned aerial system to survey ice and oil spills in the Canadian Arctic.

The department is only looking for one drone, which would conceivably replace three manned, civilian turbo-prop aircraft that patrol the region.

The Fisheries Department also conducted its own test program on the West Coast in February.

And that is to say nothing about the explosion in commercially available drone technology.

However, National Defence's equipment acquisition guide, which was updated in May, does not foresee the military getting such a capability until at least 2026, a quarter century after the plan was first suggested.

Boucher's written response did not speak to the timeline, but did say that government needs more information to determine project risks, costs and potential economic benefits.

"Going forward, additional consultations will be required to further refine a strategy that addresses National Defence's short and long term needs," he said.

Drones first discussed in 2000

The request for information was at least third time the Canadian government has gone to industry looking for ideas over the last decade and a half.

The Defence Department first began pitching for the technology in September 2000, but the project didn't get any traction until 2003 when medium-altitude drones were leased for experimentation.

The military deployed French-manufactured Spewer remotely piloted planes during the early phases of the war in Afghanistan.

The former Conservative government even promised to create a drone squadron during the 2005 election, and soon after being elected, it implemented a $500-million acquisition program.

But a shortage of staff, which were reassigned to the CH-47F Chinook helicopter program, and political disagreements over whether the drones should be armed caused delays. The program is now estimated to be between $1 billion and $1.5 billion.

The Harper government, at the insistence of the Manley commission, temporarily acquired Heron remotely piloted surveillance planes to support troops during the latter half of the Kandahar combat mission, but the lease was handed over to the Australians after Canada withdrew in 2011.

To arm or not arm? That is the question

The air force has pushed for armed drones.

The country's top military commander, Gen. Jonathan Vance, publicly supported the notion last winter.

"If we are in operations against a force like ISIS, the surveillance piece is important but we also want to contribute to the strike," he said. "In my view, there's little point to having a UAV that can see a danger but can't strike it if it needs to."

But there are also critics who say while a drone strike capability is important, the Canadian government hasn't done enough homework, or put in place a legal framework of accountability for using the weapons.

'Exceedingly exceptional' break for far from 'normal criminal'
Thursday, 21 July 2016
Byline: Jane Sims

Stephen Solis-Reyes is, by all accounts, exactly what an Ottawa judge who dealt with him said he is: "not the normal criminal."
A London judge agreed Wednesday to lift a travel ban imposed on the Heartbleed Hacker, part of his conditional sentence for breaking into the federal tax collector's website in 2014, but not without telling the computer whiz the move is "exceedingly exceptional."

It pays to be good and Solis-Reyes - a Western University student serving house arrest for his crime, but nowfree to go to an elite international computer programming competition in California - is very, very good.

"It means a lot, for sure," Solis-Reyes said outside the London courthouse of the judge's decision. "I think he is expecting big things from me. He's expecting what I do in this competition is going to help society and help me in the future."

The 21-year old Londoner was convicted in May of four charges - two counts of mischief, unauthorized use of a computer and obstructing a police officer - for sending techno-shivers through the federal government in 2014.

That spring, as the income tax-filing deadline neared for Canadians, Canada Revenue Agency's website was breached by someone exploiting the so-called Heartbleed computer bug. About 900 social insurance numbers were stolen and the website had to be shut down, the tax deadline extended by a week and the RCMP began investigating.

The Crown ultimately dropped 13 other charges against the Londoner, who maintained he'd broken into the system only to demonstrate its vulnerability.

Soft-spoken, unfailingly polite, the computer science student who appeared in court Wednesday looks far younger than his age.

He's also super-brainy, the kind of guy who rattles off high 90s in his courses and writes computer code for fun. That passion has been both his curse, and his good fortune.

Recently, solis-reyes was named one of 10 finalists - the only one from North America - in an international, IBM- sponsored computer programming competition, Mastering the Mainframe, that drew 15,000 entries worldwide.

He's now been invited to san Francisco on sept. 14 to compete for four days. If finishes in the top two places, he goes to l as Vegas for two more days.

But solis-reyes is also serving an 18-month conditional sentence, after pleading guilty for demonstrating to the federal government - and the postal service in the Guernsey Islands, off the coast of France - just how vulnerable they were to the heartbleed computer virus.

In six seconds, he was able to breach revenue Canada's security and steal the social insurance numbers - not to use them, but to teach a lesson.

By the time the competition arrives, he will have done his four months of house arrest, but the rest of his sentence requires him to stay in Ontario.

So, all dressed up, with his suit hanging loosely on his thin frame, he waited patiently with his parents outside the courtroom for his chance to make a highly unusual request of a judge to vary his sentence.

Superior Court Justice Duncan Grace gave him the green light.

Grace said he was struck by the glowing comments of Justice Lynn ratushny when she sentenced him in May. she called him "a good person who made a very bad mistake."

"You are young. You have a bright future, a very bright future," ratushny said.

"I strongly recommend to any future employer they consider this young man's excellent potential and award him employment. He is a young man who has worked hard, who has exemplary values and I don't expect those values to change."

Assistant Crown attorney James spangenberg told Grace he spoke to the RCMP and solis-reyes's probation officer, who said he's done "very well" during his sentence. But the concern was the sentence would be difficult to enforce if he's unable to travel. "Allowing for travel would undermine that order," spangenberg said.

Defence lawyer Gordon Cudmore said the Ottawa judge's comments were clearly to encourage his client's future "to move forward" and not to crush his potential.

Grace agreed. He said the hearing "would have been short" if not for those comments at sentencing and the eloquent letter sent to him by solis-reyes, Last week, solis-reyes and his mother went to a tedious scheduling court, waiting all day for a chance to file his sentence variance request.

Grace oversees that court. "I noticed how politely you sat for the entire day," he said.

He also commented on the student's "extremely bright future," and how the conditional sentence was nothing out of the ordinary.

The judge was told solis-reyes was born in the United states and has both American and Canadian citizenships and is applyingfor reissue of both documents because the've expired.

Solis-reyes told Grace he was willing to travel with his Canadian documentation if necessary, but would need the U.s. paperwork if there were questions about his listed birthplace.

Grace said he still would have to consider what to do about travel documents, but had no questions about solis-reyes' character.

"I have every confidence you will represent yourself, your family and this country positively," the judge said.

Outside court, solis-reyes said he's grateful for the chance to compete and that his sentence has allowed him to work and go to school.

"Of course, it's a jail sentence, so it's not easy, but I think it's fair," he said.

"It's been difficult, but we're past the hard part and you have to pay the consequences and that's what I'm going to do and I'll go from there."

It's meant he can still hang on to his dreams. "I think I would like to find work at a nice company as a computer programmer and just write code because it's what I enjoy."

Then his eyes lit up. "I've always enjoyed programming and working with computers. It's something I've always wanted to do for a living and I have a chance to do it."

London Daily Telegraph
Teenager crashed world computer networks and sent Twitter bomb threats 'to be cool'

Thursday, 21 July 2016
Byline: Martin Evans

London - A teenage computer hacker, who shut down government networks across the world and sent bomb threats to US airlines, has been spared jail.
The 16-year-old, from Plympton in Devon, began targeting the systems of organisations and states he disagreed with when he was just 14.

Using a laptop computer in his bedroom, the schoolboy, who cannot be named for legal reasons, caused chaos targeting Iraq's ministry of foreign affairs, the department of agriculture in Thailand and China's security ministry. He also crashed computers in the Japanese town of Taiji, where an annual dolphin hunt takes place, and the Sea-World theme park in Florida.

He was arrested after using Twitter to send bomb hoaxes to American Airlines, Delta Air Lines and even the White House, telling them: "There's a nice tick-tick in one of those lovely Boeing planes. Hurry gentlemen, the clock is ticking. High quality." District Judge Diane Baker, sitting at Plymouth Youth Court, told the boy: "I think you got carried away by the fact you thought you were cool, you thought you were clever. You didn't think of what truly happens in the real world if you do these things. I don't think there would be any positive outcome for you going into a youth detention centre. I think it would destroy you."

Addressing the court, the teenager said: "I just want to say that I am really sorry for everything that I have done. I didn't really know how serious it was. I am sorry to my family."

He was convicted of three offences under the Computer Misuse Act and two under the Criminal Law Act, for the bomb hoaxes. He was given a twoyear youth rehabilitation order and a two-year supervision order and told to attend 120 hours' reparation and two courses.

The boy's mother was told to pay £620 in prosecution costs and his computer will be destroyed.

« Cette loi est un compromis entre sécurité et liberté individuelle »
Thursday, 21 July 2016
Byline: Florent Quiquerez

Berne - Nouveau préposé fédéral à la protection des données, Adrian Lobsiger défend la loi sur le renseignement
Sa nomination avait suscité quelques crispations sous la Coupole en mars dernier. D'aucuns s'inquiétaient de l'arrivée d'un ancien haut cadre de l'Office fédéral de la police (FedPol) au poste de préposé à la protection des données. A 55 ans, Adrian Lobsiger entame son mandat alors que les défis

ne manquent pas en matière de défense des libertés individuelles. Première bataille: la future loi sur le renseignement, en votation le 25 septembre. Interview.

Cette loi va-t-elle trop loin, comme l'estiment les opposants?

Je ne suis pas là pour faire peur aux gens. Mais il faut se rendre compte que chaque Etat a la possibilité de saisir les informations de ses citoyens. La différence entre un pays démocratique comme la Suisse et un régime autoritaire, c'est que la marge de manoeuvre et les possibilités données à l'Etat de droit sont ancrées dans la loi, qui détermine le cadre procédural et les instruments de recours auprès d'une justice indépendante. Le texte qui est soumis en votation est le produit d'une longue discussion, dont l'origine remonte aux attentats du 11 septembre 2001. Nous sommes au bout de ce processus.

Les libertés individuelles sont donc assez respectées?

Nos services ont été consultés tout au long du processus législatif. Le résultat obtenu aujourd'hui représente un compromis entre les besoins de sécurité et la défense des libertés individuelles. Nous avons été entendus et je peux vivre avec ce compromis. La question qui se pose maintenant est la suivante: est- ce qu'on préfère le statu quo ou un changement? La majorité du parlement veut ce changement, et je respecte ce choix. Si le citoyen veut aussi donner plus de pouvoirs aux services de renseignements, alors il doit voter en faveur de ce texte. S'il veut se contenter du droit en vigueur, il doit dire non. Dans ce cas, la discussion sera très probablement close pour longtemps.

Votre carrière à FedPol influence-t-elle votre position?

FedPol a été impliqué au tout début du processus. Mon prédécesseur s'est beaucoup engagé pour que cette loi sur les renseignements n'empiète pas trop sur les libertés individuelles. Il y a des garde-fous techniques, politiques et judiciaires. Pour obtenir le droit de surveiller quelqu'un, il faudra faire un grand travail de préparation et avoir de très bons arguments pour justifier la procédure. Si la loi est acceptée en votation populaire, le Conseil fédéral sera lié par ses déclarations selon lesquelles les autorisations porteront sur une dizaine de cas par année.

Le Conseil fédéral ne s'arrête pas là. Il projette une surveillance discrète pour lutter contre le terrorisme

Pour l'heure, c'est une décision de principe. Le gouvernement a donné mandat au Département compétent d'élaborer des libellés concrets. De notre côté, nous allons examiner si ces mesures sont proportionnées. Il faut toujours faire une pondération entre les libertés individuelles et l'intérêt de l'Etat. Il faut toutefois relativiser la portée de ce projet. Il n'est pas du tout comparable à la loi sur le renseignement. Ici, il s'agit plutôt de propositions qui doivent compléter le système préventif policier.

Autre domaine, la mobilité. Avec les projets de vignette électronique ou le SwissPass des CFF, on saura bientôt tout de nos déplacements

Souvent, les prestataires de ce genre de services ne sont pas prêts à supprimer les données de leurs clients, car ils se disent - selon le credo de big data - qu'ils pourraient en avoir besoin pour un développement futur. Pour moi, c'est important de savoir ce que les entreprises cherchent à faire dans l'immédiat, et quelles sont les différentes étapes prévues ensuite. De mon côté, les choses sont claires: si les explications fournies par l'entreprise ne sont pas convaincantes, alors je demande la destruction des données.

A l'heure d'Internet, votre combat pour la protection des données n'est-il pas voué à l'échec?

Je ne pense pas que l'importance de la sphère privée a diminué parce que nous nous trouvons dans une révolution numérique. Avoir une sphère privée, c'est un besoin inhérent à l'être humain. Rappelons-nous les réactions publiques aux révélations d'Edward Snowden.

Mais cette liberté individuelle, existe-t- elle encore?

Bien sûr! Je dirais même que la révolution numérique lui donne un nouveau souffle. Internet, c'est aussi un endroit où les gens peuvent se rassembler pour réclamer ou défendre leurs droits, c'est-à-dire leur autodétermination et le respect de la sphère privée. Regardez ce qui se passe dans le monde. Les organisations qui ont le plus de problèmes avec les opinions libres sur Internet, ce sont les régimes autoritaires. Finalement, les choses n'ont pas vraiment changé avec le progrès technologique. Les gens n'aiment pas être manipulés ou surveillés par n'importe quel pouvoir, qu'il soit étatique ou économique.

Il y a aussi un besoin sécuritaire qui se fait au détriment de cette liberté

Vous avez raison, et c'est justement là que nous entrons en jeu. Le préposé fédéral, mais aussi les préposés cantonaux, doivent sensibiliser la population. Nous devons expliquer avec des mots simples quels sont les défis en matière de protection des données, et pointer du doigt les applications qui pourraient enfreindre les libertés individuelles.

The Hindu
Big Brother is now keeping watch on social media too
Thursday, 21 July 2016
Byline: Anuradha Raman

New Delhi - On July 19, when the Supreme Court asked Congress vice- president Rahul Gandhi to apologise for his comments on the RSS, the two- year-old New Media Wing under the Information and Broadcasting Ministry, described as the online eyes and ears of the Government came up with this finding: 44 per cent respond positively to the SC admonishing Rahul Gandhi.
The team also made the following observation: positive response (in favour of the SC and the RSS as well as against Mr. Gandhi), is 44 per cent. The responses are graded as positive, negative and neutral (posts which state things as they are).

Twitter, Facebook, blogs and YouTube are the mining ground for information on which responses are graded as positive, negative and neutral, giving an insight to senior government officials on the mood in the social media on a daily basis. Sometimes, special requests are made by Ministries to understand the responses to new initiatives of the government.

The analysis, seen by The Hindu, has sparked off questions in the Ministry about whether the New Media Wing mines data for the BJP-led NDA Government or the BJP/RSS. Officials not wishing to come on record said there were no parameters drawn for analysis of social media trends as the Wing is relatively new. "The mandate of the Wing is not clear. We analyse trending topics and put it across to our seniors," said an official.

In the last few days, topics that have been picked up on the basis of their traction on Twitter, Facebook, Google Hangouts and YouTube video posts have revolved around Mr. Gandhi, Navjot Singh Sidhu, gagging of the media in Jammu and Kashmir and the beginning of the monsoon session of Parliament, and the responses have been analysed by Oracle's Social Relationship Manager tool and Meltwater and shared with senior officials in the I&B Ministry, PMO and concerned ministries and Intelligence agencies.

Top Influencers are listed in accordance with the followers they command on Twitter. Director General of the Press Information Bureau (PIB) Frank Noronha directed this correspondent to speak to an official in the Information and Broadcasting Ministry. The New Media Wing and the Electronic Media Monitoring Centre, (EMMC) together keep a watch online and on television channels.

The PIB sends press clippings every day to senior officials of the Government of India. At one place, the Wing which works with the Government to promote its activities even analyses the impact of an event on the BJP party --making it the first time, a government's wing has associated its activity with a political party. Sample this: For resignation of Sidhu on July 18, the positive response in favour of (BJP and against Sidhu) is 34 per cent, negative is 17 cent and neutral is 49 per cent. Significantly, the neutral position has larger numbers than positive or negative responses.

On the other hand, the analysis titled, Social Media Analytics on newspaper seizure in parts of J&K, threw up the following results: three per cent respond positively; 28 per cent negatively and 69 per cent maintain neutral positions. Some officials in the PIB said the Government should have cautioned about the adverse fallout of gagging the media instead of allowing status quo for three days.

Cyber security operation center launched in Isfahan N-zone
Thursday, 21 July 2016

Tehran - Iran's Atomic Energy Organization has launched a cyber security operation center in the nuclear zone of Isfahan.

This center has been launched in order to address new threats and at the same time to enhance the safety and security levels of the nuclear site in Isfahan, said Asghar Zare'an, Deputy Head of Iran's Atomic Energy Organization in the inauguration ceremony on Wednesday.

'Presently, the issues of cyber security, the information technology and industrial control systems, tend to constitute the main priorities of the enemy,' he said.

The enemy tries by deploying malwares sabotage the industrial development of the country and damage our infrastructures, he said.

According to Zare'an similar cyber security operation centers are going to be launched with the priority given first to Arak, Natanz and Boushehr nuclear sites.

'The enemy pays special attention to this method of industrial sabotage as it is done covertly and tends to inflict greater damages while it is less costly,' he said.

Darktrace repêche un ancien agent du SCRS
Wednesday, 20 July 2016
Byline: Dominique Lemoine

Toronto - Darktrace s'implante au Canada avec l'ouverture d'un bureau à Toronto et nomme à la tête de sa direction au Canada un ancien agent de renseignements au service du Canada (SCRS) et de l'Angleterre (MI5), David Masson.
Cette multinationale se spécialise en produits de cybersécurité pour les entreprises. Elle a été fondée en 2013 à Cambridge en Angleterre et elle serait née d'une collaboration entre des mathématiciens de l'Université Cambridge et d'anciens agents du MI5, le service de renseignement responsable de la sécurité intérieure au Royaume-Uni de Grande-Bretagne et d'Irlande du Nord.

L'approche de Darktrace miserait notamment sur l'apprentissage automatique (ou machine learning en anglais) pour reconnaître le comportement normal d'un utilisateur, d'un réseau ou d'un appareil informatique et pour pouvoir détecter une anomalie de comportement qui trahirait une attaque ou intrusion, plutôt que sur la surveillance d'attaques connues.

Cette méthode basée sur la surveillance du trafic réseau et sur la veille informatique serait inspirée de la biologie du système immunitaire humain et elle viserait la protection des données internes des organisations des secteurs de la finance, du manufacturier, de services professionnels et publics, de la santé, de l'énergie, du transport, du détail et des télécommunications.

Yonhap News Agency
Gov't bolsters countermeasures to deter N.K. cyberattacks
Friday, 22 July 2016
Byline: Staff reporter

Seoul - South Korea is beefing up its governmentwide countermeasures to prevent possible cyberattacks by North Korea, officials said Friday.
The Ministry of Science, ICT and Future Planning said the number of cyberattacks by North Korea more than doubled in the first half of this year.

The cyberattacks "are judged as a part of North Korean provocations to trigger public anxiety" in South Korea, the ministry said.

Last month, South Korean police said North Korea hacked into more than 140,000 computers at 160 South Korean firms and government agencies. About 42,000 documents were suspected to have been stolen, including defense-related information.

The ministry urged people to install antivirus software and avoid opening suspicious emails.

South Korea has been on high alert against hacking attacks by North Korea following the North's fourth nuclear test in January and a series of missile launches in recent months.

Huffington Post
Where Is The Accountability For Ottawa's Communications Spies?
Friday, 22 July 2016
Byline: Monia Mazigh

Commentary: The Communications Security Establishment (CSE) Commissioner report has been just released. For those who don't know what the CSE is, it is the agency related to the Department of National Defence that spies on communications received from abroad.
In their own words, their work focuses on "collecting foreign signals intelligence in support of the Government of Canada's priorities, and on helping protect the computer networks and information of greatest importance to Canada." It is important to emphasize that CSE is not supposed to spy on communication of Canadians in Canada or abroad.

In that regard, the commissioner's mandate is mainly to review CSE activities and their compliance with the law, and in the case of complaints, to undertake investigation. However, the commissioner report, which is supposed to be an independent exercise conducted by a review body, seems more and more like a self-congratulatory document where criticism directed at the CSE or its activities is hard to find. The situation can be compared to a professor rating her own students in a national competition. Of

course, she would like them to pass, and of course she would be lenient in marking. Rather, in such circumstances we need a professor from a different school, and the students' names should be hidden.

In previous years, two main problems became clear to the public in regard to CSE activities:

The stipulations protecting the privacy of Canadians are not always respected, as CSE was reminded by Privacy Commissioner Daniel Therrien.

The lack of safeguards when it comes to information sharing with other agencies -- the Canada Security Intelligence Agency (CSIS), for example.

Indeed, in defence of the CSE's activities, Minister of National Defence Harjit Sajjan recently minimized the amount of information revealed through metadata, usually collected by CSE during its operations. Metadata, or data on data, shouldn't be of a privacy concern for Canadians, according to minister Sajjan.

But the reality is that through the records of Internet and phone communications, even without revealing the identity of the user, much information can still be inferred and shared with other foreign agencies. There exists today a whole range of science fields and theories that can extract patterns about people behaviours without knowing their identities.

The report claims that the commissioner's office "is monitoring 14 active recommendations that CSE is working to address -- 10 outstanding recommendations from previous years and four from this year," and that the privacy issue about sharing foreign intelligence is also being looked into. Nevertheless, we can't know for sure how this is being done and if there is any proposed legislation to be submitted soon. The report doesn't tell us.

It seems from the report that, in general, the commission recommends that the minister should always be informed about controversial issues, but no specific mechanism is suggested to deal with the identified problems. The issue of transparency becomes a matter of blind trust in the hands of the minister of national defence.

Leaving it up to the minister in charge to decide what is acceptable and what is not, or what is lawful and what is not, is far from a democratic and accountable model. We need review mechanisms with the necessary autonomy, independence and structure to create true accountability.

For instance, the ambiguous relationship between CSE and CSIS, described in the report, can't be investigated by any review body. There are currently agencies to oversee respectively CSIS (SIRC) and the CSE (the office of the CSE commissioner), but there is no "super-SIRC" to oversees them both and launch investigations on both of them. The parliamentary oversight presented by the government in Bill C-22 isn't clear if this aspect will be included in its mandate.

As of yesterday, it was reported that CSE won't even reveal the number of times it shared information that could lead to someone being tortured in foreign prisons. The greater the risk of mistreatment (please note how the word "torture" isn't even used), the higher level of bureaucratic or political intervention is required.

Once again, it is up to the minister or a high-level bureaucrat to take that decision, and that risks him or her making a mistake in their assessment. If that happens, Canada will become collateral damage like it has in the past.

New Straits Times
Govt to improve security in airports
Friday, 22 July 2016
Byline: Fazleena Aziz

Sepang - The government will soon introduce a new mechanism to boost security in airports, especially at boarding gates.
Deputy Transport Minister Datuk Abdul Aziz Kaprawi said the mechanism would take into consideration existing operational procedures.

He said that given the increased terror threats globally, especially in transportation hubs, upgrading security was paramount to ensure people's safety.

Aziz said ministry secretary-general Datuk Seri Saripuddin Kasim had been directed on Wednesday to draw up details of the new mechanism through a committee, which would include agencies and departments.

"Some of the issues that pose obstacles, in terms of beefing up security, which we will have to consider, are airport design, businesses and visitors sending off their loved ones.

"But we have to increase security and safety in airports as the threat is real, especially in light of the attacks in Brussels and Istanbul."

He said this after opening the 13th Steering Committee Meeting of Cooperative Aviation Security Programme Asia-Pacific Region (CASP-AP) 2016 yesterday.

Aziz, however, said Kuala Lumpur International Airport complied with International Civil Aviation Organisation (ICAO) security standards, adding that the last audit was done in 2012, while the next audit was due next year.

He said he wanted the Department of Civil Aviation (DCA) to come up with stricter measures to screen potential staff and those working in airports to minimise insider threats.

As most contract workers could also be foreigners, proper screening was vital to ensure no one slipped through the system, he added.

Earlier, he said insider threats could come in the form of former employees, current employees, contract workers or partners who had inside knowledge of the industry.

He said such threats were capable of exploitation, tampering, fraud, espionage, theft and sabotage.

Cyber threats to computer systems were also a matter of concern with increasing reliability on technology, he said, adding that such attacks could cause disruptions.

It was reported that the government was considering a cabinet proposal to allow only passengers to enter terminals in major airports to boost security.

Deputy Prime Minister Datuk Seri Dr Ahmad Zahid Hamidi had said Transport Minister Datuk Seri Liow Tiong Lai had been instructed to work out this proposal with Malaysia Airports Holdings Bhd.

Present yesterday were DCA director of aviation security Abdul Rahmat Mahat and ICAO Asia and Pacific Office regional officer Ross Lockie.

Voice of America
Russian Agent Sentenced for Illegally Exporting US High-tech Gear
Friday, 22 July 2016

New York - A federal court in New York on Thursday sentenced an admitted agent of the Russian government to 10 years in prison and ordered him to forfeit $500,000 in profit he'd gained from his criminal activity, which focused on acquiring and secretly shipping abroad high-tech microelectronics for Russian military equipment.
Alexander Fishenko pleaded guilty to all 19 charges brought by the Department of Justice. U.S. officials said a company that Fishenko had founded shipped $50 million worth of electronic products to Russia between 2002 and 2012, all in defiance of a government licensing system meant to control such exports.

"These commodities have applications and are frequently used in a wide range of military systems," U.S. officials said, "including radar and surveillance systems, missile guidance systems and detonation triggers."

Charges against Fishenko, who has both American and Russian citizenship, included conspiracy, illegally exporting controlled products, conspiring to launder money and obstruction of justice. He was indicted in October 2012, along with 10 other individuals and two corporations, both of which Fishenko

controlled. Three of the people remain at large, but the others either have pleaded guilty or been convicted in court.

To evade export controls on high-tech products manufactured in the United States, officials said, Fishenko and his co-conspirators gave false information about who was buying the electronic components, concealed the fact they were exporters and falsely described the devices on records submitted to the U.S. Department of Commerce.

Ultimate recipients of the electronic components acquired by Fishenko's companies, known as ARC and Apex, included a research unit for the Russian internal security agency FSB, a Russian entity that builds air and missile defense systems, and another that produces electronic warfare systems for the Russian Ministry of Defense.

Assistant Attorney General John Carlin said prosecuting those who violate U.S. export laws is "an important part of our national security framework ... protecting national assets from ending up in the hands of our potential adversaries."

Politics.co.uk
Boris Johnson once outed MI6 spy 'for a laugh'
Wednesday, 20 July 2016
Byline: Adam Bienkov

London - There was some nervousness in the Foreign Office when it was announced that Boris Johnson had been made foreign secretary.
Part of Johnson's new role involves overseeing MI6. This is a highly sensitive and delicate task which some within his department worry he is unsuited for.

It now appears there is good reason for them to feel uneasy.

In 2001, while editor of the Spectator, Johnson published a piece suggesting that a former friend and colleague had worked for the secret service.

On the front page of the magazine, Johnson splashed the headline "Who was Smallbrow?" Inside, Boris published an article naming Agent Smallbrow as then Sunday Telegraph editor Dominic Lawson.

The allegation was based on a controversial book by renegade spy Richard Tomlinson which had been published in Russia. Tomlinson claimed that Lawson had provided cover for MI6 agents working in Eastern Europe.

Lawson, who denies ever having been an agent, was furious. He told Johnson's biographer Sonia Purnell that the former mayor had put the lives of journalists at risk.

"He knew me, we were friendly - it was intensely annoying. And apart from anything else, if you're running a newspaper with foreign correspondents in strange parts of the world, as I was then, it's potentially a physical threat to them if it's believed that they're working for British intelligence. You can imagine how angry I was."

Johnson was unrepentant, however.

"I rang him up, but there was just this sense of "Never mind, Dommers, I just did it for a laugh. And the thing about Boris is that because in some strange way he is adorable, one forgives him. It's not just women; men too fall for that charm."

Johnson's responsibilities as foreign secretary appear to have been significantly diminished from his predecessors, with responsibility for Brexit negotiations and future trade deals passed to other departments by Theresa May.

A piece by Adam Boulton in this week's Sunday Times also claimed that responsibility for MI6 was "being quietly shifted to the prime minister and National Security Council".

However, the Foreign Office strongly denied this yesterday, telling Politics.co.uk that there were no plans to strip the department of responsibility for the secret service.

"As has been long standing practice, responsibility for SIS and GCHQ lies with the foreign secretary. This has not changed and will not change," a spokesperson said.

The Daily Beast
How the Real Edward Snowden Helped Write the Ending to Oliver Stone's 'Snowden'
Friday, 22 July 2016
Byline: Jen Yamato

Washington - The NSA's worst nightmare made his San Diego Comic-Con debut by way of video chat, moments after the first public screening of Oliver Stone's Snowden.
"The FBI actually gets a copy of this talk because we're going through Google Hangouts, which unfortunately has a sort of built-in surveillance capability," joked Edward Snowden, his face peering down on a theater full of critics and journalists. He joined Stone and stars Joseph Gordon-Levitt and Shailene Woodley from Moscow, his home for the foreseeable future, "live--from the internet."

Snowden tracks the NSA analyst as he wrestles with the decision to blow the lid off of the U.S. government's top-secret global surveillance program, an act that made him persona non grata in America and changed history. The telling of this historic expose, co-scripted by Stone and Kieran Fitzgerald, is authorized by Snowden, who appears as himself in the final coda.

After a dazzling thriller of a finale right out of a spy flick (which, yes, involves a certain Rubik's cube), Stone's larger aims materialize. News footage of President Obama, seen earlier labeling Snowden a "29-year-old hacker," is used to pose a question--the question--seemingly to the President as much as the public at large: Is Edward Snowden a spy or a whistleblower? A traitor or a hero?

Snowden makes its official world premiere in September at the Toronto Film Festival, so bringing a tech-oriented political thriller to a July geekfest filled with superhero fans in spandex cosplay was a curious move. But its official release, timed for a fall Oscar berth, is not slated until September 16th. Thursday at Comic-Con, on the same night Donald Trump accepted the Republican presidential nomination, Stone's film highlighted the fact that Obama still has time to pardon Snowden before he leaves office.

The opportunistic move of sneaking Snowden into the annual pop culture convention appearance worked. Stone grabbed plenty of attention for Snowden by likening Pokémon Go to a form of totalitarianism during a panel earlier in the day. But that evening, he told The Daily Beast he's not banking on Obama rescuing Snowden from perma-exile. I asked if the President is likely to even see the film any time soon. "I hope so," Stone said. "I hope so, but I'm holding no hopes on it."

Live from the internet, Snowden explained why he got involved in a major motion picture retelling of his life. "When there is enough in the public record you don't really get to decide if a movie gets made," he said. Stone was the right director to bring his story to the screen, he said, because "nobody tells Oliver what to do, and that's not the case with a lot of studios. That's a distinguisher that I hope shows through in the final message."

He decided to appear in the movie after Stone flew out to film him for bonus materials, he said. In the film, he professes his newfound purpose while seated at a laptop bearing a sticker for the Electronic Frontier Foundation, a nonprofit organization dedicated to "defending civil liberties in the digital world."

According to Stone, it took nine takes to nail Snowden's scene--the same number of takes it took Trump to film his deleted cameo in Stone's Wall Street: Money Never Sleeps. "I once directed Donald Trump," Stone smiled to the crowd. "It was a hard day. The difference between Donald and Ed--and this is true, I love the man in a weird way--after every take [Trump] jumped up and said, 'Wasn't that great?'"

"The confidence is unbelievable, and that's what's allowing him to run," Stone continued. "I had to say, 'Donald, I think it's great but you know what? I think we can go a little bit better here.'"

Stone also revealed that Snowden made a major contribution to the scripting of the film's climax--a nail-biter that depicts exactly how Snowden managed to get away with the stolen files he would eventually release to the world. In the movie, Snowden anxiously downloads files upon files of documents and hides the SD card inside a Rubik's cube.

After much suspense, he manages to smuggle the cube out through security, smiling his relief into the open air.

Only that's not how he really did it.

"We don't know," Stone admitted. "None of us know. He's the only one who knows and one day he may reveal. It was Ed's idea, his suggestion. We responded to it and ran with it. But it was a good idea. Thank you."

Snowden did not divulge how that scene really unfolded, but he confirmed that life as an international fugitive isn't all that terrible. "I can confirm that I'm not living in a box," he said. "I actually live a surprisingly free life."

"This was not the most likely outcome," he added. "I didn't actually expect to make it out of Hawaii. I thought it was incredibly risky... I never thought I would be saved. But I thought the stories might still be able to get out there."

He slammed the U.S. government, which cancelled his passport and made travelling impossible in the wake of the leak, for threatening trade sanctions against countries that offered him asylum.

"Particularly in the case of Ecuador, they literally got a direct threat, I believe from John Kerry, to revoke trade preferences," he said. "Trade preferences were basically the thing keeping their economy alive--literally, for broccoli farmers and rose farmers. These are impoverished, indigenous farmers, and they were like, 'We're going to make sure these people's families can't eat if you defend this guy's human rights.'"

"But this is not a criticism about the United States specifically, although that's heinous in terms of foreign policy," he continued. "This is truly about the nature of power."

Earlier in the day, Snowden and Andrew "Bunnie" Huang unveiled plans for a device that would prevent the outside surveillance of cell phones. "We're not doing productization, we're not doing sales, we're not setting up a company or anything like that," Snowden clarified. "Just saying anybody who wants to do this, here are our findings."

"I love my country. I love the things that we try to do," he declared. "I have serious policy disagreements with some agencies of government, particularly senior officials. The working level guys by and large are good people trying to do the best they can. But they're often ordered more or less to do bad things, for what they believe to be a good reason."

Speaking from exile in Russia, Snowden seemed content given the circumstances. "I don't have to worry about that anymore."

Bangkok Post
Police bust international hacking suspects
Friday, 22 July 2016

Bangkok - A Russian man and an Uzbek woman were busted by tourist police for their alleged involvement in a transnational hacking scam in which more than 50 people in several countries lost a total of one billion baht, police said.
Surachet Hakphan, commander of the Tourist Police Division, said police arrested Dmitry Ukrainskiy, a 44-year-old Russian, and Olga Komova, a 25-year-old Uzbekistan national, both of whom were wanted by US authorities for hacking into a personal financial database.

More than 50 people from various countries, including the US, Australia, Japan and Britain, were swindled out of more than one billion baht by the two suspects, he added. The police, however, declined to say where the suspects were arrested.

Pol Maj Gen Surachet said the US Federal Bureau of Investigation (FBI) had sought assistance from Thai police to track the two suspects belonging to a computer hacking network as authorities believed Mr Ukrainskiy and Ms Komova were hiding out in Thailand.

Since 2014, US authorities found that financial transactions believed to be carried out by the hacking network were made from several countries to Thailand. A police team was set up to search for the two suspects, Pol Maj Gen Surachet said.

Police found that Mr Ukrainskiy was running a yacht charter business in Pattaya and Ms Komova was working at a hotel in Koh Chang in Trat, he said.

Police said the suspects told investigators they used software that allowed them to gain access to a private computer system and stole the victims' financial information.

The Anti-Money Laundering Office had seized more than one billion baht and frozen more than 50 bank accounts from the network, Pol Maj Gen Surachet said. Meanwhile, a 50-year-old Turkish national has been arrested for robbery, police said.

Abdullah Alp Kaya, who was wanted on an arrest warrant issued by the Southern Bangkok Criminal Court on Wednesday, was caught yesterday at a coffee shop in the Terminal 21 shopping mall on Sukhumvit Road, Lumpini police said.

Investigators said people lodged complaints with police that their notebook computers, tablets, and smartphones were stolen when they were spending time at coffee shops at department stores in Bangkok.

Police said Mr Kaya admitted to police that he had stolen notebook computers and other gadgets from unsuspecting customers.

The Guardian (London)
Surge in cybercrime figures prompts police call for awareness campaign
Friday, 22 July 2016
Byline: Alan Travis

London - Police chiefs have called for a national campaign on online fraud and other cybercrime on the scale of last century's seatbelt and drink-driving campaigns in the wake of figures showing that one in 10 adults have been victims of such offences in the past year.
Chris Greany, City of London police's economic command head, said that with around 1m cases reported in the last year to Action Fraud alone, it was not possible for all cases to be investigated.

On Thursday the Office for National Statistics said there had been more than 5.8m incidents of cybercrime in the past year, far more than previously thought and enough to nearly double the headline crime rate in England and Wales.

The first official estimate of the true scale of online shopping scams, virus attacks, theft of bank details and other online offences was much higher than an initial ONS estimate in October last year, which put the annual figure at 3.8m, or 40% of all crimes.

Greany said fraud now cost an estimated £193bn each year, and with half of all crimes against people in the UK committed from abroad it was becoming more challenging for police to tackle.

"Law enforcement agencies are becoming increasingly successful at targeting the most serious offenders; however, the scale of the challenge is such that prevention, and helping businesses and individuals protect themselves, is the only long-term way of combating the escalating threat," he said. "That includes all industries taking proper steps to protect their customers from becoming victims of fraud."

Greany endorsed a call for a national fraud and cybercrime campaign on a par with the seatbelt and drink-drive campaigns of the 1980s and 90s to create a more internet-savvy society.

Deputy chief constable Peter Goodman, the National Police Chiefs Council lead on cybercrime, said digital crime was no longer a curiosity or a new specialism in policing. "The priorities for law enforcement are to make the UK a hostile place for cyber-criminals to operate, improve the response to victims and develop capabilities in local forces. Transforming our response to these crimes is a challenge but it is a priority for investment in policing," he said.

In March the Metropolitan police commissioner, Sir Bernard Hogan-Howe, faced criticism when he suggested that bank customers who were victims of online fraud should not be refunded by banks if they had failed to protect themselves from cybercrime.

The ONS says one in 10 adults have been victims of cybercrime in the past year. The chance of being a victim is the same regardless of social class or whether someone lives in a deprived or affluent, urban or rural area.

The 5.8m offences were made up of 3.8m fraud offences, including 2.5m incidents of bank and credit card fraud, and 2m computer misuse offences, including 1.4m virus attacks. The remaining 600,000 estimated offences related to unauthorised access to personal information, such as hacking of email, social media or other online accounts.

The latest overall figures, excluding online crime, in the 12 months to March 2015 show there were an estimated 6.3m offences - 6% fewer than in the previous year.

Police crime figures show that the murder rate rose by 34 to 571, the highest in five years. This is still far below the peak in 2002-03, when 1,047 homicides were recorded, but the recent rise is one of the more authoritative indicators that Britain is experiencing an increase in violence. The 96 deaths at Hillsborough in 1989 will be added to the official homicide figures and included in the next set of figures after the inquests finished in April.

Knife crime offences rose by 10% in the past year and gun crime increased by 4% over the same period.

Incidents of harassment, including new categories of offence such as malicious communications online, social media abuse and revenge porn, have risen 90%, from 82,000 to 156,000.

The police figures also show a 27% rise in offences against the person and a 21% increase in sexual offences. Those figures include a 22% increase in reported rapes from 29,300 to 35,798. By contrast, the crime survey shows no significant change in the proportion of adults who say they had been a victim of a sexual assault in the past year. The ONS said the 21% increase in sexual offences reflected both an improvement in police recording of the offences and a greater willingness of victims to come forward.

But the overall picture of all crime - excluding the 5.8m online offences - according to the crime survey of England and Wales, which is regarded as the best measure of crime trends, shows a 6% fall to 6.3m offences involving adult victims in the 12 months to March 2016.

The long- term trends in "traditional" crimes such as burglary, car thefts and criminal damage show that the fall in crime since its 1995 peak has slowed down since 2005. The crime survey found there had been no change in the overall level of violent crime compared with the previous year.

The online crime numbers give the first official snapshot of the scale of the threat from online attacks and scams. However, ONS statisticians said it would be "misleading to conclude that this means actual crime levels have doubled, since the survey previously did not cover these offences".

The first estimate is based on a 9,000-strong sample size from six months of interviews from the crime survey. Only when the ONS has 12 months of data in January will the online crime figures be incorporated into the headline crime rate.

Separate Home Office figures for police officer numbers show they fell by a further 3,126 last year to 124,000 - the lowest level since 2003.

Andy Burnham, the shadow home secretary, said: "At long last, we have the true picture of crime in England and Wales and it puts the former home secretary's record in a new light.

"Our new PM [Theresa May] was fond of saying that crime is falling but, as people can see, crime has moved online and until now the official statistics haven't shown that. Her complacent claims do not read well alongside these worrying increases in violent crime, sexual crime and homicide.

"The only conclusion that can be drawn is that it is the wrong time to be cutting the police. The PM promised real-terms protection but has failed to deliver it. Now that decision is entirely within her hands, she must honour the promise that she made and protect frontline policing," he said.

The policing minister, Brandon Lewis, said: "As crime falls, we know that it is also changing. Fraud and cyber-offences are not a new threat and the government has been working to get ahead of the game, committing to spend £1.9bn on cybersecurity and cybercrime over the next five years. We have also established the joint fraud taskforce, bringing together law enforcement and the banking sector, while Action Fraud, the National Fraud Intelligence Bureau and the National Crime Agency are working to improve our response.

"We welcome today's experimental ONS figures on fraud and cybercrime - offences which we have always known were happening but were previously unable to quantify. Having an accurate national picture will be crucial to inform future action."

New York Times
Pyongyang Radio Revives Coded Broadcasts for Spies
Friday, 22 July 2016
Byline: Choe Sang-Hun

Seoul - In an era of sophisticated spycraft, North Korea appears to be returning to the days of shortwave radio.

The North broadcast a series of seemingly random numbers on Pyongyang Radio twice recently, an eerie reminder of the days when the North encrypted messages to its spies in South Korea.

In the latest episode last Friday, an announcer read what she described as "a mathematics review assignment for investigative agent No. 27," engaged in a "distance learning" program.

"Turn to Page 459, No. 35; Page 913, No. 55; Page 135, No. 86," she said, continuing to cite numbers for 14 minutes.

Decades ago, it was not unusual for late-night radio listeners in the South to hear mysterious numbers arriving on static- filled signals from the North. The South Korean government in Seoul tried to block the signals and barred its citizens from listening.

Kim Dong-sik, a former intelligence officer for North Korea, said he used to listen for such broadcasts at midnight each night to check whether his spymasters had a message for him. Mr. Kim was caught by the South in 1995 after a gun battle with South Korean agents and police officers.

"When I arrived in the South, I had five different call signs assigned to me," said Mr. Kim, who now works as a senior analyst at the Institute for National Security Strategy, a think tank run by South Korea's National Intelligence Service. "Each night, I listened for my call signs."

The June 24 and July 15 broadcasts, confirmed by the South Korean government on Wednesday, were the first such coded messages in 16 years, leaving intelligence officials and analysts puzzled by the North's motives.

The broadcasts come amid concerns about the North, which has raised tension with the United States and its allies by conducting a series of missile tests and has issued bold claims of advances in its quest for a nuclear-tipped long-range missile.

North Korea has reacted strongly to a plan by the United States to deploy an advanced missile defense system in the South. This week, it fired three ballistic missiles, saying that they were used in simulated tests to detonate nuclear warheads over seaports and airfields in the South, where American reinforcements are supposed to arrive in the event of a war.

The tests defied a new round of sanctions that the United Nations Security Council imposed against the North after a nuclear test in January and a long-range rocket launch in February.

Jeong Joon-hee, a government spokesman for South Korea, has called the resumption of the broadcasts "seriously regrettable" but declined to comment on any motives. "The North should abandon its old ways," he said.

South Korea itself has resorted to old-school propaganda in recent years, resuming loudspeaker and radio broadcasts into the North and juicing them up with synthesized Korean music known as K-pop.

Some analysts said the North's use of a bygone encryption tool was rekindling old fear among South Koreans of an escalation in psychological warfare. North Korea stopped sending out such coded messages by shortwave radio after the Koreas held a summit meeting in 2000, agreeing to de-escalate the Cold War- era intrigue on the divided peninsula.

Since then, the North is believed to have adopted more sophisticated methods of communication. When the South's intelligence service announced the capture of a spy ring in 2011, it said that the officers contacted the North through steganography, a technique for encrypting a message into a text, image or video file delivered online.

Mr. Kim, the analyst and former spy, said the broadcasts should be taken seriously. He said the North appeared to be bolstering its espionage operations since 2009, when it created the General Bureau of Reconnaissance by merging various party and military agencies in charge of sending spies to the South.

Washington blacklisted the bureau after North Korean hackers were accused of wreaking havoc on the computer network of Sony's movie studio in 2014.

At a time when the counterintelligence authorities use sophisticated technology to monitor the digital communication of espionage suspects, "the old number broadcasts are still a dependable and preferable means of communication for spies," Mr. Kim said.

"We should assume that the North is using the radio broadcasts to communicate with its agents here or is at least using them to train spies," he added.

He recalled that when he was training in the 1980s, he spent countless hours listening to tape- recorded broadcasts and copying the numbers to master a so-called numbers station technique of encrypted communication.

Mr. Kim said he and his handlers in the North used an agreed-upon book -- "Whale Hunt," a popular novel in the South -- to decipher one another's codes. As in the broadcast on Friday, a typical five-digit combination started with a three-digit page number. The remaining two digits pointed at two Korean characters in the text of the page.

The two Koreas still accuse each other of spying. The North is holding at least four South Koreans, some of them sentenced to a labor camp for life, on charges of espionage.

In recent years, the South's intelligence service has arrested people it deemed spies as they entered the country disguised as refugees. Last week, prosecutors said they arrested two South Korean men on

charges of spying for the North. They released closed- circuit video of counterespionage officers overpowering a suspect at an internet cafe.

The men used encrypted emails to contact their handlers in the North, the prosecutors said.

Mr. Kim said that during his days as a spy, the radio was a main tool of communication.

"If there was a certain song broadcast by Pyongyang Radio at an agreed-upon hour, that meant that there was something wrong and I should immediately abort my mission," he said. "If not, it was all clear."

Gulf News
Beware ransomware attacks on your PC
Friday, 22 July 2016
Byline: Faisal Masudi

Dubai - Ransomware, a relatively new kind of cyber attack where criminals demand money for decrypting files they have taken control over, is increasingly targeting ordinary consumers -- including those in the UAE -- a new study said on Wednesday.
Security firm Symantec said in its latest research the average ransom demanded by attackers jumped to $679 (Dh2,491), up from $294 (Dh1,078) at the end of 2015.

The "Internet Security Threat Report (ISTR) Special Report: Ransomware and Businesses 2016" revealed consumers make up 57 per cent of ransomware victims.

The majority of ransomware variants are designed to attack Windows computers and ordinary home users continue to be one of the biggest victim groups, it added. Meanwhile, employees at organisations make up 43 per cent of ransomware victims.

According to Symantec's 2016 ISTR, the UAE experienced the fourth highest rate in ransomware attacks in the Middle East and Africa region, added Hussam Sidani, regional manager for Gulf, Symantec.

Furthermore, ransomware attacks grew by 44 per cent year-on-year in the UAE in 2015. "In 2015, we saw an average of 28 attacks per day and 10,279 total attacks on UAE-based organisations," Sidani said.

"Additionally, given the strong uptake of smartphones and tablets, we're seeing more mobile devices coming under attack, with attackers encrypting files, and anything else an owner will pay to recover.

"The UAE has one of the highest penetration of smartphones in the world and users enjoy great connectivity here. This can make them a very lucrative target for ransomware."

Sidani explained that one of the most common methods to spread ransomware, and malware in general, is through malicious spam email. These spam emails pose as an important email from a well-known organisation, such as a shipping or utility company. However, as soon as the user opens the malicious attachment or link, malware will be installed on their device or computer. Following this, the user's important files will be encrypted and they will receive a message demanding a ransom to release the files.

Victims can be asked to send ransom money via a payment link or by handing over their credit card information. However, Symantec's recommendation is not to pay the ransom.

"While we recognise that some organisations may feel that paying the ransom is their only option, there is no guarantee that this will recover their data. Attackers may not send a decryption key, could poorly implement the decryption process and damage files, and may deliver a larger ransom demand after receiving the initial payment."

Don't click links in unsolicited email or social media messages, particularly from unknown sources. Use strong and unique passwords for your accounts and devices, and update them on a regular basis.

When installing a network-connected device, or downloading a new app, review the permissions to see what data you're giving up. Disable remote access when not needed. Antivirus-only security is no longer enough to combat security threats like ransomware. Protect your data with a multi-platform solution and back up your computer and devices on a regular basis.

New York Times
Snowden to Help Develop a Safer Phone for Journalists
Friday, 22 July 2016
Byline: John Markoff

Cambridge, Mass. - The former National Security Agency contractor Edward J. Snowden said Thursday that he planned to help develop a modified version of Apple's iPhone for journalists who are concerned that they may be the target of government surveillance.
The announcement was made during a one-day conference on "Forbidden Research" held at the Massachusetts Institute of Technology's Media Lab.

Mr. Snowden, who spoke via a video connection from Russia, where he is living in exile, said he was working with Andrew Huang, a computer hacker known as Bunnie who studied electrical engineering at M.I.T., to see if it would be possible to modify a smartphone to alert journalists working in dangerous environments to electronic surveillance.

Mr. Snowden, who is a board member of a nonprofit group called the Freedom of the Press Foundation, said he was concerned that cellphones and smartphones serve as tracking devices that automatically

create electronic dossiers that give third parties, including governments, detailed information on location.

As an example of the dangers of location data, he cited the mortar attack in 2012 by the Syrian government that killed Marie Colvin, an American journalist who was reporting in Homs, Syria, for The Sunday Times of London.

"The radio frequency emissions of her communications that she used to file those news reports were intercepted by the Syrian Army," he said.

He said it was increasingly difficult for users to trust their smartphones. They may be tampered with by malware programs, causing them to transmit location information even when the user may believe that the device has been placed into a safe "airplane mode."

Mr. Huang said the project was still experimental, but he hoped it would provide journalists with modified phones that would come in a special case with a separate display that would provide an alert when the phone was active and transmitting data at improper times.

The conference focused on issues raised by computer hacking, as well as controversial scientific research in areas such as genetic engineering and geoengineering.

Also at the conference, Reid Hoffman, one of the founders of LinkedIn, which recently agreed to be acquired by Microsoft for $26 billion, announced that he planned to offer a $250,000 "Disobedience Prize" aimed at promoting positive social change and opposing injustice.

"It will go to a person or group engaged in what we believe is excellent disobedience for the benefit of society. The disobedience that we would like to call out is the kind that seeks to change society in a positive way, and is consistent with a set of key principles," wrote Joichi Ito, director of the M.I.T. Media Lab, in a web posting about the prize. The timing of the award has not yet been determined.

In separate panels, biologists and climate scientists explored the risks and rewards of scientific research that might have unexpected consequences.

Kevin Esvelt, a biologist who is director of the Sculpting Evolution research group at the M.I.T. Media Lab, spoke about new, easily accessible genetic engineering technologies that might be used to preserve species that are at risk of extinction, and alternatively to eradicate pests that threaten human populations by spreading disease.

He described a discussion scientists had on Wednesday with residents of Martha's Vineyard about the use of advanced genetic engineering techniques to introduce a type of mouse that had been modified to be unable to carry Lyme disease. The idea would be to break the transmission of the disease to ticks and then to humans.

He said that before beginning the experiment, the scientists engaged the community to discuss potential risks.

Scientists on several panels acknowledged that it was impossible to be certain about unforeseen effects from new engineering techniques.

"What we're worried about is something that we do that could be very attractive in the short term but have some triggering mechanism or some slow events that occur far in the future," said George Church, a Harvard geneticist who is exploring genetic engineering techniques to revive extinct species.

Lack of funds and training hamper cybersecurity
Friday, 22 July 2016
Byline: Staff Report

Dubai - Poor funding and lack of skilled staff remain serious challenges for global business IT security, according to a new survey by Accenture and HfS Research.
And insider data theft and malware attacks are the most significant threats, with 69 per cent of survey respondents saying they had suffered attempted or successful theft or corruption of data by insiders in the previous 12 months.

The survey, The State of Cybersecurity and Digital Trust 2016, polled 200 security executives and IT professionals in different countries and in different sectors.

Findings indicate that there are significant gaps between talent supply and demand, a disconnect between security teams and management expectations, and considerable disparity between budget needs and actual budget realities.

"Our research paints a sobering picture. Security leaders believe threats are not going away, in fact they expect them to increase and hinder their ability to safeguard critical data and establish digital trust," said Kelly Bissell, senior managing director, Accenture Security. "At the same time, while organisations want to invest in advanced cyber technologies, they simply don't have enough budget to recruit or train skilled people to use that technology effectively."

"While the gaps we identified can be overcome, they do collectively underscore the need for an inherently different approach, one that includes more robust risk management measures and the development of digital trust," said Fred McClimans, research vice president, Digital Trust and Cybersecurity, HfS Research.

London Times
One in ten become victims of cybercrime
Thursday, 21 July 2016
Byline: Richard Ford

London - One in ten adults have been victims of fraud or computer misuse offences, according to official figures published today.
An estimated 5.8 million fraud and cyberoffences are committed annually, pushing the overall crime figures in England and Wales to more than 12 million.

The first official estimate of the scale of online shopping scams, virus attacks, ticket frauds, computer hacking and theft of bank details along with credit and bank card fraud shows that fraud is the most common crime experienced by the public.

The chance of being a victim of victim of fraud is the same regardless of class, region and whether a person lives in a rural or urban area, according to the Crime Survey of England and Wales.

Official crime figures from the Office for National Statistics (ONS) showed that excluding fraud and cybercrime, there were 6.3 million crimes in the 12 months to March 2016, a fall of 6 per cent.

Separate police-recorded crime figures for murder rose by 34 to 571 homicides, the highest level for five years

Police figures also showed a 27 per cent rise in offences against the person and a 21 per cent increase in sexual offences. Statisticians said the rise in both types of offences was due to better recording practices by the police and that the increase in sex crimes was also due to a willingness of more victims to report offences.

Incidents of revenge porn and harassment, including online abuse, accounted for almost half the rise in personal violence.

The confirmation of the high volume of online crime provides the first official snapshot of the scale of threat from online attacks and scams.

Statisticians said "it would be misleading to conclude that this means actual crime levels have doubled, since the survey previously did not cover these offences".

The first estimate is based on a 9,000 sample size from six months of interviews from the survey.

Only when the ONS has 12 months of data in January will the online crime figures be incorporated into the headline crime rate for England and Wales.

The 3.8 million frauds included 2.5 million bank and credit account cases plus one million sales, tickets and computer software service frauds.

There were a further 0.1 million incidences involving lottery scams and frauds linked to dating sites.

Of the two million computer misuse incidents, 1.4 million involved computers being infected with viruses and 0.6m incidents of hacking of e-mail, social media or other online accounts.

The Intercept
Edward Snowden's New Research Aims to Keep Smartphones From Betraying Their Owners
Thursday, 21 July 2016
Byline: Micah Lee

Washington - In early 2012, Marie Colvin, an acclaimed international journalist from New York, entered the besieged city of Homs, Syria, while reporting for London's Sunday Times. She wrote of a difficult journey involving "a smugglers' route, which I promised not to reveal, climbing over walls in the dark and slipping into muddy trenches." Despite the covert approach, Syrian forces still managed to get to Colvin; under orders to "kill any journalist that set foot on Syrian soil," they bombed the makeshift media center she was working in, killing her and one other journalist and injuring two others.
Syrian forces may have found Colvin by tracing her phone, according to a lawsuit filed by Colvin's family this month. Syrian military intelligence used "signal interception devices to monitor satellite dish and cellphone communications and trace journalists' locations," the suit says.

In dangerous environments like war-torn Syria, smartphones become indispensable tools for journalists, human rights workers, and activists. But at the same time, they become especially potent tracking devices that can put users in mortal danger by leaking their location.

National Security Agency whistleblower Edward Snowden has been working with prominent hardware hacker Andrew "Bunnie" Huang to solve this problem. The pair are developing a way for potentially imperiled smartphone users to monitor whether their devices are making any potentially compromising radio transmissions. They argue that a smartphone's user interface can't be relied on to tell you the truth about that state of its radios. Their initial prototyping work uses an iPhone 6.

"We have to ensure that journalists can investigate and find the truth, even in areas where governments prefer they don't," Snowden told me in a video interview. "It's basically to make the phone work for you, how you want it, when you want it, but only when."

Huang made a name for himself by using a technique known as reverse engineering to hack into Microsoft's Xbox and other hardware devices locked down using various forms of encryption, and Snowden said he's been an invaluable research partner.

"When I worked at the NSA, I worked with some incredibly talented people," Snowden said, "but I've never worked with anybody who had such an incredible outpouring of expertise than I have with Bunnie."

Snowden and Huang presented their findings in a talk at MIT Media Lab's Forbidden Research event today and published a detailed paper.

Location Privacy and Smartphones

Smartphones come with a variety of different types of radio transmitters and receivers: cellular modems (for phone calls, SMS messages, and mobile data), wifi, bluetooth, and others. But using any of these radios could leak your physical location to an adversary who is watching the airwaves.

Journalists and activists use their phones to communicate with sources and colleagues, post updates and livestream to social media, and accomplish countless other networked tasks. If they need to keep their location secret, for example in a war zone, they need to turn off all of the radios within their phones. Even so, phones can still be vital tools even when offline; internet access is not needed to take photographs, record video or audio, take notes, use certain maps, or manage schedules.

Snowden and Huang have been researching if it's possible to use a smartphone in such an offline manner without leaking its location, starting with the assumption that "a phone can and will be compromised." After all, journalists and activists are often under-resourced and face off against well-funded intelligence services. They also, necessarily, use their phones to talk to, and open documents from, a wide variety of sources, leaving them especially vulnerable to targeted phishing, or "spearphishing," attacks, where an attacker baits a victim into opening an enticing document that actually contains an exploit.

The research is necessary in part because the most common way to try to silence a phone's radio -- turning on airplane mode -- can't be relied on to squelch your phone's radio traffic. "Malware packages, peddled by hackers at a price accessible by private individuals, can activate radios without any indication from the user interface," Snowden and Huang explain in their blog post. "Trusting a phone that has been hacked to go into airplane mode is like trusting a drunk person to judge if they are sober enough to drive."

Introspection Engine

Since a smartphone can essentially be made to lie about that state of its radios, the goal of Snowden and Huang's research, according to their post, is to "provide field-ready tools that enable a reporter to observe and investigate the status of the phone's radios directly and independently of the phone's native hardware." In other words, they want to build an entirely separate tiny computer that users can attach to a smartphone to alert them if it's being dishonest about its radio emissions.

Snowden and Haung are calling this device an "introspection engine" because it will inspect the inner-workings of the phone. The device will be contained inside a battery case, looking similar to a smartphone with an extra bulky battery, except with its own screen to update the user on the status of the radios. Plans are for the device to be able to sound an audible alarm and possibly also to come equipped with a "kill switch" that can shut off power to the phone if any radio signals are detected. "The core principle is simple," they wrote in the blog post. "If the reporter expects radios to be off, alert the user when they are turned on."

The introspection engine also must fit a number of design goals, including: It should be entirely open source, with open hardware, to make it easy for experts to inspect; it should operate in a separate "security domain" than the phone. Basically, the introspection engine should work even if the phone is hacked and actively lying to you; it should have a simple and intuitive user interface and require no special training to use; it should be usable on a daily basis with minimal impact on workflow.

Introspection engines don't exist yet, and the research Snowden and Huang presented today is only the beginning. In order to begin work on a prototype, the pair needed to pick a specific model of smartphone to target. They chose the 4.7-inch iPhone 6, based on their understanding of "the current preferences and tastes of reporters." However, introspection engines could be designed for any model phone.

Jacking Into the iPhone

Huang, an American who currently lives in Singapore, traveled to the metropolis of Shenzhen, China, to explore the electronics markets of Hua Qiang, which he described as "ground zero for the trade and practice of iPhone repair." While there, he bought spare parts and repair manuals that contained detailed blueprints of the target device.

Using information gleaned from these manuals, Snowden and Huang discovered that the iPhone's logic board has several test points designed by the manufacturer that can be exploited to learn the status of various on-board radios. These test points, which are built-in to many consumer devices, are crucial to improving customer experience. When a customer returns a defective device, engineers rely on them to determine the cause of the defect.

Snowden and Huang discovered 12 test points that could be used to monitor the status of the cellular radios, the GPS radio, and the wifi and bluetooth radios. While they didn't find a test point to monitor the Near Field Communication chip, the part that makes Apple Pay possible, they discovered that they could disconnect its antenna, vastly reducing its range.

They don't think that modifying an iPhone 6 to install an introspection device could be done by just anyone, but "any technician with modest soldering skills can be trained to perform these operations reliably in about 1-2 days of practice on scrap motherboards."

Supply Chain

The next step is to develop a working prototype, which Snowden and Bunnie hope to complete over the next year. Their blog post says that the project is currently operating on a "shoestring budget" and "donated time."

If it proves successful, they may seek funding through the Freedom of the Press Foundation to develop and maintain a supply chain. The nonprofit, of which both Snowden and I are board members, could then distribute iPhones that have been modified to include introspection devices to journalists who work in dangerous environments to use in the field.

Lebanon Daily Star
Touch witness completes testimony at STL
Friday, 22 July 2016
Byline: Susannah Walden

Beirut - Protected witness PRH 705 completed his testimony Thursday as the designated representative of the MTC touch cellular network at The Special Tribunal for Lebanon. Touch is one of Lebanon's two GSM networks, the second of which, Alfa has been represented by PRH 707 - another protected witness. Both networks turned over reams of extensive records concerning billingrecords, call logs and coverage maps at the request of investigators.
Prosecutors have built much of their case against the five defendants accused of conspiring to assassinate former Prime Minister Rafik Hariri on this telecommunications data. Prosecutors argue that the data can be used to retrace the movements of the defendants.

Defense attorney Thomas Hannis, representing the interests of Salim Ayyash, completed his cross-examination of the witness by clarifying comments about some of the documents handed over by the network.

The records were a source of debate at the trial, as defense attorneys contested submitting documents into evidence if the witness could not personally attest to their origin.

Hannis had previously voiced his doubt at a May appearance of PRH 705. "This witness has been placed in a very difficult position. He's speaking for the community," he said. "We have a concern that we won't be able to have fair trial for our clients if we're not able to have a meaningful cross-examination of the underlying sources of evidence."

The final appearance of PRH 705 focused on clarifications. "I apologize your honor, this may seem detailed and fiddly, but it won't take long and may be important for our submission later on," Hannis said.

After the lunch recess, Prosecutor Fabia Wong took over to ask the witness several questions on records submitted concerning cellphone handsets that prosecutors allege were used by the deceased Hezbollah commander Mustafa Badreddine. Legal proceedings against Badreddine were halted after an Appeals Chamber found there was sufficient evidence that he was killed in Syria in May.

The investigation into controversial telecommunications data will continue with further testimony from Alfa representative PRH 707, however Thursday's session ended PRH 705 contribution for the time being.

Judge David Re, the Trial Chamber president, highlighted the weight the telecommunications evidence has carried in the proceedings as PRH 705's testimony concluded.

"[There was a] considerable amount of interest in what you had to say based on the number of questions from the counsel and the bench itself. You're free to go ... As they say, don't call us, we'll call you," he said.

Yonhap News Agency
Gov't bolsters countermeasures to deter N.K. cyberattacks
Friday, 22 July 2016
Byline: Staff reporter

Seoul - South Korea is beefing up its governmentwide countermeasures to prevent possible cyberattacks by North Korea, officials said Friday.
The Ministry of Science, ICT and Future Planning said the number of cyberattacks by North Korea more than doubled in the first half of this year.

The cyberattacks "are judged as a part of North Korean provocations to trigger public anxiety" in South Korea, the ministry said.

Last month, South Korean police said North Korea hacked into more than 140,000 computers at 160 South Korean firms and government agencies. About 42,000 documents were suspected to have been stolen, including defense-related information.

The ministry urged people to install antivirus software and avoid opening suspicious emails.

South Korea has been on high alert against hacking attacks by North Korea following the North's fourth nuclear test in January and a series of missile launches in recent months.

Huffington Post
Where Is The Accountability For Ottawa's Communications Spies?
Friday, 22 July 2016
Byline: Monia Mazigh

Commentary: The Communications Security Establishment (CSE) Commissioner report has been just released. For those who don't know what the CSE is, it is the agency related to the Department of National Defence that spies on communications received from abroad.
In their own words, their work focuses on "collecting foreign signals intelligence in support of the Government of Canada's priorities, and on helping protect the computer networks and information of greatest importance to Canada." It is important to emphasize that CSE is not supposed to spy on communication of Canadians in Canada or abroad.

In that regard, the commissioner's mandate is mainly to review CSE activities and their compliance with the law, and in the case of complaints, to undertake investigation. However, the commissioner report, which is supposed to be an independent exercise conducted by a review body, seems more and more like a self-congratulatory document where criticism directed at the CSE or its activities is hard to find. The situation can be compared to a professor rating her own students in a national competition. Of

course, she would like them to pass, and of course she would be lenient in marking. Rather, in such circumstances we need a professor from a different school, and the students' names should be hidden.

In previous years, two main problems became clear to the public in regard to CSE activities:

The stipulations protecting the privacy of Canadians are not always respected, as CSE was reminded by Privacy Commissioner Daniel Therrien.

The lack of safeguards when it comes to information sharing with other agencies -- the Canada Security Intelligence Agency (CSIS), for example.

Indeed, in defence of the CSE's activities, Minister of National Defence Harjit Sajjan recently minimized the amount of information revealed through metadata, usually collected by CSE during its operations. Metadata, or data on data, shouldn't be of a privacy concern for Canadians, according to minister Sajjan.

But the reality is that through the records of Internet and phone communications, even without revealing the identity of the user, much information can still be inferred and shared with other foreign agencies. There exists today a whole range of science fields and theories that can extract patterns about people behaviours without knowing their identities.

The report claims that the commissioner's office "is monitoring 14 active recommendations that CSE is working to address -- 10 outstanding recommendations from previous years and four from this year," and that the privacy issue about sharing foreign intelligence is also being looked into. Nevertheless, we can't know for sure how this is being done and if there is any proposed legislation to be submitted soon. The report doesn't tell us.

It seems from the report that, in general, the commission recommends that the minister should always be informed about controversial issues, but no specific mechanism is suggested to deal with the identified problems. The issue of transparency becomes a matter of blind trust in the hands of the minister of national defence.

Leaving it up to the minister in charge to decide what is acceptable and what is not, or what is lawful and what is not, is far from a democratic and accountable model. We need review mechanisms with the necessary autonomy, independence and structure to create true accountability.

For instance, the ambiguous relationship between CSE and CSIS, described in the report, can't be investigated by any review body. There are currently agencies to oversee respectively CSIS (SIRC) and the CSE (the office of the CSE commissioner), but there is no "super-SIRC" to oversees them both and launch investigations on both of them. The parliamentary oversight presented by the government in Bill C-22 isn't clear if this aspect will be included in its mandate.

As of yesterday, it was reported that CSE won't even reveal the number of times it shared information that could lead to someone being tortured in foreign prisons. The greater the risk of mistreatment (please note how the word "torture" isn't even used), the higher level of bureaucratic or political intervention is required.

Once again, it is up to the minister or a high-level bureaucrat to take that decision, and that risks him or her making a mistake in their assessment. If that happens, Canada will become collateral damage like it has in the past.

New Straits Times
Govt to improve security in airports
Friday, 22 July 2016
Byline: Fazleena Aziz

Sepang - The government will soon introduce a new mechanism to boost security in airports, especially at boarding gates.
Deputy Transport Minister Datuk Abdul Aziz Kaprawi said the mechanism would take into consideration existing operational procedures.

He said that given the increased terror threats globally, especially in transportation hubs, upgrading security was paramount to ensure people's safety.

Aziz said ministry secretary-general Datuk Seri Saripuddin Kasim had been directed on Wednesday to draw up details of the new mechanism through a committee, which would include agencies and departments.

"Some of the issues that pose obstacles, in terms of beefing up security, which we will have to consider, are airport design, businesses and visitors sending off their loved ones.

"But we have to increase security and safety in airports as the threat is real, especially in light of the attacks in Brussels and Istanbul."

He said this after opening the 13th Steering Committee Meeting of Cooperative Aviation Security Programme Asia-Pacific Region (CASP-AP) 2016 yesterday.

Aziz, however, said Kuala Lumpur International Airport complied with International Civil Aviation Organisation (ICAO) security standards, adding that the last audit was done in 2012, while the next audit was due next year.

He said he wanted the Department of Civil Aviation (DCA) to come up with stricter measures to screen potential staff and those working in airports to minimise insider threats.

As most contract workers could also be foreigners, proper screening was vital to ensure no one slipped through the system, he added.

Earlier, he said insider threats could come in the form of former employees, current employees, contract workers or partners who had inside knowledge of the industry.

He said such threats were capable of exploitation, tampering, fraud, espionage, theft and sabotage.

Cyber threats to computer systems were also a matter of concern with increasing reliability on technology, he said, adding that such attacks could cause disruptions.

It was reported that the government was considering a cabinet proposal to allow only passengers to enter terminals in major airports to boost security.

Deputy Prime Minister Datuk Seri Dr Ahmad Zahid Hamidi had said Transport Minister Datuk Seri Liow Tiong Lai had been instructed to work out this proposal with Malaysia Airports Holdings Bhd.

Present yesterday were DCA director of aviation security Abdul Rahmat Mahat and ICAO Asia and Pacific Office regional officer Ross Lockie.

Voice of America
Russian Agent Sentenced for Illegally Exporting US High-tech Gear
Friday, 22 July 2016

New York - A federal court in New York on Thursday sentenced an admitted agent of the Russian government to 10 years in prison and ordered him to forfeit $500,000 in profit he'd gained from his criminal activity, which focused on acquiring and secretly shipping abroad high-tech microelectronics for Russian military equipment.
Alexander Fishenko pleaded guilty to all 19 charges brought by the Department of Justice. U.S. officials said a company that Fishenko had founded shipped $50 million worth of electronic products to Russia between 2002 and 2012, all in defiance of a government licensing system meant to control such exports.

"These commodities have applications and are frequently used in a wide range of military systems," U.S. officials said, "including radar and surveillance systems, missile guidance systems and detonation triggers."

Charges against Fishenko, who has both American and Russian citizenship, included conspiracy, illegally exporting controlled products, conspiring to launder money and obstruction of justice. He was indicted in October 2012, along with 10 other individuals and two corporations, both of which Fishenko

controlled. Three of the people remain at large, but the others either have pleaded guilty or been convicted in court.

To evade export controls on high-tech products manufactured in the United States, officials said, Fishenko and his co-conspirators gave false information about who was buying the electronic components, concealed the fact they were exporters and falsely described the devices on records submitted to the U.S. Department of Commerce.

Ultimate recipients of the electronic components acquired by Fishenko's companies, known as ARC and Apex, included a research unit for the Russian internal security agency FSB, a Russian entity that builds air and missile defense systems, and another that produces electronic warfare systems for the Russian Ministry of Defense.

Assistant Attorney General John Carlin said prosecuting those who violate U.S. export laws is "an important part of our national security framework ... protecting national assets from ending up in the hands of our potential adversaries."

Politics.co.uk
Boris Johnson once outed MI6 spy 'for a laugh'
Wednesday, 20 July 2016
Byline: Adam Bienkov

London - There was some nervousness in the Foreign Office when it was announced that Boris Johnson had been made foreign secretary.
Part of Johnson's new role involves overseeing MI6. This is a highly sensitive and delicate task which some within his department worry he is unsuited for.

It now appears there is good reason for them to feel uneasy.

In 2001, while editor of the Spectator, Johnson published a piece suggesting that a former friend and colleague had worked for the secret service.

On the front page of the magazine, Johnson splashed the headline "Who was Smallbrow?" Inside, Boris published an article naming Agent Smallbrow as then Sunday Telegraph editor Dominic Lawson.

The allegation was based on a controversial book by renegade spy Richard Tomlinson which had been published in Russia. Tomlinson claimed that Lawson had provided cover for MI6 agents working in Eastern Europe.

Lawson, who denies ever having been an agent, was furious. He told Johnson's biographer Sonia Purnell that the former mayor had put the lives of journalists at risk.

"He knew me, we were friendly - it was intensely annoying. And apart from anything else, if you're running a newspaper with foreign correspondents in strange parts of the world, as I was then, it's potentially a physical threat to them if it's believed that they're working for British intelligence. You can imagine how angry I was."

Johnson was unrepentant, however.

"I rang him up, but there was just this sense of "Never mind, Dommers, I just did it for a laugh. And the thing about Boris is that because in some strange way he is adorable, one forgives him. It's not just women; men too fall for that charm."

Johnson's responsibilities as foreign secretary appear to have been significantly diminished from his predecessors, with responsibility for Brexit negotiations and future trade deals passed to other departments by Theresa May.

A piece by Adam Boulton in this week's Sunday Times also claimed that responsibility for MI6 was "being quietly shifted to the prime minister and National Security Council".

However, the Foreign Office strongly denied this yesterday, telling Politics.co.uk that there were no plans to strip the department of responsibility for the secret service.

"As has been long standing practice, responsibility for SIS and GCHQ lies with the foreign secretary. This has not changed and will not change," a spokesperson said.

The Daily Beast
How the Real Edward Snowden Helped Write the Ending to Oliver Stone's 'Snowden'
Friday, 22 July 2016
Byline: Jen Yamato

Washington - The NSA's worst nightmare made his San Diego Comic-Con debut by way of video chat, moments after the first public screening of Oliver Stone's Snowden.
"The FBI actually gets a copy of this talk because we're going through Google Hangouts, which unfortunately has a sort of built-in surveillance capability," joked Edward Snowden, his face peering down on a theater full of critics and journalists. He joined Stone and stars Joseph Gordon-Levitt and Shailene Woodley from Moscow, his home for the foreseeable future, "live--from the internet."

Snowden tracks the NSA analyst as he wrestles with the decision to blow the lid off of the U.S. government's top-secret global surveillance program, an act that made him persona non grata in America and changed history. The telling of this historic expose, co-scripted by Stone and Kieran Fitzgerald, is authorized by Snowden, who appears as himself in the final coda.

After a dazzling thriller of a finale right out of a spy flick (which, yes, involves a certain Rubik's cube), Stone's larger aims materialize. News footage of President Obama, seen earlier labeling Snowden a "29-year-old hacker," is used to pose a question--the question--seemingly to the President as much as the public at large: Is Edward Snowden a spy or a whistleblower? A traitor or a hero?

Snowden makes its official world premiere in September at the Toronto Film Festival, so bringing a tech-oriented political thriller to a July geekfest filled with superhero fans in spandex cosplay was a curious move. But its official release, timed for a fall Oscar berth, is not slated until September 16th. Thursday at Comic-Con, on the same night Donald Trump accepted the Republican presidential nomination, Stone's film highlighted the fact that Obama still has time to pardon Snowden before he leaves office.

The opportunistic move of sneaking Snowden into the annual pop culture convention appearance worked. Stone grabbed plenty of attention for Snowden by likening Pokémon Go to a form of totalitarianism during a panel earlier in the day. But that evening, he told The Daily Beast he's not banking on Obama rescuing Snowden from perma-exile. I asked if the President is likely to even see the film any time soon. "I hope so," Stone said. "I hope so, but I'm holding no hopes on it."

Live from the internet, Snowden explained why he got involved in a major motion picture retelling of his life. "When there is enough in the public record you don't really get to decide if a movie gets made," he said. Stone was the right director to bring his story to the screen, he said, because "nobody tells Oliver what to do, and that's not the case with a lot of studios. That's a distinguisher that I hope shows through in the final message."

He decided to appear in the movie after Stone flew out to film him for bonus materials, he said. In the film, he professes his newfound purpose while seated at a laptop bearing a sticker for the Electronic Frontier Foundation, a nonprofit organization dedicated to "defending civil liberties in the digital world."

According to Stone, it took nine takes to nail Snowden's scene--the same number of takes it took Trump to film his deleted cameo in Stone's Wall Street: Money Never Sleeps. "I once directed Donald Trump," Stone smiled to the crowd. "It was a hard day. The difference between Donald and Ed--and this is true, I love the man in a weird way--after every take [Trump] jumped up and said, 'Wasn't that great?'"

"The confidence is unbelievable, and that's what's allowing him to run," Stone continued. "I had to say, 'Donald, I think it's great but you know what? I think we can go a little bit better here.'"

Stone also revealed that Snowden made a major contribution to the scripting of the film's climax--a nail-biter that depicts exactly how Snowden managed to get away with the stolen files he would eventually release to the world. In the movie, Snowden anxiously downloads files upon files of documents and hides the SD card inside a Rubik's cube.

After much suspense, he manages to smuggle the cube out through security, smiling his relief into the open air.

Only that's not how he really did it.

"We don't know," Stone admitted. "None of us know. He's the only one who knows and one day he may reveal. It was Ed's idea, his suggestion. We responded to it and ran with it. But it was a good idea. Thank you."

Snowden did not divulge how that scene really unfolded, but he confirmed that life as an international fugitive isn't all that terrible. "I can confirm that I'm not living in a box," he said. "I actually live a surprisingly free life."

"This was not the most likely outcome," he added. "I didn't actually expect to make it out of Hawaii. I thought it was incredibly risky... I never thought I would be saved. But I thought the stories might still be able to get out there."

He slammed the U.S. government, which cancelled his passport and made travelling impossible in the wake of the leak, for threatening trade sanctions against countries that offered him asylum.

"Particularly in the case of Ecuador, they literally got a direct threat, I believe from John Kerry, to revoke trade preferences," he said. "Trade preferences were basically the thing keeping their economy alive--literally, for broccoli farmers and rose farmers. These are impoverished, indigenous farmers, and they were like, 'We're going to make sure these people's families can't eat if you defend this guy's human rights.'"

"But this is not a criticism about the United States specifically, although that's heinous in terms of foreign policy," he continued. "This is truly about the nature of power."

Earlier in the day, Snowden and Andrew "Bunnie" Huang unveiled plans for a device that would prevent the outside surveillance of cell phones. "We're not doing productization, we're not doing sales, we're not setting up a company or anything like that," Snowden clarified. "Just saying anybody who wants to do this, here are our findings."

"I love my country. I love the things that we try to do," he declared. "I have serious policy disagreements with some agencies of government, particularly senior officials. The working level guys by and large are good people trying to do the best they can. But they're often ordered more or less to do bad things, for what they believe to be a good reason."

Speaking from exile in Russia, Snowden seemed content given the circumstances. "I don't have to worry about that anymore."

Bangkok Post
Police bust international hacking suspects
Friday, 22 July 2016

Bangkok - A Russian man and an Uzbek woman were busted by tourist police for their alleged involvement in a transnational hacking scam in which more than 50 people in several countries lost a total of one billion baht, police said.
Surachet Hakphan, commander of the Tourist Police Division, said police arrested Dmitry Ukrainskiy, a 44-year-old Russian, and Olga Komova, a 25-year-old Uzbekistan national, both of whom were wanted by US authorities for hacking into a personal financial database.

More than 50 people from various countries, including the US, Australia, Japan and Britain, were swindled out of more than one billion baht by the two suspects, he added. The police, however, declined to say where the suspects were arrested.

Pol Maj Gen Surachet said the US Federal Bureau of Investigation (FBI) had sought assistance from Thai police to track the two suspects belonging to a computer hacking network as authorities believed Mr Ukrainskiy and Ms Komova were hiding out in Thailand.

Since 2014, US authorities found that financial transactions believed to be carried out by the hacking network were made from several countries to Thailand. A police team was set up to search for the two suspects, Pol Maj Gen Surachet said.

Police found that Mr Ukrainskiy was running a yacht charter business in Pattaya and Ms Komova was working at a hotel in Koh Chang in Trat, he said.

Police said the suspects told investigators they used software that allowed them to gain access to a private computer system and stole the victims' financial information.

The Anti-Money Laundering Office had seized more than one billion baht and frozen more than 50 bank accounts from the network, Pol Maj Gen Surachet said. Meanwhile, a 50-year-old Turkish national has been arrested for robbery, police said.

Abdullah Alp Kaya, who was wanted on an arrest warrant issued by the Southern Bangkok Criminal Court on Wednesday, was caught yesterday at a coffee shop in the Terminal 21 shopping mall on Sukhumvit Road, Lumpini police said.

Investigators said people lodged complaints with police that their notebook computers, tablets, and smartphones were stolen when they were spending time at coffee shops at department stores in Bangkok.

Police said Mr Kaya admitted to police that he had stolen notebook computers and other gadgets from unsuspecting customers.

The Guardian (London)
Surge in cybercrime figures prompts police call for awareness campaign
Friday, 22 July 2016
Byline: Alan Travis

London - Police chiefs have called for a national campaign on online fraud and other cybercrime on the scale of last century's seatbelt and drink-driving campaigns in the wake of figures showing that one in 10 adults have been victims of such offences in the past year.
Chris Greany, City of London police's economic command head, said that with around 1m cases reported in the last year to Action Fraud alone, it was not possible for all cases to be investigated.

On Thursday the Office for National Statistics said there had been more than 5.8m incidents of cybercrime in the past year, far more than previously thought and enough to nearly double the headline crime rate in England and Wales.

The first official estimate of the true scale of online shopping scams, virus attacks, theft of bank details and other online offences was much higher than an initial ONS estimate in October last year, which put the annual figure at 3.8m, or 40% of all crimes.

Greany said fraud now cost an estimated £193bn each year, and with half of all crimes against people in the UK committed from abroad it was becoming more challenging for police to tackle.

"Law enforcement agencies are becoming increasingly successful at targeting the most serious offenders; however, the scale of the challenge is such that prevention, and helping businesses and individuals protect themselves, is the only long-term way of combating the escalating threat," he said. "That includes all industries taking proper steps to protect their customers from becoming victims of fraud."

Greany endorsed a call for a national fraud and cybercrime campaign on a par with the seatbelt and drink-drive campaigns of the 1980s and 90s to create a more internet-savvy society.

Deputy chief constable Peter Goodman, the National Police Chiefs Council lead on cybercrime, said digital crime was no longer a curiosity or a new specialism in policing. "The priorities for law enforcement are to make the UK a hostile place for cyber-criminals to operate, improve the response to victims and develop capabilities in local forces. Transforming our response to these crimes is a challenge but it is a priority for investment in policing," he said.

In March the Metropolitan police commissioner, Sir Bernard Hogan-Howe, faced criticism when he suggested that bank customers who were victims of online fraud should not be refunded by banks if they had failed to protect themselves from cybercrime.

The ONS says one in 10 adults have been victims of cybercrime in the past year. The chance of being a victim is the same regardless of social class or whether someone lives in a deprived or affluent, urban or rural area.

The 5.8m offences were made up of 3.8m fraud offences, including 2.5m incidents of bank and credit card fraud, and 2m computer misuse offences, including 1.4m virus attacks. The remaining 600,000 estimated offences related to unauthorised access to personal information, such as hacking of email, social media or other online accounts.

The latest overall figures, excluding online crime, in the 12 months to March 2015 show there were an estimated 6.3m offences - 6% fewer than in the previous year.

Police crime figures show that the murder rate rose by 34 to 571, the highest in five years. This is still far below the peak in 2002-03, when 1,047 homicides were recorded, but the recent rise is one of the more authoritative indicators that Britain is experiencing an increase in violence. The 96 deaths at Hillsborough in 1989 will be added to the official homicide figures and included in the next set of figures after the inquests finished in April.

Knife crime offences rose by 10% in the past year and gun crime increased by 4% over the same period.

Incidents of harassment, including new categories of offence such as malicious communications online, social media abuse and revenge porn, have risen 90%, from 82,000 to 156,000.

The police figures also show a 27% rise in offences against the person and a 21% increase in sexual offences. Those figures include a 22% increase in reported rapes from 29,300 to 35,798. By contrast, the crime survey shows no significant change in the proportion of adults who say they had been a victim of a sexual assault in the past year. The ONS said the 21% increase in sexual offences reflected both an improvement in police recording of the offences and a greater willingness of victims to come forward.

But the overall picture of all crime - excluding the 5.8m online offences - according to the crime survey of England and Wales, which is regarded as the best measure of crime trends, shows a 6% fall to 6.3m offences involving adult victims in the 12 months to March 2016.

The long- term trends in "traditional" crimes such as burglary, car thefts and criminal damage show that the fall in crime since its 1995 peak has slowed down since 2005. The crime survey found there had been no change in the overall level of violent crime compared with the previous year.

The online crime numbers give the first official snapshot of the scale of the threat from online attacks and scams. However, ONS statisticians said it would be "misleading to conclude that this means actual crime levels have doubled, since the survey previously did not cover these offences".

The first estimate is based on a 9,000-strong sample size from six months of interviews from the crime survey. Only when the ONS has 12 months of data in January will the online crime figures be incorporated into the headline crime rate.

Separate Home Office figures for police officer numbers show they fell by a further 3,126 last year to 124,000 - the lowest level since 2003.

Andy Burnham, the shadow home secretary, said: "At long last, we have the true picture of crime in England and Wales and it puts the former home secretary's record in a new light.

"Our new PM [Theresa May] was fond of saying that crime is falling but, as people can see, crime has moved online and until now the official statistics haven't shown that. Her complacent claims do not read well alongside these worrying increases in violent crime, sexual crime and homicide.

"The only conclusion that can be drawn is that it is the wrong time to be cutting the police. The PM promised real-terms protection but has failed to deliver it. Now that decision is entirely within her hands, she must honour the promise that she made and protect frontline policing," he said.

The policing minister, Brandon Lewis, said: "As crime falls, we know that it is also changing. Fraud and cyber-offences are not a new threat and the government has been working to get ahead of the game, committing to spend £1.9bn on cybersecurity and cybercrime over the next five years. We have also established the joint fraud taskforce, bringing together law enforcement and the banking sector, while Action Fraud, the National Fraud Intelligence Bureau and the National Crime Agency are working to improve our response.

"We welcome today's experimental ONS figures on fraud and cybercrime - offences which we have always known were happening but were previously unable to quantify. Having an accurate national picture will be crucial to inform future action."

New York Times
Pyongyang Radio Revives Coded Broadcasts for Spies
Friday, 22 July 2016
Byline: Choe Sang-Hun

Seoul - In an era of sophisticated spycraft, North Korea appears to be returning to the days of shortwave radio.

The North broadcast a series of seemingly random numbers on Pyongyang Radio twice recently, an eerie reminder of the days when the North encrypted messages to its spies in South Korea.

In the latest episode last Friday, an announcer read what she described as "a mathematics review assignment for investigative agent No. 27," engaged in a "distance learning" program.

"Turn to Page 459, No. 35; Page 913, No. 55; Page 135, No. 86," she said, continuing to cite numbers for 14 minutes.

Decades ago, it was not unusual for late-night radio listeners in the South to hear mysterious numbers arriving on static- filled signals from the North. The South Korean government in Seoul tried to block the signals and barred its citizens from listening.

Kim Dong-sik, a former intelligence officer for North Korea, said he used to listen for such broadcasts at midnight each night to check whether his spymasters had a message for him. Mr. Kim was caught by the South in 1995 after a gun battle with South Korean agents and police officers.

"When I arrived in the South, I had five different call signs assigned to me," said Mr. Kim, who now works as a senior analyst at the Institute for National Security Strategy, a think tank run by South Korea's National Intelligence Service. "Each night, I listened for my call signs."

The June 24 and July 15 broadcasts, confirmed by the South Korean government on Wednesday, were the first such coded messages in 16 years, leaving intelligence officials and analysts puzzled by the North's motives.

The broadcasts come amid concerns about the North, which has raised tension with the United States and its allies by conducting a series of missile tests and has issued bold claims of advances in its quest for a nuclear-tipped long-range missile.

North Korea has reacted strongly to a plan by the United States to deploy an advanced missile defense system in the South. This week, it fired three ballistic missiles, saying that they were used in simulated tests to detonate nuclear warheads over seaports and airfields in the South, where American reinforcements are supposed to arrive in the event of a war.

The tests defied a new round of sanctions that the United Nations Security Council imposed against the North after a nuclear test in January and a long-range rocket launch in February.

Jeong Joon-hee, a government spokesman for South Korea, has called the resumption of the broadcasts "seriously regrettable" but declined to comment on any motives. "The North should abandon its old ways," he said.

South Korea itself has resorted to old-school propaganda in recent years, resuming loudspeaker and radio broadcasts into the North and juicing them up with synthesized Korean music known as K-pop.

Some analysts said the North's use of a bygone encryption tool was rekindling old fear among South Koreans of an escalation in psychological warfare. North Korea stopped sending out such coded messages by shortwave radio after the Koreas held a summit meeting in 2000, agreeing to de-escalate the Cold War- era intrigue on the divided peninsula.

Since then, the North is believed to have adopted more sophisticated methods of communication. When the South's intelligence service announced the capture of a spy ring in 2011, it said that the officers contacted the North through steganography, a technique for encrypting a message into a text, image or video file delivered online.

Mr. Kim, the analyst and former spy, said the broadcasts should be taken seriously. He said the North appeared to be bolstering its espionage operations since 2009, when it created the General Bureau of Reconnaissance by merging various party and military agencies in charge of sending spies to the South.

Washington blacklisted the bureau after North Korean hackers were accused of wreaking havoc on the computer network of Sony's movie studio in 2014.

At a time when the counterintelligence authorities use sophisticated technology to monitor the digital communication of espionage suspects, "the old number broadcasts are still a dependable and preferable means of communication for spies," Mr. Kim said.

"We should assume that the North is using the radio broadcasts to communicate with its agents here or is at least using them to train spies," he added.

He recalled that when he was training in the 1980s, he spent countless hours listening to tape- recorded broadcasts and copying the numbers to master a so-called numbers station technique of encrypted communication.

Mr. Kim said he and his handlers in the North used an agreed-upon book -- "Whale Hunt," a popular novel in the South -- to decipher one another's codes. As in the broadcast on Friday, a typical five-digit combination started with a three-digit page number. The remaining two digits pointed at two Korean characters in the text of the page.

The two Koreas still accuse each other of spying. The North is holding at least four South Koreans, some of them sentenced to a labor camp for life, on charges of espionage.

In recent years, the South's intelligence service has arrested people it deemed spies as they entered the country disguised as refugees. Last week, prosecutors said they arrested two South Korean men on

charges of spying for the North. They released closed- circuit video of counterespionage officers overpowering a suspect at an internet cafe.

The men used encrypted emails to contact their handlers in the North, the prosecutors said.

Mr. Kim said that during his days as a spy, the radio was a main tool of communication.

"If there was a certain song broadcast by Pyongyang Radio at an agreed-upon hour, that meant that there was something wrong and I should immediately abort my mission," he said. "If not, it was all clear."

Gulf News
Beware ransomware attacks on your PC
Friday, 22 July 2016
Byline: Faisal Masudi

Dubai - Ransomware, a relatively new kind of cyber attack where criminals demand money for decrypting files they have taken control over, is increasingly targeting ordinary consumers -- including those in the UAE -- a new study said on Wednesday.
Security firm Symantec said in its latest research the average ransom demanded by attackers jumped to $679 (Dh2,491), up from $294 (Dh1,078) at the end of 2015.

The "Internet Security Threat Report (ISTR) Special Report: Ransomware and Businesses 2016" revealed consumers make up 57 per cent of ransomware victims.

The majority of ransomware variants are designed to attack Windows computers and ordinary home users continue to be one of the biggest victim groups, it added. Meanwhile, employees at organisations make up 43 per cent of ransomware victims.

According to Symantec's 2016 ISTR, the UAE experienced the fourth highest rate in ransomware attacks in the Middle East and Africa region, added Hussam Sidani, regional manager for Gulf, Symantec.

Furthermore, ransomware attacks grew by 44 per cent year-on-year in the UAE in 2015. "In 2015, we saw an average of 28 attacks per day and 10,279 total attacks on UAE-based organisations," Sidani said.

"Additionally, given the strong uptake of smartphones and tablets, we're seeing more mobile devices coming under attack, with attackers encrypting files, and anything else an owner will pay to recover.

"The UAE has one of the highest penetration of smartphones in the world and users enjoy great connectivity here. This can make them a very lucrative target for ransomware."

Sidani explained that one of the most common methods to spread ransomware, and malware in general, is through malicious spam email. These spam emails pose as an important email from a well-known organisation, such as a shipping or utility company. However, as soon as the user opens the malicious attachment or link, malware will be installed on their device or computer. Following this, the user's important files will be encrypted and they will receive a message demanding a ransom to release the files.

Victims can be asked to send ransom money via a payment link or by handing over their credit card information. However, Symantec's recommendation is not to pay the ransom.

"While we recognise that some organisations may feel that paying the ransom is their only option, there is no guarantee that this will recover their data. Attackers may not send a decryption key, could poorly implement the decryption process and damage files, and may deliver a larger ransom demand after receiving the initial payment."

Don't click links in unsolicited email or social media messages, particularly from unknown sources. Use strong and unique passwords for your accounts and devices, and update them on a regular basis.

When installing a network-connected device, or downloading a new app, review the permissions to see what data you're giving up. Disable remote access when not needed. Antivirus-only security is no longer enough to combat security threats like ransomware. Protect your data with a multi-platform solution and back up your computer and devices on a regular basis.

New York Times
Snowden to Help Develop a Safer Phone for Journalists
Friday, 22 July 2016
Byline: John Markoff

Cambridge, Mass. - The former National Security Agency contractor Edward J. Snowden said Thursday that he planned to help develop a modified version of Apple's iPhone for journalists who are concerned that they may be the target of government surveillance.
The announcement was made during a one-day conference on "Forbidden Research" held at the Massachusetts Institute of Technology's Media Lab.

Mr. Snowden, who spoke via a video connection from Russia, where he is living in exile, said he was working with Andrew Huang, a computer hacker known as Bunnie who studied electrical engineering at M.I.T., to see if it would be possible to modify a smartphone to alert journalists working in dangerous environments to electronic surveillance.

Mr. Snowden, who is a board member of a nonprofit group called the Freedom of the Press Foundation, said he was concerned that cellphones and smartphones serve as tracking devices that automatically

create electronic dossiers that give third parties, including governments, detailed information on location.

As an example of the dangers of location data, he cited the mortar attack in 2012 by the Syrian government that killed Marie Colvin, an American journalist who was reporting in Homs, Syria, for The Sunday Times of London.

"The radio frequency emissions of her communications that she used to file those news reports were intercepted by the Syrian Army," he said.

He said it was increasingly difficult for users to trust their smartphones. They may be tampered with by malware programs, causing them to transmit location information even when the user may believe that the device has been placed into a safe "airplane mode."

Mr. Huang said the project was still experimental, but he hoped it would provide journalists with modified phones that would come in a special case with a separate display that would provide an alert when the phone was active and transmitting data at improper times.

The conference focused on issues raised by computer hacking, as well as controversial scientific research in areas such as genetic engineering and geoengineering.

Also at the conference, Reid Hoffman, one of the founders of LinkedIn, which recently agreed to be acquired by Microsoft for $26 billion, announced that he planned to offer a $250,000 "Disobedience Prize" aimed at promoting positive social change and opposing injustice.

"It will go to a person or group engaged in what we believe is excellent disobedience for the benefit of society. The disobedience that we would like to call out is the kind that seeks to change society in a positive way, and is consistent with a set of key principles," wrote Joichi Ito, director of the M.I.T. Media Lab, in a web posting about the prize. The timing of the award has not yet been determined.

In separate panels, biologists and climate scientists explored the risks and rewards of scientific research that might have unexpected consequences.

Kevin Esvelt, a biologist who is director of the Sculpting Evolution research group at the M.I.T. Media Lab, spoke about new, easily accessible genetic engineering technologies that might be used to preserve species that are at risk of extinction, and alternatively to eradicate pests that threaten human populations by spreading disease.

He described a discussion scientists had on Wednesday with residents of Martha's Vineyard about the use of advanced genetic engineering techniques to introduce a type of mouse that had been modified to be unable to carry Lyme disease. The idea would be to break the transmission of the disease to ticks and then to humans.

He said that before beginning the experiment, the scientists engaged the community to discuss potential risks.

Scientists on several panels acknowledged that it was impossible to be certain about unforeseen effects from new engineering techniques.

"What we're worried about is something that we do that could be very attractive in the short term but have some triggering mechanism or some slow events that occur far in the future," said George Church, a Harvard geneticist who is exploring genetic engineering techniques to revive extinct species.

Lack of funds and training hamper cybersecurity
Friday, 22 July 2016
Byline: Staff Report

Dubai - Poor funding and lack of skilled staff remain serious challenges for global business IT security, according to a new survey by Accenture and HfS Research.
And insider data theft and malware attacks are the most significant threats, with 69 per cent of survey respondents saying they had suffered attempted or successful theft or corruption of data by insiders in the previous 12 months.

The survey, The State of Cybersecurity and Digital Trust 2016, polled 200 security executives and IT professionals in different countries and in different sectors.

Findings indicate that there are significant gaps between talent supply and demand, a disconnect between security teams and management expectations, and considerable disparity between budget needs and actual budget realities.

"Our research paints a sobering picture. Security leaders believe threats are not going away, in fact they expect them to increase and hinder their ability to safeguard critical data and establish digital trust," said Kelly Bissell, senior managing director, Accenture Security. "At the same time, while organisations want to invest in advanced cyber technologies, they simply don't have enough budget to recruit or train skilled people to use that technology effectively."

"While the gaps we identified can be overcome, they do collectively underscore the need for an inherently different approach, one that includes more robust risk management measures and the development of digital trust," said Fred McClimans, research vice president, Digital Trust and Cybersecurity, HfS Research.

London Times
One in ten become victims of cybercrime
Thursday, 21 July 2016
Byline: Richard Ford

London - One in ten adults have been victims of fraud or computer misuse offences, according to official figures published today.
An estimated 5.8 million fraud and cyberoffences are committed annually, pushing the overall crime figures in England and Wales to more than 12 million.

The first official estimate of the scale of online shopping scams, virus attacks, ticket frauds, computer hacking and theft of bank details along with credit and bank card fraud shows that fraud is the most common crime experienced by the public.

The chance of being a victim of victim of fraud is the same regardless of class, region and whether a person lives in a rural or urban area, according to the Crime Survey of England and Wales.

Official crime figures from the Office for National Statistics (ONS) showed that excluding fraud and cybercrime, there were 6.3 million crimes in the 12 months to March 2016, a fall of 6 per cent.

Separate police-recorded crime figures for murder rose by 34 to 571 homicides, the highest level for five years

Police figures also showed a 27 per cent rise in offences against the person and a 21 per cent increase in sexual offences. Statisticians said the rise in both types of offences was due to better recording practices by the police and that the increase in sex crimes was also due to a willingness of more victims to report offences.

Incidents of revenge porn and harassment, including online abuse, accounted for almost half the rise in personal violence.

The confirmation of the high volume of online crime provides the first official snapshot of the scale of threat from online attacks and scams.

Statisticians said "it would be misleading to conclude that this means actual crime levels have doubled, since the survey previously did not cover these offences".

The first estimate is based on a 9,000 sample size from six months of interviews from the survey.

Only when the ONS has 12 months of data in January will the online crime figures be incorporated into the headline crime rate for England and Wales.

The 3.8 million frauds included 2.5 million bank and credit account cases plus one million sales, tickets and computer software service frauds.

There were a further 0.1 million incidences involving lottery scams and frauds linked to dating sites.

Of the two million computer misuse incidents, 1.4 million involved computers being infected with viruses and 0.6m incidents of hacking of e-mail, social media or other online accounts.

The Intercept
Edward Snowden's New Research Aims to Keep Smartphones From Betraying Their Owners
Thursday, 21 July 2016
Byline: Micah Lee

Washington - In early 2012, Marie Colvin, an acclaimed international journalist from New York, entered the besieged city of Homs, Syria, while reporting for London's Sunday Times. She wrote of a difficult journey involving "a smugglers' route, which I promised not to reveal, climbing over walls in the dark and slipping into muddy trenches." Despite the covert approach, Syrian forces still managed to get to Colvin; under orders to "kill any journalist that set foot on Syrian soil," they bombed the makeshift media center she was working in, killing her and one other journalist and injuring two others.
Syrian forces may have found Colvin by tracing her phone, according to a lawsuit filed by Colvin's family this month. Syrian military intelligence used "signal interception devices to monitor satellite dish and cellphone communications and trace journalists' locations," the suit says.

In dangerous environments like war-torn Syria, smartphones become indispensable tools for journalists, human rights workers, and activists. But at the same time, they become especially potent tracking devices that can put users in mortal danger by leaking their location.

National Security Agency whistleblower Edward Snowden has been working with prominent hardware hacker Andrew "Bunnie" Huang to solve this problem. The pair are developing a way for potentially imperiled smartphone users to monitor whether their devices are making any potentially compromising radio transmissions. They argue that a smartphone's user interface can't be relied on to tell you the truth about that state of its radios. Their initial prototyping work uses an iPhone 6.

"We have to ensure that journalists can investigate and find the truth, even in areas where governments prefer they don't," Snowden told me in a video interview. "It's basically to make the phone work for you, how you want it, when you want it, but only when."

Huang made a name for himself by using a technique known as reverse engineering to hack into Microsoft's Xbox and other hardware devices locked down using various forms of encryption, and Snowden said he's been an invaluable research partner.

"When I worked at the NSA, I worked with some incredibly talented people," Snowden said, "but I've never worked with anybody who had such an incredible outpouring of expertise than I have with Bunnie."

Snowden and Huang presented their findings in a talk at MIT Media Lab's Forbidden Research event today and published a detailed paper.

Location Privacy and Smartphones

Smartphones come with a variety of different types of radio transmitters and receivers: cellular modems (for phone calls, SMS messages, and mobile data), wifi, bluetooth, and others. But using any of these radios could leak your physical location to an adversary who is watching the airwaves.

Journalists and activists use their phones to communicate with sources and colleagues, post updates and livestream to social media, and accomplish countless other networked tasks. If they need to keep their location secret, for example in a war zone, they need to turn off all of the radios within their phones. Even so, phones can still be vital tools even when offline; internet access is not needed to take photographs, record video or audio, take notes, use certain maps, or manage schedules.

Snowden and Huang have been researching if it's possible to use a smartphone in such an offline manner without leaking its location, starting with the assumption that "a phone can and will be compromised." After all, journalists and activists are often under-resourced and face off against well-funded intelligence services. They also, necessarily, use their phones to talk to, and open documents from, a wide variety of sources, leaving them especially vulnerable to targeted phishing, or "spearphishing," attacks, where an attacker baits a victim into opening an enticing document that actually contains an exploit.

The research is necessary in part because the most common way to try to silence a phone's radio -- turning on airplane mode -- can't be relied on to squelch your phone's radio traffic. "Malware packages, peddled by hackers at a price accessible by private individuals, can activate radios without any indication from the user interface," Snowden and Huang explain in their blog post. "Trusting a phone that has been hacked to go into airplane mode is like trusting a drunk person to judge if they are sober enough to drive."

Introspection Engine

Since a smartphone can essentially be made to lie about that state of its radios, the goal of Snowden and Huang's research, according to their post, is to "provide field-ready tools that enable a reporter to observe and investigate the status of the phone's radios directly and independently of the phone's native hardware." In other words, they want to build an entirely separate tiny computer that users can attach to a smartphone to alert them if it's being dishonest about its radio emissions.

Snowden and Haung are calling this device an "introspection engine" because it will inspect the inner-workings of the phone. The device will be contained inside a battery case, looking similar to a smartphone with an extra bulky battery, except with its own screen to update the user on the status of the radios. Plans are for the device to be able to sound an audible alarm and possibly also to come equipped with a "kill switch" that can shut off power to the phone if any radio signals are detected. "The core principle is simple," they wrote in the blog post. "If the reporter expects radios to be off, alert the user when they are turned on."

The introspection engine also must fit a number of design goals, including: It should be entirely open source, with open hardware, to make it easy for experts to inspect; it should operate in a separate "security domain" than the phone. Basically, the introspection engine should work even if the phone is hacked and actively lying to you; it should have a simple and intuitive user interface and require no special training to use; it should be usable on a daily basis with minimal impact on workflow.

Introspection engines don't exist yet, and the research Snowden and Huang presented today is only the beginning. In order to begin work on a prototype, the pair needed to pick a specific model of smartphone to target. They chose the 4.7-inch iPhone 6, based on their understanding of "the current preferences and tastes of reporters." However, introspection engines could be designed for any model phone.

Jacking Into the iPhone

Huang, an American who currently lives in Singapore, traveled to the metropolis of Shenzhen, China, to explore the electronics markets of Hua Qiang, which he described as "ground zero for the trade and practice of iPhone repair." While there, he bought spare parts and repair manuals that contained detailed blueprints of the target device.

Using information gleaned from these manuals, Snowden and Huang discovered that the iPhone's logic board has several test points designed by the manufacturer that can be exploited to learn the status of various on-board radios. These test points, which are built-in to many consumer devices, are crucial to improving customer experience. When a customer returns a defective device, engineers rely on them to determine the cause of the defect.

Snowden and Huang discovered 12 test points that could be used to monitor the status of the cellular radios, the GPS radio, and the wifi and bluetooth radios. While they didn't find a test point to monitor the Near Field Communication chip, the part that makes Apple Pay possible, they discovered that they could disconnect its antenna, vastly reducing its range.

They don't think that modifying an iPhone 6 to install an introspection device could be done by just anyone, but "any technician with modest soldering skills can be trained to perform these operations reliably in about 1-2 days of practice on scrap motherboards."

Supply Chain

The next step is to develop a working prototype, which Snowden and Bunnie hope to complete over the next year. Their blog post says that the project is currently operating on a "shoestring budget" and "donated time."

If it proves successful, they may seek funding through the Freedom of the Press Foundation to develop and maintain a supply chain. The nonprofit, of which both Snowden and I are board members, could then distribute iPhones that have been modified to include introspection devices to journalists who work in dangerous environments to use in the field.

Lebanon Daily Star
Touch witness completes testimony at STL
Friday, 22 July 2016
Byline: Susannah Walden

Beirut - Protected witness PRH 705 completed his testimony Thursday as the designated representative of the MTC touch cellular network at The Special Tribunal for Lebanon. Touch is one of Lebanon's two GSM networks, the second of which, Alfa has been represented by PRH 707 - another protected witness. Both networks turned over reams of extensive records concerning billingrecords, call logs and coverage maps at the request of investigators.
Prosecutors have built much of their case against the five defendants accused of conspiring to assassinate former Prime Minister Rafik Hariri on this telecommunications data. Prosecutors argue that the data can be used to retrace the movements of the defendants.

Defense attorney Thomas Hannis, representing the interests of Salim Ayyash, completed his cross-examination of the witness by clarifying comments about some of the documents handed over by the network.

The records were a source of debate at the trial, as defense attorneys contested submitting documents into evidence if the witness could not personally attest to their origin.

Hannis had previously voiced his doubt at a May appearance of PRH 705. "This witness has been placed in a very difficult position. He's speaking for the community," he said. "We have a concern that we won't be able to have fair trial for our clients if we're not able to have a meaningful cross-examination of the underlying sources of evidence."

The final appearance of PRH 705 focused on clarifications. "I apologize your honor, this may seem detailed and fiddly, but it won't take long and may be important for our submission later on," Hannis said.

After the lunch recess, Prosecutor Fabia Wong took over to ask the witness several questions on records submitted concerning cellphone handsets that prosecutors allege were used by the deceased Hezbollah commander Mustafa Badreddine. Legal proceedings against Badreddine were halted after an Appeals Chamber found there was sufficient evidence that he was killed in Syria in May.

The investigation into controversial telecommunications data will continue with further testimony from Alfa representative PRH 707, however Thursday's session ended PRH 705 contribution for the time being.

Judge David Re, the Trial Chamber president, highlighted the weight the telecommunications evidence has carried in the proceedings as PRH 705's testimony concluded.

"[There was a] considerable amount of interest in what you had to say based on the number of questions from the counsel and the bench itself. You're free to go ... As they say, don't call us, we'll call you," he said.

Chronicle-Herald (Halifax)
Legal experts mull risks to privacy
Saturday, 23 July 2016

Halifax - Cyber-crime and privacy issues top the agenda at the International Society for the Reform of Criminal Law annual conference in Halifax this week.
It is the first time the conference, slated to run Sunday through Thursday has been held east of Montreal.

Judges, lawyers, legislators and law enforcement officials from around the globe will weigh in on the difficult balance between the rights of the individual and society's collective security, said Hon. Justice Michael MacDonald, Supreme Court of Nova Scotia, who is co-chairing this year's conference along with Supreme Court Justice Thomas Cromwell.

"It's a huge challenge in the face of technology that's changing at warp speed," MacDonald said.

"The Internet is changing our lives daily and it's a challenge at the best of times to find that right balance between protecting your and my privacy with the need to protect society," he said.

While judges are loath to give police the right to hack anyone's account without good reason, with the Internet changing life in almost every way, the justice system has to act appropriately to make sure the use of the Internet as an instrument of crime is minimized, MacDonald said.

One of the biggest challenges is that of the principle of open court, he said.

"In Nova Scotia and Canada and all leading democracies we value our open courts principle, which means everything that happens must be open to the public and the public must be able to scrutinize to make sure justice is administered properly," MacDonald said.

The problem is that information that can be gathered through open court principle can be manipulated for malicious purposes, he said, recalling his law practice in the 1970s, when a messy divorce case might yield personal details about children or other vulnerable people.

Those same details, online, could be Googled and exploited, MacDonald said.

"We have a need to balance the requirement to preserve the open court principle but at the same time, to protect vulnerable people who could be abused by this same open court system," he said.

Caught in middle of the tug-of-war between individual privacy and collective security, law enforcement and the justice system have to weigh all the angles.

On the downside, there's cyber-stalking, cyber-bullying and internet luring.

On the upside, the Internet provides new investigative tools for solving these crimes and others, MacDonald said.

Parliament has enacted statutory measures to protect the identities of witnesses in criminal matters, with limited provision under the criminal code for in-camera testimony.

"Again, it's about fitting the proper balance between protecting your individual privacy when using the internet and protecting society by arming law enforcement officials with sufficient tools to trace and to solve crimes that are happening on the Internet," MacDonald said.

Serious criminal activities like hacking and extortion are threatening institutions that would have previously been impervious to digital attack, said attorney Don Sorochan, secretary-treasurer to the international society.

The conference has made a difference for countries with participants attending it over the years.

"They've taken what they've learned (home) and we've seen changes flowing from that a few years later," Sorochan said.

Canadian Press
Banks eye biometrics to boost security
Saturday, 23 July 2016
Byline: Alexandra Posadzki

Toronto - In the not-too-distant future, your bank will be able to prevent fraud by learning how you type, your car will unlock when it senses the electrical activity of your heart and the security system at your office will recognize your facial features.
That's according to experts in the field of biometrics, which identifies a person by measuring unique characteristics such as their fingerprints, their retinas or their voice.

But these types of distinctive identification authentication processes offer more than the promise of a higher degree of security than traditional passwords.

Biometrics will also free consumers from the need to memorize a myriad of characters - a convenience that will appeal to anyone who needs to access a secure computer or network regularly. "People are having to jump through more and more hoops to create a secure authentication," says Karl Martin, founder of Nymi, a Toronto-based startup that created a wristband that can identify its wearer based on their electrocardiogram, or the electrical activity of their heart.

"How many times a day do you have to prove who you are, whether it be through a password or a biometric or other means?" Banks - and the financial services industry, more broadly - have been one of the quickest adopters of biometrics technology, given their strong need for security and identity verification, says Bianca Lopes, director of strategy at Bio- Connect.

"They're inherently wired and regulated to protect the customer with things like know-your-client and anti-money laundering rules," says Lopes, whose company helps businesses integrate biometrics technologies across various channels.

Royal Bank is currently testing technologies such as iris scanning, face recognition, speech recognition and fingerprint scans - and is expecting to roll out the features to customers in 2017.

Martin says Nymi has completed successful pilot projects alongside RBC and TD Bank to test how its wristband can be used to verify purchases, while MasterCard recently launched a service that allows users to verify their identities with their smartphones by taking a selfie or using a fingerprint scanner.

Notably, it's the popularity of the fingerprint scanner on Apple iPhones that's made consumers more comfortable and familiar with biometrics, says Dennis Gamiello, vice-president of identity solutions at MasterCard. "Fortunately, Apple and some of the other digital players that have introduced (biometric) capabilities are in some ways helping train the consumers for us."

Biometrics can also identify users based on how they behave - for instance, their typing patterns or the way that they swipe across the screen on a mobile device.

"The way that you actually interact with the phone, the way that you swipe the phone ... it's fairly unique to you," explains Eddy Ortiz, RBC's vice-president of innovation and solution acceleration. In the future, behavioural biometrics could even be used to detect if a fraudster has somehow gained access to your bank account, Lopes adds.

While identity verification is important, the capabilities of biometrics go beyond that function, notes Martin. The technology can also be used to create personalized environments - by setting the thermostat to your preferred temperature, for example - at your home, the office or a commercial space.

"We're looking at how can identity be used to create completely personalized experiences," says Martin, pointing to cars as an example.

"You may have a shared vehicle but you have preferences in terms of the seat height and position and the steering wheel and entertainment and all of those things." Experts concede that while biometrics can beef up security, improve convenience and create personalized environments, for some users the technologies may evoke scenes from the popular science fiction film Minority Report - a Tom Cruise

mystery-thriller that features a future of nearly boundless technological advancements designed to protect its citizenry.

"There will be consumers who get creeped out," says Krista Jones, head of work and learning at the MaRS Discovery District.

Ultimately, though, the technology gives consumers a greater guarantee that their private information will be kept safe, she adds. "We have an opportunity to craft this in such a way that the privacy of the consumer is at the heart of this."

Canadian Press
StatsCan wants its freedom from central federal IT department: documents
Saturday, 23 July 2016

Ottawa - The country's chief statistician believes Statistics Canada must have complete control of its own digital systems rather than having to turn to the federal government's central IT department. Workers at the statistics agency were told earlier this year that it was antithetical having someone else look after IT services when the Liberals vowed during the election to make Statistics Canada more independent from the federal government.

The details are contained in documents obtained by The Canadian Press under the Access to Information Act that included speaking notes for chief statistician Wayne Smith.

"Dependence on another party for informatics services impedes our ability to deliver our programs, to innovate and transform, (and) to better address new and emerging data needs," Smith's speaking notes read.

"As such, this dependence is incoherent with the notion of independence, not to mention protection of the confidentiality of respondent data."

Shared Services Canada and the statistics agency have had a rocky relationship amid outages and sluggish systems critical to Statistics Canada's mandate.

Smith also wrote in response to a staff question that "programs have suffered and continue to suffer delays" since Statistics Canada handed over oversight of its systems to Shared Services Canada, creating "challenges in terms of reliability, timeliness, effectiveness and affordability of IT architecture."

A spokeswoman for Shared Services Canada said in an email that the IT department is working with Statistics Canada to "ensure its operational needs are met."

Stephanie Richardson said Shared Services Canada has proposed moving Statistics Canada systems to a new "world-class" data centre "in order to reduce incidents."

Washington Post
Clinton campaign -- and some cyber experts -- say Russia is behind email release
Monday, 25 July 2016
Byline: Tom Hamburger, Ellen Nakashima

Washington - A top official with Hillary Clinton's campaign on Sunday accused the Russian government of orchestrating the release of damaging Democratic Party records to help the campaign of Republican Donald Trump - and some cybersecurity experts agree.
The extraordinary charge came as some national security officials have been growing increasingly concerned about possible efforts by Russia to meddle in the election, according to several individuals familiar with the situation.

Late last week, hours before the records were released by the website WikiLeaks, the White House convened a high-level security meeting to discuss reports that Russia had hacked into systems at the Democratic National Committee.

Although other experts remain skeptical of a Russian role, the hacking incident has caused alarm within the Clinton campaign and also in the national security arena. Officials from various intelligence and defense agencies, including the National Security Council, the Department of Defense, the FBI and the Department of Homeland Security, attended the White House meeting Thursday, on the eve of the email release.

If the accusation is true, it would be the first time the Russians have actively tried to influence an election in this manner, analysts said.

Clinton's campaign chief, Robby Mook, told ABC News on Sunday that "experts are telling us that Russian state actors broke in to the DNC, took all these emails and now are leaking them out through these Web sites. ... It's troubling that some experts are now telling us that this was done by the Russians for the purpose of helping Donald Trump."

Trump campaign officials rejected the suggestion as absurd.

The most sensational revelation so far in the emails is that officials at the supposedly impartial DNC were in fact helping Clinton during the primary. One email written May 5 to Luis Miranda, the national communications director for the DNC, from another party official suggests that the party could help Clinton by raising questions about Sanders's faith. Other emails generally disparaged Sanders and indicated a preference for Clinton.

The emails have infuriated Sanders supporters, who have repeatedly accused the DNC of improperly helping the Clinton campaign during the primary. The episode prompted the resignation Sunday of DNC Chairwoman Debbie Wasserman Schultz.

"They said they were neutral, which we knew not to be true," said Sanders campaign manager Jeff Weaver. "Now we have evidence in black and white that they were trying to put out negative stories about Bernie Sanders. People are very angry about these leaks, and rightfully so. There's no doubt about that."

Beyond Mook, DNC and Clinton campaign officials have not responded to requests for comment Friday as reporters and unnerved campaign staff tried to assess the damage caused by the release, which comes just as the party holds a nominating convention in Philadelphia designed to project unity after a bitter primary season.

The emails were released Friday on Twitter by WikiLeaks. The document dump follows a report last month by The Washington Post that Russian government hackers had penetrated the computer network of the DNC, gaining access to an entire database of opposition research, among other material.

Other emails offered details of perks provided to party donors attending the convention and other events involving Democratic officials.

On Sunday, Mook and others noted that Trump has taken positions in the campaign that seem to align with those held by Russian President Vladimir Putin. He cited Trump's recent statement on NATO - that he might not provide assistance to member states that hadn't contributed their financial share - as a sign that the Republican nominee is taking positions favorable to Putin.

"I think when you put all this together, it's a disturbing picture and voters need to reflect on that," Mook told CNN in an interview Sunday.

Trump's campaign chairman, Paul Manafort, flatly denied the insinuation, calling Mook's comments "pure obfuscation" on ABC's "This Week."

"What they don't want to talk about is what's in those emails," Manafort said.

Last month, the forensic firm CrowdStrike said two competing Russian intelligence hacker groups penetrated the DNC's computers. In the past 24 hours, cybersecurity experts have said that the email cache released by WikiLeaks on Friday appears to have been given to the anti-secrecy group by Russian intelligence.

Thomas Rid, a professor at King's College London, said in an interview that in a private chat on Twitter on Saturday, he communicated with the entity that claimed to have released the email cache to WikiLeaks.

The party, which calls itself Guccifer2, last month claimed responsibility for the DNC hack. Several independent analysts have concluded that Guccifer2, who claimed to be Romanian, is likely linked to Russia.

"We've been looking at this very closely from both the technical and non-technical spheres," said Richard Barger, chief information officer for ThreatConnect, a cyber-intelligence software firm. "Based on our analysis, we strongly feel Guccifer2 is linked to a Russian information operations campaign and is not the independent Romanian hacker that he claims to be."

The apparent link to Russian intelligence raises troubling implications for U.S. foreign relations and national security. Russia has not to date tried to interfere in U.S. elections, analysts say. But if this is a deliberate effort by the Kremlin to meddle, it is worrisome, they say.

Michael G. Vickers, who served as undersecretary of defense for intelligence from 2011 to 2015, said an effort by the Russians to release intelligence in advance of a U.S. election is likely unprecedented.

"What is really new here is the attempt to influence the politics of the United States. That is the problem," he said.

Vickers said that the Russians have attempted to influence elections in states closer to their border but that seeking to do so in the United States would represent a historic and significant change, even in an era when Russian intelligence gathering has become more aggressive.

Because he is no longer in government service, Vickers said he had no direct knowledge of the forensic evidence in the DNC email case. However, he said that "people who have looked at it have said it looks like groups that have been tied to Russian intelligence."

Fiona Hill, a former Russia expert on the National Intelligence Council, said putting the emails out on WikiLeaks for the world to see is consistent with her view of the modus operandi of Putin and Russian intelligence.

"They're doing what they do best," said Hill, now a Brookings Institution senior fellow. "They would not be doing their jobs as intelligence officers if they were not trying to outsmart their main opponent and to have influence on their politics."

But, Rid pointed out, "what we don't know is whether this is a top-down order or not."

Russian Embassy officials did not respond to a request for comment Sunday. In the past, Russian officials denied any involvement with the hack.

"I completely rule out a possibility that the [Russian] government or the government bodies have been involved in this," Dmitry Peskov, the Kremlin's spokesman, told the Reuters news agency in Moscow.

One U.S. official, who like others interviewed for this report spoke on the condition of anonymity, said the email dump "would be the worst possible way to influence an election. It just seems a little clumsy. It just seems a very odd way of going about it."

WikiLeaks is nonetheless an ideal venue for gaining exposure, other analysts say. The site, cofounded in 2006 by Julian Assange, promotes itself as an anti-secrecy organization and promises leakers' anonymity.

"If you're the Russians and you want to leak information for maximal effect, WikiLeaks is a great platform for that," said one analyst, who spoke on thecondition of anonymity because his work involves studying Russian intelligence and he did not want to draw attention to himself.

Russia has intervened in other countries' elections. For instance, in Ukraine in 2004, a Russian hacker group calling itself Cyber Berkut claimed it hacked and disabled the electronic vote-counting system of the Ukraine central election commission three days before the presidential election. The election followed the toppling of a pro-Moscow leader, a move that set off Russia's invasion and annexation of Crimea.

Analysts have attributed the hack to the GRU, one of the same Russian military intelligence services said to have hacked the DNC. They said that the agency created Cyber Berkut, which portrayed itself as an independent hacktivist group but in reality was used to further Moscow's political interests in Ukraine.

Likewise, French authorities say a cyberattack last year on the French television network TV5Monde was carried out by Russian hackers. A group posing as being linked to the Islamic State and calling itself "Cyber Caliphate" posted jihadist propaganda on the station's website - an apparent effort to deflect suspicion away from Russia - and plunged the network's TV channels into darkness. Again, it was the GRU that was said to be behind the attack, the French authorities said. Some analysts said they believed the attack was Russian retaliation against France for backing out of a deal to sell helicopter carriers to Russia because of Moscow's aggression in Ukraine.

Within 24 hours of the news breaking of the Russian hack of the DNC, files that purported to be from the servers began to appear online. Guccifer2 claimed credit for the hack and portrayed itself as independent of Russia. But a number of independent experts pointed to evidence that Guccifer2 appeared to be linked to Russia and said they believed Guccifer2 was trying to deflect blame from Russia.

The Post has previously reported that Trump has had a long-standing interest in Russia. In addition, The Post found that Manafort has multi- million dollar financial ties to oligarchs in the former Soviet Union.

Atlantico (site web)
Comment Edward Snowden conçoit un prototype de coque anti- espionnage pour iPhone
Monday, 25 July 2016
Byline: Journaliste maison

Non identifié - Le lanceur d'alerte américain Edward Snowden a conçu une coque qui devrait permettre aux journalistes, activistes et défenseurs des droits de l'homme de se protéger de l'espionnage des gouvernements.
Edward Snowden , l'informaticien qui a dénoncé en 2013 les programmes de surveillance de masse menés par les gouvernements américains et britanniques, continue son combat contre l'espionnage.

Quelques jours avant de faire éclater le scandale, Snowden avait demandé à ses avocats qu'il avait rencontrés à Hong Kong de placer leurs téléphones au réfrigérateur afin d'empêcher toute tentative de mise sur écoute . En effet, l'habitacle métallique servait de brouilleur d'ondes.

Snowden a décidé de rendre la vie plus facile aux personnes qui comme lui, ont dû se dépêtrer de l'emprise invisible mais bien réelle de la surveillance gouvernementale : à l'occasion d'une conférence menée le 21 juillet 2016 au MIT Media Lab , célèbre sommet dédié à la l'éthique technologique se déroulant au département universitaire de Cambridge, dans le Massachusetts, il est intervenu en visioconférence depuis la Russie où il est exilé depuis trois ans, rapporte le site Wired.

Mode avion inefficace contre les hackeurs

Il a ainsi fait part de son intention de dévoiler un concept de coque pour iPhone capable d'empêcher un gouvernement de géolocaliser son porteur, entre autres, relate Le Monde informatique. "Les smartphones, bien qu'incroyablement utiles, sont également de parfaits terminaux d'espionnage. Les gouvernements peuvent surveiller la localisation d'un utilisateur au travers des signaux radio du téléphone et peuvent mettre les journalistes, activistes et défenseurs des droits de l'homme en danger" , s'est exprimé Snowden dans un article .

Pour ce projet, l'informaticien s'est associé au hackeur Andrew "Bunnie" Huang , célèbre pour ses expérimentations sur Xbox, la console de jeux de Microsoft. Dans un rapport, les deux hommes précisent que le mode avion est loin de pouvoir vous parer contre la surveillance : "croire au mode avion d'un téléphone hacké équivaut à laisser une personne ivre juger de sa capacité à conduire", indiquent-ils.

En effet, le mode avion ou éteindre son téléphone ne sont pas des moyens infaillibles. Le mode avion pourrait ne pas vraiment couper les radios et il serait également possible de "faussement" éteindre un mobile en répliquant un écran d'extinction, détaille Les Numériques.

Véritable utilité

Selon Numerama, cette coque de smartphone comporterait un oscilloscope miniature permettant de surveiller en permanence l'activité électrique du circuit utilisé par le modem sans fil, et ainsi détecter toute utilisation de ce modem alors que le mobile est censé être en mode avion et donc ne plus émettre ni recevoir aucune donnée. Une alerte est alors donnée à l'utilisateur du mobile, avant que celui-ci ne s'éteigne afin de se protéger de l'intrusion, précise Mashable.

Un premier exemplaire devrait être disponible d'ici un an et mis en production si Snowden et Huang obtiennent les financements suffisants. Les plans et codes sources seront rendus publics, et de nouvelles améliorations devraient être dévoilées afin de garantir un peu plus la confidentialité des données mobiles.

Cet outil devrait trouver son public, quand on sait que la menace d'espionnage est réelle pour certains. Par exemple, en 2012, la reporter américaine Marie Colvin qui couvrait le conflit syrien avait été tuée dans un bombardement à Homs. Une action en justice avait révélé par la suite que le gouvernement syrien l'avait assassinée en traçant ses communications téléphoniques pour la localiser .

New York Times
In Hacking, Russia Is Accused of Playing in American Politics
Monday, 25 July 2016
Byline: David E. Sanger, Nicole Perlroth

Washington - An unusual question is capturing the attention of cyberspecialists, Russia experts and Democratic Party leaders in Philadelphia: Is Vladimir V. Putin trying to meddle in the American presidential election?
Until Friday, that charge, with its eerie suggestion of a Kremlin conspiracy to aid Donald J. Trump, has been only whispered.

But the release on Friday of some 20,000 stolen emails from the Democratic National Committee's computer servers, many of them embarrassing to Democratic leaders, has intensified discussion of the role of Russian intelligence agencies in disrupting the 2016 campaign.

The emails, released first by a supposed hacker and later by WikiLeaks, exposed the degree to which the Democratic apparatus favored Hillary Clinton over her primary rival, Senator Bernie Sanders of Vermont, and triggered the resignation of Debbie Wasserman Schultz, the party chairwoman, on the eve of the convention's first day.

Proving the source of a cyberattack is notoriously difficult. But researchers have concluded that the national committee was breached by two Russian intelligence agencies, which were the same attackers behind previous Russian cyberoperations at the White House, the State Department and the Joint Chiefs of Staff last year. And metadata from the released emails suggests that the documents passed through

Russian computers. Though a hacker claimed responsibility for giving the emails to WikiLeaks, the same agencies are the prime suspects. Whether the thefts were ordered by Mr. Putin, or just carried out by apparatchiks who thought they might please him, is anyone's guess.

On Sunday morning, the issue erupted, as Mrs. Clinton's campaign manager, Robby Mook, argued on ABC's "This Week" that the emails were leaked "by the Russians for the purpose of helping Donald Trump" citing "experts" but offering no other evidence. Mr. Mook also suggested that the Russians might have good reason to support Mr. Trump: The Republican nominee indicated in an interview with The New York Times last week that he might not back NATO nations if they came under attack from Russia -- unless he was first convinced that the countries had made sufficient contributions to the Atlantic alliance.

It was a remarkable moment: Even at the height of the Cold War, it was hard to find a presidential campaign willing to charge that its rival was essentially secretly doing the bidding of a key American adversary. But the accusation is emerging as a theme of Mrs. Clinton's campaign, as part of an attempt to portray Mr. Trump not only as an isolationist, but also as one who would go soft on confronting Russia as it threatens nations that have shown too much independence from Moscow or, in the case of Lithuania, Latvia and Estonia, joined NATO.

Mr. Trump has also said he would like to "get along with Russia" if he is elected, and complimented Mr. Putin, saying he is more of a leader than President Obama. Mr. Putin has in turn praised Mr. Trump. But Trump campaign officials on Sunday strongly rejected any connections between their candidate and efforts to undermine the Democrats.

"Are there any ties between Mr. Trump, you or your campaign and Putin and his regime?" George Stephanopoulos, of "This Week," asked Paul Manafort, Mr. Trump's campaign chairman.

"No, there are not," Mr. Manafort shot back. "That's absurd. And, you know, there's no basis to it."

One of Mr. Trump's sons, Donald Trump Jr., was more definitive, charging the Clinton camp with a smear campaign. "I can't think of bigger lies," he said on CNN. The younger Mr. Trump mockingly suggested that Mr. Mook's "house cat at home once said this is what happened with the Russians."

It may take months, or years, to figure out the motives of those who stole the emails, and more important, whether they were being commanded by Russian authorities, and specifically by Mr. Putin. But the theft from the national committee would be among the most important state-sponsored hacks yet of an American organization, rivaled only by the attacks on the Office of Personnel Management by state-sponsored Chinese hackers, and the attack on Sony Pictures Entertainment, which Mr. Obama blamed on North Korea. There, too, embarrassing emails were released, but they had no political significance. The WikiLeaks release, however, has more of a tinge of Russian-style information war, in which the intent of the revelations is to alter political events. Exactly how, though, is a bit of a mystery, apart from embarrassing Democrats and further alienating Mr. Sanders's supporters from Mrs. Clinton.

Evidence so far suggests that the attack was the work of at least two separate agencies, each apparently working without the knowledge that the other was inside the Democrats' computers. It is unclear how WikiLeaks obtained the email trove. But the presumption is that the intelligence agencies turned it over, either directly or through an intermediary. Moreover, the timing of the release, between the end of the Republican convention and the beginning of the Democratic one, seems too well planned to be coincidental.

Mr. Trump himself leapt on the news after the WikiLeaks release on Saturday. In a Twitter message he wrote: "Leaked emails of DNC show plans to destroy Bernie Sanders. Mock his heritage and much more. On-line from Wikileakes, really vicious. RIGGED."

The experts cited by Mr. Mook include CrowdStrike, a cybersecurity firm that was brought into the Democratic National Committee when officials there suspected they had been hacked.

In mid-June the company announced that the intruders appeared to include a group it had previously identified by the name "Cozy Bear" or "APT 29" and been inside the committee's servers for a year. A second group, "Fancy Bear," also called "APT 28," came into the system in April. It appears to be operated by the G.R.U., the Russian military intelligence service, according to federal investigators and private cybersecurity firms. The first group is particularly well known to the F.B.I.'s counterintelligence unit, the C.I.A. and other intelligence agencies. It was identified by federal investigators as the likely culprit behind years of intrusions into the State Department and White House unclassified computer system.

Russian intelligence agencies went to great lengths to cover their tracks, investigators found, including meticulously deleting logs, and changing the time stamps of the stolen files.

Officials at several other firms that have examined the code for the malware used against the Democratic National Committee and the metadata of the stolen documents found evidence that the documents had been accessed by multiple computers, some with Russian language settings. Moscow has outsourced politically motivated hacking to outside groups in the past. A crippling attack on Estonia in 2007, for example, was attributed to the pro-Kremlin Nashi youth organization. Intelligence officials and security researchers believe this outsourcing is done, in part, to preserve a measure of plausible deniability.

Intrusions for intelligence collection are hardly unusual, and the United States often does the same, stealing emails and other secrets from intelligence services and even political parties. But the release to WikiLeaks adds another strange element, because it suggests that the intelligence findings are being "weaponized" -- used to influence the election in some way. The story has another level of intrigue involving Mr. Manafort, Mr. Trump's campaign chairman. Working through his lobbying firm, Mr. Manafort was one of several American advisers to Viktor F. Yanukovych, the Russian-backed leader of

Ukraine until he was forced out of office two years ago. Mr. Yanukovych was a key Putin ally who is now in exile in Russia.

In April, asked on Fox News about his relationship with Mr. Yanukovych, Mr. Manafort said he was simply trying to help the Ukrainians build a democracy that could align more closely with the United States and its allies.

Gulf Times
Forum explores cyber challenges in Qatar
Monday, 25 July 2016

Doha - Global technology leader Lockheed Martin has joined hands with Hamad Bin Khalifa University (HBKU) and the University of Patras, Greece, to support the development of Qatar's national cyber security capabilities.
The announcement was made at the first International Cyber Security Technologies Round Table recently.

In line with Qatar National Vision 2030, the round table is part of Lockheed Martin's growing collaboration to support the country's national cyber security objectives.

The round table brought together a group of multi-national cyber experts from across academia and industry to support innovation and open discussions in this field of growing importance to Qatar and the greater GCC region.

The discussions also focused on the build-up of the next generation of cyber defenders. The outcome of the two-day round table will support the development of a comprehensive framework to cultivate the human-capital and educational framework necessary to solve future cyber challenges across diverse sectors of national importance.

Prof Amine Bermak, acting associate provost and ICT division co-ordinator, HBKU said: "Later this summer, we look forward to welcoming our first cohort of students to our new Master of Science in Cyber Security programme. We recognise the importance of collaborating with industry to provide our students with the skills of the future to solve some of the most pressing cyber challenges facing industry and government.The discussions that took place over the past few days will help us develop the talent pipeline in this area of critical national significance to Qatar."

Prof Dimitrios Serpanos from the University of Patras and director of the Industrial Systems Institute said: "The University of Patras is a leading European University in engineering, including electrical and computing, with strong activities in cyber security research. The participation and support to this round table demonstrates the commitment of the faculty to address the growing cyber security challenge to

academia, industry, and governments around the world. Bringing talent together with a global lens will bring the innovative approach we need to shape a more secure future."

Tom Milton, chief executive, Lockheed Martin Qatar, said: "We are excited to support a strong foundation of preparedness for the emerging cyber threats this region will face. Today's increasingly complex security environment requires dynamic collaboration with academia, industry, and government to execute Qatar's national cyber priorities."

According to him the round table was just the beginning. "Lockheed Martin looks forward to leveraging our global technology expertise to support Qatar's efforts to keep its networks and citizens safe from the emerging cyber challenges," he added.

Saudi Gazette
Corporate espionage key reason for cyber attacks in mining sector (Canada).
Monday, 25 July 2016
Byline: Staff Report

Dubai - With Saudi's mining sector to represent 10% of its non-oil revenue by 2030, and other countries like Oman and the UAE investing into latest technologies, the outlook for integrated IT platforms and cloud operations in the mining sector looks promising in the region. However, companies in the sector will have to be ready for the security challenges, these technological advances bring in.
According to a recent report by Trend Micro, the global leader in security software solutions, the mining industry is being targeted by cyber criminals. The security firm has been called in to investigate 17 incidents involving cyber-attacks on 22 entities operating in the sector since 2010.

The most recent attack was recorded in April 2016, when hackers leaked 14.8 GB of data from the Canadian mining corporation Goldcorp.

Though the report does not have major cases from the Middle East and Africa, companies in the region are not immune to these attacks. The UAE-based firm Minerals and Marine Assets Corporation (MAC) and Canadian company Nautilus were the victims of a targeted cyber scam, wherein Nautilus paid a $10-million deposit intended for MAC into an unknown bank account.

According to the report, the main reason for the attacks is corporate espionage among other motives like information theft and hacktivism. The mining industry is both a geopolitical and an economic target, as the data stolen through commercial espionage can have devastating effects on the targeted firm's operations, finances, and market standing, as well as detrimental consequences on the host country's economy.

The prime target for data theft in the mining sector is information about a mine's pricing, which can help a competitor hijack a sales deal by outbidding the competition or a buyer negotiate a better purchase

price or change the terms of a takeover bid. Customer information is another prime target for data theft, competitors can use the stolen information to hijack future sales. The study says cybercriminals also target Intellectual property (IP) data, such as production methods, mineral processing methods, chemical formulae and custom software.

According to Trend Micro, the competitive global market for commodities and manufactured goods, the reliance on natural resources for economic development and fluctuating geopolitical climates have contributed to making mining industry a target of cyber espionage campaigns, and in extreme cases disruptive and destructive cyber-attacks.

Gulf News
Keeping up with next-generation datacentres
Monday, 25 July 2016
Byline: Jyoti Lalchandani

Dubai - The datacenter represents the beating heart of the modern business. It is where information flows in and out of the organisation, ultimately helping to support business functions, create competitive advantage, and drive revenue. And with the emergence of various new trends and innovations, the datacenter has been going through a continuous process of transformation over the past few years.
IT applications and services are critical elements that represent the lifeblood that flows through the datacenter to support the way in which organisations interact with their customers, deliver new products and services, and improve the productivity of their employees. Datacenters are continually being tasked with delivering workloads in the most cost-effective and efficient manner, and organisations must now look to drive greater efficiencies in their operations to provide the agility required to meet future business demand.

So what needs to happen? Well, the traditional manner of provisioning services via hardware and software needs to radically change in order to keep pace with the digital transformation that is rapidly shaping today's business landscape. Past technologies have introduced increased levels of optimisation within the datacenter, but is this enough? Most corporate datacenters were built on the assumption that technology enhancements and workloads occur at a steady and predictable pace, but that is not the rate of change we are currently experiencing.

IDC believes that CIOs must also consider whether their current technology platforms are capable of supporting the agility and scale expectations that businesses now demand. And how can the IT department manage these expectations while simultaneously facilitating greater levels of innovation? These are just some of the challenges facing IT executives today. And in order to address these challenges, the datacenter needs to evolve and keep pace with the dynamic trends that are shaping the external market.

New technologies should be implemented not only to reduce complexity and costs, but also to redefine the way in which the IT department provisions services for consumption. The concept of next-generation datacenters has been around for a while, where initially the main tasks were to rationalise, consolidate, and standardise the IT environments. While many organisations are progressing along this path, the next wave of change beyond virtualisation needs to address the provisioning of IT as a service (ITaaS) by moving away from the current silo-based approach.

With each passing year, it appears that the competitive environment requires businesses to deliver applications faster and improve productivity, whilst simultaneously reducing costs. The costs associated with provisioning, monitoring, and managing servers have escalated, challenging organisations to seek out new systems and tools that can help them lower the overall cost of it operations, including -- among others -- converged systems, hyperscale cloud infrastructure, software-defined computing, OpenStack, modularity, and virtualisation.

We currently find ourselves in the midst of widespread digital transformation, with the endgame being the conversion of all business and IT operations into digital processes. This technology evolution is already placing intense demands on CIOs and the IT departments they manage. And adding to this pressure is the way in which end-user expectations for IT services are evolving; internal and external customers alike now expect to be able to access applications and data at anytime from anywhere and on any device.

What all this means is that the performance of business operations is now intrinsically linked to the datacenter and its accompanying server infrastructure. With this in mind, next-generation datacenters are focusing on the services they deliver and how they are delivered. And for all this to be effective, CIOs must develop a comprehensive understanding of how individual business units operate, as well as a clear picture of the end user's current and future needs. Indeed, IDC believes that such knowledge of individual workload characteristics will play a critical role in deciding which server technologies to adopt, maintain, and/or retire.

Given how essential IT applications and services are to the success of any modern business, the primary goal must now be to maximise application performance and efficiency. Some applications, such as large databases, will run best on a converged system that integrates hardware with software, while other applications will be better to run in a hosted service provider environment. It is ultimately the CIO's responsibility to sift through these options and weigh the pros against the cons to make the right decision.

But to help you along the way, IDC advises customers that are deploying next-generation applications with distinctly different operational characteristics to explore containers, software-defined computing, and disaggregated and compostable systems. On the other hand, customers with more traditional enterprise application needs may be better served by avoiding disaggregated and compostable systems, as those systems are not yet optimised for these workloads.

As businesses battle to maintain a modern infrastructure and keep their business goals in context, there is often a temptation to chase the latest innovation waves. But without a clear match between innovative new technologies and a useful business outcome, new technology for new technology's sake is never a good choice to make. That said, hot new emerging technologies such as containers, OpenStack, and software-defined computing are unlocking new opportunities for IT that can deliver tangible benefits -- to the right application.

Gulf News
Don't search for a magic bullet for cyber security
Monday, 25 July 2016
Byline: Dr. Robert Statica

Dubai - Governmental agencies shouldn't just rely on installing the latest software and hardware - they should take clear steps in training, process and practice to ensure they're protected from cyber attacks. Although there is no such thing as one solution fits all when it comes to cyber defence, there are certain steps that every government agency must employ to create a solid foundation on which they can start building their cyber defences.
Government agencies remain in the cross hairs of cyber attackers as hostile nation-states, terrorists, hackers for profit and campaigning organisations (hacktivism) focus on breaching their systems. Government cyber security professionals should always take a holistic approach to managing their defences and response procedures, but there are some key steps which are the building blocks of a strong defence.

Edward Snowden's data leakage and the WikiLeaks scandal have highlighted the danger of malicious disclosure, but more often than not the threat comes not from deliberate employee sabotage, but rather from ignorance or careless practice. Threats from hostile governments or sophisticated criminal organisations - dubbed 'Advanced Threats' by the industry - often use an initial employee mistake to embed themselves in a targeted department, gaining persistent access to a system and becoming increasingly difficult to detect.

So employee mistakes can have implications far beyond the immediate incident. It is therefore vital that all employees, whatever their seniority level, should be given continuous cyber-security awareness and counter-intelligence training, to avoid poor practice and minimise the possibility of a security breach. Employees are the most important part of the information system of an agency, but also its weakest link when it comes to cyber security and defence.

Likewise, public knowledge of software and hardware used in a department's network should be limited to a few trusted and vetted employees who have a real "need to know". If hostile actors understand a system's make-up in advance (as part of their pre-attack recognisance), then they can tailor their attacks to known vulnerabilities, giving them a headstart before they begin probing the system's defences directly.

This is why it's also vital to do a constant security vetting, and re-vetting, of outside vendors with access to the system, even if their role is relatively limited. Many times breaches of the vendor's networks or software and hardware products, lead to breaches of their customer networks and to data exfiltration, and many a time goes undetected by the customer.

Just as knowledge should be compartmented and firewalled, so should software. Patches, updates and fixes can often prove a 'Trojan horse' allowing malware to enter the system either causing direct damage, or creating an opening for future exploitation. They should therefore always be deployed in a 'sandbox', a virtual space, discrete from the main system which allows new software to be run isolated without risk of contamination of the main network.

Once vetted from the security, compatibility and functionality point of view, the patches or updates should be deployed to the main network in a staged upgrade push that would minimise the possibility of the entire network being down. To avoid unwitting disclosure of information all communications should be end-to-end encrypted - that means not just voice, but texts and files as well, both in transit and at rest.

Crucially, encryption systems should also sit on hardened hardware, the best algorithm in the world won't preserve your privacy if it's hosted on an insecure computer, cloud or mobile handset.

Lastly, but certainly not least, government cyber security professionals should constantly test the security of their systems through penetration testing. Knowing your network from the outside will provide invaluable information about the vulnerabilities (and sometimes even zero day exploits) of your systems. This is an ideal role for outside vendors who can bring in some of the best hacking expertise in the world, at far lesser expense than keeping it in- house.

External contractors also have the great advantage of being unbiased by the system; they won't overlook that crucial vulnerability because that's how the department has held its data for years, or because it's due to be resolved in next year's round of IT upgrades. They bring an honest perspective on how your system works from the outside.

Testing has to be a constant and iterative process: test, analyse, remediate (both through processes and upgrades), then test again.

There's never a magic bullet to defeating cyber threats, this is a constant battle, but through a combination of training, processes and judicious use of outside expertise government security professionals can help ensure their department doesn't become the subject of the next cyber attack newspaper headline.

Renseignements personnels Au voleur !
Monday, 25 July 2016
Byline: Ariane Krol

Editorial - Aussi incroyable que cela puisse paraître, les renseignements personnels que vous partagez avec une entreprise pourraient être piratés sans que vous en soyez jamais avisés. Plus pour longtemps, heureusement. Les vols de données devront bientôt être déclarés, prévoit un règlement actuellement à l'étude au ministère fédéral de l'Innovation. Reste à s'assurer que cela se fera avant tout dans l'intérêt des citoyens.
Pour l'instant, les Canadiens ont plus de chances d'être informés si leurs renseignements sont volés à une société américaine, comme Home Depot ou Target, que si la cible du piratage est une entreprise locale. La plupart des États américains exigent en effet que ces événements soient déclarés - certains sont d'ailleurs en train d'élargir cette obligation.

Chez nous, c'est à la discrétion des entreprises. Seuls les ministères et organismes du gouvernement fédéral doivent déclarer ces failles, comme Revenu Canada l'a fait en 2014. La Loi sur la protection des renseignements personnels numériques, adoptée il y a un an, vise à corriger cette lacune. Il était temps.

Les entreprises piratées ne sont pas les seules victimes, loin de là. Si vos renseignements personnels ont été compromis, vous risquez d'en subir les inconvénients.

Devoir changer son numéro d'identification personnel (NIP) ou sa carte ne prend pas trop de temps, mais se faire créditer des transactions frauduleuses peut se révéler laborieux. Et c'est sans compter le risque de vol d'identité. Que les consommateurs soient mis dans le coup afin de pouvoir prendre certaines précautions ou, à tout le moins, redoubler de vigilance est un minimum.

Autre avantage : cette obligation de divulgation devrait inciter les entreprises à mieux protéger les renseignements personnels qu'elles détiennent. Avoir à contacter des centaines ou des milliers de clients lésés alourdit la facture, déjà salée, avec laquelle doit composer une organisation touchée par une perte ou un vol de données. Sans oublier la perte de confiance et de revenus qui suivront, surtout si l'on apprend qu'elle a été négligente. L'effet ne sera pas instantané, mais à force de voir des entreprises échaudées, celles qui rechignent à investir en sécurité referont peut-être leurs calculs.

Ottawa a déjà tenu une première consultation. Une nouvelle version du règlement devrait bientôt être publiée pour commentaires. L'intérêt des citoyens doit demeurer en tête des priorités. Déjà, seuls les cas où il y un « risque réel de préjudice grave » doivent être divulgués. Les entreprises seraient donc malvenues de crier à la lourdeur bureaucratique. Avec tous les renseignements qu'elles récoltent à la moindre transaction (carte de crédit, courriel, numéro de téléphone, et bien plus avec les achats en ligne), on s'attend à ce qu'elles fassent le maximum pour en assurer la protection.

Al Jazeera
Iran destroys 100,000 'depraving' satellite dishes
Monday, 25 July 2016

Tehran - Authorities say the banned satellite dishes are morally damaging, despite high-level calls for reform of the law.
Iranian authorities have destroyed 100,000 satellite dishes and receivers as part of a widespread crackdown against illegal devices they say "deviate morality and culture".

Most of these satellite channels not only weaken the foundation of families but also cause disruptions in children's education and children who are under the influence of satellite have improper behaviour.

General Mohammad Reza Naghdi, the head of Iran's Basij militia, oversaw the destruction ceremony in Tehran on Sunday and warned of the impact that satellite television was having in the country.

"The truth is that most satellite channels... deviate the society's morality and culture," AFP news agency reported him as saying. "What these televisions really achieve is increased divorce, addiction and insecurity in society."

Naghdi said that a total of one million Iranians had already voluntarily handed over their satellite dishes to authorities.

Conservatives regularly denounce the channels as an attempt to corrupt Iranian culture and Islamic values.

Iranian police regularly raid neighbourhoods and confiscate dishes from rooftops, and under Iranian law, satellite equipment is banned and those who distribute, use, or repair them can be fined up to $2,800.

On Friday, Culture Minister Ali Jannati called for a revision of the law. "Reforming this law is very necessary as using satellite is strictly prohibited, but most people use it," Jannati said. "This means that 70 percent of Iranians violate the law" by owning satellite dishes, he added.

Naghdi criticised Jannati's comments and said those in charge of cultural affairs "should be truthful with people rather than following what pleases them".

"Most of these satellite channels not only weaken the foundation of families but also cause disruptions in children's education and children who are under the influence of satellite have improper behaviour," Naghdi said.

There are dozens of foreign-based Farsi satellite channels broadcasting mostly news, entertainment, films and series.

President Hassan Rouhani, whose four-year mandate ends in June 2017, has repeatedly said that the ban on satellite dishes is unnecessary and counterproductive.

In D.N.C. Hack, Echoes of Russia's New Approach to Power
Tuesday, 26 July 2016
Byline: Max Fisher

Analysis - Of the questions raised by charges that Russia was involved in the release of hacked Democratic National Committee emails, at least one -- why would Russia do such a thing? -- can be answered with a little-noticed but influential 2013 Russian military journal article.
"The very rules of war have changed," Gen. Valery V. Gerasimov, the chief of the general staff, wrote in the Military-Industrial Courier.

The Arab Spring, according to General Gerasimov, had shown that "nonmilitary means" had overtaken the "force of weapons in their effectiveness." Deception and disinformation, not tanks and planes, were the new tools of power. And they would be used not in formally declared conflicts but within a vast gray between peace and war.

Those ideas would appear, the next year, in Russia's formal military doctrine. It was the culmination of a yearslong strategic reorientation that has remade Russian power, in response to threats both real and imagined, into the sort of enterprise that could be plausibly accused of using cyberattacks to meddle in an American presidential election.

'We are protecting our sovereignty'

Like so many military rethinks, what became known as the Gerasimov Doctrine began as an effort to solve a seemingly urgent problem.

Throughout the 2000s, popular uprisings in Eastern Europe and Central Asia overturned their pro-Kremlin leaders, replacing them with democratically elected governments more inclined to the West.

In Moscow, these "color revolutions," as well as the subsequent Arab Spring, were seen as a wave of hostile American operations, engineered to topple Russia's allies and weaken Russia itself.

Sergei Shoigu, the Russian defense minister, said in a 2014 speech that such uprisings were "used as an excuse to replace nationally oriented governments with regimes controlled from abroad."

The Kremlin felt encircled and threatened by what it took to be a vast American conspiracy whose ultimate goal, it concluded, was the subjugation or outright destruction of the Russian state.

In December 2011, thousands gathered in Moscow to protest legislative elections that had been marred by accusations of fraud. The demonstrations didn't come to much, but they engendered a fear among Russian leaders that they were next.

President Vladimir V. Putin, at a news conference in 2014, warned that the West was seeking to "defang" the Russian bear -- to remove its nuclear weapons so as to gain access to its natural resources.

"Once they've taken out his claws and his fangs, then the bear is no longer necessary," Mr. Putin said. "The issue is that we are protecting our sovereignty and our right to exist."

Russian military planners, apparently obsessed with such fears, concluded that their best defense would be to go on the offense. Believing that the Americans were already conducting a clandestine war through intelligence operations, media disinformation, and deniable proxy forces, they set out to do the same.

The phrase "hybrid war" -- a common label in the West for Russia's actions -- was first used by Russian analysts to describe the supposed American tactics they believed they were countering. They called their own strategy something different: "new generation war."

Projecting power beyond Russia's strength

Even before this doctrine became formalized, Russia had developed tools of coercion and subterfuge, providing a model for wider usage.

As Russian power has resurged under Mr. Putin, the country has often used asymmetrical methods to assert its interests, particularly in the former Soviet republics it still considers its "near abroad" and rightful zone of influence.

In 2007, amid tensions with the small Eastern European nation of Estonia, Russian media falsely reported that members of Estonia's Russian minority were being drugged and tortured by police, contributing to riots that injured several people and killed one. The next day, cyberattacks, attributed to a pre-Kremlin Russian group, forced many of Estonia's major institutions offline.

At no point, in the 2007 episode, did Russia commit an act of military aggression against its neighbor. Yet Estonian leaders say these actions were meant as a message: Even if their country had joined NATO and the European Union, Moscow was still the boss.

These sorts of tools allowed Russia to project power beyond its strength and, just as importantly, to assert its interests abroad despite Western military and political dominance.

To paraphrase Mark Galeotti, a New York University professor who studies Russia's military, this is a country whose economy is smaller than Canada's or South Korea's, yet is seeking a great power role akin to China or the United States. Traditional methods won't cut it.

Information struggle and Maidan technology

Russia deployed its "new generation war" to startling effect in early 2014, when, amid Ukraine's political crisis, it seized and subsequently annexed the Ukrainian region of Crimea.

While that action is most remembered for the "little green men" - - unmarked Russian special forces who seized key locations in a clandestine invasion -- there were subtler components as well.

Russian state news media flooded Crimea's airwaves with false stories about neo-Nazis taking over Ukraine and systematically attacking ethnic Russians, who are a majority in Crimea. As a result, many Crimeans welcomed the unmarked Russian troops, believing they were being saved from possible ethnic cleansing.

Dmitry Adamsky, an Israeli analyst, wrote in a 2015 report that this "information struggle" is central to Russia's new strategy.

This information war, he wrote, "comprises both technological and psychological components designed to manipulate the adversary's picture of reality, misinform it and eventually interfere with the decision-making process of individuals, organizations, governments and societies."

While this was especially visible in Crimea, Mr. Adamsky warned that it was also deployed in peacetime and against any target where Moscow seeks influence. It may be intended to pursue a "strategic goal," such as the weakening of pro-American political parties in Europe, or to simply foment a degree of instability that weakens adversaries.

Mr. Adamsky described this as a form of "subversion" that "aims to deceive the victim, discredit the leadership, and disorient and demoralize the population and the armed forces."

That sheds light on why Russia might want to release Democratic National Committee emails, whose greatest effect is creating a kerfuffle within Democratic politics. It's not as if the resignation of the party chairwoman, Debbie Wasserman Schultz, was some strategic Russian ambition.

While some observers say Moscow sees a potential friend in Donald J. Trump, it would also be well within Russian strategy to stir up trouble just to stir up trouble. This is what Mr. Adamsky calls "managed stability-instability" -- low-level confusion and disunity that Russia could perhaps one day exploit.

Russia has long seen itself as the victim of these very tactics, accusing Western governments of using vague "Maidan technology," named for the square where Ukraine's 2014 protests began, to create "managed chaos" in targeted countries. Embarrassing stories, such as the Russian doping scandal and the Panama Papers, are seen as American information warfare meant to weaken Moscow.

In this view, Kremlin leaders could see releasing internal Democratic emails as a tit-for-tat retaliation in the information struggle. Such a thing would make little sense in the Western conception of geopolitics.

But as Mr. Adamsky wrote in his 2015 study, Americans have long tried to conceptualize Russian strategy within Western ways of thinking, when it is anything but.

USA Today
It will be hard to prove Russians are behind DNC hack, experts say
Tuesday, 26 July 2016
Byline: Elizabeth Weise

Washington - Computer security researchers say it's difficult to definitively say the cyber theft of files from the Democratic National Committee was perpetrated by Russian hackers as some media outlets have reported.
"Just because you find an AK-47 at a crime scene doesn't mean a Russian pulled the trigger," said J.J. Thompson, chief executive of Rook Security, an Indianapolis-based firm.

On Friday, WikiLeaks released what it said were 19,252 emails and 8,034 attachments from leaders at the Democratic National Committee.

The documents, which the DNC has not dismissed as fraudulent, show antipathy toward Bernie Sanders, who had hoped to win the party's presidential nomination.

They infuriated Sanders supporters and led to U.S. Rep. Debbie Wasserman Schultz's announcement she would step down as the committee's chair.

On Sunday, Hillary Clinton's campaign manager, Robby Mook, said on ABC's This Week that the emails had been extracted by the Russians to help Donald Trump's campaign. To support his claim, Mook cited "experts."

Mook added to this charge Monday, telling reporters, "All we know right now is what experts are telling us," which is that "Russian state actors were feeding the emails to hackers for the purpose of helping Donald Trump."

In an article published Monday, The New York Times reported that researchers at CrowdStrike, an Irvine, Calif.-based cyber-security firm, had concluded the breach was the work of two Russian intelligence agencies, or people working for or with them.

CrowdStrike declined to comment for this article. However, in May and June it blogged that an analysis it had completed of the long- known intrusion into the DNC's computer network was the work of Russian intelligence-affiliated adversaries, one of whom it called Cozy Bear and the other Fancy Bear.

CrowdStrike said that it had run into both of these groups in previous attacks.

"Both adversaries engage in extensive political and economic espionage for the benefit of the government of the Russian Federation and are believed to be closely linked to the Russian government's powerful and highly capable intelligence services," Dmitri Alperovitch, the company's co-founder, wrote in its blog.

However, experts within the cyber-security world say it's extremely difficult to know exactly who is behind an attack without the kind of on-the-ground surveillance that only government agencies are able to provide.

The FBI said in a statement that it was investigating the intrusion into the DNC's computer network.

The Japan News
Govt to protect source code in economic deals
Tuesday, 26 July 2016
Byline: Staff reporter

The government has decided to include stipulations on protecting the confidential data of software in future economic deals it signs, aiming to curb China and other countries that have requested such data from companies, sources say.
The government intends to address the issue in economic partnership agreements and investment agreements when it signs them with other countries and regions, as advanced technologies such as the internet of things (IoT) and artificial intelligence play an ever-growing role.

At Monday's meeting of World Trade Organization member countries in Geneva, Japan was to propose that rules be established to prohibit WTO countries from making requests to divulge source code. The government ultimately aims to create a pact among countries and regions in favor of the idea.

The Trans-Pacific Partnership free trade agreement -- which was officially signed in February by Japan, the United States and 10 other countries -- prohibits signatories in principle from requesting private companies to disclose source code.

Revealing source code may leak a software creator's critical development know-how, which could not only threaten the intellectual property of developers, but also make it possible to remotely control devices connected to the internet.

Japan aims to include similar stipulations to those under the TPP in economic deals with other countries and regions. The government has been discussing the issue in talks with Colombia and the European Union over economic partnership agreements, and also plans to deal with it during negotiations on investment agreements with Ghana, Morocco and Tanzania.

The move has been driven by China, which has made requests that foreign countries operating in the country disclose source code for information-related and other products, citing security checks among other reasons. It has been reported that Russia and some developing countries have made similar requests.

CBS News
Kerry discusses DNC email hack with Russia's top diplomat
Tuesday, 26 July 2016
Byline: Staff report

Vientiane, Laos - Secretary of State John Kerry says he raised the email hack of the Democratic National Committee with Russia's top diplomat but stopped short of making any allegation about who might be responsible.
Kerry told reporters Tuesday he brought the matter up with Russian Foreign Minister Sergey Lavrov at a meeting in Laos and explained that the FBI was investigating. He did not, however, repeat allegations or echo suspicions that Russia was responsible for the hack and said he would not draw conclusions until the probe is complete. "I raised the question and we will continue to work to see precisely what those facts are," Kerry said. He would not say if Lavrov responded.

Asked about the allegations earlier, Lavrov scoffed, saying: "I don't want to use 4-letter words."

The FBI confirmed Monday that it was investigating the hack involving Democratic National Committee (DNC) emails.

A cache of more than 19,000 emails from Democratic party officials, were leaked Friday in advance of Hillary Clinton's nomination at the party's convention this week in Philadelphia, and they detail the acrimonious split between the Democratic National Committee and Clinton's former rival, Sen. Bernie Sanders, D- Vermont.

Although Wikileaks' posting of the emails Friday did not disclose the identity of who provided the private material, those knowledgeable about the breach said last month that Russian hackers had penetrated the DNC computer system. At the time, DNC Chairwoman Debbie Wasserman Schultz said the breach was a "serious incident" and a private contractor hired to sweep the organization's network had "moved as quickly as possible to kick out the intruders and secure our network."

The Hillary Clinton campaign has blamed the email leaks on Russia, reports CBS News' Julianna Goldman.

Clinton's campaign manager Robbie Mook accused Russian President Vladimir Putin of meddling in the U.S. election.

"What the experts said when this breach initially happened at the DNC was that they believed that it was Russian state actors who took these emails," Mook said.

"Russian state actors were feeding the emails to hackers for the purpose of helping Donald Trump," he continued.

But neither the Clinton campaign, the White House, nor lawmakers briefed on the hack definitively linked the leak to the Russian government on Monday.

Miami Herald
Bitcoin not money, Miami judge rules in dismissing laundering charges
Tuesday, 26 July 2016
Byline: David Ovalle

Miami - A Miami-Dade judge ruled Monday that Bitcoin is not actually money, a decision hailed by proponents of the virtual currency that has become popular across the world.
In a case closely watched in financial and tech circles, the judge threw out the felony charges against website designer Michell Espinoza, who had been charged with illegally transmitting and laundering $1,500 worth of Bitcoins. He sold them to undercover detectives who told him they wanted to use the money to buy stolen credit- card numbers.

But Miami-Dade Circuit Judge Teresa Mary Pooler ruled that Bitcoin was not backed by any government or bank, and was not "tangible wealth" and "cannot be hidden under a mattress like cash and gold bars."

"The court is not an expert in economics; however, it is very clear, even to someone with limited knowledge in the area, the Bitcoin has a long way to go before it the equivalent of money," Pooler wrote in an eight-page order.

The judge also wrote that Florida law -- which says someone can be charged with money laundering if they engage in a financial transaction that will "promote" illegal activity -- is way too vague to apply to Bitcoin.

"This court is unwilling to punish a man for selling his property to another, when his actions fall under a statute that is so vaguely written that even legal professionals have difficulty finding a singular meaning," she wrote.

The ruling was lauded by Bitcoin experts who believe the ruling will encourage the use of the virtual currency, and offer a roadmap to governments across the world that have struggled to understand and regulate it.

Espinoza's attorney, Rene Palomino, said the judge's order was "beautifully written."

"At least it gives the Bitcoin community some guidance that what my client did was not illegal," Palomino said. "What he basically did was sell his own personal property. Michell Espinoza did not violate the law, plain and simple."

A spokesman for the Miami-Dade State Attorney's Office said: "We are presently reviewing the court order to determine whether we will be appealing this decision."

Law enforcement has struggled to figure out how Bitcoin fits into illegal activities, and Espinoza's case was believed to be the first money-laundering prosecution involving the virtual currency.

The controversial virtual currency allows some users to spend money anonymously and it can be also be bought and sold on exchanges with U.S. dollars and other currencies.

The currency has gained popularity with merchants selling legitimate goods and services. In Miami, there are a few restaurants that accept the virtual currency -- and even a plastic surgeon.

Regulated services such as CoinBase, which operates similarly to PayPal, allow people to buy, sell and use the Bitcoins. But authorities have raised concerns about the currency being used in the anonymous black market.

Most notoriously, Bitcoins were used to traffic drugs in the now-shuttered Silk Road network. In an unrelated South Florida case, a Miramar man got 10 years in prison after using Bitcoins to buy Chinese-made synthetic heroin from a Canadian prisoner.

In Espinoza's case, Miami Beach detectives found him through a Bitcoin exchange site, LocalBitcoins.com, and told him they were going to use the currency to purchase stolen credit-card numbers.

The detectives met with Espinoza, 32, three times in person: on Lincoln Road, at an ice cream shop and in a hotel room.

Espinoza was arrested along with another man, Pascal Reid, who pleaded guilty to acting as an unlicensed money broker and was sentenced to probation. Under his unusual plea deal, he agreed to teach law enforcement about Bitcoin.

At a hearing in May, a defense expert, Barry University economics professor Charles Evans, testified that Bitcoin was not actually money.

No central government or bank backs Bitcoin, like the United States does the dollar. Government regulation of Bitcoin remains a messy hodgepodge from state to state, country to country. The IRS considers Bitcoin deals no more than bartering, he said.

"Basically, it's poker chips that people are willing to buy from you," said Evans, a virtual-currency expert who was paid $3,000 in Bitcoins for his defense testimony.

The judge's decision will help Bitcoin flourish in Miami and countries where banking system are tenuous, Evans said in an interview on Monday.

"Bitcoin is perfect for small-scale cross-border transactions and we are international in this area," Evans said. "If somebody from Venezuela needs a hammer, now that person can send Bitcoin to his cousin in Miami, that cousin can sell the Bitcoin, go buy the hammer and send it to Venezuela."

The ruling could also spark a push to tweak Florida law. Judge Pooler, in her ruling, said the state's money-laundering law that targets transactions that "promote" illegal activity requires a "much-needed update."

"Hopefully, the Florida Legislature or an appellate court will define 'promote' so individuals who believe their conduct is legal are not arrested," Pooler wrote.

Jerusalem Post
IDF bans 'Pokemon Go' app from all military bases amid security fears
Tuesday, 26 July 2016
Byline: Yaakov Lappin, Judy Siegel-Itzkovich

Jerusalem - Acting on concerns that soldiers on IDF bases playing Pokemon Go could download a lookalike application and inadvertently reveal sensitive data, the military this week banned all usage of the smart phone application on military property.
The decision was taken by the IDF's Security Division, which recently ordered all soldiers and officers to cease playing the game on base immediately.

The IDF Spokesperson Unit said in a statement that "a concern over the leaking of sensitive military information, such as photographs and base locations," drove the decision.

Military sources said they had become aware of another application that "looks and acts like the original [Pokemon Go] application, which causes data to be leaked out," adding that this was the real reason for banning the game.

It noted that "as part of the installation of the application, a device's camera is activated to enable the game's embedded reality, while location sensors, for orientation around an area, are also activated."

Meanwhile, with large numbers of people running around during daylight exposed to the sun trying to capture monsters for the Pokemon Go smartphone application, the Israel Cancer Association warns the public to protect itself from sunburn and the risk of skin cancer.

The relatively safe hours to go out are before 10 a.m. and after 4 p.m., the ICA cautions. Try to spend as much time in the shade, and wear a wide-brimming hat, sunglasses and light, longsleeved clothing and regularly apply sunscreen, the ICA warns. Drink water often to avoid heat prostration, and be aware of traffic dangers.

Nextgov.com
Spy Chief 'Excited' about Agency's Modernization Effort
Tuesday, 26 July 2016
Byline: Frank Konkel

Washington - Although CIA Director John Brennan admitted last week the agency's modernization effort has experienced pushback from some of its most tenured employees, he expressed excitement over how his agency has used technology to improve its data collection and analytic efforts.
The CIA made news two years ago for its deal with Amazon Web Services to lead the development of cloud computing capabilities for the intelligence community. Then, last year, the CIA stood up its first new directorate in more than 50 years, designed to improve agents' individual tech skills, improve data governance across the agency and to harness the power of big data.

Evidently, it hasn't been easy.

"I am very excited about where the agency is going," Brennan said at a July 19 Intelligence and National Security Alliance event. "Yes, a big organization that goes through a modernization is going to experience dislocations. And people who grew up in the organization over the last 20 or 30 years, it's like, 'oh, God what is Brennan doing now?' But I think the initial opposition in some quarters to this really has dissipated as we've been able to explain what the purpose is."

The goal, he continued, is "not to homogenize everybody," but to connect intelligence analysts and others in ways not possible in previous decades. Brennan said the decision to restructure was made out of necessity - the demands for signal intelligence and to feed policymakers' voracious appetites for situational information tied to international events.

A new directorate - headed by Deputy Director Andrew Hallman - is doing exactly that, helping integrate intelligence for consumption by CIA analysts and others across the IC.

"The organizational structure of the CIA was not optimally configured to give us that," Brennan said. "And I think this is going to allow us to have a better opportunity to ensure that the various regions of

the world have constant attention of CIA officers who are working together to identify what might be over the horizon."

Chief among them is the ability of analysts to pick up "early indicators" of global events, such as the recent flood of ISIL-inspired terrorist attacks or the attempted coup in Turkey. Brennan said getting those "advanced warnings" is "increasingly a challenge" meriting more resources.

Pravda
Russian FM Lavrov refuses to use 4-letter words in comments about Russian hackers
Tuesday, 26 July 2016
Byline: Staff report

Moscow - Russian Foreign Minister Sergei Lavrov said he could not exclude expletives from his comments about the Russian trace in the hacking of the US Democratic Party mail server. It was reported that Russian hackers could be involved in the recent cyber attack on the USA.
Last week, WikiLeaks published documents indicating that the party leadership was favoring Hillary Clinton in the fight for the right to become a candidate for US presidency to the detriment of Bernie Sanders.

"I would not like to use four-letter words," Lavrov said when asked to comment on the Russian track in the data leak.

The New York Times wrote with reference to computer security experts that the metadata of the documents of the Democratic National Committee contained traces of computers with Russian language settings.The traces were reportedly found in the code that was used to hack into the computer network of the national committee of the party.

In June, computer security experts told The Washington Post that the headquarters of the Democratic Party were infiltrated by hacker groups that were allegedly associated with Russia. Spokespeople for CrowdStrike clarified that it goes about such groups as Cozy Bear and Fancy Bear. According to the experts, the groups could be linked with the Russian FSB and the Central Intelligence Directorate (GRU).

The Kremlin has ruled out any involvement of Russian state structures in the hacking of computer networks of the Democrat Party. Later, lone hacker known as Guccifer 2.0 claimed responsibility for the attack. He promised that the hacked documents would be published on WikiLeaks.

On Monday, the head of the US Democratic National Committee (DNC), Debbie Wasserman Schultz, announced a decision to resign in connection with the scandal about the leak.

London Times

Judge appointed 'surveillance tsar' after police spy row
Tuesday, 26 July 2016
Byline: Neill Johnston

London - A leading judge has been appointed as the country's new "surveillance tsar" after a controversial row over police spying.
Lord Bracadale, who presided over the trials of Nat Fraser and Tommy Sheridan, is now being urged to "vigorously protect" the interests of the public and journalists.

The appointment comes after police were found to have spied on one of their own officers in an effort to uncover the source of media leaks, and was wel-comed by opposition parties after more than a year of delay in filling the role.

Liam McArthur, a Liberal Democrat MSP, said: "The fact that a commissioner is now in place will mean nothing unless he vigorously protects the interests of journalists and others who have had their communications data intercepted unlawfully. Units within Police Scotland played fast and loose with the rules to identify journalistic sources and in many respects seem to have ignored them altogether. This cannot be allowed to happen again."

Last year it emerged that Police Scotland had contravened the communications data code of practice.

Its counter corruption unit was found to have breached its requirement to seek judicial approval in trying to establish whether officers had leaked information to a newspaper about the original investigation into the murder of Emma Caldwell, a sex worker.

An independent inquiry is now likely to be carried out by an external force after a day of legal arguments before the investigatory powers tribunal in Edinburgh last week. The annual report of the UK's Office of Surveillance Commissioners for 2015-16, published earlier this month, raised concerns.

It said: "We are concerned that one police force in the United Kingdom finds itself in a different position to its counterparts across the border."

A Scottish government spokeswoman said: "Surveillance commissioners have held high judicial office, which provides strong assurance of independence and integrity in carrying out their functions. The interception of communications commissioner has commented on the robust and rigorous steps Police Scotland has now taken to ensure processes for all communications data applications are fully compliant with the code of practice." In 2012, Nat Fraser went on trial before Lord Bracadale for the murder of his wife Arlene in Elgin in 1998. He was found guilty by a majority verdict and sentenced to a minimum of 17 years imprisonment.

In 2010, Lord Bracadale presided over the trial of Tommy Sheridan, a former MSP, for perjury in a case involving News Group Newspapers. He was found guilty and sentenced to three years in prison.

Wall Street Journal
DNC Hack Prompts Allegations of Russian Involvement
Tuesday, 26 July 2016
Byline: Damian Paletta, Davelin Barrett

Washington - The theft and leak of embarrassing Democratic National Committee emails created a political firestorm at the party's convention and prompted Democratic allegations of involvement by the Russian government.
U.S. authorities said they were still investigating who perpetrated the hack, but cybersecurity experts said the email release resembled past examples of political interference that other countries have tied to Russia.

Russian officials have denied involvement in the DNC hack. U.S. national-security officials haven't drawn a conclusion in the matter but consider Russian intelligence the chief suspect, according to people familiar with the investigation.

Regardless of who is responsible, the release of the DNC emails created immediate political fallout with the resignation of Democratic Party chief Debbie Wasserman Schultz and led to maneuvering by Democrats and Republicans seeking to spin the controversy.

Multiple Democrats alleged the Russian government stole the emails and provided them to WikiLeaks for publication in an effort to help Republican presidential nominee Donald Trump win the November election, though they offered no proof. "I think that voters need to take a look at this," said Robby Mook, campaign manager for Democrat Hillary Clinton's campaign. "It's troubling if it's true."

Meanwhile, Mr. Trump has attempted to take political advantage of the development. "She worked very hard to rig the system," Mr. Trump said of Mrs. Clinton at a Virginia campaign appearance. "Little did she know that China, Russia one of our many many 'friends' hacked the hell out of us."

The November elections could have a profound impact on U.S.-Russia relations at a time when the countries are at odds over the Syrian civil war and other foreign-policy matters.

Mrs. Clinton has described Russian President Vladimir Putin as a "bully" who needs to be stood up to. Mr. Trump has said several times that the U.S. needs to work more closely with Russia--to help the U.S. disentangle itself from the Middle East-- and that the U.S. should rethink its alliance with members of the North Atlantic Treaty Organization, a group that has traditionally stood as a resistance to Russian interference.

Cybersecurity experts have said forensic evidence in the DNC breach and the leaked emails connects the operation to Russian actors.

"The Russian security services have long experience in trying to directly influence elections abroad," said Alexander Klimburg, a cyber expert at the Hague Center for Strategic Studies.

White House spokesman Josh Earnest said he couldn't verify the results of investigations by private firms and said the Federal Bureau of Investigation would determine whether to make the results of its investigation public.

He said there are "a variety of actors both state and criminal who are looking for vulnerabilities in the cybersecurity of the United States, and that includes Russia."

The FBI said it is still working "to determine the nature and scope of the matter. A compromise of this nature is something we take very seriously."

"We see the flood of inadequate and inappropriate allegations that has inundated the U.S. media. One can only be surprised by such childish groundless accusations that are far beyond reality," said Yury Melnik, press secretary at the Russian embassy in Washington.

Russian hackers have long targeted U.S. political entities and policy groups, including political parties and senior elected officials, according to U.S. officials. Alarming to some U.S. officials is the possibility that the DNC hack shows the Russians may be getting more aggressive and attempting to sway the U.S. political process.

"That foreign actors may be trying to influence our election--let alone a powerful adversary like Russia--should concern all Americans of any party," Rep. Adam Schiff, the top Democrat on the House Intelligence Committee, said Monday.

In June, CrowdStrike, a cybersecurity firm hired by the DNC, found that "two separate Russian-intelligence affiliated adversaries" had breached the DNC network in May.

CrowdStrike has labeled the alleged Russian hacking teams as COZY BEAR and FANCY BEAR.

COZY BEAR is believed to be the same team that successfully breached White House networks, the State Department, and the U.S. Joint Chiefs of Staff, among others. CrowdStrike has tied FANCY BEAR to past hacks targeting aerospace, military, energy, government and media sectors. CrowdStrike found that COZY BEAR was in the DNC's network since at least the summer of 2015, while FANCY BEAR entered in April 2016.

The officials said the case against Russian intelligence is partly circumstantial, based on similarities with past hacking behavior by what security experts call "advanced persistent threats"--terminology used to describe nation-state hackers.

"They use hacking for political effect and to shape opinion," said James Lewis, an expert on nation-state hacking practices and director of the strategic technologies program at the Center for Strategic and International Studies. "So let's just say it fits their [modus operandi]."

Not everyone is convinced the case has been cracked.

Steven Bongardt, a former FBI official now at the firm Fidelis Cybersecurity, said WikiLeaks has a history of getting documents from inside leakers, not foreign hackers, and said the emails could be the work of someone trying to disguise their handiwork behind the Russian hackers.

"The timing could indicate a disgruntled insider," said Mr. Bongardt.

Washington Post
The anxiety for Democrats: Are more leaks to come?
Tuesday, 26 July 2016
Byline: Tom Hamburger, Ellen Nakashima

Washington - The FBI warned the Clinton campaign and dozens of lawmakers in recent months that they were being targeted by hackers, according to people familiar with the discussions.
There is no evidence that those hacks were successful. But the FBI's warning came weeks before The Washington Post reported that Russian hackers had twice broken into computers at the Democratic National Committee, underscoring concerns of national security experts that foreign adversaries might be trying to influence the presidential election.

Those fears burst onto the public stage this week as Democrats gathered in Philadelphia for their national convention in the wake of Friday's release of thousands of damaging emails on the website WikLeaks. The embarrassing emails spurred the resignation of the party chairwoman and marred a carefully orchestrated opening of the Democrats' convention.

Activists and campaign officials, anxious about what leaks may be yet to come, also worried about the alleged involvement of the Russian government, with campaign officials suggesting that the Kremlin was releasing the documents to damage Clinton's candidacy. National security experts, while cautious about leaping to premature conclusions, warned of the possibility of a significant escalation in an ongoing information war.

If the Russians were behind the leaks, said former CIA director Michael Hayden, "they're clearly taking their game to another level. It would be weaponizing information." He added: "You don't want a foreign power affecting your election. We have laws against that."

On Monday, the FBI formally acknowledged that it is looking into the DNC hack. The agency has been probing the matter for months and on Monday said publicly that it will "investigate and hold

accountable those who pose a threat in cyberspace." The FBI announcement followed the stunning allegation by the Clinton campaign Sunday that the Russian government was behind the release of damaging documents on the WikiLeaks website as part of a ploy to help Republican nominee Donald Trump.

Trump's campaign manager, Paul Manafort, called the suggestions "absurd" and suggested that Democrats were looking to shift attention away from damaging information about the party's conduct during the primary campaign.

On Monday, fallout from the hack also reverberated at the Kremlin, where a spokesman declined to comment on the hack except to refer reporters to comments by Trump's son, Don Jr., calling the allegations part of a pattern of "lie after lie."

"Mr. Trump Jr. has already strongly responded" to the Clinton campaign's claims, the Russian spokesman said, according to the news agency Tass.

The founder of WikiLeaks and its current top editor, Julian Assange, told the Democracy Now radio show Monday that he would not discuss the source of the data.

"In relation to sourcing, I can say some things. (A), we never reveal our sources, obviously. That's what we pride ourselves on. And we won't in this case, either. But no one knows who our source is." Assange has said the release Friday was the first in a series.

U.S. law enforcement and intelligence experts acknowledge they are taking the claim seriously but cautioned Monday that they have reached no conclusions.

The FBI is focusing on the Russian military intelligence agency, the GRU, and investigating whether it was responsible for passing the emails to WikiLeaks, according to individuals familiar with the investigation.

The GRU is one of two Russian spy agencies that apparently compromised the DNC's computer systems, according to CrowdStrike, a cyber-firm that investigated the breach this spring on behalf of the DNC.

The GRU, which broke into the DNC's computers in late April, also stole opposition research files on Trump, according to CrowdStrike.

Another Russian spy agency, the FSB, or an affiliate, had penetrated the DNC's computers last summer and was monitoring DNC email and chat traffic, CrowdStrike said.

The FBI is trying to determine with certainty whether Russian intelligence passed the emails to WikiLeaks.

That line of inquiry probably will involve intelligence agencies such as the National Security Agency and the CIA, which might be able to pick up intercepts or gather intelligence overseas, according to intelligence experts.

A big question looming over the investigation is what, if anything, should be done if it is shown that Russian intelligence is responsible for the leak.

The email releases continued to cause anxiety among Democratic officials as the party gathered for its convention in Philadelphia.

Most unnerving to activists here is the uncertainty over what may come next.

Former Senate majority leader Thomas A. Daschle (D-S.D.) told The Post that his email account was hacked recently, but he said he had no indication that the hack originated overseas or was a matter of concern to law enforcement.

Former White House chief of staff William M. Daley, attending the convention, called the Russian hack of DNC emails "pretty frightening."

Given Russia's sophistication in this realm, Daley said that it would be reasonable to conclude that President Vladimir Putin and his government are behind the email leak in an effort to undermine Hillary Clinton's candidacy.

"I don't think anybody would be surprised if Putin would try to affect the election," Daley said in an interview Monday. "That's like the old 'Casablanca' -- there's gambling in the casino. It doesn't surprise me at all. Period. I think anybody who dismisses that is living in fairy land here."

Steve Elmendorf, a lobbyist and former aide to House Democratic leader Richard A. Gephardt (Mo.), said the link to Russia was particularly concerning and yet not surprising given its concerted effort to infiltrate various arms of the U.S. government.

Washington lobbyist Tony Podesta said he expects hacks of private information in the digital age.

"I assume that all private information is public -- it's the safest way to live," he said.

John Cordisco, a former member of the Pennsylvania House of Representatives and the current chairman of the Bucks County Democratic Party with long-standing ties to Democratic donors across the state, said the consequence of the breach is that any personal information transmitted through the Internet could become compromised.

"Anyone would be worried," he said about the chilling effect on donations.

Podesta cautioned party officials to be more careful about how they communicate about donors, given the risk of exposure.

"Everything you say can and will be used against you," he said with a grin.

While federal agencies would not discuss their response in any detail, former government intelligence officials offered insight in to what is happening. Michael G. Vickers, who served as undersecretary of defense for intelligence from 2011 to 2015, said the approach would probably include three steps involving multiple federal agencies.

First, there would be an effort by the FBI, assisted by other intelligence agencies, to nail down "attribution," the identity of the hackers, by looking for telltale bits of identifying code that are left when such breaches occur. Second, he said, there would be discussion among interagency experts "about the intelligence, the timing of the attack, and the release of the information." Was information collected just to gain intelligence, to influence policy or politics, or as a "destructive act"? Third, he said, there would careful deliberations about how to respond.

Vickers was at the Defense Department in 2014 when the most recent destructive cyberattack occurred, one against Sony Pictures apparently initiated by North Korea. Responses could range from a diplomatic wrist slap or warning to countermeasures. Of course, the federal investigators first need to determine that the hack was indeed conducted by the Russians.

In the case of Sony, the administration imposed economic sanctions on North Korea in response to the attack. Later, President Obama signed an executive order establishing a program that enables officials to impose economic sanctions specifically in response to significant cyber-incidents. That tool has not yet been used.

Yahoo News
Suspected Russian hack of DNC widens -- includes personal email of staffer researching Manafort
Tuesday, 26 July 2016
Byline: Michael Isikoff

Washington - Just weeks after she started preparing opposition research files on Donald Trump's campaign chairman Paul Manafort last spring, Democratic National Committee consultant Alexandra Chalupa got an alarming message when she logged into her personal Yahoo email account. "Important action required," read a pop-up box from a Yahoo security team that is informally known as "the Paranoids." "We strongly suspect that your account has been the target of state-sponsored actors."

Chalupa -- who had been drafting memos and writing emails about Manafort's connection to pro-Russian political leaders in Ukraine -- quickly alerted top DNC officials. "Since I started digging into

Manafort, these messages have been a daily oc----currence on my Yahoo account despite changing my p--a-ssword often," she wrote in a May 3 email to Luis Miranda, the DNC's communications director, which included an attached screengrab of the image of the Yahoo security warning.

"I was freaked out," Chalupa, who serves as director of "ethnic engagement" for the DNC, told Yahoo News in an interview, noting that she had been in close touch with sources in Kiev, Ukraine, including a number of investigative journalists, who had been providing her with information about Manafort's political and business dealings in that country and Russia.

"This is really scary," she said.

Chalupa's message is among nearly 20,000 hacked internal DNC emails that were posted over the weekend by WikiLeaks as the Democratic Party gathered for its national convention in Philadelphia. Those emails have already provoked a convulsion in Democratic Party ranks, leading to the resignation of DNC Chair Debbie Wasserman Schultz in the wake of posted messages in which she and other top DNC officials privately derided Bernie Sanders and plotted to undercut his insurgent campaign against Hillary Clinton.

But Chalupa's message, which had not been previously reported, stands out: It is the first indication that the reach of the hackers who penetrated the DNC has extended beyond the official email accounts of committee officials to include their private email and potentially the content on their smartphones. After Chalupa sent the email to Miranda (which mentions that she had invited this reporter to a meeting with Ukrainian journalists in Washington), it triggered high-level concerns within the DNC, given the sensitive nature of her work. "That's when we knew it was the Russians," said a Democratic Party source who has knowledge of the internal probe into the hacked emails. In order to stem the damage, the source said, "we told her to stop her research."

A Yahoo spokesman said the pop-up warning to Chalupa "appears to be one of our notifications" and said it was consistent with a new policy announced by Yahoo on its Tumblr page last December to notify customers when it has strong evidence of "state sponsored" cyberattacks. "Rest assured we only send these notifications of suspected attacks by state-sponsored actors when we have a high degree of confidence," wrote Bob Lord, the company's Chief Information Security Officer, in the Tumblr post.

Asked about charges by Clinton campaign manager Robby Mook that "Russian state actors" hacked the DNC in order to help Trump, who has made sympathetic comments about Russian President Vladimir Putin, Manafort on Sunday dismissed the charges in multiple television interviews as "absurd" and "crazy." The claims are "pure obfuscation on the part of the Clinton campaign," Manafort said on ABCs "This Week." "What they don't want to talk about is what's in those emails."

In mid-June, Democratic Party suspicions about the hackers seemed to be confirmed when CrowdStrike, an outside security firm retained by the DNC, reported that it traced the hackers to two separate units linked to Russia's security services: the FSB, Russia's equivalent of the FBI, and GRU, the country's

military intelligence agency. The company noted strong similarities between the attack on the DNC by the suspected GRU hackers and previous cyberintrusions of unclassified systems at the White House, the State Department and the offices of the Joint Chiefs of Staff. (After discovering the data breach, a DNC security source said its cyberexperts noted that the hackers' exfiltration of files took place "9 to 5, Moscow time.") An FBI official confirmed that the bureau has been investigating the breach for some time, and, according to one source familiar with the matter, Director James Comey has been personally briefed.

The extent of the damage was at first unclear. When they first authorized a public release of the CrowdStrike analysis, party officials said that the hackers had targeted oppo files on Donald Trump. But they told reporters that no personal information about donors had been penetrated. Party officials are no longer standing by those assurances. Two sources familiar with the breach said that the hackers' reach was far more widespread than initially thought and includes personal data about big party contributors and internal "vetting" evaluations that include embarrassing comments about their business dealings (as well as gossipy internal emails about the private affairs of DNC staffers). One newly posted email discusses a prospective DNC donor's offering to host a fundraiser with President Obama, noting that he had previously been convicted in a case involving allegations that he killed 50 horses, as part of an insurance fraud scheme. Party officials are bracing for more damaging document dumps after Labor Day. "They're having to do serious damage control with the donors right now," said a party official familiar with the matter.

There are also signs that the hackers have penetrated the personal email of some Clinton campaign staffers -- at least those who were in communication with senior DNC staff members. On May 6, John McCarthy, a DNC consultant who has since joined the Clinton campaign to do outreach to religious groups, sent an email to Chalupa from his personal Gmail account that was then forwarded to other party officials. McCarthy proposed arranging for religious leaders who have "condemned Trump for bringing out the worst in America" to stage a protest at the Republican National Convention. "It would be great to try and engage them and get them to do something at convention, etc. Maybe do a vigil at the Cleveland convention?" McCarthy wrote in the email, which included his personal cellphone number and which has now been posted as part of the WikiLeaks data dump.

There is still much that is not known about the DNC hack and how, if the Russians are indeed behind it, the emails found their way to WikiLeaks. Some commentators have noted that WikiLeaks founder Julian Assange has in the past hosted a talk show on RT, the Russian television network that serves as a propaganda arm for the Kremlin. (Assange, without providing specifics, recently claimed he will be posting more emails that will be damaging to Clinton and "provide enough evidence" to get her arrested.)

There are also signs that the Obama administration is taking the matter more seriously. The Washington Post reported Monday that White House officials convened a high-level security meeting last Thursday, hours before WikiLeaks began posting the emails, to review information about the DNC attack. Party officials are privately pushing the White House to publicly blame the Russians in the same way it blamed

North Korea for the cyberattack on Sony and China for intrusions into U.S. companies. "The last time somebody broke into the DNC, it led to the resignation of a president," said the Democratic Party security source, referring to the Watergate scandal. In some ways, the source insisted, the current cyberheist -- what some in party circles are already calling a "21st century Watergate" -- is even more sinister, the source said. "This is the Russians screwing with the integrity of our election process."

Wall Street Journal
White House to Issue New Policy for Cyberattack Responses
Tuesday, 26 July 2016
Byline: Damian Paletta

Washington - The White House as soon as Tuesday is expected to issue a new directive on how the government should respond to significant cyberattacks, two people familiar with the matter said, aiming to end confusion about the responsibilities of agencies involved in security breaches.
The new presidential policy directive is a response to the rapid escalation of cyberattacks by criminals and foreign governments that have stolen information from U.S. companies, citizens and government offices.

The policy has been in the works for months, but it will be released at a time when there is an acute focus on the damage caused by cyberattacks. Hackers last year broke into the Democratic National Committee's network and WikiLeaks began releasing some internal party emails several days ago. Some of the emails humiliated top DNC officials and led to an uproar at the party's convention in Philadelphia and the resignation of DNC chairwoman Debbie Wasserman Schultz.

A White House spokesman declined to comment.

The directive is expected to focus in part on how the government will coordinate its response to significant cyberattacks, the people familiar with the matter said.

Lawmakers and U.S. officials have said the government should clarify how it responds to cyberattacks following large-scale breaches at major U.S. companies, the State Department, the U.S. Office of Personnel Management, and even parts of the Pentagon. Hackers try and steal information for commercial reasons but also as a form of espionage, and the U.S. response to these incidents has varied.

There are numerous agencies that play a role in designing cybersecurity safeguards and responding to individual incidents.

The Federal Bureau of Investigation probes the hacks. The Department of Homeland Security is supposed to help protect civilian agencies and serve as a conduit between the government and business community. The National Security Agency has forensic tools that can determine who is behind certain breaches.

The Commerce Department plays a role in monitoring the development and sale of cyber weapons. U.S. Cyber Command has teams focused on offensive and defensive cyber tools. And a number of other agencies work with companies from a range of sectors, including banking and energy, to push them to have strong defenses.

The plethora of agencies involved in cybersecurity has led some companies to wonder who is in charge and who they should turn to when there is an attack.

NBC News
Why Experts Are Sure Russia Hacked the DNC Emails
Tuesday, 26 July 2016
Byline: Josh Meyer

New York - Many U.S. officials and cyber security experts in and out of government are convinced that state-sponsored Russian hackers are the ones who stole 20,000 emails from the Democratic National Committee and leaked them to the public just in time to disrupt the Democrats' national convention in Philadelphia.
Here's why the experts are so confident the Russians did it:

* GEOGRAPHY: At least one of the hacker groups attacking the DNC appeared to cease operations on Russian holidays, and its work hours aligned with a Russian time zone, cybersecurity company FireEye concluded in a report.

* LANGUAGE: The hackers also left an obvious digital fingerprint, one cybersecurity expert said, perhaps on purpose: a signature in Russia's Cyrillic alphabet.

* FORENSIC EVIDENCE: After a different batch of hacked Democratic emails was released last month, a wide spectrum of cyber-security experts concluded that it was the work of Russian intelligence agencies through previously known proxy groups known as COZY BEAR or APT 29, and FANCY BEAR or APT 28. "We've had lots of experience with both of these actors ... and know them well," according to the DNC's own contract cybersecurity firm, Crowdstrike, which blogged that one of the two groups had already gained illegal access to the White House, State Department and even the military's Joint Chiefs of Staff.

* MOTIVE: Given their mutual and very public bromance, Putin would much prefer a Trump presidency to a Clinton one and the timing suggests the leak was timed for maximum embarrassment to the Democrats and their presumptive nominee. Clinton campaign manager Robby Mook said the campaign was told by cyber experts that Russian hackers stole and released the emails to help Trump. "I don't think it's coincidental that these emails were released on the eve of our convention here," said Mook, "and I think that's disturbing."

* HISTORY: U.S. intelligence officials, including Director of National Intelligence James Clapper, said they had previously seen evidence of foreign hackers spying on U.S. presidential candidates, including some state-sponsored ones, and that such cyber-intrusions would become even more commonplace.

The main reason, however, is that the email hack is exactly the kind of thing Russian hackers can do, are supposed to do, and are used for by Putin and his aides, retired four-star Adm. James Stavridis told NBC News.

"It is certainly well known that the Kremlin uses Russian hackers for a variety of missions," said Stavridis, who led NATO from 2009 to 2013. "It is certainly well known that Russia possesses those kinds of capabilities. And it certainly seems sensible to assume that the Russians would rather have a Trump than a Clinton presidency."

"And as the saying goes, crime is so often where motive meets opportunity. And when you put those two elements together, I'd say it's a real possibility."

Like other cyber-experts, however, Stavridis said definitively proving such connections is virtually impossible. "I don't know the answer to that and I'm not sure anyone knows the answer to that except for a few individuals in the Kremlin."

(Stavridis, who now heads Tufts' University's Fletcher School of International Affairs, was mentioned as a possible Clinton running mate, but says he is a registered Independent.)

On Monday, Crowdstrike co-founder and CTO Dmitri Alperovitch declined to comment on the latest release of hacked emails and whether it confirmed his earlier assessment that the Russians were responsible.

"At this time, I don't have any new insights or commentary to share beyond the facts that I presented [earlier]," he told NBC News.

Trump campaign chairman Paul Manafort dismissed allegations of Russian complicity in the leak of DNC emails Monday, as the FBI announced that it is investigating what it called "a cyber intrusion involving the DNC and are working to determine the nature and scope of the matter."

"A compromise of this nature is something we take very seriously," said the FBI in a statement, "and the FBI will continue to investigate and hold accountable those who pose a threat in cyberspace."

Strait Times
Digital media the new frontier in war against terror
Tuesday, 26 July 2016
Byline: Farik Zolkepli

Putrajaya - Digital media is the new frontier in which the war against terrorism must be fought on, said Datuk Seri Najib Tun Razak. "It is the new battleground and its centrality cannot be overestimated. "We must seize the opportunity to convince the world that Muslims have nothing to do with the ideology of hatred and destruction," the prime minister said at the launch of the 36th Asean Chiefs of Police (Aseanapol) Conference on Tuesday.

Najib said Malaysia has initiated the Regional Digital Counter-Messaging Communications Centre to synchronise efforts to fight terrorism in Asean and beyond.

"It is vital that this centre uses the studies that illustrate why there is nothing "Islamic" about the state that shamefully declares itself as such.

"It is also vital that all authorities ensure that the message, which the centre puts out is solid, persuasive and real," he said.

Najib hoped that the conference would serve as useful platform for the sharing of expertise and exprience in all aspects of security.

New York Times
F.B.I. Examining if Hackers Gained Access to Clinton Aides' Emails
Tuesday, 26 July 2016
Byline: David E. Sanger

Washington - The F.B.I. investigation into the suspected state- sponsored Russian theft of emails and documents from the Democratic National Committee's computer networks has expanded to determine if aides and organizations considered close to Hillary Clinton were also attacked, according to federal officials involved in the investigation.
But so far, a sampling of senior Clinton aides at the Democratic National Convention in Philadelphia found none who said they had been notified by the F.B.I. or private investigators that their private emails had been compromised. At this point, law enforcement officials say, there is evidence only of attempts to gain access to those associates through "spear-phishing" attacks, often crude efforts to get someone to click on an email that releases malware into the computer.

The committee has said that Russia hacked into its computers and has been supported in its assertion by several private cybersecurity firms, including Crowdstrike, the company that investigated the committee's breach.

Two years ago, several Clinton aides who had worked at the State Department were notified that their accounts there had been broken into by one of the same Russian intelligence agencies, the Federal

Security Service, or F.S.B., suspected of getting into the committee's system. That hacking, which went largely undetected while Mrs. Clinton was secretary of state in President Obama's first term, gave the Russian intelligence services what one diplomat termed a road map of Mrs. Clinton's associates and frequent email partners.

Mrs. Clinton's private server while she was secretary of state, in Chappaqua, N.Y., would have been another obvious target. But last month the F.B.I. director, James B. Comey, said there was no "direct evidence" that Russia or any other power had "successfully hacked" into Mrs. Clinton's server. Still, he said, there was evidence that intruders had tried, and when Mr. Comey said any successful intruders were probably far too skilled to leave evidence of their intrusion behind, law enforcement officials said, he had the Russians in mind.

For years American intelligence agencies and the F.B.I. have tracked the operations here of two of the most sophisticated state-run hacking groups in the world, the G.R.U., Russia's military intelligence agency, and the F.S.B., the state security service and successor, twice removed, of the K.G.B. of the Soviet era.

The activities of the two groups in the United States and around the world have been tracked for so many decades that their successes and misadventures are the subject of movies and lore in both the United States and Russia. But since they turned to hacking techniques and sometimes cyberweaponry, the Obama administration has rarely protested in public about the group's boldest information-warfare attacks, in part to avoid retaliation.

The administration decided not to publicly identify the Russians as the power behind State Department, White House and Joint Chiefs of Staff intrusions. James R. Clapper Jr., the director of national intelligence, told Congress that the United States would not name or shame any country engaged in ordinary espionage -- of the kind the United States also does -- but should focus instead on setting norms against the theft of intellectual property and destructive attacks. For that reason, Mr. Obama has focused on agreements with China to protect corporate secrets.

Now some administration officials think they may have misunderstood Russia's intentions. After the public release of the emails and documents that brought down the chairwoman of the Democratic Party, Debbie Wasserman Schultz, and the threat by WikiLeaks to release more documents from this and other hacks, administration officials say they are in a strange new world in which Russia may be using the products of espionage to influence an American election.

Some outsiders agree. "There is nothing new in one nation's intelligence services using stealthy techniques to influence an election in another," Jack Goldsmith, a professor at Harvard Law School, wrote on the Lawfare blog on Monday. He noted that the United States had engaged in covert actions to influence elections in Indonesia, Italy, Chile and Poland during the Cold War.

But he added that "doing so by hacking into a political party's computers and releasing their emails does seem somewhat new." It could foretell an era of data manipulation, in which outsiders could tinker with votes, or voter data, or "lose" electronic ballots.

Federal officials say their investigation has been underway since the spring, when the committee notified the F.B.I. of the intrusion. The committee's suspicions were triggered by what appeared to be a relatively clumsy attack by the G.R.U. In the course of investigating that attack, the F.B.I. discovered an earlier, more sophisticated attack on the committee by the F.S.B., which is often in competition with the G.R.U.

But investigators say the committee was reluctant to cooperate deeply in the federal investigation, relying instead -- as many companies do -- on private investigators that they hired. The committee brought in Crowdstrike, which reported publicly in June that it had evidence that the hack began last summer.

Julian Assange, who founded WikiLeaks, argued to Richard Engel of NBC in an interview broadcast Monday that "there is no proof of that whatsoever" that Russia was behind the original hacking. "We have not disclosed our source, and of course, this is a diversion that's being pushed by the Hillary Clinton campaign."

Mr. Assange also said another round of emails to be released would provide "enough evidence" to indict her, but her campaign manager, Robby Mook, said, "He says a lot of things, so I'm not, I'm not going to pay attention to that."

Many cybersecurity firms that have examined the evidence released by Crowdstrike say Russia appears to be the source. Thomas Rid, a cyberexpert and author of "Rise of the Machines," noted in an article published on Vice's website that the intruders made several mistakes: "One leaked document included hyperlink error messages in Cyrillic," because the documents had been edited with Russian language settings, and other "metadata" was consistent with "identical fingerprints" found in attacks on the German Parliament. The Germans named one of Russia's intelligence agencies as the attacker in that case.

NBC News
WikiLeaks' Julian Assange: 'No Proof' Hacked DNC Emails Came From Russia
Tuesday, 26 July 2016
Byline: Alex Johnson

New York - WikiLeaks founder Julian Assange told NBC News on Monday that "there is no proof whatsoever" that his organization got almost 20,000 hacked Democratic National Committee emails from Russian intelligence -- adding it's what's in the emails that's important, not who hacked them.

In a Skype interview with Richard Engel for "NBC Nightly News," Assange rejected that it hadn't even been proven that it was WikiLeaks that published some email messages that have been analyzed in outlets like The New York Times.

Information in some DNC email messages led to the ouster of DNC Chairwoman Debbie Wasserman Schultz.

Three cybersecurity experts have told NBC News that the DNC's servers were hacked by Russian intelligence. But Assange said Monday that DNC servers have been riddled with security holes for years and that many sets of documents from multiple sources are now in public hands.

"The emails that we have released are different sets of documents to the documents of those [that] people have analyzed," he said.

"I have seen Hillary Clinton apologists talk -- or some experts talk -- about other material, and not the material that we have released," Assange said.

In any event, the provenance of the documents is irrelevant, Assange contended. What commentators should be focusing on is what the documents say about Clinton, Bernie Sanders and the Democratic Party.

"The real story is what these emails contain, and they show collusion at the very top of the Democratic Party" to derail Sanders' campaign, he said.

Would Hillary Clinton have won anyway?" Assange asked. "Maybe, maybe not. I think that it's completely up in the air now, and so the result of the nomination process has no political legitimacy."

Assange remains in exile in the Ecuadorian Embassy in London to avoid prosecution on sexual assault charges in Sweden. He denies the charges.

Politico
Edward Snowden weighs in on DNC leak
Monday, 25 July 2016
Byline: Caroline Kelly

Washington - Edward Snowden knows a thing or two about leaks.
The former CIA employee and government contractor weighed in on WikiLeaks' publication of thousands of emails by Democratic National Committee staffers, calling for greater transparency of government intelligence capabilities.

"To summarize: the US Intel Community should modernize their position on disclosure. Defensive capabilities should be aggressively public," he tweeted as one of a seven-tweet series earlier Monday morning.

Snowden, who now lives in asylum in Russia -- which has been widely accused of hacking the DNC's servers -- said more disclosure could give the U.S. government a greater ability to attribute blame for the DNC hack.

"If Russia hacked the #DNC, they should be condemned for it," Snowden tweeted, citing the way the FBI presented its findings related to the Sony hack in November 2014, which the agency attributed to North Korea. "Evidence that could publicly attribute responsibility for the DNC hack certainly exists at #NSA, but DNI traditionally objects to sharing," he later added.

The widespread knowledge of the formerly secret NSA data analysis program XKeyscore, which Snowed revealed in 2013, "makes following exfiltrated data easy. I did this personally against Chinese ops," he tweeted. Snowden criticized the NSA's penchant for secrecy, adding, "The aversion to sharing #NSA evidence is fear of revealing 'sources and methods' of intel collection, but #XKEYSCORE is now publicly known."

Snowden argued that publicizing the consequences of insidious data hacking clear is the best national defense. "Without a credible threat that USG can and will use #NSA capabilities to publicly attribute responsibility, such hacks will become common," he tweeted, adding, "This is the only case in which mass surveillance has actually proven effective. Though I oppose in principle, it is a mistake to ignore."

Yahoo News
Machines v. hackers: Cybersecurity's artificial intelligence future
Monday, 25 July 2016
Byline: Paul F. Roberts

New York - It's a common refrain after any recent high-profile breach into federal computers and corporate networks: There aren't enough skilled cybersecurity professionals to outwit criminal hackers. That message from officials, executives, and industry experts isn't just grousing, either. According to industry estimates, the US needs about 200,000 more workers to fill current cybersecurity roles. Globally, the gap is five times higher - an estimated 1 million workers.

The issue has become such a priority that President Obama made increasing the number of cybersecurity workers a key component of his multibillion-dollar Cybersecurity National Action Plan, which was introduced earlier this year. The White House said earlier this month it plans on boosting the federal cybersecurity workforce by 3,500 new hires by year's end.

But as businesses compete for scarce cybersecurity talent and policymakers weigh remedies for the digital security worker shortage, the ground underneath the profession is shifting.

Now, computers equipped with sophisticated learning algorithms are performing jobs that until recently required highly trained humans. Over time, experts say, the complexity of cybersecurity jobs performed by machines will increase, further reducing the demand for workers and changing the entire nature of cybersecurity work.

"If we fast forward ... I think we will see a diminished role for humans," says Amir Husain, an authority on artificial intelligence and chief executive officer of SparkCognition, a startup focused artificial intelligence.

In fact, Mr. Husain and others note, the use of artificial intelligence to do information security work is already happening. For example, antivirus companies have long relied on algorithms - not humans - to determine whether a given file is malicious or not, based on patterns identified in previous malicious files.

"Except in very rare cases, where you have an unknown threat, humans are not doing file analysis," he says.

Much of the investment that's going into the cybersecurity space to fuel the development of automation is directed at responding to cybersecurity incidents. Currently, humans are the ones who figure out how to respond to cyberattacks on networks, working to quickly block suspicious communications and analyze malicious behavior and software. But computers could perform the same functions -- and do it much more quickly than people behind the keyboard.

But computers could perform the same functions -- and do it much more quickly than people behind the keyboard.

In fact, the allure of machines quickly fixing vulnerabilities has led the Defense Advanced Research Projects Agency (DARPA), the Defense Department's technology lab, to organize the first-ever hacking competition that pits automated supercomputers against each other at next month's Black Hat cybersecurity conference in Las Vegas.

With the contest, DARPA is aiming to find new ways to quickly identify and eliminate software flaws that can be exploited by hackers, says DARPA program manager Mike Walker.

"We want to build autonomous systems that can arrive at their own insights, do their own analysis, make their own risk equity decisions of when to patch and how to manage that process," said Walker.

Technology firms large and small are already moving toward that goal. In May, IBM announced plans to train a new, cloud-based version of its Watson cognitive technology to detect cyberattacks and

computer crimes. As part of its training, IBM fed Watson a dictionary of information security-specific terms such as "exploit" and "dropper" and programmed it how to identify and respond to cybersecurity incidents.

Of course, cybersecurity isn't the only work that will be affected by artificial intelligence and automation. A recent analysis by the consulting firm McKinsey concluded that automation will "affect portions of almost all jobs to a greater or lesser degree, depending on the type of work they entail."

That study analyzed more 2,000 work activities across 800 different occupations and concluded that automation of work is already going beyond routine manufacturing activities and has the potential to transform sectors that "involve a substantial share of knowledge work."

The Register (UK)
Alleged hacker Lauri Love will learn his fate in September, says judge
Monday, 25 July 2016
Byline: Alexandr J. Martin

London - Lauri Love will not find out whether he will be extradited to the US until September, District Judge Nina Tempia said today at Westminster Magistrates' Court.
Judge Tempia will hand down her judgment on the US authorities' attempt to have Love handed to them for trial on Friday 16 September at 2pm.

There were more than 20 extradition hearings taking place in Westminster Magistrates' Court today, including that of Love. The 31-year-old is being sought on three indictments alleging he "carried out a series of cyber attacks against the websites and computer systems" of the US government, military, and private sector.

The allegations against Love concern his alleged activities during #OpLastResort, a series of online protests which followed the suicide of Aaron Swartz. Swartz was perceived to have been persecuted by the US government after being accused of hacking into academic library JSTOR.

If extradited and found guilty in the US, Love faces a maximum of 99 years' imprisonment.

Both the defence and prosecution delivered their final arguments this morning, in Court One of Westminster Magistrates' Court.

Love's lawyer, Ben Cooper, again argued that his client's extradition should be refused under the "forum bar" of section 83A of the Extradition Act 2003. This bar was introduced following the then-Home Secretary (and now Prime Minister) Theresa May blocking the extradition of Gary McKinnon to the United States because of the increased risk of suicide this posed to him.

It is a key part of Love's defence that he would be at risk of suicide if extradited. Professor Simon Baron-Cohen, director of the University of Cambridge's Autism Research Centre, said, in his view, "there is absolutely no question that [Love] has Asperger's [Syndrome]" as well as severe depression and aggressive anxiety-related eczema, and was at a "very high" risk of committing suicide if imprisoned within the US system.

Speaking to The Register, Nicole Powers of the Courage Foundation, an international group that supports "those who risk life or liberty to make significant contributions to the historical record" stated that the case is the first major test of the forum bar: "We're seeing if this law has teeth or whether it just paid lip-service to the outcry following the McKinnon case."

Peter Caldwell was the Crown Prosecution Service's barrister - the CPS represents requesting states in all extradition cases - and he argued that Love's threat to commit suicide was an attempt to spite the court. He recommended to Judge Tempia that she separate whatever influenced the Home Secretary to refuse Gary McKinnon's extradition from Love's case.

Appearing for Love, Cooper described Caldwell's efforts to downplay Love's health issues and suicide risk as "disgusting", noting that the defence had provided much evidence, including expert witness testimony, of Love's history of mental illness. He referenced the inadequacies of not just mental healthcare but healthcare in US prisons in general.

Love had a long history of mental illness, the court was told, including losing all of his hair when he was 15. He had been prescribed antidepressants on several occasions and referred to psychiatrists several times, said Cooper, and it was "impossible to predict the severity" of his reaction to extradition. At an earlier hearing, Love's father, the Reverend Alexander Love, a prison chaplain, had testified that he feared and believed his son would commit suicide if extradited to the US.

The prosecution said that Love was the source for much of the history of his mental health problems and that little existed, including his diagnosis of Asperger's Syndrome, before the extradition case had been opened.

Three separate indictments have been filed against Love, in New Jersey (PDF), the Eastern District of Virginia (PDF), and the Southern District of New York (PDF). While in England the allegations against Love would be prosecuted before a single court on a single indictment, in the US the three indictments require three separate court hearings.

Cooper argued that single venue and single prosecution in the UK would be preferable to the three prosecutions in the United States. It would be "more efficient... speedier... and enables the mental health considerations to be given full account," argued Cooper, who stated: "There's no good reason why an English prosecution would do anything to let down the complainants in this case."

The prosecution disagreed, stating that while much of the evidence was portable, "you may well find that certain details of the case may be readily available, but not all."

One issue regarded an informant witness whom it was known was prepared to assist the US in their prosecution, but it was not known whether they would be willing to help the UK. "There is no guarantee that the witness evidence would be available in the UK for a domestic prosecution," argued Caldwell, on behalf of the US authorities.

Cooper had noted the ease of transferring both digital evidence and witness evidence in the prosecution of Mustafa Al- Bassam and Ryan Ackroyd, who were members of the Lulzsec hacking crew. In the domestic prosecution of the UK-based members of Lulzsec, an informant witness, Hector Xavier Monsegur (AKA Sabu), the de facto leader of the group, had provided evidence.

Prosecution in the UK would be in the interest of the victims, argued Cooper, as the mental health factors affecting Love may compromise the prosecutions in the US, preventing the victims from accessing justice.

In the US Love would "surely be denied bail, as anyone who is extradited doesn't meet the criteria for bail as they have no ties to the country. As a matter of course he will be placed in jail and be unable to participate in his own defence, as well as being separated from his parents and support system," the Courage Foundation's Powers told The Register.

Once Judge Tempia hands down her eventual judgment, whichever side loses is very likely to appeal, thus sending the case to the High Court.

U.S., India may sign logistics pact
Tuesday, 26 July 2016
Byline: Special Correspondent

New Delhi - Taking forward the India-U.S. defence dialogue, senior U.S. defence officials are visiting India on Tuesday during which the logistics pact, the text for which has already been finalised, is in focus in addition to high technology cooperation.
U.S. Under Secretary of Defence for Acquisition, Technology & Logistics Frank Kendall will be in India on a three-day visit beginning on Tuesday, officials told The Hindu. While the focus will be on the evolving high technology and co-development projects under the Defence Technology and Trade Initiative (DTTI), the Logistics Exchange Memorandum of Understanding (LEMOA), a logistics agreement facilitating the exchange of fuel and supplies at each other's facilities, could be signed.

"The text has already been agreed. Signing it is just a formality," a senior official observed without specifically commenting on the status.

LEMOA is one of the three foundational agreements along with the Communications Interoperability and Security Memorandum of Agreement (CISMOA) and Basic Exchange and Cooperation Agreement for Geo-spatial Cooperation (BECA) which the U.S. has been pushing India to sign to further deepen defence and strategic cooperation.

Both sides have been negotiating the LEMOA and during U.S. Defence Secretary Ashton Carter's visit to India in April both sides announced in-principle agreement to conclude the pact. During Prime Minister Narendra Modi's visit to the U.S. last month the two leaders announced that the text of the agreement has been finalised.

The two sides have informally begun talks on the other two agreements and of them India has expressed particular reservations on BECA, informed sources said.

In addition the new projects agreed under DTTI along with cooperation in jet engine and aircraft carrier would be reviewed.

Snowden Posts Document Alleging US Policy to Hack Foreign Political Parties
Monday, 25 July 2016

Washington - The US intelligence community allegedly authorized the hacking of foreign political parties, according to a 2010 national security document posted by whistleblower and former National Security Agency contractor Edward Snowden on Monday.
The document, originating from the Director of National Intelligence and dated July 16, 2010, purported to identify "foreign-based political organizations" allegedly targeted by US intelligence.

"Our government specifically authorized the hacking of political parties. Mistakes were made," Snowden said in a Twitter message.

Among them were Egypt's Muslim Brotherhood and National Salvation Front, the Pakistan Peoples Party, the Lebanese Amal group and the Indian Bharatiya Janata Party.

The document was released in the midst of a significant hack of the Democratic National Committee (DNC), in which dozens of emails were publicly released showing DNC efforts to obstruct candidate Bernie Sanders's presidential campaign to increase rival Hillary Clinton's chances to become the Democratic party's presidential candidate.

DNC and other US sources have claimed Russian responsibility for the hack.

In 2013, Snowden leaked a cache of intelligence documents revealing widespread US surveillance practices at home and abroad. Snowden is currently living in exile in Russia, and faces charges of espionage and theft of government property in the United States.

Kuwait starts applying new electronic media law
Tuesday, 26 July 2016
Byline: Staff Report

Kuwait - Kuwaiti Ministry of Information started the implementation of law No. 8/2016 to regulate electronic media, which was approved and published in the Official Gazette on Sunday. The new law is to regulate all web-based publications, including electronic news services, bulletins, websites of newspapers and televisions and the likes. Under the legislation, all these services must obtain a license from the government before they can operate.
The first article in the Electronic Media tackled the activity that includes publishing or broadcasting items and forms of a media service of electronic content that is produced, developed, upgraded, dealt with, broadcast, published or reached through the internet or any other communications network, Kuna reported on Monday.

The electronic media is considered one of the components of the information system in the country, and the freedom of its use is guaranteed for all according to the rules of this law, and there is no prior censorship on what is circulated of content via electronic sites and facilities.

The executive regulations of this law shall control polls carried out by licensed websites and electronic media facilities.

Kuwaiti Minister of Information and Minister of State for Youth Affairs Shaikh Salman Sabah Al Sabah asserted that Kuwait was among the first countries that have legislated a comprehensive electronic media law.

In a press statement during a tour to the electronic publishing department at the ministry, he said that the law will regulate electronic publishing, websites, blogs and social media in Kuwait He called on all electronic media outlets to abide by law 8/2016 as to contribute to the growth of the media sector. Moreover, the ministry called on all electronic media outlets to abide by law 8/2016, as contributors to the growth of the media sector.

The ministry also underscored how helpful these media outlets can be to staving off extremist ideologies, while espousing various virtues for the betterment of the nation. The law works to promote freedom of expression while ensuring unhindered access to information. It also aims to eliminate all impediments to the spread of information on electronic media outlets in a way that would conserve national values and interests.

Facebook and UK police fail to act on Islamophobic hate abuse online
Tuesday, 26 July 2016
Byline: Jonathan Gornall

London- Islamophobia on Facebook has been "much more prevalent than previously thought" and is "being used by groups and individuals to inflame religious and racial hate", according to research carried out by the UK's Birmingham City University.
With under-resourced police forces overwhelmed by the scale of the problem and social media companies ineffective at policing their platforms, Muslims should not ignore abuse but report it at every opportunity, says the author of a paper published on Monday in the International Journal of Cyber Criminology.

A nearly two- year study of 100 Facebook pages carried out between 2013 and 2014 revealed 494 instances of Islamophobic abuse. Many were posted under the umbrella of known far-right UK-based organisations such as the English Defence League and Britain First and clearly breached British anti-hate laws, yet escaped both censure by Facebook and prosecution by the police.

According to the paper, Islamophobia on Social Media: A Qualitative Analysis of Facebook's Walls of Hate, Muslim women in particular were targeted for abuse, singled out on 76 occasions in writing and in illustrations as a security threat because of the way they dressed.

Accusing Muslim women of being a security threat was one of five main themes of anti-Islamic abuse identified by Imran Awan, an associate professor in criminology at Birmingham. The other themes were saying that Muslims should be deported, that they were terrorists or rapists and that there was a war between "them and us".

Dr Awan accused Facebook of a "laissez-faire" attitude to anti-Islamic abuse and called on it to strengthen its community standards, which he dismissed as ineffectual and weak.

Although he recognised the police were under- resourced, he said high-profile prosecutions should be pursued and lengthy sentences imposed by the courts to "make an example" of offenders and discourage others.

It was, he told The National, also "a real worry and a shame that the number of people reporting these offences is really low ... people need to bombard Facebook with complaints when this sort of thing happens, so the company will be much more in tune with what's happening on its platform".

Many of the examples of abuse quoted in the paper are too offensive to repeat in print. One typical highly abusive post, published by the so-called "English Defence League Sikh Division", was entitled

"How Muslim scum celebrate Eid" and reported a supposedly true story about drink- driving involving Muslim youths from Pakistan.

With 93 "likes", the post attracted many hateful comments, including calls for the alleged culprits to be given lethal injections and the branding of all Muslims as "scum".

Dr Awan, who in 2014 addressed a conference in Abu Dhabi designed to promote peaceful coexistence in Muslim societies, is highly critical of Facebook's community standards, which he says leave plenty of scope for hate masquerading as humour.

According to the standards, "content that attacks people based on their actual or perceived race, ethnicity, national origin, religion, sex, gender, sexual orientation, disability or disease is not allowed". However, Facebook does allow "clear attempts at humour or satire that might otherwise be considered a possible threat or attack. This includes content that many people may find to be in bad taste".

Images purporting to use humour are frequently used to spread anti-Islamic messages on Facebook. One example highlighted by the report shows two identical Qurans pictured side-by-side and captioned "Islams [sic] Quran" and "ISIS Quran", with the heading "Spot the difference?".

Another post, on the Facebook page of the group Britain First, which describes itself as "a patriotic political party", posed the seemingly innocuous question "What's a typical British breakfast?" but was clearly intended "to stoke up animosity without being so explicit that it would be obviously illegal", said Dr Awan. The quotes underneath the post - including "For breakfast it would be good to chop a Muslim's head off" - made clear its intent.

The study was carried out between January 2013 and November 2014 and Dr Awan fears that subsequent global events, including the migrant crisis and various terrorist attacks in European countries, will have provoked only more prejudice against Muslims on Facebook, which in turn will generate more hostility in the offline world. This, he says, makes it "all the more important that Facebook and the authorities respond robustly to the problem".

His fears appeared to be confirmed last month by the UK organisation Measuring Anti- Muslim Attacks which reported that incidents of anti-Islamic hate in the UK had increased by more than 300 per cent in 2015.

Last month Britain's National Police Chiefs' Council also reported that there had been a 57 per cent increase in reported hate crimes in the four days following the UK's referendum vote to leave the European Union. This followed a Brexit campaign centred on the issue of immigration.

Dr Awan said Brexit had without doubt "emboldened" those who held extreme racist and anti-Muslim views to express them on Facebook and elsewhere.

In May Facebook and other social media companies signed up to a new online code of conduct launched by the European Union, banning "all conduct publicly inciting to violence or hatred directed against a group of persons or a member of such a group defined by reference to race, colour, religion, descent or national or ethnic origin".

That voluntary commitment remains at odds with Facebook's ongoing struggle "to balance giving people the power to express themselves whilst ensuring we provide a respectful environment", as Monika Bickert, the company's head of global policy management, put it at the launch of the code.

"I hope the code has an impact, but it is only voluntary and Facebook has to be prepared to take down posts," said Dr Awan. "Its community guidelines must be revisited and they need to be much more proactive."

It is, he acknowledged, a big task - Facebook has 1.6 billion users worldwide - "but on the other hand they make a lot of money, and they have a responsibility", he said.

"Yes, freedom of expression is paramount. But it must come with limits and responsibilities." By the time of publication Facebook had not responded to a request for comment.

Times of Israel
Biometric startup sees surge in demand as security woes weigh
Tuesday, 26 July 2016
Byline: Shoshanna Solomon

Jerusalem - The rise in terror attacks in Europe and elsewhere has generated a surge in interest in products that can keep areas safe from intruders.
"There is a rise in the need for security products because people realize they have to protect themselves in these kinds of situations," said Arie Melamed, chief marketing officer of the Israeli startup FST Biometrics, which has also witnessed a rise in demand for its identification technology.

The biometric identification technology uses a combination of facial recognition and behavioral and voice analytics to identify personnel of enterprises or government buildings from a distance and in motion, doing away with keys, codes or ID cards.

FST's system is based on prevention: it enables access only to those who are authorized to enter certain areas, freeing up security guards to focus their attention on the remaining people in the building who have to be checked.

"Why should you punish everyone with the checks?" Melamed said. "Why ask everyone at airports to come three hours earlier, for example, when you could be asking that only of people who are not

frequent fliers, for example. We don't have a magic wand for everything, but we can reduce the load on security people."

Government institutions and enterprises globally in the financial, corporate, health and real estate sectors are already using the technology to secure access for their employees in a nonintrusive manner, Melamed said, and protecting security sensitive areas from intruders.

FST, whose founder and CEO is a former head of Israeli intelligence Aharon Farkash and which has former Israeli prime minister Ehud Barak on its board, said earlier this month that its In Motion Identification (IMID) access system product makes more than 1.5 million identifications a month and has increased its customer base by 30 percent in the past year.

The company is also developing a mobile solution, Melamed said, and also one for situations in which there is no user cooperation -- for example in airports, stadiums or malls, where, unlike in an office building, creating a database of all regular users is more complicated. "We have the technology; we are still deciding if that is the direction we want to company to go," he said.

The applications of the technology don't all have to be grim, however. In Holland, the ICER Innovation Center uses FST's IMID technology to allow visitors, including King Willem-Alexander and Queen Maxima of the Netherlands, to gain personalized information about exhibits as they pass through interactive checkpoints.

New York Times
China Clamps Down on Online News Reporting
Monday, 25 July 2016
Byline: Michael Forsythe

Hong Kong - China has ordered several of the country's most popular internet portals to halt much of their original news reporting, in a move that could confine an even larger share of the journalism in the country to Communist-controlled mouthpieces ahead of an important party meeting next year.
The profit-driven portals, several of which are listed on United States stock exchanges, have in recent years expanded their investigative teams to increase readership among China's more than 600 million internet users by scooping the staid state-owned news media on stories about subjects including industrial pollution, tainted milk powder and even police brutality.

But on Monday, several news organizations reported that the Beijing office of China's internet regulator, the Cyberspace Administration of China, ordered the websites of a number of the companies, including Sina, Sohu, NetEase and Phoenix, to shut down or "clean up" several of their most popular online news features.

The announcement came within weeks of the surprise departure of the Cyberspace Administration's director, Lu Wei, and his replacement by an official who had served under President Xi Jinping in a previous position. Under Mr. Xi, media controls have tightened as the Communist Party has tried to squelch news that might put its governance in an unfavorable light.

In February, Mr. Xi visited three of the top state- run news organizations, telling their staffs in a highly choreographed tour that they existed to serve as propaganda messengers for the party. This month, a respected scholarly journal run by retired Communist Party cadres shut down after a quarter-century following the dismissal of its founding publisher.

The edict made public on Monday, which said the web portals were in "serious violation" of a 2005 internet regulation, came before a meeting next year of the Communist Party Congress. The party often puts in place controls on news before important events, such as the party conclave, held once every five years, which will pick a new group of senior leaders.

The news sites are run by China's biggest internet companies, which also operate social media platforms and produce some of the country's most popular online games. Sina, which runs a news aggregation service and publishes original reporting, also created Weibo, China's popular Twitter-like social media site. The companies are roughly the equivalent of the United States' largest internet companies, like Facebook, Twitter and Google, and their news sites combine articles from other outlets with original reporting and investigative journalism.

It is unclear whether the regulation will end all original reporting at the websites, where hundreds of millions of Chinese turn for their news. Monday's announcement mentioned specific features at four internet sites, which in recent years have attracted investigative reporters from newspapers such as Southern Weekend. It was among the first news organizations to face restrictions after Mr. Xi became head of the Communist Party in November 2012.

Wen Tao, who until last year was a reporter for "Serious Reporting" at Phoenix, one of the news features shut down by the new edict, said by telephone that in recent years the news portals had played a cat-and-mouse game with government internet censors, pushing the boundaries of censorship by publishing material without submitting it for approval and waiting to see if it was taken down by the authorities.

But Mr. Wen said that even in China, with its notorious army of censors, it was difficult for the government to control news in a market powered by hundreds of millions of readers hungry for news that goes beyond Communist propaganda.

"The flow of information cannot be stopped -- it's like a flood," Mr. Wen said. "You either need to discharge it or it will run rampant. The regulators are trying to use policies to block the holes."

Sun Xuyang, a former investigative reporter for Beijing News and Southern Metropolis Daily, was more pessimistic, saying by telephone that Monday's announcement was a signal that the space for original reporting was being eroded.

"There are no more illusions," Mr. Sun said.

The news sites targeted by the Cyberspace Administration include Sina's "News Geek," which this month published an article, later deleted, about a chemical contamination at a Beijing school, and "Landmark," run by NetEase, that last year scooped the official news media in reporting the arrest of the brother- in-law of a jailed former top official.

On Monday, the media or investor relations departments at Sina, Phoenix and NetEase did not respond to emails asking how the announcement would affect news operations. A spokeswoman for Sohu declined to comment, and the Cyberspace Administration of China did not immediately reply to questions faxed to its news office.

Globe and Mail
Why Russian hackers would meddle in U.S. politics
Thursday, 28 July 2016
Byline: Derek Burney and Fen Osler Hampson
Section: oped

That Russia is strongly believed to be behind the breach and leak of e-mails from the Democratic National Committee should not be a great surprise.
U.S. federal investigators had warned DNC officials earlier about the threat of such breaches. There have been similar kinds of attacks in the past. China, for example, was allegedly behind the cyberattack of the presidential campaigns of Barack Obama and John McCain in 2008.

What is new is that the stolen files were put into the public domain with the apparent intention of embarrassing Hillary Clinton and further dividing the Democratic Party between her supporters and those of her rival, Bernie Sanders.

The motive was likely directed more against Ms. Clinton than in support of any budding love affair between Russian President Vladimir Putin and Republican presidential nominee Donald Trump (who on Wednesday called on Russia to find Ms. Clinton's "missing" e-mails, essentially encouraging cyberspying by a foreign power).

As former U.S. ambassador to Russia Michael McFaul recently noted, Mr. Putin's dislike of Ms. Clinton is palpable. Her support for Ukraine and criticisms of Russia's parliamentary elections in 2011 was seen as unwelcome meddling in Russia's internal affairs. Mr. Putin's "a guy that remembers these things," Mr. McFaul said, "maybe that's another explanation for why they're seeking this tit for tat now."

We should expect more embarrassing revelations, especially if Russia, as some allege, was able to hack into Ms. Clinton's private e-mail servers, which she used when she was secretary of state.

Julian Assange, the founder of WikiLeaks, is also an all-too willing accomplice of Mr. Putin, such is his own personal dislike of Clinton.

But this is not just simply a titillating scandal in America's electoral silly season. It sadly points to a fundamental weakness in the United States' own cyberstrategy and its inability to deal effectively with autocrats who have outsized, imperial ambitions and terrorists who want to wreak havoc.

Cyberattacks are increasingly the cornerstone of Russia's regional and global military and political security strategy. They offset Moscow's economic weakness.

Russian pro-Kremlin groups initiated DDoS (distributed denial of service) attacks against Estonia, targeting its parliament, banks, government ministries and the media, after Estonia's spat with Russia

about the removal of a war memorial. Russian-sponsored DDoS attacks targeted Georgian websites, foreign ministry and media and even a pipeline concurrent with Russia's attack on Georgia in 2008.

Russia was also responsible for a major cyberintrusion against the power grid of the Ivano-Frankivsk region in Ukraine in 2015.

The attack, according to an online report by the SANS Institute, was highly co-ordinated and effective, leading to power outages for more than 80,000 customers.

Russia is not alone in playing this game. So do China and countries such as North Korea and Iran. The challenge is only going to get bigger. With the changing of guard in the United States, the whole world has one foot in the air. Mr. Putin and others are going to exploit the political vacuum.

And Mr. Trump is no better than Ms. Clinton on national security. His comments about NATO and the defence of frontline states such as Estonia, Lithuania or Latvia show both the limitations of his understanding of America's vital national security interests and his intellect.

Nor should Canadians, who are generally complacent about global pressures, think they are immune. Cyberattacks can and do happen here. A 2011 major attack against the Canadian government appears to have originated in China; it infiltrated three Canadian government departments and obtained classified information.

Cyberhackers have a distinct advantage because of the Internet's anonymity, the speed of attacks, and the strong incentives for states and other non-state actors to try to game the system.

The breach of DNC records is a wake-up call to us all, one that undermines trust in the Internet.

Russia, or China for that matter, cannot be given a free hand to disrupt at their discretion. There need to be reprisals, countermeasures and heightened vigilance to ensure that the openness of Western societies does not become a source of weakness or vulnerability against those who oppose our most basic values.

Derek Burney was Canada's ambassador to the U.S. from 1989-1993.

Fen Osler Hampson is a distinguished fellow and director of global security at the Centre for International Governance Innovation and Chancellor's Professor at Carleton University.

Politico
NSA could hold 'smoking gun' in DNC leak
Thursday, 28 July 2016
Byline: Josh Gerstein

Washington - The political world is intensely focused on the FBI investigation into the suspected Russian hacking of Democratic National Committee emails, but the real smoking gun that could link the hack to Moscow is more likely found in the vast data troves of the National Security Agency.
While private sector cybersecurity specialists have gathered evidence pointing to Russia as the source of the hack, the U.S. Government has unique abilities to confirm such a finding, including sometimes being able to identify specific foreign government agencies or even individuals as responsible for the hacking, experts said.

"Private firms are really good at forensics, but the federal government has other tools," former NSA Director Michael Hayden said in an interview Wednesday. "It's not just following the breadcrumbs to the actual crime. It's broader intelligence collection: what someone may have been planning, what they were planning to do with it after, fingerprints on how the information was forwarded ... It's not just forensics."

"It's the difference between being able to examine the crime scene and being able to conduct a wiretap," said former National Security Agency lawyer Susan Hennessey, now with the Brookings Institution. "You can learn a lot at the crime scene and maybe even solve the crime [but] intelligence authorities allow you to listen to people ... potentially gathering the kind of smoking gun evidence you need for this kind of attribution."

Whatever information the NSA has on the DNC hack is not likely to emerge from the spy agency directly but to be compiled by the FBI. Whether to call out the Russians directly will be up to the White House. Criminal charges are always a possibility, as well, although the chances of actually putting suspects on trial is remote.

At a cybersecurity conference in New York City Wednesday, FBI Director James Comey was mum about the DNC hack, but defended the value of the so-called name-and-shame appraoch.

"If we can't lock them up, we have to call them out," Comey said.

One very prominent former NSA contractor, Edward Snowden, has already said he believes that spy agency's snooping programs would "certainly" have spotted the DNC data as it made its way to Russia, if that's what happened. It's even possible the U.S. Government has some knowledge of internal Kremlin discussions about the hack, through surveillance or human sources, former intelligence officials say.

"Even if the attackers try to obfuscate origin, #XKEYSCORE makes following exfiltrated data easy. I did this personally against Chinese ops," Snowden tweeted Monday.

Records Snowden took from the NSA that have not yet been published show the spy agency hard at work trying to trace cyber intrusions and thefts, according to an author and journalist who had access to the archive of data Snowden copied while working for an NSA contractor in Hawaii.

"A lot of the stuff shows the NSA looking into the origins of some these attacks," said Jim Bamford, whose 1982 book "The Puzzle Palace" was the first widely read history of the agency. "One slide [in the Snowden collection] shows NSA ramping it up to plant up to a million or more implants in computers around the world. When you put an implant someplace it captures where something is coming from ... If you have a million of pieces of malware all around the world in key locations, it could trace back where an email came from."

The NSA will be able to compare signatures of the DNC hacks against a broader set of existing data than private security firms have access to, experts said.

In addition, the NSA may have intercepted and stored evidence of foreigners trying to get into the DNC systems, data being pulled out of those systems, or someone forwarding the data on to WikiLeaks, which released the emails and other records on the weekend before this week's Democratic National Convention.

Hayden declined to discuss the NSA's specific capabilities in this area, but said that sifting back through the recorded data is a frequent part of this kind of sleuthing. "It is routine for something that happens to then illuminate the data you already possessed in the past, whose meaning was not obvious," he said.

The NSA's ability to trace or, in government-speak, "attribute" cyberattacks has become pretty sophisticated, although it's far from perfect, experts said.

"They've been doing this ever since the beginning of the Internet," Bamford said. "That doesn't mean they can't be fooled, but NSA does a pretty good job of locating the origin or attribution of a lot of these attacks."

So far, President Barack Obama has been cautious about apportioning blame for the hack.

"I think the FBI's still investigating. I know the experts have attributed this to the Russians," Obama told NBC's "Today." "What we do know is the Russians hack our systems, not just government systems, but private systems, but what the motives were in terms of the leaks and all that, I can't say directly. What I do know is that Donald Trump has repeatedly expressed administration for Vladimir Putin."

One former U.S.national security official said he doubted Obama would have mentioned the Russians at all unless he had some official indication they were involved. "He wouldn't make a statement like that, even attributing to experts, without him having some reason to think it's true," said the ex-official, who spoke on condition he not be named.

A policy directive Obama issued Tuesday further clarifies how the U.S. Government responds to cyber incidents. The FBI is the key agency for on-the-ground "threat response," with the intelligence

community in a supporting role. Officially, the task of "providing attribution" appears to be assigned to the FBI.

An NSA spokesperson did not respond to a request for comment on the agency's role in the DNC investigation. A Director of National Intelligence official referred requests for comment to the FBI, which offered a statement confirming its ongoing probe.

"The FBI is investigating a cyber intrusion involving the DNC and are working to determine the nature and scope of the matter. A compromise of this nature is something we take very seriously, and the FBI will continue to investigate and hold accountable those who pose a threat in cyberspace," an FBI spokesperson said.

Pointing the finger at Russia publicly will be the easy part, though, compared to the question U.S. officials are certain will come next: How do you know that?

That's where things really get messy, because explaining how the U.S. Government zeroed in on suspects can expose sources and methods and compromise ability to do the same thing again in the future. Even publicly making the claim that a specific country did it can set in motion a series of events where revealing some sophisticated or sensitive U.S. capabilities get made public, experts say.

Intelligence officials got a vivid lesson to that effect when they publicly blamed North Korea for the 2014 hack into confidential files at Sony Pictures. Many in the private cybersecurity realm were skeptical and publicly challenged the U.S. attribution. The FBI eventually released more details information about the reasons for the attribution.

"Their credibility depended on it and essentially their hand got forced," Hennessey said.

If the Russians are culpable for the DNC hack (or hacks), detailing why the U.S. thinks that could limit our insight the next time Russia tries something similar.

"In a case where information was exchanged through a single channel, people who are sophisticated can determine that's how it was made public," Hennessey observed.

While many in the political world are breathless about the DNC hack and the possibilty of Russian involvement, those immersed in the world of intelligence don't find the act shocking or much different than things the U.S. has done over the years, vacuuming up information and using it for political advantage.

"We don't come in here with clean hands," Bamford said. "A lot of stuff is being intercepted all the time everywhere ...This goes on all the time. The only difference here is there was a publicized leak."

Washington Free Beacon
Experts: DNC Hack Shows Inadequate U.S. Security Against Russian Cyber Attacks
Wednesday, 27 July 2016
Byline: Reuben F. Johnson

Fort Lauderdale - Specialists who have studied Russia's cyber warfare capabilities said the Kremlin is responsible for the hacking and eventual release of 20,000 emails from the Democratic National Committee, adding that there is no sure way to stop these kinds of attacks from recurring.
Experts who spoke to the Washington Free Beacon cautioned that it is difficult to prove the connection between the hackers and the Russian government with a legal degree of certainty, but they said the evidence indicated Russian involvement.

Russia's intelligence services decided years ago to make cyber warfare a national defense priority, said Dr. David Stupples, director of the Centre for Cyber Security Sciences at City University London. They have become increasingly proficient in cyber operations as a result.

"From around 2007, Russia decided that information warfare was key to winning any world conflict, and that it was this area of capability and technology they decided would benefit from vastly increased military investment," Stupples said. "What made this decision easier was that Russia was also home to the largest numbers of some of the world's best hackers."

While the DNC is not a high-value military target, "there was still a threefold motivation to hack its system," Stupples said. "One was to demonstrate that Russia is on top of its game in this kind of shadowy warfare. Another was to embarrass the Democrats and undermine the presidential election process at a critical time. A third was to test U.S. security measures."

Testing U.S. defenses would reveal to Moscow how Washington might react in response to further provocations.

"The goal of testing U.S. security measures is not now, nor has it in the past--proved to be a difficult objective for Moscow," Stupples said. "The National Security Agency and FBI have long suspected that Russia had penetrated a significant number of sensitive U.S. infrastructure systems in order to test efficacy and document structure--not to mention steal military secrets."

The goal of Russia's cyber warfare activities is not just random disruption or embarrassing revelations, Stupples said in May at the European Electronic Warfare Symposium in Rotterdam.

"What Russia is doing is linking cyber attacking and hacking with its open information warfare methods--propaganda disguised as news programming, funding of NGOs, etc.--and in coordination with its military establishment's use of electronic warfare," Stupples said. "By employing all three methods together in an integrated pattern of activity Moscow can achieve what its military theorists call 'reflexive control'--in

other words warping your adversary's perceptions to the point where that adversary begins to unknowingly take wrong or damaging actions."

Russia has a distinct advantage in the cyber realm because it engages the services of non-governmental cyber crime entities, which masks its role in cyber attacks.

"This is what the U.S. and others of us do not have--proxy cyber warriors," said Stupples. "What the Russians are saying is that 'we will make these criminal organizations our partners--recruiting them to do cyber work for the Russian state.'"

The Kremlin promises its criminal partners it will "turn a blind eye to their attacking banks, disrupting commerce in the west, etc." as long as they make themselves available to do the odd job for Russia's intelligence services and military.

There are currently more than one million Russian programmers engaged in cyber crime, according to the United Kingdom and other NATO intelligence services. These programmers are affiliated with 40 Russian- based cyber crime rings. The United States and its partners could not feasibly match this level of manpower using only government agencies and employees.

The United States has maintained misplaced faith in international agreements or treaties as other state actors have raced ahead in developing cyber warfare capabilities, according to several experts. While Russia, China, North Korea, and other nations sign accords about cyber warfare, they use proxies to carry out prohibited operations and then blame them on criminal enterprises. "How do you prove which cyber attacks by a criminal gang were ordered by Moscow or Beijing and which were not?" asked one European expert.

The experts said no firewall or security scheme was ever going to be effective to acceptable levels against these kinds of attacks. The most effective deterrent, they said, was an offensive response more severe than the attack suffered.

"The U.S. administration not only continues to 'fight the last war' with ineffective measures, but it refuses to engage in reprisals against Moscow," said a cyber security specialist in Poland.

In 2008, a malware program named Agent.btz compromised some of the most sensitive U.S. military computer networks, including those of the NSA. The U.S. military's offensive cyber unit proposed counter measures that could be taken against the Russian government, which was thought to be responsible for the attack.

Senior administration officials turned down these suggestions, reasoning that the Russian operation was "an act of espionage and not an outright attack," according to the Washington Post. NATO specialists on electronic warfare said Russia exploits these ambiguities in U.S. policy.

According to Stupples, "Washington is now playing catch up" in a field where its adversaries have invested considerable resources.

The problem will only worsen with time, said another European expert, who said the current administration's refusal to confront Russia directly had only made the situation worse.

"Regardless of who wins this U.S. election, this issue needs to be addressed at the highest levels as soon as a new president takes office in January 2017."

Washington Post
Is there a Russian master plan to install Trump in the White House? Some intelligence officials are skeptical.
Thursday, 28 July 2016
Byline: Ellen Nakashima

Washington - The possibility that Russia is behind an information warfare operation to interfere in the U.S. election has sparked concern among administration officials, but it also generated skepticism that there is a Kremlin master plan to install Donald Trump in the White House, as some political operatives are now alleging.
Intelligence officials, who spoke on the condition of anonymity to discuss an issue under investigation, said there is little doubt that agents of the Russian government hacked the Democratic National Committee, and the White House was informed months ago of Moscow's culpability.

What is at issue now is whether Russian officials directed the leak of DNC material to the anti-secrecy group WikiLeaks -- a possibility that burst to the fore on the eve of the Democratic National Convention with the release of 20,000 DNC emails, many of them deeply embarrassing for party leaders.

The intelligence community, the officials said, has not reached a conclusion about who passed the emails to WikiLeaks.

"We have not drawn any evidentiary connection to any Russian intelligence service and WikiLeaks -- none," said one U.S. official. Doing so will be a challenge, in part because the material may not have been passed electronically.

Also unclear, the officials said, is the motivation, even if Russia is behind the leak. It may be that the Kremlin wishes to disrupt and discredit the U.S. political process without seeking any particular result.

Michael V. Hayden, former CIA director, said, "Frankly, I don't think they're motivated by thinking they can affect the election itself." He said the Russians, already masters at "information dominance" or using information as a political and military weapon, may be flexing their muscles "to demonstrate that they can -- not necessarily to make Trump win or Hillary lose."

If they are truly behind the email dump, he said, "they're taking their game to another level."

The email dump, current and former national security officials said, is highly troubling, regardless of its provenance. And it could warrant considering whether the elements of the electoral process should be raised to the level of "critical infrastructure," such as power grids and key financial systems, which merit special protection from cyberattacks, some officials said.

"We're not used to thinking of the election system as a critical infrastructure," said one senior administration official. "But I could make the case that it ought to be considered that. We ought to start talking about that."

Whoever shared the emails with WikiLeaks, the senior administration official said, "sure as hell didn't do that for our benefit."

And WikiLeaks co-founder Julian Assange promised Wednesday another significant release, but he did not specify when.

"There are more DNC emails and we will be publishing more related to Hillary Clinton's campaign," he told The Washington Post.

The WikiLeaks release -- and the prospect of more to come -- has presented the Obama administration with a fresh set of challenges that affect both national security and cybersecurity on top of a host of other damaging cyber-events. The North Korean hack of Sony Pictures Entertainment in 2014 represented the first time a foreign government hacker targeted an American company. It not only damaged computer systems, but attacked free speech by seeking to coerce the film studio into pulling a movie that poked fun at the North Korean supreme leader, Kim Jong Un.

And the Chinese hack of the Office of Personnel Management discovered in 2015 was so vast and disruptive, slowing down the security clearance process and raising significant counterintelligence issues, that U.S. officials considered it precedent-setting.

But an influence operation by Russia to interfere in a presidential election -- if that is what happened -- would be a bold move, even for President Vladimir Putin, analysts say. It would take what began ostensibly as traditional political espionage into a new category of information warfare.

"I'm deeply concerned because, if Russia is behind this, it would represent an unprecedented and alarming escalation of Russian willingness to interfere in our political process," said Rep. Adam B. Schiff, (Calif.), the ranking Democrat on the House Intelligence Committee. It would be an effort "to help pick a candidate who is favorable to an adversary."

Some of Trump's positions -- including raising questions about mutual defense among NATO members and potentially recognizing the Russian annexation of Crimea, a part of Ukraine -- would be applauded in Moscow, but the GOP candidate has said he has no connection to the Russian president.

Republican and Democratic lawmakers alike are calling on the administration to quickly figure out who is behind the leak -- and if it is the Russians, to call them out.

"Mr. Putin's Soviet-style aggression has escalated to levels that were unimaginable just a week ago," Sen. Ben Sasse (R-Neb.) said in a statement. "America is digitally exposed. The United States must take serious offensive and defensive actions now. Russia must face real consequences."

If it is Russia, Schiff said, the administration should absolutely say so. "They should make it known publicly and forcefully," he said. "Even if they're not able to lay out the evidence because it would disclose sources and methods, they should make the attribution."

The FBI, which has been investigating the hack for months, announced its involvement this week.

Forensic evidence linking the email dump by WikiLeaks to Russia came from a cyber-researcher and former Army intelligence analyst who on Tuesday concluded that the party that passed the material to WikiLeaks was part of a Russian information operation.

The party, who calls himself Guccifer 2.0 and who claimed to be Romanian, used a Russian company that provides a special type of service that helps mask the user's true location, said Rich Barger, chief information officer at the Arlington, Va.-based ThreatConnect. Barger analyzed communications between Guccifer 2.0 and journalists that were shared with him by the reporters. He traced information in the emails to the Russian service, called a virtual private network. Guccifer also used an Internet address associated with a number of Russian online scams, he said.

"Determining with confidence who was behind it -- if the Russians were the hackers, seeing them pass that data to WikiLeaks -- is probably much more difficult than attributing it to the initial hacker," said former National Security Agency Director Keith B. Alexander at an FBI cyber-conference at Fordham University this week. "That's a tough one -- especially because there are different ways of passing that information, not all electronic."

The larger question, Alexander said, is " 'Why did they do this? And what were they trying to influence?' That's the real issue."

Not everyone is convinced that the Russians, if they did it, meant to influence the election. "This is not Putin trying to help Trump," said Leo Taddeo, a former FBI special agent in charge of cyber and special operations in New York. "I think they were messaging Hillary Clinton, telling her that they can get in the way of her election if she doesn't show some flexibility in her position toward them."

Some analysts actually think Putin would see his interests better served by a President Clinton, who is well known in Moscow. "If I'm in the Kremlin, I'd love to see Hillary in office," said one former intelligence official. "She's incredibly predictable and not willing to do confrontation. Trump is both unpredictable and confrontational. As a game theory person, I'd much rather play poker against Hillary. I'd win every hand."

The Daily Dot
Russia begins collecting encryption keys while internet companies, like Facebook, stay silent
Thursday, 28 July 2016
Byline: Patrick Howell O'Neill

New York - Russia's Federal Security Service now has a means to collect encryption keys from internet companies that will decode otherwise unreadable data on the internet, it announced on Tuesday. The FSB announced the capability on its website but the actual order, which would detail the process, was not made public.

One month ago, Russia passed a sweeping surveillance bill requiring encryption backdoor access for the state, among other expansive new spying rules. The legislation specifically pointed out apps like WhatsApp (which is owned by Facebook), Viber, and Telegram. Noncompliance can result in a fine of 1 million rubles--or $15,000--but it's not clear how frequently that punishment can be levied.

WhatsApp, Viber, and Telegram representatives have repeatedly declined to comment on the new backdoor law in Russia.

Two weeks ago, Russian President Vladimir Putin ordered the FSB to produce the "encryption keys."

Russia's new surveillance reality is one of the most extreme moves in a global debate over encryption, privacy, and surveillance. What makes it even more incredible is the utter lack of transparency from the Russian government and businesses in the country.

"It's important, but we don't know what FSB actually suggested yet," Anton Nesterov, a Russian technologist, explained to the Daily Dot in an email.

Actually, no one seems to know what this new law means in the slightest. Or, more accurately, the people who do know are keeping mum.

To illustrate just how much we don't know, Nesterov has a long list of technical and legal questions he wants answered on the law:

In a way that it's written in the law, it's a disaster, and brings a lot of questions. Should SSL keys be shared? Ok, we can share SSL keys, but what about PFS?

Should it never be enabled, or we should patch openssl to keep track on session keys and then send billions of them to FSB? What about payment systems? I'm not sure if it's allowed by Visa/MasterCard rules to share encryption keys with a third party.

How can leaks be prevented? Passing keys allows authorities not only to decode transmitted everyone's information, including people who wasn't original target [sic], but also to perform active attacks, which can be a major problem.

Should we share keys at request or at the time we started using it? What's kind of transmitted data covered by this law? All kinds of data? Should we also share SSH keys, giving direct access to servers? Should we share VPN keys used by companies to connect to their internal networks?

These are the questions which should be answered by FSB decree, it's internal documents and practice.

The one organization that did provide comment on this situation struck a defiant tone. Tor, the American-based and funded anonymity network, is decentralized around the globe.

"We encourage people to try anonymous, decentralized services based on

Tor, like OnionShare to share files, or Ricochet for instant messaging," Tor representative Kate Krauss told the Daily Dot after the law was passed. "There is no data to retain and no central server to hack. Both are super easy to use and have a lot of fans."

The new "anti-terrorism" legislation was signed into law earlier this month by Putin.

The Daily Dot
Russia's rise to cyberwar superpower
Thursday, 28 July 2016
Byline: Patrick Howell O'Neill

New York - "The Russians are top notch."
Chris Finan is a former director of cybersecurity legislation in the Obama administration, an ex- director at DARPA for cyberwar research, and a former U.S. Air Force pilot and intelligence officer. When it comes to explaining Russia's place in the evolving world of cyberwar, he ranks the world's nations and firmly declares Russia's place in the top tier.

"They are some of the best in the world," Finan, now the CEO of the security firm Manifold Technology, says. "We're not talking North Korea or even China, who are really sloppy. The Russians are really good at covering their tracks."

Sometimes the best way to explain war is the language of sport. Cyberwar is no different. So we talk about who is best, worst, and most improved--everything short of handing out a trophy. We try to predict the future geopolitical games that seemed impossible yesterday and inevitable today.

In a flurry of action over the last decade, Russia has established itself as one of the world's great and most active cyber powers.

The focus this week is on the leak of nearly 20,000 emails from the Democratic National Committee. The culprit is alleged by many, including Democratic Party officials, to be Russia. The evidence-- plainly not definitive but clearly substantial--has found support among a wide range of security professionals. The Russian link is further supported by U.S. intelligence officials, who reportedly have "high confidence" that Russia is behind the attack.

The blame and the proof for the DNC hack will be debated for weeks and months beyond. Attributing cyberattacks is notoriously difficult, doubly so when the adversary is among the best in the world.

"To definitively attribute the breach at the DNC to a Russian actor is next to impossible," Leo Taddeo, former special agent in charge of the FBI's NY cybercrime division and now the chief security officer of Cryptzone, explains. "Unless we have a window into their side, we'll probably never definitively attribute this to Russia."

Beyond the forensic evidence that points to Russia, however, is the specter of President Vladimir Putin. Feeling encircled by the West and its expanding NATO alliance, the Kremlin's expected modus operandi is to strike across borders with cyberwar and other means to send strong messages to other nations that are a real or perceived threat.

This is not unique to Russia. The United States is extremely active and effective in the cyberdomain. The Americans spend billions of dollars annually to launch hundreds of cyberattacks every year. Furthermore, Washington has a long history of interfering in foreign elections and politics. And U.S. actors are often the chief suspects in unrest when the evidence is less than clear.

The most poignant such episode began in 2011, when protesters took to the Moscow streets to speak against Russian elections they deemed flawed or fixed--elections that put Putin into his third term as Russian president. You didn't hear much about it in the American press, but Putin accused then-Secretary of State Hillary Clinton of giving "the signal" and trying to "set the tone" that led to the demonstrations--an open charge of American politicians interfering in Russian elections.

To understand Russia's decade-long rapid rise in cyberwar, you have to look at Russia's number one perceived enemy: The West's North Atlantic Treaty Organization alliance and its slow but steady creep eastward toward Moscow, the capital city that the NATO alliance was originally built to defeat.

Sixteen years can seem like an eternity when it comes to the international sport of war.

"Russia is part of the European culture," Putin said 2000, the year he rose to the presidency. "And I cannot imagine my own country in isolation from Europe and what we often call the civilized world. So it is hard to visualize NATO as an enemy."

The newly minted head of state sought "more profound integration" with NATO, he said, including the possibility of joining the alliance if Russia "is regarded as an equal partner."

Whatever warmth existed between Russia and NATO disintegrated over the next few years. The Western alliance took in a dozen new member states since the end of the Cold War, a move seen by Russian leadership as an openly broken promise meant to take advantage of Moscow's post-Soviet weakness.

Russia's western-facing cyberwar exploded onto the world stage a decade ago when, in 2007, it smashed neighboring Estonia's national internet during nights of deadly riots sparked by disputes over the country's Soviet-occupied history and a bronze statue in Tallinn, Estonia's capital, that embodied it.

This Russian cyberattack opened a new era in war. Estonia, one of the world's most connected countries, was hit with a hammer that cut down the websites and servers of the country's leading newspaper, banks, police, parliament, national ministries, and the national emergency number.

"Attacking us is one way of checking NATO's defenses," Ene Ergma, speaker of the Estonian parliament in 2007, said. "They could examine the alliance's readiness under the cover of the statue protest."

The answer to that check: The alliance was not ready.

In an attempt to fix that failure, Estonia is now home to the cyber defense headquarters of NATO.

Despite the cyber defense center's existence, however, there's little feeling or evidence the Western alliance has a coherent and effective strategy against aggressive action from their Russian rivals.

After a massive amount of behind-the-scenes work and very public diplomatic efforts, China and the U.S. seemed to reach a detente that cooled an ongoing cyberwar between the two great powers. No such success has visited American-Russian relations.

"What the president has been able to do to restrain Chinese behavior has been effective," Finan, who worked on cybersecurity in the Obama White House, says. "Hacking private companies has really dropped off. We haven't had that kind of progress with Russia. We don't have the same type of leverage with Russia, and we need their help elsewhere. But [the DNC hack] has raised the stakes."

A year after Estonia's networks buckled, Russia's growing hammer in cyberspace dropped on another neighbor and former Soviet Republic nation it deemed a threat: Georgia.

Georgia ended up in a full blown war with Russia in 2008. But before a single shot was fired, denial-of-service attacks and defacements against targets like the website of the Georgian president--he was compared to Adolf Hitler on his own Georgian websites when hackers took control--set the stage for the traditional war that would begin a month later. Dozens of Georgian government, finance, and communications websites went down in the lead up to kinetic fighting.

When the shooting war began, the cyberattacks continued, marking the first time in history that the two domains of warfare coincided. In contrast to the relatively small on-the-ground fighting, the Russian-Georgian War has been called "quite historic and precedent setting," as David Hollis wrote in the Small Wars Journal, because Russia attacked Georgia on four fronts: Land, air, sea, and cyberspace.

Georgia is no Estonia, however; it was and is not nearly as connected a nation, so the effects paled in comparison to even the relatively small and contained shooting war. But it mattered.

"As tanks and troops were crossing the border and bombers were flying sorties, Georgian citizens could not access web sites for information and instructions," journalist Jon Oltsik wrote on Networked World. "From a U.S. perspective, imagine a 9/11 or Hurricane Katrina event if citizens had no idea what to do, emergency responders couldn't communicate, and utilities were cut off in a 200 mile radius outside of the disaster zone. This is the risk."

The message became increasingly clear: Cyberwar is a ready and effective tool in Russia's growing arsenal.

Part of what makes it such a potent tool is, once again, that attribution is difficult. Does this or that attack originate within Russia? That's often tough to say, but, even when that much is definitive, there remains the trouble of sorting through all the different cyberspace movers and shakers in Russia.

Some of the 2008 cyberattacks against Georgia were linked to a Russian criminal gang known as the Russian Business Network, or RBN. Pinning down the extra level of control and coordination between the Kremlin and the criminals for each specific incident can be a titanic task.

In this particular war, however, the links shined brightly.

Hackers took out Georgian news and government websites exactly in locales where the Russian military attacked, cutting out a key communication mode between the Georgian state and citizens directly in the path of the fight.

"It created panic and confusion in the local populace, further hindering Georgian military response," Hollis, a veteran of the U.S. Defense Department's cyberspace efforts, wrote in his 2011 study on the war.

The intimacy between the Russian state, private industry, and criminal underworld is notorious in cyberspace and beyond, to the top levels of Russian government and private industry.

"There is no doubt Russia uses these criminal organizations to mask their state-sponsored intelligence and military operations," Leo Taddeo, the former special agent in charge of the FBI's New York cybercrime division, says. Taddeo began his career in the Bureau focused on Russian organized crime.

"The Russian science and math programs are very good," Finan says. "They also have a ton of organized criminal groups that are frankly very innovative in their methods. Sometimes the state will outsource their work there."

Taddeo is convinced that Putin's ultimate goal in his alleged hack of the DNC is to knock back against NATO, the U.S., and the West in general.

"Putin and his senior leadership believe the main threat to Russia is the perception of a slow but steady encirclement of Russia by the U.S. and NATO," Taddeo argues. "Throughout the Obama administration, we have moved closer to Russia with advanced missile defense systems and the expansion of NATO bases. As such, the main strategic objective for Putin is to disrupt the U.S./NATO advance to their borders. This can not be overstated."

In the last year alone, the effects of this apparent agenda have been felt strongly in countries nearest to Russia that are either already in NATO or who flirt heavily with the alliance. After NATO conducted a naval exercise from Finnish territory for the first time ever earlier this year, hackers knocked the Finnish Ministry of Defense's website offline. Germany accused Russia of a cyberattack against a steel mill that caused "massive" damage.

The steel mill attack stands as only the second known incident in which hackers have caused physical damage. The first is Stuxnet, the American-Israeli cyberattack against Iranian nuclear facilities in 2007 and 2008.

The French television network TV5 Monde was knocked off the air for 18 hours in April 2015. The website was replaced by jihadist propaganda, but French authorities insisted Russian state-sponsored hackers were behind the attack. More to the point, they accused a group called Fancy Bear that American security experts believe is behind this year's hack of the Democratic National Committee.

When a Dutch commission concluded a Russian weapon destroyed a Malaysian airliner over war-torn Ukraine, Russian hackers targeted the investigation from start to finish.

In late 2015, Ukraine itself was the target of hackers who took control of a western Ukrainian power grid that knocked out power substations and launched a blackout for 230,000 Ukrainians.

Coming amid an ongoing armed struggle in Eastern Ukraine that heavily and continuously involved Russian soldiers and weapons taking and holding formerly Ukrainian soil, it was little surprise when the finger was pointed from Kiev to Moscow.

German intelligence backs Ukraine's blaming of Russia, but, as always, definitive proof remains elusive.

A year prior, just days before a Ukrainian presidential election, self-avowed pro-Moscow hackers crippled the country's national election commission digitally. Software, hard drives, routers, and backups were decimated.

In the middle of not only a civil war and armed conflict with Russia but also a political drama about the future of Ukrainian democracy, the country's election authorities being hamstrung and unable to offer real-time results may have sparked doubts about the legitimacy of a vote that was putting a more pro-Western and anti-Russian government in office in Kiev.

Ukraine's government and military have been the target of numerous cyberattacks since war broke out, putting it squarely on the front line of a new, hybrid conflict with Moscow. And although NATO has spoken about giving resources and defense aid to Ukraine, the progress has been slow so far.

The Kremlin's response to these accusations echoed their answer to nearly every charge leveled at them in the last decade. It's "absurd," Kremlin spokesman Dmitry Peskov said.

"The campaigns being monitored by the BfV [Germany's domestic intelligence agency] are generally about obtaining information, that is spying," Hans-Georg Maaßen, who leads BfV, said this year. "However, Russian secret services have also shown a readiness to carry out sabotage."

"Cyber- attacks carried out by Russian secret services are part of multi-year international operations that are aimed at obtaining strategic information," Maaßen said, also earlier this year. "Some of these operations can be traced back as far as seven to 11 years."

It's called "gray zone" combat, because cyberwar is saturated by such a dense fog that clear understanding or response can feel out of reach.

"The biggest problem in cyber remains deterrence," Toomas Hendrik Ilves, the Estonian president, said earlier this year. "We have been talking about the need to deal with it within NATO for years now."

In June, just prior to WikiLeaks public release of emails stolen during the DNC hack, Ilves said his biggest fear was the escalation of cyberattacks. If the DNC proves to be Russian work--or, more likely, if no absolute proof is forthcoming, but the the evidence and context continues to point that way--it won't be the first time high-level American politicians were hit by Russian hackers.

In 2014, hackers breached the White House's unclassified servers and accessed some (but not all) emails from President Barack Obama to staffers. The State Department was also breached, though Secretary of State Ashton Carter said the breach there was also limited to unclassified computers. One U.S. official called their adversaries "one of the most sophisticated actors we've ever seen."

Despite the decade-long rise in Russian cyberwar, the DNC hack is seen by many in the West as a blatant escalation beyond what the Kremlin has done previously.

"Everyone steals secrets," American political scientist P.W. Singer says. "Everyone. The difference is the dumping of them in ways designed to influence elections of foreign powers. It's akin to Putin's personal rise, viewing the processes of democracy as merely something to manipulate, not institutions to respect."

Russian actions on the internet extend beyond traditional hacking. Singer points to the country's dynamic troll factory system that influences social media; the international propaganda system, centered around Russia Today, aimed at influencing news; efforts to influence European politics and Brexit; and an information war focused on the U.S. election that fuels extremist support of Donald Trump.

"They literally invented [information warfare]," Singer says of the Russians. "They also have set up a wide apparatus to support it, some 75 different organizations, ranging from university programs to military units, studying the issue and operationalizing. Finally, the willingness to look at democracy as merely something to be manipulated gives a wider scope of activity they can do."

With the DNC breach as the latest cherry on top of what seems to be an endless onslaught of headline-making hacks, the potential responses vary widely.

Financial sanctions are seen by many as the most effective immediate tool to fight Russian action. Singer suggests retaliatory data dumps targeting the bank accounts of Putin and Russian oligarchs.

Acting chair of the DNC Donna Brazile, Trump, and Putin himself take a different lesson: Just don't use email--it's horribly insecure. Plenty of security experts agree, though the ubiquity of the medium make it tough to get rid of.

"The DNC breach really hits home on the evolution of the data breach from a sort of petty crime or adolescent act of vandalism to a professionalized tool of global influence being deployed by state-sponsored organizations carefully executing these acts in order to influence national elections with international consequences," says Danny Rogers, CEO of the security firm Teribium Labs.

It's the result of these breaches that remains the biggest question mark for Rogers.

"It remains to be seen throughout the election season whether this action is effective," he says, "or if it's a desperate attempt where there aren't stronger levers to pull."

Global Times
China stresses information age military capability
Thursday, 28 July 2016
Byline: Li Ruohan and Wu Gang

Beijing - China intends to become a strong information technology power, will beef up cyber security systems and will enhance its capability to win an "informationized war," the government stated in a document Wednesday.
The Central Committee of the Communist Party of China and the State Council jointly issued the "Outline of National IT Development Strategy" on Wednesday. The plans to steer the country's IT development for the next decade have for the first time included military development for the information age.

"To adapt to the recent changes in the national security situation ... information technology will resolutely become the direction of military modernization," the document states.

It also said the Chinese military needs to enhance real combat capability based on network information systems, which will focus on taking control of information in wartime.

Zhuang Rongwen, deputy director of the Cyberspace Administration of China, said the outline is the result of two years of cross-department work based on President Xi Jinping's emphasis on cyber security and IT development since Xi established and headed the Central Leading Group for Cyberspace Affairs in February 2014.

China is planning to make major breakthroughs in 5G technology by 2020. And by 2025, a leading global mobile communication network will be in place, ridding the country of reliance on overseas technology. Cyber security must be vastly improved, according to the outline released Wednesday.

Song Zhongping, a Beijing-based military expert, said China's military is still significantly far from a real informationized military.

"Presently China is not there yet, as most of the country's army are still mechanized forces," Song told the Global Times on Wednesday.

China needs to work on advanced Internet technologies to be a rule-maker instead of a game-player, so as to have a bigger say and to better protect its national defense and military information, he said. He added that an informationized military means connecting every soldier and every weapon among all troops so that when they are operating they are not only receivers of information but also contributors.

China established a Strategic Support Force at the end of last year, to go alongside the army, navy, air force and Rocket Force. Experts said the Strategic Support Force includes cyber war and space war troops.

"China has made remarkable progress in transforming mechanized forces to informationized forces, though it still has a long way to go to actualize the full informationization in all troops," Li Jie, another Beijing-based military expert, told the Global Times on Wednesday.

The biggest difficulty lies in the lack of informationization in the core technology and key equipment, such as large- scale combat platforms and warning systems, Li said. He added that the informationization of China's most advanced weapons still needs to be improved.

Xi calls for further reform

General Secretary of the Communist Party of China (CPC) Central Committee Xi Jinping on Tuesday called for the building of strong armed forces through military reform.

Xi presided over a group study seminar of the Political Bureau of the CPC Central Committee in Beijing, which focused on national defense and military reform.

Based on the reform plan, the general command of the People's Liberation Army (PLA) army, the PLA Rocket Force, and the PLA Strategic Support Force were established. The previous seven military area commands were regrouped into five theater commands, and the four military departments - staff, politics, logistics and armaments - were reorganized into 15 agencies.

With those reforms, the PLA has a system in which the CMC is tasked with the overall administration of the armed forces, while theater commands focus on combat preparedness, and various armed services pursue development, Xi added.

In Secret Battle, Surveillance Court Reined in FBI Use of Information Obtained From Phone Calls
Thursday, 28 July 2016
Byline: Jenna McLaughlin

Washington - Beginning over a decade ago, the country's surveillance court intervened to limit the FBI's ability to act on some sensitive information that it collected while monitoring phone calls.
The wrangling between the FBI and the secret court is contained in previously undisclosed documents obtained by the Electronic Privacy Information Center, or EPIC. The documents, part of an ongoing Freedom of Information Act lawsuit, were shared with The Intercept.

The documents reveal that the Foreign Intelligence Surveillance Court (FISA) told the FBI several times between 2005 and 2007 that using some incidental information it collected while monitoring communications in an investigation -- specifically, numbers people punch into their phones after they've placed a call -- would require an explicit authorization from the court, even in an emergency.

"The newly obtained summaries are significant because they show the power that the [Foreign Intelligence Surveillance Court] has to limit expansive FBI surveillance practices," Alan Butler, an attorney for EPIC, wrote in an email to The Intercept.

Additionally, The Intercept independently obtained sections of the FBI's 2011 Domestic Investigations and Operations Guide describing how the FBI currently deals with information it obtains after getting a court order for what's called a "pen register," or "trap and trace" on a target -- a capability built into the phone lines that records incoming and outgoing phone numbers for a particular phone. The 2011 guide is currently public but heavily redacted.

The Operations Guide, in addition to shedding light on how the FBI uses pen registers, reveals that the surveillance court's pushback more than a decade ago has become internal FBI policy.

During an investigation, the FBI is often interested in who a target is talking to -- what calls they make and receive, and where those calls physically originate.

By simply telling a judge the information is "relevant," the FBI can demand that a phone company, or email or other online provider, immediately hand over any and all "telephone numbers, email addresses, and other dialing, routing, addressing, or signaling information." That information can sometimes include locational data. They don't need to notify the target or demonstrate probable cause that he or she committed a crime to get it.

But the FBI's monitoring can end up getting more information than just phone numbers, though pen-register and trap-and- trace orders are not intended to get any "content" that would provide insight into the substance or subject of a communication.

For example, the numbers people punch into the phone after making a call can reveal financial or personal information -- like a credit card number, a social security number, a PIN, a prescription number, or any other type of response via automated telephone prompts. The "term of art" for this information is "post-cut-through dialed digits."

The FBI in the 2011 Domestic Investigations and Operations Guide has described the digits dialed after someone makes a call as "content."

Following the release of documents by NSA whistleblower Edward Snowden, many have described the secretive court as a "rubber stamp" because it rarely rejects a surveillance request. But there's nuance in what the judges have challenged or modified in response to requests over the years.

Between July and December in 2005, the surveillance court approved pen registers and trap-and-trace devices to target "at least 138" people.

However, one judge started asking the FBI more probing questions about what exactly it did with post-cut through dialing digits it "incidentally" obtained with those orders -- launching what Butler describes as an "open secret" fight between the Foreign Intelligence Surveillance Court and FBI over the information. The judge's request for a "memorandum of law" appears in the July 2006 Department of Justice report to Congress on its use of FISA pen registers, obtained by EPIC. Some of that pushback was documented by Wired in 2008.

In May 2006, the government told the court that it had the authority to collect that sensitive information, and would "in some cases ... specifically seek authority for secondary orders requiring a service provider to provide all dialing, routing, addressing or signaling information transmitted by a target telephone, which, in light of technological constraints, may include content and non-content digits alike," the report continues. (According to the Domestic Investigations and Operations Guide, the FBI agent requesting the pen register has to specifically ask for any additional dialing information following the first nine or 10 digits -- it isn't automatic.)

The government also insisted it wouldn't actually use that information in an investigation -- unless there's an emergency, that is, to prevent death, serious physical injury, or "harm to national security," though it's never made explicit what exactly that means.

Between January and June in 2006, the surveillance court modified some of the FBI's applications to stop it from using that information without additional permission, no matter the urgency.

The court "had made modifications to the government's proposed pen register orders," reads the biannual report to Congress obtained by EPIC. "Although the [FISA Court] has authorized the government to record and decode all post-cut-through digits dialed by the targeted telephone, it has struck the language specifically authorizing the government to make affirmative investigative use of possible content" unless permission is specifically granted by the court.

The surveillance court wasn't the only judicial body rejecting the FBI's requests to hold on to the additional dialing information. In July 2006, a magistrate judge in Texas denied an application for a pen register because filtering technology would not eliminate the additional content information. That led then-chief judge of the surveillance court, Colleen Kollar-Kotelly, to ask the government to respond to the Texas court, and explain how it might impact decisions in foreign intelligence investigations.

The government said the court should basically ignore the decision -- and take note of new revisions to the USA Patriot Act, which said the government could obtain "noncontent" dialing information. (Because there isn't technology that can reliably separate out content from noncontent when it comes to this type of dialing information, the law basically allows for all of it, the government argued.)

In 2006, the court had not yet written a formal decision on whether or not the government could keep getting this information -- let alone use it in an investigation.

But "most" of the judges continued to strike the "emergency" language from the FBI's requests, despite the government continuing to insist that "the proposed exception is reasonable under the Fourth Amendment" because its use is so rare.

By August 2006, the court asked the FBI to produce an entire report on how the dialing information obtained through pen registers is stored and kept in its databases. By 2007, the court reported that it modified 18 different government requests out of 98 within six months.

The secret court continued to delete language that would allow the government to use the post-cut-through dialed digits in an emergency -- and added a time limit on when it could come back to ask to use that content.

By 2011, the court's resistance appeared to enter into formal policy, according to the Domestic Investigations and Operations Guide section obtained by The Intercept. The FBI, the guide states, can never in these cases use information like credit card numbers or social security numbers obtained after dialing a phone number, "even in cases of emergency."

However, that exception still applies in criminal cases, according to the 2011 Operations Guide. "In an emergency," information obtained from the numbers people dial "may be used as necessary in criminal investigations to prevent immediate danger of death, serious physical injury, or harm to national security," reads the section on post-cut through dialing digits. And if the target is calling a bank, for example -- the FBI cannot get the account number from the call, but it can use the call as a lead and subpoena the bank for that information instead.

Butler points out that despite the FBI and the secret court's fight over the information, it is basically impossible to tell whether that information triggered investigative leads agents wouldn't have otherwise had without the pen register.

The FBI declined to comment on the previously redacted portions of the 2011 Domestic Investigations and Operations Guide obtained by The Intercept as well as the FOIA documents obtained by EPIC.

"The Domestic Investigations and Operations Guide establishes the FBI's internal rules and procedures, and describes the FBI's authority to use specific investigative tools as determined through the Constitution, U.S. statutes, executive orders, and the AG Guidelines for Domestic FBI Operations," Chris Allen, an FBI spokesperson, wrote in an email. "These rules are audited and enforced through a rigorous compliance mechanism designed to ensure that FBI assessments and investigations are subject to responsible review and approval."

New York Times
Cybersecurity Experts Aren't Sure if Email Hacker Is a Person or a Front
Thursday, 28 July 2016
Byline: Charlie Savage, Nicole Perlroth

Washington - Who is Guccifer 2.0, the self-proclaimed Romanian "lone hacker" responsible for copying thousands of emails and other files from the Democratic National Committee -- a real person, or a front created by Russian intelligence officials?
Technology specialists have been debating that question since June 15, when CrowdStrike, a cybersecurity firm hired by the Democratic National Committee, announced that sophisticated hacker groups with Russian links were responsible for breaching the committee's computer servers. Within hours of the announcement, someone using the moniker Guccifer 2.0 started a blog to mock that finding, posting several of the stolen documents and claiming sole credit.

But the publication by WikiLeaks of an archive of the committee's internal emails -- and the uproar they caused on the eve of the Democratic National Convention -- have focused wider attention on who, or what, is operating behind that name. While WikiLeaks has not said how it obtained the emails, Guccifer 2.0 claimed in a blog post last month to have sent them to WikiLeaks.

Cybersecurity specialists have pointed to an array of forensic and technical evidence suggesting that Guccifer 2.0 might not be a Romanian as claimed. That evidence included metadata hidden in the early documents indicating that they were edited on a computer with Russian language settings. American intelligence officials believe that Guccifer 2.0 is a front for the G.R.U., Russia's military intelligence service, according to federal officials briefed on the investigation.

In blog posts, Twitter messages, and electronic chats with journalists, Guccifer 2.0 has insisted such skeptics are wrong.

Against that backdrop, Guccifer 2.0's words are taking on heightened interest. They may be clues to a person's decision to intervene in the American election, or they may be a case study of a 21st- century Russian information campaign -- the work of different intelligence officials, crowded around a keyboard.

"Just because the Wizard of Oz says he's a wizard doesn't actually mean he is," said Peter Singer, a security strategist at the New America Foundation, a public policy institute.

The original "Guccifer" (pronounced GUCCI-fer) is a real person: Marcel Lazar Lehel, a Romanian hacker who used the pseudonym Guccifer to hack various accounts belonging to American celebrities and government officials, including members of the Bush family, former Secretary of State Colin L. Powell, and Sidney Blumenthal, an informal adviser to Hillary Clinton.

Mr. Lehel was arrested in Romania in 2014 for hacking the email accounts of several Romanian officials. In April, he was extradited to the United States to face hacking charges and pleaded guilty in May before

a federal judge in Alexandria, Va. While awaiting sentencing, Mr. Lehel claimed to have hacked Mrs. Clinton's private email server, but federal officials have found no evidence to support his claim.

Mr. Lehel is known for his fixation on what conspiracy theorists call the Illuminati, a shadowy group that they believe controls the world. The first Guccifer 2.0 blog post, and messages Guccifer 2.0 sent along with packages of files that same day to the websites Gawker and The Smoking Gun, also denounced the Illuminati.

Other oddities also arose. Technical specialists, scouring metadata on documents posted to Guccifer 2.0's blog, found some that were last marked by a person with a user name in Cyrillic that appeared to be a nod to Felix E. Dzerzhinsky, best known for establishing the early Soviet secret police forces.

On June 21, Motherboard, an online technology magazine, posted a Twitter chat log of an interview with Guccifer 2.0, in which the person using that account claimed to be Romanian and denied working with the Russian government. Pressed on why Russian language markings showed up in the metadata of the documents he had sent out, Guccifer 2.0 claimed that was just a "watermark."

"I don't like Russians and their foreign policy. I hate being attributed to Russia," Guccifer 2.0 wrote.

During the interview, Motherboard switched from using English to Romanian and to Russian. Guccifer 2.0 claimed not to speak Russian and abruptly cut off the interview.

Motherboard later reported findings of linguistics specialists who said that his Romanian answers did not seem like those of a native speaker, and that the syntax of several of his English lines echoed Russian sentence constructions.

And a linguistic analysis provided to The New York Times by Shlomo Argamon, a chief scientist at Taia's Global, a cybersecurity firm that has questioned cyberattack attribution claims in the past, also concluded that Guccifer 2 is Russian.

Mr. Argamon, who is a professor of computer science and the director of the master of data science program at the Illinois Institute of Technology, found seven oddities in the hacker's English text, five of which pointed clearly to Russian as the speaker's native tongue.

"The linguistic evidence consistently points towards the writer being either a native Russian speaker," Mr. Argamon said. "It is possible that the writer is a Romanian speaker who has studied Russian. However, the writer denied knowing any Russian, and so the most reasonable conclusion is that he is a Russian native speaker rather than a Romanian native speaker."

On June 30, Guccifer 2.0 posted additional documents from the Democratic National Commitee's servers on the WordPress blog. The post again denied Russian links, and spoke admiringly of Julian Assange, the founder of WikiLeaks; Edward J. Snowden, the former intelligence analyst who leaked

archives of surveillance documents; and Chelsea Manning, the Army private who sent a huge trove of military and diplomatic documents to WikiLeaks in 2010.

That post accused Mrs. Clinton of being "bought and sold," in contrast to Mr. Trump, who it said "has earned his money himself. And at least he is sincere in what he says."

But the post still expressed opposition to Mr. Trump's ideas "about closing borders and deportation policy." Of Senator Bernie Sanders of Vermont, the post said, "He never had a chance to win the nomination as the Democratic Party itself stood against him!"

The Hill, a newspaper that covers Congress, reported on July 13 that Guccifer 2.0 had reached out to it and had provided documents about Democratic campaign donors and lobbyists.

It quoted Guccifer 2.0 as saying in an electronic chat, "The press [is] gradually forget[ing] about me, [W]ikileaks is playing for time and [I] have some more docs." The next day, Guccifer 2.0 posted those documents on the blog. That was the last blog posting.

The Guccifer 2.0 Twitter account posted a few more messages. The most recent one, on July 22, expressed excitement that WikiLeaks had posted the archive of nearly 20,000 Democratic committee emails that "I'd given them!!!"

Since then, that account has fallen silent, too. No messages were posted even as the Democratic Party chairwoman, Representative Debbie Wasserman Schultz, resigned and Mrs. Clinton's campaign manager accused the Russian government of providing the leaked emails to WikiLeaks to help Mr. Trump.

The Hindu
India the most targeted country for data breaches
Thursday, 28 July 2016
Byline: Varun Aggarwal

New Delhi - The average cost incurred by Indian enterprises for a data breach has shot up to Rs. 9.73 crore this year from Rs. 8.85 crore last year, making India the most targeted country for data breaches in the world, says a study by IBM and the Ponemon Institute.
"If you go by the average number of records breached per country, the highest is India. In India, 31,225 records were breached in 2015 whereas 29,611 records got breached in the US. There was a 64 per cent increase in security incidents in India in 2015 compared to 2014, with incidents growing both in terms of volume and sophistication," Vaidyanathan R Iyer, Business Unit Executive, IBM Security Solutions, told BusinessLine .

The number of breached records per incident this year in India ranged from 4,500 to 100,100 records. The study found that companies lose up to Rs. 3,704 per compromised record. Breaches in highly

regulated industries were even more costly with financial institutions losing as much as Rs. 5,544 per record.

"There is a growing awareness around the importance of cybersecurity among Indian government organisations as well as enterprises. However, India's high economic growth also makes it a big target for attacks," Iyer said.

Iyer said the growth of cybersecurity insurance policies taken by enterprises in India highlights how they are trying everything to safeguard themselves from the impact of cyber attacks.

"Indian organisations are also not as well-equipped as maybe US companies, making them the most likely to experience a data breach caused by a system glitch or business process failure," Iyer said.

Incident-response teams can expedite and streamline the process of responding to a breach, as they're expert on what companies need to do once they realise they've been compromised. These teams address all aspects of the security operations and response lifecycle, from helping resolve the incident, to satisfying key industry concerns and regulatory mandates. Additionally, incident response technologies can automate this process to further speed up efficiency and response time.

The study also found the longer it takes to detect and contain a data breach, the more costly it becomes to resolve. While breaches that were identified in less than 100 days cost companies an average of Rs. 8.94 crore, for breaches that were found after the 100-day mark the average cost rose significantly, to Rs. 10.56 crore.

The most difficult incident to detect and contain is the malicious or criminal act (97 and 203 days), while data breaches caused by human error take the least time to identify and contain (69 and 139 days), the report said.

The 'Cost of a Data Breach' study annually examines both direct and indirect costs to companies in dealing with a single data breach incident. Through in-depth interviews with nearly 37 companies across the country, the study factors in costs associated with breach response activities, as well as reputational damage and the cost of lost business.

Asharq Al-Awsat
U.S. Issues Guidelines for Responding to Major Cyber Attacks
Thursday, 28 July 2016
Byline: Staff Report

Washington - The White House recently released a new set of instructions on how government agencies should respond to major cyber security attacks. The Tuesday published directory was seen as an attempt

to combat perceptions and criticisms on the Obama administration being inactive when addressing threats from sophisticated hacking foes.
The announcement was made amid suspicion in the U.S. government that Russia-hired hackers may have engineered the leak of emails stolen from the Democratic National Committee in an attempt to influence the Nov. 8 U.S. presidential election.

The directive includes a five-point scale to grade the severity of an incident, provides the first public guidance on the specific roles of federal agencies in coordinating efforts to investigate and respond to cyber security breaches in government and the private sector.

"To put it bluntly, we are in the midst of a revolution of the cyber threat - one that is growing more persistent, more diverse, more frequent and more dangerous every day," White House counter-terrorism adviser Lisa Monaco said at a cyber security conference in New York.

She said that the new presidential policy directive "will help answer a question heard too often from corporations and citizens alike - 'In the wake of an attack, who do I call for help?'"

Monaco named Russia and China as cyber adversaries that have become more assertive and she noted that Iran and North Korea are capable and willing to carry out destructive attacks.

The directive defines a significant cyber incident as one that is likely to result in harm to national security or economic interests, foreign relations, or the public confidence, health safety or civil liberties of the American people, according to a White House fact sheet.

An event would be designated as an emergency, or level 5, if it posed an imminent threat to wide-scale critical infrastructure, the stability of the government, or lives of Americans, according to a severity schema provided by the White House.

No attack against the United States so far would register as a five, and the hack on the Democratic Party organization would likely earn a lower grade, depending on how much evidence emerges on whether or not a foreign government is using the stolen information to try to influence the election, a source familiar with the policy discussions said. The magnitude of a response will be determined by the severity assigned to an attack, Monaco said.

Asked about the DNC hack, Monaco said it would be a thorough investigation "and I'm sure there will be more to say later." The FBI is investigating while cyber security experts and U.S. officials said there was evidence of Russia's involvement. The Kremlin dismissed the allegations, labeling them as absurd.

President Barack Obama has increasingly prioritized cyber security during his second four-year term, which has been marked by a spate of high-profile hacks against government agencies and private companies that exposed tens of millions of individuals' personal data.

Lawmakers and cyber security experts have often criticized the administration for not developing a clear road map for how and whom companies should contact when facing a cyber-attack.

The new directive largely codifies existing practices and norms rather than change policy, said Ari Schwartz, a former top cyber security adviser at the White House who is now with the law firm Venable.

"But there have been times when the language used has caused major confusion," Schwartz said. "We've seen agencies use the same terms to mean different things and that has confused victims."

U.S. Department of Justice, working through the Federal Bureau of Investigation and National Cyber Investigative Joint Task Force, will be the lead agency for investigating criminal intrusions or those that could affect national security, according to the policy.

The U.S. Department of Homeland Security will serve as the lead contact in helping companies respond to breaches of their networks. Intelligence agencies will be in charge of gathering information in order to identify who is behind an attack.

Comelec assures safeguards against data hacking
Thursday, 28 July 2016

Manila - In the midst of the voter registration for the forthcoming barangay and Sangguniang Kabataan (SK) polls, the Commission on Elections assured the public that safeguards are in place against a repeat of the hacking of its database last March.
Comelec Chairman Juan Andres "Andy" Bautista noted that the commission has made sure that data has been secured from those who would try to hack their systems again. "We are more secure this time than before against data hacking," he said.

The poll body chief added that they are coordinating closely with the Department of Science and Technology to make sure that Comelec systems are safe from hackers. "We have undertaken several steps to secure the database after the hacking," Bautista said.

He added that they continue to monitor hacking attempts on their system. "We are constantly monitoring them (hacking attempts) as part of our protocol. We monitor them versus any attempts to penetrate our website," Bautista said.

Hacker group Anonymous Philippines defaced the Comelec website a month before the May 9 polls.

The incident was followed by the release of the personal information of millions of registered voters that were made searchable online. Among the sebsitive information that was leaked were voters' full names, complete addresses and passport numbers.

New York Times
Trump Eggs on Moscow in Hack of Clinton Email
Thursday, 28 July 2016
Byline: Ashley Parker, David E. Sanger

Doral, Fla. - Donald J. Trump said on Wednesday that he hoped Russian intelligence services had successfully hacked Hillary Clinton's email, and encouraged them to publish whatever they may have stolen, essentially urging a foreign adversary to conduct cyberespionage against a former secretary of state.
"Russia, if you're listening, I hope you're able to find the 30,000 emails that are missing," Mr. Trump said during a news conference here in an apparent reference to Mrs. Clinton's deleted emails. "I think you will probably be rewarded mightily by our press."

Mr. Trump's call was another bizarre moment in the mystery of whether Vladimir V. Putin's government has been seeking to influence the United States' presidential race.

His comments came amid questions about the hacking of the Democratic National Committee's computer servers, which American intelligence agencies have told the White House they have "high confidence" was the work of the Russian government.

At the same news conference, Mr. Trump also appeared to leave the door open to accepting Russia's annexation of Crimea two years ago -- which the United States and its European allies consider an illegal seizure of territory. That seizure, and the continued efforts of Russian-aided insurgents to undermine the government of Ukraine, are the reason that the United States and its allies still have economic sanctions in force against Moscow.

When asked whether he would recognize Crimea "as Russian territory" and lift the sanctions, Mr. Trump said: "We'll be looking at that. Yeah, we'll be looking."

Mr. Trump's apparent willingness to avoid condemning Mr. Putin's government is a remarkable departure from United States policy and Republican Party orthodoxy, and has fueled the questions about Russian meddling in the campaign. Mr. Trump has denied that, saying at the news conference that he has never met Mr. Putin, and has no investments in Russia.

"I would treat Vladimir Putin firmly, but there's nothing I can think of that I'd rather do than have Russia friendly as opposed to the way they are right now," he said, "so that we can go and knock out ISIS together."

Mr. Trump later tried to modify his remarks about hacking Mrs. Clinton's emails, contending they represented an effort to get the Russians to turn over their trove to the F.B.I.

With the political conventions coming to an end on Thursday, Mr. Trump is expected to receive his first national security briefings from American intelligence agencies in coming days. It is unclear whether those briefings -- which describe the global challenges facing the United States but not continuing covert operations or especially sensitive intelligence -- will change any of his views.

His comments about Russian hacking came on a day when Obama administration officials were already beginning to develop options for possible retaliation against Russia for the attack on the Democratic National Committee. As is often the case after cyber incidents, the options for responding are limited and can be viewed as seeming too mild or too escalatory.

The administration has not publicly accused the Russian government of the Democratic National Committee hacking, or presented evidence to back up such a case. The leaked documents, first published by a hacker who called himself "Guccifer 2.0" and who is now believed to be a character created by Russian intelligence, portrayed some committee officials as favoring Mrs. Clinton's candidacy while denigrating her opponent, Senator Bernie Sanders. The release of the internal party emails and documents led to the resignation of Debbie Wasserman Schultz as chairwoman of the party.

Mr. Trump contended on Wednesday that the political uproar over whether Russia was meddling in the election was a "total deflection" from the embarrassing content of the emails. Many Republicans, even some who say they do not support Mr. Trump, say they agree.

If Mr. Trump is serious in his call for Russian hacking or exposing Mrs. Clinton's emails, he would be urging a power often hostile to the United States to violate American law by breaking into a private computer network. He would also be contradicting the Republican platform, adopted last week in Cleveland, saying that cyberespionage "will not be tolerated," and promising to "respond in kind and in greater magnitude" to all Chinese and Russian cyberattacks.

In the past, the Obama administration has stopped short of retaliating against Russia -- at least in any public fashion -- for its attacks on the State Department and White House unclassified email systems, or on networks used by the Joint Chiefs of Staff. It never even publicly identified Russian intelligence as the source of those intrusions, though the subject was widely discussed by senior United States officials when they were not speaking for attribution.

In contrast, the United States did bring indictments against Chinese and Iranian hackers for thefts of intellectual property and attacks on American banks, and imposed economic sanctions against North Korea in early 2015, for hacking into Sony Pictures Entertainment's computers.

Almost as soon as Mr. Trump spoke, other Republicans raced in to try to reframe his remarks and argue that Russia should be punished. A spokesman for Speaker Paul D. Ryan termed Russia "a global menace led by a devious thug." The spokesman, Brendan Buck, added: "Putin should stay out of this election."

Even Gov. Mike Pence of Indiana, Mr. Trump's running mate, issued a statement, saying that "if it is Russia and they are interfering in our elections, I can assure you both parties and the United States government will ensure there are serious consequences." Mr. Pence did not attend Wednesday's news conference because he was giving local television interviews, and an aide to Mr. Pence said that his team had written his statement about Russia before Mr. Trump began speaking.

Shortly after that Mr. Trump sent a message on Twitter declaring "If Russia or any other country or person has Hillary Clinton's 33,000 illegally deleted emails, perhaps they should share them with the FBI!"

The fact that the Democratic committee's servers were targeted -- and, apparently, not those of the Republican National Committee -- has brought up inevitable comparisons with the origins of the Watergate scandal, when burglars found little after breaking into Democratic committee offices before the 1972 election. The hackers, more than 40 years later, were more successful: A reconstruction of events suggests the first successful piercing of the Democrats' networks occurred in June 2015, long before the Russians, or anyone else, could have known Mr. Trump would get the nomination.

The Clinton campaign, eager to turn the subject from the chaos caused by the email release to the question of Russian interference, accused Mr. Trump of encouraging Russian espionage.

"This has to be the first time that a major presidential candidate has actively encouraged a foreign power to conduct espionage against his political opponent," said Jake Sullivan, Mrs. Clinton's chief foreign policy adviser, whose emails from when he was a State Department aide were among those that were hacked.

"This has gone from being a matter of curiosity, and a matter of politics, to being a national security issue," he added.

For his part, Mr. Trump cast doubt on the conclusion that Russia was behind the hacking. "I have no idea," he said. He said the "sad thing" is that "with the genius we have in government, we don't even know who took the Democratic National Committee emails."

Mr. Trump then argued that if Russia, or any other foreign government, was behind the hacking, it showed just how little respect other nations had for the current administration.

"President Trump would be so much better for U.S.-Russian relations" than a President Clinton, Mr. Trump said. "I don't think Putin has any respect whatsoever for Clinton."

Former Representative Pete Hoekstra of Michigan, a Republican who had served as chairman of the House Intelligence Committee, said Mr. Trump was right to keep hammering Mrs. Clinton on the subject of her private emails.

Mr. Hoekstra said he was untroubled by Mr. Trump's goading of a foreign power, particularly in light of Mrs. Clinton's use of a private server while she was secretary of state.

"Trump is bringing up a fairly valid point: Hillary Clinton, with her personal email at the State Department, has put the Russians in a very enviable position," Mr. Hoekstra said. "Most likely the Russians already have all that info on Hillary."

But Representative Jason Chaffetz, a Utah Republican who led the House oversight committee that looked into Mrs. Clinton's emails, was more critical. If Mr. Trump's comments were meant literally, he said in an interview, "I think he was absolutely wrong and out of line. I would never have said it that way, and I think it was ill-advised."

If the remark was tongue-in-cheek, he added, it failed at political humor.

Toronto Star
Snowden made Canadian spies review contractor policy
Sunday, 31 July 2016
Byline: Alex Boutilier

Ottawa - When Edward Snowden begin leaking secrets about mass surveillance in the United States, Canada's electronic spy agency quietly wondered if their security screening was sufficient to stop a copycat.
Newly released documents show some of the behind-the-scenes actions taken by the Communications Security Establishment (CSE) three years ago, when contractor Snowden first pulled back the curtain on the West's pervasive mass surveillance capabilities.

Whatever changes were contemplated have been blacked out from the heavily censored document, most watermarked "secret" or "top secret." While the documents note that CSE is generally confident in its security clearance process for contractors, officials added that contractors are only "assessed for engagement for short, defined periods of time."

Snowden fled the U.S. with a massive cache of documents relating to the National Security Agency, CSE's American counterpart and close partner, while he was working as a contractor for the spy agency. While hiding in Hong Kong in 2013, Snowden passed the documents to reporters from the Washington Post and the Guardian newspapers.

On June 6, 2013, the first stories about U.S. mass surveillance hit the front page - - the NSA had a program called PRISM, which gave them direct access to the data mined by massive internet companies including Google and Facebook.

Within a month, CSE officials told then chief John Forster the agency might want to review some of its security practices around external contractors.

"Similar to its allies, CSE relies significantly on contractors for expertise in a broad range of activities," the documents, requested by the Star in 2013 and obtained only this month, read.

"(But) there are some areas of contractor engagement that may benefit from a review of current practices."

Two weeks later, another memo to Forster complained about a "pervasive lack of knowledge and understanding, in the public realm, of CSE's role and mission." The secretive spy agency, who had received less than 40 media calls in 2012, was suddenly thrust into the spotlight.

"As CSE has not been able to provide the level of detail about activities that the media requested, academics, so-called experts and commentators have provided their opinions on the subject," the memo reads.

"While some commentators have been well-versed on the issues, and have outlined accurate accounts of CSE activities, others, including [name censored] have inaccurately represented CSE's activities and authorities."

"CSE has been accused of being too secretive, which has led to misunderstandings of the agency's activities and authorities. This has highlighted the need for outreach to the academic community and to the media."

CSE's communications staff recommended a briefing for academics and journalists, including reporters at the Star, La Presse, the Globe and Mail, the CBC and a number of other outlets both Canadian and international. It does not appear that briefing took place.

CSE did give a briefing earlier this year, when its independent oversight body revealed the agency had inadvertently broken the law by transferring Canadian metadata to international partners. It was touted at the time as the first press conference in CSE's 70 year history.

More of Snowden's documents were reported over the summer in 2013. The U.S. and Britain, two members of the Five Eyes security alliance that includes Canada, spied on foreign diplomats at a G20 summit. The NSA spied on ordinary German citizens as well as high-value targets like Chancellor Angela Merkel. The Americans also kept tabs on foreign media organizations.

As the stories continued to roll out both in North America and abroad, the CSE kept a careful eye on the debate in the United States. An August 14 memo to Forster noted that while a dozen or so important disclosures about U.S. signals intelligence had been revealed, the debate in that country stayed stubbornly on the collection of telephone metadata.

On August 28, Forster briefed the prime minister's national security adviser about Snowden. At the time, documents revealing CSE's powers and actions had not yet been made public -- but the agency had figured out just how much Snowden accessed and downloaded.

"CSE has focused its efforts on reviewing key Canadian (signals intelligence) access and collection capabilities that are deemed most valuable to determine the potential damage should information on these capabilities be released," Forster wrote.

"CSE and its Five Eyes partners are working together to ensure consistent public messaging across all the allies regarding the unauthorized disclosures and their impact."

The Star requested an interview with CSE about their security screening of external contractors, and what changes the agency has put in place after Snowden's disclosures. In a written response, the agency said they could not discuss security issues.

"However, I can tell you that CSE constantly reviews its security posture to ensure that security policies and practices remain effective at protecting CSE's capabilities and information," wrote agency spokesperson Ryan Foreman in an email, noting contractors must undergo an extensive screening process that includes an in- depth interview, polygraph testing, and a psychological review.

Foreman added that Snowden's disclosures have been harmful to CSE's operations -- a line Five Eyes countries have consistently used since Snowden first revealed their activities.

Snowden remains living in exile in Moscow, but has said repeatedly said that he would return to the United States if he could be guaranteed a fair trial. The 33-year old recently joined the U.S.-based Freedom of the Press organization as a director.

New York Times
Russian News Group Walks a Tightrope in Covering the U.S. Election
Sunday, 31 July 2016
Byline: Michael M. Grynbaum & Nicholas Fandos

Philadelphia - The American news media is wildly overplaying Russia's role in a major email leak. The Democratic National Convention was troubled by chaos and dissent. Donald J. Trump's request for President Vladimir V. Putin of Russia to hack Democratic emails was a joke that American pundits simply did not get.
Such is the worldview presented by RT, the state-run, Moscow-based international news organization that, this week, found itself in a strange position: covering an American presidential election where Russia is suddenly playing a major role.

The network, formerly known as Russia Today, has long been scrutinized for being a propaganda outlet of sorts for the Putin government, which oversees its finances. But its American arm, which attracts about eight million weekly viewers, has aspired to more mainstream success, hiring a team of on-the-ground journalists and familiar, if past-their-prime, television stars like Larry King and the former MSNBC anchor Ed Schultz.

That balancing act has been strained by Russia's suspected role in the release of stolen emails from the Democratic National Committee, a leak widely viewed as an attempt to meddle with the American election process. But the small group of RT journalists in Philadelphia said this week that their only instructions were to find fresh angles in a crowded news marketplace.

"People think, as a reporter for state media, that I have to toe this line, and speak to a narrative all the time," Lindsay France, the channel's lead presidential campaign correspondent, said in an interview.

"Have I ever gotten a phone call that says, 'You need to cover a story this way or that way'? No," Ms. France said. She added: "If I had serious dilemmas, I would have left a long time ago."

Still, RT's coverage has tended to emphasize a theme of America in disarray. President Obama's convention speech on Wednesday was notable for being "upstaged by T.P.P. protesters and other noisy audience members," according to the opening paragraph of an article on the channel's website. On Friday, its lead story on Hillary Clinton's climactic address was an item about Bill Clinton being "caught napping" during the remarks.

Then there is Mr. Trump, who shocked the American foreign policy establishment by seemingly inviting Mr. Putin to hack the emails of the Democratic leader. RT's site features a skeptical headline -- "MSM Misses Trump's Joke on Russia & Hillary Emails" -- and notes that American news outlets "freaked out."

"Mainstream media can apparently no longer tell the difference between when Republican presidential nominee Donald Trump is being bombastic and when he's joking," read the article, which ran without a byline, as is the case with other RT articles. (Mr. Trump has said his remarks were sarcastic.)

Contacted for this article, representatives from RT issued a lengthy statement from the network's editor in chief, Margarita Simonyan, who wrote: "There is no special policy for treating any news stories differently when they pertain to Russia."

But, Ms. Simonyan added, "It is alarming to see the American political and media establishments across the political spectrum painting Russia as the ultimate boogeyman, referring to it exclusively as a menace, a thug, or a dictatorship."

"The same talking heads never mention the rampant crackdowns by the absolute monarchies, theocracies and ruthless strongmen allied with the U.S.," Ms. Simonyan added.

RT was founded in 2005 as an arm of a state-owned news conglomerate, RIA Novosti, intended to serve as a counterbalance to coverage by Western media companies. (Current slogan: "Question More.") RT America, based in Washington, began in 2010, and its site pledges to deliver "stories overlooked by the mainstream media to create news with an edge."

This week, those stories have focused on dissatisfied supporters of Senator Bernie Sanders of Vermont, who were infuriated by the leaked Democratic emails. Mrs. Clinton's nomination came amid "sharp divisions and mass disappointment of Sanders's delegates," the network reported.

Video of skirmishes between protesters and the police in Philadelphia were prominently featured, even though such episodes were relatively rare at a convention that was more peaceful than some observers had expected it to be.

Ms. Simonyan, the editor in chief, said that the American news media's focus on Russia's presumed role in the leak was overblown.

"There are 10 times as many articles about Russia's supposed involvement with the DNC emails than there are about what's actually in the emails," Ms. Simonyan wrote. "Hypothetical Russia connections are being used by other Americans to discredit a major party's nominee, and yet Russia's the one sabotaging the process?"

Ms. France, the correspondent, put it this way: "People call us propaganda. We take a look at what we see every day, and we do something different."

In an interview, Mr. King, the former CNN star who now anchors a prime-time interview show on RT, said that he had never received directions on coverage from the network. He said he was surprised that Russia was now such a dominant focus of the American political conversation.

"I'm almost expecting Putin to come to America to make a speech," Mr. King said by telephone from Los Angeles. "Obviously, Putin wants Trump to be the president. I've never heard that before from a Russian president."

His biggest concern, Mr. King said, is that Mr. Trump, whom he has known for decades, has so far declined to appear on his show during this election cycle.

"Donald Trump is the easiest guy to book in the world," said Mr. King, who has said he will probably vote for Mrs. Clinton. "He has not responded lately, and I have no reason for it. I've always been friends with him, we go back 40 years."

"He keeps saying, 'next Tuesday, a week from Tuesday,' " Mr. King said. "I'm a little disappointed."

Washington Post
Russia's DNC hack: A prelude to intervention in November?
Sunday, 31 July 2016
Byline: David Ignatius

Column: For decades, Russian intelligence agencies have used what they call "active measures" to destabilize their rivals. Now they seem to be turning those tools on the U.S. political system, though in the process they appear to have violated Rule No. 1 of the spy business: Don't get caught.
U.S. officials say they have strong evidence that Russian intelligence agencies hacked the files of the Democratic National Committee over the past year. What's less certain is whether they deliberately leaked some of those files to WikiLeaks, with the aim of disrupting Hillary Clinton's election campaign - though some experts think this "weaponization" of information was likely.

The scope of possible Russian political hacking broadened Friday with reports that computer systems of the Clinton campaign and the Democratic Congressional Campaign Committee had been breached.

"Anything's possible," President Obama told Savannah Guthrie of NBC's "Today" show when asked Wednesday whether Russia might have deliberately tried to influence the U.S. election. "What we do know is that the Russians hack our systems," he said, adding that "on a regular basis they try to influence elections in Europe."

Russian President Vladimir Putin grew up in a KGB culture in which such use of active measures was a standard tool of the Cold War. He seems to have carried this tradecraft into the Kremlin - employing hacking, black propaganda and other covert tools as part of what's politely described these days as "hybrid warfare."

U.S. officials say that Russian intelligence in recent years has secretly funded right-wing political parties in Europe, sponsored covert propaganda channels, hacked the electrical grid of Ukraine and cyber-sabotaged other neighboring states, and created networks of "trolls" to attack enemies online.

Why does Putin use these active measures to destabilize his rivals? Because they work. They're invisible and deniable and, for the most part, the targets don't fight back.

But the DNC hack may have been a bridge too far. It triggered blunt responses in recent days from top national security officials who were gathered here for an annual conference known as the Aspen Security Forum.

When the United States discovers evidence of foreign hacking, it should "be public about it," urged John Carlin, the assistant attorney general for national security. "Take it out of the intelligence channel ... that's the only way to change behavior," he said. James Clapper, the director of national intelligence, said that he wasn't yet ready to identify the perpetrator of the DNC hack but that from an intelligence standpoint, the United States is already "at war" with Russia.

"The Russians have had for years a doctrine of ... active measures," said Elissa Slotkin, acting assistant secretary of defense for international security affairs. She said that the Kremlin's tactics attempt "to sow dissent generally, either on a specific issue or just to cause political chaos ... in order to create an opening for themselves."

What worries U.S. officials most is that given Russia's demonstrated willingness to use covert action against its adversaries, it might secretly intervene just before the November election. That might mean releasing embarrassing Clinton emails, as GOP nominee Donald Trump has urged Moscow to do. It might mean leaking phony news stories, or finding ways to upset financial markets. The American political system is an open and vulnerable target.

Why would Russia target the DNC, in an operation that's eerily similar to the Nixon White House's 1972 burglary at the committee's headquarters at the Watergate? Partly, it was an information-gathering operation, like the reported Chinese intelligence hacks of the campaigns of Barack Obama and John McCain in 2008.

But Moscow may have had a special animus toward Clinton. When she was secretary of state, she endorsed Russian dissenters in the 2011 and 2012 elections. A furious Putin charged back then that she "gave them a signal" and that the dissidents, "with the support of the U.S. State Department, began active work." In other words, Putin thinks Clinton shot first.

The DNC noticed a problem in its computer system in April and hired a forensics firm called CrowdStrike to analyze the evidence. The firm concluded that two Internet addresses linked to Russian intelligence had been inside the DNC systems.

How did the DNC information get to WikiLeaks? A supposed Romanian hacker who calls himself Guccifer 2.0 claimed credit. But some experts believe this is what's known in intelligence parlance as a "false flag" aimed at masking the Russian hand.

And what about Trump? Some have argued that he was the intended beneficiary of Moscow's DNC hack. But it seems more likely that Trump is what Russian intelligence officers sometimes describe as a "useful idiot" - a person who unintentionally fosters Moscow's campaign of instability.

Sunday Telegraph (UK)
Cyber threat is too great to risk it, says former top spy
Sunday, 31 July 2016
Byline: Robert Verkaik

London - Theresa Mayès decision to review the Hinkley Point deal was applauded yesterday by a former head of counterterrorism, who warned against giving control of a nuclear power plant to the Chinese. Chris Phillips, who headed the police's National Counter Terrorism Security Office, told The Sunday Telegraph it was "crazy to give away a piece of critical national infrastructure to the Chinese when the world is in such a state of flux".

He said ceding any control of a nuclear plant would be a mistake. Mr Phillips, who advised the Home Office until 2011, when Mrs May was still Home Secretary, said: "The Chinese have been spying on us for years and have battalions of cyber hackers in China who are trying every day to gain a hold of our critical infrastructure and some of our companies.

"If they had access to a nuclear power station, they could turn the electricity off whenever they wanted. Nuclear power is part of the critical national infrastructure that should be protected at all costs - because the risks are so great."

Nick Timothy, Mrs May's joint chief of staff, has previously raised concerns over Chinese involvement in the deal. In a blog post last year, he said MI5 had concerns about Hinkley Point, stating that China's intelligence services "continue to work against UK interests at home and abroad".

One security expert warned that freezing China out of the deal could actually increase cyber attacks.

Professor Anthony Glees, head of the University of Buckingham's Centre for Security and Intelligence Studies, said China might retaliate if its planned 33.5 per cent stake in the £18 billion plant was turned down on security grounds.

He said: "It will be seen by China as insulting and potentially hostile and may well lead to reprisals.

"They have the capability to carry out cyber attacks on us and this may give them the motive.

"This could be the trigger for them to hack us even more in the sense that they've got nothing to lose. However friendly they are towards us, they are well known for their intrusive intelligence gathering."

Sputnik News Service
FSB Detects Cyberattacks on 20 Russian Organizations, Including Military Targets
Saturday, 30 July 2016

Moscow - Russian Federal Security Service (FSB) exposed planting of malicious software designed for cyber espionage in computer networks of about 20 Russian institutions, including government and military bodies, FSB press service said Saturday.
"Instances of planting of malicious software designed for cyber espionage in computer networks of some 20 organizations located on the territory of Russia have been exposed... Information resources of public authorities, scientific and military institutions, enterprises of the military -- industrial complex and other objects of country's critical infrastructure were contaminated," the statement read.

The press service stressed that the attack was professionally planned, has similar traits with the previously exposed attacks from all over the world.

"The latest sets of software are made for each 'victim' individually, based on the unique characteristics of the targeted PC. The spread of the virus is carried out by the means of targeted attacks on PC by sending an e-mail containing a malicious attachment," the statement continued adding that the software made it possible to do screenshots, turn on web-camera and microphones, collect data from the keyboard use.

FSB in cooperation with the ministries and agencies took a number of measures to identify all the "victims" of the malicious program on the Russian territory, as well as to localize the threats and minimize the consequences caused by its spread.

South China Morning Post
Strategic aim behind Anti-missile revelation
Saturday, 30 July 2016
Byline: Minnie Chan

Beijing - Timing of media reports on successful tests of Chinese system suggests Beijing is responding to South Korea's decision to deploy the US THAAD
Strategic and political goals are likely to be behind China's unusual disclosure this week of advances in one of its antiballistic missile systems, analysts say.

On Sunday and Monday, China National Radio, CCTV and PLA Daily's Tv.81.cn website carried reports touting four consecutive successful tests of a "ground-based midcourse defence" (GMD) system at the Korla Missile Test Complex in Xinjiang (??).

GMD systems plot, target and destroy ballistic missiles in space.

A clip of the first two tests was aired for the first time on the Tv.81.cn website.

CCTV said the four tests indicated that the system was ready for basic deployment in war, making China the second country after the United States to have the -technology.

The release of the footage came about two weeks after Washington and Seoul announced they would deploy the US Terminal High Altitude Area Defence (THAAD) anti-missile system in South Korea to counter threats from North Korea.

The THAAD system is expected to be up and running by the end of next year and Beijing has objected to its deployment in South Korea, saying the system's radar could penetrate Chinese territory.

Asked on Thursday if the GMD footage suggested China was preparing to deploy its own anti-missile system, defence ministry spokesman Yang Yujun answered with an indirect confirmation.

Yang said "prudent development" of anti-missile technology was in the interests of national defence but such a system would not target any specific country and would not affect global strategic stability.

That was the same day that PLA Daily said in an editorial that China would never "swallow insults and submit to humiliation when facing provocation", and referred to China fighting the US-led coalition in

the Korean war in the 1950s. "The Chinese people and Chinese military ... do not intend to become involved in an arms race with any country, but will firmly defend our security interests," it said.

The editorial accused the US of increasing regional tensions and warned South Korea that agreeing to deploy the THAAD system to serve the US "Asia rebalance" strategy was like inviting a wolf into the house.

There has long been speculation that China is on track to install its own answer to THAAD and there are signs that it could be well on the way to doing so.

Military experts said the ballistic missile interceptors shown in the footage were HQ-19 rockets armed with a kinetic kill vehicle, weapons that rely on damaging targets through the force of impact rather than warheads.

Together they are designed to engage ballistic missiles and satellites in lower-earth orbit.

According to the footage, the two tests were conducted on -January 11, 2010, and January 27, 2013. Other state media reports said China started the GMD project in 2007, with the last test carried out in October last year.

Macau-based military observer Antony Wong Dong said the timing of this week's announcement was deliberate.

"Obviously, China is very unhappy since the US and South Korea started negotiating the deployment of THAAD on the Korean peninsula," Wong said.

Song Zhongping, a retired instructor for the People's Liberation Army's former strategic missile force, the Second Artillery Corps, said the reports suggested the technology was reasonably advanced and was being put into service.

But Wong cautioned that the rush to develop and deploy the technology could carry hidden risks. Even the US needed to conduct at least 11 tests for its THAAD system and of those only seven were successful, he said.

"Learning from mistakes and failures is very important for weaponry development. It's not appropriate to save time and money on development of cutting-edge weapons," Wong said.

"The crash of one of China's -J-15 fighter jets in April is one of the best lessons. The aircraft project was pushed too fast and developed based on the unfinished Soviet-designed Su- 33."

CNR reported on Wednesday that a 29-year-old PLA pilot died after he lost control of his J-15 during a simulated deck landing exercise at a unspecified inland base on April 28. It is the first confirmed crash of a J- 15 since the jets went into service in December 2013.

Hong Kong-based military expert Liang Guoliang said recent official disclosures about sophisticated weapons in the last month indicated the two giants' space arms race was gathering pace.

But Song said there was still a gap between the anti-missile technology of China and the US.

"Compared with the US military, the Chinese anti-missile system lacks real battle testing, raising questions about its maturity and reliability," he said.

Reuters
Russia has motive, capability and form for U.S. email hack
Saturday, 30 July 2016
Byline: Andrew Osborn

Moscow - The Kremlin says it had zero involvement in the hacking of Democratic Party emails while U.S. officials say the hack originated in Russia. We may never know who is right, but one thing is for sure - Russia had motive, capability and form.
Seen through Kremlin eyes, Moscow would only be doing what it feels the United States has been doing to it for years anyway - interfering in a geopolitical rival's domestic politics in an attempt to destabilize and shape events.

President Vladimir Putin said in February he had seen specific intelligence suggesting Russia's foreign enemies - code for Washington - were preparing to meddle in Russian parliamentary elections later this year.

And in 2011, Putin accused the U.S. State Department and Hillary Clinton, its then head, of stirring up street protests against his rule.

"We need to head off any external attempts to interfere in the elections, in our domestic political life," Putin, who is facing re-election in 2018, told officers from Russia's FSB security service in February.

"You know that certain kinds of (political) technologies exist and have already been used in many countries."

That was shorthand for Ukraine, Libya, Egypt and Syria, which Putin thinks Washington irresponsibly destabilized. People who have studied him for years say he believes the United States is trying to foment the same kind of unrest to oust him.

His credo, set out when talking about Islamic State last year, is to strike first "if a fight is inevitable" and, as Russia has shown in its reaction to what it sees as NATO's aggressive build-up near its borders, to respond in kind.

"Clearly the Kremlin feels it should and can insert itself into domestic politics in other countries in much the same way it believes the United States and Europe insert themselves into Russian politics," Samuel Greene, the director of the Russia Institute at London's King's College, told Reuters.

"In their view it is fair play. They have seen the West involving itself in politics in Ukraine and other former parts of the Soviet space and feel they should be able to pretty much do the same thing."

He said such disruptive behavior was driven by a calculation: to stir up trouble in other countries so they have less bandwidth to focus on Russia.

Mark Galeotti, senior research fellow at the Institute of International Relations Prague, said he believed another motive for the hack - if Russia was behind it - would be to portray U.S. democracy as venal and chaotic and so take the sting out of Western accusations that Russian elections are corrupt.

Kremlin-backed media has tilted its coverage in favor of Trump over Clinton, and Putin has praised the Republican candidate as "very talented". But Greene said he thought what would matter most to Moscow would simply be to destabilize and to ensure that whoever won on Nov. 8 emerged as a weak figure.

Navigating a grinding economic crisis caused by low oil prices, and at odds with the United States over both Syria and Ukraine, Putin is under pressure.

He needs the West to lift the sanctions it imposed on Russia over its 2014 annexation of Crimea from Ukraine, which have cut off access to Western credit markets and technology imports.

Above all, though, he wants to make sure that external forces do not derail his own push for continued dominance in a political landscape where the liberal opposition is almost completely absent from TV screens and parliament.

RED WEB

Nikolai Patrushev, the head of Russia's Security Council, said earlier this year there had been a spike in the number of cyber attacks on Russian government bodies and critical infrastructure by foreign intelligence services.

And Putin, speaking in February, complained about what he said were more than 24 million attacks in the past year.

Andrei Soldatov, an expert on the FSB and co-author of Red Web, a book about the Kremlin's sprawling surveillance machine, told Reuters he thought if Russia had hacked the Democratic Party it would have been to send a signal that it could do the same and wanted U.S. intelligence services to desist.

"This could have been an attempt to deter the United States (from hacking and meddling), to try to shake the U.S. establishment, and to try to weaken Clinton," said Soldatov.

"It's pure politics, it's not about military secrets."

In Moscow, Trump, who has spoken of his desire for better relations with Russia and praised Putin, is seen as far more likely to cut a sanctions deal with Russia, while Clinton is regarded as a hawk on Russia.

"Everyone in Moscow believes that with Clinton in the White House it would be absolutely impossible to get the sanctions lifted," said Soldatov.

Trump has already raised hackles in Ukraine by saying he would be willing to consider lifting sanctions.

CAPABILITY

Experts say the Russian state, via the FSB, has a well developed offensive hacking capability. It has previously been accused of deploying that capability in Estonia, Georgia and Ukraine. Russian military intelligence, GRU, is known to have similar capabilities, Soldatov said.

There are also other non-state hacker groups which experts say sometimes collaborate with the security services, motivated by patriotism or money.

Galeotti said Russia's capacity to mount cyber attacks had increased over the past two years. Previously, Moscow would force amateur hackers into its service, he said, but lately "what we are seeing is much more of a push towards creating professional in-house capacity".

In this case, however, Soldatov said he thought it more likely that amateur hackers would have been responsible for the U.S. hack rather than the FSB or GRU who, if involved at all, would have played only a very minor role.

One reason for reaching that conclusion was how sloppily and hastily prepared the cover-up of the hack looked, he said.

Pakistan Dawn
FIA presents proposals to deal with cybercrime
Tuesday, 02 August 2016
Byline: Zulqernain Tahir

Lahore - As the Senate recently passed a law against cybercrime, the Federal Investigation agency (FIA) has proposed establishment of a special tribunal, purchase of (IT-related) equipment and extensive training of officials of all departments of law enforcement agencies to deal with the new challenge. "The FIA has proposed to the interior ministry that there is an urgent need for capacity building of law enforcement agencies and acquiring of modern equipment by the departments concerned to deal with cybercrime offences after enactment of the new cyber law. There is also a need for setting up a special tribunal to exclusively hear the cases related to cybercrime. Otherwise, mere introducing a new cyber law may not fully help achieve the purpose," an FIA official told Dawn on Monday.

The agency has also suggested that investigating officers, judges and prosecutors be taught local and international cyber laws and training of cybercrime investigation officers of FIA's National Response Centre (NRC) be conducted by foreign experts.

"International linkage for information sharing regarding cyber security should be established and signing of international covenants and agreements for international cooperation in combating cybercrime should be made. In addition to this, procurement strategies for secure and resilient hardware and software products should be developed," the FIA said.

The agency pointed out that since the general public and government institutions took cybercrime security casually which often resulted in hacking of accounts, misuse of IPs and breaking into software systems through backdoor and other serious offences, there was a need for launching awareness and education campaigns for cyber security (through media, seminars and workshops).

The NRC was established in 2007 at only five FIA stations -- Lahore, Karachi, Rawalpindi (Islamabad), Peshawar and Quetta -- with 'limited' resources, space, manpower and logistic support.

After the launch of 3G/4G technology in Pakistan, the use of internet has increased tremendously. The FIA official said that subscriber logs were not currently being provided by cellular companies, which meant that if a crime was committed by using 3G/4G subscriber, the IP (internet protocol) address of mobile number was not easily accessible.

The FIA called for developing a mechanism for monitoring internet traffic.

At present all internet service providers (ISPs) in the country are under the Pakistan Telecommunication Authority (PTA).

The FIA said that since Pakistan had not signed any mutual legal assistance treaty (MLAT) with the United States or other European countries, social networking sites often refused to provide detail of the suspects involved in cybercrimes through their websites.

"Technical experts of FIA's cybercrime wing use their own social engineering methods to trace suspects. Different web hosting service providers also often do not provide data regarding ownership of websites, thus making it difficult to lay hand on suspects," another FIA official said, adding that offenders usually used the software over internet or other different websites to make calls anonymously through Skype, Viber, etc.

"These calls do not reflect in the call data record. The mobile companies and other long distance and international licence calling companies should be directed to only allow those incoming calls which are through legitimate channels and also in proper caller line identification format," he said.

Times of Israel
Israeli lawmakers advance bill to streamline cybersecurity
Tuesday, 02 August 2016
Byline: Judah Ari Gross

Jerusalem - The Knesset's Foreign Affairs and Defense Committee approved a bill to bring the country's various cyber defense groups under one umbrella on Monday, the committee announced.
The bill will return to the plenary for a second and third reading later this week, where it will likely pass, before it is signed into law, the chairman of the committee, Likud MK Avi Dichter, told reporters Monday. "I'm not exaggerating if I say that the central threat of the beginning of the 21st century is the cyber threat," he said.

To address that threat, the committee's cyber-defense subcommittee has worked since July 2015 to craft a comprehensive and streamlined proposal to address the country's preparedness toward hacks and other digital attacks.

"During the last year, we spent dozens of hours with each body to hear how they work and how they think our preparedness should be," Dichter said in the Knesset on Monday.

One of the subcommittee's main findings was the need for one responsible body -- the National Cyber Authority -- to oversee both civilian and military networks. For example, the authority would monitor the cyber defenses of the IDF and the Mossad, as well as the Electric Company and the Water Authority.

This National Cyber Authority will be responsible for the nation's networks and overall security against cyberthreats. However, it will not necessarily act as a shield for hacks and attacks of private citizens.

Committee member Omer Barlev, a Labor MK, cited the recent hack of the US Democratic National Committee, in which the political group's emails were accessed -- allegedly by Russia -- and distributed, as an example of a cyberattack the authority would not necessarily protect against.

"It depends on which political party was affected. If it was Labor, then probably not," Barlev said with a laugh. "But really it depends on how classified the information is," he said. "There's a list of specific groups the authority protects, which doesn't include political parties."

While the committee said that something along the lines of the DNC hack would not fall under the purview of the National Cyber Authority, some American analysts have categorized the allegedly Russian operation as a full-scale attack on the United States itself, not on a political party, as it represented an attempt by one country to muddle the affairs of another.

"This is not a Democrat or a Republican issue, this is a national security and a democracy -- with a big D -- issue," Peter W. Singer, a senior fellow at the New America Foundation, told Reuters's War College podcast this week.

To explain the exact nature of the kinds of attacks the authority will try to prevent, Foreign Affairs and Defense Committee member MK Ofer Shelah mentioned the Russian cyberattacks against Georgia, which kicked off a six-day war between the former Soviet republic and Russia in August 2008.

Throughout the short conflict, Russian hackers brought down some of the country's network infrastructure and also attacked and defaced government websites as a form of psychological warfare. "That war started in the cyber realm, not with something physical," Shelah said. "If you wanted to you could see it as a weapon of mass-destruction."

The cyber-defense subcommittee presented its findings in a report released Monday, in both classified and unclassified form, dealing specifically with the "division of responsibilities and authorities" in that area.

Shelah and the other members of the cyber- defense subcommittee met with representatives from the Israel Defense Forces, Shin Bet security service, Mossad, Israel Police and Foreign Ministry.

"There was no single body that had the exclusive ability to deal with the challenge [of cyberattacks] and commit itself to true cooperation between the different groups," the subcommittee said in a statement.

The subcommittee determined that an umbrella organization was necessary due to the fact that it discovered during the course of its investigation "disputes and even clashes between the different bodies."

This National Cyber Authority is meant to prevent such conflicts; however, the decision to have the civilian, governmental authority responsible for both civilian and military networks rankled some members of the subcommittee, including its new chairperson, Likud MK Anat Berko.

"Something that definitely bothers me is that it is a non-defense agency," Berko told reporters. "That means it's breached in terms of security. There will be academics and completely civilian bodies, along with sources and information from the defense agencies. We can't have a leak of intelligence information and work methods."

The National Cyber Authority was created in February 2015 and brought into operation two months later, but did not officially receive any powers or responsibility under Israeli law, an issue that the bill will address.

The legislation will amend an existing law -- the "Regulation of Public Security Bodies" -- to formally allow the prime minister to appoint a head of the National Cyber Authority who will serve as the "authorized officer" for issues concerning cyber defense. Under a temporary order in place until 2018, Baruch Carmeli has been named head of the National Cyber Authority.

This proposed law is only one of a series of actions the government will take to formalize and create the country's digital defenses. However, members of the subcommittee noted the future is still unclear for cyber defense, as the field and the threats presented by it are rapidly evolving and changing. "Things are changing at tremendous speed," Shelah said. "And we will have to change while on the move."

Dichter, who presented the subcommittee's report, took pride in the fact that the issue of cyber defense was being addressed proactively rather than reactively. Unlike "Iron Dome or the different Patriots" -- Israel's missile defense batteries -- "which were created in response to rockets being fired at Israel," Dichter said, the decision to address digital threats preceded the attacks.

Times of Israel
IDF looks to a 'one-network' army to fight future wars
Tuesday, 02 August 2016
Byline: Shoshanna Solomon

Jerusalem - As Israel marks a decade since the Second Lebanon War, the army has used the past 10 years to take stock of lessons learned from the conflict.
One of the key changes has been to make a technological push to increase collaboration between the Israel Defense Forces' various military arms so that the air and ground forces, the navy and intelligence corps can join efforts on the battlefield based on real-time information they receive

"Today, instead of the army adding budgets for more units or planes or ships, the push it so invest in better connecting the existing forces and increase their effectiveness through collaborative activities,"

said Yariv Nir, head of the army's operations department in the signal (C41) corps, in an interview with The Times of Israel.

In 2006, the IDF encountered a significantly tougher enemy in Lebanon's Hezbollah than it had faced in its skirmishes with Palestinians in Gaza and the West Bank, armed with guns and improvised explosives. Over the course of the 34-day war, 121 Israeli soldiers fell to the Shiite group's anti-tank missiles, mines, rockets, and machine gun fire.

Some 44 Israeli civilians were also killed during the course of the conflict from the near-constant barrage of missiles that rained down on northern cities. In Lebanon, nearly 1,200 people died, though the civilian-to-combatant ratio remains highly contested. Israel says that more than half of those killed were combatants, while Hezbollah claims just 250 fighters died in the war.

The conflict began on July 12, 2006, when two Israeli soldiers -- Eldad Regev and Ehud Goldwasser -- were kidnapped by Hezbollah gunmen near Zar'it along the northern border and smuggled back to Lebanon.

Investigations into the unfolding of the events revealed that there had been command failures during the war, with soldiers unprepared for the new kind of warfare and terrain they were facing. They also highlighted an acute lack of communication that existed between the various military forces, Nir said.

One of the more glaring examples of these communication failures occurred on the first day of the war, following the kidnapping of Regev and Goldwasser. In a 2009 tell-all book, Brig. Gen. (res.) Gal Hirsch, who led the Northern Command's 91st Division during the conflict, details how crucial intelligence ahead of the kidnapping did not reach him or his soldiers on the ground until weeks later.

The army is addressing these issues, Nir said, ensuring relevant training is given to all soldiers at all levels and increasing the level of communication between the branches.

For the past three years the Signal (C41) Corps has been implementing a plan called the Network Centric IDF Program (NCIP), which will create a "one-networked army" based on a joint communications platform for all the various arms of the military.

"The idea is to create a network on which all the forces operate together - to allow the pilots, the tank commanders, the ships and the soldiers on the ground to speak on one network and be on the same page at the same time," Nir said.

The joint network already works like this: if commanders on the ground identify terrorists in a house, they can pinpoint the location on a laptop screen, and signal in real time to a nearby plane or ship the location of their target. "The aim is to deepen this kind of networked operations," Nir said.

Still today each base and the general staff receive separate inputs from the air force, intelligence, land forces and navy. Each of these arms have their own communications fiber with their own routers and encryption systems.

"The aim of the 'one-network army' is to have one fiber on which everyone works, one computer for all. Access will be allowed to all those who are eligible," Nir said. "This will enable greater resources efficiency, but also greater operational efficiency. We have started implementing this process in the past year."

The army's decision to move many of its bases to the Negev, with tens of thousands of soldiers relocating to the wide open spaces down south, was a key catalyzer in making a networked army much more of a reality, Nir said.

"We are taking advantage of this move to build new technologies that support this plan. We are setting up a new telecoms infrastructure, developing new virtual and cloud technologies, increasing our data centers. All this will enable us to be a joint force with joined platforms." The ability to share video, voice and data, will be central to the army's technological push, he said.

Operation Protective Edge, fought against Hamas in the Gaza Strip in 2014, was in effect the first networked war in the world and one in which the IDF operated with some of the new joint-network systems in place, Nir said. "That operation very much strengthened the concept of a one-network army, proving that we are going in the right direction."

In an age of greater digitalization and just one network, the threat of cyber-security attacks is high, Nir said. Securing the network will be a significant challenge in the coming years, and the IDF has to make sure that it maintains the security of its data even as it makes the most of the potential of the joint network.

The main challenges ahead, according to Nir, are to learn from past mistakes and make sure the soldiers and forces are trained to meet the tasks they will be facing in the future and to ensure the security and continuity of the network operations, he said.

Fars News Agency
Coordinated Cyber Attacks Target 20 Russian Organizations
Tuesday, 02 August 2016

Tehran - Computer networks of some 20 Russian organizations, including, state, defense and scientific organizations, came under cyber attack, the Russian Security Service (FSB) said.
The high profile organizations' network have been infected with malware used for cyberespionage, Alwaght reported.

"The advanced software was tailored for each target individually based on unique characteristic of the computer under attack," the FSB said in a statement.

According to FSB report, the malware could be used to monitor internet traffic, take screenshots, secretly take recordings with an infected computer's camera or microphone, log keyboard strokes and conduct other forms of surveillance, the FSB said.

"The IT assets of government offices, scientific and military organizations, defense companies and other parts of the nation's crucial infrastructure were infected," the report added.

The security agency said that all the cases are linked and appear to be part of a well-coordinated attack requiring considerable expertise. The coding of the malware and vectors of attack are similar to those used in previous cyber-offensive operations against targets in Russia and other nations, the report stated.

The agency did not specify which party it suspects to be behind the reported cyber espionage or whether it was sponsored by any foreign government.

Kaspersky Lab, a Russian computer security company, said that it is investigating the activities of a "powerful cyber gang" that has targeted Russian organizations.

"We need some time to confirm the data in our possession. After that we'll be ready to share the results of our inquiry," Kaspersky Lab's press-service said.

The report comes shortly after the US media accused Russia of hacking the DNC, claiming that the Kremlin wants to influence the outcome of the November presidential election. When asked about the allegations, Russian Foreign Minister Sergey Lavrov said that he would not comment because he did not want to swear.

Iran Unveils Home-Made Drone with Jamming Capability
Tuesday, 02 August 2016

Tehran - Iran on Monday unveiled a new home-made drone which is capable of jamming the enemies' communication systems.
The drone was displayed in an exhibition of the Iranian Ground Force's latest achievements in Tehran. Ground Force Commander Brigadier General Ahmadreza Pourdastan visited the exhibition on Monday.

In addition to the drone, other Unmanned Aerial Vehicles (UAVs) with the capability of taking images and footages and jamming enemy drones' camera and surveillance systems as well as a drone equipped with destructive laser weapons were unveiled in the exhibition.

Also, in May, Iran had unveiled a new UAV which can be used for reconnaissance and combat operations.

The drone named 'Siraf' has a flying range of 100km and was unveiled during Beit ul-Muqaddas 28 wargames in the Central province of Isfahan at the time.

Siraf which is capable of taking images and real-time transfer of them has been built by students at the college of the Ground Force's artillery training center in Isfahan.

Also, in February, the Islamic Revolution Guards Corps (IRGC) showed the newly-designed model of its longest-range drone, Shahed (Eye Witness) 129, during the annual rallies on the occasion of the 37th anniversary of the victory of the Islamic Revolution in Iran.

The new model whose features haven't been revealed yet to the public is different from its predecessors, at least, in appearance. Yet, it could be said that the aircraft's nose has gone under some changes.

The Shahed 129, which was unveiled in September 2012, is capable of carrying out eight combat and reconnaissance missions for 24 hours and has a flying range of 2,000 km.

Hackers can access WhatsApp in seconds
Tuesday, 02 August 2016

Dubai - It takes intruders just 30 seconds to gain access into a smartphone's instant messaging services such as WhatsApp, the UAE-based non- profit online safety organisation, Emirates Safer Internet Society (E-SAFE) has warned.
E-SAFE Emirati youth champion, Hussain Adel Al Hashmi, a student of Al Ittihad National Private School, provided a live demo during a Press conference held in Dubai on Sunday on how a user could be tricked by intruders to gain access to their instant messaging apps.

The E-SAFE team launched the Youth Online Safety Campaign with the hashtag, '#SafeUpWhatsApp', informing teens how they can stay safe on social media.

The team said a survey conducted by Kaspersky Lab with B2B International in 2015 showed that despite the UAE's relatively small population, it is the second most attacked country online in the Middle East.

The Dubai Police's Al Ameen Service received nearly 300 calls from blackmail victims between 2013 and 2014. Various cases of trauma and attempted suicides have been reported by victims of online

sextortions and blackmailing. In a noteworthy case from a neighbouring country, a man blackmailed 60 children and published 45 indecent photos of them online when they refused to give in to his blackmail.

In a new dipstick survey undertaken by E-SAFE in the region to determine the level of security practised by WhatsApp users, 42 per cent of respondents said they use the app 'extensively', while over 50 per cent use the app 'moderately'.

The survey also found that 88 per cent of WhatsApp users would allow immediate family members to access their phone unattended, while 22 per cent said they allow friends to go through their phone.

Also, 70 per cent of the participants said they never log out of WhatsApp Web - an option which allows individuals access to their WhatsApp account from a PC or other devices.

Following the discovery of the potential misuse of the app's web feature, E-SAFE has reached out to WhatsApp Inc. to urge it to introduce a safety notification feature that informs users whenever their WhatsApp account is accessed from a web device.

Emails of Seoul officials hacked by N. Korea: prosecution
Tuesday, 02 August 2016
Byline: Staff reporter

Seoul - A group of presumably North Korean hackers have attempted to break into the emails of some 90 South Korean diplomats, security officials and journalists, and dozens of passwords have been leaked in the process, state prosecutors said Monday.
The latest cyberattacks took place as Seoul is striving to better guard against Pyongyang's online infiltrations following a string of malicious attacks on government and corporate websites, for which the communist country has been blamed.

The Supreme Prosecutors' Office said that between January and June the group attempted to hack into the emails of officials at the ministries of foreign affairs, defense and unification, and also those of the journalists posted at these ministries. The victims also include some researchers specializing in North Korean issues.

During the attempts the passwords of 56 email accounts were compromised, the office said.

The investigators acted on a report earlier this year that some hackers had attempted to launch "spear phishing" attacks to break into some government officials' emails. Spear phishing is a type of fraudulent email attack that targets specific individuals or organizations by appearing to be a legitimate email from another known person or organization and asking unauthorized access to their confidential data.

Investigators are currently trying to ascertain whether any state secrets had been leaked during the hacking attempts.

Prosecutors pinpointed North Korean hackers as the culprits in the latest attacks, as the method used mirrored North Korea's high-profile cyberattack in 2014.

The prosecutors found that the hackers established some 27 phishing sites to carry out the schemes.

In cooperation with the National Security Service and the Korea Internet and Security Agency, prosecutors have shut down the phishing sites.

"It is important (for government officials) to refrain from using private email accounts for official work, and they should frequently change their email passwords," a prosecution official said. "When officials carry out important tasks, it is desirable for them to take some security steps such as temporarily shutting down the internet."

In recent years, the North has repeatedly shown a willingness to use its cybercapabilities to not only pose security challenges to its potential adversaries, but also wring out financial gains -- as evidenced in its May attack on a major South Korean commercial website, observers here said.

The North is alleged to have broken into the server of online shopping mall Interpark, which resulted in the leak of the personal data of an estimated 10.3 million people, including their names, home addresses and email addresses. It then tried to blackmail the mall for profit.

Seoul officials believe that the North's General Bureau of Reconnaissance (GBR), its premier military intelligence agency, has masterminded major online attacks on South Korea. Among the pivotal organs under the GBR is Unit 121, which is tasked with penetrating enemy computer networks to secure confidential documents or spread viruses.

According to defectors and reports, the North selects cybersavvy students from across the country at an early age and sends them to Geumseong Middle School in Pyongyang to give them intensive hacking lessons.

They are then enrolled into Command Automation University, Kim Chaek University of Technology or Moranbong University for further education. Upon graduation, they begin their career as elite cyberwarfare officers.

Xinhua News Agency
Cyber regulation to better protect users' interests
Tuesday, 02 August 2016
Byline: Staff reporter

Beijing - A series of cyber regulations officially took effect Monday, as China aims to better protect online users' interests and better guide the development of China's Internet industry.
According to a regulation on search engines, released by the Cyberspace Administration of China, search providers must ensure objective, fair and authoritative search results.

Search providers must improve censorship and remove any illegal content that could harm national interests and people's lawful rights.

The regulation ordered that search engine providers must change the paid-for listings model and rank search results according to credibility rather than price-tag.

All paid-for listings should be labeled clearly, so that they are distinguishable from normal search results, and the returned content should not mislead users, the regulation said.

The regulation came after an investigation into Baidu, which was criticized for influencing users' choices by presenting misguiding information.

Wei Zexi, a computer science major at Xidian University in northwest China who had cancer, fell victim to Baidu's "pay to play" scheme. He died in April after a controversial treatment he found via a Baidu search failed. An investigation revealed that the search engine giant had sold highlighted advertizing space to questionable medical institutions.

Another online regulation taking effect requires real-name registration for users of mobile phone apps, in an effort to hold users responsible for content they share.

On one hand, if users break the rules, they will be warned, their use of the service may be restricted and, as a last resort, accounts may be closed.

On the other hand, providers of app services must protect the privacy of its users. They will be subject to public supervision and must deal with illegal content in a timely manner.

The fast growing mobile app market has seen a boom in malicious cyber attacks, online malware and security breaches. The regulation clearly defines the role of app developers and service providers, and ordered the protection of users' right to know and purchase option.

These two regulations order all web directories to have a channel to receive complaints and compensate for any damage caused to users.

"Cyber security isn't just about national development, but also concerns the immediate interests of every Internet user. Online service providers should be aware of their social responsibility," said Li Yuxiao, a professor on Internet governance from Beijing University of Post and Telecommunications.

The regulations reflect the growing importance China attaches to public concerns over the Internet, as well as its resolve to improve its governance capability both online and offline, said Li.

The regulations are expected boost netizens' awareness of their own duty and rights online, and supervise the operation and management of Internet companies, to create a healthy environment for the people and the Internet Plus industry, said Li Zhigang, chief of Beijing Academy of Telecommunication Research.

The number of Chinese netizens has soared to 668 million.

Associated Press
Seoul blames North Korean gov't organization for email scams
Tuesday, 02 August 2016
Byline: Hyung-Jin Kim

Seoul - An organization likely run by North Korea's government hacked into the email accounts of dozens of officials, journalists and others in South Korea this year, Seoul officials said Monday, the latest cyberattack that the South blames on its rival.
The organization sent phishing emails to government officials, journalists and professors who specialize in North Korean affairs to try to trick them into giving away their passwords, Seoul's Supreme Prosecutors' Office said in a statement.

The passwords for at least 56 of the email accounts were eventually leaked, according to the statement. Seoul authorities were investigating whether any confidential government information was stolen, but the prosecutors' office said there had been no reports of leakage of sensitive information.

The statement said the contents of the phishing emails, a China-based IP address and a web-hosting service provider were the same ones used in a previous North Korean cyberattack. It didn't identify the suspected organization.

South Korea accuses North Korea of launching a series of cyberattacks in recent years, but the North has dismissed the allegations. Last week, South Korean police said they believe North Korea was behind the recent leakage of personal data for more than 10 million users of an online shopping site.

South Korea said last year that North Korea has a 6,000-member cyber army dedicated to disrupting the South's government and military. The figure was a sharp increase from a 2013 South Korean estimate of 3,000 such specialists.

North Korea's hacking technology has been improving every year, according to Simon Choi at Seoul-based anti- virus company Hauri Inc. He said the North has carried out many more cyberattacks than is publicly known, making it difficult for South Korea to fend off all of them.

Many previous alleged North Korean cyberattacks failed to infiltrate the targeted computer systems at businesses and government agencies. But in several cases, hackers destroyed hard drives, paralyzed banking systems or disrupted access to websites. One attack was so crippling that a South Korean bank was unable to restore its online services for more than two weeks.

The Koreas have been divided by the world's most heavily fortified border since the Korean War ended in 1953 with a cease- fire, not a peace treaty. Earlier this year, North Korea conducted its fourth nuclear test explosion and conducted a prohibited long-range rocket launch, prompting worldwide condemnation and tougher U.N. sanctions.

Le Figaro
Antiterrorisme : Israël s'attaque à Facebook
Tuesday, 02 August 2016
Byline: Marc Henry

Jérusalem - Pour tenter d'empêcher les crimes des « loups solitaires » et l'essor du « terrorisme viral » , un projet de loi prévoit jusqu'à 70 000 euros d'amende par message incitant à la violence sur les réseaux sociaux.
Proche-Orient Israël s'est lancé sur la piste des « loups solitaires » en déclenchant une offensive contre Facebook. Ce réseau social est accusé de refuser de censurer les messages encourageant les Palestiniens à recourir à la violence. « Facebook est devenu un monstre » , proclame Gilad Erdan, le ministre de la Sécurité intérieure, qui a été jusqu'à affirmer qu'une « partie du sang des victimes » d'attentats anti-israéliens « retombe sur la tête de Mark Zuckerberg » , le patron du réseau social. Des propos très durs qui reflètent un certain désarroi face à une « intifada » menée par des Palestiniens auteurs d'attentats au couteau ou à la voiture bélier qui ont la particularité de n'appartenir à aucune organisation susceptible d'être surveillée et infiltrée.

Face à ce nouveau type de violences, l'armée israélienne, le Shin Beth, le service de sécurité intérieure et la police ont constitué ou renforcé leurs unités spéciales chargées de placer les réseaux sociaux sous très haute surveillance. Mais ce dispositif n'a pour le moment qu'un succès limité. En dix mois, une centaine de Palestiniens de Cisjordanie accusés d'avoir posté des messages incitant au terrorisme ont été arrêtés. Résultat : le gouvernement veut passer à la vitesse supérieure contre le « terrorisme viral » .

Un projet de loi a été présenté au Parlement. Des amendes pouvant aller jusqu'à 70 000 euros pour chaque message incitant à la violence seront infligées. « Les motivations de Facebook sont avant tout financières, c'est pourquoi nous devons l'attaquer au portefeuille si les dirigeants de cette entreprise

continuent à ignorer les appels au terrorisme » , a expliqué Revital Swid, du Parti travailliste, coauteur du texte.

Mission impossible

Le projet de loi doit permettre à un tribunal d'ordonner à Facebook, Google, YouTube, Twitter ou d'autres réseaux sociaux et sites d'informations de retirer tout contenu présentant un danger pour « les personnes, la collectivité ou la sécurité de l'État » . « Si les réseaux sociaux s'étaient décidés à agir plus agressivement contre les messages terroristes, nous aurions évité de faire appel à la loi » , assure Ayelet Shaked, la ministre de la Justice.

Sur le papier, cette nouvelle législation doit permettre de retirer beaucoup plus rapidement des messages jugés dangereux. Jusqu'à présent, les responsables des services de sécurité lorsqu'ils repéraient des textes, des photos et autres vidéos appelant à commettre des attentats devaient s'adresser au réseau social qui relayait ces contenus pour demander leur suppression. En cas de refus, un juge pouvait statuer. Mais cette procédure pouvait prendre des jours. Une éternité dans le monde virtuel. Autre difficulté : passer au tamis les messages constitue un énorme défi : plus de 80 % des Palestiniens utilisent des réseaux sociaux pour s'informer et échanger des messages.

La tactique adoptée pour tenter de contrôler ce gigantesque flux d'informations ne fait d'ailleurs pas l'unanimité. « Le projet de loi qui veut contraindre une entreprise privée à se transformer en un énorme système de censure nécessiterait une quantité totalement irréaliste de personnel qualifié pour assurer toute la supervision. Il s'agit d'une mission qu'il est pratiquement impossible de mener à bien » , estime l'Institut israélien pour la démocratie.

Dans les médias, le ton est plutôt au scepticisme. Le quotidien Maariv souligne que la fermeture éventuelle de Facebook ne mettrait pas fin au terrorisme : « Des réseaux sociaux se créent tous les jours et se font concurrence. Ce n'est pas l'État d'Israël qui peut empêcher cette évolution. » Et de conclure : « Telles sont les nouvelles règles du jeu. »

Washington Post
Cyberwar, out of the shadows
Tuesday, 02 August 2016
Byline: Editorial Board

Editorial - Thousands of U.S. businesses and other institutions have been besieged by cyberattacks in recent years. But the penetration of the Democratic National Committee stands out. The theft of internal emails, attributed by some to Russia, and the use of those emails to sow discord in the middle of a presidential campaign, deserve a strong response from the United States. Along with the massive attack on Sony Pictures Entertainment and the colossal theft of sensitive records from the Office of

Personnel Management, the DNC hack is a sign of how dangerous and real this field of conflict has become.

A strong response may not be easy. The problem of attribution is exceedingly complex and not always solvable. Retaliate against whom? And what kind of response is appropriate? Would it be fair play to turn the tables on Russia and leak information about the financial holdings of President Vladimir Putin and his cronies? When specific culprits were identified in other cases, the United States issued criminal indictments against Chinese military and Iranian hackers, although they are unlikely to be prosecuted; in the Sony Pictures case, the administration imposed more sanctions on North Korea. In the OPM loss, quite probably to China, the government remained mum, as it often does about espionage.

The DNC hack is a fresh reminder that the United States needs a more robust and open debate about cyber-conflict than it has had to date. Most of the public discussion has been about defensive measures, such as how to protect networks of the government and the private sector from attack. Offensive cyber-capabilities have been largely hidden. The United States has been loath to admit it has cyberweapons or has used them, such as the secret Stuxnet computer worm used to attack Iran's nuclear program.

There are signs of change. In The Post last month, reporters Ellen Nakashima and Missy Ryan described a new team created by U.S. Cyber Command to carry out offensive cyber-operations against the Islamic State. The group, called Joint Task Force Ares, is composed of about 100 people, based at Fort Meade, Md., home to Cyber Command and the National Security Agency. The fact that this unit, under Army Lt. Gen. Edward Cardon, has been openly identified is a genuine step toward transparency. Aaron Hughes, a senior Pentagon official for cyber-policy, was quoted as saying, "We want to take cyber out of the shadows, where people think we're doing something malicious or spooky, and treat it like we do our operations in other domains." Exactly right: Cyber now ranks with air, land, sea and outer space as a domain of military conflict.

Secrecy in military and intelligence, including offensive cyberattacks, is essential to protect operations. But that should not preclude a broader discussion, to better understand the threats and what to do about them.

In 2012, President Obama signed Presidential Policy Directive 20, which stipulated that offensive cyber-operations would require presidential approval if they could result in loss of life, serious levels of retaliation, damage to property, adverse foreign policy consequences or economic impact. This settled some uncertainty about chain of command, but there are still many other questions that could be usefully debated in public. For example, what are the real effects of cyberweapons? How were cyber-operations used in Iraq and Afghanistan? How does the United States stack up against other military cyber-forces?

On July 26, Mr. Obama approved a new presidential directive that attempts to further define cyberattacks and what constitutes a "significant cyber incident," as well as how to respond. This seems to be a worthwhile exercise but is hardly the last word. We need more discussion about the limitations

and unknowns of cyber-conflict, including how to manage escalation and the risk of retaliation; and when to move beyond the cyber domain.

During the Cold War, the nuclear arms race involved many secrets, but policy and doctrine about the atomic bomb were widely debated. The United States maintained a nuclear weapons employment policy, kept classified, and also issued a declaratory policy, open for all to see. Cyber could use this, too: a simple declaratory policy. Meanwhile, let's have an open debate about how to respond to the DNC hack.

IDG News Service
Cybercrime infrastructure being ramped up in Brazil ahead of Olympics
Tuesday, 02 August 2016
Byline: Lucian Constantin

New York - Over the past few months, cybercriminals have set up thousands of malicious domains and servers in Brazil in anticipation of the 2016 Olympics in Rio.
Threat data collected by Fortinet from over 2 million sensors worldwide shows that between April and June, the number of malicious URLs detected in Brazil grew by 83 percent. That's an unusually large spike compared to the 16 percent growth in malicious URLs for the rest of the world.

According to a Fortinet report due to be released Tuesday, the number of spoofed domains that are typically used in phishing attacks has also increased, particularly those that try to mimic payment systems and government institutions.

The company's sensors detected over 3,800 malicious websites and URLs containing the government designation ".gov.br" that have likely been set up to target government and other officials involved in the Olympics.

Phishing activity increased 76 percent worldwide between April and June, with Brazil, Colombia, Russia and India representing the top four countries where this type of activity was observed. The top 5 phishing domains with the .br extension were used to spoof popular online banking services.

The Fortinet researchers believe that a large number of cybersecurity attacks will occur during the Rio Olympics, which is not unusual for such an event. However, compared to previous Olympic games, more of the attacks are likely to succeed because cyber threats are not treated as a very high priority in Brazil, they said.

According to a World Economic Forum (WEF) survey, businesses in Brazil ranked data fraud and theft as 16th among the risks they're concerned about, while cyberattacks were ranked 23rd. By comparison, U.S. businesses view cyberattacks as the number one risk and for those in the U.K. it's the number two concern.

Taking cyberattacks seriously might explain why 165 million cybersecurity events detected during the 2012 London Olympics resulted in only 97 confirmed security incidents.

"This level of aggregation and protection does not happen without the right priority and investments for cyber attacks," and is unlikely to apply in Brazil, the Fortinet researchers said in their report.

Moscow Times
Clinton Hacking Claims 'Absurd,' Says Kremlin
Monday, 01 August 2016
Byline: Staff report

Moscow - Russian officials have rejected accusations of Russian involvement in the hack of U.S. Democratic Party computers as "absurd" and "insulting."
U.S. presidential nominee Hillary Clinton made the claims in an interview on American television program Fox News Sunday.

"We know that Russian intelligence services hacked into the DNC, and we know that they arranged for a lot of those emails to be released, and we know that Donald Trump has shown a very troubling willingness to back up Putin, to support Putin," Clinton said.

Clinton's statement comes weeks after Democratic Party officials were targeted by a cyber attack which resulted in the leak of thousands of private emails. Her campaign chairman Robby Mook earlier claimed the hack "was done by the Russians for the purpose of helping Donald Trump," an accusation that both Trump and the Kremlin deny.

The Russian government again denied the involvement of Russian agencies in the cyber attack on Monday, calling the accusations "vague" and "absurd."

"Official Russian departments certainly are not engaged, and have never been engaged in, cyberterrorism. It is entirely out of the question," Kremlin spokesman Dmitry Peskov said, as quoted by the RIA Novosti news agency.

Clinton's statement is merely part of her election campaign, Peskov said.

Russian Foreign Ministry also responded to the accusations Monday calling them "insulting and unworthy," the Interfax news agency reported.

Andrei Krutskikh, Special Representative of the Russian President for International Cooperation in Information Security, also said that Washington had not officially complained about the hack.

"These claims are put forward by people who are fighting for the presidency. Officials in the White House avoid commenting or do so only vaguely," he told Interfax.

Wall Street Journal
Social-Media Firms Target Terrorism
Monday, 01 August 2016
Byline: Sam Schechner

New York - Nearly half a million teenagers and young adults who had posted content with terms like "sharia" or "mujahideen" began last fall seeing a series of animated videos pop up on their Facebook news feeds.
In one, cartoon figures with guns appear underneath an Islamic State flag. "Do not be confused by what extremists say, that you must reject the new world. You don't need to pick," the narrator says. "Remember, peace up. Extremist thinking out."

The videos are part of three experiments -- funded by Google parent Alphabet Inc., with help from Facebook Inc. and Twitter Inc. -- that explore how to use the machinery of online advertising to counterbalance the growing wave of extremist propaganda on the internet, both from Islamist radicals and far-right groups.

The goal: See what kinds of messages and targeting could reach potential extremists before they become radicalized -- and then quickly roll the model out to content producers across the internet.

The study, detailed in a report set to be published Monday by London-based think tank Institute for Strategic Dialogue, is a step toward understanding what techniques work, said Yasmin Green, who heads the counter-radicalization efforts at Jigsaw, the Alphabet unit formerly known as Google Ideas.

"At the end of the day, it is a battle of ideas," said Zahed Amanullah, head of the counter-narrative program at Institute for Strategic Dialogue.

A drumbeat of violent attacks by radicalized individuals or small groups has killed hundreds in Europe, Asia and the U.S. over the past two months.

The government response has largely been to demand technology firms move faster in removing extremist content from their services.

But Islamic State is fast to open new accounts and expand its propaganda to new apps, leading to a game of whack-a-mole. "It's simply impossible to remove it all," said Susan Benesch, a faculty associate at Harvard University's Berkman Klein Center. "Even if one platform successfully takes something down, usually that content is available somewhere else."

Institute for Strategic Dialogue began working with Alphabet on how to better target its messages in 2014 in the U.K. In that study, Google showed some sponsored search results and videos to people in selected demographics searching for information about Islamic radicalism. In the new study, organizers expanded that work to different content on Twitter, YouTube and Facebook for users in the U.S., U.K. and Pakistan.

U.S.-based nonprofit Average Mohamed made animated videos that explain Islam and criticize jihadist groups for American teens. Harakat-ut- Taleem, run by an anonymous group in Pakistan, created videos to dissuade people from joining the Taliban.

The third project, called ExitUSA, targeted white supremacists and focused on people who had already become radicalized.

By the end of the experiments, each of which lasted about three weeks, internet users had been exposed to some element of the three campaigns about 1.6 million times. The most concrete impact was that eight people approached ExitUSA producer Life After Hate for help leaving white- supremacist groups.

Wall Street Journal
Putin's Infowar on America
Monday, 01 August 2016
Byline: L. Gordon Crovitz
Section: column

Column - This column recently predicted that Russia would disclose hacked emails just before the presidential election as an "October surprise." The first surprise came early, with last week's release of emails hacked from the Democratic National Committee, whose chairman resigned for rigging the primaries in Hillary Clinton's favor.
Expect more surprises before the election. Vladimir Putin has an unprecedented trove of hacked communications at his fingertips -- and shows canny timing on when to hit "send." Moscow has an ambitious strategy for information war that goes beyond affecting a presidential election. Israeli analyst Dima Adamsky wrote last year that the Russian "information struggle" entails "technological and psychological components designed to manipulate the adversary's picture of reality, misinform it, and eventually interfere with the decision-making process of individuals, organizations, governments, and societies."

Security experts believe Russia hacked all 63,000 of Mrs. Clinton's emails as secretary of state, including the 33,000 emails she destroyed, and that Russia supplemented this information by later hacking the Clinton Foundation and the State Department. That would mean Mr. Putin has a trifecta of sources to identify suspicious links between Mrs. Clinton and multi-million dollar donors to her foundation,

including authoritarian governments and crony capitalists, and favors granted by the Clinton State Department.

According to Mr. Adamsky, Russia's goal is to cause "disillusionment and discontent with the government and disorganization of the state and military command and control and management functions." It's hard to imagine anything more disillusioning to Americans than the release by Russia of incriminating emails Mrs. Clinton had refused to disclose even under U.S. court order.

In a paper entitled "The Anatomy of Russian Information Warfare" written in 2014, Polish analyst Jolanta Darczewska traced Russian information warfare theory to Stalin's spetspropaganda (special propaganda) program in the 1940s. In recent years Mr. Putin, a KGB veteran, extended infowar to include "information manipulation," which includes "using authentic information in a way that gives rise to false implications," disinformation, fabricating information and blackmail.

Russia attacked Estonian government websites and hacked Ukraine's election commission days before a vote. A German investigator last year concluded there was no evidence behind the WikiLeaks claim that the National Security Agency eavesdropped on Chancellor Angela Merkel's mobile phone. It was likely disinformation to drive a wedge between the U.S. and Germany. Russia's information manipulation is intended both to embarrass people and to inhibit honest communications by demonstrating that governments can't protect confidential communications.

Liberals who long treated Edward Snowden and Julian Assange as heroes are now offended that WikiLeaks distributed the Russian hacks of the DNC. Journalist Franklin Foer complained in Slate last week that the "breathtaking transgression of privacy" of Democratic Party officials will have a "chilling effect" undermining the ability "to communicate honestly." That was the exact purpose of the hacks of hundreds of thousands of U.S. diplomatic cables distributed by WikiLeaks in 2011 through the New York Times and London's Guardian.

"It is not our goal to achieve a more transparent society," Mr. Assange, the WikiLeaks founder, told Time in 2010. Instead, the objective is to force U.S. officials to "lock down internally and to balkanize" so they will "cease to be as efficient as they were."

What can be done about infowar? Donald Trump was criticized last week for encouraging Russia to disclose Mrs. Clinton's emails, but making them public would be the best way to deprive Mr. Putin of the advantage he gains by holding them. A U.S. ally that spies on Washington as much as Washington spies on it, such as Israel or France, would do Americans a favor by making public its copy of Mrs. Clinton's emails. Otherwise, Moscow can drip the emails out on its schedule with its spin -- or hold them back as blackmail against Mrs. Clinton should she reach the White House. American voters should know what Mr. Putin knows.

The Obama administration has been passive in response to Russia's infowar -- even reluctant to admit its existence officially. Washington's best deterrence would be to reply in kind. The U.S. could hack and

release Mr. Putin's bank accounts detailing how rich he has become in office. U.S. prosecutors could use hacked information to indict Putin business cronies and deny visas to their associates and relatives.

Despite Russia's audacious hacking, Director of National Intelligence James Clapper last week would only go as far as to concede: "It's fair to say Vladimir Putin feels like he is fighting a low-level, asymmetric war with the U.S." Because of the Obama administration's failure to fight back, Mr. Putin is enjoying many victories.

Christian Science Monitor
The secret linguistics clues researchers used to link DNC hack to Russia
Monday, 01 August 2016
Byline: Paul F. Roberts

Boston - Call it the telltale font.
For security researchers delving into the source of malicious software that infected the Democratic National Committee's computers, linguistic clues in computer fonts, messages buried in malicious applications, and even comments from the alleged culprit helped tie the attack back to Russia.

In fact, linguistics is becoming increasingly important as governments and cybersecurity firms seek to accurately identify lone hackers or the nations that are behind high-profile attacks. And the stakes for this kind of attribution are growing higher as the US has responded to recent breaches with sanctions, political pressure, and in the future could retaliate with military action.

"In the digital world, we look at every aspect of communication," says Mario Vuksan, chief executive officer of the cybersecurity firm ReversingLabs. "From the way a hacking group connects to an asset to the way the binary code is written to text and email messages."

For instance, code could be compiled on machines that are loaded with specific languages. And hackers could tip their hand by using expressions common in certain countries or languages.

When it comes to investigating cybercrimes, techniques range from classical linguistic pursuits, such as word count analysis that examines patterns of language use, to more behavioral analysis that tries to identify unique patterns or behaviors using lexical analysis, says Steve Bongardt, a former agent in the FBI's Behavioral Analysis Unit who know works with the firm Fidelis Cybersecurity.

Mr. Bongardt likens it to investigating a crime scene, with hacking groups or individuals falling back on well-worn modus operandi that govern how an attack is carried out and less regimented "rituals" that are just as suggestive of a particular actor.

But linguistic clues often fall far short of pinning attribution for any single actor, Bongardt and others agreed. Rather, they say, governments and law enforcement agencies investigating crimes need to look

to the preponderance of evidence - most of it not linguistic - as they attempt to understand who was behind an incident.

In the case of the DNC hack, a previously unknown hacker who identified himself as Guccifer 2.0 claimed responsibility for the breach. He said he was Romanian without any connections to the Russian government. But cybersecurity experts and tech journalists poked holes in those claims by closely analyzing his comment and other language and cultural identifiers in metadata.

Initially, however, an early profile of the suspected DNC hackers by the cybersecurity firm CrowdStrike relied on a wealth of technical evidence to support the theory two groups with links to Russian intelligence were responsible.

CrowdStrike's analysis did not rely at all on linguistic clues. Rather, it compiled a list of 12 separate indicators of compromise that were common to the two hacking crew. They ranged from malicious programs to tools for managing malicious software and extracting sensitive data.

But after Guccifer 2.0 emerged to claim responsibility for the DNC breach, researchers soon noted subtle clues in his speech - as well as in documents offered from his website - that cast doubt on his account of the hack. For instance, the tech news site Ars Technica noted those clues ranged from Russian language text buried in the PDF format of leaked opposition research on Donald Trump.

But that kind of information is still not conclusive, says Mr. Vuksan of ReversingLabs, making attribution a challenge when it comes to cyberattacks and breaches,

"Cyber being what it is, it's an area where covert action can be done at different levels in many different ways," he says. "Decoys, intelligence, and counter intelligence can all reside within the same breath."

Still, clues buried in language in blog posts, social media, or malicious code is critical in an age when nation-backed hackers aren't beyond using disinformation campaigns to cover their tracks.

Experts say that Guccifer 2.0's claim of credit for the DNC hack is strikingly similar to claims of responsibility following an attack on the French TV5Monde network in April 2015. After attackers took over the network's websites and displayed images promoting the Islamic State, a group calling themselves the CyberCaliphate said they were behind the breach.

However, on closer examination, the attack was carried about by the same group tied to the DNC hack, says Toni Gidwani, director of threat research operations at the firm ThreatConnect.

The purpose of such ruses isn't to fool everyone, says Mr. Gidwani. Instead, he says, its to be "good enough" to create doubt about the prevailing narrative. "If you look at the broader Russian doctrine of cyberoperations, sowing discord is a measure of success."

The Australian
ADF seeks eye in the fly in the sky
Tuesday, 02 August 2016
Byline: Brendan Nicholson

Canberra - The Australian Army will buy up to 200 spy planes -- small enough to be held between two fingers -- fitted with cameras to let troops see what threat is lying ahead.
The army says the nano drone will provide soldiers in the field with an "over the hill, down the road and around the corner" -reconnaissance capability.

It is likely to be used by a special forces combat team of four or five soldiers or by a platoon of 30.

The Australian Defence Force has opened tenders to supply 200 of the tiny helicopters, which The Australian has been told that with control units, batteries and other supporting equipment are likely to cost several million dollars.

One option is the game-changing Black Hornet nano, which was successfully trialled by Australian troops on operations in Afghanistan and Iraq.

The drones, which can help prevent soldiers walking into ambushes, bring back clear images by day or night in close to real time.

The army wants nano drones quiet and small enough to avoid being spotted by an enemy and their cameras sharp enough to collect clear images from at least 1km away and from up to 2.5km in rough terrain or through the windows of high-rise buildings.

It must be possible for troops to launch them while lying down and taking cover in vegetation or rocky terrain.

"It is vital for the patrol not to break from their position and potentially expose themselves to the enemy to use the system," Defence documents say.

The army wants a drone with an encrypted datalink so that an enemy cannot hijack it in flight.

It should also be able to land on a vantage point such as a building or in a tree and to continue to film.

The documents contain scenarios in which the mini spy aircraft could increase troops' safety and capabilities.

A patrol on foot could hide and send out the drone to gather intelligence so that an enemy might never know it was being watched.

Or a unit which comes under fire or which moves into a potential ambush zone can launch the drone to spy on enemy positions.

"The commander uses the data to formulate the assault plan. The team moves into assault positions to clear the enemy while the NUAS (nano unmanned aerial system) loiters to provide situation awareness during the assault."The operator would be able to carry the equipment easily with his normal load of military gear and his rifle and ammunition and would be able to advance with the rest of the unit.

London Times
Putin wages propaganda war on UK
Saturday, 30 July 2016
Byline: Dominic Kennedy

London - President Putin has launched a secret propaganda assault on Britain from within its own borders, The Times can reveal.
The Kremlin is spreading disinformation through a newly opened British bureau for its Sputnik international news service, and is infiltrating elite universities by placing language and cultural centres on campuses.

Analysts said that the push was part of Russia's military doctrine, which specifies the use of "informational and other non-military measures" in conflicts.

Moscow's intelligence agencies were accused by US cybersecurity experts this week of hacking the computer servers of the Democratic National Committee, which has nominated Hillary Clinton as its candidate in November's presidential election.

The release of 20,000 stolen emails, many of them embarrassing to the party's leaders, was blamed on the Kremlin after retrieved data suggested the documents had passed through its computers. It has led to suspicion that Russia is trying to subvert the US political system and gather support for the Republican nominee, Donald Trump.

The Russians' main British target is Edinburgh, which has been chosen as the UK headquarters of Sputnik. Since opening in the city, the news agency has published reports suggesting that the Labour MP Jo Cox may have been killed because of a plot by supporters of the European Union to sway the referendum result, a conspiracy theory that has run on Russian television. It also peddles the myth that the West agreed never to expand Nato to Russia's borders, a key plank of Moscow propaganda to excuse its 2013 invasion of Ukraine.

Sputnik's bureau is in an office building where tenants have minimum leases of five years. Although it is a fringe broadcaster, its stories are picked up by respectable media and politicians. Its immediate

predecessor, Russia's international news agency RIA Novosti, used Scotland as a testing ground for a black propaganda exercise by claiming that the 2014 referendum vote to stay in the UK had been rigged. The spoof story led to a 100,000-name petition for a recount.

It can also be revealed that the University of Edinburgh accepted £221,000 from the Russkiy Mir (Russian World) Foundation to host Britain's first Moscow-sponsored language and cultural centre. The foundation has also opened centres at Durham University, which accepted £85,000, and St Antony's College, Oxford.

Russkiy Mir and Sputnik were created by decrees issued by Mr Putin. Sputnik, which was set up in 2013, is the international wing of a governmentcontrolled news agency. It is headed by Dmitry Kiselyov, who is notorious for his homophobic pronouncements and has been put on an EU sanctions blacklist for being the central propagandist for the Russian invasion of Ukraine.

Russkiy Mir was launched by the president in 2007 and is run by Vyacheslav Nikonov, a former assistant to the Continued on page 2, col 3 Continued from page 1 head of the KGB, the Soviet Union's spy agency. Vladimir Yakunin, a longstanding member of Mr Putin's inner circle, sits on the board of the foundation.

Professor Nikonov, a dean at Moscow State University who outflanks even the president in anti-western rhetoric, is the grandson of Stalin's deputy Vyacheslav Molotov, whose 1939 pact with the Nazis led to the Soviet annexation of the Baltic states. The agreement that Professor Nikonov signed with the university, which awarded him an honorary doctorate in 2012, gives his foundation the right to be consulted on staff appointments at the learning centre in Scotland.

A Nato source accused Russia of "operationalising information" from within Britain. "The Russian information effort is to muddy the waters, to create uncertainty," he said. "Sputnik is part of an overall effort [to] present a Russian view."

Mr Putin backs the concept of a "Russian world", in which the millions of speakers of the language inside and beyond its borders have a shared "living space". His invasion of neighbouring Ukraine was under the pretext of defending the rights of Russian speakers in Crimea, leading to a conflict that has claimed thousands of lives.

Scotland is an attractive strategic target for Russia, which sees Britain -- a nuclear power and permanent member of the United Nations Security Council -- as a check on its ambitions.

The Scottish National Party's desire for independence from the rest of the United Kingdom is compared favourably in Russian media with Crimea's departure from Ukraine. The Trident submarine missile system, which is opposed by the SNP, is based on the River Clyde at Faslane. President Duda of Poland has warned of marked consequences for Nato if Scotland leaves the UK. Scotland also has a ban on

fracking. Some analysts have suggested that a vote for independence would make the country dependent on natural gas from Russia.

The University of Edinburgh said it was working with the foundation on the Russian centre as "part of our wider commitment to increasing the understanding of different parts of the world". The centre "should be judged by its academic and cultural activity, which demonstrates its progressive vision, academic rigour and an evidencebased critique of the regime in Russia". Sputnik said: "We have no preference towards one political force."

The Tory MP Sir Nicholas Soames said: "If people are stupid enough to be suckered by the Russians, that's their lookout."

Washington Post
Snowden, WikiLeaks clash over DNC emails
Saturday, 30 July 2016
Byline: Andrea Peterson

Washington - Two of the biggest names in government data leaks clashed over how to responsibly release information on Twitter late Thursday.
It started when Edward Snowden tweeted that WikiLeaks's "hostility to even modest curation" was a mistake. WikiLeaks wasn't happy about the criticism - and hit Snowden back by accusing him of pandering to Democratic presidential nominee Hillary Clinton.

The spat spotlights a major split between how WikiLeaks and Snowden have handled the data they helped make public. Snowden worked with The Washington Post and other news outlets to expose National Security Agency surveillance programs. The journalists vetted the documents, many of which have not been made public, and chose to withhold some information that government officials said would compromise national security.

WikiLeaks's approach to data disclosure is more radical: It often posts massive, searchable caches online with few, if any, apparent efforts to remove sensitive personal information.

The group's release of emails from the Democratic National Committee exposed information such as the credit card numbers, Social Security numbers and passport numbers of some donors - putting them at risk of identity theft. Some observers, including University of North Carolina at Chapel Hill professor Zeynep Tufekci, also criticized the organization for promoting links to a leaked database containing Turkish citizens' personal information after a recent coup attempt.

WikiLeaks founder Julian Assange was the subject of a U.S. investigation after WikiLeaks posted a cache of diplomatic cables and military documents provided by the now-imprisoned Chelsea Manning - then

known as Bradley Manning - in 2010. Although Assange was not charged, he has accused Clinton of pushing to indict him while she was secretary of state.

WikiLeaks released the DNC emails just before the Democratic National Convention, where Clinton formally received her party's presidential nomination. The Clinton campaign and some cybersecurity experts have alleged that the Russian government was behind the release, possibly in a bid to hurt her candidacy. (Snowden lives in Russia, where he was granted temporary asylum following his NSA disclosures. A WikiLeaks activist accompanied him from Hong Kong to Moscow, making the current tension all the more surprising.)

On Wednesday, Republican nominee Donald Trump publicly urged Russian hackers to go looking for emails from the private server Clinton used during her tenure at the State Department. Trump later defended his comments as being "sarcastic."

ABC News
Predators Exploiting Personal Info in DNC Hack
Sunday, 31 July 2016
Byline: Staff Writer

Washington - The NSA deferred direct questions about its potential involvement in the DNC hack investigation to the FBI, which is the leading agency in that probe. Representatives for the bureau have not returned ABC News' request for comment. Lisa Monaco, President Obama's homeland security and counterterrorism adviser whose responsibilities include cyber policy, declined to comment.
A former senior U.S. official said it was a "fair bet" the NSA was using its hackers' technical prowess to infiltrate two Russian hacking teams that the cybersecurity firm Crowdstrike alleged broke into the DNC's system and were linked to two separate Russian intelligence agencies, as first reported by The Washington Post. In some past unrelated cases, the former official said, NSA hackers have been able to watch from the inside as malicious actors conduct their operations in real time.

Rajesh De, former general counsel at the NSA, said that if the NSA is targeting the Russian groups, it could be doing it under its normal foreign intelligence authorities, as the Russian government is "clearly ... a valid intelligence target." Or the NSA could be working under the FBI's investigative authority and hacking the suspects' systems as part of technical support for investigators, said De, now head of the cyber security practice at the law firm Mayer Brown.

In the aftermath of an attack, a CIA official said that if there is an "overseas component," the NSA would be involved along with the CIA's own newly formed Directorate of Digital Innovation. The two agencies would work, potentially along with others in government, to sniff out suspects' "digital dust."

"It turns out that the people who carry out these activities use their keyboards for other things too," said Sean Roche, Associate Deputy Director for Digital Innovation at the CIA. Any attribution

investigations, Roche said, would also include offline information -- the product of old fashioned, on-the-street intelligence gathering.

Like Joyce, Roche said he was speaking generally and could not comment on the DNC hack.

While U.S. officials have told news outlets anonymously they concur with Crowdstrike and other private cybersecurity firms who have pointed to Russian culpability, the U.S. government has declined to publicly blame the Russians.

The Russian government has said the hacking allegations are "absurd".

Director of National Intelligence James Clapper told the audience at the Aspen Security Forum Thursday that the U.S. intelligence community was "not quite ready to make a call on attribution," though he said there were "just a few usual suspects out there." The next day CIA Director John Brennan said that attribution is "to be determined" and a lot of people were "jumping to conclusions."

Professional hackers often use proxies, Brennan said, so investigators have to make two or three "hops" before tracing cyber attacks back to a state's intelligence agency, which makes the attribution process more difficult.

Kenneth Geers, a former cyber analyst at the Pentagon who recently published a book about Russian cyber operations, told ABC News earlier this week that he didn't necessarily doubt it was the Russians, but said that even in the best cases when doing cyber investigations, "You can have a preponderance of evidence -- and in nation- state cases, that's likely what you'll have -- but that's all you'll have."

That, he said, opens the possibility, however remote, that a very clever hacker or hacking team could be framing the Russians.

Michael Buratowski, the senior vice president of cybersecurity services at Fidelis Cybersecurity which studied some of the malicious code, said the evidence pointing to the Russians was so convincing, "it would have had to have been a very elaborate scheme" for it really to have been anyone else.

The NSA's Joyce said that in general it's very difficult to properly frame someone for a complex attack, since too many details have to be exactly right, requiring a tremendous amount of expertise and precision.

But Joyce said that before the U.S. government pins blame on anyone for a cyber attack publicly, the evidence has to pass an "extremely high bar."

So when they do come forward, he said, perhaps based on the results of attribution techniques that have not been publicly described, "You should bank on it."

New York Times
D.N.C. Hack Raises a Frightening Question: What's Next?
Saturday, 30 July 2016
Byline: Amanda Taub

Analysis: If Russia was indeed behind last week's leak of stolen data from the Democratic National Committee, we may be seeing one of the most sordid tools of its domestic politics deployed as a hostile weapon in foreign policy.
There is a Russian word for this practice: "kompromat." A portmanteau of the Russian words for "compromising" and "material," it refers to the timeworn tradition of obtaining information and using it to smear or influence public officials. Unscrupulous Russian politicians have been doing it for decades; there are kompromat websites (which, unsurprisingly, are often blocked or harassed).

The way it works is simple. First, Kremlin insiders or other powerful individuals buy, steal or manufacture incriminating information about an opponent, an enemy, or any other person who poses a threat to powerful interests. Then, they publish it, destroying the target's reputation in order to settle public scores or manipulate public events.

If American law enforcement officials and analysts are correct in their assessment that Russia was behind this spring's hack of the Democratic National Committee's computer servers, it seems that kompromat is being translated to the international stage.

The United States has had plenty of experience with hackers, government and otherwise, but the D.N.C. hack is something new. Rather than using the information seized for intelligence purposes, the hackers selected damaging excerpts from the cache of stolen data, and then leaked them at a pivotal moment in the presidential election.

And analysts are worried that such activity could soon become a routine element of geopolitics.

"This is not just about the United States, it is not just about Trump or Clinton, or just about American democracy," said Thomas Rid, a professor of security studies at King's College London. "If they consider this a success, they may conclude that, 'Of course, we can do this elsewhere. We can do this again. We can probably also find things, kompromat, on the next president.' "

The risks of weaponizing information

The history of kompromat in Russia shows how damaging this practice can be to democracy and the rule of law.

A 2008 article in Wired, for instance, detailed how the Kremlin leaked footage of a well-known broadcaster at an orgy to a website, apparently in order to relieve the Russian government of a

prominent news media critic. In another case, leaked surveillance video showed a prosecutor investigating high-level official corruption frolicking in bed with two young prostitutes. (The investigation eventually died.)

The term may be Russian, but kompromat is not limited to the country's borders. Chinese officials and businessmen, for instance, have long been rumored to spy on their personal and professional rivals, searching for information that could be used to discredit them.

For instance, Bo Xilai, a senior party official in Chongqing who was jailed for corruption in 2013, reportedly wiretapped a call by China's president at the time, Hu Jintao, as part of a widespread surveillance operation that gathered information on party leaders and other powerful individuals, to aid in Mr. Bo's political ambitions.

Last week's leak of data stolen from the Democratic National Committee fits that pattern, only now it is playing out in a new arena -- in an attack by one state against the political system of another.

A future of D.N.C.-style hacks and leaks

To be sure, history offers numerous examples of countries, including the United States, meddling in one another's elections. But although the aims may not be new, these technological methods and their potential consequences are.

The D.N.C. leak shows that kompromat need not reveal anything illegal to be damaging: The party's chairwoman, Representative Debbie Wasserman Schultz, had to step down after party officials were shown to have taken sides during the primaries. This sets a precedent in which virtually anyone who uses email or social media could be vulnerable to any state or private group with a grudge and access to hackers.

The Chinese and Russians are used to these tactics to settle political and business rivalries. The D.N.C. hack, in exporting kompromat abroad, has established a precedent that may tempt other hackers foreign and domestic, state-sponsored and private.

Because technology makes hacks easier to start than to counter, the risk is difficult to overcome. And anyone with money or expertise can undertake a hack, particularly against nonstate targets that have weaker security systems, and often with little risk of being caught because the attack can be denied.

"In counterintelligence before, there was a kind of granularity of targeting individuals," said Adam Segal, who studies cybersecurity at the Council on Foreign Relations and is the author of "The Hacked World Order." "And now with digital technology, you can do that with a scope and scale you couldn't have done before."

In the past, he pointed out, someone who wanted to obtain lurid details of an adversary's sex life would have had to set up a "honey trap" operation and then photograph the target in flagrante. "But now if you break into someone's email," Mr. Segal noted, "you can find a message that 'so-and-so is an idiot,' or their porn history" -- private, personal information that could be tremendously embarrassing or discrediting if released publicly.

In that climate, everyone who has something to lose, has enemies, or is a public figure is susceptible to this kind of reputational destruction. The higher a person climbs, the greater the risk becomes -- and the greater temptation to a rival.

Uncertainties on responding to hacking

More attacks may already be on the way. Last year, the federal Office of Personnel Management announced that hackers had breached its computers and stolen vast quantities of data gathered for security clearances and background checks.

Mr. Segal said that the stolen data included information on government employees' sex lives, relationships, finances, contacts with foreign governments and a host of other private details.

The data, which goes back to 1985, was gathered so that American counterintelligence officers could assess employees' vulnerability to blackmail. But that well-intentioned project may have ended up conveniently cataloging their most vulnerable points for the hackers.

Government offices and political organizations are hardly the only targets.

In 2014, North Korea hacked Sony Pictures in retaliation for its release of the film "The Interview," a comedy about a plot to assassinate the North Korean leader Kim Jong-un. The trove of released emails included information on salaries, Amazon receipts for a network executive's personal-grooming products, and plenty of embarrassing and offensive conversations. It damaged reputations and careers.

Analysts said hacking is likely to expand in the realm of foreign policy by giving states a new, low-risk method to tweak one another or to meddle in one another's internal affairs. State-sponsored hacks meant to weaponize information are relatively inexpensive and difficult to defend against, making them a tempting tool.

But it is precisely their appeal that gives these tactics the potential to make the international arena more volatile. It is difficult to determine responsibility, which creates a risk that states will punish the wrong culprit -- or respond too harshly, forcing an unintended cycle of escalation.

Because there are no established norms for what is and is not tolerated in such attacks, or for how a targeted state is expected to respond, even the prospect of this kind of hacking creates dangerous uncertainty.

This practice is beyond the reach or enforcement of most laws, and outside the scope of the established norms that limit states' interference in one another's affairs. And because effective defense is so difficult, it is hard to predict what the limits -- or the consequences -- of that might be.

Washington Post
Russian hackers could target voting machines
Sunday, 31 July 2016
Byline: Bruce Shneier

Comment: Russia was behind the hacks into the Democratic National Committee's computer network that led to the release of thousands of internal emails just before the party's convention began, U.S. intelligence agencies have reportedly concluded.
The FBI is investigating. WikiLeaks promises there is more data to come. The political nature of this cyberattack means that Democrats and Republicans are trying to spin this situation as much as possible. Even so, we have to accept that someone is attacking our nation's computer systems in an apparent attempt to influence a presidential election. This kind of cyberattack targets the very core of our democratic process. And it points to the possibility of an even worse problem in November - that our election systems and our voting machines could be vulnerable to a similar attack.

If the intelligence community has indeed ascertained that Russia is to blame, our government needs to decide what to do in response. This is difficult because the attacks are politically partisan, but it is still essential. If foreign governments learn that they can influence our elections with impunity, it will open the door for future manipulations, both document thefts and dumps like this one that we can see and more subtle manipulations that we can't.

Retaliation is a politically fraught step and could have serious consequences, but this was an attack against our democracy. The United States needs to confront Russian President Vladimir Putin in some way - politically, economically or in cyberspace - and make it clear that it will not tolerate this kind of interference by any government. Regardless of your political leanings this time, there's no guarantee the next country that tries to manipulate our elections will prefer the same candidates that you do.

Even more important, we need to secure our election systems before the fall. If Putin's government has already used a cyberattack to attempt to help Donald Trump win, there's no reason to believe it won't do it again - especially now that Trump is inviting the "help," albeit "sarcastically."

Over the years, more and more states have moved to electronic voting machines and have flirted with Internet voting. These systems are insecure and vulnerable to attack.

But while computer security experts like me have sounded the alarm for many years, states have largely ignored the threat, and the machine manufacturers have thrown up enough obfuscating babble that election officials are largely mollified.

We no longer have time for that. We must ignore the machine manufacturers' spurious claims of security, create tiger teams to test the machines' and systems' resistance to attack, drastically increase their cyberdefenses and take them offline if we can't guarantee their security online.

Longer term, we need to return to election systems that are secure from manipulation. This means voting machines with voter- verified paper audit trails, and no Internet voting. I know the old- fashioned way is slower and less convenient, but the security risks are simply too great.

There are other ways to attack our election system on the Internet besides hacking voting machines or changing vote tallies: deleting voter records, hijacking candidate or party websites, targeting and intimidating campaign workers or donors. There have already been multiple instances of political doxing - publishing personal information and documents about a person or organization - and we could easily see more in this election cycle. We need to take these risks much more seriously than before.

Government interference with foreign elections isn't new, and, in fact, that's something the United States itself has repeatedly done. Using cyberattacks to influence elections is newer but has been done before, too - most notably in Latin America. Hacking of voting machines isn't new, either. But what is new is a foreign government interfering with a U.S. national election on a large scale. Our democracy cannot tolerate it, and we as citizens cannot accept it.

In April 2015, the Obama administration issued an executive order outlining how we as a nation respond to cyberattacks against our critical infrastructure. While our election technology was not explicitly mentioned, our political process is certainly critical. And while the technology is a hodgepodge of separate state-run systems, together their security affects every one of us. After everyone has voted, it is essential that both sides believe the election was fair and the results accurate. Otherwise, it will have no legitimacy.

Election security is now a national security issue; federal officials need to take the lead, and they need to do it quickly.

Bruce Schneier is a lecturer at the Kennedy School of Government at Harvard University and the author of "Data and Goliath: The Hidden Battles to Collect Your Data and Control Your World."

New York Times
U.S. Wrestles With How to Fight Back Against Cyberattacks
Sunday, 31 July 2016
Byline: David E. Sanger

Aspen, Colo - It has been an open secret throughout the Obama presidency that world powers have escalated their use of cyberpower. But the recent revelations of hacking into Democratic campaign computer systems in an apparent attempt to manipulate the 2016 election is forcing the White House to confront a new question: whether, and if so how, to retaliate.
So far, the administration has stopped short of publicly accusing the Russian government of President Vladimir V. Putin of engineering the theft of research and emails from the Democratic National Committee and hacking into other campaign computer systems. However, private investigators have identified the suspects, and American intelligence agencies have told the White House that they have "high confidence" that the Russian government was responsible.

But suspecting such meddling is different from proving it with a certainty sufficient for any American president to order a response.

Even if officials gather the proof, they may not be able to make their evidence public without tipping off Russia, or its proxies in cyberspace, about how deeply the National Security Agency has penetrated that country's networks. And designing a response that will send a clear message, without prompting escalation or undermining efforts to work with Russia in places like Syria, where Russia is simultaneously an adversary and a partner, is even harder.

The Russians tried to make it tougher still on Saturday when they declared that they had found evidence of American activity in their government systems.

It was hardly a shocking revelation; anyone who leafed through Edward J. Snowden's revelations saw evidence of daily efforts to break into Russian spy agencies, nuclear installations and leadership compounds.

But in a talk on Friday evening at the Aspen Security Forum, an annual gathering that draws many of the nation's top intelligence and military officials, John Brennan, the director of the Central Intelligence Agency, made clear that while spying on each other's political institutions is fair game, making data public -- in true or altered form -- to influence an election is a new level of malicious activity, far different from ordinary spy vs. spy maneuvers.

"When it is determined who is responsible for this," Mr. Brennan said, choosing his words carefully to avoid any direct implication of Russia, there "will be discussions at the highest levels of government about what the right course of action will be. Obviously interference in the U.S. election process is a very, very serious matter."

The Russia problem is thorny, and persistent. Just four months into his presidency in 2009, President Obama and his top national security advisers received a warning from American intelligence agencies: Of all the nations targeting America's computer networks Russia has the most "robust, longstanding

program that combines a patient, multidisciplinary approach to computer network operations with proven access and tradecraft."

Mr. Obama may have been a bit distracted at the time. While setting up his new administration, he was also learning the dark arts of cyberwar, descending into the Situation Room to oversee a complex American-Israeli offensive operation to disable Iran's nuclear centrifuges. He expressed concern to his aides that the operation would help fuel the escalation of cyberattacks and counterattacks.

The concern was justified. Since then, Iran has attacked Saudi Arabia, Russia has brought down a power grid in Ukraine, the North Koreans have attacked the South. The list gets longer every month.

But deterrence has been spotty. In the D.N.C. case, two senior administration officials said midlevel officials were considering options, ranging from counter cyberattacks on the F.S.B. and the G.R.U., two competing Russian spy agencies at the center of the current hacking, to economic, travel and other sanctions aimed at suspected perpetrators.

But each approach has downsides: A counterattack, for example, one senior official said, "brings us to their level, and their moral code."

At the same time, the cost of doing nothing could be high. As the United States and other nations move to more electronic voting systems, the opportunities for mischief rise exponentially. Imagine, for example, a vote as close as the 2000 presidential election between George W. Bush and Al Gore, but with accusations about impossible-to-trace foreign manipulation of the ballots or the vote count, leaving Americans wondering about the validity of the outcome.

For Mr. Obama, the president who has done the most to raise alarms about the risks of cyberattacks and the most to build up the United States Cyber Command, this is fraught territory.

"I think that the administration needs to be ironclad on the evidence here to convince the American people that this is about policy, not politics," said Jason Healey, a scholar at Columbia University who specializes in cyberconflict between nations. "This has got to be about defending a constitutional process, not a party."

Mr. Obama often says the world of cyberconflict is still "the Wild West." There are no treaties, no international laws, just a patchwork set of emerging "norms" of what constitutes acceptable behavior.

For example, Mr. Obama has pressed President Xi Jinping of China to work with the United States and other nations to develop rules about the theft of intellectual property, and about not interfering with a nation's efforts to bring attacked systems back online. Attacking another nation's power grid in peacetime is considered out of bounds.

But every new case brings a new and imaginative way to weaponize cyberpower. Until November 2014, when North Korea hacked into the computers at Sony Pictures Entertainment in retaliation for a comedy that portrayed a C.I.A. plot to assassinate Kim Jung-un, the country's leader, no one seriously considered a movie studio to be "critical infrastructure."

Yet the attack on Sony -- which melted down 70 percent of its computing power -- was the only case that brought the president to the White House press room to accuse another nation of launching a deliberate cyberattack, and to promise retaliation. Mr. Obama said he was driven to go public by the fact that North Korea was trying to suppress free speech and intimidate Americans with threats if they went to the theater.

It is unclear how the United States may have retaliated against the North in secret, if it even did so. But the public punishment, the announcement of some mild economic sanctions, seemed highly ineffective. They were lost in the sea of other sanctions imposed on the North since the signing of the armistice that halted, but did not end, the Korean War 63 years ago.

Yet the decision to name North Korea -- a country with which the United States does no other real business -- was an outlier.

China was never formally named in the theft of the security clearance files on more than 21 million Americans, revealing fingerprints, personal financial details and the personal data about family, friends and former lovers. To James R. Clapper Jr., the director of national intelligence, that wasn't an "attack," it was just very good espionage. Given the chance, he said last year, "we would have done the same thing."

Similarly, the administration decided not to call out Russia when the same intelligence agencies implicated in the D.N.C. attack were believed to be behind the siphoning of tens of thousands of unclassified emails from the systems of the State Department and the White House. There was also a more targeted cyberespionage operation, which investigators attributed to the same actors, aimed at the Joint Chiefs of Staff. But again, it was considered within the bounds of spy vs. spy.

Speaking at the Aspen forum on Thursday, Mr. Clapper, while stepping around who conducted the hack, argued that in Mr. Putin's mind, the United States has meddled in Russian politics, in Ukraine and Georgia -- all part of former Soviet territory. (Mr. Putin complained that Hillary Clinton, in 2011, helped spark protests over a Russian parliamentary election that the United States considered riddled with voter fraud.)

"Of course they see a U.S. conspiracy behind every bush and ascribe far more impact than we're actually guilty of, but that's their mind-set," Mr. Clapper said. "And so I think their approach is they believe we are trying to influence political developments in Russia, trying to affect change, and so their natural response is to retaliate and do unto us as they think we've done unto them."

He later described Mr. Putin as "paranoid" and said "he is less of a throwback to the Communist era, than to the czars." He added later: "He wants to be seen as the leader of a great power, coequal with the United States."

What's the Future of Chinese Hacking?
Saturday, 30 July 2016
Byline: Adam Segal

Analysis: Adam Segal, the Ira A Lipman Chair for Emerging Technologies and National Security and director of the Digital and Cyberspace Policy Program at the Council on Foreign Relations, is the author of The Hacked World Order: How Nations Fight, Trade, Maneuver, and Manipulate in the Digital Age. After years of public reporting on the theft of intellectual property, business strategies, and trade secrets, last month the cybersecurity firm FireEye issued a report headlining a steep decline in Chinese cyber espionage against organizations in the US and 25 other countries.

The number of network compromises by 72 suspected China-based groups dropped from 60 in February 2013 to less than 10 by May 2016. While FireEye did not rule out the possibility that improvements in tradecraft were leading to less detection (FBI Director James Comey once compared Chinese hackers to drunk burglars who kick in the door and knock over a vase on their way out with the TV), US Assistant Attorney General John Carlin confirmed the company's findings that attacks were less voluminous but more focused and calculated.

A combination of the threat of US sanctions, a diplomatic accord signed by President Barack Obama and President Xi Jinping, and internal reforms of the People's Liberation Army may have temporarily produced a dramatic decline in cyber espionage, but is it time to shut down the firewall, send the threat intelligence analysts home, and declare victory? Very unlikely.

China hacks because it wants to move its economy from labor intensive manufacturing to high technology innovation.

For Beijing, cyberspace is essential to economic growth, sustaining and strengthening the Chinese Communist Party, and maintaining domestic stability and national security. As a result, China hacks because it wants to move its economy from labor intensive manufacturing to high technology innovation; defeat foreign ideologies and weaken opponents of the regime; and counter the technological advantages of the US military in the Pacific.

These fundamental motivations direct state-backed hackers to a set of high value targets. Because Chinese leaders do not want to be dependent on foreign technology suppliers, and are impatient with the results produced so far by massive investments in education and scientific research, Chinese hackers steal intellectual property from high technology companies as well as business secrets from the

pharmaceutical, financial, energy, legal, and other sectors. "The situation that our country is under others' control in core technologies of key fields has not changed fundamentally, and the country's S&T foundation remains weak," President Xi Jinping told a gathering of the nation's top scientists in May 2016. The companies breached are global, with victims identified in Germany, Australia, Japan, India, and the United Kingdom.

Worried about the spread of ideologies that threaten regime legitimacy, and the ability of domestic opponents to organize and foment dissent, Beijing supports cyber attacks on Tibetan and Uighur activists, NGOS and think tanks, and the diplomatic, military, and political agencies of all the major powers. When the New York Times and Bloomberg published stories about the massive wealth amassed by the families of China's top leaders, they, along with other media outlets, were hacked.

Chinese hackers also conduct intelligence and counterintelligence operations. The theft of 22 million records from servers of the Office of Personnel Management included information perfect for blackmail, and might also allow Chinese counterintelligence agencies to identify spies working undercover at US embassies around the world.

Chinese defense planners are preparing the PLA to fight "informationized local wars": short, technologically-intense regional wars. The potential enemy in these future wars is usually referred to as a "technologically advanced" adversary but is clearly a stand-in for the United States and its allies. As a result, these planners want to both understand and disrupt US weapons platforms. Two PLA groups, Units 61938 and 61486, have reportedly stolen information from over two dozen Defense Department weapons programs, including the Patriot missile system, the US Navy's new littoral combat ship, and the F-35 and F-22 stealth fighter jets.

Cyberspace remains central to all of Beijing's predominant economic and political interests, and cyber attacks are, and will continue to be, a potent tool.

If a conflict breaks out over Taiwan or the South China Sea, the PLA will want to disrupt communication, transportation, intelligence, and reconnaissance systems, so hackers have mapped these networks. In addition, Chinese leaders want to signal to US policymakers that the conflict may not stay regional, and so PLA operators have penetrated into banking, energy, and other critical infrastructure networks, and may have intentionally left evidence of the intrusions as a reminder that the US homeland is not immune to attack.

Given Beijing's long-term strategic concerns about technological innovation, domestic stability, and national security, Chinese hackers may change tactics and organization, but they will remain focused on a similar set of targets.The creation of the Strategic Support Forces, a move intended to centralize space, cyber and information warfare troops, will result in greater coordination among the many different hacking groups and better tradecraft overall.

Continued tension over China's sovereignty claims in the South China Sea mean that the networks of the US military and its regional allies will remain prime targets. As the economy moves up the value chain, and as Chinese technology companies like Xiaomi, Huawei, and AliBaba compete in global markets, cyber economic espionage will be narrower and more tailored to specific technologies. The attacks on domestic opponents and outside ideological threats are will become more sophisticated and increase in pace as the Chinese Communist Party appears increasingly worried about domestic stability, regime legitimacy, and the spread of information within China.

Chinese leaders will also be watching closely how the Obama administration responds to the alleged Russian hacking of the Democratic National Committee. Like Moscow, Beijing also believes that it is in an ideological contest with the West and it has tried to shape the information space, though in a more limited way, for example by trolling Tibetan independence activists on Twitter and using distributed denial of service attacks to knock GitHub offline for hosting anti-censorship technology.

However, the complex interdependence of the Chinese and US economies and a greater slate of shared interests in global affairs make a hack as brazen as an effort to influence the US election highly improbable. Still, cyberspace remains central to all of Beijing's predominant economic and political interests, and cyber attacks are, and will continue to be, a potent tool.

The Hacks We Can't See is Motherboard's theme week dedicated to the future of security and the hacks no one's talking about. Follow along here.

Sunday Times (UK)
Kremlin pours cash into media 'black ops' in UK
Sunday, 31 July 2016
Byline: Tom Harper

London - Russia has ramped up spending on foreign information "black ops" by more than £100m. The Kremlin approved a large increase last year in the budget for Russia Today, its English-language channel, and other services, including Sputnik, a news wire service that has opened new headquarters in Edinburgh and which has been accused of running conspiracy stories.

Total spending by Russia on television, radio and online services overseas was projected to be £151m in 2015, but was raised last year to £255m, according to the latest Kremlin budget.

The increase was attributed to the opening of Russia Today's office in London and other "day-and-night channels broadcasting in German and French".

News of the rise in spending comes just days after Curtis Scaparrotti, the new commander of Nato, warned that Moscow was funding "misinformation" campaigns in order to destabilise Europe. In a

speech delivered to a security conference in the US last week, Scaparrotti said Moscow had become an "adversary ... that we need to take very seriously".

He called on the West to mount its own information "black ops" campaigns in order to "meet them in that battlespace", adding: "We see the activities in cyber-space, we see the influence in Europe in terms of political parties' funding, some misinformation to build facts on the ground that really aren't true."

Scaparrotti said the use of such propaganda was an attempt by Russia to "be successful in its objectives without even approaching a conflict".

He added, however: "I think we can deal with it. It's difficult, particularly in the western world, because we believe in freedom of the press, we believe in being truthful in the press, we believe in the rule of law, so we have difficulty in approaching and countering this, but we have to."

US security sources last week accused Russian intelligence agencies of hacking the computer servers of the Democratic National Committee and releasing thousands of damaging emails just as the party was set to confirm Hillary Clinton as its presidential candidate.

The emails, published by the WikiLeaks website, were alleged to be part of a plot to boost the election chances of Clinton's Republican rival, Donald Trump.

It is the latest twist in an "information war" that security analysts say has escalated since the Russian invasion of Ukraine in 2014.

A report by the Chatham House think tank in March accused Russia Today of being a "corrosive" force in the UK.

Shortly before the invasion of Ukraine, a Russian general, Nikolay Bordyuzha, was asked about the Kremlin's propaganda efforts and was quoted as saying: "In information warfare, the side that tells the truth loses."

Washington Post
U.S . can use submarines to monitor and hack other nations ' communications
Sunday, 31 July 2016
Byline: Andrea Peterson & Brian Fung

Washington - When Donald Trump effectively called for Russia to hack into Hillary Clinton's emails last week, the Republican nominee's remarks touched off a (predictable) media firestorm. Here was a presidential candidate from a major U.S. party encouraging a foreign government to target American interests with cyberspying - an act that could not only expose national security information but also potentially undermine the security infrastructure of the United States.

Cyberwarriors working for Moscow and other regimes are already poking and prodding at our networks, so there's little reason to think Trump's words were all that damaging in themselves. But it's a good opportunity to talk about the state of state-sponsored hacking, and to offer a reminder that the United States is just as active in this space as the next government.

The U.S. approach to this digital battleground is pretty advanced. For example: Did you know that the military uses its submarines as underwater hacking platforms?

In fact, subs represent an important component of the United States' cyber strategy. They act defensively to protect themselves and the country from digital attacks, but - more interesting - they also have a role to play in carrying out cyberattacks, according to two U.S. Navy officials at a recent Washington conference.

"There is a - an offensive capability that we are, that we prize very highly," said Rear Adm. Michael Jabaley, the Navy's program executive officer for submarines. "And this is where I really can't talk about much, but suffice to say we have submarines out there on the frontlines that are very involved, at the highest technical level, doing exactly the kind of things that you would want them to do."

The "silent service" has a long history of using information technology to gain an edge on rivals of the United States. In the 1970s, the U.S. government instructed its submarines to tap undersea communications cables off the Russian coast, recording the messages being relayed back and forth between Soviet forces. (The National Security Agency has continued that tradition, monitoring underwater fiber cables as part of its globe-spanning intelligence-gathering apparatus. In some cases, the government has struck closed-door deals with the cable operators ensuring that U.S. spies can gain secure access to the information traveling over those pipes.)

These days, some U.S. subs come equipped with sophisticated antennae that can be used to intercept and manipulate other people's communications traffic, particularly on weak or unencrypted networks.

"We've gone where our targets have gone" - that is to say, online, Stewart Baker, the NSA's former general counsel, said in an interview. "Only the most security-conscious now are completely cut off from the Internet." Cyberattacks are also much easier to carry out than to defend against, he said.

One of America's premier hacker subs, the USS Annapolis, is hooked into a much wider U.S. spying net that was disclosed as part of the 2013 Edward Snowden leaks, according to Adam Weinstein and William Arkin, writing last year for Gawker's intelligence and national security blog, Phase Zero. A leaked slide showed that in a typical week, the Navy performs hundreds of "computer network exploitations," many of which are likely the result of submarine-based hacking.

"Annapolis and its sisters are the infiltrators of the new new of cyber warfare," wrote Arkin and Weinstein, "getting close to whatever enemy - inside their defensive zones - to jam and emit and spoof and hack. They do this through mast-mounted antennas and collection systems atop the conning tower,

some of them one-of- a-kind devices made for hard to reach or specific targets, all of them black boxes of future war."

But even this doesn't compare to what the Navy wants to be able to do next: turn its submarines into motherships for underwater drones that can maneuver themselves closer to shore and conduct jamming or hacking operations while allowing the sub to work at a distance.

"We want the boat to grow longer arms," said Rear Adm. Charles Richard, director of the Navy's undersea warfare division. "We are at all-ahead flank [speed], both on unmanned aerial and undersea vehicles."

It's unclear how far behind - or ahead - other navies may be when it comes to submarine-based cyber offense. Many of the cybersecurity and military experts we interviewed for this report had hardly heard of the Defense Department's undersea cyber capabilities.

But, Baker said, "espionage is a game where there's a lot of following the leader - so it's perfectly possible it's happening in this field, as well."

What is clear is that the U.S. military operates some of the most sophisticated information networks ever designed, and it's using them to penetrate foreign computer systems as part of an evolving cyber strategy.

We may never know precisely what dirt the Pentagon is digging up with its submarine espionage, or be able to draw a link between it and any political or military events in the real world. But despite the rising prominence of Russian hackers in the news - and Chinese hackers before that - it's worth pointing out that the United States has grown fairly proficient in cyberspace, too.

Toronto Star
Travel Smart: Cyberthieves to take advantage of Rio Olympics
Saturday, 30 July 2016
Byline: Henry Stancu

Analysis: Personal safety should be a key concern for anyone at the Olympics in Rio de Janeiro in August, and so should cybersecurity.
The Games will attract not only athletes and spectators, but hackers eager to sniff Wi-Fi traffic, snatch data and infect devices with malware.

So, taking steps to safeguard your digital information is as crucial these days as protecting your money and belongings.

Losing cash, credit cards, a passport or visa to a pickpocket or purse snatcher can ruin a vacation, but identity theft can be even worse, and it can all begin anywhere you use an insecure Wi-Fi hot spot.

On its "Cyber security while travelling website" (travel.gc.ca) , the Government of Canada warns us to "use free computing resources with the assumption that any information you enter could be seen by an unauthorized third party."

The Rio Olympics will no doubt be third- party central in terms of hackers.

Just as it's smart to travel with as few valuables as possible to cut the risk of losing them or having them stolen, the same goes for the amount and sensitivity of data you take with you.

Many countries monitor information passing through their networks, so travellers must realize any personal or corporate data stored on devices can be compromised.

Mobile devices can be hijacked and infected with malware, used to track the owner's movements via GPS, and to even activate the device's microphone or camera. Hackers can intercept personal communications and use the devices to also infect connected networks.

Not only are things such as tablets, laptops and smartphones prime targets for data theft, but we should assume arenas, hotels, internet cafés and any public Wi-Fi spots are fishing holes for cyberscammers.

In fact, hackers have been known to set up free internet hot spots for the express purpose of attracting prey, by naming their Wi-Fi access points to appear related to a hotel or legitimate business.

"Hotel Lux Wi-Fi" may be legit, but "Secure Hotel Lux Wi-Fi" could be the bait.

The best way to protect your data is to leave your devices at home, and the second best way is to keep any vital information backed up on your home computer or hard drive rather than on the smartphone you travel with.

You can join a VPN (virtual private network) service, which encrypts data between devices and the internet while hiding customers' IP addresses. Some charge a membership fee and some offer free online subscriptions.

Check user ratings and specs on sites such as vpncomparison.org (www.vpncomparison.org) , because some VPN services have been known to be questionable.

Communication Security Establishment Canada (CSEC), the organization that looks after the protection of electronic information at the national level, has the following tips for travellers:

Password protect your device and change the password before setting out on a trip. It's also a good idea to periodically change your password when you get back.

Identify the device as your property and how you can be contacted if it is lost. The information can be engraved on the device or on a sticker attached to it, or highlighted in a screen saver. That way, if an honest person finds it they'll know how to get in touch.

Set your device to erase all the data if invalid passwords have been entered after a number of failed attempts.

Enable your device's location detection and anti-theft features, such as data encryption.

Don't leave your device unattended but if you have to, remove the battery, expanded memory and SIM card and keep them with you.

Find out from your phone/internet service provider, or your company's IT department, whether your device will work at your destination before you head out.

Don't ever charge your device via a USB connection of an unknown or unsecured computer.

An insecure Bluetooth setting leaves a device vulnerable to hacking. Disable the function before a trip.

Sunday Telegraph (UK)
PM demanded vetting of Chinese investors.
Sunday, 31 July 2016
Byline: Tim Ross

London - Theresa May privately demanded strict new national security checks on Chinese companies seeking to take over British industries, a former cabinet colleague has revealed.
Sir Vince Cable, business secretary until last year, suggested the Prime Minister had a "general prejudice" against Chinese investments in Britain and wanted to emulate American rules banning foreign takeovers that could undermine security.

The disclosure came after Mrs May delayed a decision on whether to allow the China-backed Hinkley Point nuclear project to go ahead. Speaking to The Sunday Telegraph, Sir Vince detailed Mrs May's long-held security concerns over China's involvement in the £18 billion nuclear power plant in Somerset and other business links with China.

He said she was "never completely satisfied about Huawei", the Chinese telecommunications giant, which has a major partnership with BT.

"I and others thought they were a good thing but I think she was worried about them," he said.

During private cabinet talks, she was also reluctant to relax visa rules for Chinese businessmen, he said.

However, George Osborne, the then chancellor, overruled her and pursued what she saw as a "gung-ho" approach to wooing Chinese investment, Sir Vince said. "She has expressed in several different contexts severe reservations about China getting too close to the UK," he said.

Sir Vince argued Mrs May's stance was "bound to" lead to a cooling in relations between the UK and China, putting in doubt Chinese plans to invest tens of billions of pounds in Britain.

His comments came after the Government announced on Thursday it would delay the final decision on approving the deal on the Hinkley C power station, which would be Britain's first new nuclear plant for a generation.

Downing Street insists that Mrs May Prime Minister wanted tighter screening but was overruled by Cameron and Osborne, Sir Vince says wants to examine all of the "component parts" of the deal with the French firm EDF before deciding whether to give it the green light.

However, government sources suggest Mrs May has concerns over the security implications of allowing China's state-owned companies to take a 33.5 per cent stake in Hinkley Point and to have the opportunity to design and build a new reactor in Essex.

Sir Vince, who served alongside Mrs May in the cabinet throughout the 2010- 2015 coalition, said the Prime Minister had been unhappy with the positive attitude of David Cameron and George Osborne towards Chinese investments while she was home secretary.

He said: "Fairly early on in the coalition, she wanted to introduce a more stringent test of foreign investment, based on the American model of screening out projects that threaten national security."

Mrs May was "very hot" on this issue, he said, but "was basically overruled by Osborne and my own department".

"Secondly, my recollection was that when approval was sought for Hinkley, she raised objections on grounds of national security issues and China."

Nick Timothy, Mrs May's joint chief of staff, has said MI5 held concerns over China'sbecause Chinese intelligence services are working "against British interests at home and abroad".

He warned in an article before he began working in Downing Street that the Chinese could use their role in the Hinkley nuclear programme to "build weaknesses into computer systems which will allow them to shut down Britain's energy production at will".

Government sources confirmed that the national security issue was one of many questions the Prime Minister wanted to examine before approving the plan for Hinkley.

But it raised questions over whether she could also object to £40billion of other Chinese investments in the UK, which were announced last year. Mr Osborne had been encouraging Chinese companies to invest in the High Speed 2 rail project .

Sir Vince said Mrs May's new approach could put other investments in doubt and create difficulties for the relationship between the two countries .

"It's bound to affect it negatively for two reasons: one that Osborne isn't there and he was the main champion.

I supported him but we are no longer there. Secondly, "She has expressed in several different contexts severe reservations about China getting too close to the UK," he said. "It came up in all kinds of different ways.

Osborne kept pushing for more liberal treatment of visas for Chinese businessmenand she was very reluctant to go along with that.

So I think she has form in adopting a more suspicious approach, more in line with the American position." Last night, Downing Street declined to comment on Sir Vince's disclosures.

The chief executive of EDF yesterday attempted to downplay the signifi- cance of the Hinkley delay, insisting that he understood the Government's desire for more time.

Vincent de Rivaz has written to workers in an attempt to reassure them that the project is still "strong" despite the unexpected delay.

The company's board narrowly voted on Thursday to give the final go-ahead to the long-delayed project but the Government pulled back from signing the contract, saying it would make a decision in the early autumn.

Mr de Rivaz said: "The new Prime Minister has been in post for just 16 days. Her full Cabinet has been in post even fewer.

"We can understand their need to take a little time. We fully respect the Prime Minister's method. The very good news is that we are ready. The board's decision means that when the Government is ready to go ahead, we are ready too."

Mr de Rivaz said he had met Greg Clark, the Business and Energy Secretary, after the minister announced the Government would "consider carefully" all parts of the project before making a decision.

Jason Millett, chief operating officer for major programmes and infrastructure at Mace, a major contractor at Hinkley Point, said the decision to delay it had left people "bewildered".

Osborne kept pushing for liberal treatment of visas for Chinese businessmenand she was reluctant'

The Australian
Australian to head Lockheed Martin research lab
Friday, 05 August 2016
Byline: Brendan Nicholson

Canberra - A top Australian defence scientists will run the new research laboratory to be set up in Melbourne by US aerospace and defence giant Lockheed Martin.
Tony Lindsay, who now heads the national security and intelligence, surveillance and recon-naissance division of the Defence Department's Defence Science and Technology Group, will be the director of the Lockheed Martin Science Technology Engineering Leadership and Research Laboratory -- or STELaR Lab.

Dr Lindsay's 30-year engagement with research includes time as Defence's top science diplomat at the Australian Embassy in Washington.

He is considered a world expert in electronic warfare and intelligence, surveillance and reconnaissance. Dr Lindsay will set up the lab and oversee research and development programs including hypersonics, autonomy, robotics, and command, control, communications, computing, intelligence, surveillance and reconnaissance.

Lockheed Martin picked Melbourne as the location for an advanced research and development facility because it viewed the city as one of the world's most advanced university research centres.

The chief executive of Lockheed Martin Australia and New Zealand, Raydon Gates, said this would be the first such centre Lockheed Martin had established outside the US and that the lab had followed a rigorous internal evaluation process.

Mr Gates said Melbourne was one of the strongest-performing university cities in the world -- third only behind Boston and London. He said the centre based there would be able to attract world-beating scientists and researchers.

Mr Gates said the selection of Dr Lindsay was evidence of the depth of Australia's world-class science and technology leadership. "I am proud we were able to identify such a strong homegrown candidate to establish this leading-edge facility, which is a further endorsement of Australia's global reputation for research," he said.

Dr Lindsay said the company's reputation for research and development was unparalleled and its decision to invest in Australia by establishing the new lab had been enthusiastically welcomed by the local research community.Lockheed Martin chief technology officer Keoki Jackson said Melbourne's growing international reputation for research was a key factor in the choice of the laboratory's location. "Australia is recognised as a world research leader in fields from engineering and computer science to physics, space science and molecular biology," Dr Jackson said.

The Hindustan Times
Kaspersky Lab announces Bug Bounty Program with HackerOne
Friday, 05 August 2016

Undisclosed placeline - Kaspersky Lab announces Bug Bounty Program with HackerOne has announced at the Black Hat USA Conference the launch of the Kaspersky Lab Bug Bounty Program with HackerOne, an industry leading bug bounty platform provider. With this program, Kaspersky Lab will not only further bolster its mitigation strategy for addressing inherent software vulnerabilities, but also continue enhancing its relationship with external security researchers.
Today's cyber threat landscape is becoming increasingly complex, requiring security companies to continuously identify and implement effective tools in order to provide the most robust level of protection. Bug bounty programs are an effective and proven security measure that incentivizes external researchers to safely find and disclose software vulnerabilities to companies. As a result, these organizations are able to fix the reported issues without placing customers at risk.

The first phase of the Kaspersky Lab bug bounty program will officially began on August 2, 2016 and will last for a six-month period. During this initial phase, Kaspersky Lab will offer a total of $50,000 in bounty rewards to security researchers. Bug bounty participants will examine our flagship products for consumers and enterprises, Kaspersky Internet Security and Kaspersky Endpoint Security. After the preliminary phase is complete, the company will evaluate the results to determine what additional products and rewards should be included in the second phase of its bounty program.

"Our bug bounty program will help amplify the current internal and external mitigation measures we use to continuously improve the resiliency of our products," said Nikita Shvetsov, chief technology officer, Kaspersky Lab. "We think it's time for all security companies, large and small, to work more closely with external security researchers by embracing bug bounty programs as an effective and necessary tool to help keep their products secure and their customers protected."

"Vulnerabilities are inevitable and bug bounty programs are proven to supplement traditional security best practices with the help of the incredibly diverse global hacker community," said Alex Rice, CTO and co-founder, HackerOne. "We look forward to partnering with Kaspersky Lab to help them run the most competitive bug bounty program and continue to protect customers.".

Haaretz
ISIS Plans Attack on U.S. Air Bases, Israeli Intel Firm Says (Canada).
Friday, 05 August 2016

Jerusalem - An Israeli cyber intelligence company claims it has hacked ISIS communications and learned about the group's plans to attack U.S. air bases in Kuwait, Bahrain and Saudi Arabia.

Intsights, which is run by former Israel Defense Forces intelligence officers and based in Herzliya, said Wednesday it had hacked the forum on which ISIS operatives publish terror attack plans, Channel 10 reported.

According to Intsights, ISIS uploads potential targets to the forum, hosted through the Telegram encrypted messaging app. Some targets listed there, such as the church in Normandy, France where a priest was murdered on July 26, have been attacked after appearing on the site.

"Telegram is completely encrypted and there's no fear that someone will intercept the messages and understand what you wrote," Intsight co-founder Alon Arvatz told Channel 10.

The Intsight team did not say how it managed to hack into the group.

Arvatz said that a map uploaded to the ISIS' Telegram forum identifies air force bases in the United States, Canada, United Kingdom and other Western European countries, as well as Israeli air force bases.

BioCatch tracks memory use to catch cybercrooks
Friday, 05 August 2016
Byline: Shoshanna Solomon

Jerusalem - Did you know that everyone has a distinctive way of moving a mouse, tapping a phone or typing on a keyboard? Moreover, when you identify yourself to your bank or an online store by inserting information about yourself, like your home address or date of birth, you are using long- term memory rather than short-term, and this can be seen from the way you interact with your computer or smartphone. In fact, that's what Israeli start-up BioCatch uses to distinguish the bad guys from the good guys.
The company's latest product, which is already deployed in a set of tier- one banks and eCommerce customers, "differentiates between good users and criminal users, for situations where there is no historic data about these first time visitors," said Avi Turgeman, the founder of Tel Aviv based BioCatch, a financial security tech firm.

The company has already been selling software that checks over 500 bio-behavioral, cognitive and physiological parameters to create unique user profiles -- and an individual web presence -- for visitors to banking and eCommerce sites.

BioCatch is able to continuously authenticate users at every stage of an online banking session by analyzing these parameters, including hand tremors, eye-hand coordination, and how a person moves a mouse, combined with behavioral traits such as usage preferences and device interaction patterns. This enables the creation of what BioCatch calls a Cognitive Signature, a sum total of all the factors that go into an interactive session.

BioCatch's technology can record all this information, associating it with the user who is logged in and interacting with the site. In this way, banks or e-commerce sites can be alerted if the person performing the actions isn't who they should be, for example. The company has already been marketing its continuous authentication software and its malware and RAT detection products to banks and other customers globally.

At the end of 2015 there were more than 33 million banking customers globally using the company's behavioral biometric software, the company said. Its customers include some of the largest banks and eCommerce sites in Europe, Latin America and North America.

BioCatch's latest software, called Criminal Behavior, comes at a good time. Cyber crime will cost businesses over $2 trillion by 2019, market analysts Juniper Research has forecast, almost four times the cost of breaches in 2015.

"Today, with so much personal, financial and sensitive data open to potential threats, BioCatch uses unique personal behavioral metrics to continuously ensure that the individuals accessing their accounts are in fact who they say they are, thereby preventing security breaches before they happen and saving companies losses of millions of dollars in fraudulent activities," said Pini Lozowick, Chief Investment Officer at OurCrowd, an investor and member of the board of BioCatch, by email.

Biocatch's Criminal Behavior software is based on behavior patterns that emerged from the data the company has collected from interactions of people with their computers and phones. The data shows that interactions differ when users use short-term vs long-term memory: most people remember their birthdays and addresses without needing to check them first, before they tap them into the computer. Their credit card information, however, is stored in their short-term memories. They generally need to check the number before they click it into their phone or computers while performing a transaction.

So behavior and interaction with a device is different when using short- term vs long-term memory, though Turgeman declined to say how exactly so as not to give out too much information that would help criminal activity. And here is the clinch, because the bad guys, the impostors, only have short- term memory of your details, and the BioCatch software can home in on those behaviors that should be long-term but are actually short-term, alerting the vendors or the banks that the person in question could be an impostor.

"Today when someone is requesting an online loan or opening a new digital bank account, there is no way to know if this first-time visitor is actually who they say they are. It could be a fraudster using a stolen identity," Turgeman said. "But criminals, when impersonating a person they are not familiar with, behave very differently from an innocent user. One example is that they don't hold the details of that person in their long term memory, and that has a dramatic influence on how their interactions look, and allows us to know if the user is a criminal or not."

Other times, cyber criminals who are generally well prepared before an attack reveal that they actually know too much, and fill in the forms too quickly and perfectly.

BioCatch, which has raised a total of about $12 million from investors to date and employs 40 people in Tel Aviv, London, New York and Boston, is targeting banks and eCommerce sites for its latest product.

"The virtual world of the internet and mobile are still protected by security systems devised for the physical world," Turgeman said. "Most of the cyber security solutions try to replicate security concepts from the physical world in the virtual world. But walls and gates in the virtual world are simply made of bits and bytes, and these can be manipulated."

"Today, in the cyber space, fraudsters can enter into secured environments via the 'virtual gates,' almost hand in hand with the authorized users, or just right after them, without anyone noticing," Turgeman said. "Therefore the only way to truly protect the users' identity in the cyber space is through continuous authentication based on user activity, and this is what we do."

Gulf News
Criminals turn focus on Bitcoin
Friday, 05 August 2016
Byline: Naushad K. Cherrayil

Dubai - On Wednesday, Hong Kong-based exchange -- Bitfinex -- halted trading after hackers stole about $65 million of the digital currency Bitcoin.
It's the second major attack on Bitcoin technology, called Blockchain, this year. In July, criminals managed to steal over $50 million from a project called the Decentralised Autonomous Organisation.

Blockchain technology is fast emerging as a key area of financial technology (fintech) innovation. The technology behind Blockchain has created huge interest in everything from digital currencies to commodities trading to insurance. In simple terms, Blockchain is a cloud-based encrypted database used to record and analyse data.

Moe Levin, a member of the UAE- based Global Blockchain Council, said that blockchain is the greatest invention since the internet and has revolutionised and simplified the process of conducting financial interactions between organisations.

He said that Bitcoin and Blockchain are still in a nascent stage in the region, and the UAE is the first country to actively take the next step and encourage use of Blockchain.

As of first quarter this year, Levin said that total venture capital investment in Bitcoin and Blockchain start-ups now exceeds $1.1 billion.

Bitfinex said it was still investigating details and cooperating with law enforcement, but acknowledged 119,756 bitcoin, or about $65 million at current prices, was stolen. Bitcoin slumped 5.5 per cent against the dollar as of 2:30pm on Wednesday in Tokyo, bringing its two-day drop to 13 per cent.

"Yes -- it is a large breach," Fred Ehrsam, co-founder of Coinbase, a cryptocurrency wallet and trading platform, wrote in an email to Bloomberg. "Bitfinex is a large exchange, so it is a significant short term event, although Bitcoin has shown its resiliency to these sorts of events in the past."

Nicolai Solling, chief technology officer at security solutions provider Help AG Middle East, said that he doesn't think Bitcoin hacking is likely to stop in the near future. He said it is relatively a young currency, adding that when e-banking systems were introduced, there were lot of vulnerabilities in the system.

He believes this will take time to fix. Since digital currencies are traded anonymously, he said, this makes it even more difficult to find the hacker.

Many in the tech industry have criticised the anonymity of these transactions but that is the way Blockchain and similar technologies were designed to work, he said.

Ramez Shehadi, Executive Vice-President and Managing Director of Booz Allen Hamilton Mena, said that an increasingly digital economy has called cybersecurity risks into sharper focus. Annual losses to companies worldwide from cyberattacks now exceed $7.7 million on average per organisation, according to the Ponemon Institute.

Israelis crack secret message app used by Islamic State terrorists
Friday, 05 August 2016
Byline: Multiple reporters

Tel Aviv - An Israeli cyber-intelligence company claims to have penetrated a private messaging forum used by Islamic State to plan and inspire attacks against "extremely specific" western targets, including American military bases in the Middle East.
Intsights, which is run by former intelligence officers from the Israel defence forces, said that it had discovered the list on an encrypted channel on Telegram, a popular messaging app, used by more than 500 members of the jihadist group across the globe.

The list was said to include the locations of numerous US air force bases, with particular attention to those in the Gulf states of Saudi Arabia, Bahrain and Kuwait.

Several of the plots discussed on the channel this year eventually came to fruition, such as the attack on a church in Normandy last week, where two young men slit the throat of a priest.

Telegram has become a communication channel for Isis supporters because it uses end-to-end encryption, making it hard for the authorities to intercept messages easily. For the same reason, it is also used by human rights activists in repressive regimes such as Iran and Saudi Arabia. "Telegram is completely encrypted and there's no fear that someone will intercept the messages and understand what you wrote," Alon Arvatz, the service's co-founder, told Israel's Channel 10.

Intsights did not reveal exactly how it gained access to the channel, whether through hacking or by infiltrating the network by posing as an Isis supporter or potential recruit. Isis defectors and prisoners have said that such access requires at least one level of verification from a trusted Isis member.

Mr Arvatz said they had discovered that the Normandy attack was discussed several months ago, suggesting that the target may have been chosen by Isis long before any individuals were commissioned or inspired to carry it out. French investigators who examined a mobile phone belonging to one of the jihadists, Adel Kermiche, believe that he began communicating with his associate on Telegram only four days before the attack.

The Israeli claims underline the fear of European security forces that services such as Telegram have become vital technology for the Isis arm known as Emni, which has been described by a captured French jihadist as "the secret service for the exterior of the Islamic State".

Investigators are still teasing out to what degree secret encrypted channels are used to inspire, direct or commission specific attacks. Other, more open, channels, many of which have been closed down only to resurface with minor name changes, trade in the kind of propaganda Isis uses to encourage supporters.

One German former Emni operative, now in custody, told The New York Times that services such as Telegram were seen as crucial for future attacks on American soil.

Last night President Obama pledged that both Mosul in Iraq and Raqqa in Syria would be recaptured, but he warned that the group's violent ideology would continue even if they lost their main strongholds

.Egypt's military said that Abu Doaa al-Ansari, the leader of Islamic State's local affiliate has been killed in the Sinai peninsula, along with several key aides and 45 other members of the group. Officials said al-Ansari and his aides were killed in an airstrike that targeted a house located amid olive groves south of el-Arish. Aerial images of the strike released by the military appeared to confirm the account.

NBC News
More Than 1,000 U.S. Spies in Brazil Protecting Rio Olympics
Friday, 05 August 2016
Byline: Robert Windrem, William Arkin

New York - U.S. intelligence has assigned more than 1,000 spies to Olympic security as part of a highly classified effort to protect the Rio 2016 Summer Games and American athletes and staff, NBC News has learned.
Hundreds of analysts, law enforcement and special operations personnel are already on the ground in Rio de Janeiro, according to an exclusive NBC News review of a highly classified report on U.S. intelligence efforts.

In addition, more than a dozen highly trained Navy and Marine Corps commandos from the U.S. Special Operations Command are in Brazil, working with the Brazilian Federal Police and the Brazilian Navy, according to senior military officials.

The U.S. military, as expected, has placed larger military units on call should a rescue or counterterrorism operation be needed, the officials said.

The classified report outlines an operation that encompasses all 17 U.S. intelligence agencies, including those of the armed services, and involves human intelligence, spy satellites, electronic eavesdropping, and cyber and social media monitoring.

Areas of cooperation include vetting 10,000-plus athletes and 35,000-plus security and police personnel and others; monitoring terrorists' social media accounts; and offering U.S. help in securing computer networks, the review shows.

"U.S. intelligence agencies are working closely with Brazilian intelligence officials to support their efforts to identify and disrupt potential threats to the Olympic Games in Rio," said Richard Kolko, a spokesman for National Intelligence Director James Clapper.

The operation is being conducted with the full cooperation of the Brazilian government.

"U.S. intelligence cooperation with Brazil has been excellent since 9/11," a senior intelligence official said, adding, "We consider the Brazilians to be well-prepared and highly professional."

There is no indication of any specific plot against the Games, which officially kick off with Friday's opening ceremonies.

But two weeks ago, Brazilian authorities detained a dozen Rio residents for alleged ties to the Islamic State and arrested a Brazilian of Lebanese descent for alleged links to ISIS. Brazil's justice minister described those arrested as "amateurs" but noted they had discussed attacking the Olympics. U.S. intelligence documents from March also identify Hezbollah activity in Brazil.

Another U.S. intelligence official told NBC News that the U.S. has not seen "any threats" of an ISIS attack, contrasting the Olympics with the EuroCup soccer championship last month in France, "which was overlaid with the ISIS threat profile."

According to the intelligence review, the U.S. put a 24/7 multi- agency "Olympic Watch" in place late last year, involving all agencies of the intelligence and law enforcement communities, including the CIA, the NSA, the Secret Service, the FBI. It also included the National Reconnaissance Office, responsible for spy satellites, and the National Geospatial Intelligence Agency, in charge of imagery interpretation.

The NSA, America's eavesdropping agency, is the lead agency and played the "leading role for the [intelligence community] in the Olympics since the 1984 Los Angeles games," the review said. Officials told NBC News that the NSA has proven most able to provide unique intelligence on the ground and real-time warnings that the host nations can't provide themselves.

The U.S. is one of 51 countries supplying intelligence to the Brazilian counter terrorism effort, but the American effort is second only to the Brazilians' operation. According to senior U.S. intelligence officials, 800 intelligence professionals, mostly analysts operating in the U.S., have been assigned and another 350 are on the ground supporting U.S., Brazilian and International Olympic Committee efforts.

The official noted that the each of the U.S. military services have athletes participating in the Olympics, including shooting, men and women's boxing, and wrestling competitions. "We have actual equities involved," said the official in explaining the breadth and depth of the operation.

Reuters
The world's best cyber army doesn't belong to Russia
Thursday, 04 August 2016
Byline: James Bamford

Comment - National attention is focused on Russian eavesdroppers' possible targeting of U.S. presidential candidates and the Democratic Congressional Campaign Committee. Yet, leaked top-secret National Security Agency documents show that the Obama administration has long been involved in major bugging operations against the election campaigns -- and the presidents -- of even its closest allies.
The United States is, by far, the world's most aggressive nation when it comes to cyberspying and cyberwarfare. The National Security Agency has been eavesdropping on foreign cities, politicians, elections and entire countries since it first turned on its receivers in 1952. Just as other countries, including Russia, attempt to do to the United States. What is new is a country leaking the intercepts back to the public of the target nation through a middleperson.

There is a strange irony in this. Russia, if it is actually involved in the hacking of the computers of the Democratic National Committee, could be attempting to influence a U.S. election by leaking to the American public the falsehoods of its leaders. This is a tactic Washington used against the Soviet Union and other countries during the Cold War.

In the 1950s, for example, President Harry S Truman created the Campaign of Truth to reveal to the Russian people the "Big Lies" of their government. Washington had often discovered these lies through eavesdropping and other espionage.

Today, the United States has morphed from a Cold War, and in some cases a hot war, into a cyberwar, with computer coding replacing bullets and bombs. Yet the American public manages to be "shocked, shocked" that a foreign country would attempt to conduct cyberespionage on the United States.

NSA operations have, for example, recently delved into elections in Mexico, targeting its last presidential campaign. According to a top-secret PowerPoint presentation leaked by former NSA contract employee Edward Snowden, the operation involved a "surge effort against one of Mexico's leading presidential candidates, Enrique Peña Nieto, and nine of his close associates." Peña won that election and is now Mexico's president.

The NSA identified Peña's cellphone and those of his associates using advanced software that can filter out specific phones from the swarm around the candidate. These lines were then targeted. The technology, one NSA analyst noted, "might find a needle in a haystack." The analyst described it as "a repeatable and efficient" process.

The eavesdroppers also succeeded in intercepting 85,489 text messages, a Der Spiegel article noted.

Another NSA operation, begun in May 2010 and codenamed FLATLIQUID, targeted Pena's predecessor, President Felipe Calderon. The NSA, the documents revealed, was able "to gain first-ever access to President Felipe Calderon's public email account."

At the same time, members of a highly secret joint NSA/CIA organization, called the Special Collection Service, are based in the U.S. embassy in Mexico City and other U.S. embassies around the world. It targets local government communications, as well as foreign embassies nearby. For Mexico, additional eavesdropping, and much of the analysis, is conducted by NSA Texas, a large listening post in San Antonio that focuses on the Caribbean, Central America and South America.

Unlike the Defense Department's Pentagon, the headquarters of the cyberspies fills an entire secret city. Located in Fort Meade, Maryland, halfway between Washington and Baltimore, Maryland, NSA's headquarters consists of scores of heavily guarded buildings. The site even boasts its own police force and post office.

And it is about to grow considerably bigger, now that the NSA cyberspies have merged with the cyberwarriors of U.S. Cyber Command, which controls its own Cyber Army, Cyber Navy, Cyber Air Force and Cyber Marine Corps, all armed with state-of-the-art cyberweapons. In charge of it all is a four-star admiral, Michael S. Rogers.

Now under construction inside NSA's secret city, Cyber Command's new $3.2- billion headquarters is to include 14 buildings, 11 parking garages and an enormous cyberbrain -- a 600,000- square-foot, $896.5-million supercomputer facility that will eat up an enormous amount of power, about 60 megawatts. This is enough electricity to power a city of more than 40,000 homes.

In 2014, for a cover story in Wired and a PBS documentary, I spent three days in Moscow with Snowden, whose last NSA job was as a contract cyberwarrior. I was also granted rare access to his archive of documents. "Cyber Command itself has always been branded in a sort of misleading way from its very inception," Snowden told me. "It's an attack agency. ... It's all about computer-network attack and computer-network exploitation at Cyber Command."

The idea is to turn the Internet from a worldwide web of information into a global battlefield for war. "The next major conflict will start in cyberspace," says one of the secret NSA documents. One key phrase within Cyber Command documents is "Information Dominance."

The Cyber Navy, for example, calls itself the Information Dominance Corps. The Cyber Army is providing frontline troops with the option of requesting "cyberfire support" from Cyber Command, in much the same way it requests air and artillery support. And the Cyber Air Force is pledged to "dominate cyberspace" just as "today we dominate air and space."

Among the tools at their disposal is one called Passionatepolka, designed to "remotely brick network cards." "Bricking" a computer means destroying it - turning it into a brick.

One such situation took place in war-torn Syria in 2012, according to Snowden, when the NSA attempted to remotely and secretly install an "exploit," or bug, into the computer system of a major Internet provider. This was expected to provide access to email and other Internet traffic across much of Syria. But something went wrong. Instead, the computers were bricked. It took down the Internet across the country for a period of time.

While Cyber Command executes attacks, the National Security Agency seems more interested in tracking virtually everyone connected to the Internet, according to the documents.

One top- secret operation, code-named TreasureMap, is designed to have a "capability for building a near real-time interactive map of the global Internet. ... Any device, anywhere, all the time." Another operation, codenamed Turbine, involves secretly placing "millions of implants" -- malware -- in computer systems worldwide for either spying or cyberattacks.

Yet, even as the U.S. government continues building robust eavesdropping and attack systems, it looks like there has been far less focus on security at home. One benefit of the cyber-theft of the Democratic National Committee emails might be that it helps open a public dialogue about the dangerous potential of cyberwarfare. This is long overdue. The possible security problems for the U.S. presidential election in November are already being discussed.

Yet there can never be a useful discussion on the topic if the Obama administration continues to point fingers at other countries without admitting that Washington is engaged heavily in cyberspying and cyberwarfare.

In fact, the United States is the only country ever to launch an actual cyberwar -- when the Obama administration used a cyberattack to destroy thousands of centrifuges, used for nuclear enrichment, in Iran. This was an illegal act of war, according to the Defense Department's own definition.

Given the news reports that many more DNC emails are waiting to be leaked as the presidential election draws closer, there will likely be many more reminders of the need for a public dialogue on cybersecurity and cyberwarfare before November.

Note: (James Bamford is the author of The Shadow Factory: The Ultra-Secret NSA From 9/11 to the Eavesdropping on America. He is a columnist for Foreign Policy magazine.)

Washington Post
Policy on drone strikes is declassified
Sunday, 07 August 2016
Byline: Karen DeYoung

Washington - President Obama must approve operational plans to target overseas terrorist suspects with drones or other weapons outside war zones but in some cases does not sign off on specific strikes, according to newly declassified administration guidelines.

In addition to setting out the role of the president, the guidelines emphasize the importance of "verifying" the identity of high-value targets, even as they outline the criteria and legality of striking unidentified others when "necessary to achieve U.S. policy objectives."

The guidelines provide rules for targeting U.S. citizens abroad and include lengthy guidance on what to do with captured terrorist suspects. "In no event," the document says, "will additional detainees be brought to the detention facilities at the Guantanamo Bay Naval Base."

The 18-page top-secret document was declassified and released late Friday, with relatively minor redactions, in response to a federal court order. When Obama signed the guidelines, in May 2013, the administration released a brief "fact sheet" on procedures and criteria for such operations that were drawn from the classified version.

Those rules included "near certainty" that the terrorist target was present and that no civilians would be injured or killed, that the target posed a "continuing and imminent" threat to Americans, that capture was not feasible, and that all relevant domestic and international laws were obeyed.

Since then, the president has made clear that he anticipates the more detailed, newly declassified procedures will govern future administrations. "My hope is, is that by the time I leave office, there is not only an internal structure in place that governs these standards that we've set, but there is also an institutionalized process" to increase transparency and oversight of lethal action outside war zones abroad.

There is no legal requirement that Obama's successors adhere to the same rules. But administration officials, speaking on the condition of anonymity about internal discussions, have said that compilation of the guidelines, and making them public, will restrain other presidents.

"The president has emphasized that the U.S. government should be as transparent as possible with the American people about our counterterrorism operations, the manner in which they are conducted and their results," National Security Council spokesman Ned Price said of the new release.

"Our counterterrorism actions are effective and legal, and their legitimacy is best demonstrated by making public more information about these actions, as well as setting clear standards for other nations to follow," he said.

Despite its pledges of transparency, the administration has waited until Obama's waning months in office to release detailed information on drone and other lethal airstrikes. Last month, it published aggregate numbers on how many civilians have been killed by CIA and military strikes in countries including Yemen, Pakistan, Somalia and Libya.

The numbers - 64 to 116 civilians and 2,372 to 2,581 "combatants" in 473 strikes in countries where the United States is not at war - were challenged by nongovernment groups as discounting many more civilian deaths. The figures do not include actions in the war zones of Afghanistan, Iraq and Syria.

The newly released document was the subject of a lawsuit filed by the American Civil Liberties Union in fall 2013. The administration, on the basis of "presidential communications" privilege, had denied the ACLU's petition for its release under the Freedom of Information Act.

Early this year, after Judge Colleen McMahon, in the Southern District of New York, questioned that privilege, the government said it would publicly release a redacted version.

After extended back and forth with the court over proposed redactions, McMahon last month ordered that the document be turned over to the ACLU no later than Aug. 5. It was posted without announcement Friday evening on the Justice Department website.

"The PPG should have been released three years ago, but its release now will inform an ongoing debate about the lawfulness and wisdom of the government's counterterrorism policies," said ACLU Deputy Legal Director Jameel Jaffer. "PPG," as the government refers to the document internally, stands for Presidential Policy Guidance.

"The release of the PPG and related documents is also a timely reminder of the breadth of the powers that will soon be in the hands of another president," Jaffer said.

The document's dry, bureaucratic language seems in stark contrast to the presumably dire consequences of the actions it outlines, and it leaves a number of questions unanswered. What appears to be a description of information to be included in the profile of an individual target is blacked out.

It provides no details of how high-value targets are chosen or any geographic limitations, and it includes several presidential waivers of its criteria in the event of "fleeting opportunity" to take action.

"Nothing in this PPG shall be construed to prevent the President from exercising his constitutional authority as Commander in Chief and Chief Executive, as well as his statutory authority, to consider a

lawful proposal" that falls outside the guidelines, including a possible strike against "an individual who poses a continuing, imminent threat to another country's persons," it says.

Numerous international law experts have said that the administration's overall terminology and justification for lethal strikes are novel and without precedent.

"The government has essentially invented its own set of standards ... somewhere in between international law covering war zones and outside areas," Jaffer said. "This doesn't provide any more clarity about the substantive standards the government is using."

The document does provide new details on the president's role in deciding when a strike will be taken. "Operating agencies" - the CIA and the Defense Department - are to provide overall plans for detaining and/or targeting named high-value targets and other "lawful" targets. The plans, to be authorized by the president, must "indicate with precision" the counterterrorism objective and duration of time the authority is to remain in force, the international legal basis for taking action and assets that may be deployed.

Decisions by operating agencies to take strikes against high-value targets require no additional presidential approval, unless U.S. citizens are involved, although "operational disagreements" among top national security officials are to be brought to the president for adjudication.

"Verifying a target's identity before taking lethal action ensures greater certainty of outcome" and the ability to "satisfy the policy standard," the guidelines say. Proposals to strike other targets - presumably the "signature strikes" against groups of unidentified terrorist suspects, massed outside or in buildings or vehicles - are to be submitted for approval and require written presidential authorization.

The document devotes several pages to captures and detentions of terrorist suspects - though they are vastly outnumbered by kills - which require proposals for "long-term disposition" for such individuals and include a "screening process" for any differences of opinion among departments.

An Interagency Disposition Planning Group assesses "the availability, including the strengths and weaknesses, of potential disposition options." Captures of terrorist suspects have long been complicated by decisions on what to do with them. Some have been transferred to third-party countries, while others have been held aboard U.S. naval vessels for interrogation before being brought to the United States for prosecution.

The Guardian (London)
NSA denies 'Raiders of the Lost Ark' stockpile of security vulnerabilities
Saturday, 06 August 2016
Byline: Alex Hern

Las Vegas - The agency's stockpile of unpatched, undisclosed vulnerabilities is a big concern to the security community, but research suggests it discloses more than it keeps
America's National Security Agency (NSA) spends upwards of $25m in a year buying previously undisclosed security vulnerabilities - known as zero days, because that's the length of time the target has had to fix them - but the large investment may not result in as much of a collection of hacking capabilities as is widely assumed.

Jason Healey, a senior research scholar at Columbia University and director at the Atlantic Council policy thinktank, argues that the true number of zero days stockpiled by the NSA is likely in the "dozens", and that the agency only adds to that amount by a very small amount each year. "Right now it looks like single digits," he says, adding that he has "high confidence in this assessment."

Healey presented the research at the Defcon hacking conference in Las Vegas to a packed crowd on the opening day of the event. "I don't know if we've got the right answer, but we've tried to run down every line of evidence that we can."

Related: Using Wi-Fi in Airbnb rentals poses security threat, researchers say

The question of quite how many unpatched, undisclosed vulnerabilities the NSA has stockpiled cuts to the heart of a long-running concern the information security community has about the agency's so-called "dual mandate": it is in charge of procuring intelligence about the actions of America's enemies, a goal it often pursues through targeted hacking attacks, which are made easier by having knowledge of useful zero days, but at the same time, it is in charge of protecting the information security of the nation, a role which naturally entails warning vendors about unpatched security vulnerabilities it discovers.

NSA claims its discloses 91% of vulnerabilities to vendors The same tension exists within the wider American government, Healey says. "You see this tension between these agencies, and the government is certainly not of one mind on this ... Until 2010 it doesn't seem like there was a government-wide policy to handle this."

Before beginning his talk, Healey asked the audience how many vulnerabilities they thought the NSA had stockpiled: hundreds, thousands, more than thousands or less than hundreds. The straw poll showed roughly even numbers guessing each possibility, something that underscores how little trust there is among hackers at large that the NSA will do the "right thing" when it has knowledge of critical bugs.

While emphasising that the closed nature of the NSA makes it hard to state anything categorically, Healey argues that all the available evidence supports the case that the agency actually has much less than the hundreds or thousands or vulnerabilities some in the audience thought it might.

One key piece of evidence comes from the NSA itself, which in 2015 claimed that 91% of vulnerabilities it procured were eventually disclosed to the vendors whose products were at risk. Of the other 9%, at least some of those weren't disclosed because they were fixed before they could be, the agency adds.

Similarly, the White House has revealed that in one year since the current disclosure policy was implemented, it reviewed about 100 software vulnerabilities discovered by the NSA to determine if they should be disclose, and "kept only about two". Healey adds that in the autumn of 2014, he was personally told that every single vulnerability which had come up for review had been disclosed.

'We don't have a stockpile of zero days' Aside from anything else, the figures fit with the comparatively low number of zero days found used in the wild in general. According to security researchers Symantec, just 54 were found through the whole of 2015, "so single digits sounds reasonable".

Healey also cites Michael Daniel, a special assistant to the president and the US's cybersecurity coordinator, to support the claim: "The idea that we have these vast stockpiles of vulnerabilities stored up - you know, Raiders of the Lost Ark -style - is just not accurate," Daniel has said.

The figures don't include the actions of other agencies, though. As the war between Apple and the FBI revealed, conventional law enforcement bodies also have an interest in securing unpatched vulnerabilities. When the FBI eventually bought one such zero day to break into the iPhone 5 at the heart of its fight with Apple - for a reported $1m - it managed to avoid government regulations about zero day disclosure by arguing that it only bought the use of a tool, not the zero day itself. "To me," Healey said, "it seems to contravene pretty direct presidential guidance."

Similarly, they don't include the actions of other governments. Around 30 are known to stockpile their own vulnerabilities, but only one - Britain's GCHQ - is anywhere approaching public about their activities. GCHQ announced disclosure of 20 zero days last year.

Healey closed with a plea to governments and to the hacker attendees of the conference: "Normally in warfare if one side disarms themselves all they've done is disarm themselves. This is the one area where you can disarm governments, because once that information goes to a vendor, everyone is disarmed."

Sunday Mirror (UK)
Cyber crime poses 'real threat' to UK economy
Sunday, 07 August 2016
Byline: Geraldine McKelvie

London - Cyber attacks could devastate Britain's infrastructure and economy, the National Crime Agency has warned.
It is urging more businesses to work with law enforcement agencies in a bid to reduce the growing menace.

Its report into the crisis said: "A cyber attack that poses an existential threat to one or more major UK businesses is a realistic possibility.

"The long-term impact of such a cyber attack could include substantial loss of revenue and margin, of valuable data, and of other company assets."

The NCA said it estimated cyber crime already costs the UK economy billions per year - and that is likely to keep rising as businesses struggle to deal with the issue. The report added: "In any calculation we must consider there are millions of individual victims, many thousands of corporate victims and correspondingly substantial losses.

"Moreover, the accelerating pace of technology and criminal cyber capability development currently outpaces the UK's collective response to cyber crime.

"This cyber arms race is likely to be an enduring challenge, and an effective response requires collaborative action from government, law enforcement, industry regulators and, critically, business leaders."

The NCA went on to say that business chiefs should "challenge" their management teams to go beyond normal cyber security standards to ensure "the threat to the UK is reduced".

The organisation also urged businesses to report all forms of cyber crime to the authorities.

It said: "Directors also have an important role in addressing the underreporting of cyber crime. "In particular, we urge businesses to share more intelligence, both with law enforcement and with each other."

The Australian
The bear in the room
Saturday, 06 August 2016
Byline: David Wroe

Canberra - Cyber spying China and Russia are considered the major culprits in attacks on Australia. The Australian Signals Directorate, a grey and dull-looking building in the defence precinct on a hill above Lake Burley Griffin in Canberra, houses the nation's offensive cyber capability.

This power to attack other countries or non-state adversaries digitally - as opposed to merely shielding ourselves against their attacks - was only acknowledged in April when Malcolm Turnbull unveiled his Cyber Security Strategy.

It would be used only in extreme circumstances, such as if an enemy posed a serious cyber or other military threat to Australia. But the nation's government agencies and vital industries are routinely being hit by attempted attacks that sit somewhere below that trigger level.

The dilemma of how to respond to these regular jabs from shadowy hackers was underscored for the United States last week when the Democratic National Committee was hacked and information embarrassing to Hillary Clinton released by WikiLeaks. The hackers were widely thought to have been from Russian intelligence and there is a strong suspicion it was done to help Clinton's rival, Donald Trump, who for geo-strategic reasons the Kremlin would rather see in the White House come January.

King's College London cyber guru Thomas Rid summed up the view of the security community by branding such a brazen effort by Moscow to interfere in the US's internal politics "a game changer". Yet President Barack Obama's response was mild, saying that if Russia was behind the hack, it would not "wildly" alter Washington-Moscow relations and it was just one more item on a "long list" of differences between the countries.

In the fast-changing world of cyber threats, information is being weaponised in unpredictable ways that are difficult for the victim to respond to.

Cyber attacks are cheaper than armies. They get to ignore geography. They can be conducted in a way that makes it hard for the victim country to prove who did it without revealing its own capabilities.

"They can invest smaller amounts of money and people and asymmetrically get more for it," said Alastair MacGibbon, special adviser to the prime minister on cyber security.

"The internet gives great scope to nation-states, trouble-makers and various threat actors to do things from their lounge room that otherwise they would have had to do face to face. It's been a great enabler. It knocks down geography and a whole lot of other things that previously would have got in the way."

Canberra has admitted to two major cyber breaches in recent years, one on federal Parliament's email system and the other on the Bureau of Meteorology, which is plugged into other agencies including Defence. Both are suspected of coming from Chinese government hackers.

Concerns over the security of government information hit the headlines again this week as Australians began filling out the census largely online, with personal details being held on government systems for four years.

Serious cyber attacks are designed for warfare situations - the first shots in a conflict between major powers would be digital, attempting to take out the other side's ability to command and control their forces.

But the same capabilities can be used in scenarios well short of war to coerce, intimidate and influence, just as traditional military hardware can be used in the way it is now in the South China Sea.

Tobias Feakin, a cyber expert with the Australian Strategic Policy Institute and an independent adviser on the government's classified Cyber Security Review, said Russia was already suspected of having used cyber means for "political destabilisation and interference in its near region" in the form of attacks on Ukraine and Estonia that weren't wartime operations.

Feakin is one of those who believes the Democratic National Committee case was a "quite dangerous" watershed moment, assuming it was indeed Russia as reported.

"It is crossing the boundary around non- interference in a state political process ... almost to weaponising that information and making it harmful to another government without having to confront it."

One veteran security insider told The Age such state-on-state attempts at cyber coercion are likely being done "on a much wider scale than you would think and ... certainly than is reported". He said there was "potential for this to go seriously astray", with sabotage, manipulation of information and even blackmail of political leaders all becoming possible.

"We've created a new monster that will allow people to manipulate information for political gain," the insider said.

In a similar vein, MacGibbon noted everyone has information they wouldn't want to be made public.

"I can guarantee you I've got some of that stuff. I'm suspecting you do as well, whether it's about my personal life, or my personal finances. Could people release that for the purposes of embarrassment and causing resignation? Absolutely. Would it be nation-states or just malicious people who do it? Yes, it could be anyone."

A spokesman for the Australian Cyber Security Centre, housed in ASIO's headquarters in Canberra, said the centre was seeing a "variety of intrusion activity based on a growing range of cybersecurity threats".

"Foreign state-sponsored adversaries are targeting the networks of the Australian government (including state and territory), industry and individuals to satisfy requirements for economic, foreign policy, defence and security information, to gain advantage over Australia," he said. He declined to say where the attacks came from, saying that would "jeopardise ongoing investigations, monitoring of incidents and the ability to protect information and networks".

"The more that is disclosed about cyber incidents, the more that the perpetrators will know about our capability and the methods we have for detecting cyber threats."

Everyone in the business knows China and Russia are considered the major culprits in attacks on countries such as Australia. Feakin said Russia was known for the quality of its hacking, China for the quantity. Both use proxies, hackers who are outside the countries' intelligence agencies but do their bidding.

Where Russia is more about political destabilisation, China has a tradition of economic espionage.

There isn't any obvious looming scenario in which another country such as China might try to influence or destabilise Australia politically, Feakin said.

But he said that amid the great strategic change going on in our region and as a major US ally, there would be strong interest "in how powerful players are thinking, what future actions might be taken".

"The political cycle is always of interest for countries that might be non-aligned with us strategically."

The Turnbull government has pledged $230 million over four years under its Cyber Security Strategy for new staff and resources. The Defence White Paper put a heavy focus on cyber with a further $400 million over 10 years, noting there were more than 1200 attacks on government agencies and nationally critical sectors such as defence industry in 2015 - a steady rise on previous years.

MacGibbon said in the 15 years he's been working in cybersecurity, as a federal police officer, a consultant and a government adviser, there's been a "progressive realisation by agencies" in government that they are vulnerable.

"I would not be so churlish as to say to you that we've reached Nirvana in terms of agencies accepting that they need to mitigate those risks really aggressively," he said. "We have a way to go, there's no doubt. But I would tell you that in 2016, we are better placed than we were in 2006."

But he adds that no security will ever be perfect. Foreign cyber operations will get through.

This means countries including Australia need to figure out ways to respond, Feakin said. Hitting back needn't necessarily be done digitally. The US, for instance, has considered economic sanctions against Chinese hackers. Diplomatic responses are also an option.

But eye-for-an-eye responses are unlikely when it's hard to prove who was behind the hack without exposing one's own classified capabilities. China and Russia are "some of the worst offenders" when it comes to using criminal and hacktivist groups as proxies to carry out attacks, Feakin said.

"Without the categorical, 100 per cent proof, it becomes almost impossible to take action."

Turnbull said on revealing the ASD's offensive capability in April that by finally going public on a capability that had long been assumed to have existed he was adding "a level of deterrence".

So why don't we just surreptitiously hit back in kind whenever we are attacked? Turnbull noted that Australia would only use offensive cyber lawfully and consistent with "the international rules-based order".

In other words, we have better standards. Margaret Stone, the Inspector-General of Intelligence and Security - a watchdog on spy agencies - addressed this question to an audience of intelligence officials and experts this week. In short, she said Australia is not Russia. But this raised a looming problem - do we have to lower our standards to keep up? Stone said she didn't think so but acknowledged it was a challenge.

"The task that our intelligence agencies, particularly in the international area, are being asked to do, is becoming increasingly complex and increasingly difficult. But the demand is greater," Stone said. "So does that lead to a push for lower standards? ... I think that that is a real issue."

Endgaget
US reportedly elevates the role of Cyber Command
Sunday, 07 August 2016
Byline: Jon Fingas

Washington - Now that the US treats cyberwarfare as a staple of its combat operations, it's ready to raise the prominence of its internet warriors. Reuters sources say that the Obama administration is planning to elevate Cyber Command, turning it into a "unified command" that's just as crucial as a major regional section like Pacific Command. The proposed shuffle would also detach Cyber Command from the NSA, giving it more input on the use of online weapons and defenses.
There's no guarantee that the reorganization will go through as it exists right now. Neither Cyber Command nor the NSA are commenting, and an unnamed official tells Reuters that the link between Cyber Command and the NSA is "critical to national security." If the report is accurate, though, the reform isn't likely to face significant opposition.

A switch-up like this might be necessary. Military leaders are reportedly annoyed at the sluggish pace of Cyber Command's campaign against ISIS, and have already created a task force that partners with Central Command to improve its performance. A more powerful Cyber Command might get better resources and would have greater independence. As it is, the shift would be an acknowledgment that online warfare is no longer a side project -- it can be crucial to winning a conflict.

Daily Telegraph (Australia)
BBC detector vans to spy on internet users
Saturday, 06 August 2016
Byline: Peter Foster

London - The BBC is to spy on the internet users in their homes by deploying a new generation of Wi-Fi detection vans to identify those illicitly watching its programmes online.
The Daily Telegraph can disclose that from next month, the BBC vans will fan out across the country capturing information from private Wi-Fi networks in homes to "sniff out" those who have not paid the licence fee.

The corporation has been given legal dispensation to use the new technology, which is typically only available to crime-fighting agencies, to enforce the new requirement that people watching BBC programmes via the iPlayer must have a TV licence.

The disclosure will lead to fears about invasion of privacy and follows years of concerns over the heavy-handed approach of the BBC towards those suspected of not paying the licence fee. However, the BBC insists that its inspectors will not be able to spy on other internet browsing habits of viewers.

The existence of the new strategy emerged in a report carried out by the National Audit Office (NAO).

It shows that TV Licensing, the corporation's licence-fee collection arm, has developed techniques to track those watching television on laptops, tablets, and mobile phones.

The disclosure of the controversial new snooping technique will lay to rest the persistent claims that detector vans are no more than an urban myth designed to intimidate the public into paying the licence fee.

Sir Amyas Morse, the comptroller and auditor general of the NAO, writes in the report: "Detection vans can identify viewing on a non-TV device in the same way that they can detect viewing on a television set.

"BBC staff were able to demonstrate this to my staff in controlled conditions sufficient for us to be confident that they could detect viewing on a range of non-TV devices."

Currently, anyone who watches or records live programming - online or on television - needs to buy a £145.50 licence. But from September 1, those who use the iPlayer only for catch-up viewing will also need to pay the fee, after the BBC successfully lobbied the Government to change the law.

Under the Regulation of Investigatory Powers Act, the corporation is entitled to carry out surveillance of suspected licence-fee dodgers.

The BBC confirmed that its newly developed detection techniques had been authorised under the legislation.

While the corporation would not disclose how the new technology works, the report states that the BBC has ruled out combing its own records of computers that have logged into the iPlayer website to hunt down non-paying viewers.

Sir Amyas writes in the document: "The BBC rightly acknowledges that this would be an inappropriate invasion of privacy."

Instead, electrical engineering experts said that the most likely explanation for how the BBC would carry out it surveillance was a technique known as "packet sniffing", which involves watching traffic passing over a wireless internet network without hacking into the connection or breaking its encryption.

Researchers at University College London disclosed that they had used a laptop running freely available software to identify Skype internet phone calls passing over encrypted Wi-Fi, without needing to crack the network password.

Privacy campaigners described the developments as "creepy and worrying".

A spokesman for Privacy International, the human rights watchdog, said: "While TV Licensing have long been able to examine the electromagnetic spectrum to watch for and investigate incorrect usage of their services, the revelation that they are potentially developing technology to monitor home Wi-Fi networks is startlingly invasive."

A spokesman for TV Licensing said: "We've caught people watching on a range of devices, but don't give details of detection as we would not want to reveal information helpful to evaders.

"Our use of detection is regularly inspected by independent regulators."

The Daily Beast
How Russia Dominates Your Twitter Feed to Promote Lies (And, Trump, Too)
Saturday, 06 August 2016
Byline: Andrew Weisburd & Clint Watts
Section: Analysis

Analysis: Fake news stories from Kremlin propagandists regularly become social media trends. Here's how Moscow does it... and what it means for America's election 2016.
"Ladies and Gentlemen, We have a situation in #Turkey #Incirlik" the cry went out on Twitter last Saturday night, as news spread of the Turkish forces surrounding the U.S. airbase in Incirlik.

Thousands of armed police had reportedly surrounded the airbase amid swirling rumors of another coup attempt, according to stories tweeted within two minutes of each other on RT.com and Sputnik, the two biggest Russian state-controlled media organizations publishing in English. The stories were instantly

picked up by a popular online aggregator of breaking news and prompted hours-long storm of activity from a small, vocal circle of users.

In English, the tweets soon grouped into certain patterns of similar (and sometimes identical) content. The first were panicky expressions of concern about nuclear weapons allegedly stored at Incirlik:

#Incirlik There r 25 underground vaults, each holds up to 4 bombs. The estimated total is 50 B61 thermonuclear bombs--1/4 of B61 stockpile.

Turkey is soon going to acquire some nice nuclear weapons unless Obama pulls his finger out & does something

#Incirlik does anybody else find it ODD that there's a lot of dump trucks. Big enough to carry 90 nuclear warheads

What exactly is going on with the nuclear weapons in Turkey? And why the hell are they there, of all places?

The second group compared the situation to Benghazi.

A third group wondered aloud and repeatedly about why the media wasn't covering the alleged activity.

Why is USA MSM failing to report on events in Turkey surrounding Incirlik AFB and Erdogan's accusation that USA orchestrated the coup?

Hey MSM, you've got 10000 Muslims, steps away from a stockpile of thermonuclear weapons.

Nothing on #msm, no #potus, no #dem or #gop speaking out! Nuclear warheads, up to 90 at stake!

The main reason the media didn't show up was that the story was substantially untrue. As a later statement by the Pentagon clarified, a peaceful protest had taken place involving about 1,000 people--not the 7,000 Turkish police reported by Russian news outlets or the 10,000 cited by Twitter users. Officials at the air base had been warned of the protest in advance. The base was not "surrounded", Turkish security focused on securing the visit of U.S. Chairman of the Joint Chiefs Joe Dunford to Incirlik the next day.

The Incirlik disinformation campaign failed but demonstrates the unique way in which Russia can influence foreign audiences. Incirlik stories on RT and Sputnik news were rapidly promulgated by a curious group of English speakers on Twitter.

One of the first English tweets promoting the Incirlik story came from a Twitter user under the name Marcel Sardo--an account previously identified for instigating pro-Russian campaigns. From this initial

tweet, a cascade of Twitter accounts rebroadcast RT and Sputnik Incirlik articles adding commentary and hashtags. Accounts initially broadcasting the #Incirlik story from seemingly different locales and online communities quickly merged in the first 90 minutes after release of the RT and Sputnik news story.

An increasingly common social media pattern over the past two years as Russia has become more aggressive both on the ground and online as tensions ratchet in a renewed Cold War with the West.

The evolving pattern of retweets reveal a close-knit network and circular information flow where key amplifiers re-broadcast the base #Incirlik story adding commentary and fomenting fears. And here's the odd part: many members of this network seem to be Trump fans.

Some of the top hashtags attached to tweets broadcasting #Incirlik #Turkey were #nato, #coup, #benghazi, #trumppence16. Each of these add-on hashtags pointed to recently hot button issues in the U.S. Presidential contest. Bios of these English speaking accounts retweeting the #Incirlik story commonly included the words "god," "country," "family," "conservative," "Christian," "America," "constitution," and "military."

Two or three tweets called for prayers for U.S. service members potentially in harms way, suggesting Americans were again being overrun in another Benghazi type scenario. More than 10 percent of English speakers citing #Incirlik contained the word "Trump" in their user profile information. From the public view, it's difficult to determine which of these English accounts are real Americans supporting the Trump campaign or instead manufactured accounts inciting support for the Trump campaign and fomenting dissent amongst the U.S. electorate.

This melding of Russian-friendly accounts and Trumpkins has been going on for some time.

"I created this list of Russian trolls," writer Adrian Chen told the Longform podcast in December 2015. "And I check on it once in a while, still. And a lot of them have turned into conservative accounts, like fake conservatives. I don't know what's going on, but they're all tweeting about Donald Trump and stuff."

The Incirlik story, despite failing to endure more than a couple hours before losing credibility, provoked a reaction from Turkey and the U.S. Both countries publicly responded to a non-event seeking to maintain public confidence overseas and at home. More importantly, the propaganda effort comes alongside accusations of Russia meddling in the U.S. election on behalf of Trump. Most sources implicate Russia for hacking the Democratic National Committee's emails and subsequently releasing them on the eve of the DNC convention. Donald Trump's pro-Russia, anti-Ukraine, anti-NATO policy positions have been repeatedly questioned over the past two weeks. Trump's top aide lied about the campaign's changes to the RNC platform limiting support to Ukraine to only defensive weapons.

In a sense, this is the return of an old game. From the 1950s through the Soviet Union's collapse, the Soviet Union sought to use "the force of politics rather than the politics of force" to disrupt and defeat

their adversaries from the inside out. As explained by the 1992 U.S. Information Agency report to Congress, "Active measures seek to use slogans, arguments, disinformation and selected true information to influence the attitudes and actions of foreign publics and governments." Soviet propaganda pushed stories regarding the flaws of democracy, collapse of the world economy, environmental catastrophe, and global calamities like nuclear war.

Conduct of Soviet and Russian 'Active Measures' before the internet proved challenging, particularly in the West. Soviet agents and paid communist supporters would need to reside in the countries they sought to influence, create a print or radio media outlet or gain a job working at an established platform and evade the scrutiny of Western counterintelligence. But these days, it's as easy as setting up a Twitter account. Russia influence operations in social media represents a far more effective and efficient return to their 'Active Measures' campaign of the Cold War.

And when combined with the alleged hacks of political actors, the promotion of these Incirlik-style stories through overt Russian media outlets and 'grey' English speaking propagandists could make for a powerful one-two punch to disrupt the American election. The synchronization of hacking and social media information operations not only has the ability to promote a favored candidate, like Trump, but also has the potential to incite unrest amongst American communities.

Since Incirlik, Trump and Russian media have simultaneously pushed a new theme: the illegitimacy of U.S. elections. The Incirlik disinformation campaign, while a failure, raises the question of Russia's ability to use social media 'Active Measures' to destabilize the American public. #Incirlik wasn't the first Russian influence effort on social media and it most certainly won't be the last. To date, there's been no public U.S. response to alleged Russian hacking or social media information operations. How much longer can the U.S. wait?

New York Times
Did She 'Short-Circuit' on the F.B.I. Inquiry? Clinton Seeks to Explain
Saturday, 06 August 2016
Byline: Yamiche Alcindor

Washington - Hillary Clinton on Friday sought to explain her recent mischaracterization of the F.B.I. investigation into her private email server, saying she "may have short-circuited" in her remarks during a television interview on Sunday when she asserted that the F.B.I. director, James B. Comey, had called her statements about her private email servers "truthful."
Mrs. Clinton made the remarks while taking her most extensive questions from journalists in months -- after going more than 200 days without holding a formal news conference.

She has been under fire from Republicans and others since her remarks Sunday on Fox News about her use of a private email server as secretary of state and the resulting F.B.I. investigation. While Mr. Comey

did not recommend charges in the case, he said Mrs. Clinton had been "extremely careless" in her use of a private email server and contradicted statements she made about her handling of her email.

In her remarks here before the National Association of Black Journalists and the National Association of Hispanic Journalists, Mrs. Clinton tried to explain the discrepancy with what Mr. Comey actually said.

"I was pointing out in both of those instances that Director Comey had said that my answers in my F.B.I. interview were truthful," she said. "That's really the bottom line here."

Mrs. Clinton reiterated her explanation that the classified emails the F.B.I. had identified as having passed over her private server were not marked classified at the time.

The explanation did not appease Republicans.

"It's not hard to see why she hasn't held a press conference in 244 days," said the Republican National Committee chairman, Reince Priebus. "Hillary Clinton is once again proving herself incapable of telling the truth."

During her remarks, Mrs. Clinton said she took "seriously" the problems she has had winning voters' trust.

Questioned about why a majority of voters do not trust her, Mrs. Clinton referred to her high approval ratings when she was secretary of state and a senator from New York.

"Were 67 percent of the people in New York wrong? Were 66 percent of the American public wrong?" she asked. "Just maybe, when I'm actually running for a job, there is a real benefit to those on the other side with trying to stir up as much trouble as possible."

And she explained that the economic frustration driving many of Donald J. Trump's supporters should be taken seriously.

When asked about what Mr. Trump's millions of supporters, who are often drawn to language she and others have called racist and sexist, says about the electorate, Mrs. Clinton said that while some people were backing the businessman because of his "bigotry," she acknowledged that many were motivated by economic hardships.

"We have to recognize that of course some of the appeal is xenophobic and racist and misogynistic and offensive," she said. "We have to acknowledge that -- but let's not lose sight of the real pain that many of Americans are feeling because the economy has left them behind."

Mrs. Clinton also criticized Mr. Trump on Friday as someone who would be a dangerous president and stressed that if elected, she would work on issues related to systemic racism and the economy that often hit black and Hispanic communities the hardest.

"He is harkening back to the most shameful chapters of our history and appealing to the ugliest impulses of our society," she said. "We need to stand up as a country and say that Donald Trump doesn't represent who we are and what we believe."

Mrs. Clinton also vowed to push hard to pass a comprehensive immigration overhaul bill with a path toward citizenship for those in the country illegally, and said she would prioritize the issue during her first 100 days in office.

Mrs. Clinton joins a long list of political leaders who have spoken at the groups' conventions, which often focus on increasing diversity in newsrooms. President Obama, former President Bill Clinton, former president George W. Bush, Bob Dole and former Vice President Al Gore have all addressed past conventions. The groups invited Mr. Trump to speak, but he declined, according to the organizers.

Before taking questions, Mrs. Clinton delivered a 15-minute address focused mostly on how her plans to improve the economy would especially benefit blacks and Latinos. "Rosa Parks opened up every seat on the bus," she said. "Now we've got to open up every opportunity."

Hovering over the address was the image of Mrs. Clinton addressing a room full of journalists. Although she occasionally holds informal sessions with the news media on campaign stops, Clinton aides have spent months explaining why she hasn't held an official news conference, as most candidates, particularly Mr. Trump, do regularly.

"We'll have a press conference when we want to have a press conference," Joel Benenson, the campaign's chief strategist and pollster, told ABC News last month.

She even had some words of encouragement for the Fourth Estate: "We need you to keep holding leaders and candidates accountable," Mrs. Clinton told the hundreds of journalists attending the five-day conference here of the National Association of Black Journalists and the National Association of Hispanic Journalists.

Near the end of the event, Mrs. Clinton talked about her African-American girlfriends, whom she rarely mentions in public. Asked what the most meaningful conversation she has had with one of them, she said she was "blessed to have a crew of great friends." These include some of her most senior aides, including Cheryl D. Mills, Maggie Williams and Minyon Moore.

"I can't compress it into one conversation," Mrs. Clinton said. "They've supported me. They've chastised me. They've raised issues with me."

Find out what you need to know about the 2016 presidential race today, and get politics news updates via Facebook, Twitter and the First Draft newsletter.

Wall Street Journal
Password Hacking Forces Big Tech Companies to Act
Monday, 08 August 2016
Byline: Robert McMillan

New York - In the past few months, hackers have taken over the social-media accounts of Facebook Inc. Chief Executive Mark Zuckerberg, Google CEO Sundar Pichai and Twitter Inc.'s CEO, Jack Dorsey. Behind the scenes, security teams at every major technology company -- and many smaller firms, too -- are scrambling to protect others from the same fate.

Some of the executives apparently reused passwords that had been stolen in earlier hacks of LinkedIn, Myspace and other sites; others may have fallen victim to software that uses the old passwords to guess new ones.

Nearly two billion old passwords can be viewed for as little as $2 at a database called LeakedSource, run by anonymous operators.

Investigators estimate that maybe up to 8% of the LinkedIn usernames and passwords will work on other services, giving hackers a way to take over accounts elsewhere. LinkedIn, meanwhile, reset its own users' passwords and fixed a security hole that had allowed data to be stolen in 2012. The company is in the process of being acquired by Microsoft Corp., a $26.2 billion deal that is expected to close by year's end.

Hacking creates a dilemma for operators of other popular consumer web services. They can require all users to change their passwords, and risk losing some users. If they don't force password changes, users' accounts could be hacked.

"If they change passwords for their users, no matter how well they explain it, the perception may be completely off," said Alex Holden, the founder and chief information security officer of Hold Security LLC, which helps companies spot stolen credentials on hacking sites. "If even 0.1% of these users panic and they have to call customer service in one day, it creates a nightmare."

Carbonite Inc., which offers online backup services, chose to reset passwords for each of its 1.5 million users. The company also analyzed the hacked data and required customers whose credentials appeared in the database to confirm their identities in order to access their accounts.

Carbonite moved decisively because of the serious consequences of a compromise, said Norman Guadagno, Carbonite's senior vice president of marketing. "When you have a Carbonite account -- or

any backup service -- and you have the username or password to that account, you have access to everything," he said.

Twitter, Facebook, Yahoo Inc. and others chose a different course. Instead of resetting all passwords, they analyzed the stolen credentials and then urged or forced affected users to reset their passwords.

Over the past years, companies such as Yahoo have put in place data-analysis and customer warning systems that allow them to methodically process these huge volumes of data and protect customers who reuse their passwords against these types of disclosures.

Last week, Yahoo's security team responded to a report that 200 million of the company's user names and passwords were up for sale in hacker forums. A Yahoo spokesman said the company was aware of the claim and "working to determine the facts."

The identity intelligence company InfoArmor Inc. examined the database in question last week and believes that it isn't a brand-new database of Yahoo passwords.

The Daily Beast
Vladimir Putin Plots a New Fleet of Spies in Space
Monday, 08 August 2016
Byline: David Axe

Washington - The Russian military is apparently getting ready to launch a new generation of high-tech spy satellites.
It could help Moscow begin to match the as-yet-unrivaled resolution of America's own eyes in orbit. But the U.S. space force isn't standing still. While Russia races to catch up to the United States in one particular aspect of orbital reconnaissance--that is, imagery detail--the United States is plotting a sort of technological sidestep that could actually extend its lead over its rivals in space-based espionage.

Moscow reportedly plans to launch three of the new Hrazdan satellites--one each in 2019, 2022 and 2024. Essentially orbital telescopes that point down toward Earth, the Hrazdans will replace Russia's two existing Persona spy satellites.

Moscow has come to rely heavily on its military spacecraft to support long-distance deployments. Spy satellites, including the Personas, have played a central role in the Russian intervention in Syria, helping to spot targets for Russian bombers and cruise missiles.

The Hrazdans are built around huge, finely-crafted lenses. Where the Personas' feature 1.5-meter-diameter lenses, the Hrazdans' boast lenses with a diameter greater than two meters, according to Kommersant, a Russian newspaper.

The Personas maintain circular orbits around Earth at an altitude of 700 kilometers. At that altitude, the older sats' lenses afford them a 31-centimeter resolution, Ted Molczan, an independent satellite-tracker and space expert, told The Daily Beast. In other words, when a Persona takes a snapshot of the Earth's surface, each pixel in the image represents an area 31 centimeters by 31 centimeters.

At the same altitude, the Hrazdans would significantly improve on the Personas. Their resolution could go as high as 24 centimeters, according to Molczan.

"This is a significant upgrade for the Russian capabilities," Brian Weeden, a space expert with the Secure World Foundation in Colorado, told The Daily Beast.

But while Russia focuses on improving its spy satellites' resolution, the United States is working hard to make its own spacecraft more responsive--and combining them with for-hire, commercial satellites. That's a major, major shift for the American military and intelligence communities.The U.S. National Reconnaissance Office, which operates America's main spy satellites on behalf of the military and intelligence communities, can get resolutions as high as seven centimeters from its KH-11 Keyhole spy satellites, whose 2.4-meter-diameter lenses formed the basis of NASA's famous Hubble telescope.

But there's a catch. The KH-11s traditionally maintain elliptical orbits that dip as low as 260 kilometers and climb as high as 1,000 kilometers. At the highest altitude, the Keyholes' resolution degrades to 28 centimeters, Molczan said. It's only at the low point that the U.S. sats' can peer down with seven-centimeter resolution.

The elliptical orbits are no accident. They allow the satellites to modulate between viewing huge swathes of Earth at low resolution and much smaller sections of the planet at high resolution. By coordinating the orbits of the KH-11s--there are apparently four of the spy sats in operation--the NRO can maintain simultaneous wide and narrow surveillance.

But the NRO apparently has a new and, it clearly believes, better scheme in mind--one that could vastly improve America's space reconnaissance capability without simply counting on ever-larger lenses on successive generations of spy satellites.

The NRO appears to be shifting its KH-11s in lower, more circular orbits--and is set to continue this deployment pattern as new Keyholes come on line starting in 2018. "There are indications that the next-generation KH-11 may adopt a 260-kilometer-by-500- kilometer orbit, which would maintain the present seven-centimeter best resolution, but significantly improve the overall resolution around the orbit," Molczan explained.

That would leave gaps in wide-area surveillance compared to the traditional orbital pattern. But the NRO has a plan, according to Molczan. "The task of lower-resolution, wide-area coverage would shift to commercial satellites."

Private firms such as DigitalGlobe sell space-based imagery at resolutions as high as 30 centimeters, the current cap under U.S. law. Weeden told The Daily Beast that companies now possess the technology to collect 25-centimeter-resolution imagery, even if they can't legally sell it to private users.

DigitalGlobe's satellites orbit at 770 kilometers, near the KH-11s' old peak. The NRO could substitute imagery from DigitalGlobe or another company for the lowest-resolution Keyhole imagery--25 to 30 centimeters--and free up the KH-11s to do what they do best--take detailed snapshots at very, very high resolution.

At the same time, the NRO is improving its satellite-communications infrastructure. Spy satellites are really just remote-controlled cameras. To make use of their imagery, analysts on the ground must download the photos.

That's only possible when the spacecraft has a line of sight to a ground station and can beam down a digital file. Alternatively, the spy sat can beam its data to a constellation of dedicated, very-high-altitude "satellite data system" relay spacecraft that stays in constant contact with controllers on the ground.

The United States is the world leader in these SDS relay sats--and might be on the verge of pulling even farther ahead of rivals. "The U.S. appears to be investing a lot more in that than the Russians or anyone else," Weeden commented. The NRO generally doesn't disclose the exact nature of its satellite launches, but Weeden and Molczan both said they believe the most recent NRO launch, on July 28, involved a new SDS satellite.

So yes, the Russians are reportedly getting new spy satellites. They're apparently pretty sophisticated. But that doesn't mean the Russia is pulling ahead of the United States in the field of space reconnaissance. "From what I can tell, the U.S. still has a pretty sizable advantage at least qualitatively, if not quantitatively," Weeden said.

New York Times
Can We Still Trust WikiLeaks?
Monday, 08 August 2016
Byline: Alex Gibney

Op-ed - The release of a cache of emails from the Democratic National Committee by WikiLeaks last month has raised a great many questions -- about the role of the D.N.C. in trying to influence the primary and about the alleged interference of Russian intelligence in an American election.
It also raised long-debated questions about WikiLeaks itself, about how an organization dedicated to radical transparency continues to bring secretive worlds to light. And the episode reveals some of the weaknesses of WikiLeaks and its founder, Julian Assange, like their recklessness with personal data and their use of information to settle scores and drive personal agendas.

I've had my own run-ins with Mr. Assange. During the making of my 2013 film, "We Steal Secrets: The Story of WikiLeaks," I spent an agonizing six hours with him, when he was living in an English country house while out on bail. I was struck by how insistently he steered the conversation away from matters of principle to personal slights against him, and his plans for payback. He demanded personal "intel" on others I had interviewed, and dismissed questions about the organization by saying, "I am WikiLeaks" repeatedly. (Later, Mr. Assange and his followers attacked both me and my film.)

Even given that history, I believe that WikiLeaks was fully justified in publishing the D.N.C. emails, which provided proof that members of the D.N.C., in a hotly contested primary, discussed how to undermine the campaign of Bernie Sanders. They are clearly in the public interest.

As for Mr. Assange's animus against Hillary Clinton -- he has written that she "lacks judgment and will push the United States into endless, stupid wars which spread terrorism" -- that is evidence of bias, but no more than that. After all, many news outlets are clearly, and sometimes proudly, biased.

We still don't know who leaked the D.N.C. archive, but given Mr. Assange's past association with Russia, it wouldn't surprise me to learn that it was a Russian agent or an intermediary. Mr. Assange insists this is a mere distraction from the issue of D.N.C. interference, but the answer is also in the public interest. We should all be concerned (although hardly surprised) if it is that easy for the Russians to break into the D.N.C. and possibly United States government networks.

As for the way the leak was published, Mr. Assange and WikiLeaks have more to answer for. Contained in the D.N.C. archive were Social Security numbers and credit card data of private individuals, information that served no public interest. Mr. Assange defended this invasion of privacy by claiming that deleting the information would have harmed the integrity of the archive.

But there is a responsible tradition of redacting potentially harmful private information. In 2010, just before publishing the first Afghan war logs provided to WikiLeaks by Chelsea Manning, Mr. Assange and a group of journalists from The Guardian, The New York Times and Der Spiegel were engaged in a tussle over redacting the names of Afghan informants. The three publications all decided to do so, but Mr. Assange disagreed. As he told Nick Davies of The Guardian, "If an Afghan civilian helps coalition forces, he deserves to die."

Others present at this time insist that he was concerned about their safety but had little technical ability to do the redactions on a tight deadline. The net result: Mr. Assange held back 15,000 documents and published the rest, including the names of about 100 Afghan civilians.

There is no evidence that any of those people were killed. But people could have been hurt. And his refusal to redact allowed the United States government to deflect attention from the evidence of possible war crimes by claiming that Mr. Assange had blood on his hands.

In an underappreciated part of the WikiLeaks saga, computer- savvy volunteers at the organization corrected Mr. Assange's mistake and used an inventive computer program to scrub names and identities from the second leak of documents, the Iraq War Logs. It was an exemplary display of how to publish sensitive materials. Sadly, Mr. Assange reverted to form in subsequent leaks, including the unredacted publication of 251,000 State Department cables and his recent release of the emails from the A.K.P., Turkey's ruling party, which exposed the personal information of more than one million Turkish women.

By comparison, Edward J. Snowden has been much more careful about how leaked documents were published. He recently criticized Mr. Assange, noting that WikiLeaks' "hostility to even modest curation is a mistake."

Mr. Assange has also leaked documents to benefit his private aims. In 2010, he ordered an associate named James Ball to pass 90,000 cables covering Russia, most European countries and Israel to a shady journalist named Israel Shamir, who, according to Mr. Ball, later offered them to pro-Putin Russian media outlets for a $10,000 fee. It also seems likely that Mr. Shamir passed documents to Belarus's brutal president, Aleksandr G. Lukashenko, just before a crackdown on opposition activists (which WikiLeaks has denied). Mr. Shamir is also the father of Johannes Wahlstrom, a Swedish journalist who helped to engineer a vilification campaign against the two women who accused Mr. Assange of sexual assaults and who was to be a key witness had Mr. Assange been tried for rape in Sweden.

For many of those who know him well, Mr. Assange is afflicted by what the police call "noble cause corruption," a belief that noble ends justify reckless or immoral means. In a world awash in new information -- and misinformation -- context, motivation and trust are crucial when weighing the importance of leaks and their accuracy. Mr. Assange still claims that WikiLeaks is a beacon of transparency. We should no longer take him at his word.

Note: Alex Gibney is a filmmaker whose latest documentary, "Zero Days," is about cyberwarfare.

The Guardian (London)
The Chinese firm taking threats to UK national security very seriously
Monday, 08 August 2016
Byline: Juliette Garside

Banbury, Oxfordshire - Welcome to the Cell. All visitors must surrender their phones at the door. No cameras or filming equipment allowed.
In a deceptively humdrum office block on the outskirts of Banbury, Oxfordshire, a team of cybersecurity experts is working to combat the risk of surveillance and hacking attacks from China.

The Cell's technicians have the highest level of security clearance, with their personal and financial histories combed by investigating officers. Their work is overseen by a board that includes directors from GCHQ, the Cabinet Office and the Home Office.

But the Cell's staff are not on the British government payroll. They are employed by Huawei, one of China's largest technology companies. A maker of broadband and mobile network equipment, its kit is installed all over the UK.

In Banbury, the task is to check Huawei hardware and software for faults and bugs that could be exploited for nefarious purposes. Circuit boards are dismantled, and millions of lines of software code are analysed.

The centre was created as a compromise - between the security concerns of intelligence agencies and the private sector's desire for cheap imported technology.

With George Osborne's ejection from the Treasury, China has lost its main cheerleader in government. The new prime minister, Theresa May, is taking a more cautious approach. A decision on allowing the Beijing-backed Hinkley Point power station project to go ahead has been delayed at her request.

In a climate of cooling economic relations, could the Cell provide a model for managing the potential risks of Chinese involvement in critical national infrastructure?

Perhaps. Up and running for five years now, the Huawei Cyber Security Evaluation Centre, to use its official name, is regarded as a success by the board of government officials which oversees its work.

In their second annual report, published this spring, they found the arrangements to ensure the Cell was independent from Huawei were operating "robustly and effectively", and that any potential threats to national security "have been sufficiently mitigated".

But in 2013, the Banbury operation was heavily criticised by parliament's intelligence and security committee, then chaired by the former defence secretary Sir Malcolm Rifkind.

MPs had decided to review its work after a US senate report raised the alarm, urging American firms not to use the company's equipment. Attempts by Huawei to take over US technology companies had been blocked. In Australia, it was barred from bidding for the country's multibillion-pound project to connect every home to a superfast broadband service.

Rifkind's committee concluded that the Cell's staff should not be Huawei employees. His report warned this amounted to Huawei "effectively policing themselves". He recommended Banbury be staffed by GCHQ, and failing that, subject to much greater scrutiny by government officials.

And so, in 2014, security experts from the highest echelons of the civil service were brought together, along with representatives of Vodafone, Huawei and BT, to create the Cell's oversight board. It is currently chaired by Ciaran Martin, director general for cybersecurity at GCHQ.

Concerns persist. Ernst & Young, hired to evaluate whether the Cell is truly independent from Huawei headquarters, concluded that the ability of the company to set the bonus of the Cell's managing director, David Pollington, hired from Microsoft last year, "provides a vector by which performance ... could be influenced".

Ernst & Young argued that "by withholding or awarding the bonus (irrespective of performance), which constitutes a significant element of the reward package, the bonus could be used as a tool to motivate certain behaviours from the MD". The risk was reconsidered, but "accepted as reasonable", according to the 2016 annual report.

A spokesman for the company points out that the Huawei and Hinkley scenarios are not quite comparable. The technology firm sells its equipment to other companies which then own and manage it. At Hinkley, the proposal is to sell a stake to the Chinese state, and in return for the investment, allow it to build Chinese- designed reactors at a new nuclear power station in Bradwell, Essex.

So what kind of risk does Huawei's equipment present? The company makes everything from the routers and switches that steer traffic across the internet, to BT's green street cabinets, to the transmission equipment used in mobile phone masts.

Sending an email from your home computer, making a mobile phone call from a street corner, or using the tablet to order a weekly shop - wherever you are in the UK, the chances are your private communications will be carried over Huawei equipment.

With customers in Europe, the Americas, Africa and of course China, it claims to connect a third of the world's population.

Founded by a former Red Army officer, Ren Zhengfei, the firm has no public list of shareholders, but it claims to be privately owned and independent from the state.

Its biggest UK customers are Vodafone and BT. Until recently the only British-owned mobile network, Vodafone has carved out a niche as the largest supplier to government ministries and major corporations. The phone calls made by the prime minister and her cabinet run over its network.

BT's broadband grid stretches from Whitehall to remote rural areas and is still the largest in the UK, supplying much of the infrastructure used by rivals including TalkTalk and Sky to connect their customers.

The concern is that so-called "back doors", hidden in the Huawei software, could be used to eavesdrop on sensitive government, military and business communications. They could even be used to disrupt or shut down mobile networks in the event of a conflict.

"Bugs can be hidden in sloppy code," says Graeme Batsman, a data security consultant and blogger at datasecurityexpert.co.uk. "China and others are known for spying. But I don't think China is a terrorist state which would make these devices explode one day. The UK and US are probably just as bad anyway."

Indeed, the papers leaked from America's National Security Agency by Edward Snowden revealed that it had hacked into Huawei's headquarters, obtaining technical information and monitoring the communications of its top executives. One of the reported aims was to try and uncover vulnerabilities in the products to use them for US surveillance operations.

The Cell has identified multiple vulnerabilities in Huawei products. The latest annual report warns: "Code quality has shown signs of improvement, but remains below industry good practice." More than 100 concerns had been raised with Huawei's research and development arm in China, the 2015 report stated. Three issues identified that year resulted in interventions having to be made in equipment already deployed in telecoms networks.

On the plus side, using company staff to identify faults means they are more likely to be fixed quickly. And the cooperation has brought cash into the UK. In 2012, Ren met with David Cameron to promise £1.3bn of procurement and investment. The following year, after Rifkind's inquiry, he confirmed the deal when Osborne visited Shenzhen.

For Huawei, the monitoring arrangement not only improves its products, but makes good business sense. Cooperating with the UK advertises its trustworthiness to other foreign governments.

Reassuring the prime minister is another matter. Vince Cable has revealed that while he was in government, May was "never completely satisfied about Huawei". The Cell's recent efforts may have quelled those fears. For now, it is business as usual in Banbury.

The Independent (UK)
Police tackling fourfold rise in drone-related crime
Monday, 08 August 2016
Byline: Peter Yeung

London - Police are having to investigate a fourfold rise in the number of crime reports involving shop-bought drones - including allegations they are being used by paedophiles over children's playgrounds, peeping toms spying through bedroom windows, burglars scoping out people's properties and even cashpoint scammers recording pins.
An investigation by The Independent has found that the number of incidents reported to the police involving drones surged by 352 per cent in a single year as the public became increasingly aware, and suspicious, of the machines.

Reflecting the rapid uptake of the flying robotic devices, which can be fitted with cameras, reports to police surged from 94 in 2014 to 425 in 2015. The projected figure for 2016 is set to be even higher, with 272 reports recorded up until May this year.

The figures were obtained from freedom of information requests, with 21 of the UK's 45 police forces responding.

The numbers also include reports of drones endangering commercial airliners, causing fights between neighbours and being used by criminal gangs to transport drugs, often into prisons.

The majority of the reports, 257, were listed as a concern for public safety and under suspicious circumstances, but five cases involved acts of violence, 13 related to burglary, 14 to dangers posed to transport - largely related to air space - and seven made reference to drones in the vicinity of young children.

One remarkable incident recorded by the Police Service of Northern Ireland in June last year revealed a drone allegedly being used to film a cashpoint in Templepatrick as people entered their security codes.

The witness told police that when the drone was spotted it flew off and crashed into a taxi. The police said a male suspect had been forced to pay compensation to the taxi driver, but officers had been unable to prove the footage was being taken with criminal intent.

Drones, quadcopters and multi-rotor helicopters already equipped with 360-degree 4K video cameras, more than twice the quality of HD, are currently available to buy without any registration or permit.

Speeds range as high as 70mph for mass-produced drones, while potential altitudes up to 10,000 feet make them a threat to aircraft flying in or out of airports.

Many also offer image transmission to a handheld device, such as a mobile phone, and others include night vision.

Sexual offences involving a drone were reported in both London and South Wales, with the Metropolitan Police investigating a case of "voyeurism" and the Welsh force revealing a drone had been used to record footage of a young woman getting undressed in her apartment.

In Leicester, a pedestrian claimed to have seen a drone falling from the sky, while in Sutton Coldfield another fell and damaged the roof of a BMW, as regulation of air space has become increasingly demanding with unprecedented new risks.

Reports of disturbances to flight paths around Birmingham, Stansted and Luton airports were also provided, raising wider concerns for public welfare and potentially the threat of terrorism. In April,

Elstree Aerodrome air traffic control noted that a drone had been seen five miles north-east of Elstree, Hertfordshire, by a pilot whose aircraft was at 6,000 feet.

Greater awareness of privacy concerns has also led to some direct confrontations. In South Wales, one homeowner threatened to shoot a drone out of the sky, and dozens of other reports related to surveillance.

In a similar incident in Bedham, West Sussex, one person fired a shotgun at a neighbour's drone.

In Spennymoor, County Durham, a fight broke out over a drone, with one disgruntled bystander pushing a man and throwing his remote control into a bush.

Elsewhere, a drunken man was found to be "causing distress to livestock" after using a drone to fly close to cows in Plymouth.

There are also fears that drones could be used by paedophiles, with reports of drones flying over children's areas in Kingswinford, Dudley, and schools in Hemel Hempstead and Northumbria.

David Dunn, a professor at Birmingham University who has led research into UAVs, said there needed to be more regulation. He told The Independent: "What you have is a massive proliferation of easy access to the air from machines that have the capacity to cause nuisance, to carry out surveillance, to cause potential injury, and to frighten people and cause collisions with cars and aeroplanes.

"There needs to be regulation, and there need to be systematic attempts to educate the public. At the moment, you can buy one of these things in a supermarket without any safeguards. We are lacking accountability or a deterrent. The police are being forced to use laws that were designed before the invention of drones fit in terms of personal safety and privacy, but actually what we need is a drone bill through the House of Commons to address the technological challenges."

Mr Dunn said the terror threat was a "massive concern" to law enforcement agencies, adding: "These machines have the ability to actually deliver drugs into prisons, to deliver sim cards into prisons."

Corroborating previous reports, the data reveals a significant number of sightings of drones around prisons. At HM Prison Leicester, legal highs and a mobile phone were caught in netting around the perimeter - a measure used across UK prisons to counteract smuggling devices such as drones - and drugs were also found attached to a machine by Sherwood Prison. The Mount Prison in Bovingdon was the centre of a high number of interceptions, alongside institutions in Exeter, Bedford and Greyfriars.

Anyone found using drones to smuggle contraband into a prison can be given a sentence of up to two years.

A spokesman for the Prison Service said it was working to ensure the "right tools" are in place to tackle the problem of drones. He added: "We take a zero-tolerance approach to illicit material in prisons and work closely with the police and CPS to ensure those caught are prosecuted and face extra time behind bars."

Steve Barry, the National Police Chiefs' Council lead for unmanned aerial systems, told The Independent: "Both the police and Civil Aviation Authority (CAA) are aware of the ever-increasing use of drones by members of the public and are keen to ensure that people are aware of the rules that apply to their use. We have issued guidance to all forces on how to respond to drone misuse by the public. Work is ongoing to better understand the threat posed by drones, and to develop an appropriate technical response. We are working with the Home Office on how drones might be used to enhance operational capability in law enforcement, including for support for emergency response or for public order events."

Sara Ogilvie, policy officer at the advocacy group Liberty, said: "As the use of drones by both individuals and the police continues to soar, the need for thorough public debate and robust regulation of this shadowy industry becomes all the more obvious and urgent. As these figures show, the public have serious concerns about drone use, but the safeguards are flimsy and obscure.

"Drones have the potential to serve as incredibly intrusive spying tools, and their capacity for violating people's privacy will only increase as the technology improves. Our authorities need to wake up fast to the stark implications for our privacy and safety."

The figures also reveal a large amount of investment in drones by some UK police forces as a new way of tackling crime and helping with other investigations. Last year alone, Sussex and Surrey Police spent £ 413,000 in a joint initiative, training 38 officers to fly the remote- controlled aerial cameras. They now have five drones - more than any other force in the country. The drones are being used in missing person searches, forensic collision investigations and airport security, as well as patrol teams and neighbourhood response units.

Mr Barry, who is also assistant chief constable of Sussex Police, said in a statement: "Our drone operations will be overt, open and transparent, and we will use all outlets available to ensure the public are informed of our drone use."

Police forces in Devon, Cornwall and Dorset are also testing the use of drones for missing people searches and the photographing of crime scenes.

In September, Nigel Wilson, from Bingham in Nottinghamshire, became the first person in England to be prosecuted by the CPS for illegally flying drones. He admitted nine breaches of filming footage over football grounds and tourist attractions.

Amazon, the world's biggest online retailer, this week agreed a partnership with the Government to start using drones for deliveries by 2017.

The Australian
China bid must pass test on security
Sunday, 07 August 2016
Byline: Brendan Nicholson & Annabel Hepworth

Canberra - Scott Morrison has declared the nation's security will be the top priority as the Turnbull government faces a crucial decision on whether to allow a Chinese -company to buy a 99-year lease on half of the major NSW power distribution network, Ausgrid.
The issue is set to escalate against a background of increasing concerns about Chinese -aggression in the South China Sea and warnings in the Chinese state-owned media that if Australia joined US naval patrols through contested waters "it will be an ideal target for China to warn and strike".

The Foreign Investment -Review Board is considering whether the two Chinese bidders, the state-owned State Grid -Corporation and Cheung Kong Infrastructure Group (CKI), which is registered in Hong Kong and part owned by billionaire Li Ka-shing, should be -allowed to lease the grid.

"National security will be my prime consideration," the Treas-urer said on Sky News's Australian Agenda program yesterday.

The deal would be worth more than $10 billion and the possibility that one or both of the Chinese companies could be knocked out of the race could set the federal Liberal Party up for a battle with the Baird government, which fought last year's NSW election on its promise to use the sale proceeds to fund the biggest infrastructure building program since the Sydney Olympics in 2000.

A NSW government spokesman declined to comment last night.

But The Australian has been told there have been extensive talks of the deal among the NSW government, bidders and bodies such as the Australian Compet-ition & Consumer Commission, the tax office and the FIRB.

Mr Morrison pointed out that he appointed former ASIO chief David Irvine to the FIRB board to help more clearly identify security threats.

Mr Morrison said the Ausgrid decision was "not too far away". The decision will follow the controversial lease of Darwin's port to a Chinese- owned company, the rejection of the sale of the Kidman cattle properties over security concerns and the -government's approval of the Kimberley Ord River cattle -station sale before the election.

Peter Jennings, the executive -director of the Australian -Strategic Policy Institute, warned in The Weekend Australian that the way Australia dealt with -Chinese investment in critical infrastructure needed to be reconsidered in the face of Beijing's assertive posture in the region.

Andrew Hastie, a former SAS officer and now the Liberal MP for the West Australian seat of Canning, endorsed Mr -Jennings's concerns. "This is an important article that Australians should read and discuss," Mr Hastie said.

One Nation leader Pauline Hanson and fellow Queenslander Bob Katter have campaigned aggressively against foreign investment in critical -infrastructure. Nick Xenophon has said any sale to a foreign government-owned company should raise national -interest concerns.

But former Business Council president Tony Shepherd said -foreign capital had always been vital for Australia's prosperity. "Provided the bidder is of good standing then the best deal for NSW should win," he said.

Former Ansett and British Airways chief Rod Eddington -cautioned against anti-Chinese sentiment, saying the nation had "always relied on foreign capital to help us grow our businesses and create our jobs".

TransGrid chairwoman Kerry Schott said Australia needed foreign capital to develop.

While she expected security to be part of the FIRB's -assessment, "it's not as if somebody in China is going to flick a switch and the lights are suddenly going to go off".

Former Shanghai Australian Chamber of Commerce president Peter Arkell said he was baffled that Australia could risk squandering the opportunity for Chinese -investment as the topic "gets kicked around like a footy".

But Mr Morrison, asked how big a part in the -decision would be played by -security factors and concerns about control of strategically important infrastructure, said: "It is the prime consideration. It is the most -important consideration and -always is.

"It is why I put David Irvine on the FIRB. It is why I put David Peever (who headed a major review of the Defence Department) on the FIRB -- to have the -national security experience and input into these decisions and to assist me making these decisions." Privatisation in NSW is expected to pay for $20bn of infrastructure, which includes a second harbour rail crossing and extensions to WestConnex.

While the government reaped more than $10bn from its lease of TransGrid, key projects will -depend on the partial lease of -Ausgrid and also of distributor -Endeavour Energy going ahead.

Gary Sturgess, who advised former Liberal premier Nick Greiner and is at the Australia and New Zealand School of Government, said the Ausgrid lease was different to the sale of cattle properties.

"If people want to pour some of their spare cash into Australian -assets, I mean, frankly that's how this country got built ... the -Europeans pouring money into our country," Mr Sturgess said. "This is not an asset they can run away with." Industry sources said that should State Grid be successful in acquiring Ausgrid it would control electricity and gas connections to more than one million homes and businesses across NSW.

An issue likely to be considered by the government is whether safeguards, conditions or limitations can be imposed on the bidders to ease security concerns.

Another is whether the two companies should be viewed differently. State Grid is clearly owned by China's government. CKI has already invested heavily in Australian infrastructure but its base in Hong Kong is under increasingly intrusive control from Beijing.

State Grid already holds 46 per cent of the South Australian transmission business Electranet and 60 per cent of the Jemena energy distribution business and its 11,000km network, which delivers electricity to more than 319,000 homes and business in northwest Melbourne, and its 25,000km system which delivers gas to more than 1.3 million homes, businesses and industrial customers in NSW.CKI owns SA Power Networks, a primary state electricity distribution business, CitiPower, which supplies electricity to Melbourne's CBD and inner suburbs, Powercor, Victoria's largest electricity distributor, Transmission General Holdings, a Victorian renewable energy power transmission -business, and Australian Gas -Networks, one of Australia's largest natural gas distribution firms.

BBC News
India sets up agency to probe cyberterror
Sunday, 07 August 2016

New Delhi - The increasing use of social media by global terror groups, like ISIS [Islamic State] and the Al Qaeda, for radicalizing young people and a sharp upward trend in cyber-related offences has led to the government launching a major initiative in setting up a highly-specialized cyber agency to watch and probe such cases.
The agency will work under the Union home ministry and would be to cyber crime what the National Investigation Agency (NIA) is to probing terror-related incidents in the country, sources said. The NIA was set up in the aftermath of the 26/11 Mumbai terror attacks.

The new cyber unit will investigate all major cases of cyber crime in close coordination with respective state agencies.

The steady increase in cases of breach of cyber security across the country prompted the much-needed move by the Centre. From 5,693 cyber crime related cases registered in 2013, the spike has been to 9,622 in 2014 and 11,592 in 2015. The situation has only gone from bad to worse with 21,248 cases already reported till May this year. Intelligence officials claim they have been closely monitoring the

trend in cyber security over the last few years and it has been showing a spiraling increase, particularly in the last four years. And this is what has pushed the government to finally go ahead with a specialized agency to probe incidents related to cyber security. "The intelligence agencies too have been stressing on the need for a professional outfit to deal with cyber security. Things have now started moving and a fund of 400 crore [Indian rupees] has been earmarked for the project. The agency will have highly-trained professionals in cyber security," a government official said.

The proposed cyber agency apart from investigating cases will also assist and provide technological support to the state police and other central agencies. The new cyber agency will be the nodal agency for investigating all cyber cases where ISIS is found to be using social media for recruitment.

In fact, the increasing threat from ISIS on the cyber space is one of the main reasons why the government plans to fast-track the setting up of this agency.

"The experience of having a professional outfit like NIA for investigating terror cases has been good and it works as a nodal agency in close coordination with the States also. Now we want to do the same in the case of cyber security as well," the official added.

Associated Press
Official says Australian security key to Chinese investment
Tuesday, 09 August 2016
Byline: Rod McGuirk

Canberra - Australia's treasurer said Monday that national security would be his overriding consideration when he makes a decision on whether to allow a Chinese consortium to lease a major Sydney electricity grid.
Scott Morrison said he was close to making a decision on whether to allow Chinese state-owned State Grid Corp. and Hong Kong-registered Cheung Kong Infrastructure Group to buy a 99-year lease for half of the New South Wales state-owned electricity network Ausgrid for more than 10 billion Australian dollars ($7.6 billion).

"This is not an easy decision," Morrison told Sydney Radio 2GB. "National security out ranks everything."

Chinese foreign investment, particularly from state-owned companies, has become increasingly contentious in Australia as China takes a more aggressive stance in territorial disputes in the South China Sea.

President Barack Obama raised questions with Prime Minister Malcolm Turnbull last year after Australia allowed a Chinese company, Landbridge, to secure a 99-year lease over the strategically important Port of Darwin, which has become a U.S. Marines training hub in northern Australia. Turnbull said Australian defense and security officials determined the AU$506 million deal did not threaten national interests.

Peter Jennings, executive director of the Australian Strategic Policy Institute, a government-established independent think tank, said neither the Darwin Port lease nor the proposed Austgrid deal were in Australia's security interests.

Jennings said a Chinese-controlled Austgrid could become vulnerable to being shut down by cyberattack as hackers linked to Russia had done in the Ukraine in December.

Hackers used a coordinated attack to take down part of western Ukraine's power grid, blacking out more than 225,000 people after hitting regional electric power distribution companies. U.S. officials called it the realization of a nightmare scenario -- hackers able to take down a critical system on which a country depends.

"You have to be concerned in a future world where we might find ourselves in a much more hostile relationship with China: Could they do us damage domestically by hacking into our electricity grid in Sydney?" Jennings told Australian Broadcasting Corp.

Senator Nick Xenophon, the leader of three senators whose support could be crucial to the government to pass legislation through the upper chamber when Parliament resumes this month, said the foreign investment decision-making process lacked transparency.

"I don't believe it is in the national interest for a state- owned enterprise to control one of our biggest power assets in this country," Xenophon told ABC.

Sydney Morning Herald
E-currencies regulated to fight terrorism (Canada)
Tuesday, 09 August 2016
Byline: Jewel Topsfield

Jakarta - Australia is moving to become one of the first countries to regulate e-currencies such as bitcoin under its anti-money laundering and counter-terrorism financing laws.
Bitcoin - the most prominent digital currency to emerge globally - is backed by a computer code rather than a physical substance such as gold or mainstream currency.

The anonymity of payments using digital currencies make them attractive for terrorism financing, according to Australia's financial intelligence agency, AUSTRAC, which is co-hosting a counter-terrorism financing summit with Indonesia in Bali this week.

Justice Minister Michael Keenan will inform the summit of the work Australia is doing to improve its anti-money laundering and counter-terrorism financing legislation after a review recommended the regulation of digital currencies.

"The report ... recommends strengthening an already robust legal framework to respond to new and emerging threats," he said.

"The government is committed to facilitating growth and innovation in this sector and appropriate anti-money laundering and counter-terrorism financing regulation will aid that development."

The AUSTRAC report, Terrorism Financing in Australia 2014, said electronic, online and new payment methods posed an emerging terrorism financing risk, which was likely to increase over the short term as use of these systems grew.

"Terrorist groups engaged in radicalisation, recruitment and communication online [such as through social media] are a particularly high risk of using online payments systems and digital currencies," it said.

"Prepaid travel money cards [a type of stored value card] have also been used to transfer funds offshore for terrorism financing."

AUSTRAC's national manager of strategic intelligence and policy, Brad Brown, said there were examples of the misuse of bitcoin globally.

He pointed to Mt Gox, a defunct bitcoin exchange in Tokyo where bitcoins worth hundreds of millions of dollars went "missing", and Silk Road, a now closed online black market that sold illegal drugs.

"I think it's important to regulate where there is a potential risk of abuse of money laundering and terrorism financing," Mr Brown said.

The statutory review of the Anti-Money Laundering and Counter-Terrorism Financing Act, which Mr Keenan tabled in Parliament on April 29, recommends the act be amended to regulate activities relating to digital currency.

It also recommends the definition of e-currency be broadened to include digital currencies such as bitcoin that are not backed by a physical asset.

"While digital currencies have undoubted legitimate uses, the transfer of convertible digital currencies can occur without passing through the formal financial sector," it says.

"This provides another tool for criminals and terrorist financers to move and store illicit funds beyond the reach of law enforcement and other authorities and purchase illicit goods and services."

In 2014, Canada became the first country to regulate bitcoin and other virtual currencies under its anti-money laundering and counter- terrorism financing laws.

The Australian
Morrison warned blocking China tender will hurt ties and budget
Tuesday, 09 August 2016
Byline: Kylar Loussikian and David Uren
Section: oped

Blocking a Chinese state-owned company's $14 billion bid for control of NSW power distribution network Ausgrid could be a -"colossal blow" for the state budget and would risk diplomatic -issues with Australia's largest trading partner, the government has been warned.
After Scott Morrison sparked speculation about State Grid Corporation of China's bid by declaring national security would be his "prime consideration", former premier Bob Carr said rejection would affect NSW's infrastructure plans, while former Liberal federal leader John Hewson described national security concerns as "spurious".

Deputy director of the Australia China Research Institute, James Laurenceson, said a government decision to block State Grid's further involvement in Australian electricity assets would create diplomatic problems for the China relationship.

In 2012, Australia signed a memorandum of understanding with China for co-operation on opportunities for infrastructure investment. Australia promised in the Australia-China free- trade agreement that it would take a non-discriminatory approach to Chinese investment.

Mr Laurenceson told Chinese newsagency Xinhua yesterday Australia had to get away from its Cold War approach. "The people I've talked to in cyber security say ownership and cyber-hacking are two separate issues. If you want to hack a network, you do not need to pay ($11 billion) for the privilege of taking half ownership of that asset," he said.

The Treasurer is under pressure to reject the Chinese offer, with crossbenchers including Pauline Hanson, Bob Katter and Nick Xenophon objecting on -national interest grounds.

Mr Morrison on Sunday said national security would be his "prime consideration" for assessing the sale, which is being considered by the Foreign Investment Review Board.

After a furore over the leasing of the port of Darwin to a Chinese company, Mr Morrison last year appointed former ASIO chief David Irvine to FIRB's board to advise on national security issues.

Maurice Newman, chairman of the Abbott government's business advisory council, yesterday suggested anti-investment sentiment was becoming "a little xenophobic".

"I understand when it comes to agriculture there may be some food security issues, but it's not clear to me what how this is pertinent to the electricity grid," Mr Newman said.

A Moody's spokesman told The Australian the credit ratings agency was considering the effect on NSW's rating of delaying or deferring of the transaction.

State Grid is competing with Hong Kong-listed Cheung Kong Infrastructure, a public company headed by billionaire Li Ka-shing, for a 99-year lease, giving the winner 50.4 per cent of Ausgrid.

Mr Carr, who now heads the Australia-China Relations Institute at University of Technology, Sydney, said if Ausgrid bids were rebuffed, it would be a "colossal blow to the NSW budget, to infrastructure spend, and to the state's economy".

"The simple fact is there are only Chinese bidders for these -assets, ownership of electricity grids doesn't help anyone spy; no owner is going to blow it up.

"State Grid is the single largest owner of the national grid of The Philippines, and the lights in Manila didn't flicker for a second when the two countries were at odds (over the South China Sea)." Concerns about State Grid -include its leaders' close connection to the Communist Party and People's Liberation Army, and suspicions the company made a higher bid for strategic, rather than commercial, reasons.The Baird government will use the proceeds from the deal, together with $10.26bn from selling TransGrid, to fund $20bn worth of infrastructure projects. FIRB approved State Grid's unsuccessful bid for TransGrid.

Data is only of value when it can be accessed
Tuesday, 09 August 2016
Byline: Anthony Wong

Op-ed: Amid all the noise about big data, the internet of things and open government data (OGA), it's tempting to think that if we just run the algorithm, slice the data and dive into the analytics, we'll gain the insights and intelligence we need to change the world.
It's not quite that simple. Data is the new capital and as the current debate over tonight's census clearly illustrates, data increases in value according to its level of specificity, uniqueness, maintainability, reusability and relevance to the audience, along with the integrity of the actual data.

But the value can only be unlocked through access. Sensitivities of the census aside, there are enormous economic benefits to be gained from appropriately increasing access to different government data sets.

This is the main driver for the current Australian Productivity Commission review into data availability and use. The commission has received more than 150 responses from stakeholders across the community and is due to release its draft report in -November this year.

The Australian Computer Society's response outlined a series of recommendations designed to provide a consistent, predictable framework within which government data can be classified, managed and shared in ways that will benefit all Australians.

We should continue to strongly advocate the benefits of data sharing and OGA as major drivers of innovation and productivity. The Australian Government Bureau of Communications Research suggests the potential economic return for Australian from effective use of OGA could be as high as $25 billion per annum.

But in order to create an environment conducive to the development of the trust so essential for effective open government, we need a range of measures aimed at improving collaboration and ensuring privacy protection. The ACS response to the Productivity Commission includes recommendations for: . Mandatory reporting of data breaches.

. The appointment of an open data evangelist, both to oversee strategic and operational progress, and to advocate for the rights of individuals.

. A national education and awareness-raising campaign.

. A review of regulatory and legislative settings to ensure they align with, and actively enable, a world-leading open data regime.

. A framework that defines and supports anonymisation of valuable datasets to facilitate wider sharing while protecting individuals and organisations.

. A nationally accepted definition for personally identifiable data (PID) and recommended methods for de-identifying PID from other data.

. A new accounting standard.

Australia lags behind the UK and the US when it comes to releasing public data for business. By embracing the potential of open government we could maximise the inherent opportunities for all Australians.

Anthony Wong is president of the ACS and chief executive of AGW Consulting, a multidisciplinary ICT, intellectual property legal and consulting practice.

Security fears deter investors, say academics
Tuesday, 09 August 2016
Byline: Lisa Murray

Shanghai - The Australian government is putting Chinese investors offside by stressing national security concerns in the Ausgrid sale before any final regulatory decision has been made, according to two senior Chinese government-linked academics.
Han Feng, from the state-run China Academy of Social Sciences, said it was inappropriate for Australian politicians to be making comments ahead of a decision from the Foreign Investment Review Board, which is assessing bids from China's State Grid and the Hong Kong- listed Cheung Kong Infrastructure.

"This will have a negative impact on the long-term investment relationship and it's not good for the China-Australia relationship," said Mr Feng, a former deputy director and researcher at CASS's National Institute of International Strategy.

"When the [Australian] government stresses national security concerns, it needs to explain to China what the rules are."

Australian Treasurer Scott Morrison earlier stressed security was the "primary consideration" in assessing the bids for a 50.4 per cent stake in Ausgrid, the country's biggest electricity distribution grid. He signalled the federal government would be prepared to go against NSW Premier Mike Baird to block the sale.

Wang Zhenyu, from the China Institute of International Studies, a think tank attached to the Foreign Ministry, said Mr Morrison's emphasis on national security was an "investment barrier" for Chinese companies.

"In my view, Australian politicians make these comments based on domestic politics rather than economic considerations," he said.

"This would create negative sentiment among Chinese investors looking at Australia because it suggests their investment is not welcome. This shows the Australian government's inclination not to support Chinese investment."

Security analysts have raised concerns about the bid from State Grid given it is a state-owned enterprise and has strong links with the Communist Party and the military at a time when Beijing is adopting an increasingly assertive foreign policy stance.

While CKI is listed in Hong Kong and controlled by billionaire Li Ka-Shing, analysts have also pointed out Beijing's growing influence over the city government and its big corporations could be a potential risk.

"These national security concerns are targeted at China and I would describe them as an investment barrier," said Mr Wang. "This is discrimination against investment from China."

Peter Jennings, executive director of the Australian Strategic Policy Institute, recently said the federal government needed to take into account the ability of so-called "malign actors" to shut down critical infrastructure by means of offensive cyber-attacks.

However, James Laurenceson from the Australia-China Relations Institute (ACRI) at the University of Technology Sydney, said that State Grid, which is attracting the most concern, already owned electricity distribution assets in Victoria and South Australia and had been assessed by FIRB.

He also points out the only bidders for Ausgrid are Chinese and if the sale was blocked it would be a big economic loss for NSW.

ABC (Australia)
Jacqui Lambie to push for Foreign Investment Review Board overhaul
Tuesday, 09 August 2016

Byline: Brett Worthington

Tasmanian senator Jacqui Lambie is vowing to push for an overhaul of the Foreign Investment Review Board (FIRB).
The re-elected politician says she will grill officials when they front Senate Estimates later this year over FIRB's history of approving foreign farm and asset purchases had been against the national interest.

"I just don't think they're getting the job done," she told RN Drive.

"Whether it's the Chinese or anybody else buying from outside and when it comes to assets like our power and our water and what's going on with cyber security and all the rest.

"I've had a gutful like many other people have of selling our assets and leasing our assets out there. We've had enough."

Debate about the role of the FIRB has raged this week as it considers the Chinese state-owned business State Grid's bid for a 50 per cent stake in Australia's largest electricity network.

The FIRB is required to review all foreign investments in farmland, irrespective of size, once a buyer has a portfolio worth $15 million.

It also assesses all agribusiness sales above $55 million.

There is also an automatic trigger for the FIRB to review to invest in Australian farmland.

Senator Lambie last year failed in her bid to amend investment laws to require , regardless of the sale's value.

"You can only sell the farm gate once," she said this week.

But Professor James Laurenceson, from the Australia-China Relations Institute, rejected the need for an overhaul of FIRB.

the appointment of former ASIO boss David Irvine to review board late last year had it well placed to assess foreign purchases.

"Look I think it is helpful to have someone like David Irvine casting their mind over these deals and look each deal is going to be different.

"I don't think it necessarily serves the national interest to have a fixed-in-stone approach."

The Australian Financial Review
China 'spies' put power sale at risk (Canada)
Tuesday, 09 August 2016
Byline: Aaron Patrick and Primrose Riordan

Canberra - Chinese spies have been caught by the intelligence services conducting "brazen" espionage in Australia over the past year, hardening concerns within the federal government about allowing a Chinese company to buy a $10 billion power company from NSW.
Senior government officials were "deeply concerned by the consequences" of a Chinese state- owned company, State Grid Corp, being issued a 99-year lease to operate Ausgrid, which provides all of Sydney's electricity, according to a security source. There were at least 60 cyber attacks on energy networks last financial year, according to official figures.

Cabinet's national security subcommittee has already been briefed on their concerns and Treasurer Scott Morrison seems not to be afraid of vetoing the deal, which would fund a large part of the NSW Coalition government's new infrastructure projects.

"That's the job. There are no easy decisions. This is not an easy decision and there are implications of the decision either way. Foreign investment is a very sensitive issue out there in the public and it has to be managed carefully," Mr Morrison said.

The decision over Chinese investment in Australia's power grid is shaping up as the first major foreign policy test of the re-elected Turnbull government, which wants to promote foreign investment to drive the economy.

Along with State Grid Corp, Cheung Kong Infrastructure, the largest publicly-listed infrastructure company in Hong Kong, is also waiting for government clearance to purchase a 99-year lease for 50.4 per cent of Ausgrid.

State Grid Corp already owns electricity networks in South Australia and Victoria and was cleared by the Foreign Investment Review Board to bid last year for Transgrid, a NSW electricity distributor that was sold to Canadian interests.

Sources said the change in ministers last year meant the bureaucracy had to work hard to explain to the government's new leaders the threat posed by Chinese espionage, and the discovery of several Chinese agents "red handed" had highlighted the security challenges.

Security experts said Chinese security services were active in Australia and making Ausgrid the responsibility of a company controlled by the Chinese central government was too great a risk.

"The public has to understand that there are some countries taking substantial intelligence operations against this country," said Ross Babbage, a former senior Defence Department official and the managing director of consulting firm Strategy International.

"This is not a figment of someone's imagination. It takes a big leap of faith to say there is no security risk [from selling Ausgrid]."

Former Ausgrid chief George Maltabarow said critics of State Grid Corp's bid were "xenophobic" and security threats could be resolved by the buyer.

"I don't really believe that the security concerns are really justified and some of it seems to be just plain xenophobia to me, populist xenophobia that you do get from some politicians," Mr Maltabarow said.

"The idea that somehow the governance of the company is going to be result in security being compromised I think is just pathetic. Quite frankly, if the Chinese wanted to hack into the Ausgrid systems, they don't need to own it."

Former prime minister Tony Abbott added his voice to the debate on Monday, saying he was not opposed to foreign investment, but there should be a way of selling the grid that does not cede control of the asset.

Ausgrid, which has been state owned for 112 years, supplies electricity to Sydney, the NSW Central Coast and the Hunter Valley. It has more than 200 large electricity substations, 30,000 small distribution substations, 500,000 power poles and almost 50,000 kilometres of electricity cables.

Deakin University Research Fellow Shihanur Rahman, who researches grid cyber security, said it was entirely possible for a grid to become a target if it was sold to a foreign government. "For the data that is stored in a secure database, what we called secure, the existing security is not sufficient," he said.

Knocking out one of the bidders could reduce the amount the NSW government gets.

The Pioneer
The spy who hacked a thousand Indian sites
Tuesday, 09 August 2016

New Delhi- Pro- Pakistan hacker Afzal Faizal who breached the firewalls of more than a thousand Indian websites in the last two years has come under the scanner of Indian security agencies, five days after he claimed to have got access to the e- payment system of a nationalized bank.
Intel officials said earlier, Faizal restricted his hacking efforts to defacing random websites and teasing Indian techies, but has now stepped up to target websites of the Indian government and critical institution such as banks.

Cyber security experts went into tizzy when on August 2, Faizal claimed to have got access to E-payment gateway of nationalized bank. Officials, however, claim that no financial loss or data leak took place. After the defacement, he also challenged Indian hackers to secure the Indian cyber space as he may target more such critical websites in the future. Similarly, in June this year, he had hacked the websites of the Indian embassy in up to seven countries and defaced them with pro-Pakistan messages as a warning to India.

The hacked websites had an image of a person in a red and black hooded jacket, with a message: "Intruder Here. You got hacked". This included websites of Indian embassies in Dushanbe (Tajikistan), Bucharest (Romania), Athens (Greece), Ankara (Turkey), Mexico City, Sao Paolo and Pretoria. The hackers also left a message on the front page of the website that read, "Hey Indian Government, Don't Mess with Us." "Faizal and other members of Pro-Pakistan hacking community have carried out some serious attacks recently. They have hacked several government websites in north-eastern and southern states. They have also made a breakthrough in web security system of banks and educational institutions. They are mocking Indian web security at a time when country is pushing for digital India," a senior officer of central security agency told Mail Today.

He explained that all such attempts are being seriously monitored and as most of these hackers are based out of India. He added that they are being tracked and monitored online. Experts believe that Faizal was also tracked in Dubai recently and may be routing his attacks from South-Asian countries, including Indonesia.

Earlier, Pakistani hackers used to carry mass defacement but now they are more focused on targeting government websites. Even state police websites are being defaced by Pakistani hackers where they post anti- India comments with an image of the Pakistan flag. However, Indian hackers have taken on the mantle for retaliation and claim a similar large scale attacked will be launched against Pakistan. "He has cre- Vaishnodevi, Amarnath pilgrims stranded due to landslides ated nuisance in Indian cyber world and we will destroy their web space," said a hacker, requesting anonymity. "We had tracked Faizal and even got his accounts blocked in past but now we are working on getting access to their critical establishment and will expose their security by hacking their bank accounts and websites on August 15 and celebrate our Independence Day," the hacker told Mail Today.

Cyber security experts say that attacks coming from Pakistan are alarming, but believe that it is the handiwork of youngtechies. "These are nationalistic hacker groups and they flaunt each successful hack. But, the damage they could create should not be ignored. Each attack on government websites or banks should be treated seriously, which unfortunately is not being done at the moment. Indian hackers have informed about several vulnerabilities in Indian banks, which have not been patched yet," Kislay Chaudhary, a cyber security analyst and CEO of Indian Cyber Army said. Another cyber crime expert, Deep Shankar believes that recent hack attempts are just warm up before Independence Day. "India and Pakistan's Independence Days, which fall on August 15 and August 14 respectively, has seen mass defacement the past few years.

Times of Israel
Major security flaw in 900m Android phones, tablets, says Check Point
Tuesday, 09 August 2016
Byline: Dan Schwartz

Jerusalem - Nearly a billion Android phones and tablets are vulnerable to malware that could allow hackers "complete control of devices and access to sensitive personal and enterprise data on them," according to Israeli cybersecurity firm Check Point.
The hacks are possible due to a series of four vulnerabilities -- dubbed QuadRooter -- affecting Android devices built on Qualcomm chipsets, which are found in nearly two-thirds of mobile devices. "If any one of the four vulnerabilities is exploited, an attacker can trigger privilege escalations and gain root access to a device," said the Check Point research team that discovered the problem.

Unlike most malware, which can be rooted out or at least detected by antivirus software, there's little users can do except wait for Qualcomm to issue patches to fix the problem, according to Check Point. The vulnerabilities are in the chipset's software drivers - the basic operating system-level programs that provide usability to the chipsets - which control communication between the chipset components.

As such, the vulnerability is on the hardware level, built into the device itself - and accessible only through software packages that update those drivers. "Pre-installed on devices at the point of manufacturing, these vulnerable drivers can only be fixed by installing a patch from the distributor or carrier. Distributors and carriers can only issue patches after receiving fixed driver packs from Qualcomm," according to Check Point.

With 900 million devices affected, there is no "safe" phone or brand; the list of devices affected includes some of the most popular models by Samsung, HTC, Motorola, LG and more. Among the many models affected are the LG G4, G5, and V10; Samsung Galaxy S7 and S7 Edge; Sony Xperia Z Ultra; Google Nexus 5X, 6 and 6P; and OnePlus One, 2 and 3.

Android devices, of course, are the industry foil to Apple's ioS devices, with the Android operating system the default OS for manufacturers of devices that are not iPhones. Many iPhones and iPads contain Qualcomm chipsets as well, but because the operating system handles communications and software differently, Apple devices are not vulnerable to the hacks.

Android pitches a big tech tent, inviting manufacturers large and small to build their devices around the operating system, which allows programmers a great deal of freedom in app design (unlike Apple, which places many security and function strictures on programmers).

But according to Check Point, Android's openness, generally considered its strength, is actually its greatest weakness. "A myriad of device models, operating system versions, and unique software modifications makes handling Android vulnerabilities a challenge," according to the Check Point team.

"The earlier these vulnerabilities are born in the supply chain, the more difficult they are to fix. The fragmented world of Android leaves many users exposed to risk, even with out-of-the-box devices."

According to Google, which develops the Android operating system, three of the four vulnerabilities have been patched; a patch to prevent hackers from exploiting the fourth will not be available until September. Until then, said Check Point, users need to tread very carefully - installing only well- known apps, "carefully reading permission requests when installing apps, being wary of apps that ask for unusual or unnecessary permissions or that use large amounts of data or battery life, using known, trusted Wi-Fi networks" -- and hope for the best.

Khaleej Times
Student-run cyber security event in Abu Dhabi hacks a global issue
Tuesday, 09 August 2016
Byline: Silvia Radan

Dubai - The world's largest student-run cyber security event - Cyber Security Awareness Week (CSAW) - will take place at the New York University Abu Dhabi (NYUAD), and the Indian Institute of Technology (IIT), Kanpur, this year in November. Finalists from the Middle East, India, North Africa and the US will compete at the event in November 2016. The event was founded 13 years ago by the New York University Tandon School of Engineering.
This year, the schools are also accepting registrations for the elimination rounds in August and September. Last year, nearly 20,000 students competed in CSAW, from high schools through doctoral programmes, against global contestants, all working from their own computers.

The competitions challenge their knowledge of virtually every aspect of IT security, from hardware and software penetration testing and protection, to digital forensics and government policy.

This year, the best students from the MENA region, India, and the US will earn travel awards to participate in the final rounds, to be held on November 10-12, 2016, at IIT Kanpur, NYUAD, and NYU Tandon.

At the regional CSAW campuses, students network with top professionals who serve as judges, hear experts address emerging issues, meet recruiters eager to fill what is expected to be a shortfall of 1.5 million cyber security professionals by 2020, and face tough competition from other schools.

The CSAW games were founded by Professor Nasir Memon, now chair of the NYU Tandon Department of Computer Science and Engineering, and his students. Memon heads NYUAD's cyber security programme, as well as NYU Tandon's.

Students continue to design the contests under the mentorship of IT security professionals and faculty. "Data security is a critical global issue. Attackers know no national boundaries and neither should those who protect our personal privacy and institutions," said Memon.

"In the past, CSAW brought high school teams to New York. This year, thanks to the leadership of students and faculty, it will expand its reach to high school and university students across the MENA region."

Each regional finalist competition will vary slightly in content. Winners of the final rounds can walk away with cash prizes, scholarships and more. This year, CSAW will have eight different competition categories. Among them is 'Capture the Flag', a hacking competition, 'High School Forensics', a case of fictional murder mystery and 'Embedded Security Challenge', where a Blue Team from NYU Tandon designs a target system and everyone else - Red Teams - will hack it to mimic real-world attacks.

"With hobby hackers, foreign state actors, terrorist organisations and other adversaries abounding, cyber security is not just a computer science topic, but a national security issue. IIT Kanpur is delighted to join hands with the NYU Tandon School of Engineering to bring cyber security awareness competitions to India," said Manindra Agrawal, professor at IIT Kanpur's Department of Computer Science and Engineering.

For more info and registration, visit csaw.engineering.nyu.edu (follow @CSAW_NYUTandon) Preliminary rounds for the Embedded Security Challenge will be held in August; the other preliminary challenges will be in September.

Khaleej Times
Are 900m Qualcomm-powered Android devices at risk?
Tuesday, 09 August 2016
Byline: Alvin R. Cabral

Dubai - Qualcomm's processors are powering over 900 million Android devices globally, which would be a haven for hackers should a vulnerability can be exposed and exploited. Apparently, that could be the case, according to a not-so-inspiring report.
Cyber-security firm Check Point says that it has uncovered a set of four vulnerabilities affecting almost a billion Android devices that use Qualcomm chipsets.

The company called the issue "QuadRooter", which, according to them, is "a set of four vulnerabilities that gives attackers complete control of your Android smartphone or tablet".

"These vulnerabilities are found on out-of-the-box devices and can only be fixed by installing patches when they become available," the report added.

The company listed the following devices as among those that can potentially be compromised: BlackBerry Priv; Blackphone 1 and 2; Google Nexus 5X, Nexus 6 and Nexus 6P; HTC One, M9 and 10; LG G4, G5 and V10; the new Motorola Moto X; OnePlus One, 2 and 3; Samsung Galaxy S7 and S7 Edge; and Sony Xperia Z Ultra.

While there has been no proof so far that these vulnerabilities have been used for illegal means, it could happen "in the next three or four months", Check Point head of mobility product management Michael Shaulov said in a BBC report.

In the UAE, the devices listed are available either from retailers, online or both.

However, latest figures from the Telecommunications Regulatory Authority (TRA) show that there might not be much of a concern here in the UAE.

The TRA report, released on August 7, revealed that in the first quarter of 2016, 68.9 per cent of handsets registered on the UAE's networks were smartphones, with the iPhone 6 and iPhone 5 - which use ARM chipsets - being the most used at 4.48 per cent and 2.39 per cent, respectively.

The Samsung J100H/J1, which uses Spreadtrum, and the iPhone 6s were third (1.81 per cent) and fourth (1.69 per cent), respectively. The Nokia 108 feature phone was overall the second most-used phone at 2.92 per cent.

The report added that Samsung is the most widely-used brand in the UAE in the January-to-March period, boasting a 33 per cent share of all registered handsets. Nokia was second at 28 per cent, followed by Apple (14 per cent) and BlackBerry (two per cent).

However, no specific device breakdown was provided. As at Press time, the TRA was unreachable for comment.

Khaleej Times also sought statements from device manufacturers listed in the Check Point report.

BlackBerry says that its engineers in its headquarters in Canada are looking into the matter, while LG Gulf says it has not received any statement from its corporate offices in Seoul.

HTC, Samsung and Sony Mobile did not respond to requests either, while Qualcomm has yet to release a statement on the report.

Shaulov is just hopeful that those who would find the bugs first are the type who would squash them. "It's always a race as to who finds the bug first - whether it's the good guys or the bad."

Asharq Al-Awsat
Russia Admits Drone Entered Israeli Airspace
Tuesday, 09 August 2016
Byline: Nazir Majli

Tel Aviv - Three weeks after the Russian drone entered the Golan Heights airspace, Moscow admitted to the incident saying that it belonged to the Russian forces stationed in Syria.
A high-ranking Israeli source, who spoke on condition of anonymity, said the drone had crossed into the Israeli airspace as a result of human error.

The incident was considered the gravest between the Russian and the Israeli armies since Russian President Vladimir Putin declared the deployment of the Russian military in Syria in September 2015.

On July 17, a Russian aircraft crossed four kilometers into the airspace under Israeli occupation. Israel fired two Patriot missiles and an air to air missile at the unidentified drone, but the missiles failed to intercept the drone returned to its origin.

Following the incident, a series of discussions were launched between officials at the Russian and Israeli armies as part of their coordination mechanism.

Investigations by the Israeli army revealed that the aircraft was a Russian drone, yet the infiltration was not clear whether it was an error or intentional to gather information or test the Israeli response.

The Israeli official said that Russians had clarified that the crossing over was an error.

He added that this was also discussed during a phone call between the Israeli Prime Minister Benjamin Netanyahu and the Russian president on July 23.

The Russian statement issued back then didn't discuss the incident and stated that the phone call was about the coordination against terrorism between both countries. The two also discussed regional matters.

During his meeting with political correspondents last week, Netanyahu refused to comment whether the drone was Russian, but didn't deny the information either. He told the press that there is constant communication between Israel and Russia regarding Syria. He added that coordination is important between the two armies.

The Guardian (London)
The state of cyber security: we're all screwed
Tuesday, 09 August 2016
Byline: Dan Tynan

Las Vegas - When cybersecurity professionals converged in Las Vegas last week to expose vulnerabilities and swap hacking techniques at Black Hat and Defcon, a consistent theme emerged: the internet is broken, and if we don't do something soon, we risk permanent damage to our economy.
"Half of all Americans are backing away from the net due to fears regarding security and privacy," longtime tech security guru Dan Kaminsky said in his Black Hat keynote speech, citing a July 2015 study by the National Telecommunications and Information Administration. "We need to go ahead and get the internet fixed or risk losing this engine of beauty."

There's no lack of things to be worried about: organized cybercriminal gangs; government surveillance; not to mention hack attacks from nation states.

That may be good news for the cybersecurity industry, which is expected to grow more than 10% annually and surpass $200bn worldwide by 2021, according to research firm Markets and Markets.

But it's bad news for the rest of us. As we conduct more of our lives online, we're being asked to become increasingly savvy about computer security. Many are simply uninterested or not up to the task.

Add up all these factors, and the question becomes not why many consumers are losing confidence in the internet, but whether they should have any confidence at all.

Consumers: the new ATM for cyber crooks The online crooks' weapon of choice: crypto-ransomware, which encrypts all the data files on a user's machine, making them inaccessible. The malware, which accounts for nearly 60% of all infections, according to research firm Malwarebytes, then displays a screen demanding hundreds of dollars. If victims don't pay up in time, the files are destroyed.

"Over the last few years attackers realized that instead of going through these elaborate hacks - phishing for passwords, breaking into accounts, stealing information, and then selling the data on the internet's black market for pennies per record - they could simply target individuals and businesses and treat them like an ATM," says Brian Beyer, CEO and founder of enterprise security firm Red Canary.

According to Symantec, the average ransom paid doubled from just under $300 in 2015 to $679 this year. Last year, the criminals behind the CryptoWall3 malware cost victims more than $325m, according to estimates from the Cyber Threat Alliance ; 2016's haul is expected to be significantly higher.

A ransomware attack is relatively easy to overcome if you have a current and complete copy of your data; you can simply restore the untainted files to your machine, says Beyer. (Before you do, though, be sure to install security software that will remove the ransomware, or you may find yourself being jacked all over again, he warns.)

The problem? About 3 in 10 people never back up their data, while others do it sporadically. And even for those who do backup religiously - or use software such as iCloud or CrashPlan that automatically copies files to machines in the cloud - restoring data can be a hassle.

Which is why for many victims it just seems easier to pay up, says Beyer. And that's what the criminals are counting on.

The cyber enemy is us It's a truism that the biggest threat to security isn't increasingly sophisticated cyber criminals, data-hungry corporations or even espionage-happy nation states; it's the people who get duped into clicking random links or opening rogue files.

To paraphrase Pogo : we have met the cyber enemy, and he is us.

In a Black Hat demonstration, Zinaida Benenson, a researcher at University of Erlangen-Nuremberg in Germany, measured how many people would click on a potentially malicious link inside an email, then compared the results to how many did the same with a message they received on Facebook. (Spear phishing, or targeting a specific person via a message containing bogus links, is a common way for attackers to steal information.)

The results: one in five test subjects clicked a link from a stranger in an email; more than twice as many did it on the social network. Lured by curiosity, even tech-savvy users in the study could not resist clicking.

In another study, Elie Bursztein, head of Google's anti-abuse research team, tracked whether people would pick up a USB thumb drive they found lying on the ground and stick it into their computers (which, he noted, was used as a major plot point in season one of USA Network's Mr Robot). His research team left 300 USB drives at various locations at the University of Illinois Urbana-Champagne campus. Unwitting test subjects picked up 98% of them; nearly half plugged the drives in and opened the files contained on them.

Ask security companies what consumers should do to stay safe, and you'll get the same advice they've been handing out for years - use better passwords, keep software up to date, back up your data, etc. Dan Kaminsky's advice is more stark: keep a close watch on your financials and immediately report anything that looks suspicious.

"If you have a bank account that will not send you a text message when there's a transaction, move your money," he says. "Because now it's not about preventing the fraud, it's about seeing it as soon as it happens."

In other words, assume you're going to be hacked, and try to catch it before it does too much damage.

Could the situation change? If everyone really followed all the advice out there, we wouldn't be in this mess. But they don't. Many consumers will never do any of these things, and scant few will do all of them all the time.

Jake Braun, CEO of strategic security consultancy Cambridge Global Advisors, says moves by companies such as Apple, Google, and Facebook to encrypt data and communications are a huge step in the right direction. When your data is encrypted, the bad guys can't get to it. (And, sometimes, neither can the good guys. That's why the US government is putting huge pressure on these companies to relax their encryption standards to allow access by law enforcement - known colloquially as " the crypto wars ".)

Braun is optimistic that as younger generations take over, they'll demand more secure versions of products from vendors. Still, he says, the scope of the problem is so large that more government intervention is needed.

"I think consumers should be putting more pressure on their elected officials to fund criminal investigation programs that more aggressively track down cyber criminals domestically and abroad," Braun says. "For example, the Homeland Security investigations unit investigates many types of cybercrime (most notably child pornography and online human trafficking that often targets unwitting children) but is embarrassingly underfunded."

In his keynote, Kaminsky called for a federal agency devoted to security issues, similar to the National Institutes of Health, that can "create engineering solutions to the real-world security problems that we have".

"It can't just be two guys," he said. "I need a pile of nerds to be able to work for on this 10 years. We can support health and energy and roads and cars, but somehow we can't support the thing that is driving our economy right now? That's crazy."

Reuters
New spyware detected targeting firms in Russia, China: Symantec
Monday, 08 August 2016
Byline: Staff report

Frankfurt - A previously unknown hacking group variously dubbed "Strider" or "ProjectSauron" has carried out cyber-espionage attacks against select targets in Russia, China, Iran, Sweden, Belgium and Rwanda, security researchers said on Monday.
The group, which has been active since at least 2011 and could have links to a national intelligence agency, uses Remsec, an advanced piece of hidden malware, Symantec researchers said in a blog post.

Remsec spyware lives within an organization's network rather than being installed on individual computers, giving attackers complete control over infected machines, researchers said. It enables keystroke logging and the theft of files and other data.

Its code also contains references to Sauron, the all-seeing title character in The Lord of the Rings, Symantec said. Strider is the nickname of the fantasy trilogy's widely traveled main character Aragorn.

Separately, Moscow-based Kaspersky Lab has labeled the same group using the Remsec spyware as "ProjectSauron".

The newly discovered group's targets include four organizations and individuals located in Russia, an airline in China, an organization in Sweden and an embassy in Belgium, Symantec said.

Kaspersky said it had found 30 organizations hit so far in Russia, Iran and Rwanda, and possibly additional victims in Italian-speaking countries. Remsec targets included government agencies, scientific research centers, military entities, telecoms providers and financial institutions, Kaspersky said.

"Based on the espionage capabilities of its malware and the nature of its known targets, it is possible that the group is a nation state-level attacker," Symantec said, but it did not speculate about which government might be behind the software.

Despite headlines that suggest an endless stream of new types of cyber-spying attacks, Orla Fox, Symantec's director of security response said the discovery of a new class of spyware like Remsec is a relatively rare event, with the industry uncovering no more than one or two such campaigns per year.

Remsec shares certain unusual coding similarities with another older piece of nation state-grade malware known as Flamer, or Flame, according to Symantec.

Kaspersky agreed that the same group it calls ProjectSauron appears to have adopted the tools and techniques of other better-known spyware, including Flame, but said it does not believe that ProjectSauron and Flame are directly connected.

Flamer malware has been linked to Stuxnet, a military-grade computer virus alleged by security experts to have been used by the United States and Israel to attack Iran's nuclear program late in the last decade

Reuters
Facebook Denies Withholding User Data in German Criminal Investigations
Monday, 08 August 2016
Byline: Staff report

Berlin - Facebook rejected on Monday claims made by Germany's state authorities that it was reluctant to co-operate with them on criminal investigations, saying many of the requests it received for user data were incorrectly formulated.
Several regional interior ministers have complained that the social media group is hesitant to respond to requests for data and have called on the Federal Justice Ministry to introduce new laws.

But Facebook said it had provided "round the clock assistance" to the authorities in Bavaria following a spate of violent attacks in Munich, Wuerzburg and Ansbach last month.

A spokeswoman for the Justice Ministry said it was examining whether there was a need to change the law or whether there was a problem with its implementation.

A recent spate of attacks in Germany has highlighted the importance security agencies give to working with social networks to uncover possible links to militant groups.

Police said the Ansbach bomber had six Facebook accounts including one held under a false identity. Traces of an online messaging conversation found on his phone also suggest he was influenced by an unknown person up until the time of the attack, Bavaria's interior minister said.

Germany's spy chief called on Monday for a more intensive exchange of information between social networks and security agencies in the fight against terrorism.

"Social networks are an important communication method for jihadists. Therefore closer co-operation between the security agencies and the operators of social networks is necessary," Hans-Georg Maassen, the head of the BfV domestic intelligence agency, told the Rheinische Post newspaper.

Facebook produced data for 42% of requests in Germany relating to criminal cases in the second half of 2015, compared with 54% in France and 82% in Britain. It said it rejected requests that were overly broad or vague.

The company said it worked with law enforcement officials to help them use their systems, but said there were still a large number of officers that didn't know how to make a successful request.

"Along with our points of contact in Law Enforcement we work tirelessly to raise awareness of the correct procedures," a Facebook spokeswoman said.

A spokesman for the Interior Ministry said co-operation between Facebook and the BKA federal police agency and the BfV was good.

"Conversations are constructive and co- operation is also fruitful as far as we can see," he said, adding they were not in a position to judge how well Facebook worked with the state authorities.

The Express (UK)
Lawyer with links to Russian secret service says Edward Snowden is 'alive and well'
Monday, 08 August 2016
Byline: Will Stewart

London - A lawyer with close links to the Russian secret services took the extraordinary step of announcing that US whistleblower Edward Snowden is "alive and well".
Rumours spread following a mysterious 64- character tweet appeared on Snowden's Twitter account and was then deleted, triggering speculation that he had been kidnapped or even killed.

The former National Security Agency (NSA) contractor, wanted in the US for spilling state secrets, currently has asylum in Russia granted by Vladimir Putin.

Lawyer Anatoly Kucherena said: "I can authoritatively say that he is alive and well, he is living in Russia and is busy with his favourite work."

The lawyer, close to the secret services, did not explain how suspicious messages appeared on Snowden's Twitter account, or what they meant.

Nor has Snowden been seen in public.

But Kucherena said: "Again, we are seeing certain speculations about Edward Snowden.

"Of course, there probably are people interested in speculating on this matter who have been doing this for the last several years."

He claimed without further explanation that "the appearance of certain codes in his Twitter does not mean that he is in danger of some sort.

"This is an attribute of his work and there is nothing bad about it."

One message sent out on Snowden's account read: "It's time."

The second carried 64 characters of code. Both were then deleted.

In 2013, computer geek Snowden started revealing classified documents pertaining to mass surveillance practices carried out by US authorities around the globe.

The same year, Russia granted the whistleblower temporary asylum for one year.

In August 2014, Snowden received a three-year residence permit to live in Russia.

In the United States, he faces up to 30 years in prison on charges of espionage and theft of government property.

Kucherena has represented Snowden since 2013.

Glenn Greenwald, a journalist who helped Snowden to leak details of the secret US data, said the whistleblower was fine.

Reuters
European intelligence database seen aiding fight against suspected militants
Monday, 08 August 2016
Byline: Staff report

Amsterdam - A European counter-terrorism intelligence database designed to generate greater intelligence sharing among allies to avert deadly Islamist attacks has gone online after overcoming traditional reluctance by spy agencies to sharing information.
European officials were spurred into setting up the project by the Paris attacks last November by Islamist militants which exposed intelligence gaps. A total of 130 people were killed in those attacks.

Hosted by the Dutch intelligence service in the Hague, the database went live on July 1, the German Interior Ministry and the German domestic intelligence agency (BfV) said.

"The intelligence database will make it much easier and quicker to share information about possible threats," said one intelligence official.

The database enables European intelligence agencies to share real-time information about suspected Islamist militants collected by members of the Counter-Terrorism Group (CTG), which groups all 28 European Union countries, Switzerland and Norway.

Its creation marks a step forward in the fight against Islamic State, which is focused increasingly on orchestrating large-scale and "lone wolf" attacks as it suffers setbacks and loses territory in Iraq and Syria.

"We need a close exchange of information that is rapid and comprehensive, based on the relevant legal and privacy regulations," said one official at the German interior ministry.

A refinement of earlier databases, the new system is designed to make it easier to cross-reference material provided by different countries' security services, a Dutch security services official told Reuters.

"If we see one of our targets traveling to Amsterdam, we haven't been checking until now if his brother or nephew is also traveling," the official said, giving an illustration of the way the new database worked.

European police agencies have long shared information about potential criminals through Europol and Interpol, but spy agencies are generally reluctant to share intelligence data, except on a specific case-by-case or bilateral basis.

Lack of cooperation was a focal point after the Paris attacks. Several of those involved in the attacks had been on the radar of authorities in other countries.

Abdelhamid Abaaoud, suspected mastermind behind the Paris attacks, for instance, had mocked European frontier controls and boasted how easy it was for him to move between Syria to his Belgian homeland and the rest of Europe.

In another case, the former French spy Claude Moniquet has been quoted as saying that France did not pass on information about Mehdi Nemmouche, a French-Algerian dual national, who shot four people at the Jewish Museum in Brussels in 2014.

After Abdesalam's arrest, U.S. officials privately disparaged European intelligence-gathering and said they were working closely with European authorities to ensure they had the training needed to prevent another Paris-style attack.

The Netherlands, which held the rotating EU presidency at the time, played a key role in setting up the database. Dutch officials urged global counter-terrorism officials to agree to greater sharing of banking details and key data about potential militants after missed signals in Paris.

In the past, they said, countries often failed to share lists of suspects whose assets had been frozen, making it possible for someone blacklisted in one country to drive across the border and use their bank cards in a neighboring country.

Concerns About Election Day Cyberattacks Mount in the Wake of DNC Hack
Tuesday, 09 August 2016
Byline: Geneva Sands

New York - Officials and security experts have raised concerns about potential Election Day cyber vulnerabilities amid reports that hackers -- believed to be from Russsia -- breached the Democratic National Committee's (DNC) computers last month.
On Monday, the Ranking Member of the Senate Homeland Security Committee called on the federal government to examine its efforts to protect election systems and voting machines in the United States against similar attacks.

"Election security is critical, and a cyberattack by foreign actors on our election systems could compromise the integrity of our voting process," wrote Sen. Tom Carper, D-Del., in a letter to the Department of Homeland Security (DHS).

The DNC intrusion raised concerns about the ability of foreign actors to interfere in the American political process, including through cyberattacks targeting electronic voting machines or the information technology of state and local election officials, wrote Carper.

The senator said that while the risk of voter fraud and a successful cyberattack is remote, the federal government can play a role in addressing the potential for these types of attacks.

The letter follows DHS Sec. Jeh Johnson's announcement last week at that the department should consider designating the election system "critical infrastructure," like the power grid, which would have "several implications."

The official designation would make it easier to unlock the department's resources to help local and state jurisdictions, according to a Senate aide.

In response to the DNC hack, CIA Director John Brennan said, "if there has been some manipulation of the election process here, this is going to be something that this government and our country is going to have to look at," during the annual Aspen Security Forum at the end of July.

He said the nation will have to look at "what the vulnerabilities are to the system out there," and some places may decide to go with paper ballots. But he said the country should focus on strengthening the cyber security of the relevant systems.

"[The DNC hack] points out a number of imperatives for the Congress, and chief among them are ensuring the integrity of the election itself," said Rep. Adam Schiff (D-Calif.) at the same conference.

There are currently more than 9,000 different voting jurisdictions and security varies widely among them.

Forty-three states are using electronic voting machines that are at least 10 years old, "perilously close" to the end of most systems' expected lifespan, according to a report by the Brennan Center for Justice.

In many cases vendors no longer serving the machines and as a result election officials are "basically jerry- rigging" these systems, said Larry Norden a deputy director at the Brennan Center.

"If you have a system that has a lot of reliability flaws, those are security concerns as well," he said.

People imagine votes are going to get switched, but there's also the threat of denial-of-service attacks, which could result in long lines or voting disruptions, said Norden.

However, Norden points out that a lot of progress has been made over the past ten years, moving from electronic-only ballots to ballots with a paper trail.

This November 80 percent of Americans will vote on with paper ballot or machine with paper trail. A paperback-up is an important deterrent to make sure bad actors don't hack the machines or infrastructure, said Norden.

Reuters
Australia sets up specialist cyber unit to trace terrorism payments
Tuesday, 09 August 2016
Byline: Staff reporter

Sydney - Australia has set up a cyber-intelligence unit to identify terrorism financing, money laundering and financial fraud online, the government said on Tuesday, because of "unprecedented" threats to national security.
The measure expands on a major platform of conservative Prime Minister Malcolm Turnbull, who narrowly won re-election last month after promising to improve Australia's cybersecurity and transform the economy into a tech-savvy business hub.

Justice Minister Michael Keenan said the new unit, set up under money-tracking agency the Australian Transaction Reports and Analysis Centre (AUSTRAC), would investigate online payment platforms and financial cybercrime to crack down on money-laundering and criminal networks.

"We know that the use of fraudulent identities continues to be a key enabler of serious and organised crime and terrorism," Keenan said in a statement.

The statement said the new AUSTRAC unit would work with the Australian and New Zealand government-funded identity support service, ID Care, to target job recruitment scams that crime syndicates used to recruit innocent people to traffic money between jurisdictions.

The new unit would also work with the Australian Cybercrime Online Reporting Network to identify patterns and trends that could indicate large-scale financial scams or their methodology, Keenan said.

Reuters previously reported that a decision by Australia's major banks to stop offering overseas remittance services had driven the money transfer business underground, making it harder for the authorities to track.

In February, unknown hackers tried to steal nearly $1 billion from the Bangladesh central bank's account at the Federal Reserve Bank of New York, and succeeded in transferring $81 million to four accounts at RCBC in Manila.

Wall Street Journal
Security Screeners Cut Corners at Rio Games
Tuesday, 09 August 2016
Byline: Multiple reporters

Rio de Janeiro - Security screeners posted outside some Olympics venues have taken to waving spectators through checkpoints without X-raying their bags in order to help reduce long lines, the latest breakdown in a process that has raised fears about lax security at the Rio Games.
Olympics security officials have at times been halting the use of X-ray scanners and instead inspecting bags by hand to help shorten wait times, an organizing committee spokesman said Monday.

He said security personnel were also performing "random" checks, an acknowledgment that at times not all bags are being screened in an effort to speed the lines.

At several Olympics locales over the weekend, including the beach-volleyball stadium in Copacabana and the equestrian venue in Deodoro sports complex on the city's north side, screeners opted for visual inspections of bags in lieu of machine screening of backpacks and purses. In some cases, screeners didn't review bags at all, although ticket holders were required to walk through metal detectors.

Mario Andrada, a spokesman for the Rio 2016 Organizing Committee, said the occasional lack of X-ray screening was deliberate, describing it as a move meant to reduce congestion. Security lines to enter some Olympic venues have been so long that some fans have given up, leaving swaths of empty seats at many events.

"Sometimes we go to manual screening when we see the lines forming...but it's never like, open the doors, open the gates," Mr. Andrada said. "We do manual screening and we do random screening and we have very experienced people." Mr. Andrada said such moves don't compromise security.

But Benjamin Yelin, a senior law and policy analyst at the University of Maryland Center for Health and Homeland Security, said shelving X-ray screening at a megaevent is a "radical" move that should only be attempted by veteran screeners capable of quickly assessing which people pose the highest risks.

"It's a significant step to sacrifice X-ray screening," Mr. Yelin said. "You can be incredibly skilled and still not be able to do the level of security that's achieved when every single person is subject to an X-ray."

As the Games officially opened Friday, Brazil's government was still scrambling to patch together a team of weapons screeners to pat down spectators and search for weapons and other contraband outside

Olympics venues. The government was forced to call up retired police officers with little experience operating X-ray machines to replace a similarly inexperienced private contractor that had failed to hire enough staff after Brazil waited until July 1 to award the contract.

On the eve of the opening ceremonies, the retired police officers were still being trained in the use of metal detectors and other equipment, according to Brazil's Ministry of Justice, which is in charge of venue security.

A spokesman for the Ministry of Justice didn't immediately respond to a request for comment about the latest screening issues.

Brazil has been on high alert following recent terror attacks in Europe, Turkey and the U.S. The federal government has deployed about 85,000 police and soldiers during the Games. Brazilian officials have repeatedly assured visitors and competitors that they will be safe while in Rio, and that security measures for the Games are adequate. Heavily-armed soldiers and police are stationed throughout the city.

In July, Brazilian authorities arrested at least a dozen suspected Islamic State sympathizers, who police said had been planning attacks during the Olympic Games.

But the screening lapses, plus a spate of recent muggings in Rio, have cast doubt on the effectiveness of Brazil's massive show of force.

Over the weekend Portugal's Minister of Education was robbed at knife point near the rowing venue, and a Chinese athlete was robbed of his luggage last month by a thief pretending to be drunk.

Brett Costello, a photographer for News Corp Australia, lost around $40,000 of camera equipment Thursday after a team of thieves snatched his bag at a coffee shop in Ipanema. One of the alleged thieves was captured two days later when Mr. Costello spotted him walking inside the Olympic Park.

The suspect, who was wearing Mr. Costello's Olympic-issued photographer's vest, had apparently slipped through security without the official press credentials required of all journalists seeking to enter the facility.

News Corp owns The Wall Street Journal.

Journalists have observed a number of security lapses at Olympic venues. At the media center near Rio's main Olympic Park on Sunday, a Journal reporter was waiting for his bag to be checked at the entrance when security workers walked away, leaving the journalist free to enter the facility with no challenge or inspection. Two others wandered out of the perimeter of the Olympic Park on Saturday and got back in through an unguarded gap in a security fence.

Mr. Andrada, however, cast the security- screening operation as a success because it has significantly reduced wait times outside the venues.

"Yesterday the main goal was, let's get rid of the lines without compromising security," Mr. Andrada said Monday of the previous day's events. "We did that."

The Daily Beast
Spies-for-Hire Now at War in Syria
Tuesday, 09 August 2016
Byline: Kate Brannan

Washington - Every day at 5 p.m., the Pentagon releases a list of that day's contracts worth more than $7 million. On July 27, buried in the daily email was an eye-catching detail: military contractors would be working inside Syria alongside the roughly 300 U.S. troops already deployed there.
This appears to be the first time the Pentagon has publicly acknowledged that private contractors are also playing a role in the fight against the so-called Islamic State inside Syria, and it's one more signal that the U.S. military is deepening its involvement in the fate of the country.

The contract announcement said Six3 Intelligence Solutions -- a private intelligence company recently acquired by CACI International -- won a $10 million no-bid Army contract to provide "intelligence analysis services." According to the Pentagon, the work will be completed over the next year in Germany, Italy and, most notably, Syria.

Beyond this, details are scant. For example, it is difficult to say, given how little information is available, how many contractors might have to go into the country under this contract. It could be just a few (presumably well-paid) intelligence analysts augmenting a military unit or it could be many more.

The Pentagon and CACI would not elaborate on the kind of work Six3 would be doing either, other than "intelligence analysis services," which encompasses a broad spectrum of activities.

But Sean McFate--a professor at Georgetown University's School of Foreign Service, the author of Shadow War, and a former gun-for-hire himself--told The Daily Beast: "This is no ordinary contractor... Six3 Intelligence Solutions is a private intelligence company, and the fact that we outsource a good portion of our intelligence analysis creates a strategic dependency on the private sector to perform vital wartime operations."

Six3, which gets the bulk of its work from the intelligence agencies, specializes in biometrics and identity intelligence-- figuring out who people really are--as well as cyber and reconnaissance. Its former CEO has said that 95 percent of the company's staff has the highest level of security clearance.

An archived version of Six3's website says this about the company's biometrics division: "Our expertise ranges from finger, palm, face, and iris examinations to exploitation and forensic analysis."

Fewer of its contracts are with the military, but it has previously provided intelligence services in Afghanistan and Europe, as well as supporting the "Counter-Insurgency Targeting Program," and related intelligence and operational support for the Army National Ground Intelligence Center and U.S. forces in Afghanistan, according to a search of the Defense Department's contracts archive.

Recognizing this is an ever- expanding field, CACI acquired Six3 Intelligence Solutions, which had only been around for four years, for $820 million in 2013, describing it as "the biggest deal" in CACI's "51-year history."

At the time of the purchase, CACI CEO Ken Asbury said he thought Six3 would open up an additional $15 billion in contract opportunities. CACI has been providing the U.S. military contractor support for years, including interrogators assigned and working at Abu Ghraib prison at the time of the abuse scandal.

"Contractors do a lot more than drive trucks and cook meals; they do intelligence, pull triggers and support Special Operations forces," McFate said.

So far, there has been no mention of private contractors going inside Syria with U.S. troops, but military contracting and special operations experts said it is safe to assume that Six3 isn't the first.

"I've long said, the military looks at professional services contractors like the old American Express commercial, i.e., they dare not leave home without them," said David Isenberg, author of Shadow Force: Private Security contractors in Iraq.

The intelligence community is particularly reliant on contractors today, he added.

But due to the highly sensitive and dangerous nature of the mission in Syria, little information is unclassified. In Iraq -- where there are just over 4,000 U.S. troops on the ground -- the Pentagon is more transparent. Since last summer, the number of contractors working for the Defense Department had just about doubled from 1,300 to 2,500.

The number has ticked up as the number of U.S. troops on the ground steadily increases and bases grow to house them. Private companies are providing everything from meals to perimeter security at Iraq's Besmaya Compound and Camp Taji, both sites where U.S. troops are training Iraqi soldiers to fight ISIS. In 2015, only 98 people were on the ground in Iraq providing base support. Today, that number is 390, and includes American contractors, third country nationals and local Iraqis, according to a July report from U.S. Central Command.

These are just the Pentagon's numbers. The U.S. government -- including the U.S. Embassy in Baghdad -- employ far more contractors. The Central Command report says there are approximately 7,100

contractors supporting U.S. government operations in Iraq. They're washing laundry, cooking meals and providing security, to name a few of the jobs the U.S. government outsources.

"Contractors encourage 'mission creep' because they allow the Administration to put more people on the ground than they report to the American people," McFate said.

Last week's clue that contractor support is growing in Syria suggests something similar might be happening in that country.

The Pentagon first announced in November that 50 U.S. commandos were deploying to northern Syria to advise forces battling the Islamic State there. Before that, the CIA was believed to be operating in the country, arming rebel groups as part of a separate clandestine program. Needless to say, if contractors were supporting the CIA mission, those details were classified.

In April, the U.S. military presence in Syria expanded when President Barack Obama announced that an additional 250 special operations forces would deploy to help local fighters as they battled ISIS. With more troops on the ground, local infrastructure is quietly being built or improved to support them and the local fighters they are there to advise. For example, the length of an airstrip in Hasakah, a town in northern Syria controlled by Kurdish forces, is being doubled to receive larger planes, CNN reported in February.

While the battle against ISIS continues, Iraq and Syria will continue to offer opportunities to defense contractors, but the big money will come when reconstruction begins. The U.S. spent $60 billion in Iraq on reconstruction efforts and so far, over $110 billion in Afghanistan.

Last week, Defense Secretary Ashton Carter signaled that after ISIS is pushed out of towns and cities across Iraq and Syria, there will be an opportunity for private contractors.

"There will be towns to rebuild, services to reestablish and communities to restore," Carter told troops July 27 in Fort Bragg, N.C.

"That's not a principally American job. We will play a role in it, but remember the more than $2 billion in pledges that we got last week will mostly be executed through civilian agencies and frequently they'll use contractors to do that," he said later that day, speaking to reporters. It's "going to be a big job."

Hard drive noises could betray sensitive data

Tuesday, 16 August 2016
Byline: Dan Schwartz
Section: general

Jerusalem - First it was video screens sending out electromagnetic waves that could be picked up by a cellphone; then it was Radio Shack-type equipment hidden inside something the size of a pita bread that could be used to "read" the electromagnetic pulses emanating from a standard laptop's keyboard. Now, Ben Gurion University researchers have discovered a new take on air-gapped network **hacks** - malware that reads sensitive data and sends it out to a waiting device.

It's another example of how malefactors could pull off a **hack** on some of the most secure networks and individual computers in the world - networks and computers that are not connected to the **internet**. **Hackers** generally practice their craft on connected systems, using long-distance network and wifi connections to reach into troves of sensitive data. Ostensibly, though, systems that are not connected to the **internet** are not within reach of **hackers**.

Not quite. New research led by the Ben Gurion University team, led by security researcher Mordechai Guri, shows that even unconnected systems are vulnerable. All a **hacker** has to do is implant the right kind of malware into a system (usually accomplished by connecting a USB drive or other peripheral to a computer) and get a cellphone within range of the computer. This peripheral manipulates the computer's hard drive to broadcast data to a waiting cellphone or other device, which then stores it and can later upload it to **hackers**.

This is known as an air-gap attack. In the past, researchers at Ben Gurion and Tel Aviv universities have discovered several other applications of this kind of attack - like PITA, the Portable Instrument for Trace Acquisition attack, which uses electromagnetic wave detection equipment (available at any computer hardware store) that could "read" the electromagnetic pulses emanating from a standard laptop's keyboard, including the keystrokes used to de-encrypt secure documents.

The new attack, called DiskFiltration, does something similar using the acoustic signals emitted from the movement of a computer's hard disk drive (HDD). Malware on the computer seeks out data like text files, logins and passwords, databases, and other useful information. Once the preferred data is discovered, the malware manipulates the hard driver's actuator (a device that controls the hard drive head arm, which reads data off the disk) to create specific sound patterns - the clicks and whirrs of the movement of the drive.

Those patterns are recorded by a device like a smartphone, smartwatch, or other **Internet** of Things (IoT) device that could either transmit the sound patterns to a remote computer (via the cellphone network connection of the device) or keep it intact, awaiting the retrieval of the device by a **hacker** or their agent.

It sounds implausible, if not impossible, but air-gap attacks are nothing new. According to many experts, the Stuxnet attack on Iran's nuclear system - in which a virus infected the servers controlling the Iranian nuclear program's centrifuges, "choking" them until they ground to a halt - was an air-gapped one, as the computers were not connected to the **internet**.

One way to beat air-gap attacks, according to the researchers, is to switch to solid-state drives (SSDs), which have no moving parts and therefore emit no noise. However, according to the researchers, "despite the increased rate of adoption of SSDs, HDDs are still the most sold storage devices, mainly due to their low cost. In 2015, 416 million HDD units were sold worldwide, compared to 154 million SSD units. Currently, HDDs still dominate the storage wars, and most PCs, servers, legacy systems, and laptops are installed with HDD drives," so there are still many vulnerable systems out there.

Other than that, say the researchers, the best bet is to keep devices away from secure computers. "Procedural countermeasures involve a physical separation of emanating equipment from potential receivers," says the team. "Smartphone and other types of recording devices should not be permitted in close proximity of the computer."

34 cyber labs operationalised

Tuesday, 16 August 2016
Section: general
Mumbai - In a major initiative to combat growing cyber crimes, the Maharashtra on Monday launched a comprehensive Crime and Criminal Tracking Network System (CCTNS) through the operationalisation of 34 cyber laboratories across the state.

Announcing the commencement of the operations of 34 cyber cells in the, Maharashtra chief minister Devendra Fadnavis said on the occasion of the 70th Independence Day: "The 34 cyber laboratories are out a total 51 such labs that we intend to set up in the state by December this year. The labs will come in handy for the Maharashtra police in tackling complex crimes in the cyber era we are in".

Fadnavis said that under the CCTNS, a dedicated cyber police force would be developed and "We will train 1,000 policemen under CCTNS to handle cyber crimes across the state," he said.

The CM said that the cyber labs would analyse mobile forensic and call detail records. He said that the Maharashtra police would develop a mobile application by October this year to provide services to the people under CCTNS.

Speaking at an inauguration ceremony of the Cyber Lab project held at the World Trade Centre here, Fadnavis said: " With the increased use of internet, criminals are using advanced techniques to commit newer types of online crimes. I am confident, the Cyber Labs will track down the criminals involved in online crimes...Advanced technology will be deployed for the safety and security of all the citizens and their properties through the Cyber Police Force".

The CCNTS will facilitate linking of all police stations across the state with one another for sharing information about crimes in their respective jurisdictions "in real time", a scenario that that would make a 'Digital Police Force' a reality in Maharashtra.

Linked by secure high-speed fibre optic cable network, the data from the cyber labs will be at the disposal of the police to address security concerns of private organizations and banks among others, the chief minister said.

Latest technology put in place for emergencies

Tuesday, 16 August 2016
Byline: Staff Report
Section: general
Riyadh - The Unified Operations Center, 911, will help the security staff to coordinate and respond to emergencies within a few minutes, thanks to the latest technology used for the system.

Maj. Gen. Abdulrahman Al- Saleh, commander of the National Operation's Center in the Ministry of Interior, said latest cameras have been installed at holy sites to serve Umrah and Haj pilgrims.

"The unified operations project represents a quantum leap in security work. The center has been launched in Makkah, Taif and Jeddah to contribute to speedy coordination between security bodies and other supporting services," he told local media.

The project was launched by Crown Prince Mohammed bin Naif during the Haj season last year through a number of phases. It started with road security patrols, and was then introduced to other security sectors, such as Civil Defense, traffic and security patrols.

Al-Saleh pointed out the secretariat of security planning and development in the Ministry of Interior is responsible for the project, while the National Operations Center is delegated the task of its operation.

The project was launched from Makkah and then Taif, while it was launched in Jeddah on Saturday. The project will be operational after 10 days in certain parts of the Makkah Province, and work will be finalized on Aug. 20, to bring the whole of Makkah Province under the emergency number 911.

The government has put in a lot of efforts in the preparation of this project, which is housed in the government complex, which was constructed by the Ministry of Finance in the Al-Awali area in Makkah, said Al-Saleh.

The operations room in Makkah manages security operations in all parts of the Kingdom, and there are other projects that will be implemented in phases in other cities. He revealed that the number 911 was carefully chosen because it is different from previous emergency numbers, in addition to it being popular globally.

Advanced systems have been used in the project to guarantee speedy response and supervision of workers' performance, which is a very important requirement for the success and smooth running of the operations.

Al-Saleh said the unified center has a number of supporting bodies, such as the Ministry of Health, Red Crescent, water company, electricity and the Ministry of Transport. He confirmed that these bodies offer support to security bodies only during emergencies.

The center includes a directorate for Haj and Umrah, called crisis management. There are advanced cameras at the holy sites.

911 is the emergency number in Makkah Province and anyone who calls this number from inside the Kingdom will be answered from the operations center in Makkah.

A number of officers have been enrolled for a training course in King Fahad Security College and will be employed in the center as soon as they graduate.

Al-Saleh confirmed that some people were sent to China and Germany to study the system and technology used in the center. "We don't underestimate the efforts of previous operations' rooms. Their experience over the years is appreciable," added Al-Saleh.

Security Experts: Remotes Are Hackable on Many Vehicles

Tuesday, 16 August 2016
Section: general
Tehran - A group of computer security experts say they figured out how to hack the keyless entry systems used on millions of cars, meaning that thieves could in theory break and steal items without leaving a broken window.

The experts say that remote entry systems on millions of cars made by Volkswagen since 1995 can be cloned to permit unauthorized access to the car's interior. The same experts say another system used by other brands including Ford, General Motor's Opel and Chevrolet and Renault can also be defeated.

In a paper to be delivered Friday at the Usenix security conference in Austin, Texas, the authors say a thief could use commonly available equipment to intercept entry codes as they are transmitted by radio frequency, and then use that information to clone another remote so the car could be opened.

Volkswagen said its latest models such as the Golf, Tiguan, Touran and Passat were not affected. It said it was having a "constructive exchange" with the experts aimed at improving security technology.

"The bar for theft prevention is constantly being raised, but ultimately there is no comprehensive guarantee for security," the company said in a statement.

The paper leaves out key details on how to perform the hack but says the codes can be intercepted with commercially available equipment.

"It is unclear whether such attacks... are currently carried out in the wild by criminals," the report says. "However, there have been various media reports about unexplained theft from locked vehicles in the last years."

The report did not establish the exact number of cars that use the vulnerable systems.

General Motors said that it "does not consider this item to be a significant risk to customers due to the technical sophistication of the demonstration and the very limited circumstances under which the demonstration can be carried out."

The company added that "the issue in question does not impact the operation of the vehicle or the safety of its occupants."

The report authors said that insurance companies might have to accept that car theft scenarios that would otherwise be considered insurance fraud have a higher probability of being genuine. The only surefire countermeasure, they said, would be to stop using the remote and fall back on the mechanical lock using the conventional metal key.

The authors are Flavio Garcia, David Oswald, and Pierre Pavlides from the University of Birmingham School of Computer Science and Timo Kasper from German security firm Kasper & Oswald GmbH.

The Specter of an Accidental China - U . S . War

Tuesday, 16 August 2016
Byline: Andrew Browne
Section: general
Shanghai - The last time America and China went to war--in Korea in 1950--they fought each other to a standstill.

Later that decade, as the Cold War ramped up, they came close to blows again; the Eisenhower administration repeatedly threatened "Red China" with nuclear devastation as tensions bubbled over Taiwan.

Today, given the astronomical stakes at play, many assume that armed conflict between the two giants is out of the question. They are each other's largest trading partner. Military confrontation wouldn't only threaten these huge flows but also student exchanges, scientific collaboration, joint technical projects and the myriad other ways in which the fates and fortunes of the world's two largest economies and their peoples are inextricably linked.

Yet, as China flexes its muscles in the South China Sea and East China Sea, the risks of an inadvertent clash on the water or in the air are growing by the day.

A new RAND Corp study says that a Sino-U. S. war as a result of such a crisis "cannot be considered implausible."

Violence could ignite quickly, the report warns. That is because each side has deployed precision-guided munitions, as well as cyber and space technologies, able to inflict devastating damage on the other's military assets, including Chinese land- based missile batteries and American aircraft carriers. Thus they have a strong incentive to launch massive strikes first as part of a "use it or lose it" calculation.

Once out of control, fighting could be prolonged, although it is unlikely to go nuclear, according to the RAND study sponsored by the U.S. Army. Both nations possess the military, industrial and demographic resources to absorb heavy losses and slog on. As in Korea, there would likely be no clear victor.

Washington and Beijing "need to contemplate the possibility of a severe, lengthy, uncontrollable and devastating, yet indecisive, conflict," the RAND paper asserts.

This is the troubling context in which to view China's defiant response to last month's ruling by a panel of jurists in The Hague, who struck down Beijing's claims to almost the entire South China Sea and rebuked it for dredging artificial islands topped by military-capable runways that have intimidated other claimants, including Vietnam and the Philippines.

Instead of backing off, China has doubled down on its assertive strategy, flying a bomber over the Scarborough Shoal, which it has effectively seized from the Philippines, announcing war games with Russia and sending militia fleets swarming into waters contested with Japan.

The Center for Strategic and International Studies, a Washington think tank, has published satellite photos showing aircraft hangers springing up on the fake islands, reinforced apparently to withstand air attack.

So far there are no signs that the People's Liberation Army has stationed military aircraft on the mid-sea platforms.

Then again, some Western experts think China may be biding its time so as not to spoil a Group-of-20 summit of leading economies it is hosting for the first time next month. Watch out for even more aggressive moves between then and the U.S. presidential election in November, they say.

Washington's response to The Hague ruling has been conspicuously restrained. U.S. officials seem to hope that avoiding provocative words and actions, such as sending warships steaming close by the island fortresses in "freedom of navigation" missions, will make it easier for Beijing to find a graceful way to comply with the ruling over time.

For the U.S., striking the right balance between displays of conciliation and resolve is critical. As the RAND report argues, war is much more likely to arise as a result of China misjudging America's willingness to defend its East Asian allies, and pushing them too far, than from a premeditated attack.

Indeed, Chinese leaders -- arch-realists on foreign policy -- may even feel emboldened now. Their man-made islands are a fait accompli; the tribunal has no power to enforce its judgment.

Southeast Asia has been silent. So has a struggling Europe, as ever, most concerned with ginning up Chinese investment.

"Nobody is pushing back," says Jennifer Lind, an East Asia specialist at Dartmouth College. She thinks the Chinese strategy has been successful. "They control more territory; they have more influence than ever before," she says.

Worryingly, the RAND report notes an increasing confidence among Chinese military strategists that they could conduct a short, sharp and victorious war.

Among the report's recommendations: America should make clear it doesn't favor pre-emptive strikes against China and must "expand communications with China in times of peace, crisis, and war."

On that latter objective, history isn't encouraging. In 2001, when a Chinese fighter ran into an America spy plane, its pilot killing himself and forcing the crippled U.S. plane to make an emergency landing on Hainan Island, then U.S. President George W. Bush tried to reach his Chinese counterpart, Jiang Zemin, on a hotline. Mr. Jiang wouldn't take the call.

China Makes Quantum Leap Forward

Tuesday, 16 August 2016
Byline: Josh Chin
Section: general
Beijing - A rocket that shot skyward from the Gobi Desert early Tuesday is expected to propel China to the forefront of one of science's most challenging fields.

It also is set to launch Beijing far ahead of its global rivals in the drive to acquire a highly coveted asset in the age of **cyberespionage**: **hack**-proof communications.

State media said China sent the world's first quantum-communications satellite into orbit from a launch center in Inner Mongolia about 1:40 a.m. Tuesday. Five years in the making, the project is being closely watched in global scientific and security circles.

The quantum program is the latest part of China's multibillion- dollar strategy over the past two decades to draw even with or surpass the West in hard-sciences research.

"There's been a race to produce a quantum satellite, and it is very likely that China is going to win that race," said Nicolas Gisin, a professor and quantum physicist at the University of Geneva. "It shows again China's ability to commit to large and ambitious projects and to realize them."

Scientists in the U.S., Europe, Japan and elsewhere are rushing to exploit the strange and potentially powerful properties of subatomic particles, but few with as much state support as

those in China, researchers say. Quantum technology is a top strategic focus in the country's five-year economic development plan, released in March.

Beijing hasn't disclosed how much money it has allocated to quantum research or to building the 1,400-pound satellite. But funding for basic research, which includes quantum physics, was $101 billion in 2015, up from $1.9 billion in 2005.

U.S. federal funding for quantum research is about $200 million a year, according to a congressional report in July by a group of science, defense, intelligence and other officials. It said development of quantum science would "enhance U.S. national security," but said fluctuations in funding had set back progress.

Beijing, meanwhile, has tried to lure Chinese-born, foreign-educated experts in quantum physics back to China, including Pan Jianwei, the physicist who is leading the project.

"We've taken all the good technology from labs around the world, absorbed it and brought it back," Mr. Pan told Chinese state TV in an interview that aired on Monday.

With state support, Mr. Pan was able to leapfrog his former Ph.D. adviser, University of Vienna physicist Anton Zeilinger, who said he has tried since 2001 to persuade the European Space Agency to launch a similar satellite.

"It's a difficult process, which takes a lot of time," said Mr. Zeilinger, who is now working on his former student's satellite.

Neither Mr. Pan nor the Chinese Academy of Sciences, which is directing the project, responded to requests to comment. The European Space Agency and the U.S.'s National Science Foundation, which provides federal funding for basic American science research, also didn't respond to requests to comment.

China's investment in the field is likely being driven in part by fear of U.S. cyber capabilities, said John Costello, a fellow at Washington, D.C.-based New America specializing in China and cybersecurity, pointing to 2013 disclosures that the U.S. had penetrated deeply into Chinese networks. He also noted that U.S. institutions are researching how to build powerful quantum computers theoretically capable of shattering the math-based encryption now used world-wide for secure communication.

Quantum encryption is secure because information encoded in a quantum particle is destroyed as soon as it is measured. Gregoir Ribordy, co-founder of Geneva-based quantum cryptography firm ID Quantique, likened it to sending a message written on a soap bubble. "If someone tries to intercept it when it's being transmitted, by touching it, they make it burst," he said.

Quantum physicists have recently advanced the use of photons to communicate securely over short distances on earth. The satellite, if successful, would vastly expand the range of unhackable communication. Mr. Pan has said he and his team will try to beam a quantum cryptographic key through space from Beijing to Vienna.

Homeland Security Offering States Voting Cybersecurity Help

Tuesday, 16 August 2016
Byline: Staff report
Section: general
Washington - The U.S. Department of Homeland Security offered Monday to help state elections officials with the challenge of securing voting systems from the threat of cyber attacks.

Homeland Secretary Jeh Johnson hosted a meeting by telephone with officials from around the country as well as representatives from the Justice Department and the National Institute for Standards and Technology.

Most voters in the U.S. encounter some kind of machine during the voting process, whether they vote directly on a touchscreen device or put their paper ballot into a scanner. But which system is used is up to officials overseeing the 9,000 separate voting jurisdictions across the country, not the federal government.

Johnson encouraged states to implement recommendations that include making sure electronic voting machines are not connected to the internet while voting is taking place.

He also announced a new campaign to bring together government and private sector experts to promote voting security and heighten awareness of the potential risks to the infrastructure involved in the process.

Hackers Say They Hacked NSA-Linked Group, Want 1 Million Bitcoins to Share More

Monday, 15 August 2016
Byline: Lorenzo Franceschi-Bicchierai
Section: general
New York - A mysterious hacker or hackers going by the name "The Shadow Brokers" claims to have hacked a group linked to the NSA and dumped a bunch of its hacking tools. In a bizarre twist, the hackers are also asking for 1 million bitcoin (around $568 million) in an auction to release more files.

"Attention government sponsors of cyber warfare and those who profit from it!!!!" the hackers wrote in a manifesto posted on Pastebin, on GitHub, and on a dedicated Tumblr. "How much you pay for enemies cyber weapons? [...] We find cyber weapons made by creators of stuxnet, duqu, flame."

The hackers referred to their victims as the Equation Group, a codename for a government hacking group widely believed to be the NSA.

The security firm Kaspersky Lab unmasked Equation Group in 2015, billing it as the most advanced hacking group Kaspersky researchers had ever seen. While Kaspersky Lab stopped short of saying it's the NSA, its researchers laid out extensive evidence pointing to the American spy agency, including a long series of codenames used by the Equation Group and found in top secret NSA documents released by Edward Snowden. The Equation Group, according to Kaspersky Lab, targeted the same victims as the group behind Stuxnet, which is widely believed to have been a joint US-Israeli operation targeting Iran's nuclear program, and also used two of the same zero-day exploits.

The Shadow Brokers claimed to have hacked the Equation Group and stolen some of its hacking tools. They publicized the dump on Saturday, tweeting a link to the manifesto to a series of media companies.

The dumped files mostly contain installation scripts, configurations for command and control servers, and exploits targeted to specific routers and firewalls. The names of some of the tools correspond with names used in Snowden documents, such as "BANANAGLEE" or "EPICBANANA."

It's unclear if the data is legitimate, but some security experts agree that it likely is.

"If this is a hoax, the perpetrators put a huge amount of effort in," the security researcher known as The Grugq told Motherboard. "The proof files look pretty legit, and they are exactly the sorts of exploits you would expect a group that targets communications infrastructure to deploy and use."

Claudio Guarnieri, an independent security researcher who's investigated other hacking operations by the Western intelligence agencies, told me that the files might be from a hacked NSA server used in an operation. He also cautioned that this is a preliminary analysis and that more analysis is needed.

The most recent file is dated June 2013, though the hackers could have tampered with the dates. Dmitri Alperovitch, the co-founder of security firm CrowdStrike, theorized that "the leakers were probably sitting on this information for years, waiting for the most opportune time to release."

Matt Tait, another security researcher and former British intelligence officer, tweeted that the data could come from "an old counter-hack."

A Kaspersky Lab researcher declined to comment. Another Kaspersky Lab researcher noted on Twitter that there is "nothing" in the dumped files that links them to the Equation Group, but some of their names are from the ANT Catalog, an NSA hacking toolset published by Der Spiegel in late 2013. It's worth noting that while the files dumped by The Shadow Brokers might not have a direct connection with the Equation Group, they could come from a different operation that those seen by Kaspersky Lab.

The Shadow Broker claimed to have gotten the files by following Equation Group "traffic," hacking the group and finding its "cyber weapons." (The hackers did not respond to a request for comment, and neither did the NSA.)

At the time of writing, the Bitcoin wallet where the hackers accept auction offers has yet to receive any funds.

The motives behind this strange dump are unclear, but if legitimate, this could be one of the most shocking hacks ever.

India to tap Israeli radar tech to thwart terrorism in volatile Kashmir area

Thursday, 18 August 2016
Byline: Staff Report
Section: general
Jerusalem - India is reportedly preparing to install Israeli radar technology in the jungles of the volatile Kashmir Valley region as part of operations to prevent terrorists from infiltrating from Pakistan.

Representatives from India's Border Security Force are due to visit Israel later in August as part of the acquisition of the detection system, a senior security officials told India Today TV this week. During the trip, the Indian forces are set to receive training on the system's operations.

The so-called foliage penetrating radar is allegedly equipped with high- sensitivity sensors that can track human and vehicular movement in areas of dense foliage.

According to India Today, the Indian government will established a 24/7 control room to monitor the signals received from the Israeli technology installed throughout the Kashmir Valley and the Line of Control (LoC) between India and Pakistan.

India is working to erect an air-tight defense mechanism along the borders with nuclear-armed Pakistan modeled after Israeli security apparatus, the officials said.

Indian National Security Adisor Ajit Doval approved the deal to purchase the radar system from Israel, the officials added.

India and neighboring Pakistan have been embroiled in a territorial dispute over the Jammu and Kashmir region since the partition of India in 1947.

Islamic insurgents, many identifying with jihadi elements, have carried out attacks in the region in efforts to claim the contested land for Pakistan.

Cyber Meeting

Thursday, 18 August 2016
Byline: Special Correspondent
Section: general
Thiruvananthapuram - Lt. Gen. Sheik Saif bin Zayed Al Nahyan, Deputy Prime Minister and Minister for Interior, UAE, will be the guest of honour at a two-day international cyber security and policing conference scheduled to be held at Hotel Raviz in Kollam on October 19.

Governor P. Sathasivam will inaugurate the function. Chief Minister Pinarayi Vijayan will address the valedictory session on October 20.

Julie Gommes, renowned cyber security expert from Devoteam, France, will speak on Crypotgraphy and Jihadism, while renowned cyber evangelist Ben Herzberg will speak on the latest cyber attacks.

Other noted speakers included Gulshan Rai, Cyber Security Chief, Prime Minister's Office, Government of India, and Aruna Sundararajan, Secretary, Ministry of Electronics & Information Technology.

Bessie Pang, Executive director of Polycb (Society for Policing of Cyber Space), will speak on private-public participation in cyber security. Polycb is supporting the conference.

The event will run in two parallel streams from 10 a.m. onwards. Track one will be non-technical and track 2 will be a purely technical. Apart from foreign delegates, students, IT experts, police cyber cells, and police officers from around the country will attend the conference.

The conference will focus on Innovations in cyber security, Prevention - detection of cyber crimes against women, Digitization for better service delivery, Digitalization as a force Multiplier, Cyber safe government, tackling latest cyber crimes and ethical hacking.

The conference, is aimed at providing a platform to discuss and share new information and latest trends in cyber crimes, across the world.

The conference will be a platform to share latest information on high tech cyber crime methods. It will focus on data theft, piracy, hacking, identity theft, violation of intellectual property rights, etc.

3. Bangladesh Daily Star

From crackers to rocket launchers

Thursday, 18 August 2016
Byline: Zayadul Ahsan
Section: general
Dhaka - They are no longer into small arms and crude crackers only. Local terrorists over the years have mastered the skills of making deadly weapons like rocket launchers, mines, car bombs, and cycle bombs.

They even took initiative to make drones. Besides, various types of sophisticated weapons like AK-47 assault rifle and MK-11 sniper were recovered from them in the last three to four years.

In close liaison with cross-border terror outfits, they not only went abroad to train in making arms and explosives, but also brought in foreign experts for training programmes within the country.

Piecing together information gleaned from captured militants, findings of investigators and news of the recoveries, we get a picture where militants appear to have developed much earlier the capacity to launch attacks like the July 1 Gulshan café strike.

Though law enforcers had considerable success in recovering arms and ammunition, the policymakers failed to foresee the looming crises. They didn't notice the ominous signs in the reports of the recoveries, security experts observed.

As the possibility of further attacks like Gulshan and Sholakia cannot be ruled out, the experts call for constant vigilance, especially to prevent building of new terror networks and stockpiling of weapons by militants.

"The recovery of arms and explosives proves that our law enforcers are vigilant. But what if an extremist group manages to gather military strength beyond the knowledge of law enforcers?" said security expert Brigadier (retd) Shahed Anam.

"There is always a risk like that. So the government must focus on capacity building of law enforcement agencies."

DMP's counterterrorism unit chief Monirul Islam believes that no radical group is likely to emerge with considerable military strength again because of continuous raids, seizures and arrests. "But to eliminate the threat permanently," he said, "we need to do a lot of capacity building." One can recall that experts were brought in from Pakistan to train militants on making car bombs.

Two Pakistani nationals -- Mehmud and Osman -- came to Bangladesh sometime in 2012 posing as businessmen. When it came to the knowledge of the detectives, the two were interrogated several times but no information could be gleaned from them.

So they were produced before a court and sent to jail for suspicious activities under section 54 of the Code of Criminal Procedure. They came out on bail about a year later. Then their mentor Fakhrul Hasan came to Dhaka from Pakistan.

The Detective Branch of police arrested the three from the gate of Shilpakala Academy in the capital on January 19, 2014. A manual on bomb-making was found with them. Their laptops contained information about training on military weapons. In police interrogation, they confessed they were members of Tehrik-e-Taliban of Pakistan.

After primary interrogation, Monirul Islam, also additional commissioner of Dhaka Metropolitan Police (DMP), told the media that the Pakistani militants were capable of making 12 types of explosives, including car bombs and grenades.

A group in Bangladesh has brought them to train militants. The official said attempts were on to detect the group and arrest them. It is not known whether the group has been tracked down or efforts to do that are still on.

In February this year, DB police recovered a good number of car bombs from Mohammadpur in the capital. The information was not given to the media thinking that it might spread panic.

It is possible that the trainers from Pakistan before being arrested trained others on making car bombs or some new trainers replaced them.

DB police on December 16, 2014 arrested two members of Ansarullah Bangla Team (ABT) at Jatrabari in the capital with a "drone" or "quadcopter".

Drone-making project, equipment for making drones and various types of electronic devices were recovered from them.

ABT had been manufacturing drone using advanced technology for launching attack on important installations and persons. It is notable that one of the arrestees, Golam Maula Mohan, had studied computer science at a private university in Dhaka.

Officials at that time told the media that since the important installations are well guarded, the militants planned to strike those from air using drones. After research for about six months, the two arrestees were at the last stage of making a drone capable of carrying a 30Kg bomb. They made the drone for carrying out attack from the top of a 25- 30-storey building.

The incident of recovering a bicycle bomb from Karnaphuli Garden City area in the capital's Shantinagar on March 8 last year was beyond the imagination of the detectives.

Explosives were put inside the rods of the bicycle. It was meant to explode with a big bang the moment it comes in contact with fire. At that time Rab said that if it exploded, the bicycle bomb could cause a disaster within 30 yards.

The militants attacked the Hossaini Dalan premises in Old Dhaka on the night of October 23 last year with three grenades made with chemicals. Two persons, including an adolescent, were killed in the incident. That was the first attack in the country using a bomb or grenade made with chemicals.

In a 15-hour raid on December 24 last year, detectives recovered 16 hand-made grenades, two hand bombs, some suicide vests, pipe bombs and equipment for making more than 200 grenades.

The suicide vests were of special type -- it had "double switch" system. If one switch somehow fails to trigger the explosion, a backup switch is there. Explosives, arms, bullets and money could be kept in the vest at the same time.

After the recovery of a huge amount of arms, ammunition and new type of suicide vests, Monirul Islam of the DMP said it was a high-profile raid.

On December 27 last year, police recovered an MK-11 sniper rifle along with 250 bullets from a JMB den. This semiautomatic weapon is highly accurate and durable. Its firing rate is 750 rounds per minute and the range 1,500 yards.

A military uniform and rank badge were also found with the modern rifle, made in the United States. The explosives recovered were enough to blow up four buildings, said the then chief of Chittagong Metropolitan Police.

On February 20, detectives recovered some car bombs, handmade mines and some new kinds of grenades from two apartments in the capital's Mohammadpur and Dakkhin Khan. Each of the

grenades weighed between 3-4kg. At least eight hand grenades that looked like tennis balls were also recovered.

Police at the time said the grenades, bombs and explosives found there could blow up multi-storey buildings. The grenades looking like tennis balls were the new invention of the militants.

On April 4, high-power explosives were found in Bogra. Made on the model of Arges grenades, those explosives were capable of causing massive destruction. It was possible to make about 300 powerful explosives with bomb-making materials recovered then.

On May 23, 2010, JMB chief Saidur Rahman, caught by police, admitted that the JMB militants had suicide vests and rocket launchers. They even successfully tested several rocket launchers in areas near the Sundarbans in Barguna and in remote areas of Jamalpur district. Police recovered 10 suicide vests from a Siddhirganj den on May 24 on information given by the JMB chief.

A bomb found there was of a special type. After its pin is removed like a grenade, the outer shell opens on one side. A metallic object gets connected with a battery and electricity begins to flow, causing explosion.

Inside the bomb, there is a pencil battery, a circuit and white explosive powder. The powder is pentaerythritol tetranitrate (PETN). A car can be destroyed with just 100 grams of it. When the bomb goes off, tiny pieces of its shell hit the target like splinters.

In January, eight AK-22 rifles were recovered from the members of Shaheed Hamza Brigade of Islami Chhatra Shibir in Chittagong. AK-22 rifles were used in the Holey artisan attack.

Besides, the law enforcement agencies on different occasions informed journalists about recovery of arms and ammunition. There were AK-47 and submachine guns.

In the last 12 years, law enforcers seized over a thousand grenades, more than one hundred firearms and 4-5 tonnes of explosives from militants.

Talking to officials dealing with militancy it is learnt that law enforcers hardly have time to look back to the past as they are mostly busy cracking down on Neo JMB or other radical groups.

Experts believe that to understand the strategy of new radicals, there is no alternative to studying and investigating the militant activities in the past.

They say law enforcers should not forget that many key persons behind those remained out of touch and many mysteries remained unsolved.

4. Washington Post

NSA's use of software flaws to hack foreign targets posed risks to cybersecurity

Thursday, 18 August 2016

Byline: Ellen Nakashima, Andrea Peterson
Section: general

Washington - To penetrate the computers of foreign targets, the National Security Agency relies on software flaws that have gone undetected in the pipes of the Internet. For years, security experts have pressed the agency to disclose these bugs so they can be fixed, but the agency hackers have often been reluctant.

Now with the mysterious release of a cache of NSA hacking tools over the weekend, the agency has lost an offensive advantage, experts say, and potentially placed at risk the security of countless large companies and government agencies worldwide.

Several of the tools exploited flaws in commercial firewalls that remain unpatched, and they are out on the Internet for all to see. Anyone from a basement hacker to a sophisticated foreign spy agency has access to them now, and until the flaws are fixed, many computer systems may be in jeopardy.

The revelation of the NSA cache, which dates to 2013 and has not been confirmed by the agency, also highlights the administration's little-known process for figuring out which software errors to disclose and which to keep secret.

The hacker tools' release "demonstrates the key risk of the U.S. government stockpiling computer vulnerabilities for its own use: Someone else might get a hold of them and use them against us," said Kevin Bankston, director of New America's Open Technology Institute.

"This is exactly why it should be U.S. government policy to disclose to software vendors the vulnerabilities it buys or discovers as soon as possible, so we can all better protect our own cybersecurity."

The weekend's release prompted immediate speculation about who might be behind it. A group calling itself Shadow Brokers claimed responsibility. Some experts and former employees suspect, although without hard evidence, that Russia is involved. Other former employees say it is more likely a disgruntled insider seeking to make a profit.

Whoever it is, "it's very concerning that potentially someone working for another government is essentially holding hostage companies that are sitting behind these [firewalls], making them very vulnerable," said Oren Falkowitz, chief executive of Area 1 Security and a former NSA analyst.

The firewalls sold by Cisco, Juniper and Fortinet are highly popular and work on large-scale enterprise systems. "These are very, very powerful and successful" products, Falkowitz said. "They aren't devices bought by two people."

Already, the firms are racing to reverse-engineer the code, identify any flaws and devise patches. Cisco confirmed Wednesday that one of the flaws was a "zero-day" -- previously unknown to the public - - and that it is working on a fix. The flaw was in a tool or exploit code-named Extrabacon.

Juniper spokeswoman Leslie Moore said the company is reviewing the released file. "If a product vulnerability is identified, we will address the matter and communicate to our customers," she said.

Fortinet spokeswoman Sandra Wheatley Smerdon said that the firm is "actively working with customers" who are running the FortiGate firewall version 4.X and that it "strongly" recommends that they update their systems "with the highest priority."

The government has a process for determining when to share software flaws. Agencies such as the NSA and the FBI are supposed to submit any flaws they discover to a multiagency group of experts, who then weigh whether the advantage of keeping the vulnerabilities secret outweighs the public's cybersecurity.

White House cybersecurity coordinator Michael Daniel has said that "in the majority of cases," disclosure of the bug is in the national interest. The multiagency process didn't really begin until spring 2014. The NSA had had its own internal process for years before that.

Either way, in this case, disclosure never happened.

"This is what happens when you have security agencies hoarding exploits insecurely -- poorer security for all," said Kevin Beaumont, a cybersecurity researcher who verified that some of the leaked tools rely on still unpatched vulnerabilities.

Former NSA personnel who worked with the tool cache that was released say that when they worked at the agency, there was an aversion to disclosure.

"While I was there, I can't think of a single example of a zero-day [flaw]" used by the agency "where we subsequently said, 'Okay, we're done with it and let's turn it over to the defensive side so they can get it patched,' " said the former employee, who worked at the agency's Tailored Access Organization for years. During that time, he said, he saw "hundreds" of such flaws.

He added: "If it's something in active use, my experience was they fight like all get-out to prevent it from being disclosed."

Said a second former employee, who also spoke on the condition of anonymity to describe sensitive government operations: "It's hard to live in a world where you have capabilities and you're disclosing your capabilities to your defensive team."

This former operator said that sometimes a vulnerability is patched, but that "if you weaponize it in a different fashion" with a special technique, "maybe that's one way to increase the longevity of a tool."

In that way, a flaw could still be good for several years.

"Two or three years is not really a long time for a bug to go undiscovered," said Joseph Lorenzo Hall, the chief technologist at the Center for Democracy & Technology.

For example, a major vulnerability called Heartbleed made its way into the code of widely used encryption software in 2011, but didn't come to light until 2014, he noted. Last year, Microsoft fixed a critical zero-day bug that had been lurking in Windows for at least a decade.

"There are so many vulnerabilities in software that we can't possibly find them all," Hall said. "It's really kind of scary, especially when you're talking about technology like firewalls, which are supposed to help keep systems safe."

Experts studying the release say the material probably was stolen in October 2013, the date of the last file creation. If that's true, then someone or another spy agency has had time to hack companies using the vulnerable firewalls or watch NSA's own cyber spying.

Past NSA employees, including former contractor Edward Snowden, say it is unlikely that the material was hacked from the agency's servers. It is more likely, some say, that the tools were uploaded and inadvertently left by a TAO hacker on a server used to stage hacks on targets. These servers are sometimes called redirectors or staging servers, and they mask the hacker's true location.

The NSA has always had audit controls on its systems. But particularly in the wake of leaks of classified material by Snowden that began appearing in the media in June 2013, the agency has strengthened its control mechanisms.

UN experts: Extremists foiling governments with encryption

Thursday, 18 August 2016
Byline: Staff report
Section: general
The United Nations - Increasing numbers of foreign fighters for the Islamic State group and al-Qaida are returning home, potentially to carry out attacks, and are using the "dark web" or encrypted messaging that the most sophisticated intelligence agencies can't penetrate, U.N. experts said in a report circulated Wednesday.

The experts monitoring sanctions against the extremist groups said governments highlighted the challenge to national security from the communication methods being used by these "foreign terrorist fighters" and people being radicalized at home who need to be monitored and investigated.

They said the rise in the use of the "dark web" -- a collection of thousands of websites which use tools to maintain anonymity -- and especially encrypted messaging "has closed off the ability of even the most sophisticated agencies to penetrate huge quantities of messages."

The result, the experts said, is that governments are "potentially losing much of their previous technological advantage over terror groups."

Recruiters for the Islamic State group, once they engage potential fighters, also swiftly move them to "closed forums" and guide them toward encrypted messaging systems, the experts said.

The expert panel's report to the Security Council said the threat from al-Qaida, the Islamic State, and their associates "is serious and diversifying," despite military setbacks for Islamic State fighters in Iraq, Syria Afghanistan and Libya.

The Islamic State "demonstrated its ability to conduct complex, multi-stage attacks outside the conflict zone" while at the same time the role of its affiliates in the wider region was elevated, the panel said.

The near-simultaneous attacks conducted by Islamic State operatives in Paris in November 2015 and Brussels in March generated an overwhelming flow of information to command centers which governments described as a deliberate tactic by the extremist group "to make it more difficult to mount coordinated and targeted responses to the most dangerous continuing threats," the experts said.

Al-Qaida and its affiliates also maintained their position in various regions "and also demonstrated an ability to successfully plan and execute significant attacks," the panel said.

The experts said governments estimate that the Islamic State has up to 30,000 fighters in Syria and Iraq.

Significant numbers of IS fighters have been killed as a result of military attacks and the rate of fighters leaving the extremist group has increased, but the panel said governments report that this trend is partially offset by the continued flow of new fighters into Syria and Iraq and by forced recruitment among tribes and the use of child soldiers since 2014.

The panel said the Islamic State group's financial situation has deteriorated since last July, with oil production declining by between 30 and 50 percent as a result of air strike targeting oil infrastructure.

"Consequently oil revenue has fallen by tens of millions of dollars per month," it said.

The group's financial woes have also led to salary cuts for fighters, the panel said, but the Islamic State continues to earn significant revenue from taxation and extortion, the panel said.

According to governments, IS may earn as much as $30 million a month from these methods which include business taxes, fees for electricity and water, rent for seized real estate and customs duties and passage fees.

In a sign of desperation, the panel said that in February IS started to tax the most impoverished civilians in areas under its control who had previously been exempt.

Hacked Attack Code Looks Genuine

Thursday, 18 August 2016
Byline: Robert McMillan

Section: general

New York - Evidence is mounting that a mysterious hacking group claiming to have stolen data from a spying operation linked to the National Security Agency is telling the truth.

Security vendor Kaspersky Labs ZAO, which first identified the NSA-linked operation last year, said files released in the latest hack use an unusual mathematical approach it had seen in that operation's code. Kaspersky dubbed the operation the Equation Group, and said it appeared to be supporting U.S. interests in cyberspace.

The new files were released last weekend by a hacking group calling itself the Shadow Brokers, which claims to have a bigger cache of files it is offering to sell. They appear to be attack code that targets security software on routers that direct computer traffic around the internet.

"This code similarity makes us believe with a high degree of confidence that the tools from the Shadow Brokers leak are related to the malware from the Equation Group," Kaspersky said in a blog post.

Two former NSA employees said the code published by the Shadow Brokers looked authentic.

Security analysts, meanwhile, said several attacks that appear in the files can in fact alter how internet routers handle certain traffic.

None of the code appears to be of the high-value type that could command the millions of dollars that the Shadow Brokers are seeking, said Pedram Amini, chief technology officer of computer-security firm InQuest LLC. He estimated the most significant attacks, targeting products built by Cisco Systems Inc., would fetch "tens of thousands of dollars" in the attack-code market.

On Wednesday, Cisco confirmed that the Shadow Broker code took advantage of a bug in its software that wasn't publicly known, along with a second bug that it had patched in 2011. Fortinet Inc., another router maker identified in the attack code, confirmed that the Shadow Broker code could be used to attack versions of its products that were built in 2012 and earlier.

A third router maker, Juniper Networks Inc. didn't reply to requests for comment.

The developments add to a murky affair. The previously unknown Shadow Brokers released an encrypted version of files that it said contain hacking tools, pledging to disclose the password that would unlock them free to the world if they raised 1 million bitcoins, or close to $600 million, in an online auction.

Nicholas Weaver, a researcher with the International Computer Science Institute who also has examined the files, said they appear to be legitimate NSA attack code that was copied in mid-2013. Some of the files dated months after former NSA contractor Edward Snowden disclosed classified data that he had removed from the NSA.

Mr. Weaver doesn't know who is behind the attacks. Like other U.S. security experts, he said he believes that entities related to the Russian government are likely suspects, amid allegations that Russian hackers had compromised servers belonging to the Democratic National Committee and other organizations.

Susan Hennessey, a Brookings Institution fellow and former lawyer for the NSA, said a nation-state might be involved in the Shadow Brokers breach and might be signaling the U.S. to be careful about accusing foreign countries of cyberattacks. "It also has the significance of potentially warning the United States that attribution is also available against them," she said.

Kaspersky, which didn't explicitly link the Equation Group to the NSA, declined to comment beyond its blog post. The NSA didn't respond to requests for comment on the hacking group's claims, nor did the Shadow Brokers respond to messages.

The Kaspersky analysis sheds some light on the situation, but leaves many unanswered questions, including the identity of the Shadow Brokers and what information the group actually has.

Former NSA employees interviewed by The Wall Street Journal said it is extremely unlikely the attackers were able to access the full catalog of NSA attack code. Some experts, including Mr. Snowden, have said the Shadow Brokers may have accessed a "staging server" that was used for a time by the Equation Group and wasn't properly scrubbed of information.

"NSA malware staging servers getting hacked by a rival is not new," Mr. Snowden said via Twitter on Tuesday. "A rival publicly demonstrating they have done so is."

Cyberespionnage Un oeil pour les espionner tous

Thursday, 18 August 2016
Byline: Pierric Marissal
Section: general
Moscou - Sauron, l'outil de cyberespionnage le plus ingénieux jamais conçu, est actif depuis juin 2011. Son existence vient d'être mise au jour.

Le 30 juillet dernier, le FSB, le service de renseignements de Moscou, a reconnu que pas moins de vingt systèmes informatiques gouvernementaux, militaires et scientifiques russes ont été infiltrés par un cyberespion. Ce programme dont les spécificités ont été publiées mardi dernier est nommé comme le méchant du Seigneur des anneaux, représenté par un menaçant oeil cerclé de flammes : Sauron. Parfaitement camouflé, cet espion a pu se fondre pendant des années - les premières infections découvertes datent de l'été 2011 - au coeur des réseaux les plus stratégiques. Sauron a espionné aussi en Iran et au Rwanda, au sein d'une ambassade à Bruxelles. Touchées aussi, des entreprises de télécommunication et une compagnie aérienne chinoise. « Et on n'a découvert que le sommet de l'iceberg », reconnaissent dans leur rapport les chercheurs de la société de sécurité informatique russe Kaspersky.

Lorsque le cyberespion s'est niché, il se développe et crée son propre écosystème camouflé

« On était vraiment très excités », raconte à l'Humanité Orla Cox, qui dirige le département de recherche en sécurité de Symantec, entreprise qui a débusqué le programme chez l'un de ses clients stratégiques, en octobre dernier. « Ces découvertes-là, on en fait à peine une fois par an. » Une fois repéré, on traite un tel programme informatique comme on le ferait d'un virus

inconnu, dans un laboratoire ultrasécurisé. « On regarde comment le programme se développe dans un environnement fermé, comment il réagit, se protège, et on analyse les lignes de code une à une, explique la chercheuse. On a essayé ensuite de détecter sa signature, le schéma qui fait que Sauron est unique. De manière à le reconnaître sur d'autres machines. » Ces spécialistes de la sécurité informatique disposent d'outils extrêmement précieux : leurs programmes sont installés sur des millions d'ordinateurs dans le monde et composent un maillage dense qui permet de cartographier les réseaux informatiques. Et c'est en scrutant des anomalies comportementales que les analystes dénichent des virus aussi fourbes que Sauron.

On n'a aucune idée de la façon dont ce cyberespion rentre et s'installe dans ces systèmes si protégés. En revanche, lorsqu'il s'est niché, il se développe et crée son propre écosystème camouflé, quasiment indétectable. Il va en premier lieu se développer dans le système d'attribution des mots de passe. Ainsi, sa première tâche est d'envoyer à ses commanditaires tous les codes et les clés de cryptage des systèmes infectés. Pour ne pas être découvert, il se cache très astucieusement. Il se déguise par exemple en requête de nom de domaine (DNS). Lorsqu'on rentre une adresse dans un navigateur, celui-ci envoie au site un message poli : « Bonjour, qui êtes-vous ? Moi je suis le navigateur de X », et si les deux parties se reconnaissent, le navigateur affiche le site. Ces requêtes sont considérées comme sûres et ne sont pas surveillées par les services de sécurité. Sauron a réussi à cacher dans ces messages apparemment anodins les mots de passe et clés de cryptage volés. Les sites en question sont, en apparence, d'innocentes pages Web de fleuristes, de vente de vélos, une cave à vin allemande... Mais les mots de passe arrivent directement chez les commanditaires, qui peuvent désormais prendre la main sur le logiciel Sauron installé dans la machine infectée. Il devient alors la boîte à outils parfaite pour cyberespion. Il peut enregistrer tout ce que les victimes tapent sur leur clavier, faire des captures d'écran, activer les micros et la webcam de l'ordinateur, dérober des pans entiers du disque dur ou tous les messages envoyés et reçus... Des options de sabotage sont peut-être incluses, comme la destruction de fichiers, la modification de certains programmes ou dossiers, la falsification de résultats... Mais les analystes en sécurité interrogés n'ont repéré aucune preuve d'une telle pratique. Selon eux, Sauron ne fait qu'espionner et il est le plus discret possible, ce pourquoi les meilleurs experts ont mis presque cinq ans à repérer sa présence...

Sauron voyage aussi sur des clés USB, où il est quasiment indétectable, même lorsqu'il transporte de grosses quantités de données volées. Lorsqu'il doit envoyer à ses commanditaires, via Internet, tous les documents dérobés, Sauron est capable de simuler une mise à jour générale de Windows ou de tous les antivirus du système informatique pour camoufler le transfert des documents. Symantec et Kaspersky se sont ainsi aperçus que des données ont été volées, cachées derrière l'activité factice de leurs propres logiciels de sécurité.

Sauron a de solides liens de parenté avec de précédents programmes espions comme Flame

Pour les chercheurs, pas de doutes possibles : au moins un État est derrière ce programme. Selon Orla Cox, il faut au moins cinquante ingénieurs et hackers chevronnés pour le faire fonctionner. Cela représente des moyens colossaux. Et comme aucune pratique mafieuse n'a été dénichée, les chercheurs excluent sans hésitation l'implication d'une entreprise criminelle. De plus, Sauron a de solides liens de parenté avec de précédents programmes espions comme Flame, un peu moins sophistiqué, qui a infecté des structures stratégique au Moyen-Orient, particulièrement en Palestine, en Iran ou au Liban. Pour Orla Cox, il y a de fortes probabilités pour que les auteurs soient les mêmes. Mais Symantec se refuse à avancer une quelconque hypothèse sur le ou les pays derrière ce cyberespionnage. En cherchant des indices,

Kaspersky a par exemple repéré des mots en italien à l'intérieur du code, de même que plusieurs notes en alphabet non latin. Mais dans leur rapport, les chercheurs russes restent prudents : « Tout indice trouvé dans un programme aussi sophistiqué est certainement un écran de fumée. »

8. Le Monde

La Chine prend de l'avance dans le cryptage des communications

Thursday, 18 August 2016
Byline: Harold Thibault avec David Larousserie
Section: general
Pékin - L'envoi réussi d'un satellite " quantique " permettra à Pékin de tester une technologie destinée à un usage commercial et militaire

La Chine a pris une longueur d'avance dans la maîtrise des technologies de cryptage en lançant, mardi 16 août, un satellite de communication quantique. Pékin se démarque ainsi en mettant à l'essai, au niveau spatial, une technique de transmission de clés d'encodage réputée inviolable, fondée sur les lois de la physique quantique. Le projet est suivi de près par les physiciens mais aussi par les militaires.

Une fusée Longue Marche 2-D tirée mardi à 1 h 40 de la base de Jiuquan, dans le désert de Gobi, a placé en orbite un satellite d'expérimentation quantique à échelle spatiale (Quess, selon l'acronyme anglais). Egalement surnommé Mozi, du nom du philosophe et scientifique chinois du Ve siècle avant J.-C., il permettra, sur une mission de deux ans, de tester l'envoi de clés hypersécurisées.

" De tels moyens en disent long sur les ambitions de la Chine. Elle n'hésite pas à investir des sommes colossales dans ces recherches ", commente Hoi Kwong Lo, chercheur en cryptographie quantique à l'université de Toronto (Canada). La recherche quantique est l'une des priorités du treizième plan quinquennal, feuille de route présentée en mars et qui guidera l'économie chinoise jusqu'à la fin 2020.

Clés de chiffrement De son côté, le Conseil national américain des sciences et technologies note dans un rapport rendu public le 26 juillet que si les Etats-Unis dépensent actuellement 200 millions de dollars (177 millions d'euros) par an dans ce domaine de recherche, leur rythme de progression dans le -domaine de l'information quantique a souffert de " l'instabilité " des financements.

Le protocole du satellite chinois utilise des propriétés quantiques des photons qui peuvent être corrélés de telle manière que modifier l'un modifie immédiatement son jumeau, trahissant donc une intervention non désirée.

Si les signaux transitant entre le satellite et la Terre sont interceptés par un espion, la source s'en rendra compte immédiatement et n'utilisera pas les informations envoyées. Des clés de chiffrement de messages pourront ainsi être transmises sans risque, assurant la sécurité des communications. Derrière ce projet se trouve un scientifique chinois, Pan Jianwei. A la fin des années 1990, M. Pan a effectué sa thèse à l'université de Vienne, sous la direction d'un

chercheur en physique quantique, Anton Zeilinger. Ce dernier raconte avoir demandé un peu plus tard à l'Union européenne (UE) d'appuyer un programme de développement d'un satellite quantique sans jamais avoir obtenu les financements.

De leur côté, les Chinois ont perçu les applications stratégiques d'une telle technologie, y voyant un intérêt national. M. Pan, devenu vice-président de l'Université chinoise des sciences et technologies, a pris, en 2011, la tête de ce nouveau programme.

" Beaucoup de gens pensent que les communications quantiques joueront un rôle, notamment, dans le futur d'Internet. C'est à double usage, on pourra aussi bien crypter une communication militaire que commerciale, ce ne sera qu'une question d'applications ", résume par téléphone le professeur Zeilinger, qui assiste Pan Jianwei sur le projet chinois et était présent lors du lancement de la fusée.

" Usage à l'échelle planétaire "En mai, M. Pan se référait aux fuites de dossiers de l'Agence nationale de sécurité (NSA) américaine pour justifier le développement par la Chine de nouvelles technologies de cryptage. " Le cas Edward Snowden nous a appris que, dans les réseaux de transmission, l'information est exposée au risque d'être surveillée et attaquée par des hackers ", déclarait-il à la presse officielle. La Chine testera d'abord des communications sécurisées entre Pékin et Urumqi, grande ville de l'ouest du pays distante de 2 400 kilomètres, puis entre la capitale chinoise et celle de l'Autriche.

La technologie de cryptage quantique est déjà utilisée au sol, par exemple à l'essai entre des banques reliées par fibre optique, mais sur des distances très limitées. " On sait depuis plusieurs années faire du cryptage quantique dans une même ville, mais pas entre des régions éloignées. L'emploi du satellite permet d'envisager un usage à l'échelle planétaire ", résume Alexander Ling, professeur au Centre de technologies quantiques de l'université de Singapour.

Le président chinois, Xi Jinping, avait regretté en mai la " faiblesse " de son pays, " toujours sous le contrôle d'autres pour ce qui est des technologies fondamentales dans les secteurs clés " . Il avait détaillé les objectifs fixés par l'Etat : s'imposer comme " l'un des pays les plus innovants en 2020 " puis comme une puissance technologique incontournable en 2049, pour le centième anniversaire de la fondation de la République populaire.

9. The Australian

National Security must come firm in any China deal

Thursday, 18 August 2016
Byline: Greg Sheridan
Section: column
The Turnbull government made exactly the right decision in rejecting proposed Chinese bids for majority ownership of the NSW poles and wires company Ausgrid, and it did so in substantially the right way. There is no reputational damage to Australia in this at all.

Most, not all, of the criticism of both the decision and the process has been wildly overblown and demonstrates a lack of understanding of the national security issues involved or the reality of Chinese foreign investments and strategic policy. There are three positions open to a

government. Either the Chinese can invest in any Australian infrastructure, in which case our national security would be hopelessly compromised. Or they can invest in no Australian infrastructure. This would be a very controversial and discriminatory policy, hard to justify and cost some otherwise welcome investment.

Or there is reality, that difficult and sensitive cases must be exhaustively evaluated case by case.

The Ausgrid rejection by Scott Morrison was on national security grounds. This was the unanimous recommendation of every relevant national security agency and the unanimous view of every member of the Foreign Investment Review Board. Calls for greater transparency are utterly ridiculous. Name the nation that publishes the most sensitive vulnerabilities and secrets of its critical national infrastructure.

After the disastrous Port of Darwin sale to a Chinese company, the Turnbull government, in consultation with the states, and with their full agreement, amended the relevant regulations so all state and territory sales of critical infrastructure to foreign entities will be reviewed by FIRB.

It is absolutely right that the government, not some notionally apolitical bureaucracy, makes the final decision. It is the government that has the political authority, and the constitutional and democratic requirement, to safeguard Australian national security.

But each piece of infrastructure is different -- indeed, each is unique -- and each bid is different. Australia welcomes foreign investment, including Chinese investment. The overwhelming majority of Chinese investment applications have been approved by FIRB. By any Asian standard, Australia has a remarkably liberal and welcoming approach to foreign investment.

That does not mean we have given up our sovereignty and, unique among the nations of the world, cannot exercise it over any particular proposed foreign investment. So the question of, say, a Chinese company buying Australian farmland is more a political than a security question. But it is perfectly legitimate for a government to take a political view of that.

At the other end of the scale is Chinese investment in our telecommunications network. That would be unlikely to be approved. Power companies lie somewhere in the middle. When a proposed sale is reviewed, the government asks the security agencies a lot of technical questions. What harm, if it wanted to do harm, could the Chinese investment facilitate? How important and sensitive is the infrastructure involved? Are there thresholds of potential influence, or information, that a controlling investment would yield as opposed to a passive investment?

All of these questions can be answered in each specific case only in response to a specific bid. They cannot be meaningfully addressed in a policy paper, a grand vision statement or even a treaty unless Australia decides to strip itself of the normal powers of sovereignty, which may please the Chinese but is a perverse action for us to take.

There are a few points of context to bear in mind. It is no longer a crucial distinction, if it ever was, between a Chinese state-owned company and simply a Chinese company based in China. The former Labor government banned Huawei from involvement in the National Broadband Network even though Huawei is not government owned. The intelligence and analytical

agencies of every significant Western and Asian nation all conclude that, in the end, when push comes to shove, a Chinese company will do as its government tells it to.

For the first time in our history, we have a big foreign investor who is not an ally or a broadly strategically aligned power. National security agencies have to look at credible worst-case scenarios. Rejecting a proposed investment does not mean the government has decided the proposed investor is a bad actor. Rather, it is just saying the overall risk is unacceptable.

The second point of context is that you cannot possibly ignore Beijing's appalling behaviour over the past half decade and more, and this is not solely, or even in a sense mainly, about the South China Sea. Although they won't say this publicly, the security agencies are aware that the biggest source of hostile cyber intrusions against Australia is China. The Americans have made this case at length in public and in detail. The Chinese are also the most active foreign espionage power in Australia. Good China policy requires balance. We welcome China's economic development and take every opportunity for co- operation. But we don't abdicate our responsibility for our own national security.

The Australian National University's Peter Drysdale has co- authored a pretty useless paper with a lot of silly recommendations that would cede a lot of Australian power to China in the guise of promoting greater co-operation. Drysdale, and his long-term friend and collaborator Ross Garnaut (not involved in this paper), have made big contributions to Australian policy over the years, but they have been very poor guides on China policy for many years now.

In 2009 the Chinese state-owned Chinalco bid for a huge stake in Rio Tinto fell over as it became clear the Australian government was very reluctant about it. Drysdale wrote in The Australian Financial Review that "our policymakers looked like a bunch of stumblebums ... opposition leaders (Malcolm Turnbull, Peter Costello, Joe Hockey) performed like a bunch of clowns" and so on. He went on to rhapsodise that among the official Chinese, "There is generosity (to Australia) to a fault, about what failings we might have ... Above all, there is a genuine warmness towards Australia." Shortly after this column the Chinese arrested Stern Hu, a senior Australian Rio Tinto executive in China whose life of alleged corruption had apparently gone unnoticed until the Chinalco bid fell over. More recently Chinese state-owned media have been threatening to shoot our planes out of the sky in the South China Sea. I'd hate to see what Drysdale would regard as coolness towards Australia. In any event we would be ill advised to take his advice or that of a document that advances Chinese strategic interests while being disguised as an economic study.Australian leaders since Bob Hawke have handled China policy exceptionally well. This may become harder in the future, but there is no case at all for sacrificing our national security interests.

Privatization Of Internet Governance Begins Oct. 1

Wednesday, 17 August 2016
Byline: John D. McKinnon
Section: general

Washington - The Obama administration said Tuesday it will formally shift authority for much of the internet's governance to a nonprofit multi- stakeholder entity on Oct. 1, a move likely to spark a backlash from some in Congress.

The administration regards the move as necessary to maintain international support for the internet and prevent a fracturing of its governance. They say transferring authority for the internet's domain-name system from the U.S. government to the Internet Corporation for Assigned Names and Numbers will have no practical effect on the internet's functioning or its users.

But the move is likely to stir concerns among conservative Republicans, who say it could endanger national security. As recently as Friday, Sens. Ted Cruz (R., Texas) and Mike Lee (R., Utah) and Rep. Sean Duffy (R., Wis.) sent a letter to the administration, complaining again of its "planned internet giveaway." Lawmakers have adopted budget restrictions in recent years to try to stave off the move. But restrictions expire Sept. 30, giving lawmakers little time to act if they want to block the executive action.

The administration in March 2014 announced its intent to wind down the U.S.'s stewardship role when it comes to the domain-name system and relinquish control to Icann, which manages technical functions that help computers locate servers and websites.

11. New York Times

'Shadow Brokers' Leak Raises Alarming Question: Was the N.S.A. Hacked?

Wednesday, 17 August 2016
Byline: David E. Sanger
Section: general
Washington - The release on websites this week of what appears to be top-secret computer code that the National Security Agency has used to break into the networks of foreign governments and other espionage targets has caused deep concern inside American intelligence agencies, raising the question of whether America's own elite operatives have been hacked and their methods revealed.

Most outside experts who examined the posts, by a group calling itself the Shadow Brokers, said they contained what appeared to be genuine samples of the code -- though somewhat outdated -- used in the production of the N.S.A.'s custom-built malware.

Most of the code was designed to break through network firewalls and get inside the computer systems of competitors like Russia, China and Iran. That, in turn, allows the N.S.A. to place "implants" in the system, which can lurk unseen for years and be used to monitor network traffic or enable a debilitating computer attack.

According to these experts, the coding resembled a series of "products" developed inside the N.S.A.'s highly classified Tailored Access Operations unit, some of which were described in general terms in documents stolen three years ago by Edward J. Snowden, the former N.S.A. contractor now living in Russia.

But the code does not appear to have come from Mr. Snowden's archive, which was mostly composed of PowerPoint files and other documents that described N.S.A. programs. The documents released by Mr. Snowden and his associates contained no actual source code used to break into the networks of foreign powers.

Whoever obtained the source code apparently broke into either the top-secret, highly compartmentalized computer servers of the N.S.A. or other servers around the world that the agency would have used to store the files. The code that was published on Monday dates to mid-2013, when, after Mr. Snowden's disclosures, the agency shuttered many of its existing servers and moved code to new ones as a security measure.

By midday Tuesday Mr. Snowden himself, in a Twitter message from his exile in Moscow, declared that "circumstantial evidence and conventional wisdom indicates Russian responsibility" for publication, which he interpreted as a warning shot to the American government in case it was thinking of imposing sanctions against Russia in the cybertheft of documents from the Democratic National Committee.

"Why did they do it?" Mr. Snowden asked. "No one knows, but I suspect this is more diplomacy than intelligence, related to the escalation around the DNC hack."

Around the same time, WikiLeaks declared that it had a full set of the files -- it did not say how it had obtained them -- and would release them all in the future. The "Shadow Brokers" had said they would auction them off to the highest bidder.

"I think it's Snowden-era stuff, repackaged for resale now," said James A. Lewis, a computer expert at the Center for Strategic and International Studies, a Washington think tank. "This is probably some Russian mind game, down to the bogus accent" of some of the messages sent to media organizations by the Shadow Brokers group, delivered in broken English that seemed right out of a bad spy movie.

The N.S.A. would say nothing on Tuesday about whether the coding released was real or where it came from. Its public affairs office did not respond to inquiries.

"It certainly feels all real," said Bruce Schneier, a leading authority on state-sponsored breaches. "The question is why would someone steal it in 2013 and release it this week? That's what is making people think this is likely the work of Russian intelligence."

There are other theories, including one that some unknown group was trying to impersonate hackers working for Russian or other intelligence agencies. Impersonation is relatively easy on the internet, and it could take considerable time to determine who is behind the release of the code.

The Shadow Brokers first emerged online on Saturday, creating accounts on sites like Twitter and Tumblr and announcing plans for an auction. The group said that "we give you some Equation Group files free" and that it would auction the best ones. The Equation Group is a code name that Kaspersky Labs, a Russian cybersecurity firm, has given to the N.S.A.

While still widely considered the most talented group of state- sponsored hackers in the world, the N.S.A. is still recovering from Mr. Snowden's disclosures; it has spent hundreds of millions of dollars reconfiguring and locking down its systems.

Mr. Snowden revealed plans, code names and some operations, including against targets like China. The Shadow Brokers disclosures are much more detailed, the actual code and instructions for breaking into foreign systems as of three summers ago.

"From an operational standpoint, this is not a catastrophic leak," Nicholas Weaver, a researcher at the International Computer Science Institute in Berkeley, Calif., wrote on the Lawfare blog on Tuesday.

But he added that "the big picture is a far scarier one." In the weeks after Mr. Snowden fled Hawaii, landing in Hong Kong before ultimately going to Russia, it appears that someone obtained that source code. That, he suggested, would be an even bigger security breach for the N.S.A. than Mr. Snowden's departure with his trove of files.

However, the fact that the code is dated from 2013 suggests that the hackers' access was cut off around then, perhaps because the agency imposed new security measures.

The attack on the Democratic National Committee has raised questions about whether the Russian government is trying to influence the American election. If so, it is unclear how -- or whether -- President Obama will respond. A response could be public or private, and it could involve sanctions, diplomatic warnings or even a counterattack.

"The real problem for us is that the Russians seem to have taken the gloves off in the cyberdomain," said Mr. Lewis, of the Center for Strategic and International Studies, "and we don't know how to respond."

Powerful NSA hacking tools have been revealed online

Wednesday, 17 August 2016
Byline: Ellen Nakashima
Section: general
Washington - Some of the most powerful espionage tools created by the National Security Agency's elite group of hackers have been revealed in recent days, a development that could pose severe consequences for the spy agency's operations and the security of government and corporate computers.

A cache of hacking tools with code names such as Epicbanana, Buzzdirection and Egregiousblunder appeared mysteriously online over the weekend, setting the security world abuzz with speculation over whether the material was legitimate.

The file appeared to be real, according to former NSA personnel who worked in the agency's hacking division, known as Tailored Access Operations (TAO).

"Without a doubt, they're the keys to the kingdom," said one former TAO employee, who spoke on the condition of anonymity to discuss sensitive internal operations. "The stuff you're talking

about would undermine the security of a lot of major government and corporate networks both here and abroad."

Said a second former TAO hacker who saw the file: "From what I saw, there was no doubt in my mind that it was legitimate."

The file contained 300 megabytes of information, including several "exploits," or tools for taking control of firewalls in order to control a network, and a number of implants that might, for instance, exfiltrate or modify information.

The exploits are not run-of-the-mill tools to target everyday individuals. They are expensive software used to take over firewalls, such as Cisco and Fortinet, that are used "in the largest and most critical commercial, educational and government agencies around the world," said Blake Darche, another former TAO operator and now head of security research at Area 1 Security.

The software apparently dates back to 2013 and appears to have been taken then, experts said, citing file creation dates, among other things.

"What's clear is that these are highly sophisticated and authentic hacking tools," said Oren Falkowitz, chief executive of Area 1 Security and another former TAO employee.

Several of the exploits were pieces of computer code that took advantage of "zero-day" or previously unknown flaws or vulnerabilities in firewalls, which appear to be unfixed to this day, said one of the former hackers.

The disclosure of the file means that at least one other party -- possibly another country's spy agency -- has had access to the same hacking tools used by the NSA and could deploy them against organizations that are using vulnerable routers and firewalls. It might also see what the NSA is targeting and spying on. And now that the tools are public, as long as the flaws remain unpatched, other hackers can take advantage of them, too.

The NSA did not respond to requests for comment.

"Faking this information would be monumentally difficult, there is just such a sheer volume of meaningful stuff," Nicholas Weaver, a computer security researcher at the University of California at Berkeley, said in an interview. "Much of this code should never leave the NSA."

The tools were posted by a group calling itself the Shadow Brokers using file-sharing sites such as BitTorrent and DropBox.

As is typical in such cases, the true identity of whoever put the tools online remains hidden. Attached to the cache was an "auction" note that purported to be selling a second set of tools to the highest bidder: "!!! Attention government sponsors of cyber warfare and those who profit from it !!!! How much you pay for enemies cyber weapons?"

The group also said that if the auction raised 1 million bitcoins -- equivalent to roughly $500 million -- it would release the second file to the world.

The auction "is a joke," Weaver said. "It's designed to distract. It's total nonsense." He said that "bitcoin is so traceable that a Doctor Evil scheme of laundering $1 million, let alone $500 million, is frankly lunacy."

One of the former TAO operators said he suspected that whoever found the tools doesn't have everything. "The stuff they have there is super-duper interesting, but it is by far not the most interesting stuff in the tool set," he said. "If you had the rest of it, you'd be leading off with that, because you'd be commanding a much higher rate."

TAO, a secretive unit that helped craft the digital weapon known as Stuxnet, has grown in the past decade or so from several hundred to more than 2,000 personnel at the NSA's Fort Meade, Md., headquarters. The group dates to the early 1990s. Its moniker, Tailored Access Organization, suggests a precision of technique that some officials have likened to brain surgery. Its name also reflects how coding whizzes create exquisite tools from scratch, in the same way a fine tailor takes a bolt of wool and fashions a bespoke suit -- only the computer geeks more often work in jeans and T-shirts and "have epic Nerf gun fights," as one former hacker said.

Some former agency employees suspect that the leak was the result of a mistake by an NSA operator, rather than a successful hack by a foreign government of the agency's infrastructure.

When NSA personnel hack foreign computers, they don't move directly from their own covert systems to the targets', fearing that the attack would be too easy to trace. They use a form of proxy server called a "redirector" that masks the hackers' origin. They use one or more such servers to make it difficult to trace a hack.

"NSA is often lurking undetected for years on the .?.?. [proxy hops] of state hackers," former agency contractor Edward Snowden tweeted Tuesday. "This is how we follow their operations."

At the same time, other spy services, like Russia's, are doing the same thing to the United States.

It is not unprecedented for a TAO operator to accidentally upload a large file of tools to a redirector, one of the former employees said. "What's unprecedented is to not realize you made a mistake," he said. "You would recognize, 'Oops, I uploaded that set' and delete it."

Critics of the NSA have suspected that the agency, when it discovers a software vulnerability, frequently does not disclose it, thereby putting at risk the cybersecurity of anyone using that product. The file disclosure shows why it's important to tell software-makers when flaws are detected, rather than keeping them secret, one of the former agency employees said, because now the information is public, available for anyone to employ to hack widely used Internet infrastructure.

Snowden, Weaver and some of the former NSA hackers say they suspect Russian involvement in the release of the cache, though no one has offered hard evidence. They say the timing -- in the wake of high-profile disclosures of Russian government hacking of the Democratic National Committee and the Democratic Congressional Campaign Committee -- is notable.

The Russians are also suspected of involvement in the release of hacked DNC emails and of the private email addresses and personal cellphone numbers of Democratic lawmakers that

were taken from DCCC computers. Those moves have caused great consternation among party officials and dread that more is to come.

Tweeted Snowden: "Circumstantial evidence and conventional wisdom indicates Russian responsibility." He said that the disclosure "is likely a warning that someone can prove U.S. responsibility for any attacks that originated from this" redirector or malware server by linking it to the NSA.

"This could have significant foreign policy consequences," he said in another tweet. "Particularly if any of those operations targeted U.S. allies" or their elections.

"Accordingly," he tweeted, "this may be an effort to influence the calculus of decision-makers wondering how sharply to respond to the DNC hacks."

In other words, he tweeted, it looks like "somebody sending a message" that retaliating against Russia for its hacks of the political organizations "could get messy fast."

Fighting crime in the digital age

Wednesday, 17 August 2016
Byline: Adam Belsher
Section: oped
Op-ed - This week, top police officials from coast to coast have descended on our nation's capital for the 111th annual Canadian Association of Chiefs of Police conference. The topic that will shape their discussion, Public Safety in a Digital Age: Real Victims - Real Crime, is timely, given that we're at an important societal juncture.

So much of our daily lives now take place online: our wealth passes through jurisdictions in the form of ones and zeros; the most intimate details of our lives, whether they are held by government or industry, rest on servers located somewhere around the globe; and our critical infrastructure, whether it is managed by the public or private sector, is operated digitally.

Given the recent media coverage of data breaches and many people's personal experiences with fraudulent phishing schemes, it's understandable that we, as consumers and citizens, want to erect the highest walls possible around our valuable digital assets. This is a natural human reaction, but it isn't a realistic societal response, given the magnitude of our online world. Consider some facts. Ninety per cent of the data that has ever been created has been produced in the past two years. Every minute, 300 hours of video are uploaded to YouTube. Current prototypes of driverless cars generate a gigabyte of data a second. This year alone, 1.4 billion smartphones will be shipped. In the next five years, it is estimated that there will be 50 billion connected devices worldwide. And these are conservative estimates, given the exponential innovation we've seen in the field of information technology in recent years.

Securing ourselves and our digital assets on our own is not feasible. We cannot create a zero-risk digital environment. The statistics underscore this. In Stats-Can's last national analysis on

crime, it reported that the overall crime rate is down to its lowest point since 1998. However, three areas of crime have increased significantly: fraud, child exploitation and terrorism.

What ties these together is the fact that they are crimes that are enabled by our digital connectivity and how hard it is for police agencies to deter and investigate these felonies, because technology allows the perpetrators to conduct their crimes with relative anonymity. But that has not deterred police forces throughout the country from trying to tackle these issues - especially in the case of child sexual exploitation, which is one of the most heinous crimes imaginable.

Last year, a number of federal, provincial and municipal agencies worked together to apprehend 41 Canadian suspects involved in a child pornography ring. In that case, there were allegedly 7,500 unique IP addresses in 100 countries used to create and trade the content. There was 1.2 petabytes of digital evidence. For context, that's the equivalent of 22 million four-drawer filing cabinets filled with documents, or 13 years of high-definition video. Most importantly, there were 19 children, whose ages ranged from nine to 15, who were being exploited.

Due to the intensive resource requirements needed to overcome the technological and legal complexities they encounter while investigating and prosecuting such cases, police agencies get to pursue only one such multi-jurisdictional child exploitation case every year. This means that many perpetrators remain free to continue exploiting children.

If we as a society are to curb these heinous crimes, and other emerging areas of crimes enabled by the Internet, building digital walls, such as end-to-end encryption, will not suffice. We must rally around our police organizations and their leaders, so they can modernize, in order to effectively fight crime in the 21st century.

This is not only about providing more resources to our police agencies. It will also require our political leaders to work with chiefs of police to change the laws surrounding evidence, jurisdictional responsibility and information sharing. Many of these laws were written before evidence resided in a virtual cloud and criminals could cross borders at the speed of light.

Information technology companies also have an important role to play. Their social licence to operate will depend, in part, on the principles by which they support police agencies' efforts to maintain a just and secure society in the digital age.

This does not mean they should give the police unfettered access to Canadians' data. It means they should establish the principles under which they will work constructively with law enforcement and under what circumstances they won't.

The digital age has shifted how we do business and socially connect here in Canada and around the world. This has largely been to the benefit of mankind. However, these technological advancements have empowered unscrupulous, technologically savvy criminals. It's time we get behind our law-enforcement agencies and give them the ability to tackle these real crimes and help real victims.

Adam Belsher is CEO of Magnet Forensics, a software company headquartered in Waterloo, Ont., that supports more than 3,000 police, national security and other agencies with investigative authorities in 93 countries by developing evidencemanagement tools.

Hackers Claim to Hit NSA-Linked Super-Cyberespionage Group

Tuesday, 16 August 2016
Byline: Lee Ferran
Section: general

New York - A group of mysterious hackers recently claimed to have broken into the systems of another hacking group with suspected links to the National Security Agency, and the attackers are now attempting to auction off the cyber superweapons they said they found.

Cybersecurity experts were abuzz Monday after a group calling itself the Shadow Brokers claimed in stilted English in messages online to have hacked the Equation Group. The Equation Group was revealed last February to be an extremely high-level veteran hacking squad with "solid links" to the creators of the cyber superweapon Stuxnet, which was reportedly used in a joint NSA-Israeli intelligence operation that targeted an Iranian nuclear facility.

"How much you pay for enemies cyber weapons?" says one of the messages purportedly from the Shadow Brokers. "You see pictures. We give you some Equation Group files free, you see. This is good proof, no? You enjoy!!!"

The hackers said that they are auctioning off the best cybertools -- "better than Stuxnet" -- to the highest bidder and that if the auction raises a total of more than 1 million bitcoins -- worth more than $560 million -- they will dump more Equation Group files online to the public.

Cybersecurity experts were initially split on whether the hack was legitimate, but after initial analysis of some teaser code released by the Shadow Brokers, some have come to the conclusion that at least those tools appear to be real.

"The level that a nation-state would have to go through to fake this stuff would be like nothing we've seen before and highly unlikely," said one cybersecurity expert, who requested he not be identified because of the sensitivity of the subject.

The U.S.-based cybersecurity firm Symantec wrote today in a blog post, "It will take some time to assess all of the released files. However, early indications are that at least some of the tools released are functioning exploits."

The question remains if the tools yet to be seen are real and if they were stolen from an American intelligence agency -- presumably the NSA or its partner hacking organization U.S. Cyber Command -- a contractor, an allied intelligence agency or someone else, though some file names match the names of NSA operations revealed by former NSA contractor Edward Snowden. Four cybersecurity experts, including a U.S. official, told ABC News that from time to time the NSA outsources the development of cyberespionage tools to private contractors.

Snowden weighed in on the purported hack today on Twitter, saying that apparently an NSA "malware staging server" -- essentially a holding pen for cyberweapons -- had been breached. He suggested that someone, possibly Russian hacking teams, had been sitting on the server for a long time, collecting intelligence and stealing code.

"NSA's hackers (TAO) are told not to leave their hack tools ("binaries") on the the server after an op. But people get lazy," Snowden wrote. TAO refers to the NSA's elite offensive hacking squad, Tailored Access Operations.

Like some others who analyzed the teaser code, Snowden noted that the date references appear to end in 2013, the same year he walked out of the NSA with a huge cache of data on NSA operations so he could expose what he believed were illegal or unconstitutional surveillance programs. He said that's no coincidence; the NSA would have "migrated offensive operations to new servers as a precaution" and unknowingly cut off the mysterious hackers' access.

"You're welcome, @NSAGov. Lots of love," Snowden tweeted.

The Shadow Brokers claimed in their posting that the group "followed" Equation Group traffic, found its "source range" and then hacked it, finding "many many Equation Group cyber weapons."

The NSA did not respond to ABC News' requests for comment for this report. Dick Clarke -- a former White House counterterrorism adviser, a cybersecurity expert and an ABC News consultant -- said, "You can bet the NSA is trying to figure out whether or not this is legitimate."

According to the Russian-based Kaspersky Lab's profile, the Equation Group may have been born as far back as the mid-1990s and was found to have "solid links" indicating it was connected to the hacking team that created the Stuxnet worm that attacked and physically damaged the Iranian nuclear facility before Stuxnet's discovery in 2010. The New York Times reported that the NSA was deeply involved in the creation and deployment of Stuxnet, an unprecedented cyberweapon.

Kaspersky did not directly connect Equation Group with any government organization, but it noted that attacks from the Equation Group have focused on Iran, Russia, Pakistan, Afghanistan and others including China. The same targets would presumably be at the top of a list of U.S. intelligence priorities.

"[The Equation Group] is unique almost in every aspect of their activities: They use tools that are very complicated and expensive to develop, in order to infect victims, retrieve data and hide activity in an outstandingly professional way, and utilize classic spying techniques to deliver malicious payloads to the victims," said a Kaspersky online post in February 2015.

Representatives for the White House National Security Council declined to comment on specific cases and declined to elaborate on what actions, if any, the U.S. government would take to inform private companies about potential vulnerabilities in their systems that may be revealed to any number of malicious actors, should the hack and the auction prove real. In 2014 the White House laid out its criteria for when the U.S. government will alert private companies about vulnerabilities in their systems and when it will keep quiet about those vulnerabilities in order for U.S. intelligence to exploit them.

The Shadow Brokers' auction for the cyberweapons got off to a slow start and, as of this report, has received 13 bids, topping out at just under $1,000.

Haj security alert for organisers

Wednesday, 17 August 2016
Byline: Haneen Dajani
Section: general

Abu Dhabi - Haj pilgrims should be made aware of safety precautions to avoid becoming victims of crime or stampedes, authorities have warned. This year almost 5,000 people from the UAE have been issued permits to attend the pilgrimage in Saudi Arabia.

At a meeting for Haj mission organisers on Tuesday, officials from the General Authority of Islamic Affairs & Endowments (Awqaf) reminded attendees that it was their duty to ensure the safety of pilgrims under their command. "It is inevitable that we should be on security alert more than usual," said Dr Mohammed Al Kaabi, general director of Awqaf.

He said the heads of missions should pass on security advice to pilgrims. "The UAE is targeted by [some] pilgrims and other concerned parties, so by all means you should sense security issues and educate pilgrims on these issues," he said. "Don't let them act randomly, you should coordinate with them."

He instructed the organisers to monitor the entrances to their pilgrims' camps, not allowing anyone without a UAE Haj permit to enter. Pilgrims should also be told that they are not allowed to let strangers or non-UAE-based pilgrims inside their tents. "This is also to avoid congestion inside the tents," said Mr Al Kaabi.

There will be electronic scanners on entry to the camps, which will display the pilgrims' details, tent and bed number.

The Emirates Identity Authority has provided Awqaf with 200 electronic ID readers for this year's Haj. He said that pilgrims should be made aware of the location of the UAE's official mission headquarters in Mecca, Mina, Muzdalifa and Arafat - the locations of the Haj.

At last year's Haj, hundreds of pilgrims were killed in a stampede in Mina in which crowds were crushed into a bottleneck. Mr Al Kaabi said the UAE mission heads were able to handle the situation "with great expertise" as they congregated all the pilgrims in a place away from the crush, thus preventing any injuries.

He stressed that mission heads should keep all their clients' passports with them in a safe place, so they do not get lost or stolen if left with the pilgrims. "Instruct them to keep copies of their ID cards and passports with them for emergencies."

Captain Mohammed Al Naqbi, a border official from the Ministry of Interior, said pilgrims should try to avoid crowded areas for security reasons. "Their permit must always be with them, because it is a must to enter Mina (and other Haj locations), to avoid delaying procedures."

The UAE's 4,982 pilgrims have been allocated special airport entry checkpoints in Saudi Arabia to avoid getting stuck in long queues, he said. "We already prepared our borders and added more staff members and counters for pilgrims."

He reminded the audience that Saudi Arabia, like many other countries, will not allow anyone with less than six months passport validity to enter. "So everyone should double check their passports beforehand," he said.

Omran Khamis, general manager of the Al Ghoroob Haj agency, said every year they faced problems when trying to leave Arafat to go to Muzdalifa. "Last year we were standing in the queue, but the police let pilgrims who were staying on the streets pass first," he said. "So you could send an official letter to the police informing them that we should be given priority, because they follow orders."

Another problem was women's accommodation in Mina and Arafat. The Awqaf said this problem would be solved this year, because each mission manager will be in charge of big camp for all his pilgrims with enough sofa beds and facilities in advance. "So each owner will have the keys and run his tent by himself."

Cybersécurité au Canada L'accès légal aux mots de passe réclamé par la police

Wednesday, 17 August 2016
Byline: Jim Bronskill
Section: general
Ottawa - Les chefs de police canadiens réclament une loi pour contraindre les gens à révéler leurs mots de passe aux forces de l'ordre s'ils ont obtenu l'approbation d'un juge.

L'Association canadienne des chefs de police (ACCP) a adopté une résolution incitant le gouvernement à prendre des mesures législatives pour faciliter l'obtention de preuves électroniques. L'ACCP estime que les criminels ont de plus en plus recours au chiffrement pour dissimuler leurs activités illicites en ligne.

Le commissaire adjoint de la Gendarmerie royale du Canada (GRC), Joe Oliver, a déclaré qu'aucune loi canadienne ne contraignait actuellement le détenteur d'un mot de passe à le révéler aux policiers dans le cadre d'une enquête.

Lors d'une conférence de presse mardi, M. Oliver a soutenu que les criminels, qu'ils soient membres de la mafia ou pédophiles, bénéficient d'un anonymat quasi absolu grâce à des outils en ligne qui camouflent leur identité de même que leurs communications.

«Les victimes dans l'espace numérique sont réelles, a rappelé M. Oliver. Les lois du Canada et sa capacité à maintenir l'ordre doivent suivre le rythme de l'évolution technologique.»

Début des consultations

Cette résolution de l'ACCP survient alors que le gouvernement fédéral entame ses consultations en matière de cybersécurité, notamment par rapport à l'équilibre entre les besoins des policiers et les libertés fondamentales. Ces consultations se poursuivront jusqu'au 15 octobre.

Au cours des dernières années, les demandes de policiers quant à l'accès aux communications en ligne ont attisé les tensions entre les autorités et les défenseurs des libertés civiles préoccupés par le droit à la vie privée.

L'enjeu a ressurgi, l'an dernier, lorsque le bureau fédéral d'enquête des États-Unis (FBI) est allé devant la cour pour obtenir le mot de passe du cellulaire d'un présumé terroriste, dans la foulée de la tuerie de San Bernardino, en Californie.

Le commissaire adjoint Joe Oliver affirme que les policiers du pays cherchent à obtenir plus aisément des informations de base sur les abonnés de services de télécommunications, dont leur nom et leur adresse, pour démarrer les enquêtes.

Autorisation d'un juge nécessaire

En juin 2014, la Cour suprême du Canada a statué que l'autorisation d'un juge est nécessaire à l'obtention de données personnelles auprès d'un fournisseur Internet.

Le plus haut tribunal au pays a rejeté l'idée que la loi fédérale sur la vie privée permettait aux entreprises de révéler, de leur propre chef, des informations relatives à l'identité de leurs clients.

Les policiers soutiennent que les entreprises de télécommunications ainsi que d'autres fournisseurs de services, telles les banques ou les agences de location, exigent dorénavant un mandat de perquisition pour pratiquement toutes les demandes d'informations de base sur une personne.

La Chine s'offre un satellite « quantique »

Wednesday, 17 August 2016
Byline: Cyrille Vanlerberghe
Section: general
Pékin - Une fusée Longue Marche a mis en orbite un satellite expérimental qui va tester la transmission de clés de chiffrement par laser, une technologie dite « de cryptographie quantique » , théoriquement inviolable.

Espace La Chine a une nouvelle fois fait la preuve de son immense ambition, à la fois scientifique et technique, en envoyant en orbite le premier satellite de cryptographie quantique.

Cet engin, appelé Mozi (ou Micius dans sa transcription latinisée), en hommage à un philosophe et artisan chinois du Ve siècle avant J.-C., peut théoriquement permettre un système inviolable de communications cryptées.

Cette mission, qui a décollé mardi matin à bord d'une fusée Longue Marche depuis le centre spatial de Jiuquan, dans le désert de Gobi, est pour l'instant purement scientifique, mais nul doute qu'elle intéresse fortement les militaires chinois, en recherche de solutions pour contrer les efforts massifs d'espionnage numérique des Américains.

« Le satellite ne transmet pas lui- même le message codé que l'on veut sécuriser, mais il permet d'échanger entre l'expéditeur et le destinataire une clé de chiffrement qui va rendre la communication inviolable. Le message codé est transmis de manière classique par **Internet** » , explique le Pr Anton Zeilinger, de l'université de Vienne, l'un des meilleurs experts au monde dans cette **technologie** de cryptographie quantique, et collaborateur du programme chinois. Le responsable scientifique du satellite, Pan Jianwei, physicien à l'université des sciences et **technologies** de Chine, est un des anciens étudiants d'Anton Zeilinger à Vienne.

La clé de chiffrement, un outil très courant en cryptographie, transmise par le satellite est une suite de 0 et de 1 qui permet au départ de transformer un message clair en une forme indécryptable, puis de le déchiffrer à l'arrivée.

L'étonnante particularité du satellite Mozi tient dans la manière dont la clé de chiffrement est partagée entre l'expéditeur et le destinataire, en exploitant des propriétés très étranges de la mécanique quantique, et plus particulièrement des photons, les particules élémentaires de la lumière. À bord du satellite se trouve un dispositif optique qui peut créer ce qu'on appelle des paires de photons en état d'intrication quantique.

Pré carré de l'Europe et des États-Unis

Un état très particulier créé pour la première fois au début des années 1980 par le Français Alain Aspect à l'Institut d'optique à Orsay. Les deux particules créées sont dans un état corrélé, et toute modification des propriétés quantiques de l'une d'entre elles se répercute immédiatement sur l'autre, même si elles sont éloignées de centaines de kilomètres l'une de l'autre. En écrivant la clé de chiffrement avec de tels photons, qui sont envoyés du satellite vers la Terre, où ils sont reçus par des télescopes, on peut ainsi s'assurer qu'aucune personne extérieure n'a pu intercepter le code. Car, en mécanique quantique, la simple opération de « lire » l'état d'une particule modifie son état, ce qui dans ce cas modifierait aussi celui de l'autre photon corrélé (resté dans le satellite) et permettrait de détecter une tentative d'espionnage. Grégoire Ribordy, cofondateur de l'entreprise suisse de cryptographie ID Qantique, prend l'analogie d'un message écrit sur une bulle de savon : « Si quelqu'un essaie de l'intercepter pendant la transmission, en touchant la bulle, il va la faire éclater. »

En utilisant ce principe de chiffrement de l'information, le satellite chinois va servir à échanger une clé quantique entre deux interlocuteurs distants de plusieurs milliers de kilomètres, au début entre Pékin et Urumqi, la capitale de la région du Xinjiang, puis entre Pékin et Vienne, avec l'équipe du professeur Zeilinger. Mais comme le satellite se trouve sur une orbite basse, à 600 km d'altitude, il ne peut survoler les deux destinations au même moment, et la transmission de la clé de chiffrement se fera en deux temps. « Le satellite échangera d'abord une clé quantique avec Pékin, puis quelques heures plus tard une autre avec Vienne, et par une

opération mathématique simple, il sera possible de reconstruire une clé commune utilisable entre Pékin et Vienne » , décrit par téléphone depuis la Chine le physicien autrichien.

Si l'expérience chinoise réussit, ce qui dépendra principalement de la finesse du pointage du satellite vers les stations au sol, cela ouvrira la voie à un échange global de clés quantiques de chiffrement. « Aujourd'hui, les applications de cryptographie quantique existantes sont basées sur une transmission par fibre optique, ce qui limite leur portée à 100 ou 150 kilomètres à cause de l'absorption de la lumière, précise Grégoire Ribordy. Notre solution est essentiellement utilisée pour sécuriser des communications sur des réseaux optiques, par exemple entre deux centres de calcul, par des clients ayant des besoins de sécurité à long terme, comme des gouvernements, des banques ou des entreprises du secteur de la santé. »

Mais l'idée que la Chine puisse prendre le leadership mondial dans un domaine aussi sensible que la cryptographie quantique, domaine qui a longtemps été le pré carré de l'Europe et des États-Unis, pourrait avoir des conséquences importantes en termes de sécurité au niveau mondial. Car le système chinois qui gérerait l'échange des clés de chiffrement « pourrait obtenir une copie des clés, et donc intercepter toutes les communications de ses éventuels clients » , prévient Grégoire Ribordy.

Aujourd'hui, les applications de cryptographie quantique existantes sont basées sur une transmission par fibre optique

Grégoire Ribordy

China faces serious threat of Internet vulnerabilities

Wednesday, 17 August 2016
Section: general
China is facing a serious threat of Internet vulnerabilities to hacking, as statistics show that over 200,000 vulnerabilities were found from 2009 to 2016, a cyber security expert said at a conference on Tuesday.

According to China's National Vulnerability Database (CNVD), domestic Internet security monitoring platforms reported 25,314 vulnerabilities in 2015. Meanwhile, a report published by a security center affiliated to IT company Qihu 360 showed that 43.9 percent of 2.3 million monitored websites were found to have vulnerabilities, and 12.3 percent had high-risk vulnerabilites as of November 2015.

Yan Hanbing, a senior official with the National Computer Network Emergency Response Technical Team Coordination Center (CNCERT), said Tuesday that an increasing number of cyber vulnerabilities have been found by general software or revealed by individuals, partly due to the activity of domestic Internet security monitoring platforms in recent years.

Yan made the remarks at the 2016 China Internet Security Conference, which was jointly held by Qihu 360 and the Cyber Security Association of China on Tuesday in Beijing.

"The increase in number does not mean that our cyberspace is not safe. Instead, it shows that China is paying more attention to cyber security and will put more investment in the field," said Yan.

Xie Yongjiang, an associate professor at Beijing University of Posts and Telecommunications, said that Internet vulnerabilities are a double-edged sword, as they can bring harm to consumers or become strategic resources for companies or countries.

But several recent cases have stoked public concern about possible information leaks caused by Internet vulnerabilities.

In April 2015, Qihu 360's Internet security monitoring platform butian.360.cn found that tens of millions of Chinese residents registered in the country's social security system face a risk of personal information leaks due to system loopholes.

Yan pointed out that despite the exposure of Internet vulnerabilities, large numbers of them fail to be repaired quickly. For example, 40 percent of government websites failed to repair high-risk vulnerabilities that had been exposed for one month.

Cyber security expert Qin An previously told the Global Times that loopholes are common in the Internet era, but they should serve as a reminder to local governments to fix them as quickly as possible.

China's launch of quantum satellite major step in space race

Wednesday, 17 August 2016
Section: general
China's launch of the first quantum satellite Tuesday will push forward efforts to develop the ability to send communications that can't be penetrated by hackers, experts said.

The satellite launched into space from the Jiuquan launch base in northwestern China's Gobi desert will allow Chinese researchers to transmit test messages between Beijing and northwestern China as well as other locations around the world.

If the tests are successful, China will take a major step toward building a worldwide network that can send messages that can't be wiretapped or cracked through conventional methods.

"It moves the challenge for an eavesdropper to a different domain," said Alexander Ling, principal investigator at the Centre for Quantum Technologies in Singapore. "Lots of people around the world think having secure communications at a quantum level is important. The Europeans, the Americans had the lead, but now the Chinese are showing the way forward."

Quantum communications use subatomic particles to securely communicate between two points. A hacker trying to crack the message changes its form in a way that would alert the sender and cause the message to be altered or deleted.

Researchers around the world have successfully sent quantum messages by land. But a true satellite-based network would make it possible to send quickly encrypted messages in an instant around the world and open the door to other possible uses of the technology.

Cybersecurity has been a major focus in recent years for China, which has pushed regulations aimed at limiting technology imported from the U.S. in the wake of Edward Snowden's revelations of widespread surveillance by the U.S. through the use of American hardware.

China has in turn been repeatedly accused by the U.S. of hacking into computer systems to steal commercial secrets and information that could harm American national security. China has rejected claims that it runs a state-sponsored hacking program and says that it is among the leading victims of cybercrime.

Quantum messaging could become a major defense against hackers and have applications ranging from military and government communications to online shopping.

The biggest challenge, Ling said, is being able to orient the satellite with pinpoint accuracy to a location on Earth where it can send and receive data without being affected by any disturbances in Earth's atmosphere. The results of China's tests will be closely watched by other research teams, he said.

"It's very difficult to point the satellite accurately," Ling said. "You're trying to send a beam of light from a satellite that's 500 kilometers (310 miles) above you."

Hoi Fung Chau, a professor and quantum communications researcher at Hong Kong University, said that it was too soon to say if the tests will succeed, but added he expected quantum messages by satellite to become the global standard eventually.

"The theory is already there, the technology is almost there," he said. "It's just a matter of time."

The launch is a major triumph for China, which has spent years researching quantum technology and developing the satellite and other uses for it. China has previously announced the construction of a quantum link between Beijing and Shanghai that would be used by government agencies and banks.

Pan Jianwei, chief scientist on the satellite project, was quoted by the official Xinhua News Agency as saying the launch proved China was no longer a follower in information technology, but "one of the leaders guiding future IT achievements."

Seriousness towards cyber crime laws in Pakistan

Friday, 19 August 2016
Byline: Dr Nadia Khadam
Section: general

Islamabad - After the advent of 3G and 4G technology in Pakistan, cyberspace seemed to be more sensitive area. Cybercrime's rate in Pakistan is also considerably increasing day by day. To control any such like situations law is the only tool. Even if the issue got attention somewhere in preceding years that also proved to be an attempt to misuse the law either in favour or against someone. This remained a dilemma in Pakistan that whenever this issue was focused, it was with some hidden motives and not to redress the grievances of the aggrieved.

Initially due to lack of any proper specific legislation on this subject, offences relating to cybercrime are dealt under Electronic Transaction Ordinance 2002 (ETO 2002). ETO 2002 was promulgated after accepting the challenging situation created by the increased use of internet vis-a-vis electronic commerce. Section 36 of ETO 2002 penalises the violation of privacy with imprisonment up to seven years whereas Section 37 of same penalises the damage to information system with imprisonment up to seven years.

On perusal of preamble of Electronic Transaction Ordinance 2002, it is clear that this law was not enacted with an intention to penalise the offences relating to cybercrimes. That is the reason limitations of this law are very much visible. Due to the increase in use of computer, new ways of crime were emerged but none of them was included in this Ordinance, hence made this legislation less effective. The effect of this legislation is that most offenders easily escape from the law and judges are unable to frame charge against them.

After observing the deficiencies in Electronic Transaction Ordinance 2002 with respect to cybercrime a detailed law was introduced in the form of Ordinance i.e. Prevention of Electronic Crimes Ordinance 2007 (PECO 2007). PECO 2007 was likely to improve problems relating to misuse of technology. Since, this Ordinance, to a certain extent, gives provisions regarding cyber or electronic crimes and devices to curb the menace through effective legislation. But unfortunately, this ordinance remained unable to attain the status of an Act, hence, repealed in 2009. Since then, offences relating to cybercrime are dealt under ETO 2002.

After passing of six years, fortunately, cybercrime laws came under limelight again in 2014 when three bills were introduced before Parliament -- two were tabled before Senate and one before National Assembly. One was Cyber Security Council Bill, 2014 was introduced before Senate by Senator Mushahid Hussain Syed. This bill proposed the formation of National Cyber Security Council empowering the Council to make policies, guidelines and governance model, conduct research, advise different branches of government, to make laws and to analyse the situation in international perspective and more.

The other bill was Protection of Cybercrimes Bill 2014, introduced by Senator Karim Ahmad Khawaja with a purpose to prevent unauthorised acts with respect to electronic crimes and for related offences as well as procedure for their investigation, trial, prosecution, punishment and international collaboration in this regard.

Third bill namely Prevention of Electronic Crimes Bill 2014 was introduced by Ms. Anusha Rehman, Minister of State for Information Technology. It is presented before National Assembly. This law is under heated discussion currently. This bill was introduced in 2014 and approved few days back by the Parliament and it is waiting for the assent of the president. The Prevention of Electronic Crimes Bill gained more attention due to vast coverage of crimes in it. It is penalising the unauthorised access, copying, transmission, interference with information system and critical infrastructure information system or data.

Moreover, if any of the above mentioned acts done with intention to create fear in society shall be punished with imprisonment of fourteen years. Electronic forgery and fraud is penalised which will definitely help to curb emerging related crimes in Pakistan. Identity information should not be obtained or used by anyone without authorisation, if so it would be criminalised. Offences against dignity like displaying and transmitting of false information with intention to harm the reputation or privacy of natural person is a declared offence now but there is an important exception, and that is, if anything aired by the broadcast media or distribution service licensed under Pemra Ordinance 2002.

No one would now think to blackmail or harm the reputation of other by displaying immoral pictures otherwise person would face criminal liability. No individual will do cyber stalking by threatening or creating fear for any kind of contact. Glorification of an offence or convict of a crime relating to terrorism is also penalised. Selling of unauthorised SIM cards will declared as an offence. This is comprehensive law which was dire need of the time.

This area was remained neglected by the Parliament but this time concerned authorities taken this issue with much seriousness and commitment, which resulted in the passing of this bill after exhaustive debates. This law is passed and certain issues can be removed and improved through amendments. This is the beauty of law that it can be changed anytime through amendments as per requirement of time.

The way this bill was presented, perused, shared and discussed with the stakeholders and public at large is significant. Moreover, the way the criticism over the bill was welcomed is also appreciable and improvements were made in the light of the suggestions. After passing of any Act people have two options whether to do criticism for the sake of criticism or to do criticism with suggestion to make laws better and more practicable.

Ministry of Information Technology is to be commended for making it possible and all the stake holders are also to be acknowledged for giving their feedback and for helping to improve this upcoming legislation for Pakistan which is need of the hour.

Even after the passage of this Bill from the Parliament a lot of criticism is on record. The critics to this law were of the view that this law might pose serious obstacles in freedom of information and some provisions of the law needs clarification since according to them there is a danger of misuse of certain provisions. But, prudently observing those obstacles, if any, could be taken care of by suitable amendments. Those should be welcomed by the Parliament to amend and improve the law. If the same is not done this time then again Pakistan will be in a position of lawlessness in terms of cybercrimes.

Central varsity's website hacked

Friday, 19 August 2016
Section: general
Bhopal - The official website of Dr Hari Singh Gour Central University in Sagar was allegedly hacked from across the border. The Pakistani hackers put up their national flag on the homepage and posted messages mocking India's cyber security.

As the news about Pakistani hackers breaking into the varsity's website went viral on Thursday, the university administration acted swiftly and closed the site for a while.

As soon as the administration got information about hacking of the institute's website, it was closed. Later, when it was re-started, it was again hacked by them following which it was made offline by the authorities concerned, University's Media Officer Diwakar Rajput said.

The hackers mocking Indian cyber security wrote messages on the website beginning with a dialogue of an Indian film, "...Kamaal karte ho Pandeyji...Well it's hacked by Pakistani hackers and a slap on the faces of Indian cyber security."

Describing themselves as the cyber world's Al-Qaeda, the hackers further wrote, "Bharat sarkar hume cyber apradhi manti hai...Haa hum cyber space ke Al-Qaeda hai (Indian Government treats us as cyber criminals...Yes we are the Al-Qaeda of cyber space)."

Meanwhile, varsity authorities are planning to restore the website by this evening. "The website will be re- started by this evening. Entire data is safe. A formal complaint has been registered in this regard with the Civil Lines Police Station and a report has been sent to the Union Human Resources Development Ministry on the issue," Rajput said.

However, a senior police officer posted in Cyber Cell told that it is a routine affair. Whenever there is vulnerability in the website, the hackers attack the website, not matter where it belongs.

Al Qaida suicide bomber kills four Yemen troops

Friday, 19 August 2016
Byline: Staff Report
Section: general
Aden - An Al Qaida suicide bomber killed four Yemeni soldiers in an attack on Thursday in the southern Abyan province, where government forces have launched an anti-terror offensive, a military official said.

The attacker rammed his car into two military vehicles parked on a road linking the towns of Loder and Moudia in Abyan province, the source said. "Four soldiers were killed and others were wounded," the official said.

Military sources said the bombing was a retaliation attack by Al Qaida after government troops recaptured parts of Abyan, including provincial capital Zinjibar.

Government forces, backed by air power from a Saudi-led coalition, launched the offensive to retake Abyan on Sunday, after they failed to recapture the vast province earlier this year.

Al Qaida and Daesh terrorists have exploited a power vacuum in Yemen to expand their presence in the country's south and southeast.

Yemeni authorities had trained hundreds of soldiers in the nearby province of Aden over the past two months to retake Abyan.

The Arab coalition, which intervened against Iran-backed rebels in March last, began supporting the government's war on terrorists this year.

The United States has also pressed a drone war against them. Washington considers the Yemen-based Al Qaida in the Arabian Peninsula, or AQAP, to be the extremist network's deadliest franchise.

Mobilising the datacentre with modular solutions

Friday, 19 August 2016
Byline: Jyoti Lalchandani
Section: general
Dubai - The term 'datacentre' has been part of the technologist's lexicon since the 1960s. Back then, organisations housed large mainframe computers in huge rooms and referred to them as datacentres. However, it wasn't until the late 90s that datacentres actually started living up to their name by functioning as central hubs for storing, managing, and circulating enterprise data.

Today, the datacentre is critical to enterprise operations, as it is the place where the organisation's most critical processes are run and managed from. The transformation of the datacentre over the last 50 years has helped organisations embrace the advantages of consolidation, convergence, and cloud implementations. Indeed, the datacentres of today are an essential cloud-enabling technology, forming the platform for private cloud implementations.

Over the last five years or so, various breakthroughs in the datacentre market helped organisations to efficiently manage their data and processes while also keeping a lid on their capital expenditure. Consolidation has been a key motivator in spurring innovations within the datacentre space, and one such innovation has been the introduction of the modular datacentre solution.

Modular datacentres (MDCs) are modular facility products that are portable in nature and procured with the purpose of mobilising datacentre resources. Container datacentres (CDCs) are a subset of modular datacentres, where the IT and facilities assets are all bundled in a

single unit the size of a standard shipping container. While MDCs are usually built indoors, CDCs can typically be found outdoors.

Although these New-Age solutions are still in the early stages of adoption here in the Middle East, they are being embraced by datacentre providers and end-user organisations alike. This is because both MDCs and CDCs offer a string of benefits that traditional datacentres simply cannot match.

The construction of traditional datacentres is a lengthy and complex affair, with traditional datacentres often taking years to design, build, and put into operation. By contrast, MDCs and CDCs can be built in a matter of months.

The main reason for this is that certain parts of these solutions are prefabricated, meaning they are built in a factory and shipped to their desired location ready for use. This saves considerable time for the end user and enables a much quicker return on investment.

The initial capital costs for building a traditional datacentre are also very high when compared to MDCs. The main reason for this is that MDCs are extremely scalable, so additional datacentre capacity can be deployed as and when needed. This eliminates unnecessary costs around unused capacity, which is a common complaint with traditional datacentres. Furthermore, construction costs for MDCs and CDCs are much lower than for traditional datacentres.

Traditional datacentres are also not particularly secure when it comes to storing and exchanging mission-critical information. As such, many organisations prefer to use modular solutions when setting up their datacentres, which is another clear advantage that MDCs and CDCs have over traditional brick-and-mortar data centers.

Crucially, these new modular solutions can be deployed in any place and at any time. Indeed, both MDCs and CDCs have proved extremely popular in remote locations and places that experience extreme weather conditions, and they are now increasingly seeing traction among enterprises that are looking to expand their existing datacentres. CDCs are also regularly used for temporary deployments, such as in a disaster-affected area or during the construction phase of a new project.

MDCs come with different options and a variety of capacity levels. The most popular MDCs in the Middle East region come with a power density of 5KW/rack and feature in-row cooling systems. The in-row cooling is a particularly popular feature here due to the high temperatures that characterise the region's climate.

The government sector is the region's biggest user of MDCs and CDCs, with the solutions often deployed in remote locations or as border control stations. Other verticals deploying these solutions include the oil and gas sector for offshore projects, the health care sector for use inside hospital pharmacies, and the BFSI sector for managing huge amounts of data, particularly in insurance organisations.

They are also finding use in the telecommunications sector as operators look to expand their current datacentres in order to cope with the huge amounts of data that is being generated on a daily basis.

While many organisations see modular datacentres as the future, the traditional datacentre market continues to grow in the region. This is simply because one size cannot possibly fit all, and a lot of organisations still prefer the build-to-suit concept. So the emergence of these New-Age modular solutions does not necessarily sound the death knell for the traditional datacentre.

Instead, they are offering a viable alternative to those organisations that are seeking a more economical and efficient way to manage their IT infrastructure.

Modular datacentre solutions make up anywhere between 10--20 per cent of the total datacentre market in the Middle East, depending on the country in question. Datacentre providers are constantly trying to build awareness around these solutions and the benefits they offer.

So, while traditional datacentres aren't going anywhere in the near future, you can be sure that the region's MDC and CDC markets are set to grow at a very fast pace over the next five years.

Here's why the NSA won't release a 'smoking gun' implicating Russia in these major hacks

Friday, 19 August 2016
Byline: Paul Szoldra
Section: general
London - Was Russia behind the massive hack of the Democratic National Committee, or the latest breach of what appears to be the NSA's elite hacking unit?

That's quite possible, but the US National Security Agency is probably not going confirm that -- even as former employees proclaim that it can do so, and top US officials say that there is "little doubt" Moscow is involved.

Former NSA contractor Edward Snowden said on Twitter that "evidence that could publicly attribute responsibility for the DNC hack certainly exists at NSA" with a tool known as XKeyscore, which he previously described as a "one stop shop" for information it collects.

If that's true, then it's likely that that same tool could find the culprits behind the latest attack.

But Dr. Peter Singer, a strategist at the think tank New America and coauthor of "Ghost Fleet," argues that releasing a "smoking gun" clearly pointing the finger at Russia -- or some other nation -- for a cyberattack bears a much larger risk of blowing future operations.

If the NSA has covert computers just sitting back and watching as Russian hackers hit a target, then it probably doesn't want to give those up by trying to prove it.

"You give away capabilities and maybe even access if you reveal that," Singer told Business Insider, adding that it's a case of "I can't show you my homework because it means I'll give up this intelligence goldmine."

That's not to say that Russia is not involved in the hack of the DNC or the NSA. Cybersecurity firm CrowdStrike found two different Russia-linked hacker groups inside the DNC servers, while providing a technical analysis of its findings. And some former agency employees believe that Moscow is behind the mysterious "Shadow Brokers" claiming to have hacked the NSA.

But a detailed dump of evidence like President John Kennedy did in 1962, proving that nuclear missiles were inside Cuba, is probably not coming.

"President Kennedy famously gave his press briefing where he actually showed U-2 spy plane photos, and this gave away great secrets of the United States, but it also proved to the world that there were, in fact, missiles in Cuba," Cris Thomas, a strategist at Tenable Network Security and former hacker at the legendary L0pht collective, told Business Insider in May of the Sony hack, which officials publicly blamed on North Korea.

The US should "say 'this is why we think this country did this thing ... here's our evidence, here's our IP addresses, here's our packet captures,' just so that it's not a he-said/she- said type of thing."

Many in the computer-security community are often skeptical of attribution claims, since attacks can originate from previously hacked machines and hop over a variety of servers, and exposed code and hacker toolkits can end up pointing the finger at someone else entirely.

In short, attribution is difficult, if not impossible.

The problem is twofold: Gathering definitive evidence is extremely hard, and even that data, if obtained, is not easy to understand by average people outside the world of computer-security research.

"What is persuasive when so few people understand the topic?" Singer asked. "The most persuasive stuff might be the most technical."

Even a former NSA hacker who took part in cyberattacks on behalf of the US agrees.

"I can tell you that if I got onto a machine today and I found a Russian backdoor and I started using it, it's just software. You wouldn't know that I was using it," the source, who spoke on condition of anonymity to discuss sensitive matters, told Business Insider. "It's just really hard to know who's using, who created it. I find these analyses that 'the code had a reference to this part of the Bible, so it must be Israel,' it's just really kind of silly."

6. Ottawa Citizen

Parliament Hill and Rideau Hall overflown 14 times so far in 2016

Friday, 19 August 2016
Byline: Andrew Duffy
Section: general

Ottawa - The restricted airspace over Parliament Hill and Rideau Hall has already been violated 14 times this year in a series of incidents that highlight the difficulty of securing the capital's most sensitive facilities.

Among the offenders was a lowflying helicopter that violated both protected airspaces on the same day in late March. Contacted by air traffic controllers, the pilot said that his GPS was broken and he was having trouble finding the Casino du Lac Leamy.

The incident was reported both to the Royal Canadian Mounted Police and the North American Aerospace Defense Command (NORAD), according to a Transport Canada database that tracks federal airspace violations.

In the first seven months of this year, five aircraft violated the airspace over Parliament Hill and nine penetrated the protected space over Rideau Hall, the grounds on which Prime Minister Justin Trudeau and his family are living while 24 Sussex Drive is repaired.

Most of the offending aircraft were privately owned small planes or helicopters.

One, a Piper aircraft, was owned by the Airborne Sensing Corporation of Toronto, a company that does aerial photography. It descended to 1,500 feet above Parliament Hill on April 23.

During 2015, there was a total of 15 incursions into Ottawa's protected airspace, and 13 the year before that, according to a Postmedia analysis of the federal government's Civil Aviation Daily Occurrence Reporting System (CADORS) database.

In 2011, there were only three airspace violations in Ottawa, but those numbers skyrocketed in 2012 when the restricted area over the two sites more than doubled in size.

After conducting a risk evaluation, the RCMP sought and received approval from Transport Canada to increase the designated altitude for the restricted areas to 3,000 feet from 1,500. The radius of the protected areas also increased.

Air traffic controllers at Ottawa International Airport monitor the restricted airspace over Parliament Hill and Rideau Hall, while Transport Canada officials enforce the no-fly regulations. Fines - usually $750 to $1,000 - are regularly imposed against offending pilots.

The RCMP's National Division is responsible for the protection of key federal properties in the city, including Parliament Hill, Rideau Hall, the Supreme Court and the

prime minister's residences.

A National Division spokesperson declined to comment on the challenge posed by airspace incursions, as did Sen. Vern White, the former Ottawa police chief who co-chairs an advisory committee on Hill security.

The RCMP's security posture on Parliament Hill, including its approach to airspace defence, was reviewed after Michael Zehaf-Bibeau, 32, an armed jihadist, stormed into Centre Block in October 2014.

He was shot dead by security forces within four minutes of entering Parliament's front doors. In March 2015, the OPP released its review and also made recommendations about airspace defence, but that part of the report was not made public.

The challenge posed by airspace defence is considerable, particularly when today's drones are so small that they can evade radar.

Early last year, for instance, a small drone, a DJI Phantom, crashed into the South Lawn of the White House after a government employee lost control of it. Under U.S. federal law, it is illegal to fly a drone in Washington, which has a large flight-restricted zone.

Also last year, in April, a small aircraft known as "gyroplane" flew into Washington's restricted airspace and landed on the West Lawn of the Capitol building. The Florida mailman who staged the stunt as a protest was later sentenced to four months in jail.

In September 1994, a light plane crashed on the White House lawn during the night, killing the pilot. Twenty years earlier, in 1974, a U.S. soldier commandeered a military helicopter and flew it to the White House - the same year that another man, Samuel Byck, tried to hijack a commercial aircraft in a failed attempt to assassinate thenpresident Richard Nixon.

Canada's police chiefs: "We need laws that force cybercriminals to reveal their passwords"

Friday, 19 August 2016
Byline: Ryan Patrick
Section: general
Ottawa - The news that Canada's police chiefs are advocating for federal laws that would compel individuals to provide electronic passwords with a judge's consent isn't sitting well with some members of Canada's IT community.

Earlier this week at its annual conference in Ottawa, the Canadian Association of Chiefs of Police (CACP) passed a resolution that formally requests legal measures to lawfully unlock digital evidence, citing the rise of cybercriminals who are using encryption tools to hide illicit activities as the impetus.

During a news conference on Tuesday, RCMP Assistant Commissioner Joe Oliver noted that at present under Canadian law, police cannot compel individuals to comply with a request to provide a password during an investigation. Law enforcement needs to keep pace with modern criminals who are effectively "going dark" by operating in cyberspace with tools that mask their identities, said Oliver.

"The victims in the digital space are real," said Oliver, adding that Canada's law and policing capabilities aren't keeping pace with the evolution of technology.

But according to Jacob Ginsberg, senior director for Toronto-based email encryption software firm Echoworx, such as move would be an "unconscionable" one.

"While we don't blame CACP for wanting tools to make their jobs easier, a law of this kind would criminalize privacy, and it would be unconscionable for a democratic society to draft a law whereby denying a request from police to go through your things, digital or otherwise, would be illegal," he said in an email.

The association represents in excess of 90 per cent of the police community in Canada which include federal (RCMP), First Nations, provincial, regional and municipal, transportation and military police leaders. The CACP theme for its 111th conference was "public safety in a digital age" and police chiefs such as Ottawa Police Chief Charles Bordeleau noted in a statement the event was intended as an "opportunity to share, learn and work together on a way forward that helps us fuse traditional policing with modern day cyber activity."

"Police services across the world are facing new challenges and threats related to technological developments and the criminal innovation that has ensued," Bordeleau said.

In 2014, the rights of online users were upheld in a Supreme Court of Canada ruling that Internet service providers cannot deliver user names and addresses to law enforcement without a warrant. At the time, The Supreme Court didn't agree with the concept of users having "no reasonable expectation of privacy" for the data obtained by police.

According to police, service-oriented enterprises such as financial firms and telecommunication companies currently require court approval for nearly all types of requests from authorities for basic identifying information.

The CACP also cited a recent Osterman Research report that revealed that 44 of 125 Canadian companies interviewed suffered a ransomware attack in the past 12 months -- of which 33 of the victims paid a ransom that was between $1,000 and $50,000 in order to regain stolen data.

But the issue of handing over passwords --even with a court order -- will be controversial, predicts Ray Boisvert, CEO of I-Sec Integrated Strategies and former deputy director of intelligence at the Canadian Security Intelligence Service (CSIS).

In an interview with IT World Canada, he said he understands the view of those worried about privacy. However, he also understands the position of police, who have legitimate obligations to investigate crime.

In the non-digital world, he noted, search warrants already allow police to seize and go through paper documents looking for specific information spelled out in the warrant. Sometimes, he added, the warrant can be quite broad.

"On the face of it, this seems like it's clearly unconstitutional," David Christopher of Internet advocacy group OpenMedia told CBC News, adding the CACP request represents a "wildly disproportionate" response considering the individual privacy risks involved.

Added Echoworx's Ginberg: "Policy makers and courts across the globe are still adjusting to crime in the digital age, but having the power to access a person's whole digital life, especially

during the course of an investigation where it's not established that wrongdoing has taken place, should not make you a criminal."

Japan eyes fighter drone, seeks record defence budget amid China assertiveness

Friday, 19 August 2016
Section: general
Japan aims to develop a prototype drone fighter jet in two decades with private sector help in a technology strategy that focuses on weapons communications and lasers, according to a document seen by Reuters.

The plan will be announced this month when the Defence Ministry also unveils its request for a record budget of 5.16 trillion yen ($51 billion) for fiscal 2017, as tension rises in the East China Sea and North Korea steps up its missile threat, government officials with direct knowledge of the matter said.

The military technology plan calls for first developing an unmanned surveillance aircraft in the next decade and then an unmanned fighter jet 10 years later, the document showed.

The rise of 2.3 percent over this year's budget of 5.05 trillion yen marks the fifth successive annual increase sought by the ministry, which is keen to stiffen Japan's defences as North Korea upgrades its ballistic missile technology.

However, one security analyst said the spending was insufficient. "The security environment surrounding Japan is severe, due to neighbouring North Korea and China," said Takashi Kawakami, a security expert at Japan's Takushoku University.

"I personally think it's not enough."

Japan will this month formally unveil budget requests for its defence and other ministries for the year ending March 2018.

The defence ministry's request covers the 100 billion yen cost to upgrade Japan's PAC-3 missile defence system, said one government source, who declined to be identified, as he was not authorised to speak to the media.

Such an upgrade would roughly double the missile system's range to more than 30 km (19 miles), other sources have said.

The budget proposal also includes the cost of production of the Block IIA version of the Standard Missile-3 system being jointly developed with the United States to shoot down missiles at higher altitudes, the source added.

The ministry will also allocate budget funds to acquire an upgraded version of the F-35 stealth fighter, made by U.S. company Lockheed Martin Corp, the source said.

The budget request also includes the cost of strengthening the coast guard in the southern islands of Miyakojima and Amami Oshima to allay worries over China's more assertive activities in the East China Sea, said the source.

Tension mounted this month after a growing number of Chinese coast guard and other vessels sailed near disputed islets in the East China Sea.

Japan, China and South Korea are in talks to hold a meeting of their foreign ministers next week.

9. Global Times

Watchdog asks websites to strictly manage online content

Friday, 19 August 2016
Section: general
China's Internet watchdog has vowed to strengthen supervision over new Internet products and functions, including live webcasts and bullet screens.

At a forum in Beijing on Wednesday, the Cyber Administration of China (CAC) proposed eight measures for websites to better manage online information, including better scrutiny of online news products, applications, functions, such as live webcasts and bullet screens, The Beijing News reported Wednesday.

Bullet screens refer to comments that users make while watching videos. The comments shoot across the screen, a barrage of one-line quips like shots fired from a gun.

News websites would be required to develop a list of responsibilities for their chief editors, who should take charge of news content as well as the process that goes with it, according to an announcement on the CAC's official website.

Websites should also build 24/7 duty systems, provide comment management and report replies. In its inspection of eight major commercial websites, the State Internet Information Office found several problems, including information security bugs.

Deputy chief Ren Xianliang said administrative departments and Internet companies should work together to find new methods.

The Beijing Cyberspace Administration shut down some portions of several commercial news portals run by major Internet giants for publishing original articles related to social and political issues in July.

Les chefs des grands services de renseignements

Friday, 19 August 2016
Byline: Vincent Nouzille
Section: general

Paris - Ils ont fait carrière dans l'armée, la diplomatie, la police ou... les services secrets, et disposent de la toute confiance des chefs d'Etat qu'ils servent. Mais qui sont vraiment les patrons des grandes centrales du renseignement contemporain?

? Bernard Bajolet (DGSE), l'homme de confiance de Hollande

À 67 ans passés, Bernard Bajolet ne devrait normalement plus occuper le siège de patron de la Direction générale de la sécurité extérieure (DGSE) et profiter d'une retraite méritée dans son château d'Ouge, en Haute-Saône. Mais cet énarque diplomate a déjà été prolongé deux fois à son poste par François Hollande, qui veut le garder jusqu'en mai 2017. Car le président de la République a toute confiance en ce Lorrain au tempérament rugueux, qu'il a connu lorsqu'il effectuait son stage à l'ambassade de France à Alger en 1978. Les deux hommes se tutoient et se parlent presque tous les jours.

Bernard Bajolet n'a pas été nommé par hasard au printemps 2013 à la tête de la DGSE. Il connaît tous les arcanes de la diplomatie, des couloirs du Quai d'Orsay au palais Farnèse à Rome. Ce polyglotte arabophone a surtout occupé des postes exposés dans des pays difficiles: en Jordanie, en Bosnie-Herzégovine, en Irak où il a rouvert l'ambassade de France en 2004, en Algérie, en Afghanistan de 2011 à 2013. Habitué à vivre dans des bunkers blindés, l'ambassadeur a négocié, avec la DGSE, de nombreuses libérations d'otages, comme celles des journalistes Georges Malbrunot et Christian Chesnot en Irak en 2004. Repéré par Nicolas Sarkozy, il a aussi étrenné le poste de coordonnateur national du renseignement créé à l'Elysée en 2008.

A la tête de la DGSE, qui emploie près de 5000 personnes dont un quart de femmes*, il gère ses dossiers en toute autonomie, n'hésitant pas à assumer des opérations clandestines musclées, que ce soit en Libye ou en Syrie. Il est aussi à l'aise avec les experts du monde arabe qu'avec ses pairs étrangers, qu'il rencontre régulièrement. Il lui arrive aussi de voyager incognito lors de missions secrètes, dont il ne rend compte qu'à son ami François Hollande.

*À lire sur le sujet, l'enquête de Dalila Kerchouche: Espionnes (Flammarion, 360 p., 21 , à paraître le 21 septembre).

? Patrick Calvar (DGSI), l'expert de l'Intérieur

Lorsque Patrick Calvar explique, le 24 mai, devant les membres de la commission parlementaire sur les attentats de 2015, que les risques terroristes n'ont jamais été aussi élevés et que Daech va continuer de monter en puissance, tout le monde l'écoute. Car ce policier de 60 ans, qui pilote la Direction générale de la sécurité intérieure (DGSI) depuis quatre ans, est un expert reconnu du monde arabo-musulman. Ce commissaire de police d'origine bretonne se consacre aux affaires de terrorisme depuis son arrivée en 1984 à la Direction de la surveillance du territoire (ancêtre de la DGSI), maison dont il a gravi les échelons jusqu'au poste de directeur adjoint en 2007-2008. Il a aussi fait quelques incursions aux Renseignements

généraux, à l'ambassade de France à Londres et, surtout, de 2009 à 2012, à la Direction du renseignement de la DGSE, le service concurrent avec qui il a gardé de bonnes relations. Réputé pour son caractère discret et sa connaissance des dossiers, Patrick Calvar a enduré les attentats de 2015 comme autant d'échecs. Mais il garde la confiance du ministre de l'Intérieur, Bernard Cazeneuve, qui se repose sur ce bagarreur.

? Alex Younger (MI6), le diplomate au service de Sa Majesté

Un diplomate de haut vol, Alex Younger, 53 ans, dirige depuis fin 2014 le très fameux MI6, le service de renseignement extérieur britannique, connu également sous le nom de Secret Intelligence Service. La réputation du MI6 a été ternie par les informations biaisées sur les armes de destruction massive en Irak en 2002- 2003, base de l'engagement dans la guerre de Tony Blair aux côtés des Américains. Pour redorer son blason, l'ambassadeur John Sawers, en poste de 2009 à 2014, s'est évertué à fournir des renseignements plus étayés au gouvernement, que ce soit sur la Libye ou la Syrie. Son successeur Alex Younger - appelez-le «C» - est un habitué des postes difficiles: il a supervisé la sécurité des JO de Londres en 2012 et il a été ambassadeur au Moyen-Orient et en Afghanistan. Son profil s'apparente à celui du patron français de la DGSE, Bernard Bajolet, qu'il connaît bien.

? Robert Hannigan (GCHQ), le gardien des grandes oreilles britanniques

Diplomate, Robert Hannigan, 51 ans, est né dans le comté du Gloucestershire, non loin du siège du Government Communications Headquarters (GCHQ), qu'il pilote depuis avril 2014. Cette agence technique, qui emploie 6000 agents, est célèbre pour avoir déchiffré le code de cryptage des communications allemandes Enigma durant la guerre. Le GCHQ est le partenaire privilégié de la NSA depuis 1947, selon les termes d'un traité baptisé UKUSA, resté secret durant des décennies. Mis en cause par les révélations d'Edward Snowden en 2013, le GCHQ, alors dirigé par le très influent sir Iain Lobban, a défendu ses programmes de surveillance au nom de la lutte antiterroriste. Pour calmer le jeu, sir Iain Lobban a été prié de quitter ses fonctions après treize ans de règne. Son remplaçant n'est pas un amateur: ancien directeur au Foreign Office en charge de la défense et du renseignement, Robert Hannigan conseilla Tony Blair sur le processus de paix en Irlande du Nord, puis Gordon Brown sur les questions de sécurité nationale de 2007 à 2010. Un homme de confiance pour un poste stratégique.

? Michael Rogers (NSA), technologiquement vôtre

Réputé pour sa connaissance du renseignement et de la cyberguerre, l'amiral Michael Rogers, 56 ans, a succédé, en avril 2014, au tout-puissant général Keith Alexander, en poste depuis 2005. La National Security Agency (NSA), née en 1952, s'occupe pour les Américains de la collecte de renseignements électroniques dans le monde entier et de la cyberguerre, avec un budget annuel estimé à 10 milliards de dollars et plus de 20.000 employés. La NSA s'est retrouvée sous les feux des projecteurs avec la révélation, en 2013, par son ancien consultant Edward Snowden, de ses programmes de surveillance très intrusifs. Malgré le scandale, l'Administration Obama n'a guère limité les pouvoirs de la NSA, dont les commandes ont été confiées au moins controversé Michael Rogers.

? John Brennan (CIA), le cow-boy de Langley

Agé de 61 ans, John Brennan dirige depuis mars 2013 la Central Intelligence Agency (CIA), la plus connue des agences de renseignements américaines, dont le siège est installé à Langley,

en Virginie. Mais c'est un vieux routier de la maison, puisqu'il y a fait carrière durant vingt-cinq ans, avec notamment des postes en Arabie saoudite, à la division Proche-Orient, au contre-terrorisme et au sein de la direction. Passé dans le privé en 2005, il est devenu le conseiller du président Obama pour les affaires de sécurité intérieure et pour la lutte antiterroriste en 2008. Favorable aux techniques de torture pratiquées par la CIA sous le mandat de Bush, Brennan a soutenu les attaques de drones et les assassinats ciblés décidés par Obama.

? Alexandre Bortnikov (FSB), l'exécuteur de Poutine

Il ne fait jamais parler de lui. Pourtant, le général Alexandre Bortnikov est l'un des rouages essentiels du système de pouvoir de Vladimir Poutine. A la tête du service fédéral de sécurité (FSB) de la Fédération de Russie, ce militaire chevronné de 64 ans, entré au KGB en 1975, est en poste à la Loubianka, siège du FSB, depuis 2008. Héritier du KGB, le très redouté service de renseignement extérieur soviétique dissous en 1991, le FSB a repris la main progressivement, notamment en intervenant en Tchétchénie, en Géorgie, mais aussi en Syrie et en Ukraine. Soumis à une interdiction de visa par les Occidentaux, Alexandre Bortnikov a quand même pu se rendre à Washington début 2015 pour discuter de terrorisme avec le patron de la CIA. Aux côtés d'Alexandre Bortnikov, Vladimir Poutine, qui a dirigé le FSB de 1998 à 1999, s'est inquiété, en février dernier, des 4000 Russes partis faire le djihad en Syrie qui risquent de provoquer des attentats à leur retour. «Il faut les identifier et les neutraliser», a expliqué le président russe. Message reçu au FSB, qui n'hésite jamais, si besoin, à recourir aux exécutions.

? Yossi Cohen (MOSSAD), l'homme des secrets de Netanyahou

Surnommé «le modèle» à cause de son physique de playboy, Yossi Cohen, 54 ans, a été nommé en décembre 2015 à la tête du Mossad, le service de sécurité extérieure d'Israël. Proche du Premier ministre Benyamin Netanyahou, dont il fut le conseiller à la sécurité nationale, Yossi Cohen est issu de la droite religieuse. Vétéran du Mossad, il y a travaillé durant trente ans jusqu'à diriger l'ensemble de ses opérations à la tête du département Tzomet. A son actif: le sabotage partiel du programme nucléaire iranien, par des moyens allant de l'élimination de scientifiques à la destructions de matériels en passant par l'intrusion de virus informatiques ralentissant son développement. Nul doute que, malgré l'accord international sur le nucléaire iranien signé mi-2015, le pays des mollahs restera une de ses priorités, outre la surveillance de la Syrie voisine et des soubresauts de Daech.

? Bruno Kahl (BND), le verrouilleur de Merkel

Le **scandale** a fini par emporter Gerhard Schindler, le très secret patron du service fédéral de renseignement extérieur allemand, le Bundesnachrichtendienst (BND). Accusé d'avoir travaillé sans vergogne pour les Américains de la NSA, y compris en espionnant des Allemands, Gerhard Schindler a été démis de ses fonctions au printemps dernier. Pour le remplacer, la chancelière Angela Merkel a choisi un fidèle de son parti, Bruno Kahl. Agé de 54 ans, juriste de formation, il dirigeait le secteur public et les privatisations au ministère des Finances, tenu par son ami Wolfgang Schäuble. A lui de remettre de l'ordre au BND, en lien direct avec la chancelière, dans une maison de 6500 employés jugée opaque et incontrôlable.

Vanity Fair
How the Clinton campaign is foiling the Kremlin
Saturday, 27 August 2016
Byline: Nick Bilton

On May 17, as dusk was setting over Brooklyn, around a dozen employees from Hillary Clinton's campaign, and a consultant who worked with the Democratic National Committee, walked through the cavernous halls of the campaign's office headquarters, which tower over Cadman Plaza's expansive fields and the elegant federal buildings surrounding them. Through the halls, they wandered past endless posters adorned with blue "H"s bisected by red arrows and posters that proclaimed, "I'm with her." Eventually, they settled upon an empty conference room. As the Democratic staffers took their seats, they were joined by Marc Elias, the general counsel for Clinton's 2016 presidential campaign, and given a grave warning: from that point forward, they should avoid using one single word in their e-mails. That word, according to someone with intimate knowledge of the meeting, was one with which they were increasingly familiar: "Trump."

This meeting took place one month before the news would break that the D.N.C. had been hacked, allegedly by Russians, and two months before its controversial chairwoman, Debbie Wasserman Schultz, would resign after thousands of embarrassing e- mails were published on Wikileaks, including some suggesting her favoritism of the Clinton campaign over Bernie Sanders's operation.

According to reports, the D.N.C. was notified as far back as April that the organization's servers had been compromised. Consultants from the private security firm CrowdStrike were brought in at the time, but it wasn't until June that the hackers were kicked out of the server. In the intervening weeks, staffers were told, according to a person who works with the committee, that if anyone was going to communicate about Donald Trump over e-mail or text message, especially if those missives were even remotely contentious or disparaging, it was imperative that they do so using an application called Signal. In July, the trove of e-mails was posted to the Wikileaks Web site. (One of the most damning e-mails found in the D.N.C. archives, which focused on Sanders's religious beliefs, was sent on May 5, several days after the intrusion was allegedly discovered, and two weeks before staffers were told to use Signal.)

Signal, staffers in the meeting were told, was "Snowden-approved." A week after the meeting at the campaign headquarters, according to two people who have worked with the D.N.C. and the Clinton campaign, an e-mail was sent out instructing staffers where to download the app and how to use it. Shortly thereafter, the news broke that the D.N.C had been hacked. (Elias did not respond to e-mails and voicemails. A spokesman for the D.N.C. declined to comment, as did a spokesman for Hillary Clinton's campaign.)

The fear of what could lurk in people's e- mails has--particularly in the wake of the Sony hack and several hundred massive data breaches last year--left many Americans oscillating between a state of anxiety and one of resignation. People who use Web-based e-mail accounts have correspondences going back a decade or more, and text-message trails that reach back just as far. (Gmail was founded 12

years ago; Hotmail goes back 20 years.) Regarding the stuff in most people's digital archives, you essentially have two choices: either delete everything (and hope it is also deleted from the server) or leave it all, cross your fingers, and hope for the best.

"THERE ARE TWO KINDS OF COMPANIES OUT THERE. THOSE THAT HAVE BEEN HACKED, AND THOSE THAT DON'T KNOW THEY HAVE BEEN HACKED YET."

Moving forward, however, companies and organizations are urging people to use products like Signal, which is an encrypted message and voice app for smartphones, or other applications that feature self-destructing messages, such as Wickr, which vanquishes messages after they have been read. Some people take their correspondence to further extremes. I know journalists who now use burner phones to talk to sources (these are the smartphone of choice for drug dealers, cheating spouses, or those engaged in other nefarious things, as you've inevitably noticed on any number of HBO or Netflix series), and then get rid of the phone when they are done working on a story.

When Sony Pictures was hacked by a group that called themselves Guardians of Peace, in 2014, the public release of memos and correspondence led to a lot of embarrassment among executives, and eventually contributed to the resignation of co-chair Amy Pascal. At the time, I called around to people in Hollywood asking if the breaches had changed their behavior. Were they more sensitive, perhaps, about how they referred to mega-stars in e- mails, or even public figures, like the president? I was told that it wasn't that people were saying less disparaging things, but rather that they were now simply doing so in person or over the phone. "I've seen much, much worse," a well-known screenwriter told me at the time, and then noted, "Heck, I've sent much, much worse."

Gossiping about Hollywood industry professionals is one thing, but operating a campaign amid perhaps the most controversial election in history is another altogether. The Clinton campaign is right that the Signal app is Snowden-approved. Edward Snowden, who famously requires that people place their cell phones in a freezer before he agrees to meet with them in person (the freezer, or fridge, acts as a faraday cage and blocks any N.S.A.-like snooping of people's whereabouts), has touted the security of Signal numerous times, saying on Twitter, "I use Signal every day."

Other security experts I know speak just as highly of the service because it uses end-to-end encryption to secure all communications to other people on the app, which means that only the two people sending and receiving the message can see it. In other words, it's not hanging out on a server for Russian hackers to peruse. Even phone calls on Signal are allegedly safe. "We cannot hear your conversations, and no one else can either," the app says. "No exceptions." (If you really want to nerd-out, you can look online at the tech Signal uses. According to Wikipedia, "instant messages are encrypted with the Signal Protocol which combines the Double Ratchet Algorithm, prekeys, and a 3-DH handshake. It also uses Curve25519, AES-256, and HMAC-SHA256 as primitives"--whatever any of that stuff means.)

Signal also has a very clever solution to ensure that you know if the person you're speaking to is really them. For example, let's just say that I'm calling my editor, Jon, on Signal. His phone would ring, and

once he accepted the call, we would both be shown the same two words, like "spyglass pacific" or "nightbird undaunted." If both of us do not see the same matching words, then it means our phone call has been compromised.

Signal was founded by Moxie Marlinspike, who formerly oversaw security at Twitter, and is a member of the Anarchist Yacht Clubb (two Bs). If you mention his name in Silicon Valley, the response you'll inevitably hear (as I have many times) is that "Moxie is legit, and doesn't fuck around." Hence, why his app is the preferred choice for a clearly shaken and scared national political committee and an ex-N.S.A. operative exiled to Russia. But that doesn't mean that everyone is adhering to the rules laid out for them months ago. While the D.N.C. hack sent tremors down the spines of virtually everyone in Washington, it didn't take long for people to take the easy route, once again e-mailing sensitive information that could easily hamper the campaign if it ever became public. Or, as one Washington insider told me: "No one really learned."

There's a saying in the cyber-security world that goes something like this: "There are two kinds of companies out there. Those that have been hacked, and those that don't know they have been hacked yet." As we all parlay more and more of our communication to digital platforms that are as easy to use as they are to hack, it seems that mantra will soon start to apply to people, too. In the not-too-distant future, we might all start to worry about what could be lurking in not only our e- mails, but also every correspondence we've ever exchanged on a digital device--virtually ever.

Wall Street Journal
Bank Hackers Target Smartphones
Saturday, 27 August 2016
Byline: Robin Sidel

Washington - Hackers are using the growing popularity of mobile banking apps on smartphones to launch new types of attacks on big banks and their customers.
While it is difficult to quantify how much money has been stolen as a result of malicious software, or malware, on mobile phones, the trend is alarming the Federal Bureau of Investigation and U.S. banking regulators. The move by cyber thieves to target mobile banking apps has occurred amid a glut of stolen credit-card data for sale on underground websites.

Cyber thieves are using the malware to steal banking credentials from unsuspecting consumers when they log onto their bank accounts via their mobile phones, according to law enforcement officials and cybersecurity specialists.

Attacks have occurred on the two most common mobile operating systems -- Apple Inc.'s iOS and Alphabet Inc.'s Android. Phones typically come with built-in security protections, but the devices can still be vulnerable. On Thursday, Apple urged some iPhone users to update their software due to a security flaw that could allow a hacker to remotely take control of the operating system.

The problem for banks, which have stepped up spending on cybersecurity in recent years after several high-profile breaches, is that consumers often aren't as vigilant about security on their phones as they are on their desktop computers.

"As a bank, you can have all the protections you want, but unless there is protection on the device, you can't protect against this kind of attack," says Ross Hogan, global head of the fraud prevention division at Kaspersky Lab, a cybersecurity firm.

Also troubling is that the attacks can be hard to track down because thieves can access an account through any normal channel after they steal credentials through a phone.

The FBI is seeing new types of malware specifically aimed at banking applications for the purpose of stealing account credentials, says Richard Jacobs, an assistant special agent in charge who handles cybercrimes. He has been warning the financial-services industry about the trend, which is typically aimed at large banks.

The Federal Financial Institutions Examination Council, which brings together five banking regulatory bodies, in April updated its guidance for banks to include potential threats facing mobile financial services, including mobile-phone malware.

The malware often gets onto a phone when a user clicks on a text message from an unknown source or taps an advertisement on a website. Once installed, it lies dormant until the user opens a banking app.

The malware then creates a customized overlay on the authentic banking app. This allows criminals to follow a user's movements on the phone and eventually grab credentials to the account.

In some cases, the malware adds fields that request the customer's date of birth or Social Security number, says the FBI's Mr. Jacobs. Some of the more advanced forms of malware can even track verification codes that the bank may send to the customer in text messages as a secondary authentication, cybersecurity officials said.

Once the malware captures a phone user's banking credentials, it can send them remotely to the criminal, who can use them or sell them.

Bank executives say they are trying to thwart the malware by frequently updating and revising their banking applications.

They also say that the banks' security systems can often trigger alerts for unusual behavior, such as a large withdrawal or if the account is accessed from a previously-unknown device or an unfamiliar location. In such cases, the bank may require additional authentication from the user.

Malware that has gained popularity around the world among criminals have names like Acecard and GM Bot. Some of the bank- specific malware sells for as much as $15,000, according to people who are tracking the trend.

Ian Holmes, banking fraud solutions manager for analytics firm SAS, estimates that the Acecard malware has customized overlays to imitate 50 financial-services apps. The malware "is gaining credibility in the criminal underworld," said Mr. Holmes.

The growing threat represents a new entry point for criminals who typically steal bank credentials by other means, such as installing skimmers on automatic teller machines or by using scams targeting desktop computer users.

It is a setback for banks that are pushing customers toward digital channels as a way to reduce costs and improve efficiency. Banks typically reimburse customers for money stolen from their accounts, particularly if they notify the institution quickly after the theft occurs.

Kaspersky, the security firm, said in a recent report that banks may be underestimating the risk associated with the malware. "While the industry has so far been relatively unscathed by a major mobile banking security attack, the sophistication and levels of malicious activity on mobile solutions have begun to rise, which we believe increases the security risks of mobile banking," it said.

The rising popularity of mobile-banking malware also creates yet another security headache for consumers who are increasingly turning to their mobile phones for everyday tasks from banking to shopping.

The crimes can be difficult to track because customers might not notice thefts have occurred until well after they used their phones to log onto their accounts. Plus, customers are unlikely to consider a mobile phone as an entry point for hackers if the phone hasn't left their possession.

A recent study conducted by SAS and Javelin Strategy & Research found that fewer than one-third of smartphone owners use mobile antivirus or anti-malware software on their phones. Additionally, some mobile-phone owners unknowingly make their devices vulnerable to attacks when they tamper with operating systems in order to run unauthorized apps.

Guardian (London)
The police chief battling cybercriminals from Russia and Ukraine
Saturday, 27 August 2016
Byline: Patrick Collinson

London - Half of online fraud comes from abroad, says Ian Dyson, commissioner of the City of London police, who has enlisted the help of Google and Microsoft to fight it.

Last Christmas Ian Dyson got a call from his bank. Was he really in a Travelodge, ordering takeaway pizzas? No, was his answer, he was at home with his family. Like millions of others, Dyson had fallen victim to card fraudsters stealing from his account. But Dyson is not like everyone else - he is the commissioner of the City of London police, with the job of protecting not just London but the whole country from fraud. And the depressing reality is, like so many other frauds, the criminals got away with it.

Dyson is disarmingly honest about the explosion in online fraud and cybercrime, and what realistically the police can do about it. "Every month Action Fraud [the national fraud reporting service] receives 40,000 reports, half a million a year, and we know from the ONS stats that's only a small percentage of what is going on. There were 3.8 million frauds and two million cyber offences. You cannot enforce your way out of this. It's physically impossible."

It's partly because the perpetrators are abroad, with around half of all cybercrimes reported to Action Fraud originating overseas, says Dyson, citing Indian call centres and Russian and Ukrainian websites. The City of London police have a specialist officer permanently stationed in Wall Street, and worked with the Spanish police to swoop on 110 conmen operating a "boiler room" fraud targeting elderly investors.

But Russia? Do the London police receive any help from their counterparts in Moscow? "No, not at all. Ukraine is limited too. You'll be aware of the limitations of some foreign jurisdictions."

Another limitation is budgets. "Policing has taken a 20% hit in its budget so I've got to do what I can with what I've got," he says, while noting that virtually everyone else in the public sector has faced similar cuts.

"You have to be realistic with the volumes [of crimes] you've got, [and] about the global nature of the crime issue. I cannot possibly sit here and say I am going to investigate every crime. You can't. But policing has never investigated every crime."

The 40,000 reports to Action Fraud every month are whittled down to ones where the police think there are "actionable leads". Some go up to the National Crime Agency or the Serious Fraud Office, some are pushed out to the other 43 police forces across the UK, while the City of London police tackle the rest.

"There are 700 cases the City of London police are investigating at the moment. That's me rather than ones disseminated to other forces. In the top 10 there is about half a billion pounds worth of fraud being investigated."

What he dubs "CEO fraud" is the latest online crime wave City of London police are facing. It's when a junior person in the finance department of a big company receives an email from the chief executive officer of the firm, asking him or her to move money from one account to another. The email is fake; somehow the fraudsters have hijacked the boss's email account, or created one that is near identical.

There are 700 cases the City of London police are investigating at the moment

"One major company lost three lots of £250,000 this way," says Dyson, noting that the culture in some big businesses is such that junior staff are too nervous about confronting their bosses when they receive an email which appears to be from them.

Dyson notes that the other worrying online crime wave is "mandate fraud". You receive an email from your builder, who's doing your extension, politely telling you he has changed his bank account details, and could the next £20,000 payment for the extension go into this account? Again, the email has been hijacked, and the householder hands over their life savings - never to be seen again, as banks do not take responsibility. Guardian Money has highlighted numerous sad tales of how people have been conned this way.

Have online fraudsters caught the police napping? Did we put bobbies on the beat when we should have been investing in fighting online fraud? In a frank admission, Dyson says: "To be honest, who'd hold up a bank these days? Who would rob a bank now when you can make it all online in seconds?" His office is just yards from the Bank of England, yet about the only robberies he sees are of betting shops, one of the last major cash-handling businesses around.

He acknowledges that the public think that when they report an online crime, nothing seems to happen. "There is a public perception that PC Plod is losing the war against these highly sophisticated cybercriminals. It's a perception I'm trying to address.

"Last year 180,000 websites, phonelines and bank accounts involved in fraud were closed down following police intelligence. So disruption is a big thing... Your report, combined with hundreds of others could lead us to close down that website and prevent people from becoming victims of fraud. While you might not get your money back, it will go at least some way to stopping others [from being a victim]."

Disruption is a word Dyson uses a lot. He reckons the best approach for his force is to gain intelligence from the public and other government agencies, and use that to intervene before more victims are conned. It's why he's investing heavily in a new IBM project for Action Fraud that should turn it into the world's most sophisticated anti-fraud intelligence system in the world. The quicker the police can see the signs, the more rapidly they are able to respond, he says.

But the public have to do more: "The public have to shift their mindset around crime. The public have to understand we cannot enforce our way out of this, [given] the volume of crime, the fact that it is global and happening so fast, and that money can be moved so quickly. It has to be about prevention and protection."

Don't use "password" as your password, he says. If that email arrives asking you to pay the money into another account, ring the builder, he adds. There are many, many more simple measures the public can take, he insists. In September, the government will begin a public information campaign, which Dyson says will evoke the message of the 1970s "clunk-click, every trip" campaign to get the public to use seatbelts in cars. We need the same thinking when it comes to transacting online, he says.

But shouldn't the banks be doing more? Can the public really protect themselves from genius hackers determined to break into their accounts?

Dyson is reluctant to criticise the big banks, though he says insurance companies have a much better record than high-street banks at cooperating in fighting fraud. The insurers have paid for 35 police officers in the City of London force alone to battle fake insurance claims and have had a string of prosecution successes.

He would like the banks to be rather more intelligent when an elderly customer walks into a branch and demands to withdraw nearly all their savings when they have never taken out more than £100 before in one go. It's usually because they are being conned.

Banks may often fail to report a fraud, in part because of the odd way in which crime is recorded. When Dyson's own card details were stolen, he was fully compensated by the bank. That means, according to Home Office rules, that the bank was the victim of the crime, not Dyson. "It's something we are talking to the Home Office about," he says.

Critics say that police fraud-busters are just not technically competent and resourced to catch cybercriminals. Dyson bridles: "I'd like to disabuse anyone of the view that they are all smart computer geeks, the archetypal spotted teenager hacking into US military computers. They are not. You have some people who are business people who before the internet would have been conning people out of investments. They are doing the same now but are doing it online. Then you have the people with a slightly smarter mate who have found a quick way to make money."

The boiler room criminals in Spain are the type who were breaking into cars before the advent of the internet, he says. But in 33 years of policing, he says criminals are changing. They used to specialise in a line of business - armed robberies, drug dealing, etc. Now, Dyson says, everybody tries a bit of everything.

Meanwhile, the police have their own geeks. Dyson says the City of London force have staff seconded to them from Google and Microsoft whose internet expertise is a match for any cybercriminal in Russia: "My guys will understand the forensic footprint of these crimes in the same way detectives are aware of forensic opportunities at the scene of a burglary."

He is proud of his force's work to fend off pension fraud, which was widely expected to balloon in the wake of the new pension freedoms, but has so far been suppressed by the police working with the

pension providers. The force was also instrumental in stopping BT from keeping lines open after a phone is put down, a frequent tactic used by fraudsters to convince people who called back that they were speaking to their bank.

More money would help, Dyson says. For every pound invested in fighting fraud "we are preventing about £60 worth of fraud". Meanwhile he's behind a pilot project in which private law firms will be hired by police to help seize the proceeds of crime and repay victims earlier.

"We're an innovative police force," he says. "The investment in the last 10 years was in neighbourhood policing and the visibility of police officers. We are shifting, in fairness, policing is shifting to deal with online."

Unfortunately, as he looks out of his offices over the towers of London, while fighting fraud fills much of his time, there is another more serious threat. "My number one priority at the moment is counter-terrorism. We are quite a target-rich environment."

How to protect yourself

There were more than 5.8m incidents of cybercrime in the past year, enough to nearly double the headline crime rate in England and Wales, writes Patrick Collinson.

The Office for National Statistics said last month that one in 10 adults have been victims of cybercrime and online fraud over the previous year in the first official estimate of the scale of scams, virus attacks, thefts of bank details and other offences. An initial ONS estimate in October last year put the annual figure at 3.8m, or 40% of all crimes.

Costing an estimated £193bn a year, cybercrime is nearly as big as all other crime, such as home burglary, car thefts and violence against the person. The ONS added that the chance of being a victim is the same regardless of social class or whether you live in a deprived or affluent, urban or rural area.

Meanwhile, the figures for crime excluding online offences dropped in the year, falling by 6%. The long-term trends in traditional crimes such as burglary, car thefts and criminal damage showed that the fall in crime since its 1995 peak had slowed down since 2005. The survey found there had been no change in the overall level of violent crime compared with the previous year.

So what are the easy steps to protect yourself from online crime that Commissioner Ian Dyson recommends?

. Never disclose security details, such as your pin or full banking password

Banks and other trusted organisations will never ask you for these in an email, on the phone, by text or in writing. Before you share anything with anyone, pause to consider what you're being asked for and

question why they need it. Unless you're 100% sure who you're talking to, don't disclose any personal or financial details.

. Don't assume an email or phone call is authentic

Just because someone knows your basic details (name and address, even your mother's maiden name), it doesn't mean they are genuine. Fraudsters may try to trick you and gain your confidence by telling you that you've been a victim of fraud. Fraudsters can also make any telephone number appear on your handset, so even if you recognise the number or it seems authentic, do not assume they are genuine.

. Don't be pressured into a decision

Under no circumstances would a bank or organisation force you to make a financial transaction on the spot; they would never ask you to transfer money into another account for fraud reasons.

. Listen to your instincts

If something feels wrong, it is usually right to question it. Fraudsters may lull you into a false sense of security when you are out and about or rely on your defences being down when you're in the comfort of your own home. They may appear trustworthy, but they may not be who they claim to be.

. Stay in control

Have the confidence to refuse unusual requests for personal or financial information. It's easy to feel embarrassed when faced with complex conversations, but it's OK to stop the discussion if you do not feel in control of it.

The Guardian (London)
Burglars aren't the problem, we need to catch Russian cybercriminals
Saturday, 27 August 2016
Byline: Patrick Collinson

London - Just how defeatist are our police over online crime? The top fraud crime fighter in the country, City of London Police commissioner Ian Dyson, won't agree with that, but he certainly talks down the possibility of arrests and convictions. There's a bluntness to his assessment that won't, perhaps, go down too well with the Foreign Office. Crooks in Russia and Ukraine are behind much of it, he says, and law enforcement there won't cooperate with the British.
It's a common saying that you can't put a policeman on every street corner, and we certainly can't put one on Kreschatik Street or Old Arbat. But arguably our problem is that we tried to put too many bobbies on the beat, with the vogue for neighbourhood policing skewing resources to threats, such as home burglary and car theft, that have actually been in steep decline.

One sound that always greets me when I return to London from abroad is police sirens. New York and Paris are no match for the hyper-visibility and siren volumes of police here, but given the decline in traditional crime (even the terrorism death tolls are lower than in the 1980s) then it's time to assess whether we need to switch priorities.

The volume of cybercrime now matches the number of traditional crimes, and its estimated £193bn cost is far in excess of the value of physical goods nicked from homes, cars and workplaces. Yet we devote relatively few resources to fighting it. The City of London police force's budget is around £120m a year, yet it is the country's lead force on fraud - and also has the not-insignificant duty to protect the likes of St Paul's, the Tower of London and other high-value targets from terrorism. The commissioner reckons that each £1 spent on fighting fraud prevents around £60 in online theft; even if the reality is that it's only half that, then it's still one hell of a return.

More money could go into prevention and disruption, where Dyson thinks the returns are best. My guess is that the public would prefer to see many more arrests and convictions. If crooks think the worst that could happen is their website being prematurely shut down, then it's hardly much of a deterrent.

Dyson was determinedly uncritical of the banks when I interviewed him. Yet the banks can't escape the fact that they are the getaway car when it comes to online crime. Without online banking, the money simply can't be stolen or lured out of your account and into the scammer's account.

The banks save a colossal sum from shutting their branch networks (eventually they will nearly all go) and making us do the work the bank tellers used to do. We firmly believe that one reform - forcing sort codes and account numbers to be matched with individual names - will go some way to halting a number of frauds. But Dyson doesn't share our belief that this will change much.

A second reform requires consent as much from the public as from the banks. The "faster payments" system - transferring money instantly - opened up a gold mine for fraudsters. We all like the speed and convenience, but it means there is no time for second thoughts. So often here on Money we hear stories from fraud victims who say they were not quite sure what was going on, and it was a day (or even hours) later when they tried try to block the transaction. But too late, the money had been looted. There is a strong argument for three-day clearance on transfers to new payees, say for sums above £250. And would it be that onerous if all transfers above £1,000 took a day or so to clear?

Hacker targets remote northern Alberta communities
Sunday, 28 August 2016
Byline: Zoe Todd

Edmonton - A northern Alberta municipality is in emergency mode after a suspected computer hack.

The Municipal District of the Opportunity No. 17 is concerned all its files were accessed, including personal and financial information, according to a public notice released by the municipality.

Administrative staff say they first became aware of "suspicious activity" in July. Last Friday, the activity escalated.

"We just unplugged everything and cut ourselves off from the outside world," said Deborah Juch, the municipality's manager of legislative services.

About 3,400 people live in its seven hamlets, about 400 km north of Edmonton. Many residents log personal information with the municipality, such as social insurance numbers, credit card numbers and payroll bank deposit card numbers.

Juch cited money as the most likely motive for hackers.

"We're working in emergency mode," she said. "The northern municipalities have a large amount of tax dollars coming and going through their accounts."

The district's sole information technology veteran worked a 22-hour shift to protect the municipality's servers and network. But someone continued to undo his efforts, Juch said.

"We were not going to be able to stop whatever was trying to get in the door," she said. "We ordered an unplug."

The municipality has reported the problem to the RCMP, and has now flown in what Juch described as a team of "high-power IT people" to work on the server.

She said the network should be restored within two weeks, at which point the municipality will know how much information has been accessed.

New Strait Times
Military forms cyber defence unit
Monday, 29 August 2016
Byline: Nur Aqidah Azizi

Kuala Pilah - A cyber defence unit has been set up to prevent the leak of the country's confidential and sensitive data.
Defence Minister Datuk Seri Hishammuddin Hussein said the unit was formed last year under the Royal Intelligence Corps in the armed forces.

"This unit is different from the cyber security unit under the Home Ministry. It serves to defend and protect the country from cyberattacks. It also protects confidential data and information on assets from being leaked to irresponsible parties."

Hishammudddin, who is also Umno vice-president, said the formation of the unit was crucial, especially following the alleged leak of secret documents from French shipbuilding company DCNS recently.

"We should learn from this. This is a wake-up call for all countries to tighten and improve security defence. "The world is changing rapidly and it will be hard to avoid such situations if we are not prepared.

"Since last year, we have worked closely with other countries to prevent any leak of the country's confidential information," he said after officiating the Kuala Pilah Umno division delegates' meeting at Dato Bahaman Hall here yesterday.

On the Scorpene-class submarines, Hishammuddin said the vessels Malaysia owned were not affected by the documents that were allegedly leaked from DCNS.

"The leak of classified information only involved the Indian Navy's six new Scorpene-class submarines.

"Navy chief Admiral Tan Sri Ahmad Kamarulzaman Ahmad Badaruddin has made it clear that our submarines were built with different specifications than those of other countries.

"We are confident that this issue won't affect the operations and capabilities of Malaysia's submarines."

He said the Defence Ministry had launched an investigation into the alleged leak of information related to the Scorpene-class submarines. "We will investigate this matter thoroughly."

A report in The Australian on the leak of secret documents from DCNS was published recently.

Some 22,400 pages of documents detailing the capabilities of the Scorpene- class submarines the company designed for the Indian Navy were allegedly leaked.

The discovery of the alleged leak raised fears about the future security of top-secret data of the Indian Navy's future fleet.

A variant of the same French-designed submarine is used by the Navy of various countries, including Malaysia.

Tehran Times

Iran detects malware in petrochemical plants, rejects link to recent fires

Monday, 29 August 2016

Tehran - Head of Iran's civilian defense said on Saturday that the country has detected and removed malicious software from its petrochemical units, rejecting links to recent fires in some of the country's petrochemical facilities, Mehr reported.
"Necessary defensive measures were taken" after the malware was detected and removed, according to brigadier general Gholam-Reza Jalali.

Over the past two months, a number of Iran's petrochemical units, including Imam Khomeini as the biggest one, stopped operating wholly or partially due to fires. The issue is still being probed by Iranian officials and expert teams. Initial informal speculations linked the fires to cyber-attacks.

Last week, Iran's National Cyberspace Council announced that it was investigating whether the recent fires triggered in petrochemical plants were caused by a cyber attack. Following the investigations, Jalali said while the malicious software affected two petrochemical complexes, it did not play a role in the recent fires because it was inactive at the time.

According to the official, the malware packages petrochemical units had purchased from abroad were to blame. "Investigations indicated that the industrial software packages, bought from foreign countries, were already corrupted," he added. Iran has been increasingly afflicted with the threat of cyber attacks by foreign countries.

Learning from the cyber attack by the U.S. and Israel on its nuclear facilities in 2009, what came to be known as Stuxnet virus, the country has been upgrading its cyber security capabilities in recent years, developing homegrown firewalls for its sensitive facilities, including nuclear, military, and economy sites.

Haaretz
Sophisticated Tracker Program' That Wormed Into Apple
Monday, 29 August 2016
Byline: Yisrael Fischer and Ruti Levy

Jerusalem - On August 10, Ahmed Mansoor, a human rights activist in the United Arab Emirates, received a text message that invited him to click on a link that would reveal new information about torture in jails in his country.
Mansoor, who has been a repeated target of the regime, grew suspicious and turned over the message to researchers from Citizen Lab.

Mansoor's gut feeling was right. The link would not have led him to information on torture but rather would have taken advantage of three flaws that Apple was not aware of to surreptitiously hack his iPhone, turning it into the perfect spying device.

The researchers discovered that the malware enabled recording conversations, accessing photos, text messages and geographic location, and control of the phone such as remotely operating the camera or loudspeaker. The program was connected to 200 different servers, some of them leading to a Herzliya-based company called NSO Group and to software it developed called Pegasus.

Lookout, a company involved in discovering how NSO's malware operates, was impressedy. "It's the most sophisticated tracking software we have encountered, that completely takes over the device with just one click of a link," one person at the company said.

Lookout said another advantage was the company's ability to maintain secrecy: Pegasus hacks the device without its owner being able to detect its existence, and can only be detected by a lab.

For the past six years, almost all global technology companies have offered hefty cash prizes to hackers who could detect bugs in their systems and warn them - save for Apple. Its iOS platform is considered particularly secure and many people handling sensitive data choose Apple products for this reason. Apple's announcement over the weekend about an urgent software update due to security problems showed that the company finally realized that no one is safe in the new spying age.

Omri Lavie, Shalev Hulio and Niv Carmi founded NSO in 2009, naming it from the initials of their first names. Carmi left shortly thereafter over disagreements with his partners. Meanwhile, a group of investors, headed by Eddy Shalev, a founding partner of Genesis Partners, took a 30% the company for just $1.8 million. When Francisco Partners, a California private equity firm, bought NSO in 2014 they bought it for $130 million. Reuters reported last year that the fund was looking to sell NSO for $1 billion.

NSO, based in Herzliya Pituah, employs 200 people, more than twice as many as two years ago. NSO's annual revenue is estimated at $100 million.

"We insisted that all intellectual property remains in Israel, that the development center remains in Herzliya and not move to Silicon Valley or anywhere else outside Israel," Hulio, the CEO, wrote on Facebook after the acquisition.

NSO's asserts that the technology is meant to help fight crime and terror. "The company develops products to help governments fight crime and terror. The company only sells to authorized government bodies, subject to all security export laws," the company said in a statement.

It also stressed that it sells the technology but doesn't operate the systems for its customers. "The contracts signed with clients require strictly legal use of the technology, only for investigating and preventing crime and terror."

But its Pegasus product may have been put to unauthorized uses. Israeli media reported in 2012 that Pegasus was sold to the Mexican government for $15.5 million to help it fight the country's drug cartel.

But The New York Times said last week that the software was also used to spy on Rafael Cabrera, a Mexican journalist who uncovered conflicts of interests among the country's ruling family.

In other cases, according to the report, NSO's tools were adapted for use against targets in Yemen, Turkey, Mozambique, Kenya and the United Arab Emirates.

The Israeli government regards its tracking software as no less than a weapon, whose exports are supervised by the Defense Ministry. The ministry lets NSO sell the software only to countries with good relations with Israel and not to businesses.

Israel is a star of the global interception and tracking industry. According to Bloomberg, there are some 230 companies, prominent among them being Israeli Verint, European Nokia-Siemens, French QOSMOS and Amesys, American Blue Coat and SS8, Italian Hacking Team and British Gamma.

Other prominent Israeli companies are Alut, Cellebrite and Elta, as well as Israeli-American Narus, which Lockheed Martin acquired. Israeli company Nice Systems last year exited the defense market, which generated limited profitability for it and unflattering headlines about problematic regimes using its products.

Lavie and Hulio, 35, have been starting up companies since their high school days in Haifa.

Hulio served six years in the army, half in intelligence and later as a search-and-rescue commander. In reserve duty, he has joined all of Israel's overseas rescue missions in recent years, including in Nepal, Haiti and Turkey.

Lavie served in artillery before studying business administration at the University of Haifa, while Hulio started studying law at Herzliya's Interdisciplinary Center. But they both dropped out in favor of entrepreneurship.

They founded their first startup, MediAnd, which helps viewers locate and buy items appearing on the screen, in 2007. It closed after three years, ending in a court case with the third founder, Yael Lerner Levy.

They founded their second startup, CommuniTake, a year later to help cellular operators remotely identify problems and support. The two left it following disputes with their cofounders and then founded NSO.

In 2013 they teamed up with Avi Rosen, the former vice president for development at Cyota, Education Minister Naftali Bennett's security information company that was sold to RSA for $145 million in 2005. The three founded Kaymera Technologies, which develops cellular security solutions, in other words security from spyware like NSO's.

"Anybody who sees the capability of NSO systems immediately thinks of ways to protect themselves against similar capabilities," Rosen, Kaymera's CEO, told Bloomberg in 2014.

Kaymera has developed secure smartphones for governments and private customers worldwide, with annual sales estimated at $15 million. The company has raised $13 million, $10 million of that in February. Its investors include Hong Kong-based GOEC Go Capital Ventures and Israeli angels Yariv Gilat and Eddy Shalev, who has accompanied the entrepreneurs the entire way.

Kaymera is located in Herzliya Pituah, in the same building as NSO. However, the company asserts Hulio and Lavie are not involved in Kaymera's daily operations.

AEOI Launches 2nd Cybersecurity Network Center at Arak N. Facilities
Monday, 29 August 2016

Tehran - Iran has launched a second cybersecurity network center at the country's nuclear facilities near the Central city of Arak, a senior advisor to the head of the Atomic Energy Organization of Iran (AEOI) said on Sunday.
Asqar Zare'an made the remarks in the Central city of Isfahan, addressing a ceremony to pre-launch a semi-industrial unit to produce the raw materials for the production of stable isotopes.

"We are happy that today we could pre-launch the semi-industrial unit to produce the raw materials for stable isotopes at Isfahan's UCF center," he said.

"Before this, the know-how and capability to produce stable isotopes were monopolized by a few countries, including the US, Russia and Germany," Zare'an added.

Iranian Foreign Ministry's Director General for Political Affairs and International Security Hamid Baeedinejad underlined in June the country's plans to further expand its nuclear industry despite powers' attempts to prevent it.

Iran's nuclear industry will never be shut down nor will it be subjected to restrictions, but it will make further progress day after day, Baeedinejad said.

He added that despite attempts by the world powers, led by the US, Iran's nuclear industry will continue to prosper.

While they sought to shut down Arak heavy water plant, now the US and Russia are main customers of Iran's heavy water, Baeedinejad said.

Iran Unveils National Data Network's Phase 1
Monday, 29 August 2016

Tehran - Iran unveiled the first phase of its National Data Network project on Sunday. Iranian First Vice President Eshaq Jahangiri and Minister of Communications and Information Technology Mahmoud Vaezi attended the unveiling ceremony.
The main purpose of the network is to help Iranian users to use the capacities of the network systems for communication purposes anytime and anywhere, while enhancing security of Iranian operaters' data.

Earlier this year, Head of Iran's Information Technology Organization Nasrollah Jahangard had said that national network means having a network across Iran which could provide services under Iran's security, management and control. "The network cannot be attacked at all," Jahangard said.

Last week, Iranian Minister of Communications and Information Technology Mahmoud Vaezi underlined that several international mobile operators have voiced their willingness to invest in Iran's telecommunication projects.

"Iran Connect 2016' conference would be an economic and technical forum in which the major operators will get acquainted with Iran's ICT capabilities," Vaezi said.

He said that international mobile operators have already welcomed taking part in the upcoming Iran-Connect Conference in Tehran.

Iran's Telecommunication Infrastructure Company (TIC) will host the conference on in Tehran on September 6-7.

Vaezi reiterated that the government is interested in cooperation between domestic and foreign private companies.

The Daily Beast
FBI vs. State Department Over Hillary Clinton's Secrets
Monday, 29 August 2016
Byline: Shane Harris

Washington - The FBI and the State Department are at odds over whether Hillary Clinton's personal lawyers had the proper government-issued security clearances that they needed to keep copies of her emails in a Washington, DC, law office last year.
Some of those emails contained classified information, which the lawyers and State Department officials knew at the time.

The issue has become a flashpoint in the broader controversy over Clinton's private email server. Republican lawmakers are pressing the FBI on whether it investigated the State Department's decision to give security clearances to Clinton's attorneys and let them store copies of the emails on a thumb drive. And statements from FBI and State Department officials show that there's no clear agreement on whether Clinton's attorneys were appropriately cleared to handle the material.

In July, FBI Director James Comey testified before the House Oversight and Government Reform that Clinton's attorneys didn't have the security clearances they needed. The FBI elaborated in a statement this week to The Daily Beast, saying "most of the attorneys representing former Secretary of State Clinton in this matter did not have the appropriate security clearances to review special access program material," which is highly secret information that is restricted only to a few people based on their need to know.

Seven email chains, which included messages sent and received by Clinton, contained such material, the FBI found.

The bureau didn't specify which lawyers didn't have the right clearances, but Clinton has been represented by at least two lawyers in matters related to her email, including her longtime personal attorney, David Kendall, of Williams & Connolly, and his colleague, Katherine Turner.

Kendall, who has previously said he and Turner hold a top secret clearance from the State Department, didn't respond to a request for comment.

But the State Department says Clinton was represented by appropriately cleared lawyers. A department spokesperson defended the decision in 2015 to let the attorneys keep the thumb drive in a government-issue safe, which department security officers provided after visiting Williams & Connolly's offices. At the time, Clinton's lawyers said they needed a full record of the emails in order to respond to questions from the House committee investigating the Benghazi, Libya, terrorist attacks, which happened on Clinton's watch.

"It's routine for individuals outside government to have temporary security clearances to work on a range of issues," State Department spokesperson Elizabeth Trudeau told The Daily Beast. "This includes legal representatives who may need it to better represent their clients appropriately. The Department does not confirm individuals' security clearance status, however, as we have confirmed in the past, former Secretary Clinton has counsel with clearance."

While Clinton's lawyers won't face any criminal prosecution over the issue, legal and security experts say giving them access to classified emails in their own offices was an unorthodox decision that appeared to give preferential treatment to the former secretary of state. Keeping classified information stored outside a government facility increases the possibility that it could be seen or stolen by people who aren't authorized to have it.

Rep. Jason Chaffetz, the chairman of the powerful House Oversight Committee, held Clinton personally responsible for the matter.

"Hillary Clinton gave her private attorneys, without proper security clearance, access to classified information. This once again illustrates Secretary Clinton's cavalier and sloppy behavior in handling highly sensitive information," Chaffetz told The Daily Beast. Earlier this week, Chaffetz asked Comey in writing whether law enforcement officials had "investigated the possibility that Secretary Clinton's classified emails were improperly stored or accessed" either by her "personal representatives" or her attorneys.

The issue is complicated by the fact that not all classified government information is treated the same. There are three ascending levels of classification: confidential, secret, and top secret. Clinton's emails contained information in all three categories.

But her lawyers learned about classified information in the emails at different times. First, they were informed in May 2015 by the State Department that at least one email contained "secret" information. At the time, State decided to install the safe at Williams & Connolly's offices.

Then, in June 2015, the State Department told the lawyers that 25 emails contained "confidential" information. That's a lower level than secret, and department security officers had determined that the safe and the law office were appropriate for handling information up to the secret level.

But in July, the inspectors general for the State Department and the intelligence community said they'd found four emails that contained information derived from intelligence agencies. That signaled that the emails could contain information from the most highly-classified category, and the law offices weren't set up to handle those sensitive secrets.

"We knew nothing about the clearances for counsel or for the law firm," Charles McCullough, the inspector general for the intelligence agencies, told Congress last month. "I was facing a situation where I had classified information, it appeared to me, outside the care, custody, and control of the U.S. government."

After the inspectors general discovered the classified information, intelligence agencies and the State Department would spend the next several months arguing over precisely how many of Clinton's emails contained which category of secrets. And internal emails obtained by The Daily Beast under the Freedom of Information Act show that in late July and early August of 2015, State Department lawyers were trying to determine whether attorneys representing Clinton had the clearances they needed.

The question was pressing enough that a State Department legal adviser sent several emails marked "URGENT" to the security officers who had been in charge of vetting Clinton's attorneys' offices and setting up the safe.

"Do any of the attorneys have TS [top secret] clearances," the adviser, Sarah Prosser, wrote, apparently not knowing the answer. The replies from her colleagues are heavily redacted, but the exchanges make clear that State's attorneys tried to sort out the issue at a critical time.

On the same day Prosser sent the message, the FBI took possession of the thumb drive from Clinton's lawyers. They would no longer be allowed to keep the emails in their office.

In its statement to The Daily Beast, the FBI seemed to absolve Clinton's attorneys of any responsibility for knowing what was in the emails. "The FBI does not believe the lawyers knew, or should have known at the time, that there was classified information in her emails," the statement read.

But clearly the lawyers did know that the emails contained confidential and secret information, because they were told so by State Department officials. Asked to clarify which levels of classification the lawyers did or didn't know about, an FBI spokesperson declined further comment.

But in the end, it was the responsibility of the State Department to ensure that the lawyers were properly vetted and their firm was prepared to handle classified information. And, the department says, its staff did just that.

The decision to give the attorneys a safe was approved by the State Department's Diplomatic Security Bureau, "taking into account all relevant factors including security clearances and access controls," Trudeau said. State also provided "instructions for how to secure the material (up to the Secret level of classification)," the second-highest of the three basic classification levels the government uses.

"Through a physical security expert, we confirmed that they were taking those measures," Trudeau continued. "The Department also informed counsel that additional steps would be required if the Department determined the material contained more highly classified information."

That ultimately proved unnecessary because the FBI came in August and took the thumb drive. At the time, investigators also seized Clinton's private server. In going through those records, investigators determined that Clinton's lawyers hadn't actually read all her emails when they tried to sort out which ones were work-related--the ones that ended up on the thumb drive--and which ones were personal. The lawyers deleted those.

Last week, the FBI revealed that investigators have found another 15,000 emails that Clinton's attorneys never turned over. It's not clear how many of those involved official communications, and the FBI has said there's no evidence the lawyers intentionally withheld the messages. But the revelation has only added to Republican suspicions that Clinton--and her attorneys--haven't told the full story about her email.

USA Today
Spyware firm linked to hack of iPhone has strong ties to U.S.
Monday, 29 August 2016
Byline: Elizabeth Weise

Washington - The spyware firm tied to an iPhone hack that prompted an emergency patch this week by Apple keeps a very low profile. But the NSO Group has strong ties here as well as in Israel, where it's staffed by specialists from Israel's military cyber division.
One of its recent owners, U.S. private equity firm Francisco Partners, operates from an office complex in San Francisco's leafy Presidio district that's also home to Lucasfilm and Industrial Light & Magic.

In Herzelia, an area of near Tel Aviv with a thriving tech culture, NSO was founded by Shalev Hulio and Omri Lavie in 2009, according to Hulio and Lavie's LinkedIn pages. Several of its employees previously worked for United 8200, the Israeli Army's cyber division, which produces spying software.

The tech company's background, pieced together from industry reports, reflects the growing boom in cybersecurity firms that operate in a nebulous area: creating software and processes that break into encrypted devices for government entities.

Company 'gotten caught'

NSO is described as "a leader in the field of cyber warfare," according to an apparent company brochure posted online by Privacy International.

The company uses "a powerful and unique monitoring tool, called Pegasus, which allows remote and stealth monitoring and full data extraction from remote target devices via untraceable commands," the brochure says.

While these hacks can be legal, they raise severe privacy worries from consumer groups. They also highlight concerns that increasingly rigorous encryption from Apple and other consumer tech companies is vulnerable to attacks funded by deep-pocked entities.

"What most people don't understand about espionage these days is just how dramatically sophisticated the technologies to conduct this kind of intelligence gathering have become," said Michael McFaul, director of the Freeman Spogli Institute for International Studies at Stanford University and the former U.S. ambassador to Russia.

Cybersecurity firms that can thwart encryption shot into the spotlight earlier this year when the FBI hired an unnamed private contractor to help it hack into the contents of the iPhone used by one of the San Bernardino shooters. The successful hack allowed the U.S. government to shelve a contentious fight with Apple, which did not want to provide a software override to its mobile operating system.

The NSO Group is rare "because it's one company that's gotten caught," said Eva Galperin, a global policy analyst with the Electronic Frontier Foundation, a digital rights group in San Francisco. "There's still a lot of light to be shed on this world," she said.

Its involvement, according to researchers who published findings on the spyware and notified Apple, was traced to the software's coding.

Suspicious text sent

Ahmed Mansoor, a prominent human rights activist in the United Arab Emirates, told University of Toronto's Citizen Lab he was sent a suspicious SMS link. Working with mobile security firm Lookout, Citizen Lab said the link carried a powerful, rare form of spyware that could have cost as much as $1 million. If Mansoor had clicked on it, it would have given the sender the ability to control his phone's camera and microphone, track his movements and rifle through all his apps, files and contacts, they said.

NSO Group spokesman Zamir Dahbash would not confirm or deny involvement in the Mansoor spyware. He said: "NSO's mission is to help make the world a safer place, by providing authorized governments with technology that helps them combat terror and crime."

Apple said it immediately fixed the vulnerability upon learning of it. On Thursday it advised customers to download the latest version of its iOS, version 9.3.5, for security protection.

Citizen Lab's John Scott-Railton said a likely suspect for the attempted attack was the United Arab Emirates, where Mansoor is seen as a dissident. He has been unable to leave the country since 2011 after his passport was taken. A representative for the UAE did not return a request for comment.

NSO Group has an extremely low profile. The company does not have a Web page. On its LinkedIn page, it is described as working "in the field of Internet security software solutions and security research." No contact information is listed.

NSO is U.S. owned

In 2014, Francisco Partners bought a majority stake. The private equity company, founded by West Coast investment banking pioneer Sanford Robertson and run by former Texas Pacific Group investor Dipanjan Deb, did not respond to requests for comment. Among its 75 portfolio companies, it does not list NSO as an investment.

According to a Reuters report last year, NSO Group had annual earnings of around $75 million.

If the software was produced, sold and used outside of the U.S., there would be no U.S. jurisdiction over it, said Robert Cattanach, a partner at Dorsey & Whiney who specializes in cyber security law. If it had

been used inside of the U.S., the Computer Fraud and Abuse Act would apply, but that doesn't appear to have happened here, he said.

Some say the availability of software is at least partly due to technology firms' reluctance to provide a back door to law enforcement.

"We are going to continue to see law enforcement agencies buying 'hacking tools,'" said Chris Hoofnagle, a professor of cyber crime law at the University of California- Berkeley.

Wall Street Journal
U.S. Revamps Line of Attack in Social-Media Fight Against Islamic State
Monday, 29 August 2016
Byline: Nicole Hong

New York - Recent initiatives by technology companies to push back against Islamic State's social-media messaging highlight a sobering fact: The U.S. government's battle on that front has mostly sputtered. In a number of terrorist attacks over the past year, the attackers were found to have been inspired by Islamic State propaganda and videos, which are often described as Hollywood-level productions. Despite numerous military victories against Islamic State, U.S. officials acknowledge they have struggled to counteract the terrorist group's online campaign.

"We were able to disrupt networks, arrest terrorist cells, kill terror operatives," said Ali Soufan, a former Federal Bureau of Investigation counterterrorism agent who now runs a security consulting firm, the Soufan Group. But "we haven't been doing a great job in countering the ideology."

Since early 2014, approximately 100 individuals have been arrested in the U.S. on charges related to providing support to Islamic State. In 69% of the cases, officials found the individuals had watched or read the group's electronic dispatches, according to a report released last month by Fordham University's Center on National Security.

The government's countermessaging efforts so far have been scattershot and, some close to the government think, largely ineffective. Officials say the government's new strategy is to empower third parties to create their own messages, a contrast from earlier efforts that were criticized for having too much direct government involvement.

One of the government's earliest messaging campaigns against Islamic State began in 2013 with a Twitter account run by the State Department called "Think Again Turn Away," which aimed to dissuade people interested in joining the terrorist group. But the account would often tweet directly at pro-Islamic State accounts, sparking back-and-forths on Twitter that drew more attention to the voices of individual jihadists, critics said.

People looking to view the account's tweets are now redirected to the account for the Global Engagement Center, a new State Department initiative created this year to combat Islamic State messaging. Unlike the previous effort, the center aims to reduce the government's direct engagement online, especially in English, which officials saw as ineffective.

There are some encouraging signs. Since June 2014, there has been a 45% drop in pro-Islamic State tweets, said U.S. officials, citing data analytics technology that tracks Islamic State's presence on social media. It's unclear, however, whether the drop in tweets has resulted in fewer foreign fighters wanting to join the terrorist group. Islamic State supporters are also becoming more active on encrypted messaging apps, experts say, which raises the question of whether counternarratives on platforms like Twitter or Facebook are reaching the proper audience.

Government-backed messaging has always been fraught with challenges. In 1948, Congress passed the Smith-Mundt Act, which said government information about the U.S. could only be distributed overseas. Those restrictions were later loosened but are still seen as somewhat outdated in the internet age. Nevertheless, the legal rules have forced the State Department to be careful not to present its messaging efforts as domestic propaganda, experts say.

The most significant hurdle lies not with the messages themselves, but with the messenger, according to current and former government officials. Experts widely acknowledge that directives from the U.S. government are unlikely to resonate with young people interested in joining Islamic State.

That presents the dilemma of how the government can support countermessaging efforts by tech companies and Muslim community leaders without undermining them.

A bipartisan congressional task force and the Homeland Security Advisory Council, which advises the Homeland Security secretary, have both recommended stronger countermessaging efforts by the government.

The task force's report, released last September, noted that a State Department video featuring an Islamic State defector received only 500 views after two months, while Islamic State execution videos received tens of thousands of views within hours of going online. The task force recommended the government "urgently" develop ways to contest the propaganda and work with partners such as social-media companies and universities.

The Department of Homeland Security announced last month that it would set aside $10 million of its budget to launch the first federal grant program devoted exclusively to "countering violent extremism," which includes countermessaging initiatives. School districts, local governments and nonprofits around the U.S. have been invited to apply.

Both the government and private sector are trying to use data analytics to target the messaging at the most vulnerable audiences.

Earlier this month, the Institute for Strategic Dialogue, a London think tank, published a report studying what kinds of counternarratives are most effective online. The experiments were funded by Google parent Alphabet Inc., Facebook Inc. and Twitter Inc. One conclusion from the study: The messages should be narrowly targeted to a particular audience.

Over the past year, the government has helped tech companies like Facebook create competitions for college students around the world to come up with their own campaigns against extremism. The efforts recognize that young people will respond best to messages created by other young people. This spring there were 54 universities in the competitions, up from 45 schools last fall.

In April, the House passed a bill that would require Homeland Security to use testimonials of former extremists and defectors to combat terrorism, a strategy that is widely employed in Europe. State Department officials also have encouraged media companies and filmmakers to host workshops where Muslim activists can learn to film their own content.

Whether the messages are dimming the appeal of Islamic State is hard to know. It's virtually impossible to quantify the number of people who were convinced not to join a terrorist group. For that reason, some experts say the government should be wary of devoting too many resources to this area and focus on military efforts with more tangible results.

"You're never going to get rid of bad ideas," said Will McCants, a former senior adviser at the State Department who now is a senior fellow at the Brookings Institution. "If we want to diminish them in the eyes of the public, let's have it, but let's also recognize that it is a marginal effort."

ABC (Australia)
Government computer networks breached in cyber attacks as experts warn of espionage threat
Monday, 29 August 2016
Byline: Linton Besser & Jake Sturmer

Canberra - Sensitive Australian Government and corporate computer networks, including those holding highly confidential plans for a privately financed geostationary communications satellite, have been penetrated by sophisticated cyber attacks, Four Corners reveals.
Sensitive Australian Government and corporate computer networks -- including those holding highly confidential plans for a privately financed geostationary communications satellite -- have been penetrated by sophisticated cyber attacks, a Four Corners investigation has established.

Austrade and the Defence Department's elite research division, now named the Defence Science Technology Group, both suffered significant cyber infiltrations in the past five years by hackers based in China.

Intelligence sources say they suspect the attackers in these cases were sponsored by Beijing.

Four Corners has also confirmed Newsat Ltd, an Australian satellite company whose assets were sold off last year after the company went into administration, was so comprehensively infiltrated three years ago that its entire network had to be rebuilt in secret.

But these incidents, revealed for the first time, are only a fraction of the cyber attacks being waged against Australian governments and companies.

The Prime Minister's cyber security adviser, Alastair MacGibbon, told the program the Australian Government was "attacked on a daily basis".

"We don't talk about all the breaches that occur," he said.

Former Central Intelligence Agency boss Michael Hayden, who also served for six years as the head of the US electronic spying division, the National Security Agency (NSA), said both Australia and the US had to harden up their defences and "protect their data" from foreign cyber attacks.

"It is what adult nation states do to one another," he said.

"What my dad told me when I came home beat up from a fight once when I was about 10 years old: 'Quit crying, act like a man and defend yourself'."

A spokesman for the Chinese Embassy in Canberra denied China had conducted any cyber espionage against Australian interests, calling such allegations "totally groundless" and "false cliches".

"Like other countries, China suffers from serious cyber attacks and is one of the major victims of hacking attacks in the world," he said.

Defence assets may have been target in BoM hack

Four Corners has also been given fresh details about the high-profile , which was officially confirmed by Mr Turnbull earlier this year.

Government and industry sources said the true targets for the cyber attack may have been defence assets linked to the BoM and its vast data-collection capabilities.

One was the Australian Geospatial-Intelligence Organisation, an intelligence agency within the Department of Defence which provides highly detailed mapping information for military and espionage purposes.

The other was the Jindalee Operational Radar Network (JORN), a high-tech over-the-horizon radar run by the Royal Australian Air Force.

JORN provides 24-hour military surveillance of the northern and western approaches to Australia but also assists in civilian weather forecasting.

Four Corners was told the cyber attack failed to reach into these networks, and that it was "sandboxed", or contained within the BoM.

Intelligence sources confirmed the attack was attributed to China, which was again denied by Beijing.

Mr MacGibbon said he did not know what the intention was of the people who compromised the system.

"I would say to you that people who compromise systems will usually try to find a way to move laterally through it. If that means through a third party that's what they'll try to do," he said.

The Australian Signals Directorate (ASD) has conducted detailed investigations into the cyber intrusion, but its boss, Dr Paul Taloni, declined to comment.

A former high-ranking intelligence officer told Four Corners the Defence Department itself had significant, unresolved, cyber-security issues and had "to look at itself".

He confirmed that in about 2011 the Defence Science Technology Organisation had been successfully hacked by China-sponsored hackers, but declined to provide any further details citing national security concerns.

A spokesman for the Defence Science Technology Group said: "Defence policy is to not comment on matters of national security."

Sensitive information 'stolen for profit'

Mr Hayden said, however, China's efforts against Australia had been primarily focused on "the theft of information, and really by and large the theft of information for commercial profit", activities which he said go beyond acceptable state-on-state espionage.

The Newsat attack by China- based hackers may be a case in point.

"Given we were up against China, state-sponsored, a lot of money behind them and a lot of resources and we were only a very small IT team, it certainly wasn't a fair fight for us," Newsat's former IT manager Daryl Peter said.

While the company carried communications for resources and fossil fuel companies, as well as the US military's campaign in Afghanistan, Mr Peter said the real target for the cyber infiltration was its plans for a Lockheed Martin-designed satellite dubbed Jabiru-1.

"A company like Lockheed Martin, they have restrictions on the countries where they can build their satellites," he said.

"So a country like China being able to get a hold of confidential design plans would be very beneficial for them because it's not something they would see or be able to have access to."

Mr Peter was first told about the hack of the company in 2013 at a top-level meeting with ASD. The issue had come to a head because of Newsat's advanced plans to employ a restricted encryption tool for use with the new satellite designed by the US Government's NSA.

ASD refused to release the tool to Newsat until it tackled the sophisticated cyber intrusion, with intelligence officials telling the company its networks were "the most corrupted" they had seen.

"They actually said to us that we were the worst," Mr Peter said.

"What came out of that meeting was we had a serious breach on our network and it wasn't just for a small period of time, they'd been inside our network for a long period, so maybe about two years. And the way it was described to us was they are so deep inside our network it's like we had someone sitting over our shoulder for anything we did."

To rid the network of the infestation, Mr Peter had to build a parallel network in secret so as to not tip off the hackers that had been identified.

That work took almost a year and cost the better part of $1 million.

Mr MacGibbon said the revelations were no surprise.

"I can't say which particular nation state would get involved in getting into a telecommunications system but I can understand why a nation state would," he said.

"If you wanted to listen to someone's communications that's probably a good place to start."

Austrade regularly challenged by security issues

Australia's trade and investment commission, Austrade, has had persistent problems with cyber security, Four Corners has learned.

The discovery of a major infestation in the Austrade network was made during work that began in 2013 within the department to develop a new data centre and a redesigned IT infrastructure.

In March 2014, the agency's cyber security regime underwent an ASD-designed security assessment required because Austrade not only carries sensitive communications but works closely with the Department of Foreign Affairs and Trade.

An intelligence community figure said the tests resulted in a "series of red flags". He said the infiltration was "covering the network".

Austrade brought in UXC Saltbush, a cyber security contractor, to investigate its networks and put mitigation works in place to prevent future breaches

A former high-ranking intelligence official said the Austrade breach followed a previous problem in 2011, which was a textbook example of a "successful [and] deeper penetration".

Jim Dickins, an Austrade spokesman, said the organisation "faces ongoing and fluid challenges to its information technology security".

"Austrade has worked with the Australian Signals Directorate on occasion to contain and eradicate threats but is unable to comment on specific instances. Mitigation strategies developed on those occasions are applied on an ongoing basis."

The intelligence community figure said the problems had still not been entirely addressed because of the high cost of a comprehensive network-wide security upgrade, but Mr Dickins denied there were any "significant" persistent issues.

"Austrade is not currently dealing with any significant threats or breaches of its network," he said.

A third intelligence source told Four Corners that "Austrade is inherently vulnerable" because of its international footprint and reliance on locally-employed staff.

"People are getting breached all the time," he said.

Watch Cyber War on Four Corners tonight at 8.30pm on ABC TV and on iView.

Globe and Mail
RC hack nearly brought agency 'back to the buggy'
Saturday, 03 September 2016
Byline: Colin Freeze

Ottawa - Upon discovering that it had been hacked by China, the Canadian government's scientific-research body did digital damage control on an enormous scale. Firing up its vintage fax machines, it jettisoned scores of computer servers, bought its staff hundreds of new laptops and drew up a list of about 20,000 corporate partners in Canada whose secrets risked being collateral damage.
Records newly released to The Globe and Mail reveal these and other details about the extensive fallout from this nightmare at the National Research Council.

The hack of the NRC was highlighted in July, 2014, when the then-Conservative government blamed China, making it the first and only cyberespionage campaign that Canada has ever pinned on a specific state adversary.

While hacks of government departments occur relatively routinely, the NRC could be considered a more valuable target than most. For decades, it has been routing tax dollars to fund cutting-edge research in agriculture, engineering and computer science. Placing bets on Canadian companies helps the NRC work to ensure future prosperity, and its staff gets a glimpse of emerging technologies and proprietary business plans.

That's why the Canadian government was alarmed when federal officials announced two years ago that they had "detected and confirmed a cyberintrusion" within the NRC by "a highly sophisticated Chinese state- sponsored actor."

But while prime minister Stephen Harper's government took the unprecedented step of allowing officials to make the controversy public, it remains unknown how or when Chinese hackers first infiltrated the NRC's computer systems, or what drew them to it in the first place.

The records released to The Globe under the Access to Information Act show only the aftermath. Job No. 1 at the agency was to warn the "clients" - corporations, academics, entrepreneurs - via phone calls and mailed letters that they were at risk. "The NRC has been the target of a cyberintrusion. As a result the information held in our systems from your organization may have been compromised," one form letter reads.

One version of this letter in the NRC files was accompanied by a spreadsheet of more than 20,000 Canadian firms, most of them apparently engaged in governmentsponsored research.

"As a precautionary measure, NRC informed all clients and research partners involved in business relationships and research activities of the cyberintrusion," spokesman Guillaume Berube said in reply to questions about this list.

Several of the companies that were contacted by The Globe said they felt that the fallout was minimal because they were careful, even before the hack, about sharing trade secrets with the agency.

Their biggest gripe with the NRC was that correspondence and payments became frustratingly slow in 2014. "It wasn't back to the buggy, but it was pretty close," said one entrepreneur, who asked not to be named.

This was because staff at the scientific agency had been told not to use computers to communicate. E-mail "must not be used to transmit secure, sensitive or confidential information," one memo reads. "The preferred way of transferring confidential information ... is paper (fax, mail, courier)," another says.

Clients were to be told that "if you must share sensitive information with the NRC, the best practice is to do it via physical media" - meaning on paper or via USB sticks.

As the hack was announced publicly, one enterprising NRC employee wrote that he found a stash of safe digital devices. "I've dug up a box of brand new McAfee USB keys that we bought a few years ago," he told colleagues in an e-mail. Calling them "state of the art" for their encryption capability, he said they could serve as a "stopgap, at least until NRC gets in more for everyone."

Even the act of plugging a smartphone into an NRC computer was deemed risky. "Instead of using your computer to charge your phone, charge it through a wall outlet," one memo says.

The agency started to pull the plug on almost all its existing computer architecture as it created the data equivalent of an airlock. The hope was to move electronic files from the NRC's legacy "black" environment to a blank slate of new machines dubbed the "green" environment.

The in-between step was the "grey zone," a locked-down "scrubbing" station with no external network connectivity and which banned unfamiliar digital devices and outsiders.

"The process of scrubbing data to be taken out of the Grey Zone can take a long time. We have seen up to 40 minutes to scrub 1 GB [gigabyte] of data," one employee complained.

The NRC's initial hope was to have fully rebuilt systems within a year. Most are in now place, but The Canadian Press recently reported that some parts will not be ready until July, 2018.

Early this summer, the NRC announced that it had embarked on a partnership with its scientific counterparts in a foreign country.

And that country is China. This new joint venture with Guangdong Province aims to better fund collaborative Canadian and Chinese research projects.

The NRC was asked by The Globe why it would want to do business with a country that allegedly stole from it just two years ago.

Mr. Berube said simply that "global collaboration is a competitive necessity to generate new business opportunities." The NRC spokesman added in his e- mailed reply that "the government of Canada is committed to deepening our trade relationships with established and emerging markets, including China."

The Hill Times
Canadians lack understanding of CSE and why it needs to snoop
Monday, 05 September 2016
Byline: Phil Gurski
Section: oped

OTTAWA--If there is one spy agency in Canada that is poorly understood and about which much of little veracity has been published it has to be CSE, or the Communications Security Establishment.
CSE has a number of roles, but the one that gets the most public attention is signals intelligence, or SIGINT. This method of intelligence collection entails capturing telecommunications in a variety of forms by a variety of techniques, few of which are known. This is indeed a good thing: the spy agency that openly shares how it gathers intelligence will not be in the spy business very long. This may sound sacrilege to some, but some things need to remain secret.

CSE is not a law-enforcement agency and does not go to court to acquire warrants to collect information, unlike CSIS and the RCMP. It is limited to the collection of intelligence outside Canada and it cannot include Canadians (or Americans, British, Australians, and New Zealanders for that matter--Canada's so-called "five eyes"partners) in its dragnet.

And yet, some information pertaining to Canadians has apparently been picked up, and the scale of that collection appears to be on the upswing, according to a recent National Post article. Should Canadians be worried?

It is hard to say, but I will go with no. Before I explain why I think that there are limited circumstances under which CSE should be able to collect information on Canadians. it would be remiss not to note that I worked for that organization for almost 20 years. I knew how it operated very well in the pre-9/11 period, but would not purport to be an expert on how it operates now. Nevertheless, I am certain that the same rigour and observance of Canadian law, as well as internal policies, are being followed today much as they were when I was there.

We do not know precisely what kinds of information were collected, but there is a particular circumstance under which Canadian communications should and must be intercepted by CSE, and I think that Canadians would agree with me.

Much discussion has been held in recent years over how and whether CSE should assist other Canadian security agencies--i.e., CSIS and the RCMP--in their lawful investigations. CSE's partners do take action to monitor threats like terrorism and they have a suite of tools with which to do so. They do a very good job but on rare occasions could use the help of an agency like CSE.

Consider the following scenario. Either CSIS (under its Section 21 powers) or the RCMP (Part VI) have successfully obtained a warrant to capture the communications of a person under investigation. These warrants are granted by Federal Court judges once these agencies provide compelling arguments as to why they need these intrusive powers (not a rubber-stamp process by any stretch) and apply them to communications within Canada. But what if the subject of investigation high tails it to Somalia or Syria or Afghanistan? Not only do Canadian warrants not apply in those countries, but it would be next to impossible to get local law enforcement or intelligence agencies there to cooperate with us. That is where CSE could assist.

I have absolutely no issue with CSE helping either the RCMP or CSIS collect an individual's communications while outside the country when they already have such powers within Canada. Having access to this information can assist ongoing investigations and could make a difference in stopping a terrorist act or not. We have seen instances, here and abroad, where terrorists have travelled to some hotspot, received training, and returned to their homeland to kill and maim people. Having that extra information should not be seen as injurious to privacy concerns or outside CSE's remit.

As I have said many, many times, we need an adult conversation in this country on what is reasonable to expect from our intelligence agencies and what they need to keep us safe. We have to stop relying on information from pseudo experts and engage in meaningful dialogue. CSE has a lot of resources and tools at its disposal and it should not be handcuffed in its efforts to help keep us safe.

The Hindu
Scorpene data breach echoes on G20 sidelines
Tuesday, 06 September 2016
Byline: Atul Aneja

Hangzhou - The breach of sensitive data regarding the French Scorpene submarines being built in India has echoed in Hangzhou, with Prime Minister Narendra Modi taking up the issue during the "pull aside" with French President Francois Hollande on the sidelines of the G20 summit on Monday.
Foreign Ministry spokesperson Vikas Swarup, during his briefing on Monday afternoon confirmed that the Scorpene issue was raised during the Prime Minister's brief meeting with the French President. However, he was non-committal when asked separately by The Hindu on whether the sensitive information seepage, reported by the Australian newspaper, also came up during Sunday's talks

between Prime Minister Modi and his Australian counterpart, Malcolm Turnbull. "I can neither confirm nor deny it," he said. Official sources, however, had earlier told The Hindu that "it was inconceivable" that the Scorpene issue did not feature during the Prime Minister's talks with Mr. Turnbull.

The Mazagon Docks Limited (MDL) is building six Scorpene submarines with technology transfer from DCNS of France. "The stunning leak, which runs to 22,400 pages and has been seen by The Australian, details the entire secret combat capability of the six Scorpene-class submarines that French shipbuilder DCNS has designed for the Indian Navy," The Australian had reported last month.

On Monday, the Financial Review reported from Hangzhou that Mr. Turnbull has received assurances from Mr. Hollande regarding the submarines that Australia is set to acquire from DCNS of France in the aftermath of the data leakage of the Scorpene.

The daily said that Mr. Turnbull revealed on Monday that he had already raised the matter with Mr. Hollande on the sidelines of the G20 leaders' summit. It was formally raised when the pair had a bilateral meeting later in the day.

"We've had a brief discussion about it already and we will be addressing it in more detail," Mr. Turnbull said before formal talks.

"Maintaining absolute maximum security, total security on information of this kind is critical. The leaks of the material relating to Scorpene submarine are very, very regrettable."

Mr. Turnbull said that while the Scorpene submarine was different to the 12 Barracuda subs DCNS would be building for Australia, he needed an assurance that the security breach would not happen again.

"There's a thorough investigation going on the French side to see how that happened -- of course it's a different submarine to the one that we are going to build in collaboration with the French -- but it is absolutely critical to continue to maintain the highest level of security," he said.

When asked by The Hindu to comment on the grave security implications of the leak on Monday, the sources said that "a court injunction in Australia has already been obtained" that would prevent further seepage of information regarding the Scorpene submarines. The Australian has said that it would not be publishing additional confidential data on the Indian Scorpene Class submarines after the New South Wales Supreme Court imposed a temporary ban on further publication of the documents.

Reuters had earlier reported that Indian officials have pointed to a "non-disclosure of information" clause that was written into the 2005 contract at French insistence. Quoting a defence ministry official, it said that New Delhi could only invoke that clause if it was established that the data was leaked and not stolen.

Arab News
Shortage of IT specialists exposes govt networks to spy threats
Tuesday, 06 September 2016
Byline: Sharif M. Taha

Riyadh - An information technology expert said a shortage of specialized cadres in information security has exposed government and service sector networks to spy and infiltration attacks.
Last week, the Electronic Security Center (ESC), an affiliate of the Interior Ministry, detected foreign attacks targeting the electronic networks of a number of government agencies and other vital sectors in the Kingdom.

Dr. Hani Al- Zaid, an expert in information security, told local media that the issue is linked to challenges facing the Saudization of technical jobs, notably those related to information security.

Based on his experience in the government sector, he said there were two challenges facing the Saudization of technical jobs: Shortage of specialized cadres in information security, and difficulty in the recruitment of qualified cadres due to limited privileges of such jobs.

To address the problem, he suggested the assignment of information security jobs in the government sector to government companies specialized in information security. This will help in rotating qualified cadres into such specialized jobs, safeguarding the secrecy of information circulated in the public sector, he said.

According to the ESC report last week, the foreign electronic attacks came on a number of governmental and service sector networks.

The governmental sector received 39 percent of the total electronic attacks, followed by the media sector (23 percent), the telecom and IT sector (15 percent), whereas the electricity and water sector was the least attacked at 8 percent, the ESC said.

Al-Zaid estimated the Kingdom's losses arising from the electronic attacks at SR2.8 billion. He stressed that the electronic attacks sustained by some government agencies necessitates the building of a national plan to qualify national cadres in information security.

Lebanon Daily Star
STL: Telecoms expert details final calls before bombing
Tuesday, 06 September 2016
Byline: Ned Whalley

Beirut - A telecoms expert described to the Special Tribunal for Lebanon how a covert network of cellphones exhibited striking call patterns in the leadup to the assassination of ex-Prime Minister Rafik Hariri, culminating in a flurry of activity in the hour before his death. John Edwards Philips testified that the activity of a group of eight "red phones" can be strongly associated with the crime. "They worked in a pattern together. They were coordinated and cohesive," he said.
Philips is the prosecution's primary expert on cell-siting and the analysis of call data records. Overlaying coverage maps with satellite photos, he demonstrated the remarkable activity of the red phones in the final minutes before a massive car bomb killed the former prime minister outside Beirut's St. Georges Hotel.

Prosecutors say they have identified a number of covert networks used in the conspiracy, giving each a color. The red phones were allegedly used in the actual execution of the bombing. The phones made 28 calls in the hour before the attack, six in the final three minutes. One in particular made a rapid succession of calls to the others just before the blast. Philips' map showed each as they made way their way south, away from the soon-to-be blast site. The handsets were never used again.

Philips said the phones demonstrated "high-forensic visibility," due to their heavy usage in physical and temporal proximity to the incident. He called their discovery "inevitable" and suggested that any analysis of cellphone usage would have revealed them. Furthermore, he suggested the operators of the red phones knew this. What was intended to be secret was the association with other covert networks and, ultimately, the identities of users.

Philips documented the "hierarchical call flow" exhibited by the activity of these other groups, where a call from one phone appeared to precipitate atypical activity among the entire network.

"Whenever certain activities occur, the command element is inextricably involved," Philips said.
Prosecutors contend this evidence illustrates the phone of defendant Salim Ayyash being used to send other members of the operation on trips to Tripoli, Baalbeck and Anjar.

The excursions to Tripoli were allegedly undertaken to purchase the Mitsubishi van used in the attack and to travel to Baalbeck and Anjar to obtain the necessary explosives. Anjar held particular significance at the time as the Lebanese headquarters of Syrian intelligence.

Associated Press
Kuwait warns citizens on carrying extremist materials to US
Sunday, 04 September 2016

Kuwait City - The Gulf nation of Kuwait has warned citizens travelling to the U.S. to check their phones and laptops to ensure they do not contain any material that could be linked to extremist groups.
The official Kuwait News Agency reported Saturday that the Kuwaiti Embassy to Washington also urged citizens to ``co-operate fully'' with American airport officials seeking access to their devices.

It warns that immigration officials could interrogate Kuwaitis and cancel entry visas if extremist photos, videos or other materials are found.

The warning comes after Kuwaiti media reported that three Kuwaitis were refused entry to the U.S. earlier this year.

Kuwait is a U.S. ally that hosts American troops taking part in operations against the Islamic State militant group.

Attempt at smuggling drone parts to Pakistan foiled
Sunday, 04 September 2016
Byline: Javed Hamim Kakar

Kabul - An attempt to smuggle military equipment, including drone parts, to Pakistan was frustrated by security forces in eastern Nangarhar province on Sunday, a source revealed.
One official wishing to go unnamed told Pajhwok Afghan News that Special Forces were dispatched from Kabul to eastern Nangarhar province in the morning.

The Special Forces conducted a joint raid jointly with Nangarhar Border Police in Momand Dara district and recovered the military gear from a house.

New York Times
F.B.I. Email Inquiry Reveals Some of Secretary's Habits
Saturday, 03 September 2016
Byline: Michael S. Schmidt

Washington - Documents released by the F.B.I. on Friday revealed new details about the Justice Department's yearlong investigation into Hillary Clinton's use of a private email server and whether she and her aides mishandled classified information. Among the documents was an 11-page summary of an interview F.B.I. agents conducted with Mrs. Clinton on July 2. Two days later, the F.B.I. director, James B. Comey, said the bureau had recommended to the Justice Department that neither Mrs. Clinton nor her aides should be charged with a crime. Here are six highlights from those documents:
New details about the deletion of Mrs. Clinton's emails

According to the F.B.I., in December 2014 a top aide to Mrs. Clinton told the company that housed her server to delete an archive of emails from her account. The company, Platte River Networks, apparently never followed those instructions. On March 2, 2015, The New York Times reported that Mrs. Clinton had exclusively used a personal email account when she was secretary of state. Two days later, the

congressional committee investigating the 2012 attacks in Benghazi, Libya, and Mrs. Clinton's response to them, told the technology firms associated with the email account that they had to retain "all relevant documents" related to its inquiry.

Three weeks later, a Platte River employee realized he had not deleted the emails as instructed. The employee said he then used a special program called BleachBit to delete the files. The F.B.I. said Mrs. Clinton was unaware of the deletions.

The F.B.I. said it was later able to find some of the emails, but did not say how many emails were deleted, or whether they were included in the 60,000 emails that Mrs. Clinton said she sent and received while secretary of state from 2009 to 2013.

But Mrs. Clinton's lawyer, David Kendall, said in a letter to Congress on March 27, 2015, that after Mrs. Clinton gave roughly 30,000 work-related emails to the State Department, Mrs. Clinton "chose not to keep" her personal emails while she was secretary of state, which she has said numbered roughly 30,000. Mr. Kendall said he confirmed with Mrs. Clinton's support staff that no emails from the time she was in office "reside on the server or on any backup systems associated with the server."

Mrs. Clinton relied on her staff to know what was classified

In Mrs. Clinton's interview with the F.B.I., she said she did not recall receiving any emails "she thought should not be on an unclassified system." She said she had relied on State Department officials to use their judgment when emailing her sensitive information, adding that she "could not recall anyone raising concerns with her regarding the sensitivity of the information she received at her email address."

Colin Powell had told Mrs. Clinton to 'be very careful'

In a summary of the investigation, the F.B.I. said Mrs. Clinton had emailed Colin L. Powell, a former secretary of state, a day after she was sworn into office about Mr. Powell's use of a personal email account when he was the country's top diplomat. Mr. Powell warned Mrs. Clinton that if she used her BlackBerry for official business, those emails could become "official record[s] and subject to the law."

Mr. Powell, apparently implying that he was cautious in his use of his personal email account, added: "Be very careful. I got around it all by not saying much and not using systems that captured the data." According to a summary of her interview, Mrs. Clinton said she did not know exactly what Mr. Powell meant and that his message "did not factor into her decision to use a personal email account."

Some of Mrs. Clinton's closest aides were unaware of the server

Mrs. Clinton said in her interview it was "common knowledge" that she had a private email address because it was "displayed to anyone with whom she exchanged emails." But the F.B.I. said in a summary of its findings that "some State Department employees interviewed by the F.B.I. explained that emails

by Clinton only contained the letter 'H' in the sender field and did not display her email address." The F.B.I. said that some of Mrs. Clinton's closest aides were aware she used a private email address but did not know she had set up a private server. The aides said they were "unaware of the existence of the private server until after Clinton's tenure at State or when it became public knowledge."

Mrs. Clinton had taken her BlackBerry into prohibited areas

According to the summary of the investigation, Mrs. Clinton brought her BlackBerry into a secure area on the seventh floor of the State Department, where such electronics are prohibited. The F.B.I. interviewed three former State Department diplomatic security agents who said that Mrs. Clinton kept her BlackBerry in her desk drawer in the secure area, a so-called Sensitive Compartmented Information Facility, or SCIF. But Huma Abedin, a top aide to Mrs. Clinton, told the F.B.I. that Mrs. Clinton left the secure area to check her BlackBerry, often going to the State Department's eighth-floor balcony to do so.

Mrs. Clinton had used a lot of electronic devices to send emails

The F.B.I. said that it had identified 13 mobile devices that Mrs. Clinton potentially used to send emails. Mrs. Clinton's aides were in charge of buying replacement BlackBerry devices when she was in office. Ms. Abedin told the F.B.I. that "it was not uncommon for Clinton to use a new BlackBerry for a few days and then immediately switch it out for an older version with which she was more familiar." Ms. Abedin and another aide told the F.B.I. that "the whereabouts of Clinton's devices would frequently become unknown once she transitioned to a new device." An aide to Bill Clinton, Justin Cooper, who helped set up the server, told the F.B.I. that he recalled "two instances where he destroyed Clinton's old mobile devices by breaking them in half or hitting them with a hammer."

Microsoft's Legal Challenge to Government Secrecy Wins Dozens of Supporters
Saturday, 03 September 2016
Byline: Nick Wingfield

Seattle - Dozens of allies threw their weight behind Microsoft on Friday in a case that challenges law enforcement's use of secrecy orders to cloak its pursuit of digital communications in investigations. Amazon, Google, Snapchat, Salesforce and several others filed a brief on Friday in support of Microsoft in its case against the United States Justice Department, while Apple, Mozilla and others made their own filing. Civil liberties groups and media organizations like Fox News, National Public Radio and The Washington Post submitted their own briefs.

Microsoft was also backed by a collection of law professors and a group of former United States attorneys who worked in the Western district of Washington, where Microsoft filed its federal lawsuit in April.

Microsoft's effort to rally support is part of a growing resistance by technology companies to government attempts to snoop on the electronic communications of their customers.

Revelations by Edward J. Snowden, the former United States government contractor, about the extent of electronic surveillance by spy agencies have rattled technology companies, which worry that trust in their products is being undermined.

In a statement, Brad Smith, Microsoft's president and chief legal officer, said the company was grateful for the support from what it expected to total 80 signatories on multiple briefs by the end of the day. He noted the diversity of backgrounds of the signatories, saying, "it's not every day that Fox News and the A.C.L.U. are on the same side of an issue."

"We believe the constitutional rights at stake in this case are of fundamental importance, and people should know when the government accesses their emails unless secrecy is truly needed," Mr. Smith added.

Peter Carr, a spokesman for the Justice Department, declined to comment.

The lawsuit argued that the government's use of a provision of the Electronic Communications Privacy Act of 1986 -- which prevents Microsoft from notifying customers when their communications have been turned over to law enforcement, sometimes indefinitely -- is unconstitutional.

Microsoft said the secrecy orders violated the Fourth Amendment, which grants people and businesses the right to know if the government seizes or searches their property, along with the company's First Amendment right to communicate with its customers.

Technology companies are concerned that secrecy orders are especially troubling in the era of cloud computing. "In contrast to a search of a home or a seizure of physical property, there may be no way for a user to detect that the provider has disclosed information stored in the account to the government," the brief filed by Amazon, Google and others said.

In March, nearly every major technology company, including Microsoft, Amazon and Google, filed briefs backing Apple in a legal showdown with the federal government, which had demanded Apple's technical assistance in bypassing security software on an iPhone used by a gunman in the shootings in San Bernardino, Calif., last year.

The F.B.I. eventually broke into the phone with the help of an outside party, not Apple.

The Microsoft lawsuit is different in that it does not center on any individual case, but instead is aimed at the legal process the government uses to keep its information requests secret.

The company said such secrecy orders are becoming more frequent. In its lawsuit, Microsoft said of the more than 5,600 federal demands for customer data it received between September 2014 and March 2016, nearly half were accompanied by secrecy orders that prevented Microsoft from telling affected customers that it had turned over their information to the government.

Microsoft executives have said they appreciate the necessity of secrecy orders in some cases. But they have criticized as too low the bar that prosecutors must meet to obtain a secrecy order from courts.

Microsoft is also concerned about the absence of time limits on when it can disclose to customers that the government has obtained their communications. For physical searches of files and the like, most secrecy orders delay notification for a limited period of time, often one to three months.

For the government data requests with secrecy orders that Microsoft received in the period it examined between 2014 and 2016, more than 68 percent contained no fixed end date.

"Law enforcement officials have no practical need to keep their searches secret indefinitely, except in the rarest of circumstances, which must be supported by particularized need," read the brief filed Friday by former United States attorneys supporting Microsoft.

Le piratage de l'Elysée en 2012 venait bien des Etats-unis (Canada)
Saturday, 03 September 2016

Paris -Les Etats-Unis sont bien à l'origine d'une attaque informatique contre l'Elysée au printemps 2012, a déclaré un ancien responsable des services secrets français. Dans une conférence donnée en juin dev... Les Etats-Unis sont bien à l'origine d'une attaque informatique contre l'Elysée au printemps 2012, a déclaré un ancien responsable des services secrets français. Dans une conférence donnée en juin devant les élèves de l'école d'ingénieurs CentraleSupélec, dont LeMonde.fr diffuse un enregistrement samedi, Bernard Barbier reconnaît également la responsabilité de la France derrière une autre attaque informatique détectée par les services canadiens en 2009. Cet ancien chef de la direction technique de la Direction générale de la sécurité extérieure (DGSE) raconte qu'il a reçu un appel à l'aide du responsable de la sécurité informatique de l'Elysée en mai 2012, entre les deux tours de la présidentielle, à la suite d'un piratage d'ordinateurs de collaborateurs du chef de l'Etat, alors Nicolas Sarkozy.

"On a vu qu'il y avait un 'malware' (logiciel malveillant) qui avait une signature identique à celui que nous avions identifié lors d'une attaque contre la Communauté européenne en 2010. Il n'y avait que les Américains et les Russes qui avaient pu faire cette première opération", a- t-il dit. "En 2012, nous avions davantage de moyens et de puissance techniques pour travailler sur les métadonnées. J'en suis venu à la conclusion que cela ne pouvait être que les Etats-Unis", ajoute-t-il en précisant que le logiciel en question avait été infiltré lors de connexions sur Facebook.

Bernard Barbier indique qu'il a reçu par la suite l'ordre de François Hollande se rendre aux Etats-Unis pour protester contre cette opération auprès de l'Agence nationale de sécurité (NSA) américaine.

"Ce fut le 12 avril 2013 et ce fut vraiment un grand moment de ma carrière professionnelle (...) A la fin de la réunion, Keith Alexander (NDLR: directeur de la NSA de 2005 à 2014), n'était pas content. Alors que nous étions dans le bus, il me dit qu'il est déçu car il pensait que jamais on ne les détecterait. Et il ajoute : 'Vous êtes quand même bons.'"L'ancien responsable de la DGSE reconnaît que les services français ont commencé à faire du piratage informatique dès 1992 et qu'ils sont responsables d'une vaste opération lancée en 2009, comme le soupçonnait le Canada dans une note dévoilée en 2013 par le lanceur d'alerte américain Edward Snowden. Les cibles étaient alors des institutions iraniennes liées au programme nucléaire de la République islamique mais aussi plusieurs pays, dont le Canada, et des objectifs en France. "Les Canadiens ont fait du 'reverse' sur un malware qu'ils avaient détecté. Ils ont retrouvé le programmeur qui avait surnommé son malware 'Babar' et avait signé 'Titi'. Ils en ont conclu qu'il était français. Et effectivement, c'était un Français", dit-il.

Putin calls DNC hack public service, denies Russia's involvement
Saturday, 03 September 2016

Moscow - Russian President Vladimir Putin said Thursday that the hack of the Democratic National Committee's emails was a public service, but denied that Moscow played any part in the cyberattack. Security experts have suggested that Russian-backed cyber militias were behind the cyberattacks on top Democratic Party groups and the possible breach of Clinton Foundation computers. But Putin wondered why it mattered who was behind the hacks.

"Listen, does it even matter who hacked this data?" he said in an interview with Bloomberg News. "The important thing is the content that was given to the public."

U.S. officials have pointed to the Russian government as the possible culprit of the attacks on DNC servers earlier this year that led to WikiLeaks published 20,000 DNC documents prior to the Democratic National Convention. The leaks showed that party officials leaned favorably toward Hillary Clinton over Bernie Sanders and led to Debbie Wasserman Schultz stepping down as the chairwoman of the Democratic National Committee.

"There's no need to distract the public's attention from the essence of the problem by raising some minor issues connected with the search for who did it," Putin said of the breach. "But I want to tell you again, I don't know anything about it, and on a state level Russia has never done this."

Based on available data and what's known of the time line on the recent attacks, the first was on the Democratic National Committee.

2016 Election Headquarters

The latest headlines on the 2016 elections from the biggest name in politics.

See Latest Coverage ?

Then hackers "island hopped" to other computer networks after staffers at the Democratic Congressional Campaign Committee and perhaps elsewhere opened phishing emails from which their user IDs, passwords and other credentials were stolen.

The FBI is investigating the breaches at the DNC, made public in late July, and the DCCC, announced in August. It is not clear whether that work has expanded with the apparent targeting of the Clinton Foundation.

Putin has repeatedly denied involvement, but Russian intelligence is thought to routinely use cyber gangs to do its bidding and to create plausible deniability.

"Within the former Soviet bloc, Russian- speaking hackers pay homage as cyber-militia members to the regime in Russia," CEO of the next-generation tech group Strategic Ventures Tony Kellerman told Fox News in August. "They act as proxies ... when called upon to leverage their sophisticated tool sets and attack against victims in the U.S."

Putin is thought to have a vendetta against Clinton after a failed attempt to re-establish positive relations in 2009. Putin also blamed her for stoking protests in 2011. Clinton had compared Russia's annexation of Crimea in 2014 to Adolph Hitler's advancements in Europe during World War II, Bloomberg News reported.

A person familiar with the hack attack told Bloomberg News that the FBI is highly confident that the Moscow government was behind the security breach of the DNC and other Democratic groups.

The Clinton campaign accused Putin of trying to influence that U.S. election.

"Unsurprisingly, Putin has joined Trump in cheering foreign interference in the U.S. election that is clearly designed to inflict political damage on Hillary Clinton and Democrats," Clinton spokesman Jesse Lehrich said in an email to Bloomberg. "This is a national security issue and every American deserves answers about potential collusion between Trump campaign associates and the Kremlin."

Though Putin is not taking blame, an internal probe of the DNC hack found that two groups connected to Russian federal security and the Defense Ministry were responsible for the hack.-

New York Times
Phone Spying Is Made Easy. Choose a Plan.
Saturday, 03 September 2016
Byline: Nicole Perlroth

San Francisco - Want to invisibly spy on 10 iPhone owners without their knowledge? Gather their every keystroke, sound, message and location? That will cost you $650,000, plus a $500,000 setup fee with an Israeli outfit called the NSO Group. You can spy on more people if you would like -- just check out the company's price list.
The NSO Group is one of a number of companies that sell surveillance tools that can capture all the activity on a smartphone, like a user's location and personal contacts. These tools can even turn the phone into a secret recording device.

Since its founding six years ago, the NSO Group has kept a low profile. But last month, security researchers caught its spyware trying to gain access to the iPhone of a human rights activist in the United Arab Emirates. They also discovered a second target, a Mexican journalist who wrote about corruption in the Mexican government.

Now, internal NSO Group emails, contracts and commercial proposals obtained by The New York Times offer insight into how companies in this secretive digital surveillance industry operate. The emails and documents were provided by two people who have had dealings with the NSO Group but would not be named for fear of reprisals.

The company is one of dozens of digital spying outfits that track everything a target does on a smartphone. They aggressively market their services to governments and law enforcement agencies around the world. The industry argues that this spying is necessary to track terrorists, kidnappers and drug lords. The NSO Group's corporate mission statement is "Make the world a safe place."

Ten people familiar with the company's sales, who refused to be identified, said that the NSO Group has a strict internal vetting process to determine who it will sell to. An ethics committee made up of employees and external counsel vets potential customers based on human rights rankings set by the World Bank and other global bodies. And to date, these people all said, NSO has yet to be denied an export license.

But critics note that the company's spyware has also been used to track journalists and human rights activists.

"There's no check on this," said Bill Marczak, a senior fellow at the Citizen Lab at the University of Toronto's Munk School of Global Affairs. "Once NSO's systems are sold, governments can essentially use them however they want. NSO can say they're trying to make the world a safer place, but they are also making the world a more surveilled place."

The NSO Group's capabilities are in higher demand now that companies like Apple, Facebook and Google are using stronger encryption to protect data in their systems, in the process making it harder for government agencies to track suspects.

The NSO Group's spyware finds ways around encryption by baiting targets to click unwittingly on texts containing malicious links or by exploiting previously undiscovered software flaws. It was taking advantage of three such flaws in Apple software -- since fixed -- when it was discovered by researchers last month.

The cyberarms industry typified by the NSO Group operates in a legal gray area, and it is often left to the companies to decide how far they are willing to dig into a target's personal life and what governments they will do business with. Israel has strict export controls for digital weaponry, but the country has never barred the sale of NSO Group technology.

Since it is privately held, not much is known about the NSO Group's finances, but its business is clearly growing. Two years ago, the NSO Group sold a controlling stake in its business to Francisco Partners, a private equity firm based in San Francisco, for $120 million. Nearly a year later, Francisco Partners was exploring a sale of the company for 10 times that amount, according to two people approached by the firm but forbidden to speak about the discussions.

The company's internal documents detail pitches to countries throughout Europe and multimillion-dollar contracts with Mexico, which paid the NSO Group more than $15 million for three projects over three years, according to internal NSO Group emails dated in 2013.

"Our intelligence systems are subject to Mexico's relevant legislation and have legal authorization," Ricardo Alday, a spokesman for the Mexican embassy in Washington, said in an emailed statement. "They are not used against journalists or activists. All contracts with the federal government are done in accordance with the law."

Zamir Dahbash, an NSO Group spokesman, said that the sale of its spyware was restricted to authorized governments and that it was used solely for criminal and terrorist investigations. He declined to comment on whether the company would cease selling to the U.A.E. and Mexico after last week's disclosures.

For the last six years, the NSO Group's main product, a tracking system called Pegasus, has been used by a growing number of government agencies to target a range of smartphones -- including iPhones, Androids, and BlackBerry and Symbian systems -- without leaving a trace.

Among the Pegasus system's capabilities, NSO Group contracts assert, are the abilities to extract text messages, contact lists, calendar records, emails, instant messages and GPS locations. One capability that the NSO Group calls "room tap" can gather sounds in and around the room, using the phone's own microphone.

Pegasus can use the camera to take snapshots or screen grabs. It can deny the phone access to certain websites and applications, and it can grab search histories or anything viewed with the phone's web browser. And all of the data can be sent back to the agency's server in real time.

In its commercial proposals, the NSO Group asserts that its tracking software and hardware can install itself in any number of ways, including "over the air stealth installation," tailored text messages and emails, through public Wi-Fi hot spots rigged to secretly install NSO Group software, or the old-fashioned way, by spies in person.

Much like a traditional software company, the NSO Group prices its surveillance tools by the number of targets, starting with a flat $500,000 installation fee. To spy on 10 iPhone users, NSO charges government agencies $650,000; $650,000 for 10 Android users; $500,000 for five BlackBerry users; or $300,000 for five Symbian users -- on top of the setup fee, according to one commercial proposal.

You can pay for more targets. One hundred additional targets will cost $800,000, 50 extra targets cost $500,000, 20 extra will cost $250,000 and 10 extra costs $150,000, according to an NSO Group commercial proposal. There is an annual system maintenance fee of 17 percent of the total price every year thereafter.

What that gets you, NSO Group documents say, is "unlimited access to a target's mobile devices." In short, the company says: You can "remotely and covertly collect information about your target's relationships, location, phone calls, plans and activities -- whenever and wherever they are."

And, its proposal adds, "It leaves no traces whatsoever."

Le Monde
Les confessions d'un maître de l'espionnage français (Canada)
Saturday, 03 September 2016

Bernard Barbier, l'ancien chef de la direction technique de la DGSE, a levé le voile sur plusieurs secrets d'Etat lors d'une conférence dans son ancienne école d'ingénieurs.
C'est une intrusion inespérée dans un monde interdit aux regards extérieurs, celui du renseignement et des guerres secrètes. Face aux élèves de l'école d'ingénieurs CentraleSupélec, dont il est issu, Bernard Barbier, l'un des personnages les plus importants de l'espionnage français des dix dernières années, a levé le voile sur des mystères qu'on pensait insolubles. Au cours de cette causerie, il a ainsi fait oeuvre de transparence sur certaines des principales affaires d'espionnage récentes ayant touché la France. Il a brisé des tabous, notamment en relatant l'attaque chinoise sur Areva et en confirmant la responsabilité de la France derrière une attaque informatique mondiale détectée par les services canadiens.

Espionnage et cybersécurité, Bernard Barbier reçu par Symposium CentraleSupélec

M.Barbier, qui fut de 2006 à 2014 l'homologue du directeur de l'Agence nationale de sécurité (NSA) américaine, en tant que chef de la direction technique de la Direction générale de la sécurité extérieure (DGSE), a commencé sa carrière au Commissariat à l'énergie atomique (CEA). Au sein de la DGSE, il obtient, en2008, une enveloppe de 500millions d'euros et 800 nouveaux postes pour l'une des plus formidables révolutions du renseignement français: créer un système de collecte massive de données replaçant la France dans la course à l'espionnage moderne.

De façon surprenante, le contenu de son intervention, faite en juin sur le campus de l'école à Châtenay-Malabry (Hauts-de-Seine) et dont nous avons pu consulter l'enregistrement filmé, n'a eu aucun écho public. En revanche, le milieu du renseignement et sa principale figure, Bernard Bajolet, le chef de la DGSE, ont eu tout l'été pour s'offusquer de ces déclarations qui montrent, sans doute, que les vrais secrets ne sont peut-être pas là où l'on croit. Extraits choisis.

La vérité sur l'attaque informatique contre l'Elysée en2012

A ce jour, il ne s'agissait que de soupçons. Les Américains auraient pu jouer un rôle dans le piratage, découvert entre les deux tours de l'élection présidentielle, en mai2012, des ordinateurs des collaborateurs du chef de l'Etat français, alors Nicolas Sarkozy. Une note interne de la NSA, dévoilée par Le Monde à l'automne 2013 et préparant la visite, le 12avril 2013, de deux hauts responsables français, dont M. Barbier, venus demander des comptes aux Américains, orientait plutôt les soupçons vers les services secrets israéliens...

«Le responsable de la sécurité informatique de l'Elysée était un ancien de ma direction à la DGSE, relate M. Barbier. Il nous a demandé de l'aide. On a vu qu'il y avait un "malware" [logiciel malveillant] qui avait une signature identique à celui que nous avions identifié lors d'une attaque contre la Communauté européenne en2010. Il n'y avait que les Américains et les Russes qui avaient pu faire cette première opération. En2012, nous avions davantage de moyens et de puissance techniques pour travailler sur les métadonnées. J'en suis venu à la conclusion que cela ne pouvait être que les Etats- Unis.

Ce malware avait aussi attaqué d'autres pays avec une méthode révolutionnaire qu'a révélée, en2013, Edward Snowden: la " quantum attack " . Quelqu'un de l'Elysée allait sur Facebook, mais au lieu d'aller directement sur le serveur du réseau social, cette consultation était interceptée par une machine de la NSA qui répondait à la place de Facebook (...), lui permettant d'entrer dans votre ordinateur. Ce malware trouvait la faille et permettait de prendre le contrôle de votre ordinateur.

J'ai reçu l'ordre du successeur de M. Sarkozy d'aller aux Etats-Unis les engueuler. Ce fut le 12avril 2013 et ce fut vraiment un grand moment de ma carrière professionnelle. On était sûrs que c'était eux. A la fin de la réunion, Keith Alexander [directeur de la NSA de 2005 à 2014] , n'était pas content. Alors que nous étions dans le bus, il me dit qu'il est déçu car il pensait que jamais on ne les détecterait. Et il ajoute: "Vous êtes quand même bons." Les grands alliés, on ne les espionnait pas. Le fait que les Américains cassent cette règle, ça a été un choc.

Quand Le Monde s'apprêtait à publier le document interne de la NSA préparant notre visite du 12avril 2013, j'ai demandé à mon correspondant de la NSA à Paris de m'en donner une copie. Il me répond qu'il ne peut pas, car le niveau de secret de la note est tel que seul le président Obama peut le déclassifier. J'ai réagi en disant que dix millions de Français allaient lire cette note alors que je n'y ai pas accès. Je l'ai finalement eue un jour avant sa publication.»

Babar ou la fin d'un secret d'Etat

En2013, Le Monde publie une note dévoilée par Edward Snowden révélant que les services secrets canadiens suspectent leurs homologues français d'être derrière une vaste opération de piratage informatique lancée en2009. Si l'attaque vise une demi-douzaine d'institutions iraniennes liées au programme nucléaire de ce pays, elle cible également le Canada, l'Espagne, la Grèce, la Norvège, la Côte d'Ivoire, l'Algérie et même certains objectifs en France. Sur ses auteurs, les Canadiens restaient flous: «Nous estimons, avec un degré modéré de certitude, qu'il s'agit d'une opération sur des réseaux informatiques soutenue par un Etat et mise en oeuvre par une agence française de renseignement.» Du côté français, silence absolu. Paris admet s'être doté de capacités défensives, mais dément toute activité offensive, un tabou. Jusqu'au récit de M. Barbier.

«Les Canadiens ont fait du " reverse " [remonter la trace informatique] sur un malware qu'ils avaient détecté. Ils ont retrouvé le programmeur [le codeur] qui avait surnommé son malware "Babar" et avait signé "Titi". Ils en ont conclu qu'il était français. Et effectivement, c'était un Français (...). On a franchi un seuil énorme entre 1990 et 1995 quand on a acheté un supercalculateur américain Cray. On s'est aperçu qu'avec une très grande puissance de calcul, on pouvait casser les mots de passe.

On a commencé à faire du hacking en1992. J'ai monté les premières équipes de hacking étatique, les premiers soldats de la cyber-armée française. Les meilleurs n'ont pas de formation universitaire. Ce n'est pas un problème de connaissance, c'est un problème de cerveau. C'est quelqu'un qui, à partir de 15-16 ans, a commencé à bidouiller. Il va trouver des choses et donc des failles. Aujourd'hui, ce n'est pas 100 personnes qu'il faudrait recruter, il en faut 200 à 300.»

La fusion de la DGSE et de son homologue allemand, le BND

M. Barbier ne s'est pas contenté de relater des opérations. Il a également évoqué la frilosité du pouvoir politique face à ses propositions visant à répondre plus efficacement aux nouvelles menaces, et notamment son projet audacieux esquissant un embryon de renseignement européen.

«Il est impossible de construire un seul service de renseignement européen avec vingt-huit pays qui n'ont pas les mêmes moyens ni la même culture. Les meilleurs, par rapport à leur nombre d'habitants, ce sont les Suédois. Les Italiens sont mauvais. Les Espagnols sont un peu mieux, mais n'ont pas de moyens. Et les Britanniques, avec 6500 agents au sein du GCHQ [le renseignement électronique

britannique] , sont forts, mais sont-ils européens? Et la France est la première force de renseignement technique en Europe continentale.

Restent les Allemands, qui sont de solides partenaires. J'ai beaucoup travaillé avec eux, à la fois en transmettant notre savoir-faire mais aussi en leur apportant des moyens techniques. Les ingénieurs allemands et français travaillent très bien ensemble. En revanche, l'ingénieur britannique avec l'ingénieur français, c'est compliqué.

Pour être plus efficaces, j'ai dit aux politiques en France qu'il fallait fusionner le BND [le Service fédéral allemand de renseignement] et la DGSE. C'est la seule solution. Cela ferait un service de 15000 personnes. La NSA compte 60000 personnes, et la direction technique de la DGSE, seule, c'est 3000 agents. Mais les politiques français n'ont jamais donné suite.»

Une révolution dans le secret de la DGSE

Au cours de son exposé, Bernard Barbier a illustré le rôle primordial joué désormais par la direction technique dans la lutte contre les milieux djihadistes et l'espionnage moderne.

«Pour avoir du renseignement humain sur les réseaux djihadistes, c'est quasiment impossible. Leurs membres [de ces réseaux] ne travaillent qu'avec des gens qu'ils connaissent. Dans la direction, on était déjà bien conscient en2012 que des Français voulaient revenir faire le djihad en France. A plusieurs reprises, en2013, mes équipes m'avaient déjà fait écouter des interceptions de Français de Syrie parlant à leur famille ou à des proches, en évoquant clairement leur projet de venir en France (...) .

J'ai réussi à convaincre le service "action" de travailler avec ma direction technique lors d'une première opération conjointe en juillet2010 sur une équipe qui voulait faire sauter l'ambassade de France à Nouakchott, en Mauritanie. On a montré aux militaires que, grâce aux satellites, on pouvait faire une maquette 3D de leur lieu d'intervention [le campement djihadiste] au milieu de dunes, et donc leur permettre de choisir virtuellement leur chemin. Ils les ont éliminés à leur réveil.

Cette collaboration a été une vraie révolution au sein de la DGSE. Pour moi, en tant qu'ingénieur, c'était fondamental. Pour les commandos, faire venir des gens d'autres services avec eux, c'était une révolution. Car leur règle absolue, c'est: "Je fais tout moi-même." En guise de remerciement pour le succès de l'opération, le chef du service action m'a offert une des kalachnikovs prises aux djihadistes.»

Edward Snowden, «un traître qui nous a plutôt aidés»

Enfin, interrogé sur le lanceur d'alerte le plus connu de l'histoire du renseignement, M.Barbier a apporté une nuance inattendue au discours officiel tenu habituellement sur Edward Snowden, soulignant les services rendus à la France.

«Pour moi, Snowden est un traître à son pays, mais il n'a rien à voir avec Julian Assange [fondateur de WikiLeaks] . Les Américains ont fait de Snowden, contractuel extérieur de la NSA, un administrateur système. Alors que ceux qui font ce métier à la DGSE sont des fonctionnaires qui ont entre quinze et vingt ans d'ancienneté. La probabilité d'avoir un Snowden en France est très faible. Snowden a montré que l'espionnage entre alliés existait et que le matériel était piraté par les Américains comme celui vendu par l'entreprise Cisco, ce qui pose un problème d'indépendance pour la technologie. A ce titre, Snowden nous a plutôt aidés.»

New York Times
F.B.I. Files on Email Inquiry Show Grilling on Clinton's Judgment
Saturday, 03 September 2016
Byline: Eric Lichtblau

Washington - F.B.I. officials questioned Hillary Clinton extensively about her judgment in using her private email system to discuss classified drone strikes and in allowing aides to destroy large numbers of emails, before ultimately deciding she should not face criminal charges, according to investigative documents released Friday.
The documents provided a number of new details about Mrs. Clinton's private server, including what appeared to be a frantic effort by a computer specialist to delete an archive of her emails even after a congressional committee had requested they be preserved.

In a 3Â½-hour interview with the Justice Department's top counterintelligence officials on July 2, Mrs. Clinton defended her handling of the private email system by repeatedly saying she had deferred to the judgment of her aides, an F.B.I. summary of the interview showed.

Mrs. Clinton's use of the private server has shadowed her presidential campaign for a year and a half. And the newly disclosed records, while largely reinforcing what had already been known about the F.B.I. investigation, provided Republicans more ammunition to attack the Democratic nominee's judgment and honesty as she heads into the final, post-Labor Day phase of the campaign.

Among the other key findings in the F.B.I. documents:

â- Mrs. Clinton regarded emails containing classified discussions about planned drone strikes as "routine."

â- She said she was either unaware of or misunderstood some classification procedures.

â- Colin L. Powell, a former secretary of state, had advised her to "be very careful" in how she used email.

The F.B.I. documents show that an unnamed computer specialist deleted the archive of Mrs. Clinton's emails weeks after the existence of the private server became public in March 2015.

Days after The New York Times first reported that Mrs. Clinton had used a private email system exclusively as secretary of state, the House committee investigating the 2012 attacks in Benghazi, Libya, asked that her emails be preserved and subpoenaed those that were related to the attacks.

About three weeks later, however, the unnamed specialist "had an 'oh shit' moment" and realized that he had not destroyed an archive of emails that was supposed to have been deleted a year earlier, according to the F.B.I. report.

The specialist then used a program known as BleachBit to delete an unknown number of emails, according to the report. Mrs. Clinton told investigators that she was unaware that the aide had deleted the emails.

Dozens of times during her interview, Mrs. Clinton said she did not remember details about the server or guidance she had received on how to handle classified information.

In its summary of the investigation, the F.B.I. said that Mrs. Clinton had emailed Colin Powell, a former secretary of state, a day after she was sworn in to office about Mr. Powell's use of a personal email account when he was the country's top diplomat. Mr. Powell warned Mrs. Clinton that if she used her BlackBerry for official business, those emails could become "official record[s] and subject to the law."

Mr. Powell, apparently implying that he was cautious in his use of a personal email account, added: "Be very careful. I got around it all by not saying much and not using systems that captured the data." According to the summary of her interview, Mrs. Clinton said that she did not know exactly what Mr. Powell was saying in that email and that his message "did not factor into her decision to use a personal email account."

F.B.I. officials appear to have questioned Mrs. Clinton most aggressively about her judgment in using her private, unsecured system to get emails about how or where the Obama administration was planning to launch drone strikes against terrorism suspects, the documents indicated.

The F.B.I. showed her one email after another containing information about possible drone strikes that was considered classified. But Mrs. Clinton appeared almost blasÃ© in explaining her use of her private system to gather information on drone strikes.

After being shown one email that was redacted from the public release of her emails, Mrs. Clinton "stated deliberation over a future drone strike did not give her cause for concern regarding classification," according to the F.B.I. summary of the interview.

"Clinton understood this type of conversation as part of the routine deliberation process," the summary said. "Moreover, she recalled many conversations about future strikes that never occurred."

Mrs. Clinton's lawyer, David Kendall, declined to comment. In a statement, her campaign said it was pleased that the F.B.I. had made the documents public.

"While her use of a single email account was clearly a mistake and she has taken responsibility for it, these materials make clear why the Justice Department believed there was no basis to move forward with this case," the campaign said.

But Representative Jason Chaffetz, Republican of Utah and the chairman of the House Oversight and Government Reform Committee, said that the deletion of the emails violated an order his committee issued to Mrs. Clinton in 2012 and a subpoena issued by the Benghazi committee in 2015.

He said he planned to seek answers from Mrs. Clinton about the deletions. "These were not Hillary Clinton's emails -- they were government records, and this was potentially one of the largest security breaches at the State Department because they had all these years of security records that just went out the door," Mr. Chaffetz said. "It's a very black-and-white order. There's no wiggle room."

Reince Priebus, the chairman of the Republican National Committee, called the F.B.I. documents "a devastating indictment of her judgment, honesty and basic competency."

The F.B.I. released only small portions of its thick files on the Clinton investigation, and Senator Charles E. Grassley, the Iowa Republican who leads the Senate Judiciary Committee, accused the F.B.I. of withholding key documents -- including many unclassified ones -- from public view.

The selective release, he said, produced "an incomplete and possibly misleading picture of the facts without the other unclassified information that is still locked away from the public and even most congressional staff."

Mrs. Clinton told F.B.I. investigators that she had used a personal email server "out of convenience" and did not remember anyone raising legal concerns about the practice.

She also said that she "did not recall receiving any emails she thought should not be on an unclassified system," the F.B.I. documents say. "She relied on State officials to use their judgment when emailing her and could not recall anyone raising concerns with her regarding the sensitivity of the information she received at her email address," they say.

The document summarizing Mrs. Clinton's interview, known in the F.B.I. as a 302 report, runs only a dozen pages. The memorandum on the investigation is lengthier, and goes into greater detail about aspects of the case. The materials were presumably provided to James B. Comey, the F.B.I. director, who later decided to not recommend charges in the case.

A senior law enforcement official said the interview at F.B.I. headquarters had been intended "to fill the gaps" of what the F.B.I. did not know about why Mrs. Clinton used a private email server. Both documents were partly redacted, which slowed their release as the bureau sought to protect some information while satisfying the public's right to know.

The documents offer the most detailed account of Mrs. Clinton's role from the bureau's yearlong investigation into whether she or her aides broke the law by using a private system -- clintonemail.com -- to send tens of thousands of emails about government business, including classified matters.

German Intelligence Service Accused of 'Systematically' Violating Constitution
Saturday, 03 September 2016

Moscow - President of the German Federal Intelligence Agency (BND) Gerhard Schindler stands at the former monitoring base of the National Security Agency (NSA) in Bad Aibling, south of Munich, June 6, 2014.
The confidential report, dated March 2016, was brought to attention by public broadcasters NDR and WDR on Thursday evening. The 60-page study was carried out by Federal Data Protection Commissioner Andrea Voßhoff, who is responsible for ensuring that government agencies do not violate German citizens' rights when using their personal data.

"The BND systematically lifted and used personal data without a legal basis to do so," wrote the commissioner.

Voßhoff named a total of 12 violations of the law in seven spheres of activity, including obstruction of her own work.

"The BND massively and illegally blocked my ability to oversee it -- a comprehensive and efficient oversight on my part was therefore not possible. These are serious breaches of the law."

According to the report, the commissioner was blocked from checking so-called selectors -- the lists of the key concepts, which identify information such as phone numbers and email addresses used by the BND for targeted surveillance.

Voßhoff also called for shutting down large parts of the BND's data base in Bad Aibling, Bavaria. "According to law these databases must be immediately deleted. They must not be used anymore," the document said.

Opposition politicians said that the report confirmed what they had long been saying -- that the BND acts outside the law.

"The report cannot be misunderstood, either in its unusual level of clarity or in the extent of its criticism," said Konstantin von Notz, Green Party Member of Parliament and head of the parliamentary committee on the NSA.

Activities of the Germany's Federal Intelligence Service attracted the attention of the German public and the Bundestag after the scandalous revelations of Edward Snowden. BND management was accused of helping the American NSA, when it was spying on a global scale. It was revealed that the NSA tapped a number of European governments and organizations, including German ones.

The Australian Financial Review
PM's stance on China worries experts
Saturday, 03 September 2016
Byline: Aaron Patrick

Canberra - The government's top intelligence experts are concerned Prime Minster Malcolm Turnbull isn't taking their warnings about the security threat posed by China seriously enough and the former banker is relying on advice from outside experts.
Despite vetoing a Chinese bid for Sydney's electricity network this month, Mr Turnbull and some other cabinet ministers are reluctant to act on or receive warnings that China is engaging in spying on an "industrial scale" and that business secrets are among its top targets, three sources with senior contacts in the security services said.

"It is far more ambitious and better resourced than ever before," said Paul Monk, an intelligence and foreign affairs expert who headed China analysis for the Defence Intelligence Agency. "It's notorious with politicians that they find intelligence to be a new thing when they go into politics. It's things they would prefer not to know or suggest actions that can be embarrassing."

Mr Turnbull, who flies this weekend to Hangzhou, near Shanghai, for a Group of 20 leaders summit, has a history of pro-Chinese comments but has taken a tougher approach in public since he became prime minister.

A senior government source denied Mr Turnbull wasn't listening to advice from the intelligence and security services and said people outside the government would not know what was happening in his office.

Security experts say China has a well-resourced effort that uses cyber-espionage and human agents to steal Australian commercial secrets and obtain sensitive government information.

"There is an unspoken rule that we spy on each other," said Alan Dupont, a former military officer and defence analyst. "But to target in a massive way the business community of your trading partners and friends, in a way China has done, is unprecedented."

Mr Turnbull has frustrated the intelligence services by seeking outside advice and through an apparent scepticism towards some of his official briefings, the sources said.

The former Goldman Sachs partner has wide contacts in international business circles, did business in China before he moved into politics, and has a reputation for confidence in his own opinions. His intelligence advisers are uncertain about where he is seeking outside advice from, one source said.

The government official said Mr Turnbull's appointment two months ago of Frances Adamson as the secretary of the Department of Foreign Affairs and Trade, which works with the Australian Security Intelligence Service, which collects information overseas, showed the important he placed on advice about China from government experts. Ms Adamson was previously ambassador to China and Mr Turnbull's international relations adviser.

The Australian Security Intelligence Organisation declined to comment.

Intelligence leaders are conscious Mr Turnbull predicted five years ago that China would not use the expansion of its navy to become more militarily assertive and opposed the Labor government's strategy of preparing for a naval war in the South China Sea, where China is now turning islets into bases.

Now in office, Mr Turnbull has become less enthusiastic about China in public. He has criticised Chinese aggression in the South China Sea while emphasising China's importance to the Australian economy.

Some foreign policy experts, including former foreign minister Bob Carr, and business leaders are pushing Mr Turnbull to take a more friendly approach to China. They are opposed by the intelligence establishment, which appears staunchly anti-Chinese and pro-American.

Mr Turnbull has taken a low profile on foreign affairs since he became prime minister. But in 2011 he advocated that Australia prepare for the end of US military dominance in east Asia and said it was futile to try to contain China, a position more dovish than his four Liberal and Labor predecessors, John Howard, Kevin Rudd, Julia Gillard and Tony Abbott. "Suggestions that China's recent launch of one aircraft carrier and plans to build another are signs of a new belligerence are wide of the mark," Mr Turnbull said in a speech to the London School of Economics. "Prejudice is not a substitute for coolly rational analysis." Mr Turnbull, when communications minister, pushed for Chinese telecommunications equipment manufacturer Huawei to be allowed to help build the national broadband network. He was overruled by cabinet on national security grounds. As prime minister, he hasn't sought to open the contracts.

"There is still a lot of cynicism among senior officials about him," a government contractor with close links to the intelligence services said, referring to Mr Turnbull.

"Their view is they know about what the problems are but they are hesitant about pushing it too hard because the indications are that a couple of key ministers are not going to give them a good reception or think they know better.

"He is probably the first time since [Gough] Whitlam where we have had a prime minister where we don't know where he stands on national security grounds."

Australian Associated Press
Queensland police access social justice advocate's personal file 1,400 times
Saturday, 03 September 2016
Byline: Kym Agius

London - A Queensland Council for Civil Liberties social advocate has had her personal file accessed by Queensland police 1,400 times since 2008, in what she says is an abuse of privacy.
A social justice advocate has had her personal file accessed by Queensland police 1,400 times since 2008, which she says is an abuse of privacy.

The database, where her file was accessed, is a secure online tool capturing administrative and intelligence information, which police access during the course of their work, such as when checking a speeding motorist.

Queensland Council for Civil Liberties advocate Renee Eaves, who does not have a criminal record, submitted a Right to Information (RTI) request in to see how many times her Queensland Police Records and Information Management Exchange (QPRIME) file had been accessed.

She was startled to see it had been checked 1,400 from 2008 to May.

Ms Eaves said officers are supposed to give a reason each time they access a personal file, but she was not given any insight into the 1,400 cases.

When she submitted a second RTI application to see how many times her personal file was accessed between May and last month, Ms Eaves said it was knocked back on the grounds that there was an investigation underway into her first complaint.

She initially became suspicious when officers would ask her date of birth when advocating on behalf of police brutality victims, or officers who had issues with upper management.

"I was right in that there was a gross abuse of this system," Ms Eaves told 612 ABC Brisbane.

"It is being used against innocent members of the public who deserve and are entitled to privacy.

"It should only be for the eyes of only people who are authorised and have a reason to access that information."

Ms Eaves said police are now denying RTI requests by other members of the public.

"This goes to the very heart of transparency with the Queensland Police Service," Ms Eaves said.

"Once they realised that this questionable behaviour was going on, they started to shut down and close ranks and reject applications.

"Maybe this is just the tip of the iceberg?"

Police Commissioner needs to explain: QLS

Queensland Law Society president Bill Potts said he was concerned Ms Eaves' file was being accessed when she was not the subject of a police investigation.

"It is extraordinarily important they don't misuse, or at least have perception of misuse, of such details as well," he told ABC 612 Brisbane.

"Rather than have extended secrecy and hiding behind walls of bureaucratic paper, perhaps the Police Commissioner can have a look at it and give some reasons or an explanation as to why this is happened.

"And if it has happened, and there is no proper basis for it, then the people who are doing this really seriously should be looked at.

Queensland Police have been contacted for comment.

New York Times
Does the Messaging Service Telegram Take Privacy Too Far?
Tuesday, 06 September 2016
Byline: Celestine Bohlen

Paris - The encryption of digital information is considered the best protection against hackers, snoops or potential enemies looking to poke around into private exchanges of all sorts.
That is why technology experts and privacy advocates in Europe went on high alert last month when the French Ministry of the Interior suggested that it might limit encryption as part of the fight against terrorist threats.

That fear abated somewhat on Aug. 23 when the French interior minister, Bernard Cazeneuve, at a joint news conference with his German counterpart, Thomas de Maizière, stepped back from a more sweeping proposal. Instead, he pressed for a coordinated international effort to get messaging services to comply with judicial warrants for information.

Mr. Cazeneuve named one such service: Telegram, a three-year-old messaging application, that is a favorite of the Islamic State, also known as ISIS or ISIL, which has claimed responsibility for a series of terrorist attacks in Europe in recent years.

According to news reports, killers in two attacks in France this summer -- one against two police officers and the other in a church in Normandy, during which they slit the throat of a Catholic priest -- were exchanging messages on Telegram, even boasting of their plans. In August, Telegram was again used in two abortive cases, one involving a 16-year-old girl.

Telegram's vaunted privacy safeguards, involving multiple servers in different countries, are designed to prevent access to information about its users, even by the service itself.

At the news conference, Mr. Cazeneuve admitted as much but claimed that French investigators, armed with a court order, had been unable to even contact "an interlocutor" at Telegram.

In response to a query on his Telegram account, Pavel Durov, co-founder of the service, batted back the widely reported French claims.

"We haven't received any such request and have no idea what the French officials are after," he wrote. "In any case, Telegram Secret Chats and information on them are not logged on our servers."

Last November, after attacks in Paris that left 130 people dead, Telegram scrubbed 78 Islamic State-related public channels hosted on its servers, but Mr. Durov insisted that privacy would remain paramount on the rest of the service.

Mr. Durov's background explains his die-hard libertarian attitude on privacy. He left his native Russia in 2014 after refusing to give intelligence information about Ukrainian protesters.

However, most privacy advocates agree that messaging services should cooperate with court-issued warrants, even if they are unable to provide investigators with complete information about their users.

"There is an issue with Telegram," said Mounir Mahjoubi, president of the National Digital Council, an independent advisory group established by former President Nicolas Sarkozy that focuses on privacy issues. "They had done everything to make it a technological nightmare to find where their server is."

At a time of heightened public anxiety over terrorism, technology companies and privacy advocates are wary about politicians looking to mandate "back door" access to encrypted data.

This, they say, would not only violate privacy rights but put the wider public at an even greater risk, leaving users even more vulnerable to terrorists and other criminals.

Mr. Mahjoubi, for one, supports alternative approaches, such as an international network that could call on judges in individual countries to swiftly react to requests from antiterrorism investigators.

These ideas also are also backed by the Computer and Communications Industry Association, a lobbying organization that counts Amazon, Google and Microsoft among its members.

"Cyberspace blurs the notion of national jurisdictions, and companies are caught in the middle," said Christian Borggreen, the organization's Europe director. "The tech industry encourages like-minded nations to develop international frameworks for quicker response to law enforcement requests while respecting users' right and the rule of law."

That kind of targeted approach -- aimed at criminals, not at privacy -- would be more effective than a blank check for law enforcement to break open encoded messages, Mr. Mahjoubi said.

"I am deeply and heartily against any effort to limit encryption," he said, "and I will fight my whole life against that possibility."

Supreme Leader Calls for Reinvigoration of Iran Cyberspace Activities to Confront Enemies' Threats
Tuesday, 06 September 2016

Tehran - Supreme Leader of Islamic Revolution Ayatollah Seyed Ali Khamenei underlined the vital importance of cyberspace's potentials and capacities in the promotion of the country in various fields and also in defusing enemies' threats.
"The enemy is seeking to pervert devoted and righteous youths from the essence of religion; today this is being done across the cyber world," Ayatollah Khamenei said on Tuesday on the occasion of the commencement of education at seminaries across Iran.

He noted that confronting this scheme was the first and foremost responsibility of the clergymen, and said, "Seminaries and religious scholars should equip themselves with the capability to confront the massive enemy army."

The Supreme Leader said that the cyber world was a simultaneous source of blessing and cursing.

Ayatollah Khamenei reiterated that Iran's Supreme Council of Cyberspace was created toward lending concentration to such a goal.

On March 7, 2015, Ayatollah Khamenei assigned the administration of former president Mahmoud Ahmadinejad with the task of establishing the Supreme Council of Cyberspace in an effort to safeguard national and cultural values as well as ensuring the safety of the Internet in Iran.

The Council is now headed by President Hassan Rouhani and is comprised of high-ranking officials.

In September 2015, Ayatollah Khamenei underlined the vital importance of cyberspace's potentials and capacities in the promotion of the country in various economic, cultural, and political fields.

"Using capability and talents of the country's youth and through making right policies and adopting well-calculated and coordinated measures and without losing time, let's move towards ridding the cyberspace of passivity and having active, influential presence and production of reliable and attractive Islamic content," said the Supreme Leader in a meeting with Head of Supreme Council of Cyberspace (President Rouhani) and members of the Council.

Referring to the wide-scale impact of cyberspace, as an extraordinary soft power on various fields, such as culture, politics, lifestyle, faith, religious ideology and morals, Ayatollah Khamenei underlined appropriate and careful designs to guarantee intellectual and ethical security of the society in the field.

The requisite for active and influential presence in the cyberspace is concentration on the decision making, seriousness in execution without wasting time, coordination among organs and avoiding parallelism and confrontation, concluded the Supreme Leader.

He also underlined that planning and support of government, especially the Science and Technology Department of the Presidential Office, for expansion of the Information Technology (IT) is highly necessary.

In July 2014, Ayatollah Khamenei appreciated Iranian scientists for their rapid progress and achievements, and underlined the necessity for the non-stop continuation of this trend.

The great significance of keeping up the rapid pace of the country's scientific movement is due to the fact that it is a main factor in shaping up both Iran's future fate and that of the Islamic world, Ayatollah Khamenei said in a meeting with hundreds of Iranian university professors and elites in Tehran at the time.

Qui a passé à tabac le patron de Swiss Space Systems?
Monday, 05 September 2016

Byline: Journaliste maison

Payerne, Suisse - Le Vaudois qui veut révolutionner le lancement de satellites s'est fait sauvagement agresser
Qui a passé à tabac le patron de Swiss Space Systems? « La pression était forte depuis longtemps: intimidations, lignes sur écoute, espionnage. C'est de la folie, du vrai James Bond. » Au bout du fil, cet investisseur du projet Swiss Space Systems (S3) est consterné. Pascal Jaussi, 40 ans, patron de la société basée à Payerne, qui ambitionne de lancer des satellites depuis des navettes spatiales, est au CHUV sous bonne garde et dans un état sévère. Le jeune entrepreneur souffre de graves brûlures sur 25% du corps, il a été victime d'une strangulation et de divers coups. Une agression mystérieuse intervenue la semaine dernière dans un bois de la Broye fribourgeoise, où deux individus armés ont forcé Jaussi à se rendre avant de bouter le feu à sa voiture. Une enquête est ouverte pour lésions corporelles graves, incendie intentionnel et contrainte.Depuis plusieurs mois, le fondateur de S3 confiait à ses proches et à la police se sentir menacé. Le secteur spatial conjugue des enjeux financiers et stratégiques importants, et l'arrivée d'un acteur indépendant est génératrice de tensions. L'an dernier, les locaux de S3 avaient été saccagés, des inconnus arrosant les ordinateurs de la société à la lance à incendie.Ce printemps, S3 avait acquis un Airbus A340 pour effectuer des vols « zéro gravité » dès cet hiver. Qui a passé à tabac le patron de Swiss Space Systems?Le Vaudois qui veut révolutionner le lancement de satellites s'est fait sauvagement agresserVaud et régions, page 15Les détailsde l'agression sauvage dont a été victime Pascal JaussiLe projetde Swiss Space Systems, une révolution spatiale

DGSE L'espion qui parlait trop
Monday, 05 September 2016
Byline: Journaliste maison

Paris - Lors d'une anodine réunion d'anciens élèves d'une grande école d'ingénieurs, Bernard Barbier, personnage central de la DGSE durant dix ans, a livré en public, dans une intervention filmée, quelques secrets d'Etat, notamment sur la guerre cybernétique.
Comment les Etats-Unis ont espionné l'Elysée, par le biais des logiciels malveillants glissés sur Facebook par la NSA. Comment la France a monté ses équipes de " hacking " et créé son propre logiciel malveillant, baptisé " Babar ". Comment Bernard Barbier a proposé une fusion entre la DGSE et son homologue allemand, qui a été rejetée pour des raisons politiques. Comment les révélations d'Edward Snowden ont aidé la France à se protéger de l'espionnage " ami " des Américains. Ces révélations intempestives ont agacé en haut lieu. Le Monde a pu en prendre connaissance.

ABC News
Obama Met With Putin, Said Hackers Shouldn't Create a Cyber 'Wild Wild West'
Monday, 05 September 2016

Byline: Jordyn Phelps

New York - President Obama addressed his tense, 90-minute-long meeting with Russian President Vladimir Putin on the sidelines of the G20 in a press conference on Monday. The two leaders apparently held fast to their positions on hot button issues like cyber-security and brokering a cease- fire in Syria. Russian hackers having been implicated in some current cyber threats and security issues was a key topic. Though Obama didn't identify specific instances, he said "we have had problems with cyber intrusions from Russia in the past" and that the goal is to not to duplicate a "cycle of escalation" that has occurred in arms races of the past.

"What we cannot do is have a situation where this becomes the wild, wild West, where countries that have significant cyber capacity start engaging in unhealthy competition or conflict through these means," the president said. He added that nations have enough to worry about in the realm of cyber attacks from non-state actors without nation-states engaging in hacking against one another.

Obama also said the two countries "haven't yet closed the gaps" that remain to reach a meaningful ceasefire deal for Syria but said that they had a productive conversation.

The president said he has instructed Secretary of State John Kerry to continue working with Russian Foreign Minister Lavrov to broker a deal in the coming days.

Describing the current situation in Syria as one where the Assad regime is again "bombing with impunity," Obama emphasized the need to reach a compromise quickly and provide needed humanitarian relief for civilians caught in the crossfire of the raging civil war. He also said the two countries should focus on common enemies like ISIS and Al Nusra.

Washington Post
Intelligence community investigating covert Russian influence operations in the United States
Monday, 05 September 2016
Byline: Multiple reporters

Washington - U.S. intelligence and law enforcement agencies are probing what they see as a broad covert Russian operation in the United States to sow public distrust in the upcoming presidential election and in U.S. political institutions, intelligence and congressional officials said.
The aim is to understand the scope and intent of the Russian campaign, which incorporates cyber-tools to hack systems used in the political process, enhancing Russia's ability to spread disinformation.

The effort to better understand Russia's covert influence operations is being spearheaded by James R. Clapper Jr., the director of national intelligence. "This is something of concern for the DNI," said Charles Allen, a former longtime CIA officer who has been briefed on some of these issues. "It is being addressed."

A Russian influence operation in the United States "is something we're looking very closely at," said one senior intelligence official who, as others interviewed, spoke on the condition of anonymity to discuss a sensitive matter. Officials are also examining potential disruptions to the election process, and the FBI has alerted state and local officials to potential cyberthreats.

The official cautioned that the intelligence community is not saying it has "definitive proof" of such tampering, or any Russian plans to do so. "But even the hint of something impacting the security of our election system would be of significant concern," the official said. "It's the key to our democracy, that people have confidence in the election system."

The Kremlin's intent may not be to sway the election in one direction or another, officials said, but to cause chaos and provide propaganda fodder to attack U.S. democracy-building policies around the world, particularly in the countries of the former Soviet Union.

U.S. intelligence officials described the covert influence campaign here as "ambitious" and said it is also designed to counter U.S. leadership and influence in international affairs.

One congressional official, who has been briefed recently on the matter, said "Russian 'active measures' or covert influence or ma-nipu-la-tion efforts, whether it's in Eastern Europe or in the United States" are worrisome.

It "seems to be a global campaign," the aide said. As a result, the issue has "moved up as a priority" for the intelligence agencies, which include the FBI and Department of Homeland Security as well as the CIA and the National Security Agency.

Some congressional leaders briefed recently by the intelligence agencies on Russian influence operations in Europe, and how they may serve as a template for activities here, have been disturbed by what they heard.

After Senate Minority Leader Harry M. Reid (D-Nev.) ended a secure, 30-minute phone briefing by a top intelligence official recently, he was "deeply shaken," according to an aide who was with Reid when he left the secure room at the FBI's Las Vegas headquarters.

The Russian government hack of the Democratic National Committee, disclosed by the DNC in June but not yet officially ascribed by the U.S. government to Russia, and the subsequent release of 20,000 hacked DNC emails by WikiLeaks, shocked officials. Cyber-analysts traced its digital markings to known Russian government hacking groups.

"We've seen an unprecedented intrusion and an attempt to influence or disrupt our political process," said Rep. Adam B. Schiff (Calif.), the ranking Democrat of the House Intelligence Committee, speaking about the DNC hack and the WikiLeaks release on the eve of the Democratic convention. The

disclosures, which included a number of embarrassing internal emails, forced the resignation of DNC Chairwoman Debbie Wasserman Schultz.

Members of both parties are urging the president to take the Russians to task publicly.

Sen. Ben Sasse (R-Neb.) in a statement urged President Obama to publicly name Russia as responsible for the DNC hack and apparent meddling in the electoral process. "Free and legitimate elections are non-negotiable. It's clear that Russia thinks the reward outweighs any consequences," he wrote. "That calculation must be changed. .?.?. This is going to take a cross-domain response -- diplomatic, political and economic -- that turns the screws on [Russian President Vladimir] Putin and his cronies."

Administration officials said they are still weighing their response.

Russia has denied that it carried out any cyber-intrusions in the United States. Putin called the accusations against Russia by U.S. officials and politicians an attempt to "distract the public's attention."

"It doesn't really matter who hacked this data from Mrs. Clinton's campaign headquarters," Putin said, referring to Democratic presidential nominee Hillary Clinton, in an interview with Bloomberg News. "The important thing is the content was given to the public."

The Department of Homeland Security has offered local and state election officials help to prevent or deal with Election Day cyber-disruptions, including vulnerability scans, regular actionable information and alerts, and access to other tools for improving cybersecurity at the local level. It will also have a cyber-team ready at the National Cybersecurity and Communications Integration Center to alert jurisdictions if attacks are detected.

Last month, the FBI issued an unprecedented warning to state election officials urging them to be on the lookout for intrusions into their election systems and to take steps to upgrade security measures across the voting process, including voter registration, voter roles and election- related websites. The confidential "flash" alert said investigators had detected attempts to penetrate election systems in several states.

Arizona, Illinois and both the Democratic and Republican parties, as well as the DNC, have been the victims of either attempted or successful cyberattacks that FBI agents with expertise in Russian government hacking are investigating.

Federal law enforcement and local election officials say the decentralized nature of the voting process, which is run by states and counties, makes it impossible to ensure a high level of security in each district.

"I have a lot of concern" about this year's election, said Ion Sancho, the longtime supervisor of elections in Leon County, Fla. "America doesn't have its act together," said Sancho, who has authorized red team attacks on his voting system to identify its vulnerabilities. "We need a plan."

Sancho and others are particularly concerned about electronic balloting from overseas that travels on vulnerable networks before landing in the United States and efforts to use cyberattacks to disrupt vote tabulations being transmitted to state-level offices. Encryption, secured paper backups and secured backup computers are critical, he said.

Tom Hicks, chairman of the U.S. Election Assistance Commission, an agency set up by Congress after the 2000 Florida recount to maintain election integrity, said he is confident that states have sufficient safeguards in place to ward off intrusions. He noted that electronic balloting from overseas is conducted by email, not through online voting machines. The overseas voter "waives their right of privacy" by emailing the ballot, which is tabulated by election officials. The email may still be hacked, but it is not a systemic risk, he said.

Recently, Homeland Security Secretary Jeh Johnson said he favors designating the various voting systems used in the country's 9,000 polling places as "critical infrastructure" -- in other words as vital to the nation's safe functioning as nuclear power plants and electrical power grids.

Such a designation could mean increased DHS funding to localities to help ensure that voter registration, ballots and ballot tabulation remains free from interference. But it won't happen before the November elections, federal and local officials said.

Russia has been in the vanguard of a growing global movement to use propaganda on the Internet to influence people and political events, especially since the political revolt in Ukraine, the subsequent annexation of Crimea by Russia, and the imposition of sanctions on Russia by the United States and the European Union.

The Baltic states, Georgia and Ukraine have been subject to Russian cyberattacks and other hidden influence operations meant to disrupt those countries, officials said.

"Our studies show that it is very likely that [the influence] operations are centrally run," said Janis Sarts, director of the NATO Strategic Communications Center of Excellence, a Riga, Latvia-based research organization.

He also said there is "a coordinated effort involving [groups using] Twitter and Facebook and networks of bots to amplify their message. The main themes seem to be orchestrated rather high up in the hierarchy of the Russian state, and then there are individual endeavors by people to exploit specific themes."

Sarts said the Russian propaganda effort has been "successful in exploiting the vulnerabilities within societies." In Western Europe, for instance, such Russian information operations have focused on the politically divisive refugee crisis.

On the eve of a crucial post-revolution presidential vote in Ukraine in 2014, a digital assault nearly crippled the country's Central Election Commission's website. Pro-Moscow hackers calling themselves the CyberBerkut claimed responsibility, saying they were not state-affiliated, but the authorities in Kiev blamed Moscow. The Russians used a "denial of service" technique, flooding the commission's Web server with a high volume of requests, which was meant to slow down or disable the network.

The Register (UK)
Parliament's back for Snoopers' Charter. Former head of GCHQ talks to El Reg
Monday, 05 September 2016
Byline: Alexander J. Martin

London - Parliament has returned from recess (only for a fortnight before conference season begins) and the House of Lord's committee stage examination of the Investigatory Powers Bill will resume this afternoon.
The upper chamber had been waiting for the publication of a review of the bill's bulk powers, which had been led by the independent reviewer of terrorism legislation, David Anderson QC.

Anderson's report was published while the politicians were on their holidays, and although it found that there was no proven case GCHQ needs to engage in bulk hacking missions, it was otherwise overwhelmingly supportive of the bulk powers provided for in the Snoopers' Charter.

Anderson made what he called a "single, major, recommendation" -- the creation of a Technical Advisory Panel to monitor how developments in technology affect the investigatory powers.

An amendment to the bill [PDF] proposed by Lord Rosser would create such a panel to advise both the Secretary of State and the Investigatory Powers Commissioner on "the impact of changing technology on the exercise of the investigatory power; and the availability and development of techniques to use investigatory powers while minimising interference with privacy."

Those bulk hacking missions were addressed last week at a panel convened by the Chartered Institute of IT. Academics, National Crime Agency representatives, and Sir David Omand -- the former director of GCHQ and visiting professor at KCL -- discussed the difficulties that traditional law enforcement techniques encountered when attempting to tackle cybercrime.

Corresponding with The Register, Sir David explained how in his experience such bulk hacking powers were necessary for law enforcement purposes on the internet, rather than just being necessary for national security reasons.

Omand wrote: "Over 20 years ago Parliament in the 1994 Intelligence Services Act wisely recognised the added value that GCHQ and MI6 could bring to the fight against international crime, and made the prevention and detection of serious crime a statutory function for the agencies."

"The recent serious rise in global cybercrime by organised criminal groups based in jurisdictions that do not cooperate with law enforcement has only reinforced the importance of having the specialist techniques and international liaisons of the secret agencies available to support the investigations of law enforcement, for example in helping to dismantle child abuse networks," he explained. "And where it is not possible to bring the perpetrators before a Court, the Agencies may be able to help law enforcement reduce the potential harm to the public by disruption of the criminal operations."

Disrupting cybercriminals through hacking involves sinkholing malware strains, or borking all of the nasties' command-and- control nodes so they can't communicate any more. Such targeted hacking operations are not only available to the spooks, but to police forces too.

As terror law reviewer Anderson explained in the 200-plus page report: "There is no requirement for a link to the interests of national security: it is enough that the warrant be necessary for the purpose of preventing or detecting serious crime, or (in some cases) preventing or mitigating death, injury or damage to a person's physical or mental health."

Sir David, meanwhile, in his correspondence with The Register, considers that old- fashioned Snowden-revelation surveillance couldn't be understated in the fight against cybercrime:

Less publicised has been the part that bulk access to digital communications now plays in detecting cyber attacks. By scanning the technical detail of Internet communications GCHQ has been able to pick up the electronic signatures characteristic of cyber exploits, including new attacks, and share the warnings with industry partners.

95% of the cyber attacks on the UK detected by the intelligence community in the last 6 months came from the collection and analysis of bulk data. Right now GCHQ is monitoring cyber threats from high-end adversaries against 450 companies across the aerospace, defence, energy, water, finance, transport and telecoms sectors.

According to Omand, GCHQ dealt with more than 200 "cyber national security incidents" each month last summer, doubling its work-load on the previous year. This involved assisting Blighty's law enforcement agencies tackle a number of "high-profile operations against pernicious cybercrime malware threats, like Dridex, Shylock and GameOver Zeus."

So if 2013 and 2014 saw the revelation of the capability of the digital revolution to supply intelligence on those who mean us harm, and if 2015 and 2016 sadly saw the recognition of the legitimacy of the demand for such intelligence to counter terrorists and cyber criminals, then this also has to be the year in which Parliament passes the Investigative Powers Bill, with all its added safeguards and judicial oversight, to allow this vital activity to continue.

These issues, Lord Rosser's amendment, and other arguments will be considered when the House of Lords convenes to debate these matters this afternoon

Iran's Leader urges confronting enemy schemes in cyberspace

Wednesday, 07 September 2016

Section: general

Tehran - The Leader of the Islamic Revolution Ayatollah Seyyed Ali Khamenei has called attention to attempts by Iran's enemies to undermine Islamic values by making inroads across the cyberspace, urging the clergy to confront such attempts.
Ayatollah Khamenei made the remarks on Tuesday on the occasion of the commencement of education at seminaries countrywide. The Leader said the enemy is seeking to pervert devoted and righteous youths from the essence of religion.

"Today, this is being done across the cyber world," Ayatollah Khamenei said, noting that confronting this scheme was the first and foremost responsibility incumbent upon the clergy. "Seminaries and religious sages should equip themselves with the capability to confront the massive enemy army."

The cyber world, the Leader asserted, was a simultaneous source of blessing and cursing, noting that its potentials had to be rightly availed of toward the large-scale promotion of Islamic concepts.

"Iran's Supreme Council of Cyberspace was created toward lending concentration" to such a goal, the Leader said.

On March 7, 2015, Ayatollah Khamenei assigned the administration of former president Mahmoud Ahmadinejad with the task of establishing the Supreme Council of Cyberspace in an effort to safeguard national and cultural values as well as ensuring the safety of the Internet in Iran.

The Council is now headed by President Hassan Rouhani and is comprised of high-ranking officials.

Israeli start-up 'imitates the way computer hackers think'

Wednesday, 07 September 2016

Byline: Staff Report

Section: general

Jerusalem - An Israeli start up firm that imitates the way hackers think in order to offer its customers cyber security has raised $3.5 million in financing, Globes reported on Sunday. Including the current round of financing, the company has raised a total of $6.2 million since its founding.
The company described its CTO Matan Azugi as one of the world's leading ethical hackers, according to Globes. Using Azugi's skills and knowledge, the company provides cyber security by using an algorithm which imitates the way a hacker thinks. Cronus is chaired by former head of the Israeli Air Force, Eitan Ben Eliyahu.

The company's current round of financing, according to Globes, has come from US fund, Janvest Capital Partners, a European investor and a Hong Kong investor. The new funding is expected to allow the Haifa-based company to extend its activities to the US. It is currently active in Germany, Hong Kong and the UK. The company also provides cyber security services to local firms, including the First National Bank of Israel.

Asharq Al-Awsat

U.S. Fears E-Piracy Could Manipulate Electoral Results

Wednesday, 07 September 2016

Byline: Heba El Koudsy

Section: general

Washington - U.S. intelligence and law enforcement agencies are investigating several attempts to break through the systems and electronic voting records for the U.S. coming presidential elections, which will be held on November 7.
The agencies are concerned that these cyber attempts might affect the results of the elections between Republican candidate Donald Trump and Democratic candidate Hillary Clinton.

They see these attacks as a broad covert Russian operation in the United States to sow public distrust in the upcoming presidential election and in U.S. political institutions.

The effort to better understand Russia's covert influence operations is being coordinated by James R. Clapper Jr., the director of national intelligence.

"This is something of concern for the DNI," said Charles Allen, a former longtime CIA officer who has been briefed on some of these issues. "It is being addressed."

According to a report by the "Washington Post," the FBI, CIA, National Security Agency (NSA) and Department of Homeland Security are all involved in the probe of what officials say is an "ambitious" Russian cyber-operation to influence both national and local politics in the United States.

A top intelligence official told the newspaper that the agencies do not yet purport to have "definitive proof" of Russian interference.

"But even the hint of something impacting the security of our election system would be of significant concern," the official said.

FBI, last week, warned by issuing a statement confirming it has proofs that foreign hackers were able to hack database in Arizona and Illinois states.

The Russian government hack of the Democratic National Committee, disclosed by the DNC in June but not yet officially ascribed by the U.S. government to Russia, and the subsequent release of 20,000 hacked DNC emails by WikiLeaks, shocked officials. Cyber-analysts traced its digital markings to known Russian government hacking groups.

"We've seen an unprecedented intrusion and an attempt to influence or disrupt our political process," said Rep. Adam B. Schiff, Calif., the ranking Democrat of the House Intelligence Committee, speaking about the DNC hack and the WikiLeaks release on the eve of the Democratic convention.

The disclosures, which included a number of embarrassing internal emails, forced the resignation of DNC Chairwoman Debbie Wasserman Schultz.

Russia denied that it carried out any cyber- intrusions in the United States. Putin called the accusations against Russia by U.S. officials and politicians an attempt to "distract the public's attention."

Govt sets defence innovation priorities

Wednesday, 07 September 2016

Byline: Staff reporter

Section: general

Canberra - The government has spelled out priorities for improving defence capabilities through clever ideas, with boosting intelligence, surveillance, electronic warfare and cyber heading the list.
Defence Industry Minister Christopher Pyne says the new $640 million Defence Innovation Hub to be launched later this year will drive growth in defence industry innovation.

The government has set six areas for research and innovation, with three given top priority for 2016-17.

"In the intelligence, surveillance, reconnaissance, electronic warfare, space and cyber capability stream we will focus on improving intelligence collection, analysis and dissemination," he said in the keynote address to the Land Forces conference dinner in Adelaide.

Mr Pyne said that would include biometric data and cyber innovation to support intelligence capability development.

Next priority is capabilities to better enable defence operations, including command and control systems, satellite communication and simulation.

Third priority will be capabilities to enhance land combat and amphibious warfare, including remotely operated armed reconnaissance aircraft.

"Of course, the beauty of innovation is that we do not yet know what great ideas or fields will yield us the most success," he said.

Mr Pyne said he wanted to ensure that when the government spent taxpayer money, it was spent on what serving men and women need.

That's the best possible equipment with funding invested in Australia where possible.

"We are determined to use the defence dollar to drive a high technology, advanced manufacturing future," he said.

Mr Pyne said the relationship with industry must change.

"We must involve industry earlier in our capacity development processes to understand just what they can contribute," he said.

Mr Pyne said Defence, industry and state and territory governments all had to work together to maximise return on investment and guarantee the best capability available and support for the Australian Defence Force

Rare gift as undercover G20 spooks go under the covers (Canada)

Wednesday, 07 September 2016

Byline: Tory Shepherd

Section: general

Vientiane - Gifts, "honeypots" and cyber hacking are among the weapons used by the Chinese to hunt top-secret information at the G20 summit.
Delegates at the global economic forum were warned not to accept presents such as USB sticks that could gather data, and to resist overly friendly people who might be out to scam secrets.

Australians were warned about "honeypots" - women or men who might try to seduce them in order to steal information or plant a listening device. Another strategy is to give a gift with a bug inside.

Prime Minister Malcolm Turnbull and the Australian delegation travelled to Hangzhou in China for the summit - and for those without encrypted communications networks, the main internet option was the easily hacked official G20 network.

Among the more old-fashioned espionage efforts were "tourists" who looked remarkably un-touristy as they focused long lenses on jour-nalists along Hangzhou's fam-ous riverfront.

As Mr Turnbull addressed the crowd at the B20 business leaders' meeting, a man in uniform sidled up behind journalists to read what they were writing. News Corp Australia was warned not to write anything about spies while in China because of the possibility of being detained or not being allowed a visa in the future.

Peter Jennings, the Australian Strategic Policy Institute's executive director, said honeypots were "part and parcel of espionage", adding: "(Sex) has often been used as a way of trying not only to get people in but then to create a suitable basis (for blackmail)."Russian ships sailed close to the coast during the Brisbane G20 and in 2013 Russia reportedly spied on other countries at the G20 by giving out "Trojan Horse" USB sticks, while Canada was accused of allowing spying at the 2010 G20.

New York Times

After Edward Snowden Fled U.S ., Asylum Seekers in Hong Kong Took Him In

Wednesday, 07 September 2016

Byline: Patrick Boehler

Section: general

Hong Kong - When the 42-year-old Filipino woman opened the door of her tiny Hong Kong apartment three years ago, two lawyers stood outside with a man she had never seen before. They explained that he needed a place to hide, and they introduced him as Edward Snowden.
"The first time I see him, I don't know who he is," the woman, Vanessa Mae Bondalian Rodel, recalled in an interview. "I don't have any idea."

Ms. Rodel is one of at least four residents of Hong Kong who took in Mr. Snowden, the former National Security Agency contractor, when he fled the United States in June 2013. Only now have they decided to speak about the experience, revealing a new chapter in the odyssey that riveted the world after Mr. Snowden disclosed that the N.S.A. had been monitoring the calls, emails and web activity of millions of Americans and others.

At the time, governments and news outlets were scrambling to find the source of the leaks, which were published in The Guardian and The Washington Post. In an interview recorded in a hotel room, Mr. Snowden identified himself and revealed he was in Hong Kong. Then he went into hiding. About two weeks later he turned up in Moscow.

It was never clear where Mr. Snowden was holed up during those critical days after leaving his room at the five-star Mira Hotel, when the United States was demanding his return. As it turns out, he was staying with Ms. Rodel and others like her -- men and women seeking political asylum in Hong Kong who live in cramped, substandard apartment blocks in some of the city's poorest districts.

They were all clients of one of Mr. Snowden's Hong Kong lawyers, Robert Tibbo, who arranged for him to stay with them.

Ms. Rodel said Mr. Snowden slept in her bedroom while she and her 1-year-old daughter moved into their apartment's only other room. Not knowing what he would eat, she bought him an Egg McMuffin and an iced tea from McDonald's.

"My first impression of his face was that he was scared, very worried," she recalled.

Ms. Rodel said her unexpected guest "was using his computer all day, all night." She said that she did not have internet service but that Mr. Tibbo provided him with mobile access.

On Mr. Snowden's second day there, he asked Ms. Rodel whether she could buy him a copy of The South China Morning Post, the city's main English-language newspaper, she said. When she picked up the paper, she saw his picture on the front page.

"Oh my God, unbelievable," she recalled saying to herself. "The most wanted man in the world is in my house."

Jonathan Man, another of Mr. Snowden's lawyers in Hong Kong, said that he had initially considered hiding him in a warehouse but that he and Mr. Tibbo quickly dismissed the idea. Instead, after taking him to the United Nations office that handles refugee claims in Hong Kong and filing an application, they brought him to the apartment of a client seeking asylum.

"It was clear that if Mr. Snowden was placed with a refugee family, this was the last place the government and the majority of Hong Kong society would expect him to be," Mr. Tibbo said. "Nobody would look for him there. Even if they caught a glimpse of him, it was highly unlikely that they would recognize him."

There are about 11,000 registered asylum seekers living in Hong Kong, mostly from South and Southeast Asia. They generally cannot work legally and survive on monthly stipends that rarely cover living costs.

Mr. Tibbo said he turned to these clients for help in part because he expected them to understand Mr. Snowden's plight. "These were people who went through the same process when they were fleeing other countries," he said. "They had to rely on other people for refuge, safety, comfort and support."

He noted that Mr. Snowden was not wanted by the Hong Kong police at the time and that he had advised his clients to cooperate with the police if they showed up. He said his clients had decided come forward in the hope that the publicity would put pressure on the Hong Kong authorities to expedite their applications for refugee status and resettlement.

Ms. Rodel, for example, has been waiting nearly six years for a final decision on her application, which she declined to describe.

After a few days with Ms. Rodel and her daughter, Mr. Snowden spent a night with Ajith Pushpakumara, 44, who said he fled to Hong Kong after being chained to a wall and tortured for deserting the army in his native Sri Lanka.

Mr. Pushpakumara said he had listened to online radio broadcasts about Mr. Snowden and was surprised to suddenly find him in the dingy apartment that he shared with several men. He realized Mr. Snowden was in the same situation he was, hiding in a small room. "I was worried about him," he said.

Supun Thilina Kellapatha, his wife and their toddler also sheltered Mr. Snowden, putting him up for about three days in their 250-square-foot apartment.

Mr. Kellapatha, 32, who said he sought protection in Hong Kong after being tortured in Sri Lanka, described their guest as a tired man who was unfailingly polite.

"He said, 'You are a good man,' " when he arrived at the apartment, Mr. Kellapatha recalled. "But I feel he is better than me, because he respected me."

Mr. Kellapatha and his wife, Nadeeka Dilrukshi Nonis, said they were not worried about hosting Mr. Snowden. "I don't think I take the risk," he said. "He is the one who take the big risk."

When Mr. Snowden left, he left the couple $200 under a pillow, which they said they used to buy necessities for their daughter. "Sometimes I tell Supun, maybe he forgot us," Ms. Nonis said. "I want to tell him, 'Edward, how are you? We will never forget you.' "

National Post

Meet the Canadian who hid Snowden

Wednesday, 07 September 2016

Byline: Theresa Tedesco

Section: general

Hong Kong - It's mid-afternoon and Robert Tibbo has sweat through his second shirt of the day in the sweltering subtropical humidity of the Hong Kong summer.
Sitting in a small, non-descript conference room on the ninth floor of the High Court building in Central Hong Kong, the Canadian- born barrister is one of the busiest human rights lawyers in the Chinese city-state, and the strain of coming to the constant aid of more than 70 refugee clients who depend on him for more than just their asylum cases is showing.

In recent days, Tibbo has dealt with eviction notices, improper charges on utility bills and general complaints about not having enough money to buy groceries, which he temporarily rectifies by reaching into his own pocket.

"Good lawyers are hard to find, but one with a big heart is even more rare," said Jonathan Man, a solicitor at Hong-based Ho, Tse Wai & Partners who has worked on numerous cases with Tibbo.

"He is somebody who has devoted his life to protecting refugees and people seeking asylum and he takes that very seriously," added Laura Poitras, a U.S. journalist and Oscar-winning documentary director who has worked with Tibbo.

Despite the accolades, the 52-year-old Montreal native is actually a relative newcomer to the high-minded world of human rights law. Tibbo's bread and butter after he obtained his law licence in Hong Kong in 2005 was corporate and constitutional law.

That changed in 2012 amid mass arrests in the local asylum community. Tibbo established a legal clinic to help hundreds of destitute refugee claimants who had mostly been tortured or sexually abused in their home countries, notably Sri Lanka, Indonesia, the Philippines and West Africa. "My phone never stopped ringing as people who were incarcerated started seeking me out rather than seeking out legal aid," he said.

A year later, Tibbo landed the most famous client on the planet. For two frantic weeks in June 2013, he helped Edward Snowden, the former U.S. Central Intelligence Agency (CIA) contractor who leaked an unprecedented cache of classified documents to the media, escape Hong Kong and the clutches of U.S. law enforcement.

"It was insanity," he said. "It all happened really quickly and I realized that my life was going to change because of my professional association with Ed."

Snowden, now 33, lives in self-imposed exile in Moscow. Tibbo, meanwhile, operates in a post-Snowden bubble. For one, he appears to be in a state of perpetual paranoia, a consequence of what Poitras, who recently returned to live in New York after years of being on the U.S. government's watchlist, called the "backlash" of surveillance directed at the Canadian lawyer by Hong Kong and U.S. officials.

Most days, Tibbo can be seen walking purposefully through the crowded streets of Hong Kong lugging a leather case strapped onto his shoulder packed with plastic zip-lock bags containing an array of burner cellphones, an IBM laptop computer -- whose battery he is constantly removing -- and a spare shirt.

Visitors to his office must deposit their cellphones in a small refrigerator until they leave -- a trick he learned from Snowden.

During a wide-ranging interview, he speaks fondly of his famous client, and still jealously guards certain aspects of their relationship, most notably how he was retained to represent the most-sought-after dissident in the world.

Even Snowden won't answer the question, deferring to Tibbo in an encrypted text message to the National Post. "Let him speak to this one. I've got to say that he's earned it. There aren't a lot of lawyers who could successfully protect their client in the midst of something like that."

Jonathan Man said his Canadian partner took on a lot of responsibility during the frantic days when sheltered the U.S. fugitive. "He had a lot more pressure on him than I did. Most of the plan was Robert, but we executed it together," he said.

"He's what we call a boy scout," said Ben Wizner, Snowden's principal legal adviser and director with the American Civil Liberties Union. "He's an extremely scrupulous and ethical lawyer."

Wizner acknowledged that Tibbo became involved in Snowden's case at a time "of much greater danger than when I got involved and when the outcome not only seemed uncertain, but could have ended badly." For that, he said, "I have enormous respect for Robert and the role that he played."

Masterminding one of the world's greatest political escapes seems an unlikely outcome for Tibbo, a McGill University chemical engineering graduate who spends his annual summers cycling at his property in Nova Scotia. After earning his degree in 1988, he headed to Australia and then in the early 1990s to China, where he learned Mandarin.

For the next decade, Tibbo travelled to Thailand and Hong Kong, studied law at the University of Auckland in New Zealand and graduated in 2001. He settled in Hong Kong, obtained a law licence, married and founded Eastern Chambers the following year.

His cramped one-room office in the Wan chai district is far from the polished chrome and glass towers of the major firms. Bookcases filled with black binders line the back wall, piles of papers are strewn on the floor, mismatched chairs are spread throughout the room, and a large table is pushed up against the wall over which diplomas hang haphazardly. Two small air conditioner units attached to the windows wheeze cool air to break the stifling heat and humidity and a small refrigerator contains bottles of water and cellphones.

As incongruous as it appears, the ramshackle office was the nerve centre for Snowden's getaway and Tibbo was pivotal to the execution of the plan.

"He [Tibbo] played the role that only he could play at that time. That's all it is. I doubt Robert would feel other than lucky than to have been involved in the case," said Snowden's U.S. lawyer Wizner. Currently, there are at least another seven lawyers in other jurisdictions on retainers waiting to play the same role for the U.S. fugitive.

Tibbo has certainly parlayed his association with Snowden to burnish his human rights credentials in Hong Kong. He said he is overwhelmed with refugee client requests, for which he is paid about HK$750 an hour (approximately C$135). Still, his cases haven't won him accolades within the conservative local legal fraternity. "He touched Snowden and that's his biggest claim to fame," said a Hong Kong barrister who is friendly with Tibbo but asked not to be named.

Now, with the world premiere of famed director Oliver Stone's movie on Snowdon imminent, Tibbo's more immediate concern is the potential backlash against the refugees who sheltered Snowden in Hong Kong. "He's very concerned about the people who helped Ed underground knowing they are very vulnerable," Poitras said.

But for Tibbo, fretting over his clients is an integral part of the services he provides -- and the one the asylum seekers count on the most.

National Post

Edward Snowden lauds 'courageous' asylum seekers who sheltered him: 'They had a hundred chances to betray me' (Canada)

Wednesday, 07 September 2016

Byline: Theresa Tedesco

Section: general

Interview - Edward Snowden, the world's most wanted dissident, looks back on his escape from Hong Kong. The National Post's Theresa Tedesco communicated with him via encrypted text messages through his Canadian lawyer, Robert Tibbo. The interview has been edited and condensed.
Q: How are you? How is life in Russia?

A: I'm doing surprisingly well, given some rather sinister figures are still feeling a bit vengeful about having been thrust into the spotlight. Public opinion regarding my decision to reveal mass surveillance to journalists has been moving favourably around the world, including perhaps unexpectedly the U.S. where even the former attorney general who once charged me as a criminal now says that while he can't condone it, he believes what I did was a "public service." Most of my time nowadays is focused on my work at the Freedom of the Press Foundation I sleep in Russia, but thanks to technology, I move all over the world.

Q: Do you have any regrets? Would you have done anything differently?

A: One of the things we've seen in the wake of these revelations is that the abuse of intelligence by authorities acts like a kind of cancer of government. The longer they go undetected, the harder they become to remove. Because the public at large wasn't permitted to know of them, and therefore couldn't object, we reached a point where critical masses of government staff became implicated in these abuses domestically and via foreign liaisons. At that point, if you actually try to enforce the law

and bring investigation and charges, you've got half of the institution fighting you, even if they know it's immoral, because they worry they might be the next one to be held to account. Had I known what was going on sooner, if I had come forward earlier, maybe we'd be in a better place. But there's always next time.

Q: Why did you choose Russia?

A: That's not quite right. I never intended to end up in Russia, much less chose it. When my government learned I had departed Hong Kong en route to Latin America, they cancelled my passport, trapping me in a Russian airport. Unable to travel and unable to leave, I filed applications for asylum in 21 countries, places like France and Germany, Austria and Finland. But those countries neither accepted my respective requests nor permitted safe travel onwards. Later we would learn that this was due to pressure from the White House, possibly in violation of international law forbidding interference with asylum claims. Eventually after spending a month trapped in limbo, I was allowed to leave the airport.

Q: Did you have concrete evidence that you might be killed?

A: Nobody on my team thought it would be the likeliest outcome, but it would have been irresponsible not to consider the possibility. Perhaps I come from a different perspective after working at the CIA for years, but do you really think it's be the first time they've killed someone for having the wrong politics?

Q: How were you able to trust total strangers in that situation? Were you in shock?

A: No matter how much you prepared yourself, taking a decision like that is frightening for sure. But it's also liberating. Think about it: when you walk into a fight you're almost certain you're going to lose, you realize incredible risks work in your favour, not to the adversary's. Suddenly, instead of fixating on your overwhelming odds of failure, you start evaluating tiny chances for success. For me, it was trusting strangers who knew what it meant to be hunted.

Q: What was it like?

A: They had a hundred chances to betray me while I was amongst them, and no one could have blamed them, given their precarious situations. But they never did. Despite not even having enough space for themselves, they never complained. Instead they smiled. The children would watch me crack neighbourhood wireless access points with a special antenna so I could communicate with journalists without drawing the police to where I was. I still remember the feeling in my stomach as I'd hear sirens screaming toward the building. I'd pray like hell that they were for something else as I raced to disable any equipment that might be transmitting, getting ready to move. Fortunately, it was always something else.

Q: How did you react when Robert Tibbo suggested the plan?

A: I was in a mission-focused state of mind by that point, so there wasn't a lot of agonizing. I wasn't bothered by the idea of rough living, but I was worried about accidentally dragging people down with me. Robert promised me they'd have my back despite the risks, and he was right. Supun, Nadeeka, Vanessa and Ajith are among the most courageous people I've ever had the privilege to know. Imagine the world's most wanted dissident is brought to your door. Would you open it? They didn't even hesitate, and I'll always be grateful for that. If not for their compassion, my story could have ended differently. They taught me no matter who you are, no matter what you have, sometimes a little courage can change the course of history.

National Post

How Snowden escaped (Canada)

Wednesday, 07 September 2016

Byline: Theresa Tedesco

Section: general

Hong Kong - The tall, lanky American dressed in all black looked familiar. But Ajith, a 44-year-old Sri Lankan refugee seeking asylum in Hong Kong figured the nervous-looking man with the red-rimmed eyes fidgeting in the darkness outside the United Nations building in the Tsim Sha Tsui district of Kowloon was a U.S. army dodger.
Summoned by his immigration lawyer in the late evening of June 10, 2013, Ajith (last names of the refugees in this story have been withheld), a former soldier in the Sri Lankan military, was told the unidentified man was "famous" and needed "protection." Little else was revealed except that he would be responsible for covertly moving the American around at a moment's notice.

"I was very happy to help him," Ajith recalled during a recent interview with the National Post in his small windowless room in Kennedy Town, on the western tip of Hong Kong Island. "This famous person was a refugee too, same as me."

Earlier that day, that "famous" 29-year-old walked out of the five- star luxury Hotel Mira in Kowloon and sparked an intensive global manhunt not seen since the search for al-Qaeda's Osama Bin Laden after the Sept. 11, 2001, bombings.

Edward Snowden, a former U.S. intelligence contractor, became the most wanted fugitive in the world after leaking a cache of classified documents to the media detailing extensive cyber spying networks by the U.S. government on its own citizens and governments around the world.

To escape the long arm of American justice, the man responsible for the largest national security breach in U.S. history retained a Canadian lawyer in Hong Kong who hatched a plan that included a visit to the UN sub- office where the North Carolina native applied for refugee status to avoid extradition to the U.S.

Fearing the media would surround and follow Snowden -- making it easier for the Hong Kong authorities to arrest the one-time Central Intelligence Agency analyst on behalf of the U.S. -- his lawyers made him virtually disappear for two weeks from June 10 to June 23, 2013, before he emerged on an Aeroflot airplane bound for Moscow, where he remains stranded today in self-imposed exile.

"That morning, I had minutes to figure out how to get him to the UN, away from the media, and out of harm's way with the weight of the U.S. government bearing down on him. I did what I had to do, and could do, to help him," Robert Tibbo, the whistleblower's lead lawyer in Hong Kong told the Post in a wide-ranging interview, the first detailing the chaotic days of Snowden's escape three years ago. "They wanted the data and they wanted to shut him down. Our greatest fear was that Ed would be found."

The covert scheme to dodge U.S. attempts to arrest Snowden could have been ripped from the pages of a spy thriller.

The fugitive was disguised in a dark hat and glasses and transported by car at night by two lawyers to safe houses on the crowded and impoverished fringes of Hong Kong. Snowden hunkered down in small, cluttered, dingy rooms where as many as four people shared less than 150 square feet. Batteries were removed from cellphones when they gathered, burner phones were used to place calls, SIM cards were exchanged and sophisticated computer encryption was used to communicate when face-to-face meetings were not possible. Snowden rarely ventured out, and only at night where he could easily be lost among the many other asylum seekers.

"Nobody would dream that a man of such high profile would be placed among the most reviled people in Hong Kong," recalled Tibbo, a Canadian-born and educated barrister who has practiced law for 15 years. "We put him in a place where no one would look."

Perhaps more importantly, added Jonathan Man, another Snowden lawyer who worked alongside Tibbo: "We knew (the asylum seekers) because we had helped them on their (immigration cases). And we knew they would not betray us."

Until now, details of how Snowden avoided detection, and where and who sheltered him have been closely guarded secrets known only by the famed whistleblower and his Hong Kong-based lawyers. Since then, he has become a controversial figure: a traitor to U.S. lawmakers and many in the intelligence community, but a pop-culture icon to legions of anti-establishment followers. Inevitably, Hollywood has entered the fray with a biopic of his life, directed by Oliver Stone and produced with Snowden's cooperation; the film is scheduled for a world premiere on September 9 at the Toronto Film Festival.

"Imagine the world's most wanted dissident brought to your door. Would you open it? They didn't even hesitate, and I'll always be grateful for that," Snowden said in an exclusive encrypted text to the Post.

The lives of the refugee families who concealed Snowden without question -- and without much choice -- may be forever changed now that their roles in helping him elude law enforcement will become public in the upcoming movie.

"I think these are very brave, selfless people who did something extraordinary at a very difficult time and at enormous personal risk," said Laura Poitras, a journalist and Oscar-winning documentary maker who filmed Snowden inside his Hong Kong hotel room for eight days.

Late on the evening of June 10, 2013, a cellphone rang in one of the dozens of decrepit, filthy apartment complexes that line the streets in the Lai Chi Kok area of Kowloon. Supun, a 32-year-old native of Colombo, Sri Lanka, who has languished in Hong Kong's refugee system since 2005, took a call in a cramped 150-square-foot apartment he shared with his partner Nadeeka and one-year-old daughter Suwasistiki. The voice on the other end of the phone was his immigration lawyer Robert Tibbo, asking to meet outside on the crowded sidewalk. "I was scared to ask questions," Supun said. "I told Nadeeka, 'I don't know why he's coming.' I thought it had to with my [asylum] case."

Reflexively, he brought his baby daughter outside with him. There, he was met by Tibbo, Jonathan Man and Edward Snowden. Asked if he recognized the American, Supun lied and said yes. "I was very scared," he said, and thought Snowden was in the military because of his short haircut.

Supun recalled the three men whispering amongst themselves and overheard them talking about someone being followed. "They told me he was staying with me. Feed him and don't talk to nobody about him," he said. Confused, he nonetheless obliged.

Supun wasn't told that Snowden had earlier that day escaped his hotel room where he had been holed up with journalists Laura Poitras and Glenn Greenwald for eight days leaking classified documents he'd stolen from the National Security Agency's Threat Operations Centre in Hawaii where he worked as an outside contractor for Booz Allen Hamilton Inc. The media's explosive reporting captivated the world and infuriated and embarrassed the U.S. government.

The intensely shy Snowden finally unmasked himself as the source of the classified disclosures on the Guardian's website on June 9. "He was scared for his life. He was fully aware that his life was at risk," Tibbo said. "Ed was clear in his mind about making the disclosures, but Ed's a human being. No matter that he understood intellectually what he did, it was only after he made the disclosures that thousands of tons of realizations weighed heavily on his emotional and physical state. He had the weight of the world on his shoulders and he had to move very quickly."

A high-stakes plan to keep Snowden safe was set in motion that began when he was escorted from the hotel to the UN building where Tibbo was waiting. Because Snowden's visa was still valid, he couldn't be

sure that the Hong Kong government would protect him. However, the UN would with a refugee claim and filing one bought time and tied the hands of Hong Kong authorities -- which answer to China's central government in Beijing -- from extraditing him at the U.S.'s request. As an asylum seeker, though, Snowden would also have been subject to harsh refugee rules and faced the possibility of being incarcerated while his application was processed, which could have taken decades.

At the same time, any thoughts that Snowden could remain in Hong Kong to fight extradition through local courts were quickly banished when it became clear that his freedom -- and his access to computers -- would have been curtailed.

"I wasn't familiar with Hong Kong's asylum policies," Snowden said in his text to the Post. "My plan was just to return this information to the public, not to take care of myself, which I considered impossible. This can be seen in my lack of an after-action plan."

Still, in the flurry of activity on that first day, and in the absence of a clear plan, filing with the UN was a necessary first step. From there, Snowden's lawyers knew they had to embed him somewhere safe until they hammered out an exit strategy, which is why they arrived at Supun's door in a grimy building with cracked walls and chipped green tiles on the stairs.

Children's clothes blow in the dirty air hanging over barbed wire. The squalor is visible; open garbage rots in stairwells and in open pits that were once courtyards. The stench, aided by the unbearable heat and humidity, is overpowering.

These housing estates, where Vietnamese, Indonesian, Filipino, African and Sri Lankan refugees live with inadequate resources from the government through International Social Services (ISS), are not just places where dreams come to die; it's where hope is decimated.

According to government statistics, Hong Kong has only accepted 52 refugees out of tens of thousands since 1992, an acceptance rate of about 0.05 per cent. Currently, there are 12,000 asylum seekers registered with the government, but there are several thousand more unregistered.

"The Hong Kong government hates poor people -- there are 1.5 million of its own and the refugees, who are at the bottom of the pile," said Cosmo Beatson, founder and executive director of Vision First, an independent NGO that advocates for refugees in the city-state founded in 2009.

Inside Supun's cramped two-and-a-half-room living space, a threadbare cotton sheet covers a small filthy window where an air conditioner wheezes incessantly. Supun, 32, Nadeeka, 33, and their now-four- year-old daughter and newborn son Dinath sleep on a mattress that barely fits in a room no bigger a large janitor's closet. A stuffed Minnie Mouse toy rests against a pillow and piles of bags containing their meagre belongings are jammed into a corner.

In the adjacent room where we sit on three plastic red stools are a small refrigerator, tattered green upholstered chair and ancient Dell desktop computer. A nearby bathroom doubles as the kitchen, with pots and pans stacked on top and underneath the sink and toilet.

This is the kind of place where Snowden hid from the world during the first days he went underground. "You're a good man to take care of me," Supun said Snowden told him. When they asked what the stranger liked to eat, he replied, burgers and spaghetti. Armed with the money Tibbo gave him, Supun went to buy food while Nadeeka prepared the only bed in the house for their unexpected guest.

The next day, Supun was dispatched to buy the South China Morning Post, an English-language newspaper he admitted he never reads. It wasn't until he brought the paper home that he and Nadeeka saw the giant front-page photo of the pale young man in their bed. "We were very, very surprised that this famous person was in our house," Nadeeka said. "We can't believe he's here in our house."

The tiny living space soon became overcrowded, especially since during his stay, Snowden "stayed in the room all the time," Nadeeka said. She had to force him to come out to shower so that she could clean the room. Nadeeka, who fled Sri Lanka in 2007 after years of systemic rape and subsequent hospitalization according to her refugee claim, also worried about Snowden, "because I knew he was living a dangerous life."

Once Snowden confirmed his identity, he ordered his host to unplug the old Dell computer because he was worried about it being traced. He also asked Supun to purchase specialized software at a local computer shop that would have allowed Snowden to communicate through sophisticated encryption. Everything was paid in cash so there would be no trace.

"He was in shock for the first three days," Tibbo recalled of his famous client. "He was a zombie, like he'd just walked out of a car crash."

Snowden saw it differently. "I was in a mission-focused state of mind at that point," he said. "I wasn't bothered by the idea of rough living, but I was worried about accidentally dragging people down with me."

Snowden's stay with Supun and Nadeeka was without incident. He ate mostly McDonald's food and loved sweets, especially cake. His legal team limited their presence at the tiny apartment, but dispatched interns to deliver cakes and sweets embedded with USBs as a way to communicate with him.

After almost a week, police suddenly began patrolling Supun's neighbourhood for no apparent reason. During Snowden's stay there, the U.S. government filed sealed criminal charges against Snowden on June 14, and requested Hong Kong authorities detain him the following day under an extradition treaty between the two countries, as a prelude to a formal application. Meanwhile, Snowden's passport and visa to visit Hong Kong remained valid as long as the seal remained in place, but his legal team feared the authorities were closing in.

"I still remember the feeling in my stomach as I'd hear sirens screaming toward the building, I'd pray like hell that they were for something else as I raced to disable any equipment that might be transmitting, getting ready to move," Snowden said.

Once darkness fell, the fugitive hugged Nadeeka, shook hands with Supun and gave them US$200 for their hospitality before he was clandestinely shuttled off to another secret location.

"In the early days, I understood it was a serious case that must be handled with care, but as the days wore on, I came to understand how dangerous the matter was becoming," Tibbo's associate Man said.

Sham Shui Po is among the poorest of Hong Kong's 18 districts. As the birthplace of the city-state's first public housing project, it was once the location of a POW camp for British, Canadian and Indian soldiers during the Second World War. In the 1970s and 1980s, the area was used to house Vietnamese refugees. Today, it is home mainly to the poorest new immigrants, especially from mainland China, and many of the refugees seeking asylum.

Snowden was taken to a cramped one-bedroom apartment in Sham Shui Po where Vanessa, a Filipino asylum claimant, lived with her mother and one- year-old daughter Keana. Again, it was late in the evening when Tibbo, Man and a stranger showed up at the 46-year-old's door. "I had no idea who [Snowden] was," she said. "My lawyer Robert Tibbo told me this man needed help. So I let them come into my house. They talked and I gave them privacy. Then he [Tibbo] told me he wanted him to stay with me. They didn't explain anything; just that he needed help, safety and do not talk to anyone."

Sitting in a tiny two-room apartment near North Point on Hong Kong Island where she moved last year, Vanessa described Snowden that night as "very, very upset" and visibly shaken. Once Tibbo and Man left her home, she changed the linens on her only bed and went to buy Snowden Chicken McNuggets and iced tea from a nearby McDonald's. He thanked her and went to sleep.

The next morning, Snowden woke up early and dispatched Vanessa to buy the local English-language newspaper. "I was shocked," she said, to learn his identity. She demanded to see his passport, and Snowden obliged. Still, despite being shaken and upset, she wasn't overly concerned. "Mr. Tibbo would not put me in trouble. I just listened to him and didn't talk to anyone," she said during an interview with her lawyer present.

Vanessa arrived in Hong Kong in 2002 as a domestic care worker. The contract ended after three years, but she stayed and worked in the country illegally for about five years until she was arrested. She filed for a refugee claim in 2010 and has been Tibbo's client since 2012.

Most of the time, Vanessa said her secret house guest was quiet and preoccupied on his computer. "He was worried a lot about his next step," she said. "He talked about his past life. He was really scared most of the time."

Snowden took cover at Vanessa's home for about four days and once again gave US$200 to his host on his way out the door.

Snowden's next stop was a tiny windowless, one-room apartment belonging to Ajith, the man who had been helping to move him around the city. The two men didn't talk much mostly because of the language barrier -- the Sri Lankan speaks little English. "My feeling was he had big tensions, he was very scared, he was nervous," recalled the lithe man with tattooed arms. Having landed in Hong Kong from a small town just outside Colombo in 2003 (too poor to bring his wife and one-year-old daughter with him) Ajith recalled that his guest was so jumpy "he would not let me open the door."

Snowden stayed with Ajith only one night. On June 21 -- his 30th birthday -- the whistleblower was formally charged with three felonies under the 1917 U.S. Espionage Act. A criminal complaint was filed in the Eastern District of Virginia, and the U.S. formally requested his arrest by the Hong Kong government. With that, the clock began ticking on when the U.S. would revoke his passport.

It was no longer safe to keep Snowden -- who faced the prospect of a trial in Virginia, and up to 30 years in a maximum-security prison if convicted -- with any refugees because they would be harbouring a fugitive from the law, making them even more vulnerable to Hong Kong government authorities.

Snowden was clearly concerned about how he would be treated if he was taken into custody by U.S. law enforcement. At the time, the military trial of Chelsea Elizabeth Manning, a 24-year-old former intelligence analyst in Iraq who passed along more than 700,000 classified documents to the Wikileaks website in 2010, was underway.

Before Snowden, Manning's case ranked as the largest breach of classified materials in U.S. history. Manning was convicted of 20 counts by court martial after she pleaded guilty to 10 of the 22 charges under the U.S. Espionage Act.

During her incarceration, A UN envoy accused the U.S. of cruel, inhuman and degrading treatment for keeping the former solider in solitary confinement at the Quantico military base in Virginia for almost a year. Manning was sentenced to 35 years in a maximum-security military prison at Fort Leavenworth, Kan., in August 2013.

After 12 days of hiding underground in Hong Kong's refugee community, Snowden was shuttled to the home of one of his lawyers. Terrified of a drone attack, according to Tibbo, they still celebrated the fugitive's milestone birthday with pizza, his favourite meal. With the U.S. justice system in hot pursuit, Snowden's lawyers had advised him of his rights as a refugee claimant, including, his various options to cross borders, possible routes and modes of transportation.

It was clear that fighting for asylum in Hong Kong was fraught with too much uncertainty. "It was Ed's decision to leave," Tibbo said. But Snowden also knew he needed assistance elsewhere. He instructed

his lawyers to reach out to Julian Assange and the Wikileaks network whose global group is committed to disclosing government secrets.

Sarah Harrison, a British Wikileaks staffer and close confidante of Assange, flew to Hong Kong from Australia and consulted with Snowden's lawyers. She purchased more than a dozen airline tickets to different destinations, including Iceland, Cuba and India, to confuse U.S., Chinese and Hong Kong officials monitoring the airport, despite having received "neutral to a green-light" from the city-state's government allowing Snowden to leave unhindered. Meanwhile, Assange, who was in self-exile at the Ecuadorean embassy in London, worked his connections with South American governments to obtain diplomatic protection for the young American.

On June 23, Tibbo drove Snowden and Harrison to Hong Kong International Airport. During that journey, Snowden, who had just met his travelling companion from Wikileaks for the first time, seemed unusually nervous. The pair posed as a young couple headed on a vacation. Leaving little to chance, Man simultaneously bought a ticket to Shanghai to get access to the boarding gates in the event Snowden encountered problems before boarding the plane. Tibbo waited at the Immigration department at the airport. Unlike the early days, this escape was meticulously planned.

"We tried our best to avoid surveillance," Man recalled. "Looking back, we must have been crazy. We understood the danger, but we didn't think much about it. Luckily, it turned out successfully."

Once the Aeroflot flight to Moscow had exited Chinese airspace, the Hong Kong government announced Snowden had left the country. The U.S. government was livid. Predictably, Snowden's departure kicked off a global pursuit and his passport was finally revoked.

However, when Snowden landed in Moscow, he was grounded in the transit zone of the airport because his cancelled passport meant he was prohibited from boarding any further commercial flights.

"I never intended to end up in Russia, much less choose it," he said. "When my government learned I had departed Hong Kong en route to Latin America, they cancelled my passport trapping me in a Russian airport. Unable to travel and unable to leave, I filed applications for asylum in 21 countries around the world, places like France, and Germany, Austria and Finland. But those countries neither accepted my respective requests nor permitted safe travel onwards."

In the end, Snowden and Harrison were marooned at the Sheremetyevo airport for a month before the Russian government granted him temporary asylum, which was recently extended for another three years.

Snowden, now 33, remains America's most wanted fugitive, although he has maintained that he would be prepared to return to the U.S. if he were guaranteed a fair trial. His lawyers are working on a plea deal and, more hopefully, are preparing to petition for a presidential pardon this fall. In the meantime,

Snowden has multiple emissaries in different jurisdictions around the world in the event he is able to move from Moscow.

Most of Snowden's time is focused on his work at the Freedom of the Press Foundation as he has forged a new life in Moscow with his long-time girlfriend Lindsay Mills. "I sleep in Russia, but thanks to technology, I (live) all over the world," he said.

Inevitably, Oliver Stone's movie will reignite the debate over whether the high-school dropout turned CIA computer whiz was a reckless traitor to his country or a disillusioned idealist with sincere motives.

For the vulnerable people back in Hong Kong who helped him escape to safety, the danger is potentially more palpable. According to Tibbo, Snowden sent them each US$1,000 when he realized he may have unwittingly put them at risk by revealing their role for the Hollywood movie.

"They had a hundred chances to betray me while I was amongst them, and no one could have blamed them, given their precarious situations. But they never did," Snowden said. "If not for their compassion, my story could have ended differently. They taught me no matter who you are, no matter what you have, sometimes a little courage can change the course of history."

DHS secretary Johnson vows 'no stone unturned' on election security

Tuesday, 06 September 2016

Byline: Nick Gass

Section: general

Washington - Faced with the potential threat of an election compromised by foreign hackers, Homeland Security Secretary Jeh Johnson on Tuesday sought to reassure Americans, pledging to "leave no stone unturned" when it comes to ensuring the integrity of the process.
"Well first, we have a lot of confidence in the integrity of the election process itself," Johnson told MSNBC's "Andrea Mitchell Reports." "There are some 9,000 state and local jurisdictions that are involved in the election process, including national elections, we've looked at a fair amount of it. We've looked at what states and cities do."

Johnson went on to say that "we have a lot of confidence in the process itself, we're in the mode now of wanting to leave no stone unturned, and so, what DHS, my department, has been going over the last several weeks is contacting state election officials to say, we want to leave no stone unturned."

The FBI said last month that foreign hackers were able to penetrate state election systems in Arizona and Illinois, and both the Democratic and Republican parties, have been compromised by cyberattacks seen as emanating from Russia.

"There are services we can offer by way of vulnerability to detection, incident response, we're in a general environment where there's an increasing level of sophistication by cyber attackers," he continued. "Across the spectrum, whether it's nation-state actors, plain criminals, hacktivists, and so we want to inform state election officials of what we see on a national level as best practices, and we're doing that right now."

Pressed on whether the department could protect the election from interference given past intrusions of top security agencies from China, Russia and others, Johnson responded that the "election process itself is not one that is tied to the Internet, the grid."

"It's a matter of vote counting and delivering vote tallies to a central repository, which occurs multiple different ways in multiple different layers," Johnson said, to which Mitchell responded that it is "electronic in many instances."

Johnson replied, "But it's not generally linked to the Internet."

"In terms of federal.gov, we're moving in the right direction," Johnson continued. "DHS is now installing across lots of federal agencies, including [the Office of Personnel Management] now, the ability to not just monitor and detect cyber intrusions, but to block them as well. We're in a much better place than we were as recently as a year ago, pursuant to a pretty aggressive timetable that I've set for the federal.gov system."

Putin Says DNC Hack Was a Public Service, Russia Didn't Do It

Friday, 02 September 2016

Byline: Multiple reporters

Section: general

Vladivostok - Vladimir Putin said the hacking of thousands of Democratic National Committee emails and documents was a service to the public, but denied U.S. accusations that Russia's government had anything to do with it.
"Listen, does it even matter who hacked this data?" Putin said in an interview at the Pacific port city of Vladivostok on Thursday. "The important thing is the content that was given to the public."

U.S. officials blame hackers guided by the Russian government for the attacks on DNC servers earlier this year that resulted in WikiLeaks publishing about 20,000 private emails just before Hillary Clinton's nominating convention in July. The documents showed attempts by party officials to undermine her chief Democratic rival, Bernie Sanders, and led to the resignation of the head of the DNC, Representative Debbie Wasserman Schultz of Florida.

Putin, in power since 2000 and facing re-election in 18 months, has had an acrimonious relationship with Clinton since her failed attempt to "reset" relations as secretary of state in 2009. Putin in 2011 blamed her personally for stoking the biggest protests of his rule by sending an activation "signal" to "some actors" inside Russia. Clinton has compared his annexation of Crimea in 2014 to actions taken by Adolf Hitler before World War II.

"There's no need to distract the public's attention from the essence of the problem by raising some minor issues connected with the search for who did it," Putin said of the DNC breach. "But I want to tell you again, I don't know anything about it, and on a state level Russia has never done this."

The Federal Bureau of Investigation has high confidence that the government in Moscow was behind the theft at the DNC and other Democratic Party organizations seeking to propel Clinton to victory over Republican Donald Trump in November, a person familiar with the findings has said. Trump has praised Putin as a great leader and the billionaire's former campaign chairman spent years working for the Kremlin ally who was ousted from Ukraine's presidency in 2014.

Clinton's campaign struck back at Putin on Friday for characterizing the cyber intrusions at Democratic Party groups as a public service and accused him of endorsing the disruption of the U.S. vote.

"Unsurprisingly, Putin has joined Trump in cheering foreign interference in the U.S. election that is clearly designed to inflict political damage on Hillary Clinton and Democrats," Clinton spokesman Jesse Lehrich said in an email. "This is a national security issue and every American deserves answers about potential collusion between Trump campaign associates and the Kremlin."

In a two-hour conversation near Russia's eastern fringe, Putin touched on subjects ranging from the war in Syria to oil prices and trade with China. It came just two days before Putin, Barack Obama and other world leaders gather at a Group of 20 meeting in Hangzhou.

Video: Putin Says Compromise Possible With Japan in Islands Dispute

An internal DNC probe by CrowdStrike Inc., a cybersecurity company, traced the DNC break-in to two groups it says are linked to Russian intelligence services. One, Cozy Bear, it says is affiliated with the Federal Security Service, the main successor to the KGB, while the other, Fancy Bear, it says is tied to the Main Intelligence Directorate, a branch of the Defense Ministry.

James Lewis, a cybersecurity expert at the Center for Strategic and International Studies in Washington, said Russia's "track record" of state hacking goes back at least a decade, so Putin's denials aren't credible.

"Nice try, but no goal," Lewis said.

The digital net cast by the hackers has widened almost weekly -- security experts say it now includes congressional staffers, NATO generals, Washington think tanks and the Democratic Congressional Campaign Committee -- adding another unpredictable element to a highly unusual election. The subsequent leaks have included the mobile number of House Minority Leader Nancy Pelosi, who said she was barraged with "obscene" calls within hours.

Putin also took a dig at the U.S. campaign and what he saw as an obvious party bias in favor of Clinton, saying he "couldn't imagine" that the information leaked from the DNC would be newsworthy for "American society -- specifically that the campaign headquarters worked in the interest of one of the candidates, in this case Mrs. Clinton, rather than equally for all of the Democratic party candidates. "

Alexander Gostev, the chief expert at Kaspersky Lab, a Moscow-based software security firm, said of all the Russian-speaking hacking groups targeting governments, Fancy Bear "is the most notable."

Malware linked to Fancy Bear was widely detected in Ukrainian government computers during the elections that were held after the country's Kremlin-backed leader, Viktor Yanukovych, was deposed, Gostev said, adding that "six or seven" groups may be tied to the Russian government.

At the same time, Russia has come under attack by viruses linked to U.S. and U.K. intelligence services, Gostev said, adding that hacking efforts from China against Russian defense and nuclear agencies have intensified in the past year.

Snowden Warning

Edward Snowden, the former National Security Agency contractor who exposed U.S. surveillance secrets, said on Twitter last month that Russia, where he lives in exile, may have been behind the hack of NSA- linked malware that was made public. The reason, Snowden said, may have been to "influence the calculus of decision-makers wondering how sharply to respond to the DNC hacks."

Putin said that even if Russia did want to try to influence the U.S. election through leaked secrets, it doesn't have the nuanced understanding of American politics required to succeed.

"To do that you need to have a finger on the pulse and get the specifics of the domestic political life of the U.S.," the Russian president said. "I'm not sure that even our Foreign Ministry experts are sensitive enough."

Putin, 63, said the state of hacking is so sophisticated that it's impossible to know the identities or locations of the people ultimately behind them.

"You know how many hackers there are today?" Putin said. "They act so delicately and precisely that they can leave their mark -- or even the mark of others -- at the necessary time and place, camouflaging their activities as that of other hackers from other territories or countries. It's an extremely difficult thing to check, if it's even possible to check. At any rate, we definitely don't do this at a state level."

Moscow Times

Russian Security Services Say 'Spy Pen' Found in Pokemon Go Player's Home

Tuesday, 06 September 2016

Byline: Staff report

Section: general

Moscow - Russian security services say they found a "spy-pen" in the home of video blogger Ruslan Sokolovsky, who was recently detained for filming himself playing Pokemon Go in a Yekaterinburg cathedral. Police have charged Sokolovsky with committing an extremist act and offending religious sensitivities. If convicted, he could face several years in prison.
Russia's Investigative Committee said the pen could be used to receive illegal information from abroad. Other potentially incriminating items in the suspect's apartment include a video camera, a tripod, and a professional microphone.

Police are also investigating magazines published by the video blogger, which they say contain illustrations which incite religious hatred. Earlier this year, Sokolovsky launched a self-titled magazine for atheists. He wrote that: "we have been inspired by Charlie Hebdo and have decided that there are too few such publications in Russia that take an absolutely amoral approach to ridiculing the contemporary national reality."

The Russian Orthodox Church initially called for Sokolovksy's release. Its Yekaterinburg representatives said the church "does not lust for blood." But the church has since changed its stance on the matter. Its local spokesman, Veniamin Raynikov, told the press that the church "will not put pressure on the court so that we appear to be the good guys. We support re-education."

The blogger's mother hopes the church will forgive her 21 year-old son. In an interview with the pro-Kremlin Life News channel, she said: "he should not have done it. We want to talk to bishop Kirill so that the whole thing will end in peace and friendship." She also said she recently lost her older son and that the family buried him in a church ceremony. "I went through such sadness - and now this. I want to talk to the church, perhaps they could release him at least out of pity for me."

Amnesty International has released a statement urging Russian authorities to release the blogger, calling his detention an "absurd attack on freedom of expression."

"The farcical nature of the case against the Russian blogger, detained for playing Pokemon Go in a church, demonstrates what happens when the authorities do not value freedom of expression. Even if someone deems Sokolovsky's behavior disrespectful, authorities should not imprison people purely for offending religious beliefs," said John Dalhuisen, director of Amnesty International's Europe and Central Asia office.

The Local (Germany)

German government attacked by hackers 20 times a day

Tuesday, 06 September 2016

Byline: Staff report

Section: general

Berlin - Cyber attacks on the German government and businesses are becoming ever more sophisticated and effective, security experts warn.
Each day there are more than 20 highly specialized attacks on the government's computer networks, the president of the Federal Office for Information Security (BSI), Arne Schönbohm, told Bild on Tuesday.

"Today cyber attacks are much more precise than before and aimed at single targets, like the German parliament. That unfortunately means they're also more successful," Schönbohm said.

The BSI is at the front line of protecting government networks, and so far "no hacker has yet cracked this".

Last year though, a magazine reported that German-owned Patriot missiles in Turkey were briefly taken over by hackers.

Schönbohm said that the frequency of attacks on both private and public entities has become great.

"Volkswagen says the number of attacks on their IT network is 6,000 per day."

A study last year found that one in five major German firms had been attacked by hackers.

DPA recently found that some German states, in the fight against cyber crime and terrorist activity, have significantly expanded their investigative authorities to include new specialized departments, prosecutors and IT experts.

Security experts fear that terrorists or other groups could, for example, target through cyber attacks certain vital resources for communities, like water or energy supplies.

The German government also warned of cyber attacks in its first civil defence plan since the end of the Cold War. The strategy called for citizens to stockpile food for ten days and water for five in case of cyber or other attacks against resources.

In April, a computer virus found at a Bavarian power plant raised alarm, though plant operators insisted that it did not pose a threat. Authorities later discovered that the virus came from a USB stick rather than over the internet.

Associated Press

Missed opportunities to stop OPM cyber breach spelled out

Wednesday, 07 September 2016

Byline: Staff report

Section: general

Washington - It was time to purge the hacker from the U.S. government's computers. After secretly monitoring the hacker's online movements for months, officials worried he was getting too close to critical information and devised a plan, dubbed "the Big Bang," to expel him.
Trouble was, with all their attention focused in that case, they missed the other hacker entirely.

A new congressional report provides previously undisclosed details and a behind-the-scenes chronology of one of the worst-ever cyberattacks on the United States, laying out missed opportunities before the break-in at the Office of Personnel Management exposed security clearances, background checks and fingerprint records. That attack - widely blamed on China's government - compromised personal information of more than 21 million current, former and prospective federal employees, led to the resignation of the OPM director and drew outrage over changing explanations about the hack's seriousness.

The report by the House Committee on Oversight and Government Reform faulted the personnel agency for failing to secure sensitive data despite warnings for years that it was vulnerable to hackers. It concluded that the hacking revealed last year could have been prevented if OPM had put in place basic, required security controls and recognized from an earlier break-in that it was actually dealing with a sophisticated, persistent enemy.

"We have literally tens of millions of Americans whose data was stolen by a nefarious overseas actor, but it was entirely preventable," Rep. Jason Chaffetz, a Utah Republican and committee chairman, said in an interview.

"With some basic hygiene, some good tools, an awareness and some talent, they really could have prevented this," he added.

OPM Acting Director Beth Cobert said in a statement the agency disagrees with much of the report and it "does not fully reflect where this agency stands today." She said the OPM hack "provided a catalyst for accelerated change within our organization," including hiring new cybersecurity experts and strengthening its security.

The government discovered the first OPM hacking in March 2014 when a specialized Homeland Security Department team noticed suspicious streams of data leaving its network between 10 p.m. and 10 a.m. - the online equivalent of moving trucks hauling away filing cabinets containing confidential papers in the middle of the night. The government's so-called Einstein intrusion warning system detected the theft.

"DHS called us and let us know, hey, we think this is bad," Jeff Wagner, OPM's director of information security operations, told officials investigating the hack, according to the hack.

For two months, the personnel office worked with the FBI, National Security Agency and others to monitor the hacker to better understand his movements. Officials developed a plan to expel the hacker over a three-day weekend in May 2014, dubbed "the Big Bang." The effort included resetting

administrative accounts, building new accounts for users who had been compromised and taking offline compromised systems.

"The risk of kicking them out too early had come and gone," Wagner said, "and now the risk was becoming having them in too long, and we didn't want to keep them around any longer than we had to."

The problem was far from solved.

Unknown to the experts focused on expelling the hacker, a second intruder posing as an employee of a federal contractor had infiltrated the system weeks before "the Big Bang." That hacker used a contractor's credentials to log into the system, install malicious software and create a backdoor to the network, according to the report.

Over the next several months, roaming unchecked through the system, the hacker stole sensitive security clearance background investigation files, personnel files and, ultimately, fingerprint data.

That breach was not detected until April 2015, when an OPM contract employee traced the flow of stolen material back to an Internet address that had been registered to Steve Rogers, the alter ego of Captain America, indicating a spoof account. By then, sensitive information on millions of American workers had already been compromised.

The report also faulted the personnel office for failing to quickly deploy security tools from an outside firm to detect malicious code and other threats. Once deployed, the tool from Cylance Inc. of Irvine, California, "lit up like a Christmas tree," indicating it found malware throughout the federal computers, an engineer is quoted as saying in the report.

"Could they have done better? Absolutely," said Cylance founder and chief executive Stuart McClure. "But once they had been definitively convinced there was a breach, they took it very seriously."

It said OPM officials misled the public about the scope of the breach and also by saying the two breaches were unrelated when, instead, "they appear to be connected and possibly coordinated," according to the congressional report.

"The two attackers shared the same target, conducted their attacks in a similarly sophisticated manner, and struck with similar timing," the report said.

Though the U.S. suspects the hack was an act of Chinese espionage, the House inquiry did not go into great detail about who was responsible. It mentions that the data breaches discovered in April 2015 were likely perpetrated by the group "Deep Panda," which has been linked to the Chinese military.

Times of Israel

Israeli government okayed sale of spyware that exploits iPhones

Wednesday, 07 September 2016

Byline: Staff Report

Section: general

Jerusalem - NSO Group, an Israeli technology company that created spyware that was found being used to compromise a prominent United Arab Emirates activist's iPhone, had sold the software to an Arab company with the express permission of the Israeli Defense Ministry.
The discovery of the sophisticated spyware, called Pegasus, capable of infiltrating and remotely taking control of iPhones without leaving a trace, forced Apple to push out a security update last week. The software came to light after researchers said the Emirati rights activist, Ahmed Mansoor, was targeted by a simple text message that asked him to tap on a link for information on detainees tortured in the UAE. Suspicious, he forwarded it to internet watchdog group Citizen Lab.

The software can track calls and contacts, collect passwords, read text messages and emails, record calls and trace the whereabouts of the user. Mike Murray, a researcher with Lookout, a San Francisco-based smartphone security company, called it "one of the most sophisticated pieces of cyberespionage software we've ever seen."

The exploit took advantage of previously undisclosed weaknesses in Apple's mobile operating system, iOS 9.3.5, according to reports published late last month by Lookout and Citizen Lab.

According to a report Wednesday in the Yedioth Ahronoth daily, the Defense Ministry's Defense Export Controls Agency (DECA), which must approve the export of sensitive security products, gave NSO Group permission to sell the software to an Arab company.

The report said the decision was met with a great deal of criticism within the agency. A senior Defense Ministry staffer called the export license "a scandal."

A Foreign Ministry official -- none of the report's sources were named due to the sensitivity of the case -- noted that the Israeli company is not accused of taking part in the attempted hacking, but said "the very fact that the company is being linked in the press to a cyberattack on a human rights activist damages the country's good name."

According to the report, the original license allowed NSO to sell a version of Pegasus that would take over the iPhone without requiring its user to even tap the link that would download the spyware.

Merely receiving the text message would allow the takeover. DECA then changed the license to only permit the sale of the version that requires a tap on the link.

The sale itself was facilitated by former senior officials in Israel's defense establishment. The Arab company, its home country and the officials involved on either side were not named in the Yedioth report.

In a statement last month that stopped short of acknowledging the spyware was its own, the NSO Group said its mission was to provide "authorized governments with technology that helps them combat terror and crime."

"The agreements signed with the company's customers require that the company's products only be used in a lawful manner," the statement read. "Specifically, the products may only be used for the prevention and investigation of crimes."

The company said that it "does not operate the software for its clients, it just develops it," according to Channel 2.

Israeli companies have been criticized in the past for selling software to monitor internet and phone communication to regimes with poor human rights records, including in Uzbekistan and Kazakhstan, as well as Colombia, Trinidad and Tobago, Uganda, Panama and Mexico, according to the NGO Privacy International.

In a statement to Yedioth, the Defense Ministry said it "operates an orderly oversight mechanism, under law," of sensitive defense exports, "that works in close cooperation with the Foreign Ministry."

L'avocat général de la Cour de Justice de l'UE retoque l'accord PNR avec le Canada
Thursday, 08 September 2016
Byline: Journaliste maison

Paris - L'avocat général de la Cour de justice de l'UE a estimé que l'accord sur le transfert des données des dossiers passagers (PNR) prévu entre l'UE et le Canada ne pouvait être "conclu sous sa forme actuelle".
Selon l'avocat général, Paolo Mengozzi, l'accord "ne peut être conclu sous sa forme actuelle", est-il rapporté dans un communiqué, car contraire aux droits fondamentaux de l'Union.

L'accord envisagé doit être soumis "à un contrôle strict au regard du droit au respect de la vie privée et familiale et du droit à la protection des données à caractère personnel", considère le magistrat.

Ce dernier s'appuie sur deux arrêts de la CJUE sur ces sujets, dont celui concernant le dossier Max Schrems, requérant autrichien à l'origine de l'invalidation du "Safe Harbour", le précédent accord de transfert de données personnelles entre l'UE et les Etats-Unis. Ce dernier a été récemment remplacé par un nouveau cadre juridique baptisé "Privacy Shield" ("Bouclier de protection des données").

"Il est en effet nécessaire que (...) la Cour s'assure que les mesures projetées, fussent- elles sous la forme d'accords internationaux envisagés, reflètent une pondération équilibrée entre le souci légitime de préserver la sécurité publique et celui, non moins fondamental, à ce que toute personne puisse jouir d'un niveau élevé de protection de sa vie privée et de ses propres données", souligne le communiqué de la CJUE.

Le projet d'accord PNR entre l'UE et le Canada a été signé en 2014, avec pour but de lutter contre le terrorisme et les formes graves de criminalité internationale.

Dans ses conclusions, qui ne lient pas la Cour de justice pour sa décision finale attendue ultérieurement, M. Mengozzi liste de nombreuses conditions à remplir pour que l'accord soit compatible.

Mais surtout, il énumère plusieurs dispositions qu'il juge contraires à la Charte des droits fondamentaux, notamment la possibilité d'élargir le traitement des données PNR "au-delà de ce qui est strictement nécessaire".

L'avocat général dénonce aussi l'autorisation donnée au Canada de conserver des données PNR pour cinq ans en cas de besoin de vérification ou enquête "sans que ne soit requis un lien quelconque avec la finalité de sécurité publique poursuivie dans l'accord".

L'arrêt de la CJUE sera très suivi alors que l'Union vient de se doter de son propre registre européen des données de passagers aériens, après cinq ans d'âpres débats. Les Etats membres ont deux ans pour transposer la directive.

Australian Associated Press
Turnbull breaks down walls to China
Thursday, 08 September 2016
Byline: Paul Osborne

Canberra - There are risks and opportunities when it comes to Australia working more closely with China.
But, as Malcolm Turnbull's visit to Hangzhou for the G20 summit showed, the opportunities outweigh the risks.

The risks are both obvious and subtle.

More regular contact with Chinese authorities and business since the 1970s has led to greater interest, and engagement, in the Australian domestic political process.

But allowing any foreign interests to throw their weight around the political process - through donations and gifts to MPs and political parties - is fraught with danger.

There is a clear public benefit for such donations, whether direct or channelled through entities such as educational bodies, to be banned.

More sophisticated technology in China is also posing its problems.

As more business executives, tourists and politicians take their mobile phones, iPads and computers into China, the threat of cyber nasties creeping into Australian corporate and government computer systems grows.

Australians travelling to China for work are routinely warned about not accepting free USB sticks, or using public wi-fi or plugging into local networks which can pass on subtle computer bugs.

Politically, Turnbull's embrace of greater Chinese investment poses problems as he seeks to deal with the likes of One Nation and the Nick Xenophon Team, which advocate protectionism and tougher thresholds for checks if not outright bans.

The release of data this week about China's level of investment in agriculture - less than 1 per cent - should go some way to addressing this.

Then there is the human rights question. Isn't Australia obliged to expect more progress on freedom of speech and religion and getting China to abide by international law when it comes to the South China Sea before it goes further down the trade track?

But it was the prime minister's visit to the headquarters of the global e-commerce giant Alibaba in the G20 host city that showed the depth of opportunity for Australian businesses in China and the thirst for a more open approach from within China.

On Tuesday, Turnbull signed a deal between Austrade and Alibaba to work more closely on selling more Australian goods online on the popular Tmall.com and Tmall Global websites, focusing on fresh produce such as dairy and seafood.

Alibaba online markets have more than 434 million users and take 12.7 billion orders each year.

There are already more than 1300 Australian brands on the two online platforms, 80 per cent of which had never before reached the Chinese market, and demand is growing exponentially.

An Alibaba hub office is planned for Melbourne by the end of the year to support local operations in Australia and New Zealand and encourage small, medium and large businesses to use it as a stepping stone into exports.

Interestingly, Alibaba founder Jack Ma told Turnbull and journalists, during a visit to the Hangzhou headquarters for the agreement signing, it was a trip to a friend in the NSW city of Newcastle in 1985 that opened his mind to the world.

Importantly for free trade advocates such as Turnbull and Barack Obama, Ma said putting up the walls of protectionism "is the road back to poverty" for his country.

Chinese President Xi Jinping was also making the right noises at the G20 summit about tearing down global trade and investment barriers.

In a bilateral meeting with Turnbull, the president remarked he hoped Australia continued to provide foreign investors a "fair, transparent and predictable policy environment".

It wasn't that long ago Treasurer Scott Morrison knocked back the sale of the NSW electricity distributor Ausgrid to two Chinese buyers, on national security grounds.

The prime minister is adamant China understands Australia's sovereign right to determine what investment is allowed.

Helpfully for Australia, Xi is on the same page when it comes to Turnbull's interest in innovation being the driver of the next economic revolution.

The final G20 communique's call for innovation to remain on the summit's agenda into the 2017 Hamburg event is reflective of his and Xi's thinking.

Also going in Australia's favour during the summit was Turnbull's injection of political reality into the talks, especially over the future of the steel industry.

A global forum was agreed which would monitor Chinese steel production as capacity was reduced by as much as 150 million tonnes by 2020.

While the Europeans went in heavy-handed about China needing to quickly cut back on its production of steel, the prime minister warned his fellow leaders at one session that any adjustments would have "political consequences", put millions of jobs at risk and bring with it "social problems and injustices".

It is this empathy and realism that will stand Australia in good stead when it comes to closer ties with China.

Cyberattaque contre la CS des Appalaches
Thursday, 08 September 2016
Byline: Ian Bussières

Québec - Des pirates paralysent le système informatique depuis la fin de semaine
Des pirates informatiques paralysent depuis la fin de semaine le système informatique de la Commission scolaire des Appalaches (CSA), dans la région de Thetford Mines. Au total, 75 % des données de l'établissement auraient été perdues et l'escouade des crimes majeurs de la Sûreté du Québec tente de régler le problème et d'identifier les responsables de cette cyberattaque.

Les directions des différentes écoles de la CSA ont rencontré leurs employés mercredi après-midi pour leur annoncer qu'ils devraient fort probablement se débrouiller sans le réseau informatique de la commission scolaire au moins jusqu'à la fin de la semaine.

C'est lors de ces rencontres, selon des employés qui y ont assisté, qu'on a annoncé que le système avait été fermé à la suite d'une attaque menée durant la fin de semaine par des pirates informatiques et que les trois quarts des données étaient perdues. Depuis mardi, il était entre autres devenu impossible pour les travailleurs d'entrer normalement dans le système en utilisant leur code.

Enseignants peu affectés

«Concernant les renseignements personnels, on semble nous dire qu'ils n'auraient pas été touchés par l'attaque», a déclaré au Soleil un employé de la CSA qui préfère taire son identité. «On ne sait pas si le système de paie et de perception des taxes scolaires a été touché, mais il semblerait que les horaires et les listes d'élèves soient hors de danger puisqu'ils sont hébergés ailleurs», poursuit notre source.

Les employés de bureau de la commission scolaire et des différentes écoles auraient donc beaucoup de difficulté à faire leur travail. Quant aux professeurs, ceux qui utilisaient les nouveaux tableaux intelligents pourront continuer de le faire, mais sans être branchés au réseau de l'école. Ce serait la classe iPad de la polyvalente de Black Lake qui serait la plus touchée à la suite de l'attaque.

«Les enseignants ne sont pas les plus affectés. La commission scolaire a branché un ordinateur à un photocopieur pour les enseignants qui auraient besoin de documents sur le réseau de l'école», poursuit notre source.

Silence radio

Le directeur général de la CSA, Camil Turmel, a refusé de répondre aux questions des médias mercredi, son adjointe indiquant que le dossier avait été transféré à la Sûreté du Québec.

Le coordonnateur du secteur des technologies de l'information et des communications de la CSA, Manuel Granger, affirmait toutefois dans un message enregistré que c'est pour «limiter les dommages» que la totalité du système informatique de la commission scolaire avait été arrêté et qu'une cellule de crise avait été mise en place.

Du côté de la Sûreté du Québec, on n'était guère plus loquace. Le sergent Claude Denis a indiqué mercredi que des spécialistes en informatique analysaient présentement la situation pour tenter de régler le problème et que le service d'enquête des crimes majeurs avait été saisi du dossier.

Possible demande de rançon... en bitcoins!
Thursday, 08 September 2016
Byline: Ian Bussières

Québec - Les pirates informatiques qui ont mené une cyberattaque contre la commission scolaire des Appalaches (CSA) auraient demandé une rançon en bitcoins, une monnaie cryptographique, pour fournir la clé qui permettrait de décrypter le système informatique paralysé depuis la fin de semaine. L'information, qui n'a pas été confirmée aux employés par la direction de la commission scolaire, circulait cependant beaucoup mercredi chez certains employés plus au fait du dossier.

«La direction n'a ni confirmé ni infirmé qu'une rançon en bitcoins avait été réclamée par les pirates», a affirmé au Soleil un employé de la CSA à la suite de la rencontre avec la direction de son école. La Sûreté du Québec a refusé elle aussi de confirmer ou d'infirmer ce scénario.

Si tel est le cas, il ne s'agirait pas d'une première puisque les attaques informatiques dont le but est de réclamer une rançon, aussi appelées ransomwares, se multiplieraient à travers le monde.

Dans une attaque ransomware, un pirate inconnu bloque ou crypte un ordinateur ou un réseau jusqu'à ce qu'une rançon soit payée et, lorsque l'argent a été versé, une clé ou une méthode de décryptage est fournie.

De plus en plus fréquentes

En juin, l'Université de Calgary avait payé une rançon de 20 000 $ afin de récupérer le contrôle de son système après une attaque du genre. Une boutique de vin de Calgary, des cabinets d'avocats de Colombie-Britannique, une famille de Winnipeg et une petite station de radio d'Ostego, au Michigan, figurent parmi les victimes récentes de ce type d'extorsion.

Selon les données de la filiale McAfee du géant de l'informatique Intel, ces attaques auraient plus que doublé au cours de la dernière année, permettant aux pirates de récolter entre 10 et 50 millions $ par mois. La plus importante demande de rançon enregistrée jusqu'à maintenant serait de 800 000 $, mais les pirates qui ciblent des individus plutôt que des entreprises demandent généralement une rançon de quelques centaines de dollars.

Islamic Republic News Agency
Iran to take cyber attacks against its nuclear facilities to domestic, int'l courts
Thursday, 08 September 2016

Tehran - Deputy for the Iranian Prosecutor General Abdolsamad Khorramabadi said Iran is to take the case of cyber attacks to its nuclear centers to relevant domestic and international courts.
He said that based on the article 290 of the Iranian law of criminal procedure, the Prosecutor General's Office has asked the Atomic Energy Organization of Iran (AEOI) to work in harmony with the Iranian Foreign Ministry to follow up the case of cyber attacks through domestic and foreign legal channels.

Based on the guidelines given by the Supreme Leader of the Islamic Revolution as to following up the cases of cyber attacks to the Iranian nuclear facilities and networks, he noted, Iran is going to file cases against the individuals and companies which were behind production and using of the Stuxnet viruses.

He noted that all world countries have filed any attacks to computer systems via compiling viruses or ban software as a criminal act so international courts are ready to take such complaints into consideration.

Sputnik (Russia)
German Intelligence Plans 12% Budget Increase for Communications Monitoring
Thursday, 08 September 2016
Byline: Staff report

Moscow - Germany's Federal Intelligence Service (BND) plans a 12 percent increase in spending on communications monitoring, including the deciphering of encrypted communications, in 2017, Der Spiegel reports.
The 2017 BND budget for the purpose is projected to be 808 million euros (about $909 million), the news magazine said on Wednesday citing secret budget documents.

The twelve percent increase over the current year comes amid BND plans to boost its response to the widespread use of messenger services such as WhatsApp, Der Spiegel explained. The services encrypt the messages of its users making it difficult for intelligence services to capture the content. BND is planning to overcome this difficulty, which is necessary amid the rise of cybersecurity and terrorism threats.

The Intercept
Google Program to Deradicalize Jihadis Will Be Used for Right- Wing American Extremists Next Thursday, 08 September 2016
Byline: Naomi LaChance

Washington - A Google-incubated program that has been targeting potential ISIS members with deradicalizing content will soon be used to target violent right-wing extremists in North America, a designer of the program said at an event at the Brookings Institution on Wednesday.
Using research and targeted advertising, the initiative by London-based startup Moonshot CVE and Google's Jigsaw technology incubator targets potentially violent Jihadis and directs them to a YouTube channel with videos that refute ISIS propaganda.

In the pilot program countering ISIS, the so-called Redirect Method collected the metadata of 320,000 individuals over the course of eight weeks, using 1,700 keywords, and served them advertisements that led them to the videos. Collectively, the targets watched more than half a million minutes of videos.

The event at Brookings was primarily about the existing program aimed to undermine ISIS recruiting. "I think this is an extremely promising method," said Richard Stengel, U.S. Undersecretary of State for public diplomacy and public affairs.

Ross Frenett, co-founder of Moonshot, said his company and Jigsaw are now working with funding from private groups, including the Gen Next Foundation, to target other violent extremists, including on the hard right.

"We are very conscious as our own organization and I know Jigsaw are that this [violent extremism] is not solely the problem of one particular group," Frenett said.

"Our efforts during phase two, when we're going to focus on the violent far right in America, will be very much focused on the small element of those that are violent. The interesting thing about how they behave is they're a little bit more brazen online these days than ISIS fan boys," Frenett said.

He noted that this new target demographic is more visible online.

"In the U.K. if someone in their Facebook profile picture has a swastika and is pointing a gun at the camera, that person is committing a crime," Frenett said. "In the U.S., there is absolutely nothing wrong with that. So we found that when we're looking for individuals that are genuinely at risk of carrying out violence, that they're relatively open online."

Adnan Kifayat, head of global security ventures at Gen Next Foundation, said he is optimistic about applying the ISIS approach to North America. "Our interest is in countering extremism... particularly in the homeland," he told the Intercept.

Gen Next Foundation, based in Newport Beach, Calif., was founded by a group of young executives, authors, entrepreneurs and others to fight terrorism.

In the ISIS pilot program, the YouTube channel pulls preexisting videos that, according to Yasmin Green, the head of research and development for Jigsaw, "refute ISIS's messaging."

One video is from a woman who secretly filmed her life in ISIS-controlled Raqqa. Another shows young people in Mosul, their faces obscured by keffiyehs for their protection, talking about life under the Islamic State.

"The branding philosophy for the entire pilot project was not to appear judgmental or be moralistic, but really to pique interest of individuals who have questions, questions that are being raised and answered by the Islamic State," Green said.

The next phase will also hone in on changes in users' behavior.

"The idea that you can't measure consumption patterns online is frankly absurd," Frenett said.

London Daily Telegraph
Rudd warns of struggle to stop online extremists
Thursday, 08 September 2016
Byline: Christopher Hope

London - Security experts are struggling to stop the spread of extremist messages on the internet despite taking down 1,000 videos a week, the Home Secretary has admitted.

Amber Rudd said she was in talks with social media websites about setting up a new industry standard board to agree the rules that set out when sites should be taken down.

The new Home Secretary was grilled by MPs on the Commons home affairs committee about what more could be done to force US sites like Twitter, Facebook and YouTube to take action. Ms Rudd said that major internet companies could take more responsibility "because the speed these damaging videos get put up and then we manage to take down - at the moment we are taking down 1,000 a week of these sites - is too slow compared to the speed at which they are communicated".

Ms Rudd was particularly asked what more could be done to require them "frequently and regularly" to take down websites "but also to report content to the police".

She said: "I do think more can be done and we are in discussions with industry to see what more they are prepared to do. We would like to see a form of industry standard board that they could put together in order to have an agreement of oversight and to take action much more quickly on sites which will do such damage to people in terms of making them communicate terrorist information."

Baroness Shields, a former Facebook executive and a Home Office minister, was also in talks with internet service providers internationally.

The committee warned in its report that social media websites were becoming the "vehicle of choice" for spreading terrorist propaganda but websites are policing them with just a "few hundred" employees.

The committee accused US technology giants including Google, Facebook and Twitter of "passing the buck" and said that they have become a "recruiting platform for terrorism".

Its report said: "These companies are hiding behind their supranational legal status to pass the parcel of responsibility and refusing to act responsibly in case they damage their brands."

'I do think more can be done and we are in discussions with the industry to see what they are prepared to do'

CNN.com
FBI director defends Clinton email probe, document releases
Wednesday, 07 September 2016
Byline: Evan Perez

Washington - FBI Director James Comey is defending the bureau's Friday afternoon release of documents from the Hillary Clinton email investigation, saying "we don't play games" and that the documents were put out when ready.

In a memo to employees Wednesday, Comey said the decision to not recommend charges against the now-Democratic nominee wasn't a close call.

"At the end of the day, the case itself was not a cliff-hanger; despite all the chest-beating by people no longer in government, there really wasn't a prosecutable case," he said in the memo.

In recent weeks, Comey has met with groups of former FBI agents as part of his routine visits to field offices around the country. In at least one recent such meeting,

according to people familiar with the meeting, former agents were sharply critical of the FBI's handling of the Clinton probe and particularly the decision to not recommend charges against Clinton. Comey gave the meeting participants a similar answer about the case not being a cliff-hanger.

Comey said he briefly considered holding the documents until after the Labor Day holiday, knowing that the Friday afternoon release would likely prompt criticism. He also said more document releases are coming.

"I almost ordered the material held until Tuesday because I knew we would take all kinds of grief for releasing it before a holiday weekend, but my judgment was that we had promised transparency and it would be game-playing to withhold it from the public just to avoid folks saying stuff about us," Comey said.

"We don't play games. So we released it Friday. We are continuing to process more material and will release batches of documents as they are ready, no matter the day of the week," Comey said.

He concluded the memo by writing, "Those suggesting that we are 'political' or part of some 'fix' either don't know us, or they are full of baloney (and maybe some of both)."

On Tuesday, Republican House Speaker Paul Ryan criticized the FBI's handling of the matter, accusing the bureau of playing politics with the release.

"It's like the most buried time you could ever put out a story. I'm surprised. I can't believe that they would do what is such a patently political move. It makes them look like political operators versus law enforcement officers," Ryan said in a radio interview with WRJN's Glenn Klein.

« Epier Facebook ne suffit pas : il faut investir dans l'humain »
Thursday, 08 September 2016
Byline: Pierre Vassart

Bruxelles - Sécurité Yvan Mayeur s'agace du mutisme de Jan Jambon

Le ministre de l'Intérieur se réjouissait mardi de l'expérience pilote de recrutement local de policiers à Anvers. La Ville de Bruxelles voudrait faire de même, mais le ministre de l'Intérieur ne répond pas.

Scrogneugneu ! Le bourgmestre de la Ville de Bruxelles Yvan Mayeur (PS) a retrouvé toute sa verve à son retour de vacances. Et lorsqu'il a lu mardi que, sollicité par l'agence Belga, le cabinet du ministre de l'Intérieur Jan Jambon (N-VA) avait indiqué que ce dernier était « disposé à étendre à d'autres zones de police l'expérience en cours depuis l'automne 2015 à Anvers qui vise à permettre de recruter localement des agents afin d'accroître la diversité au sein des corps de police » , citant Gand en exemple, il a respiré un grand coup. Ah bon ?, réagit-il en substance. Et pourquoi la Ville de Bruxelles, elle, ne peut-elle pas procéder à ces recrutements locaux de policiers ?

C'est que, rappelle Yvan Mayeur, il avait déjà écrit au ministre en octobre dernier afin que la Ville puisse également procéder à ce type de recrutement pour la zone de Bruxelles Ixelles. Mais son courrier était demeuré sans réponse. « Le fédéral ne nous aide pas ! Alors qu'avec toutes les tâches qui lui incombent, la police locale souffre d'un vrai problème d'effectifs , rappelle-t-il. Et que la Ville souhaite un effectif policier qui corresponde davantage à sa réalité démographique et sociologique. » Une volonté mise en oeuvre par ailleurs : « Dans tous ses services, administration, hôpitaux, CPAS, etc., la Ville s'est largement ouverte à son caractère diversifié. Mais pour la police, impossible d'avancer ! » , regrette-t-il.

Il est vrai que l'expérience d'Anvers, dont le bourgmestre Bart De Wever (N-VA) se plaît à répéter qu'elle est un succès, est présentée comme un projet pilote, et que son évaluation sur deux ans est toujours en cours. Mais là où tique Yvan Mayeur, c'est lorsqu'il lit les propos du porte-parole du ministre de l'Intérieur, qui déclarait à Belga : « « Nous avons initialement voulu une expérience de deux ans à Anvers, mais les résultats sont si encourageants que nous sommes enclins à regarder si nous pouvons entamer un tel projet à Gand ou dans d'autres villes » La capitale, ses multiples obligations en matière de sécurité (manifestations, sommets internationaux, événements, etc.) ne constitue manifestement toujours pas une priorité pour l'Intérieur, aux yeux du bourgmestre.

Et lorsqu'on objecte que le « plan Canal » du ministre de l'Intérieur, dont la phase 2, qui concerne la Ville de Bruxelles, a démarré début septembre et prévoit un renfort de 25 policiers fédéraux dans la zone de police de Bruxelles Ixelles, Yvan Mayeur avale de travers. « Ils sont affectés dans notre zone mais repartent aussitôt. Rien ne les oblige à rester, par exemple pour une période de cinq ans. Ils demandent tout de suite à être réaffectés. » Ce que confirmait d'ailleurs mardi dans nos pages la bourgmestre de Molenbeek Françoise Schepmans (MR), dont la commune a bénéficié de la première phase du « plan Canal », avec un renfort de cinquante policiers fédéraux : 48 policiers avaient été transférés sur sa zone au premier semestre, il n'en reste plus que 30 aujourd'hui. Autre exemple, cité par La Libre Belgique : pour la zone de police Midi (Anderlecht, Forest et Saint-Gilles), 15 des 18 policiers fédéraux en renfort affectés à cette zone l'ont été sans leur consentement. Leur départ rapide ne constituerait donc pas une surprise.

Ce n'est pas première fois que le bourgmestre de la Ville tire le signal d'alarme. On se souvient que début juillet, il avait (encore) écrit au ministre de l'Intérieur pour réclamer des renforts. « Nos policiers

sont fatigués » , s'était-il désolé (Le Soir du 16 juillet). A l'époque, le cabinet de Jan Jambon avait répliqué que Bruxelles bénéficiait bien de renforts de la police fédérale pour les grandes manifestations (c'était à la veille de la Fête nationale). Aujourd'hui, Yvan Mayeur remet le couvert : « C'est très bien d'investir dans la technologie pour renforcer la sécurité, dans la surveillance des réseaux sociaux et tout ça. Mais épier Facebook ne suffit pas : il faut investir dans l'humain, maintenir le contrôle humain. Les terroristes ne communiquent pas via Facebook d'ailleurs, mais via Telegram Messenger. Un réseau crypté. »

La solution serait-elle pour la Ville de se tourner vers des sociétés de gardiennage privées, comme on en a vu dans le parc de Bruxelles à l'occasion de la Fête de la bande dessinée ou, comme on en verra encore ce week-end autour de l'événement « Eat Brussels, drink Bordeaux » ? Des affichettes ont effet été placardées aux entrées du parc, reproduisant une ordonnance de la Ville de Bruxelles qui autorise les vigiles privés à fouiller les sacs des visiteurs.

« Rien à voir , répond Yvan Mayeur. Ce dispositif est autorisé et réglementé depuis plusieurs années. Mais il est vrai que le climat actuel contraint les organisateurs d'événements privés à assurer la sécurité de leur manifestation. »

24 Heures (Suisse)
Une indiscrétion aussi crasse qu'inutile
Thursday, 08 September 2016
Byline: Yoann Péclard

Opinion - On peut en apprendre beaucoup sur vous en consultant votre ordinateur: votre santé, vos informations bancaires, qui sont vos amis, ce que vous leur dites, où vous avez mangé ou voyagé, ce que vous aimez, ce que vous achetez, vos opinions Bien plus que si l'on fouillait votre maison de fond en comble.
Or, en Suisse, nos foyers sont bien protégés face aux possibles dérives de l'Etat. La police ne vient pas vous fouiller sans raison valable et sans que la justice soit derrière la procédure. A la question « Acceptez-vous que des inconnus entrent chez vous pour vous fouiller, sans vous le demander, sans se justifier et à n'importe quel moment? » je ne connais personne qui répondrait par l'affirmative.

Pourtant, en votant oui à la LRens, c'est ce que vous ferez, non pas pour votre maison, mais pour votre ordinateur. Grâce aux nouveaux moyens de contrôle accordés au Service de renseignement de la Confédération (SRC) et à l'affaiblissement du contrôle judiciaire, vous serez à nu. Exactement comme si un agent entrait dans votre salle de bains au moment de votre douche. Ce sera la même violation de votre intimité, sauf qu'elle sera invisible.

Et pour quelle utilité? Les immenses masses de données collectées en France ou aux Etats-Unis n'ont jamais permis de stopper les criminels. Pire encore, des agents de la justice française critiquent

vertement cette politique d'espionnage, elle ralentirait le véritable travail d'enquête. Alors pourquoi importer ce modèle ici?

Et si, en tant qu'honnêtes citoyens, nous n'avons rien à cacher, nous n'avons justement pas à accepter la suspicion générale et la violation de nos vies sans que nous le sachions et sans recours possible.

Il serait stupide de créer une nouvelle usine à gaz fédérale

La nouvelle LRens est censée améliorer la lutte étatique contre le terrorisme et l'espionnage en légalisant les possibilités d'interceptions téléphoniques et la surveillance d'Internet. Cela en cas d' « indices fondés » (et non de preuves) et sans mandat délivré par un juge. Elle s'inscrit dans l'action de surveillance d'Internet par la NSA américaine et par sa consoeur anglaise, le Government Communications Headquarters. Les deux pratiquent en deux étapes, à savoir que le suspect, ses correspondants et ceux qui prennent contact avec les correspondants sont surveillés à leur insu et parfois pendant longtemps. Ils ne sont avertis qu'éventuellement et a posteriori.

La question qui se pose en Suisse consiste à se demander s'il est absolument nécessaire de pondre 182 articles de loi pour considérer une douzaine de cas par année, comme l'annonce le Conseil fédéral.

S'agirait-il de complaire aux Américains qui nous espionnent éhontément?

Selon Edward Snowden, les agents du renseignement suisse ne font pas du tout peur aux espions américains.

Nous aurions grand tort de surévaluer la menace terroriste en Suisse, ainsi que l'efficacité du renseignement électronique. La collecte du renseignement est une chose, son analyse et son traitement en sont d'autres. Ce dont le pays a surtout besoin, c'est d'analystes en nombre suffisant, compétents et bien formés. Et parmi eux des arabisants pointus.

Enfin, s'agissant des contrôles prévus par la loi, les écoutes sauvages menées en Allemagne de 2002 à 2016 par le Bundesnachrichtendienst pour le compte des Américains devraient nous rendre circonspects. Il serait stupide de créer une nouvelle usine à gaz fédérale.

Fox News
DHS chief has 'a lot of confidence' in security of US electoral infrastructure
Thursday, 08 September 2016
Byline: Matthew Dean

Washington - Homeland Security Secretary Jeh Johnson said Wednesday he has "a lot of confidence" in the security of America's electoral infrastructure despite concerns about intrusions by cybercriminals.

Johnson's declaration, in response to a question from Fox News, follows recent hack attacks on two different state election websites that are believed to have been the work of Russian actors, according to sources.

Those actions, which were disclosed in an August FBI bulletin distributed to law enforcement agencies and obtained by Fox News, urged states to contact their respective Boards of Elections to determine if they had experienced any similar activity.

While he would not comment directly on the cyber activity, citing an ongoing FBI investigation into the matter, Johnson said he could assure the American public that DHS is up to the challenge of safeguarding state election systems. He added that election officials should consult the department on cybersecurity matters.

"The Department of Homeland Security is in a position to shore up electoral infrastructure," the DHS chief said. "We are in a position to help - to offer best practices, information sharing, vulnerability assessments, incident response."

The recently disclosed hacks, which successfully compromised the election system of one state and targeted an election website in another state, have added fuel to already loud concerns over the potential for foreign nationals to influence the 2016 presidential race.

Russian government-linked hackers are also believed to have carried out cyber breaches of the Democratic National Committee and the Democratic Congressional Campaign Committee, seizing troves of information over the course of those attacks.

U.S. officials have yet to publicly name Russia as the perpetrator in either of those incidents and Russian President Vladimir Putin has denied any involvement.

Sources told Fox News that FBI investigators are working to determine the exact scope of the intrusions, which cybersecurity analysts fear could run deeper than already disclosed, given the hackers' ability to "island hop" to other networks once an initial compromise is made.

For some IT security experts, any Russian connection would not be surprising, given the Kremlin's recent reported history of using cyber activity as a clandestine tool for meddling in foreign affairs.

"You're seeing more and more manifestations of information warfare via cyber means to destabilize U.S. public opinion and undermine the trust and confidence in American institutions like, for example, the electoral system," Strategic Cyber Ventures CEO Tom Kellermann told Fox News in a recent interview.

As Fox News has previously reported, cybersecurity analysts have implicated Russia-linked cybermilitias with web-based attacks against a number of foreign entities over the past several years. Specific to the United States, multiple sources familiar with the research behind these incidents said that the Kremlin

has targeted the Department of State, the Pentagon, the White House, and numerous private sector entities, including several media outlets.

While not directly naming Russia as the perpetrator in the DNC, DCCC, or state election system attacks, the United States' top intelligence official did acknowledge the Kremlin's persistent cyber activity.

In agreeing with a recent public admission by President Obama, Director of National Intelligence James Clapper acknowledged "the Russians hack our systems all the time, not just government but also corporate and personal systems."

Speaking Wednesday at the Intelligence and National Security Summit in Washington, D.C., the DNI added a blunt prediction for the nation's path forward when it comes to dealing with the cyber threat.

"Cyber will continue to be a huge problem for the next presidential administration, as it has been a challenge for this one," Clapper said.

Snowden Is Turning Into a Liability for Putin
Friday, 09 September 2016
Byline: Leonid Bershidsky

Column - Edward Snowden is increasingly unhappy with the situation in Russia, where he has lived for more than three years. President Vladimir Putin once welcomed the National Security Agency contractor for his propaganda value, but he may be wondering if it's all been worth it.
Snowden arrived in Moscow in June 2013. That was almost a year before the Crimea annexation, and Russia could still try to sell itself to radical leftists who admired Snowden as the lesser evil, compared with the Big Brother U.S. Putin talked a lot about Snowden showing obvious delight for thumbing his nose at the U.S., which had tried to intercept the whistle- blower. He described Snowden as a "weird guy," an idealist, who was safe in Russia even though he had no secrets to pass on.

After Crimea, though, such statements started to appear hollow. "Russia is not the kind of country that hands over fighters for human rights," Putin said at the St. Petersburg Economic Forum in May 2014. That the Russian president could talk about human rights after faking a secession referendum in Crimea would have been funny if it weren't so manipulative.

Snowden appeared to play along. In 2014, he took part in Putin's carefully stage-managed and scripted annual call-in show, asking the Russian leader whether Russia intercepted, stored and analyzed its citizens' electronic communications. Putin said Russia used advanced technology to fight terrorism. "But we do not allow ourselves to use it on a mass scale, in an uncontrolled way," he added. "I hope, I very much hope, that we never will."

Snowden defended what appeared to be a softball question in a column for The Guardian, saying that he had "sworn no allegiance" to Russia and that he would fight total surveillance everywhere. The Guardian article helped him maintain credibility among Western radicals.

On several other occasions, Snowden criticized Russia for its treatment of homosexuality and for attacks on internet freedoms, but the Kremlin was unconcerned. "These are rather arguable statements, but he has his point of view," Putin's press secretary, Dmitri Peskov, said last year. "Yes, he lives in Russia, but it doesn't mean anything is being imposed on him."

In recent months, though, Snowden has stepped up his harsh criticism of Russian ways: It became clear to him that Putin had lied during that call-in show.

The NSA leaker took to Twitter in July, when the Russian Parliament was passing the so-called "Yarovaya package" -- a fiercely repressive set of laws aimed at establishing total control over Russians' online communications. Internet providers and mobile operators are expected to record and store all conversations and message exchanges for six months, and their metadata for three years. Internet

companies are obliged to help the Russian secret police decrypt any encrypted communication. Snowden's condemnation was vehement.

The Yarovaya package is harsher than any electronic surveillance legislation in the U.S., because the Russian measures openly tell citizens that their communications will be monitored pretty much at the discretion of the intelligence services. It embodies all the abuses that Snowden has opposed.

Three years is enough time to understand Russian politics a little better, and Snowden appears to be interested in more than his professional area. On Wednesday, he tweeted about the recent news that Russia's last remaining big independent pollster, the Levada Center, has been designated a "foreign agent," along with some of Russia's strongest human rights organizations, for accepting foreign research grants.

Levada received the designation after publishing a poll that showed Putin's United Russia losing support ahead of the Sept. 18 parliamentary elections. Snowden now openly criticizes the Kremlin on matters of political importance, such as its "anti-terrorism" policy and its own special brand of electoral democracy. The whistle-blower tweets in English, but Russian media, including pro-Kremlin ones, invariably pick up his posts.

I would be surprised if the Kremlin weren't irritated. It does its best to squeeze local critics out of the country or discredit them, yet it's stuck harboring a foreigner whose initial gratitude may have worn out and who is less willing to give Putin the benefit of the doubt.

Snowden has tweeted that he fears retaliation for his criticism, but he won't desist. There aren't too many ways for the Kremlin to retaliate, though, without handing a moral victory to the U.S. It certainly won't extradite Snowden: In March, when Donald Trump called for the return of the whistle- blower, Peskov said the Russian government's position hadn't changed. It would be no surprise, however, if arrangements were quietly made to move Snowden to another asylum country. With his zealotry, he is a liability to Putin, and he may never really have been an asset.

The Media Line
Iran Introduces Halal Internet
Friday, 09 September 2016
Byline: Katie Beiter

Jerusalem - In an effort to "de-Westernize" and maintain control over internet users and the spread of information, the Iranian government has revealed a state-sponsored internet known formally as the National Information Network. This new service, nicknamed the "halal" (lawful) internet, is another ploy by the Iranian state to limit the spread of information into and around Iran.
"The network is basically a government effort to create a nationally controlled internet," Sanam Vakil, an associate fellow at Chatham House, an international affairs think tank, in London, told The Media Line.

"Iran is a state that has heavy internet censorship so a national internet would be a way to provide increased government control."

This state-sponsored internet acts more as an intranet, which is essentially a private network controlled by an organization, which, in this case, is the Iranian government. In this type of system, all users are identifiable and the state controls what users can and cannot see. These types of systems are common in workplaces and other large organizations to control what employees can and cannot access at the workplace.

"It is a more managed, internal internet," Gabi Siboni, head of cyber security at the Institute for National Security Studies at Tel Aviv University, told The Media Line.

The Islamic Republic of Iran, which is a theocracy, has been vehemently anti-Western since the Iranian Revolution of 1979, which overthrew the dictatorial monarchy and instead introduced all- powerful religious figures, known the ayatollahs. Since then, the country has opposed all things Western, blaming the West and American infiltration for being oppressed prior to the 1979 coup.

The state has maintained a tight grip on the press and the spreading of information in and around Iran, which is ranked 169 out of 180 for lack of press freedom by the Press Freedom Index compiled by Reporters Without Borders, an NGO dedicated to defending media freedom. In a country where journalists are arrested and sometimes beheaded, publishing anything anti-government or anti-Islam on websites or social platforms is often grounds for arrest.

"There is no open freedom of information or freedom of the press in Iran," Vakil said. "This new service is an effort to have more institutionalized control over the internet and, particularly, the freedom of information."

Both the government and the clergy fear Western infiltration, especially through the world-wide Internet. Thus, creating an intranet can keep Western topics, from pornography to fashion, out of Iran.

"It's a nice culmination, or next step, in a long series of attempts to control what Iranians can see," Ze'ev Maghen, a Middle Eastern history professor at Bar-Ilan University near Tel Aviv told The Media Line. "It's like an amplified 'Google safe' search."

While the Iranian government does not want to ban the internet, they want to purify it. The government has even created an agency known as the Cyberspace Supreme Council to police internet usage in the country, Vakil added.

This network service is not the only one still available to Iranians, however. In an effort to attract users, the government has offered a series of incentives, like low prices and quick installation, to using this state-sponsored internet, which claims to be 60 times faster than any current internet in Iran.

"This is a persuasive tool to increase internet usage and deceive people that the internet connection is faster," Vakil said.

Most Iranians have figured out ways to circumvent the closely monitored web. Many people use proxies, which are essentially intermediate servers that hide an internet user's IP address creating anonymity and allowing users to access sites that are currently unavailable in their countries.

"If I'm looking at something in Google and I don't want people to know what I am looking for, I go through a VPN (a virtual private network) and the request comes from a different IP address and it is presumably more secure," Siboni said.

This new internet service was unveiled after some 100 internet users were arrested in Iran and two press agencies as well as two online news outlets were blocked, according to Reporters Without Borders.

Journal de Montréal
Une cyberattaque dans 25 écoles sème la grogne
Friday, 09 September 2016
Byline: Eliane Thibault

Thetford Mines - Un programme axé sur l'enseignement avec des tablettes électroniques a dû revenir aux bons vieux cahiers d'exercices en raison d'une cyberattaque.
Les 25 écoles de la Commission scolaire des Appalaches, dans la région de Chaudière-Appalaches, ont dû revoir leurs méthodes d'enseignement depuis mardi matin. Le système informatique de la Commission a été victime d'une cyberattaque qui a paralysé toutes les activités de l'organisation qui nécessitent du matériel informatique.

Les données de la Commission scolaire auraient été cryptées et une demande de rançon en bitcoins aurait été exigée pour qu'elles soient rendues lisibles de nouveau.

«Les tableaux blancs interactifs ne fonctionnent plus dans notre classe, raconte Mariloup, une élève de 8 ans. Notre professeur a dû utiliser l'ancien tableau blanc avec les crayons-feutres qui s'effacent.»

DE LA tABLEttE Au tABLEAu

La fillette trouve ennuyeux d'avoir perdu une période de classe en technologie parce que les ordinateurs ne fonctionnent pas. Quant aux enseignants, c'est surtout le système de paie qui les inquiète. Plusieurs d'entre eux ont contacté leur syndicat à ce sujet.

«Être enseignant, c'est apprendre à se revirer sur un 10 cents. Quand ils ont vu que le matériel informatique ne fonctionnait pas, les enseignants ont tout simplement recommencé à utiliser le tableau et les craies», raconte le président du Syndicat de l'enseignement de l'Amiante, Francis Jacob.

Une plainte a été déposée auprès de la Sûreté du Québec qui a dépêché une équipe spécialisée. Afin de ne pas nuire à l'enquête, la Commission scolaire a refusé toutes les demandes d'entrevue. Impossible de savoir si elle a ou non l'intention de payer la rançon.

Marc-André Léger, spécialiste de la sécurité informatique, n'est pas étonné que des attaques de ce type aient lieu. Toutefois, il affirme qu'habituellement, ce sont de grandes corporations privées qui sont ciblées.

«D'après moi, c'est une coïncidence avec de l'hameçonnage. Quelqu'un a envoyé 1 million de courriels et [il est] probable qu'une personne de la Commission scolaire a cliqué sur quelque chose. Les malfaiteurs ont réussi à entrer dans le réseau et ont pu se dire qu'il y avait de l'argent à faire ici», explique celui qui est aussi chargé de cours à l'Université de Sherbrooke.

Errors in communications data use led to wrongful arrests, report finds
Thursday, 08 September 2016

London - Errors in the use of communications data led to the arrests of 13 innocent people, a watchdog has said.
The wrongful arrests were among 23 serious mistakes made in acquiring 761,702 items of communications data, the Interception of Communications Commissioner report found.

Other incidents included delayed welfare checks on vulnerable people.

Communications data includes when and where electronic communications are made, but not their content.

'Devastating impact'

The report found mistakes were made either by law enforcement agencies or communications service providers, with the majority of errors believed to relate to child abuse inquiries.

In these instances often the evidence used was an internet address which was wrongly linked to an individual.

There were six instances in which people unconnected to the investigations were visited by police and seven cases that resulted in delayed welfare checks on vulnerable individuals.

Of the 23 serious mistakes, 14 were human errors and the other nine "technical system errors".

Commissioner Sir Stanley Burnton's annual report said: "Any police action taken erroneously in such cases, such as the search of an individual's house that is unconnected to the investigation or a delayed welfare check on an individual whose life is believed to be at risk, can have a devastating impact on the individuals concerned."

Overall, 1,199 communications data errors were reported to the watchdog in 2015 - an increase of 20% on the previous year.

Of these, 86.6% were attributable to public authorities, 12.6% to communications service providers and 0.8% to other parties.

Nearly 94% of the requests were by police and law enforcement and just under 6% by the intelligence agencies.

The watchdog also inspected prisons and identified some instances where not all of the calls made by inmates subject to monitoring were being listened to, or that the calls were not being listened to quickly enough.

The report said: "This is of concern because a significant piece of intelligence could be missed completely or not reacted to promptly, leading to a serious incident occurring which may have otherwise been prevented."

Meanwhile, a separate report, also released on Thursday, revealed that security services made nearly double the number of mistakes using intelligence powers in 2015 than in the previous year.

Almost all of the 83 errors in 2015 led to an intrusion into privacy "to some degree", the Intelligence Services Commissioner found.

MI5 was also criticised for its form-filling procedures and for inserting unauthorised devices into MI5 systems, such as charging mobile phones, on six occasions.

In a written statement to the Commons, Prime Minister Theresa May said both reports "recognise the diligence and rigour of those who use investigatory powers".

She said: "These are important powers that are used, when necessary, to keep our country safe.

"Both reports contain details of the recommendations that the commissioners have made to continue to improve the way that these powers are used.

"The public authorities who have received these recommendations will be giving careful consideration to them and how to further improve their processes."

Wall Street Journal
U.S. Voting System So 'Clunky' It Is Insulated From Hacking, FBI Director Says
Friday, 09 September 2016
Byline: Devlin Barrett

Washington - The head of the Federal Bureau of Investigation sought to calm fears that Russians or others could electronically sabotage the nation's election in November, saying the 50-state voting system is so dispersed and "clunky" it would be difficult for hackers to affect the outcome.
Appearing at a panel with other senior U.S. intelligence officials Thursday, FBI Director James Comey was asked about the concerns that hackers acting on behalf of the Russian government might try to manipulate the presidential election.

Such concerns have grown in recent weeks, after the FBI issued an alert to state officials about the possibility of hackers penetrating state election computer systems. In Arizona, a hacker obtained one of two credentials needed to access the state's voter-registration system.

The FBI is also investigating a number of computer data thefts from Democratic Party organizations, in which the leading suspects are Russian intelligence operatives, according to officials close to the case.

Mr. Comey wouldn't discuss those investigations, but he tried to reassure participants at the Intelligence and National Security Summit that there is a big difference between accessing voter-registration records and hacking into actual vote-counting systems.

"The beauty of the American voting system is that it is dispersed among the 50 states, and it is clunky as heck," said Mr. Comey. "A lot of people have found that challenging over the years, but the beauty of that is it's not exactly a swift part of the internet of things, and so it is hard for an actor to reach our voting process."

Even federal elections are conducted by state election agencies, meaning there is no centralized computer system or technology tabulating votes. Much of the vote-counting is still done by people, not machines, Mr. Comey noted, which "makes it more resilient and farther away from an actor who might be willing to crawl down a fiber optic cable."

Even if hackers could reach into a state voting system, they may find "it actually isn't a fiber optic cable, it's a woman named Sally, a guy named Joe [who] pull out the punch cards, and that's hard to reach," Mr. Comey said. "There's a lot of pain in that, but there's a lot of beauty."

A day earlier, Defense Secretary Ash Carter warned Russia that the U.S. would not ignore "efforts to interfere with our democratic processes," though he didn't mention hacking specifically.

Russian President Vladimir Putin has denied the Kremlin was involved in the hacks, but he suggested the subsequent leaks of the Democrats' internal discussions was a positive development.

BuzzFeed News
Washington Really Doesn't Want To Deal With A Cyber War With Russia
Friday, 09 September 2016
Byline: Ali Watkins, Sheera Frankel

Washington - The Obama administration is wary of publicly accusing Russia of meddling in the US election despite increasing pressure from within Washington, for fear of fanning public concerns over the security of the election and igniting a cycle of tit-for-tat cyber attacks, several US government officials told BuzzFeed News.
"Do you really want to call it out, and recognize it? With everything you do, you should be reinforcing the public's confidence in the election system," said one US intelligence official, who is frequently briefed on Russia issues. Calling Russia out, he said, could also validate widespread worries over the security of the November election. "Do you really want that shitstorm? I don't think you do."

The White House has not assigned blame for the hack of the Democratic National Committee emails, which cybersecurity experts say were most likely stolen by Kremlin-backed hackers. The emails were eventually published by Wikileaks on the eve of the Democrats' convention. Wikileaks' founder, Julian Assange, has refused to reveal the source for the emails despite growing concerns over his ties to Russia. The private cybersecurity experts who provided the strongest evidence that Russian actors were behind the hack linked them to a group that was previously accused of hacking into the State Department and White House. Suspicions of Russian meddling were further fueled when the FBI warned last week of two suspected-Russian linked hacks into state election systems.

Pressed at the G20 summit in China on Monday, President Barack Obama again declined to publicly point a finger at Russia, citing fears of a Cold War-style cyber arms race.

"Frankly, we got more capacity than anybody both offensively and defensively. But our goal is not to suddenly, in the cyber arena, duplicate a cycle of escalation that we saw when it comes to other arms races in the past," Obama said when asked to address the allegations that Russia was meddling in US politics.

Defense Secretary Ash Carter, speaking in the UK on Wednesday, warned Russia against "efforts to interfere with our democratic process," going a step further than the White House but stopping short of directly blaming them for recent hacks.

Asked whether it was concerned about potentially naming Moscow, National Security Council spokesman Mark Stroh declined to comment, and referred inquiries on the matter to the FBI.

The Bureau, which is investigating the DNC hack, has yet to publicly identify Russia as the culprit. "I'm going to continue the streak of not talking about that," Comey said Thursday, when asked at an intelligence conference to address Russia's alleged attempts to manipulate the election.

Washington has long been worried about Russian hacking, and the intelligence community has begun delegating more and more of its resources to countering and probing Russian threats.

But, until the DNC hack, the concern has been over the type of intelligence Russia was accessing and how it would use it to thwart US ambitions on the world stage. Russian hackers were suspected in 2015 of breaching both the State Department and White House servers, gaining access to sensitive, though unclassified, information.

Nothing from that hack has ever been made public. So why were the DNC emails leaked? Some cybersecurity experts say the US and Russia are already engaged in a type of cyber Cold War, in which each side is continually testing the other to see how far they can go.

"There are no rules to this, but both sides are moving pieces around their chess boards and trying to figure how close they can get to a check-mate without acknowledging that they are actually playing the game," said one cybersecurity expert, who consults with US officials regularly though his position at a private company keeps him from speaking publicly about his work.

Another US intelligence official said it appeared as though actors in Russia weren't even trying to hide their efforts anymore. The official said his organization had buckled down on official travel to Moscow, urging employees to follow protocol and leave their phones and laptops at home. Asked what that meant for working conditions, the official said "We just have to trust that the facilities we use in the embassy are secure."

If Russia is proven to be behind the DNC hack, it would mark a serious escalation, with Russia using intelligence it had accessed through cyberespionnage to try and influence elections in the US.

But the question of concrete attribution is becoming more difficult each year, as techniques to mask location and inject false flags into code become more and more sophisticated.

"If the US were to stand up and say 'Russia hacked the White House, Russia hacked the DNC,' they would need to give solid evidence -- and nothing in cyber is solid, and they would have to be willing to face the repercussions of what came next," the expert said. "Something that has been fought quietly until now would get loud and it would get ugly."

Speaking at the 2016 Intelligence and National Security Summit this week, the deputy head of U.S. Cyber Command, Air Force Lt. Gen. Kevin McLaughlin, said that when it came to drawing red lines on cyberattacks, "Ambiguity, not locking yourself in, is the way that our government prefers to do this."

But the concern is there. In the coming weeks, lawmakers will vote on whether to reinstate a Cold-War era task force dedicated solely to keeping tabs on covert Russian efforts in the US. That panel, proposed in the Senate Intelligence Authorization Bill, would be appointed by the White House and meet monthly. While the panel will be tasked with everything from unmasking Russian spies to foiling assassinations, its primary purpose, another intelligence official said, was to expose Russian propaganda efforts.

Underscoring the White House's timidity on the issue, the National Security Council declined multiple inquiries on whether the White House would support the executive branch panel being proposed by Congress. It also declined to say if the White House was receiving regular briefings on the variety of intelligence community probes into Russian meddling, including a broad effort being led by the Director of National Intelligence's office.

Asked to address Russia's suspected involvement in the hacks, National Security Council spokesman Stroh pointed to several recent public statements from officials, including a comment from White House spokesman Josh Earnest last week.

"The US government has not formally declared any specific entity or country as responsible for these reported intrusions," Earnest said in a press conference.

What Russia's goal is in attacking the US election process remains unclear, the first intelligence official said. There remains widespread suspicion that the Kremlin is working actively to elect Donald Trump -- Democratic nominee Hillary Clinton has said as much.

But that suggests Moscow truly thinks Trump would be easier to work with, a notion that the official thought were "overblown." Instead, it may be a part of a broader Russian effort to cut at the heart of Western democracy.

"It may not be so much intentional as instinctive on their part. They do it because they can," he said. "Any rationale you can try to apply to this is irrational."

Deutsche Welle
Germany to pour cash into mass surveillance
Thursday, 08 September 2016

Berlin - Germany's spies will be working with significantly increased resources next year, if a budget report leaked to three media outlets is approved. The federal domestic intelligence agency, the Verfassungsschutz (BfV) is bidding for an 18-percent budget boost in 2017, up to 307 million euros ($345

million), while the foreign intelligence agency BND will get a 12-percent rise to 808 million euros, according to a report released Thursday by the "Süddeutsche Zeitung" along with public broadcasters NDR and WDR.
A special parliamentary committee must now approve the increase - which, like all secret service budgets, are classified - but opposition parties have already voiced their concern.

The BND says it needs much of the extra money - some 73 million euros over the next few years - to set up "Panos," a new project specifically aimed at decrypting such messaging systems by finding weaknesses in the apps. The leaked plan also says the intelligence agencies need extra money to buy expertise from "external companies and service providers."

This is a dangerous game to play, according to opposition parties, as it likely means using taxpayer's money to shop in the so-called "Darknet" - where anonymous purchasing is made easy and often used for criminal purposes.

"It's a spiral that has no end," said Frank Herrmann, privacy spokesman for the Pirate Party in North-Rhine Westphalia. "No one can guarantee that these security gaps won't be sold on to other bidders. It's a black market. Security gaps are sold on the darknet by hackers, and we already know that government agencies have bought from them, too."

Herrmann says that instead of exposing flaws in services so that they can be corrected, the intel agencies will be getting extra money to make sure that such gaps remain open - which will have consequences for businesses as well as private citizens, since foreign competitors could also exploit those gaps. "Gaps aren't just used to find criminals - gaps are dangerous to everyone," he told DW. "It will create extra insecurity for everyone and feed the black market."

Competing with the NSA?

In the leaked plan, the BfV said it needs extra money because its own resources are currently inadequate to fulfill its mission. This echoed a complaint made by German intel agency chiefs to the German parliament's inquiry into the NSA affair, when they justified providing intelligence to the US National Security Agency by saying they needed access to data from the NSA's mass surveillance programs like XKeyscore - one of the NSA projects revealed by whistleblower Edward Snowden in 2013.

But Herrmann doubts whether the BND can ever really be independent of the NSA, since its budget is less than a tenth of the estimated $10.8 billion the NSA has to work with.

"Given that most of the manufacturers of software are American companies, and that American law gives the NSA all kinds of powers to force those companies to cooperate, the NSA has the power to spy on communications worldwide," said Herrmann. "It doesn't make it better to copy that with our own money here."

Opposition anger

Other budget plans revealed by the leak include 1.6 million euros, and 15 new jobs, to link Germany's Central Register of Foreign Nationals (AZR) - a database containing the details of 20 million non-Germans - with the databases of the BfV, and 55 new jobs to help network databases kept by Germany's federal and state agencies on far-right, far-left and Islamist extremists.

The BfV also wants an extra 4.5 million euros to strengthen its "cyber-defense" capabilities - the budget where it might need to go shopping from shadowy external contractors. Should the plans be approved, the "Süddeutsche Zeitung" said the BfV would end up employing some 2,900 people, plus 800 freelance contractors, in 2017 - a tripling of its personnel since 2000.

Other opposition parties were also appalled at the agencies' alleged plans, not least because the parliamentary inquiry into the NSA scandal had uncovered, they argued, illegal practices by the BND. "With its behavior the government is not only showing that it still does not have the will to draw the necessary legal consequences from Edward Snowden's revelations, it is also showing that the protection of the basic rights of citizens is in very bad hands," the Green party's Internet policy spokesman Konstantin von Notz told DW in an email.

Left party spokesman Jan Korte was equally scathing. "The grand coalition is clearly continuing to march on towards a surveillance state," he said in a statement. "The dwindling trust of people in the state also has something to do with the expansion of surveillance. For who would trust a state that doesn't stick to the law? On top of that, it's clear that this doesn't create more security, but more insecurity."

The majority of the increased funds are expected to be plowed into mass surveillance - particularly decrypting what the report calls "non- standardized telecommunications" - meaning widely-used messaging services, such as WhatsApp.

Such online services appear to be a particular concern to the BND. "Encryption means that of the more than 70 available communication services ... only less than ten can be gathered and the content read," the budget plan read.

Politico
DHS secretary: Ballot counts are largely safe from cyberattack
Thursday, 08 September 2016
Byline: Jennifer Scholtes

Washington - Homeland Security Secretary Jeh Johnson said Thursday it would be very difficult for hackers to alter Election Day ballot counts.

"It is so decentralized and so vast," the secretary said during a forum hosted by The Atlantic. "You've got state governments, local governments, county governments involved in the election process. It would be very difficult to alter the count."

Johnson said federal officials are generally concerned, however, about the potential for state actors, hacktivists or cyber criminals to manipulate or interfere with online state election systems. It was recently revealed that hackers had infiltrated voter registration databases in Illinois and Arizona.

To help protect against those threats, the Department of Homeland Security has been offering to assist election officials with cyber hygiene evaluations, incident response and information sharing.

But the secretary said those offers are being misconstrued. Several state officials have expressed concerns about a federal overreach into local election control.

"There's a lot of chatter on the Internet about what [DHS help] could mean," Johnson said. "It does not mean a federal takeover of state election systems or state elections, or even national elections."

"We don't have the authority to do that," he added. "What we do in homeland security, in cybersecurity, is offer assistance when people ask for it. So I've been trying to educate state election officials about what we are in a position to offer them, to help them manage their election systems."

Turkish hacker group says it was behind airport cyber attack
Thursday, 08 September 2016

Vienna - Austrian police are investigating whether a Turkish nationalist group was behind a failed cyber attack on Vienna airport last week.
Hackers attempted to penetrate the airport's computer systems but were prevented from doing so.

In a tweet, the hacker group "Aslan Neferler Tim" or "Lion Soldiers Team" says it launched the attack in response to the "racism" of airport authorities.

It was referring to the refusal of Austrian officials to issue a group of Turkish nationals emergency visas that would have allowed them to leave the airport and stay the night in a hotel after their flight was grounded for technical reasons

The hackers describe themselves as responding to attacks against "Islam and the (Turkish) nation."

Diplomatic relations between Austria and Turkey have taken a downward turn after the failed coup attempt in Turkey, with Austrian Foreign Minister Sebastian Kurz warning he will stop any move that brings Turkey closer to joining the European Union.

Reuters
White House names retired Air Force general as first cyber security chief
Friday, 09 September 2016

Washington - The White House on Thursday named a retired U.S. Air Force brigadier general as the government's first federal cyber security chief, a position announced eight months ago that is intended to improve defenses against hackers.
Gregory Touhill's job will be to protect government networks and critical infrastructure from cyber threats as federal chief information security officer, according to a statement.

The administration of President Barack Obama has made bolstering federal cyber security a top priority in his last year in office. The issue has gained more attention because of high-profile breaches in recent years of government and private sector computers.

U.S. intelligence officials suspect Russia was responsible for breaches of Democratic political organizations and state election systems to exert influence on the Nov. 8 presidential election. Russia has dismissed the allegations as absurd.

Obama announced the new position in February alongside a budget proposal to Congress asking for $19 billion for cyber security across the U.S. government. The job is a political appointment, meaning Obama's successor can choose to replace Touhill after being sworn in next January.

Touhill is currently a deputy assistant secretary for cyber security and communications at the Department of Homeland Security.

He will begin his new role later this month, a source familiar with the matter said. Touhill's responsibilities will include creating and implementing policy for best security practices across federal agencies and conducting periodic audits to test for weaknesses, according to the announcement.

Grant Schneider, who is the director of cyber security policy at the White House's National Security Council, will be acting deputy to Touhill, according to the announcement.

Washington Post
Men who allegedly hacked top government officials arrested
Thursday, 08 September 2016
Byline: Rachel Weiner, Ellen Nakashima

Washington - U.S. authorities have arrested two North Carolina men accused of hacking into the private email accounts of high-ranking U.S. intelligence officials.

Andrew Otto Boggs, a.k.a. "INCURSIO," 22, of North Wilkesboro, N.C., and Justin Gray Liverman, a.k.a. "D3F4ULT," 24, of Morehead City, N.C., were both arrested Thursday morning and will be extradited next week to the Eastern District of Virginia, where federal prosecutors have spent months building a case against a group that calls itself Crackas With Attitude.

Along with Boggs and Liverman, authorities say the group included three teenage boys. One, a 17-year-old Briton, was arrested in February.

The hacking collective has claimed to have gained access to the private email accounts of CIA -Director John O. Brennan and Director of National Intelligence James R. Clapper Jr. The group regularly bragged about its escapades to reporters, explaining its methods and providing evidence of its activities.

According to U.S. officials, the group also hacked into the accounts of former FBI deputy director Mark Giuliano; Amy Hess, the FBI executive assistant director for science and technology; Gregory Mecher, who is married to White House communications director Jen Psaki; and Harold Rosenbaum, chief executive of the CIA contractor Centra Technology.

In an affidavit, FBI agent B.J. Kang wrote that "Cracka," the British teen, took the lead in hacking the accounts, while Boggs and Liverman encouraged him and used the exposed information to harass the targets.

According to both Kang and interviews the hackers have given to reporters, the group relied not on computer skills but "social engineering" to gain access to social media, phone and email accounts.

Kang wrote that "Cracka" gained access to Brennan's account by posing as a Verizon technician and tricking the company's tech-support unit into revealing the CIA director's account number, password and other details. He then used that information to lock Brennan out of his AOL account. Later, he released the form Brennan filled out to obtain his top-secret security clearance, a 47-page document full of personal details, according to the affidavit.

"Cracka" then gained access to Giuliano's Comcast account information and began forwarding the official's cellphone calls to a number associated with the Free Palestine Movement, according to the affidavit and interviews with the alleged hacker.

Liverman allegedly texted threats to Giuliano, calling him a "f---ing boomer," and paid for a campaign of harassing phone calls to Giuliano's cellphone.

When "Cracka" got access through Giuliano's accounts to a database of sensitive law enforcement information, Liverman allegedly requested information on Miami police. Authorities say a file containing information on 80 Miami-area officers was found on his computer. Those names and numbers were released online.

Boggs also allegedly used the information to post online the prison booking report for Chicago hacker Jeremy Hammond. The work emails and phone numbers for thousands of law enforcement personnel across the country were also posted online.

According to the affidavit, "Cracka" appears to have gotten into the law enforcement database simply by calling an FBI help desk and asking for Giuliano's password to be reset. The group is accused of using the same tactics to access an internal website for staffers at the Civil Division of the Department of Justice and post employee information online. In that instance, a member of the group allegedly used the credentials of a Justice Department contractor.

Both the FBI and Justice Department information was found on Liverman's computer, according to authorities.

Liverman pruportedly asked "Cracka" to target Mecher because Psaki had spoken critically of National Security Agency whistleblower Edward Snowden. Again, "Cracka" allegedly obtained access to Mecher's account simply by pretending to be both him and a Verizon employee in calls to Verizon. Liverman allegedly called Mecher, taunted him on Twitter by pretending to be Snowden, and attempted to gain access to Mecher's account himself.

Hess was targeted because Liverman believed she likely knew government secrets, according to Kang. "Cracka" allegedly obtained access to her Comcast account and began altering her settings, changing her passwords and playing movies on her television. He and Liverman allegedly released her call logs online.

Rosenbaum's company became a target because of its government work, according to Kang's affidavit. "Cracka" allegedly hacked into Rosenbaum's and his wife's Facebook accounts, canceling their dinner reservations and posting anti-Israel and pro-Palestinian messages. They also defaced his LinkedIn page, according to authorities.

"Cracka" and Liverman were also behind a fake bomb threat called in to the Palm Beach police in January, according to Kang.

Last year, before his arrest, "Cracka" told the New York Post he was motivated by "opposition to U.S. foreign policy and support to Palestine."

One member told CNN he smoked pot "all day every day" and was "probably" high when gaining access to high-level accounts.

Wall Street Journal
FBI Arrests Two in String of Breaches at CIA, Justice Department
Thursday, 08 September 2016
Byline: Devlin Barrett

Washington - Two North Carolina men were arrested Thursday on charges that they were part of the hacking group "Crackas With Attitude" that pulled off a series of embarrassing data breaches against the head of the CIA, a senior FBI official, and the Justice Department's case management system. Andrew Otto Boggs, 22, and Justin Gray Liverman, 24, were charged with being part of a conspiracy to access the personal accounts of senior government officials in late 2015 and early 2016.

Although court documents didn't name the victims, they include CIA Director John Brennan and then-Deputy FBI Director Mark Giuliano, according to officials close to the case. The hackers also managed to repeatedly access the Justice Department's computer system over a week earlier this year, according to authorities.

The hacking group also targeted officials from the White House, Department of Homeland Security, and the Office of the Director of National Intelligence, as well as their families, according to authorities.

The two men were charged in a criminal complaint filed in federal court in northern Virginia with conspiring to commit offenses against the U.S. If found guilty they could face up to five years in prison. The two men couldn't immediately be reached for comment, and court records didn't identify lawyers for them.

Three teenagers in the U.K. are also under investigation in the hacking conspiracy, officials said. One of those teens was arrested in February.

The suspects often gained access to the accounts by calling the help lines at internet-service companies and impersonating employees at those companies or the victims they were targeting.

In doing so, they were often able to reset the passwords to their targets' private email accounts, giving them access to those accounts. Computer-security experts refer to such techniques as social engineering, rather than hacking, because they typically depend on one person tricking another into providing key information that allows the suspect to access private accounts.

The "Crackas With Attitude" then used their access to taunt the officials, particularly Messrs. Brennan and Giuliano, with harassing phone calls and public ridicule posted online.

In January, one of the teenage hacker suspects in England was able to sneak into the Justice Department's computer system after calling the department's technical help desk and pretending to be a contract employee, according to an FBI affidavit filed in the case.

The group was able to access the Justice Department's civil division case information management system, the court papers say. They then began posting tens of thousands of names, phone numbers, and email addresses of FBI and Department of Homeland Security employees, officials said.

The Australian Financial Review
Cyber security 'more than just for IT guy'
Wednesday, 14 September 2016
Byline: James Eyers

Canberra -Directors should improve their knowledge about cyber security, assess technology vulnerabilities more regularly than other business risks, and develop more comprehensive plans for responding to attacks according to ASIC commissioner Cathie Armour.
With cyber crime estimated to cost the Australian economy more than $1 billion a year - a figure that will rise as more commerce moves into the digital world and hacker sophistication grows - the corporate regulator is encouraging directors to assess cyber security as part of the broader risk management framework, and not view it as one merely for the IT department.

"We do think there is one universally incorrect answer [for directors], and that is 'I am not sure about our cyber resilience, ask the IT guy'," Ms Armour told the inaugural Sinet61 summit in Sydney on Tuesday.

"We think with the pace of change, directors should be actively thinking about whether cyber security should be assessed more regularly than other risks. I would encourage board members to think about lifting their capability in this area ... and find ways they can get more confident in the space."

The Sinet conference was brought to Australia by the Security Innovation Network and presented by CSIRO and its subsidiary, Data 61. Security experts from some of the major banks will address the summit on Wednesday morning.

The Australian Institute of Company Directors has been working with Data61 since April to improve the digital and cyber literacy of boards and directors across Australia.

"There has been a keen interest from directors in learning about cyber resilience," said AICD chief executive John Brogden, who chaired the panel session at the event. "The digital age has provided businesses with a whole new world of opportunity, but it has also bought with it significant risk. Managing cyber risk is crucial for all organisations, and boards are taking that responsibility seriously."

While financial services cyber attacks around the world have largely focused on retail banking accounts, it is expected that criminals will increasingly focus on critical market infrastructure in order to disrupt economies. ASIC recently stress-tested the cyber resilience framework of both the Australian Securities Exchange and Chi-X. The Nasdaq was the target of a serious cyber attack in 2011.

Amanda Harkness, group general counsel of ASX, said cyber "has been identified as a big operational risk which means there is regular reporting" to the board about threats. The exchange's planning has included conducting simulated attacks to track staff response times. "At ASX, is it not just a matter for the IT guys - for ASX it is very much a brand and reputational issue," she told the summit.

But one issue ASX, like other companies, is struggling with is identifying quality staff. This is "one of the major challenges that we have," she said.

Ms Armour said boards might need to amend hiring practices. It would depend on the nature of each company, but "perhaps strategic technology skills are an important skill when a board is thinking about recruiting," she said.

The special adviser to the Prime Minster on cyber security, Alastair MacGibbon, told Sinet61 that the recent denial of service attacks on the Australian Bureau of Statistics on census night were relatively small but would have a big impact on the government's reputation, so held important lessons for the business community.

"Their impact in terms of trust and confidence of the ability of government to deliver services will last for a significant period and that is what we need to prepare for," he said.

Directors advised to improve their knowledge about cyber threats.

Criminals expected to target critical infrastructure in order to disrupt economies.

The Register (UK)
So, Gov.UK infosec in 2015. 'Chaotic'. Cost £300m. NINE THOUSAND data breaches...
Wednesday, 14 September 2016
Byline: Alexander J. Martin

London - The Cabinet Office is failing to coordinate the UK's government departments' efforts to protect their information according to a damning report by the National Audit Office.
The NAO found that the Cabinet Office failed in its duty and ambition to coordinate and lead government departments' efforts in protecting such information.

The Cabinet Office has "tried to take a more strategic role in offering support and guidance to central government departments," the NAO report found. "However, senior- level governance remains complex and unclear and, until recently, a wide array of central teams have been involved in information assurance and protecting information, sometimes offering overlapping and contradictory advice."

Reporting personal data breaches is chaotic, with different mechanisms making departmental comparisons meaningless. In addition, the Cabinet Office does not have access to robust expenditure and benefits data from departments, in part because they do not always collect or share such data. The

Cabinet Office has recently collected some data on security costs, though it believes that actual costs are "several times" the reported figure of £300 million.

As a result, NAO stated that GCHQ dealt with 200 "cyber national security incidents" per month in 2015, double the number of attacks it had addressed in 2014, though the result of these attacks has not been reported.

The report certainly suggests that departments need to get their own houses in order before they start opening up access to even more of citizens' data, as per the porn-blocking Digital Economy Bill, with 8,995 data breaches in the 17 largest government departments in 2014- 15.

Government departments are being challenged by the increasing need to share data with other public bodies, with delivery partners, service users, and citizens. According to the NAO, recent years' "cuts to departmental budgets and staff numbers, and increasing demands form citizens for online public services, have changed the way government collects, stores and manages information".

At the same time "the threat of electronic data loss from cyber crime, espionage and accidental disclosure has risen considerably. Alongside this new challenge, reporting to the Information Commissioner's Office (ICO) by public bodies shows that the loss of paper records remains significant."

Efforts have complicated by the lack of coordination by the 12 separate teams and organisations which play a role in governmental infosec, including: GDS; GCHQ; CESG, CERT-UK; and the UK National Authority for Counter Eavesdropping (UKNACE).

That this work hasn't been coordinated "has meant that a large number of bodies continue to have overlapping mandates and activities" according to the NAO, which noted how last November the then-Chancellor of the Exchequer noted this acronym- heavy problem and the need to "address the alphabet soup of agencies involved in protecting Britain in cyberspace."

As part of that address, Osborne announced the launch of a new National Cyber Security Centre (NCSC) which will act as a hub for sharing best practices in security between public and private sectors, and will tackle cyber incident response.

Speaking to The Register earlier this month, the former head of GCHQ Sir David Omand said: "Next month, the new National Cyber Security Centre starts its work, under the Director of GCHQ, drawing on the technical expertise of GCHQ staff in operating in cyberspace, a further major development in harnessing the skills of the intelligence community in protecting the public."

NAO's head, Amyas Morse, said: "Protecting information while re-designing public services and introducing the technology necessary to support them is an increasingly complex challenge. To achieve this, the Cabinet Office, departments and the wider public sector need a new approach, in which the

centre of government provides clear principles and guidance and departments increase their capacity to make informed decisions about the risks involved."

Washington Free Beacon
DNI Declines Required Damage Assessment of Clinton's Leaked Email Secrets
Wednesday, 14 September 2016
Byline: Bill Gertz

Washington - The U.S. intelligence community declined to conduct a required assessment of the damage to national security caused by former secretary of state Hillary Clinton sending and receiving secrets on a private email server.
"ODNI is not leading an [intelligence community]-wide damage assessment and is not aware of any individual IC element conducting such formal assessments," Joel D. Melstad, a spokesman for the of the Office of the Director of National Intelligence, said.

The most sensitive classified information leaked and possibly obtained by foreign intelligence services included ultra-secret information on U.S. drone strikes, according to American intelligence officials.

James Clapper, the director of national intelligence, agreed with security officials who argued against the need to carry out the damage assessment. Intelligence officials argued in internal discussions that since many details of the drone missile program targeting terrorists were disclosed in earlier leaks unrelated to Clinton's use of a personal email server, gauging the damage done by her conduct would be difficult, and possibly unnecessary.

Melstad, the DNI spokesman, declined further comment when asked the reasons behind Clapper's decision not to launch the damage assessment.

Other officials said Clapper's decision appeared based on political considerations and was an effort to avoid embroiling American intelligence agencies in charges they were attempting to influence the outcome of Clinton's bid for the White House.

The intelligence about drone strikes was compromised by its transmission on Clinton's private server. The information is classified above the Top-Secret level and limited to distribution to a few officials in what is called a Special Access Program--an intelligence compartment used to prevent the disclosure of the government's most secret information.

Drone strike intelligence is classified as a part of Special Access Programs in order to prevent revealing the sources and methods used for targeting terrorists with missiles fired by unmanned aerial vehicles, a signature tool of President Obama's counterterrorism policy.

Clinton, the Democratic presidential nominee, lied repeatedly about her handling of the unsecure email server, initially saying no classified information was sent in the private emails, and then asserting no information that was marked classified was sent and received during use of the server between 2009 and 2013.

Both claims were disputed by an FBI investigation that concluded in July. FBI Director James Comey said among the 30,000 emails obtained from the server, "very sensitive, highly classified information" was found, including seven email chains containing Special Access Program secrets.

"These chains involved Secretary Clinton both sending emails about those matters and receiving emails from others about the same matters," Comey said. "There is evidence to support a conclusion that any reasonable person in Secretary Clinton's position, or in the position of those government employees with whom she was corresponding about these matters, should have known that an unclassified system was no place for that conversation."

The Intelligence Community inspector general had requested the investigation focusing on the transmission of classified intelligence on emails sent and received by Clinton and her aides.

A June 2014 counterintelligence directive requires the Intelligence Community to conduct damage assessments in the aftermath of unauthorized disclosures or other failures, such as espionage cases.

The directive, ICD-732, states that "damage assessments shall be conducted when there is an actual or suspected unauthorized disclosure or compromise of classified national intelligence that may cause damage to U.S. national security."

A member of Congress and three intelligence experts disagree with the DNI's decision not to conduct the assessment, which they assert is needed to prevent further national security damage.

Rep. Mike Pompeo (R., Kan.), a member of the House Permanent Select Committee on Intelligence, wants the DNI to do a formal damage assessment.

"FBI Director Comey has made clear that there was highly classified and sensitive information on Secretary Clinton's personal server," Pompeo said. "It is imperative that an investigation be conducted to determine what harm to American national security may have occurred and, just as importantly, to prevent the massive mishandling of sensitive materials from ever happening again."

Pompeo said the refusal to do the damage assessment, despite the FBI's determination that a serious leak of national security data took place, "is inappropriate and a grave failure."

Angelo Codevilla, a former intelligence officer and former Senate Intelligence Committee staff member, said the FBI director's vague and evasive comments regarding Clinton's handling of classified information confirm that she compromised a significant number of secrets.

"Common sense, the intelligence community's standard practice, as well as a 2014 directive, require assessing the damage done by any such compromise," Codevilla said.

Politics in support of Clinton also appeared to be behind the decision. "The DNI's refusal to conduct such an assessment, even more than the FBI director's obfuscation, shows that U.S. intelligence agencies have been reduced to mere political arms of the Democratic Party," Codevilla added.

Michelle Van Cleave, former national counterintelligence executive, a senior counterspy policymaker, also called for the assessment.

"Whenever there is a significant compromise of national security information, as the FBI's report confirms happened here, it is essential to conduct an assessment of the damage in order to protect plans, programs, or lives that may be at risk," she said.

"The FBI has done a first cut at identifying classified information that was transmitted to or from the secretary of state in the 'open'--which means even any second-rate intelligence service could scoop it up," she added. "So you have to assume the Russians, the Chinese, the Iranians, and a host of others, have their hands on it all."

Van Cleave said that under a DNI directive a damage assessment team is responsible for looking at the information that was compromised and analyzing the potential harm to national security, "so we aren't going along blindly thinking all is well when it isn't."

An FBI report on the server investigation stated that foreign hostile hackers penetrated computer systems of people who communicated with Clinton through the private email.

"The FBI did find that hostile foreign actors gained access to the personal email accounts of individuals with whom Clinton was in regular contact, and, in doing so, obtained emails sent to or received by Clinton on her personal account," the report noted.

The report did not identify whether the emails obtained by the foreign hackers included classified information.

Comey said in July that "sophisticated adversaries"--code for states such as Russia and China--likely gained access to Clinton's private emails.

Kenneth E. deGraffenreid, a former deputy national counterintelligence executive, said intelligence bureaucrats have opposed damage assessments for years.

"Intelligence agencies hate conducting damage assessments that could show people that somebody did something wrong, or improper, or did it poorly," deGraffenreid said. "They never want that known. It's a bureaucracy that does one thing: protects itself."

In the past, intelligence agencies ducked conducting damage assessments by claiming the assessments could not be conducted without interfering with law enforcement investigations or prosecutions.

Both the FBI and Justice Department, however, have said the investigation of the Clinton email server was completed and prosecution declined.

DeGraffenreid said Congress should take action to force the intelligence community to launch the damage inquiry.

A special intelligence unit with access to secrets but which is independent of any political pressure from intelligence leaders should be created, he said.

"These assessments can't simply be done by the people in the agencies involved," deGraffenreid said. "That would be like allowing inmates to do an assessment of their crimes."

Congressional sources said the House and Senate intelligence oversight committee are reluctant to require the damage assessment since it would codify in writing the false claim that no damage was caused to the drone program by the compromise of secrets by Clinton and her aides.

The Obama administration has suffered a string of highly damaging security failures, including the theft of some 250,000 secret documents stolen by Bradley Manning, a soldier in the U.S. Army, and given to Wikileaks.

That compromise was followed by the theft of some 1.7 million highly classified documents on electronic intelligence gathering from the National Security Agency by renegade contractor Edward Snowden, currently wanted on espionage charges and living in Moscow.

A Clinton campaign spokesman did not respond to an email requesting comment.

Arab News
All-seeing 'eye' watches over Makkah pilgrims
Wednesday, 14 September 2016

Mina - Under a bank of monitors broadcasting live footage from more than 5,000 cameras, Saudi officers have kept their eyes on every route and gathering spot at this year's Haj pilgrimage.

As custodians of the most sacred sites in Islam, the authorities have been at pains to assure the world that every possible measure has been taken to prevent a repeat of last year's deadly stampede during Haj.

An "eye" which never closes forms the heart of the command and control center located in Mina, near Makkah, said Col. Saad Al-Dosari, its planning chief.

Another officer, Captain Tareq Al-Azam, told AFP that his dozens-strong team has been on duty around the clock monitoring this year's 1.8 million pilgrims who have converged on the desert kingdom from across the globe.

More than 5,000 cameras have been installed in the entire Makkah sector covering a radius of around 10 kilometers (six miles) around its Grand Mosque, the single holiest place in Islam.

From his vantage point, the captain can direct the cameras and is able to zoom in to investigate any suspicious-looking or potentially dangerous activity.

The job of the security team was "to survey the screens to detect any problem or any blockage" in the constant stream of pilgrims navigating the holy sites, explained Dosari. If any anomaly is detected, "they inform the operations center to prevent any problem before it can even happen."

Dozens of soldiers are posted at the center, located a few meters (yards) away, with headphones on and microphones at the ready to pass on information to the tens of thousands of members of the security forces on the ground.

They also redirect any complaints from the pilgrims on a special number provided by Saudi authorities, who have said this year's Haj which started last Saturday and ends on Thursday has been free of any major incident.

Times of Israel
Israel's new spy satellite 'not functioning' as expected
Wednesday, 14 September 2016
Byline: Judah Ari Gross

Jerusalem - The Ofek-11 reconnaissance satellite launched by Israel on Tuesday evening may be malfunctioning, officials involved in the project said a few hours after launch, though they said they have been able to make contact with the craft.
The Israel Aerospace Industries satellite was successfully put into orbit using a Shavit rocket, a locally produced space launch vehicle, the head of the Defense Ministry's Space Department, Amnon Harari, told reporters. However, in the hours after the launch, it was "not clear that everything was in order," he said.

Due to the rotation of the Earth, the teams on the ground are only able to make contact with the satellite "once every few hours," something that makes the work of the engineering teams "sevenfold more difficult," said Doron Ofer, CEO of the Israel Aerospace Industries' Space Division.

"We have downloaded some figures, and we are now checking them. It's not functioning exactly the way we expected, and we don't know what it's status is," Ofer said. "We are now working to stabilize it, but it will take some time because of the small amount of communication we have with it when it comes in our area," he said.

The satellite was shot into space from the Palmachim Air Base, just outside the Tel Aviv suburb of Rishon Lezion, at 5:40 p.m., Harari said.

The Ofek-11 is an upgrade from the Ofek-10 satellite launched in April 2014. However, Ofer would not discuss what exact improvements were made to the design of the satellite to make it superior to its predecessor.

The Ofek-11 was to join approximately 10 other satellites, including the Ofek- 10, Ofek-9, Ofek-7 and Ofek-5, that feed intelligence to Israel's security forces.

The launch came less than two weeks after the civilian Amos-6 communications satellite was destroyed when the SpaceX rocket carrying it exploded on the launchpad in Cape Canaveral, Florida during a pre-launch test.

Facebook had planned to use the satellite, which was built by Israeli company Spacecom, to beam high-speed internet to sub-Saharan Africa.

The National (UAE)
UAE companies 'wide open' to cyber attacks due to lack of staff training
Wednesday, 14 September 2016
Byline: Jennifer Bell

Abu Dhabi - Companies are failing to provide their employees with basic cyber security awareness training, leaving their systems "wide open" to attacks.
Experts say that the vast majority of local organisations underestimate the "human factor" that allows online criminals to infiltrate companies' internal networks, and many budget-cutting businesses do not see the value in investing in adequate training.

"If any organisation lacks the initiative to provide cyber security awareness as a part of their cyber security platform, they might as well remove the doors and windows to their offices and invite the

criminals in," said Amir Kolahzadeh, managing director of Itsec, one of the Middle East's cyber security leaders.

"Cyber security awareness provides the basic knowledge of identifying the barrage of attacks on email boxes, networks and telephone systems."

Mr Kolahzadeh said it was of "utmost importance" that every single employee completed a basic cyber security awareness seminar and be able to identify ransomware, which encrypts data on infected machines and demands a ransom to restore it.

He said because the UAE was an "extremely safe environment", it made people too trustworthy online. "This naturally causes people's guards to be down, versus if we lived in New York or London," he said.

"A cyber criminal can easily use a phone to call an employee and pretend to be a Microsoft engineer that has been assigned to upgrade the PCs for this company to the latest Windows and all the individual needs to do is allow a remote session for the three-minute install and, boom - suddenly the criminal has full access to the employee's PC, files and the company's networks."

Research by Symantec and Deloitte found that more than two thirds of organisations in the Middle East were still incapable of protecting themselves from sophisticated cyber attacks.

Mr Kolahzadeh said there was a lack of will in organisations to invest in security measures. "I would say 99 per cent of all IT directors are not looking to protect the organisation, they are simply looking for the cheapest compliance form they can pass on," he said. "This is a major -security threat for the region."

Mike Weston, vice president of Cisco Systems Middle East, said that no matter how many sophisticated security technologies were deployed within an organisation, a security solution was only as secure as its weakest link.

"UAE workplace security research conducted by Cisco and GBM showed employee behaviour is a genuine weak link in cybersecurity and becoming an increasing source of risk - more through complacency and ignorance than malice - because companies have so insulated employees from the scale of daily threats that people expect the company's security settings to take care of everything for them," he said. "Training employees to understand that they too are liable on an individual level is of critical importance.

"When data breaches are the result of an external attack, it is often the inexperience of employees that is exploited, whether it be by clicking on an email link they shouldn't open or downloading an unapproved app."

David Michaux, of online security company Whispering Bell, also said companies often underestimated the role their employees - from boardroom members to frontline workers - could play in preventing cyber crimes.

"Security awareness needs to be pushed down from the top and enforced," he said. "This means it needs to be written into the HR policies and enforced by IT."

Stephen Brennan, senior vice president of cyber network -defence at UAE cyber security company DarkMatter, said employers needed to have a rolling education programme for staff.

"You look back at the old day and it was 'loose lips sink ships' - the only thing we are really talking about now is transferring this mindset to the digital domain. "[It needs] a constant programme of not just educating people but also positive reinforcement."

The National (UAE)
Shortage of security professionals hindering UAE's cyber crime fight
Wednesday, 14 September 2016
Byline: Jennifer Bell

Abu Dhabi - The UAE must invest in training its own security professionals as a priority in the war against cyber crime, as the global pool of skilled workers is shrinking, experts say.
The Arab Gulf States Institute in Washington said cyber attacks in the region cost US$1 billion (Dh3.67bn) a year - an amount predicted to grow.

The institute said the Middle East was fertile ground for cyber crime, with its wide use of technology and high-value targets.

Mike Weston, vice president of Cisco Middle East, said that although there were more than a million cyber security positions available worldwide, the shortage of professionals to fill them was likely to grow rapidly.

The Cisco Annual Security Report 2016 said the deficit of cyber security workers would rise to 1.5 million by 2019.

"More and more organisations are looking to digitisation to compete in an increasingly global economy, while inadvertently increasing exposure to cyber attacks," Mr Weston said.

"Organisations need to invest in the people, processes and technology that will enable them to become more resilient in the face of new attacks."

David Michaux, of online security company Whispering Bell, said talent was a "big factor" in the UAE's vulnerability.

"We seem to have a lot of thinkers who advise companies on how to change strategies and reorganise their security," Mr Michaux said. "We need more people to do hands-on fixing."

As the UAE forges ahead with its knowledge economy, smart cities and other ambitious strategies, the potential for attacks will grow, he said.

Amir Kolahzadeh, managing director of Itsec, a leading cyber security company in the Middle East, said 85 per cent of UAE residents were online. "The UAE is a major target because of its glamour and vision," he said.

The Local (Austria)
Turkish hacker group targets Austrian National Bank
Wednesday, 14 September 2016

Vienna - A Turkish hacker group has allegedly tried hacking into the National Bank of Austria after reportedly being behind an attempted cyber attack at Vienna airport two weeks ago.
The hackers' collective, which goes under the name of Aslan Neferler, said the cyber attacks on Austrian institutions are revenge for Austria's "anti-Turkish political stance".

They claimed responsibility for two DoS-attacks on Friday night, when most of the bank's IT-technicians were not working. By sending five million emails per minute the attackers tried to clog the bank's server.

Christian Gutlederer, the spokesman for Austria's National Bank, said: "Our website was temporarily unavailable. The hackers did not have any access to any of our sensitive data."

The Turkish nationalists announced their "success" on various social networks, writing that they had "blocked access to the Austrian National Bank for a while". They promised that the attacks would continue.

The hacking attempts come after diplomatic relations between Austria and Turkey sharply deteriorated. After the failed coup attempt in Turkey, Austrian Foreign Minister Sebastian Kurz warned he will stop any move that brings Turkey closer to joining the European Union.

Turkey has recalled its ambassador to Austria and accused the country of being supportive of terrorism and a centre of Islamophobia.

The National (UAE)
A token nod at online security
Wednesday, 14 September 2016
Byline: Jonathan Gornall

Abu Dhabi - They crept up on us almost unnoticed. Small, annoying, plastic pieces of mysterious technology easily lost at the back of a drawer or the bottom of a handbag that have become ubiquitous, tediously essential bits of kit for anyone who banks online, whether at home or on the move. They are also sometimes necessary to gain access to a secure, corporate VPN or virtual private network.
Among banks, for reasons best known to the industry, their precise nature varies according to location. In the Middle East, for instance, including the UAE, they are a simple "token", a branded device that looks a little like a calculator and asks only for a PIN before issuing an apparently random number that allows access to online accounts.

Elsewhere in the world, including the US and Europe, they are card-readers - a slightly more sophisticated version of the token, into which bank cards must be inserted to generate a one-off number.

Either way, they do nothing to improve the consumer experience. At best they are a tiresome wrinkle in what has otherwise become the extremely smooth process of online banking. Lose them, and there's no way you can set up new payments or carry out a range of other online banking acts.

Presented as "an extra layer of protection against online fraud", the device is in fact nothing less than a tacit admission that the digital revolution is fatally flawed. Its very existence is evidence that, for all our digital ingenuity, we have yet to figure out a way of telling if people are who they say they are online.

Surely our usernames and passwords offer sufficient reassurance to the banks? Not any more, say the banks. We need the extra security, they say (although not in so many words), because large numbers of us are stupid and gullible and give away our login details to anyone who asks for them, and the banks are fed up picking up the bill for our collective naivete.

Card readers and tokens first surfaced in the early days of online banking, during the early 2000s, and spread like wildfire among banks. Today, they are everywhere, including in the Middle East - HSBC introduced its first token device in the UAE in June 2012.

The main reason for their introduction, says Ali Imanat, e-crime fraud lead for the UK-based industry organisation Financial Fraud Action, was "to move away from using static passwords for home banking customers, because those details can be easily phished or captured using malware".

It isn't obvious to the average customer - or fraudster, come to that - how "dynamic", or "two-factor authentication", as it is known in the trade, works. When you use the device, it generates an apparently random code that then has to be entered into the bank's website before the user can proceed.

Despite appearances, it's not magic. Although a "dumb" device, unconnected to the internet or your computer and hence immune to e-attack, the little piece of plastic is loaded with a basic algorithm, or pre-loaded set of instructions, designed to generate a different code each time you use it. The bank's system recognises the code spat out by the token, because it is running the same algorithm and, by counting your online transactions or according to the date and time, knows exactly which number to expect next.

So far, so good. In the early 2000s, Mr Imanat says, "this was seen as the most effective way forward in terms of improving security for customers". The banks "recognised it was an additional hardware device and not ideal for all customers, but they believed it would have a substantial impact on improving security, which it has".

Up to a point. The FFA has, but does not release, fraud figures for individual banks, but insists that "when you look at individual bank losses, there is a clear correlation between the introduction of two-factor authentication in about 2004-2005, and a reduction in the fraud figures".

It was, Mr Imanat says, clear which banks had introduced the new precaution and which had not - and it was to the latter that the fraudsters turned their attention.

Overall, however, fraud has pretty much held its ground. There was a spike in the key depression year of 2008 - financial hardship makes people more desperate, and so vulnerable to cruel scams - but in 2014 fraud was costing UK banks £479 million, £40m more than in 2004.

The problem, Mr Imanat says, is that "the fraudsters have worked out methods to circumvent the use of the devices and the security they provide".

Which isn't to say that the portable technology has been hacked. Well, it has been hacked, but as far as anyone can tell only in a university laboratory.

In 2009, a team from Cambridge University's computer laboratory took a peek under the hood. They emerged with a warning that while "the basic principle behind [the system] - a trusted user interface and secure cryptographic microprocessor - is sound, the system has been optimised literally to death".

They clarified the point by quoting the late Roger Needham, a Cambridge computer scientist and security protocols expert. Optimisation, Mr Needham once said, was "the process of taking something that works and replacing it with something that almost works, but is cheaper".

And, technology aside, there were other issues, particularly with card readers. These, Dr Steven Murdoch and his two Cambridge colleagues pointed out in a paper presented to the 2009 Financial Cryptography and Data Security conference in Barbados, could easily be stolen by muggers, along with cards. Whereas previously "muggers marched a victim to an ATM to ensure he gave them the right PIN,

now criminals have a portable device that will tell them if their victim is lying", without the risk that they will be caught on CCTV while loitering by a cash machine.

It would, they concluded, have been "easy enough for the banks to design [the system] without revealing the result of the PIN verification, but they failed to foresee the risk. In our view, this was negligent [and] placed customers in harm's way".

Both card reader and token also offer thieves a low-tech way of figuring out a PIN for themselves. Used often enough, the print on the rubber keys can wear down, decreasing the odds of guessing a four-number PIN in three attempts from 1 in 3,333 to 1 in 8. If the customer has several cards with the same PIN, basic maths dictates that "the attacker has even better odds".

All well and good, Mr Imanat says. The banking sector "is aware of the findings of that paper but it's not something that the industry is massively concerned about".

Yes, in a lab in Cambridge you probably can break in and do all sorts of funny things, but out in the real world "we haven't seen it happen". For the average fraudster, cracking tokens and card readers is simply too much like hard work and, because it would have to be done for each one, "simply isn't a scaleable solution".

As for the charge that the industry was relying on an "optimised" (read: "compromised") device, "banks have to balance gains in security with convenience. We could provide a solution that is 99.9 per cent secure, but we know no consumer will ever use it because it's going to be too cumbersome and inconvenient".

What is "sometimes overlooked in these academic papers", he says, is that "banks have to balance making it easy for customers to go online versus how many padlocks and chains are people prepared to open before they can get to their money".

Besides, he says, the real reason that bank fraud figures continue to climb has nothing to do with technology.

Yes, fraudsters phishing for personal details "continues to be an issue for the industry". Amazingly, it seems there are still people out there falling in large numbers for poorly worded email appeals to click on links, supposedly sent by banks or other organisations. (One pathetic example currently doing the rounds, purportedly emanating from iTunes: "Dear Client, As a part of our security plan, Please Finished your billing informations. This actionis very locked and private. Competed now."

It's enough to make one miss those charming email appeals for help from all those dispossessed African princes.

But such phishing, Mr Imanat says, is "not as significant as it used to be - the introduction of two-factor authentication means capturing static passwords is pretty much useless to the criminal now".

Indeed, phishing as a problem is now dwarfed by the issue of malware, increasingly used by fraudsters as users grow more aware, and planted on home computers or smartphones by innocent-looking attachments or links in emails. ("Click here for latest Britney Spears video", or "Hi, have you seen these HR salaries for 2016??")

Such implanted software lies doggo on your hard drive, springing to life and hoovering up information or even taking over your computer and doing unspeakable things whenever you visit selected target sites, such as banks.

But nothing, Mr Imanat says, compares with the rise of what he calls "social engineering, this is the biggest area of concern for us, more so even than malware".

And what this means is that in our high-tech digital age, it is the old-fashioned conman who has the banking system on the run: "Essentially it's a fraudster using a very clever script to dupe the customer into making payments or giving away their credentials over the phone."

It's the same old problem that has plagued financial transactions ever since currency was invented: a fool and his money are easily parted. "When it comes to social engineering I've seen some very IT-savvy, security-minded individuals duped," Mr Imanat says.

Malware sounds scary, he says, "And it is. But it is a technical problem and so there is a technical solution. Unfortunately it is very difficult to come up with a technical fix for customers' naivete. We have education and awareness campaigns, but at the end of the day you can't put a piece of code into people."

But you can put it on their smartphone. If you haven't already lost your token or card reader, or choked it with biscuit crumbs at the bottom of your bag, don't get too attached to it. Having argued for the invulnerability of the devices because they are not linked to any other device connected to the internet, in the escalating arms race that is online security, banks are now poised to get rid of them.

"Security technology develops," Mr Imanat says. "The banks realised that not every customer wants to have to carry around one of these cumbersome devices."

The solution? "They are starting to move away from hardware devices to use software versions instead, apps that generate the same code, but as a bit of software, so the customers don't have to carry a separate device and can do it all from their mobile device." Brilliant. What could possibly go wrong?

New York Times

Vengeful Russian Hackers Leak Medical Files of Top U.S. Athletes
Wednesday, 14 September 2016
Byline: Rebecca R. Ruiz

New York - Russian hackers -- possibly the same group that compromised the Democratic National Committee's computer servers -- have made top American athletes their latest target.
Joining an intercontinental dispute over sports doping, the hackers penetrated the World Anti-Doping Agency's athlete database and publicly revealed private medical information about three of the United States' most famous athletes: Serena Williams, Venus Williams and Simone Biles.

The hackers published documents this week showing that Ms. Biles, who won four gold medals in gymnastics at the Rio Olympics last month, and the Williams sisters received medical exemptions to use banned drugs.

The antidoping agency confirmed the authenticity of the documents in a statement Tuesday, attributing the hack to Fancy Bear, a Russian cyberespionage group that forensics specialists have tied to breaches against government agencies, nonprofit organizations and corporations. That group is believed to be associated with G.R.U., the Russian military intelligence agency suspected of involvement in the recent theft of emails and documents from the D.N.C.

"These criminal acts are greatly compromising the effort by the global antidoping community to re-establish trust in Russia," WADA's director general, Olivier Niggli, said Tuesday, referring to revelations of elaborate government-ordered doping by Russia that prompted more than 100 of the country's athletes to be barred from the Rio Games.

The hackers wrote on their website that the United States had "played well but not fair" in Rio de Janeiro, and the medical documents were hailed in Russia on Tuesday as evidence of both widespread doping among American athletes and the double standards of global antidoping regulators.

Dmitry Peskov, spokesman for President Vladimir V. Putin, said that the Kremlin was not involved in the hacks. "It's simply ruled out," Mr. Peskov said.

Russia has gone to to great lengths to maintain plausible deniability in matters of espionage. The Kremlin often delegates high- profile political attacks to third parties, such as in the case of a 2007 attack on Estonia, according to one classified American intelligence estimate.

On their website, the hackers claimed to be both members of Anonymous, the global hacking collective, and Fancy Bear, which typically works in extreme stealth and takes great measures to cover its tracks. Those two groups have not been aligned before.

Revenge, apparently, motivated the WADA hacks. In May, The New York Times reported the account of Russia's longtime antidoping lab chief, who said the country had run a doping program and staged an

elaborate cheating scheme at the 2014 Sochi Olympics. A subsequent report commissioned by WADA confirmed that account.

The United States Anti-Doping Agency said that the American athletes in question had sought the requisite approvals to take typically prohibited substances, and that none of the positive drug tests constituted a violation.

The drugs mentioned in the documents are commonly prescribed medications that treat ailments including pain and allergies. The Times is not identifying the drugs for privacy reasons.

Ms. Biles acknowledged on Tuesday that she was prescribed medication for attention-deficit hyperactivity disorder. "Having ADHD, and taking medicine for it is nothing to be ashamed of, nothing that I'm afraid to let people know," she wrote on Twitter.

Athletes with particular medical conditions may apply for special permission to take banned substances, requiring a doctor's diagnosis and the approval of sports authorities. The WADA list of prohibited drugs -- including a range of substances, from cannabis to attention-deficit disorder drugs to anabolic steroids -- is updated each year.

In 2016, meldonium -- a heart medication that improves blood flow -- was added to that list, resulting in infractions for several Russian athletes, including the tennis star Maria Sharapova. (Ms. Sharapova, who said she was unaware the drug had been banned, was barred from competition for two years. She appealed that decision at an arbitration hearing in New York this month, and awaits a verdict in October.)

The records published by the hackers showed that at the Rio Games, Ms. Biles tested positive for a prohibited substance used to treat A.D.H.D. that she had received permission to take.

U.S.A. Gymnastics officials said Ms. Biles's drug use had been approved. "Simone has filed the proper paperwork," said Steve Penny, the organization's president. "Simone and everyone at U.S.A. Gymnastics believe in the importance of a level playing field for all athletes."

The International Tennis Federation confirmed on Tuesday that it, too, had approved exceptions for Serena and Venus Williams to take banned substances in recent years.

"In each of the situations, the athlete has done everything right in adhering to the global rules for obtaining permission to use a needed medication," said Travis T. Tygart, Usada's president. "It's unthinkable that in the Olympic movement, hackers would illegally obtain confidential medical information in an attempt to smear athletes to make it look as if they have done something wrong."

WADA said its management system was infiltrated through the so- called "spearphishing" of email accounts, in which attackers send tailored emails to authorized users to convince them to click on

malicious links or attachments that give attackers a toehold onto their machines. The agency said the attackers used that unauthorized access to gain entry through an International Olympic Committee account that was set up for the Rio Games.

Law enforcement authorities determined that the attacks originated in Russia, WADA said.

This week's hack came in the wake of revelations about the hacking of the WADA account of the Russian whistle-blower Yuliya Stepanova, a middle-distance runner who fled the country and is now living in an undisclosed location in the United States. That account contained her whereabouts.

Ms. Stepanova said last month that she feared for her safety, and that she and her husband -- a former employee of Russia's antidoping agency who has also spoken publicly about the country's systematic doping -- had moved to a new address as a result.

The hackers said Tuesday that they planned to release the medical records of additional athletes from around the world in coming days.

"This is just the tip of the iceberg," a statement posted to the Fancy Bears site said. "Today's sport is truly contaminated while the world is unaware of the large number of American doping athletes."

New York Times
A Hacker Releases Democratic Documents
Wednesday, 14 September 2016
Byline: Alan Rappeport

New York - A hacker who American intelligence officials believe has ties to the Russian government made public on Tuesday a second batch of documents suspected of having been stolen from the Democratic National Committee's computer system, leaving the organization rushing to contain damage or embarrassment less than two months before the presidential election.
The internal documents, which party officials were verifying for authenticity, were distributed at a cybersecurity conference in London.

The release was apparently the work of Guccifer 2.0, a self-identified Romanian hacker who claimed responsibility for publishing a trove of the committee's documents before the Democratic convention in July.

Donna Brazile, the interim chairwoman of the Democratic National Committee, blamed Russian espionage for the hack and said that foreign agents were trying to help Donald J. Trump, the Republican presidential nominee, be elected.

"The D.N.C. is the victim of a crime: an illegal cyberattack by Russian state- sponsored agents who seek to harm the Democratic Party and progressive groups in an effort to influence the presidential election," Ms. Brazile said in a statement. "There's one person who stands to benefit from these criminal acts, and that's Donald Trump."

The first batch of documents showed that party officials had favored Hillary Clinton over Senator Bernie Sanders of Vermont in the Democratic primary campaign, and their disclosure appeared to have been timed to sow discord before a unifying moment.

Ms. Brazile said that the committee had expected more documents to be released and that its legal team was working to determine whether they were real or forged.

The documents released Tuesday were not immediately as damaging as the first trove, and they proved difficult to access. WikiLeaks, the anti- secrecy platform, posted multiple messages on Twitter explaining how to download the documents after users struggled to do so. Initial reports suggested that they were old records related to the committee's donor outreach program.

Their release is likely to put more focus on Russia's efforts to meddle in the presidential election. American intelligence agencies and private investigators concluded in July that the hack was the work of the Russian government.

President Vladimir V. Putin of Russia denied involvement in the security breach in an interview with Bloomberg News this month, but he did describe it as a public service.

Mr. Trump has dismissed suggestions of Russian involvement, but he drew scorn this summer when he invited Russian hackers to track down missing emails from the private server Mrs. Clinton used as secretary of state.

While Mr. Trump laughed off his remark, the Democratic National Committee said Tuesday that the hacking was not a coincidence.

"Not only has Trump embraced Putin, he publicly encouraged further Russian espionage to help his campaign," Ms. Brazile said, calling Mr. Trump's statements "dangerous, divisive and unprecedented."

Lawmakers Probe Intelligence Officials on How the US Will Respond to a Cyberattack
Wednesday, 14 September 2016
Byline: Mohana Ravindranath

Washington - The federal government, including the Defense Department, needs a clearer plan about how to respond to attacks on civilian systems, members of the Senate Armed Services Committee argued Tuesday.
Sen. John McCain, R.-Ariz., suggested drafting a policy about "what the United States' actions would be in the case of a threat, in the case of an actual attack," he said during a hearing on encryption and cybersecurity.

"If you don't act, I guarantee you Congress will act," he said, addressing witnesses Adm. Mike Rogers, director of the National Security Agency, and Marcell Lettre, undersecretary of defense for intelligence.

The hearing illustrated disagreements between members of Congress, senior cyber officials and private technology companies about the best way to cooperate on preventing not only future cyberattacks, but physical attacks planned using encrypted communication such as WhatsApp.

In response to McCain's suggestion, Lettre argued during the hearing that "new legal and regulatory approaches are not as potentially productive as robust" conversations between the public and private sectors.

Lettre said the public and private sectors are often able to cooperate "if on the government side, we're able to communicate the problems we're trying to solve, and ask for industry's best expertise and wisdom about solutions."

Sen. Jeanne Shaheen, D-N.H., noted that so far there have been "limits" to that strategy, as Twitter has still been reluctant to share access to its so called firehose of data.

"Right now, we've had mixed reviews of the opportunity to work collaboratively with the private sector," she said.

Senators seemed stumped by Twitter's refusal to share access to its analytics service Dataminr with intelligence agencies.

"Shame on them," McCain said, asking witnesses what could be done other than "exposing [Twitter] for what they are."

The United States "must balance our national security needs and the rights of our citizens," McCain said, though he added the U.S. must recognize that authoritarian governments may search for keys to suppressing dissents and monitor their own citizens.

"Yet, ignoring the issue, as the White House has done, is not an option," he said.

Asked what new technology could change domestic cyber response, Rogers explained his team is especially interested in artificial intelligence and machine learning.

"How do we do cyber at scale, at speed," he said, noting that focusing purely on hiring more cyber talent instead of investing in more advanced technology "will be both incredibly resource intensive and it will be very slow."

Rogers said he was especially worried hackers might become less interested in extracting U.S. data for their own purposes, and more on manipulating information so it can't be trusted. For instance, if military commanders can't trust the tactical maps they have, they can't effectively make decisions, he explained.

"What happens when nonstate actors decide that the internet is not just a forum to coordinate ... but instead offers the opportunity to act as a weapons system?" he asked.

Reuters
Pardon for former NSA contractor Snowden seen unlikely
Wednesday, 14 September 2016

Washington - The U.S. government will not budge on its demand that former National Security Agency contractor Edward Snowden return to face prosecution for stealing thousands of classified intelligence documents, despite new calls for President Barack Obama to pardon him, U.S. officials said on Tuesday. The officials said they expect Snowden's supporters to use the Thursday release of "Snowden" - directed by veteran filmmaker Oliver Stone - to mount a public campaign demanding a pardon before Obama leaves office in January.

Snowden, who lives in Moscow, is scheduled to appear via video link on Wednesday at a New York press conference, where advocates from human rights groups will call for a pardon.

They argue that Snowden performed a public service by exposing excessive and intrusive electronic spying by the intelligence agency and its English-speaking allies, including Britain's Government Communications Headquarters (GCHQ).

In an interview published by The Guardian on Tuesday, Snowden said the U.S. Congress, the courts and the president all "changed their policies" as a result of his disclosures, and that "there has never been any public evidence that any individual came to harm as a result."

White House spokesman Josh Earnest said on Monday that Snowden is charged with "serious crimes, and it's the policy of the administration that Mr. Snowden should return to the United States and face those charges."

Two other U.S. officials said there are no discussions inside the Justice Department about granting him a pardon.

Some officials have acknowledged that Snowden raised legitimate questions about the extent and effectiveness of some electronic eavesdropping, particularly the NSA's sweeping collection of "metadata" on domestic telephone calls by Americans, a practice that was curtailed after his revelations.

Other officials, however, say the material Snowden gave the media included sensitive details about the locations and operations of U.S. and allied global spying operations, some of which were compromised.

London Daily Telegraph
GCHQ blocks 58,000 scam emails from government addresses every day
Tuesday, 13 September 2016
Byline: Cara McGoogan

London - The UK's intelligence agency GCHQ has stepped up the fight against online scammers and created a tool that blocks malicious emails that appear to be sent from government addresses, but are in fact run by cyber criminals.
The blocking system can identify when "gov.uk" emails are being sent from IP addresses not associated with an official government computer and block them.

GCHQ has been testing the system on emails from the fake "taxrefund@gov.uk" address, which was sending 58,000 messages a day.

"Whoever was sending 58,000 malicious emails per day from taxrefund@gov.uk isn't doing it anymore," said Ciaran Martin, the chief executive of the National Cyber Security Centre, which is launching in October.

Emails that appear to come from official accounts can be used to harvest personal information, bank details and tax records. The tax system, which the government plans to make completely digital by 2020, is lucrative for cyber criminals using unsophisticated methods.

In 2014 almost 50 per cent of HMRC consumers reported being targeted in a phishing scam. And in 2015 there were 17,000 fraudulent or incorrect repayment claims to HM Revenue and Customs, potentially worth up to £100 million, some of which could have been filed using information retrieved through phishing emails.

GCHQ's tool could help prevent such phishing attacks in the future, which have also plagued Apple customers, WhatsApp users and people worried about Brexit.

The security breakthrough was announced at Martin's first public appearance as head of the National Cyber Security Centre, Britain's first dedicated cyber unit that will open in October.

The newly established centre is a branch of GCHQ that will work from a separate office in London, allowing it to use the spook agency's intelligence while also working with the private sector.

"The NSCS is designed to bring together various sources of expertise into a single organisation," said Martin. This includes experts from MI5 and GCHQ, as well as partnerships with law enforcement and private companies.

"It's about tackling the most capable threats and protecting our most important national systems. But also our strategy represents a significant shift in thinking towards looking - at a national level - at how we use technology to improve cyber security at all levels."

As a result, the department will be equally focused on the security of the government's, private companies' and individuals' computer systems.

The Guardian (London)
Edward Snowden makes 'moral' case for presidential pardon
Tuesday, 13 September 2016
Byline: Ewen MacAskill

London - Edward Snowden has set out the case for Barack Obama granting him a pardon before the US president leaves office in January, arguing that the disclosure of the scale of surveillance by US and British intelligence agencies was not only morally right but had left citizens better off.
The US whistleblower's comments, made in an interview with the Guardian, came as supporters, including his US lawyer, stepped up a campaign for a presidential pardon. Snowden is wanted in the US, where he is accused of violating the Espionage Act and faces at least 30 years in jail.

Speaking on Monday via a video link from Moscow, where he is in exile, Snowden said any evaluation of the consequences of his leak of tens of thousands of National Security Agency and GCHQ documents in 2013 would show clearly that people had benefited.

"Yes, there are laws on the books that say one thing, but that is perhaps why the pardon power exists - for the exceptions, for the things that may seem unlawful in letters on a page but when we look at them morally, when we look at them ethically, when we look at the results, it seems these were necessary things, these were vital things," he said.

"I think when people look at the calculations of benefit, it is clear that in the wake of 2013 the laws of our nation changed. The [US] Congress, the courts and the president all changed their policies as a result of these disclosures. At the same time there has never been any public evidence that any individual came to harm as a result."

Although US presidents have granted some surprising pardons when leaving office, the chances of Obama doing so seem remote, even though before he entered the White House he was a constitutional lawyer who often made the case for privacy and had warned about the dangers of mass surveillance.

Obama's former attorney general Eric Holder, however, gave an unexpected boost to the campaign for a pardon in May when he said Snowden had performed a public service.

The campaign could receive a further lift from Oliver Stone's film, Snowden, scheduled for release in the US on Friday. Over the weekend the director said he hoped the film would help shift opinion behind the whistleblower, and added his voice to the plea for a pardon.

Ahead of general release, the film will be shown in 700 cinemas across the US on Wednesday, with plans for Stone and Snowden to join in a discussion afterwards via a video link.

In his wide-ranging interview, Snowden insisted the net public benefit of the NSA leak was clear. "If not for these disclosures, if not for these revelations, we would be worse off," he said.

In Hong Kong in June 2013, when he had passed his documents to journalists, Snowden displayed an almost unnatural calm, as if resigned to his fate. On Monday he said that at that time he expected a "dark end" in which he was either killed or jailed in the US.

More than three years on, he appears cheerful and relaxed. He has avoided the fate of fellow whistleblower Chelsea Manning, who is in solitary confinement in the US. Snowden is free to communicate with supporters and chats online late into the night.

His 2.3 million followers on Twitter give him a huge platform to express his views. He works on tools to try to help journalists. He is not restricted to Moscow and has travelled around Russia, and his family in the US have been to visit him.

But Snowden still wants to return to the US and seems confident, in spite of all the evidence to the contrary, that it will happen. "In the fullness of time, I think I will end up back home," he said.

"Once the officials, who felt like they had to protect the programmes, their positions, their careers, have left government and we start looking at things from a more historical perspective, it will be pretty clear that this war on whistleblowers does not serve the interests of the United States; rather it harms them."

Snowden attracts lots of conspiracy theories. Early on, he was accused of being a spy for China and then a Russian spy. In August a cryptic tweet followed by an unusual absence prompted speculation that he was dead. He said he had simply gone on holiday.

There had also been rumours that his partner, Lindsay Mills, had left him, which would have been embarrassing as their romance occupies a large part of the Stone film. Snowden said "she is with me and we are very happy".

His revelations resulted in a global debate and modest legislative changes. More significant, perhaps, is that surveillance and the impact of technological change has seeped into popular culture, in films such as the latest Jason Bourne and television series, such as the Good Wife.

Snowden also welcomed "a renaissance of scepticism" on the part of at least some journalists when confronted by anonymous briefings by officials not backed by evidence.

He warned three years ago of the danger that one day there might be a president who abused the system. The warning failed to gain much traction, given that Obama's presidency seemed relatively benign. But it resonates more today, in the wake of Donald Trump's response to the Russian hacking of the Democratic party: that he wished he had the power to hack into Hillary Clinton's emails.

If Obama, as seems likely, declines to pardon Snowden, his chances under either Clinton or Trump would seem to be even slimmer. He described the 2016 presidential race as unprecedented "in terms of the sort of authoritarian policies that are being put forward".

"Unfortunately, many candidates in the political mainstream today, even pundits and commentators who aren't running for office, believe we have to be able to do anything, no matter what, as long as there is some benefit to be had in doing so. But that is the logic of a police state."

He is even less impressed by the British prime minister, referring to Theresa May as a "a sort of Darth Vader in the United Kingdom", whose surveillance bill is "an egregious violation of human rights, that goes far further than any law proposed in the western world".

Snowden was initially berated by opponents for failing to criticise the Russian president, Vladimir Putin, but he has become increasingly vocal. It is a potentially risky move, given his application for an extension of asylum is up for renewal next year, so why do it?

"Well, it would not be the first time I have taken a risk for something I believe in," he said. "This is a complex situation. Russia is not my area of focus. It is not my area of expertise. I don't speak Russian in a fluent manner that I could really participate in and influence policy. But when something happens that I believe is clearly a violation of the right thing, I believe we should stand up and say something about it.

"My priority always has to be my own country rather than Russia. I would like to help reform the human rights situation in Russia but I will never be well placed to do so relative to actual Russian activists themselves."

Might he end up as part of a US-Russian prisoner exchange, with Putin possibly more amenable to the idea if Trump was in power? "There has always been the possibility that any government could say, 'Well, it does not really matter whether it is a violation of human rights, it does not really matter whether it is a violation of law, it will be beneficial to use this individual as a bargaining chip'. This is not exclusive to me. This happens to activists around the world every day."

He said he saw the Stone film as a mechanism for getting people to talk about surveillance, though he felt uncomfortable with other people telling his story.

Snowden has toyed with writing his memoirs but has not made much progress. There are at least three books about him on the way; an extensively researched one by the Washington Post's Bart Gellman and two others thought to be hostile.

Asked if he was the source for the Panama Papers - the comments by the source sound like Snowden - he laughed. He praised the biggest data leak in history, adding that he would normally be happy to cloak other whistleblowers by neither denying nor confirming he was a source. But he would make an exception in the case of the Panama Papers. "I would not claim any credit for that."

For someone who has spent his life trying to keep out of the public eye, he has now appeared in a Hollywood movie and an Oscar-winning documentary, and several plays, including Privacy, which just ended a run in New York and in which he has a part alongside Daniel Radcliffe.

"It was an alarming experience for me. I am not an actor. I have been told I am not very good at it. But you know if I can, I can try and maybe it will help, I will give it my best shot."

For Snowden, his campaign for a pardon, even if forlorn, offers a chance to highlight his plight, and he expressed thanks to all those who were backing it. He also said he hoped that after the fuss of the movie he could finally fade into the background. "I really hope it is over," he said. "That would be the greatest gift anyone could give me."

Reuters
Spy agencies concerned about possible U.S. election hacks: NSA chief
Tuesday, 13 September 2016

Washington - American intelligence agencies are concerned about reports that foreign governments may be attempting to undermine the Nov. 8 U.S. elections through cyber attacks, Admiral Mike Rogers, the director of the National Security Agency, said on Tuesday.
"We continue to be actively concerned," Rogers told a Senate hearing, responding to a question from Senator John McCain, chairman of the Senate Armed Services Committee.

Marcel Lettre, Under Secretary of Defense for Intelligence, testified that the government is taking any such activities "quite seriously" and said an "aggressive investigation" is under way.

McCain noted that one of the two states in which media reports said there was evidence of attempted Russian hacking was his home state, Arizona.

Some analysts have said Arizona, which recently has been reliably Republican in presidential elections, could be tilting more toward the Democratic nominee, Hillary Clinton, this year. McCain, a Republican, himself is in a tougher than usual re-election fight.

Rogers said he could not provide specifics about spy agencies' current assessment of the alleged hacking in a public setting. But he added, "I will say this, that it continues to be an issue of great focus ... for the foreign intelligence community, attempting to generate insights into what foreign nations are doing in this area."

Under further questioning, Rogers declined to characterize the activity as by a foreign nation-state.

Lettre said the government would adopt a policy for dealing with any such activity once it had the results of the investigation.

"The FBI and the Department of Homeland Security has an aggressive investigation underway," Lettre said.

U.S. security officials have said that, starting last year, hackers infiltrated computers of the Democratic National Committee, Clinton's presidential campaign and her party's congressional fundraising committee.

U.S. officials said they have concluded that Russia or its proxies were responsible, leading to calls by some Democrats and cyber security officials for the Obama administration to blame Russia publicly.

Kremlin officials have dismissed the allegations as absurd, but there is anxiety in Washington over the possibility that a foreign power might be using hacked information to meddle in the November elections.

Financial Times
Spymasters plan to build 'Great British Firewall'
Tuesday, 13 September 2016
Byline: Sam Jones

London - Ambitious new plans are being drawn up by GCHQ to create a "Great British Firewall" to block malicious websites countrywide and combat a doubling of serious cyber attacks threatening national security over the past year.
Though still in its infancy, the scheme is intended to be a flagship project for the new National Cyber Security Centre -- a public- facing arm of GCHQ which will open next month to better co-ordinate the UK's digital defence efforts.

The NCSC plan envisions private-sector internet service providers, such as BT, Sky or Virgin Media, voluntarily complying with its proposals, circumventing any need for legislation. Consumers will be able to opt out of the censorship should they wish in order to allay concerns over civil liberties.

Malicious websites which automatically infect visitors' computers with malware -- often disguised as legitimate domains -- are one of the most common methods of cyber attack.

They are widely used by states such as China, Iran or Russia in efforts to penetrate sensitive government networks, steal commercial information or compromise national infrastructure. They are also a common means for cyber criminals to target individuals.

Ciaran Martin, GCHQ's director-general for cyber security, and the incoming head of the NCSC, told a US audience of security experts and government officials at a conference in Washington on Tuesday that steps were now being taken to combat such websites.

"It's possible to filter unwanted content or spam. It's possible to filter offensive content. It's technically possible to block malicious content," he said. "So, the question is: why aren't we, the cyber security community, using this more widely? Well, we -- in the UK -- now are,"

"We're exploring a flagship project on scaling up DNS [domain name system] filtering: what better way of providing automated defences at scale than by the major private providers effectively blocking their customers from coming into contact with known malware and bad addresses?" Mr Martin said.

Because of its strategic interests and digital development, the UK is one of the most vulnerable economies in the world to cyber attack, Mr Martin added, making the need for more robust government action to protect businesses and civilians urgent.

"Behind the necessarily closed doors of our cyber defence operations centre, last year we detected twice as many national security level cyber incidents -- 200 per month -- than the year before," he said.

Efforts by GCHQ and the government to try to boost the UK economy's cyber defences have so far had a patchy effect. Even large companies, such as the Telecoms provider TalkTalk, have fallen victim to attacks in recent months.

Plans for a national DNS filtering regime are nevertheless likely to raise concerns among civil liberties campaigners: the same technical principles lie behind China's "Great Firewall" which allows the government effectively to control what its citizens have access to online and what not.

It is not yet clear who will decide which websites are blocked and by what criteria.

GCHQ hopes to demonstrate the security benefits of the proposals to ISPs by example: it is already testing a number of automated features across government networks and domains to clampdown on spoofing and attempts by hackers to mimic government services.

It is now far harder for hackers to mask malicious emails with fake "@gov.uk" suffixes. Only emails claiming to be from gov.uk addresses that contain specific keys known to the email domain owner -- the government -- can now be sent to UK internet users.

"Whoever was sending 58,000 malicious emails per day from taxrefund@gov.uk isn't doing it any more," noted Mr Martin.

GCHQ has also rolled out automated detection and response systems which identify large- scale "commodity" attacks where hundreds of spam emails are sent out indiscriminately. Internet companies receive automatic takedown requests from the systems as soon as spam campaigns which masquerade as government services are identified. The average lifespan of such attacks has dropped from 49 hours to 5 hours as a result, Mr Martin said.

"Faced with a problem of this importance and scale, we believe it is worth trying something new, unleashing innovation in the hope and expectation we can achieve a very significant breakthrough in the coming years."

Washington Post
Obama to be urged to split cyberwar command from NSA
Tuesday, 13 September 2016
Byline: Ellen Nakashima

Washington - The Pentagon and intelligence community are expected to recommend soon to President Obama that he break up the joint leadership of the National Security Agency and U.S. Cyber Command to create two distinct forces for electronic espionage and cyberwarfare.
The potential move is driven by a sense that the two missions are fundamentally different, that the nation's cyberspies and military hackers should not be competing to use the same networks and that the job of leading both organizations is too big for one person.

Obama was on the verge of ending the "dual-hat" leadership in late 2013, but was persuaded to hold off when senior officials, including then-NSA Director Keith B. Alexander, argued against it on the grounds

that the two organizations needed one leader to ensure that NSA did not withhold resources from CyberCom.

Three years later, Defense Secretary Ashton B. Carter and Director of National Intelligence James R. Clapper are pressing for the split, with Carter seeking to build Cyber Command into a full- fledged fighting force that has its own network accesses to conduct attacks. Clapper, officials said, supports the idea in part to reduce tension over which force gets to use the networks -- the spooks or the warfighters.

And with the White House apparently eager to get it done before Obama's term ends, some officials said that the decision appears all but certain.

Carter and Clapper also favor having a civilian in charge of the NSA, as at CIA. That would be a break from tradition. Since its inception in 1952, the NSA has been led by a military officer.

The proposed decision reflects a growing debate over how to organize military cyberoperations as they mature and diverge from the intelligence realm that birthed them.

Adm. Michael S. Rogers, currently the head of the NSA and CyberCom, last week told an audience at the Intelligence & National Security Summit that "I believe in the long run the right thing is to keep these two [organizations] aligned, but to separate them."

But on Tuesday, Rogers clarified his remarks to suggest now was not the time.

At a hearing of the Senate Armed Services Committee, the chairman, Sen. John McCain (R-Ariz), noted Rogers earlier this year supported retaining the "dual-hat" relationship. "Is it still your professional advice" that such an arrangement is in CyberCom's best interests? McCain asked. "Yes," Rogers replied.

McCain also issued a warning to the administration. If it separated the two organizations, McCain said he would oppose any nominee put forward to head the NSA if that person is not also picked to lead Cyber Command.

Cyber Command, established in 2009 inside NSA headquarters at Fort Meade, Md., has long depended on the spy agency's capabilities. NSA and Cyber Command personnel sit side-by-side and use the same networks that were built by the agency.

But following revelations of NSA surveillance programs by former contractor Edward Snowden, a presidential commission recommended that NSA and Cyber Command be separated, arguing that the intelligence-gathering and combat functions have distinct targets and purposes. The spies want to steal information without getting caught. The fighters want to disrupt systems and don't mind if the enemy knows who did it.

Carter has brought Cyber Command into the fight against the Islamic State and wants it to act openly, like other military commands, rather than as the annex of a highly secretive spy agency. He also wants Cyber Command to control the resources it needs.

"Whether or not it's true, the perception with Secretary Carter and [top aides] has become that the intelligence agency has been winning out at the expense of [cyber] war efforts," said one senior military official, who like other officials interviewed for this article spoke on condition of anonymity because he was not authorized to discuss the issue publicly.

The Office of the Director of National Intelligence and the Pentagon declined comment.

"We are constantly reviewing if we have the appropriate organizational structures in place to counter evolving threats, in cyberspace or elsewhere," one senior administration official said. "While we have no changes to this structure to announce, the relationship between NSA and Cyber Command is critical to safeguarding our nation's security."

Some former officials believe that Cyber Command can never be fully independent of the NSA and that it makes no sense to cleave one from the other.

"When you have two organizations whose missions overlap or touch, unless you have some way to control both of them, then they will instantly go to war with each other," one former senior intelligence official said.

"Cyber Command's mission, their primary focus, is to degrade or destroy," the former official said. "NSA's is exploit [to gather intelligence] only. So without having one person as the leader for both, the bureaucratic walls will go up and you'll find NSA not cooperating with Cyber Command to give them the information they'll need to be successful."

On Capitol Hill, the Senate Intelligence Committee has put language in its 2017 intelligence authorization bill that bars the NSA director from serving at the same time as the Cyber Command head. The Senate Armed Services Committee, however, is reluctant to see a split until the defense secretary and chairman of the Joint Chiefs of Staff certify to Congress that such an arrangement will not "pose risks" to the military effectiveness of Cyber Command.

There is a uniform agreement, however, that if joint leadership is ended the two organizations must still work closely with one another. They would need to ensure that operations don't interfere with each other's and that the NSA must continue to supply CyberCom with intelligence.

Military officials said that Cyber Command could develop its own network nodes or "accesses" to carry out missions independent of the NSA, although some are skeptical that it can be done without spending substantial sums to duplicate NSA's infrastructure.

"The country can't afford it," the former intelligence official said. "NSA's a trillion-dollar investment."

Others disagreed. "It's not like you have to rebuild all of NSA in order for Cyber Command to be independent," a second administration official said.

If the separation goes forward, a key challenge will be funding for Cyber Command to develop the capabilities it needs. The command is still building up its force structure, aiming for 6,200 personnel by October 2018.

Motherboard (Vice)
Hacker Guccifer 2.0 Gives Rambling Speech at Cybersecurity Conference
Tuesday, 13 September 2016
Byline: Lorenzo Franceschi-Bicchierai

New York - The hacker who claimed to be behind the breach on the Democratic National Committee, who goes by the name Guccifer 2.0, was slated to talk via livestream at a London cybersecurity conference on Tuesday.
But, perhaps unsurprisingly, Guccifer 2.0, whom experts believe is just a front for Russian government hackers, was a no show. Instead, someone else read out loud a rambling statement purportedly sent by the hacker.

In the long statement, Guccifer 2.0 talks about who's really to blame for data breaches (spoiler alert: definitely not hackers like him), accuses Twitter of censoring his "twits," and blames government contractors as the real culprits because they make buggy software.

"As a result they pose a threat to the critical infrastructure elements and the national security as a whole. Total computerization along with inadequate software development may cause a lot of troubles," Guccifer 2.0 said, according to a transcript obtained by Motherboard. "That's why it's better to use paper sometimes. We should start now to prevent electronic apocalypse and rise of the machines in the future. Or else it would be too late."

Guccifer 2.0 also released around 600 megabytes of data, allegedly stolen from NGP VAN, a company that provides services to the DNC. The hacker claimed in an interview with Motherboard earlier this summer that he broke into the DNC by finding a flaw in NGP VAN. NGP VAN did not respond to a request for comment, but there's no evidence that a flaw in the company's software was the way in for the hacker. ThreatConnect, a security firm that's followed the DNC breach since the beginning, said that Guccifer 2.0's claims regarding NGP VAN don't make any sense.

It's unclear why Guccifer 2.0 didn't connect via livestream as it was advertised. The conference organizers did not respond to a request for comment. Guccifer 2.0 also did not respond to a Twitter message.

Here's the full transcript of Guccifer 2.0's rambling message, read out loud during the conference.

Hello everyone This is Guccifer 2.0.

I'm sure you know me because my name is in the conference program list. As I see it, this is the place to discuss cyber security and cyber threats. And may be to propose some solutions. Let's figure out who poses the real threat to begin with.

Cyber security firms are quick to blame hackers for their activity. Yeah, they cause a lot of troubles for business and politics. But, who poses a real cyber threat? what do you think? Is it Guccifer? Or Snowden? Or Assange? Or Lazar? No. It seems obvious. It's plain as day you would say. But still my answer is no. Large IT companies pose a real cyber threat nowadays.

You may perfectly know some of them or may not. But their responsibility for the future of our world is growing from day to day. And I will explain to you why.

So. What's wrong with large IT companies? First. On their way to a global progress and big money they are collecting users' personal data, which is the same as spying on people, because many of us don't even realise they track us online and collect our info. Companies store these data making it vulnerable for leaks.

Second. They create conditions that make people store their info in cloud services. It seems convenient but it's extremely vulnerable because it's thousand times easier to steal the data from the cloud than from a personal cell phone for instance.

The next reason, and the crucial one, is software vulnerability. Tech companies hurry to finish the work and earn money. So they break development cycle very often omitting the stage of testing. As a result, clients have raw products installed on their systems and networks with a great number of bugs and holes.

Fourth. It's well known that all large companies look forward to receiving governmental contracts. They develop governmental websites, communication systems, electronic voting systems, and so on and have their products installed to critical infrastructure objects on the national level. They are aggressively lobbying their interests. You can see it at the diagram that they spent millions of dollars for lobbying. That doesn't mean they will produce better software. That means they will get even more money in return.

Fifth. This is censorship. For example Twitter censors unwelcome users. I can judge it by myself here. You can see how Guccifer 2 hashtag unnaturally abruptly stops trending. It seems impossible that all Twitter users just stop twitting about Guccifer 2 leaks, in a moment. That's why people started Guccifer

3, 4, 5 hashtags to avoid censorship. People also told me their twits [sic] were not shown in the Twitter live wall unlike to their account's wall.

So, the cyber aggressiveness is progressing nowadays. The number of cyber attacks is steadily growing. What's the reason? What's wrong with the cyber defense? Well. they take wrong measures. They search for cyber criminals, sentence them. But two more hackers appear instead of one convicted.

The real problem is inside. This is just the same as in offline world. This is not enough to prosecute criminals. It requires preventive measures, to fight criminality by elimination of the possibility of crime.

So, what's the right question we should ask about cyber crime? Who hacked a system? Wrong. The right question is: who made it possible that a system was hacked? In this regard, what question should you ask me? How I hacked the DNC??? Now you know this is a wrong question. Who made it possible, that I hacked into the DNC. This is the question.

And I suppose, you already know the answer. This is NGP VAN Company that operates the DNC network. And this is its CEO Stu Trevelyan who is really responsible for the breach. Their software is full of holes. And you knew about it even before I came on stage. You may remember Josh Uretsky, the national data director for Sander's presidential campaign. He was fired in December, 2015 after improperly accessing proprietary data in the DNC system.

As it was agreed, he was intentionally searching for voter information belonging to other campaigns. However, he is not to blame. The real reason voter information became available for non- authorized users was NGP VAN's raw software which had holes and errors in the code.

And this is the same reason I managed to get access to the DNC network. Vulnerabilities in the NGP VAN software installed on its server which they have plenty of. Shit! Yeah? This scheme shows how NGP VAN is incorporated in the DNC infrastructure.

It's for detailed examination, if you are interested. And here are a couple of NGP VAN's documents from their network. If you r [sic] interested in their internal documents. You can have them via the link on the screen. The password is usual. It's also on the screen. You may also ask the conference producers for them later.

So, as you see there's no need to breach into separate users accounts or separate systems. You just need to hack their tech company. This is the feature. Big IT companies lead us to a disaster. In their pursuit for money they release raw software, so their clients are highly vulnerable. It became usual to blame everything on hackers while IT companies just pretend they are working hard to patch bugs and to plug holes. And they even ask for more and more money to correct their own mistakes. As a result they pose a threat to the critical infrastructure elements and the national security as a whole. Total computerization along with inadequate software development may cause a lot of troubles. That's why it's better to use paper sometimes.

We should start now to prevent electronic apocalypse and rise of the machines in the future. Or else it would be too late. As the financial corporations are ruling the world now so the IT companies will rule it in the near future. What should we do? You would tell me I could report a bug to the company as it's commonly done. What do you think they would answer me? Thanks? Or this is not crucial? Or maybe they would even give me some money. Yeah But what could it change? Nothing. Yeah. Really. Nothing at all.

We need to shake the situation, to make our voices sound. Yeah, I know if they find me I'm doomed to live like Assange, Snowden, Manning or Lazar. In exile or in prison. But it's worth it for they are the heroes, heroes of new era.

Thanks for ur attention. See you online!

Geek Wire
Edward Snowden's former boss speaks out: 'I would have hired him again' -- but not now
Wednesday, 14 September 2016
Byline: Alan Boyle

Seattle - The cybersecurity expert who hired Edward Snowden for his last job is laying out his lessons learned - but admits it would have been hard to stop the man who spilled some of the National Security Agency's most closely held secrets.
"Knowing what I knew at the time, I would have hired him again," Steven Bay, a former cyberintelligence analyst for Booz Allen Hamilton, said today in Seattle at the IEEE Computer Society's "Rock Stars of Cybersecurity" conference.

"Knowing what I know now, obviously, I wouldn't," he added.

Bay said today's talk marked the first time he discussed his side of the Snowden story in a public forum.

After the story broke, Bay lost his NSA access and had to switch to a different position at Booz Allen Hamilton, which was Snowden's employer for those crucial few months in the spring of 2013. Bay said he couldn't talk openly about the case until he left Booz Allen this June. Now he's the chief information security officer for NuVasive, a medical devices company in San Diego.

'Nerded out' at job interview

Snowden's timeline is well-known by now: After years of working at the CIA, and as a Dell contractor for the NSA, he applied for another NSA contract job in Hawaii with Booz Allen. Bay said he and his office's technical director interviewed Snowden at a Wendy's restaurant near the agency's facilities in Kunia.

"He was a highly technical person," Bay recalled. "He was very passionate about internet anonymization, as he's come out and talked about. He claimed to have run two Tor nodes out of his home ... and he also claimed to have known a zero day vulnerability within Tor."

Snowden knew his stuff so thoroughly that Bay said the technical director took over the interview and "basically nerded out for an hour."

Snowden got the job, and started working as an intelligence analyst at the NSA's facility in Hawaii at the beginning of April in 2013.

Bay said two red flags came up in the weeks that followed. First, Snowden began asking about a highly classified mass-surveillance program that's now known to the public as PRISM. Bay had access to the PRISM data, but Snowden didn't.

Bay didn't give Snowden access to PRISM, but he did provide him with some data that in retrospect he shouldn't have. "I shared a little bit too much information," Bay acknowledged today. He said that's what caused him to lose NSA access after the Snowden story broke.

A case of epilepsy?

The second red flag popped up when Snowden started coming in late to work, only a few weeks after starting the job. When Bay asked about it, Snowden told him he was suffering from epilepsy.

In response, Bay played the role of a supportive manager. Then, in mid-May, Snowden told him the epilepsy was getting worse and that he'd have to go in for tests on the following Monday and Tuesday. If the results weren't good, he might have to be out even longer.

Bay said he suggested that Snowden apply for short-term disability, but Snowden told him he didn't want to bother with the paperwork. "Which made no sense to me ... but to each his own. If he wanted to take leave without pay, take leave without pay," Bay said.

In reality, Snowden wasn't suffering from epilepsy. Unbeknownst to Bay, Snowden took off for Hong Kong on that Monday, May 20, carrying gigabytes' worth of NSA data with him.

Bay said he received an email from Snowden the next day, telling him the test results were bad and that he'd have to take more time off work. In a reply email, Bay reminded Snowden to check in with human resources about filing for disability.

"Wednesday night, the next night, he emails me back, and says, 'OK, sounds good, I'll get in touch with HR.' And that was the last I ever heard from him," Bay said.

Bay tried to check in with Snowden several times afterward, to no avail. At the end of the month, Bay called his boss in Georgia, asking what to do about Snowden's time sheet. In response, the supervisor alerted NSA's security team to Snowden's medical leave and his missing status.

"Thank goodness he did this," Bay said. "It really protected us at Booz Allen, and myself as well."

'I was worried that he was dead'

That was on a Friday. The following Monday, NSA officials told Bay they were on the case. All that week, he and NSA agents went searching for Snowden.

"In my mind, I was worried that he was dead," Bay said. "I was worried that he had an epileptic seizure of some sort, or a blackout while driving on the island, and he drove off a cliff and killed himself. That's what I was concerned about. The thought that Ed could be doing any of this didn't even cross my mind."

Bay said The Guardian published its first story based on NSA leaks on the Thursday of that week in June. "It was the talk of the agency," he said. A couple of days later, one of his best friends at work wondered out loud whether Snowden might be involved.

"I thought, 'No way! There's not a chance that Ed would do that.' And I made the comment that that would be my worst nightmare," Bay said.

The next day - Sunday, June 9 - Bay turned off his phone for a church meeting. When he turned it back on, he faced a torrent of texts. The first text was from his friend, reading: "Sorry, man, it looks like your worst nightmare came true."

'Are people going to die over this?'

That's how Bay found out Snowden was the leaker. Three years afterward, Bay still gets emotional when he remembers the moment.

"I found an empty room at the church, and I broke down," Bay said. "Every negative thought one could have, I had. There were thoughts of 'I'm going to lose my job, I'm going to be blamed, I'm going to get fired, I'm going to go to jail, I'm going to be the scapegoat.' And I started thinking about what this is going to do to NSA, what about all of our undercover agents, what if that sort of information gets out? Are people going to die over this?"

Bay spent most of the rest of the day in meetings with executives at Booz Allen and agents from the FBI. "Surprisingly, the FBI was totally cool," he recalled. "I was expecting to be in a dark room with a hot light on me. ... It was nice to hear, despite all these negative emotions that I felt earlier in the day, that nobody blamed us."

The days after that were devoted to damage control. Eventually, it came out that Snowden had been planning his moves for several years. The fact that he was skilled in information technology and gained access to classified information made him the ultimate "insider threat," Bay said.

"I was visiting with the director of NSA Hawaii, and he made the comment that, well, Booz Allen got caught holding the hot potato when the attack went out. That's pretty accurate," he said.

"It turns out, as [Snowden] admitted a few weeks later, he targeted our contract directly," Bay said. "Somehow he figured out that our contract, and what we did on that contract, were the types of gates he needed to get access to."

American hero or Russian agent?

Today, Snowden is seen as a hero by millions of people opposed to government intrusions and invasions of privacy. An Oliver Stone movie opening this week, titled "Snowden," casts the whistleblower in a sympathetic light. But as you can imagine, Bay is not a fan.

The fact that Snowden has been given asylum by the Russian government, under the leadership of President Vladimir Putin, leads Bay to say that Snowden is probably colluding with that country's security services.

"I do believe that Ed has given up the goods to Putin," Bay said.

Snowden strongly denies making any such deal with Russian intelligence, or handing over any secrets to the Russians. "Everything I had is in the hands of journalists," Snowden told the BBC last year.

La Tribune (France)
La France a été la cible d'une vingtaine de cyberattaques majeures en 2015
Wednesday, 14 September 2016
Byline: Michel Chabriol

Paris - Le directeur général de l'ANSSI Guillaume Poupard a indiqué que la vingtaine d'attaques informatiques majeures lancées en 2015 contre la France a principalement concerné des entreprises. Soit clairement de l'espionnage économique.
Cela fait évidemment froid dans le dos même si, in fine, ce n'est guère surprenant. "Il faut savoir que la France a connu, en 2015, une vingtaine d'attaques majeures informatiques", a révélé le directeur général de l'Agence nationale de la sécurité des systèmes d'information (ANSSI), Guillaume Poupard, dans le cadre du premier rapport d'activité de l'Agence publié mardi depuis sa création en 2009. Interrogé sur les révélations du "Monde" sur un piratage américain de l'Elysée en 2012, il a répondu lundi lors d'un point presse portant sur le bilan de l'activité de l'ANSSI en 2015, qu'il ne confirmait pas ces informations.

Dans un contexte croissant d'attaques informatiques, le secrétaire général de la défense et la sécurité nationale (SGDSN), Louis Gautier, auquel l'ANSSI est rattachée, a pour sa part assuré lundi que "les mois qui viennent vont être marqués par la continuité des nos actions". Notamment dans le domaine de la prévention. "On n'est pas sur un effet de mode", a d'ailleurs expliqué le patron de l'ANSSI, qui a rappelé que dans ce domaine la France n'avait "pas d'amis mais des alliés".

Espionnage économique

Guillaume Poupard a souligné "un état des lieux particulièrement inquiétant" en matière d'attaques informatiques "plus fortes et mieux organisées". Mais il est resté très discret sur les attaques de grande ampleur lancées contre la France - sabotage ou prise de contrôle du système d'information à des fins d'espionnage -, à l'exception de celle subie en avril 2015 par TV5 Monde.

Cette cyberattaque spectaculaire et médiatique est l'oeuvre de Daech, qui aurait été aidé par des mercenaires informatiques, a soupçonné Guillaume Poupard. Elle a ainsi offert à l'Agence, gardienne de la sécurité des systèmes informatiques de l'Etat et des opérateurs d'importance vitale (OIV), une vitrine de son savoir-faire. "Le cas de TV5 Monde a permis de mettre en avant la menace réelle", a-t-il souligné.

Sinon, pour les autres attaques, c'est le black-out complet ou presque "pour des raisons de sécurité", a expliqué Guillaume Poupard. Le patron de l'ANSSI a simplement indiqué que ces attaques, difficilement attribuables, avaient principalement concerné des entreprises en 2015. Donc très clairement de l'espionnage économique notamment lors d'appel d'offres internationaux. "Reconstruire les réseaux informatiques attaqués est extrêmement compliqué et long à réaliser, a en outre fait remarquer Guillaume Poupard. Cela peut durer entre six mois et deux ans".

4.000 signalements reçus

En 2015, l'activité de l'ANSSI en réponse à des incidents signalés a connu une croissance importante. Ainsi, 4.000 signalements ont été reçus, soit 50 % de plus qu'en 2014. "Cette augmentation est notamment due au développement, par des prestataires privés, de services de détection des attaques au profit des entreprises", souligne l'ANSSI dans son rapport. Un grand nombre de ces signalements (61% concernent des défigurations de sites internet) se sont avérés être des incidents de sécurité et ont été traité par le le centre opérationnel de la sécurité des systèmes d'information (COSSI) de l'ANSSI.

Ce travail d'enquête a permis à l'Agence de constater l'émergence de nouvelles attaques, dont les "rançongiciels", des logiciels malveillants chiffrant les données d'un ordinateur, qui sont alors prises en otage le temps de payer une rançon. L'an dernier, plusieurs opérations de recherche de codes malveillants ont permis d'en identifier 2.300. L'ANSSI, qui est également chargée de superviser les systèmes d'information de l'Etat et des OIV, a publié 568 avis des correctifs de sécurité, et surtout quinze alertes sur des vulnérabilités critiques. L'Agence a notamment conseillé des OIV, tels ERDF, Areva ou Engie (ex-GDF Suez).

Montée en puissance de l'ANSSI

Ces dernières années avec la lutte contre les attaques informatiques devenue une priorité, l'ANSSI a connu une importante croissance de ses effectifs, passant de 120 agents en 2009 à près de 460 à la fin de l'année 2015. "On approche aujourd'hui les 500 salariés", a souligné Guillaume Poupard. L'an dernier, 108 salariés ont ainsi rejoint l'agence, qui toutefois subit un turn-over important de ces effectifs. "L'effectif cible est de 600 personnes à l'horizon de 2018", a rappelé Louis Gautier.

« Avec la montée de la dimension numérique dans tous les aspects de l'économie et de la société, la place et les missions de l'ANSSI sont nécessairement vouées à s'accroître, souligne Guillaume Poupard. L'agence va donc continuer à renforcer ses moyens, son expertise et ses relations avec les différents acteurs". »

En 2015, l'ANSSI a dépensé pour ses projets 36,9 millions en crédit de paiement. Elle a notamment travaillé à l'acquisition et à la maintenance d'équipements informatiques et de réseaux locaux pour son propre usage. Elle a également oeuvré à la conception, à la réalisation, au déploiement, à la maintenance et à la gestion de dispositifs de communication électroniques sécurisés. Enfin, 2015, l'ANSSI a ouvert un chantier sur les objets connectés, sources d'innovation mais aussi de nouvelles menaces.

Darkrace Un système immunitaire contre les cybermenaces
Friday, 16 September 2016
Byline: Karim Benessaieh

Ottawa - Chaque jour au Canada, 1600 attaques de rançongiciels auraient lieu. Mots de passe et dossiers confidentiels volés font régulièrement l'actualité, stimulant la recherche de nouvelles approches pour assurer la sécurité des réseaux. L'une d'elles, conçue à l'Université de Cambridge et imitant le système immunitaire humain à partir des mathématiques probabilistes, semble prometteuse. Elle est proposée depuis 2013 par l'entreprise britannique Darktrace, qui a ouvert en avril dernier son bureau canadien, dirigé par l'ex-agent des services secrets David Masson. Entrevue.
Q D'abord, pourriez-vous vous présenter ?

R J'ai été membre du service de renseignement britannique, le MI5, pendant plus de 20 ans, puis j'ai travaillé au sein du Service canadien du renseignement de sécurité (SCRS) pendant quatre ans. Je m'occupais de cybersécurité et de sécurité nationale en général. Je me suis ensuite joint à la compagnie Darktrace en janvier de cette année, après une invitation à établir un bureau ici, au Canada.

Q Expliquez-nous l'approche de type « système immunitaire » au coeur de la technologie proposée par Darktrace.

R J'aimerais utiliser une métaphore. On a pris le modèle du système immunitaire humain. La première protection, c'est ma peau. Pour un réseau, c'est le pare-feu. Mais ce n'est pas assez, j'ai besoin d'un système immunitaire à l'intérieur qui a une compréhension innée de mon corps. Au moment où quelque chose traverse la peau, mon système immunitaire sait immédiatement que ce virus ou cette bactérie ne fait pas partie de moi.

Q Comment votre « système immunitaire pour entreprises » reconnaît-il les anomalies ?

R Il n'a pas besoin d'une formation, n'a pas besoin de recevoir des indications, il est sans cesse à l'écoute. Il comprend le comportement normal des utilisateurs et peut repérer ce qui ne fait pas partie du fonctionnement habituel du réseau. Il apprend par lui-même, sans intervention humaine. C'est nécessaire parce que les réseaux ne sont pas statiques, ils se développent sans cesse, ont des visiteurs, de nouveaux membres. Un humain ne pourrait pas gérer toute cette information. Un ordinateur, lui, le peut.

Q Le concept est séduisant. Mais est-ce que ça fonctionne ? Est-ce plus efficace que les antivirus et les protections informatiques classiques ?

R On a toujours besoin des pare-feu et des antivirus. Notre technologie est supplémentaire. Ça marche, absolument : on a trouvé des menaces que les autres méthodes n'avaient pas détectées. La technologie actuelle est basée sur les signatures et les règles. Une signature signifie que quelque chose de mauvais

est déjà passé. C'est de la vieille nouvelle, en quelque sorte. Ça ne vous protégera pas contre les menaces qui n'ont pas encore frappé.

Q Les fameuses vulnérabilités « Zero day », pour lesquelles il n'existe pas encore de protection...

R Oui, les « Zero day », ou une menace qui a déjà traversé le pare-feu, qui existe à l'intérieur du réseau. Un employé qui a cliqué sur un lien sans savoir ce qu'il a fait et a téléchargé un virus, ou un employé qui a décidé de faire des dommages à l'organisation...

Q Êtes-vous la seule entreprise à utiliser cette approche du système immunitaire ?

R Il y en a d'autres, mais nous sommes la seule qui utilise l'apprentissage automatique non supervisé, avec une approche mathématique appelée « estimation récursive bayésienne » [qui évalue les probabilités d'un événement].

Q Quelles sont les cybermenaces les plus dangereuses en 2016 ? Quel est l'état des lieux ?

R Il y en a deux types. Les rançongiciels sont un grand problème partout dans le monde, ils peuvent frapper partout, les statistiques indiquent que le phénomène va aller en s'aggravant. Parce que c'est facile à effectuer pour les pirates : ils entrent, brisent tout et prennent l'argent.

Q Et le deuxième type ?

R L'autre danger, ce sont les menaces intérieures. Un employé qui décide de faire des dommages, qui fait des erreurs... Toutes les entreprises peuvent être touchées. Si 99 % des employés ne représentent aucune menace, le 1 % qui reste peut causer beaucoup de problèmes.

National Post
Dutch police to get Canadian BlackBerry data
Friday, 16 September 2016
Byline: Joseph Brean

Ottawa - After a police raid on a Toronto technology company, Canada has agreed to share a massive stash of encrypted BlackBerry Ltd. messages with Dutch police investigating an underworld conspiracy involving robberies, drug trafficking, attempted murder and assassinations.
But rather than simply hand over the messages, from 20,000 different users, an Ontario judge this week

imposed restrictions designed to prevent a "fishing expedition" by police in the Netherlands or any other country. The ruling ensures the data will remain under Canadian control, and not be shared further without a court's approval.

The fear is that unfettered disclosure would expose innocent people to the unjustified attention of police, just because they used an encrypted Black-Berry.

"Canada remains the home of this data," Judge Ian Nordheimer wrote.

The case arose from a Dutch probe of an organized crime ring, in which police seized assault rifles, machine guns, grenades, vehicles, tracking devices, and large sums of money. Unusually, they also kept discovering BlackBerrys that had been modified to send only encrypted messages, outside the normal cellphone network.

The BlackBerrys had been modified so they could not be used for phone calls or Internet access or to take pictures. Their microphones had been disabled or removed.

That service was offered by a Dutch company, Ennetcom, which sold the modified BlackBerrys for about 1,500 euros ($2,220), and had the power to remotely "wipe" them clean of data. Ennetcom bills itself as a pioneering data protection company that will "defend against all forms of cybercrime."

Dutch authorities, however, allege Ennetcom was actively facilitating organized crime by offering an almost uncrackable encryption service for gangsters, using the famously secure BlackBerry.

Further Dutch investigation revealed the devices were all using a particular IP address, a routing code for Internet traffic, which they traced to Bitflow Technologies Inc., an Internet hosting company with offices at One Yonge Street on the Toronto waterfront.

Riaz Timol, a lawyer for Bitflow, said the company's part in the case is entirely innocent. "They don't know what's on the servers. They rent space to people," he said.

The search warrant executed at Bitflow was coordinated with raids in the Netherlands on April 19. The head of Ennetcom, Danny Manupassa, 36, was held for two weeks by police

on money laundering and weapons charges. He was released with conditions that included not leaving the country.

He later wrote a letter that came before Judge Nordheimer in which he "denies any conscious involvement with anyone who used the services of his company for criminal purposes." Manupassa was also "critical of Dutch authorities for not requesting assistance and/or information from him, prior to taking the steps that they did."

The 20,000 users are said to include the Dutch criminal suspects and their associates, but also likely include many innocent users of Ennetcom's service.

Most are believed to be Dutch.

Washington Post
U.S. gives 'no free pass' to Russia, other nations on cyberespionage, Justice official warns
Friday, 16 September 2016
Byline: Ellen Nakashima

Washington - A senior Justice Department official this week issued a thinly-veiled warning to Russia that significant acts of cyberespionage will not be ignored.
That would include the Democratic National Committee hack, which would be considered an act of political cyberespionage of the sort the United States traditionally has not publicly attributed to a culpable foreign spy agency.

That set of intrusions, disclosed by the DNC in June, has been linked to the Russian government by FBI investigators, though the U.S. government has not publicly acknowledged that.

Nonetheless, said Assistant Attorney General for National Security John Carlin, if Russia or any other country thinks "there's going to be a free pass, that we can't figure out what they're doing in cyber-enabled espionage, I think the message should be clear: You're wrong. You can and will be held accountable." Carlin was speaking at a conference Wednesday at the Center for Strategic and International Studies held on the 10th anniversary of the Justice Department's National Security Division.

He added that although all nations have spy operations, that does not mean the U.S. government will not take action against cyber spies who are detected. "If you get caught spying," he said, "there are consequences."

A White House official echoed Carlin when asked if the administration would take action against Russia for the DNC hack. "Look, we know Russia is a bad actor in cyberspace, just as China has been, just as Iran has been," said Lisa O. Monaco, President Obama's adviser on counterterrorism and homeland security, who also spoke at CSIS. "Nobody should think that there is a free pass when you're conducting malicious cyber activity."

But she said she did not want to say what response the government might take until the FBI completes its investigation into the DNC hack and related incidents, including a mass disclosure by the anti-secrecy site WikiLeaks of stolen DNC emails.

Other officials at the conference made clear that a U.S. response might be under the radar. "We have a variety of tools that we as a government use to try and deter behavior on the Internet outside of norms," FBI Director James B. Comey said. "That can involve a variety of things, only some of which would be visible to the public. Just because you can't see something doesn't mean your government's not doing something to change behavior."

The administration is struggling with whether to publicly blame Russia for the DNC hack. There are political and diplomatic concerns -- and a reluctance to do something that might escalate the situation.

"There's a question of whether public attribution will further the administration's goals and national security interests," said one administration official, who spoke on condition of anonymity because of the matter's sensitivity. "That's always a part of the equation."

BBC News
Edward Snowden hits out at critical report into his activities
Friday, 16 September 2016

London - Edward Snowden has dismissed a report by the House of Representatives intelligence committee that heavily criticised his activities.
It rejected his view of himself as a whistleblower, and said he was a disgruntled employee whose actions did nothing more than help US enemies.

The report comes a day after two rights groups launched a campaign for President Obama to pardon Mr Snowden.

The White House has rejected the possibility of a presidential pardon.

The release of the report, two years in the making, also coincides with that of the film "Snowden", directed by Oliver Stone.

In a series of tweets, Mr Snowden dismissed the report's findings, writing: "Their report is so artlessly distorted that it would be amusing if it weren't such a serious act of bad faith."

Mr Snowden, the former National Security Agency (NSA) contractor, has been living in Russia since 2013, when he gained notoriety for releasing thousands of classified documents that revealed mass phone and internet surveillance put in place after the 9/11 attacks.

Releasing a summary of its 36-page investigation into the case, the House committee said Mr Snowden had fallen out with his colleagues and lied about his background while at the NSA.

It says that most of the material he leaked related to military secrets that had nothing to do with Americans' privacy but were to "protect American troops overseas and... provide vital defenses against terrorists and nation- states".

Amnesty International and the American Civil Liberties Union launched their 'Pardon Snowden' campaign on Wednesday, urging President Obama to do so before he leaves office in January 2017.

Amnesty said no-one should be prosecuted for exposing human rights violations, which, it claimed, is what "indiscriminate mass surveillance of communications" amounts to.

The ACLU acts as Snowden's legal adviser, and called him "a great American who deserves clemency for his patriotic acts".

Dhaka Tribune
CID fears failing to catch hackers
Friday, 16 September 2016
Byline: Kamrul Hasan

Dhaka - At six months into the investigation of the Bangladesh Bank cyber heist, investigators say they are continuing to focus on the beneficiaries of the crime.
They also admitted that they may not be able to trace the hackers at this point as the criminals had had enough head start to erase all traces from the mechanism.

"They can remove their traces but they cannot make the crimes clueless. We have got the names of the people who received the stolen money and keeping them under surveillance with assistance from concerned local police forces," said Criminal Investigation Department (CID) spokesperson Mirza Abdullahel Baqui.

CID took charge of the case on March 16, 41 days after the heist took place. On February 4, hackers stole more than $101 million from Bangladesh Bank's account with the Federal Reserve Bank of New York and wired it to a number of bank accounts in the Philippines and Sri Lanka.

According to the case statement, a total of 101 million dollars were illegally transferred from Bangladesh Bank fund against 35 payment instructions. Of the money, $20 million went to Sri Lanka while $81 million to the Philippines.

The central bank has received the $20 million transferred to Sri Lanka, minus transfer fees of about $70,000. All procedures for getting $18m has been completed in the Philippines, said BB sources.

Two CID teams visited the Philippines and Sri Lanka in April and another team sat on a conference with the concerned countries in Manila later.

CID said they might not get hold of the hackers as the cyber evidence had already been removed when the case was filed. They said the crime should have been given top priority and law enforcement engaged immediately.

Every second was valuable in tracking cyber crime, but the denial of the concerned authorities helped criminals erase their traces, said an investigator seeking anonymity.

Asked if they could trace the hackers or their location, Baqui said they had contacted every advanced agency in the world who had also failed to unearth the truth. Besides, CID is yet to determine the number of suspects.

Confirming that no Bangladeshi, especially any BB officials were involved in the heist, the CID spokesperson said the number of suspects was still uncertain as they were yet to interrogate the foreigners whose names came up in the investigations.

"We cannot name anyone as we do not know who to prosecute due to lack of evidence. We need evidence that we have asked the concern countries to provide."

The CID has not even confirmed any date to interrogate the persons suspected in the Philippines and Sri Lanka, he added.

He said they had asked the concerned officials to provide them some necessary documents several times after they took charge of the investigation. But no country has provided documents yet. However, he said, they were hoping that the documents would be sent soon.

"We were hoping that we would get the documents during the Asia Pacific Group meeting at Dhaka during August but our hopes faded as the meeting was moved to USA. Although the counter countries were to come to our country for attending APG, but an additional meeting was scheduled with them at the same venue," the SS added.

The CID was now planning to arrange another meeting. But could not confirm the date. According to another officials involved in the investigation said polices from around 12 countries were assisting them as the criminals were from those countries were staying there during the time.

The Society for Worldwide Interbank Financial Telecommunication (SWIFT) says it has taken steps to strengthen their security measures.

After the BB heist it sent mails to its users to follow instructions strictly. Reuters reported on May 24 that SWIFT will hold a financial services conference in Brussels where it will launch a five-point plan. On August 30, SWIFT emailed to the user members of the country asking them to update their software.

Abul Kalam Azad, the joint secretary of SWIFT User Group of Bangladesh, confirmed to the Dhaka Tribune of receiving the mail and said they had already taken all necessary measures. He said SWIFT and BB had issued instructions to create improved passwords.

He also said that with the improvement of SWIFT security measures now the system could identify changes in modus operandi, for example accessing the system at odd times from a user account before hacking would alert the users.

Gulf News
Cyber security is the key to happiness
Friday, 16 September 2016
Byline: Faisal Al Bannai

Dubai - As information technology and the internet become integral parts of our daily lives, being secure and confident are one of the essential ingredients of individual happiness.
The advance of technology has been at root a quest to improve a lot of humanity. Investment in intelligent nations and cities is essentially the pursuit of one goal; enabling access to information and tasks to be performed more quickly and efficiently in order to make people's lives easier, and by inference happier.

In the decades ahead, we are likely to see this trend expand even further, as information technology is embedded into every aspect of our daily lives, enabling us to shorten once time-consuming tasks, and be better informed about every aspect of our life from our health to our working schedule.

However, this unprecedented interconnectedness comes with risks. In the world before networked technology, simple threats could be isolated and contained. Intelligent cities, however, thrive because of their very interlinked nature; the dark side of this interconnectedness is a vulnerability. Interconnectedness leaves smart cities and the citizens who live in them vulnerable to cascading threats.

When chaos theory was being popularised at the end of the last century, the "Butterfly Effect" was often cited. The idea that a butterfly flapping its wings in Brazil might, through the complex interaction of weather systems, generate a hurricane on the other side of the world.

Smart cities, and indeed modern civilisations, equally face vulnerability as a consequence of the growing level of interconnectivity and interdependence. Monitoring and control systems may be able to understand traffic flow patterns and adjust energy distribution as required, but the same systems, if hijacked by a malicious hacker, can be used to generate chaos.

Disabling of traffic lights or the shutdown of a power station can generate a wide range of secondary effects, which can often spread far beyond the immediate impact of the initial incident.

A city can still be successful without a beach, or a metro network, or an international airport, but it is impossible for it to be successful without robust digital networks, which can be relied upon to work reliably.

The price to be paid for cyber security breaches is no longer being counted in just monetary terms or dented reputations, but in lives lost and families devastated. In many respects, cyber security is the single most critical issue facing the world today.

Technology has evolved to a point that the 'happiness' we have been able to achieve over the decades through automation and intelligence may effectively be undone if our technological environment is not protected from corruption and abuse.

Nor are threats confined to the city level. We all store, deliberately or through our browsing and consumption habits, vast amounts of personal information online. Should this environment be breached and exploited, it leaves many of US Open to everything from criminal manipulation to theft and potentially reputational damage.

As we are aware of many aspects of our life; remaining happy is harder than pursuing happiness in the first place. If we are to guarantee future happiness, we need to think about security holistically, embedding it routinely into our hardware, networks, and habits. Cyber security isn't just an addition to our everyday lives; it's a vital part of securing our current and future happiness; which is what organisations such as ours are attempting to do -- protecting the future by securing its technologies.

Los Angeles Times
Hack the vote? Not easily
Friday, 16 September 2016
Byline: Del Quentin Wilber, Brian Bennett

Washington - The recent Russian hack into the Democratic National Committee's computers and subsequent FBI warning that two states' elections databases had been victims of cyberattacks are raising fears that a foreign power might penetrate U.S. systems and try to alter the outcome of November's vote. Though possible, such an unprecedented foreign election day hacking would be hard to pull off, experts say. Here are some answers to common questions:
How realistic is the threat that hackers could break into U.S. election systems and alter vote tallies?

Not very, thanks mostly to the fact that even presidential elections are highly decentralized and often still rely on old-fashioned systems rather than cutting-edge technology.

First, there are more than 8,000 separate local jurisdictions where voters cast ballots for president, and each one is largely free to use whatever methods, technology and vendors they deem appropriate, based on varying local or state rules and guidelines. There are few federal mandates on how to conduct elections, and the mechanics of voting have been left to the states. For would-be hackers, that means there's no easy, one-stop target.

Secondly, about 75% of all votes this cycle will be cast on paper, said Pamela Smith, president of Verified Voting, which tracks election systems nationwide. And many results are still conveyed by telephone, fax or hand delivery.

Even in cases where results are tallied or transferred electronically, if someone were to try to surreptitiously alter official results, there are built-in redundancies -- such as following up an email with a phone call, fax or hand delivery. And with paper, a hand recount is always possible whenever in doubt.

Very few voting machines are directly connected to the Internet, where they might be targeted by hackers based in foreign countries, said Denise Merrill, secretary of state of Connecticut and president of the National Assn. of Secretaries of State.

For hackers to infiltrate voting machines not connected to the Internet, they would need to individually install a bug or virus, presumably by hand, and then hope that one machine spreads the virus to another, or to a computer that tabulates the results. It's possible, and experts note that most voting machines are usually left unguarded on election eve in schools, town halls and other polling places. But it's not likely, particularly on a scale that would make a difference.

"I think it is highly improbable that anything that has been suggested could happen," Merrill said. "There are thousands upon thousands of polling places, each operated independently, by nonpartisan people. It is all broken into such small units, it is just hard to imagine someone hacking into them and being able to make much of a difference in the outcome."

James B. Comey, the FBI director, reiterated that view during a security forum in Washington on Thursday, saying that the U.S. election system's antiquated nature is beneficial from a security standpoint.

"The voting system is dispersed among 50 states. It's clunky as heck," Comey said.

Didn't many jurisdictions move to computerized voting after the disputed 2000 election?

After Bush vs. Gore there was a push to modernize and computerize. In 2002, Congress established a $4-billion fund to help states upgrade their voting machines and systems. Many raced to buy and install touch-screen digital devices in the hopes they would eliminate controversy surrounding paper ballots -- remember Florida's "hanging chads"?

But as states soon discovered, digital machines can break down and are more vulnerable to hackers, software bugs and calibration errors than ones based on paper ballots. Many of the early digital machines did not keep paper backups or receipts of votes cast, making it difficult to audit results.

Over the last decade or so, states have been junking purely digital machines in favor of those that spit out paper receipts or keep a paper record of a vote.

Now most cybersecurity experts are pushing states to embrace optical scanning systems, in which voters fill out bubbles or boxes on paper, and then ballots are scanned by machines. (Remember those Scantron tests from high school?) This method has two major benefits -- paper ballots can be checked against the computerized results, and the machines tabulate votes much faster than poll workers counting by hand.

Where are hackers most likely to strike?

Battleground states. If a hacker wanted to tip the election for GOP nominee Donald Trump, he or she would not try to flip California, a strongly Democratic-leaning state, into Trump's column because such a result would immediately raise suspicions.

If hackers penetrated the machines or voting systems in swing states such as Ohio or Pennsylvania -- which deploy digital machines, for example -- to affect just a sliver of the votes, they might change the outcome in a close election.

"In a battleground state, a small nudge may have a big impact," said Dan Wallach, a Rice University computer science professor. He urged battleground states to step up measures to guard against attacks and to upgrade to optical scanners.

Couldn't someone hack into a state's election results website and alter numbers as they were being reported?

They could, and it might result in some initial confusion, but it would almost certainly be detected once local jurisdictions compared their results with the state's tally and noticed discrepancies. "That kind of hack would be caught very quickly," said Merle S. King, executive director of the Center for Election Systems at Kennesaw State University in Georgia.

But it illustrates a bigger problem of credibility. In an election in which Trump has already warned that results might be "rigged," even an unsuccessful attempt to alter tallies could open the door to conspiracy theories and fuel questions about the election's legitimacy for years to come.

Aren't some votes cast online?

A small percentage of votes cast by U.S. citizens and military service members stationed and living overseas are transmitted over the Internet and thereby more susceptible to hacking. However, Merrill said those ballots are first filled out by the voter and then emailed or sent electronically to elections officials who print and then count the ballots.

While there was once a push to permit widespread online voting, election and security officials have resisted, warning it would make hacking and manipulation far easier. In light of recent hacks, the prospects for Internet voting have greatly dimmed.

Sounds like there is nothing to worry about.

Not quite. A bigger concern is that hackers might infiltrate voter registration databases, which are frequently connected to the Internet. They could theoretically delete names, hoping to create delays or confusion on election day.

In recent months, hackers believed to be from Russia penetrated voter registration systems in Illinois and Arizona. They made off with personal data on about 200,000 people from the Illinois, forcing officials to close the registration system for 10 days, Yahoo News reported. The hacks spurred the FBI to issue a flash bulletin warning about the dangers of hacking.

"Those systems have some vulnerability because they are more connected to the Internet than voting systems," King said. "Hacking those systems and disrupting something would certainly satisfy the goal of undermining confidence in the election, but it would not alter the course of the election."

Election officials noted that even if a voter's name does not appear on the rolls, federal law requires they be offered a provisional ballot and allowed to vote. Once the voter's eligibility is confirmed, those votes must be counted. However, if a hacker managed to purge a swath of voters from the rolls, the resulting lines and chaos may discourage others from casting ballots.

"It doesn't require much imagination to ponder what could happen," Wallach said. "If you selectively disenfranchised voters that you didn't like, you could cause havoc. Yes, provisional voting allows voters to say, 'Your data is wrong. I need to vote.' But they are filling out affidavits. The system is meant to handle dozens and hundreds of voters -- not millions."

What's being done to protect against cyberattacks?

In addition to the FBI alert, Homeland Security Secretary Jeh Johnson in an Aug. 15 phone call reminded state officials that the Department of Commerce's National Institute of Standards and Technology and the U.S. Election Assistance Commission have made recommendations for securing election equipment, such as disconnecting electronic voting machines from the Internet while voting is taking place.

Election officials were also told they can call on cybersecurity experts from the Homeland Security Department's National Cybersecurity and Communications Integration Center to check voting systems for vulnerabilities.

Johnson said he was so concerned about the possibility of a hack he was examining whether to declare certain parts of the election system to be "critical infrastructure," which would free up funding and

resources to help secure ballots, according to a description of the meeting released by the Homeland Security Department.

Washington Post
Answer Russia's cyberattack
Friday, 16 September 2016

Editorial - Less than two months ago, President Obama approved a presidential policy directive spelling out how the federal government would respond to "significant cyber incidents." In the shadowy world of cyberconflict, this is often a difficult problem: how to identify the source of an attack and respond appropriately. Mr. Obama set benchmarks. He defined a significant incident as one that is likely to result in "demonstrable harm" to the national security, economy or foreign relations of the United States, or "to the public confidence, civil liberties, or public health and safety of the American people."
In recent weeks, according to private security experts and government sources, hackers associated with Russia's government have carried out high- profile intrusions intended to weaken that public confidence and disrupt the U.S. election campaign. Mr. Obama should do something about it.

The most spectacular act was the hack of the Democratic National Committee on the eve of the party's convention, in which 20,000 embarrassing internal emails were stolen and then made public through WikiLeaks. The leaked emails showed that DNC staffers leaned against Bernie Sanders; party Chairwoman Debbie Wasserman Schultz was forced to quit, and the campaign of Hillary Clinton was damaged, probably as Russia intended. This was followed by an upload this week of internal DNC data such as private phone numbers and email addresses. And in an assault that seems aimed at besmirching Ms. Clinton and sowing discord, hackers obtained and released emails from former secretary of state Colin Powell that maligned her and Republican nominee Donald Trump.

This adds up to a full-blown attempt by Russia to interfere with the U.S. election cycle and weaken public confidence. It probably won't work - we don't think Americans are so easily cowed. But it calls for a forceful response. The administration has been hesitating, in part because of fragile negotiations with Moscow over the war in Syria. The FBI probe is not complete, and some senior officials have told The Post's Ellen Nakashima they want to wait for the results.

Mr. Obama ought to put his foot down, and soon. The cyberattacks are of a piece with a larger attempt by Russian President Vladimir Putin to subvert Western democracies and the ideals of a liberal, rule-based international order. Mr. Putin's broader campaign has included incitement of war in Ukraine, seizure of Crimea, support for right-wing groups and candidates in Europe, and using a tide of war refugees from Syria to create instability.

In responding, Mr. Obama must take advantage of the strength of an open society and call out the perpetrators, telling the American people what is happening. Mr. Obama does not need to release sensitive intelligence to effectively make the point. Second, Mr. Obama should order the preparation of

economic sanctions against Russian individuals under an executive order he signed that permits sanctions against people linked to malicious cyber-acts. He must put Russia on notice that such disruptive "active measures," as the KGB once called them, will not be tolerated. If Mr. Putin thinks he can get away with generating fog and doubt, the best answer is to drag him and his dirty tricks into the sunshine.

Asharq Al-Awsat
Open Cloud Computing, Key to Smart Cities
Friday, 16 September 2016
Byline: Khaldoun Ghassan Said

Jeddah - In the past years, the world has been witnessing a huge transformation with regards to adopting innovative and creative technology solutions. By developing strategies, governments are working on enhancing citizens' lives, moving to smart cities and investing in communication and information technology and digital transformation towards applying cloud services.
Users need to be wirelessly connected to a high-speed internet that makes the process of sending data to internet, processing it via cloud and browsing results on the user's device look like an instant process.

Movement of communities to smart services requires a development of technical infrastructure that covers all services such as healthcare, education, transport, energy and financial sector. For this purpose, advanced programs should be developed to serve the mass quantity of data processed via cloud.

With the development of Application Programming Interface, any person can benefit from the enormous computing capabilities provided by network servers.

Wireless networks will connect everything together and cloud networks will be the source of techniques in the near future. Cloud services must focus on development of individuals' experiences more than enterprises; the infrastructure should be open for all developers to ensure its spread.

During the Huawei Connect Conference 2016, holding the name "Shape the Cloud", Huawei's Rotating CEO Ken Hu expected the coming ten years to witness the launch of the cloud computing second generation. Hu sees that by 2025, enterprises technology solutions will be all based on the cloud computing technology as well as more than 85% of business applications.

Huawei also formed a coalition that includes the world biggest technology companies for the purpose of insuring an integration between technology and cloud computing. The coalition includes Accenture, Linux Foundation, Intel, TianZi Biodiversity & Development Center, Siemens, General Electric, Honeywell, Hexagon and Infosys.

Near future applications will probably transform devices into a gate to pass data to the cloud via using programming interfaces that are made available for everyone. This indicates that data processing will not occur in the user's device but on specialized devices of high performance.

Yet, the bulk role of smart cities is to protect people through identifying criminals "cloudily". This happens when analyzing the data coming from cameras set up in important and critical locations, given that the systems are able to analyze the way suspicious people behave.

This technique can also brief one-hour videos in one minute to be examined by the specialized security forces.

Sputnik Deutschland
Real Secret Agents on New 'Call a Spy' Hotline Answer Your Burning Questions
Friday, 16 September 2016
Byline: Staff report

Berlin - If you ever wanted to chat to a spy, now's your chance - a group of German artists have set up the "Call a Spy" hotline.
Ariel Fischer from the art group "Peng!" told Sputnik Deutschland that they can set up the hotline anywhere with a stable internet connection.

It looks like an ordinary telephone, but is connected to the "Call a Spy" server.

The server contains a database of spy's numbers, and randomly selects one to connect the caller with. Calls are routed through a private network that masks the original source of the call.

Fischer said that despite the secrecy of intelligence work, the majority of the numbers were freely available on the internet, and come from a range of different countries.

"You can find most of the numbers on the internet, some of them are from professional organizations, and some of them became known as the result of intelligence leaks. You just have to search," Fischer explained.

"We have a lot of them, including for the Canadian Security Intelligence Service, NSA, CIA, FBI, BND (Germany's federal intelligence service), and the BfV (Germany's domestic intelligence service). There are also Italian and French intelligence services. We are also constantly searching for people who might be able to find new numbers so that we can bring 'Call a Spy' to different countries," Fischer said.

The group was motivated by a desire to show that "these agents are also people, and not characters in a Hollywood film who sit in dark rooms and control everything."

"At the end of the day, these people are given tasks by our government, they are supposed to protect us and not spy on us."

"The conversations vary from short prank calls to very serious talks about moral questions, work or the intelligence agent's personal view on a particular issue. These people usually consider themselves to be great patriots who carry out their work with conviction. Of course, they have something to say and the media today criticizes them a lot. We also have something to say but there is always the problem of how to ask the question and build a bridge so that that person will talk to you. It's not easy, but it's realistic," the artist explained.

Peng! has developed three different ways of calling a spy. The first is a phone booth, the second is a call center which provides people with training about how to best communicate with the spies, and the third is a live show in which contestants compete to see who can communicate best with their spy.

Fischer said that the reaction of the spies is particularly interesting, given their training. "Of course, these people aren't used to being called on these numbers. However, they have had special training and it is quite exciting to observe how they react, how suspicious they are, what questions they ask, how they automatically start digging for information and how they professionally avoid answering questions."

While some spies reacted positively to calls, some intelligence agencies were less enthusiastic, and Fischer suspects some agents have decided to take further action.

"There have been some different (counter) measures. It happened that our connection with the UK just stopped working. We have had some different technical problems associated with testing the connection. We can't be sure, but there were also some suspicious activities. We are always trying to find more technical solutions, but today it is working," he said.

New York Times
House Intelligence Committee Urges Obama Not to Grant Snowden Pardon
Friday, 16 September 2016
Byline: Charlie Savage

Washington - Lawmakers on the House Intelligence Committee unanimously signed a letter to President Obama on Thursday asking him not to pardon Edward J. Snowden, the former intelligence contractor who leaked troves of information about National Security Agency surveillance and data collection in 2013.
"We urge you not to pardon Edward Snowden, who perpetrated the largest and most damaging public disclosure of classified information in our nation's history," the bipartisan letter said. "If Mr. Snowden returns from Russia, where he fled in 2013, the U.S. government must hold him accountable for his actions."

The committee also said it had completed a 36-page report summarizing the results of its multiyear investigation into the leaks and their effect. The report was classified, but the panel released a three-page executive summary that portrayed Mr. Snowden as a "serial exaggerator and fabricator" who is "not a whistle- blower."

"Snowden caused tremendous damage to national security, and the vast majority of the documents he stole have nothing to do with programs impacting individual privacy interests -- they instead pertain to military, defense and intelligence programs of great interest to America's adversaries," the report said.

The release of the letter and the report coincides with the opening this week of the movie "Snowden," in which the director Oliver Stone portrays Mr. Snowden as a hero, and a new campaign by human rights groups urging Mr. Obama to pardon him before leaving office.

A pardon by the president appears to be unlikely. In late July, the administration responded to an earlier petition campaign by rejecting the idea and saying that Mr. Snowden should return to the United States to face trial.

But in effect, the intelligence committee and Mr. Snowden's supporters are using the idea of a presidential pardon to frame a public- relations duel over whether history should view him as a whistle-blower or a traitor.

Ben Wizner, an American Civil Liberties Union lawyer representing Mr. Snowden, criticized the House report. He noted that it states as a fact -- without supporting documentation -- claims such as that Mr. Snowden took 1.5 million documents from the N.S.A. It has been widely reported that the N.S.A. cannot determine what data he copied, and that it based its estimate on the number of documents to which he gained access.

Calling the 1.5 million figure "wildly inflated," Mr. Wizner said that "if they are as loose as that with other facts in their report, there is nothing here of value."

While Mr. Snowden has said he did not take any of the classified files with him to Russia, the report quotes a lawmaker on a security committee in Russia's Parliament as saying that "Snowden did share intelligence." That allegation appears to come from an NPR interview, and Mr. Wizner rejected it as "totally uncorroborated," saying the lawmaker was "not in the loop."

The report's executive summary also accused Mr. Snowden of claiming that he had left Army basic training earlier in his career because of broken legs, as The Guardian reported when Mr. Snowden first came forward, "when in fact he washed out because of shin splints." Mr. Wizner said that Mr. Snowden has actually said the problem was "stress fractures."

And the report criticizes Mr. Snowden for sometimes citing as part of his motivation for the leaks testimony in March 2013 by James R. Clapper Jr., the director of national intelligence, in which Mr. Clapper falsely said that the N.S.A. did not collect records about millions of Americans. But Mr. Snowden had already begun copying classified files many months before that congressional hearing, it noted.

In June 2013, The Guardian and The Washington Post began publishing reports that revealed highly classified N.S.A. surveillance and data collection activities, starting with the existence of the bulk phone records program. Soon after, Mr. Snowden came forward and identified himself as the source of the leaks.

At the time, he was in Hong Kong. He later tried to travel to Latin America via Moscow and Cuba, but the State Department revoked his passport, stranding him in Russia.

In the ensuing debate over surveillance, leaders of intelligence oversight committees -- particularly in the House -- were some of the most outspoken defenders of the programs he had disclosed and some of his harshest critics.

In particular, the chairman of the House panel at the time that it opened the investigation, Representative Mike Rogers, Republican of Michigan, who is no longer in Congress, repeatedly insinuated that Mr. Snowden was a spy for Russia. But executive branch officials have said that they have never found evidence that he had been working with or for anyone else.

London Times
Fears over rise of Chinese CCTV
Friday, 16 September 2016
Byline: Alexi Mostrous, Billy Kember

London - China's investment in Britain came under fresh scrutiny last night after Beijing was revealed to be the country's biggest provider of surveillance equipment.
Hikvision, a company controlled by the Chinese government, has sold more than a million closed-circuit television cameras and recorders to British clients who have installed them at sites including airports, government buildings, sports stadiums and the London Underground.

Former MI6 officers and security ministers called for greater oversight of Chinese business after an investigation revealed that no national security assessment had been made of Hikvision's British operations. Some suggest that the cameras could be hacked from Beijing.

Senior figures at GCHQ are understood to be concerned that the government lacks a policy to assess the security risk of foreign investments. Nigel Inkster, former director of operations and intelligence at MI6, said: "There are questions to be asked [on Hikvision]. It's far from evident that they have been."

The disclosure comes after Theresa May yesterday approved the £18 billion Hinkley Point nuclear power plant, which will be part-financed by China. The deal paves the way for Beijing to build its own nuclear reactor in Bradwell on Sea, Essex. The Times revealed last month that China had become the largest crude oil operator in the North Sea in what one expert described as an exercise in "soft power".

The government said yesterday that it would introduce "significant new safeguards" on future foreign investment in nuclear power and critical infrastructure. Downing Street said that it would take a "special share" in future nuclear projects, enabling it to block changes of ownership on national security grounds. However, such reforms would be unlikely to apply to state-run companies such as Hikvision, which sell technology rather than invest in assets.

Many of Hikvision's cameras can automatically recognise car numberplates, track moving vehicles or use thermal imagery to see at night. Most are capable of being connected to the internet.

"If you've got cameras that are IP [internet-link] enabled, or potentially could covertly be so enabled . . . they could potentially be used for malign purposes," Mr Inkster said. "I can think of a hypothetical case of a Chinese [dissident] making his way to a police station seeking protection of asylum. It doesn't require a Nobel prize-winning intellect to work out what the possible implications of that could be. I think there are questions to be asked. It's far from evident that they have been."

Chinese companies have been accused of installing "back doors" in products, allowing them to spy on western companies. The United States has banned Huawei, the Chinese telecoms company, from entering the market on security grounds. Huawei has denied working for the Chinese government.

Hikvision grew out of China's military surveillance wing and several high-ranking executives continue to hold positions in the Communist Party. By offering significantly lower prices than its rivals it has captured 14 per cent of the British video surveillance market in only four years, according to the analysts IHS Markit.

By the end of the year 1.27 million Hikvision cameras will be in Britain, with nearly a quarter used to monitor public sector buildings. One distributor said that Hikvision was "aware that their cameras are in use by [the British] government" although this could not be confirmed.

Sir Malcolm Rifkind, the former foreign secretary, said that the government and western allies needed to carry out a "much more comprehensive assessment as to what is the line we will not cross with regard to giving China access to our infrastructure".

Sites with Hikvision cameras include Stanstead and Glasgow airports, the boroughs of Hammersmith & Fulham and Salford, Ely and Folkestone town centres, Burnley football club, Teesport sea port in Middlesbrough, Preston bus station and Legoland in Windsor. Public bodies do not normally disclose who makes their CCTV cameras.

Spokesmen for Salford council and London Underground said that their systems were not internet enabled and were installed on a secure network. A spokeswoman for Hammersmith & Fulham council said it had no concerns about security although its CCTV network could be connected to the internet to share information with the police. Experts said that disconnecting cameras lowered the risk although they warned that networks claiming to be "closed" often connected to the web through a weak point.

The Chinese state holds a controlling 42 per cent stake in Hikvision, with the remainder divided up between smaller private shareholders in Hong Kong and China. Hikvision says that the company is run independently. Hikvision declined to comment.

Council on Foreign Relations
Shouting at Americans: A Peek Into French Signals Intelligence
Friday, 16 September 2016
Byline: Alex Grigsby

Comment: Something remarkable happened a few months ago. Bernard Barbier, the former head of signals intelligence (SIGINT) between 2006 and 2014 at France's foreign intelligence agency (DGSE), gave a speech at one of France's top engineering schools in which he reflected on his career and imparted some of his wisdom to students. He also said some things that he probably shouldn't have, like confirming that France was behind the Animal Farm advanced persistent threat, commenting on the SIGINT capabilities of European allies, and reacting to the revelation that the U.S. National Security Agency (NSA) had compromised the networks of the French presidency.
Last week, Barbier's speech surfaced on YouTube but was quickly taken down (UPDATE: A new version of the video is up here. H/T Boing Boing). However, it was up long enough for French daily Le Monde to transcribe some of the highlights. Here they are, paraphrased and translated from the original French.

1. "I got the order from Mr. Sarkozy's successor [current President Hollande] to shout at the Americans ... it was a great moment in my professional career"

Barbier recalls that he was first informed of a possible compromise at the Élysée palace in 2012, when a former colleague working IT security at the palace reached out for analysis on a piece of malware. With the help of a new metadata capability the French obtained in 2012 and Edward Snowden's revelation of the NSA's QUANTUM capability in 2013, Barbier's staff concluded that the attack on the Élysée was the work of the United States. Barbier recalls:

I received the order from Mr. Sarkozy's successor to go to shout at the Americans. It was on April 12, 2013 and it was really a great moment in my professional career. We were convinced it was them. At the end of the meeting, Keith Alexander [director of the NSA from 2005 to 2014] was not happy. While we were in the bus, he told me he was disappointed because he never thought they would have been caught. He added: "You are pretty good." As allies, we didn't spy on them. The fact that the Americans broke this rule took us by surprise.

2. "And yes, it was a Frenchman"

In 2014, Le Monde published documents from the Snowden archive revealing that Canada's SIGINT agency, the Communications Security Establishment (CSE), suspected that Paris was behind a cyber espionage campaign that began in 2009 targeting Iran's nuclear program but also targeting computers in Canada. CSE was able to attribute the campaign to the French based on some reverse engineering revealing that the malware developer used references to a French children's cartoon character, Babar the Elephant. That reference also led Kaspersky to baptise the malware Animal Farm. Barbier recalls that CSE "concluded that he [the malware author] was French. And yes, it was a Frenchman."

3. The pipe dream of united European intelligence agency and the possibility of merging French and German intelligence.

In one of the more surprising aspects of Barbier's speech, he mused about the possibility of creating a European intelligence agency but quickly dismissed the notion, noting that only a fusion of French and German intelligence agencies would be feasible.

It is impossible to build a single European intelligence agency with twenty-eight countries that don't have the same capabilities or the same culture. The best, by population size, are the Swedes. The Italians are bad. The Spanish are a bit better, but don't have the capabilities. And the Brits, with 6,500 staff at GCHQ [Government Communications Headquarters, the UK SIGINT agency] are very good, but are they European? And France has the strongest technical capabilities for intelligence collection in continental Europe.

That leaves the Germans, who are solid partners. I've worked a lot with them, sometimes transmitting our knowhow and bringing them some technical capability. German and French engineers work very well together. In contrast, a British engineer with a French engineer is complicated.

To be more effective, I told French politicians that we had to merge the BND [the German foreign intelligence agency] and the DGSE. It's the only solution. It would be a an agency with 15,000 staff. The NSA has 60,000 people, and the SIGINT section of the DGSE is 3,000 agents. But the French politicians never followed up.

Merging the BND and the DGSE would have made for some awkward conversations given that last year, news reports revealed that the BND had been spying on France.

4. Snowden is a traitor that "rather helped us"

Finally, Barbier gives his opinion on Edward Snowden, presumably in response to a question from the audience.

For me, Snowden is a traitor to his country, but he has nothing to do with Julian Assange. The Americans made Snowden, who was an external contractor, a systems administrator. Those who do that job in the DGSE are bureaucrats that have between fifteen and twenty years of seniority. The possibility of having a Snowden in France is very low. Snowden showed that espionage between allies existed and that Americans compromised hardware, such as that sold by Cisco and poses a problem for technological independence. In that sense, Snowden rather helped us. (Note: Alex Grigsby is the assistant director for the Digital and Cyberspace Policy program at the Council on Foreign Relations.)

Washington Post
House Intelligence Committee urges no pardon for Edward Snowden
Friday, 16 September 2016
Byline: Ellen Nakashima

Washington - The House Intelligence Committee on Thursday sent a bipartisan letter to President Obama urging him not to pardon Edward Snowden, asserting that the former National Security Agency contractor carried out "the largest and most damaging" leak of classified information in U.S. history. The letter emerged on the same day that the panel unanimously voted to adopt a classified report on Snowden that, according to a three-page unclassified summary, portrays him as a disgruntled employee whose leak caused "tremendous damage to national security."

Snowden, 33, gave large numbers of sensitive files to journalists in 2013, an action he said he took out of concern that government surveillance programs were operating in violation of the U.S. Constitution. He said the public had a right to be informed of the programs so it could engage in debate about the proper scope of such surveillance.

On Wednesday, a coalition of human rights groups launched a campaign to urge Obama to pardon Snowden before he leaves office. Snowden was charged in June 2013 with espionage and felony theft of government property. And the letter comes on the eve of the release of an Oliver Stone movie that portrays Snowden sympathetically.

He is living in Russia under a grant of political asylum.

The intelligence panel rejected arguments that Snowden acted out of conscience and insisted that he should be held accountable for his actions. In their letter, the lawmakers reminded Obama that he had said in a news conference in 2013, "I don't think Mr. Snowden was a patriot."

"In short," they wrote, "we agree with you. Mr. Snowden is not a patriot. He is not a whistleblower. He is a criminal."

The lawmakers faulted Snowden for leaking material rather than reporting his concerns about surveillance overreach to oversight officials, such as the committee or inspector general. They said he began his massive download two weeks after a spat with a supervisor.

The vast majority of the documents he leaked had nothing to do with programs that affected privacy and civil liberties, they said, but pertained to military and intelligence programs "of great interest to America's enemies."

They said that Snowden failed basic annual training for NSA employees on a key provision of the Foreign Intelligence Surveillance Act, which included explanations of the privacy protections related to PRISM -- another program whose details were revealed as a result of Snowden's leaks.

Ben Wizner, an American Civil Liberties Union lawyer who represents Snowden, slammed the committee's letter and report summary. "There's no there there," Wizner said.

"They've been using the same rhetoric about damage to national security for three and a half years and have produced absolutely no evidence of concrete harm," he said. "If they had any evidence that any individual had come to harm, that would have been on the front pages of the newspapers."

The first document to emerge from the leaks revealed a secret program of bulk collection of data on Americans' phone calls. That program had been launched by President George W. Bush and retained by Obama. It had been operating with the approval of a federal court that oversees classified surveillance programs. And the intelligence committees, as well as some lawmakers on other committees, had been briefed on it.

"There is no oversight body that a whistleblower can go to when a program has been comprehensively approved by all three branches of government," Wizner said. "The only avenue is to find a way to bring the public into the conversation, which [Snowden] did by releasing information to journalists."

The committee asserted that Snowden "stole 1.5 million sensitive documents." But senior intelligence officials have couched it as "probably downloaded," cautioning that they do not know for sure how many he took.

The committee's classified report is 36 pages, with 230 footnotes, but must remain secret "to avoid causing further harm to national security," the summary stated.

Washington Times
Edward Snowden characterized as 'serial exaggerator' in House intelligence committee report
Friday, 16 September 2016
Byline: Andrea Noble

Washington - A House intelligence committee report on Edward Snowden characterizes the former National Security Agency contractor not as a whistleblower but as a "serial exaggerator" whose theft of 1.5 million classified government documents has done tremendous damage to national security.
A 4-page summary of the classified report released by the House committee on Thursday says the bulk of the documents taken "have nothing to do with programs impacting individual privacy interests" but rather pertain to military, defense and intelligence programs.

"A review of the materials Snowden compromised makes clear that he handed over secrets that protect American troops overseas and secrets that provide vital defenses against terrorists and nation-states," the report states. "Some of Snowden's disclosures exacerbated and accelerated existing trends that diminished the IC's capabilities to collect against legitimate foreign intelligence targets, while others resulted in the loss of intelligence streams that had saved American lives."

The report, two years in the making, was released a day after supporters of Mr. Snowden launched a formal campaign to request that President Obama grant him a pardon and just ahead of the release of Oliver Stone's theatrical film about Mr. Snowden.

The documents leaked by Mr. Snowden in 2013 revealed the U.S. government's global surveillance capabilities, which triggered public outcry and ultimately led to reform of the programs. The 33-year-old computer technician went into hiding as the reports about the telephone record surveillance programs were published. Prosecutors later charged him with theft of government property and espionage, but Mr. Snowden has avoided prosecution by taking asylum in Russia.

While Mr. Snowden has characterized himself as a whistleblower for revealing the surveillance programs, lawmakers on Thursday referred to him a disgruntled employee who argued with his supervisors and had been reprimanded just two weeks before he began illegally downloading classified documents.

"Edward Snowden is no hero - he's a traitor who willfully betrayed his colleagues and his country. He put our servicemembers and the American people at risk after perceived slights by his superiors," said Intelligence Committee Chairman Devin Nunes. "In light of his long list of exaggerations and outright fabrications detailed in this report, no one should take him at his word."

However, Mr. Snowden's supporters, including civil and privacy rights advocates, say his actions brought about awareness of secret government activities and should be applauded, not criminalized.

In addition to its conclusions about Mr. Snowden and the documents taken, the report summary also notes concern about the NSA's ability to prevent a breach of such magnitude in the future.

The report states that the NSA and the intelligence community "have not done enough to minimize the risk of another massive unauthorized disclosure. Although it is impossible to reduce the chance of

another Snowden to zero, more work can and should be done to improve the security of the people and computer networks that keep America's most closely held secrets."

The full report, which is 36 pages long, is classified. The summary report indicates that to write the report, the committee interviewed key individuals who had reviewed interviews with Mr. Snowden's coworkers and supervisors but that they did not speak with anyone directly who could be called as a witness in the criminal case against Mr. Snowden if he is eventually brought to trial.

Sputnik (Russia)
WikiLeaks' Assange Offers to Go to Prison in Exchange for Chelsea Manning Pardon
Thursday, 15 September 2016
Byline: Staff report

Washington - On Thursday morning WikiLeaks publisher Julian Assange tweeted that if US President Barack Obama would grant clemency to imprisoned whistleblower Chelsea Manning, Assange would turn himself over to the US government for imprisonment, "despite its clear unlawfulness."
In the tweet, WikiLeaks included a letter from their lawyer addressed to US Attorney General Loretta Lynch, detailing why the "Clinton precedent" requires closing the Department of Justice (DOJ) case against the publisher. "If Obama grants Manning clemency, Assange will agree to US prison in exchange -- despite its clear unlawfulness," the proposal read, linking to a previous tweet containing the letter.

The letter, from WikiLeaks attorney Barry Pollack, explained that on November 29, 2010, the DOJ announced an investigation into potential crimes committed by Assange and WikiLeaks, and that in March of this year it was confirmed that the investigation "continues to this day."

The investigation stems from the thousands of classified Army documents provided by Manning to the website, including diplomatic cables and airstrike videos, which later became known as the Afghan War Diaries. Manning is currently serving a 35-year prison sentence at Fort Leavenworth for revealing the extent of the US military's criminal actions.

"As Mr. Assange's criminal defense counsel in the United States, I have repeatedly sought information from the Department of Justice regarding this now nearly-six-year-old investigation," Pollack writes. "Despite the fact that the Department has continually publicly confirmed through court filings and statements to the press that it is conducting an on-going criminal investigation of Mr. Assange, the Department has provided me no substantive information whatsoever about the status of the investigation."

Pollack asserts that two developments during the pendency of the investigation led him to write and ask for a public announcement that the case is closed with no criminal charges filed.

The first development points to the Attorney General's revision of the DOJ regulations with respect to obtaining evidence from and charging members of the press in January 2015. "The Department's policy is intended to provide protection to members of the news media from certain law enforcement tools, whether criminal or civil, that might unreasonably impair newsgathering," the policy revision reads. "No member of the Department shall present information to a grand jury seeking a bill of indictment, or file an information, against a member of the news media for any offense which he or she is suspected of having committed in the course of, or arising out of, newsgathering activities without first providing notice to the Director of the Office of Public Affairs and obtaining express authorization of the Attorney General," it states. Pollack argues that the investigation against Assange is clearly based on his newsgathering activities, and that WikiLeaks had published the information because they believed it was newsworthy. The lawyer argues that the extensive coverage of the published documents by third party media outlets affirms the assertion of newsworthiness. The second development indicates that the investigation should be dropped due to a lack of charges against Democratic presidential nominee Hillary Clinton. He notes that FBI Director James Comey based his recommendation of no charges for Clinton on his belief that there was no criminal intent. "In his statement, and in subsequent testimony before Congress, Director Comey made it clear his conclusion was based on the necessity of proving criminal intent. Director Comey noted that responsible prosecutors consider the context of a person's actions," Pollack wrote. "Criminal prosecution is appropriate only when a person was knowingly violating the law and was intending to aid enemies of the United States or was attempting to obstruct justice."

Pollack argues that WikiLeaks' intent was lawful, as it was not intended to aid enemies of the United States or to obstruct justice; it was simply to publish material that was, and remains to this day, of urgent public interest.

"Manning disclosed the materials because, under the circumstances, she thought it was the right thing to do," Manning's attorneys state, in an appeal brief filed in May. "She believed the public had a right to know about the toll of the wars in Iraq and Afghanistan, the loss of life, and the extent to which the government sought to hide embarrassing information of its wrongdoing." Many have long believed that Manning's disclosures contributed significantly to bringing about an official end to the war in Iraq. Assange has been residing in the Ecuadorian Embassy in London out of fear of prosecution by the US government since 2012. In February, the UN Working Group on Arbitrary Detention (WGAD), ruled that Assange's four-year stay in the embassy was considered "arbitrary detention," as he had not been allowed to leave the building without the threat of arrest.

"For six years now, his rights have been severely violated, as have the rights of his children. WikiLeaks began its publication of US diplomatic cables on November 29, 2010, a week before Sweden and the UK arbitrarily imprisoned him," Assange's legal representatives said in a statement in August.

Assange has not been formally charged with any crime. In prison, Manning has just ended a hunger strike, after the Army finally agreed to allow her to receive gender- transition surgery. Following Manning's sentencing, it was announced that she would like to transition to a woman, but the prison

initially refused gender-affirming treatment. The lack of proper care culminated in a suicide attempt, after which she is now potentially facing further charges. If charged, she could be sentenced to finish her lengthy sentence in solitary confinement, or be reclassified to maximum security. "It is unnecessarily cruel to threaten Chelsea with additional punishment while in this very vulnerable state," a petition against the charges states. "The government is trying to silence her important voice--for good. Chelsea has been systematically mistreated by the US government since she was first taken into custody in 2010, including long stretches of extreme solitary confinement even before she had ever been convicted."

The Independent (UK)
Julian Assange: WikiLeaks founder could still be extradited as Swedish court upholds detention order
Friday, 16 September 2016
Byline: Samuel Osborne

London - A Swedish appeals court has upheld a detention order for WikiLeaks founder Julian Assange. Mr Assange is wanted by prosecutors in a rape investigation stemming from his visit to Sweden in 2010.

The decision made by the Svea Court of Appeal on Friday means the arrest warrant stands for the 45-year-old Australian, who has avoided extradition to Sweden by taking shelter in the Ecuadorian Embassy in London since 2012.

Mr Assange denies the rape allegation and has challenged the detention order several times.

It is unclear whether he will make an appeal against the decision to the Supreme Court.

Upholding a lower court ruling, the appeals court said Swedish prosecutors are actively trying to move the investigation forward and set up an interrogation of Mr Assange at the embassy.

Acting on behalf of Swedish investigators, an Ecuadorian prosecutor is set to question Mr Assange on 17 October.

"This means that there is at present no reason to set aside the detention order. Julian Assange's claim to that effect shall therefore be refused," the court said.

New York Times
Concern Over Hacked Emails Becomes a Fear of Being Next
Friday, 16 September 2016
Byline: Nicholas D. Shear, Nicholas Fandos

Washington - A panicked network anchor went home and deleted his entire personal Gmail account. A Democratic senator began rethinking the virtues of a flip phone. And a former national security official gave silent thanks that he is now living on the West Coast.
The digital queasiness has settled heavily on the nation's capital and its secretive political combatants this week as yet another victim, former Secretary of State Colin L. Powell, fell prey to the embarrassment of seeing his personal musings distributed on the internet and highlighted in news reports.

"There but for the grace of God go all of us," said Tommy Vietor, a former National Security Council spokesman for President Obama who now works in San Francisco. He said thinking about his own email exchanges in Washington made him cringe, even now.

"Sometimes we're snarky, sometimes we are rude," Mr. Vietor said, recalling a few such moments during his time at the White House. "The volume of hacking is a moment we all have to do a little soul searching."

The Powell hack, which may have been conducted by a group with ties to the Russian government, echoed the awkwardness of previous leaks of emails from Democratic National Committee officials and the C.I.A. director, John O. Brennan. The messages exposed this week revealed that Mr. Powell considered Donald J. Trump a "national disgrace," Hillary Clinton "greedy" and former Vice President Dick Cheney an "idiot."

The latest hack could well spur a new rash of email deletions across the country as millions of people scan their sent mail for anything compromising, humiliating or career-destroying. It adds to the sense that everyone is vulnerable.

The soul searching is happening with a special urgency in Washington, where email accounts burst with strategies, delicate political proposals, gossipy whispers and banal details of girlfriends, husbands, bank accounts and shopping lists.

A television news anchor said that producers and staff members at her network had jokingly agreed at a morning news meeting to issue blanket apologies to one another if their emails were ever made public.

She said Mr. Powell's emails had revealed him, a normally stoic public official, to be just as gossipy as everyone else, and added that the gossip, not classified information, was what people feared becoming public.

On Capitol Hill, Senator Richard J. Durbin of Illinois, the chamber's No. 2 Democrat, said the news of Mr. Powell's hacked emails had him thinking that Senator Chuck Schumer's never-ending use of an old-fashioned flip phone "makes more sense than ever."

"I think more and more people are realizing that there isn't a thing you can say in an email that isn't likely to be hackable or discoverable at some later point," Mr. Durbin said, lamenting his own complacency.

Senator Lindsey Graham, Republican of South Carolina, shrugged off the news. "I haven't worried about an email being hacked since I've never sent one," Mr. Graham said. "I'm, like, ahead of my time."

But for another network anchor in Washington, who declined to be named for fear of becoming an even more prominent hacking target, the Powell disclosures led to a long night Wednesday that involved saving a few personal emails and then deleting his entire account. Everyone, he said, has sent emails they would not want released, including innocent messages that could be misinterpreted.

Washington may be behind other big cities in learning that lesson. Bankers on Wall Street have favored very brief emails since their conversations were splashed across front pages because of lawsuits filed after the financial crisis. In 2010, Goldman Sachs executives used the acronym "LDL," for "let's discuss live," when a conversation turned at all sensitive.

Hank Paulson, a former Goldman Sachs chief executive, refuses to use email. Ben S. Bernanke, a former chairman of the Federal Reserve, once set up an email account under the pseudonym Edward Quince in the hopes of greater privacy.

Similar precautions have been common in Silicon Valley since a 2009 Chinese state cyberattack on servers at Google and other tech companies. In Hollywood, a breach at Sony Pictures in 2014 spilled out gossipy secrets and persuaded film crews, actors and executives alike to adopt security measures they once considered paranoid. Studios have turned to a new class of companies with names like WatchDox that wrap screenplays with encryption, passwords and monitoring systems that can track who has access to confidential files.

"It has, without question, affected what I say in writing," said Jordan Roberts, a writer and director whose credits include the coming comedic drama "Burn Your Maps." The Sony hack gave him "a personal pause button that hopefully spares me future potential embarrassment for the sake of a quick and pithy and frequently unfounded, and almost always unnecessary, insult," he said.

Joe Quenqua, who runs the entertainment practice at the DKC public relations firm, said by email that everyone thinks twice before shooting off an email. "Might it make for some more banal email exchanges? A bit less gossipy?" he wrote. "Sure, but it's so simple: Better safe than sorry."

Richard Gelfond, the chief executive of IMAX, said: "I used to be a little more tolerant of what others say in email. That ended."

In some countries outside the United States, there has long been a more cautious approach to electronic communications. In Pakistan, politicians often agree to speak to reporters in person only after removing

phone batteries or covering the microphones with a pillow. Many in the Middle East have migrated to more secure services like Telegram or Signal.

Many Americans have learned the hard way. Aaron E. Carroll, a pediatrician and research professor at Indiana University, discovered the dangers after writing a newspaper article defending artificial sweeteners that prompted health groups to demand his university emails. The groups hoped to prove links between Dr. Carroll and companies that make sugary drinks and snacks.

"It totally devastated me," Dr. Carroll said on Thursday. "I was freaking out, not because I did anything wrong -- all of a sudden, I was panicked about what have I said that was inappropriate or that could be taken out of context."

Dr. Carroll, who said he had no connection to any food companies, engaged in a "scorched earth" policy in the weeks after his emails were handed over to the health groups. He deleted just about everything off his university email account and now clears out the account regularly.

"I'm a little more careful now. I'll just walk down the hall instead of sending a long email," he said, though he added that he still sent personal and work messages on the same account for convenience. "It has not changed my daily habits of email as much as you might think."

That was also a sentiment on Capitol Hill, where some treated the prospect of a Powell-like hack lightly.

Senator Roy Blunt of Missouri said he was already a "late adopter" when it came to email because he never thought it was secure. He said he had been careful not to rely heavily on email when he was in charge of wrangling votes for Republicans in Congress.

"I think that a lot of people are now finding out why that should have been the case for lots of other people," Mr. Blunt said.

Mr. Durbin, asked if he was worried enough to scour through his sent mail, sighed and shook his head.

"Oh, no," he said. "The Russians will have to read it."

Globe and Mail
Bahrain using Canadian software to stifle dissent: report
Wednesday, 21 September 2016
Byline: Colin Freeze

Toronto - A new report from The Citizen Lab alleges that Canadian- made software is - once again - being used by a repressive Mideast state to keep its citizens from learning about news, religion and politics. The kingdom of Bahrain this summer starting using Web-filtering software from Netsweeper Inc. as a means of keeping a lid on dissent, the report said. It added that the Sunni-dominated monarchy is going so far as to use the software to deny Bahrain's majority Shia citizens access to basic information about their religion and religious leaders.

The Citizen Lab, a group of civil-minded technological researchers at the University of Toronto's Munk School of Global Affairs, last year released similar findings about Netsweeper software being used in Yemen, where religious strife has led to ongoing civil war. It has also previously documented the Ontario company's software being used in Pakistan and Somalia.

Typically Netsweeper sells its products to large firms which purchase it to keep computer viruses out of corporate networks or curb employees' access to porn and gambling sites.

Selling such software so that it can be used across an entire country can be controversial, however, especially if it ends up being tweaked to police morality and dissent. The Citizen Lab alleges this is what has happened in Bahrain, an island-nation monarchy strategically located between two much larger regional rivals, Iran and Saudi Arabia, which are now stoking sectarian tensions across the Middle East.

Ron Deibert, the director of The Citizen Lab, said that any Canadian company that sells information-scrubbing software in this backdrop risks raising the same kinds of questions as have surfaced in other ongoing corporate controversies. These include the question of whether Ottawa should be facilitating, or blocking, the Canadian armoured-vehicle companies that sell their wares to Saudi Arabia.

"I think the government has to develop some kind of guideline," said Mr. Deibert, adding that it could be simple enough for Canadian officials to put in place an array of measures, including export restrictions. "That would require Netsweeper, and other companies like them to apply for a licence to export their technology, that would have a checklist around due diligence for human rights. But, he added, "the rub of that would be they couldn't make a sale like this."

Bahrain had used Web- scrubbing software developed by an American company before it awarded Netsweeper a $1.2-million contract earlier this year.

The Citizen Lab report, financed with the help of the U.S.-based MacArthur Foundation, says its researchers confirmed the active use of Netsweeper software in Bahrain through Internet-scanning methods that looked for the company's telltale digital fingerprints.

"We confirm that Netsweeper technology is being used by at least one key [Internet service provider] ... to filter content, including critical political speech, news websites, human-rights content, websites of oppositional political groups and Shia-related content," the report reads.

In recent months, Bahrain has faced international condemnation for stripping a leading Shia cleric of his citizenship, for shutting down the country's largest political-opposition group and for arresting the founder of the Bahrain Centre for Human Rights. Access to websites relating to these groups and people have all recently been curbed in Bahrain, according to The Citizen Lab.

Ordinary Bahrainis have also had their access blocked to "websites on the Shia sect," "Iranian media outlets" and " content critical of Islam," according to the report.

The Globe and Mail called and e-mailed members of Netsweeper's management team on Tuesday but did not hear back.

New Straits Times
Kudos over setting up of cyber court
Wednesday, 21 September 2016
Byline: Ahmad Kushairi

Kuala Lumpur - The first cyber court in Malaysia officially began operations early this month. It's about time, too, as cybercrime has been growing at an unbelievable rate with each passing year as technology continues to evolve and play an important part in the lives of many.
Today, there are more than 13.5 million Internet users in the country, which is a staggering number of people who can be potentially exposed to cybercrime.

The CyberSecurity Malaysia agency had stated that there was no comprehensive definition of cybercrime, but for now, it could be categorised into three.

The first focuses on information and communications technology (ICT) systems and virtual properties that become the target of exploitation, infringement, and identity and information theft.

The second comprises ICT devices used to commit crimes in the virtual space, such as personal computers that are used to carry out acts of stealing money, information and identities in other computers.

The final category is where ICT devices are used as a medium to commit cybercrime. Using your personal ICT devices, such as computers and tablets, for slandering, sedition or instigating at a higher scale falls into this category.

CyberSecurity Malaysia reported that it received 3,752 cases of online fraud and intrusion this year, as well as a shocking 191,096 cases of botnet and malware viruses. Some 30 Malaysians have fallen prey to cybercrime daily, with fraud and intrusion cases taking the highest spot.

With that said, the setting up of the nation's first cyber court, located in the Duta Courts complex, is timely. The cyber court deals with cybercrime, such as hacking, bank fraud, spying, web defacement, identity and information theft, online gambling and online pornography.

Things are not like what they used to be after technology came into the picture. As technology continues to evolve, so does cybercrime. Many predators seek out the virtual world every day in the hopes of carrying out online crimes, thinking that there are no laws in the virtual space and they are free to do as they like.

There is no better time than now to take action, and the setting up of the cyber court is a positive move towards protecting Malaysians from the various forms of online menace.

Our cyberspace needs to be put in order. Regulating cybercrime would force online predators and those with bad intentions to think twice before carrying out their actions, as they now risk the possibility of getting caught and punished.

It was reported recently that more than 2,100 servers had been compromised. Precious and personal information is allegedly sold on an underground cybercrime shopping website called xDedic.

Imagine your banking details, those on properties and assets, and identification and passport details being made available to just about anyone. That's enough to send one into a frenzied state, as such information may be used by greedy cybercriminals. One stands to lose everything if his or her personal data is exposed.

One of the most common cases of cybercrime in the country, as reported by CyberSecurity Malaysia, is victims being targeted via social networking sites. Scammers hide behind an attractive female profile, lure potential lonely victims into chats and slowly gain their trust. Once this is achieved, they ask the victims to commit indecent acts via video chats and, then, proceed to blackmail the victims with the threat of exposing the videos online.

This is known as cyber blackmail, and it is growing exponentially across the globe. Of course, there are also other forms of cybercrime, such as extortion, bullying and shopping scams, which need to be addressed accordingly.

The setting up of the cyber court is, therefore, a positive move to enable the authorities to use cyberlaws in dealing with the increasing number of cybercrime cases more effectively. It sends out the message to criminals that they can no longer roam cyberspace as freely as before, as the long arm of the law is out to nab them. This, over time, will help Malaysians feel more secure and safe in cyberspace.

As Malaysia joins other countries, like the United States and those in Europe, in establishing its own cyber court and the subsequent use of cyberlaws, it is sending out positive vibes that it is keeping up with its duty as a responsible government to protect its people in cyberspace.

Just like the real world, the virtual world also needs law and order. It should be a safe haven where all can work, live and play.

Jakarta Post
Indonesia sees drastic increase in cyber crime
Wednesday, 21 September 2016
Byline: Ayomi Amindoni

Jakarta - President Joko "Jokowi" Widodo said on Tuesday that Indonesia had seen a drastic increase in cyber crime, with the number of cases growing by 389 per cent in 2014 to 2015. Most of the cases occurred in the e-commerce sector, he added.
Speaking during a limited Cabinet meeting at the State Palace, Jokowi said cyber threats posed new challenges regarding the readiness of government institutions.

"To deal with cybersecurity issues, we do not need to form a new institution, or start from zero. We can expand or consolidate units at ministries or institutions that have cyber security functions," he said.

The Office of the Coordinating Political, Legal and Security Affairs Minister revealed in July that cyberattacks in Indonesia rose by 33 per cent in 2015 from the previous year, of which 54.5 per cent were aimed at e-commerce-related websites. Most of the attacks caused systems to stop working.

In the meeting, the President also told his Cabinet members to improve the management of state officials amid an era of tighter competition. He said improved management could provide more professional, responsive and faster services.

"State official management reforms should be carried out thoroughly, from upstream to downstream," he said.

It World Canada
Prepare for threat of quantum computing to encrypted data, Canadian conference told
Wednesday, 21 September 2016
Byline: Howard Solomon

The race to create new cryptographic standards before super-fast quantum computers are built that can rip apart data protected by existing encryption methods isn't going fast enough, two senior Canadian officials have warned a security conference.
"I think we are already behind," Scott Jones, deputy chief of IT security at the Communications Security Establishment (CSE), responsible for securing federal information systems, told the fourth annual international workshop on quantum-safe cryptography in Toronto on Monday.

Quantum computing - or more accurately, computers that use quantum mechanics - is not a dream, Jones and others told the conference of business executives, crypto academics, IT companies and government officials. One prediction is there's a one in seven chance that by 2026 a quantum computer will exist that can break RSA-2048 encryption. It may take longer -- or, if there's an advance, shorter.

"Quantum represents a fundamental change and challenge to encryption for all of us," Jones said, noting that encrypted transactions are the backbone of security and trust on the Internet.

His comments were backed by David Sabourin, CSE's manager of cryptographic security, who said that if the 2026 prediction is right "we're in trouble." Speaking on a panel of government experts, Sabourin noted the U.S.-based National Institute of Standards and Technology (NIST) will close its call for proposed new and more quantum-secure public key encryption algorithms next year. Then it will take a couple of years of review, which means products that can use new crypto standards might be released in 2025 - and then start to be implemented around the world. So 2026 will be "messy," he concludes, with organizations rushing to install new solutions.

(For a more detailed look at post-quantum cryptography, see this NIST report)

However, Sabourin, Jones and others said chief information and risk officers can take steps today to start to mitigate the risk. That includes evaluating all organizational data to decide what could be at the greatest risk if encryption is broken and be ready to deploy what will hopefully be quantum-resistant solutions when they are approved. One possible interim solution is using symmetric key encryption rather than public key encryption solutions, Jones said. But it's expensive and likely could only be used for the most sensitive data.

There's no need to panic, Sabourin stressed, pointing out that the challenge of quantum computing has been known for some time and that governments, the computing industry and standards organizations (like NIST) have been working on it for some time. And, he noted, the first target of people who have quantum computers will probably be sensitive government information, not not go after corporate or banking data.

CSE is the lead federal agency working on quantum-safe computing solutions for the government.

Briefly, quantum computers take the theory of quantum mechanics to change the world of traditional computation of bits represented by zeros and ones. Instead, a bit can be a zero OR a one. Again, briefly, quantum computing means information could be stored and manipulated at the sub-atomic level.

Quantum offers the potential of huge speed gains in computing that could bring both benefits to science and medicine as well as threaten IT security. The problem quantum computing raises is to data secured with today's encryption that has to last years if not decades - for example, personal medical information, data required to be held for years by regulations or a any database held by a country's intelligence services. Merely using a solution with a longer encryption key won't defeat a quantum computer, at least for public key algorithms. The problem expands as organizations store more data in the cloud, where they may have to rely on the security of a provider. But quantum computers don't exist yet, so no one is sure products based on new crypto standards could withstand attack.

A number of countries and IT companies around the world are sponsoring research into building a quantum computer, including Canada. The European Union has set aside $1 billion.

Monday's session was aimed mainly at leaders of companies and government. Sessions today and Wednesday will see more technical proposals discussed on creating standards to meet the problem.

In an interview Jones said CSOs today have ask what information they have that is at risk. "If I take the worst case scenario] a quantum system that can break encryption in 10 years], is there information I am holding that I'm responsible for protecting? Then, what steps do I need to take to protect that. It's the same quesiton around general cyber security," he added.

Some governments are already taking action. For example, the conference heard, Germany requires satellites regulated by the country to be able to be reconfigured for quantum-secure solutions.

The conference is organized by the European Telecommunications Standards Institute (ETSI) and the University of Waterloo's Institute for Quantum Computing.

"This is not a just a nuisance for technical people or mathematicians," Michele Mosca, the IQC's co-founder and deputy director told the conference "This is going to seriously compromise the security and integrity of our information assets and core business functions. The business functions you and your customers rely on won't work - and its not a matter of patching it up in a couple of days."

There are two ways of mitigating the threat, he said: Deploying conventional quantum-safe cryptography (also called quantum resistant algorithms or post-quantum cryptography), which includes hash-based and lattice-based and symmetric key cryptography solutions; and the yet-t0-be built quantum cryptography, which uses the properties of quantum mechanics to establish keys that cannot be broken.

To help risk officers Mosca's reduced the problem to a mathematical equation, where x is the shelf life of current information, y is the number of years it would take to retool the organization's existing infrastructure with large scale quantum-safe solution, and z the number of years it will take for a large scale quantum computer to be built.

If x+y is greater that z, the organization has a problem and has to act, he said.

He also added that the threat is serious enough to predict that in the next six to 24 months organizations will be differentiated by whether they have a well-articulated quantum risk management strategy.

Governments and academics aren't working alone on the problem. So are companies as big as Cisco Systems, Microsoft and Intel, who had representatives on a panel. All said one reason is they need to ensure their companies are able to deliver secure software updates in the future.

It doesn't matter how far away a quantum computer is, said Brian LaMacchia, director of Microsoft Research's security and cryptography group - it's coming. Even if a quantum computer isn't built, he added, the solutions being worked on will help strengthen IT security.

David McGrew, a fellow in Cisco's advanced security research group, said one way CIO can be ready is ensuring it's organization has an agile infrastructure ready to adopt new encryption solutions.

Encrypted messaging apps need backdoors, says top Dutch spook
Wednesday, 21 September 2016
Byline: Jennifer Baker

London - Backdoor access to encrypted communications has been demanded by Netherlands' spy chief Rob Bertholee--a view that differs from the government's official position.
In an interview with local daily De Volkskrant at the weekend, Bertholee--head of the General Intelligence and Security Service of the Netherlands (AIVD)--said that terrorists are using encrypted chat applications such as Telegram, WhatsApp, and Signal, and argued that those services made it extremely difficult for authorities to prevent terrorist attacks.

At the beginning of the year, the Dutch government adopted a strong stance against "any restriction in the development, availability, or use of cryptography" in an official paper. It said that weakening encryption products with backdoors for law enforcement would leave systems vulnerable to criminals, terrorists, and foreign intelligence services.

However, Bertholee said he wants to have access to "the communications of those who pose a threat."

"Will people who value privacy over anything else continue to pursue their goal with the same enthusiasm after they have fallen victim to a terrorist attack? You should ask yourself how much security you are prepared to sacrifice for privacy," he said.

Dutch digital rights organisation Bits of Freedom said Bertholee was creating a "false dichotomy between privacy and security." It added:

Bertholee said that protection of privacy was "very important," added he wasn't interested in a "dragnet," then took a swipe at the current government position, and referenced Apple's refusal to unlock the San Bernardino shooter's iPhone for the FBI: "In that case the Dutch government should also accept the fact that we are no longer able to access communications of terrorists--and Apple. Should helping terrorists communicate securely be one of Apple's aims?"

Last month, France's interior minister, Bernard Cazeneuve, called for EU-level "action" on encrypted messaging apps.

The Daily Beast
Cellphone Bombs: The New American Terror
Tuesday, 20 September 2016
Byline: David Axe

Washington - Ahmad Khan Rahami the 28-year-old suspect in the twin bombings in New York City and New Jersey that injured dozens of people this weekend, apparently used cellphones to detonate his homemade bombs.
That should worry authorities. It's not hard to convert a cellphone into a remote trigger for an improvised explosive device. But it is hard--and illegal in most cases--to jam cell signals without inflicting extensive collateral damage that could be even worse than the harm a small IED might cause.

"Jamming technology generally does not discriminate between desirable and undesirable communications" is how the Federal Communications Commission put it in a fact sheet (PDF). "Use of cell phone jammers poses an unacceptable risk to public safety."

Cellphones are basically just small, sophisticated radios. They convert a radio signal into an electrical current and then process that current into sound. Incorporated into a bomb, a cellphone's electrical current is enough to jolt a small detonator charge, which in turn can set off the main explosive.

Modifying a cellphone into a trigger is so easy that some DIYers rig up old phones to set off fireworks. All it takes is a phone, five bucks worth of parts, and a few minutes of tinkering--plus, for first-timers, any one of scores of easy-to-follow internet tutorials.

Working the trigger is equally simple. Just get a safe distance away from your bomb and dial the number of the phone attached to the detonator. Boom.

In theory, it's a fairly straightforward process to jam a cell signal and thus prevent a bomb from exploding. Cellular jammers-- you can illegally buy them online for a few hundred dollars--work by flooding radio channels with jibberish signals, essentially crowding out the particular signal a cellphone is looking for.

But cellular jammers--any radio jammers, really--are fairly indiscriminate. Try to jam one phone or a few phones and, in practice, you'll end up wiping out communications across a wide area, potentially causing greater insecurity than you're preventing by blocking a bomb detonation.

To be sure, cellphone jamming in a small or fixed area can be useful. Many prisons jam incoming signals. The U.S. Secret Service reportedly possesses jammers that accompany presidential motorcades.

The U.S. military equips many of its armored vehicles with radio jammers, creating an electronic bubble in which many remotely triggered bombs won't detonate. More powerful airborne military jammers can sweep away signals underneath the emitting aircraft.

But jamming cellular signals across a wider area can be highly problematic. For starters, the most modern cellular services take advantage of what's called "frequency- hopping." That is, they can rapidly move signals across different frequencies more or less to avoid overcrowding. This complicates jamming. The more a signal hops, the more frequencies you'd have to jam.

Consider this scenario. Police get a credible tip that a terrorist is planning to detonate an IED by cellphone... somewhere. The cops set up jammers across a range of frequencies all over the city, perhaps for hours. Yes, authorities might stop the bomb from exploding. But they've also jammed 9-1-1 and many of their own communications.

Medical emergencies and crimes in progress could go unanswered. Thousands of crises of a personal nature might go unresolved. Business would suffer hugely. Unable to make plans and connections, untold throngs of commuters could find themselves lost or stranded.

The military certainly appreciates this problem. Ground convoys must turn off their jammers when they enter bases, lest they shut down the whole base's communications. Airborne jammers require careful coordination with other forces, as their powerful blocking signals could wipe out friendly troops' own radios and phones and potentially scuttle delicate battle plans.

The risk of collateral damage is one reason why the federal government bans most cellular jamming. It's illegal to sell a cell-jammer in the United States, so most buyers order theirs online from overseas retailers--and usually get away with it.

The jamming-ban isn't actually new. The Communications Act of 1934 states that "no person shall willfully or maliciously interfere with or cause interference to any radio communications of any station licensed or authorized by or under [the Communications] Act or operated by the United States government" (PDF).

"Jammers cannot be marketed or operated in the United States except in the very limited context of authorized, official use by the federal government," the FCC explained in its fact sheet. In May, the FCC fined a Florida man $48,000 for operating a cell-jammer during his commute to work, apparently in order to prevent other commuters from driving while on their phones and distracted.

And in March, Chicago cops arrested a man for jamming cellular calls on his daily train ride. "He was disturbed by people talking around him," his attorney said.

Legally speaking, the Department of Homeland Security or some other federal agency could authorize cell-jamming in support of local law enforcement. Some police departments have been caught jamming signals without federal approval. Devices called "stingrays" act as decoy cellular towers. Deployed by police eavesdroppers, stingrays can intercept cellular calls for purposes of gathering evidence.

But if a stingray is sucking up cell signals, that means calls--including, for example, 9-1-1 calls--aren't reaching actual cellular networks. On that basis and others, Georgetown University professor Laura Moy filed a complaint to the FCC over the Baltimore Police Department's use of stingrays.

"In a clear violation of law, BPD has no license whatsoever to operate its [cellular-site] simulator equipment on frequency bands that are exclusively licensed to cellular phone carriers in Baltimore," Moy wrote. "BPD further violates the Communications Act by willfully interfering with the cellular network through its use of [cell-site] simulator equipment."

To be clear, local authorities can skirt the 1934 law by simply asking telecoms to briefly shut down cellular service in a particular area, as city officials in San Francisco did in 2011 as they tried to disrupt a planned protest of a police shooting.

Voluntary cellular shutdowns aren't necessarily illegal, but like jamming, they do run the risk of interfering with emergency responders, business, and travel. So while cellphones have made it easier for terrorists to set off homemade bombs, cellphone-jamming probably isn't the best tactic for stopping them.

The Local (Germany)
Foreign state 'aims hack attack' against top politicians
Tuesday, 20 September 2016
Byline: Staff report

Berlin - Several German political parties were the target of hacker attacks over the summer, with a foreign government suspected to be behind them, the Süddeutsche Zeitung reports.
Security experts employed by the federal government believe that a foreign power initiated the attacks in order to gain sensitive information that could influence next year's national election, the Süddeutsche Zeitung (SZ) reports.

The security experts suggested to the SZ that the Russian government could be behind the latest attack on Germany's political establishment.

Politicians and employees of several parties received emails on August 15th and August 24th which appeared to come from NATO headquarters. Within the email was a link which, if clicked on, would enable spying software to be downloaded onto the computer.

The attack targeted high profile politicians such as opposition leader Sahra Wagenknecht (Die Linke), as well as the youth section of Angela Merkel's Christian Democratic Union (CDU). State offices of the CDU and Die Linke (Left Party) in Saarland, where elections will be held next spring, also received the email.

The emails came from a Heinrich Krammer, allegedly an employee at NATO headquarters, and offered information about the Turkish putsch attempt in July and the earthquake which hit central Italy in August.

In 2015, the German parliament was the target of a cyber attack. Following a similar pattern, the emails sent on that occasion appeared to come from the United Nations and claimed to offer information on the situation in Ukraine.

The hackers succeeded in stealing administrative passwords and accessing the entire internal network of the Bundestag (German parliament).

Bundestag IT experts said that the extensive damage from the virus attack meant that the whole parliamentary network would have to be replaced, at a cost of millions of euros.

Security experts voiced suspicions in May that Russia was behind the attack.

Washington Free Beacon
Snowden--Ultimate Insider Threat Missed by NSA Security
Tuesday, 20 September 2016
Byline: Bill Gertz

Column - Security officials today use the politically correct term "insider threat" to describe what were once called traitors, and no one was more aggressive in pursuing them than counterintelligence types at the National Security Agency.
Thus many intelligence officials saw more than a tinge of irony in NSA contractor Edward Snowden making off with 1.5 million highly classified NSA intelligence documents in May 2013 and handing them over to several anti-American journalists who seemed more interested in inflicting as much damage as possible on America's premier electronic spying and code-breaking agency than exposing alleged wrongdoing.

Until Snowden, the NSA had a reputation as one of the intelligence organizations most dedicated to protecting secrets. But the case exposed gaping holes at the agency, and a House intelligence report says gaps persist years after Snowden fled the country and holed up in Moscow.

Sure, the super-secret agency whose name itself was once classified had its share of Cold War spies, but nothing quite like Snowden.

One of my first reporting assignments 30 years ago was to cover the espionage trial in Baltimore of NSA analyst Ronald Pelton. Prior to the proceedings, NSA had argued within the government against prosecution in favor of a plea deal. The spooks were worried about the disclosure of secrets and spying methods during the high- profile case.

At trial, NSA technicians for the first time revealed how they secretly recorded Pelton's conversations using remote electronic equipment that turned slight vibrations on a windowpane in his house into a type of microphone for eavesdropping.

Also at trial, the federal government threatened this reporter and several others with unspecified action if we reported how Pelton had revealed to Moscow a secret underwater eavesdropping program that spied on Soviet military communications in the far east Sea of Okhotsk by tapping undersea cables. The operation, known as Ivy Bells, eventually became public despite the NSA's attempts to keep it secret.

Security at the NSA's large campus, visible from the Baltimore- Washington Parkway and inside the Army's Fort Meade, Maryland base, has always been tight. Anyone at the agency who runs afoul of feared security and counterintelligence police quickly can finds themself without a security clearance and assigned to the motor pool. Others have faced what critics describe as unfair scrutiny from NSA psychiatrists whose evaluations have spelled a quick end to intelligence careers. Employment at NSA is all about security clearances. Have one, and you work; lose one or have it suspended for a security infraction, and you might as well seek employment in another field.

Snowden had enough security clearances to get him access to a trove of secrets that he then leaked. For doing so, he has been lionized by many on the political left and a few on the libertarian right as a hero who allegedly exposed illegal electronic spying against Americans. The lionization reached new heights last week with a campaign seeking a presidential pardon and release of a new film by one the left's chief

conspiracy theorists, filmmaker Oliver Stone. The film traces Snowden's background as a washout from Army Ranger school to first the CIA and then to Booz Allen, an intelligence contractor who assigned him to NSA.

Stone held a Georgetown reception last week at a French restaurant where wine and cocktails were served and a number of officials rubbed shoulders with NSA critics after an exclusive screening of the film.

Once attached to NSA, Snowden worked as a computer administrator and hacked his way through electronic flaws in NSA's secret computer and information systems to siphon off the documents. The extremely secure networks used for classified information are not accessible from outside secure areas of NSA. But as with all computers, the systems have ports and entryways for loading software that Snowden was able to exploit in pilfering some of the crown jewels of the NSA.

An earlier documentary on Snowden, Citizenfour, featured the renegade contractor in Hong Kong claiming the NSA had engaged in a massive conspiracy to spy on Americans and violate their privacy--charges that were never proven.

What was revealed in NSA documents was not the agency portrayed by Snowden--a rogue elephant trampling the privacy rights of Americans. Instead, agency documents reveal remarkable capabilities for stealing secrets, some of them highly encrypted, and turning them into valuable intelligence for use in dealing with terrorists and enemies like China, Russia, North Korea, and Iran.

Those capabilities are now at risk. The reason is that one of the first rules of effective electronic eavesdropping is that the information gathered is only good as long as the method used to gather it remains a closely guarded secret.

NSA officials are unabashed about the agency's spying prowess, unlike the politicized CIA under current Director John Brennan. Brennan invoked scorn from agency veterans in February by making the dubious assertion that "we don't steal secrets." The comment reflected the CIA's shift away from its traditional role of conducting difficult cloak-and-dagger human spying abroad. According to former officials, the CIA today has lost much of its clandestine operations capabilities, instead embracing the much easier task of targeting and killing terrorists in remote-controlled drone strikes, which has become one of the agency's primary missions.

By comparison, the NSA's spying power is formidable, as revealed in documents showing that the agency not only breaks into foreign computers to steal secrets, but breaks into the computers of foreign intelligence services and steals secrets foreign intelligence services are gathering from their own targets. NSA wags code- named the practice "I drink your milkshake," after a quote in the 2007 film There Will Be Blood about oil drillers tapping wells of nearby competitors to secretly siphon off their crude.

Republicans in Congress last week sought to dispel the myth that Snowden is some kind of hero. On Friday, no doubt timed to the release of the Stone film, the House Permanent Select Committee on Intelligence released the damning executive summary of its still-secret 36-page review of the case. Its conclusions do not paint Snowden in a favorable light, to say the least.

"First, Snowden caused tremendous damage to national security, and the vast majority of the documents he stole have nothing to do with programs impacting individual privacy interests--they instead pertain to military, defense, and intelligence programs of great interest to America's adversaries," the report said.

The damage included compromised secrets that protect American troops overseas and bolster defenses against terrorists and states. Foreign states now know how the NSA targets their information and can take steps to counter the agency.

Snowden, who has been under Russian government protection since June 2013, has shared some of the stolen documents with Moscow. According to the House report, a Russian parliamentarian stated in June that Snowden shared intelligence with the Russians.

NSA reviewed all 1.5 million documents Snowden removed and will spend "hundreds of millions of dollars and will eventually spend billions, to attempt to mitigate the damage Snowden caused," the report said.

The House report also sought to counter the notion that Snowden was a whistleblower motivated to expose NSA wrongdoing.

Contrary to Snowden's claims that he sought to alert the NSA or other officials to his concerns about domestic spying, "the Committee found no evidence that Snowden took any official effort to express concerns about U.S. intelligence activities--legal, moral, or otherwise--to any oversight officials within the U.S. government, despite numerous avenues for him to do so."

The report reveals that Snowden, in the course of stealing documents, obtained login credentials from colleagues through unspecified misleading means. He then used administrator access to search coworkers' personal drives and removed personal information from thousands of intelligence officials and contractors.

Snowden has not disclosed the details surrounding his flight from Hawaii. The House report notes, however, that he engaged in "a fiery email argument" with an NSA supervisor about how to manage computer updates in June 2012.

"Two weeks later, Snowden began his mass downloads of classified information from NSA networks," the report said, describing Snowden as a "serial exaggerator and fabricator." One action was to doctor

his performance evaluations to obtain new positions at NSA. He notified his supervisor in May 2013 that he was taking time off for epilepsy treatment when in fact he was heading to Hong Kong.

Perhaps the most worrisome aspect of the House report was its conclusion that, three years after Snowden's actions, the NSA and intelligence community remain vulnerable to further document thefts.

"More work can and should be done to improve security of the people and computer networks that keep America's most closely held secrets," the report said, adding that the NSA has not initiated post-Snowden security enhancements.

The problem for NSA and other intelligence agencies is the imposition of liberal-left political correctness policies that prevent questioning the motives of renegade employees like Snowden.

The days of independent counterintelligence units within the intelligence community were ended in the 1970s. Since then, aggressive programs for the security of people and information systems remain off limits by policies that prevent questioning loyalties. Until that changes, expect further cases of betrayal.

China Daily
Three years after his revelations, Snowden in spotlight again
Wednesday, 21 September 2016
Byline: Chen Weihua

When President Xi Jinping and US President Barack Obama were about to meet in the California desert resort of Sunnylands in June 2013, the US government had worked hard to paint China as a villain in cyberspace.
The revelation made by former National Security Agency contractor Edward Snowden just days before the shirt-sleeves meeting, however, shocked the world. It showed that whatever other countries had done in cyber-surveillance and spying was really nothing compared to the massive scale of operations by the NSA, often labeled as No Such Agency.

To the rest of the world, Snowden is undoubtedly a whistleblower and a great hero because he revealed the US government secret scheme to spy on people all over the world, including foreign leaders who are US allies.

Such spying, which violates people's privacy and civil rights, often involves willing and unwilling collaboration with several major US tech companies.

In the US, debate about whether Snowden is a hero, patriot or traitor is still a divisive issue, despite that his revelation has resulted in the US government and Congress correcting many mistakes.

For example, the panel appointed by Obama to review NSA surveillance programs made dozens of reform recommendations. A federal appeals court has found NSA's call-tracking program revealed by Snowden illegal. The USA Freedom Act passed by the US Congress ended the bulk collection of phone data by the government.

In the past week, Snowden has again been in the spotlight. The German-American movie, Snowden, directed and written by Oliver Stone and Kieran Fitzgerald, hit US theaters on Sept 16.

Meanwhile, Snowden has pleaded for a pardon from Obama, arguing that his massive leak of NSA surveillance programs was "not only morally right" but also "left citizens better off".

On Sept 14, the American Civil Liberties Union (ACLU) Executive Director Anthony Romero called Obama to pardon Snowden by launching the Pardon Snowden campaign that will last untll the end of the Obama administration.

"Thanks to Edward Snowden's act of conscience, we've made historic strides in our fight for surveillance reform and improved cybersecurity," he said.

The ACLU campaign was joined by Amnesty International, Human Rights Watch and a list of more than 100 legal scholars, former national security officials, business leaders, human rights activists and artists.

Romero believes the Espionage Act, which the US government used to charge Snowden, is a World War I era law that doesn't distinguish between selling secrets to foreign governments and giving them to journalists in the public interest.

Most of the people who believe that Snowden is a traitor and should spend the rest of his life in prison argue, as I heard in the latest C-SPAN Journal on Sept 16, that he broke an oath and put the US national security in danger.

It is true that Snowden broke trust, but it occurred in a situation where he found serious wrongdoing by the US government, which is a much more serious crime that people should care about.

Even former US attorney general Eric Holder said that "we can certainly argue about the way in which Snowden did what he did, but I think that he actually performed a public service by raising the debate that we engaged in and by the changes that we made".

However, the US House Intelligence Committee unanimously signed a letter to Obama on Sept 15 not to pardon Snowden, describing his action as causing huge damage to the US intelligence community.

While Obama has commented that the debate triggered by Snowden "will make us stronger", it does not look likely that he will have the guts to pardon Snowden.

Both Republican and Democratic presidential candidates Donald Trump and Hillary Clinton are clearly against a pardon. Trump has repeatedly called for execution of Snowden although he said back in 2013 that he might become a major fan if he could reveal Obama's records.

Le Devoir
Médias - Snowden dans l'impasse
Wednesday, 21 September 2016
Byline: Brian Myles

Editorial - Le "Washington Post" a largué son plus célèbre lanceur d'alerte depuis "Deep Throat" en reprochant à Edward Snowden d'avoir compromis la sécurité nationale. Le quotidien fait reculer le journalisme d'enquête avec sa position, même si elle est nuancée.\r\nEn marge de la sortie du film d'Oliver Stone sur la vie d'Edward Snowden, ce spécialiste de la sécurité informatique qui a divulgué une avalanche de documents confidentiels de l'ultrasecrète National Security Agency (NSA), un mouvement international réclame qu'il soit gracié par le président Barack Obama. Trois médias qui ont collaboré avec le lanceur d'alerte, The New York Times, The Guardian et The Intercept, militent pour qu'il obtienne ce pardon. Le Washington Post, principal bénéficiaire des secrets de Snowden, fait figure d'exception en calquant désormais le discours des hauts gradés de la sécurité nationale à la Maison-Blanche.
" Pas de pardon pour Edward Snowden ", titrait le Post en éditorial, samedi dernier. Il n'est pas dans l'habitude d'un journal de critiquer l'éditorial d'un autre journal, mais la position défendue par le vénérable quotidien est à ce point dommageable pour le journalisme d'enquête et la protection des sources qu'elle mérite d'être condamnée.

Le Post ne reproche pas à Snowden d'avoir coulé des documents confidentiels sur le programme de collecte de métadonnées téléphoniques de la NSA, sur lesquels le quotidien s'est basé pour mener une série d'enquêtes lui ayant valu un prix Pulitzer pour service public (avec The Guardian). Les révélations de Snowden étaient à ce point dommageables que le gouvernement américain s'est résigné à circonscrire la collecte de métadonnées par la NSA, en juin 2015, avec l'adoption de l'" USA Freedom Act ".

Non, le Post reproche plutôt à Snowden d'avoir éventé le secret sur un autre programme de surveillance (Prism) " parfaitement légal ", sur les activités de renseignement visant la Russie, sur l'espionnage de l'épouse de feu Oussama ben Laden, et ainsi de suite. Il s'agit, à quelques nuances près, de la position défendue par un comité bipartisan du Congrès sur la sécurité nationale.

Selon cette logique, Edward Snowden a causé " des dommages énormes " à la sécurité nationale des États-Unis et ne mérite aucunement la grâce présidentielle. Qu'il revienne de la Russie, où il s'est réfugié en 2013, pour rentrer aux États-Unis et y subir un procès pour espionnage. Les détracteurs de Snowden ne lui laissent guère d'autre choix que de se cacher sous le manteau protecteur du président russe, Vladimir Poutine. Voilà qui n'est guère rassurant.

Le Washington Post passe un mauvais quart d'heure sur les réseaux sociaux, quoique sa position ne soit pas dépourvue de sympathie pour Snowden : celui-ci devrait accepter une responsabilité criminelle pour sa conduite, dans la plus pure tradition de la désobéissance civile, en échange d'une sentence clémente, écrit-on.

Cette position ne saurait faire oublier l'essentiel. Comme le souligne le journaliste d'enquête Glenn Greenwald, qui a mis l'affaire Snowden au monde dans The Guardian, le Washington Post est le premier quotidien à exiger des poursuites criminelles contre sa propre source.

Snowden n'a jamais rien publié de lui-même. Les médias, dont le Washington Post, portent le fardeau de ce " crime ". Les journalistes qui ont donné vie à l'affaire Snowden mériteraient-ils donc d'être poursuivis en justice ?

L'éditorial du Post est une trahison du rôle historique joué par les médias privilégiant le journalisme de qualité. Ils ont toujours protégé leurs sources et leur matériel contre les intrusions de l'État, même lorsque la sécurité nationale était en cause. Ce fut le cas du New York Times lors de la publication des " Pentagon Papers ", portant sur les insuccès de la guerre au Vietnam. Idem pour la décision de l'Ottawa Citizen de contester la perquisition abusive au domicile de la journaliste Juliet O'Neill, qui enquêtait sur le renvoi de Maher Arar en Syrie. Les exemples de résistance médiatique ne manquent pas.

Le fait qu'une source ait obtenu des documents de manière illégale ne change rien au fait que les médias ont le droit de colliger et de diffuser ce matériel, pourvu qu'il réponde à des critères de véracité et d'intérêt public.

Bien sûr, Edward Snowden a commis un geste illégal. Mais son geste en est un de " service public ", selon l'expression de l'ancien procureur général des États-Unis Eric Holder. Il est l'instigateur d'un débat national aux États-Unis et ailleurs dans le monde sur l'étendue démesurée des pouvoirs de surveillance des agences de sécurité nationale.

Si l'éditorial du Post choque autant, c'est qu'il est en rupture marquée avec les idéaux de défense des libertés civiles dont les médias traditionnels sont habituellement les gardiens.

Journal de Montréal
Les drones toujours plus populaires pour la livraison illégale en prison
Wednesday, 21 September 2016
Byline: Michaël Nguyen

Québec - Le nombre de vols observés au-dessus des prisons est passé de 4 à 27 en deux ans
L'utilisation des drones pour livrer des articles de contrebande en prison ne dérougit pas, surtout à Montréal où des détenus tentent d'obtenir de la drogue, des cellulaires, mais aussi des épices et des écouteurs.

Sur les 60 vols de drones observés autour des prisons du Québec en trois ans, 38 ont été recensés à l'Établissement de détention de Montréal.

«Le phénomène est en hausse, c'est une réalité depuis quelques années», déplore Mathieu Lavoie, président du Syndicat des agents de la paix en services correctionnels du Québec.

Selon des données obtenues auprès du ministère de la Sécurité publique, le nombre de vols de drones observés dans les prisons du Québec ne cesse d'augmenter.

En 2013-2014, le ministère avait recensé quatre vols de drones. L'année suivante, il y en a eu 18. Le nombre a encore augmenté en 20152016 pour atteindre 27.

Et depuis le mois d'avril, 11 vols de drones ont été observés, dont 10 à Montréal.

Sur les 60 événements au total, 49 concernaient les deux établissements de détention dans la métropole.

Selon les documents obtenus auprès du ministère de la Sécurité publique, les détenus tentent principalement d'obtenir des cellulaires, de la drogue et du tabac.

GROS PROFITS

«Compte tenu de la rareté, le prix du tabac peut être trois ou quatre fois plus élevé en prison», explique M. Lavoie, qui presse le gouvernement d'agir pour contrer le phénomène des drones autour des établissements de détention.

Mais les détenus peuvent aussi se faire livrer des articles plus insolites, comme des épices, une caméra GoPro ou une lampe de lecture.

Dans certains cas, l'interception de colis livrés par drone a permis de saisir des pics artisanaux et une lame pour scier le métal.

«Le trafic en prison est très lucratif, mais il représente un risque de sécurité. Il faut trouver des solutions», explique M. Lavoie, tout en ajoutant qu'un drone peut être capable de transporter jusqu'à 1 kg de matériel.

Il propose par exemple les brouilleurs d'ondes dans les prisons. Comme la plupart des drones sont souvent contrôlés avec un téléphone intelligent, dit-il, le problème serait ainsi réglé. De plus, cela empêcherait les détenus d'utiliser illégalement des cellulaires.

PEU DE MESURES

Le syndicat déplore toutefois le manque de mesures concrètes du gouvernement pour contrer le phénomène des drones, qui ne fait qu'augmenter.

«C'est préoccupant. Il y a des études, mais rien n'est mis en place, explique M. Lavoie. Soit les dirigeants n'ont pas d'argent, soit ils ne sont pas préoccupés par la problématique. Peut-être que c'est le prix de l'austérité.»

Lorsque nous l'avons contacté, le ministère de la Sécurité publique n'était pas en mesure d'indiquer quelles mesures étaient mises en place pour contrer le problème de livraison d'articles de contrebande par drone.

Notons qu'aux Pays-Bas, les autorités ont entraîné des aigles pour intercepter les drones qui survolent des zones interdites.

Philippine Star
NICA: 170 job vacancies up for grabs
Wednesday, 21 September 2016
Byline: Alexis Romero

Manila - The National Intelligence Coordinating Agency (NICA) is set to fill 170 job vacancies to perform its mandate and carry out its operations.
The agency is hiring analysts, researchers, information technology (IT) and technical personnel, lawyers and medical and dental staff, an advertisement published yesterday in The STAR showed.

The advertisement said those who would be hired would be "part of the change" and would "contribute to national development."

NICA is looking for 10 analysts, 10 junior analysts, and 20 senior analysts. Analysts will be tasked to process and analyze information on national security concerns as well as prepare, review and update reports for policy makers, according to a job description posted on the NICA website.

The agency is also hiring 10 field researchers, 10 junior field researchers and 10 senior field researchers.Researchers will gather information related to national security for policy makers and coordinate with state agencies and private institutions.

There are also job openings for 10 IT officers, 20 computer programmers and 10 computer maintenance technologists.

NICA is also looking for five engineers, 10 electronics and communications equipment technicians, 10 audio-visual technicians and 10 communication equipment operators.

Other vacancies are five chief accountants, five attorneys, five medical officers, five dentists and five nurses.

NICA, which is the principal adviser to the president on intelligence, is mandated "to be the focal point for the direction, coordination and integration of government activities involving national intelligence, and the preparation of intelligence estimates of local and foreign situations."

Asharq Al-Awsat
ISIS' Internet Communication Lessens after Sirte Battle
Wednesday, 21 September 2016
Byline: Abdul Sattar Hatita

Cairo - "Liberated Sirte", "Wilaya of Tripoli", "Soldiers of Caliphate in Libya" are samples of names that have disappeared from social media pages of ISIS in Libya.
Observers from Misrata say that the propaganda ISIS used to launch through social media and internet has remarkably declined after its defeat in Sirte.

During their capture of ISIS' strongholds in Sirte, Libyan forces of the Government of National Accord found laptops, smartphones and cameras, which were used by the extremist organization to spread its thoughts and to promote its intellect and achievements through internet not only in Libya, but also across the world in different languages.

A military investigator from Misrata said that after destroying ISIS' communication centers in Sirte and seizing all its equipment, the organization's propaganda on the internet has decreased, leaving the group with the option of using websites and pages in Syria and Iraq to cover its news.

Many forces supported by the United States and operating under the leadership of Fayez Al-Sarraj have broken into the city of Sirte and the sites ISIS used to control. They were able to confiscate more than 50 laptops and smartphones with several instant messaging programs uploaded on them.

According to investigations, ISIS used programs like Viber, WhatsApp Messenger, You Tube, and Telegram during its control of the city. One of the folders found after the break comprised religious lectures and speeches for the alleged Caliphate Abu Bakr al-Baghdadi and his spokesperson Mohammad Al-Adnani.

Investigations have also shown that many Libyan and foreign people were cooperating with the organization after its control of Sirte. The investigator from Misrata says that many merchants who used to transport relief and food aid among Libyan regions were obliged to pass by ISIS checkpoints and to give up shares of the provisions they were loading.

The government armed forces have recaptured the building of 'Sirte's radio" in the past month; national and foreign investigators (most of them from the United States and the United Kingdom) have participated in the post-liberation inquisitions.

Some of the videos feature leaders of ISIS ordering militants to kill people who refused to surrender in public squares.

A source from Tripoli has revealed to Asharq Al-Awsat that some ISIS-related documents concerning its links with sleeping cells and its communications in Libya and abroad have been moved out of the country during the past two weeks; however, many documents have been kept in Benghazi.

It is worth mentioning that following the liberation of Sirte, ISIS has admitted its defeat against the forces supported by the government in the city through its news outlets like Dabiq Agency and al-Naba newspaper.

ISIS has heavily attacked militias and factions which were supposed to back it in Libya. It has also threatened the leaders of factions that cooperated with the government, the parliament and the Presidential Council.

India urges SAARC states to counter cyber tactics of Islamic State militants

Friday, 23 September 2016

Byline: Staff Correspondent

Section: general

New Delhi - India has appealed the SAARC countries to adopt strong methodologies to counter all cyber threats from the Islamic State militants.
"The terrorist organisations use easily accessible technology to attack both soft and hard targets. Self-radicalisation over internet and social media, and spread of influence of Islamic State all over, including in our country, has added new dimensions to the threat," said Dineshwar Sharma, director of India's Intelligence Bureau, on Thursday.

He said IB has identified countering financing of terrorism as one of the most important tools to fight the terror menace.

"Cyberspace has become an important area for radicalisation and spread of jihadi materials. Besides, the problem of fake currency feeds into supporting terrorism and can create economic destabilisation in our region," he said.

He was speaking at the second meeting of the High Level Group of Eminent Experts to strengthen the SAARC Anti-Terrorism Mechanism.

Sharma called upon the eight member states to ratify and enable various conventions enacted by the South Asian Association for Regional Cooperation (SAARC) grouping, including the Convention on Suppression of Terrorism and Additional Protocols and the Mutual Assistance in Criminal Matters.

Sharma said terrorism has emerged as a big challenge for the entire world and no country today is in a position to tackle this problem on its own.

"Close cooperation and sharing of real-time intelligence are, therefore, imperative for all of us to secure our countries and our peoples," he stressed.

He lamented that not much progress has taken place on the operationalisation of the SAARC Terrorist Offences Monitoring Desk and SAARC Drug Offences Monitoring Desk.

The First meeting of the Anti-Terrorism Mechanism of SAARC in 2012 had stressed upon the need for immediate operationalisation of the desks.

Meeting of a High Level Group of Eminent Experts to strengthen the SAARC Anti-Terrorism Mechanism was recommended by the SAARC Ministerial Declaration on Cooperation in Combating Terrorism (adopted by the 31st Meeting of SAARC Council of Ministers in Colombo, February 2009).

India had hosted its first meeting in New Delhi from 9-10 February 2012.

Hosting the meeting for the second time, it is in line with the high priority India attaches for regional cooperation in Anti-Terrorism activities and given that terrorism remains the single biggest threat to peace, stability and progress in the region and beyond.

The meeting provides a platform for discussing and identifying measures to tackle this menace threatening our societies.

La Presse+

Deux drones observés, de la drogue et des armes trouvées

Friday, 23 September 2016

Byline: Daniel Renaud

Section: general

Montréal - C'était le jour des drones jeudi dernier au Centre de détention Rivière-des-Prairies à Montréal. Alors que deux de ces engins volants auraient été observés au-dessus des cours de la prison, les gardiens ont découvert dans un secteur abritant des membres de gangs de rue une quantité relativement importante de stupéfiants et d'inquiétants outils vraisemblablement arrivés par drone, a appris La Presse.
Drogue, cellulaires et lames de scie...

Après avoir reçu une information ou eu des doutes, les agents correctionnels ont effectué une fouille en soirée dans les 16 cellules d'un secteur où sont détenus majoritairement des individus d'allégeance bleue. Selon des sources, ils ont trouvé plus de 50 grammes de haschisch, une substance s'apparentant à de l'héroïne, six téléphones cellulaires, des lames de scie et un petit appareil électrique multifonctionnel. Quelques heures plus tôt, deux drones auraient été aperçus au-dessus de deux cours

de l'établissement, dont un autre secteur où les prévenus sont classés « général ». On ignore toutefois si des objets ont été saisis à la suite de l'observation de ces drones.

Grillages réclamés

Le président du Syndicat des agents en services correctionnels du Québec, Mathieu Lavoie, n'a pas voulu confirmer les informations recueillies par La Presse. Mais il implore le gouvernement d'agir pour mettre fin aux livraisons, de plus en plus nombreuses, par drones dans les 18 prisons du Québec. « On se rend compte que les projets-pilotes ou les mesures mis en place après les évasions de Québec et de Saint-Jérôme n'ont pas fait cesser ces intrusions », lance M. Lavoie.

Explosion des apparitions

Selon des chiffres obtenus du ministère de la Sécurité publique grâce à la Loi sur l'accès aux documents publics, les observations de drones au-dessus des terrains des prisons québécoises ont explosé depuis 2014. On en a dénombré 27 l'an dernier. Cette année, on en était à 11 au 16 juillet, un chiffre qui est déjà plus important qu'à la même période l'an dernier. Les statistiques de cette année ne comprennent pas les deux observations de jeudi dernier au- dessus du Centre de détention Rivière-des-Prairies.

Drones signalés à la sécurité dans les prisons du Québec

2013-2014 4

2014-2015 18

2015-2016 27

2016-2017 (au 16 juillet dernier) 11

Les plus livrés

Les objets apportés par drones les plus souvent saisis sont les stupéfiants, le tabac et le papier à rouler, en raison notamment du trafic institutionnel causé par la valeur très élevée de ces produits à l'intérieur des murs, où ils sont interdits. Les appareils cellulaires, qui peuvent permettre à un détenu de poursuivre ses activités criminelles depuis sa cellule, sont aussi très régulièrement saisis.

Saisies d'objets arrivés par drones (2013-2016)

Papier à cigarettes 9

Tabac 8

Stupéfiants 6

Briquets 5

Chargeurs de cellulaires 5

Cellulaires 4

Pic artisanal 2

Pots d'épices 2

Lame de scie à fer 1

Sphère de métal 1

Plaquette identificatrice 1

Bois 1

Draps 1

Caméra GoPro 1

Carte SIM 1

Écouteurs 1

Vis 1

Lampe 1

Ziploc 1

Timbres Nicoderm 1

Câble USB 1

Inconnu 1

*Le chiffre représente le nombre d'événements au cours desquels l'objet a été saisi et non pas le nombre d'objets de cette nature qui ont été saisis.

**Ces statistiques ne comprennent pas les objets de la saisie de jeudi dernier au Centre de détention Rivière-des-Prairies.

Jerusalem Post

New Israeli intelligence satellite 'sending back great images'

Friday, 23 September 2016

Byline: Yaakov Lappin

Section: general

Jerusalem - More than a week after it was launched and ran into serious technical difficulties, the Ofek-11 spy satellites began sending "great images" back to the ground control station, the Defense Ministry announced on Thursday evening.
Amnon Harari, head of the Space Administration in the Defense Ministry, and Ofer Doron, head of Israel Aerospace Industry's MBT Space Division, said the satellite's transponder and image broadcasting system began kicking in on Thursday, and that ground control officials were now seeing "operational results."

The IAI-made satellite was launched on September 13, and ran into unspecified difficulties after going into orbit.

Harari and Doron said the images they were now receiving "are what we hoped for," though they declined to provide further details on the overall health of the satellite.

Since the launch, engineers have been working to stabilize the satellite and its on board systems, the Defense Ministry and IAI said in a joint statement.

The teams systematically checked all of its systems from the moment of launch, and maintained continuous communication and control with it.

Ofek-11 launched from Palmahim Air Base south of Rishon Lezion near last week. Soon after its launch, officials said, "it's not yet clear if all on board systems are working," adding, "There are a number of things that are worrying us."

Ofek-11 is part of the Ofek series of satellites, and is Israel's sixth active spy satellite.

The troubled launch came after Amos- 6, an Israeli civilian communications satellite, was lost when its Falcon-9 launcher, made by SpaceX, blew up at the launch pad at Cape Canaveral in Florida on September 1.

Two years ago, the Defense Ministry and IAI launched Ofek-10 successfully into space on board a Shavi launch vehicle. Ofek -0 carries a SAR (Synthetic aperture radar), which has advanced day and night imaging capabilities.

Times of Israel

Despite initial woes, new Israeli spy satellite beams back first pictures

Friday, 23 September 2016

Byline: Judah Ari Gross

Section: general

Jerusalem - The Ofek-11 reconnaissance satellite launched earlier this month sent its first images down to Israeli engineers on Thursday, dispelling fears that the craft, which experienced issues after launch, would not be able to function at all, the Defense Ministry said.
At 5:10 p.m., engineers turned on the satellite's "payload" and downloaded the first images from the spacecraft, according to a ministry statement.

Shortly after the launch earlier this month, the team operating the satellite discovered it was "not functioning exactly the way we expected," Doron Ofer, CEO of the Israel Aerospace Industries' Space Division, said at the time.

Since then "dozens of engineers have been working to stabilize the satellite and its systems," the ministry said.

According to the ministry, that work paid off. "The Ofek-11 satellite will provide operational outputs," the ministry said.

The teams working on the satellite were made up of representatives from both the Defense Ministry's Space Department and the IAI Space Division, who ranged from "youngsters in their 20s to veteran engineers in their 70s," according to the statement.

The engineers have been in contact with the satellite since its launch, though the work was somewhat slowed due to the rotation of the Earth.

The satellite was shot into space at 5:40 p.m. on September 13 from the Palmachim Air Base, just outside the Tel Aviv suburb of Rishon Lezion.

The Ofek-11 is an upgrade from the Ofek-10 satellite launched in April 2014. However, Ofer would not discuss what exact improvements were made to the design of the satellite to make it superior to its predecessor.

The Ofek-11 was to join approximately 10 other satellites, including the Ofek-10, Ofek-9, Ofek-7 and Ofek-5, that feed intelligence to Israel's security forces.

Canadian Press

Feds warn of potentially crippling 'insider' cyberthreat to key sectors

Friday, 23 September 2016

Byline: Jim Bronskill

Section: general

Ottawa - Federal officials have quietly warned operators of electrical grids, transportation hubs and other key infrastructure of the cyberthreat from insiders who could unleash devastating viruses and cripple systems, internal government notes reveal.
Crucial networks that Canadians rely on for everyday needs face a ``substantial threat'' from rogue employees out to wreak digital havoc, warn the Public Safety Canada briefing notes.

``The insider threat is difficult to detect and can cause real damage.''

No special hacking skills are required, just a portable memory key loaded with a malicious code. As a result, it is important that organizations have the right security protocols and procedures, ``for example by limiting access to systems only to those who genuinely need it.''

A federal briefing on the insider threat was delivered last December to leaders of the 10 most crucial infrastructure sectors, the notes say.

They point out that over 90 per cent of critical infrastructure _ key to delivering everything from food and clean water to banking and health services _ is controlled by the private sector and all of it is dependent in one way or another on information technology to operate. Many critical infrastructure sectors are interdependent, meaning a problem in one could have a ``cascading impact'' in others.

The notes, prepared earlier this year for Monik Beauregard, a senior assistant deputy minister at Public Safety Canada, were obtained by The Canadian Press under the Access to Information Act.

Beauregard is chairing a panel today on the global implications of the challenges to cybersecurity at an intelligence conference in Ottawa.

In addition, Greta Bossenmaier, the head of Canada's electronic spy agency, the Communications Security Establishment, plans to discuss the various cyberchallenges the country faces.

The conference comes as the Liberal government undertakes a cybersecurity consultation that runs through mid-October. The overall aim is to identify gaps and opportunities, bring forward ideas to shape a renewed approach and capitalize on the advantages of new technology.

State-sponsored hackers, sophisticated criminals, cause-motivated hacktivists and people out to make mischief online all pose a threat, the government warns.

Public Safety is already working with critical infrastructure operators to prepare for the possibility of a major cyberattack on the Canadian electrical grid and telecommunications systems, the internal notes say.

Security officials call such an occurrence a ``black swan'' _ a rare but devastating event that requires special attention due to the potential for massive losses should it happen.

Washington Post

Yahoo hit in world's biggest data breach

Friday, 23 September 2016

Byline: Multiple reporters

Section: general

Washington - Yahoo on Thursday reported the largest data breach in history - affecting at least 500 million user accounts - months after first detecting signs of an intrusion that the company blamed on "state-sponsored" hackers.
The Web giant called on customers to change their passwords and institute other protective measures, but the largest fallout could be for Yahoo itself. The long-faltering company this summer agreed to sell its core business for $4.8 billion to telecommunications giant Verizon in a deal now clouded by news of the massive breach. Verizon said it learned of the incident only "within the last two days."

The timeline highlighted a predicament created by hacks: Companies often take months or even years to report suspicions of breaches - if they report them publicly at all - holding the information back from customers, business partners and even potential new owners of a company.

"The dark cloud this casts will be very long and will likely impact the merger agreement," Jeff Kagan, a Georgia- based telecommunications industry analyst, said in an email. "We'll just have to wait and see what happens next."

Yahoo learned of the incident in July, the same month it announced its deal with Verizon, a person familiar with the matter said, speaking on the condition of anonymity to freely discuss the issue.

When asked, Yahoo declined to say whether it learned of the hack before or after that deal was announced.

Yahoo revealed the breach after recode, a news site focusing on Silicon Valley, reported Thursday morning that the ailing tech giant would confirm a data breach affecting hundreds of millions of accounts.

Yahoo reported that the intrusion apparently began in 2014.

The number of affected accounts, by reaching 500 million, gave it the dubious distinction of being the largest breach on record, said Paul Stephens of the Privacy Rights Clearinghouse.

Stephens said that consumers must also take steps to take care of matters themselves, outside of their Yahoo accounts. "It's really important that individuals think long and hard about passwords as well as security questions and answers they used on Yahoo that they might have used somewhere else," Stephens said. "It's very important to remember that if that information is available to hackers, they are going to try and use it on other sites, as well."

Company Chief Information Security Officer Bob Lord wrote in a blog post that names, email addresses, telephone numbers, dates of birth and answers to security questions may have been stolen but that financial information such as credit card numbers apparently was not because that data was stored in a separate system.

"Yahoo is working closely with law enforcement on this matter," Lord wrote.

Sen. Mark R. Warner (D-Va.) chastised Yahoo for not reporting suspicions of a breach sooner and called on the federal government to impose stricter disclosure requirements for companies. Companies face a messy patchwork of state disclosure laws but no federal standard for reporting about breaches, including when, how and who was affected.

"While its scale puts it among the largest on record, I am perhaps most troubled by news that this breach occurred in 2014, and yet the public is only learning details of it today," Warner said in a statement. "Action from Congress to create a uniform data breach notification standard so that consumers are notified in a much more timely manner is long overdue."

Although President Obama proposed a federal law in 2015 that would give companies 30 days to notify the public about a discovered hack, lawmakers have yet to approve a national standard.

On Thursday, Sen. Richard Blumenthal (D-Conn.) called on investigators to determine whether Yahoo intentionally withheld information about the incident to "artificially bolster its valuation" by Verizon - a potentially serious act of deception.

The impact on Verizon's deal with Yahoo was not immediately clear. Major data breaches have become a routine event for corporate America and also for major government agencies and political groups. The Yahoo intrusion stands out for the sheer scale of the customers apparently affected, a legacy of the company's once-commanding position for Internet users who turned to the company for Web searches, email accounts, user groups and news reports.

The Verizon deal was seen as a relatively soft landing for Yahoo, a company overtaken by competitors in nearly every one of its major businesses.

Verizon, in a statement, said it was monitoring news of the breach. "We understand that Yahoo is conducting an active investigation of this matter, but we otherwise have limited information and understanding of the impact," the company said. "We will evaluate as the investigation continues through the lens of overall Verizon interests, including consumers, customers, shareholders and related communities. Until then, we are not in position to further comment."

The security breach is yet another bruise for the aging tech firm and chief executive Marissa Mayer, who joined Yahoo in 2012 to effect a turnaround and ended up having to sell the firm's core assets instead.

Microsoft's recent acquisition of LinkedIn, which came one month after the social network revealed that 167 million of its accounts had been breached, show a breach alone is not necessarily enough to derail a deal, said John Lovallo, senior vice president at the public relations and strategic communications firm Levick.

But he said the tech giant will be hard-pressed to rehabilitate its overall reputation in light of this breach.

"Focus on the consumer and not the deal," Lovallo said. "If I were in that boardroom at this moment in time, I would say, 'We understand there's a huge deal on the table right now.' But first address and resolve the issue for your consumers, and the transaction will take care of itself."

Yahoo has had a poor security reputation in the past, one of the many things that Mayer has focused on since becoming chief executive.

Vice's Motherboard blog in August reported that Yahoo was investigating an alleged breach after the news organization found that a cybercriminal known as "Peace" claimed to be offering 200 million Yahoo user credentials for sale online. The data was advertised on the "dark Web" - a part of the Internet accessible only through the use of special software such as the anonymous browsing tool Tor and often associated with illicit activities.

UK Government, Wayra and GCHQ partner to launch cybersecurity accelerator

Friday, 23 September 2016

Byline: Yessi Bello Perez

Section: general

London - The UK government has announced that it will be partnering with tech startups to develop new technologies aimed at protecting the country from cyber attacks.
According to a statement, the Department for Culture, Media and Sport (DCMS), Wayra UK and GCHQ - the UK's intelligence and cybersecurity agency - have come together to launch a new cybersecurity accelerator.

The partnership is considered to be the first step in the development of two world-leading innovation centres as part of the Government's £1.9bn National Cyber Security Programme.

Successful candidates will gain access to GCHQ's personnel and tech expertise to allow them to expand capability, improve their ideas and develop innovative products to counteract emerging threats.

Speaking about the announcement, Matt Hancock, Minister of State for Digital and Culture, said:

"We are making progress in our ambitious programme to support innovation in cyber security, grow the UK's thriving sector and protect Britain from cyber attacks and threats.

"Our two new Cyber Innovation Centres will bring together government, academic and business expertise, and will be invaluable in helping support start-up companies and develop world-class cyber technology," he concluded.

The accelerator will be based at a new Cheltenham Innovation Centre and is due to open around the turn of the year. A second innovation centre is expected to open in London in 2017.

The news comes after Hancock spoke at a Sharing Economy UK event yesterday, noting his desire to work collaboratively with industry to ensure the UK became the 'natural home' for firms operating in the sharing economy sector.

Ottawa Citizen

Hollywood gets it right on Snowden

Friday, 23 September 2016

Byline: David Lyon

Section: Opinion

Agency (NSA) leaker, distracted by a pre-dinner discussion with girlfriend Lindsay Mills, dashes to the stove where he has left the pasta. Testing the dangling fettuccine, he declares it as close to correctly cooked as he's managed.
Whatever the film critics make of the Snowden docudrama, it, too, may come as close to correctly rendered as Hollywood can manage. If you want to understand the serious computer geek who dared defy the NSA and, indeed, the entire U.S. government, Stone gets it about right.

This is no paranoid melodrama. The movie focuses persistently on the transformation of Snowden, from a loyal son of a military and government family, and who believes in patriotic obedience in service to his country, to the disabused but determined truth-telling NSA whistleblower whose controversial actions have ongoing global repercussions.

The film offers several players in that transformation. There's Snowden's dawning realization that his admired NSA seniors take the law into their own hands; the shocking discovery that his workmates

routinely conduct searches well beyond what is required for the task; and, most tellingly, his relationship with Lindsay Mills. Their early conversations contrast Snowden's conservative caution with Mills's open criticism of government as her democratic right and responsibility, and the film ends with his being entirely committed to her position - as a faithful citizen who "loves his country."

Though we might not express things in exactly the same way, many Canadians are also leery of some government activities. They're not being unpatriotic; it's an expression of the desire to see Canada flourish. Many, too, are concerned about the uncomfortably close relationship between the NSA and our own Communications Security Establishment (CSE), and about specific ways that the Anti-terrorism Act (Bill C-51) facilitates just such suspicionless surveillance (that is, placing under surveillance persons to whom are attached no already-existing suspicions) - based on "big data," as seen in the NSA. Films such as Snowden should be a spur to pressuring security agencies to more transparency and accountability. The current government's proposals for new oversight mechanisms are a solid start.

This does not mean governments should abandon all surveillance, as the movie also makes clear. It means querying the idea that metadata - details such as the times, places and duration of communication between identifiable persons - is merely "like a phone book," or that oldfashioned labour-intensive sleuthing can be abandoned in favour of flashy new solutions involving big data. Equally, the Snowden biopic may inspire efforts to demystify the arcane algorithms that guide the security surveillance systems to their persons of interest. The film hints helpfully at ways these algorithms are far from the neutral instruments they may be sold as - when in fact they're shaped politically.

Another way for Canadians to read this film is to consider its educational role in showing how once-secret NSA programs such as PRISM (which collects data from Internet companies) and XKeyscore (which searches and analyzes global Internet data) actually work. We have a long history of exploring the genesis, workings and impact of media and communication technologies - think Harold Innis or

Marshall McLuhan - and this can be put to good purpose right now. The Snowden Digital Surveillance Archive is based at Ryerson University, for instance, and is an ideal resource for making balanced judgments about contemporary surveillance practices. For director Oliver Stone, who spent many hours interviewing Snowden in Moscow, the quest is not merely to discover what made the truthteller tick, but how to do so in ways that resonate with regular filmgoers' lives. The issues, especially in Internet surveillance, are real, huge, complex and affect ordinary users' lives in often profound ways - without our knowing it. Learning to be digital citizens - as Snowden did - is a task for us all, not just in the land of the NSA.

At the very end of the film, Joseph Gordon-Levitt - the actor who plays Snowden - disappears symbolically behind his laptop lid and the person who reappears a moment later is not the actor, but the real Edward Snowden. He says nothing, but surely this image silently signals Snowden's approval of the film. It may not please the critics, but that message, at least, seems clear. Al dente. David Lyon directs

the Surveillance Studies Centre at Queen's University. His latest book is Surveillance After Snowden (Polity Press, 2015).

Washington Post

Report finds cyber-intrusions soaring, and slow progress on security measures

Friday, 23 September 2016

Byline: Joe Davidson

Section: column

Column - For the naive who still think cyberdata is safe with Uncle Sam, here is some information that demonstrates the harsh reality.
The number of cyber incidents reported by federal agencies jumped more than 1,300 percent, from 5,503 to 77,183, over the 10 years through fiscal 2015. Federal information security has been on the high-risk list of the Government Accountability Office (GAO) since 1997, and the situation has only grown worse.

These statistics, at once sobering and alarming, were included in a GAO report presented to the President's Commission on Enhancing National Cybersecurity this week. The report was in the form of a statement from Gregory C. Wilshusen, the GAO's director of information security issues.

"Over the last several years, we have made about 2,500 recommendations to agencies aimed at improving their implementation of information security controls," Wilshusen said. "These recommendations identify actions for agencies to take in protecting their information and systems. For example, we have made recommendations for agencies to correct weaknesses in controls intended to prevent, limit, and detect unauthorized access to computer resources. ... However, many agencies continue to have weaknesses in implementing these controls, in part because many of these recommendations remain unimplemented. As of September 16, 2016, about 1,000 of our information security-related recommendations have not been implemented."

Ineffective cyberprotection "can result in significant risk to a broad array of government operations and assets," he added.

Jamal Brown, press secretary at the Office of Management and Budget (OMB), responded by saying that "cybersecurity is one of the most important challenges we face as a nation. Over the last nearly eight years, federal agencies have made significant progress in strengthening their overall cybersecurity

posture. Yet, as cyberthreats continue to evolve and grow, we must remain vigilant in our efforts to combat them."

Among those efforts was release of a first-ever cybersecurity workforce strategy and implementation of the Cybersecurity National Action Plan, which established the commission that heard Wilshusen's statement.

These examples from Wilshusen show how broad the array of threatened "government operations and assets" can be: "Sensitive information, such as intellectual property and national security data, and personally identifiable information, such as taxpayer data, Social Security records, and medical records, could be inappropriately added to, deleted, read, copied, disclosed, or modified for purposes such as espionage, identity theft, or other types of crime."

This is not just a theoretical warning. In June 2014, the Office of Personnel Management announced that personal information, including Social Security numbers, belonging to 22 million federal employees and others had been hacked. That is the largest announced cybertheft, but far from the only one. The private sector also has been repeatedly hit by cyberthieves.

"These threats come from a variety of sources and vary in terms of the types and capabilities of the actors, their willingness to act, and their motives," Wilshusen said. "For example, advanced persistent threats - where adversaries possess sophisticated levels of expertise and significant resources to pursue their objectives - pose increasing risks."

In a March report to Congress, the OMB linked the rising number of cybersecurity incidents to "an increase in total information security events and agencies' enhanced capabilities to identify, detect, manage, respond to, and recover from these incidents."

Although the report indicates that about 40 percent of the GAO's recommendations have not been implemented at any one time, Wilshusen said in an interview that the government's long-term record is significantly better. Within four years, 88 to 90 percent of the recommendations are followed, he said by phone. "Over time," he added, "the agencies do a pretty good job of implementing our recommendations."

The GAO offered several recommendations, including strengthening oversight of government contractors that provide information-technology services. That was a lesson learned the hard way through the OPM breach. In 2014, the GAO found that five of six selected agencies "were inconsistent" in their oversight of contractor cyber controls.

The GAO also recommended expanding the federal cyber workforce and training. That is not a new need. Said Wilshusen: "This has been a long-standing dilemma for the federal government."

Globe and Mail

Privacy watchdog concerned by 'smart' devices

Friday, 23 September 2016

Byline: Susan Krashinsky

Section: general

Ottawa - Canada's federal privacy watchdog is participating in a global initiative that's raising red flags about connected devices - everything from "smart" TVs to fitnesstracking wristbands and Internetconnected toys - and their failure to provide users with control over the personal information those gadgets collect.
The Office of the Privacy Commissioner of Canada (OPC) took part in the global "privacy sweep" in April, and is now releasing the results. The sweep involved 25 privacy authorities. It looked at 314 connected devices - often collectively referred to as the "Internet of Things" - and how they communicate their privacy practices.

Canada's focus was on 21 health and wellness devices that are popular among Canadians, including fitness trackers, smart watches, smart scales and bloodpressure monitors.

They found that connected devices "fail to inform users about exactly what personal information is being collected and how it will be used" - including sensitive data such as health and financial information.

The OPC says that the concept of "the body as information" is a major focus, as health, genetic and biometric information is being tracked more than ever.

During the sweep, staff used connected products and analyzed what information those devices asked for - and what privacy collection and protection information they provided to users.

Nearly half of Canadian "sweepers" - OPC staff who tested the devices - and more than three-quarters of international sweepers were unable to find basic instructions on how to delete their data once they had begun using the devices.

The Global Privacy Enforcement Network, now in its fourth year, is a joint effort among privacy organizations in many countries, including the United States, Britain , members of the European Union and China, and has conducted such privacy sweeps before. By acting in concert, the group is attempting to add global heft to major privacy concerns.

Last year, for example, the network conducted another sweep that showed how websites and mobile applications targeted to kids often do not do enough to protect children's privacy.

Among the devices that the OPC analyzed in this sweep, it highlighted concerns about a bloodpressure monitor and a thermometer that both asked to track users' locations, without giving adequate explanations about why that was necessary for the device's purposes.

Another concern was the Jawbone UP3, which tracks a user's activity, sleep and heart rate. The OPC noted that the device provided an easy online form to request that the company delete all personal information on its servers, including data shared with partners. But the "sweeper" found his account was still active, with personal information intact, two months later .

Both the Fitbit and Garmin Vivosmart HR fitness trackers were highlighted by the OPC for being too vague in their privacy policies about safeguards they put in place to protect users' data.

In another case, the iMazeFitness heart rate strap had a placeholder on its personal information page that said "[Insert customer data privacy clause here if applicable.]" "Many of the privacy communications were generic or vague, or had privacy policies that weren't specific to the devices being evaluated," said Brent Homan, the OPC's director-general of PIPEDA investigations. (PIPEDA stands for the Personal Information Protection and Electronic Documents Act, which is the law in Canada concerning privacy and personal data.)

"Providing information about what is being collected at key points - such as registration or purchase - is a best practice ... rather than having it buried in privacy policies," Mr. Homan said.

Not only should devices make clear what types of data are being collected and shared, Mr. Homan said, they should make it easier for users to exercise control over that information. Further, where information gathering is not essential to the device's purposes, user consent should be explicit - and the default setting should be not to gather that information, he said.

Washington Post

Key lawmakers accuse Russia of campaign to disrupt U.S. election

Friday, 23 September 2016

Byline: Greg Miller

Section: general

Washington - Two senior Democratic lawmakers with access to classified intelligence on Thursday accused Russia of "making a serious and concerted effort to influence the U.S. election," a charge that appeared aimed at putting pressure on the Obama administration to confront Moscow.
The jointly issued statement from Sen. Dianne Feinstein and Rep. Adam B. Schiff -- Californians who are the ranking Democrats on the Senate and House intelligence committees, respectively -- described recent cyber penetrations of the Democratic National Committee and other U.S. political entities as intrusions that were likely directed by Russian President Vladi-mir Putin.

"At the least, this effort is intended to sow doubt about the security of our election and may well be intended to influence the outcomes," the statement said. "We believe that orders for the Russian intelligence agencies to conduct such actions could come only from very senior levels of the Russian government."

Feinstein and Schiff said they reached their conclusion "based on briefings we have received" from U.S. intelligence agencies.

The blunt language goes far beyond the more equivocal characterizations issued by the White House and U.S. intelligence agencies, which have so far been unwilling to explicitly blame Moscow.

Speaking this week at a public event hosted by The Washington Post, Director of National Intelligence James R. Clapper Jr., cited a long history of Russian efforts to influence elections abroad, and said that "it shouldn't come as a big shock to people" that Moscow might seek to use cyber capabilities for that purpose.

But he stopped short of drawing aa direct link between the DNC hack and Russian intelligence services, amid an ongoing debate within the administration over whether to publicly blame Russia.

White House officials have repeatedly insisted that they are awaiting the outcome of a formal FBI investigation, even though U.S. intelligence are said to have concluded with "high confidence" that Russia was responsible for the DNC breach and other attacks.

The White House hesi-ta-tion has become a source of frustration to critics, including senior members of Congress.

The statement from Schiff and Feinstein did not critize President Obama's handling of the matter and called on Putin "to immediately order a halt to this activity." In an interview, Schiff said that he and Feinstein "think it's important to deter Russia from continuing this kind of conduct that they be called out on it. We've urged the administration to do that."

He said the timing of the statement was not driven by any new developments in the investigation of the hacks. "It's been in the works for longer than that," Schiff said, adding that "evidence is strong in terms of attribution."

Reuters

Probe of leaked U.S. NSA hacking tools examines operative's 'mistake'

Friday, 23 September 2016

Byline: Staff report

Section: general

San Francisco - A U.S. investigation into a leak of hacking tools used by the National Security Agency is focusing on a theory that one of its operatives carelessly left them available on a remote computer and Russian hackers found them, four people with direct knowledge of the probe told Reuters.
The tools, which enable hackers to exploit software flaws in computer and communications systems from vendors such as Cisco Systems and Fortinet Inc, were dumped onto public websites last month by a group calling itself Shadow Brokers.

The public release of the tools coincided with U.S. officials saying they had concluded that Russia or its proxies were responsible for hacking political party organizations in the run-up to the Nov. 8 presidential election. On Thursday, lawmakers accused Russia of being responsible.

Various explanations have been floated by officials in Washington as to how the tools were stolen. Some feared it was the work of a leaker similar to former agency contractor Edward Snowden, while others suspected the Russians might have hacked into NSA headquarters in Fort Meade, Maryland.

But officials heading the FBI-led investigation now discount both of those scenarios, the people said in separate interviews.

NSA officials have told investigators that an employee or contractor made the mistake about three years ago during an operation that used the tools, the people said.

That person acknowledged the error shortly afterward, they said. But the NSA did not inform the companies of the danger when it first discovered the exposure of the tools, the sources said. Since the public release of the tools, the companies involved have issued patches in the systems to protect them.

Investigators have not ruled out the possibility that the former NSA person, who has since departed the agency for other reasons, left the tools exposed deliberately. Another possibility, two of the sources said, is that more than one person at the headquarters or a remote location made similar mistakes or compounded each other's missteps.

Representatives of the NSA, the Federal Bureau of Investigation and the office of the Director of National Intelligence all declined to comment.

After the discovery, the NSA tuned its sensors to detect use of any of the tools by other parties, especially foreign adversaries with strong cyber espionage operations, such as China and Russia.

That could have helped identify rival powers' hacking targets, potentially leading them to be defended better. It might also have allowed U.S officials to see deeper into rival hacking operations while enabling the NSA itself to continue using the tools for its own operations.

Because the sensors did not detect foreign spies or criminals using the tools on U.S. or allied targets, the NSA did not feel obligated to immediately warn the U.S. manufacturers, an official and one other person familiar with the matter said.

In this case, as in more commonplace discoveries of security flaws, U.S. officials weigh what intelligence they could gather by keeping the flaws secret against the risk to U.S. companies and individuals if adversaries find the same flaws.

Critics of the Obama administration's policies for making those decisions have cited the Shadow Brokers dump as evidence that the balance has tipped too far toward intelligence gathering.

The investigators have not determined conclusively that the Shadow Brokers group is affiliated with the Russian government, but that is the presumption, said one of the people familiar with the probe and a fifth person.

One reason for suspecting government instead of criminal involvement, officials said, is that the hackers revealed the NSA tools rather than immediately selling them.

The publication of the code, on the heels of leaks of emails by Democratic Party officials and preceding leaks of emails by former U.S. Secretary of State Colin Powell, could be part of a pattern of spreading harmful and occasionally false information to further the Russian agenda, said Jim Lewis, a cybersecurity expert at the Center for Strategic and International Studies.

"The dumping is a tactic they've been developing for the last five years or so," Lewis said. "They try it, and if we don't respond they go a little further next time."

London Times

White House leak suspects linked to Kremlin

Friday, 23 September 2016

Byline: Rhys Blakely

Section: general

Washington - Hackers with suspected links to Russian intelligence boasted of infiltrating the White House yesterday.
Detailed travel plans for Michelle Obama, Hillary Clinton and Joe Biden, the US vice-president, were released, along with what appeared to be Mrs Obama's passport.

The documents, allegedly stolen from the personal Gmail account of a White house staff member, outlined the precise movements of three of the most protected people in the world. One set of plans included the exact number of steps Mr Biden had to climb as he entered a luxury hotel through a service entrance.

An email to The Times by DCLeaks, the website that shared the documents, said: "If terrorists hack emails of White House Office staff and get such sensitive information we will see the fall of our country."

Analysts have connected the website to Russia because of the techniques used to access other documents it has leaked. Its latest release came after one of America's top spy chiefs said Russia was suspected of attempting to meddle in the US presidential election.

The same website was behind a leak of hacked emails from Colin Powell, the former secretary of state, this month. In those messages Mr Powell shared candid assessments of Mrs Clinton and Donald Trump, calling the former sleazy and greedy and branding Mr Trump a "national disgrace and an international pariah".

DCLeaks yesterday claimed to release emails from the personal account of Ian Mellul, a White House employee responsible for planning travel. It is not clear why he was using a Gmail email address rather than an official account.

The documents included a copy of Mrs Obama's passport. One email detailed the itinerary for a visit that she made to a middle school in the state of Georgia in April, including details of how she would be waiting in a gymnasium locker room before the event began.

Another message contained a presentation, apparently prepared for Mr Biden before a visit to Cleveland in June. A series of photographs laid out the route he would take during an event in the Intercontinental hotel.

He would enter via a back loading entrance, the slides explained, adding: "1. YOU arrive in the loading dock and proceed up 4 stairs. 2. YOU proceed to HOLD via the staircase and walk up 26 steps to the 2nd floor." It showed which hotel room he would wait in until the event got under way and which adjacent hotel room his Secret Service detail would use.

A third message showed the route to be walked by Mrs Clinton at a fundraising event at a private home in Houston, including a plan of the house. Neither the White House nor Mr Mellul responded to requests for comment.

James Clapper, the US director of national intelligence, said this week that it would be no surprise if Russia was trying to influence the race for the White House. There was a well- established history of such attempts, dating back to the Cold War, he told a conference in Washington. An attempt to meddle in the presidential race "certainly should not come as a big shock to people", he said.

.Russia's increased willingness to flex its military muscle around the world dominated Theresa May's first in-depth security briefing with defence chiefs. The prime minister underlined Britain's decision to lead Nato's rapid reaction force in eastern Europe, Whitehall sources said. Mrs May was also updated on the RAF bombing campaigns in Syria and Iraq as well as Britain's operations in Afghanistan.

ABC (Australia)

Yahoo breach puts focus on Australian consumer hacking protections

Friday, 23 September 2016

Byline: Jake Sturmer

Section: general

Canberra - Yahoo's confirmation of a serious breach affecting 500 million users puts the spotlight on Australia's lack of regulation forcing businesses to tell victims their information has been stolen. Yahoo's confirmation of a serious hack has put the spotlight on Australia's lack of regulation forcing businesses to tell victims their information has been stolen.

The that occurred in 2014, with hackers accessing data from at least 500 million users.

Yahoo believes they may have been state sponsored attacks, capturing names, email address, birth dates, and scrambled passwords, along with encrypted or unencrypted security questions and answers that could help hackers break into victims' other online accounts.

In Australia, there are no laws that force companies that have been breached (or inadvertently disclosed information) to notify the affected customers.

The Government has released draft laws to force notification of personal information data breaches, known as mandatory data breach notification.

The legislation is proposed to be introduced in this year's Spring sittings of Parliament, as an amendment to the Privacy Act.

These laws have long been advocated for by privacy experts and were recommended as part of a Parliamentary Joint Committee on Intelligence and Security inquiry into Australia's data retention laws.

However, industry groups are pushing back against the changes fearing they could be difficult to implement and impose an unreasonable compliance burden on businesses.

Nick Abrahams, a partner at law firm Norton Rose Fulbright, advises companies on how to deal with data breaches.

He said "more often than not in Australia people aren't getting notified" and that the legislation was inevitable.

"We just need to get on with it - we're going to get it, we should have it," he said.

"Most other countries of our level of development have similar concepts.

"Particularly boards are having to deal with this issue because right now [breaches don't] get escalated to them because there's no obligation to notify.

"It's an important issue for boards to think about - 'are we risking serious harm to those people whose data we have compromised?'

"The reality is there's so much more of it happening now."

Dark web marketplace booming

Last month,

Other major companies including Jetstar and Suzuki had systems suspected to have been compromised, but both companies denied being breached.

Computers like these can be rented by cyber criminals and used to launch attacks against others for as little as $6.

And yesterday

H&L Australia, whose clients include Woolworths-owned Australian Leisure and Hospitality (ALH) Group, provide point-of-sale (POS) systems for more than 300 restaurants and liquor stores as well as pubs and clubs.

H&L confirmed to the ABC that a server containing marketing material and its client list, known as a Customer Relationship Management system, had been hacked but said no financial details had been stolen.

Several other Australian companies - and Kmart - have also been attacked by hackers, who then stole personal information.

The Australian

Attorney-General calls for more data sharing

Friday, 23 September 2016

Byline: Annabel Hepworth

Section: general

Canberra - The Attorney-General's Department has thrown its weight behind calls for more sharing of data across government in a fillip to some of the nation's most powerful regulators.
The department has pointed to NSW laws on data sharing as a model the government could look to. The move comes after the Australian Taxation Office has pushed for a review of decades-old confidentiality rules that restrict the sharing of personal data across government, while the Australian Securities & Investments Commission also wants to able to secure a wider scope of intelligence.

"The complexity of the current legislative regime can lead to a perception that the use and sharing of data within government is more restricted than it is in reality," the department says.

"Further, this complexity does give rise to genuine barriers to use of data across government including where secrecy provisions may operate ... If real or perceived barriers prove insurmountable to facilitate data sharing between agencies under current legislative settings, one option would be to introduce legislative changes to address cultural and systemic barriers to data use and sharing." The department also says that while public servants often point to concerns such as security or privacy, "the real issue can be a reluctance to make data available." The comments are contained in a new submission to an inquiry by the government's chief micro-economic adviser.

The Productivity Commission inquiry was called by the government after the Murray inquiry and the Harper inquiry both called for more reviews of the use of data.

The government is of a view that greater data sharing could use technology to drive efficiency. Last year, as part of the $1 billion innovation statement, the government released an open data policy.

However, critics have raised privacy concerns.

The Business Council of Australia has told the inquiry that governments should make their data more available. "When done appropriately, this can promote greater transparency, increased effectiveness of government services and broader innovation," the council told the review.Lateral Economics has estimated that greater open data could add $16bn a year to the economy, helping to deliver on the G20's target of boosting growth. Others groups such as the Actuaries Institute have told the inquiry that public access to information from bodies such as the ATO, Treasury and the Australian Prudential Regulation Authority would allow the financial services sector to develop products that meet the needs of consumers.

New York Times

Yahoo Hackers Plundered Data on 500 Million

Friday, 23 September 2016

Byline: Nicole Perlroth

Section: general

San Francisco - Yahoo announced on Thursday that the account information of at least 500 million users was stolen by hackers two years ago, in the biggest known intrusion of one company's computer network.

In a statement, Yahoo said user information -- including names, email addresses, telephone numbers, birth dates, encrypted passwords and, in some cases, security questions -- was compromised in 2014 by what it believed was a "state-sponsored actor."

While Yahoo did not name the country involved, how the company discovered the hack nearly two years after the fact offered a glimpse at the complicated and mysterious world of the underground web.

The hack of Yahoo, still one of the internet's busiest sites with one billion monthly users, also has far-reaching implications for both consumers and one of America's largest companies, Verizon Communications, which is in the process of acquiring Yahoo for $4.8 billion. Yahoo Mail is one of the oldest free email services, and many users have built their digital identities around it, from their bank accounts to photo albums and even medical information.

Changing Yahoo passwords will be just the start for many users. They'll also have to comb through other services to make sure passwords used on those sites aren't too similar to what they were using on Yahoo. And if they weren't doing so already, they'll have to treat everything they receive online with an abundance of suspicion, in case hackers are trying to trick them out of even more information.

The company said as much in an email to users that warned it was invalidating existing security questions -- things like your mother's maiden name or the name of the street you grew up on -- and asked users to change their passwords. Yahoo also said it was working with law enforcement in their investigation and encouraged people to change up the security on other online accounts and monitor those accounts for suspicious activity as well.

"The stolen Yahoo data is critical because it not only leads to a single system but to users' connections to their banks, social media profiles, other financial services and users' friends and family," said Alex Holden, the founder of Hold Security, which has been tracking the flow of stolen Yahoo credentials on the underground web. "This is one of the biggest breaches of people's privacy and very far-reaching."

The Yahoo hack also adds another miscue to what has been a troubled sale of a long-troubled company. In July, Verizon said it would acquire the internet pioneer, roughly a month before Yahoo security experts started looking into whether the site had been hacked. It is unclear what effect, if any, the breach will have on Yahoo's sale price.

In a statement on Thursday, a Verizon spokesman, Bob Varettoni, said his company learned of the breach of Yahoo's systems only two days ago and had "limited information and understanding of the impact."

It is unclear whether security testing -- such as a test to see if security experts could break into the Yahoo network -- was performed as part of Verizon's due diligence process before it agreed to the acquisition.

But such security is often overlooked by investors, even though breaches can result in stolen intellectual property, compromised user accounts and class-action lawsuits. To date, no law requires such security checks as part of due diligence.

"Cybersecurity can absolutely affect a valuation, and these are important questions that investors need to be asking," said Jacob Olcott, vice president of BitSight Technologies, a security company.

Yahoo said it learned of the data breach this summer after hackers posted to underground forums and online marketplaces what they claimed was stolen Yahoo data. A Yahoo security team was unable to verify those claims. But what they eventually found was worse: a breach by what they believe was a state- sponsored actor that dated back to 2014.

A potential breach of Yahoo's systems was first reported by the tech news site Recode early Thursday morning.

The first sign that something was amiss appeared in June, when a Russian hacker who goes by the user name Tessa88 started mentioning, in underground web forums, a new trove of stolen Yahoo data, Mr. Holden said. In July, Tessa88 supplied a sample of the stolen collection to people in the so-called underground web for authentication.

The sample contained valid Yahoo user accounts, but it was unclear whether the data was from a breach of a third-party service or Yahoo itself. And it was not clear whether it came from a recent Yahoo breach or a previous incident in 2012, when the internet service acknowledged that more than 450,000 user accounts were compromised.

Then, in August, a second hacker who goes by the alias Peace of Mind began offering a large collection of stolen Yahoo credentials -- including user names, easily cracked passwords, birth dates, ZIP codes and email addresses -- on a site called TheRealDeal, where hackers can buy and sell stolen data, Mr. Holden said.

TheRealDeal uses Tor, the anonymity software, and Bitcoin, the digital currency, to hide the identities of buyers, sellers and administrators who are trading attack methods and stolen data.

After looking into that data, Yahoo did not find evidence that the stolen credentials came from its own systems. But it did find evidence of a far more serious breach of its systems two years earlier.

Two years is an unusually long time to identify a hacking incident. According to the Ponemon Institute, which tracks data breaches, the average time it takes organizations to identify such an attack is 191 days, and the average time to contain a breach is 58 days after discovery.

Security experts say the breach could bring about class-action lawsuits, in addition to other costs. An annual report by the Ponemon Institute in July found that the costs to remediate a data breach is $221 per stolen record. Added up, that would top Yahoo's $4.8 billion sale price.

Thursday afternoon, Senator Mark R. Warner, a Democrat from Virginia and former technology executive, issued a statement that said the "seriousness of this breach at Yahoo is huge."

He weighed in with a call for a federal "breach notification standard" to replace data notification laws that vary by state. Senator Warner added that he was "most troubled" that the public was only learning of the incident two years after it happened.

New York Times

Email Hack Details Movements of Clinton, Biden and Michelle Obama

Friday, 23 September 2016

Byline: Michael D. Shear, Matthew Rosenberg

Section: general

Washington - Hackers on Thursday posted hundreds of emails from a young Democratic operative that contained documents detailing the minute-by- minute schedules and precise movements of the vice president, the first lady and Hillary Clinton during recent campaign fund-raisers and official political events.
The emails included names and cellphone numbers of numerous Secret Service agents, spreadsheets with the names and Social Security numbers of campaign donors, and PowerPoint presentations showing step-by-step directions for where officials like Vice President Joseph R. Biden Jr. should walk when they arrived at events.

The hackers who posted the emails also distributed what they claimed was a scanned image of the information page from Michelle Obama's passport, though the authenticity of the image could not be verified.

The emails were stolen from the personal Gmail account of the Democratic operative, Ian Mellul. They reveal how widely White House officials, Clinton campaign operatives and Secret Service agents have exchanged detailed and sensitive information with people using personal email accounts.

There is no indication that Mr. Mellul, 22, who was in effect working as a freelancer when the White House or the Clinton campaign needed help, did anything wrong, and government officials declined to talk about the use of the private account.

About a year and a half's worth of emails from Mr. Mellul's account were posted late Wednesday by the website DCLeaks.com, which earlier this month released a batch of emails from the personal account of Colin L. Powell, the former secretary of state, in which he voiced his scorn for Donald J. Trump, the Republican presidential nominee, and his personal peeves with Mrs. Clinton, his Democratic opponent.

The newly released emails do not provide specific security details, but they do reveal the types of movements that top political officials make at such events. If emails were hacked before an event, that could present a more serious security issue.

One document instructed Mr. Biden to walk up four steps at a loading dock in Cleveland before climbing 26 steps to a holding room. Another used blue arrows to show the route Mrs. Clinton should walk through a donor's house in Houston. Both documents included close-up pictures of the event locations.

Mr. Mellul, who volunteered to work as an advance staff member for the White House and the Clinton campaign as he finished his undergraduate education at George Washington University in Washington, declined to comment. "I've got to hang up," he said Thursday when reached on his cellphone.

Cathy L. Milhoan, the director of communications for the Secret Service, said the agency was "aware of the alleged email hacking of a White House staffer.

"Obviously the Secret Service is concerned any time unauthorized information that might pertain to one of the individuals we protect, or our operations, is allegedly disclosed," she added.

An F.B.I. spokesman said the bureau was looking into the hacking. Josh Earnest, the White House press secretary, said that officials took "any reports about a cyberbreach seriously" and that the episode was "something we are taking a close look at."

DCLeaks.com is a relatively new website that has posted documents taken from the accounts of prominent figures like Gen. Philip M. Breedlove, the former commander of NATO forces in Europe, and George Soros, a wealthy backer of liberal causes. On the site, its creators describe themselves as American "hacktivists" who aim to "publish a large amount of emails from top-ranking officials and their influence agents all over the world."

Mr. Mellul hardly fits either description. His low-level job ranks just above that of an intern.

The emails from his account document the often mundane process that White House or campaign staff members go through to prepare for an event, including setting up stages, organizing photo lines,

arranging for lecterns and coordinating with the Secret Service about getting clearances for all of the people the politician will encounter along the way.

One email contained a spreadsheet with the names and Social Security numbers of almost 100 people scheduled to attend a Houston fund-raiser for Mrs. Clinton. In another exchange, a Secret Service agent discussed how many official "pins" would be provided for hotel staff members to have access to an event. After Mr. Mellul said the hotel had requested 50 Secret Service pins, the agent wrote, "Yikes."

Several of the emails contain what is referred to as a "movement document" or a "site diagram" involving the vice president, the first lady or Mrs. Clinton. Those emails were often sent to a large number of people, including Mr. Mellul. In other cases, Mr. Mellul emailed copies of the documents to other campaign or government officials, including Secret Service officials.

"Good morning all," Mr. Mellul wrote on May 20, the day of a Hillary for America fund-raiser. "Please find the attached site diagram for Houston's H.F.A. finance event this evening. Please let us know if you have any questions or concerns. Ian."

The emails begin in February 2015, when Mr. Mellul was in the honors program and studying political science. In the messages, Mr. Mellul comes across as a conscientious and courteous young man whose friends would email him for help with their school essays and résumés.

After high school, he jumped into the intern circuit that feeds into entry-level jobs in Washington. In 2014, he received a coveted internship at the White House and later parlayed the connections he had made as an intern into low-level freelance work for the White House.

His tryout, it appears, was helping Mrs. Obama's team at a lunch for congressional spouses on April 15, 2015.

In an email two days before the event, Lindsay Drewel, a Washington public relations executive, wrote to Anthony R. Bernal, the deputy chief of staff for Jill Biden, the vice president's wife, that if Mr. Mellul "can survive that crazy event (which we know he will) he'll be ready to go! Haha."

After the event, Mr. Mellul even included a Secret Service agent in his round of emails thanking those with whom he had worked. And the day after the lunch, the first lady's office reached out again to see if he could help with an event in Virginia.

Mr. Mellul was excited, and in an email to a friend later that day, he noted that he had been told "it takes a few good trips/events before they really trust you."

On April 20, 2015, five days after his first job with Mrs. Obama's team at the congressional lunch, Mr. Mellul described himself as "on the advance team" for the first lady in an email to his professor saying he might miss class because of an event.

Ottawa a autorisé l'utilisation de dispositifs d'espionnage des communications

Friday, 23 September 2016

Byline: Journaliste maison

Section: general

Ottawa - Le ministère de la Sécurité publique du Canada a maintes fois autorisé l'utilisation par le Service canadien du renseignement de sécurité (SCRS) et la Gendarmerie royale du Canada (GRC) de dispositifs pour espionner les communications des Canadiens, révèlent des documents obtenus par CBC. Ceux-ci sont lourdement caviardés et ne permettent pas d'identifier les fabricants ou les dispositifs en question.

On y apprend ainsi que le ministère a approuvé des demandes de la GRC, du SCRS et du ministère de la Défense nationale pour qu'ils accordent plus d'une douzaine de licences à une société anonyme afin de posséder, fabriquer ou vendre des dispositifs « utilisés principalement pour l'interception des communications ».

Les licences, d'une durée d'un et deux ans, ont été émises à partir de 2015 et, dans certains cas, s'étendent jusqu'en 2018.

Elles ont été accordées en vertu de l'article 191 du Code criminel, qui interdit l'utilisation de technologie pour l'interception clandestine de communications privées, à moins que l'autorisation soit donnée par le ministère de la Sécurité publique.

La GRC a refusé de divulguer la nature de ces licences. Le SCRS n'a pas voulu commenter la nouvelle.

StingRay, un dispositif contesté

Il n'y a pas de politique claire sur la façon dont la police utilise la technologie à des fins de surveillance, ce que dénoncent des défenseurs de la vie privée.

Le mois dernier, la police de Vancouver a admis avoir utilisé le système de surveillance téléphonique StingRay, un appareil de la taille d'une petite valise dont se servent les agences de renseignement du monde entier.

Ce dispositif contesté dupe les téléphones cellulaires à proximité en envoyant des signaux semblables à ceux des tours cellulaires. Une fois connecté, un utilisateur de StingRay peut amasser de l'information transmise par le téléphone, comme son emplacement ou ses messages textes.

StingRay est utilisé également par la GRC pour ses enquêtes, ont révélé récemment des dossiers de tribunaux dans l'affaire Salvatore Montagna. Pour mener son enquête, la GRC avait intercepté des dizaines d'appels des accusés impliqués dans le meurtre de ce mafioso, près de Montréal.

Blazes at Iran petrochemical plants raise suspicions of cyberattack

Friday, 23 September 2016

Section: general

Dubai - A series of fires at Iranian petrochemical plants and facilities have raised suspicions about hacking potentially playing a role, with authorities saying that "viruses had contaminated" equipment at several of the affected complexes.
Iran officially insists the six known blazes over the span of three months weren't the result of a cyberattack. However, the government acknowledgment of supposedly protected facilities being infected points to the possibility of a concerted effort to target Iranian infrastructure in the years after the Stuxnet virus disrupted thousands of centrifuges at a uranium enrichment facility.

Among the worst of the fires was a massive, days-long inferno in July at the Bou Ali Sina Petrochemical Complex in Iran's southwestern province of Khuzestan. Insurance officials later estimated the damage at some $67 million. Authorities preliminarily blamed the blaze on a leak of paraxylene, a flammable hydrocarbon, without elaborating.

Initially, Brig. Gen. Gholam Reza Jalali, who heads an Iranian military unit in charge of combatting cybersabotage, dismissed any notion that the fires could have been caused by hacking. Iran's aging oil pipelines and plants, hit hard by years of Western sanctions, have seen a rapid push to increase production this year to take advantage of the nuclear deal with world powers. Iran also faces occasional separatist attacks on its pipelines.

But on Aug. 27, Jalali acknowledged Iran's petrochemical industry had been the target of cyberattacks. He put the blame on imported and installed components at the facilities.

"The viruses had contaminated petrochemical complexes," he said, according to a report by the state-run IRNA news agency. "Irregular commands by a virus may cause danger."

But despite the infections, Jalali said cyberattacks had no hand in the fires and explosions. He also said "defensive measures are underway," without elaborating. Beyond Jalali's vague comments, what actually infected the plants remains unclear.

It's unknown if Iran, which has boosted its own cyberwarfare and defense capabilities in recent years, has sought outside assistance in its investigation. The Russian antivirus firm Kaspersky Lab, whose analysts were among the first to investigate Stuxnet, said it wasn't involved in investigating this outbreak and declined to comment.

However, Jalali's comments that the viruses spread through imported parts suggests a concerted effort by a foreign power. Iran likely relied on black-market parts while the country faced international sanctions, said Robin Mills, a Dubai-based oil industry analyst and CEO of Qamar Energy.

"Maybe they couldn't always get the high-quality parts coming from countries who are sanctioning it and had to get second-hand parts or parts not of the right specifications and put these pieces together without a lot of international expertise," Mill said. "In that case, of course, accidents can happen." But the number of fires in row has raised suspicions of Iran being targeted.

Such an attack "requires a lot of resources" that individual hackers would not have, said Idan Udi Edry, a former Israeli air force captain who now is the CEO of Nation-E, a cybersecurity firm specializing in protecting industrial systems.

Asked if the Iranian blazes were the result of hacking, Edry said he was "100- percent" sure, based on his own company's experience and surveillance.

"No company, organization or nation in the world would like to admit they've been hacked," he said. "This specific attack was exact the same one (like Stuxnet), only on a different critical infrastructure area."

However, Ralph Langner, another industry expert who studied the Stuxnet virus, said it seemed "unlikely" the fires were caused by cyberattacks, though his firm hasn't investigated.

Stuxnet, widely believed to be an American and Israeli creation, infected thousands of centrifuges at the Natanz uranium enrichment plant at the height of Western fears over Iran's nuclear program. The virus targeted the machines through the industrial control systems that set their speeds, causing them to spin out of control and destroy themselves.

Such control devices, used for years in fields ranging from utility companies to the oil industry, are especially susceptible to hackers. That's because they weren't initially envisioned to be connected to the internet and that most security attention focuses on consumer products such as email and laptops.

While the Stuxnet virus was the most famous hack to exploit them, there have been others that caused real-world destruction. German authorities say a steel mill sustained massive damage to its blast furnace in 2014 after hackers took control of its industrial control systems, though details on the incident remain few.

Iranian hackers also allegedly penetrated the controls of a small dam less than 30 kilometers (20 miles) away from New York City. That dam's system, however, was connected directly to the internet, while the Iranian oil industry is believed to be "air-gapped" -- or not connected directly to the web.

Meanwhile, hackers of all kinds appear to be increasingly targeting industrial control systems. In the US alone, a Homeland Security center tasked with handling such attacks reported it responded to 295 incidents in 2015, up from 245 the year before.

"Cyberattacks are no longer how to steal information," Edry said. "These are attacks that are meant to shut down a country."

Réseau câblé: le futur mode opératoire des espions suisses

Friday, 23 September 2016

Byline: Mehdi Atmani

Section: general

Berne, Suisse - Surveillance L'exploration du réseau câblé prévue par la loi sur le renseignement cristallise les critiques car, aux yeux de certains, elle permettrait une surveillance de masse. Mais, techniquement, de quoi s'agit-il?
« Pêche au chalut » ou « pêche au harpon » ? Les nouveaux moyens d'action dont le Service de renseignement de la Confédération (SRC) devrait se doter avec la loi sur le renseignement (LRens) lui permettront-ils de mener une surveillance ciblée ou de masse? C'est principalement sur ce point que le projet de loi soumis en votation le 25 septembre divise la société civile et les partis. Car elle oppose l'impératif sécuritaire dans un contexte de lutte contre le terrorisme au respect des libertés fondamentales du citoyen.

Dans la future boîte à outils du SRC, la mesure de surveillance par l'exploration du réseau câblé cristallise toutes les critiques. La LRens autorisera en effet le SRC à intercepter en continu toutes les communications internationales qui transitent par la Suisse via le réseau câblé. Avec l'aval du Tribunal administratif fédéral et de la Délégation pour la sécurité du Conseil fédéral, le SRC pourra filtrer les courriers électroniques, procéder à des écoutes téléphoniques par Internet, et rechercher des informations par catégorie de mots clés. Au hasard: djihadisme, islam, finance...

« Menace pour la sécurité intérieure »

Avec l'exploration du réseau câblé, le mode opératoire du SRC rappelle celui du GCHQ - l'agence de renseignement britannique - et son programme Tempora. En juin 2013, Edward Snowden révélait que le GCHQ surveillait les câbles sous-marins reliant l'Amérique du Nord. L'agence interceptait les données pour les partager avec la NSA. En Suisse, la surveillance se fera sur les noeuds où convergent et transitent les données. Le SRC ne pourra rechercher que des informations sur des événements importants en matière de politique de sécurité se produisant à l'étranger. Les données qui ne correspondraient pas à ce critère devront être détruites. « En théorie », s'inquiètent les adversaires de la LRens, qui réunissent les Jeunes socialistes, les Verts et le Parti pirate.

L'habilitation du SRC est également valable dans le cas d'une « menace pour la sécurité intérieure » ainsi que pour « préserver les intérêts nationaux d'une grande importance » . En d'autres termes, seules les données transitant par le réseau câblé suisse vers des fournisseurs étrangers seront surveillées. L'utilisation des données collectées entre expéditeur et destinataire situés en Suisse sera interdite. Pour autant que leurs adresses e-mail soient enregistrées auprès d'un fournisseur d'accès à Internet (FAI) en Suisse.

Prenons l'exemple d'un e-mail envoyé de Lausanne à Saint-Gall. Si le destinataire utilise une adresse Gmail ou du service de messagerie allemand GMX, le courriel transitera par les serveurs de Google à l'étranger ou par l'Allemagne. Il traversera momentanément les frontières helvétiques et pourrait donc être intercepté. Le projet de loi précise que « les exploitants suisses de réseaux câblés ainsi que les fournisseurs suisses de prestations de télécommunication » fournissent « des renseignements sur les itinéraires des flux de données et, sur ordre, en détournant les flux de données en question » .

Pour les opposants à la LRens, l'exploration du réseau câblé par catégorie de mots clés est une méthode de collecte et d'analyse de l'information « archaïque » . Selon eux, toutes les agences internationales de renseignement n'utilisent plus seulement des mots clés, mais surtout des algorithmes. Ceux-ci viennent enrichir des bases de données dans lesquelles l'information interceptée est structurée, puis mise en relation et enrichie avec d'autres informations, dites secondaires: adresse postale, abonnement de téléphone mobile, profil LinkedIn, soit les données personnelles d'un citoyen.

Cette technique de « Deep Learning Management » permet aux agences d'affiner au maximum l'information et d'en tirer le plus de sens possible, comme un Google du renseignement. Si les services

suisses ont l'objectif de se mettre au niveau des techniques de collecte et d'analyse des agences internationales, ils devront employer les mêmes méthodes, préviennent les opposants à la LRens. « Les garde-fous prévus par la loi n'y changeront rien », insiste Guillaume Saouli, le président du Parti pirate.

Pour les opposants à la LRens, l'exploration du réseau câblé par mots clés est archaïque

Sur les réseaux sociaux, Daech se fait plus discret

Friday, 23 September 2016

Byline: Fanny Lauzier

Section: general

Paris - La maîtrise des réseaux sociaux et des codes du divertissement permet à Daech de recruter des djihadistes de plus en plus jeunes.
Facebook, Twitter, Instagram ou encore Snapchat... Depuis deux ans, l'État islamique avait pignon sur rue sur les réseaux sociaux préférés des adolescents. Des forums d'initiés, la propagande de l'organisation terroriste s'était largement déplacée, en 2014, sur les canaux de transmission habituels de la webculture.

Pour recruter le plus largement possible, les partisans de Daech ont utilisé tous les codes d'Internet, étant eux-mêmes, pour beaucoup, des « digital natives » . « Ils ont autour de 25 ans et sont eux-mêmes usagers de ces réseaux » , explique David Thomson, journaliste spécialiste du djihadisme. Daech s'était largement approprié les symboles de la culture Web : ici, une photo de combattant armé d'une kalachnikov câlinant un chaton, là, des selfies de soldats s'immortalisent à bord de tanks ou autour de la piscine d'un hôtel abandonné en Syrie...

Mais l'âge d'or de la communication de l'EI touche peut-être à sa fin. « Depuis quelques mois, on note que Daech est de moins en moins présent sur Twitter. La phase d'euphorie est clairement passée » , constate David Thomson. Depuis la promulgation de la loi Urvoas, le 3 juin dernier, les sympathisants de Daech qui vivent en France sont plus vigilants. En effet, toute consultation « habituelle » de sites Internet ou réseaux sociaux faisant l'apologie d'actes terroristes est désormais punie par la loi. « Depuis, plus aucun partisan basé en France ne se revendique comme tel sur les réseaux sociaux » , observe David Thomson.

Même depuis la zone irako-syrienne, la communication marque le pas. « Des consignes de silence ont été données. Ils ne veulent plus voir circuler de contenus non officiels. La période des selfies est finie. » Les superproductions diffusées depuis le califat, qui reprenaient tous les codes hollywoodiens et des jeux vidéo ultraviolents, se sont aussi raréfiées. « Beaucoup de djihadistes des brigades médiatiques ont été tués. Ils ne sont plus en capacité de produire. »

Toutefois, l'EI pratique un « opportunisme digital » , rappelle Pascal Lardellier, professeur à l'université de Bourgogne et auteur de Génération 3.0, enfants et ados à l'ère des cultures numérisées . « Les partisans de Daech jouent à saute-mouton avec les technologies. Hier actifs sur Twitter et Facebook, ils sont aujourd'hui présents sur Telegram » , une application de communication chiffrée permettant d'échanger de façon sécurisée. C'est d'ailleurs sur cette plateforme que les deux terroristes de Saint-Étienne-du-Rouvray, âgés de 19 ans, se sont rencontrés. Mais sur Telegram, la propagande n'a pas le même impact : « C'est une sphère confidentielle. Il faut donc en faire partie pour avoir accès aux contenus » , nuance David Thomson.

Ottawa Citizen
Quantum computing will cripple encryption methods within decade, spy agency chief warns
Saturday, 24 September 2016
Byline: Ian MacLeod

Ottawa - The head of Canada's electronic spy agency warned Friday the advent of super-fast quantum computers will cripple current encryption methods for securing sensitive government and personal information within a decade.
In a rare public speech, Greta Bossenmaier, chief of the Communications Security Establishment, said cryptologists at the CSE and around the world are racing to find new cryptographic standards before Y2Q - years to quantum - predicted for 2026.

She is the third senior CSE official this week to warn publicly of the threat quantum computing poses to widely used public key cryptography (PKC), protecting sensitive data transmissions from hackers, hacktivists, foreign state spies and other malicious actors.

The CSE is best known as a spy agency -- it collects, decrypts and analyzes phone calls, faxes, emails, tweets, satellite and other electronic signals emanating from adversarial foreign nations and overseas threat actors. But it's also mandated to protect government computer systems and networks, and the information they carry.

Already, federal computer systems are "probed" more than 100 million time a day by suspected malicious actors searching for vulnerabilities.

Potentially every Canadian citizen could be vulnerable

Now, "the challenge of protecting systems is about to get a lot harder thanks to quantum computing," Bossenmaier told an Ottawa conference of the Canadian Association for Security and Intelligence Studies.

"Nearly every company, nearly every organization, nearly every government currently employs some form of encryption," she said. "It's also part of almost every Canadians' daily life, whether we know it or not. Our credit cards, debit cards, work and building passes, just to name a few examples, all work on some form of encryption.

"It's not really a question of if, it's a question of when. The clock has started to tick. So unless we collectively get ahead of the quantum challenge and rethink encryption, the systems and information of companies, of governments, of organizations, of citizens -- potentially every Canadian citizen -- could be vulnerable."

Her warnings follow remarks Monday by David Sabourin, CSE's manager of cryptographic security.

He told a Toronto conference on quantum-safe computing if the 2026 Y2Q prediction holds, "we're in trouble," according to an IT World Canada report.

Scott Jones, CSE's deputy chief of IT security, responsible for securing federal information systems, reportedly told the gathering, "I think we are already behind."

Quantum computing is based on quantum mechanics, the branch of physics that explores and explains the set of laws governing the atomic and subatomic world of atoms, electrons, photons and other particles. While traditional computers use long strings of bits to encode either a zero or a one, quantum computers use quantum bits, or qubits.

Two remarkable properties of qubits - the ability to be in multiple states at the same time (superposition) and the phenomenon in which pairs or groups of qubits can only be described in relation to one another even if they're on opposite sides of the universe (entanglement) - allow quantum computing to be exponentially faster and more capable at factoring very large numbers, which is the basis of current cryptology.

Today's computers simply can't solve what amounts to mathematical problems blocking unauthorized access to encrypted information. But the immense processing power of quantum computers will someday, rendering current PKC ineffective, if not useless.

Yet, as Bossenmaier noted, once the new class of technology becomes a commercial reality, it promises tremendous opportunities that could result in significant advances in science, medicine and engineering.

In April, the Toronto Star obtained a CSE memo discussing how to defend against the quantum threat. The document did not make it clear if the organization also is exploring quantum technology to decrypt intercepted computer communications, the newspaper said.

Toronto Star
National electronic intelligence agency executive calls for 'rational debate' on encryption
Monday, 26 September 2016
Byline: Alex Boutilier

OTTAWA-Canadians are being encouraged to ask more questions about the security of their electronic devices from an unlikely source: an executive at the country's electronic intelligence agency.
Scott Jones, the deputy director of IT security at the Communications Security Establishment, said Canadians need to start taking a greater interest in how their electronic devices protect personal information.

"We should be asking when we go and buy the stuff we have at home, OK, tell me how it's being protected," Jones said in an interview.

"If it's my cellphone, does it have encryption if I lose it? Can somebody just read the data off of it or not? We need to start asking questions like that ... We need to start helping each other, and helping citizens, helping businesses, helping the government when we're buying these products they need to be secure by default."

It may surprise some to hear an employee at CSE counselling Canadians to protect their private information. The agency, which has largely operated in secret since its creation at the end of the Second World War, was thrust into the spotlight after U.S. whistleblower Edward Snowden's disclosures.

CSE is part of the Five Eyes alliance, which includes security agencies in the United States, the United Kingdom, Australia and New Zealand. Snowden's disclosures drew back the curtain on mass surveillance programs used by those countries, including programs that scooped up their own citizens' communications.

Jones' comments also come as law enforcement agencies in the U.S. and Canada are forcefully arguing for limiting citizens' ability to secure their information through encryption programs -- calling for so-called "backdoors" that would let authorities decode the data.

When this is pointed out, Jones agreed the encryption debate is a difficult one to resolve.

"I don't take it personally, because I think it's a really important question," Jones said.

"(We need) a rational debate over the tools that law enforcement needs to do its job, right? I trust law enforcement to keep me safe, but I also trust the legal system to protect my privacy as well, and to find a balance. But we haven't been able to have those conversations in this country (yet)."

While police and intelligence agencies argue about whether citizens should have access to strong encryption, the federal government, on the other hand, is trying to improve its own electronic defences.

Known as "Part B" of CSE's mandate, cyber- defence operations require the agency to work with a host of other federal departments to try and protect government information -- including Canadians' personal information.

For serious cyberattacks, the response could include the RCMP, CSIS, Public Safety, Shared Services Canada, even Global Affairs and the Privy Council Office.

"Cyber is not a singular dimensional problem, it's not just a technical issue or the computer system, it's also about the objective of the compromise or what the threat actor was trying to obtain," Jones said.

"You can't have the master of cyber in a single department, because to do that you'd have to create the department of everything."

The Liberal government is in the middle of a wide-ranging review of Canada's approach to cyber security, and Jones expects the encryption debate to figure into that larger discussion.

The government has also pledged to review Ottawa's overall national security regime, beginning with increased oversight from a parliamentary committee, and to roll back some of the powers granted to intelligence agencies through the Conservatives' controversial terrorism law, Bill C-51

Byline: Mudassar Jehangir

Undisclosed placeline - The official statistics suggest that more than half of Pakistani population carries a mobile phone, and the craze is rising exponentially. From a small kid to a mature adult, everyone wants to get hold of the latest smart phone but out of all the people who believe they cannot live without a cell phone, merely a negligible percentage knows what actually a smart phone is. A dominant part of our mobile phone subscriber base does not want to think beyond selfies, cameras, and social media. Probably we just don't care, but a computer user is as vulnerable to a cyber criminal as a mobile phone user is. I assume we never have time to read the manual before installing any software. We never bother and believe in hit-and-trial methods. Mobile phone technology was boastfully introduced in Pakistan in the late 90s. However, it is still indigestible how all those strategists could never find few moments to sit together and chalk out some useful rules and regulations to regulate the use of this technology. In 2016, we finally have a document called Prevention of Electronic Crimes Bill 2015 which is also somewhat controversial and not comprehensive enough as the Pakistan Electronic Crimes Ordinance (PECO) in 2008.

We were all living a simple life. Therefore, the odds of technology have always been an alien concept to us but with the establishment of technology parks, centrally controlled metro train systems, several e-governance initiatives and a series of announcements of digitizing the entire society make us evenly exposed to the tyranny of cyberspace. If we don't equip ourselves with the arsenal, we would never be safe in this e- world. Only a set of clauses won't make a difference. Our society needs a change of mindset and the realization of the fact that we are not protected even inside our homes.

The smart phones have every necessary hardware and pre-built softwares that can even count the number of breaths we take. It keeps communicating with the nearest tower all the time and that tower to the entire system of telecommunication that has encapsulated the whole world like clouds. Whatever we do, is going into the safe repositories of large organizations. There is no way you can stop the auto-activation of any feature of your mobile phone. And what if you figure out such spying, where would you complain in Pakistan? We have no adequate forum....

Just to give you a little understanding, 97% of the smart phones in Pakistan are based on Android OS and for activating all the apps you need to log in through your Gmail ID. Now, how secure is your Gmail solely depends on your level of information and exposure to the technology. According to a survey, most of the users in Pakistan don't have sufficient knowledge of configuring proper security levels inside their smart phones. Ever wonder why a picture from past suddenly pops up on your screen even when you had deleted it long ago. It happens because Google, on its servers, keeps a record of every tiny thing you do through your mobile phone.

To breach the security of servers and steal the data, there exist a lot of ways. Or they (in the case of more individuals) just need to activate a virus inside our phone that you must have erroneously installed, unknowingly, because it was embedded into a free game app that you or your kid downloaded a few days ago. In this case, you will no more be the owner of your phone. I rarely believe in the claims of software and security companies because even the most secure systems are a piece of cake to crack by a smart hacker.

This is why even the most secure companies on earth keep paying white hackers for improving the security bugs. A recent example is the USD 200,000 offer from Apple for finding loopholes into its products. This measure is a part of SOPs for strengthening the systems that clearly shows there is always room for the smartest guy to get in. If these companies are unable to secure themselves, where does a poor technology user stand in Pakistan?

Just recently child abduction went viral on social media and many days after it was realized by the authorities that certain groups on social media are also taking benefit of the situation and circulating news of fake abduction cases through Facebook and other social networking sites for creating a panic situation in the public. Interestingly, a high-ranking police official in Karachi came up with a confession of helplessness that he did not have enough resources to track people behind the mess.

Since we are relatively new to this world, we therefore don't have a clue about what's going on around us. Producing proper statistics on the rate and pattern of cybercrime in Pakistan is a far-sighted wish. Let's take the example of the most developed country, the U.S. A latest research done by BTB Security based on the data from the FBI, FTC, U.S. Justice Department and other vendors confirm that cybercrime has risen exponentially in the U.S. and despite all the tech-based measures, it is surging like anything.

The findings reveal that business data of 190 million users was compromised in 2015. The identity theft had gone up by more than double from 8.3 million in 2005 to 17.6 million registered cases in 2014. Similarly, ransomware which was once a sub-million dollar business has swelled to $ 24 million in 2015. When I asked BTB Managing Director, Ron Schlecht about what cybercrime would be like in next ten years, he responded with concerns about the infrastructure that creates the digital world. According to him, "Hardware and software are aging, and it will create a vacuum of expense and time for those who were defending it."

Today, security experts believe that cyber wars are imminent, and terrorist organizations will exploit the digital realm to inflict real physical damage.

A widely accepted fact in the U.S. is its critical infrastructure which is vulnerable to collapse, and its electronic voting system is equally vulnerable to cyber attack. Huffington Post reports that what is considered a remote possibility in the U.S. - cyber attacks throughout the most sensitive parts of the U.S. government - are now becoming commonplace.

Just to refresh your mind, we are talking about a country considered technologically aware and that exports the most secure security solutions to the world. Where do we put Pakistan on the map where more than half of the population keeps a mobile phone, and most of the devices are housing multiple mobile SIMs which unfortunately are not backed by proper documentation. Most would argue with me in favor of biometric SIM verification system but how fool proof a verification would be when NADRA is in the process of verifying the CNICs of more than 25 million families.

Cybercrime happens because we step in the cyber world, and you can't protect a nation today by just making a law stringent than ever. The technology we use for our comfort also opens the window for an outsider to peep in. We have to shut that window, and it can only be done through mass education. There should be an extensive exercise and involvement of people from all walks of life for making a comprehensive policy to meet the challenges of the cyber world. The cyber world should be a proper subject and must be made a part of the curriculum in our education system.

Jerusalem Post
Spies in space: The story of Israel's Ofek satellite program
Monday, 26 September 2016
Byline: Barbara Opall-Rome

Jerusalem - If you're looking for a story that captures Israeli innovation, cunning and can-do chutzpa, think spy satellites. Look to Ofek, the Hebrew word for horizon. It's all there in Israel's military satellite program, the newest of which - Ofek 11 - is struggling to stabilize itself in space after its launch earlier last week.
Inserted successfully into orbit by the country's homemade Shavit launcher, the newest and most advanced satellite is likely to soldier on in space, but with limited lifespan and ability to perform its high-resolution spy duties. White- knuckled technicians and program managers toiling around the clock at Israel Aerospace Industries' (IAI) ground control station near Ben-Gurion Airport are still hoping for a favorable ending to the latest chapter still unfolding. But like the chapters that have gone before, Ofek 11 represents the highs and lows of a story driven by strategic need and enhanced by its share of diplomatic intrigue. Conceived in secret, it's a story of battling the laws of physics; and struggling on a shoestring budget to build rockets strong enough to loft satellites small enough into retrograde orbit against Earth's eastward spin.

It's also a story of fortitude. How the euphoria of reaching space in 1988 was followed by bitter back-to-back failures that saw two satellites swallowed by the sea. And how the heroes of our story finagled their way back from the brink with the 1995 launch of Ofek-3, Israel's first operational imaging satellite whose progeny continue to fuel the regional power status of the Jewish state.

"Small countries can be great only if they dream big," said former president Shimon Peres. "With Ofek, we penetrated space and skepticism." (Israel launches new spy satellite, but trouble reported)

Interviewed before the stroke that befell the pioneer of Israel's aerospace and defense industry, Peres said Israel's small size makes it uniquely positioned as a "center of excellence" for advanced research and development. "Our advantage is creative, out-of- the-box thinkers who push the boundaries of what was deemed impossible." But with all due respect to Israel's senior statesman, this is where our tale takes a cautionary turn.

Because the flip side of this story is one of untapped potential and failure to leverage billions of dollars invested in military space to assure commercial competitiveness on the global market.

The US Futron Corp. consistently ranks Israel eighth in an annual competitiveness survey based on myriad criteria, including government investment, national space policy, the ability to attract financing and annual sales. In its latest Space Competitive Index (SCI), we have dropped to number nine.

"Israel continues to be a leader in space technology, but has limited commercial sales," Futron reported in its first SCI survey from 2008. The same holds true today.

"Although Israeli technology is high quality and generally cost-competitive, Israeli manufacturers have less global scale than their counterparts," Futron senior analyst Jonathan Beland told the Jerusalem Post Magazine. But let's go back.

Our story begins in the late 1970s. US President Jimmy Carter was proving relentless in prodding Israel and Egypt toward peace. In the run-up to Camp David, the era of Israeli Air Force reconnaissance flights over Sinai was about to end.

Plan Treasure was a top-secret forum where US and Israeli officials hashed out compensation to come from the 1978 accord. Among Israel's requests: access to imagery from US spy satellites.

"The Americans didn't even answer us; they ignored the request," recalls David Ivry, a retired major general who commanded the Israel Air Force at the time. That's when the indigenous Israeli satellite program started to gain traction. Ivry said. "We knew after the treaty was signed, we would be obliged not to violate Egyptian sovereignty by overflying their airspace as we used to do," he added.

Even prior to the US slow-roll, Israel had been dabbling in military satellite research. Rafael Ltd., then an R&D arm of the Defense Ministry had the lead, but all three Israeli government-owned firms were involved in aspects of rocketry.

In any case, Israel did not start from scratch with continuously upgraded versions of the three-stage Shavit rocket that launches Ofek into space.

From here our story turns to the courageous few who fought for funding as fiercely as the technological hurdles blocking their way.

Chaim Eshed is a key protagonist. He's now a retired brigadier general, teacher and chairman of the national committee for space R&D, but then a young Air Force lieutenant colonel working technical issues for military intelligence. Eshed ran the Ofek satellite part of the program, subsequently serving for decades as Israel's military space czar.

Another key character in our story is Uzi Rubin. An aeronautical engineer hailing from the IAI, Rubin headed the Shavit launch effort for the Defense Ministry and went on to establish Israel's missile defense organization.

Together they toiled in secret - without the benefit of external assistance or outside consultants - on tenuous funds, working with guys named Moshe Bar- Lev, Aby Har-Even, Ilan Porat and a few dozens of others involved in the effort.

Success was achieved in September 1988, when the Israeli-built Shavit launched a test satellite named Oz into space. With Oz - Hebrew for courage - Israel joined only seven other nations at the time to launch satellites in space.

Confidence grew with a second success. Just 18 months after the first Oz entered orbit, another Shavit launched Oz number 2, another test satellite capable of communicating with its ground-based operators, but not yet endowed with a payload to capture images from space.

As testament to their confidence of the horizon ahead, they changed the name of the satellite program from Oz to Ofek. But that horizon proved elusive with two failures that followed.

Problems with the Shavit rocket sent two Ofeks fully equipped with imaging cameras plummeting into the sea.

To this day, Israel only acknowledges one failure - of Ofek 2 in September 1994 - prior to the successful April 1995 launch of Ofek 3. The name change offered a convenient cover for public consumption, but those back-to-back failures put the program on borrowed time.

No courage and conviction would save them from another failure. "After the first failure, there was tremendous pressure to cancel the project. But we managed to continue," recalls Ivry, who by this time was chief executive of the Defense Ministry.

"After the second failure, it was really a crisis. I managed to find a small amount of money to keep the team and continue the program... But I must say, if it failed yet again, we wouldn't have been able to proceed," Ivry said.

Eshed estimates the penalty of launching from Israel westward - over the Mediterranean rather than above its neighbors - at nearly 40 percent. To make up for it all, the launcher had to lift well above its weight class and Ofek satellites had to weigh a lot less and be more maneuverable than those that benefit from the initial velocity from Earth's rotation.

Every kilo counts, so much so that Israel had to develop new composite materials and super performing substructures. Even the screws holding it all together had to be hollow.

From his high-rise Tel Aviv sea-view flat, Eshed credited "the shadow of the guillotine" for the engineering feats.

"We had no choice. To do otherwise could be construed by our neighbors as an act of belligerence that could trigger a war... We had to struggle both ways with miniaturization of the satellite and added thrust to our launchers. Under the shadow of the guillotine, we can do wonders."

In an interview at a popular Tel Aviv café, Rubin remembered the intense pressure to perform. "We were out of money. We were desperate. And then the chief of my financial department figured out an aggressive accounting formula that basically allowed us to build the next launcher on credit, something that was not and is still not permitted."

As they struggled to identify and fix failures with the launcher, a separate team was racing to ready a replacement satellite.

"We were caught in a vise; pressed by both ends to come up with the launcher and satellite that would finally succeed," said Moshe Keret, former president and chief executive officer of IAI, the state-owned firm that still builds the Shavit launcher and all Israeli-made satellites.

With no more satellites on the shelf and no funds for new builds, they scavenged for the components that would transform a test satellite into an operationally capable vehicle.

"It was a qualification model; not flightworthy. But we had to make it work," recalls Uzi Eilam, a retired brigadier general who managed the entire effort as head of the Defense Ministry's research and development directorate.

After overcoming the breakdown of tracking radars, and other upsets too many to count, Israel managed to find a window between freak rainstorms and Russian satellites orbiting overhead for the ultimately successful April 1995 launch. Ofek 3, Israel's first orbital spy, finally made it to space.

Rubin said he would never forget the reaction of then-prime minister Yitzhak Rabin upon hearing the news.

"Uzi [Eilam] and I went to brief Rabin, and when we told him the satellite was going to take pictures, the first thing he blurted out was, 'What will Amr Moussa say?' ... Rabin hated his guts," Rubin said, referring to Egypt's foreign minister at the time.

Like earlier high points, success proved short- lived, when a January 1998 launch failure sent Ofek 4 plummeting into the Mediterranean. After that setback, the program was again in crisis; actually on the brink of bankruptcy.

But a big part of this story is refusing to go down for the count. Here's where Ilan Biran enters in a big way. A retired major general who hailed from Israel's can-do Golani infantry brigade, Biran succeeded Ivry as Ministry of Defense managing director.

When informed by his bosses that no more funds would be approved for the program, what did he do? He sold some 1000 MoD-owned apartments, from Safed in the Galilee down to Eilat on the Red Sea, netting some 400 million shekels ($115.69 million), enough, he maintained, to keep the program afloat for the coming years. "It doesn't sound like a lot of money, but for us, it was plenty enough to stabilize the program," Biran recalled.

"Instead of carrying on month-by-month or - in best cases - year-by-year, we finally had the multi-year funding that brought us additional electro-optic satellites and especially the all-weather/ day-night SAR [synthetic aperture radar] satellite, which at the time, was a kind of dream," he said.

Israel went on to deploy that first radar satellite, dubbed TecSAR, ahead of schedule in January 2008, thanks in large part to Biran's real estate sales and funding from India, according to publications. Now known as Ofek 8, TecSAR was the first MoD satellite to be launched abroad; part of a joint venture agreement whose details remain under wraps to this day. The satellite was launched in India from an Indian PSLV launcher.

At the same time, Biran threw Defense Ministry support into a new commercial venture that joined IAI, the nation's sole satellite producer; Elbit's Elop Electro-Optical Industries, producer of the high-resolution payload; and a commercial US firm then called Core Software Technology.

The resulting company, ImageSat International (ISI), would own and operate Ofek spinoff satellites for the commercial market under a new line called Eros (Earth Remote Observation System). Their first Eros reached orbit in December 2000 aboard a Russian Start-1 rocket.

And it's a good thing that it did, because at the time, Israel's defense establishment was still struggling to upgrade its Shavit launcher from the Ofek 4 failure while its sole pair of eyes in the sky - Ofek 3 - was running out of fuel. For nearly two years - from the eventual hero's death of Ofek 3 until the successful May 2002 deployment of Ofek 5 - that Eros satellite was Israel's prime source of space-based intelligence.

In the years that followed, Israel continued to put increasingly higher performance satellites into space, while suffering just one additional failure, that of Ofek 6 in 2004.

But instead of reaping the commercial benefits of the ImageSat venture - which aspired to a constellation of eight Eros satellites - turf battles and competing agendas led to the largest and most potentially damaging lawsuit in Israeli aerospace history.

IAI finally resolved the issue in 2014 by acquiring full control of ISI and settling claims out of court. Today, it has sole authority over the Eros satellite sector and is busy building a third Ofek-derived commercial satellite, dubbed Eros C.

Experts including Tal Inbar of the Fisher Institute for Strategic Air and Space Studies lament the lost time spent battling one another instead of growing Israel's observation satellite sector.

"This industry was built to support strategic needs, but we all knew it could never survive only on low volume orders from the MoD. In order to be truly self-sustaining, we needed to export," Inbar said.

But barring a few notable exceptions - which include an imaging payload to South Korea and joint scientific projects with the French, Italian and European Space Agencies - export and commercial orders failed to come. Industry titans at the time were in such distress they went public with heretofore closed-door appeals for state- level funding.

"We've had some successes, but on balance, it's been a failure," Haim Rousso, former president of Elbit Elop, a publicly traded firm that provides Israel's electro-optical imaging payloads, told an international conference here in early 2011.

"We Israelis, instead of relying on chutzpah and innovation to cover our share, must be able to tap into a significant, long-term, non-military budget, not crumbs," Rousso said.

For years, the Israel Space Agency had been subsisting on a joke of a budget; a mere $700,000 in 2000 that failed to breach the $1 million level until recently. After years of complaints and threats to close down key parts of Israel's satellite sector, the Treasury, in 2012, authorized 200 million shekels ($57.67 million) over two years.

Today, the Israel Space Agency's budget stands at 78 million shekels for 2017 and 86 million shekels for 2018.

Zvi Kaplan, a former Israel Space Agency director, welcomed the budget boosts, yet cautioned: "If you don't come out with a satellite every two or three years, the line goes cold. Your technology grows stale. And even if you manage to secure new collaborative projects every four or five years, if they are persistently plagued by funding flow, the market catches up."

But ours is a tale with an ending unknown. If you ask Joseph Weiss, IAI president and chief executive, it's already a feelgood story, and much like good wine, Weiss says the story only gets better with time.

"Look what we've done since the Camp David days, when less than a handful of countries could utter the word 'space.' We dived into an empty pool and slowly and surely, without budget, here we are: one of only eight or nine in the world who can really deliver a turnkey project to design, develop, manufacture, launch, operate and of course maintain the satellite throughout its life."

Weiss acknowledged numerous disappointments and missed opportunities. Among them, failure to translate the performance of the indigenous Shavit launcher into a business success; a failed joint venture with state-owned Rafael to develop micro-satellites weighing less than 120 kilograms; and competitions lost in Turkey.

The IAI chief insists the firm's earth imaging sector is not only surviving, but profitable, due to steady work from the Defense Ministry and occasional export orders. "Now I'm not saying its billions. That will take some time. Perhaps we'll need some partners."

Aside from Ofek 11, which was recently sent into space, two other IAI-built imaging satellites - one of the French Space Agency and another for the Italian Space Agency - are planned for launch in 2017. The firm is also building, as noted, the Eros C and at least two more successors to Ofek 11. As for new business, IAI is eyeing Brazil, Chile, Columbia and Mexico, among others.

Equally upbeat is Isaac Ben-Israel, a retired major general and former head of the Defense Ministry's Research and Development Directorate who now serves as chairman of the Israel Space Agency.

Ben- Israel led the effort to vector for commercial and civil space the approximately $80 million that the government invests annually in its military space program. He maintains that every dollar the government invests in space can yield fruit 15 times more than initial investment.

"I'm telling you that with $100 million investment, we can get to $1.5 billion, which is about 1 percent of the global space market. This year, the global space sector is about $200 billion all told - products and services - and all I want to get is one percent."

Meanwhile, Eshed, our protagonist from the beginning of this tale, refuses to stop dreaming big. He's now pushing to develop a world-leading sector for nano-satellites, each comprising several units weighing one-to-10 kilograms programmed to operate in small clusters or even huge swarms.

He's gathering inter-ministerial government support for a national program called "Israel 70," which aims to launch 70 such satellites built by 70 different local schools to mark Israel's 70th birthday in 2018.

"Imagine a swarm of 2000 nano-satellites working coherently together; you can get a huge aperture telescope far larger than the sum of their individual parts."

Eshed acknowledges that this vision is yet not widely shared by Weiss and other big players in Israeli industry.

But he insists Israeli industry salvation will not be achieved with more and better of the same, but by a whole new class of capabilities for government, commercial and scientific needs.

"Israel has all the means of becoming the world's fourth or fifth leading power in space... We have the manpower, we have the technology, we have 30 years of heritage, and that's the direction I'm trying to move us in," said Eshed.

"You can dream the dream as long as it does not contradict the laws of physics. You may need to be courageous; even a little crazy, but that's what happened with Oz and Ofek. It's the same story."

Al Jazeera
Facebook 'blocks accounts' of Palestinian journalists
Monday, 26 September 2016
Byline: Sophia Hyatt

Gaza - Editors from two Palestinian news publications based in the occupied West Bank say their Facebook accounts were suspended last week and that no reason was provided, alleging their pages may have been censored because of a recent agreement between the US social media giant and the Israeli government aimed at tackling "incitement".
Last week, four editors from the Shehab News Agency, which has more than 6.3 million likes on Facebook, and three executives from the Quds News Network, with about 5.1 million likes, reported they could not access their personal accounts. Both agencies cover daily news in the occupied Palestinian territories.

Nisreen al-Khatib, a translator and journalist at the Quds News Network, told Al Jazeera that the publication believes the account suspensions were triggered by an agreement between Facebook and Israel earlier this month, in which they agreed to jointly combat what Israeli claims is "incitement" by Palestinians on social media.

Al-Khatib said that even Quds News Network's non-political vertical that focuses on "entertainment" and "international news" had been suspended, although access was later restored.

"[Sharek-Quds News Agency] does not publish anything that violates Facebook standards or that could annoy governments. But still, we are targeted," she said.

Al-Khatib said the news agency asked Facebook for an explanation on why the accounts had been suspended "for no reason". Facebook replied on Saturday with an apology, saying the suspension had been "accidental".

The three suspended accounts of Quds News Newtork journalists were unblocked over the weekend by the networking site, she said.

Remah Mubarak, manager of Shehab News Agency, said one of four managers' accounts that had been suspended "with no warning" by the California-based tech company had still not been reactivated as of late Sunday.

"One manager's account is still suspended," he told Al Jazeera, adding the other three accounts were unblocked on Saturday.

Al Jazeera contacted Facebook for comment, but it did not respond by the time of publication.

Mubarak of Shehab News said the "agency covers news in the West Bank, Gaza Strip and also inside Israel".

"Maybe they don't want this covered, especially in the West Bank, where executions have happened in recent days. Maybe that effects them on social media and they want to stop these pages to hide the proof," he said.

Al-Khatib said the incident isn't the first time Palestinian news sites have had issues with Facebook.

"Many other Palestinian network agencies have been shut down by Facebook for no reason actually. There are at least five Palestinian pages that have been shut down. Gaza 24 was [one of them]," she said.

The Israeli military said on Sunday it has indicted more than 145 Palestinians so far this year for incitement over social media.

Sunday's announcement comes amid an Israeli campaign to put an end to online postings it says have fueled a near continuous wave of violence over the past year. Palestinians say the violence is the result of nearly 50 years of Israeli military occupation.

Since October, at least 230 Palestinians, 34 Israelis, two Americans, one Jordanian, an Eritrean and a Sudanese have been killed, according to a count by the AFP news agency.

Shortly after news broke earlier this month of the agreement between the Israeli government and Facebook, Israeli Justice Minister Ayelet Shaked said Tel Aviv had submitted 158 requests to the social media giant over the previous four months asking it to remove content it deemed "incitement". She said Facebook had granted 95 percent of the requests.

Over the summer, an Israeli legal advocacy group - connected to the Israeli army and intelligence agencies -filed a $1bn lawsuit against Facebook claiming the company was violating the US Anti-Terrorism Act by providing services that assist groups in "recruiting, radicalising and instructing terrorists".

But rights groups and monitors argue that activists and journalists, not "terrorists", are often the target of incitement charges.

USA Today
In breach's wake, Yahoo user lawsuits begin to pile up
Monday, 26 September 2016
Byline: Mike Snyder

Washington - The lawsuits filed against Yahoo in the wake of a massive data breach at the Net media company continue to come.
Two cases filed in U.S. District Court in San Francisco seek class action-status -- one Saturday on behalf of Edward McMahon of New York and another Friday for Maria Sventek of Little Rock, Ark. -- and charge Yahoo with failing to protect users' personal information in one of the largest data breaches of its kind.

Yahoo on Thursday said that it had been the victim of a breach in 2014 in which at least 500 million Yahoo accounts were stolen from the company in what it thought was a hack by a state-sponsored actor. Among the data possibly taken: names, email addresses, telephone numbers, dates of birth, and in some cases, encrypted or unencrypted security questions and answers.

In the McMahon case, his attorneys say that Yahoo "intentionally, willfully, recklessly, or negligently" failed to protect its computer systems and failed to tell users that their data "was not kept in accordance with applicable, required, and appropriate cyber-security protocols, policies, and procedures."

Yahoo violated Federal Trade Commission Act provisions and California business laws by "failing to employ reasonable and appropriate security measures to protect subscribers' personal information," Sventek alleges in her suit.

These suits follow a similar one filed Friday by another Yahoo user Robert Schwartz of New York.

The investigation into the breach threatens to delay Verizon's acquisition of Yahoo. The telecom giant bet out multiple bidders for Yahoo's core business and assets and seeks to pay $4.8 billion to close the deal in the first quarter of next year.

Yahoo declined comment on the lawsuits.

The Australian
ASX told to step up cyber defences
Monday, 26 September 2016
Byline: Richard Gluyas

Canberra - The Australian Securities Exchange should upgrade its readiness for an extreme cyber attack, ensuring by the end of June next year that it can recover its critical clearing and settlement operations within two hours, says the Reserve Bank.
The RBA's recommendation is contained in its annual review of the ASX's clearing and settlement facilities. It came at the close of a torrid week for the ASX, which suffered an outage in its equities trading system, ASX Trade, last Monday, due to a hardware failure in the system's main database. The review was completed before the ASX's recent outage.

Equities trading is a separate function to clearing and settlement, and ASX chief executive Dominic Stevens said from the outset that the breakdown did not stem from a cyber attack.

Global regulators, however, are increasingly concerned about the resilience of financial market infrastructure to online threats.

The RBA said it had adopted a guidance note published in late June by IOSCO (the International Organisation of Securities Commissions) and CPMI (the Committee on Payments and Market Infrastructures), which recognised that it might take time to meet expectations of a full recovery of critical operations within two hours of a cyber attack.

"Consistent with the guidance, the assessment recommends that ASX develop concrete plans to improve its capabilities to meet this requirement by end June 2017," the RBA review said.

The review also stressed the importance of improving the resilience of the ASX's extended network, following the infiltration of the SWIFT global money-transfer system earlier this year.

Banks rely on the network, formally called the Society for Worldwide Interbank Financial Telecommunication, to guarantee the authenticity of orders to make payments from customers'

accounts. However, gaps in security standards and poor communication about breaches have raised questions about SWIFT's ability to deal with cyber attacks.

The RBA noted that the IOSCO and CPMI guidance required users of financial market infrastructure to adequately support cyber resilience frameworks.

"In light of these developments, the assessment recommends that ASX consider developing participant requirements in the area of cyber resilience, liaising as appropriate with (the RBA) and other relevant authorities," it said.

The ASX and Chi-X Australia got the thumbs up last March from an inaugural cyber resilience review of both exchanges by the Australian Securities & Investments Commission. The ASIC report concluded that the ASX and Chi-X had, up to that point, met their statutory obligations to have sufficient resources for the management of cyber resilience.

ASIC Commissioner Cathie Armour said a comprehensive and long- term commitment to cyber resilience was essential to assist all organisations and the Australian economy to manage the threat.

"ASIC encourages all financial services providers to consider and discuss the information in this report as they develop or enhance their cyber resilience frameworks," Ms Armour said.

"We also strongly encourage organisations to share threat intelligence and collaborate with industry peers to improve cyber resilience practices across the financial services industry." In its assessment, the RBA also said the ASX had completed a detailed review of the collapse and default of the stockbroking firm BBY, with a particular emphasis on default management actions.

The ASX, it said, had developed a plan to implement a number of enhancements to its risk management and default management arrangements, including an improvement in stress-testing models so they could better reflect liquidity, spread and concentration risk.

Implementation of the plan, which also features improvements to the close-out process and education and communication initiatives, will take place in 2016-17.

The RBA said the ASX had a well-established framework for managing the default of a participant, which it had continued to enhance in recent years.

The central bank, even so, had made a number of recommendations in line with the requirements of the financial stability standards.

The ASX's Mr Stevens last week apologised for the glitch, labelling the outage "unacceptable" to both market participants and the company.

Associated Press
Intelligence over riches in Yahoo breach
Sunday, 25 September 2016
Byline: Brandon Bailey

San Francisco - If a foreign government is behind the massive computer attack that compromised a half billion user accounts at Yahoo, as the company says, the breach could be part of a long-term strategy that's aimed at gathering intelligence rather than getting rich. Yahoo says the breach involved users' email addresses, passwords and other information - including birthdates - but not payment card or bank account numbers. Although the stolen data could still be used in financial crimes, such as identity theft, experts say a foreign intelligence agency might combine the Yahoo files with information from other sources to build extensive dossiers on U.S. government or corporate officials in sensitive positions. "With state-sponsored attacks, it's not just financial information that's of value," said Lance Hoffman, co-director of the Cyberspace Security and Privacy Institute at George Washington University. "In the long run, if the state accumulates a lot of information on you, and especially if it corroborates that with other sources, it can assemble a pretty good profile."

Governments have also been known to hack email accounts to keep tabs on their own citizens or dissidents. Experts believe that was one motive behind a 2010 hacking of Google Gmail accounts used by Chinese human rights activists.

Yahoo hasn't revealed the evidence that led it to blame a "state-sponsored actor" for the latest attack, which the Sunnyvale, California, company said occurred two years ago and was discovered only in recent weeks.

Some analysts warn that "state sponsored" can be a vague term. It might also be an easy excuse to deflect blame for a company's own security lapses, by suggesting it had no

See Breach, D2

From D1

hope of defeating hackers who had all the resources of a government intelligence agency behind them, warned Gunter Ollmann, chief security officer at Vectra Networks, a San Jose, California, security firm.

Yahoo declined comment, but its top security official, Bob Lord, has said the company would make that claim only "when we have a high degree of confidence." In a policy statement last year, Lord also said the company wouldn't release details about why it believes attacks are state-sponsored because it doesn't want to risk disclosing its methods of investigating breaches.

This wouldn't be the first time that governments were implicated in high-profile hacking attacks.

U.S. officials have hinted that China might be to blame for a 2015 breach at the U.S.

Office of Personnel Management, in which background files and even fingerprints of millions of federal employees were stolen.

China denied any official involvement.

More recently, news reports say U.S. intelligence officials have blamed Russian spies for the hack of Democratic National Committee files, although Russia's government has also denied this.

Some security experts believe the OPM attack was carried out by the same hackers who also stole data files from large U.S.

insurance and health-care companies in 2014 and 2015.

It may have been part of an effort to gather sensitive or compromising information to blackmail or coerce individuals working at a variety of federal agencies. Hackers could also use such personal information to concoct bogus emails and send them to a person's Yahoo account, in what might be a sophisticated "phishing" scheme aimed at getting the target to click on a link containing "spyware" or other malicious computer code.

"They'd have the ability to conduct targeted phishing attacks against individuals with potentially valuable information, without going through their government email accounts," said Tim Erlin, senior director of security and risk strategy at Tripwire, a cyber- security firm.

Similarly, governments might want to target executives at multi- national corporations, especially if they're competing with companies based in the country that sponsored the attacks. In such cases, intelligence officials might share useful commercial secrets with their home-grown industries, said Jeremiah Grossman, an official at SentinelOne, a Silicon Valley computer security firm. He noted that the 2010 attack on Google was blamed on Chinese hackers who also targeted U.S. companies outside the tech industry.

In any event, security experts warn that the Yahoo breach could still put ordinary users at risk, particularly if the hacked information finds its way to online marketplaces where stolen data are bought and sold.

Many people use the same email address and password for a variety of online services, where they might also have provided financial information such as credit card numbers.

Is Quantum Computing A Risk For Canad'a Spy Agency
Sunday, 25 September 2016
Byline: Matthew Barnes

(Unidentified Placeline) - Quantum computing technologies are already here in various commercial application is select parts of the world. While a personal quantum computer is a reality that's several years away, that is not stopping the Communications Security Establishment(Canada's spy agency) from ringing the alarm bells.
On Friday, the head of the Communications Security Establishment warned that these highly advanced computers have the potential to bypass current encryption methods used all over the world.

According to the article in the National Post, many cryptologists around the world are in a race to find a viable solution to defend against hackers who want to use quantum computing techniques to hack into secure systems.

There are predicting this technology would be widely available sometimes in and around 2026.

Greta Bossenmaier, chief of the Communications Security Establishment:

It's not really a question of if, it's a question of when. The clock has started to tick. So unless we collectively get ahead of the quantum challenge and rethink encryption, the systems and information of companies, of governments, of organizations, of citizens -- potentially every Canadian citizen -- could be vulnerable.

Scientists are still working at harnessing the high potential of quantum computers. This technology can process colossal amounts of data extremely quickly and at the same time by using atoms as a computing platform.

What Is Quantum Computing

I have only just begun researching the technology in more detail, and already what could be achieved with this sort of computing power for artificial intelligence is absolutely astonishing. Major tech companies such as Google and Microsoft are already developing this technology for use in future products.

Moreover, it is this which security agencies around the world are worrying about. Using this technology, to hack into a secure server would not take too much time at all, if a quantum computer can analyze every possible combination at once to break into a system.

Swiss hold referendum on state snooping
Sunday, 25 September 2016

Geneva - Swiss voters granted new powers Sunday to the country's intelligence services, allowing them to track internet activity, snoop on email and tap phones to better fight spies, criminal hackers and violent extremists.
A majority of 65.5 percent voted for the new law in the national referendum, Swiss media reported.

Under it, the Federal Intelligence Service and other authorities will be allowed to tap phones, infiltrate email and deploy hidden cameras and microphones to monitor suspects who are deemed a clear threat -- but only if authorized by the federal administrative tribunal and oversight counselors.

Until now, Swiss authorities had been barred from using anything more than publicly available information or tips from foreign officials when monitoring threats inside the country.

Proponents said the law was needed to help Switzerland catch up with other countries that have stronger legal arsenals to counter cyber- crime or extremist attacks. Opponents say it will deplete civil liberties, do little to truly impede terrorism and chip away at Switzerland's long- vaunted neutrality.

Hacker who aided Islamic State reveals complexity and challenges of terrorism in cyber age

Saturday, 24 September 2016

Washington - Ardit Ferizi wasn't your typical Islamic State soldier. He didn't travel to Syria or launch a "lone-wolf" style attack. He contributed in his own way - by hacking.
The teenage computer prodigy last year broke into a well-known US retailer's computers, swiped information on tens of thousands of its customers and provided a list to Islamic State of more than 1,300 names of those believed to be government and military personnel.

Within weeks of the June 2015 hack, the group published the identities as part of a "kill list", urging home-grown extremists to hunt and murder the military and government officials. The publication sent chills through those on the list and represented a propaganda coup that allowed Islamic State to boast of being able to reach directly into Americans' computers, "watching your every move".

In court papers and in interviews, US officials say the case highlights how fast the terror threat is evolving in the age of computers and social media, especially for a terror group urging its followers to carry out "lone-wolf" attacks when given the chance. It also revealed Islamic State's global reach - Ferizi, a citizen of Kosovo, used a computer in Malaysia to hack the US retailer and then forwarded the data to Islamic State operatives in Syria, who called on followers to strike the workers where they lived.

"This is the blended threat," said John Carlin, the Justice Department's top national security prosecutor. "Terrorism is now occurring at the speed of cyber, and they are exploiting Western-made technology and social media platforms."

Ferizi, who was arrested in Malaysia not long after the successful hack, was extradited to the United States. He was sentenced on Friday to 20 years in federal prison after having pleaded guilty to terrorism and hacking-related charges.

Standing before a US district judge in Alexandria, Virginia, on Friday, Ferizi wore a green jail jumpsuit and spoke in a quiet voice, saying he was "very sorry for what happened, making people scared".

His lawyer, Elizabeth Mullin, portrayed him as a troubled, misguided drug user who did not subscribe to Islamic State's radical ideology and didn't understand the consequences of his actions.

Federal prosecutors disagreed, pointing to excerpts of messages between Ferizi and well-known Islamic State recruiters that they said left little doubt he understood his work could be used in deadly ways.

"This was a hit list," said Special Assistant US Attorney Brandon L. Van Grack said. "This wasn't about stealing money from these people."

Ferizi, 20, was born in Gjakova, Kosovo, and raised in a middle- class family who endured ethnic cleansing at the hands of the Serbs in the late 1990s, his lawyer wrote in court papers. As a four-year-old, Ferizi and his family were forcibly removed from their uncle's home by Serbian police and watched helplessly as the uncle was executed, according to the papers.

After Nato intervened in the war and stopped the fighting, Ferizi returned to a somewhat normal life and got interested in computers. By the age of 10, he was a hacking prodigy and eventually assumed the online persona of "Th3Dir3ctorY", the leader of an Albanian hacking collective responsible for breaking into government databases in Israel, Serbia, Ukraine and elsewhere, court papers show.Ferizi, who struggled with undisclosed mental health problems. kept getting into trouble and was caught hacking into a Kosovo government database, court papers show. Hoping to turn his life around and improve his computer skills so he could earn a legitimate living, he moved to Malaysia to attend college.

While there, he communicated via Twitter's direct messaging system with two well-known members of Islamic State, Tariq Hamayun and Junaid Hussain, both British citizens who were fighting and acting as recruiters for the terror group in Syria. Both men had been in communication with jihadists linked to terror plots, federal officials say.

The FBI found Twitter records, for example, showing that Hamayun had been communicating with one of the two men who were fatally shot by police while trying to attack a "Draw Muhammad Contest" in Garland, Texas, in May 2015. Drawn to the Islamic State's rhetoric, Ferizi at first administered a website that published the group's violent videos and literature. He next passed along some stolen credit card data to Hamayun, who complimented the effort and said the credit card information was good enough to "do some damage".

"U sound like a good person," Hamayun messaged Ferizi in April 2015, according to excerpts of their Twitter direct messages included in court filings. "Plz brother come and join us in the Islamic State."

Two months later, Ferizi hacked into the US retailer, which is not identified in court papers, and began stealing the identities of tens of thousands of customers.

Proud of his work, he boldly emailed a representative of the company, demanding US$500 in Bitcoin, an online currency, to relinquish his access to the company's computers and to explain how he had broken into them.

The company's representatives reported the hack to the FBI, thinking they were the victims of an all-too-common cyberattack and extortion scheme. As the FBI traced the intrusion to Ferizi, the hacker was narrowing more than 100,000 identities down to 1,351 that had military and government email addresses.

He next sent the information to Hussain, who was a member of Islamic State's cyber unit. Two months after that, Hussain and the Islamic State unit published the identities, bragging, "We are extracting

confidential data and passing on your personal information to the soldiers ... who will strike at your necks in your own lands!"

Clearly proud of Ferizi's work, Hussain told the hacker he was helping Islamic State to "hit them hard".

"God willing", Ferizi replied in Arabic, punctuating the message with a smiley-face emoticon.

Hussain then urged the young man to come to Syria to join his elite group of cyberterrorists.

"We can work together here," the recruiter promised. "u will stay in the base. free food. free electric. free gas."

Ferizi never got the chance. Not long after that exchange, Hussain was killed in a US air strike, and the hacker was captured.

New York Times
What the hacking at Yahoo means for Verizon
Saturday, 24 September 2016
Byline: David Gelles

Washington - It was the kind of phone call no chief executive wants to make - or receive - in the middle of a multibillion-dollar deal.
On Tuesday, Lowell McAdam, head of Verizon Communications, was on the road. Marissa Mayer, chief executive of Yahoo, was at work in Silicon Valley. Executives at both companies were moving forward on Verizon's $4.8 billion acquisition of Yahoo's core business.

But Mayer had some unexpected bad news. She caught up with McAdam and Marni Walden, a rising star at Verizon who is expected to oversee the Yahoo business after the deal is complete, by phone, according to people briefed on the call, who spoke on the condition of anonymity.

Yahoo recently discovered that at least 500 million of its user accounts had been breached by hackers two years ago, well before the two companies began talks. Yahoo and law enforcement officials were scrambling to unwind the intrusion.

After calling McAdam and Walden, Mayer phoned Tim Armstrong, who leads the AOL business at Verizon, according to the people briefed on the conversation. Again, the news was not good.

The calls set off a flurry of questions at Verizon - How could this possibly have happened? Who was behind it? Why is it only becoming known now? Could this jeopardize the deal? - but also the sounding of an alarm and the deployment of a triage team to assist Yahoo.

The telecom giant directed its online security experts, including Chandra McMahon, Verizon's chief information security officer, to do their own investigation of the hack. And they enlisted the help of Verizon's security division, part of its enterprise solutions business, which helps companies defend against and manage hacks.

Now, just a few days after Verizon learned of the breach, it is contending with the ramifications of what is believed to be the largest hack of a single company. Even as Verizon tries to assess the damage at Yahoo and prevent further security intrusions, the scope of the hack and the potential fallout - including the possibility of a costly class-action lawsuit - is inevitably prompting renewed scrutiny of a deal that was intended to transform the telecom behemoth into a digital media powerhouse.

For now, Verizon has given no indication of whether the breach will affect its plans to acquire Yahoo. On Friday, the company declined to provide a comment beyond a statement it issued Thursday in which it said it would evaluate the situation "as the investigation continues through the lens of overall Verizon interests, including consumers, customers, shareholders and related communities."

Yahoo declined to provide further comment Friday.

The effort is complicated because the sales proceedings between Verizon and Yahoo are at an early stage. Though teams from the two companies were working together on integration plans, Verizon does not yet own Yahoo. As a result, Verizon does not have direct access to the Silicon Valley company's servers to conduct its own investigation.

In late July, after the Verizon deal was announced, Yahoo became aware of a claim that about 280 million of its user credentials had been hacked, according to a person briefed on the specifics, who spoke on the condition of anonymity. Yahoo started an investigation but could not substantiate the claim, this person said. It was not clear Friday whether Yahoo had made Verizon aware that it was looking into this claim in July.

During the course of that investigation, Yahoo learned of the more severe breach, which it has said it believes was state-sponsored. Yahoo has not yet said exactly when it realized how large the intrusion was, leaving open the question of whether Mayer and her team waited to notify Verizon of the hack. Yahoo is now working with outside security consultants on the matter and said its investigation was continuing.

Brian Quinn, an associate professor at Boston College Law School, said Verizon had two main options if it decided to use the hack as leverage in setting the terms of the deal.

"They could say, 'This thing is huge. We want to walk away from the transaction,' " he said. Were Verizon to try to claim that the breach was so severe it was grounds to terminate the deal, it would have to prove that the hack amounted to a material adverse effect on the value of Yahoo.

Such claims can be difficult to prove in court. According to Quinn's reading of the merger document for the deal, Verizon would most likely have to prove that certain high-level Yahoo employees were aware of the severity of the hack before the deal was agreed upon, and intentionally withheld that information.

In the merger agreement, Yahoo states that "there have not been any incidents of, or third-party claims alleging" security breaches or thefts of user data that might result in a major change to the value of the company.

More likely, Quinn said, Verizon could pressure Yahoo to renegotiate the terms of the deal.

"They go to court, or threaten to go to court, and renegotiate the price," he said. "That can be a very winning strategy."

Daily Telegraph (Australia)
Yahoo cyber attack affected 8m Britons
Saturday, 24 September 2016
Byline: Cara McGoogan

London - Eight million Britons have been urged to change their internet passwords after the information commissioner confirmed they were affected by the cyber attack against the US internet giant Yahoo, which involved the loss of at least half a billion users' information globally to "state-sponsored attackers".
The British watchdog said she will be asking "serious questions" after Yahoo revealed that it had suffered what is believed to be the worst cyber attack on record. The commissioner, who Continued on Page 2 Continued from Page 1 could levy fines of up to £500,000 against the company for not protecting its customers' information, described the data loss as "staggering" and warned companies that it is their responsibility to make theft "impossible" for cyber criminals.

"It is our job to ask serious questions of Yahoo on behalf of British citizens and I am doing that today," said Elizabeth Denham.

Yahoo advised any customer who had not changed their password since 2014 to do so. The company was under mounting pressure to provide more information about how attackers had got away with swathes of personal data, which included names, email addresses, telephone numbers, dates of birth, and encrypted passwords.

Yahoo claimed that the information was taken in a "state-sponsored attack" in 2014, but did not provide any further information, leading some to question the company's explanation.

Russia or China are the most likely candidates, according to cyber security experts.

But some analysts suggested that Yahoo could have overplayed the role of a nation state in the attacks to mitigate criticism about its security practices and defences.

New York Times
Hackers Trawl User Data in Hopes a Small Target Will Lead to a Big One
Saturday, 24 September 2016
Byline: Nicole Perlroth

San Francisco - In disclosing that at least 500 million of its user accounts had been hacked, Yahoo blamed an unnamed "state-sponsored actor" for the intrusion. While Yahoo customers were caught by surprise, officials in Washington were not.
For more than a year, they had been getting warnings from government technology managers that hackers were targeting their personal Yahoo email. Even the accounts of their friends and family were in the cross hairs.

These days, intelligence and security experts say, nearly anyone can be the target of government-sponsored hackers. By perusing the personal accounts of people with even the thinnest thread of a connection to power, hackers can unearth the occasional gold nugget, like the low-level Democratic operative whose private email correspondence, published online by hackers on Thursday, detailed the movements of Vice President Joseph R. Biden Jr. and Hillary Clinton and what appears to be Michelle Obama's passport.

This expanded hacking strategy presents a new challenge: While top-secret material is usually kept in more secure computer systems, it is hard -- if not impossible -- to predict what information people are exchanging in personal email accounts. And it is even harder to know if hacking into one person's account can set off a cascading chain of events that could lead foreign spies to more useful information.

In 2014, Yahoo also investigated attacks by Russian hackers that targeted dozens of private Yahoo accounts, one person with knowledge of Yahoo's investigation said, but it is not yet clear whether the same hackers were behind the larger hack.

"The Yahoo attack alone may not make sense, but when you combine the stolen data from Yahoo with other stolen data sets, it makes a lot more sense," said Sean Kanuck, the former national intelligence officer for online security issues at the Office of the Director of National Intelligence.

Hackers working on behalf of governments can match stolen Yahoo account data with their own material or information available on the criminal underground and published on the website WikiLeaks for a variety of purposes, Mr. Kanuck and other intelligence officials say.

At this point, they'd have a lot to work with. In the two years since Yahoo believes the hackers first penetrated its network, state-sponsored hackers have stolen tens of millions of records from the insurance companies Anthem and Premera Blue Cross, including Social Security numbers, health records, birth dates, addresses, emails, passwords and employment information -- basically, everything you'd need to know about a person.

Hackers amassed a vast collection of security clearance records, even fingerprints, in a yearlong hacking of the United States Office of Personnel Management. They have breached law firms and accounting firms, and last year they even made off with flight records for millions of United Airlines passengers.

It may sound like a crazy collection of unrelated information. But it is not that difficult to make connections among seemingly random bits of information using data-sifting technology.

Just as a corporation may use big data to figure out what a consumer might buy based on their past purchases, a spy agency can use big data to make connections to useful intelligence. A Palo Alto, Calif., company named Palantir sells this technology to American intelligence agencies, allowing them, for example, to match travel records and personal data to identify possible terrorists.

So while Yahoo's announcement on Thursday that state-sponsored hackers -- the company did not say what country it believes they are working for -- had made off with more than 500 million customers' personal records was stunning to many, intelligence officials say it can be seen as just the latest step in an escalating nation-state digital warfare campaign.

"A lot of people overlook why some of these seemingly purposeless breaches matter," said Mr. Kanuck.

Intelligence services could use this information for a range of things -- some trivial and some intrusive. They could match international flights taken by their own officials with those taken by American personnel to the same cities at the same time. They could, for example, comb the user names and emails released in a hacking of Ashley Madison, the online affairs site that was breached last year, with the personal Yahoo accounts of government officials and contractors or their spouses, and leak that information online or use it for blackmail.

And they can use the most intimate details of people's lives -- their medical records -- to undercut the reputations of prominent American athletes, as Russian hackers did in a release of medical records stolen from the World Anti-Doping Agency that belonged to the gymnast Simone Biles, the tennis stars Venus and Serena Williams and other Olympic athletes.

The biggest worry, Mr. Kanuck and other American intelligence officials say, is the impact these data thefts can have on global politics. James. R. Clapper, the director of National Intelligence, warned Senate officials earlier this year that Russia was escalating its espionage campaigns against United States targets.

"Russia continues to take information warfare to a new level, working to fan anti- U.S. and anti-Western sentiment both within Russia and globally," Mr. Clapper said in his annual worldwide threat briefing in February.

Intelligence officials and private security researchers say it's not just prominent United States government officials that Russian hackers are after. It's their spouses, staff members, lawyers, accountants and business partners, who may not have the same level of security awareness around their data and communications.

"In the past year, we've seen personal webmail accounts and social network accounts specifically being targeted by Russian, Chinese and Iranian espionage operators, on several occasions," said John Hultquist, an espionage analysis manager at FireEye, the security software company. "That's where some of the most sensitive conversations take place, and hacking private accounts leaves a much lighter footprint."

One of the most adept at this approach, Mr. Hultquist and other security researchers say, has been a Russian intelligence hacking group alternately known in the security and intelligence community as APT28, Fancy Bear or Pawn Storm. The group regularly uses the compromised personal webmail accounts of staff members, spouses and their colleagues as tools to glean more information on high-level government targets.

In just the last few months, the group has been blamed for attacks on the Democratic National Committee, the White House and the World Anti-Doping Agency.

Going back to last year, the Russian group also has been trying to break into the online accounts of 2,600 members of the Washington elite -- lobbyists, journalists, officials, contractors and even their spouses, according to private security researchers at Trend Micro, the global security company, who briefed intelligence agencies on the hacking.

Among the Russians' targets were Colin L. Powell, the former secretary of state, whose personal emails caused a sensation when they were leaked online last week, according to people with knowledge of the briefing who spoke on the condition of anonymity.

"This is the new normal," said Tom Kellermann, one of the security experts who briefed intelligence officials last year in his former role as chief security officer at Trend Micro. "It's not just the usual targets who are being hunted. It's their spouses."

Mr. Kanuck said no one should be shocked that this is going on. "Every prominent person in Washington, every publicly known intelligence official, congressman and significant staffer should presume they have been targeted," Mr. Kanuck said. "You'd be a fool not to think that's the case."

Wall Street Journal
FBI Gave Two Aides Of Clinton Immunity
Saturday, 24 September 2016
Byline: Byron Tau

Washington - Two of Hillary Clinton's attorneys were granted immunity as part of a now-closed Federal Bureau of Investigation probe into whether the former secretary of state or her aides mishandled classified information through her email practices, lawmakers said on Friday.
Meanwhile, a federal judge set a new timetable for the processing and release of Clinton emails recovered during the FBI probe, shifting the release of most of the material to after Election Day.

Judge James Boasberg ordered the State Department to finish processing 1,050 pages of material for release by Nov. 4 -- just a fraction of what could be as much as 10,000 pages of material -- in one of dozens of cases seeking access to Clinton materials.

Lawmakers who have reviewed documents turned over to Congress by the FBI said Cheryl Mills, a longtime Clinton aide, and aide Heather Samuelson were given limited immunity by the FBI in exchange for turning over their personal laptop computers as part of the investigation. A State Department staffer who at the time managed information resources was also granted immunity.

"The FBI was handing out immunity agreements like candy. I've lost confidence in this investigation," House Oversight and Government Reform Committee Chairman Jason Chaffetz (R., Utah) said.

The FBI declined to comment.

"The [Justice Department] and FBI considered my clients to be witnesses and nothing more," said Beth Wilkinson, an attorney for Mses. Mills and Samuelson. "At all points my clients cooperated with the government's investigation."

Brian Fallon, a spokesman for Mrs. Clinton, said "House Republicans are trying to make something out of nothing by rummaging through the files of a Justice Department investigation that was closed months ago."

London Times
Forged British documents being traded on dark web
Saturday, 24 September 2016
Byline: John Simpson

London - Forged British passports and documents including driving licences, utility bills and GCSE certificates are being sold on hidden websites, an undercover investigation has found.

Researchers who gained access to the sites -- known as the dark web -- saw the passports being offered by several sellers for as little as £800.

The investigation reveals for the first time the scale of the online trade in high-quality forged identity documents, which experts said yesterday were a goldmine for criminals.

Fraudsters can combine payslips, bank statements and gas and electricity bills with doctored photographic ID to open bank accounts and take out loans, or obtain genuine passports or driving licences in their victims' names.

The ready availability of forgeries vital to the activities of terrorists seeking to create fake identities will act as a warning to security services of the threat posed by the dark web. It is accessed only by invitation through secure internet browsers.

"It's scary that it's so easy for anyone to organise and buy stuff to be sent to their home," Sin Wee Lee, of the University of East London, which carried out the investigation, said. "It's so easy to get a user name and account and start buying."

Islamic State jihadists are known to be adept at using the kind of encoded technology that enables the use of the dark web, and have repeatedly shared guides on how to do it.

The sites also offer drugs and guns for sale, with the university team finding AK47s, cocaine and methamphetamine. The threat of the dark web was brought into sharp focus in Munich in July, when Ali David Sonboly, 18, murdered nine people with a Glock 9mm pistol bought through an illicit site before turning the gun on himself. MI6 said this week it would recruit almost a thousand spies to fight terrorism and exploit the potential of the digital age.

Dr Lee and Andres Baravalle, who led the research, spent three months trawling the Agora marketplace, known as "the king of the dark web".

They found eight sellers offering multiple British passports. These were mostly described as cloned or hacked, while two were offering only scanned copies. However, one of the passports was described as "custom", suggesting that it could be tailor made for the user.

False UK driving licences, templates for faking British Gas accounts and Barclays and HSBC bank statements, and forged GCSE results and university degrees were also on offer.

In three hours the academics intercepted several invitations to join Agora. They entered the site and unleashed custom-made "spider" software, which mimicked human behaviour while harvesting data. They found more than 30,000 illegal products on sale, largely fake or real identity documents and drugs worth at least £26 million. There were weapons and counterfeit goods.

They found a trade of nearly £2 million in identity documents, including EU identity cards for £142 and driving licences from EU countries for £419.

Dr Baravalle and Dr Lee worked undercover between July and September last year, when Agora was taken offline, but security experts warned that the marketplaces are quick to crop up in different guises. Silk Road was worth nearly £1 billion when it was shut down by the FBI in 2013. The site apparently resurfaced in March this year, in its third incarnation.

New questions have emerged over an £11 billion project to install smart energy meters in every British home, after experts warned that hackers could use the devices to shut down the nation's electricity supplies. A report on the meters from MPs on the Commons science and technology committee pointed to serious cyber- security concerns. About 3.6 million of the meters, which measure household electricity and gas consumption in real time, have already been installed. The report cited experts from the Royal Academy of Engineering who warned MPs that there was a "real and pressing threat of cyberattacks either to gain information, 'steal' electricity or disrupt supply".

Politico.com
Obama used a pseudonym in emails with Clinton, FBI documents reveal
Saturday, 24 September 2016
Byline: Josh Gerstein and Nolan D McCaskill

Washington - President Barack Obama used a pseudonym in email communications with Hillary Clinton and others, according to FBI records made public Friday.
The disclosure came as the FBI released its second batch of documents from its investigation into Clinton's private email server during her tenure as secretary of state.

The 189 pages the bureau released includes interviews with some of Clinton's closest aides, such as Huma Abedin and Cheryl Mills; senior State Department officials; and even Marcel Lazar, better known as the Romanian hacker "Guccifer."

In an April 5, 2016 interview with the FBI, Abedin was shown an email exchange between Clinton and Obama, but the longtime Clinton aide did not recognize the name of the sender.

"Once informed that the sender's name is believed to be pseudonym used by the president, Abedin exclaimed: 'How is this not classified?'" the report says. "Abedin then expressed her amazement at the president's use of a pseudonym and asked if she could have a copy of the email."

The State Department has refused to make public that and other emails Clinton exchanged with Obama. Lawyers have cited the "presidential communications privilege," a variation of executive privilege, in order to withhold the messages under the Freedom of Information Act.

The report doesn't provide more details on the contents of that particular email exchange, but says it took place on June 28, 2012, and had the subject line: "Re: Congratulations." It may refer to the Supreme Court's ruling that day upholding a key portion of the Obamacare law.

A report on the FBI's June 7, 2016 interview with "Guccifer" confirms FBI Director James Comey's claim that Lazar falsely asserted that he'd surreptitiously accessed Clinton's server.

"Lazar began by stating that he had never claimed to hack the Clinton server. [An FBI agent] then advised that Fox News had recently published an article which reported that Lazar had claimed to have to Clinton server. Lazar then stated that he recalled the interview with Fox News, and that he had lied to them about hacking the Clinton server."

Additional FBI interviewees whose reports were made public Friday included Jake Sullivan, Clinton's policy planning director; Bryan Pagliano, a former Clinton technology aide; Monica Hanley, a veteran Clinton aide who worked for her in the Senate and at State; and Sidney Blumenthal, Clinton's longtime confidant.

Hanley revealed in her FBI interview that she had no idea where a thumb drive she used to store an archive of Clinton's emails had gone. Hanley searched for the thumb drive, which the FBI described as "something she happened to have laying around the house," several times but was unable to find it.

The interviews provide more insight into Clinton's lack of technical acumen. According to the FBI's Abedin writeup, she "could not use a computer"; Hanley said Clinton had no idea what her own email password was, and had to rely on aides.

The so-called "302" reports also detail FBI interviews with former Secretary of State Colin Powell, former CIA acting director Mike Morell, State Department official Pat Kennedy, State Department Inspector General Steve Linick, Bill Clinton aide Justin Cooper, former diplomatic security chief Eric Boswell and longtime diplomat Lewis Lukens.

Some of the interview reports had the subject's name removed on privacy grounds before the records were released. Many of those people seem to be computer technicians or lower-level State Department officials.

The FBI published 58 pages of documents earlier this month that revealed Clinton had relied on others' judgment to not send her classified material during email correspondences.

"Clinton did not recall receiving any emails she thought should not be on an unclassified system," the FBI said in its Sept. 2 report. "She relied on State officials to use their judgment when emailing her and could not recall anyone raising concerns with her regarding the sensitivity of the information she received at her email address."

China 'strips cloak' from US stealth bomber
Sunday, 25 September 2016
Byline: Damien McElroy

London - Chinese scientists claim to have developed a "stealthstripper" radar that could hand Beijing a decisive advantage in the military build-up in the South China Sea, just as America deploys more than half its navy to the Pacific.
The race to dominate the sea around China has drawn in military ships and planes from America, China, Japan and Taiwan, as well as the southeast Asian states.

A military-run research institute, China Electronics Technology Group, says it has developed a type of radar that can strip the cloak of invisibility used by the US B-2 stealth bomber. It detects the shadow the aircraft casts as it flies.

Capable of spotting planes at a 60-mile range, it is reported to be five times more powerful than anything produced for the Pentagon's rival Darpa programme.

"China has had a great leg-up over a short period of time since the 1990s by shopping for technology from the former Soviet Union and Israel," said Douglas Barrie, who is an expert in military aviation at the International Institute for Strategic Studies in London. "It has spent a lot of money and poured a lot of national resources into radar development."

The radar threatens to alter the military balance in the South China Sea, where Beijing asserts its territorial rights over scattered island chains.

The system was unveiled after America and Japan this month announced joint patrols of the islands claimed by China.

The Japanese said they were responding to Beijing's attempts to take over international waterways. The Chinese foreign ministry said that it was disappointed to the point of despair by the Japanese intervention.

China sets its southern maritime boundary within a disputed "nine-dash" line drawn on maps since the 1940s. But the islands and reefs, including Scarborough Shoal and the Spratly Islands, within the line are also claimed by the Philippines, Vietnam and Malaysia. China and its rival Taiwan rejected a UN tribunal ruling in July that the reefs were not their territory under the law of the sea. The two have continued a building spree and said they will ignore the ruling.

Concern over the military build-up on the islands grew last week when images emerged of Taiwanese fortifications, apparently designed for weapons emplacement, on Taiping, an island between Vietnam and the Philippines under Taiwanese control.

Taiwan asked Google Maps to blur the images, which show a cluster of reinforced concrete buildings. "Taiping is an important militarily jurisdiction. Some related infrastructure on the island is in a state of alertness," the request stated. Google was reported to be considering the request.

Military analysts regard the airstrips and other military facilities as substitutes for aircraft carriers.

While China has reconditioned a 1980s aircraft carrier in dry dock, it has not tried to build a vessel capable of going to sea. "Building a carrier strike capability doesn't happen overnight," said Barrie. "China can gain naval air power from putting an airstrip or bulldozing a runway out at sea." President Barack Obama's main foreign policy legacy is the pivot to Asia under which the Pentagon is deploying 60% of all its ships in the Pacific by 2020. The goal of the policy is to ensure freedom of navigation through a passageway for $5.3 trillion (£4 trillion) in trade, almost 30% of the global total.

With so much at stake, regional alliances are under strain. Diplomats have expressed concern for the longstanding US alliance with the Philippines after a spat between Obama and Rodrigo Duterte, the foul-mouthed new president.

Duterte signalled he could compromise with Beijing over the Spratlys when he visits China next month. "This piece of paper, the arbitral award, we don't go out of the four corners of this paper. Let's talk," Duterte declared.

In the long-run Washington's military superiority is not guaranteed. In one key area experts believe that China will have expanded its squadrons of fighter jets to match the numbers of US planes in the region by 2020.

Rand, the US military think tank, warns Washington could no longer count on a "decisive victory" in a war that would probably happen on the ocean.

"It would be waged mainly by ships on and beneath the sea, by aircraft and missiles of many sorts, and in space and cyber-space," it said.

"Sensors, weapon guidance, digital networking and other information technologies used to target opposing forces have advanced to the point where US and Chinese military forces seriously threaten each other."

"It would be waged mainly by ships on and beneath the sea, by aircraft and missiles of many sorts, and in space and cyber-space," it said.

"Sensors, weapon guidance, digital networking and other information technologies used to target opposing forces have advanced to the point where US and Chinese military forces seriously threaten each other."

Canadian Press
Dropping crime statistics not reflecting rise of cyber crime, Halifax police chief says
Saturday, 24 September 2016
Byline: Michael MacDonald

Halifax - Statistics suggesting crime rates in Canada have been falling for decades may not tell the whole story when it comes to criminal wrongdoing, the chief of Halifax Regional Police says.
Jean-Michel Blais says there are indications that the nature of crime is changing in a way that is not reflected in traditional crime data.

"And this crime is not being committed by your neighbour, and probably not someone here in Nova Scotia or even in Canada," he said in an interview.

"It's being committed by somebody in a different country."

Blais, who plans to explore the issue Friday in a speech to the Halifax Chamber of Commerce, says traditional crimes appear to be "morphing" and migrating to criminal acts perpetrated online.

As a result, he says, crime probably hasn't decreased as much as statistics might suggest.

In 2014, a study in the United Kingdom found just over half of those surveyed in Britain had been the victim of an online crime, including identity theft, hacking and illegally accessing and stealing from bank accounts.

The study found that much of this crime was never reported, which means it didn't show up in police statistics.

The Get Safe Online survey, conducted by market research firm Vision Critical, also showed that 53 per cent of those surveyed said they considered online crimes as serious as physical crimes.

"Crime really hasn't gone down as much as we think," Blais said in an interview. "It's ... migrated onto the internet."

To illustrate his point, he suggested it has become common for anyone using email to be routinely prodded by fake messages that seek access to bank accounts or offer rich rewards for participating in shady international transactions.

"Think about the number of passwords that you have in your life, and imagine if those were hacked," he said. "On average, it takes 400 hours of time to rehabilitate a person's identification."

Last year, a PwC study conducted for the British government found 90 per cent of large corporations surveyed in Britain had experienced a security breach last year, up from 81 per cent in 2014, reflecting a similar trend for small- and medium-sized businesses.

"So, if you're part of a large company, chances are that in the future you will have a data breach," Blais said. "It's a real challenge."

The chief also mentioned the rise of the so-called Dark Web, an off-limits layer of the Internet where special software and codes are needed to access illicit material.

Statistics Canada says that the overall police-reported crime rate in Canada has been falling for more than 20 years -- a reversal of the upward trend recorded between 1962 to 1991.

The trend applies to violent crime, including homicides, and many other Criminal Code offences, Statistics Canada reports.

The federal agency says experts have attributed the decline to a long list of factors, including an aging population, changing policing practices, shifts in unemployment and variations in alcohol consumption.

Similar downward trends have been observed in other countries.

Blais, a former Mountie who has served as Halifax police chief for almost four years, is also expected to speak about how traumatic events in other parts of the world -- such as the rise in gun violence in the United States -- can have ripple effect in Canada.

Washington Post
Tech law needs a reboot
Sunday, 25 September 2016
Byline: Garrett M. Graff

Washington - Last year, the FBI nearly destroyed the life of an innocent physicist. In May 2015, agents arrested Xi Xiaoxing, the chairman of Temple University's physics department, and charged that he was sneaking Chinese scientists details about a piece of restricted research equipment known as a "pocket heater." An illustrious career seemed suddenly to implode. A few months later, though, the Justice Department dropped all the charges and made an embarrassing admission: It hadn't actually understood Xi's work. After defense experts examined his supposed "leaks," they pointed out that what he'd shared with Chinese colleagues wasn't a restricted engineering design but in fact a schematic for an altogether different type of device. The case helped lead earlier this year to new Justice Department restrictions that took power away from prosecutors in the field and centralized certain investigations in Washington, where they could receive more oversight from a specially trained team of lawyers. Whether it's high- level physics research or the technology of our daily lives, the government's lawyers are struggling to grasp the increasingly technical cases that come before them. Both federal prosecutors and the attorneys who represent executive agencies in court are bungling lawsuits across the country because they don't understand what they're talking about. Too few lawyers have the skill set or the specialized knowledge to make sense of code, networks and the people who use them, and too few law schools are telling them what they need to know. "It would be enormously helpful to have a deeper bench of lawyers with technical backgrounds," says Susan Hennessey, a Brookings Institution fellow and former National Security Agency lawyer.

This situation is stymieing criminal investigations, upending innocents' lives and making it harder to set legal boundaries around mass- surveillance programs. The result is that, when it comes to technology, justice is increasingly out of reach.

Just this past week, a federal judge in Iowa threw out evidence collected by the FBI in a child porn investigation because the Justice Department's search warrant misstated the technical details of where and how it hoped to gather the evidence. As the judge concluded, either the FBI or the prosecutors hadn't understood exactly how their own "network investigative technique" worked, or they'd failed to explain it correctly in the courtroom. What's more, the judge who issued the original warrant didn't have the jurisdiction to do so, because the "network investigative technique," a piece of FBI-designed malware that sniffed out people trading illegal files, collected evidence far beyond the bounds of the Virginia district where the warrant was authorized.

Today, cyber, data and privacy questions lie at the core of numerous corporate and government cases, and there aren't anywhere near enough practicing lawyers who can adequately understand the complex issues involved, let alone who can sufficiently explain them in court or advise investigators on how to build a successful case. "This is a problem that pervades all of the national security apparatus," says Alvaro Bedoya, previously the chief counsel to the Senate Judiciary Committee's subcommittee on privacy, technology and the law, who now leads Georgetown Law's Center on Privacy & Technology. "You don't have a pipeline of lawyers right now who can read code."

The fallout from Edward Snowden's revelations exposed numerous instances in which agency lawyers miscommunicated to courts about what the government was doing. There are two possible explanations: Either they willfully exploited judges' lack of technical knowledge, or the lawyers themselves couldn't fathom the programs they were trying to explain. In a 2009 case that became public in 2013, NSA Director Keith Alexander admitted that none of the lawyers overseeing one surveillance program grasped what it was doing when it queried a particular agency database: "It appears there was never a complete understanding among the key personnel ... regarding what each individual meant by the terminology used." In a 2011 suit, Judge John Bates of the secret Foreign Intelligence Surveillance Court wrote an angry (and heavily redacted) 85-page decision saying he was "troubled" that the case marked "the third instance in less than three years in which the government has disclosed a substantial misrepresentation regarding the scope of a major collection program." And in yet another case, Solicitor General Donald B. Verrilli Jr. found in 2013 that he'd misled the Supreme Court about how the Justice Department was using evidence derived from warrantless surveillance programs targeting foreigners, an error that led to a months-long internal debate as Verrilli questioned the department's interpretation of the law.

Such confusion is hardly confined to the NSA's most technical work. On a more mundane basis, government attorneys frequently confuse content and metadata, even though the two types of information face very different legal standards. One possible reason: The Justice Department's decade-old Electronic Surveillance Manual is incorrect about the basic mechanics of how email works, according

to a forthcoming article in the Harvard Journal of Law & Technology. Such problems are becoming more pervasive as lawyers misapply law designed for telephone surveillance to cases focused on the Internet, says Susan Landau, a computer scientist at Worcester Polytechnic Institute and one of the article's authors. They "don't know the right questions to ask." And it's not just them: "A judge may not even know what's wrong with the briefs. It's an extremely serious problem," she says.

Jurists have noticed how awkwardly analog-era laws govern modern digital life, and they've struggled over what to do with the disjunction, even at the Supreme Court. "It may be necessary to reconsider the premise that an individual has no reasonable expectation of privacy in information voluntarily disclosed to third parties," Justice Sonia Sotomayor wrote in a 2012 opinion. "... This approach is ill suited to the digital age, in which people reveal a great deal of information about themselves to third parties in the course of carrying out mundane tasks."

The Obama administration has made strides in incorporating technology into government, creating teams like the U.S. Digital Service that bring more of Silicon Valley to Washington. But the knowledge base of the government's lawyers is still badly lacking, particularly when it comes to marrying legal and technological tools, says Paul Ohm, a Georgetown law professor who used to work in the Justice Department's computer crime and intellectual property section. "Too much of [the focus] has been the import-export model - forgo your Silicon Valley salary for a couple years and help us be more savvy. And as awesome as that is, they're not going to solve the problem," Ohm says. The rotations through government are useful in the short term, but they don't help the bulk of the permanent workforce better understand the new digital landscape. "I've seen far less internal education at the agencies," Ohm says.

Some of today's technical legal befuddlement stems from the fact that the field is so new. "No one who is practicing today had a cybersecurity class in law school," explains Kristen Eichensehr, a UCLA law professor whose own cybersecurity course has doubled in the three years it's been offered. "Everyone who has been in practice has had to learn this on the job."

That problem won't go away soon: Even though student demand for such classes is growing, only a handful of mostly elite law schools - like Harvard, Yale, Cornell, Stanford, New York University, Georgetown and UCLA, as well as Indiana University's Maurer School of Law, which helped pioneer the field in the early 2000s - currently offer classes focused on cybersecurity. At Georgetown, Ohm is helping with what he thinks is the first law school class in the nation to teach students to code in the basic programming language Python. The course launched in January with spots for 20 students and a waitlist of more than 100. (For this school year, the class was expanded to 75 students but still had a long waitlist.) Among other projects, students learn to manipulate a 700-megabyte file of 200 years of Supreme Court opinions and code a search engine.

Yale, working with its first "cyber fellow," Ido Kilovaty, is offering its first mixed cybersecurity course this year, bringing together 10 law students and 10 computer science students in an attempt to bridge the jargon chasm between specialists in each field. "People who are trying to come up with solutions in this

area usually understand only one side - the law side or the technology side," Kilovaty says. "We want them to talk the same language when the class is done."

That's proving particularly essential in government, where few of the 93 U.S. attorney's offices around the nation have federal prosecutors who specialize in cyber-cases, even though cybercrime now touches every corner of the country. "Most lawyers are pretty deathly afraid of code. They don't even have a working knowledge - what an algorithm is, what a DDOS attack does, how a botnet operates," says Georgetown's Bedoya.

Kilovaty adds that too often he sees prosecutors limited by the complexity of the crimes confronting them. In one recent prosecution of a security researcher accused of illegal hacking, an assistant U.S. attorney summarized the case to the court by saying, "He had to download the entire iOS system on his computer, he had to decrypt it, he had to do all of these things I don't even understand." The government ultimately lost the case.

It is falling to law schools to educate attorneys who are already on the job. Georgetown hosts an annual conference on cyber- law. Stanford's Hoover Institution runs "cyber bootcamps" for congressional staffers who oversee the nation's technical and intelligence infrastructure, as well as for the judges who set precedent for how law will develop online. "Most of what they're getting is on-the-job learning. From a legal perspective, that's really troubling," says Amy Zegart, a Stanford intelligence expert who works on the cyber program.

Given the scope of the questions at hand - from digital eavesdropping to how the FBI should fight Russian ransomware attacks to how social-media sites can target user advertising and how Twitter should be blocking Islamic State recruitment online - the field will only grow more complicated and integral to daily life. "The number of people involved in cybersecurity [law] has to increase dramatically," says Harriet Pearson, who helps lead Hogan Lovells's cybersecurity and privacy practice, and who was IBM's first chief privacy officer. "There's going to need to be a huge amount of education."

The good news, at least, is that as the government scrambles to boost its cyber-law knowledge, students coming out of classes like Ohm's will have no shortage of job prospects.

Globe and Mail
Canada, China to discuss accord on cybersecurity
Tuesday, 27 September 2016
Byline: Colin Freeze

Prime Minister Justin Trudeau has directed his top security officials to discuss a cyber accord with China to help protect Canadian corporations from hackers.

The Prime Minister's national-security adviser, Daniel Jean, was sent to China earlier this month to co-chair the first in a series of meetings between the two countries' public-safety officials. These talks have become the focus of controversy because they include a possible extradition treaty.

Now The Globe and Mail has learned the discussions will also be a forum for Canada and China to iron out their differences on cybersecurity.

"The U.S. and U.K. recently concluded agreements with China not to engage in, or support, the theft of intellectual property and trade secrets to gain economic advantage," said Scott Bardsley, a spokesman for Public Safety Minister Ralph Goodale. "A similar agreement is a possible outcome."

Such a dialogue has profound implications for Canada's business community, given that Chinese government hackers are frequently seen as adversaries with a voracious appetite for corporate intellectual property as well as state secrets. Past victims of Chinese hacking campaigns include the federal government's National Research Council and, allegedly, the former telecom giant Nortel Networks.

The new security talks are a "forum for both countries to frankly discuss issues that need to be resolved," Mr. Bardsley said.

In September, 2015, U.S. President Barack Obama and Chinese President Xi Jinping announced a cyberaccord. Former British prime minister David Cameron unveiled a similar agreement when he met Mr. Xi one month later.

In April, a U.S. private-sector cybersecurity expert noted "a material downtick in what can be considered cyberespionage" after the U.S.-China accord. But U.S. government security officials have said they are unsure China is complying.

The president of the Business Council of Canada recently told The Globe that Canadian corporations are increasingly concerned about data theft of all kinds. "Many of the CEOs who are members of our council consider it their No. 1 risk factor," said John Manley, a former Liberal cabinet minister. "And they lose sleep over it."

Experts say diplomatic discussion of cybersecurity is a pressing need. Globally, recent months have shown that state-sponsored hackers and their proxies are becoming increasingly powerful in their bids to make mischief, steal secrets or engage in campaigns to sabotage utilities.

"If there is a general feeling, an assessment on the part of some hackers, there are no rules, that this is the law of the jungle, then that is a very destabilizing thing," Michael Walma, a senior Government Affairs Canada official, said during a conference last week.

Billed as Ottawa's "cyber foreign policy co-ordinator," he was one of several high-level civil servants who spoke at the Canadian Association of Security and Intelligence Studies (CASIS) symposium. Last Friday's discussion focused on cybersecurity and took place at Ottawa's War Museum.

Calling the discussion "timely," Mr. Walma told the gathering that Canadian diplomats are joining their counterparts in trying to iron out cybersecurity issues in bilateral and multilateral forums.

He specifically mentioned the U.S.-China accord as an example of what dialogue can achieve. But, he added, diplomatic agreements need to be backed up with deterrents, and pointed out that the United States is targeting state-sponsored hackers with criminal prosecutions, travel bans and financial sanctions.

"They are starting to equip themselves with a toolbox that allows them to respond with something between a diplomatic note and a nuclear strike," Mr. Walma quipped. "I think that kind of points to the way we should all be working."

In the summer of 2014, the U.S. government charged five officers of China's People's Liberation Army with hacking U.S. solar, steel and manufacturing companies. Shortly after, the United States launched a separate case against Vancouver-based Chinese national Su Bin, accusing him of helping PLA-affiliated hackers target aviation companies.

At that time, Canada's Conservative government publicly called out China for hacking into the computer networks of the National Research Council, the federal government's repository of secrets about emerging technology.

Whether "naming and shaming" foreign hackers accomplishes much was debated at the CASIS conference. "If you are going to call out an action by another country, there has to be actually something that's going to be a follow-up of some consequence," said Melissa Hathaway, a U.S. consultant who has advised two American presidents on cybersecurity.

She explained that any country that publicly accuses an autocratic country of hacking could expose its own expatriate citizens and corporate branch plants to countermeasures, given that such states react unpredictably when challenged.

Canada is not without some cybercapabilities. It is a member of the "signals intelligence" collective known as The Five Eyes, the world's most formidable electronic- spying alliance.

The Five Eyes' partners - agencies in Canada, the United States, Britain, Australia and New Zealand - are highly secretive, yet members publicly insist they do not spy on foreign corporations for the commercial gain of their countries' firms.

This was somewhat undercut in 2013, when Edward Snowden, a former U.S. government contractor, leaked documents that showed the Five Eyes frequently targeted the Chinese telecom giant Huawei Corp., among other foreign corporations.

The cyberaccords between the United States and Britain and China are primarily about stopping countries from spying on businesses. These accords sidestep state-on-state espionage - a prerogative governments have basically exercised since antiquity.

Yonhap News Agency
Prosecutors conduct 533 telecom-related monitoring since 2012: lawmaker
Tuesday, 27 September 2016
Byline: Staff reporter

Seoul - South Korean prosecutors conducted 533 individual cases of telecommunications-related monitoring through August from 2012, a lawmaker said Tuesday, urging the government to reorganize its privacy-related policies that can better protect the rights of its people.
Around 63 percent of the monitoring was made on request by South Korea's intelligence agency, the data compiled by Rep. Keum Tae-sup of the main opposition Minjoo Party of Korea showed.

Only 5.4 percent of the people involved, however, were notified of the monitoring, data showed.

"Nearly 95 percent of those monitored by investigators were not notified," Keum said. "There needs to be an improvement in policies to regulate abuse and protect the privacy of ordinary people."

ABC News
IBM 'unlikely to hit Customs and Immigration merger deadline' amid growing fears of system failure (Canada)
Tuesday, 27 September 2016
Byline: Matthew Doran and Chris Uhlmann

Canberra - Concerns are raised about IBM's ability to meet the demands of merging the Customs and Immigration computer systems. An IT failure could have serious national security implications as the mainframe will manage Australia's border controls, including red flagging terror suspects.

Serious concerns have been raised about IBM's ability to meet the demands of merging the Customs and Immigration computer systems by people familiar with the roll-out of the half-billion dollar contract.

The ABC has been told IBM looks increasingly unlikely to hit its October 31 deadline and there are growing fears in the Department of Immigration and Border Protection that the risk of a system failure is rising, as the busy Christmas holidays loom and a long-running industrial dispute remains unresolved.

An IT failure could have serious national security implications as the mainframe will manage Australia's border controls, including red flagging terror suspects attempting to enter or leave the country.

In response to a series of questions from the ABC, the department issued a statement saying: "This schedule remains under active review."

"This is common to all major system changes in which the protection of operational capability and security protections remains the overarching priority," the statement said.

The concerns about the enterprise-wide mainframe contract come in the wake of the high profile woes of another federal agency.

The Australian Bureau of Statistics was embarrassed by a census-night shutdown, .

The company is also currently embroiled in a Canadian payroll scandal, where .

And that echoes the billion-dollar health payroll debacle in Queensland, after which the .

Problems involving IBM would be 'deeply disturbing'

Labor's immigration spokesman Shayne Neumann said any problems involving IBM's contract with the department would be "deeply disturbing".

"You can't muck around with border protection and national security," Mr Neumann said.

"I have been to airports and seen the how the system works behind the scenes and any software problems will affect that."

He also pointed to a in the department when it came to procurement, and a between Immigration and Customs that said there was "an absence of a solid plan" for executing the integration.

"We can't have a department that's not up to the job and a tick-and-flick minister," Mr Neumann said.

Before Customs and Immigration merged in 2015, two companies had been delivering IT services -- IBM for Customs; and CSC, another US information technology giant, for Immigration.

CSC lost the bid for the combined tender and was told in February that its contract would be terminated 20 months early, with the new finish date set at October 31, this year.

That upped the ante on transferring enormous amounts of information between CSC-managed and IBM-managed data centres.

'Robust risk management framework in place'

As that deadline approaches, fears have grown within the department that IBM is not ready and that the system might fail.

There have been meetings between IBM and officials as they war game solutions, which might include IBM hiring CSC's workforce.

The total value through to 2019 of the mainframe contract is $509 million, and it is understood that the department does not have any more money to bolster the transition and is struggling to find the staff it needs within its own ranks to handle the change.

It is just one of many contracts IBM has with the Federal Government.

The department's statement in response to the ABC's questions also said it "has a robust risk management framework in place to address any potential risks that may arise from a large scale change to border systems".

"IBM has had a long relationship with the former Australian Customs and Border Protection Service and has maintained a stable computing environment for critical border systems," the statement said.

IBM said the department was also responding on its behalf.

Wall Street Journal
More Breaches Hit Swift System
Tuesday, 27 September 2016
Byline: Katy Burne

New York - Interbank message carrier Swift said customers had sustained three new cyber breaches over the summer and warned that attacks on banks in the network are continuing.
The company, whose systems are in the back offices of 11,000 financial institutions across more than 200 countries, issued the warnings as it rolled out new mandatory security requirements for customers.

Swift Chief Executive Gottfried Leibbrandt shared some anecdotal details of the fresh attacks in a speech at the company's annual conference in Geneva on Monday. He said a few months ago he got a series of calls from users with security breaches to report, although no money was stolen.

In the first, hackers had fraudulently sent payment instructions from the bank's Swift terminal to an unauthorized beneficiary and then altered payment records to cover their tracks. The next day, a second bank noticed the fraudulent messages being sent to the same rogue beneficiary. In the third instance, the same pattern of hacking was attempted but was thwarted with antivirus software that was part of a security patch.

The attacks follow a wave of cyberattacks on Swift bank customers in the past several months. Those attacks spanned the globe, including banks in Vietnam, Ecuador and one in Bangladesh where the thieves made off with $81 million from the country's central bank. The perpetrators remain unidentified and the money is yet to be returned.

In response, Swift, whose formal name is the Society for Worldwide Interbank Financial Telecommunication, has issued security patches and required customers to update their software, and encouraged banks that were attacked to share their findings on a restricted part of the network. Swift has also been under scrutiny from regulators.

"The attacks will continue and get more sophisticated. We are certainly not taking a break," Mr. Leibbrandt said. "I believe that in cyber, only the paranoid survive."

Swift has repeatedly said its core network, which processes the messages between senders and receivers, wasn't compromised.

Military intelligence cyber programs get boost from fund shift
Tuesday, 27 September 2016
Byline: Scott Maucione

Washington - The Defense Department is beefing up its cyber investments in the military intelligence arena by shifting some of its 2016 funds.
DoD moved nearly $20 million in funds from failing programs and contract savings early this summer to prioritize cyber, stated a reprogramming action released this week and signed by DoD Comptroller Michael McCord.

A large chunk of the funds will go to expanding the U.S. Army Intelligence and Security Command (INSCOM). The command, which conducts intelligence, security and information operations for military commanders, is set to receive about $6.2 million.

That money will go toward rapid research and development of low-density, non-standard technologies for cyberspace intelligence operations.

The funds will specifically go to upgrades for back-end enclaves, command and control device integration, integration of data storage capability supporting analytics and proxy and exit nodes.

"Without immediate funding, INSCOM will not be able to conduct the necessary system engineering changes to optimize the cyberspace platform, develop and modify cyberspace payloads, or conduct developmental and operational testing evaluation that enables the cyberspace mission," the reprogramming action stated.

DoD is also dropping money into the military services' IT, cyber and intelligence funds.

Nearly $3 million was programmed to the Air Force to build out and update tailored intelligence IT enterprise architectures for U.S. Strategic Command, U.S. Africa Command, U.S. European Command and U.S. Northern Command.

Those architectures are needed to create the Intelligence Community Information Technology Enterprise or ICITE. The ICITE network connects the intelligence agencies and military services all over the world to a common IT system.

Other services are also integrating in ICITE. The Army just restarted its ICITE initiative after a few years of delay. The service is slated to begin a small common desktop environment adoption pilot in 2017 that will create momentum for a larger movement in 2018 and 2019.

The Air Force is grabbing another $7.5 million for sensor and awareness systems. Funds will go to recapitalize Arc Storm system sites and upgrade system components. Those will be used to locate hostile electromagnetic interference of U.S. and allied satellites.

Other parts of the $7.5 million will go toward the Integrated Broadcast Service Enterprise, which provides near-real-time lethal warning and situational awareness to joint forces and coalition partners.

Finally, the reprogramming document gives $3 million to U.S. Cyber Command for classified purposes.

In the grand scheme of DoD's more than $600 billion budget, the recently released reprogramming seems tiny. But the direction of the funds does reiterate the Pentagon's increasing push toward cyber and space.

"Cyber operations and cyber security is a sustained area of focus for the Pentagon, and they will take advantage of the opportunity to add additional resources to that effort," Katherine Blakeley, a research fellow at the Center for Strategic and Budgetary Assessments told Federal News Radio.

This isn't the first time DoD has reprogrammed funds for cyber initiatives. In August, DoD requested to reprogram $100 million to uncover flaws in major weapons systems.

DoD already had $200 million set aside for the project, which it is required to inform Congress on in 2019.

SC Magazine
Presidential debate 2016: Candidates pledge cyber investment, differ on Russia
Tuesday, 27 September 2016
Byline: Teri Robinson

New York - In a brief exchange during the first of three presidential debates Monday night, former Secretary of State Hillary Clinton and Republican nominee Donald Trump agreed on the importance of investing in cybersecurity and briefly sparred over whether Russian hackers have a penchant for launching cyber attacks against U.S. targets.
Noting that the U.S. faces "two adversaries" - those hackers who engage in cyber espionage and nation-state actors, Clinton pledged that the country "will not sit idly by" as Russia, Iran, China and others ramp up their attacks. "We don't want to get into another kind of war," she said, but noted the U.S. will not back down. "Cyber warfare will be our biggest challenge."

Clinton specifically called out Russian President Vladmir Putin for "letting loose hackers allegedly behind hacks of the Democratic National Committee (DNC) and others.

But Trump contended that there was no proof that those hackers were Russian. "I don't think anyone knows whether Russia broke into the DNC," he said, adding that the hacks could be the work of another nation-state or group or even "someone 400 pounds sitting on a bed" with a laptop.

He also said that "ISIS is beating us at our own game" in cyberspace. "We have to do better," he said.

Clinton quickly noted that her plan for defeating ISIS includes a cyber component.

Slate
Donald Trump Defended Putin, Had No ISIS Plan, and Was Stunningly Ignorant on Iran
Tuesday, 27 September 2016
Byline: Fred Kaplan

Column - If anyone still thinks Donald Trump should be president after Monday night's debate, I'd like to know the reasons. In the segment dealing with foreign policy, he revealed himself--not for the first time, but more plainly than usual--to have little grasp of what power, diplomacy, and recent events are all

about. Hillary Clinton left a few gaps open as well, but the differences between the two could be measured in leagues, even light-years.
The first question was about cybersecurity and Russia's hacks of the Democratic National Committee. Hillary Clinton said we needed to make it clear that we're not going to let state actors go after our information, and that, while we don't want to unleash the full extent our far superior cyber powers, we will if this sort of "probing" continues. Trump came to the defense of Vladimir Putin, as he strangely has on many occasions, saying, "I don't think anybody knows it was Russia." The hacker, he added, could have been China, some other country, or "somebody sitting on their bed who weighs 400 pounds." (What is it with Trump and overweight people?) In fact, as his intelligence briefer could have told him (and perhaps did), there is no doubt that the hack came from Russia. Then Trump rambled, saying, "My 10- year-old son is so good with these computers, it's unbelievable. The security aspect of this cyber is very tough. We are not doing the job we should be doing." He also used the question as a chance to boast of his endorsement by lots of generals and admirals.

Neither candidate pointed out that the United States engages in a lot of cyberespionage as well, albeit not of the same type of espionage as Russia, China, and others. This is a contest that has been going on, though secretly, for decades.

Clinton spelled out her plan for defeating ISIS: recruiting Silicon Valley to block jihadist traffic online; intensifying air strikes; supporting Arab and Kurdish ground fighters; and launching an "intelligence surge" by promoting more cooperation among law-enforcement, intelligence agencies, and foreign intelligence. These are all good ideas, which the Obama administration has been pursuing very forcefully (if, in some cases, a little late). Trump put forth no plan, saying he didn't want to tell ISIS what he would do.

In a follow-up, Clinton pointed out that the fight against ISIS depends on our allies in the Middle East, who have Muslim-majority populations, which Trump has alienated with his rhetoric. Trump dismissed her premise, saying, "We've been working with them for many years, and we have the greatest mess anyone has ever seen." His alternative? He didn't say.

Trump said the biggest mistake happened when Obama pulled out of Iraq, even telling the jihadists the date of the withdrawal. After we left, ISIS erupted. Clinton noted, correctly, that the pullout date was specified in the 2008 Status of Forces Agreement signed during George W. Bush's presidency and that the Iraqi government would not allow any U.S. forces to remain after that date.

On NATO, Trump took credit, as he has in the past, for revitalizing the alliance. A while back, he said NATO was obsolete unless it helped us defeat terrorism--then, lo and behold, he read in the New York Times that NATO was creating a counterterrorism commission. "I think it's in large part because of what I said," he claimed. Clinton pointed out that, after the Sept. 11 attacks, all the NATO allies invoked Article 5--which says an attack on one member is an attack on all--and joined our war against al-Qaida and the Taliban in Afghanistan. She could also have pointed out that NATO issued specific "policy guidelines" on counterterrorism in 2012, well before Trump's off-hand remark.

And once again Trump prevaricated on the war in Iraq. He insisted that he always opposed the invasion, but then admitted that, in a 2002 interview, Howard Stern asked him about the war and, as he put it, "I said, 'I don't know, maybe.' " But, he insisted, he came out strongly against the war in an Esquire interview "shortly after the war started, I think in '04"--perhaps forgetting that the war started in March 2003.

Trump called the Iran nuclear deal "one of the worst deals ever made by any country in history," which, even if the deal's critics were right, betrays a stunning ignorance of history. Clinton pointed out that the deal puts a "cap" on Iran's nuclear program (that's an understatement, as it has actually forced Iran to dismantle almost the whole program) and added, "There's no doubt we have other problems with Iran, but I'd rather deal with those other problems having put that lid on their nuclear program."

Clinton didn't answer Trump's other claim about the deal--that it required us to pay Iran $150 billion--so I'll do it: That payment (and it hasn't been nearly that much) came from Iran's assets, which the United States and the European Union had frozen, as a sanction against its nuclear program. That was the deal: If Iran dismantles its nuclear program, the United States and the EU would unfreeze Iran's assets; that's what motivated Iran to make the deal.

The moderator, NBC anchor Lester Holt, asked whether the United States should adopt a "no-first-use" policy on nuclear weapons. This may have been the first time Trump had heard the phrase. First he said, "I certainly would not do first-strike; once the nuclear alternative happens, it's over"--an interesting comment that many doves might welcome--but then he said, in his next sentence, "At the same time, I can't take anything off the table." But that's what a no-first-use policy would do--explicitly take the nuclear option off the table. A quite detailed debate on this issue has been occupying the strategic community for decades, with legitimate points on both sides. It's not surprising that a real-estate tycoon is unfamiliar with the debate, but you'd think someone might have briefed him on it.

Clinton dealt with the question the way presidents generally do: "Words matter when you run for president, and they really matter when you are president. I want to assure our allies, in Japan and South Korea and elsewhere, that we have mutual defense treaties, and we will honor them." This, in response to Trump's point, famously made in a New York Times interview, that he might not come to the defense of an invaded ally if the ally hadn't paid its fair share--and that maybe it's not such a bad thing if such remarks compelled Japan and South Korea to build their own nuclear weapons.

Finally, Holt asked Trump what he meant when he said Clinton didn't have the "look" to be president. Trump replied, "She doesn't have the look, she doesn't have the stamina"--to which Clinton said, "As soon as he travels to 112 countries and negotiates a peace treaty, a cease-fire ... or even spends 11 hours testifying in front of a congressional committee, he can talk to me about stamina."

Game to Clinton.

Palestinian activists protest Facebook over incitement agreement
Tuesday, 27 September 2016

Palestinian social media activists said Monday that they have launched a campaign against Facebook, asking supporters to boycott the social media site for alleged bias towards Israel.
The campaign comes after several Palestinian journalists said Facebook blocked them from accessing their personal accounts last week and several news outlet pages were taken down.

All have since been reactivated, according to Husam al-Zayegh, a leader of the campaign and editor-in-chief at Gaza-based Shehab News Agency.

The Gaza-based activists are calling on supporters to avoid Facebook for two hours every night and to instead post on Twitter with the hashtag #FBCensorsPalestine.

"All we want is to see Facebook [act fairly] and implement its laws and regulations on all users," al-Zayegh told dpa.

The affected journalists say Facebook deactivated the pages in a bow to Israel following a September 12 agreement between the two to address concerns over material Israel says could incite terrorism.

Facebook said Monday the pages were mistakenly removed after being flagged, and that it restored them as soon as it learned of the error.

"Our team processes millions of reports each week, and we sometimes get things wrong. We're very sorry about this mistake," Facebook said in a statement.

Among other demands, the protesters want Facebook to withdraw from the Israeli agreement, arguing "it will contribute to further persecute Palestinians both on the ground and on the virtual space."

Facebook adheres to its own content removal policy, which has earned it criticism from Israeli politicians who have called for it to take down violence-inciting posts by Palestinians.

Press Trust of India
5th India-US cyber dialogue in New Delhi
Tuesday, 27 September 2016

A US delegation will participate in the fifth India-US cyber dialogue in New Delhi this week and interact with industry representatives to build strong regional partnerships with key stakeholders working on a range of cyber issues.

The US delegation is being led by Christopher Painter, US Department of State Coordinator for cyber issues, who along with the National Security Council Staff, will lead the American engagement on the broad set of cyber policy issues.

The fifth US-India Cyber Dialogue is part of an effort to build strong regional partnerships with key stakeholders working on a range of cyber issues, focusing on promoting an open, interoperable, reliable, and secure internet that benefits all users.

Daniel Sepulveda, Deputy Assistant Secretary of State and US Coordinator for International Communications and Information Policy, will lead the US-India Information and Communication Technology (ICT) Working Group which includes industry and government participation from both countries.

They will attend public events to engage with civil society and Indian youth on Internet and digital economy issues, a media release said.

At the ICT Working Group, it will be discussed how the US and India can work together to help expand the benefits of the digital economy to both of the countries and increase internet connectivity through programs like the Global Connect Initiative, which has a goal of bringing 1.5 billion new internet users online by 2020.

Ex-CSIS official backs Canada's attempt to get cyber promise from China
Wednesday, 28 September 2016
Byline: Howard Solomon

For several years Western governments have blamed official Chinese or Chinese-government backed groups for hacking into databases of public and private organizations. But a year ago the U.S. president Barack Obama and Chinese president president Xi Jinping signed an agreement not to direct or support cyberattacks that steal corporate data for economic benefit.
Now Canada wants to do the same.

A spokesman for Public Safety minister Ralph Goodale told the Globe and Mail that this country will try to get a similar agreement, which has also been negotiated between China and the United Kingdom.

The idea has the support of Ray Boisvert, a former assistant director for intelligence at the Canadian Security Intelligence Service (CSIS) who now has his own security consulting company.

"I do support this type of approach," he said in an email to ITWorldCanada.com. "As we collectively mature in this new networked, cyber-enabled world, be it governments, the private sector or citizens, we will have to apply all types of risk reduction strategies. And of course diplomacy should always be a first among strategic plays. It is no guarantee of success, especially without verification, but two previous agreements involving the U.S. and U.K. (and China) have recorded measurable reductions in cyber thefts of intellectual property and by extension breaches of individual privacy.

"We must do our utmost to get countries like China to enforce international laws and norms in regards to cyber security. Of course, I don't see that being possible with Russia at the moment as, unlike China, it has demonstrated total disregard for international agreements as it sees it's role as an unlawful, unregulated disruptor -- one that has pioneered new approaches in hybrid warfare (applying pressure on governments through stealth, including the enablement of proxies to attack Western organizations and institutions). "

Satyamoorthy Kabilan, director of national security and strategic foresight at the Conference Board of Canada, which represents CEOs was more cautious. "If such an agreement could be enforced, it could be a very worthwhile proposition. But we do need to look into the details - what does this cover, how will it be enforced, etc. I would be interested in finding out more about the exact terms before deciding on whether this would be a worthwhile effort."

Signing a deal and getting it implemented are two different things. In June the Wall Street Journal reported that nine months after a big ceremony at the White House the U.S. and China were still jousting over how to talk to each other. Apparently in the months all they could agree on were temporary email addresses for exchanging communications.

Early on there were signs that the agreement was limited to controlling the official intelligence agencies of each country. "With 1.3 billion people, (the premier) can't guarantee the behavior of every single person on Chinese soil," Obama was quoted as saying when the deal was signed.

One of the key problems of both sides in the Internet era is having absolute proof a government agency was behind an attack on a company.

In a paper earlier this year for the National Bureau of Asian Research, Adam Segal, a fellow at the U.S. Council on Foreign Relations, and Tang Lan, a deputy director at the China Institutes of Contemporary International Relations, wrote that the two countries have significant differences in their views on Internet governance, cyberattacks, cyber-espionage and the security of information and telecom equipment sold into each others' countries. Still they are both worried about threats to their critical infrastructure, stopping the proliferation of cyberattack capabilities of terrorist and criminal groups.

"While the two governments have vowed to clarify responsible behaviors through bilateral and multilateral discussions, identifying common ground and cooperative projects is necessary to reduce tensions in cyberspace," they wrote. But. they warned, failure to build on the agreement "could generate greater mistrust that spills over into other aspects of [their] relationship."

One thing both countries want to avoid, the report and other experts note, is cyber attacks -- particularly on critical infrastructure -- that lead to hostilities.

The academics noted that the U.S. and China have agreed on guidelines for requesting assistance on cybercrimes or other malicious cyber activities, as well as agreeing to conduct "tabletop exercises" and to define procedures for use of a hotline.

Globe and Mail
Privacy watchdog urges Ottawa to pass 'metadata' legislation
Wednesday, 28 September 2016
Byline: Colin Freeze

Canada's privacy czar is calling on the Liberals to fulfill a promise to pass laws constraining the federal spies who are allowed to capture records of Canadians' phone and Internet activities.
The Communications Security Establishment needs new legislation because it has not been careful enough in handling such material, says Daniel Therrien, the Privacy Commissioner of Canada. "The National Defence Act should be amended," he said in an interview. "I would want some clarity around the standards used to collect and share 'metadata.' Right now, the act is completely silent on this."

"Metadata" is the name federal officials give to phone logs, Internet exchanges and similar activity that spy agencies can electronically intercept in bulk. The substance of the underlying communications and the identities of communicators are not known.

CSE has been tasked with providing intelligence about foreigners to the Canadian cabinet since the 1940s. Mr. Therrien's call for new laws for CSE was formally made in his office's annual report on Tuesday. While the Liberals are not obliged to implement his findings, they promised new CSE laws on the campaign trail last year.

Canadian police officers who want access to an individual's phone records must get a judge to sign a warrant. CSE's technological analysts, which work with Canada's closest allies to capture and share communication trails of as many people as possible, operate without warrants and largely through secret edicts signed by the minister of national defence.

A once-classified "metadata ministerial directive" from the Liberal government of 2005 first told CSE it can capture and share as many phone and Internet logs as it can, so long as it does not go after Canadians specifically.

Should such metadata turn up in the wider trawl, the minster tells the spy agency to scrub out any known "Canadian identifying information" before sharing with allies.

During the 2015 campaign, the Liberals suggested they would like judges rather than ministers to make these decisions. The party has said almost nothing about constraining CSE since, but a spokeswoman for Defence Minister Harjit Sajjan told The Globe on Tuesday the government still hopes to introduce a law.

Problems with CSE metadata programs were revealed to the public earlier this year by the spy agency's watchdog, who reviews operations.

Jean-Pierre Plouffe, who is also calling for new laws for the spy agency, unveiled records showing the CSE bought privacy-protecting software that failed. Specifically, it did not remove identifiably Canadian phone logs and Internet Protocol exchanges.

So for years, potentially vast amounts of such material was shared in almost its raw form with allied agencies.

Mr. Sajjan played down the privacy implications, telling reporters the members of the intelligence partnership known as the Five Eyes - agencies in the United States, Britain, Australia, Canada and New Zealand -undertake to protect the privacy of one another's citizens, and not merely their own.

The privacy commissioner says such remarks cannot be taken at face value. "The privacy risk was minimized, downplayed."

Mr. Therrien said in the interview that the only reason spy agencies such as CSE collect metadata is that it is so very revealing.

And he added that no Five Eyes "gentlemen's agreement" overrides anyone's national interest.

When asked what kinds of worst-case scenarios could emerge from all this, Mr. Therrien cited the case of a Canadian software engineer once famously caught in the U.S. Central Intelligence Agency's crosshairs.

In 2001, Canadian officials wrongly red-flagged Maher Arar as a terrorist threat. He was arrested in a New York airport and flown on a CIA-leased jet to the Middle East and spent the next year jailed in his native Syria.

"We only need to think about Arar," Mr. Therrien said, adding that the Syrian-Canadian was tortured. "Arar is a real-life example of where information was shared to a third state. That is the worstcase scenario."

Sydney Morning Herald
Data delays thwart counter-terrorism
Wednesday, 28 September 2016
Byline: Rachel Olding

Sydney - Counter-terrorism police fear crucial information may slip through the cracks in major investigations because a national case- management system has not been rolled out, despite repeated requests for almost a decade.
The number of terrorism investigations in Australia is rising, yet officers say some are being jeopardised because each state police force uses a different system for managing investigations.

Fairfax Media understands that counter-terrorism police have picked up an increasing amount of communication between terror suspects in Sydney and Melbourne in recent months. Both cities remain the overwhelming focus of investigations.

But the country's eight police forces have 18 different systems and counter-terrorism police, who work in joint state and federal teams, are filing information twice into two systems.

Sam Mullins, professor of counter-terrorism at George C. Marshall European Center for Security Studies, interviewed 11 counter-terrorism officers from NSW, Victoria, Queensland and the AFP for a paper published in the latest Journal of Policing, Intelligence and Counter Terrorism.

While some officers viewed the issue as simply a hassle, others said it was jeopardising investigations.

"That would be the number one inhibitor that we've got today, because we miss out on so much intelligence," one Victorian officer said. "And missing [out] on something may well be that needle in a haystack."

An AFP officer said it needed fixing urgently because, if "a piece of information slips through the cracks, that may then have a ... significant implication".

A senior NSW officer said having to duplicate information is "a pain in the butt, it's costly, it's time-consuming".

The pace and frequency of terrorism investigations has rocketed since September 2014 when the national threat level was raised to probable. In some cases, police have been forced to move on rapidly radicalised individuals within hours.

There is "significantly more pressure" on information sharing, an AFP officer said.

Chief executive of the Police Federation of Australia Mark Burgess said police forces were getting an isolated picture of major incidents.

"One piece of information added to another piece added to another piece could become something vital," he said. "Sometimes the second, third or fourth piece is being missed."

The federation has been lobbying since 2007 for a $100 million national system, funded by criminals' confiscated assets.

In 2008, an inquiry into the bungled case of Queensland doctor Mohamed Haneef recommended a national system be adopted "as a matter of urgency".

Dr Haneef was detained, charged and had his visa cancelled on incorrect allegations of aiding a terrorist cousin in Britain. He was later awarded about $1 million compensation.

The inquiry found poor information sharing between Queensland police and the AFP meant evidence was not properly consolidated.

Justice Minister Michael Keenan said national security and counter terrorism legislation "is under constant review to ensure our law enforcement, security, and intelligence agencies have the tools and powers they need".

A feasibility study in 2009-10 highlighted a need to conduct further analysis on the economic and legal impacts associated with a national system.

The government spent $9.8 million last year on a two-year pilot of a national criminal intelligence database. Mr Burgess said a case-management system would be a logical extension but would require legislative change across all states.

The case-management system is the end-to-end process of managing a criminal case from the initial response to all aspects of the investigation, such as forensics and intelligence, to the prosecution.

Global Times
Security shortage
Wednesday, 28 September 2016
Byline: Cao Siqi

Beijing - Tech experts revealed that China is not training anywhere near enough IT workers to deal with digital threats issues at the country's largest cyber security event Tuesday.
"As of 2014, China has more than 700,000 cyber security talents working in key information system and infrastructure industries. By 2020, China will need about 1.4 million cyber security talents. In the last three years, we have recruited about 10,000 students pursuing cyber security, but we are hugely lagging behind demand," Feng Huamin, vice president of the Beijing Electronic Science and Technology Institute, said at a plenary session during China Cybersecurity Week held in Wuhan, capital of Central China's Hubei Province on Tuesday.

As China is launching a national push to train more cyber security talents, many top universities have started to offer cyberspace-related majors since 2015.

Vice Minister of Education Lin Huiqing said at a press conference in February that the number of new university majors involving cyber security, information countermeasures and confidential data management has surpassed 120 and other cyberspace-related majors have exceeded 4,800.

However, many cyber security experts at the Wuhan event pointed out that only a small proportion of China's schools offer such courses and there is a lack of qualified instructors, calling for the country to quickly establish a systematic discipline on cyber security education and promote more practical training.

No systematic method

At the session, Feng said that China now needs more cyber security talents working in several sectors, including those working in Party and government systems; in key infrastructure and information systems; and in combating cybercrimes and cyber terrorism.

Statistics show that China has 3,115 teachers involved in information security education but only 7 percent of them are classed as high-level talents.

Feng pointed out that only 10 percent of the 1,200 Chinese technology and science universities offer related majors while over 100 leading universities do not. Besides, only 15 Chinese universities have established cyber security schools and there is no systematic method for cyber security education.

In June 2015, China's State Council released a notice, demanding the quick establishment of a cyber security discipline and the cultivation of cyber security talents.

Moreover, Feng noted that a lack of practical training and high-quality instructors are also two highly important problems.

Ernest McDuffie, former director of the US National Initiative for Cybersecurity Education program, said at the Wuhan conference that he has not met many college students who have an interest in studying cyber security and the growth rate of global cyber security talents in 2015 was under their expectation.

Greater investment

Shen Changxiang, an academician at the Chinese Academy of Engineering, suggested China open classes to train minors and offer chances for special talents to study cyber security at college without taking the national college entrance examinations.

The Wuhan government has pledged to double the number of scholarships for cyber security majors and recruit top cyber security graduates from Chinese and overseas schools as well as the winners of cyber security contests. It will also open a class for minors and run special recruitment drives for "maverick geniuses."

Moreover, the city government will establish a new evaluation system. Instead of taking exams, cyber security majors will be evaluated based on their performance and priority will be given to those with practical and entrepreneurship experience.

As for cultivating first-class instructors, the Wuhan government vowed to offer twice the salary and research funds to the best cyber security experts compare to those working in similar positions.

Specifically, they will also receive 2 million yuan ($299,823) in subsidies and up to 100 million yuan in funding if they have innovative technologies that have a significant impact on the economy.

Mengchow Kang, board member of the Information Security Certification, called for the standardization of cyber security workforce development.

With such a system, cyber security talents, no matter where they are working, could get recognized with an international qualification, said Kang.

In February, China launched its first special fund for cyber security with initial capital of 300 million yuan to realize the nation's strategic goal of becoming a strong Internet power.

The fund, established by the China Internet Development Foundation, will be used to provide financial assistance to experts and teachers who specialize in cyber security.

Wall Street Journal
Facebook Told Not to Collect Data --- A German regulator ordered network to stop gathering WhatsApp user data
Wednesday, 28 September 2016
Byline: Friedrich Geiger

Berlin - A German privacy watchdog has ordered Facebook Inc. to stop collecting user data from its messenger subsidiary WhatsApp, the latest clash between European privacy authorities and the social network company.
Hamburg's commissioner for data protection, Johannes Caspar, said user-data exchange between the two services infringed on German data- protection law after WhatsApp changed its data-sharing terms last month. The Federation of German Consumer Organizations sent WhatsApp a similar warning.

A Facebook spokeswoman said, "We will appeal this order and we will work with the Hamburg [authority] in an effort to address their questions and resolve any concerns."

Facebook complied with EU data- protection law, she said. Mr. Caspar said Facebook reneged on a pledge it made on acquiring WhatsApp in 2014, when it said the services would keep user data separate. His office's order, Mr. Caspar said, protected the data of about 35 million WhatsApp users in Germany. WhatsApp has notified existing users of the change and given them the opportunity to opt out. In Mr. Caspar's view, however, Facebook is an independententity that also has to ask the permission of WhatsApp users.

"It has to be their decision whether they want to connect their accounts with Facebook," he said. "Facebook must ask their permission in advance (but) this did not happen."

In Germany, Mr. Caspar's office oversees Facebook's privacy practices because the company has its national office in Hamburg. His order forbids Facebook from collecting and storing data of German users of WhatsApp and requires the company to delete data it has received.

WhatsApp's plan to share user information with Facebook immediately raised concerns among privacy regulators in Europe when it was announced last month. The Article 29 Working Party, a body representing the European Union's 28 national data-protection authorities, at the time said its members were scrutinizing the WhatsApp change of terms "with great vigilance."

The change of terms is just one in a series of concerns about Facebook's data policies. France threatened the company with fines if it didn't change how it handled data, and Germany's Federal Cartel Office

earlier this year began an investigation into whether Facebook abused its dominance as a social network to harvest personal information.

According to Mr. Caspar, people who don't use WhatsApp or Facebook also were at risk of having their details collected should WhatsApp forward data that it collected from users' address books of external contacts.

"Facebook's answer that it hasn't done this yet nevertheless is a reason to worry that the magnitude of the data-protection breach will have a much more severe impact."

As part of its warning earlier this month, the Federation of German Consumer Organizations said it had given WhatsApp until Sept. 21 to agree to a cease-and-desist order regarding data transfer to Facebook. The federation's spokesman Timo Beyer said WhatsApp asked for a postponement of the deadline until Oct. 14, which was granted.

Al Jazeera
Opposing nuclear weapons in the era of millennials
Wednesday, 28 September 2016
Byline: James Reinl

New York - The mushroom clouds of nuclear explosions cast a long shadow over the 20th century. The fungal smoke stacks provoked fear of an atomic apocalypse and became a rallying symbol for anti-war activists.
Their fright factor may be waning. The Cold War arms race was over by the time millennials were born. For the Instagram generation, cyber-strikes and hijacked jets hitting skyscrapers weigh heavier on the mind.

"Nuclear weapons kind of faded down once, like, the issue of terrorism and 9/11 happened," New York high school pupil Lucy Li, 16, told Al Jazeera. World War II was a long time back, she said. "Terrorism is the main focus and worry right now."

This month, Li and other teens visited the United Nations headquarters to learn about the 1945 bombing of Hiroshima from survivor Setsuko Thurlow, 84, who relived harsh childhood memories of the blast, infernos and relatives dying from radiation sickness.

Thurlow worries that the strike, which claimed some 140,000 lives by the end of the year, was too-quickly forgotten. People "went back to sleep", she told Al Jazeera. "We gotta clean up this mess before we pass on the planet to the next generation."

Lecturing youngsters is only half the battle. Downstairs at the world body, diplomats were hatching plans to outlaw nuclear weapons, of which there are more than 15,000 globally, owned by nine countries.

Many nations abhor the weapons, saying any nuclear strike would kill masses of civilians and automatically constitute an atrocity. Like mustard gas and land mines, they are inhuman and should be banned, they say.

For several years, Austria, a landlocked European nation, has built support for a push against Russia and the United States - which have the lion's share of nuclear weapons - and other nuclear powers in a bid to declare the weapons illegal.

On September 21, Austria's Foreign Minister, Sebastian Kurz , told the UN General Assembly that Austria "will table a draft resolution to convene negotiations on a legally-binding comprehensive instrument to prohibit nuclear weapons".

Diplomats familiar with the talks told Al Jazeera that Austria, Mexico and others will shortly release a UN General Assembly resolution that already has the support of more than 120 of the UN's 193 members.

The document is still being drafted in Geneva, but is expected to arrange a confab aimed at creating a nuclear weapons treaty akin to legal prohibitions on chemical weapons, landmines and cluster bombs .

"We all agree that the humanitarian consequences of the explosion of nuclear weapons would be unacceptable," said Kurz. "Experience shows that the first step to eliminate weapons of mass destruction is to prohibit them through legally-binding norms."

In some ways, he is preaching to the converted. The five legally-recognised nuclear-armed states - the United States, Russia, France, China and Britain - known as the P5, have long vowed to ditch their doomsday arsenals under the Non-Proliferation Treaty.

In 2009, US President Barack Obama called for a world without nuclear weapons while in Prague. His New START deal with Russia, ratified the next year, cut the number of deployed strategic nuclear warheads to 1,550.

In his UN address this month, Obama spoke of his "unique responsibility" to scrap nuclear weapons and on September 23 the UN Security Council passed a resolution supporting a 20-year-old treaty against nuclear test blasts.

But progress is too slow for Austria and others. Despite talk of disarmament, the US will spend some $1 trillion over three decades to modernise its nuclear arsenal. Britain plans to renew its missile-launching submarines.

Prospects for more US-Russia deals are bleak, given the rows over Ukraine and Syria. Donald Trump, the Republican presidential nominee in this year's White House race, even suggested that Japan and South Korea acquire the weapons.

Meanwhile, the nuclear-toting states outside the NPT - Pakistan, India, North Korea and also Israel, which neither confirms nor denies its stockpiles - answer to nobody. Some fear that Iran will join them after its 10-year deal with the US and others expires.

North Korea came closer to being able to launch nuclear warheads at neighbours this month with its fifth test blast. Pakistan is deploying small, tactical nuclear weapons to deter India that could be stolen or misused.

The UN calls for a world free of nuclear weapons and marks September 26 as the International Day for the Total Elimination of Nuclear Weapons, but has largely shelved the issue to focus on more-likely gains against poverty and climate change.

Thomas Countryman, the US State Department's point man on nuclear arms, called Austria's effort "meaningless" and "dangerous". Pyongyang's recent test blast showed why the US should retain its deterrent advantage, he said.

"The international security environment needs to evolve in a way that gives the Russian Federation and the United States first, and later other nuclear weapon states, the confidence to negotiate further reductions in their nuclear arsenals," Countryman told Al Jazeera. "That is not something that can be accomplished by outside pressure from other states or from NGOs."

Opinions are mixed on whether Austria will achieve anything beyond a UN General Assembly resolution, which carry moral, not legal, force. Joseph Gerson, an anti-war activist, predicted an "intense fight" between the P5 and smaller UN members.

"It's the many against a few, but the few have considerable power," Gerson, from the American Friends Service Committee, a Quaker group, told Al Jazeera. "The US has sent out a demarche to quite a number of countries telling them not to push on this."

Kenneth Luongo, president of the Centre for a Secure Nuclear Future, a policy group, doubts that the US or Russia will yield to pressure. Their generals, however, may scrap some costly nuclear arms for weapons better suited against armed groups and other, more urgent, threats.

Global risk analyst Ian Bremmer, president of the Eurasia Group, says the threat of nuclear brinksmanship has subsided, while cyber-strikes are ever-more menacing and available to many more than the nine nuclear powers.

While envoys negotiate between governments, the activists continue campaigning, though without the frequent "Ban the Bomb" marches that once drew big crowds in western cities but dwindled from the 1980s onwards.

Hidenori Watanave, a Harvard University scholar, is building an online archive of survivors' testimonies from Hiroshima. Youngsters can use it to become "storytellers about the atomic bomb" via Facebook-style sharing, once Thurlow and others like her are gone, he told Al Jazeera.

His project and other efforts are having an impact, however limited. After the UN class, pupil Li grappled with a question that vexed even Robert Oppenheimer, the physicist behind America's nuclear project, seven decades ago.

"I feel like they were created in this race to show who is the No 1, like, most powerful country in the world," Li said. "What I don't get is why you would create a weapon that could destroy the world in a few seconds, just for the sake of power."

Associated Press
Across US, police officers abuse confidential databases
Wednesday, 28 September 2016
Byline: Staff report

Denver - Police officers across the country misuse confidential law enforcement databases to get information on romantic partners, business associates, neighbors, journalists and others for reasons that have nothing to do with daily police work, an Associated Press investigation has found.
Criminal-history and driver databases give officers critical information about people they encounter on the job. But the AP's review shows how those systems also can be exploited by officers who, motivated by romantic quarrels, personal conflicts or voyeuristic curiosity, sidestep policies and sometimes the law by snooping. In the most egregious cases, officers have used information to stalk or harass, or have tampered with or sold records they obtained.

No single agency tracks how often the abuse happens nationwide, and record-keeping inconsistencies make it impossible to know how many violations occur.

But the AP, through records requests to state agencies and big-city police departments, found law enforcement officers and employees who misused databases were fired, suspended or resigned more than 325 times between 2013 and 2015. They received reprimands, counseling or lesser discipline in more than 250 instances, the review found.

Unspecified discipline was imposed in more than 90 instances reviewed by AP. In many other cases, it wasn't clear from the records if punishment was given at all. The number of violations was surely far higher since records provided were spotty at best, and many cases go unnoticed.

Among those punished: an Ohio officer who pleaded guilty to stalking an ex-girlfriend and who looked up information on her; a Michigan officer who looked up home addresses of women he found attractive; and two Miami-Dade officers who ran checks on a journalist after he aired unflattering stories about the department.

"It's personal. It's your address. It's all your information, it's your Social Security number, it's everything about you," said Alexis Dekany, the Ohio woman whose ex- boyfriend, a former Akron officer, pleaded guilty last year to stalking her. "And when they use it for ill purposes to commit crimes against you - to stalk you, to follow you, to harass you ... it just becomes so dangerous."

The misuse represents only a tiny fraction of the millions of daily database queries run legitimately during traffic stops, criminal investigations and routine police encounters. But the worst violations profoundly abuses systems that supply vital information on criminal suspects and law-abiding citizens alike. The unauthorized searches demonstrate how even old-fashioned policing tools are ripe for abuse, at a time when privacy concerns about law enforcement have focused mostly on more modern electronic technologies. And incomplete, inconsistent tracking of the problem frustrates efforts to document its pervasiveness.

The AP tally, based on records requested from 50 states and about three dozen of the nation's largest police departments, is unquestionably an undercount.

Some departments produced no records at all. Some states refused to disclose the information, said they don't comprehensively track misuse or produced records too incomplete or unclear to be counted. Florida reported hundreds of misuse cases of its driver database, but didn't say how often officers were disciplined.

And some cases go undetected, officials say, because there aren't clear red flags to automatically distinguish questionable searches from legitimate ones.

"If we know the officers in a particular agency have made 10,000 queries in a month, we just have no way to (know) they were for an inappropriate reason unless there's some consequence where someone might complain to us," said Carol Gibbs, database administrator with the Illinois State Police.

The AP's requests encompassed state and local databases and the FBI-administered National Crime and Information Center, a searchable clearinghouse that processes an average of 14 million daily transactions.

The NCIC catalogs information that officers enter on sex offenders, immigration violators, suspected gang members, people with outstanding warrants and individuals reported missing, among others. Police use the system to locate fugitives, identify missing people and determine if a motorist they've stopped is driving a stolen car or is wanted elsewhere.

Other statewide databases offer access to criminal histories and motor vehicle records, birth dates and photos.

Officers are instructed that those systems, which together contain data far more substantial than an internet search would yield, may be used only for legitimate law enforcement purposes. They're warned that their searches are subject to being audited and that unauthorized access could cost them their jobs or result in criminal charges.

Yet misuse persists.

'SENSE OF BEING VULNERABLE'

Violations frequently arise from romantic pursuits or domestic entanglements, including when a Denver officer became acquainted with a hospital employee during a sex-assault investigation, then searched out her phone number and called her at home. A Mancos, Colorado, marshal asked co- workers to run license plate checks for every white pickup truck they saw because his girlfriend was seeing a man who drove a white pickup, an investigative report shows.

In Florida, a Polk County sheriff's deputy investigating a battery complaint ran driver's license information of a woman he met and then messaged her unsolicited through Facebook.

Officers have sought information for purely personal purposes, including criminal records checks of co-workers at private businesses. A Phoenix officer ran searches on a neighbor during the course of a longstanding dispute. A North Olmsted, Ohio, officer pleaded guilty this year to searching for a female friend's landlord and showing up in the middle of the night to demand the return of money he said was owed her.

The officer, Brian Bielozer, told the AP he legitimately sought the landlord's information as a safety precaution to determine if she had outstanding warrants or a weapons permit. But he promised as part of a plea agreement never to seek a job again in law enforcement. He said he entered the plea to avoid mounting legal fees.

Some database misuse occurred in the course of other misbehavior, including a Phoenix officer who gave a woman involved in a drug and gun-trafficking investigation details about stolen cars in exchange for arranging sexual encounters for him. She told an undercover detective about a department source who could "get any information on anybody," a disciplinary report says.

Eric Paull, the Akron police sergeant who pleaded guilty last year to stalking Dekany, also ran searches on her mother, men she'd been close with and students from a course he taught, prosecutors said. A lawyer for Paull, who was sentenced to prison, said Paull has accepted responsibility for his actions.

"A lot of people have complicated personal lives and very strong passions," said Jay Stanley, an American Civil Liberties Union privacy expert. "There's greed, there's lust, there's all the deadly sins. And often, accessing information is a way for people to act on those human emotions."

Other police employees searched for family members, sometimes at relatives' requests, to check what information was stored or to see if they were the subjects of warrants.

Still other searchers were simply curious, including a Miami-Dade officer who admitted checking dozens of officers and celebrities including basketball star LeBron James.

Political motives occasionally surface.

Deb Roschen, a former county commissioner in Minnesota, alleged in a 2013 lawsuit that law enforcement and government employees inappropriately ran repeated queries on her and other politicians over 10 years. The searches were in retaliation for questioning county spending and sheriff's programs, she contended.

She filed an open-records request that revealed her husband and daughter were also researched, sometimes at odd hours. But an appeals court rejected her suit and several similar cases this month, saying the plaintiffs failed to demonstrate the searches were unpermitted.

"Now there are people who do not like me that have all my private information ... any information that could be used against me. They could steal my identity, they could sell it to someone," Roschen said.

"The sense of being vulnerable," she added, "there's no fix to that."

BETRAYAL OF TRUST

Violations are committed by patrol officers, dispatchers, civilian employees, court personnel and high-ranking police officials. Some made dozens of improper searches. Some were under investigation for multiple infractions when they were punished, making it unclear whether database misuse was always the sole reason for discipline.

Agencies uncover some violations during audits, or during investigations into other misconduct. Some emerge after a citizen, often the target of a search, finds out or grows suspicious. A Jacksonville, Florida,

sheriff's officer was found to have run queries on his ex-girlfriend and her new boyfriend after she raised concerns she was being harassed, an internal affairs report says.

The AP sought to focus on officers who improperly accessed information on others but also counted some cases in which officers divulged information to someone not authorized to receive it, or ran their own names for strictly personal purposes, including to check their car registrations.

The tally also includes some cases in which little is known about the offense because some agencies provided no details - only that they resulted in discipline.

The AP tried when possible to exclude benign violations, such as new employees who ran only their own names during training or system troubleshooting. But the variability in record-keeping made it impossible to weed out all such violations.

Agencies in California, for instance, reported more than 75 suspensions, resignations and terminations between 2013 and 2015 arising from misuse of the California Law Enforcement Telecommunications System, state records show. But because the records didn't identify officers or specify the allegations, it's unclear whether multiple violations were committed by the same person or how egregious the infractions were.

Colorado disclosed about 35 misuse violations without specifying punishment. Indiana listed 12 cases of abuse but revealed nothing about them. The Florida Department of Highway Safety and Motor Vehicles reported about 400 violations in 2014 and 2015 of its Driver and Vehicle Information Database, or DAVID, but didn't include the allegations or punishment.

The FBI's Criminal Justice Information Services Division offers training to state and local law enforcement agencies on NCIC use, and conducts audits every three years that include a sample of local departments, said spokesman Stephen Fischer.

But it doesn't track how often NCIC information is misused. Violations, which are not required to be reported directly to the FBI, are inconsistently disclosed to the federal government. The FBI relies on local agencies to address violations that are identified, Fischer said.

The AP requested records from large police departments and state agencies tasked with administering NCIC usage within their districts. The responses included cases where officers misused motor vehicle data, including driver's license and registration information, and also more sensitive criminal history records.

Officers are only occasionally prosecuted, and rarely at the federal level.

One recent exception is a former Cumming, Georgia, officer charged in June with accepting a bribe to search a woman's license plate number to see if she was an undercover officer. Another involved Ronald

Buell, a retired New York Police Department sergeant who received probation for selling NCIC information to a private investigator for defense attorneys.

At his July sentencing, Buell said he hoped other officers would learn "to never put themselves in the position I'm in."

It's unsettled whether improper database access is necessarily a federal crime and whether it violates a trespass statute that criminalizes using a computer for other than authorized purposes.

A federal appeals court last year reversed the computer-crime conviction of ex-NYPD officer Gilberto Valle, whom tabloids dubbed the "cannibal cop" for his online exchanges about kidnapping and eating women and who improperly used a police database to gather information. Valle argued that as an officer, he was legally authorized to access the database. The court deemed the statute ambiguous and said it risked criminalizing a broad array of computer use.

Misuse has occasionally prompted federal lawsuits under a statute meant to protect driver's license data.

A Florida Highway Trooper, Donna Watts, accused dozens of officers of searching her in the state's driver database after she stopped a Miami-Dade officer for speeding in 2011. She alleged in lawsuits that she was harassed with prank calls, threatening posts on law enforcement websites and unfamiliar cars that idled near her home.

Each unlawful access, she said in a court document, "has either caused or worsened anxiety, depression, insomnia, and other medical/physical/psychological conditions I suffer."

Law enforcement officials have taken steps to try to limit abuse, though they say they know of no foolproof safeguard given the volume of inquiries and the need for officers to have information at their fingertips.

"There's no system that could prohibit you from looking up your ex-wife's new boyfriend, because your ex-wife's new boyfriend could come in contact with the criminal justice system," said Peggy Bell, executive director of the Delaware Criminal Justice Information System.

The Minnesota Department of Public Safety said it changed the way officers access a state driver database after a 2013 legislative audit found over half of the 11,000 law enforcement personnel who use it made searches that appeared questionable. The audit was conducted after a former state employee was charged with illegally viewing thousands of driver's license records.

In Florida, a memorandum of understanding this year increased the amount of field audits law enforcement agencies must undergo regarding DAVID usage. Troopers in the Florida Highway Patrol sign

usage warnings when they access the DAVID system and a criminal sanctions acknowledgment. Users are audited and instructed to select a reason for a search before making inquiries.

Denver's independent monitor, Nicholas Mitchell, argued for strong policies and strict discipline as a safeguard, especially as increasing amounts of information are added to databases. His review found most of the 25 Denver officers punished for misusing databases over 10 years received at most reprimands.

Miami-Dade police cracked down after the Watts scandal and other high-profile cases. The department now does quarterly audits in which officers can be randomly asked to explain searches. A sergeant's duties have been expanded to include daily reviews of proper usage and troubleshooting, said Maj. Christopher Carothers of the professional compliance bureau.

Even if the public is unaware of the amount of available information, Carothers said, "The idea that police would betray that trust out of curious entertainment or truly bad intent, that's very disturbing and unsettling."

New York Times
Defending Against Hackers Took a Back Seat at Yahoo, Insiders Say
Wednesday, 28 September 2016
Byline: Nicole Perlroth, Vindu Goel

San Francisco - Six years ago, Yahoo's computer systems and customer email accounts were penetrated by Chinese military hackers. Google and a number of other technology companies were also hit.
The Google co-founder Sergey Brin regarded the attack on his company's systems as a personal affront and responded by making security a top corporate priority. Google hired hundreds of security engineers with six-figure signing bonuses, invested hundreds of millions of dollars in security infrastructure and adopted a new internal motto, "Never again," to signal that it would never again allow anyone -- be they spies or criminals -- to hack into Google customers' accounts.

Yahoo, on the other hand, was slower to invest in the kinds of defenses necessary to thwart sophisticated hackers that are now considered standard in Silicon Valley, according to half a dozen current and former company employees who participated in security discussions but agreed to describe them only on the condition of anonymity.

When Marissa Mayer took over as chief executive of the flailing company in mid-2012, security was one of many problems she inherited. With so many competing priorities, she emphasized creating a cleaner look for services like Yahoo Mail and developing new products over making security improvements, the Yahoo employees said.

The "Paranoids," the internal name for Yahoo's security team, often clashed with other parts of the business over security costs. And their requests were often overridden because of concerns that the inconvenience of added protection would make people stop using the company's products.

But Yahoo's choices had consequences, resulting in a series of embarrassing security failures over the last four years. Last week, the company disclosed that hackers backed by what it believed was an unnamed foreign government stole the credentials of 500 million users in a breach that went undetected for two years. It was the biggest known intrusion into one company's network, and the episode is now under investigation by both Yahoo and the Federal Bureau of Investigation.

Certainly, many big companies have struggled with cyberattacks in recent years. But Yahoo's security efforts appear to have fallen short, in particular, when compared with those of banks and other big tech companies.

To make computer systems more secure, a company often has to make its products slower and more difficult to use. It was a trade-off Yahoo's leadership was often unwilling to make.

In defense of Yahoo's security, a company spokeswoman, Suzanne Philion, said the company spent $10 million on encryption technology in early 2014, and that its investment in security initiatives will have increased by 60 percent from 2015 to 2016.

"At Yahoo, we have a deep understanding of the threats facing our users and continuously strive to stay ahead of these threats to keep our users and our platforms secure," she said.

The breach disclosed last week is the latest black eye for Ms. Mayer, whose failed turnaround effort resulted in Yahoo's agreement in July to sell its core operations to Verizon for $4.8 billion. It is unclear whether the episode will affect the sale. Although Yahoo's email users are its most loyal and frequent customers, the company has been losing market share in email for years.

"Yahoo is already suffering. I don't think they'll suffer more because of this," said Avivah Litan, a security analyst with the research firm Gartner.

Ms. Mayer arrived at Yahoo about two years after the company was hit by the Chinese military hackers. While Google's response was public, Yahoo never publicly admitted that it had also been attacked.

A former Google executive credited with creating the search company's simple, colorful aesthetic, Ms. Mayer turned her attention at Yahoo to beating Google at search, creating new mobile apps, and turning Yahoo into a video powerhouse with television-style broadcasts featuring big-name talent like Katie Couric.

But in matters of security, Ms. Mayer, current and former employees said, was far more reactive. In 2010, Google announced it would start paying hackers "bug bounties" if they turned over security holes

and problems in its systems. Yahoo did not do the same until three years later, after it lost countless security engineers to competitors and experienced a breach of more than 450,000 Yahoo accounts in 2012 and a series of humiliating spam attacks in 2013. Yahoo said it had paid out $1.8 million to bug hunters.

In 2013, disclosures by Edward J. Snowden, the former National Security Agency contractor, showed that Yahoo was a frequent target for nation-state spies. Yet it took a full year after Mr. Snowden's initial disclosures for Yahoo to hire a new chief information security officer, Alex Stamos.

Jeff Bonforte, the Yahoo senior vice president who oversees its email and messaging services, said in an interview last December that Mr. Stamos and his team had pressed for Yahoo to adopt end-to-end encryption for everything. Such encryption would mean that only the parties in a conversation could see what was being said, with even Yahoo unable to read it.

Mr. Bonforte said he resisted the request because it would have hurt Yahoo's ability to index and search message data to provide new user services. "I'm not particularly thrilled with building an apartment building which has the biggest bars on every window," he said.

The 2014 hiring of Mr. Stamos -- who had a reputation for pushing for privacy and antisurveillance measures -- was widely hailed by the security community as a sign that Yahoo was prioritizing its users' privacy and security.

The current and former employees say he inspired a small team of young engineers to develop more secure code, improve the company's defenses -- including encrypting traffic between Yahoo's data centers -- hunt down criminal activity and successfully collaborate with other companies in sharing threat data.

He also dispatched "red teams" of employees to break into Yahoo's systems and report back what they found. At competitors like Apple and Google, the Yahoo Paranoids developed a reputation for their passion and contributions to collaborative security projects, like Threat Exchange, a platform created by Yahoo, Dropbox, Facebook, Pinterest and others to share information on cyberthreats.

But when it came time to commit meaningful dollars to improve Yahoo's security infrastructure, Ms. Mayer repeatedly clashed with Mr. Stamos, according to the current and former employees. She denied Yahoo's security team financial resources and put off proactive security defenses, including intrusion-detection mechanisms for Yahoo's production systems. Over the last few years, employees say, the Paranoids have been routinely hired away by competitors like Apple, Facebook and Google.

Mr. Stamos, who departed Yahoo for Facebook last year, declined to comment. But during his tenure, Ms. Mayer also rejected the most basic security measure of all: an automatic reset of all user passwords, a step security experts consider standard after a breach. Employees say the move was rejected by Ms.

Mayer's team for fear that even something as simple as a password change would drive Yahoo's shrinking email users to other services.

On Tuesday, six Democratic senators, led by Patrick Leahy of Vermont, sent a letter to Ms. Mayer demanding more details about the 2014 breach and what Yahoo was doing to prevent a recurrence. Another senator, Mark Warner, Democrat of Virginia, has asked the Securities and Exchange Commission to investigate Yahoo's disclosures to investors regarding the incident. And the company is already the subject of several class-action lawsuits from users over the intrusion.

Reuters
At your service: cyber criminals for hire to militants, EU says
Wednesday, 28 September 2016
Byline: Staff report

Brussels - Cybercriminals offering contract services for hire offer militant groups the means to attack Europe but such groups have yet to employ such techniques in major attacks, EU police agency Europol said on Wednesday.
"There is currently little evidence to suggest that their cyber- attack capability extends beyond common website defacement," it said in its annual cybercrime threat assessment in a year marked by Islamic State violence in Europe.

But the internet's criminal shadow the Darknet had potential to be exploited by militants taking advantage of computer experts offering "crime as a service", Europol added: "The availability of cybercrime tools and services, and illicit commodities (including firearms) on the Darknet, provide ample opportunities for this situation to change."

Overall, the report found, existing trends in cybercrime continued to grow, with some of the European Union's member states reporting more cyber crimes than the traditional variety.

"Europol is concerned about how an expanding cybercriminal community has been able to further exploit our increasing dependence on technology and the internet," its director, Rob Wainwright, said in a statement. "We have also seen a marked shift in cyber- facilitated activities relating to trafficking in human beings, terrorism and other threats."

"Ransomware" - programs which break into databases and demand payment for unlocking codes via virtual currencies such as Bitcoin - continued to expand as a problem, as did highly targeted "phishing" attacks to extract security data from senior figures - "CEO fraud" - and video streaming of child abuse.

Attacks on bank cash-machine networks were also increasing, the report found, as were frauds exploiting new contactless payment card transactions, while traditional scams involving the physical presence of a card had been successfully reduced.

Khaleej Times
Be cautious using social media, experts stress
Wednesday, 28 September 2016
Byline: Rohma Sadaqat

Dubai - The power of social media today for both consumers and businesses can't be ignored, however users have to be cautious about how they choose to consume it, experts at a panel discussion on media and technology have said.
The event brought together a number of industry experts including Sara Al Madani, board member of the Sharjah Chamber of Commerce and Industry; Shereen Ghabrial, general manager of Pyramedia Media Consultancy & Production; Vinay Kamat, editor of Khaleej Times; and Noor Shamma, founder of the Postcard Initiative.

"Technology has become part of our lives 24/7," said Saghir Ahmed Khan, senior vice president of finance and operations at Khaleej Times, in his opening address. "It needs to be embraced rather than adapted for us to reap its rewards. However, we have to be careful about the extent to which we use technology in our daily lives. We should be careful in that we don't allow it to affect they way that we interact with the people around us."

Al Madani highlighted how social media today is a platform for many users to share their culture with millions of people around the world. Through social media platforms such as facebook, twitter, and Instagaram, people can learn about different cultures, trends, and what is making news around the world. However, she also pointed out that with the many positives that come with using social media, there were also a few negatives such as inappropriate content, and being bombarded with information that has nothing to do with you.

"It is important to choose a social media platform that works best for you," she said. "Some people will of course misuse it, so it is up to you to determine how best to use it. If something offends you, then you can easily choose to ignore it or unfollow that person. Choose to follow what interests you, and you will have a whole world of opportunities open to you, whether it has to do with business, entertainment, or lifestyle."

Like Al Madani, Shamma cautioned attendees on using social media and technology to an extent where it is having a negative impact on your relationship with different people. "You must remember that some people, especially elders think it is offensive when you are on your phone constantly in front of them. For them it is a sign of respect when you give them your full attention. Also it is very important to monitor what children today are learning from social media, because everything, and I mean everything today is online. A lot of the content is inappropriate for young children and care should be taken to make sure that they aren't exposed to it."

Ghabrial pointed out how businesses that fail to have a social media presence in this day and age will not be very successful.

"Most businesses today have several different social media accounts that are linked to their website, and which they rely on to reach a wider audience," he said. "For example, a fashion house might have five shops in different locations that attract a certain number of customers. Now, with social media that same company can attract almost triple the number of their current clients. Their penetration online can reach millions of people. Also your reach isn't limited; for many businesses in the UAE today, social media is the tool with which they can expand their operations to the other GCC countries. E-trading is the name of the game now, and people are making millions through the use of social media."

Kamat also highlighted how social media has impacted journalism and mainstream media. "Journalism has had various transformational points throughout history. January 15, 2009 was one such date which sent out a signal that journalism as we knew it was about to change," he said.

It was the date that US Airways Flight 1549, on a routine flight from New York to North Carolina, ran into problems when a flock of birds flew directly into the plane's engines, rendering both useless. The aircraft was forced to make a controlled water landing on the Hudson River. The playing field was immediately changed when a single tweet, from one of the rescuers, headed for the floating aircraft reached millions of people, almost 15 minutes before any major news channel had even reached the site.

Fox News
Fewer than one in five State Dept employees with security clearance completed classified info training
Wednesday, 28 September 2016
Byline: Catherine Herridge

Washington - Fewer than one in five employees with a security clearance at the State Department has completed the mandated training for handling classified information as required by a 2009 Executive Order signed by President Obama, according to a new report from the government watchdog with oversight.
"Based on training records obtained from the Foreign Service Institute, the OIG (Office of the Inspector General) found that less than 14 percent of security-cleared employees had completed the required training within the timeframe considered in this review. Moreover, only 20 percent had completed the training even one time since the outset of the training program," the report said.

The report was commissioned after a 2013 review found severe deficiencies at the department when Hillary Clinton was secretary of state. "When Department employees and contractors are unaware of classification standards and no mechanism is in place to enforce training requirements, there is an increased risk that information could be incorrectly marked, misclassified, and/or improperly restricted or disseminated," it said.

The findings are notable because the recently released FBI files show how Clinton and her aides could not recall their classified information training, or if they did, still mishandled sensitive information.

In one case, the FBI documents show Clinton's "confidential" aide Monica Hanley received a high level clearance known as a Top Secret/SCI clearance. Despite acknowledging she received the training, during one trip to Russia, Hanley was specifically criticized for leaving a classified document in a hotel suite she shared with Clinton. "Hanley was informed by DS (Department of State) that the briefing book and document should have never been in the suite," the document said. Career government employees, who asked to speak off the record because they still hold clearances, said it was another example of a "double standard." In their experience, they said, in all other cases the individual would immediately lose his or her clearance pending a full investigation.

Two emails from Hanley to Clinton were marked classified with a c for "confidential," the lowest level of classification. Fox News first reported some of the emails contained classified markings despite Clinton's public claims.

Despite signing two non-disclosure agreements, known as NDA's, Clinton told the FBI she could not recall the training, and had trouble identifying classified information. Clinton told agents she could only speculate that the 'c' was part of an alphabetical listing such as A, B, C even though the other markings on the email were "SBU" for sensitive but unclassified.

Fox News has asked the State Department to respond to the findings.

New York Times
Voice in Russia Adds to Intrigue Over Computer Attacks in U.S.
Wednesday, 28 September 2016
Byline: Andrew E. Kramer

Biysk, Russia - Living anonymously, down a winding road in the wilderness of western Siberia, not far from the Mongolian border, the only person so far implicated in the flurry of Russian hacking of the Democratic National Committee and other political sites was obviously enjoying the moment.
"We have the information, but nobody contacted us," said Vladimir M. Fomenko, a tattooed 26-year-old who snowboards in his free time and runs a business out of a rented apartment.

"It's like nobody wants to sort this out," he added with a sly grin.

Mr. Fomenko was recently identified by an American cybersecurity company, ThreatConnect, as the manager of an "information nexus" that was used by hackers suspected of working for Russian state security in cyberattacks on democratic processes in several countries, including Germany, Turkey and Ukraine, as well as the United States.

Rather than issuing blanket denials, Mr. Fomenko is apparently eager to discuss his case, lending another, if still cryptic, dimension to the intrigue, restricted before now to digital codes and online fingerprints.

Mr. Fomenko is the owner of a server rental company called King Servers used by hackers in an incursion on computerized election systems in Arizona and Illinois this year. Its other principal clients, he said, have been pornographers.

His response has been a blend of sarcasm, vague denials and an invitation to cooperate with the F.B.I., offering potentially critical evidence in the Arizona and Illinois cases, should officials reach out to him here.

"If the F.B.I. asks, we are ready to supply the I.P. addresses, the logs," he said, referring to internet protocols, which identify a particular web page or device. "But nobody is asking. That is a big question."

Another is just how much Mr. Fomenko knows. Attribution in cases like these is a notoriously tricky business, especially when governments route their attacks through proxy servers like his or, in many cases, outsource espionage activities to criminal groups to maintain a measure of plausible deniability.

The investigation that led here began after the hacking of the state voting systems from June until August, what cyberanalysts say could be a bold bid by a resurgent Russia to undermine Americans' faith in their electoral process. The F.B.I. published eight internet addresses used in the attack. The bureau did not name the states, but officials in Arizona and Illinois acknowledged that their computers had been hacked.

ThreatConnect then identified six of the eight addresses as originating from servers owned by King Servers, Mr. Fomenko's company, in Dronten, the Netherlands, and possibly elsewhere. Mr. Fomenko also owns servers in Fremont, Calif.; Garden City, N.Y.; and Moscow.

The hackers, according to ThreatConnect, had used one of the eight internet addresses to send 113 precisely targeted, so-called spear phishing emails intended to dupe election officials and politicians in Turkey, Germany and Ukraine to click on links that downloaded malware. Some emails mimicked Gmail security warnings or notes from LinkedIn, the social networking site.

The emails were sent to members of the governing Justice and Development Party in Turkey, the German Freedom Party and Ukrainian members of Parliament, ThreatConnect said.

This spear phishing activity targeting the three countries was staged from one of the two addresses not originating from King Servers, while a King Servers address used Tor, the anonymity software, in the Illinois and Arizona electoral board hacks.

The security researchers said that the hackers who used Mr. Fomenko's server as part of this broader campaign were "looking to manipulate multiple countries' democratic processes" and that their modus operandi was "more suggestive of state-backed rather than criminally motivated activity."

Russian officials have denied any involvement in the hacking, but in an interview this month, President Vladimir V. Putin asked Bloomberg, "Does it even matter who hacked this data?" implying that the revelations were more important than the source. "The content was given to the public," he added.

The Democratic presidential nominee, Hillary Clinton, blamed the Russian security services for the hackings, and said that Mr. Putin "could barely muster the energy to deny" Russia's involvement. Donald J. Trump, the Republican nominee, has played down the prospect that Russia was involved.

Ambiguity has trailed the Russian hacking story all along. Mr. Fomenko, in an interview in a bar here called Rocks, flatly denied having any ties to the hacking. Yet he sports a collarbone-to-jaw tattoo of what he described as a version of the theatrical mask that is the symbol of the hacking group Anonymous.

He denied any connection to the group, saying he simply liked the symbolism of the mask. "A person can be evil, or a person can be good, or a person can hide who they are," he said.

The equivocation of responses by Mr. Putin and Mr. Fomenko is studied and deliberate, Kenneth Geers, a senior research scientist at Comodo, a cybersecurity firm, and a former cybersecurity officer with NATO, said in a telephone interview.

"You are not saying yes, you are not saying no, so it's frustrating for the victim, and it's intimidating," he said. "You are suggesting there is more to come."

The tattoo, though, "is something of a giveaway."

Mr. Fomenko, raised by a single mother, studied computer science at a technical college. He said he founded King Servers in 2008 when he was 18, buying computer servers and arranging for their installation remotely in Fremont, a city he said he had never visited.

He said he had about a thousand clients, 20 percent to 30 percent of whom are pornographers. Authorities in the Netherlands, he said, have notified him on several occasions that his servers had been used for spreading malware, advertising counterfeit designer handbags and distributing child pornography; in those cases, he said, he immediately revoked the rental agreements and closed the servers.

"If the person looks young, maybe 17 or 18, you cannot tell, we shut them down," he said. "Every company has their problems. You cannot control everything."

Mr. Fomenko said prospective renters using the nicknames Robin Good and Dick Robin had contacted him online in May and paid through WebMoney, an online payment system, not an uncommon profile for his clients.

On Sept. 15, Mr. Fomenko issued a statement saying that he had learned belatedly from news reports of the accusation that the hacking of the Arizona and Illinois voting systems were staged from two of his servers, and that he had shut them down. Mr. Fomenko does not deny that hackers used his servers, but does deny knowing that they did until Sept. 15. He says he does not know who they are, but that they are certainly not the Russian security agencies.

"The analysis of the internal data allows King Services to confidently refute any conclusions about the involvement of the Russian special services in this attack," he said in his statement. But then, apparently striking a sarcastic tone, he said he would send a bill to Mr. Trump and Mr. Putin for server rent left unpaid by the hackers.

He also says he has never been contacted by Russian or foreign law enforcement.

The clients, though, had left a trail through their contact with his billing page, he said. He added that he possessed the next step in the chain to bring investigators in the United States closer to the hackers, about 60 I.P. addresses used by his client -- the hacker of the state electoral systems -- to contact him. He said the addresses belonged to server companies in Britain, Finland, France, Italy, Norway and Sweden.

It was these addresses, he said, that he would be willing to share with the F.B.I., if "somebody wants to sort this out."

While ambiguous about the hacking on his servers, Mr. Fomenko minced no words about American presidential politics. "In Russia, we don't have this type of election," he said. "It looks like little children fighting."

Reuters
FBI probes hacks targeting phones of Democratic Party officials: sources
Wednesday, 28 September 2016
Byline: Mark Hosenball

Washington - The FBI is investigating suspected attempts to hack mobile phones used by Democratic Party officials as recently as the past month, four people with direct knowledge of the attack and the investigation told Reuters.
The revelation underscores the widening scope of the U.S. criminal inquiry into cyber attacks on Democratic Party organizations, including the presidential campaign of its candidate, former U.S. Secretary of State Hillary Clinton.

U.S. officials have said they believe those attacks were orchestrated by hackers backed by the Russian government, possibly to disrupt the Nov. 8 election in which Clinton faces Republican Party candidate Donald Trump. Russia has dismissed allegations it was involved in cyber attacks on the organizations.

The more recent attempted phone hacking also appears to have been conducted by Russian-backed hackers, two people with knowledge of the situation said.

Federal Bureau of Investigation representatives had no immediate comment, and a Clinton campaign spokesman said they were unaware of the suspected phone hacking.

The Democratic National Committee (DNC) did not respond to a request for comment. An official of the Democratic Congressional Campaign Committee (DCCC) said that nobody at the organization had been contacted by investigators about possible phone hacking.

Interim DNC Chairwoman Donna Brazile told CNN: "Our struggle with the Russian hackers that we announced in June is ongoing - as we knew it would be - and we are choosing not to provide general updates unless personal data or other sensitive information has been accessed or stolen."

FBI agents had approached a small number of Democratic Party officials to discuss concerns their mobile phones may have been compromised by hackers, people involved said. It was not clear how many people were targeted by the hack or whether they included members of Congress, a possibility that could raise additional security concerns for U.S. officials.

'OFFICE BRAIN'

If they were successful, hackers could have been able to acquire a wide range of data from targeted cellphones, including call data, text messages, emails, photos and contact lists, one person with knowledge of the situation said.

"In a sense, your phone is your office brain," said Bruce Schneier, a cyber security expert with Resilient, an IBM company, which is not involved in the investigation. "It's incredibly intimate."

"Anything that's on your phone, if your phone is hacked, the hacker can get it."

The FBI has asked some of those whose phones were believed to have hacked to turn over their phones so that investigators could "image" them, creating a copy of the device and related data.

U.S. investigators are looking into whether hackers used data stolen from servers run by Democratic organizations or the private emails of their employees to get access to cellphones, one person said.

Hackers previously targeted servers used by the DNC, the body that sets strategy for the party, and the DCCC, which raises money for Democrats running for seats in the House of Representatives, officials have said.

Clinton said during Monday's presidential debate there was "no doubt" Russia has sponsored hacks against "all kinds of organizations in our country" and mentioned Russian President Vladimir Putin by name.

"Putin is playing a really tough, long game here. And one of the things he's done is to let loose cyber attackers to hack into government files, to hack into personal files, hack into the Democratic National Committee," Clinton said.

Trump countered that there was no definitive proof that Russia had sponsored the hacks of Democratic organizations.

"I don't think anybody knows it was Russia that broke into the DNC," he said. "It could be Russia, but it could also be China. It could also be lots of other people."

USA Today
What a real cyber war would look like
Wednesday, 28 September 2016
Byline: Elizabeth Weise

San Francisco - Both U.S. presidential candidates have vowed to take on the world when it comes to cyber warfare. But full-scale cyber retaliation might be hard to spot and even harder to count as a win. "Unlike a traditional war, there is no end where there are clear winners and losers, no physical flag to capture," said Peter Tran, senior director at RSA Security in the company's worldwide advanced cyber defense practice.

If the U.S. were to ramp up its counterattacks on countries it thinks are sponsoring hackers that breach American accounts, don't expect a sci-fi digital armageddon. The target's electric grid might still work, and so may the ATMs. Think of it more as a creeping worry that simple things we rely on can't be trusted -- the machines that count our votes, the total on our bank balance, our personal digital files.

Democratic presidential nominee Hillary Clinton said the U.S. had the capability to stop the waves of attacks, which vaulted into the public consciousness again last week with Yahoo's disclosure that information from at least 500 million customer accounts was stolen in 2014. Yahoo said it believed the hacks came from a state-sponsored actor.

"We need to make it very clear -- whether it's Russia, China, Iran or anybody else -- the United States has much greater capacity. And we are not going to sit idly by and permit state actors to go after our

information, our private-sector information or our public-sector information," said Clinton when asked about attacks on U.S. institutions and theft of U.S. secrets.

In his reply, Republican nominee Donald Trump seemed to indicate the problems posed by cyber attacks were almost insurmountable.

"So we have to get very, very tough on cyber and cyber warfare. It is -- it is a huge problem. I have a son. He's 10 years old. He has computers. He is so good with these computers, it's unbelievable. The security aspect of cyber is very, very tough. And maybe it's hardly doable," he said.

N. Korea blackout

Many say we're already in the early stages of cyber war on multiple fronts. Nation-state hackers have targeted election databases in several states. U.S. officials believe China was behind a hack of the Office of Personnel Management in 2014, and that Iranians were behind an attack on the control system for a dam in New York state in 2013. Intelligence sources have fingered Russia as being behind the theft and release of embarrassing files from the Democratic National Committee.

So far the U.S. response has been mainly diplomatic. The most visible example was the sanctions on North Korea in 2014 and 2015 after it was tagged as the perpetrator of the hack that took down the Sony Pictures Entertainment computer network. That attack cost the company hundreds of millions of dollars and was purportedly the secretive nation's response to "The Interview," a comedy about the assassination of its leader by two bumbling Internet entertainment writers.

A month after the attack, the North Korean Internet was blacked out for about ten hours. The United States was coy about acknowledging whether it was behind the disruption.

Nor does cyber warfare have to stay in the digital realm. The U.S. Army Cyber Command is just one of multiple entities within the military focused on digital protection. And the United States has long reserved the right to retaliate with physical force against "significant cyber attacks directed against the U.S. economy, government or military."

Hot digital war

In a hot cyber war, the first line of attack would not be like on Star Trek, with spectacular bursts of sparks flying out of computers. Instead it would be a stealth attack on the enemy's military command and control infrastructure, to keep it from being able to strike, said Matt Devost, managing director of Accenture Security and a special government advisor to the U.S. Department of Defense.

The problem is that much like nuclear attacks, no one wants to let the genie officially out of the bottle. Certainly the United States and Europe benefit the most from a free and open Internet, so weaponizing it is not a step taken lightly.

"The United States is going to care a lot about not setting a precedent for that," said Christopher Porter, manager of iSIGHT Intelligence, which does strategic risk forecasting for the digital security company FireEye.

In many ways, digital fighting is a way for countries to engage in conflict when they don't want to escalate a dispute to the level of armed attack.

Russia excels at this, said Porter.

"They may not go after the government they're disagreeing with, they may go after citizens of the government, leaking documents on key political or military leaders" Porter said. "That's a very deliberate strategy and one they've been very effective at."

A higher level of escalation involves damaging critical infrastructure. This has already happened.

Russian launched a cyber attack against the Ukrainian power grid in 2015, according to U.S. officials. The attacks caused power outages in 103 cities and towns in the nation. Russia had been involved in military clashes with Ukraine over the Crimea.

A computer virus believed to be the work of Israel and the United States disabled a critical part of Iran's nuclear weapons program in 2010.

Multiple government websites in Estonia, one of the most wired nations on earth, were crashed in 2007. The country's foreign minister accuses Russia of being behind the attacks in retaliation over Estonia's move away from the Russian sphere of influence.

The United States has an advantage in this type of attack because so much of the technology that controls the networks today was either designed or built by the United States, said Srinivas Mukkamala, CEO of the computer security firm Risk Sense and one of the lead researchers for U.S. government research team that worked on CACTUS, the Computational Analysis of Cyber Terrorism against the U.S.

"Who designed the payment platforms? Who designed the chips? We did. So we can always find backdoors to get into whatever we've build," he said.

Cyber more humane

A final advantage of cyber warfare is that it's reversible, say experts. In a traditional war the only way to incapacitate an enemy's electric grid or transportation system is to physically destroy them. With cyber you can take them down but once the conflict is over they can be brought brought back online.

"It's potentially more humane," said Devost.

Reuters
Senior national security official to leave Justice Department
Tuesday, 27 September 2016
Byline: Staff report

Washington - A senior U.S. Justice Department official who oversaw efforts to prosecute Islamic State sympathizers and pursue cyber criminals is leaving the Obama administration next month, he told Reuters on Tuesday.
Assistant Attorney General John Carlin, chief of the national security division at the Justice Department, is departing on Oct. 15, less than a month before the U.S. presidential election.

Carlin, 43, confirmed his departure, expected to be announced later on Tuesday, in an interview with Reuters.

The departure comes as the Obama administration has struggled to develop clear guidelines on how to pursue hacking amid growing threats posed by foreign nation-states and criminal groups.

He declined to say where he was headed next. Carlin said he intended to spend time with his family before starting a new job, likely involved in cyber security.

Carlin, who has served in government for more than 15 years, oversaw a range of prominent cases in three and a half years since assuming an acting rank of the Justice Department's top national security lawyer in March 2013, including the prosecution of one of the 2013 Boston Marathon bombers.

He was confirmed full-time to the position in a 99-1 vote by the U.S. Senate in April 2014.

Carlin focused on pursuing cyber criminals during his two and a half years running the national security division.

His tenure included the unprecedented indictment of five Chinese military hackers in 2014 for alleged hacking into six U.S. companies in order to steal trade secrets, and the indictment of Iranian hackers earlier this year for alleged hacks on U.S. financial institutions and a New York dam.

Through a combination of legal cases, diplomatic sanctions and an effort to publicly name and shame hacking adversaries, Carlin sought to tame what he often called the wild west of cyberspace, where international norms for appropriate cyber activity are nascent or nonexistent.

"We've laid a strong foundation in cyber, but we've got to do more, faster, given the state of the threat," Carlin told Reuters. He said he hoped the next presidential administration could further "institutionalize" consequences from cyber crime.

Most recently Carlin announced this month the formation of a threat analysis team to study potential national security challenges posed by self-driving cars, medical devices and other Internet-connected tools.

Carlin's appointment in early 2014 coincided with territorial gains by Islamic State in Iraq and Syria that propelled the militant group to global notoriety. Since then, the department has prosecuted dozens of people on counts related to Islamic State: more than 100 people have been charged since 2014 in public federal cases.

Under Carlin, the national security division has also ramped up the Justice Department's efforts to combat what it sees as a rising threat from domestic anti-government extremists.

Teenager appears in court over TalkTalk cyber-attack
Tuesday, 27 September 2016

London - A teenager has appeared in court accused of hacking the internet company TalkTalk to obtain customer data before asking for a six- figure blackmail payment in bitcoin.
Daniel Kelley, 19, appeared at Westminster magistrates court on Tuesday accused of demanding 465 bitcoins, worth about £216,000, from the company after allegedly carrying out a cyber- attack on its website in October last year.

He is also accused of carrying out similar attacks and making blackmail demands against other companies and their workers, including cigarette lighter manufacturer Zippo and an educational business in Queensland, Australia, in 2015.

Kelley, of Heol Dinbych in Llanelli, South Wales, faces 14 charges - eight of blackmail, four computer hacking offences and two fraud offences.

In total, he is accused of trying to obtain 593 bitcoins worth about £276,300.

The court heard he was arrested in November last year and charged by Scotland Yard detectives on Monday.

He did not enter a plea in court on Tuesday and was released on conditional bail to appear at the Old Bailey on 10 October.

Le Darknet et les cyberprédateurs

Wednesday, 28 September 2016
Byline: Anthony Doiron

Non identifié - Il ne suffit pas de taper quelques mots clés dans un moteur de recherche pour trouver de la pornographie infantile. Les cyberprédateurs se tournent plutôt vers une facette sombre de l'internet - le Darknet -, accessible qu'à l'aide de certains logiciels disponibles gratuitement.
Cette expertise, autrefois réservée à quelques initiés, s'est démocratisée avec l'essor technologique des dernières années. Jonathan Nadeau, développeur web récemment diplômé, en témoigne.

«Prendre une année sabbatique dans le monde de la programmation informatique c'est une éternité. Il faut être à l'affût des nouvelles façons de faire dans ton domaine... et ça bouge vite.»

Le jeune programmeur est familier avec le Darknet. Il le décrit comme un système élaboré de relais entre ordinateurs, d'abord créé pour transférer des documents sensibles et assurer l'anonymat des délateurs politiques.

Des programmes disponibles gratuitement en ligne permettent d'y accéder, comme Tor et I2P. Ceux-ci masquent également l'adresse IP (Internet Protocol) d'un ordinateur, soit l'adresse internet accordée par un fournisseur internet. Les utilisateurs peuvent donc communiquer librement entre eux sans craindre d'être épiés par quiconque, dont les autorités policières. Même le fournisseur internet ne peut identifier les requêtes effectuées sur la connexion qu'il offre.

Par la force des choses, ce stratagème a attiré l'attention des criminels. Les réseaux du Darknet pullulent aujourd'hui de forums de services illégaux, comme l'embauche de tueurs à gages et la vente de drogues. Les pornographes pédophiles y ont également trouvé refuge.

Le Darknet est essentiellement un réseau à l'intérieur d'un réseau, explique Jonathan Nadeau.

«L'internet, c'est des ordinateurs connectés entre eux. Tu envoies une requête, mais tu ne sais pas par où ça va passer avant d'arriver à destination. Ça peut être intercepté par beaucoup de gens, incluant les services policiers. Le Darknet permet d'éviter ça.»

Le système n'est toutefois pas infaillible.

En février 2015, un forum d'échange de pornographie infantile nommé PlayPen a été la cible d'une vaste opération du FBI. L'agence fédérale a pris le contrôle du site et l'a hébergé sur ses propres serveurs pendant deux semaines, infectant les ordinateurs des présumés pédophiles de logiciels malveillants, pour permettre de les retracer. Le site comptait plus de 100 000 utilisateurs inscrits; seulement près de 200 d'entre eux ont été arrêtés.

«Tor n'est pas infaillible; l'opération du FBI l'a bien démontré. Mais avec Darknet, c'est impossible de faire de la surveillance de masse. Il faut identifier les cibles une par une», explique Jonathan Nadeau.

Ce sont souvent de petites erreurs qui vont permettre aux policiers de mettre la main au collet des cyberprédateurs: l'utilisation d'une même adresse courriel sur différents sites, le téléchargement d'un fichier contenant un logiciel d'espionnage de la police, ou carrément la publication de certaines informations personnelles sur les forums de discussion.

«Il peut y avoir des traces dans n'importe quel fichier transmis. L'information de l'appareil photo, la date, même la géolocalisation parfois.»

Jonathan Nadeau ne se surprend pas de voir cette montée fulgurante d'activité criminelle chez les cyberprédateurs. Le niveau de connaissance générale envers les outils technologiques a beaucoup augmenté au fil des ans. Le cyberespace a également pris de l'expansion.

«Avec l'internet, les pédophiles de toute la planète peuvent communiquer entre eux. Maintenant ils peuvent se rencontrer et s'organiser. C'est certain que ça risque de faire des sites inquiétants.»

Protection de la vie privée Les lois canadiennes jugées inadéquates
Wednesday, 28 September 2016
Byline: Joël-Denis Bellavance

Ottawa - Le gouvernement fédéral doit de toute urgence dépoussiérer et moderniser les lois canadiennes en matière de protection des renseignements personnels afin de tenir compte des changements technologiques fulgurants qui sont survenus au cours des dernières années, estime le commissaire à la protection de la vie privée du Canada, Daniel Therrien. Selon lui, reporter un tel exercice risque de compromettre la protection de la vie privée des Canadiens et miner la confiance des consommateurs dans l'économie numérique.
OTTAWA - DES OUTILS « INSUFFISANTS »

Dans son rapport, intitulé Le temps est venu de moderniser les outils du 20e siècle, le commissaire à la protection de la vie privée Daniel Therrien rappelle que l'internet n'existait pas quand le gouvernement fédéral a adopté la Loi sur la protection des renseignements personnels, en 1983. Et que des médias sociaux comme Facebook étaient des innovations qui n'avaient pas encore germé dans la tête de leurs inventeurs quand une deuxième loi en la matière, la Loi sur la protection des renseignements personnels et les documents électroniques, a été promulguée en 2001. « Le rythme incessant des changements technologiques exerce des pressions toujours croissantes sur la vie privée. Cet environnement exige une approche moderne de la protection des renseignements personnels. Nous essayons comme société de nous servir d'outils du XXe siècle pour résoudre des problèmes du XXIe siècle, et il est évident que ces outils sont de plus en plus insuffisants », a affirmé M. Therrien en conférence de presse.

DE GRAVES CONSÉQUENCES

Il y aura inévitablement de graves conséquences pour les Canadiens si le gouvernement fédéral tarde à moderniser les lois en matière de protection des renseignements personnels. Ces renseignements pourraient être mal protégés par le gouvernement ou le secteur privé et se retrouver inopinément entre les mains d'individus ou d'organismes qui ne devraient pas y avoir accès. Les Canadiens pourraient perdre confiance dans l'économie numérique. Des sondages indiquent que 90 % des Canadiens sont très préoccupés par leur incapacité à protéger leurs renseignements personnels. « Ultimement, si nous ne faisons rien, les conséquences seront réelles : risque d'atteinte à la protection des renseignements personnels, collecte et échange excessif de renseignements personnels par les entreprises et les gouvernements et diminution de la confiance dans l'économie numérique », a dit M. Therrien.

LES LACUNES DE LA LOI ANTITERRORISTE

Le commissaire Daniel Therrien se dit de nouveau inquiet que les ministères puissent partager plus facilement les renseignements qu'ils détiennent avec les agences de renseignement et les forces de l'ordre - des pouvoirs qui leur ont été accordés en vertu de la Loi antiterroriste (C-51). Le commissaire s'étonne d'ailleurs que la plupart des ministères n'aient pas fait d'évaluation de l'impact de la mise en oeuvre de cette loi sur la protection de la vie privée. Six mois après l'entrée en vigueur de C-51, les ministères et agences gouvernementales ont communiqué des renseignements personnels à 58 reprises et en ont reçu à 52 reprises. Ces renseignements concernaient des personnes soupçonnées de présenter une menace à la sécurité. Le gouvernement Trudeau a promis de modifier la Loi antiterroriste afin de mieux protéger les droits et libertés des individus.

MIEUX ENCADRER LE SECTEUR PRIVÉ

Grâce aux nouvelles technologies, les entreprises peuvent suivre à la trace des clients potentiels et analyser leur comportement comme jamais auparavant. Selon le commissaire Daniel Therrien, il faut mieux encadrer la notion de consentement à la collecte, à l'utilisation et à la communication de renseignements personnels pour éviter la multiplication de techniques de marketing « envahissantes ». Le commissaire a d'ailleurs lancé des consultations publiques afin de trouver des solutions possibles permettant de mieux encadrer la notion de consentement. « L'obtention du consentement sur la base de conditions d'utilisation que personne ne lit n'est pas un moyen efficace de protéger les renseignements personnels. On doit faire beaucoup mieux », a-t-il dit.

COMMUNICATION DE MÉTADONNÉES

Dans son rapport, le commissaire Daniel Therrien revient sur la controverse entourant la communication de métadonnées par le Centre de la sécurité des télécommunications (CST) à des partenaires internationaux du domaine de la sécurité en 2014. À l'époque, le CST avait soutenu que les risques d'atteinte à la vie privée étaient minimes parce que les métadonnées ne contenaient pas de renseignements personnels « sensibles » comme le nom d'individus, ni de détails contextuels qui les concernaient ou encore la teneur des communications. Mais Daniel Therrien demeure sceptique devant

ces explications. « Les métadonnées peuvent révéler des renseignements très sensibles concernant les activités, les relations, les champs d'intérêt et d'autres éléments de la vie d'un individu », écrit-il dans son rapport.

LE MODÈLE EUROPÉEN

Selon M. Therrien, le gouvernement canadien devrait s'inspirer de l'Union européenne en modernisant ses lois relatives à la protection des renseignements personnels. « Certains gouvernements ont déjà pris des mesures pour renforcer leur cadre de protection de la vie privée, en particulier l'Union européenne. Si l'Union juge que les lois canadiennes en matière de la protection de la vie privée ne sont plus équivalentes aux siennes, les relations commerciales entre le Canada et l'Europe risquent de devenir difficiles. C'est ce qui est arrivé aux États-Unis lorsque l'accord Safe Harbor a été invalidé par les tribunaux européens », a-t-il dit.

GOODALE RÉAGIT

Le ministre de la Sécurité publique, Ralph Goodale, a dit accueillir favorablement les critiques et les recommandations du commissaire à la protection de la vie privée Daniel Therrien, notamment en ce qui a trait aux changements qui devraient être apportés à la Loi antiterroriste. « Je porte un grand intérêt à l'examen, aux commentaires et aux recommandations du commissaire à la protection de la vie privée. Je vois en lui un acteur important pour assurer la reddition de comptes par le gouvernement. Il a fait l'examen de la première période de mise en vigueur de la Loi C-51 au sujet de l'échange d'informations. Il a des préoccupations importantes et je vais les traiter avec sérieux parce que ses opinions comptent », a dit le ministre Goodale.

Jordan police make arrests over 'social media hate'
Wednesday, 28 September 2016
Byline: Suha Maayeh

Amman - Jordan's police arrested several people on Tuesday accused of circulating videos and posts on social media "promoting hate" days after a prominent Jordanian writer was shot dead.
Nahed Hattar, 56, an outspoken leftist and secular writer from a Christian family was killed on Sunday as he arrived at court to face charges for reposting on Facebook a cartoon deemed offensive to Islam.

Authorities are concerned his death would be exploited to sow discord in a country that is trying to avoid the violence that has engulfed the region.

The minister of justice Bassam Talhouni warned on Tuesday that those who misused social media to incite or spread hate speech would be prosecuted.

He told government news agency Petra that offenders would be referred to special courts where "deterrent legal action [would be taken] against them", particularly after a media gag order was issued by the state security court over the murder of Hattar. Mr Talhouni also said some acts of incitement could treated as terrorism offences.

The exact number of those arrested was not disclosed, but they included a relative of the shooter Riyad Ismaeel Abdullah. The family member created a Facebook page on social media called: "Yes to free the killer of Hattar". Police said several people who circulated such posts and videos were outside the country.

Jordanian authorities have been trying hard to reign in extremist ideology and have cracked down hard on extremists. But police described Abdullah, 49, as a lone wolf.

According to the police, Abdullah - who works as an electrical engineer at the ministry of education - planned his crime and bought a gun after Hattar shared the cartoon on August 13.

When Abdullah found out about the court session that Hattar was scheduled to attend, he waited for him in front of the court of justice and shot the writer several times before attempting to escape, a police report said.

A team of senior police officers searched Abdullah's house, car and electronic devices but did not find any evidence that proved he had accomplices. "He confessed to the crime and he carried out on his own and he did not inform anyone about his plans. It is an isolated crime," the statement said.

Abdullah will be detained for two weeks pending further investigation. He has been charged with crimes including premeditated murder, possessing a weapon illegally, and will face terrorism charges at the state security court.

La Tribune (France)
Surveillance spatiale : la France modernise le système Graves... a minima
Wednesday, 28 September 2016
Byline: Michel Cabirol

Paris - La notification du contrat de modernisation du système de surveillance de l'espace Graves est imminente. Un enjeu crucial pour la France qui peut ainsi suivre dans l'espace les satellites espions. C'est à la fois une bonne et une mauvaise nouvelle. La notification du contrat de modernisation du système de surveillance de l'espace Graves, par la direction générale de l'armement (DGA) au profit de l'ONERA est imminente, selon des sources concordantes. Ce n'est plus qu'une question désormais de quelques jours, le contrat étant actuellement dans les tuyaux administratifs. Cette notification est bien sûr très attendue tant ce système est stratégiquement clé pour la France, qui grâce à Graves (Grand Réseau Adapté à VEille Spatiale) peut suivre dans l'espace les satellites espions qui la survolent.

Contrairement aux préconisations de la DGA, cette opération de modernisation du système se fait malheureusement à minima. D'où un contrat relativement modeste évalué entre 20 et 30 millions d'euros dont une partie pourrait être financée par l'Europe. "Plus on avance dans le temps, plus on aura besoin de ces systèmes, explique-t-on au sein des armées. Mais ce qui nous manque aujourd'hui, c'est l'argent". Interrogé par La Tribune, le centre français de recherche aérospatiales, l'ONERA, "n'a pas de commentaire quant au périmètre de ce contrat dont le processus de notification n'est d'ailleurs pour l'heure pas encore finalisé".

Un manque de vision?

L'armée de l'air, qui a manqué de vision sur ce dossier, passe à côté d'un système beaucoup plus performant et surtout, d'un outil de puissance spatiale incroyable... alors même que l'espace va progressivement devenir un champ de bataille entre puissances spatiales ennemies et même alliées pour des raisons d'espionnage. Pourtant en 2012, 2013 et 2015, des engins spatiaux se sont approchés de satellites militaires français et sont restés à leur contact pendant une période relativement longue.

Avec un peu plus d'ambition, la France aurait pu disposer d'un système de veille spatiale plus puissant, notamment en augmentant les performances de son calculateur. Le système Graves aurait pu détecter

des objets plus petits. Mais l'opération de modernisation ne traitera finalement que les obsolescences du système pour qu'il puisse être opérationnel jusqu'en 2020- 2025.

« La France a été le troisième pays au monde, après les Américains et les Russes, à se doter d'un tel système, avait expliqué en juin 2015 dans une interview accordée à la Tribune le PDG de l'ONERA, Bruno Sainjon. L'Onera a conçu Graves, a piloté sa réalisation et l'a transféré à l'armée de l'air en 2005. Ce programme a notamment permis des échanges de données avec les États-Unis. Et, en avril 2015, cette coopération s'est renforcée, les deux ministères de la Défense voulant désormais échanger des informations classifiées. »

Un outil de puissance

Plus de 12.000 satellites artificiels et objets divers, dont la taille est supérieure à dix centimètres, orbitent autour de la Terre. Jusqu'en 2005, seuls Américains et Russes disposaient d'un système de veille spatiale opérationnel. En France, la mise en service du système Graves a permis de développer une mission de surveillance des satellites en orbite basse (d'altitude inférieure à 1.000 km). La France est ainsi entrée dans le club très fermé des puissances spatiales dotées de capacités autonomes de surveillance de l'espace.

Développé sous contrat de la DGA, le système Graves est constitué d'un radar spécifique associé à un système de traitement automatisé qui permet la création et le maintien à jour d'une base de données des paramètres orbitaux des satellites qu'il détecte. Fruit de la collaboration des spécialistes des départements Électromagnétisme et radar (DEMR) et Conception et évaluation des performances des systèmes (DCPS) de l'ONERA, le radar du système Graves a été spécifiquement conçu pour la surveillance de l'espace.

Trois prétendants demeurent en lice pour l'ex-Morpho (Canada)
Wednesday, 28 September 2016
Byline: Isabelle Chaperon

Paris - La décision sur le rachat de Safran Identity & Security, spécialiste de la biométrie et de la sécurité, devrait intervenir à la fin de la semaine
La bagarre pour le rachat de Safran Identity & Security (ex- Morpho), le spécialiste de la biométrie et de la sécurité mis en vente par Safran, bat son plein, sur fond de fortes tensions. Trois prétendants sont toujours en lice. Une décision est attendue en fin de semaine.

Advent, le fonds américain, également propriétaire d'Oberthur Technologies, et Gemalto, le leader mondial de la carte à puce, restent les favoris. Les offres d'Advent et de Gemalto seraient " très proches " , selon une source bien informée, pas loin de 2,4 milliards d'euros. Mais, selon plusieurs sources, Impala, le fonds de Jacques Veyrat, associé à KKR, n'a pas renoncé, même s'il est légèrement en retrait pour ce qui est du prix.

Parmi les cinq offres qui avaient été déposées, vendredi 16 septembre, auprès de Safran, deux auront donc été éliminées : celle de Bain Capital, avec le français Ardian et des investisseurs canadiens, et celle du fonds européen CVC Capital Partners associé à Astorg, sont arrivées loin derrière en matière de valorisation.

Safran a obtenu le prix qu'il désirait, et même bien au- delà. Le motoriste discute désormais, essentiellement avec Advent et Gemalto, pour les départager sur d'autres critères. En particulier, Safran demande aux deux candidats de renforcer leurs engagements sur le maintien de l'emploi chez Morpho et de prendre à leur charge le risque lié à la réglementation sur les concentrations.

Sujet sensible Il n'y a pas de miracle : si Gemalto et Advent sont capables de proposer des prix aussi élevés, c'est parce qu'ils estiment pouvoir tirer plus de synergies du rapprochement. Mais qui dit synergies, dit souvent aussi casse sociale. Au moment où le gouvernement doit gérer la crise liée à l'arrêt de la fabrication de locomotives chez Alstom à Belfort, il n'est pas question d'ouvrir un autre front.

Dans une lettre en date du 7 septembre adressée à Michel Sapin, le ministre de l'économie et des finances, Cédric Chateau, directeur associé d'Advent International, et Didier Lamouche, PDG d'Oberthur Technologies, ont assuré qu'ils envisageaient descréations d'emplois en France : " Cela nous permet de garantir un niveau global d'emplois permanents en France pendant une période d'au moins deux ans. " De son côté, Gemalto a promis qu'il n'y aurait pas de suppressions de postes en France, sans limitation de durée.

Le sujet est d'autant plus sensible que Patrick Drahi, le patron d'Altice, qui s'était engagé à ne pas licencier pendant trois ans après avoir racheté l'opérateur télécom SFR en 2014, vient d'annoncer un vaste plan social, une fois cette période expirée.

Cette négociation avec Safran se double d'une autre. Les prétendants discutent, en effet, en direct avec l'Etat. Compte tenu des activités exercées par Morpho en lien avec la sécurité et la défense, plus son poids dans une filière technologique majeure, les pouvoirs publics veulent s'assurer que les prétendants respecteront les intérêts français, de la localisation des centres de recherche à la propriété intellectuelle.

Pour s'assurer dans la durée du respect de ces engagements, l'Etat souhaite l'intervention de Bpifrance. La banque publique, qui détient déjà 8,4 % de Gemalto, pourrait ainsi accompagner le repreneur, quel qu'il soit, dans ce rachat.

Ottawa Citizen
Missing IDs won't alter military's policy
Thursday, 29 September 2016
Byline: David Pugliese

An incident involving hundreds of blank Canadian Forces identification cards that went missing just days after the 2014 attack on Parliament Hill has been meet with a shrug from the military.
The case involving the identity cards, which disappeared while being shipped from Ottawa to Toronto through Canada Post, resulted in a brief police investigation and no changes to the military's security policy.

Missing for 73 days, the cards were eventually discovered in a batch of mail that had been returned as undeliverable, according to the 2015 military police report obtained by the Ottawa Citizen using the Access to Information law.

They had been sent by mail during a tense period when the Canadian government and military were on edge and worried about domestic terrorist attacks. On Oct. 20 an Islamic extremist in Quebec deliberately struck Warrant Officer Patrice Vincent with his car, killing him. Two days later, Michael Zehaf- Bibeau gunned down Cpl. Nathan Cirillo at the National War Memorial in Ottawa before running into the Parliament Buildings, where he was shot dead. He had also espoused Islamist extremist views and was planning to leave for the Middle East.

The first inkling something had gone wrong with the shipment was after a military officer in Scarborough, a Toronto borough, received a package of 100 ID cards marked as "undeliverable mail." The cards were supposed to have been delivered to a Toronto armoury but instead appeared to have been misdirected to another address.

Military police wondered if they had been found by "an unknown person" who then dropped them into a Canada Post mailbox. Another 100 were successfully delivered, leaving the remaining 300 cards unaccounted for, the police report noted.

Initial attempts to find out the location of the cards were met with "negative results," the report added. One sailor who tried to alert Canadian Forces officials couldn't get through and instead had to leave phone messages at a number of locations.

On Jan. 9, 2015, the cards were discovered back in a military police unit in Ottawa, having been returned by Canada Post as undeliverable mail. Military police closed their investigation on March 26, 2015.

The incident has not prompted any changes, the Department of National Defence confirmed.

Military identification cards are still shipped using Canada Post, DND noted in an email to the Ottawa Citizen. "The Department of National Defence (DND) is confident this was an isolated incident," its

statement said. "The security implications were limited, as all of the identification cards were recovered and were not tampered with during shipping and recovery."

DND acknowledged in its email, "there is always a risk associated with lost ID (military and civilian) cards, and building access cards."

But it noted that since such temporary access cards had an expiry date, if such a card is misplaced or stolen, the risk it poses "is minimal."

DND statement also pointed out that the shipment was appropriately handled by all military and civilian staff.

CBC News
Conservatives took payroll training responsibilities away from Phoenix creator IBM
Thursday, 29 September 2016
Byline: Katie Simpson

Ottawa - As the federal government shaped its plan to modernize the public service payroll system, CBC News has learned that the former Conservative government took training duties away from IBM -- the company that created the Phoenix program.
The move raises new questions about what led to the payroll fiasco, as problems with training have been listed as a key cause of Phoenix's troubled rollout.

"Responsibility for training design and execution was transferred to the Crown in March 2014," said IBM spokeswoman Carrie Bendzsa.

The change was made at the request of the former government, Bendsza confirmed by email.

Conservative MP Diane Finley was the minister of Public Works at the time and responsible for overseeing the modernization project from 2013 to 2015. Her office refused multiple requests for an interview.

The current Liberal government is accusing the Conservatives of cutting corners on training to save money.

"There was a cost associated with training, and it was made clear to me that the Conservatives opted to go with the train-the-trainer model versus buying the IBM training approach. In this case, savings were prioritized before the project was fully implemented?," Judy Foote, the current minister of Public Services and Procurement Canada, said in a statement.

"It appears that when the previous government decided to go with Phoenix, the proper training wasn't done and they tried to implement a system without a sufficient number of employees," she added.

Liberals should have hit pause, MP says

While the Conservatives did not have an explanation as to why the decision was made, they blame the current government for not slowing down the rollout of Phoenix, which started this past February.

"If they weren't ready and they knew about it ... why would you go ahead and start the system if you're now saying that you knew the training was insufficient?" said Kelly McCauley, the Conservative critic of Public Services and Procurement.

"It goes back to, you knew it wasn't ready to implement, so why would you?"

Since the Phoenix system was fully implemented in April, more than 80,000 public servants have experienced problems with their pay. Most workers have been underpaid, while some have been over paid, or not paid at all.

The Department of Public Services and Procurement Canada has promised to clear the backlog of problems by the end of October. As of Sept. 21, there were still 57,500 public servants waiting for individual cases to be resolved.

The government estimates it will cost $50 million to fix the program, which was originally touted as a way to save the federal treasury $70 million annually.

Union 'not surprised'

The Public Service Alliance of Canada, the largest union representing federal public servants, expressed frustration over this latest development.

"I'm very disappointed but not surprised at all," said PSAC National Vice-President Chris Aylward. "[There's] no regard for the employees who have to perform those duties. No regard for the employees going on that new pay system."

At a labour board tribunal hearing earlier this month, a senior bureaucrat explained that training problems are at the root of the Phoenix issue.

"We underestimated the time it took people to adapt to the new technology. The learning curve just seemed to be much longer that we expected," said Rosanna Di Paola, the associate assistant deputy minister of Public Services and Procurement Canada.

Quantum computer has radical power
Thursday, 29 September 2016
Byline: Gordon Ball
Section: editorial

Re: Spy chief issues encryption warning, Sept. 24.
A Citizen article quoted the head of the Communications Security Establishment as saying that, in eight to 10 years, if people are able to build quantum computers they could break the security and encryption codes in use today.

Some years ago, I learned a bit about quantum computing. The experts said that formidable technological challenges would have to be overcome before anyone could actually build quantum computers. The experts were not sure it could be done at all. Perhaps the scientists and engineers have made advances since.

If it were actually possible to build working quantum computers, they would revolutionize computing as we know it.

La cyberattaque coûtera des centaines de milliers de dollars
Thursday, 29 September 2016
Byline: Ian Bussières

Thetford Mines - La commission scolaire devra remplacer plusieurs centaines d'ordinateurs
La cyberattaque dont a été victime il y a près d'un mois la commission scolaire des Appalaches (CSA) coûtera quelques centaines demilliers de dollars à cette commission scolaire de la région de Thetford Mines qui devra remplacer plusieurs centaines d'ordinateurs et en «nettoyer» plus de 2000.

-- PHOTO 123RF/ TYLER OLSON

Les classes iPad de la polyvalente de Black Lake et les cours de formation professionnelle nécessitant un ordinateur et l'accès à Internet ont pu reprendre mercredi.

Le président de la CSA, Denis Langlois, a confirmé au Soleil que son organisation était sur la bonne voie pour un retour à la normale. «Nous avons pu récupérer beaucoup de données grâce à une copie de

sauvegarde faite à la fin du mois de juin. Nous sommes présentement à rebâtir le reste, notamment le mois d'août », a-t-il expliqué.

Les classes iPad de la polyvalente de Black Lake et les cours de formation professionnelle nécessitant un ordinateur et l'accès à Internet ont également pu reprendre mercredi, mais M. Langlois a indiqué qu'il y aurait un peu de rattrapage à faire pour ces élèves.

« Nous avons payé nos employés, nous sommes en voie de compléter le paiement de tous nos fournisseurs, et le logiciel pour le transport scolaire est de nouveau en fonction. Il reste maintenant l e dossier des tableaux interactifs et l e "nettoyage" de tous les ordinateurs», a expliqué M. Langlois. Le parc informatique de la CSA compterait quelque 3000 appareils.

La commission scolaire profitera de l'occasion pour remplacer les ordinateurs qui arrivaient en fin de vie. «On parle de plusieurs centaines d'ordinateurs qui seront changés, l'é quivalent de deux années en une.»

PAS DE HAUSSE DE LA TAXE

Sans vouloir en dévoiler le chiffre précis, M. Langlois a laissé entendre que la gestion de l'attaque informatique allait coûter quelques centaines de milliers de dollars à l'établissement. «Je ne dirais pas "plusieurs" centaines de milliers de dollars, car en bout de ligne la récupération des données va mieux que prévu. Et il n'y aura pas de hausse de la taxe scolaire à cause de la cyberattaque», a-t-il ajouté pour rassurer les contribuables.

Denis Langlois affirme connaître le pourcentage des données perdues et récupérées ainsi que les sommes déjà dépensées et la facture totale qui sera déboursée pour faire face à la situation, mais préfère ne pas les dévoiler. Il a d'ailleurs défendu le mutisme dans lequel s'est emmuré le directeur général de la commission scolaire, Camil Turmel, depuis l'attaque. « La Sûreté du Québec nous a bien dit de ne pas commenter durant leur enquête. Nous avons fait une communication interne à nos employés et c'est tout.»

Le président de la CSA ajoute qu'il serait surprenant que les renseignements personnels des employés et des élèves aient été transmis aux pirates. « Les mesures prises sur le réseau privé ne démontrent pas un flot plus élevé que d'habitude, ce qui aurait été le cas si une grande quantité de données était sortie du serveur. De toute façon, il semblerait que ce n'est pas ce qui intéresse ces hackers. »

«UN SPAM»

Ce serait via le courrier électronique que les pirates auraient réussi à s'infiltrer dans le système informatique de la CSA. « C'est un spam qui est passé par là et il semblerait que c'est un spam nouveau et plus fort qui fait des dommages à plein. Ce qu'on nous a expliqué, c'est que c'est c o mme u n robot qui entre n'importe où et qui f ait des dommages » , a i ndiqué M. Langlois en soulignant qu'un plan

d'action était déjà en place pour éviter un autre épisode du genre. « Nos employés ont déjà reçu des directives à l'effet de faire certaines choses.»

Denis Langlois a dit toujours ignorer la provenance des pirates informatiques et a refusé de confirmer l'information corroborée par plusieurs employés de la commission scolaire voulant qu'ils aient réclamé une rançon que l'établissement a refusé de payer. «Ils pourraient venir de l'Inde, de l'Afrique, de la Chine ou du Québec. On ne le sait pas pour l'instant.»

Israel Defense
IntSights, Check Point to Deliver Threat Intelligence Capabilities for Thwarting Cyber Attacks
Thursday, 29 September 2016

Undisclosed placeline - IntSights, a leading intelligence-driven security provider for cyber threats from the dark, deep and open web, announced a partnership with Check Point Software Technologies Ltd. As part of this partnership, Check Point will integrate IntSights's cyber threat intelligence platform with its security suite. The combined offering will help customers leverage real-time threat intelligence to detect and remediate cyber threats.
Organizations consume endless amounts of information, but due to lack of context and automation they fail to create a cohesive view and act upon it. Often a crucial piece of intelligence is left unutilized due to an analyst's error or is simply lost in the siloed data stream.

"In the constant battle against cyberattacks, Check Point leverages threat intelligence and rapid response capabilities through our Next Generation Firewalls and SandBlast Zero-Day Protection," said Alon Kantor, vice president of business development, Check Point. "Our partnership with IntSights's intelligence adds additional capabilities and actionable intelligence that will help customers respond to attacks quicker."

IntSights provides extensive intelligence coverage that is easy to understand and act upon by a single analyst. This joint product offering will provide advanced warning and customized insight for customers, as well as continue to improve on and increase automated security and threat remediation.

"The IntSights platform is crucial in finding, detailing, reporting and understanding all of the potential Internet risks that face our business," said Rob Duchscher, Chief Information Officer, Starkey Hearing Technologies. "The IntSights platform is complementary to the Check Point security suite and helps provide end-to-end protection - from the external to the internal network."

This cooperation between IntSights and Check Point also extends the companies' existing research collaboration. Through intelligence cooperation, IntSights will complement Check Point's current research capabilities, collecting information from the many difficult-to-penetrate, closed communities and forums on the dark web.

"We are pleased to work alongside an industry leader like Check Point," said Guy Nizan, CEO, IntSights. "This newly formed partnership will provide long-term benefits for both parties and will provide added value to our customers. In addition, the opportunity for intelligence and research cooperation will be an advantage for both companies."

The two companies recently have produced joint research projects, including "An overview of the ransomware phenomenon" and "CerberRing: An In-Depth Exposé on Cerber Ransomware-as-a-Service." The latter, published last month, sheds new light on the Cerber ransomware, one of the most prominent ransomware variants.

Wall Street Journal
Yahoo Claim That Hack Was State Sponsored Is Disputed
Thursday, 29 September 2016
Byline: Robert McMillan

New York - An information-security firm says the hackers who stole at least 500 million records from Yahoo Inc. two years ago are criminals who are selling access to the database, and not a state-sponsored group as Yahoo contends.
The firm, InfoArmor Inc., appears to have access to portions of the Yahoo database. It successfully decrypted the passwords for eight Yahoo accounts provided by The Wall Street Journal, and provided the date of birth, phone number and ZIP Code information associated with the accounts.

InfoArmor said the hackers, whom it calls "Group E," have sold the entire Yahoo database at least three times, including one sale to a state-sponsored actor.

The hackers are engaged in a moneymaking enterprise and have "a significant criminal track record," selling data to other criminals for spam or to affiliate marketers who aren't acting on behalf of any government, said Andrew Komarov, chief intelligence officer with InfoArmor.

That is not the profile of a state-sponsored hacker, he said. "Their clients are state sponsored, but not the actual hackers."

Mr. Komarov's assessment conflicts with Yahoo's statement last week that its users' account information was stolen by "what it believes is a state- sponsored actor."

Yahoo didn't respond to requests for comment.

Mr. Komarov said InfoArmor has been tracking Group E for three years. It believes the hackers are Eastern European, but declined to specify why.

InfoArmor has linked the group to hacks that stole more than two billion records from about a dozen websites, including LinkedIn Corp., Dropbox Inc. and Myspace.

In a report published Wednesday, InfoArmor offered new details on the Yahoo breach and Group E.

The analysis still leaves many questions unanswered, including how InfoArmor obtained access to the database and why Yahoo didn't uncover the magnitude of the breach for nearly two years.

InfoArmor declined to say whether it has a copy of the database or accessed it through a third party.

Yahoo has said it began its investigation in July, around the time the company was completing plans to sell its core assets to Verizon Communications Inc. for $4.8 billion.

In a Sept. 9 securities filing, Yahoo said it wasn't aware of any "security breaches" or "loss, theft, unauthorized access or acquisition" of user data.

The Wall Street Journal reported last week that Yahoo in fall 2014 detected what it believed was a small breach involving 30 to 40 accounts, carried out by hackers working on behalf of the Russian government.

Yahoo reported the incident to the Federal Bureau of Investigation in late 2014 and notified affected users.

After selling the Yahoo database three times, starting in early 2015, the hackers have shifted tactics, Mr. Komarov said. They are no longer offering to sell the full database, but are seeking "to extract something from the dump for significant amounts of money," he said.

Prices vary based on the value of the target, Mr. Komarov added.

Meanwhile, six Democratic U.S. senators have written to Yahoo Chief Executive Marissa Mayer, seeking answers to questions about the company's 500 million-account data breach, thought to be the largest ever.

The letter, sent Tuesday, notes that Yahoo said the breach occurred in late 2014, yet was only disclosed last week. "That means millions of Americans' data may have been compromised for two years," the senators wrote. "This is unacceptable."

"We have received the letter and will work to respond in a timely and appropriate manner," a Yahoo spokesman said Tuesday in an email.

Wall Street Journal
U.S. Thinks Russia Shields Hackers
Thursday, 29 September 2016
Byline: Damian Paletta

Washington - U.S. officials are increasingly confident that the hacker Guccifer 2.0 is part of a network of individuals and groups kept at arm's length by Russia to mask its involvement in cyberintrusions such as the theft of thousands of Democratic Party documents, according to people familiar with the matter. While the hacker denies working on behalf of the Russian government, U.S. officials and independent security experts say the syndicate is one of the most striking elements of what looks like an intensifying Russian campaign to target prominent U.S. athletes, party officials and military leaders.

U.S. officials believe that at least two hacking groups with ties to the Russian government, known as Fancy Bear and Cozy Bear, are involved in the escalating data-theft efforts, according to people briefed on the Federal Bureau of Investigation's probe of the cyberattacks.

Following breaches, stolen material has been published by WikiLeaks, DCLeaks.com and a blog run by Guccifer 2.0. The websites have posted batches of stolen data at least 42 times from April to last week.

WikiLeaks has published U.S. secrets for years but has recently taken an overtly adversarial tone toward Democratic presidential nominee Hillary Clinton. Cybersecurity experts believe that DCLeaks.com and Guccifer 2.0 often work together and have direct ties to Russian hackers.

Guccifer 2.0 said in a Twitter direct message sent to The Wall Street Journal that he wants to expose corruption in politics and shine light on how companies influence policy. The hacker said he also hopes to expose "global electronization."

"I think I won't have a better opportunity to promote my ideas than this year," Guccifer 2.0 added in a long exchange with a Journal reporter.

The Journal couldn't verify the identity of the person sending messages on behalf of Guccifer 2.0, but the account is the same one that was used to publish personal information about Democrats. A posting on a blog run by Guccifer 2.0 says he is a man who was born in Eastern Europe, has been a hacker for years and fears for his safety.

"I think u've never felt that feeling when u r crazy eager to shout: look everyone, this is me, this is me who'd done it," the hacker wrote to the Journal. "but u can't."

WikiLeaks officials didn't respond to requests for comment on whether Russia fed them the stolen files it published in July. A DCLeaks.com representative asked the Journal to submit questions via email but hasn't responded to them.

Last week, U.S. intelligence chief James Clapper said it "shouldn't come as a big shock to people" that Russia is behind the hacking operation. While Russia has tried to interfere in U.S. elections since at least the 1960s by spying and funneling money to particular political groups, "I think it's more dramatic maybe because now they have the cyber tools," he said.

Earlier this month, leaked emails from former Secretary of State Colin Powell on DCLeaks.com revealed him calling Republican presidential nominee Donald Trump a "national disgrace" and accusing Mrs. Clinton of "unbridled ambition" and being "greedy, not transformational."

German officials said last week that hackers have sought to infiltrate computer systems of several German political parties. Two officials familiar with the investigation say there is evidence Fancy Bear was involved in the attempted German hack.

Longtime Russia analysts say its goal in the U.S. might be to attack the basic credibility and reputation of institutions such as the military, election system, political parties and the federal government more broadly.

Russian President Vladimir Putin has said disclosure of U.S. records is a public service. He has denied involvement in the hacks, and Russian officials have said they don't interfere in the democratic process in other countries.

In August, Russian Foreign Minister Sergei Lavrov said critics were falsely trying to pin offenses on Moscow. "We can hear and see Russophobia, which is off the charts in the U.S. media," he said.

Signs of an escalating strategy emerged in April when DCLeaks.com published batches of emails stolen from U.S. Air Force Gen. Philip Breedlove, then the top military commander of the North Atlantic Treaty Organization.

Gen. Breedlove was one of the U.S. government's biggest Russia critics, warning openly about the country's aggression toward Ukraine and the West while other U.S. leaders were taking a lower-key approach.

He realized his Facebook, LinkedIn and Gmail accounts had been hacked when friends received strange messages purporting to be from him. Then he found out that DCLeaks.com posted dozens of his emails.

From the start, Gen. Breedlove had little doubt that Russia was behind the intrusion. "A major world power has turned its cyber force onto private individuals and is now pouring out private accounts and emails to affect U.S. policy," he said in an interview with the Journal. He retired this summer.

In June, cybersecurity company CrowdStrike Inc. said Fancy Bear and Cozy Bear had penetrated the Democratic National Committee. The next day, Guccifer 2.0 published stolen records from the DNC. Three days later, the hacker disclosed DNC financial reports and donor data.

Washington Post
Russian hackers went after journalists investigating the downing of MH17
Thursday, 29 September 2016
Byline: Ellen Nakashima

Washington - Russian government hackers began targeting a British citizen journalist in February 2015, eight months after he began posting evidence documenting alleged Russian government involvement in the shoot- down of a Malaysian jetliner over Ukraine.
And then in February 2016, a group that researchers suspect is a propaganda mouthpiece of the Russian government - CyberBerkut - defaced the home page of Eliot Higgins's citizen journalism website, Bellingcat.com.

That same month, CyberBerkut hacked the email, iCloud and social-media account of a Bellingcat researcher in Moscow, then posted online personal pictures, a passport scan, his girlfriend's name and other private details.

Russia's information operations against Bellingcat are a taste of what may be in store for other media organizations whose reports anger the Kremlin, said a cyber-research firm that has extensively documented the effort.

"If Russia is willing to go these lengths to compromise a small journalist organization and its contributors, consider what they are willing to do to major news and media outlets that publish similar articles," said Rich Barger, chief intelligence officer at ThreatConnect, a Northern Virginia-based research firm that analyzed the campaign against Bellingcat in a report released Wednesday. ThreatConnect looked into the matter after being approached by Bellingcat.

The report comes on the same day that a Dutch-led, multinational joint investigative team announced the results of a criminal probe that corroborated Bellingcat's findings: The airplane was downed by a Russian surface-to-air missile fired from territory held by pro-Moscow separatists.

Russia has denied complicity in the downing.

Malaysia Airlines Flight 17 was destroyed on July 17, 2014, over eastern Ukraine. All 298passengers and crew members were killed.

Beginning that day and for the next 26 months, Bellingcat published no fewer than 92 posts focused on Russian involvement in the plane's downing, using open-source information and imagery to prove the presence of Russian military equipment that had been moved into eastern Ukraine despite the Kremlin's denials.

The Russian harassment and propaganda campaign against Bellingcat, and Higgins in particular, began in February 2015. Bellingcat had completed a report that documented Russian shelling of Ukrainian military positions in eastern Ukraine, which Moscow had denied. The state-run Sputnik website ran an article suggesting that Bellingcat was linked to the CIA.

Beginning that month through July 2016, three Bellingcat researchers, including Higgins, received "spearphishing" emails that were written in a way meant to dupe the recipient into clicking on a link containing malware. Higgins received 16 such emails, which consisted of false Gmail security notices urging the recipient to click a link to review recent suspicious activity.

That technique, Barger said, is consistent with a technique used by a Russian hacker group dubbed Fancy Bear by some security researchers. The group is run out of the GRU, the military intelligence service, analysts said.

Meanwhile, with every new Bellingcat revelation, Russian propaganda outlets such as Sputnik and RT, formerly Russia Today, produced pieces that called into question the citizen journalists' work.

In October, for instance, Bellingcat published reports based on the geolocation data of Russian defense ministry videos that showed that Russian airstrikes were destroying positions held by the Free Syrian Army and other rebel groups rather than the Islamic State, as Russia had indicated.

Nearly every day for a week, a new piece emerged on RT or Sputnik attacking Bellingcat. "After the fourth day, I said, 'This is out of control,'" Higgins said. "They've gone crazy."

RT even sent a satirist with a cameraman to find Higgins in his home town of Leicester, England.

The comic Nimrod Kamer wound up reaching Higgins's mother, who, Higgins said, was "in tears" after being questioned by Kamer about her son. "It was intimidating, given the circumstances," he said.

Then, in February, CyberBerkut, which describes itself as a group of pro-Russian Ukrainian hacktivists, defaced Bellingcat's website.

In a blog post, the group also said it had hacked Bellingcat researcher Ruslan Leviev. To gain access to his email inbox, the group hijacked a text message sent to his cellphone that contained a security code, Leviev said.

Barger said he thinks the group gained access to Bellingcat's website through Leviev's account.

In July, two days before the second anniversary of the crash, Russian bloggers "trolled" Higgins, publishing more than 30articles in Russian in 30 hours attacking his credibility and questioning his reporting.

Higgins is "bringing to light the truth behind the 298" people killed, Barger said. "There is an aggressive campaign to undermine those who are shining a light" on the tragedy.

"If you cross Russia, you become a target for Russia," said Higgins, 37.

But, he added, he thinks the campaign of harassment and hacking may backfire. "It just makes them look insane and makes us look far more credible because they are going at us so hard."

Pentagon's 5,000-Strong Cyber Force Passes Key Operational Step
Thursday, 29 September 2016
Byline: Nafeesa Syeed

Washington - A 5,000-person Pentagon force created to bolster military computer networks and initiate cyber attacks against terror groups should be ready to carry out its mission by the end of the week, a key step in improving the U.S.'s ability to respond to hacks by overseas adversaries.
The Cyber Mission Force will reach "initial operational capability" by Friday, said Colonel Daniel J.W. King, a Cyber Command spokesman, in an e-mail. The group's 133 teams have met basic criteria on personnel, training, resources and equipment, but all of them aren't necessarily ready to launch attacks, he said.

The force, which falls under the U.S. Cyber Command created in 2009, likely will focus on the highest priorities, such as risks from Russia, China, Iran and terrorist groups including Islamic State, according to Bob Stasio, a fellow at the Truman National Security Project and former chief of operations at the National Security Agency's Cyber Operations Center.

Until the force becomes fully operational, which is planned in 2018, the question officials directing it will ask first will be, "What's the minimum operation I need against the biggest threats that I have today -- the closest alligators to the boat," Stasio said.

Previously, cyber operations were scattered in silos across Cyber Command, the NSA and other military branches, according to Stasio. The new centralized force will help cut through the bureaucracy, he added. Officials plan to expand the force by another 1,200 people as part of the process of becoming fully combat ready.

"We continue to generate the mission force," Admiral Michael Rogers, who heads Cyber Command and the NSA, said in a Sept. 13 speech in Washington. "At the same time, we got to tell ourselves we are not where we need to be in this mission."

The operational capability designation means the Pentagon has better streamlined cyber activities across its bureaucracy, but analysts say it doesn't necessarily reflect greater security chops as defense officials try to keep up with fast-evolving technology and threats.

"What it means is we have the people, the tools, we've practiced and we're ready," said Mark Young, chief security officer and senior vice president at IronNet Cybersecurity Inc. and a former senior executive at Cyber Command.

Digital Labyrinth

As hacking attacks traced to countries such as Russia and China continue to make U.S. headlines, people "can feel more comfortable -- not completely comfortable - - but they can feel more comfortable, that we now have a military force that could respond if directed to these activities," Young said.

The mission force is tasked with defending the Defense Department's data and its labyrinth of thousands of digital networks across the world. It also has to defend the U.S. "against cyber attacks of significant consequence" as well as the nation's critical infrastructure, King said. Cyber war plans are also in place for the military's various regional commands.

Setting up the force is also a sign that cyber is more "baked into" the military's overall strategy, while providing defense officials a grasp of how much it needs to spend on cybersecurity, said Dave Aitel, chief executive officer of Immunity Inc. and a former NSA computer scientist. In its 2017 information technology budget, the Defense Department requested $6.8 billion for cyber operations.

Money Buckets

"You have to kind of look at it as if you're building a whole new Navy, that's a very expensive operation," Aitel said. "It gives them better buckets to throw money into and know where that money is going."

There's work ahead as the military builds out all of its cyber teams to full capability in the next two years.

Even when they reach that stage, officials will still have to keep pace with emerging tech tools and cyber-attack tactics, according to Ben FitzGerald, a senior fellow at the Center for a New American Security, who previously worked as an executive for technology companies with defense contracts.

"Cyber Comm is still going through a process of establishing the command and control arrangements between their teams, and the support they provide to rest of the Department of Defense, and that's going to take time to figure out," FitzGerald said. "The key challenge is will they be able to adapt and keep making changes as rapidly as they need to?"

Times of Israel
Poor cybersecurity habits persist worldwide
Thursday, 29 September 2016
Byline: Iacopo Luzi

Jerusalem - Israel's second-largest public security company, CyberArk, said a survey it published recently showed that heightened awareness of cybersecurity threats among information technology professionals has failed to translate into greater success in defending against those threats. "Despite increased cybersecurity awareness, nearly every IT security breach or cyberattack continues to be underpinned by the failure of organizations to enforce best practices or adequately protect against advanced threats," CyberArk's Global Advanced Threat Landscape Survey 2016 said.

Today, as never before, global enterprises are vulnerable to worldwide hackers. Last week, Yahoo announced that at least 500 million of its accounts were hacked in 2014, in the world's biggest known cyberattack by far.

CyberArk's report -- the result of surveys conducted with 750 IT and IT security decision makers from around the world -- shows rising confidence in cybersecurity strategies and, at the same time, poor IT security habits that continue across the industry in critical areas such as privileged account security, third-party vendor access and cloud.

According to the report, 79 percent of respondents said their organization has taken appropriate action to improve security while 55% of respondents said they have changed or evolved processes for managing privileged accounts. Yet, these changes do not always go hand in hand with best practices.

For example, 40% of interviewees store privileged and/or administrative passwords in Word documents or spreadsheets on a company computer, making this information easy for a hacker to discover.

The report also notes that nearly half of the organizations commonly allow third-party vendors (such as supply chain and IT management firms) remote access to their internal networks, making them an additional pathway for cyberattack.

With the threat landscape constantly shifting, it's hard to determine what type of cyberattacks will be the most dangerous in the next months, leading many organizations today to adopt a "post-breach" mindset, meaning they operate under the presumption of a breach and have developed response plans.

This attitude leads to positive steps in defensive post- breach planning, but it also reveals a risk of overconfidence - or maybe complacency - and may hamper the ability to efficiently respond when facing a sudden cyberattack.

"Many global organizations are taking positive steps toward better protecting against the damaging effects of a cyberattack, including implementing measurable security programs to benchmark progress.

However, there is still a gap between 'awareness' and 'preparedness' in protecting against attacks," the report said.

Washington Times
China cyber espionage continues
Thursday, 29 September 2016
Byline: Bill Gertz

Washington - U.S. Cyber Command recently reported within secret government channels that China is continuing aggressive cyber espionage against American companies.
An intelligence report disseminated earlier this month stated that one of China's biggest cyber spying operations involved the theft of 1.65 terabytes of sensitive proprietary data from a major U.S. software company, according to a defense official familiar with the report.

The U.S. company was not identified by name. But the hacker group behind the data theft is part of the Ministry of State Security, China's main police and intelligence service.

The hacking operation by the MSS was carried out from at least October 2015 and contradicts the U.S.-China agreement on cyber espionage reached between President Obama and Chinese President Xi Jinping in September 2015.

The agreement requires both sides to halt government-backed cyber espionage against private companies. Critics say the accord was skewed in Beijing's favor because U.S. intelligence agencies are barred from spying for American firms, while most Chinese companies are under government control or influence and regularly benefit from the state's intelligence-gathering.

American intelligence officials testified earlier this year that they have serious doubts about China halting cyber spying in the United States. Only FBI Director James B. Comey has said he believes the Chinese are abiding by the agreement. The Chinese have stolen massive amounts of American proprietary corporate and defense data over the past decade or more.

According to National Security Agency documents leaked by renegade contractor Edward Snowden, in 2010 the NSA assessed Chinese data theft totaled 50 terabytes -- or five times the holdings of the Library of Congress. Defense industrial espionage by China has compromised information on the B-2 bombers, the F-22 and F-35 jet fighters, space-based lasers and other high technology weapons.

Another NSA document revealed that most of Chinese cyber espionage is carried out by a military, with the MSS a close second.

A Cyber Command spokesman did not respond to email requests for comment.

CNN.com
Cyber warfare: Who is China hacking now?
Thursday, 29 September 2016
Byline: Kristie Lu Stout

Hong Kong - It's the nagging glitch in the US-China relationship that was inevitably mentioned during the first US presidential debate this week between Donald Trump and Hillary Clinton -- cyber warfare. During the debate, Trump questioned whether Russia was indeed behind a series of cyberattacks on the Democratic National Committee -- a conclusion that US officials and his election rival have reached.

"She says, 'Russia, Russia, Russia,'" said Trump. "It could be China."

In the dark world of cyber- espionage, the finger of blame has often been pointed at China.

Earlier this year, China's cyber spies were accused of hacking into dozens of workstations and servers at the Federal Deposit Insurance Corp.

Last year, Chinese hacking was blamed for the massive data breach at the US Office of Personnel Management which compromised the data of over 21 million people.

And in May 2014, US federal prosecutors indicted members of the People's Liberation Army (PLA) for cyber-espionage for economic gain.

China has all along denied the allegations of state-sponsored hacking. But analysts say China's cyber operations are an active threat.

"Military intelligence has rapidly moved from cloak-and-dagger to bits-and-bytes over the last fifteen years... and China's no exception to that," says Bryce Boland, Asia-Pacific CTO of FireEye, a cybersecurity firm.

"China has been developing its capabilities within the PLA for a number of years, going back at least a decade. And their capabilities have now also been brought together into a single, strategic organization that is essentially a new branch of the military."

China is of course not the only actor in this era of cyber warfare.

But it has taken a significant step forward with the United States to establish some ground rules in a new domain of conflict with no widely-held norms.

During President Xi Jinping's state visit to the US last year, the China and the US formally agreed not to conduct or knowingly support economic cyber-espionage.

"I think China, after that, has tried to comply with that agreement," says Tong Zhao of the Beijing-based Carnegie-Tsinghua Center for Global Policy.

"China increasingly realizes it is in China's interests to promote a rule-based system."

And since the agreement, FireEye has observed a significant change in Chinese cyber activity.

"We've seen a shift in behavior since the Obama-Xi agreement. And that shift in behavior has resulted in a decrease in attacks against US and Western organizations for the purposes of stealing their intellectual property," says Boland.

"We've almost seen a pivot towards Asia. We've seen more targeted attacks now focused on information gathering and intelligence collection from countries on the periphery of China -- anyone with a land boundary or involved in a maritime dispute. And that kind of activity is much more focused on intelligence."

China's cyber-spies are pivoting away from stealing US trade secrets as they move towards gathering intelligence in a region fraught with geopolitical tension.

Take Taiwan, for instance.

Relations with Taipei and Beijing have been tense since the landslide election of Tsai Ing-Wen, Taiwan's first female president. Her Democratic Progressive Party (DPP) has traditionally leaned in favor of formal independence from China.

After the DPP's election win, its website was compromised and replaced with a spoofed site to collect data on visitors.

And then, there's Hong Kong.

Two years after Hong Kong's pro- democracy "Umbrella Movement," the city's first legislative elections since the mass demonstrations provided a platform for a small but vocal independence movement -- much to the chagrin of Beijing.

Before the election, two Hong Kong government agencies were targeted by cyber-attackers using new malware tools.

According to FireEye, both incidents were the work of Chinese state-sponsored hackers.

"We know those that those attacks were originated from China... they were clearly politically motivated attacks," says Boland.

"The only logical consequence is that they are operated by a group of people who had a political activity to conduct, so we believe they were state-sponsored."

Not all attacks officially sanctioned

But not all hack attacks originating from China have the official red seal of approval.

After an international court ruled that China did not have a historic right to a disputed area in the South China Sea, flight information screens at Vietnam's two biggest airports were hacked to show messages criticizing the Philippines and Vietnam and their territorial claims in the region.

Analyst Tong Zhao is convinced that the Vietnam airport hack was not the work of Chinese state agents.

"We used to assume that China is a country having a very centralized political system -- the central government must be in control of everything. I think that assumption is inaccurate," Zhao says.

And he's right. As powerful as it may be, China is not a single monolith. It's a vast system of many different actors -- military or civilian, state-backed or for-hire.

But China's many cyber actors can come together for a common goal -- to advance China's security interests and its standing in the information age.

The Local (Norway)
Oslo court denies Snowden no-extradition pledge
Wednesday, 28 September 2016
Byline: Staff report

Oslo - A Norwegian court on Wednesday dismissed a fresh bid by fugitive whistleblower Edward Snowden to win assurances he would not be extradited to the US should he come to Norway to collect an award.
The Oslo appeals court said it was not competent to offer such a pre-emptive guarantee since Snowden had not set foot in Norway and Washington had not submitted a formal request for his extradition.

The former National Security Agency (NSA) contractor, who lives in exile in Russia, faces US charges of espionage and theft of state secrets that could land him up to 30 years in jail.

The charges followed his 2013 release to the media of the extent of the NSA's surveillance programmes.

The appeals court upheld the June ruling of a lower court to which Snowden had taken his challenge against the Norwegian justice ministry's position that no guarantees on extradition could be given before a request had been formally received.

The Norwegian branch of the PEN Club has invited Snowden to Oslo on November 18th to collect the Ossietzky prize, which celebrates "outstanding efforts for freedom of expression."

Norway's Pen Club said it would appeal the case at the Supreme Court.

Norway was one of the countries where Snowden had sought asylum when he fled the US in 2013, but Oslo's response was that asylum seekers had to be physically present in the country to apply.

Considered a whistleblower by some and a traitor by others, Snowden won a similar Norwegian award in 2015, but was unable to collect it in person for the same reason.

Snowden has also been nominated for the Nobel Peace Prize, also awarded in Norway, for a third straight year. This year's award will be announced on October 7th.

NBC News
Were the Russians Behind the Massive Yahoo Email Hack?
Wednesday, 28 September 2016
Byline: Chris Francescani

New York - The hack of more than a half billion Yahoo email accounts was motivated by espionage, not profit, according to an independent cybersecurity firm report released Wednesday, which contends that an Eastern European state-sponsored actor appears to have ordered the massive hack as part of a coordinated effort to infiltrate the email accounts of U.S. military, diplomatic and political figures.
The findings by the cyber security firm InfoArmor are consistent with Yahoo officials' claim last week that a state-sponsored actor was behind one of the largest corporate breaches in U.S. history.

Yet InfoArmor's version of events, if accurate, provides significant new details about how and why the company was hacked. Minor league hackers who were peddling Yahoo users' personal information for cash in "dark web" marketplaces were also part of a foreign government espionage campaign dating back to 2014. And the findings also suggest that hacks of LinkedIn, Dropbox, MySpace and other firms -- breaches affecting billions of customers worldwide -- might've been part of the same state- sponsored effort.

In an interview with NBC News prior to the release of his firm's findings, InfoArmor's chief intelligence officer Andrew Komarov described the Yahoo breach as part of a larger, ongoing campaign to break in to the email accounts of prominent officials from the U.S. and across the globe.

He said that his analysts have uncovered a previously unidentified collective of elite black hat hackers-for-hire from Eastern Europe -- a group that InfoArmor analysts now contend was also responsible for hacks of the other social media companies.

Komarov said that a state-sponsored actor from Eastern Europe commissioned and later paid the hacker collective $300,000 for the Yahoo data trove. He said he didn't know if the hacks of the other social media companies were also commissioned by a state-sponsored actor, but believed it was likely. He also said he didn't know if the state that directed the hacks was Russia, or if the state-sponsored actor that paid the hackers was a Russian intelligence agency or some other arm of the Russian government, but that Eastern European hackers often have links to the Russian government.

Eastern European operatives tied to Russia's intelligence agencies have been widely suspected by cybersecurity researchers of multiple efforts to hack U.S. government officials' email accounts and the accounts of Democratic party operatives.

Komarov said that InfoArmor's conclusions that the hackers who attacked Linkedin and other companies were also responsible for the Yahoo breach are based on an extensive intelligence analysis, underground contacts and information gleaned from multiple sources surrounding the Yahoo hack. His firm went into dark web chatrooms and made contact with hackers advertising Yahoo addresses for sale who said they were involved in the breach, and accessed and validated what Komarov described as a "large sample" of the stolen Yahoo data.

Yahoo's confirmation last week of the massive breach has placed the tech giant at the center of a storm of controversy and unanswered questions, and could jeopardize the company's imminent $4.8 billion sale of its core business to the telecom giant Verizon.

It remains unclear how long and how much Yahoo officials knew about the breach before publicly acknowledging it. Company officials have said that Yahoo became aware of the breach in August, and began to investigate. Experts have said that it's not uncommon for a company of Yahoo's size to withhold disclosure of a suspected breach until an internal forensic investigation has been complete.

Last week, Yahoo's chief information security officer, Bob Lord, said that an internal probe had determined that usernames, email addresses, telephone numbers, dates of birth, security questions and answers, and in some cases passwords were harvested from more than 500 million compromised Yahoo accounts.

Lord said in a blog post that the company does not believe that banking or payment information was stolen, and has found no evidence to indicate that the hackers remain inside Yahoo's systems.

Yahoo declined to comment.

"Island- Hopping" To Reach U.S. Officials

Komarov said that the apparently state- sponsored actor involved in the heist was using an indirect but increasingly common strategy known as "island-hopping" or "leap-frogging" to reach its ultimate targets. Rather than going after U.S. and other government officials directly, the aggressors used the data from the hired black-hat hackers to breach the Yahoo accounts of friends, family and associates of their ultimate targets.

Once inside compromised Yahoo accounts, hackers can email or respond to their targets directly with seemingly legitimate Yahoo emails that are virtually indistinguishable from real ones.

"The target will receive the exact same email from the Yahoo user and, for him, it will look legitimate," Komarov said.

He said that while it's extremely difficult to directly infiltrate a Google Gmail account, for instance, all you really need to get into it is a compromised account of a Yahoo email user who corresponds with the Gmail user.

"Then you simply hack the Yahoo account's contacts, and then analyze the [emails] sent from the real object of interest. At some point you replace [a legitimate Yahoo email sent to a target] and fill it with malware," he said. Once the end target clicks on a link or an attachment in the infected Yahoo email, hackers can get inside the target's account.

From Foreign Espionage to Dark Web Marketplaces

Komarov said that the state-sponsored actor appears to have been working with the black hat hacker collective -- which the InfoArmor team has dubbed "Group E" -- for at least several years.

He said that his analysts have determined that Group E was also responsible for earlier, high-profile hacks of LinkedIn, MySpace, Dropbox, the music-streaming service Last.fm, the microblogging site Tumblr and others -- likely for the same purpose of identifying trusted third parties surrounding their real targets. Tumblr was purchased by Yahoo in 2013.

"If you calculate all the victims for all these hacks by the same group, it will be several billion victims," Komarov said.

InfoArmor has determined that at least some of the hacks of the other tech firms "were requested of Group E...so we assume that the Yahoo breach was one of the tools used for successful attacks against U.S. government officials."

Komarov said that in recent years the state sponsored actor approached Group E and asked them to hack millions of Yahoo email users' accounts. They provided Group E with specific email addresses they

were seeking, and when they were turned over and verified, the foreign agent agreed to purchase the entire trove, he said.

The agent had initially sought exclusive access to the stolen Yahoo data set, but balked at Group E's $500,000 price. Instead, Group E brought the price for the Yahoo trove down to $300,000, and retained the right to peddle the hacked emails elsewhere.

Komarov told NBC News that the Yahoo trove was later sold off to two well-known spammers, who exploited it for profit.

After it had been sold off and mined for months, Group E appears to have provided a low-level but well-known hacker named Tessa88 with mostly useless leftovers from the Yahoo trove to further distance the foreign agent from the Yahoo hack, Komarov said.

Tessa88 began advertising Yahoo data for sale on a Russian- speaking dark web marketplace, and appears to have partnered with a hacker who goes by the handle "Peace," or "Peace of Mind," to do the same in an English-speaking online marketplace called The Real Deal, according to InfoArmor.

It was only when Peace began advertising the Yahoo trove for sale that the company apparently became aware that they had been breached.

InfoArmor's report describes the entire enterprise as "carefully orchestrated in order to mask the actual sources of the hacks."

"Hands in the Cookie Jar"

An independent cybersecurity expert, who was briefed by NBC News on the upcoming report -- with the permission of InfoArmor -- said the firm's conclusions are consistent with what the cybersecurity community has privately postulated about the Yahoo hack.

"The story overall has a legitimacy to it," said Ann Barron-DiCamillo, chief technology officer for Strategic Cyber Ventures, who recently retired as director of the U.S. Department of Homeland Security's Computer Emergency Readiness Team (U.S. CERT).

"If you look at when the data was stolen, because the data was stolen in 2014 and never [until recently] showed up for sale on these [dark web] markets, there's usually going to be a nation-state involved," Barron- DiCamillo said on Tuesday.

"Nation-state actors like to have a degree of separation, so their hands are not in the cookie jar if they get caught. You're seeing them more and more leveraging others. Plus there's the fact that the [Yahoo] data wasn't quickly monetized." She said that with large scale hacks like those of Yahoo email users, the attackers must move quickly to profit off the theft.

If the motive is pure profit, hackers "are going to want to monetize [the data] so quickly, because it has a short shelf-life in terms of its value."

Barron-DiCamillo said that she wouldn't be surprised to see a nation-state haggle over the price for a data dump it had commissioned.

"It's just like any other business transactions," she said. "It feels different because the outcome is a little unusual, but it's just like any other business transaction."

Washington Post
Hackers have attempted more intrusions into voter databases, FBI director says
Wednesday, 28 September 2016
Byline: Matt Zapotosky

Washington - Hackers have attempted more intrusions into voter registration databases since those reported this summer, the FBI director said Wednesday, and federal officials are urging state authorities to gird their systems against possible other attacks.
Testifying before the House Judiciary Committee, FBI director James B. Comey said that the bureau had detected scanning activities -- essentially hackers scoping out a potential attack -- as well as some actual attempted intrusions into voter registration databases.

He said those attempts were beyond what had been made public in July and August, likely referring to hacking efforts in Illinois and Arizona, though he offered no other specifics.

"We are urging the states just to make sure that their deadbolts are thrown and their locks are on, and to get the best information they can from" the Department of Homeland Security, he said.

Federal officials have been closely watching attempted hacking of the U.S. election system. Russia is believed to be behind the high-profile hack of Democratic National Committee computers, and the FBI told Arizona officials in June that Russians tried to access their system.

That hack shut down the voter registration system for a week, although it turned out that the hackers had not compromised the state system or even any county system. Illinois officials said they discovered a successful breach in which hackers were able to retrieve a small percentage of voter records, and they said the FBI told them agents were looking at foreign governments and criminal hackers as possible suspects.

Hacking that would actually affect an election would be difficult because of the localized, disparate and sometimes antiquated nature of the United States' voting systems, and because the balloting systems

are generally not connected to the Internet, officials have said. Such efforts, though, could spark doubts about the strength of the system and the legitimacy of the outcome it produces.

Homeland Security Secretary Jeh Johnson has said that 18 states have asked for help in improving their election-systems cybersecurity.

The National (UAE)
End of an era as BlackBerry bites the bullet and stops making phones (Canada).
Thursday, 29 September 2016
Byline: Staff Report

Abu Dhabi - BlackBerry, the Canadian firm that helped to pioneer the smartphone market, said on Wednesday it will stop making handsets, outsourcing production to an Indonesian partner, after it reported another loss and a steep decline in revenue.
Analysts had been holding their breath for the news after the chief executive John Chen said September was his deadline for making the chronically money-losing device business profitable. BlackBerry's device business, which it calls "Mobility Solutions", will focus on developing applications and an extra-secure version of Google's Android operating system that it can licence to other companies.

"Our new Mobility Solutions strategy is showing signs of momentum, including our first major device software licensing agreement with a telecom joint venture in Indonesia," Mr Chen said. "Under this strategy, we are focusing on software development, including security and applications. The company plans to end all internal hardware development and will outsource that function to partners. This allows us to reduce capital requirements and enhance return on invested capital."

Handsets with the BlackBerry name will be produced under licence by Tiphone Mobile Indonesia, allowing BlackBerry to concentrate on software and services, the firms said.

BlackBerry posted a 31.8 per cent fall in second-quarter revenue. The firm's net loss came to US$372 million, or 71 cents a share, on revenue of $334m, as it booked $147 million in charges from its reorganisation. A year ago, it reported a profit of $51m, or 24 cents a share, on revenue of $490m.

Excluding one-time items, the company said it said broke even. On that basis, analysts had on average expected an adjusted loss of 5 cents a share on revenue of $393.7m, according to Thomson Reuters I/B/E/S.

The company raised its adjusted earnings outlook for the year to a range of breakeven to a 5-cent loss, compared with an earlier forecast of a 15 cent loss, after refinancing its debt and as margins improved.

The company's shares rose 6.7 per cent to $8.35 in premarket trading. BlackBerry, which a decade ago was among the largest smartphone makers, has seen its global market share slip to less than one percent amid domination by Apple and Android devices.

As the market shifted, BlackBerry has sought to refocus on software, including security applications, and the latest announcement takes the company out of the handset market entirely. "We are reaching an inflection point with our strategy. Our financial foundation is strong, and our pivot to software is taking hold," said Mr Chen.

New Indian Express
Govt websites hot targets of foreign hackers
Thursday, 29 September 2016

New Delhi - Attacks on government computers are nothing new. But, unlike the past, when computers had not entirely permeated official works, more and more departments today are digitising information that affect the common man and storing them away in computers.
Ergo, this switch has exposed them to more sophisticated cyber attacks and bigger security risks. IT security experts believe so, too, when they warn that malware presence in systems of a crucial department such as Finance could affect salaries, pensions, contract payments and other related transactions.

According to them, computers and websites of government departments are favourite targets of foreign hackers. "Last year, 50 websites were defaced by pro- Pakistani hackers. This year, there have been 10 such incidents. Although we are yet to achieve complete digitisation, there are serious risks to data security," said Project Manager of Computer Emergency Response Team- Kerala, Renjith A.

Using unauthorised software, hosting websites sans proper security audit and the staff 's lack of awareness to cyber security threats are some major reasons that make them targets of hackers. Stepping up Now, there are plans to improve security of websites via SDCs.

Besides providing services for government's access, the SDCs would act as mediators and convergence point between open unsecured public domain and sensitive government environment. "We do not allow hosting of applications in SDC without mandatory security audit," said T Mohan Dhas, State Informatics Officer. The 'audit' he referred to was a half-yearly practice of National Informatics Centre (NIC) - which provides IT solutions to the state - on applications hosted in SDC to check for security loopholes.

Le Bigh Daddy Show, la web série animée qui caricature Daech
Thursday, 29 September 2016
Byline: Journaliste maison

Non identifié - Vidéos - Des activistes arabes ont choisi l'humour comme arme pour combattre la propagande de l'État islamique. Morceaux choisis.
Un message clair. «Nous nous moquons de Daech pour ce qu'ils sont, des idiots», indique la page d'accueil You Tube de la web série animée The Big Daddy Show. Combattre la folie meurtrière de Daech par l'humour, telle est la devise du groupe d'activistes arabes qui se cache derrière ces petits clips facétieux.

Des djihadistes qui n'arrivent pas à manier leurs armes, un calife qui joue à «Pokémon Go» ou encore un âne qui demande l'asile politique en Turquie... «Tout est fait pour amuser le spectateur»,relate la journaliste Chloé Domat qui a déniché cette pépite pour Rue89.

Journalistes, écrivains, artistes ou avocats composent ce groupe de militants. Certains vivent dans les territoires occupés par l'État islamique en Irak, en Syrie et en Libye. Menacés de mort, c'est sous couvert d'anonymat que des membres du groupe se sont exprimé sur Skype auprès de Chloé Domat: «L'État islamique a mis la main sur les réseaux sociaux. Ils mènent une guerre psychologique qui vise à terroriser les gens à travers le monde.»

Et le porte-parole d'expliquer sa démarche: «Nous voulons contrer leur discours en occupant la Toile avec de l'humour.» Les vidéos sous- titrées en anglais, et parfois en français, mettent en scène sept personnages qui évoluent autour du calife Abu Bakr el BighDaddy, une évocation détournée d'Abou Bakr al-Baghdadi qui dirige actuellement l'État islamique d'Irak. À ses côtés, son épouse Chaïmaa et quelques djihadistes, parmi lesquels un play-boy australien converti. Cette galerie de personnages a été présentée, dans la première vidéo mise en ligne en février dernier. Retouvez ci-dessous notre sélection de quelques épisodes.

CSIS halts bulk data searches after watchdog flagged concerns
Friday, 30 September 2016
Byline: Jim Bronskill

Ottawa - Canada's spy agency sifted through large troves of data for information of value until a federal watchdog raised questions about a lack of guidelines for such searches, a new report reveals.
The Canadian Security Intelligence Service agreed to halt its acquisition of bulk datasets until it had a framework in place to govern the process of mining so-called "big data."

In its annual report tabled Thursday, the Security Intelligence Review Committee said CSIS used datasets to identify previously unknown individuals of interest by linking together types of information that have indicated "threat behaviour."

"They can be used to conduct indices checks by taking information already connected to a potential threat -- such as an address, phone number or citizen identification number -- and using it to search for 'hits' in the data," the review committee report says.

Overall, the review committee was satisfied that CSIS acted in accordance with the law in 2015-16. But it issued several recommendations to make the spy service more accountable when examining data, tracking Canadian foreign fighters in Iraq and Syria, exchanging information with other agencies and using new powers to disrupt suspected terrorist plots.

CSIS argued that openly sourced and publicly available datasets were akin to the phone book, and therefore restrictions in the CSIS Act limiting collection to "strictly necessary" information did not apply.

However, the review committee looked at the full list of datasets held by CSIS and, in come cases, disagreed with the spy service's assessment that they were publicly available and therefore beyond the legal restriction.

As a result of the committee's intervention, CSIS finalized and implemented guidelines for acquiring bulk data and agreed to ensure it abides by the CSIS Act in collecting such information.

Pierre Blais, the review committee chairman, said in an interview that for many years CSIS essentially gathered information "piece by piece," making it easier to meet the threshold of "strictly necessary."

The advent of electronic databases containing hundreds of thousands of pieces of information has made things "more complicated," he said.

The committee also found CSIS failed to tell the public safety minister about a notable overseas incident during a probe into jihadi-inspired fighters.

The committee says CSIS should have informed the minister about the development -- one of several problems with the spy service's investigations of Canadian foreign fighters.

Neither Blais nor Public Safety Minister Ralph Goodale's office would disclose details of the incident. However, a spokesman for Goodale said the minister was eventually briefed on the matter.

CSIS needs to deal with lingering challenges associated with overseas operations, the review committee report says. The spy service can expect these challenges to increase as government demand for intelligence on threats to the security of Canada from conflict zones grows.

The committee found CSIS needed to emphasize strategic planning for foreign operations -- for instance, ensuring employees fully understand the legal risks of certain activities.

It also called on CSIS headquarters to take a more decisive leading role in some foreign activities.

In addition, the committee said CSIS should develop formal means of consulting with other government agencies about its efforts to derail threats using new powers introduced in the legislation known as Bill C-51.

Globe and Mail
Yes, please, to real metadata legislation
Friday, 30 September 2016
Section: editorial

Editorial: Metadata is not something metaphysical. As Daniel Therrien, the Privacy Commissioner of Canada, rightly says, "We generate metadata constantly." Like an envelope, this outer shell of any electronic communication - a phone log, a time stamp, an e-mail address or an IP address - can reveal a lot.
Mr. Therrien is particularly worried about the Communications Security Establishment, the Canadian member of the intelligence alliance called the Five Eyes; the other four eyes are the United States, Britain, Australia and New Zealand.

As long ago as 2008, the Five Eyes dealt well with metadata. But then something went wrong with the CSE's "filtering technique" - that is, separating the metadata attached to the private communications of Canadians from that of the foreigners the CSE is mandated to monitor. In 2013, the CSE realized that Canadians were getting scooped up in its metadata trawling.

The CSE maintains that the risk to privacy is minimal. If that is so, why did the Five Eyes design the the filtering technique in the first place? Was it really superfluous?

CSE officials themselves acknowledged to the Privacy Commissioner's office that the CSE had improperly shared large amounts of metadata. This could undermine the public's confidence, and the various governments' too, that the Five Eyes will never, ever spy on each others' citizens.

Mr. Therrien pointed to the work of three computer scientists at Stanford University that was published this year. They argue that people's supposedly innocuous metadata are often every bit as revealing as the types of evidence that police present when they apply for search warrants.

The scientists concluded that "telephone metadata is densely interconnected, can trivially be reidentified, and can be used to draw sensitive inferences."

Meanwhile, the Supreme Court's decision in R. v. Spencer in 2014 strongly reasserted the search-warrant requirement in cases of electronic communication.

Thus, Mr. Therrien is right to say that the National Defence Act should be amended to clarify the CSE's powers and to establish clear legal standards to protect the privacy of Canadians. In other words, metadata legislation.

CSIS suspends some bulk data mining programs pending new guidelines
Friday, 30 September 2016
Byline: Colin Freeze

Ottawa - Canada's domestic spy service has halted its "bulk collection" of data after criticisms were raised within government about the lawfulness of such techniques.
A watchdog agency's new report about the Canadian Security Intelligence Service speaks of littleknown CSIS data- mining programs, and of how some have recently been suspended because of a lack of clear rules and guidelines surrounding them.

CSIS is said to have wanted to leverage big pools of data "to identify previously unknown individuals of interest by linking together types of information that have mirrored threat behaviour," according to the report. But after concerns raised in the report, "CSIS agreed to halt ingesting bulk data sets pending" new rules.

These findings are from the Security Intelligence Review Committee (SIRC), the watchdog agency that tabled its annual report in Parliament on Thursday.

The cryptic discussion of CSIS's "data management and exploitation activities" is intriguing on several levels. Talk of spies "ingesting" data in "bulk" has had connotations of intelligence officials indiscriminately amassing citizens' telecommunications records. Yet CSIS officers, who work to track terrorists within Canada, are generally understood to handle cases one wiretapping warrant at a time.

This makes them more like conventional police detectives than the foreignfocused signals-intelligence - or "sigint" - spies who deal in volume.

On Thursday, a CSIS spokeswoman said the agency engages in a different kind of "bulk." "The collection referred to in the SIRC report is not the same collection that is sometimes done by sigint agencies," said Tahera Mufti.

She said what was at issue was CSIS collecting "data sets like maps, foreign telephone directories and airport codes." She did not explain how such data pools would help CSIS track terrorists.

The fundamental critique of SIRC, which won't speak to what kind of data it is referring to, is that CSIS has been amassing records at rates that may push past the parameters of federal law. Under its 1984 act, the spy agency can only collect information that is "strictly necessary" to preserve national security.

SIRC says the spy agency it watches keeps two kinds of records. "Referential" data sets are less inherently sensitive, and acquired through publicly available means. This probably means CSIS is buying material from "Big Data" brokers who routinely sell similar material to corporations.

But CSIS also independently acquires "non-referential" data.

SIRC regards such records as relatively intrusive "as they contain bulk information on a wide variety of individuals," the report says. "However, these can only be retained if they are assessed as being relevant to an ongoing, mandated investigation."

If CSIS wants to dredge up any data in bulk, SIRC says there needs to be compelling reasons.

"If there is no reasonable alternative to bulk collection, CSIS needs to provide an objective assessment of how closely connected the bulk information is to intelligence of value," reads the report.

This week, the federal Privacy Commissioner called for Parliament to pass new laws after finding Canada's other intelligence agency had been careless with records about the logged telecommunications of Canadians.

Communications Security Establishment (CSE), a foreignfocused "sigint" agency, says that whenever it collects Canadians' telecommunications trails, it does so only "incidentally." That's because it is pursuing foreign records in enormous volumes.

While CSIS and CSE have vastly different mandates, they also have adjacent headquarters. They can team up if a Federal Court judge endorses a joint operation.

In 2013, the former U.S. intelligence contractor Edward Snowden leaked documents to the media about the bulk collection of American citizens' telecommunications trails.

One revealing record showed CSE's and CSIS's U.S counterparts teamed up to acquire Americans' phone bills, thanks to sweeping warrants signed in secret courts.

The United States "targets the communications of everyone. It ingests them by default," Mr. Snowden said.

Washington Post
Cyber-experts: New Md. voting system is at risk
Friday, 30 September 2016
Byline: Josh Hicks

Washington - Cybersecurity experts are warning that Maryland's online absentee-ballot system is dangerously vulnerable to tampering and privacy invasions, both growing concerns in a year when hackers have breached the Democratic National Committee and attempted to access boards of elections in at least two states.
The system allows voters who request an absentee ballot to receive the form by email and send back a printed hard copy, with their votes marked by hand or with a new online tool that allows users to mark the document with the click of a mouse or the touch of a keyboard, then print it for mail delivery. Until this year, in large part because of security concerns, the latter option was available only to people with disabilities.

Critics say it is easy for impostors to use stolen credentials to request absentee ballots or for cyberthieves to hack in and retrieve data about who is requesting ballots or details of votes that were cast online.

All registered voters in Maryland are allowed to request an absentee ballot, regardless of whether they will be away from their polling station on Election Day.

With less than six weeks before Election Day, officials say they have taken steps to safeguard their online system, which was required as part of a 2013 law designed to increase voter participation and make voting more accessible. The board voted 4 to 1 on Sept. 14 to certify broad use of the online marking tool.

"The issue of electronic- ballot delivery is resolved," Nikki Charlson, deputy administrator of the Maryland State Board of Elections, said Thursday. "The General Assembly has made its policy decision, and without a repeal of the statute, it is what it is."

A group of computer scientists and cybersecurity experts wrote to the board two days before its vote and urged it not to certify the system, saying the setup would "make Maryland one of the most vulnerable states in the U.S. for major election tampering."

Save Our Votes, a voting-integrity group, says the state board shouldn't have certified the online marking tool, arguing that Maryland law prohibits the panel from greenlighting any voting program until it can ensure the secrecy of ballots.

"No information transmitted over the internet can be considered private or secure," the group said in an August letter to the board.

Charlson said the elections board has implemented numerous safeguards, including software that tries to identify and exploit potential vulnerabilities, regular monitoring for suspicious behavior and the use of best practices for information technology. She said the panel has no plans to take additional action.

During the board's meeting on Thursday, members met in a private session to discuss the security of the online system but did not share details of that conversation.

Chairman David J. McManus Jr. (R) and Vice Chairman Patrick J. Hogan (D) said that the state had adequately tested the system and that no online program could be completely secure.

"I felt comfortable, based on briefings that we had from our information-technology staff as well as the contractors," Hogan said. "Based on the continued work that is going on, it's as secure as it can be. The idea that any system is 100 percent secure - there is no such thing. If you took that attitude, you would never have any system."

Kelley A. Howells (R), the board member who voted against certification, said she was "worried by some of the writings of people at major universities saying 'stay away from the Internet.' " But she said she feels confident with the work of the board's information- technology team.

Charlson said that the state had sent out about 10,000 emails to voters who wanted to access absentee ballots as of Thursday and that 4,200 of those accounts had been logged into. Among those users, 2,500 had chosen to mark their ballots by hand, while 1,800 had chosen to use the online tool to mark their ballots.

The 2013 law requires online delivery of absentee ballots for all voters who request the service. It says the state board had to certify that the online ballot-marking system would ensure privacy before deploying it.

After a divided board refused to certify the tool in 2014, advocates won a federal court order that required the state to make the option available for the disabled anyway.

The 2016 presidential election will be the first time the state has offered the online ballot- marking system to all absentee voters.

More than 30 states use some form of electronic system for ballot delivery.

Alaska and Washington are the only other states that allow all voters to obtain absentee ballots from personal computers. Unlike Maryland, both of those states use a signature- verification process. Alaska also allows ballots to be submitted online.

"Very little information is required to impersonate a voter and request an online absentee ballot," Save Our Votes said in its letter.

North Dakota permits electronic ballots for overseas citizens and military members, while Missouri provides them only for members of the military serving abroad.

At least 20 other states and the District will allow certain voters living overseas to return their absentee ballots via email or fax in the upcoming election.

The threat of cyberattacks against electronic-voting systems has caused alarm within the Obama administration. Last month, U.S. Homeland Security Secretary Jeh Johnson said the federal government should consider designating electronic-ballot-casting systems as "critical infrastructure," meaning that, like the nation's power grid, they would require enhanced protections.

New York Times
It's No Cold War, but Putin Relishes His Role as Disrupter
Friday, 30 September 2016
Byline: David E. Sanger

Washington - Escalating airstrikes in Syria. Sophisticated cyberattacks, apparently intended to influence the American election. New evidence of complicity in shooting down a civilian airliner.
The behavior of Russia in the last few weeks has echoes of some of the uglier moments of the Cold War, an era of proxy battles that ended in 1991 with the collapse of the Soviet Union. President Obama, fresh from a meeting with President Vladimir V. Putin this month, wondered aloud whether the Russian leader was content living with a "constant, low-grade conflict." His reference was to Ukraine, but he could have been addressing any of the arenas where Mr. Putin has reveled in his new role as the great disrupter of American plans around the globe.

"It seems to me we have Mr. Putin's answer," said Richard Haass, the president of the Council on Foreign Relations and the author of a coming book, "A World in Disarray." "He's answered in the affirmative. Low-grade conflict is his thing. And the question is how directly or indirectly we introduce costs."

None of these conflicts have, in fact, cost Mr. Putin very much. Cyberpower in particular is tailor-made for a country in Russia's circumstances -- a declining economy with the gross domestic product of Italy. It

is dirt cheap, hard to trace to a specific aggressor and perfect for sowing confusion, which may be the limits of Mr. Putin's goals.

The bigger question confronting American intelligence officials, though, is whether the Russian president has a grander scheme at work. So far, their conclusion is probably not. Mr. Putin's moves, they argue in background conversations, are largely tactical, intended to bolster his international image at a moment he has plenty of troubles back home.

For a year now, the White House has argued that these escalating clashes, while worrisome, do not constitute a new Cold War. There is no great ideological struggle underway. No one is brandishing nuclear weapons, though after two decades of reducing their forces, each is now racing to modernize them. Syria is a humanitarian disaster of barely imaginable scope, but it is not a fundamental strategic threat to American interests.

Yet the few veterans of that era still in senior posts see similarities. "It shouldn't come as a big shock to people," James R. Clapper Jr., the director of national intelligence, said about the "information warfare" that has been put to sophisticated use from Kiev, Ukraine, to Washington. "I think it's more dramatic maybe because now they have the cybertools."

Mr. Clapper's colleagues go a step further in less public conversations. They argue that Mr. Putin has played his hand skillfully, stringing along Secretary of State John Kerry in a yearlong negotiation over cease-fires and political transitions in Syria, all the while bolstering their proxy, President Bashar al-Assad. Mr. Kerry's efforts in Syria all but collapsed this week in waves of Russian and Syrian government airstrikes.

The deal in Ukraine is hanging on, but just barely: Russia conveniently ignores many of the commitments it signed and has denied involvement in the downing two years ago of a Malaysia Airlines jet flying over Ukraine that killed 298 people.

The theft of voter rolls in Arizona and Illinois -- and "poking around" in the networks of other states, as James B. Comey, the F.B.I. director, described it to Congress this week without naming the Russians as perpetrators -- may be intended to rattle the United States, rather than change votes.

"It's probably not real, real clear whether there's influence in terms of an outcome," Mr. Clapper said. "What I worry about more -- frankly -- is just sowing the seeds of doubt, where doubt is cast on the whole process."

So far, the American response has been decidedly mixed. The West's sanctions against Russia for the annexation of Crimea have clearly stung; Russian officials make no effort to hide their desire to get them lifted. But the White House has not publicly blamed Russia for the hacking of the Democratic National Committee, the theft of the Arizona and Illinois voter registration rolls, or breaking into the cellphones of Democratic operatives.

Mr. Obama pulled Mr. Putin aside in China for a conversation that officials decline to recount, and Mr. Kerry has done the same with his counterpart during the long effort to find common ground in bringing peace to Syria.

The president's reluctance to publicly blame the Russians -- born of concern that taking on Mr. Putin head-on would only invite him to escalate -- has led to something of an uprising in parts of the White House and the State Department. A range of cyberstrategists and younger diplomats have complained over the past nine months that the failure to draw lines has encouraged Mr. Putin to see what else he can accomplish, especially at a time of political transition in the United States.

Few in the American intelligence community predicted much of this. Intelligence assets have been so focused for the past 15 years on counterterrorism that traditional targets have taken something of a back seat -- they have not been ignored, one senior intelligence official said recently, but only lately have they begun to receive new resources.

Perhaps that contributed to some misjudgments. It was more than a year ago that Mr. Obama said Russia would find itself in a "quagmire" in Syria; it may yet, but so far Mr. Putin's air war has propped up Mr. Assad, though at such a horrific human cost in the city of Aleppo that the United Nations' humanitarian chief, Stephen O'Brien, told the Security Council on Thursday that it had become a "merciless abyss of humanitarian catastrophe."

Mr. Kerry threatened earlier this week to cut off all negotiations with the Russians. The Russian Foreign Ministry responded that the United States was in an "emotional breakdown" and rejected the effort to restore a seven-day pause in hostilities, the first step in an agreement Mr. Kerry reached with his counterpart, Sergey V. Lavrov, on Sept. 9.

That was mild compared with what the spokesman for the Russian Ministry of Defense, Maj. Gen. Igor Konashenkov, said. He called the opposition leaders the United States has been not-so-covertly arming in Syria "a U.S.-controlled terrorist international," using a phrase that was a throwback to Soviet times.

And he warned that "should any attempt be made to carry out any threats against Russia or Russian servicemen in Syria, it is far from guaranteed" that the American-backed militias would have enough body bags.

So far, though, Mr. Putin has shown some caution. While he has tried to intimidate NATO nations with overflights of bombers, nuclear submarine runs along coasts and military exercises near the borders of Estonia and Latvia, he has been careful to stay on his side of the boundaries.

"These are all occurring in gray-zone locations with gray-zone tactics," said Robert Kagan, a historian at the Brookings Institution who has written on the return of geopolitical conflict. The question the United States will have to face, he added, is "Are we willing to operate in the gray area, too?"

New York Times
In Hacked Audio, Clinton Rethinks an Obama Plan
Friday, 30 September 2016
Byline: David E. Sanger, William J. Broad

Washington - Hillary Clinton expressed doubts about whether the United States should go forward with a trillion-dollar modernization of its nuclear forces at a fund-raiser in February, questioning an Obama administration plan that she has remained largely silent on in public.
Mrs. Clinton also suggested she would be far tougher against foreign nations that hack into American computer networks and would kill one of the Pentagon's pet projects, a nuclear-tipped cruise missile.

"The last thing we need," she told the audience, "are sophisticated cruise missiles that are nuclear armed."

Her comments were contained in an audio recording of the fund- raiser that appeared on the website of The Washington Free Beacon, a conservative publication, which said it was gleaned from the hack of a campaign staff member. But it said nothing about who did the hacking.

At a moment when Mrs. Clinton and the Obama administration have warned that Russia is trying to influence the American election, the mysterious release of the tape is also certain to raise new questions about the scope of attacks on the Democratic National Committee and the Clinton campaign.

A former Defense Department official present at the fund-raiser, Andrew C. Weber, who raised the question about nuclear modernization, verified the contents of the tape, but also suggested its release was part of the same hacking campaign that exposed D.N.C. emails.

Before she turned to nuclear matters, Mrs. Clinton used the fund-raiser to suggest that she would be much firmer against foreign nations that hack into American networks. Though the administration never formally accused China of stealing the security-review records of nearly 22 million federal employees and contractors, she called the theft "a gold mine for Chinese intelligence."

"They are at it all the time," she said of the Chinese state-sponsored hackers. But she also seemed to suggest -- more directly than she did in Monday night's debate -- that she thinks the best deterrent to the Russians, the Chinese, the Iranians and the North Koreans, all of whom she named, was a dose of American offensive cyberweaponry.

"They have physical assets that are also connected on the internet," she said. "So they have to know we would retaliate. So that provides a certain level of deterrence."

It may not: The Russian-backed hacks of the Democrats' infrastructure, so far without a visible American response, suggest that the deterrence Mrs. Clinton is relying on is not working.

The 50-minute recording was made in February during a fund-raising event at the home of Beatrice and Anthony Welters in McLean, Va. Mrs. Welters was ambassador to Trinidad and Tobago when Mrs. Clinton was secretary of state.

Mr. Weber was an assistant secretary of defense for nuclear programs from 2009 to 2014. Last year, after leaving office, he joined William J. Perry, a secretary of defense in the administration of President Bill Clinton and one of the Democratic Party's most influential nuclear advisers, to write an op-ed in The Washington Post strongly opposing White House approval of an upgraded nuclear cruise missile.

The missile is part of a sweeping modernization of the American nuclear arsenal that is estimated to cost up to $1 trillion over three decades. Undertaken by the Obama administration, it features new factories, refurbished nuclear arms, and a new generation of weapon carriers, including bombers, missiles and submarines. The new bombers are to carry the new cruise missile.

At the fund-raiser, Mr. Weber asked Mrs. Clinton about the modernization push and whether she, as president, would cancel the cruise missile, which he called a "particularly destabilizing, dangerous type of nuclear weapon."

"I certainly would be inclined to do that," she answered. "The last thing we need are sophisticated cruise missiles that are nuclear-armed."

Mrs. Clinton went beyond the question to warn of an emerging nuclear arms race, naming Russia and China as well as Pakistan and India. "This is one of the most dangerous developments imaginable," she told the audience.

"Pakistan is running full speed to develop tactical nukes in their continuing hostility with India." she said. "But we live in fear that they're going to have a coup, that jihadists are going to take over the government, they're going to get access to nuclear weapons, and you'll have suicide nuclear bombers. So, this could not be a more threatening scenario."

The United States, Mrs. Clinton said, needs to "do everything we can" to restrain the competitions, including exploring new treaties with Moscow that would go beyond the New Start treaty of 2010, which she helped negotiate.

Mrs. Clinton proceeded to praise Mr. Perry, saying the more he spoke out publicly and joined with Republican statesmen in trying to curb nuclear arms, "the better off we'll be in trying to really cut this off.'

"This is going to be a big issue," she added. "It's not just the nuclear-tipped cruise missile. There's a lot of other money we're taking about to go into refurbishing and modernization."

"Do we have to do any of it?" Mrs. Clinton asked. "If we have to do some of it, how much do we have to do? That's going to be a tough question, so I will look to people like you and Bill Perry to help me answer that question."

Mr. Obama has said he wants to reduce the role of nuclear weapons in American strategy, and his aides have hinted he may believe the modernization program needs reconsideration. But he seems to have left that to his successor, and the cruise missile Mrs. Clinton spoke about so disparagingly remains in the Pentagon budget.

NBC News
Hackers Target Election Systems in 20 States
Friday, 30 September 2016
Byline: Multiple reporters

New York - There have been hacking attempts on election systems in more than 20 states -- far more than had been previously acknowledged -- a senior Department of Homeland Security official told NBC News on Thursday.
The "attempted intrusions" targeted online systems like registration databases, and not the actual voting or tabulation machines that will be used on Election Day and are not tied to the Internet.

The DHS official described much of the activity as "people poking at the systems to see if they are vulnerable."

"We are absolutely concerned," the DHS official said. "The concern is the ability to cause confusion and chaos."

Only two successful breaches have been disclosed, both of online voter registration databases, in Illinois and Arizona over the summer.

While those two hacks were linked to hackers in Russia, the DHS official did not say who was responsible for the other failed attempts, noting that "we're still doing a lot of forensics."

Meanwhile, intelligence officials tell NBC News there is now "no doubt" the Russian government is trying to influence the election.

Classified material, prepared for briefings of Donald Trump and Hillary Clinton and examined by NBC News, reveals that officials have drawn "direct links" between Vladimir Putin's government and the recent series of hacks and leaks.

The secret material confirms what lawmakers on the Senate and House Intelligence Committees said they had concluded last week, based on briefings they received.

"At the least, this effort is intended to sow doubt about the security of our election and may well be intended to influence the outcomes of the election -- we can see no other rationale for the behavior of the Russians," Sen. Dianne Feinstein and Rep. Adam Schiff, both D-Calif., said in a statement.

For weeks, American officials have been saying that Russian intelligence agencies were behind hacks into the DNC, state election databases and other political entities, but they weren't definitive about the motive since nations routinely hack into their adversaries' political organizations to gather information for spying purposes.

In recent days, U.S. officials tell NBC News, American spy agencies have determined that the Russian government was behind the leaks of Democratic National Committee emails to Wikileaks and others -- and that the goal was to undermine confidence in the American presidential election.

Another possible aim: sending a geopolitical warning.

NBC News has learned that this summer, Adm. Michael Rogers, director of the National Security Agency, told congressional intelligence committees that Washington believes "potential adversaries might be leaving cyber fingerprints on our critical infrastructure partly to convey a message that our homeland is at risk if tensions ever escalate toward military conflict."

FBI Director James Comey told a congressional hearing this week that he is taking the threat to election systems "extraordinarily seriously."

"We are urging the states just to make sure that their deadbolts are thrown and their locks are on and to get the best information they can from DHS just to make sure their systems are secure," he told the House Judiciary Committee.

DHS has been pushing states to undergo free cyber-hygiene scans and other assessments before the Nov. 8 vote. Yet, as Homeland Security Secretary Jeh Johnson told a congressional committee this week, just 18 have signed up for the free help. The results of those scans are not available yet.

Washington Times
FBI partly blames Snowden for reduction in email, phone surveillance
Friday, 30 September 2016
Byline: Andrea Noble

Washington - The FBI's use of a surveillance statute to collect Americans' phone and email records has declined since details about the program were leaked by Edward Snowden in 2013, a watchdog report has found.

The FBI's use of Section 215 of the Patriot Act to obtain "business records" as part of national security investigations peaked in 2012, with the Foreign Intelligence Surveillance Court approving 212 orders seeking records, according to a report released Thursday by the Justice Department's inspector general's office.

The program was publicly disclosed in June 2013 after the former National Security Agency contractor leaked information to the press. That year, the number of orders authorized by the court dropped to 179. The number of orders approved by the court has continued to decrease annually, with 142 orders approved in 2015.

The program allowed authorities to collect information about clients from service providers, such as email or phone records -- including the numbers, times and durations of calls. Outcry over the program after Mr. Snowden's revelations led to reform the surveillance program. When Congress renewed the USA Freedom Act last year, it blocked bulk collection and storage of data.

A deputy chief within the FBI's National Security Division partly blamed Mr. Snowden's disclosures for the decrease in use of the provision.

"He attributed the decline in part to revelations by Edward Snowden about the U.S. government's use of Section 215 to collect bulk telephony metadata, both in terms of the stigma attached to use of Section 215 and increased resistance from providers," the inspector general's report said.

Responding to the report, FBI officials told the inspector general's office that the degree to which Mr. Snowden's disclosure led to the decrease was speculative and said agents had come to rely more on a different statute to obtain surveillance approvals -- specifically, Section 702 of the Foreign Intelligence Surveillance Act, which allows surveillance of foreigners.

Under the USA Freedom Act reforms enacted in 2015, authorities can't collect and keep bulk telephone data in government databases. Instead, spy agencies have to ask phone companies for data -- and they must submit a narrow search so it's clear that analysts are looking for a specific person, number or group, rather than bulk collection.

Frustration with oversight of the Section 215 program and the length of time it took to approve orders under it appear to have played a role in the decline of its use even before the law's reform.

"Agents also told the OIG that they increasingly were electing to use criminal legal process instead of FISA authority in counterterrorism and cyber investigations because of their frustrations with the lack of timeliness and the level of oversight in the business records process," the report states.

Some were opting to open parallel criminal cases and using grand juries "to obtain the same information more quickly and with less oversight than a business records order."

The increased reliance on other surveillance statutes or basic criminal processes raises questions from privacy rights advocates.

"We want the department to go through a process with a high level of oversight," said Neema Singh Guliani, legislative counsel with the American Civil Liberties Union.

If agents opt to use other surveillance statutes to obtain records because they are able to do so more easily, it raises concerns over the level of oversight of the alternative methods now favored, Ms. Singh Guliani said. If agents are falling back on basic criminal investigative practices to obtain information for national security investigations, "it raises real practical questions" about whether the specialized national security provisions are needed.

The report indicates that of the 561 records requests approved from 2012 through 2014, a median of 115 days passed from the time a field office made a records request to the FISA Court's order.

The inspector general's report recommends finding a way to make the process more efficient, particularly in cyberdata cases.

The FISA Court denied none of the 561 business records requests, though the report notes that some draft applications were withdrawn and not formally submitted for numerous reasons.

Large portions of the inspector general's 68-page report were redacted.

Overall, the report found that the business record orders were used "far more frequently in counterintelligence cases than as a counterterrorism or cyber tool." The exact figures for each type of case were redacted from the report.

CBS News
Cybersecurity expert: One battleground state most vulnerable to voting hacks
Thursday, 29 September 2016
Byline: Shanika Gunaratna

New York - The battleground state of Pennsylvania might as well have a target on its back as Election Day nears, the cybersecurity company Carbon Black warned in a new report released Thursday.
"If I was a 400-pound hacker, I would target Pennsylvania," Carbon Black chief security strategist Ben Johnson told CBS News, a reference to Donald Trump's comment in Monday's debate that the hacker behind the Democratic National Committee email leak could be someone "sitting on their bed that weighs 400 pounds."

U.S. intelligence officials actually believe Russia was behind that breach and a number of recent intrusions into state voter databases.

What makes Pennsylvania such a vulnerable target for hackers seeking to influence the election?

Across the state, most Pennsylvania counties use particularly high-risk electronic voting machines that leave behind zero paper trails, which could be useful to audit the integrity of votes cast. In addition, many of these machines -- called "direct-recording electronic" machines -- are running on severely outdated operating systems like Windows XP, which has not been patched by Microsoft since 2014, Carbon Black said in its report. In general, these complex machines are a headache compared to so-called fixed-function devices that perform just one task and are thus harder to hack.

Politically, Pennsylvania has extraordinary value with 20 electoral votes and polls showing a narrowing race between Hillary Clinton and Donald Trump.

According to Carbon Black, Pennsylvania is an easier target than other battleground states like Ohio and Florida. Ohio conducts post-election audits and has a manual recount provision that kicks in for tight races. Florida also has required audits.

The general lack of a paper trail throughout Pennsylvania is a recipe for disaster, Johnson said. Before he co-founded Carbon Black, Johnson was a National Security Agency (NSA) engineer and defense contractor during the Iraq and Afghanistan wars.

"If you buy something in the store with a credit card, you get a receipt. But if you cast your vote for president of the United States, you get nothing," Johnson said.

According to the Brennan Center for Justice, more than 40 states are using voting machines that are at least ten years old. Across the country, the disjointed patchwork of different ballots, different electronic voting machines, and different polling station standards creates a perfect storm for targeted hacking, particularly in battleground states.

With just over a month till Election Day, there's no time to redesign the voting process nationwide. But it's imperative to minimize risk in the system we already have, Johnson said.

At the very least, he suggested election officials should:

* Keep individuals from having prolonged access to the physical voting machines;

* Turn off any communications capacities, like Wi-Fi or Bluetooth, on the machines;

* Make sure no other devices are plugged into the machines;

* And train polling station workers, typically volunteers unfamiliar with cybersecurity, on the importance of enforcing these measures.

In the U.S., states select and operate their own voting systems, adhering to federal standards-- but beyond those standards, the federal government cannot dictate how states run their voting systems.

That oversight could conceivably change. Earlier this month, Rep. Hank Johnson, D-Ga., introduced legislation that would designate voting systems as "critical infrastructure" -- a move that would heighten the federal government's security obligations towards voting systems nationwide. It would also limit the purchase of new voting systems that do not provide adequate paper trails for verification.

But for now, the federal government's power is limited to pushing individual states to "wake up" to the imminent threat of voting system hacks, Johnson said.

"You kind of need a federal, Congressional discussion. You need that kind of energy and influence. But it's really up to the states to opt into something like that," he said of the possibility of an overhaul.

Fears of hackers tampering with Election Day have mounted for months, especially during a campaign season in which the Democratic National Committee's internal email communications were leaked to the public and Donald Trump invited a foreign actor, Russia, to hack into his rival's emails (jokingly, he later said).

In August, the FBI found evidence that hackers broke into Arizona and Illinois' state election databases. And this week, law enforcement officials told CBS News the intrusions may have been more widespread, with about 10 states' systems probed or breached.

Experts said the ultimate goal of these hackers is not necessarily to change the outcome of the election, but to de- legitimize it by sowing doubt, uncertainty and suspicion through a series of cyberattacks.

Last month, Senate Minority Leader Harry Reid asked the FBI to be more aggressive in examining the possibility that Russia could try to "falsify official election results."

There is no indication that any previous U.S. election has been tampered with.

But the fear of Election Day hacks this time around has already had a chilling effect on the electorate. More than half of U.S. voters (56 percent) are concerned that this year's election will be affected by a cyberattack, and more than one-third of U.S. voters (36 percent) feel their voting information is insecure, according to the survey by Carbon Black, which polled 700 registered voters ranging in age from 18-54.

Among the voters who believed their voting information is not secure, one in five said they would consider not voting in this year's election given their concerns -- a "surprising and depressing" reality that America must grapple with, Johnson said.

"We fundamentally say, 'Go vote. Don't let this get you down.' But we need to understand the risk," Johnson said.

He likened this moment in U.S. politics to an addict's first Alcoholics Anonymous meeting: the first step in a long process is acknowledging that a problem exists, he said. The next is probing the weaknesses in the system with the same vigor that, chances are, America's adversaries are doing at this very moment.

What's Johnson's personal plan for Nov. 8? The former NSA engineer said he's somewhat comforted by the state he's registered in.

"I'm in Illinois, and most of Illinois gets a paper receipt," he said.

The Intecept
The FBI Wanted to Target Yemenis Through Student Groups and Mosques
Thursday, 29 September 2016
Byline: Cora Currier

Washington - The FBI envisioned infiltrating mosques and Muslim student associations to look for young Yemenis to serve as informants, according to an internal presentation obtained by The Intercept. The document suggests that agents scour Facebook "to find individuals who are dramatically increasing their levels of piety -- that's the demographic you want."

"Since we're looking for young people re-engaging with their Islamic faith," it continues, "the local MSA [Muslim Student Association] is a great place to start."

The 24-slide presentation, prepared for a Source Development Unit in the FBI's Directorate of Intelligence, is titled "Responding to the Yemeni Threat: Scenarios for CHS Development," using the bureau's lingo for informants, which it calls "confidential human sources."

It's not clear if the presentation describes a specific program that was put into action or whether it was meant to offer general tips for cultivation of sources who could provide information related to al Qaeda in the Arabian Peninsula, al Qaeda's Yemen affiliate. The document appears to suggest identifying potential informants solely on the basis of their religious affiliation or national origin, which could violate FBI rules meant to curb profiling and discrimination.

The document is undated, but from references in the text, it appears to have been prepared around 2010 or 2011 by Centra Technology Inc., a company selling intelligence services. Centra Technology has

had regular contracts with the FBI since 2008, including for training courses vaguely described in contract records as "analytic tools and techniques." Centra did not respond to a request for comment.

According to FBI operating guidelines originally promulgated in 2008, agents are allowed to use a variety of tactics when it comes to seeking information to identify potential informants or recruiting particular individuals, including database searches, physical surveillance, and even combing through someone's trash. Still, the current version of the guidelines state that someone should not be targeted as an informant "based solely on race, ethnicity, national origin, religion or activities protected by the First Amendment, or a combination of only such factors."

It's not clear how looking at expressions of piety and attendance at a Muslim student group would not run afoul of that guidance. An FBI spokesman declined to answer specific questions about the document, instead providing a statement saying that the FBI conducts investigations under guidelines that are "intended to ensure that FBI employees act in accordance with the law and the Constitution." He added that "all Confidential Human Source relationships with the FBI are voluntary."

According to the FBI's guidelines, investigations involving academic or religious groups are considered "sensitive investigative matters" and require extra supervision and particular rules for deploying undercover officers or informants, as do investigations of mosques. The presentation does not mention any such sensitivities.

"The FBI's focus on Muslim student groups does not make anyone safer," said Ramzi Kassem, a law professor at the City University of New York who directs CLEAR, an initiative that works with communities affected by counterterrorism policies. "It also comes at the expense of students whose college experience is no longer a time for intellectual exploration and the building of lasting friendships but a paranoid nightmare where certain thoughts are taboo and your classmate might be an informant."

FBI surveillance of mosques and Muslim communities in the past has generated controversy, as has the bureau's aggressive use of its army of informants -- which grew to over 15,000 in the years after the 9/11 attacks. In 2012, the American Civil Liberties Union obtained documents showing that the FBI had used "mosque outreach" programs ostensibly meant to build relationships with Islamic communities in order to collect intelligence. There is a long-running lawsuit over an FBI informant who was sent into mosques in Southern California in 2006 and 2007.

Federal authorities investigating the influence of the Islamic State in the United States have increased their use of informants and sting operations. In the past two years there have been 101 Islamic State-related cases in U.S. courts, and 59 percent of them involved the use of informants or undercover agents, according to a report released in July by the Center on National Security at Fordham Law School.

Many of the individuals who actually carried out attacks motivated by violent Islamic ideologies in recent years were known to authorities, illustrating the difficulty in predicting who may become violent. Omar Mateen, who killed 49 people in an Orlando nightclub this year, had been the subject of an FBI

investigation involving informants; the suspect in recent bombings in Manhattan and New Jersey, Ahmad Khan Rahami, was reported to the FBI by his own father.

"Younger, More Devout Sources"

The Centra Technology presentation obtained by The Intercept is undated but the figures mentioned in it suggest that it was prepared around 2010 or 2011. It focuses on the threat to the United States posed by al Qaeda in the Arabian Peninsula, al Qaeda's affiliate in Yemen, and mentions the radical Yemeni-American cleric Anwar al-Awlaki, and Samir Khan, who published the jihadist magazine Inspire. Both were killed in a drone strike in 2011; the presentation references their influence on would-be terrorists in the United States, but in such a way that it remains unclear if they were still alive when it was written. It also mentions Sharif Mobley, an American citizen who has been in prison in Yemen since 2010. (The FBI interviewed Mobley in 2010 after he was arrested by Yemeni authorities on terror charges, which were later dropped; Mobley's family denies that he has any ties to extremism.)

The presentation's authors were especially interested in Salafism, a conservative form of Sunni Islam, and the influence of particular schools in Yemen, including al-Iman University, in Sanaa, and schools they call "DAHN," perhaps a reference to Dar Al Hadith, a group of Salafist schools where foreign converts studied and in which Western intelligence agencies have long been interested. (The Intercept spoke to one Yemeni-American who was questioned by the FBI in 2011 about both institutions.)

Yet the presentation admits that "institution of study is of limited predictive value" and there is "no systematic way of identifying who has become radicalized." The only commonalities between the individuals they had identified -- presumably referring to people who had left the United States to join AQAP -- were that they were all between the ages of 20 and 40, and "'born again' Muslims -- either converts to Islam or people who had rediscovered their faith in mid-life."

"Our 'threat pool' consists of born- again muslims who have traveled to Yemen or who intend to do so. However, there are thousands of such people, and very few of them become AQ groupies," the presentation asks. "How do we weed out the true threats?"

The FBI thought it could get to them by looking for "younger, more devout sources" -- specifically, "young Salafists." They wanted people who had been or were thinking of going to Yemen, or were "in the social circles where travel for overseas study is discussed." It also suggests that agents "focus on recruiting young Salafists of any ethnic background," who could serve as "human tripwires -- they're the ones who can tell you when people they know begin to move in the takfir/jihad direction."

Under headings like "Finding Your Salafis" and "Seducing the Salafis," the presentation suggests that "existing sources in local mosques should be able to tell you about groups of young Salafis in the community," and advises that agents take advantage of undercover operations "that capture discussions between Salafis," study Facebook profiles for signs of increasing "levels of piety," and target "the local MSA," or Muslim Student Association.

The goal was "to look for people at the edges who are in the same circles, but not radical enough" to warrant opening an investigation into. The presentation suggests exploiting doctrinal disputes and making appeals to potential sources who may "hold views that strike us as extreme," but who are not "jihadists of the AQ stripe."

A Broad-Brush Approach

The focus in the document on young, pious Muslim students echoes a now- discredited effort by the New York City Police Department to monitor Muslim student groups as part of widespread surveillance of Muslim communities and businesses in and around New York. The NYPD sent undercover police officers onto college campuses in the city and across the Northeast, and monitored students' online interactions. Internal records showed that the NYPD was especially interested in Muslim student associations, which they defined as "a university-based student group, with an Islamic focus, involved with religious and political activities." Some groups drew NYPD interest because they had invited "salafist speakers," according to the AP, while another had "students who are politically active and radicalizing." The program was exposed in 2011 and the department eventually disbanded the unit in charge, admitting that it had never generated a lead.

In 2011, when the Associated Press first reported on the NYPD surveillance, the FBI insisted that its agents were bound by stricter rules, and in fact, that the NYPD's clumsiness was interfering with the bureau's investigations. Given that the presentation says the FBI was looking for informants with specific insights into Al Qaeda, it's possible that the approach would have been more tailored and required more supervision than the kind of blanket surveillance of entire neighborhoods and establishments that the NYPD engaged in. Yet the presentation does suggest broad scrutiny of Yemeni populations, and does not mention rules governing that type of surveillance. The presentation notes that the "FBI has access to thousands of Yemeni immigrants residing in the U.S." and was "developing strategies for identifying people in the U.S. with familial connections to specific tribes." The presentation encourages agents to "know where the Yemenis in your [Area of Responsibility] are from," and to ask their existing sources "to find individuals from the relevant regions."

"I don't think there is much difference between this approach and what the NYPD was doing, in that it is identifying religious practice or ethnicity as an indicator of association with terrorism," said Mike German, a former FBI agent and fellow at the Brennan Center for Justice at New York University School of Law.

The fixation on Salafism was common in both agencies, German said. He pointed to other FBI materials that include references to Salafism "as the foundation from which terrorism arises, which is an inaccurate and simplistic idea."

The NYPD had produced a heavily criticized report that drew a direct link between commonplace religious activity and terrorism; FBI materials from the same time period also described a simple theory

of a line from conversion to jihad, and identified mosques and other associations as places where radicalism might grow. German says that the FBI's current radicalization theory "tends to be more vague about what indicators they should look for, I think because we know there aren't reliable indicators" of propensity to violence.

Yet, he said, the FBI is still "looking at the general population and trying to predict where someone will go bad -- a broad-brush approach that amounts to profiling -- as opposed to looking at where there's actual evidence."

The National (UAE)
GCC gains from French high-tech experience
Friday, 30 September 2016
Byline: Colin Randall

Toulon - On the quayside at Saint-Mandrier-sur-Mer, opposite the French naval port of Toulon, state-of-the-art drones and robots capable of performing the most intricate of tasks on land, in the air and at sea stand gleaming in the Mediterranean sunshine.
Behind them rest two elderly and decommissioned warships. The frigates' remaining function is to serve as breakwater for the combat diving school run by DCI, the French defence ministry's commercial arm for exporting know-how.

The expertise taught by DCI centre instructors travels successfully and 60 per cent of the divers trained there in the past 14 years have been from the Arabian Gulf.

DCI sales in the fields of consulting, training and technical assistance reached 227.5 million (Dh904m) in 2015m, reflecting a 35 per cent increase in five years. It brings employment for almost 1,000 people and there are permanent offices in the UAE, Saudi Arabia, Qatar and Kuwait and Saudi Arabia as well as South East Asia and India.

The juxtaposition of old and new on the Saint-Mandrier quayside presents a striking contrast. The old frigates have done their active service and been replaced by much more modern vessels; the robotic equipment to which they provide a backdrop has a wide range of military and civil applications in a more technological age.

The most eye-catching device on display is a yellow drone from the Toulon-based defence manufacturer ECA's IT180 range. Valentin Hanns, ECA's export sales director, says it would cost a buyer up to 300,000 for the basic model, adding: "What you pay above that depends on what kind of payload you want fitted."

Beyond their value in conflict zones - a camera system with powerful zoom can identify enemy troops at a range of 600 metres - IT180s can be used in survey missions in mining and on pipelines and power lines and are proving an effective tool in firefighting.

At the naval air base of Hyeres, a short drive east of Toulon, Lt Bernard Bastien is happy to talk about the Panther Standard 2 helicopter he flies.

The aircraft is classically used for naval missions, either in conflict or in combating drug trafficking and piracy at sea. Gulf Armed Forces deploy several of the aircraft.

A reliable workhorse with a history stretching back more than 20 years, the Airbus-built helicopter has undergone significant upgrades to give it, in the words of the makers, a second youth. "We do not carry arms but act as the eyes of the frigate in any operation," says Lt Bastien, 31, who serves with the French navy's 36 Squadron or Flottille 36F.

"Previously, it could be like flying blind at night, with just radar, so we were able to detect what was there but not identify it. Infrared night visibility has made a huge difference; it's as if we are flying in daylight."

The Euronaval exhibition will also showcase developments in systems to counter cyber threats.

As Jean-Michel Orosco, senior vice- president in charge of cyber security for DCNS, puts it, "it comes down to trying to stay a step ahead of the bad guys".

At the company's new site in Ollioules, just outside Toulon, Mr Orosco says cyber attacks can be mounted for reasons of espionage or for use as a weapon or in organised crime.

"Just think about any major country in the world being without electricity supply for several weeks, as a result of state, terrorist or criminal cyber attacks," he says. "It would be a nightmare."

DCNS, which employs 13,000 people in 10 countries including Saudi Arabia, Malaysia and India, is currently building six Fremm-class frigates for the French navy, all to be delivered by 2019. It prides itself on its "cyber resilient" ships.

But as if to demonstrate the need for constant vigilance - that need to outsmart the assorted enemies mentioned by Mr Orosco - DCNS is currently embarrassed by a huge data breach concerning six Scorpene-class submarines it is due to supply to the Indian navy later this year.

The technical information targeted by hackers was handed to an Australian newspaper, which published extracts from the 22,000 pages reportedly leaked.

The technewsworld.com website says the episode raised questions about an Australian deal to buy 12 submarines from DCNS.

It echoes previous cyber attack on contractors who were in the running for the Australian deal.

No DCNS official was willing to comment beyond confirming that the leak was being investigated - and that the Australian contract was still considered on.

Times of India
First major use of Cartosat images for Army
Friday, 30 September 2016
Byline: Chethan Kumar

Bengaluru - In what's being described as the first major use of the Cartosat family of satellites, the last one (2c) launched in June this year, sources in Isro said that the armed forces were aided by high-resolution images for the surgical strikes+ conducted across the line of control+ (LoC) in the small hours of Thursday.
A source in Isro said: "We've been providing images to the armed forces, the army in particular. While I cannot comment if any specific image was sent on a particular day in the previous week, I can say that Cartosat images are meant for this purpose and the army has used this."

Both Isro and the Ministry of Defence (MoD) have largely remained tight-lipped about the uses of the Cartosat family of satellites-- which experts call India's 'eye in the sky'--built for dual use.

The Cartosat-2C in particular added more teeth to India's military surveillance and reconnaissance capabilities, and has been providing high resolution images of 0.65 metres, an improvement over the 0.8m resolution of the earlier missions.

"Cartosat also provided Area of Interest (AOI) based images for the armed forces," the source said. Another explained that based on requests, one or more scenes/images covering the AOI as specified is provided in as a single polygon (all the areas in one circle) in the form of a shapefile (non-topological geometry and attribute information for the spatial features).

According to the National Remote Sensing Centre (NRSC) in Hyderabad, AOI products are of two types--standard and precision-based ortho (where images taken from space are corrected to have an uniform scale- -both of which are useful for the armed forces. Ortho rectified products are corrected for terrain distortions and camera tilt effects.

While the first Cartosat was launched in 2005, Cartosat-2A launched in 2007 was the first dual-use satellite with capabilities of monitoring missile launches in India's neighbourhood.

And, the Cartosat-2C is the best in the class that India boasts of although countries like the US and Israel boast of better ones. This satellite can not only click pictures of areas of interest, but also record videos of sensitive targets from space, compress it, and relay it back to earth.

Gulf News
Why IT spending is top priority for organisations?
Friday, 30 September 2016
Byline: Naushad K. Cherrayil

Dubai - With a wide array of new cyber threats constantly pushing IT organisations, it is no wonder that IT security is the top spending priority for most organisations worldwide.
IT security spending is only a small part of the total IT budget, but it has been steadily growing and will continue to do so.

Statistics show that the average share of IT budgets has been growing every year. According to Ponemon Institute, it was 7.5 per cent of their overall IT budgets in 2005 and 10 per cent in last year.

In Europe, Middle East and Africa, it is between 8 and 12 per cent of the IT budget on security. Why is it growing? Many high-profile companies have been subject to hacker attacks recently and they probably won't be the last.

"Organisations are struggling to keep up against cyber threats as cyberattacks are growing in complexity," said Alain Kallas, Middle East managing principal for security and risk consulting at Dell Technologies subsidiary SecureWorks, a provider of intelligence-driven information security solutions.

He said that 66 per cent of the cyberattacks on organisations are discovered by third parties and 33 per cent of attacks are discovered only within two years.

For example, Yahoo revealed last week that personal information accounts belonging to at least 500 million accounts, biggest data breach so far, was stolen from its network in late 2014.

"50 per cent of the cyberattacks use evasive techniques to bypass existing controls to steal information. $3.7 million is the average cost of a breach involving records in one organisation," Kallas said.

Kaspersky Lab estimated that every day a security breach goes undetected costs large businesses $100,000 on average, while an average cost of recovery from a breach detected within hours is less than $400,000.

Kallas said that organisations are not only finding it difficult to hire the right security professionals but also struggling to retain the talents. "75 per cent of security professionals have been approached by a

hiring organisation or headhunter about IT job opportunities in the past year. 17 per cent premium paid to senior and middle level managers with security in their titles," he said.

With security risks becoming more pervasive and difficult to prevent, he urged companies in the Middle East to be more vigilant and invest in cyber defence to protect their infrastructures.

The cyber groups are well financed because of the amount of money generated out of each transaction.

"The Darknet eCommerce, which is an environment within the internet which a common cannot access and cannot be monitored, is an illegal marketplace where criminals buy and sell stolen information," he said.

One of the website, Evolution, makes roughly between $20 million and $25 million revenue a month. There are other sites like Tor, i2P, The Freenet Project, etc.

"It is difficult to trace them and needs huge amount of sophisticated technologies, even Cyber Threat Intelligence Units around the world find it difficult to catch them. These guys have huge salaries and life insurance, among other benefits. It is an organised cybercrime and it is a big business," he said.

SecureWorks collects billions of events on a daily basis from over 4,300 clients across 59 countries and multiple industries worldwide.

He said that SecureWorks' Counter Threat Platform (CTP) processes as many as 190 billion events a day, and the platform quickly determines which of these events are cyberattacks and blocks them, while providing important clues as to the hackers behind the attacks and their ultimate intent.

"It will take two to three months to detect a signature and once detected, we inform the industries to be aware that a new attack is detected and this is what you can do to protect it till further action is taken. Based on that, we can tell our clients who are the threat actors and how they operate," he said.

Cyber security experts said that ransomware, which has been growing in leaps and bounds globally, is a lucrative and safe method of making money for criminals.

Kallas said that 55 per cent growth in quarter-on-quarter in ransomware in the second quarter of this year.

Ransomware is software that infects a computer and prevents users from accessing their data unless the user pays a ransom.

Kaspersky Lab said that the total number of users encountering any type of ransomware increased from 1.97 million in 2014 to 2.31 million users in 2015 around the world.

The cost of decryption varies -- from as little as $30 to thousands of dollars. The average ransom demanded by cybercriminals is $300, and according to various sources, at least 40 per cent of the victims pay their ransom.

The victims were asked to pay between $50 and $500, depending on the data.

Symantec said that 40 per cent of global consumers have admitted to paying a ransom to attackers to unlock their computers and smartphones.

Businesses in the UAE were a victim of 2.7 per cent of global targeted attacks, with an organisation facing an average of 2.2 attacks through the year.

Over the last five years, the Middle Eastern organisations surveyed have incurred a total financial loss of approximately $1.49 million due to system perimeter breaches. Subsequently, the average cost of detecting and fixing these breaches was approximately $35.23 million.

Yahoo News
Russia steps up trolling attacks on the West, U.S. intel report finds
Thursday, 29 September 2016
Byline: Michael Isikoff

New York - A new U.S. intelligence report says the Russian government is conducting a wide-ranging and "opportunistic" campaign to expand its political influence in Europe by deploying Internet "trolls and other cyber actors" to challenge pro-Western journalists and spread pro- Kremlin messages in social media forums.
Yahoo News obtained a declassified summary of the report, which also describes the role of two state-owned media outlets, RT and Sputnik, in what some experts say is an increasingly aggressive "information warfare" campaign. According to the report, the outlets promote Russia's political aims with programming targeted to "activist" audiences including "far-right and far-left elements of European society." It adds that the RT channel gives "disproportionate coverage and airtime to the European Parliament's more extreme factions."

The report, by the office of Director of National Intelligence James Clapper, was originally requested by congressional intelligence committees late last year. The panels also asked for a separate report on Russia's use of political assassination. Classified versions of both documents were delivered by Clapper's office to Capitol Hill in July.

The decision to declassify brief excerpts from the first report coincides with recent disclosures about suspected Russian cyberattacks on the Democratic National Committee and other political groups. Many in the U.S. intelligence community believe that indicates Russia has expanded its cyberwar and disinformation efforts to the United States. "This is the 21st century version of 'active measures,'" said

Heather Conley, director of the Russia program at the Center for Strategic and International Studies (CSIS), a reference to the Cold War term for the Soviet Union's efforts to manipulate Western opinion by spreading false information, such as the claim that U.S. scientists had manufactured the AIDS virus as part of a biological weapons project at Fort Detrick, Md.

Conley added that the use of "information warfare" techniques to pursue political goals has now been incorporated into official Russian military doctrine. The goal, she said, is not "the annihilation" of the country's enemies, but to "weaken them from within" by "keeping everybody off balance" and "sowing doubt" about their political leaders and institutions. A report by Conley describing this effort is due to be released by CSIS next month.

Russia's use of trolls on social media would appear to fit that pattern. A report in the Guardian last year identified a St. Petersburg office building where "hundreds of paid bloggers work around the clock" to flood Internet sites and Western social media forums with posts praising Russian President Vladimir Putin and denouncing the "depravity and injustice" of the West.

Michael Weiss, editor of the Interpreter, an online publication that tracks the Russian media (and that is funded by Radio Free Europe/Radio Liberty), said he was personally targeted by Russian trolls after he published an article exposing a frequent RT commentator on Germany as the editor of a neo-Nazi magazine. "They've been on a campaign to destroy my career," said Weiss. He's found himself attacked on social media forums as a "neocon Zionist propagandist," he said. A pro-Russian troll even dug into his wife's Facebook account to retrieve old photos, he said.

Another tactic of the trolls is to inject blatantly false stories into the media, forcing public officials in Europe and the U.S. to respond, according to Weiss and other experts. A New York Times Sunday Magazine piece last year documented how Russian trolls based in the St. Petersburg office had swamped Twitter with hundreds of messages about an explosion at a Louisiana chemical plant that never took place, setting up dozens of fake accounts and doctoring screenshots from CNN and Louisiana TV stations to make the pseudo-event seem real. (The trolls even created a fake Wikipedia page about the supposed explosion, which in turn linked to a phony YouTube video.) Similar methods were used to spread false stories about an outbreak of Ebola in Atlanta, the Times account reported.

The author of the Times article, Adrian Chen, now a writer for the New Yorker, recently said many of the Russian trolls he was tracking have begun tweeting favorably about Donald Trump.

Although the activities of the Russian trolls have been aired in a handful of media accounts in recent years, the decision to include references to them in the declassified DNI summary appears to be part of a stepped-up effort by Washington to publicly combat Russian Internet efforts and cyberattacks. The full report covers a much broader subject: the scope of Russian influence operations throughout Europe and Central Asia, including the covert funding of political parties and nongovernmental organizations.

"Moscow has been opportunistic in its efforts to strengthen Russian influence in Europe and Eurasia by developing affiliations with and deepening financial or political connections to like- minded political parties and Non-governmental Organizations," according to a letter containing the declassified excerpts that was sent this week by Clapper's office to House Intelligence Committee Chair Rep. Devin Nunes and ranking minority member Rep. Adam Schiff.

"Moscow appears to use monetary support in combination with other tools of Russian statecraft, including propaganda in local media, direct lobbying by the Russian Government, economic pressure, and military intimidation," the letter states.

The declassified excerpts don't include specific examples. But a separate report on the same subject earlier this year by the Congressional Research Service, prepared at the request of Rep. Chris Stewart, a Republican from Utah, cited as evidence Russian financial and political support for far-right, anti-immigrant European political parties, including the National Front in France and Jobbik in Hungary. The French National Front, which is headed by Marine Le Pen and which backed Russia's annexation of Crimea, has received a loan of 9 million euros from a Russian bank with close ties to Putin, the CRS report notes, and Jobbik's finances have been under investigation by the Hungarian Parliament amid allegations that it had received funding from Moscow.

Time Magazine
How Russia Wants to Undermine the U.S. Election (Canada)
Thursday, 29 September 2016
Byline: Massimo Calabresi

New York - The leaders of the U.S. government, including the President and his top national-security advisers, face an unprecedented dilemma. Since the spring, U.S. intelligence and law-enforcement agencies have seen mounting evidence of an active Russian influence operation targeting the 2016 presidential election. It is very unlikely the Russians could sway the actual vote count, because our election infrastructure is decentralized and voting machines are not accessible from the Internet. But they can sow disruption and instability up to, and on, Election Day, more than a dozen senior U.S. officials tell TIME, undermining faith in the result and in democracy itself.
The question, debated at multiple meetings at the White House, is how aggressively to respond to the Russian operation. Publicly naming and shaming the Russians and describing what the intelligence community knows about their activities would help Americans understand and respond prudently to any disruptions that might take place between now and the close of the polls. Senior Justice Department officials have argued in favor of calling out the Russians, and that position has been echoed forcefully outside of government by lawmakers and former top national-security officials from both political parties.

Unfortunately, it's not that simple. The President and several of his closest national- security advisers are concerned about the danger of a confrontation in the new and ungoverned world of cyberspace,

and they argue that while the U.S. has powerful offensive and defensive capabilities there, an escalating confrontation carries significant risks. National Security Council officials warn that our critical infrastructure-including the electricity grid, transportation sector and energy networks-is vulnerable to first strikes; others say attacks on private companies, stock exchanges and the media could affect the economy. Senior intelligence officials even worry about Russia exposing U.S. espionage operations in retaliation. And while U.S. officials have "high confidence" that Russia is behind what they describe as a major influence operation, senior U.S. officials tell TIME, their evidence would not yet stand up in court.

And so with five weeks to go, the White House is, for now, letting events unfold. On one side, U.S. law-enforcement agencies are scrambling to uncover the extent of the Russian operation, counter it and harden the country's election infrastructure. On the other, a murky network of Russian hackers and their associates is stepping up the pace of leaks of stolen documents designed to affect public opinion and give the impression that the election is vulnerable, including emails from the computers of the Democratic National Committee (DNC). Meanwhile, the FBI alerted all 50 states to the danger in mid-August, and the states have delivered evidence of a "significant" number of new intrusions into their election systems that the bureau and their colleagues at the Department of Homeland Security "are still trying to understand," a department official tells TIME.

All of which makes Donald Trump's repeated insertion of himself into the U.S.-Russia story all the more startling. Trump has praised Putin during the campaign, and at the first presidential debate, on Sept. 26, he said it wasn't clear the Russians were behind the DNC hack. But the U.S. intelligence community has "high confidence" that Russian intelligence services were in fact responsible, multiple intelligence and national security officials tell TIME. Trump was informed of that assessment during a recent classified intelligence briefing, a U.S. official familiar with the matter tells TIME. "I do not comment on information I receive in intelligence briefings, however, nobody knows with definitive certainty that this was in fact Russia," Trump told TIME in a statement. "It may be, but it may also be China, another country or individual."

Russia's interference in the U.S. election is an extraordinary escalation of an already worrying trend. Over the past 2½ years, Russia has executed a westward march of election meddling through cyberspace, starting in the states of the former Soviet Union and moving toward the North Atlantic. "On a regular basis they try to influence elections in Europe," President Obama told NBC News on July 26. With Russia establishing beachheads in the U.S. at least since April, officials worry that in the final weeks of the campaign the Russian cybercapability could be used to fiddle with voter rolls, election-reporting systems and the media, resulting in confusion that could cast a shadow over both the next President and the democratic process.

Obama's decision not to call out the Russian espionage operation has so far left the effort to educate Americans about it to lawmakers and national-security experts. On Sept. 22, the ranking Democrats on the Senate and House Intelligence Committees, California's Senator Dianne Feinstein and Representative Adam Schiff, released an unusually blunt statement. "Based on briefings we have received, we have concluded that the Russian intelligence agencies are making a serious and concerted

effort to influence the U.S. election," they said. "At the least, this effort is intended to sow doubt about the security of our election." Orders for Russian intelligence agencies to conduct electoral-influence operations, they added, could come only from very senior levels of government. "We call on [Russian] President [Vladimir] Putin to immediately order a halt to this activity." The statement, though not endorsed publicly by the Administration, was cleared with the CIA.

To understand why Putin would want to undercut the legitimacy of the U.S. election, it helps to step back from the long and ugly presidential campaign and remember why we're voting in the first place. Elections are the ultimate source of authority in our democracy. Because Republicans and Democrats have agreed for decades that spreading democracy is good for everyone, America has pushed for free and fair elections around the world. And many nations have embraced them: peasants in the Balkans put on their Sunday best to go to the polls, and burqa-clad women in Afghanistan brave terrorist attacks to stand in line for hours to cast their ballots.

Not surprisingly, quasi- authoritarian rulers in the former Soviet Union, latter-day communists in China and medieval theocrats in the Middle East, among many others, see America's sometimes aggressive evangelism about the benefits of liberal democracy as a direct threat to their own claims to authority. Putin has taken particular umbrage, accusing the U.S.-and former Secretary of State Hillary Clinton in particular-of meddling in Russia's presidential election in 2012. He has publicly questioned the validity of past U.S. presidential elections, saying, on June 17, of the Electoral College, "You call that democracy?" Now, experts say, Putin is expanding his anti-American campaign into cyberspace. "More than any attempt to get one candidate or another elected, this [Russian influence operation] is about discrediting the entire idea of a free and fair election," says Dmitri Alperovitch, co-founder and chief technology officer of CrowdStrike, the cybersecurity company that did the analysis of the DNC hack.

No one knows that better than Arizona secretary of state Michele Reagan. One day in June she was in her backyard in Phoenix when she got a call from her chief of staff. "Are you sitting down?" he asked. The FBI had been monitoring a corner of the so-called dark web, the network of hidden sites used by criminals to buy and sell drugs, pedophilic pornography and stolen identities. A group of hackers known collectively as Fancy Bear, which the U.S. government believes is controlled by Russian military intelligence, was trying to sell a user name and password that belonged to someone in an Arizona county election official's office, which holds the personal data of almost 4 million people. "My first reaction was, Well, this is like the worst thing that you want to hear," Reagan recalls.

Reagan and the FBI scrambled to figure out how the Russians had gotten into Arizona's system and what needed to be done to secure it. It turned out that an election official in rural Gila County, pop. 54,000, had opened a Word document on her desktop computer that contained malicious software. Fortunately, while Fancy Bear had penetrated a local computer system, it hadn't accessed the statewide registration database. Others weren't so lucky. Fancy Bear's electronic fingerprints were found on the hack into the DNC computers. In Illinois, the feds found that Fancy Bear had stolen 85,000 voter records from that state's registration systems in mid- July. Later that month, the Democratic Congressional Campaign Committee (DCCC) revealed that it, too, had been hacked by Fancy Bear.

With other states now reporting intrusions of unknown origin, the government wants to reassure the public that the vote count itself is safe. "We have confidence in the overall integrity of our electoral systems," Homeland Security chief Jeh Johnson said on Sept. 16. "It is diverse, subject to local control, and has many checks and balances built in." Each of the U.S.'s more than 9,000 polling places uses machines not connected to the Internet, precincts count and report their results independently, and most have paper or electronic backups in case a recount is needed.

The Administration has a message for Russia too. The U.S. has privately warned that any effort to sway the election would be unacceptable, intelligence and other Administration officials tell TIME. Secretary of State John Kerry delivered the message to his counterpart, Russian Foreign Minister Sergei Lavrov, in Laos on July 27. During a 90-minute meeting with Putin on the sidelines of the G-20 meeting on Sept. 6, Obama pulled Putin aside and discussed the cyberconcerns one-on- one, with no aides present, a White House official tells TIME. In a press conference later, the President called for restraint on all sides in the use of cyberweapons and issued a veiled threat about America's cyberpowers. "Frankly, we've got more capacity than anybody both offensively and defensively," Obama said.

Putin's history of using influence operations against opponents begins, appropriately enough, with himself. As he was rising quickly through the Kremlin ranks in 1999, one of his main opponents, Prosecutor General Yuri Skuratov, was caught on tape having sex with two women in a hotel room in what Skuratov later claimed was a Putin-run espionage operation traditionally known as a "honey trap." Putin, who had risen from a Soviet-era KGB operative to head the country's intelligence services, denied he was behind it but said on TV that his agents had confirmed that the man in the grainy video was Skuratov. Putin went on to win the presidency the next year. Skuratov, who ran against him, got less than 1% of the popular vote.

With the expansion of the Internet in the decade that followed, the Russians adopted cyberweapons as a standard tool of political meddling. Nowhere has their tactic of spreading chaos around a vote been clearer than in Ukraine, where three days before the presidential election on May 25, 2014, the computer systems of the Central Electoral Commission went dark. "The servers wouldn't turn on. The links to the local election authorities were cut off," says Victor Zhora, director of the cybersecurity firm Infosafe, which had been hired to defend the system. "Literally, nothing worked."

As Zhora and his team worked successfully to restore the system in time for the vote, they became convinced that the collective behind the hack, known as CyberBerkut, was a front for Russian security services. The malware that crashed the system was not available on the market and had been built from scratch. And the effect of the attack supported Russia's strategic goal of undermining the validity of the election. The hackers could have manipulated the outcome of the vote, Zhora says, but "their main goal was to take out the system itself, to destroy the data, to wipe out the hard drives before the elections started." Moreover, the CyberBerkut efforts appeared to be coordinated with Russian state propaganda. Zhora and his team stopped a subsequent effort by CyberBerkut to post false voting results on the election commission's website that would have showed a far-right militant ahead in the polls. But a

screenshot of the fake web page appeared anyway on Russia's main state-run news network as the vote was still going on.

Russia has also meddled in the elections of major U.S. allies that have imposed sanctions on Russia for its invasion of Ukraine, and many of the Russian cyberoperations have benefited populist, anti-immigrant parties that oppose Western European unity in the face of rising Russian aggression. In August, a spear-phishing e-mail attack targeted German party officials, including some members of Chancellor Angela Merkel's Christian Democrats. The emails contained malware that bore the signatures of Fancy Bear, according to Germany's top cyberdefense official, Arne Schönbohm, who warned on Sept. 9 that the attack could be an attempt to manipulate parliamentary elections next year. Merkel had previously ordered German intelligence agencies to look into Russia's peddling of a false story about a Russian girl raped by migrants in Germany-a story that has helped fuel the rise of the right-wing opposition party AfD. That party beat Merkel's Christian Democrats in a regional ballot in the Chancellor's home district in September.

Farther west, in France, a Russian bank with close ties to the Kremlin lent the far-right party of Marine Le Pen some 9 million euros in November 2014, helping it prepare for regional elections a year later, when it received its best results ever. Russia also tried a more subtle information operation designed to fuel the anti-immigrant and national-security fears that have contributed to Le Pen's rise. In April 2015, the programming of the French broadcaster TV5Monde was blocked by unknown hackers, and for 18 hours the channel's websites transmitted only the image of the signature black flag of ISIS. French intelligence officials and the British signals-intelligence agency, the GCHQ, found it was not ISIS but in fact Fancy Bear that was behind the hack, according to a Sept. 25 article by the London Sunday Times and U.S. officials.

Britain, too, has been targeted. The Times article quoted David Anderson, an independent watchdog appointed under British law, as saying the GCHQ had blocked a Russian attempt to disrupt the May 7, 2015, general election there. The Times said Fancy Bear planned to target government servers and major TV broadcasters. But not all stations were to be hit. In the fall of 2014, the pro-Moscow RT network, which is funded by the Kremlin, launched a 24-hour news network in the U.K. aimed at British viewers. The message, Russia experts say, is that Western democracy is not so hot. "It's a cynical message: No one is democratic," says Peter Kreko, an expert on the European right and a visiting professor at Indiana University.

The most pessimistic Kremlin watchers worry how far Putin will go with the combination of psychological manipulation and cyberwarfare. They view the pattern of Russia's electoral meddling in the context of Putin's recent embrace of what is known as the Gerasimov doctrine, a nontraditional approach to military conflict named after the chief of the Russian general staff, Valery Gerasimov, that relies heavily on cyberwar and influence operations. "A perfectly thriving state can, in a matter of months and even days, be transformed into an arena of fierce armed conflict," Gerasimov posited in a now famous 2013 manifesto, through "political, economic, informational, humanitarian and other nonmilitary measures applied in coordination with the protest potential of the population."

That is how Putin stoked a separatist rebellion in eastern Ukraine in 2014. But the current and former senior intelligence and national-security officials interviewed for this story agree that the principal benefit Putin gains from his Western European and U.S. meddling is the leg up it gives him with his own political and diplomatic challenges at home. "In the long run, if people start to question the integrity of our election system," says one senior U.S. intelligence official, "potentially to Russia that's a plus. But I would argue more strongly that this is as much about domestic constituents and his public," the official says. The more chaos in Europe and the U.S., the better.

Putin has shown little sign of stopping, even when meddling is discovered. In April, the DNC suspected it had been hacked and called in the cyberforensics firm CrowdStrike, which was co-founded in 2011 by Alperovitch and employs a number of former government cybersecurity experts. CrowdStrike was familiar with Fancy Bear: it had previously found the group's hacks in Canada, Japan and the former Soviet republic of Georgia. It identifies the group based on the Russians' unique cybertradecraft, including nonpublic code in its malware, its infrastructure of servers around the world and the techniques that it uses to move and hide within the systems it penetrates. After inspecting the DNC computers, Alperovitch concluded that the hack was indeed executed by the Russians. And while CrowdStrike usually keeps its findings secret, the DNC told the company it was outraged that the Russians were trying to interfere with our political system, and "they wanted us to come forward," Alperovitch says.

Twelve hours after the DNC break-in was revealed in June, a hacker who insisted he was Romanian and who called himself Guccifer 2.0 popped up online and tried to discredit CrowdStrike's attribution to Russian military intelligence. Guccifer 2.0 started leaking information from the DNC hack in blog posts and on Twitter, but his professed identity wasn't very convincing. When reporters reached out to him online, for example, the responses he sent in Romanian were riddled with errors. U.S. government officials privately confirm that they believe Fancy Bear and Russian military intelligence are behind the DNC and DCCC hacks.

The pace of leaks has accelerated as the election approaches, revealing a murky network of actors. Around the time of the DNC hack, a website called DCleaks.net was established by a group identifying themselves as "hacktivists." By June the group began posting hacked documents, including emails from retired General Philip Breedlove, the former commander of NATO and U.S. forces in Europe, asking former Secretary of State Colin Powell how to persuade Obama to more forcefully oppose Russian meddling in Ukraine.

Initially, there was no evidence of a connection between DCleaks and Russian hackers, and even now it is not clear who is behind the site. In late June, however, Guccifer 2.0 contacted the website the Smoking Gun and provided it with a link to material from the DNC hack that DCleaks was preparing to publish. In recent weeks, DCleaks has published new emails belonging to Powell, which included damaging remarks about Clinton, even though the overall gist of his emails was supportive. And recently, the site published what purported to be a copy of Michelle Obama's passport.

The leaks tend to favor isolationist policies over ones aimed at confronting Russia. The Breedlove leaks showed an embarrassing and unsuccessful effort to build U.S.-led pushback against Russia in Ukraine. The DNC documents, which made their way to WikiLeaks through unknown channels, weakened Putin's old foe, Clinton, on the eve of the Democratic National Convention. And DCleaks claimed that its ability to obtain the First Lady's passport demonstrated U.S. vulnerability to terrorism.

Putin has done what he can to maintain deniability. Asked by Bloomberg TV on Sept. 2 whether Russia was behind the DNC hack, he said, "I don't know anything about that." But he seemed admiring, if not proud, of Fancy Bear's work. "They work so much like fine jewelers, so delicately, that they can leave their tracks, or someone else's tracks, at just the right place and just the right time in order to camouflage their work and make it look like the work of some other hackers from somewhere else, some other country."

In fact, it might take a real jewel thief-or an army of them-to rig the U.S. presidential election. Because they are not connected to the Internet and are controlled by thousands of independent precincts, U.S. voting machines are largely safe from meddling, says Merle King, executive director of Kennesaw State University's Center for Elections Systems. The feds have pushed out patches for known vulnerabilities in state computers and offered security scans. America's cyber and counterespionage forces will be looking "to see if there's anything coming from overseas or even domestically that looks like an effort to target election offices," says George W. Bush's Homeland Security chief, Michael Chertoff. The FBI has opened a formal investigation into the DNC, DCCC, Arizona and Illinois hacks

But with the election fast approaching, some experts in and out of government say the Administration is moving too slowly to publicize the Russian influence operation and explain it to Americans. A bipartisan group of former national-security officials that included Chertoff and others called on Obama in July to name the perpetrators of the DNC hack. Alperovitch says the U.S. is misreading the battlefield in cyberspace. "The U.S. government for the last 20 years was so focused on how to achieve kinetic effects in cyberspace, how to produce what they call cyberbombs, because that's what we're used to," he says. "But the Russians understand that the real power of this domain is in influence operations, psychological warfare, changing people's perceptions of what's truly going on."

For much of the summer, Trump made casting doubt on the validity of the U.S. electoral system a prominent feature of his campaign. "I'm afraid the election's gonna be rigged," Trump said in Ohio on Aug. 1. " I have to be honest." Trump backers who sign up to be "Trump Election Observers" are told the campaign will "stop crooked Hillary from rigging this election."

Asked at the first debate whether they would support the outcome of the vote, both candidates said they would. But Trump has a record of doing the opposite. As results came in on election night in 2012, he falsely tweeted that the Republican had won the popular vote and urged an uprising. "The phoney Electoral College made a laughingstock out of our nation," Trump tweeted. "The world is laughing at us.

More votes equals a loss ... revolution! This election is a total sham and a travesty. We are not a democracy!"

Clinton has said Putin is trying to get Trump elected; there is no evidence of that. Trump does have some ties to Russia. Trump's former campaign manager worked for Putin's proxy in Ukraine until the pro-Western uprising there, and Trump, his family and a foreign policy adviser have done tens of millions of dollars of business in Russia. The exact amount is unclear, and Trump has declined to disclose details of his Russian business partners.

The links worry even rock-ribbed Republicans. Chertoff led the Senate Whitewater investigation of Bill and Hillary Clinton's obscure Arkansas land deal in the mid-'90s and has been critical of the Democratic presidential candidate. But he is alarmed by Trump's talk of a rigged election. "This business about talking about rigged elections is very dangerous," Chertoff says.

On the ground in Arizona, Michele Reagan, a Republican, has been working to make the vote safe. She took the entire state voter database offline for 10 days after learning of the Fancy Bear hack to ensure the system was secure. In conversations with the FBI and her own cybersecurity team she has learned phrases like SQL injection and dual- factor authentication. "Yes, we believe we're safe," she now says.

That doesn't mean she isn't worried about Russian attempts to undermine the credibility of the vote. "We know there's these bad actors out there that are coming in from other countries and they're trying to scare us," she says. "This isn't about stealing information or altering information. The entire conversation I believe needs to be shifted to what this is really doing to the confidence of the American electorate." Does she have a message for Americans on how to respond to Putin's effort? "Our job is to try to encourage people to get involved and to be connected in government, to go out and vote."

New Zealand Herald
NZME alerts contest entrants after cyber attack on server
Friday, 30 September 2016

Wallington - Media company NZME has warned some details of competition entrants may have been accessed by a cyber attack on a third- party cloud server used by the company.
Initial investigations show information relating to about 76,000 people was held on the overseas cloud server.

They were primarily email addresses, names and phone numbers, and some travel information for a small group.

NZME said that when it was alerted to the breach by a competition partner earlier this week, access to the server was immediately locked down.

Chief executive Michael Boggs said there was no evidence any of the information hacked had been used.

It did not contain any financial information or credit card data.

Competition partners and those contest entrants in the database were being contacted.

"The priority for us is firstly security and secondly then making sure that they're not open to spam or phishing that could come from this," he said.

"We're continuing our investigations - we believe it would be an offshore person or persons involved."

An external forensics team is working on the breach.

NZME, publisher of the New Zealand Herald and other newspapers and websites, and owner of radio stations including Newstalk ZB and ZM, had briefed the Privacy Commission and would work to ensure all appropriate steps were taken.

"Our priority now is working with competition partners and customers to [help them] make sure their information stays secure," said Boggs.

Chief executives responding to the Herald's Mood of the Boardroom identified cyber security as one of their main concerns.

"This highlights these threats are ever-present and we have to ... evolve and keep on top of them to protect the customers," Boggs said.

Ottawa Citizen
'Critical' for DND staff to do mandatory Phoenix training
Saturday, 01 October 2016
Byline: David Pugliese

Ottawa - Thousands of civilian employees at the Defence Department have until next week to complete mandatory training on the controversial Phoenix pay system.
The training is critical to minimize errors affecting the problemplagued federal government system, noted a message sent to all department workers and obtained by the Ottawa Citizen.

Phoenix pay system foul-ups have left thousands of Canada's public servants unpaid. But senior federal officials have countered that many of the issues with the pay system are not technical, but linked to employees failing to properly fill out workrelated information.

"It is critical that you complete the mandatory training to minimize errors that will lead to pay issues," the Department of National Defence message pointed out. "Training can help both employees and managers overcome the challenges associated with the transition to the new system."

The training must be completed by Oct. 7 and involves a one-hour course that can be completed online.

"The majority of employees who have taken the self-paced course have indicated that the training was beneficial to ensuring that their information was entered correctly," the message said.

Once training is completed, the employee must provide a training co- ordinator with a copy of a certificate of completion. There was no indication what the consequences of failing to complete the course are.

DND employees have been taking the training voluntarily, but as many as 30 per cent of the 24,900 workers have yet to complete the course. "The October 7th deadline reflects the fact that resolving pay issues is a top priority for the department,"

DND spokeswoman Jessica Lamirande said in an email response to the Citizen.

Lamirande said the training is offered by the Canada School of the Public Service to all federal employees. "DND chose to make the training mandatory for those who had not yet taken it," she said.

Several weeks ago, the senior bureaucrat who oversaw the Phoenix project suggested problems could have been avoided if all federal employees were forced to take training on how the system worked.

Rosanna Di Paola, Public Services and Procurement Canada's associate assistant deputy minister of accounting, banking and compensation, told a labour board hearing that when she looks back at what went wrong she now believes she should have pressed for mandatory training.
