TOP STORIES / ACTUALITÉS

More changes to Parliament Hill security could be coming, says senior Mountie
A year after a rampaging gunman stormed the Centre Block, the RCMP and federal officials are still studying ways to make Parliament Hill more secure, says a senior Mountie.While it's still early, the process could lead to new, highly visible security measures on the Hill, said RCMP Assistant Commissioner Gilles Michaud."We want to make sure that we address all potential threats," Michaud said in an interview.One year ago today, Michael Zehaf Bibeau fatally shot honour guard Cpl. Nathan Cirillo at the National War Memorial before rushing into Parliament Hill's Hall of Honour, where he was killed in a hail of bullets.The RCMP was responsible for the grounds of the parliamentary precinct, while House of Commons and Senate security forces had jurisdiction inside the Parliament Buildings.A now-merged parliamentary protective service manages day-to-day security on Parliament Hill, a direct consequence of Oct. 22 intended to eliminate possible confusion.But Defence Research and Development Canada is quietly working away at two studies that could further transform security on the Hill and for about three dozen other buildings in the parliamentary precinct.One report, to be done by the end of the year, is looking at officer training, exercises and co-ordinating procedures of the newly merged security forces. The other, to be completed by April, is examining possible investments in new security facilities and equipment or other kinds of measures."I'm sure that they're looking at some aspect of how we can better screen people before they come on to the Hill," Michaud said. "Because we're doing screening of vehicles, but what about people? Is there a way that that can be done without limiting their access?"He cautioned that wouldn't necessarily mean setting up guard booths just inside the Hill gates, noting screening could be accomplished through other tools, such as security cameras — which are already being used to some extent. CONTRACT & ABORIGINAL POLICING / SERVICES DE POLICE CONTRACTUELS ET AUTOCHTONES

RCMP boss says impaired driving still a problem on highways
Assistant RCMP Commissioner Roger Brown knows the ugliness of impaired driving. Brown, who has been the commander of the force in the province for two years, said he was driving to Fredericton one night from Saint John, when he stumbled upon an impaired driver. "I was driving behind a guy and the guy was so drunk behind the wheel that he passed out and the car came to a stop," Brown said in an interview. "I was Johnny-on-the-spot." Brown said he obtained the services of another officer and between the two of them, they were able to remove the individual from the car, arrest him and read him his rights. "I couldn't even lift the guy, he was that drunk." Brown said the case went to court and the blood alcohol reading was more than 400 milligrams of alcohol per 100 millilitres of blood. The legal limit is 80 mg. "This guy was on the road. He could have been driving toward you that night." Brown said drinking and driving continues to be a problem on the province's highways and he just can't understand why. "It's wrong, it kills people and that should never be." Statistics contained in the RCMP's recently released annual report revealed that nine **New Brunswickers** lost their lives last year in collisions where alcohol or drugs were involved. Daily Gleaner, A4 (Times & Transcript, A12)

Hearing set for human trafficking case
An **Airdrie** man accused of human trafficking and prostitution offences will get his chance to hear the Crown's case against him at his upcoming preliminary hearing. Javyrell Raymond Baird, 25, elected to be tried by a Red Deer Court of Queen's Bench judge alone Wednesday in Red Deer provincial court. Represented by defence counsel Greg Gordon, Baird appeared by closed circuit television from the Red Deer Remand Centre. Preliminary hearings are held to test the strength of the Crown's case to determine if a trial is warranted. Baird faces charges of trafficking a person under the age of 18 for the purpose of exploiting or facilitating exploitation, living on the avails of prostitution of a person under 18 and assault. He was arrested in Gasoline Alley June at a hotel. The Airdrie RCMP General Investigation Section and Crime Reduction Unit were investigating a report of a missing female youth. The investigation led them to believe the teen had been a victim of human trafficking. Baird remains in custody, however Gordon has scheduled a bail hearing for Oct. 26. Red Deer Advocate, C1

Man charged in hammer assault
A **Red Deer** man has been charged following a Riverside Meadows home invasion where two men were assaulted with a hammer. Police say the suspect climbed to a second-floor apartment balcony and assaulted two people inside with a hammer shortly before midnight on Friday. He climbed onto the roof of a parked vehicle to gain access to the balcony. Two men sustained bruises and abrasions but were able to push their assailant out of the apartment. The suspect then jumped from the balcony, landed on the same parked vehicle, and fled in another vehicle. The suspect was known to his victims, and Red Deer RCMP located him shortly afterward on 55th Avenue. Police executed a traffic stop and took the suspect into custody without incident. Tyrel George Jackson, 28, of Red Deer is charged with break and enter and committing a crime, two counts of assault with a weapon, possession of stolen property under $5,000, uttering threats and operating motor vehicle while disqualified, mischief under $5,000 and possession of controlled substance. Jackson appeared in Red Deer provincial court on Wednesday with a white bandage wrapped around his head. Represented by defence counsel Lorne Goddard, Jackson reserved his plea. Crown Prosecutor Blair Brandon said he is opposed to Jackson receiving bail. The matter was adjourned by judge Gordon Yake to Oct. 28 in Red Deer provincial court. Red Deer Advocate, C1; Postmedia Network (Edmonton Journal, A16)

Mounties probe shooting reports
Police are investigating reports of a drive-by shooting in **High River** that left a home and truck with bullet holes. Mounties were called to Highwood Heritage Estates, west of High River cemetery, in the town south of Calgary at 4:30 p.m. Tuesday for a possible drive-by shooting. Officers discovered bullet holes in the truck and house, but no one was injured, even though people had been home at the time. Early indications suggest the shooting was not random, and that the public is not at risk, according to RCMP. Postmedia News (Calgary Herald, A14, Edmonton Journal, A13)

A diamond detective story
Twenty-two people tried to claim a diamond ring found last spring before the rightful owner was located. According to East Hants District RCMP, a citizen found a diamond ring in a parking lot off Highway 1 in **Mount Uniacke** in early June and turned it in to the Rawdon detachment. After issuing a news release and sharing photos of the ring on social media in July, the RCMP received numerous tips from the public. Oct. 13, the RCMP in East Hants was able to confirm the rightful owner, and the ring has since been returned to a Kings County woman. Const. Dianne Hartery with the Rawdon Detachment of the RCMP said the found ring was stolen during a break-and-enter earlier this year. Hartery said she didn't want to give too many details to avoid re-victimizing the victim. Hartery did say the ring was stolen in Kings County in 2015 and that no charges are pending. The investigation into the break-and-enter is still open. More than 20 people contacted the RCMP to claim or inquire about the ring, the officer said. Cape Breton Post, A9

Moncton
Trois hommes ont été arrêtés et font face à de nombreuses accusations pour l'enlèvement d'une femme âgée de 50 ans et le cambriolage de son domicile, la semaine dernière à **Moncton**. Le 13 octobre, peu après 11 h, la police été informée qu'une femme de 50 ans avait été enlevée dans son appartement sur la rue Gordon à Moncton, plus tôt en matinée, et qu'on l'avait emmenée à Sackville. Elle a ensuite été libérée par ses ravisseurs. Elle n'a pas été blessée... Jeremy Bernard a été arrêté le 15 octobre, à Moncton, et il a comparu en cour provinciale à Moncton lundi. Il a été libéré et devrait comparaître de nouveau le 17 novembre. Meneka Weva a été arrêté le 16 octobre, à Moncton, et il a comparu en cour lundi. Il a été mis en détention et devrait comparaître de nouveau le 4 novembre. Shawn Augustine a été arrêté le 17 octobre, à Moncton, et il a comparu en cour lundi. Il a été mis en détention et devrait comparaître en cour provinciale à Moncton le 6 novembre. Les trois hommes font face à des accusations, entre autres, pour séquestration, enlèvement, agression armée, voies de fait ayant causé des lésions corporelles et braquage d'une arme à feu. La GRC poursuit son enquête. Acadie Nouvelle, 2

Attentat à Ottawa - La GRC avait été prévenue de la menace

Un an après l'attentat qui a coûté la vie au soldat Nathan Cirillo devant le parlement à Ottawa, des documents obtenus par la CBC révèlent que la Gendarmerie royale du Canada (GRC) avait été prévenue à trois reprises d'une potentielle attaque terroriste dans les jours précédant le drame. Les autorités ne sont cependant pas à blâmer, jugent des experts qui rappellent à quel point il est difficile de contrer une menace provenant d'individus isolés. Un an après l'attentat qui a coûté la vie au soldat Nathan Cirillo devant le parlement à Ottawa, des documents obtenus par la CBC révèlent que la Gendarmerie royale du Canada (GRC) avait été prévenue à trois reprises d'une potentielle attaque terroriste dans les jours précédant le drame. Les autorités ne sont cependant pas à blâmer, jugent des experts qui rappellent à quel point il est difficile de contrer une menace provenant d'individus isolés. Le réseau anglais de Radio-Canada a dévoilé mercredi des informations contenues dans près de 1000 pages de documentation obtenues en vertu de la Loi sur l'accès à l'information. On y apprend d'abord que le 17 octobre 2014, le Centre intégré d'évaluation du terrorisme a mis en garde la GRC contre un possible " acte terroriste violent ". Il a du même coup fait passer l'indice de la menace terroriste au pays de " basse " à " moyenne ", alors que cet indicateur était demeuré inchangé pendant quatre ans. Le 18 octobre, le Groupe des renseignements criminels a quant à lui fait parvenir un rappel de sécurité. Le document d'une page prévient les autorités que le groupe État islamique (EI) " encourage activement les djihadistes de l'Occident et les nouveaux militants à lancer des attaques contre des membres des forces de l'ordre dans les pays qui combattent ses troupes ". Finalement, un troisième avis a été transmis le 21 octobre, soit le lendemain de l'attaque terroriste survenue à Saint-Jean-sur-Richelieu. Ce jour-là, Martin Couture-Rouleau a foncé avec sa voiture sur trois militaires, tuant l'adjudant Patrice Vincent et blessant un de ses collègues. Ce dernier avis produit par le Centre national de coordination du renseignement de la GRC rappelle aux policiers l'importance d'appliquer les mesures de sécurité et de prévention en lien avec les récentes menaces du groupe EI à l'endroit des forces de l'ordre. Un autre rapport qui détaille les ressources humaines déployées par la GRC en octobre 2014 indique par ailleurs que sur les 177 postes autorisés sur la colline du parlement, au moins 29 étaient vacants pendant cette période. Ce manque de ressources s'explique vraisemblablement par les coupes budgétaires imposées par le gouvernement Harper en 2012. Un rapport réalisé par la police provinciale de l'Ontario notait également en juin dernier que les compressions nuisent au dispositif de sécurité de la GRC sur la colline parlementaire. Le Devoir, A1; Agence France-Presse (Le Droit, 7) (2015-10-22); Agence France Presse (Le Journal de Québec, Le Journal de Montréal, Le Devoir (2015-10-21)

'He Stood His Ground'

Three hours into a Wednesday morning shift, the constable stood in the south corridor of Centre Block, chatting with another member of the House of Commons security force as MPs arrived for their weekly caucus meeting. A few bored journalists and camera operators congregated around the rotunda inside the Centre Block doors. The attack that killed a Canadian Forces member in Saint-Jean-sur-Richelieu two days earlier was still fresh news, and the two men - the constable in uniform, his colleague in plainclothes - speculated about whether something like that could ever happen on Parliament Hill. Then it did. "Gun! Gun! Gun!" someone yelled from the main doors, shortly before 10 a.m. Then a shot. "I smelled powder and I saw my buddy beside me draw his firearm," said the constable, a 30-year veteran of Parliament Hill security who asked not to be named. A year later, he still worries about someone targeting his family. "I said, this is tango time. We're getting hit. I'm not sure what type of attack we're getting but in hindsight I'm thinking there's a possibility the 18 are coming," he said, in reference to the Toronto 18 terror group that planned to attack Parliament and behead the prime minister... In fact, says the constable, there was no RCMP security detail in the room at the time Harper went into the closet. Until the constable arrived moments after the shooting, there were no House of Commons security there, either. Under the rules in place at the time, the prime minister's RCMP protective detail was required to wait outside of Centre Block after handing him off to plain clothes House of Commons guards. Postmedia News (Windsor Star, N1/Front, Ottawa Citizen, A1, Edmonton Journal, N1/Front) (2015-10-22); Ottawa Citizen (2015-10-21)

Securing the Hill

Could it happen again? Could worse happen? Could an attacker like rifle-wielding Michael Zehaf-Bibeau - or one who is better-trained, better-armed or with back-up, say a team of assailants - breach Parliament Hill to launch an even more deadly assault on the seat of Canada's national democracy? The question still nags as Ottawa marks the one-year anniversary of a terrible week in the country's life last October... More people have been hired to monitor more live video camera feeds around the clock. During the

attack last October, an RCMP officer in a cruiser reading a report didn't see Zehef-Bibeau run onto the grounds. Astonishingly no one at the operational centre, which monitors video feeds of all protected sites, actually saw the gunman flash on a screen as he stormed through the East Gate either. A new intelligence unit has been created within the parliamentary protective service to share and assess different threats. An armed RCMP "Quick Response Team" is permanently posted outside to respond to suspicious or emergency circumstances while other officers maintain a secure perimeter. On Oct. 22, Mounties vacated their posts to race to Centre Block so for several minutes the Hill was exposed. A vehicle screening facility at the only point of public vehicle access to the Hill is being reinforced. All Hill police and security forces will soon have the same radios and operate on the same frequency. The OPP said the lack of "interoperability" was a major problem. Commons and Senate guards, RCMP and the Ottawa police operated on different radio systems. When Ottawa cops responded to 911 calls to the War Memorial the RCMP did not know the attacker was headed their way. Commons and Senate security did not know he was out on the lawn when a Mountie screamed into her radio. The civilian forces weren't aware of the threat until it crashed through the front door. Now all Commons and Senate personnel are being security-cleared to the level of RCMP officers to receive and respond to law enforcement information on police frequencies, and the integrated service has been looped into a region-wide communications network for emergency responders known as Intersect. Toronto Star, A1 (Spectator, A5)

Interpol issues alert on Fredericton woman facing charges in Philippines

A Fredericton woman facing charges in the Philippines relating to the 2012 shooting death of her husband is now listed on the International Criminal Police Organization's (Interpol) website. Erma (Jane) Doyle, 39, has been living in Fredericton since August 2012. She came to Canada shortly after former Fredericton businessman Harry Doyle was shot and killed on Aug. 12 during a family barbecue at Palma Beach Resort in Punta Pilar, Surigao City. In August 2013, the Philippine National Police issued an arrest warrant for Doyle on a charge of parricide. She continues to live in Fredericton along with her sons, 15-year-old Joseph and Daniel who will turn three in November. Earlier this year, Philippine prosecutor A.S. Casurra requested the Canadian Embassy contact the Department of Justice to ask if it could use its influence to help expedite the process. Interpol's notification on the arrest warrant for Doyle has been sent to its 190 member countries at the request of the Philippine National Police, including the RCMP. The Daily Gleaner contacted the RCMP's head office in Ottawa for comment. None was available prior to press time. In an email, Interpol said it facilitates international police co-operation and explained that individuals listed on what it refers to as its 'Red Notice' are wanted by national jurisdictions. "Interpol's role is to assist national police forces in identifying or locating those individuals with a view to their arrest and extradition," the agency stated on Wednesday. Daily Gleaner, A1

Harper comments on Islam damaged relations with Muslims, says former CSIS analyst

Stephen Harper's comments about the threat of "Islamicism" strained the fragile trust federal officials built with Muslim Canadians in the fight against terrorism, says a former analyst with Canada's spy agency. The frequently harsh tone Harper and his cabinet members struck with Muslims created a rift the new Liberal government must work to overcome, said Phil Gurski, who spent almost 13 years at the Canadian Security Intelligence Service before moving to Public Safety Canada. Rebuilding trust will be an important element in national counter-extremism efforts by police and community groups, said Gurski, a specialist in radicalization and homegrown terrorism now working as a private threat and risk consultant. "I think now that with a new government, we have at least the opportunity to start - not with a blank slate - but to kind of reset the relationship," he said in an interview. This week marks the grim anniversary of two fatal attacks on Canadian soldiers by men with jihadist sympathies. One year ago Thursday, Michael Zehaf Bibeau shot Cpl. Nathan Cirillo, an honour guard at the National War Memorial, before rushing into Parliament's Centre Block. Zehaf Bibeau was quickly gunned down. Two days earlier, Martin Couture-Rouleau had fatally rammed Warrant Officer Patrice Vincent with a car in St-Jean-sur-Richelieu, Que. After a chase, police shot and killed the knife-wielding assailant. Gurski said security agencies need to continue investigating potential threats, but the government must also do more to support police and community-led programs to stop young people from becoming radicalized in the first place. He has distilled his insights into a book, "The Threat from Within," published this week. He praises grassroots counter-radicalization initiatives - noting such efforts work better than government-run ones - and lauds the police services active in the field, notably Toronto and Calgary. In the federal sphere, Public Safety and the RCMP have guided the efforts, with CSIS playing a background role. At Public Safety, Gurski

worked with the department's citizen engagement bureau. Canadian Press (Times & Transcript, B1) (2015-10-22); Canadian Press (CTV News, 580 CRFA, Kelowna Daily Courier, Brandon Sun, Huffington Post) (2015-10-21)

Attack changed policing in Ottawa
A year after an ISIL-inspired gunman killed an unarmed ceremonial sentry at the National War Memorial, Ottawa police now guard the guards at the vulnerable location. In some ways, the duty is emblematic of the challenges the police service of the nation's capital faces - counter-terrorism investigations fall outside the force's mandate, except that any threat of terrorism affects the city's safety. The cenotaph and Parliament Hill might be national landmarks, but they're nestled inside the City of Ottawa. Officers policing the nation's capital have always been cognizant of their special role that extends beyond the mandate of most city police forces. But in the year since the attack on the Hill, Ottawa police have had to accept that terrorismrelated threats are real - and that's changed how they police this city... Counterterrorism is the mandate of the national police force, the RCMP. But Ottawa police, while a municipal force, work to support those investigations. "A lot of information can be generated at the local level," Hinterberger said. That information can come to officers in the form of a tip from a concerned member of a religious community who wants to flag someone who has expressed radical views, or from someone who overhears a co-worker making threats against people or places. While RCMP will then lead investigations, local officers often do the grunt work. "A full-blown (counterterrorism) investigation is a tremendous effort and it requires a lot of resources," Hinterberger said. Once the RCMP launches an investigation, local patrol officers work the streets to help out. The Ottawa force has its own officers who are on loan to the RCMP's national security unit, called INSET - integrated national security enforcement teams. Postmedia News (Ottawa Citizen, A7)

Ottawa se souvient de l'attentat du 22 octobre
La cérémonie aura lieu au Monument commémoratif de guerre à Ottawa, où le caporal Cirillo est tombé sous les balles de Michael Zehaf-Bibeau, abattu plus tard à l'intérieur du parlement, le matin du 22 octobre. Deux jours plus tôt, le caporal Patrice Vincent était happé mortellement par un autre islamiste radical, Martin Couture-Rouleau, à Saint-Jean-sur-Richelieu. L'événement vise de plus à souligner le courage des premiers intervenants qui ont tenté de secourir les victimes et aux autres qui ont abattu les agresseurs pour mettre un terme à leur folie. Le gouverneur général du Canada, David Johnston, assistera à la cérémonie en compagnie d'autres dignitaires. Le 30e Régiment d'artillerie de campagne de l'Artillerie royale canadienne fera résonner 21 coups de canon, et sera suivi par le passage de CF-18 Hornet de l'Aviation royale canadienne dans le ciel de la capitale, à 11h20. Les avions traverseront la région en formation d'hommage aux disparus, à quelque 500 pieds d'altitude... La GRC n'a pas renforcé la sécurité malgré les alertes concernant de possibles attaques par des individus radicalisés, qui lui avaient été transmises moins d'une semaine avant l'attaque au parlement d'Ottawa l'an dernier, a révélé mercredi CBC. Par deux fois, les 17 et 18 octobre, la Gendarmerie royale du Canada (GRC) a été destinataire de notes prévenant d'encouragements soutenus du groupe État islamique (EI) pour mener des attaques contre des pays occidentaux dont le Canada, selon CBC qui s'appuie sur des documents obtenus dans le cadre de la Loi d'accès à l'information. La première note du service de renseignements, transmise le 17, signalait que des «actes de terrorisme pourraient se produire» et remontait de faible à moyen le niveau d'alerte pour la première fois en 4 ans. Le 18, dans une circulaire, la GRC indiquait elle-même que le groupe EI encourageait «activement les jihadistes dans le monde occidental à lancer des attaques contre des membres des forces de sécurité des pays engagés dans les combats contre nos troupes». La Presse (Le Droit); La Presse, A9 (La Voix de l'Est, 18, Le Quotidien, 16); Chronicle Herald, A16

Details to be released of major human trafficking investigation
Ontario Provincial Police have scheduled a press conference Thursday morning to reveal details of a major human trafficking investigation. A media release states several police forces were involved in the investigation nicknamed Operation Northern Spotlight including the RCMP and FBI. A human trafficking victim, a member of a child advocacy support agency, and experts in the case will also be present during the press conference. Global News

12 trafiquants arrêtés

Une large opération de l'Escouade régionale mixte (ERM) Québec visant un réseau de trafiquants qui serait lié aux Hells Angels a conduit à l'arrestation de 12 individus alors que deux suspects sont toujours recherchés.Tôt hier matin, des policiers de l'ERM Québec ont exécuté 14 mandats d'arrestation contre des trafiquants de drogue qui seraient reliés aux motards criminels Hells Angels. «Les suspects font partie d'un réseau important dans la région de Québec, avec des ramifications sur la Côte-Nord», a expliqué Ann Mathieu, porte-parole de l'ERM. Si une majorité de ces suspects ont été arrêtés hier, les autorités sont toujours à la recherche de deux individus. Il s'agit de Éric Champlain-Laroche, 39 ans, de Charlesbourg, et de Jonathan Roberge- Nöel, 29 ans, de Québec. Les autres individus arrêtés ont comparu sous des accusations de gangstérisme, complot et trafic de stupéfiants. Certains d'entre eux n'ont pas de casier judiciaire et ont été libérés en échange de conditions, mais d'autres suspects sont demeurés détenus. Journal de Québec, 15

Security experts say terror-attack warnings before Parliament Hill shootings too vague
A security expert and former RCMP officer say the trio of terror-attack warnings the Mounties received in the days preceding last year's deadly shootings on Parliament Hill were likely too general for the force to take specific actions. CBC News has reported that the RCMP disseminated separate terror warnings to officers on Oct. 17-18 and Oct. 21, each citing potential attacks on Canadians in uniform. On Oct. 22, a lone gunman did just that, killing a soldier at the National War Memorial and injuring a guard inside Centre Block on Parliament Hill. "If the threat is general, then the level of awareness is heightened, but it's hard to go beyond heightened state of awareness," said Pierre-Yves Borduas, a retired RCMP deputy commissioner. "It's always easy to second-guess after the attack." Wesley Wark, a security expert and academic at the University of Ottawa, said frequent generic warnings can even have an unintended effect. "Warnings that contained no 'actionable' intelligence ... may have been frequent enough to induce, at least in part, a cry wolf phenomenon," he said. A 1,000-page RCMP dossier obtained under the Access to Information Act also shows that so-called "enhanced patrols," ordered in the wake of two minor security incidents in Ottawa, were ended shortly before the Oct. 22 attacks. The file also shows that the RCMP unit whose duties include Parliament Hill security was chronically short-staffed in the fall of last year, by at least 29 positions, because of cuts announced in the Harper government's 2012 budget. CBC News (2015-10-21)

ORGANIZATIONAL ISSUES / ENJEUX ORGANISATIONNELS

Mountie found not guilty of assaulting pub patron
A Kelowna cop has been found not guilty of assaulting a patron at a local pub after he refused to leave following last call. Provincial court Judge G.W. Koturbash, in a ruling handed down Wednesday, found RCMP Const. Grant Jacobson not guilty of assaulting pub patron John McCormick. McCormick, 60, according to Koturbash's decision, had been drinking at Rose's pub June 28, 2014, for up to 13 hours when he was told last call was over and it was time to leave. According to the judge, McCormick "was drunk but he said not totally wasted or stumbling." Postmedia News (Province, A13)

Stay strong and carry on
Just a month ago, the province was trying to come to grips with the tragic death of a dedicated police officer. The body of Const. Catherine Campbell, a six-year member of the Truro Police Service, was found underneath a bridge ramp off Barrington Street in Halifax. It's fitting then that the annual Atlantic Women in Law Enforcement conference is being held this week near Campbell's beat, at the Holiday Inn in Truro. "She was a member of our organizing committee, and her dedication to this conference is what gave us all the courage to continue with our planning," Sgt. Carolyn Nichols of Halifax Regional Police and president of the organization said in an email interview. "The theme of the conference is Staying Strong and Carrying On," Nichols said. "It is a reminder to all of us of the importance of taking care of ourselves and each other, to stay strong in both body and spirit and to reach out to others for support when you need it. We are fortunate to have employee assistance programs and referrals available through our agencies and unions." The 23rd annual training conference brings together 95 women to talk about topics that include investigative case studies, forensic psychology, prostitution, post-traumatic stress disorder, leveraging social media to solve and prevent crime, and radicalization within communities. "The Atlantic Women in Law Enforcement was founded on promoting teamwork by fostering

professional and inter-agency associations," Nichols said. "At the conference, we have representation from numerous provincial agencies, which gives our membership the ability to network and discuss issues which are common across all our departments." The four-day conference, which got underway Tuesday, is co-hosted by the Truro Police Service, Colchester County District RCMP, the Nova Institution for Women in Truro and Correctional Service Canada. The conference will provide informative presentations and workshops that promote professional development and provide opportunities for inter-agency networking. Chronicle Herald, A4

Manitoba RCMP staff shortages taking toll on officers, warn representatives
Staffing levels within the RCMP in Manitoba have dropped over the past two years while job vacancies have increased, creating a situation that a staff representative says is taking a toll on members. As of April 1, there were 36 vacant positions in Manitoba for regular members, according to documents obtained by CBC News under the Access to Information Act. The number of RCMP regular members in Manitoba dropped from 1,082 in April 2013, to 1,070 in 2014, to 1,055 in 2015 - a loss of 27 positions over the two-year period. Even with the smaller complement, the vacancy rate increased from 3.2 per cent in 2014 to 3.4 per cent in April 2015. By contrast, there was slightly more than a full complement in April 2013. "Typically the members who are left behind fill the gaps by taking on additional duties, working extra overtime," said Staff Sgt. Scott Bird, a staff relations representative with D Division. Bird said to maintain public safety while dealing with the shortages, officers are moved around from detachment to detachment, where they're most needed. Often it means working longer hours and spending less time with their families, he said. "We have an extremely dedicated group of RCMP members and they continually take on more and more. But they get tired ... and they're working more than they want to in some instances," said Bird. His concerns were reinforced by Rob Creasser, a media liaison with the Mounted Police Professional Association of Canada. CBC News

Mountie guilty of driving RCMP all terrain vehicle while impaired
An RCMP officer from Wollaston Lake has pleaded guilty to crashing an RCMP all-terrain vehicle while drunk and off duty. Constable Kevin Granrude was fined $1,000 and given a one-year driving prohibition. He pleaded guilty to impaired driving. A second charge of driving over .08 was withdrawn. The accident happened in the summer of 2014 when he was driving the ATV outside Wollaston at 1:30 in the morning. It was not clear to investigators why he was driving it while off duty. The RCMP launched a code of conduct investigation, but the outcome has not been made public. Granrude had more than nine years service at the time of the crash. Granrude -- who was not wearing a helmet -- was thrown from the ATV and suffered a serious head injury. He was later transferred to Swift Current. CBC News (2015-10-21)

Members of Alyssa George's family question RCMP response at inquest into in-custody death
"I can't breathe."That's what Mark Oleksiuk remembers hearing his wife Alyssa George say shortly before she was found in medical distress in her cell at the Terrace RCMP holding cells on Sept. 4, 2013. Oleksiuk, who was being held in a nearby cell at the time, appeared at the B.C. Supreme Court in Terrace on Oct. 19 to give his testimony at a public inquest into George's death. George, a 25-year-old First Nations woman, also known as Alyssa Oleksiuk, was found face-first on the floor of her jail cell 15 hours after being taken into custody on an arrest warrant. She was flown to Vancouver General Hospital for more intensive treatment, but died there on Sept. 10, 2013. CBC News (2015-10-21)

Lloydminster RCMP showcase police dog services
One of the most active members of the Lloydminster RCMP doesn't have a driver's license. He also is four years old, weighs 65 pounds, and has four legs and a tail. His name is Drax, and his partner is Constable Mark Freeman, who has been partnered with the purebred German Shephard for the past three years. On Tuesday afternoon, media were invited to view a demonstration of Drax's takedown skills and obedience training, as Freeman put his partner through the paces on the back lawn of the Lloydminster Legacy Centre, which sits behind the RCMP detachment building. "I think I have the greatest job in the world, because I get to work with a dog all day, and I have a partner with me all the time," said Freeman, who has been with the Lloydminster RCMP for the past two years. Freeman and Drax make up of 125 other Police Dog Services (PDS) across the country. Lloydminster meridian booster (2015-10-21)

LEGISLATION & POLICIES / LÉGISLATION ET POLITIQUES

Liberals planning swift overhaul of anti-terror law
The controversial security bill rammed through Parliament by the Conservative government in the spring is expected to be overhauled without delay by the new Liberal government, say party officials and other sources. Proposed legislation to add new measures and repeal some existing parts of the law, now known as the Anti-terrorism Act of 2015, or C-51, is already being drafted and is to be tabled early in the new parliamentary session. Consultations with the public and various experts are planned before the replacement legislation is put to a final House vote. The bill was brought in by the Conservatives after the killings in October 2014 of Warrant Officer Patrice Vincent in Saint-Jean-Sur-Richelieu and Cpl. Nathan Cirillo in Ottawa by lone-wolf extremists. A key feature of the replacement legislation is expected to be the creation of a multi-party, joint House of Commons-Senate committee, sworn to secrecy and reporting to the prime minister and through him to Parliament... Public opinion polling shows many Canadians want a tighter watch over spy agencies and other federal intelligence gatherers, commensurate with their extended powers under C-51. A day after the Oct. 22, 2014 terror attack on the National War Memorial and Parliament Hill, Prime Minister Stephen Harper told the Commons that an existing government initiative to strengthen laws dealing with the surveillance, detention and arrest of national security suspects would be "expedited." Two months later, he unveiled Bill C-51, which the Conservative government used as the centrepiece of a security narrative on protecting Canadians from the Islamic State and its followers... As well, they want to narrow some of the "overly broad" definitions of what constitutes a threat to national security, including defining "terrorist propaganda" more clearly.
Current oversight and review is chiefly the responsibility of the Security Intelligence Review Committee (SIRC), which conducts after-the-fact reviews of the operations of CSIS, the country's human spy service. The activities of the electronic spy service, the Communications Security Establishment, are reviewed by a watchdog known as the Office of the Communications Security Establishment Commissioner (OCSEC). Increasingly, in the era of the Edward Snowden leaks on U.S. spying, CSE's domestic cyber-spying activities are raising privacy and legal concerns, though the agency has never been charged with law-breaking. There is no independent oversight or review of the Canada Border Services Agency, which has a dual intelligence and law-enforcement role. Nor is there dedicated, independent monitoring of the intelligence arms of the RCMP, Citizenship and Immigration Canada, the Privy Council Office, Department of Foreign Affairs, Trade and Development, and the Financial Transactions and Reports Analysis Centre of Canada. Dieppe Mountie gets major Interpol post
A New Brunswick Mountie and former commanding officer of the Codiac Regional RCMP has been elected Interpol's vice-president for the Americas. Todd Shean, who was born and raised in Dieppe,is currently an assistant commissioner and officer in charge of the RCMP's Federal Policing Special Services. This new position will be part of his regular duties with the RCMP. He was elected to Interpol's 13-member executive committee during the 84th Interpol General Assembly, which took place last week in Kigali, Rwanda. He is now one of three vice-presidents of the organization. Created in 1923, Interpol is the world's largest international police organization, with 190 member countries. In 1949, Canada became a member of Interpol and the RCMP was delegated the responsibility for administering and operating Canada's National Central Bureau, known as Interpol Ottawa. The bureau works with other countries through international criminal databases, the exchange of timely and accurate information and the coordination of international requests for assistance. Reached in Berlin, where he was attending the G7 summit on Monday, Shean said he plans to improve policing partnerships to advance Interpol's operational priorities. "We know that crime and all that goes with it is increasingly international," he said, emphasizing that it is more important than ever for law enforcement agencies to cooperate, corroborate and share information and best practices. Shean's 29-year career in law enforcement has included operational and leadership positions in tackling organized crime and financial crime, as well as in criminal intelligence and international policing. From 2005 to 2008, he led the Codiac Regional RCMP. At Codiac, he established a street crime unit, dedicated traffic section and other specialist officers in areas such as domestic violence. During that time, Metro Moncton had one of the lowest crime rates in the country. In 2008, Codiac had the best "clearance rate" among police forces in Canada for resolving serious crimes. Leading one of the largest RCMP detachments in the country, policing a bilingual city that is a microcosm of Canada, and providing services to three different municipalities were all good training, Shean said. "Codiac brings a number of different challenges. It really helps you prepare for other challenges." Shean

has also held posts in British Columbia and Florenceville. Since leaving Codiac, he has gone back and forth between Ottawa and Fredericton. His base will continue to be in Ottawa, but he maintains a home in Dieppe. "I'm a Maritimer. All my ties are there. I'll be back." Times & Transcript, A1

CONTRACT & ABORIGINAL POLICING / SERVICES DE POLICE CONTRACTUELS ET AUTOCHTONES

Man critically injured in fight
Three suspects are in custody after a man was critically injured during a confrontation between two groups of people in **Surrey** City Centre early Monday. RCMP said that at 3:20 a.m. police were called to 108th Avenue and 132nd Street following reports of screams and two groups fighting on the street. Police found one man, in his early 20s and known to police, with a serious gash to his chest. Two men and one woman were arrested and remain in custody while the investigation continues. The victim is listed in critical condition. Postmedia Network (Vancouver Sun, A4); Canadian Press (Times Colonist, A4) (2015-11-10); Vancouver Sun; CTV News Vancouver (2015-11-09)

Moose cull prompts protests
Dennis Day was all ready to protest a Mi'kmaq moose hunt that Parks Canada approved for Monday on **North Mountain in Cape Breton Highlands National Park**, but there was nothing to protest. Day, a resident of nearby Cape North, set up camp along the Cabot Trail just outside the park on Sunday night, but Mi'kmaq hunters and Parks Canada officials were still putting things in place Monday and were not expected to start hunting until Tuesday at the earliest. "I'm not even going up on the mountain," Day said Monday morning inside his roadside hut, which is equipped with a wood stove inside and a porta-potty next to it. "I'm staying right here." Day said he intends to peacefully protest Parks Canada's plan to cull up to 90 per cent of the moose population in a 20-square-kilometre area on North Mountain... However, Const. Mark Skinner of Nova Scotia RCMP said no complaints had been laid by Monday morning and police were not investigating any threats. Day said he didn't complain to police, because he didn't take an online threat he received seriously. And, he said, he has no intention of disrupting the hunt. "We just want to get our word across," he said. "I can't stress enough that this isn't against the aboriginals. This is against the park." RCMP and Parks Canada enforcement officers spent Monday morning meeting with Day and local citizens to keep things calm. Chronicle Herald, A3

Cops hunt for man
Surrey RCMP are looking for a man who allegedly tried to force his way into the home of a 15-year-old girl. Police say the man approached the teen outside her home in the 13300-block of Sutton Place around 2:15 p.m. Friday. He talked to her, then tried to go into the home uninvited. The two struggled in the doorway and the teen was able to call for help, police said. The man, described as a 25-to 30-year-old South Asian man, about 5-foot-8 with a medium build, fled in an older black car, possibly a Honda Civic. Canadian Press (Province, A8)

Brutal cas d'intimidation dans une école du Nord-Ouest
L'image du jeune Mitchell LaFrance (ci-dessus), victime la semaine dernière d'une sauvage agression près de l'école Southern Victoria High à **Perth-Andover**, est certes loin d'être passé inaperçue. Les images et propos au sujet de l'adolescent âgé de 17 ans continuent de plus belle à alimenter les réseaux sociaux. Selon le père de la victime, Tony LaFrance, l'élève de 12e année a brutalement été battu par deux élèves et a dû être transporté par ambulance à l'hôpital, après l'agression survenue mardi pendant l'heure du repas. Des propos déplacés au sujet de l'amie de coeur d'un des agresseurs seraient à l'origine de l'agression. La nuit suivant l'incident, l'homme n'a pas hésité à publier sur Facebook une photo de son enfant et d'y aller de sa version des faits. «Deux lâches lui ont sauté par-derrière. Ceci est un triste jour pour notre famille», a tout d'abord indiqué Tony LaFrance, qui a pour l'occasion créé la page Facebook "Please support anti bullying at our school", qui comptait déjà près de 1000 membres dimanche. La GRC a confirmé être intervenue à l'école Southern Victoria High mardi midi. Les parents de la victime ont indiqué sur Facebook que les présumés agresseurs avaient hérité d'une suspension de cinq jours d'école. Acadie Nouvelle, 9

Charges laid in theft of poppy donations
A man faces charges after poppy boxes were stolen in **Grande Prairie** gas station. RCMP were called to the business on Sunday. Corey Donald Muise, 23, is charged with theft under $5,000, possession of stolen property and failure to abide by probation orders. Grande Prairie is approximately 460 kilometres northwest of Edmonton. Postmedia Network (Edmonton Journal, A5); Edmonton Sun, A6 (2015-11-10); Global News (2015-11-09)

Bible Hill RCMP office undergoes renovations
The RCMP detachment in **Bible Hill** is getting an expansion and facelift. Work is underway on the project that will expand and upgrade the detachment at 283 Pictou Rd., consolidating in one building all units and offices in the Bible Hill area, an RCMP news release said. "By expanding and upgrading our current detachment facility, the RCMP is making a long-term commitment to policing services in the Bible Hill area and Colchester County in general," Staff Sgt. John Berry, Colchester District commander, said in the release. "This infrastructure project will also bring all RCMP resources in Bible Hill under one roof, which will enhance service delivery in the long run." In the first phase of the project, the original building will be expanded by about 1,200 square metres. The original structure will be renovated and upgraded in the second phase. When it is completed, the detachment will house eight RCMP units, including those now located in the nearby Agritech Park. Chronicle Herald (2015-11-09)

FEDERAL & INTERNATIONAL OPERATIONS / OPÉRATIONS FÉDÉRALES ET INTERNATIONALES

'Our country benefits to this day'
Sgt. Gil Boone proudly participates in local Remembrance Day ceremonies each year with other members of the Cape Breton Regional Police Service. He is among 22 members of the Cape Breton Regional Police Service who have participated in 24 peacekeeping missions in places like Kosovo, Sierra Leone, Jordan and Afghanistan. Each Nov. 11, he is reminded of his own time overseas, but says his service hardly compares to what others have gone through... He said it reminded him of the quality of life back in Canada and the veterans who fought in wars to make sure that was possible. "The men and women that went over and fought for us, they did so much for us, and our country benefits from it to this day. People just don't seem to realize that." That's why he marches each year in a Remembrance Day parade. This year, he'll take part in commemorations on the Northside. The RCMP manages the deployment of Canadian police on peacekeeping missions, including planning and evaluating, selecting and training personnel and providing support throughout deployment. Cape Breton Post, A3/Front

Youth worker left alone with violent teen
A 15-year-old Charlottetown youth in the care of the province has been placed on probation for two years after he engaged in the unwanted sexual touching of a female youth worker. The youth, whose identity is protected under the provisions of the Youth Criminal Justice Act, has been ordered by the court to attend a sexual education program. He must undergo assessment, counselling and treatment for any underlying issue that might have contributed to the commission of this offence. That counselling could include sessions on sexual deviancy and anger management. Provincial Court Judge Nancy Orr ordered the accused to provide a sample of his DNA for the national DNA databank. She also imposed a weapons prohibition. Guardian, A1

'God didn't want me to die'
A Charlottetown youth who attempted to commit suicide by cop in the parking lot of the Charlottetown Mall was placed on probation Monday for two years on each of four weapons- related offences. The youth, whose identity is protected by the Youth Criminal Justice Act, had entered guilty pleas to possession of brass knuckles, using brass knuckles in a careless manner, using a firearm in a careless manner and possession of a weapon for a purpose dangerous to the public peace. The court was told the accused had drawn police to the rear parking lot of the Charlottetown Mall last Good Friday by placing a call to the authorities to say there was a man in the parking lot with a gun and shots had been fired. Multiple units were dispatched and when police arrived they spotted a figure with a gun, his face covered

with a balaclava... Orr ordered the accused to perform 25 hours of community service on each of the four charges. He must also provide a DNA sample for the national DNA databank. Guardian, A3

Drug probe hits jackpot
A Saskatchewan police investigation dubbed Project F-Jackpot has cashed in, with four arrests and 25 charges. "The objective of this investigation was to disrupt the criminal activity and dismantle the group of individuals involved in the distribution of cocaine and crystal methamphetamine in communities in the province of Saskatchewan," said a news release issued Monday. No one was available for an interview to provide further details. The bust was made by the Saskatchewan Combined Forces Special Enforcement Unit (CFSEU), a provincewide integrated policing task force targeting existing and emerging organized criminal groups. Members of the Regina CFSEU have been involved in Project FJackpot for the past two months. The investigation concerned alleged drug trafficking by a group operating "extensively" across the province, according to the release. Saskatoon CFSEU, the Regina Police Service and RCMP units in Saskatchewan's F Division were also involved in the project. It culminated in four arrests on Wednesday. James Edward Lloyd, 36, of Regina is charged with trafficking in cocaine, possession of cocaine, meth and oxycodone for the purpose of trafficking, possession of cannabis under 30 grams, possession of proceeds of crime exceeding $5,000, and six weapons charges. Postmedia News (Leader-Post, A1) (2015-11-10); Global News (2015-11-09)

Ils seront 25 000
De Harper à Trudeau, le contraste est saisissant en matière d'accueil des réfugiés. D'un gouvernement qui utilisait la sécurité comme prétexte pour ne pas agir, nous voilà devant un gouvernement déterminé à relever tout un défi: accueillir 25 000 réfugiés au Canada d'ici le 31 décembre.Un scénario à l'étude prévoit l'accueil de 6000 réfugiés syriens par semaine qui seraient hébergés dans des bases militaires comme celles de Valcartier ou de Trenton, selon des informations obtenues par Le Devoir. Une opération d'urgence d'envergure qui s'inspire du plan déployé en 1999 lors de l'arrivée des réfugiés kosovars au Canada.Est-ce réaliste d'accueillir autant de réfugiés en si peu de temps? ... A priori, 25 000 réfugiés, ça peut paraître beaucoup. En temps normal, le Canada reçoit 5700 réfugiés par année, pris en charge par l'État. Mais tout est relatif. Quand on sait que l'Allemagne recevra 800 000 demandeurs d'asile cette année, 25 000, ça semble très peu. Quand on sait aussi que des pays voisins de la Syrie, aux capacités beaucoup plus limitées que les nôtres, accueillent en ce moment la majorité des réfugiés syriens, on se dit que le Canada peut certainement faire mieux. Rappelons qu'en ce moment, 95% des Syriens fuyant la guerre civile sont recueillis par les pays limitrophes (Liban, Jordanie, Irak, Égypte et Turquie). Accueillir un grand nombre de réfugiés pose-t-il des problèmes de sécurité? C'est ce que prétendait le gouvernement Harper. Mais il faut encore rappeler qu'il est beaucoup plus difficile d'entrer au Canada comme réfugié que comme simple visiteur. Les demandeurs d'asile doivent obligatoirement se soumettre à des contrôles de sécurité très poussés de la GRC et du SCRS que les milliers de visiteurs qui débarquent au pays chaque jour n'ont pas à subir. La Presse

Arbitration gets the boot - Carstairs backs away from option to resolve expense-claim dispute
A former Manitoba senator has changed her mind about using binding arbitration to resolve her Senate expense-claim issues and will likely now face legal action. Sharon Carstairs, who left the Senate in October 2011, is one of 30 senators who were identified in June by the auditor general as having made what were deemed to be ineligible expense claims. Senators were given the option to repay the amount owing or go to binding arbitration with former Supreme Court Justice Ian Binnie. Those who don't repay and don't go to arbitration will be pursued in court... Former Liberal senators Rose-Marie Losier-Cool and Bill Rompkey and Conservatives Gerry St. Germain and Don Oliver also initially requested binding arbitration but have since rescinded that request. There are seven senators who still owe money from the audit who haven't sought binding arbitration, including former Manitoba Liberal senator Rod Zimmer, whose outstanding amount of $176,014 was the highest total for any of the senators identified in the audit. Zimmer's claims were related to his secondary residence as well as travel the auditor said didn't appear to be for Senate business, contracts without proper documentation, as well as gifts and taxi rides for Zimmer and his spouse in Ottawa for personal activities. All seven are among the nine whose files were referred to the RCMP to see if any criminal laws were broken. None of those senators has been charged. Winnipeg Free Press, A3

Un Néo-Brunswickois soupçonné d'agressions sexuelles
Un homme âgé de 61 ans du Nouveau-Brunswick, Jean-Marie Rodrigue, doit faire face à la justice pour des agressions sexuelles graves qui auraient été commises il y a quelques années au Québec. Les faits qui lui sont reprochés seraient survenus entre 1985 et 1998 en Beauce et en Montérégie. Le Service d'enquêtes régionales de la Sûreté du Québec (SQ), avec la collaboration de la Gendarmerie royale du Canada (GRC), a procédé à l'arrestation du suspect samedi à sa résidence au Nouveau-Brunswick. L'Acadie Nouvelle a contacté la SQ pour savoir à quel endroit avait eu lieu l'arrestation, mais un agent nous a répondu que cette information «n'est pas disponible». Jean-Marie Rodrigue doit comparaître à Saint-Joseph-de-Beauce relativement à ces accusations d'agressions sexuelles. L'enquête de la Sûreté du Québec tend à démontrer qu'il pourrait avoir fait d'autres victimes. Selon la sergente aux communications de la SQ, Ann Mathieu, le suspect connaissait les personnes avec lesquelles il aurait posé ces gestes à caractère sexuel. La Presse Canadienne (Acadie Nouvelle, 7) (2015-11-10); La Presse Canadienne (98,5 FM) (2015-11-09)

RCMP stymied in probe of Parliament Hill shooter's Winchester rifle
The RCMP believes it has "come to a dead end" in its probe of where Parliament Hill shooter Michael Zehaf Bibeau got his gun one of the most vexing questions about the events of Oct. 22, 2014. The Mounties continue to investigate several threads of what happened that day, including whether Zehaf Bibeau had accomplices, but have not gathered evidence sufficient for criminal charges. A source with direct knowledge of the police investigation provided the update to The Canadian Press on condition of anonymity due to the ongoing sensitivity of the file. On Wednesday, crowds will gather for Remembrance Day ceremonies at the National War Memorial, where Zehaf Bibeau killed honour guard Cpl. Nathan Cirillo, shooting him in the back three times with a .30-30 Winchester rifle. The attacker quickly made his way up Parliament Hill and into the Centre Block before being gunned down in the Hall of Honour, not far from then-prime minister Stephen Harper and countless MPs. The RCMP will honour 20 Mounties and former House of Commons security officers later this month in recognition of their bravery during the violent episode. Shortly before his attack, the gunman made a video in which he cites retaliation for Canada's military involvement in Afghanistan and Iraq as his motivation. Zehaf Bibeau, 32, plainly speaks of assaulting soldiers to show Canadians "that you're not even safe in your own land, and you gotta be careful." RCMP Commissioner Bob Paulson told a Commons committee in March that the Mounties considered Zehaf Bibeau a terrorist, and that he would have been charged with terrorism offences under the Criminal Code had he lived. Guardian (Prince Albert Daily Herald, Western Star, Telegram, Mississauga News, Brandon Sun); CTV News; Globe and Mail

Les Premières Nations somment Trudeau de passer aux actes
Le nouveau premier ministre du Canada doit passer de la parole aux actes, a sommé le chef d'Uashat mak Mani-Utenam, Mike McKenzie, qui invite Justin Trudeau sur la Côte-Nord pour qu'il constate «personnellement» la crise que vit sa communauté de 4000 âmes, après que cinq des leurs se soient enlevé la vie depuis 2015. Le chef McKenzie, appuyé du chef de l'Assemblée des Premières Nations du Québec et du Labrador (APNQL), Ghislain Picard, s'est adressé à la presse lundi, à la suite du déclenchement, vendredi, d'une enquête publique du coroner sur la mort de Nadeige Guanish, une jeune Innue qui a mis fin à ses jours le 31 octobre... Le chef revendique notamment le financement «adéquat» de la Sécurité publique de la communauté et la création d'une escouade mixte, avec la GRC, pour enrayer le problème de trafic de stupéfiants. Un meilleur soutien des programmes de prévention et l'amélioration des «corridors de services» entre les ressources autochtones et le réseau québécois sont aussi exigés. La Presse (2015-11-09)

Brandon boy, 16, faces terrorism-related charge
A 16-year-old boy in Brandon, Man., faces a terrorism charge for allegedly using social media to express support for the Islamic militant group ISIS. The teen has also been charged with one count of possessing child pornography. He appeared in court in Brandon on Monday, but the case was adjourned until Thursday because he had not secured legal counsel, said Manitoba's chief federal prosecutor Ian Mahon. The boy, who cannot be named under the Youth Criminal Justice Act, remains in custody. Mahon said he expects a bail application to be heard on Thursday. Not much is known about the boy. Brandon residents told CBC News he grew up in the western Manitoba city and is attending high school there. Mahon said items have been seized from the teen's home, including a computer that is closely being looked at. The

matter remains under investigation. Another Manitoban, Aaron Driver, was arrested in Winnipeg in June after he openly supported ISIS on Twitter. Although Driver is not accused of any crime, the RCMP is seeking to have his current bail conditions extended for a longer term, based on the suspicion that he might help or engage in terrorist activities. He appeared in court last week to fight the Mounties' attempts to limit his freedoms. Mahon, who is also the federal prosecutor in that case, had said the restrictions are "not punitive" but reasonable for public safety. CBC News (2015-11-09)

Nova Scotia man charged with possession for the purpose of trafficking in ecstasy
The Combined Forces Special Enforcement Unit — Newfoundland and Labrador (CFSEU-NL) received a complaint from Husky Energy regarding an offshore employee whom the company suspected was in possession of illegal drugs. CFSEU-NL initiated an investigation and learned the man was in possession of pills in a prescription bottle that did not match the prescription label, the RCMP stated in a news release. He was returning to work in the offshore and the pills were found during a routine inspection. The pills are suspected to be MDMA (ecstasy) and will be forwarded to Health Canada for further analysis, the RCMP stated. The Telegram (2015-11-09)

ORGANIZATIONAL ISSUES / ENJEUX ORGANISATIONNELS

RCMP to honour Hill terror heroes
The RCMP will give awards to 20 Mounties and former House of Commons security officers in recognition of their bravery when a gunman stormed Parliament Hill last year. The national police force will make the presentations during a private Nov. 23 ceremony at RCMP headquarters. The RCMP said the awards are intended to recognize the online post. 1.866.977.2737 "bravery, dedication and quick thinking" of those who were directly involved in the events of Oct. 22, 2014. On that day, Michael Zehaf Bibeau fatally shot honour guard Cpl. Nathan Cirillo at the National War Memorial before rushing into Parliament's Hall of Honour, where he was killed in a flurry of bullets. Former House of Commons sergeant-at-arms Kevin Vickers, now Canada's ambassador to Ireland, was lauded for his role in subduing Zehaf Bibeau, but there has been no formal recognition of others. The RCMP was responsible for the grounds of the parliamentary precinct during the attack, while House of Commons and Senate security forces had jurisdiction inside the Parliament nuildings. A now-merged parliamentary protective service manages dayto-day security on Parliament Hill, a direct consequence of Oct. 22 intended to avoid confusion. Times Colonist, A8 (Kingston Whig-Standard, London Free Press, Chronicle Herald); Postmedia News (Ottawa Citizen, A8); Agence QMI (Journal de Montréal, 18)

Remembrance Day ceremonies planned throughout region
Communities across southeastern New Brunswick will join Canadians across the country in pausing to remember those who have served the nation in uniform and those who made the ultimate sacrifice doing so. Here's a look at some of the main Remembrance Day ceremonies around our region. Moncton: Thousands will gather at the Moncton Coliseum for the largest ceremony in our region, organized by the Royal Canadian Legion Branch Number 6. The ceremony runs from 10:30 a.m. to noon, with a special Lest We Forget display open after the ceremony in the adjacent Agrena complex. As well, the Sunny Brae Legion will host a parade that will leave the legion, 164 Broadway St., at 10:40 a.m. and end at the cenotaph on Massey Avenue. If it rains, the ceremony moves to the Knights of Columbus Hall on Broadway. There is also the annual informal ceremony at the Victoria Park cenotaph - including veterans and anyone who has served as a police officer, firefighter or in the military - that will be held at 11 a.m. Dieppe: The City of Dieppe, in collaboration with the Dieppe Military Veterans Association, will be holding a ceremony on Wednesday, November 11, at École Anna-Malenfant to commemorate Remembrance Day. The parade, made up of veterans, cadets and members of the RCMP, will form up around 10:30 a.m. and will make its way indoors for the ceremony. Times & Transcript, A3

Troubled veterans lacking necessary support: critics
It was chilly March day when former master corporal Collin Fitzgerald - one of the country's most highly decorated Afghan war veterans - decided that the way he wanted to go out was in a spray of police bullets. It was, he believed at the time, the only thing he could do to wash away the pain of his crumbling marriage and to erase from his mind the faces of dead Taliban fighters that haunted him each night, every

time he closed his eyes. "I was done with life and everything," Fitzgerald told The Canadian Press. "And I cannot truly say to you what that feels like, but is a very hollow, shallow, cold place to be." He tried everything. Nothing worked. "Therapy. The alcohol had run its course, the (prescription) drugs had run their courses; I was done," he said. "You just want the pain to be done. I get it." But the fact he found the strength to go on living for his daughter, and to eventually face justice after holding police at bay for five hours at his home in Iroquois, Ont., south of Ottawa, was just the start of his nightmare. Fitzgerald soon encountered another chilling reality: that Canada's justice system often treats troubled veterans as threats to public safety. After an eight-month investigation, The Canadian Press has found that the federal government allowed key findings in the tragic shooting death of another troubled veteran with severe post traumatic stress disorder to gather dust. The B.C. coroner's office investigated the September 2012 RCMP killing of retired corporal Gregory Matters and made several recommendations to both National Defence and Veterans Affairs, including making mental-health professionals available to police emergency response teams who deal with troubled veterans. Letters obtained by CP, dated from the summer of 2014 and addressed to the coroner, show that both federal departments believe they are doing enough to reach and treat troubled military members. Canadian Press (Record, A3, Spectator, Times & Transcript, Daily Gleaner)

Help sought in shooting probe - Investigative unit seeks witnesses to Friday's events
The province's team of independent investigators is looking for witnesses as it probes a police shooting that killed a Winnipeg man Friday. Mark DiCesare, 24, died after being shot by officers near Kapyong Barracks following a police chase through River Heights around 1:15 p.m. Friday. DiCesare had been upset over a recent breakup with his girlfriend, a source told the Free Press. Whether DiCesare was armed as he led police on a chase Friday is part of the Independent Investigation Unit of Manitoba's probe, said executive director Zane Tessler... The unit is currently investigating several other cases, including the recent police shooting of 44-year-old Haki Sefa Sept. 20, the case of a stolen RCMP gun being used in a gang-related shooting that injured a teenage girl Oct. 24 and the apparent suicide of a murder suspect who shot himself after police tried to pull him over Nov. 2. Missing man left financial quandary
Harold Backer, who has been missing since Nov. 3, may have left the country as a result of financial mismanagement that has cost his clients a considerable amount of money. The 52-year-old Backer, who is registered as an active mutual fund dealer with Investia Financial in B.C. and Ontario, was listed as missing last week by Victoria police. Some of Backer's clients, who asked to remain anonymous, told the Times Colonist it looks as though they have lost a substantial amount of money due to his actions.
It is unknown how many clients are affected. According to Canadian Securities Administrators, the umbrella group that brings together the country's various provincial securities regulators, Backer was an active dealer with Investia but under the terms and conditions of his registration he had agreed "to be closely supervised." The Mutual Fund Dealers Association did not return calls Monday to clarify what that meant. According to a spokesman, the B.C. Securities Commission cannot comment on whether a complaint has been made against a dealer or if an investigation is ongoing... On Monday, Victoria police announced they are working with U.S. law enforcement agencies to find Backer. "Both through our efforts and the fantastic support from our U.S. law enforcement partners, such as the Port Angeles Police Department, we continue to receive tips that we're working with now," said Det. Sgt. Kris Rice in a

statement. "Tips are important in a missing persons file like this and sometimes it is the smallest detail that helps." Times Colonist, A1

Opposition calls for action on fentanyl

Alberta's main opposition parties say Premier Rachel Notley's government has responded with indifference as deaths from fentanyl abuse have surged in the province and turned into a public-health crisis. Ms. Notley's New Democrats have defended their response to the fast-acting opioid by pointing to the creation of a committee to review mental health care in the province. However, members of the Wildrose and Progressive Conservative parties say resources need to be allocated immediately to overtaxed health and police services. In the first half of the year, 145 Albertans died from fentanyl... A pill of fentanyl costs about $20 on the streets of Alberta's major cities and is 50 times more potent than heroin. While the drug has been tied to prescription abuse in Eastern Canada, the variant found in the Prairies is believed to be produced by organized crime. What sets fentanyl apart from other opioids is how toxic it is - two milligrams are enough to kill the average person in less than 15 minutes. Globe and Mail, A11

Whistleblower to deliver address for Queen's

A man some people consider a hero and others believe is a criminal is to present the opening address at a Queen's University conference later this week. Edward Snowden, 32, the former Central Intelligence Agency employee and United States government contractor who leaked thousands of classified documents that revealed the extent of global surveillance programs operated by the U S. and its English-speaking allies, is to present the opening keynote speech at the Queen's International Affairs Association's Model United Nations Invitational on Thursday. The event is to include 250 student delegates from 15 schools across North America. Snowden, who has asylum in Russia, is to speak about cyber security at the conference via video link... Bill C-51, the Anti-terrorism Act 2015, broadened the authority of Canada's surveillance and law enforcement agencies by giving them more power to thwart suspected terrorist plots - not just gather information about them. Lauren Craik, president of the international affairs association and a third-year economics student, said the talk is to be tailored to the Canadian audience. Kingston Whig-Standard, A3

Screening for refugees ready to go, Liberals say
Some security screening will be conducted on Canadian soil as the Liberals push to bring in 25,000 Syrian refugees by the end of the year, Public Safety Minister Ralph Goodale says. Goodale told reporters that security checks on the refugees will be conducted both before and after the refugees begin arriving in Canada. "It will be a combination of both," said Goodale after a cabinet meeting Thursday. Security concerns were among the chief reasons the previous Conservative government advocated for moving slower on the refugee file - although Harper's former chief of defence staff, Rick Hillier, suggested those were overblown. Goodale said his officials assured him they can get the job done, despite the ambitious timeline. Goodale's portfolio includes CSIS, which does much of the screening work, as well as the Canada Border Services Agency and the RCMP. "My officials are satisfied that, to the extent that there are security issues, that they can be properly managed within the frame that the government is considering, and that Canada can fulfil the objective of receiving and settling 25,000 refugees in an expeditious way," Goodale said. CONTRACT & ABORIGINAL POLICING / SERVICES DE POLICE CONTRACTUELS ET AUTOCHTONES

WINDSOR HOSPITAL ASSAULTS
The president of the **Nova Scotia** Nurses' Union wants a plan in place to protect her members after a nurse and security guards were assaulted in the Hants Community Hospital emergency room Tuesday night. Janet Hazelton says the occurrence, which resulted in minor injuries, is far from a rarity and needs to stop. There were 153 assaults on nurses by patients last year, she said. "When a violent patient comes

into (a hospital), we should have a plan. We should have security that are actually able to restrain patients if they have to." Thomas Steven Orman, 40, of no fixed address was arraigned in Kentville provincial court Thursday on charges of assault (twice spitting at a nurse), causing a disturbance and breach of a court order. Orman was a patient at the Windsor hospital. He has consented to a remand for a psychiatric assessment at the East Coast Forensic Hospital in Dartmouth. He returns to Windsor provincial court for a plea on Nov. 24. Hazelton said it took several serious incidents involving nurses in Ontario before the government there gave security the power to step in and restrain patients when necessary. "They're able to handcuff patients if they have to and they're allowed to physically take a patient down if they need to. They very seldom have to, but just the thought that they can is reassuring for the patients and for the nurses." A spokesman for the Nova Scotia health authority said security guards are trained to provide "hands-on assistance with aggressive patients, at the direction of clinical staff." At about 8 p.m. Tuesday, Windsor District RCMP responded to a complaint of a disturbance in the hospital's emergency room. The accused is known to police, provincial RCMP spokesman Const. Mark Skinner said. Prior to Tuesday night's police call, RCMP had received other calls about the man "but this is the call we had to act on," Skinner said. Hazelton said part of the problem is a reduction in services for people with behavioural issues. Group homes usually have zero tolerance for assaults on patients, she said, and so it usually means if a patient is kicked out of a home, they end up in an emergency department at a hospital where nurses and other staff aren't equipped to deal with situations when they escalate. Chronicle Herald, A1

Man pleads guilty to killing his mother

Ryan Ernest Roy has pleaded guilty to killing his mother. In Court of Queen's Bench in Woodstock Thursday morning, the 25-year-old pleaded guilty to second-degree murder of Phyllis Roy in **Peel**, a small community in the outskirts of Hartland. Roy, who was originally charged with first-degree murder, entered his guilty plea before Justice Tracey K. DeWare. Roy was scheduled to be in the Woodstock court to begin his preliminary hearing... Following the guilty plea Thursday morning, the family of Phyllis Roy released a media statement: "In March, our family was heartbroken when we lost our beloved Phyllis. Phyllis was a loving person who touched the lives of many people, especially her family and friends. We miss her every day. "It is difficult for anyone to lose a family member at any time. Our grief has been compounded by the tragic circumstances surrounding Phyllis's death. We greatly appreciate those in the community who have extended their kindness, thoughts and prayers to us during this difficult time. We want to thank the RCMP for their professionalism and compassion throughout their investigation. We also want to thank the members of the media who have respected our request for privacy as our family continues to deal with this tragedy. Daily Gleaner, A1

Prank with raft cost BC Ferries $40,000

A man who deployed a life raft and jumped overboard from a ferry in Active Pass last week cost BC Ferries $40,000, according to a company spokeswoman. Deborah Marshall says the cost was greater than a typical search and rescue mission because the life raft was damaged and had to be replaced. A young man was arrested after he allegedly jumped offa ferry, swam to **Galiano Island**, and broke into a house while naked. The RCMP is recommending criminal charges of break and enter and mischief under $5,000. Postmedia Network (Vancouver Sun, A12)

Northern Alberta man charged in wife's death

A man has been charged in the death of his common-law wife on a northern Alberta First Nation. Peter Noskey, 35, has been charged with manslaughter in connection with the death of Vicky Cardinal, 35, police said. Cardinal was transported from **Peerless Lake**, a community 235 kilometres east of Peace River, to hospital in Edmonton last Thursday. She died Sunday. An autopsy has been scheduled. Cardinal and Noskey lived together on Peerless Trout First Nation, police said. Postmedia Network (Edmonton Journal, A7)

Quesnel man promoted hatred

A **Quesnel** man charged with using his website to promote hatred against Jewish people has been found guilty by a B.C. Supreme Court jury. Roy Arthur Topham, publisher and editor of The Radical Press since 2008, had been charged with "communicating statements which wilfully promote hatred against an identifiable group." On Thursday morning, a 12-person jury in Quesnel found Topham guilty on one of two

counts of wilful promotion of hatred, Crown prosecutor Jennifer Johnston said. Johnston said she hadn't yet formulated her sentencing position, but a sentence for promoting hatred carries a maximum two years less a day in prison. Following a six-month investigation, Topham was arrested in his car in 2012 when he and his wife were leaving their property. Mounties searched and seized Topham's property after determining there were "reasonable grounds that the offence of promotion of hatred was committed." Topham's site hosts anti-Semitic texts including "The Protocols of the Learned Elders of Zion," "The Biological Jew" and "The Jewish Religion: Its Influence Today." Postmedia News (Province, A13) (2015-11-13); Prince George Citizen (2015-11-12)

Moose hunt on North Mountain suspended
Parks Canada temporarily suspended a moose hunt in the **Cape Breton Highlands National Park** following a confrontation between protesters and Mi'kmaq harvesters. Discussions are underway between Parks Canada and Mi'kmaq representatives to ensure that all necessary safety measures are in place before the controlled moose hunt resumes this fall. "Public safety for all involved remains the top concern of Parks Canada in this endeavour," said Coady Slaunwhite, Parks Canada public relations and communications officer. "We are working with RCMP and Unama'ki Institute of Natural Resources on public safety and security measures." At around 10 a.m. Wednesday, 30 protesters entered the restricted area moose harvest zone. Some proceeded to the staging area and confronted the Mi'kmaq harvesters. Parks Canada law enforcement branch personnel and RCMP responded. Slaunwhite said by 11 a.m., most of the protesters had left. Cape Breton Post, A7

Family holds Winnipeg vigil for woman found dead on First Nation
The family of a woman found dead on a remote, northern Manitoba First Nation this week gathered for a vigil at the steps of the Manitoba Legislature Thursday night. Krystal Andrews, 23, was found dead in an isolated area on **God's Lake First Nation** on Monday. RCMP are calling her death suspicious. CBC News (2015-11-13); CTV News (2015-11-12)

FEDERAL & INTERNATIONAL OPERATIONS / OPÉRATIONS FÉDÉRALES ET INTERNATIONALES

Shadowy Black Axe group leaves trail of tattered lives
Canadian police say they are fighting a new kind of criminal organization. The signs began to appear two years ago: photos on Facebook of men wearing odd, matching outfits. Then there were stories, even old police files, attached to the people in the photos: a kidnapping, a man run over by a car, brutal beatings over what seemed to be a small slight. Mapping a secret criminal hierarchy for the first time is a rare kind of detective work. So when two Toronto police officers and an RCMP analyst in British Columbia started documenting the existence of something called the "Black Axe, Canada Zone," they could not have predicted it would take them to funerals, suburban barbecue joints and deep into African history before they understood what they were seeing. The Black Axe is feared in Nigeria, where it originated. It is a "death cult," one expert said. Once an idealistic university fraternity, the group has been linked to decades of murders and rapes, and its members are said to swear a blood oath. Most often, the group is likened to the Mob or to biker gangs, especially as it spreads outside Nigeria. An investigation by The Globe and Mail that included interviews with about 20 people found that "Axemen," as they call themselves, are setting up chapters around the world, including in Canada. Globe and Mail, A1

Tragédie Lac-Mégantic: Tom Harding comparaît à nouveau
Il fait face cette fois à deux chefs d'accusation provenant des procureurs de la Couronne fédérale, à la suite de l'enquête menée par le Bureau de la sécurité dans les transports (BST), Transports Canada, la Sûreté du Québec (SQ) et la Gendarmerie Royale du Canada (GRC), un premier relatif à la Loi sur la sécurité ferroviaire, en rapport avec la tragédie elle-même, et un deuxième concernant la Loi sur les pêches et l'environnement, à la suite de la pollution du lac Mégantic. M. Harding a comparu devant le juge Paul Dunnigan, de la Cour du Québec. L'homme n'a pas eu à témoigner et est resté imperturbable. Il était le seul accusé présent, même si six autres personnes reliées à la MMA devaient aussi comparaître, soit Robert Grindrod, président de la MMA et résidant du Maine, Jean Demaître, directeur des opérations au Canada, Michael Horan, directeur adjoint aux opérations à Farnham, Lynne Labonté, directrice

générale des opérations de transport, Richard Labrie, contremaître, et Kenneth Strout, directeur des pratiques d'exportation. La Presse (La Tribune, 30); 1

ORGANIZATIONAL ISSUES / ENJEUX ORGANISATIONNELS

Trudeau troublé que la GRC ait voulu espionner des journalistes de La Presse
Le premier ministre Justin Trudeau juge troublantes les informations voulant que des policiers de la Gendarmerie royale du Canada aient voulu espionner les déplacements et appels téléphoniques d'un journaliste de *La Presse* pour démasquer la source qui lui avait fourni des informations sur les plans terroristes attribués à Adil Charkaoui. Estimant que la liberté de la presse fait partie des fondements d'une saine démocratie, M. Trudeau a aussi indiqué que son gouvernement examine scrupuleusement cette affaire afin de déterminer s'il y a des correctifs qui doivent être apportés. En point de presse hier à l'issue d'une réunion de son cabinet, M. Trudeau a affirmé qu'il défendrait avec énergie la liberté de la presse en tant que premier ministre. « J'ai toujours reconnu le principe et la valeur de la liberté de la presse. Une presse forte et indépendante est un fondement important d'une démocratie forte et en santé. » - Justin Trudeau « Les questions que vous soulevez feront l'objet d'un examen. Il est important de s'assurer que nous avons une presse forte et libre qui est capable de faire son travail. C'est ce que j'appuie », a affirmé M. Trudeau en réponse à une question d'une journaliste du quotidien *Toronto Star*. En français, M. Trudeau a ajouté : « Je sais que la presse joue un rôle extrêmement important dans le bon fonctionnement de notre démocratie et de toute démocratie. Je continue de vouloir défendre la liberté de la presse. « Évidemment, sur ces enjeux troublants, j'attends d'en savoir un peu plus. Mais vous pouvez être assurés que la liberté de la presse en est une que je prends très au sérieux. » La Presse, 13; Canadian Press (Times Colonist, B7, Daily Gleaner, Times & Transcript); Weekly Standard (2015-11-13); Toronto Star, A4; La Presse (2015-11-12)

3 Mounties hurt, 3 cruisers damaged during wild escape attempt
Two suspects are facing a slew of charges following a wild escape attempt through Kimberly, B.C. that left three Mounties injured and three RCMP vehicles badly damaged early Thursday morning. Authorities said the incident started while an officer was responding to a theft at a local golf course around 2 a.m. He was speaking with a security guard when a truck suddenly rammed his cruiser and took off. On its way out, the truck – which the RCMP determined was stolen – also allegedly struck a second police car that was headed to the scene. "The two police cars were able to follow it down into our downtown core," Cpl. Chris Newel told CTV News. "The suspect vehicle stopped very quickly, shoved it into reverse, and smashed into the front-end of [one of the cruisers]." Shortly after, the driver of the stolen truck allegedly lost control of the vehicle and struck a storefront – but still managed to drive off once again. Newel said the truck headed to a local ski hill next, where the officers managed to corner it, only to be rammed once again. At that point, one of the cruisers was so badly damaged it was inoperable, but another RCMP vehicle from the neighbouring detachment in Cranbrook arrived to assist in the pursuit. The stolen truck was ultimately surrounded and stopped at the ski hill's maintenance yard, but the RCMP said two suspects bolted on foot before finally being placed under arrest a short distance away. Newel said the suspects are facing "a multitude of charges," including possession of stolen property, dangerous operation of a vehicle, resisting arrest, assault, and theft. It's unclear how much it will cost to clean up the damage from the chaotic incident. "We've got three vehicles that have been probably destroyed in this incident… and some injuries to a few of our officers which, fortunately, are not serious," Newel said. The RCMP said two of the officers involved suffered back injuries and another sustained an injury to his eye. CTV News

Mounties apologize for handling of verbal racist attack
Two years after being subjected to a racist tirade by an unruly passenger a Calgary cab driver has received an apology. The apology to Sardar Qayyum comes from the RCMP, which reviewed how the verbal assault in November 2013 was handled. A video from the cab's dashcam became public last summer and shows a front-seat taxi passenger using racial slurs and telling the driver to go back to where he came from. He also implied the driver was involved in terrorism. An RCMP officer got the passenger to pay Qayyum for breaking his camera, but there were no criminal charges. Canadian Press

(Cape Breton Post, A10, Guardian); Canadian Press (National Post, A6, Calgary Herald, Edmonton Journal); Calgary Sun, A3 (2015-11-13); Calgary Herald (2015-11-12)

Man who stole cruiser caught near Thorsby
RCMP have arrested a 26-year-old man who escaped custody by stealing a police cruiser near Thorsby late last month. Jason McGinn was captured Sunday in Rocky Mountain House, police said. He escaped Oct. 26 while being transferred from Thorsby RCMP to Drayton Valley RCMP about 9 a.m. He jumped into the driver's seat of a marked RCMP car and drove away. The car was discovered a short time later abandoned near Warburg. Nothing had been removed from the car. As a precaution, there was a lockdown at Warburg School while RCMP searched the area. McGinn is expected in court in Thorsby Nov. 17 to faces 10 charges connected to his escape, including dangerous operation of a motor vehicle, assault with a weapon, mischief, escaping lawful custody, theft over $5,000 and breach of recognizance. He was originally in custody on charges of personation, possession of stolen property, driving while prohibited and many charges related to violating probation. He was to appear in court in Rocky Mountain House Nov. 18 to face this set of charges. Thorsby is 70 kilometres southwest of Edmonton. Postmedia Network (Edmonton Journal, A2); Edmonton Sun, A7; Red Deer Advocate, A3 (2015-11-13); CTV News; Global News; Edmonton Journal (2015-11-12)

Case of Edmonton man ticketed for anti-Harper sign going to higher court
An Edmonton man who was issued a $543 fine for putting a sign in his car window with an expletive aimed at former prime minister Stephen Harper says his case is being bumped up to provincial court. Rob Wells made an appearance in traffic court on Thursday, where he served notice of his intent to file a constitutional argument against the stunting ticket. He had been pulled over last August by an RCMP officer just south of Edmonton and was told to remove the sign but refused, saying it was a political statement and he had a right to have it in his window. At the time, RCMP Sgt. Josee Valiquette wouldn't comment on the sign and said police stopped Wells after receiving two complaints about erratic driving. The case was put over to Nov. 27, when Wells will appear before a provincial court judge and a later court date will likely be set. Wells devised the handmade, pink "F--k Harper" sign to voice his contempt for Harper's Conservative government. He said although some motorists gave him the thumbs up of approval, in Alberta he got more than a few birds flipped at him, including one woman who he said filed an official complaint with RCMP. CTV News

Lawyer in civil suit seeking toxicology, autopsy, ballistic reports
A lawyer representing the partner of a Tracadie man shot and killed by Bathurst Police is seeking toxicology, autopsy, scene reconstruction and ballistic reports into his death. Last July, Annick Basque launched a civil suit against the City of Bathurst and its police force following the death of her common-law partner, 51-year-old Michel Vienneau, who was killed last January. A motion to receive documents pertaining to the case was heard in French before Judge Larry Landry in the Court of Queen's Bench at the Bathurst courthouse on Nov. 12. Neither Basque nor anyone representing the city appeared in court on Nov. 12. Basque's lawyer, Charles L. LeBlanc, explained why he felt the documents should be released to him. The documents he seeks are a toxicology and autopsy report on Vienneau and a copy of RCMP documents on the case including scene reconstruction and the ballistic report. Maya Hamoud, counsel for the attorney general of New Brunswick, and Catherine McIntyre, counsel for the Department of Justice of Canada, presented their points as to why the documents should not be released. One of the reasons sited by Hamou is the possibility of interfering with a criminal case if charges are laid by the Public Prosecution Services of New Brunswick. The New Brunswick prosecution office is looking into Vienneau's death following the completion of an investigation by Nova Scotia RCMP last July. The RCMP investigated to determine if any criminal charges should be laid in Vienneau's death. Police will not reveal their findings to the public. Telegraph-Journal, A5

Affaire Vienneau
Les procureurs généraux du Canada et du Nouveau-Brunswick refusent de dévoiler, pour l'instant, le rapport indépendant de la GRC sur la mort de Michel Vienneau, abattu par un policier il y a dix mois, de même que les dossiers d'autopsie et de toxicologie. Ils invoquent qu'une divulgation prématurée pourrait nuire à d'éventuelles accusations criminelles et à un procès. Dans le cadre de sa poursuite civile contre la Ville de Bathurst, la compagne de la victime, Annick Basque, demande que ces rapports lui soient

fournis, en vertu d'une ordonnance du tribunal. La motion a été débattue en Cour du Banc de la Reine de Bathurst, jeudi matin. Au nom de la GRC, le procureur général du Canada affirme que l'inspecteur Larry Wilson, qui a mené l'enquête sur les circonstances du drame, collabore toujours avec le service des poursuites publiques du Nouveau-Brunswick quant à de possibles accusations au criminel. «Notre inquiétude est que la divulgation des documents demandés pourrait nuire à la poursuite criminelle. Nous ne disons pas que les documents pertinents ne seront pas divulgués, mais que nous ne pouvons pas le faire maintenant», a expliqué Me Catherine McIntyre au juge Larry Landry. Acadie Nouvelle, 2

EDITORIALS & OPINIONS / ÉDITORIAUX ET LETTRES D'OPINIONS

In search of a better way
An opinion piece by a former soldier states ''It was chilly March day when former master corporal Collin Fitzgerald - one of the country's most highly decorated Afghan war veterans - decided that the way he wanted to go out was in a spray of police bullets. It was, he believed at the time, the only thing he could do to wash away the pain of his crumbling marriage and to erase from his mind the faces of dead Taliban fighters that haunted him each night, every time he closed his eyes. "I was done with life and everything," Fitzgerald told The Canadian Press. "And I cannot truly say to you what that feels like, but is a very hollow, shallow, cold place to be." He tried everything. Nothing worked. "Therapy. The alcohol had run its course, the [prescription] drugs had run their courses; I was done," he said. "You just want the pain to be done. I get it." But the fact he found the strength to go on living for his daughter, and to eventually face justice after holding police at bay for five hours at his home in Iroquois, Ont., south of Ottawa, was just the start of his nightmare. Fitzgerald soon encountered another chilling reality: that Canada's justice system often treats troubled veterans as threats to public safety. After an eight-month investigation, The Canadian Press has found that the federal government allowed key findings in the tragic shooting death of another troubled veteran with severe post traumatic stress disorder to gather dust. The B.C. coroner's office investigated the September 2012 RCMP killing of retired corporal Gregory Matters and made several recommendations to both National Defence and Veterans Affairs, including making mental-health professionals available to police emergency response teams who deal with troubled veterans.'' Canadian Press (Times Colonist, C1/Front)

Experts defend 'big data' spying
Federal security agencies risk being overwhelmed by threats - or failing to even foresee them - unless they embrace the digital-age phenomenon of big-data crunching, warns an internal Public Safety Canada presentation. With billions of people using mobile phones and surfing the Internet, security officials are preoccupied with getting timely access to valuable information. But the recent past is littered with challenges related to information sharing and privacy, including controversy over the Conservative omnibus bill known as C-51, the presentation notes. Officials acknowledge the public might not trust government to respect privacy in the process, pointing to revelations by former U.S. spy contractor Edward Snowden about widespread surveillance of communications. "Canadians are increasingly concerned about issues of crime and terrorism, but in the post-Snowden era, public concerns about government data use may stand as a barrier to the effective use of innovative data analytics by law enforcement and security organizations," the presentation says. Big data analytics generally refers to the process of gathering and systematically sifting through millions or even billions of pieces of data - numbers, text, graphics, videos and sensor information - to glean insights that can't be detected through standard methods. Mounties sent to help authorities in Burkina Faso
RCMP officers have been dispatched to Burkina Faso to help local authorities after more than two dozen people - including six Canadians - were killed in a terrorist attack. A government official, speaking on condition of anonymity, says the Mounties will assist officials with victim identification and paperwork so the bodies of Canadian victims can be returned home. Six Quebecers on a humanitarian mission were killed in Burkina Faso's capital of Ouagadougou last week during an attack carried out by al-Qaida. Four of the dead were from the same family: Yves Carrier, his wife Gladys Chamberland, their adult son Charlelie Carrier and Yves' adult daughter, Maude Carrier. Adam Barratt, a spokesman for Foreign Affairs Minister Stephane Dion, says the department's priority is the families of the victims. He says departmental resources in Ottawa and overseas will be used to help repatriate the victims as fast as possible. CONTRACT & ABORIGINAL POLICING / SERVICES DE POLICE CONTRACTUELS ET AUTOCHTONES

Crime Stoppers plays vital role
If you were driving past the **Lunenburg County** RCMP detachment in Cookville during the late afternoon of Jan. 8 you may have seen two hardened criminals being apprehended by detachment staff. You may also have seen those same criminals, in handcuffs and leg irons with ball and chains hampering their walking, being forced to raise the Crime Stoppers flag on the flag pole in front of the RCMP detachment. January is National Crime Stoppers Month and those two hardened criminals, Fenton Dibbin and Marlene

Mercer, are volunteers with Lunenburg County Crime Stoppers. This month, several of the volunteers with the local organization will be at retail locations in the county promoting Crime Stoppers and the work that the organization does to support local police officers in their work. Crime Stoppers is a non-profit organization that combines the public, media and police in a crime-solving effort. The simple premise of the program is to use the media to ask the public to get involved in assisting the police by identifying suspects involved in criminal activities. It is funded by donations from the public, service groups, organizations and through fund raising initiatives, emanating from the board of directors of local Crime Stoppers chapters. Postmedia Network (Chroncile Herald, S4)

Saisie de drogue à Shippagan

Deux femmes de **Shippagan**, âgées de 47 et 50 ans, ont été arrêtées à la suite de l'exécution d'un mandat de perquisition dans un appartement de Shippagan. Vendredi, vers 19 h, des agents du District du Nord-Est de la GRC, assistés par des membres de la Section de la réduction de la criminalité et de la Section des chiens policiers, ont exécuté un mandat de perquisition à Shippagan. La GRC annonce que les agents ont saisi de la marijuana, de la méthamphétamine, de la cocaïne, des produits du tabac non estampillés, de l'argent ainsi que des instruments pour l'utilisation de drogues illicites. Les femmes ont été libérées, mais devront comparaître en cour provinciale ultérieurement. Acadie Nouvelle, 7

Sex assault charge dropped against cabbie

An **Antigonish** cab driver has had one of two sexual assault charges against him dropped. William Roger MacLellan was charged in November 2014 for allegedly, on two separate occasions, groping highly intoxicated young women who took his cab home from Piper's Pub to their dorms at St. Francis Xavier University. "I've reviewed the evidence," Crown attorney Darlene Oko told Judge Laurel Halfpenny-MacQuarrie during the third day of MacLellan's trial in Antigonish provincial court. "I do not believe the court could convict him on that charge." The dropped charge stems from an alleged incident during the early-morning hours of Feb. 15, 2014, when an underage St. F.X. student claimed a cab driver had groped her breasts. The woman admitted during her testimony last October that she was drunk to the point of blacking out during the alleged assault and that she never looked at the driver and could only identify him by his voice. Testimony by RCMP officers on Tuesday focused on the remaining sexual assault charge. (...) "My cab driver molested me," the alleged victim told the 911 operator. In the background, a man could be heard telling her that she had fallen and hit her head at the pub. "That's Roger (MacLellan)," RCMP lead investigator Const. Catherine Bezaire told the court. "I know his voice." Bezaire was one of three RCMP officers who testified Tuesday to the events of Oct. 19, from responding to the St. F.X. dorm where the heavily intoxicated victim was surrounded by a growing crowd of concerned passersby, to taking her statement and searching for a dark green van driven by a non-white male. Postmedia Network (Chronicle Herald, A4)

Trial on hold over photo issue

The trial of a man charged with several sex-related and child pornography crimes had to be delayed Tuesday because some of the images in the disclosure package had not been altered to render them non-pornographic. Crown attorney Bob Morrison told Judge Alan Tufts in **Kentville** provincial court that he received a compact disc of material from the RCMP's technical crime unit Monday but found that some of the images had mistakenly not been altered. Without that, the Crown couldn't provide the disclosure package to the defence without committing the crime of distributing child pornography. The information within the package included images from a phone seized as part of the police investigation. Morrison said after court that only a few of the images were mistakenly not altered. He said there were hundreds of images that police were dealing with in the case. Robin Lee Spidle, 24, is charged with sexual touching of a minor under the age of 16, invitation to sexual touching, sexual assault, possession of child pornography, and communicating with a person under the age of 18 for the purpose of obtaining sexual services.Postmedia Network (Chronicle Herald, A7)

Lawyer lands discharge for angler caught with pot at border

A New Jersey man avoided a criminal record on Tuesday for entering Canada with 14 grams of marijuana in his vehicle last year. However, Matthew Simonelli has likely earned himself trouble crossing the border, Judge Henrik Tonning noted in **Saint John** provincial court. The judge accepted the arguments from defence counsel Charles Bryant to grant the 30-year-old, Toms River, N.J., native an absolute discharge

for possession of marijuana at St. Stephen on Sept. 9. Simonelli did not attend court, but Bryant entered a plea of guilty on his behalf. Federal Crown prosecutor Peter Thorn related in court that Simonelli and his wife crossed the border at St. Stephen and declared two expensive bamboo fishing rods. The Canada Border Services Agency officer discovered that one Ryan Mockler tried to bring these same rods into the country earlier but he was deemed inadmissible to Canada, Thorn said. Border agents searched Simonelli's vehicle and found the marijuana plus $600 U.S. in a black shoulder bag, the prosecutor said. The agents investigated further and found messages on Simonelli's cellphone "that made a reference to other drugs and pills being contained in a container or cooler," Thorn said. The border guards searched the vehicle but found nothing, Thorn said. The agents issued a civil penalty of $250 and turned the matter over to the RCMP. "There was no nefarious intent. There was no smuggling operation," Bryant said. Postmedia Network (Telegraph-Journal, B2)

Driver unaware of fatal strike on senior

Oceanside RCMP believe they have found the driver involved in a Jan. 13 incident that killed an 80-yearold woman in French Creek. Based on evidence from the scene and witness accounts, police believe a commercial truck driver unknowingly hit the woman with a piece of equipment that was sticking out from the side of the vehicle. The woman was found lying on the side of the road a short distance from her home. She was taken to Nanaimo Regional General Hospital and then airlifted to Victoria General Hospital, where she died from head trauma. Speed or alcohol do not appear to have been factors. Police said the driver is very upset and is co-operating fully. Postmedia Network (Times Colonist, A4)

Mounties arrest man after tires slashed on four RCMP cruisers

An RCMP detachment east of **Edmonton** has been going through a lot of tires. Mounties say they have arrested a man after the tires of four police cruisers were slashed at the Vegreville detachment earlier this month. Jason Larry Kotowich, who is 35, has been charged with three counts of mischief under $5,000, resisting arrest and breaching a probation order. Postmedia Network (Red Deer Advocate, A3)

Death toll from fentanyl in Calgary exceeds fatal crashes, homicides combined

More **Calgarians** lost their lives to fentanyl overdoses last year than to homicide and fatal traffic collisions combined. It will be several months yet before the final number of fentanyl-related deaths in the city for the year are made public, but it was 74 from January 2015 through to the end of September. For all of 2015 there were 34 homicides and 23 fatal traffic collisions. Staff Sgt. Martin Schiavetta says it's showing no signs of slowing down. CalgarySun.com (2016-01-19)

Sexist signs cause stir on social media

A Prince Edward Island garage manager says he has received a death threat because of a promotional sign branded "sexist and misogynistic" by some angry commenters on social media. "Women are like snowflakes. They can't drive," read the sign outside Mellish Motors in New Annan, P.E.I., a rural community just outside of Summerside, P.E.I. John Mellish, 55, and his wife say they started the business nine years ago and post a new lighthearted message to the board every Sunday. "We've always had something funny or a topic of local conversation on our sign. I've poked fun at myself, my wife, overweight people. We've been brutal to some male people. " Because of social media, this morning at 6:45 a.m., a person phoned and threatened to shoot me. I reported it to the local RCMP because I think that person needs a little bit of help if an issue like this is touching them that bad." Local residents, commenting on Facebook, backed the business for its humorous messages. Some can remember phrases on the board from last February. Toronto Star, A3

Ambulance joyride ends in charges against patient

A 21-year-old woman has been charged with dangerous driving and theft after she allegedly stole an ambulance from the Royal Alexandra Hospital Tuesday and took it on a 40-minute joyride to Duffield. The woman, a patient at the hospital, gained access to a secure ambulance bay on the east side of the central **Edmonton** hospital and made off with the vehicle at about 6 a.m., ramming it through a glassand-steel garage door on 102nd Street north of Kingsway Avenue, said Dave Weiss, executive director for emergency medical services in the north zone. The keys were in the ignition, he said. Edmonton police pursued the vehicle, tracking it using its onboard GPS system, west through Edmonton and along Highway 16 into Parkland County. The RCMP managed to stop the ambulance and arrested the woman

without incident at about 6:40 a.m. near Range Road 32 and Highway 16 in Duffield. No injuries were reported, police said. Edmonton Journal, A1

Charge laid, but cold case remains open

It took 30 years for a murder charge to be laid in the death of an elderly **Interlake** man, and RCMP still don't consider the case solved, delaying closure for the family of two men who took polygraph tests in an attempt to prove their innocence. Four months ago, RCMP laid a second-degree murder charge against Lee Norman Pischke, 50, of the RM of Grahamdale, in the death of 80-year-old Michael Kalanza, who went missing in 1985. Police also arrested a 53-year-old Winnipeg man but let him go without laying criminal charges. At the time, Manitoba RCMP said investigators believed the two were the only ones responsible for Kalanza's death. Police said the 53-year-old Winnipeg man is still not facing charges and the investigation remains open. "We are continuing on vigorously to ensure that all persons involved are held accountable for this murder," an RCMP spokesman said in an emailed statement. "To this end, we would ask that anyone with information regarding the murder of Mike Kalanza call the historical case unit tip line at 204-984-6447 or call Crime Stoppers anonymously at 1-800-222-8477." RCMP couldn't release any other details about the ongoing investigation, which has spanned three decades. The lack of closure doesn't sit well with Pischke's uncle, 67-year-old Dennis Pischke. Winnipeg Free Press, B2

RATS, In gang culture, those who talk to cops are the worst form of life

But a former Mafia associate and a senior RCMP interviewer say it's becoming much more acceptable to violate the code of the underworld and co-operate with police. Former **New York** mobster Lou Ferrante still remembers the day in 1991 that he heard the shocking news that Salvatore (Sammy the Bull) Gravano had betrayed the Gambino family and was going to testify against John Gotti Sr. "When Sammy the Bull became a rat, none of us believed it. I was the first to say: 'no way'. And a few people said, 'yeah, it's true. It's happening,'" Ferrante recalled in a recent interview. The underworld perception of ratting has percolated through other gangs as well - including B.C. groups like the Red Scorpions and United Nations. The late gangster Bal Buttar once told The Vancouver Sun he was involved in several murders, but would never help police. "I've never in my life been a rat and I'll never be one," Buttar said. Ferrante, who left the Mafia while serving an eight-year prison sentence, thinks Gravano's deal to turn on the powerful Mob boss changed the underworld perception of rats. Breaking omerta - the code of silence ingrained in Mafia culture - was considered the worst offence, more odious than murder, and punishable by death. But then came a string of American cases where powerful mobsters like Gravano struck deals to testify. Some wrote books and became celebrities. "Now I understand there are a lot of rats, not to name names, that are walking around in Howard Beach and in Brooklyn and no one's doing anything to them, so I think the whole culture has changed," said Ferrante, who turned his life around without ever co-operating with police. He has written three books, including Unlocked: The Life and Crimes of a Mafia Insider. Postmedia Network (Vancouver Sun, A1)

RCMP defend handling of root beer incident

RCMP officers believed a man was obstructing a liquor offence investigation when he refused to comply with their instructions. Const. Robert Andrew Scott Burchett, 50, and Cpl. Kevin Roger Lee Halwa, 42, both testified Monday as to why they applied the force they did on Levi Desjarlais on the evening of Aug. 20, 2011. Desjarlais has filed a lawsuit against Halwa, Burchett and Cpl. Dean Allan Purcka, 41, for the alleged assault that followed. The three RCMP officers also face assault charges. Desjarlais said he was pepper-sprayed, kneed in the groin and beaten during the altercation. "If you obstruct the police, sometimes bad things happen," said Burchett during his testimony. Burchett and Purcka were in Sylvan Lake that evening on overtime from other detachments. In the summer, the **Sylvan Lake** RCMP are provided extra money from the town to increase the police presence for the summer rowdiness. Burchett was driving in a dark blue unmarked prisoner van. He saw Desjarlais walking on the sidewalk holding what he believed at the time to be a bottle of beer. Later, Burchett would learn it was in fact root beer. Throughout direct and cross examination, Burchett said he thought Desjarlais held a beer during the incident. Postmedia Network (Red Deer Advocate, A1)

La GRC appelle à la vigilance dans une affaire de fraudeurs agressifs

Des fraudeurs sophistiqués et agressifs qui se font passer pour des employés de l'Agence du revenu du Canada visent des **Néo-Brunswickois**. La GRC dit avoir reçu plus de 100 plaintes au cours du dernier

mois. Alors que la saison des impôts approche, la GRC demande aux Néo-Brunswickois d'être sur leurs gardes contre des escrocs qui se font passer pour des employés de l'Agence du revenu du Canada (ARC). Équipés d'outils qui leur permettent d'afficher un numéro de l'ARC ou de la GRC, les fraudeurs demandent à leurs victimes potentielles de rembourser de l'impôt impayé. Avec un accent étranger, ils parlent d'un ton agressif et menacent de se rendre à la maison de leurs victimes si elles ne leur donnent pas immédiatement de l'argent par carte de crédit ou par Western Union. La fraude est répandue à travers le pays. Lundi, la GRC de l'Ontario a publié la transcription d'un échange entre un arnaqueur et sa victime dans laquelle le faux employé de l'ARC menace de faire sauter la maison de son interlocuteur (voir encadré). Acadie Nouvelle

Wig-wearing robbery suspect arrested
Police in **Surrey** said they have arrested a suspect after a man robbed a bank last month wearing an odd disguise. RCMP said they arrested a 39-year-old resident of Surrey after asking for the public's help in identifying the man following a heist near the Guildford Town Centre on Dec. 29. Police said the suspect was wearing a patterned dress, white wool sweater, a long blond curly wig and a pink tuque that partially obscured his face. Postmedia Network (Times Colonist, A2, Vancouver Sun)

RCMP searching for alleged attempted murder suspect
Police are still looking for a **Grand Rapids** man wanted for an alleged attempted murder last month. Manitoba RCMP say Alex Sanderson, 22, is considered armed and dangerous. He's wanted in connection with a Dec. 11 shooting and stabbing in Grand Rapids that left two victims with non-life-threatening injuries. Police believe Sanderson may be in Winnipeg, Brandon, Grand Rapids or Easterville and urge the public to call 911 or their local police if they see him. Winnipeg Free Press; CTV News (2016-01-19)

La police saisit 1,4 kg de cocaïne
Après avoir entamé une enquête en août 2015, des membres de l'Unité de crimes de la rue de la Force policière de **Saint-Jean** ont procédé vendredi soir à l'arrestation de deux individus et à une importante saisie de stupéfiant. Vers 22 h 15, des membres de la police régionale de Kennebecasis, de la GRC et de la Force policière de Saint-Jean ont arrêté un véhicule automobile circulant sur la route 7 en direction de Saint-Jean. Une fouille du véhicule a permis la découverte à bord d'environ 1391 grammes de cocaïne, dont la valeur de revente dans les rues de Saint-Jean peut aisément atteindre 139 000$. Les policiers ont également mis la main sur une somme de 3700 $ en argent. L'Acadie Nouvelle, 9

Seven charged in Muskowekwan home invasion
Mounties are hunting for three men after a violent home invasion on a **Saskatchewan** First Nation. Police say it happened Monday night at a home on the Muskowekwan First Nation, about 140 kilometres northeast of Regina. RCMP say seven people in disguise forced their way into the home with steel bars, baseball bats and a firearm. The six adults and two children were in the home at the time. Leader-Post; CBC News (2016-01-19)

Nunavut RCMP investigate stabbing in Pangnirtung - 22-year-old man medevaced to Iqaluit
RCMP are looking for a suspect after a 22-year-old man was stabbed in **Pangnirtung**, Nunavut, on Saturday. Police say the man was outside his home when he was stabbed. He was medevaced to Iqaluit, where he's being treated for non-life-threatening injuries. CBC News (2016-01-19)

Medical marijuana grow ups raided
On Jan. 13, Comox Valley RCMP Drug Section and General Investigation Section executed three search warrants in relation to licenced medicinal marijuana grow operations in the **Comox Valley**. Warrants were executed at a residence in Courtenay and at licenced marijuana operations in both Cumberland and Black Creek. A total of 423 plants were seized, as well as several vehicles including a motorhome, three motorcycles, a snowmobile, two automobiles and a boat, which are believed to have been purchased with proceeds of crime. ComoxValleyRecord.com (2016-01-19)

FEDERAL & INTERNATIONAL OPERATIONS / OPÉRATIONS FÉDÉRALES ET INTERNATIONALES

Burkina Faso Attacks: RCMP Dispatched After 6 Canadians Killed
RCMP officers have been dispatched to Burkina Faso to help local authorities after more than two dozen people — including six Canadians — were killed in a terrorist attack. A government official, speaking on condition of anonymity, says the Mounties will assist officials with victim identification and paperwork so the bodies of Canadian victims can be returned home. Six Quebecers on a humanitarian mission were killed in Burkina Faso's capital of Ouagadougou last week during an attack carried out by al-Qaida. Canadian Press (Huffington Post); Québec Hebdo; CBC News; La Presse Canadienne (L'actualité); Canadian Press (Globe and Mail) JournaldeMontréal.com (2016-01-19)

What, if anything, should Canada do after Burkina Faso? Your reactions
A senior Canadian government official told CBC News that RCMP officers have been sent to Burkina Faso to "help in whatever way they can." They will be repatriating the bodies of the six Canadians killed in last weekend's attack on a popular hotel and a cafe in Ouagadougou. Government officials, including Prime Minister Justin Trudeau, have condemned the attacks, while interim Conservative Leader Rona Ambrose used the attacks to criticize Trudeau for not doing enough to fight terrorism. We posed the question to you: what do you think of Canada's response to the Burkina Faso attacks? How should we respond? You weighed in via the discussion on CBC Forum, our new attempt to encourage a different kind of conversation on our website. Here are some of the most insightful, passionate and engaging comments we received during that discussion. CBC.ca (2016-01-19)

Weighing our privacy against security
With a spike in terrorism over the past 15 years, governments around the world have moved to enhance border security. At first it was seen in more flight security and stricter travel laws but with advances in computer technologies security agencies have turned their attention toward spying on their own citizens. Agencies like the NSA have inserted themselves into the homes of almost every U.S. family, and even share data with other countries. In light of revelations into just how widespread government surveillance is, thanks to whistleblowers like Edward Snowden, a global debate has erupted on the ethical implications. Do governments have the right to collect data on their own citizens without their consent? And should personal freedoms like privacy be sacrificed in the name of security? (...)As one who has expressed grave concern in the past about the anti-terrorism legislation enacted by the previous government, I have to point out that the expectation of privacy for citizens and residents of Canada is not the same for visitors, nor should it be. There are very different standards. In our haste to undo the covert and immoral surveillance of people going about their everyday business, we should not lose sight of the legitimate expectations of Canadians to be secure from outside threats. Entry to Canada is precisely when we should employ due diligence. (...)The RCMP must either prove the allegations against Ayaan Farah or apologize and get her employer to rehire her. Toronto Star, A12

Terror charge dropped but still no passport
Nearly two years after a court stayed charges against Mouna Diab, who had been accused of smuggling arms parts to the terror group Hezbollah, the government is still balking at granting her a passport. The National Post has learned that Diab, 30, filed a motion with the Federal Court last month, claiming Ottawa is infringing her Charter rights by refusing to act on a passport application she made in June 2014. The passport application came after the Crown abruptly dropped charges against Diab, who was arrested at Montreal's Trudeau airport in 2011. A native of Lebanon, Diab emigrated to Canada in 1993 as a seven-year-old and gained Canadian citizenship two years later. When she was charged with committing a crime for the benefit of a terrorist group, the Royal Canadian Mounted Police issued a news release alleging she was "acting under the direction of a contact person in Lebanon who is associated with Hezbollah." She faced a second charge of violating a United Nations arms embargo of Lebanon. But on April 17, 2014, a federal prosecutor requested a stay of proceedings, declaring in a brief statement that "there was no longer a reasonable prospect of conviction." Her passport had been revoked following her arrest. When she applied for a new one she was told her request required "a second level of examination" and would not be processed within the standard time. Her lawyer, Richard Prihoda, said she was interviewed for 90 minutes by two Passport Canada agents in October 2014 and was told a decision was

imminent. "Everybody keeps saying a decision is going to come soon, but here we are almost two years later, and nothing has been done," he said. He would not speculate on why her application is being held up, but described her arrest and the subsequent charges as "a tempest in a teapot." The federal attorney general has declared its intention to oppose Diab's request for a court order requiring the Department of Citizenship and Immigration to act on her application. The department would not comment when asked why Diab's passport application has been delayed. "As the matter is before the court, it would be inappropriate to comment," department spokeswoman Jessica Seguin said. This would not be the first time the government has used its passport powers against people who have come under RCMP scrutiny. The government has had the power to refuse or revoke passports on security grounds since 2004. The section was used to deny a passport to Fateh Kamel, who returned to Canada after serving prison time in France for terrorism-related offences. In 2014, Ali Sbeiti, an Iranian-trained Montreal imam, had his passport revoked and was informed he was a "subject of interest" in an RCMP national security investigation. National Post, A5

We can't go backwards on terrorism

If charity begins at home, so does national security - specifi cally at the House of Commons. Prime Minister Justin Trudeau is advised to remember this in the upcoming weeks, as Parliament resumes sitting and he has to decide whether the security measures of the previous Conservative government are too strong, too weak or just right. You know Trudeau has never discovered a security or defence scenario he considers too weak. He hypocritically voted for the Tory Anti-Terrorism Bill (C-51) while in Opposition because if there is anything Trudeau understands it is optics. With terrorist attacks, including a recent assault on Parliament Hill by an ISILinspired, lone-wolf fanatic named Michael Zehaf Bibeau, in everyone's mind, Trudeau reasoned (or at least received the correct advice) that he had better not appear too soft on terrorism with an election around the corner. Incredibly, the nattering Trudeau national media supporters now applaud Justin's "strategic" (read: cynical) decision to side with Stephen Harper. More incredibly, in the wake of outrageous terrorist attacks across Europe, and with the recent RCMP revelation that lone gunman Bibeau would have had a tough time pleading not guilty by reason of insanity in a court of law, Trudeau is prepared to pounce on the anti-terrorism act, suffi-ciently neutering its efficacy to the point of rendering it null and void. Make no mistake, the Oct. 22, 2014, attack on Parliament Hill was not an indication of how serious a terrorist attack on our government structure can be; it was an omen of worse to come should we choose to pretend that violent protest is not indigenous to Canada. Postmedia Network (Ottawa Sun, A6)

Goodale calls refugee integration crucial

Public Safety Minister Ralph Goodale says it's vital that resettled Syrian refugees are successfully integrated into Canadian towns and cities, not just from a social and cultural perspective, but from a public safety perspective. (…) At a Liberal cabinet retreat this week in New Brunswick, Immigration Minister John McCallum said the challenge is not if the target number will be met, but to find places for them to live and help them find jobs. In the face of incidents like the fire-bombing of a Peterborough, Ont. mosque and the pepper-spraying of Syrian refugees in B.C., Goodale was asked by the Star whether he worried about the ability of some Syrian refugees to integrate and the issues of radicalization that might arise in communities where Muslim youth may feel isolated or disenfranchised. (…) However, Goodale, the minister in charge of national security agencies such as the RCMP, CSIS and Canada Border Services Agency, said his first order of business is to create a watchdog committee of parliamentarians who would serve as a check and balance on those forces. Toronto Star, A10

Provinces, feds team up on drug buys

The federal government has joined Canadian provinces and territories in a bulk-buying drug program that aims to lower the cost of prescription medications. Health Minister Jane Philpott says federal drug plans will unite with the provincial and territorial pan-Canadian Pharmaceutical Alliance, which negotiates to lower prices on brand name and generic drugs. The announcement comes as the country's health ministers gather in Vancouver this week to discuss issues such as chronic diseases, drug costs and funding formulas. Philpott says in a statement that combining the negotiating power of federal, provincial and territorial governments achieves greater savings for all publicly funded drug programs, increases access to drug-treatment options and improves consistency of pricing. Federal health plans provide drug benefits to First Nations and Inuit, the RCMP, the Canadian Forces, veterans, federal inmates and

refugee protection claimants, totalling $630 million in 2014. Postmedia Network (Chronicle Herald, A8, Edmonton Sun, Times Colonist, Vancouver Sun, Times& Transcript); Toronto Star, A14

ORGANIZATIONAL ISSUES / ENJEUX ORGANISATIONNELS

Police puppy dies after eating rope
An RCMP plan to document the lives of two German shepherd puppies during their training has ended sadly for one of the canine recruits. The Halifax division announced Tuesday one of the pups - Helo - has died after ingesting rope and rocks. Const. Mark Skinner says the accident occurred as the puppy pursued his natural tendency to chew on objects. (…) During the media launch of the two puppies on Dec. 18, the RCMP officers training them said the dogs live at their homes. Const. Tim Reid, Helo's trainer, had said that every two weeks he and the puppy took part in a six- to eight-hour training day that included a heavy focus on tracking skills. In a few more months, had Helo lived, a fully trained dog handler would have assessed the dog's progress. Reid said Helo was the sixth puppy he'd trained and that only one had graduated to become a police dog. One of the others died of a heart attack, another returned to Innisfail to breed and two others were sold as pets. Reid had said there are about 80 people like himself across the country who are in training to make it into the RCMP dog handler program in central Alberta. An RCMP news release said Reid was saddened by the loss, and noted that condolences can be shared on the force's Facebook page in Nova Scotia and on Twitter using the hashtag RIPHelo. Postmedia Network (Chronicle Herald, A9, Cape Breton Post, London Free Press)

Puppy in training with RCMP dies
A puppy training with the RCMP died at the Atlantic Veterinary College in Charlottetown on Monday. Fourteen-week-old Helo, who was being socialized by an RCMP member in Bible Hill with an interest in becoming a dog handler, died as a result of complications following surgery. It is believed Helo ingested rocks and rope earlier this month which caused internal issues. He required three surgical procedures. "He was doing well until then," said Const. Mark Skinner, media relations officer with the Nova Scotia RCMP. "He was very young and was getting used to the world around him." Helo was born Oct. 4 at the RCMP Police Dog Service Training Centre in Innisfail, Alta., and arrived in Bible Hill in early December. Postmedia Network (Cape Breton Post, A9, London Free Press, Chronicle Herald); Metro News; Global News; CTV News; CBC News (2016-01-19)

Girls enjoy 'harm, repair' exercise
For those long removed from the lives of young teenage girls, observing their interactions can be a reminder that "Mean Girls" isn't just a movie - for some, it's a reflection of real life. To counter such meanness, Hamilton's female police officers held a Girls Leadership Day at Queen Victoria School on Forest Avenue Tuesday, focusing on what it feels like to be bullied, and what it feels like to be valued. The event was put on by Hamilton police and ProAction Cops and Kids, for girls in Grades 5 to 8. Volunteers came from the RCMP, fire department, and the military. In a "harm and repair exercise," the 83 girls involved split into groups and created an art piece paper doll representing "the perfect you." They later had to glue on mean and hurtful written statements like "nobody likes you," "you're dumb," "you're ugly," "you're stupid" and "you're a loser." As each phrase was attached, the girls were instructed to tear a piece of their beautifully adorned doll or crumple one of its body parts. It was a poignant reminder of the pain that hurtful words can cause. Postmedia Network (Hamilton Spectator, A4)

For the second consecutive day, the Selinger government has named a lake near Flin
On Tuesday, government officials announced a lake about 45 kilometres north of Flin will be named after Rhonda Commodore, a corrections officer in The Pas who died in a November 2014 crash while transporting six inmates to Dauphin. "Naming a lake in Rhonda Commodore's honour, and thereby recognizing for eternity her contributions to community safety and service, is a very special and appropriate gesture in remembering her," said Michelle Gawronsky, head of the Manitoba Government and General Employees Union, in a press release. "It is comforting that now all Manitobans, including her extended family as well as her correctional officer family, have one more reason to think of and cherish her and keep her memory alive." The naming of Commodore Lake came a day after the government

announced another lake near Flin Flon would be named after RCMP Const. Dennis Strongquill, who was gunned down while in the line of duty in 2001. Postmedia Network (Winnipeg Sun, A4)

New resource officer for Coaldale schools
Coaldale schools have a new RCMP School Resource Officer (SRO). His name is Const. Doug Sokoloski and he's all geared up since the RCMP took over policing duties from the Lethbridge Police Service on Jan. 1…"I was a community policing officer. Part of that was school resource officer and traffic and public relations were the other few main components. I have done that, of course, at the normal detachment level when I was in Raymond/Magrath – schools were part of our mandate and in Fort McMurray, as well," said Sokoloski., who has been a member of the RCMP for more than 19 years. Lethbridge Herald (2016-01-19)

Disciplinary hearings scheduled for three B.C. Mounties
Disciplinary hearings have been scheduled for three B.C. RCMP officers, all accused of disgraceful conduct. The RCMP won't give details about the allegations citing privacy, but say Corporals Correy Eggen, Nancy Joyce and Eric Irani will have public hearings. CKNW AM 980 (2016-01-19)

Man accused of shooting Kamloops Mountie slated to plead guilty
A man accused of shooting a Kamloops Mountie is set to enter guilty pleas to numerous charges this spring. Kenneth Michael Knutson faces several charges in Kamloops Supreme Court including attempted murder after an incident which left an RCMP officer critically injured and led police on a 12-hour manhunt through the Batchelor Heights neighbourhood in December 2014. Cpl. Jean-Rene Michaud was shot after he pulled over a white sedan in the early morning hours of Dec. 3, 2014. He survived the shooting after several surgeries and months in the intensive care unit. InfoTel.ca (2016-01-19)

LEGISLATION & POLICIES / LÉGISLATION ET POLITIQUES

'Troubling' Conservative torture policy up for review
The Trudeau Liberals will review controversial directives enacted by the Harper government that allow for the sharing of information even when it might lead to torture, says the public safety minister. The "troubling set of issues" raised by the foreign information sharing policy "will be raised in the course of our consultations" on the overall national security direction of the new government, Ralph Goodale said in a recent interview with the Canadian Press. The news follows pressure from human-rights and privacy advocates to conduct a wide-ranging examination of security policies introduced by the Conservatives, whisked from office in the October election. The federal policy on foreign information-sharing has been roundly criticized for effectively condoning the torture of people in overseas prisons, contrary to international law and Canada's United Nations commitments. A four-page 2010 framework document, released under the Access to Information Act, says when there is a "substantial risk" that sending information to, or soliciting information from, a foreign agency would result in torture - and it is unclear whether the risk can be managed through assurances or other means - the matter should be referred to the responsible deputy minister or agency head. In deciding what to do, the agency head will consider factors including the threat to Canada's national security and the nature and imminence of the threat; the status of Canada's relationship with - and the human rights record of - the foreign agency; and the rationale for believing that sharing the information would lead to torture. Critics say when there is a serious risk of torture, there should be no sharing - period. The Canadian Security Intelligence Service, the RCMP, the Canada Border Services Agency, National Defence and the Communications Security Establishment, Canada's electronic spy agency, are bound by the federal policy on sharing information with foreign agencies. Postmedia Network (Kingston Whig-Standard, B3)

Torture: Ottawa veut consulter les Canadiens sur la politique de partage de renseignements
Une «série de questions troublantes» soulevées par la politique de partage de renseignements avec des pays étrangers qui peuvent conduire à la torture de citoyens canadiens innocents, «seront abordées dans le cadre de nos consultations» sur la politique nationale globale du nouveau gouvernement, a indiqué le ministre de la Sécurité Publique Ralph Goodale à la Presse Canadienne. Cette nouvelle fait suite à la

pression exercée par des défenseurs des droits de la personne qui demandent que soient examinées les politiques de sécurité mises en place par les conservateurs avant les élections d'octobre où ils ont été renversés par les libéraux. La politique fédérale sur le partage de renseignements avec des pays étrangers a été l'objet de nombreuses critiques et accusée pour avoir comme conséquence de condamner des personnes à la torture dans des prisons outremer, contrairement au droit international et aux engagements du Canada envers les Nations unies. Personne n'a oublié le cas de Maher Arar, arrêté sur la foi de renseignements transmis par la GRC le 26 septembre 2002 à l'aéroport de New York alors qu'il revenait au Canada après des vacances en Tunisie. Emprisonné en Syrie sans accusation pendant plus d'une année où il été torturé à plusieurs reprises et forcé de signer de faux aveux, il n'a été libéré que le 5 octobre 2003, après que le gouvernement syrien a admis qu'il n'avait aucune preuve contre lui. Après le rapport d'une commission d'enquête au Canada le 18 septembre 2006. le gouvernement canadien a reconnu ses torts et a offert 10,5 millions de dollars de dédommagement à Arar. 45eNord.ca (2016-01-19)

BC's health minister wants to seize opportunity to talk about effects of pot legalization
The conversation on legalizing pot in Canada has to include the medical perspective according to BC's health minister. Terry Lake is answering questions ahead of meetings with the federal health minister next week. Lake is pointing to studies which raise concern over what pot does to the brain, especially young ones. "We've got a situation now where young people are, I think, very high risk of marijuana that's out there now on growing and developing brains. This is an opportunity to create a system that protects young people and so I think we have to be very careful. You really only get to do this once." Lake understands public safety ministers will take the lead on this and doesn't think many hard solutions will come out of the meetings. He isn't ruling out the idea of selling marijuana in government liquor stores, something proposed by the BCGEU. "I think that will be something that evolves. There has been some discussion. You heard the premier of Ontario say that the liquor store model would be suitable. There are public health officials that I've talked to who say that the co-location of marijuana and liquor sales is not advisable from a public health perspective. There's a lot of discussion ongoing." News1130.com (2016-01-19)

Marijuana in Montreal: How legalization could shake up black market
In the final instalment of Daybreak's "Montreal 420" series, a retired Montreal police officer discusses how legalization could change the city's illicit drug trade. Philippe Paul spent 28 years with the Montreal Police force, most of that working on the drug and anti-gang squad. Paul is also an expert witness in narcotics trafficking cases and author of the book Coupable d'etre policier. CBC.ca (2016-01-19)

EDITORIALS & OPINIONS / ÉDITORIAUX ET LETTRES D'OPINIONS

Un registre dont l'existence n'est pas justifiée
Un article d'opinion dit, « Enregistrer, immatriculer et buriner les armes à feu ne va pas rendre notre monde plus sécuritaire. Depuis 1978, le Canada possède le meilleur contrôle sur les armes à feu au monde. Toutes les personnes qui veulent se procurer une arme à feu légalement doivent se qualifier et obtenir un certificat d'acquisition et de possession. Cette démarche est le moyen que les policiers ont pour savoir si une personne peut acheter ou posséder légalement une arme à feu. C'est un processus qui se fait en moins de 60 secondes. Je connais personnellement ce procédé pour l'avoir enseigné pendant trois ans à la formation du personnel de la GRC à Montréal. J'ai pris connaissance de votre projet de loi et je m'interroge : pourquoi cet acharnement auprès de personnes qui agissent légalement ? Pourquoi avoir surtaxé les chasseurs avec des augmentations du coût des permis de 25 à 53 %, pendant que l'indice au coût de la vie était de 1,2 % ? Pourquoi créer une loi qui vous permettrait d'altérer un produit déjà marqué d'un numéro de série par le fabricant ? Où se trouve l'aspect « sécurité publique » dans cette démarche ? (...)Je suis renversé, comme tous les propriétaires d'armes au Québec, de voir mon gouvernement exploiter les chasseurs et tireurs sportifs en utilisant des prétextes fallacieux ; c'est de l'abus de pouvoir, de l'acharnement, voire du harcèlement. » LeDevoir.com

Canada's weapons exports grew more than 89 per cent under Harper
Canada's arms exports shot up while Prime Minister Stephen Harper's Conservative government was in office, fuelled by higher sales to countries like Saudi Arabia, Jordan, Mexico and Austria, an analysis by iPolitics has found.(…) One of the countries where Canadian military exports rose the most during Harper's government was Jordan - a country whose human rights record has been questioned by groups like Amnesty International. Military exports jumped from only $6,580 in 2006 to $ RCMP 15 million in 2011 before falling back to $888,467 in 2013 - the year that Harper named the head of his RCMP security detail, Bruno Saccomani, as Canada's ambassador. iPolitics

Toronto police buy 51 high-powered, military-style rifles
Patrol carbines paired with less lethal sock guns to give front-line officers a choice when using force The Toronto Police Service has purchased 51 patrol carbines, high-powered rifles that will be distributed to each of the city's 17 police divisions and made available to front line officers. The force has purchased the C8 patrol carbines - a military-style, semi-automatic gun - to be paired with the "less lethal" sock guns currently being sent to each division, Toronto police spokesman Mark Pugash said Tuesday. The rollout of the weapons will be finished by the end of May. (…) Darryl Davies, a criminology instructor at Carleton University, said police are now confronting criminals and terrorists wielding high-power assault rifles with greater regularity - and their pistols and shotguns are "antiquated weapons" that are no match for an assault rifle. Following the 2014 shooting deaths of three RCMP constables in Moncton, N.B., there was harsh criticism that officers did not have the weaponry necessary to compete with convicted killer Justin Bourque's M305 semi-automatic rifle. The Mounties only had their handguns and three shotguns. Many experts said the carbine may have levelled the playing field. Davies, who recently served as a consultant to the RCMP on the feasibility of its officers using the patrol carbine, said he hopes Toronto police have a "very intensive training program" in place to ensure officers know how to use, store and maintain the weapon. Toronto Star, GT1

Civilian oversight coming to RNC and RCMP, as number of investigations spike
Justice Minister Andrew Parsons is calling for civilian oversight of police forces in this province, as CBC News has obtained new details that reveal just how often the police are being investigated in Newfoundland and Labrador. Parsons's comments come less than a week after CBC News revealed that senior members of the Royal Newfoundland Constabulary were under criminal investigation. That probe is being carried out by a civilian-led agency from Nova Scotia. Parsons says the need to shift to civilian oversight is reinforced by information contained in government briefing notes obtained by CBC News through access to information. According to those briefing materials, the RNC and RCMP were investigated 42 times in 2015 alone. CBC.ca (2016-01-19)

RCMP toxic to women, says lawyer as B.C. hearing begins for potential class-action
A lawyer arguing for a class-action lawsuit against the RCMP says the cases of hundreds of female employees alleging the force discriminated against them must be considered together. David Klein said the RCMP is toxic to women and has been for a number of years. "Day after day, week after week, year after year, they were subjected to degradation, humiliation, and demoralizing comments and behaviour. Comments and behaviour that were not adequately addressed by management," he said Monday outside B.C. Supreme Court. Klein is arguing this week that the complaints of 363 female RCMP employees should move forward collectively because that would provide a full picture of a systemic problem. "This is conduct that occurs over months or years, by multiple perpetrators, that's ignored by management at multiple locations," he said of the women. Two thirds of them still work for the force. No dollar figure has been attached to the case, but Klein said that with hundreds of cases involved, a judgment could be in the "many millions of dollars." The RCMP has taken small steps to address harassment on the force since the suit was originally filed in 2012, Klein said. But he believes there's more to be done. "They at least pay lip service to taking the problem seriously, but they're not taking the women seriously. And until they take the women seriously, until they take those claims seriously, the problem will not be solved." The hearing began three years after for Nanaimo RCMP officer Janet Merlo came forward with allegations about discrimination she experienced throughout her career, including lewd comments and actions from her male colleagues. CONTRACT & ABORIGINAL POLICING / SERVICES DE POLICE CONTRACTUELS ET AUTOCHTONES

Pair charged with murdering man and setting his Jeep on fire
A man from B.C. and a woman from Ontario are charged with first-degree murder in a December **Strathcona County** case where an Ontario man was slain and his vehicle burned. Around 12:45 a.m. on Dec. 30, the body of Adrian Gregory, 30, was discovered inside a green Jeep that had been set on fire and left in an industrial area west of Sherwood Park. A second person, identified by police Monday as Jeremy Pershawm, was also found in the Jeep and was taken to hospital with undisclosed injuries. Police said Monday both victims had been shot before the Jeep was set on fire. The victims had been targeted, added RCMP. Investigators had asked for anyone who may have had contact with Gregory before Dec. 30 to come forward. Police said Gregory worked in Alberta for a few years. In an extensive investigation by RCMP Major Crimes Unit North and Strathcona County RCMP, a woman was arrested and charged on March 17, 2015, in Port Elgin, Ont., while a man was arrested in Chilliwack, B.C., on May 29, 2015. The woman has been released on bail in Ontario, with a subsequent court date in Strathcona County to be fixed at a later date. Postmedia News (Ottawa Sun, Calgary Sun, Kingston Whig Standard, London Free Press, Edmonton Sun); Canadian Press (Ottawa Citizen); Postmedia News (Edmonton Journal) (2015-06-02); CBC News; Agence QMI (Ottawa Sun, Edmonton Sun) (2015-06-01)

Four face charges for vandalizing property in north Halifax
Four people face charges early Saturday morning for allegedly vandalizing property with spray paint in north-end Halifax. **Halifax** Regional Police arrested three men, all 19, and a 17-year old after they allegedly spray painted signs and utility boxes at the intersection of Gladstone and North streets. All four were charged with property damage and released, and are to appear in provincial court and provincial youth court at a later date. Mounties are also investigating a report of 15 vehicles and a garage door being spray painted in Cole Harbour. Most of the cars were allegedly sprayed in orange and brown lines and sometimes a "graphic indecent image," according to an RCMP release. Police believe the incident happened between midnight Saturday and early Sunday morning. The public is urged to contact police if they know anything about any crime involving spray painting. Chronicle Herald

IHIT investigating Langley homicide, one in custody
Mounties took one person into custody after a homicide in **Langley** Monday night. RCMP officers were called around 7 p.m. to the 20300 block of Fraser Highway, where they found one person dead, according to a news release by Holly Largy, an RCMP spokeswoman. Members of the Integrated Homicide Investigation Team took control of the investigation and the area was shut down into the evening. Investigators say the homicide is likely not random, but they won't release more information until Tuesday. Postmedia News (Vancouver Sun, The Province)

RCMP seek the owner of tribal drum
RCMP are looking for the owner of a tribal drum found in **St. Albert** in March. "A tribal drum can be quite expensive, and are also held to be very valuable by their owners," RCMP Corp. Laurel Kading said Monday. She said RCMP are specifically not releasing any information to ensure it is claimed by the rightful owners. The drum was found in a case in the area of Hogan Road in St. Albert on March 13. Kading said the location means the owner may have been travelling through the area. It also possible it was stolen and then ditched. "We don't know the origin of it, but someone somewhere is missing a very nice drum," Kading said. She said the woman who handles found property for the RCMP was concerned the item would end up in a police auction, rather than back with its owner. Kading said RCMP recognize the cultural significance of the drum and have taken extra steps to ensure it is being held in a safe place and being treated in a respectful manner. Postmedia News (Edmonton Journal)

Are police properly equipped?
Several recommendations resulted from the RCMP shootings in **Moncton** a year ago. One was that police forces across the province be equipped with carbines and the training that goes with them. To see whether or not that has happened, visit telegraphjournal.com for legislature bureau reporter Karissa

Donkin's report. Jason Rideout keeps a set of horseshoes in the trunk of his car so that he's always prepared for a game and the Silver Horseshoe, the sport's equivalent of the Olympic torch, hangs in his office. So there is little wonder why Rideout was selected to lead the organizing committee after St. Stephen became the smallest community ever to host the 2015 Canadian championships. For more, visit telegraphjournal.com. The Public Safety Communication Centre, which handles 911 calls in the city, is still understaffed but is getting closer to having all positions filled, said Marven Corscadden, director of human resources and finance for the Saint John Police Force. Telegraph Journal, A2

RCMP divers discover body in river after extensive search
RCMP divers discovered a body just before 9 a.m. on Monday, in the St. Charles River in **Aldouane**, following a report of a sudden death Sunday. Police say a sudden death occurred in the early hours Sunday after a group of people were jumping off the Daigle Creek Bridge into the St. Charles River, just over an hour north of Moncton. Southeast RCMP received a call shortly before 4 a.m. on Sunday that a 23-year-old man from Pointe-Sapin had jumped off the bridge and did not resurface from the water. Cpl. Dan Melanson with Richibucto RCMP detachment said several fire departments were on scene from the initial call, as was Ambulance New Brunswick, the RCMP underwater recovery team, forensics, a canine unit and the Tri-County Ground Search and Rescue. Melanson said no one else was injured and that nothing was out of the ordinary in terms of the river's state. Times & Transcript, A6; Acadie Nouvelle, A2

Gov't may have broken law over teen's death, says B.C. grand chief Phillip
Government agencies may have broken the law by repeatedly failing to report that an aboriginal teen who died of a drug overdose in **Vancouver's** Downtown Eastside needed protection, says the head of the Union of B.C. Indian Chiefs. Grand Chief Stewart Phillip called for a police probe of workers in health care, education, policing and community agencies accused in a report of harbouring a "culture of indifference" toward aboriginal kids. The case of a 19-year-old woman identified only as Paige was highlighted in a scathing report released last month by B.C.'s representative for children and youth, who criticized the province for what she called persistent indifference by front-line workers. (…) Meanwhile, a federal government bureaucrat ordered the destruction of legal opinions over the potential of First Nations in B.C. to reach land-claim deals, Phillip claims. The allegations come days after ex-B.C. government worker Tim Duncan alleged he was told to delete emails connected to the Highway of Tears probe into murdered and missing women that were part of a Freedom of Information request. Phillip alleged a federal access to information request revealed a director with Aboriginal Affairs and Northern Development Canada ordered the destruction of the legal opinions. Canadian Press (Times Colonist); Postmedia News (Province)

Food tampering reports come from Annapolis Valley, Bridgewater - Nail found in potato salad at Woodville community barbecue
Potatoes containing metal objects continued to turn up in food tampering incidents in two different parts of **Nova Scotia** over the weekend, police reported Monday. Kings District RCMP announced it is investigating an incident where a finishing nail was found in a potato salad at a community barbecue in Woodville on Sunday. No one was hurt in the incident. RCMP said the potato salad was made by Kings Processing in Middleton, which is working with investigators to determine the source of the potatoes. Police have the nail and the partially eaten meal. CBC News (2015-06-01)

Name the RCMP foal contest begins, contest open to kids across Canada - Six RCMP foal names needed this year
The RCMP is inviting kids from across Canada to help them come up with the names for six foals who were born this spring at the RCMP breeding farm west of **Ottawa**. The foals may grow up to be part of the world-famous RCMP Musical Ride. “Every year we look forward to seeing the creative names children and young people from across the country submit for the foals,” says Superintendent Leslie Cook, Officer in Charge of the Musical Ride Branch. “The Name the Foal” contest is an annual tradition we look forward to, thanks in large part to the enthusiasm of the participants.” Beacon News (2015-06-01)

Learning the rules of the road
Members of the RCMP and EMS were at St. Joseph Elementary School on Friday for a special bike rodeo, with the goal of teaching students the importance of safe driving. The rodeo was for students in

kindergarten up to Grade 4, who went through various stations to teach them how to be safe while driving their bicycles on the road. The RCMP organized the event, and the EMS was there to do a presentation with their ambulance and sirens. "There's a lot of kids that don't know how to stop properly, they don't know they're hand signals, so it gives them a chance to get their hand signals, to learn which way is left, which way is right, to let the people behind them know which direction they're going when they're stopping, and also it helps to practice their turning because sometimes the kids aren't sure how to turn their bike properly so it works out well that way as well," said RCMP constable Debra Wenisch. Meridian Booster (2015-06-01)

The 'uncomfortable truth' about missing & murdered indigenous women
Twenty years ago, Helen Gillings' body was found in an alley on King Street. She was 19. Gillings is one of hundreds of missing and murdered indigenous women, some of whom grew up in nearby Six Nations, some of whom, like Gillings, were killed in **Hamilton**. Gillings, whom police say was a sex worker, was last seen alive at 1 a.m. entering the alley with a man the day before her body was found. Hamilton Police have a $10,000 reward advertised for clues leading to the arrest and conviction of the person responsible for Gillings' death. And Monday night, to kick off Aboriginal Awareness Month, a forum at Hamilton city hall will focus on stories like Gillings' and others — the "uncomfortable truth" about these hundreds of unsolved murders and missing persons cases. CBC News (2015-06-01)

FEDERAL & INTERNATIONAL OPERATIONS / OPÉRATIONS FÉDÉRALES ET INTERNATIONALES

Zehaf- Bibeau was shot 31 times
Michael Zehaf-Bibeau was shot 31 times after he stormed Parliament Hill on Oct. 22, and was finally killed by a bullet to the back of his head, according to CBC News based on a report by the Ontario Provincial Police to be released Wednesday. According to the CBC, the OPP report will conclude that Zehaf-Bibeau was alive until the final shot to the back of the head, and that the parliamentary security team followed a "justifiable" course of action. The report will reveal in "graphic detail" what happened in the time between Cirillo's shooting at the National War Memorial and Zehaf-Bibeau's death inside Parliament's Centre Block minutes later, according to sources who have seen the report and spoke to the public broadcaster. After a physical confrontation with one parliamentary security guard and a shootout with three more inside Centre Block, Zehaf-Bibeau sprinted down the Hall of Honour and hid in an alcove behind a pillar in front of the Parliamentary Library, the CBC reports. Sergeant-at-Arms Kevin Vickers then took cover on the other side of the pillar and was close enough to hear Zehaf-Bibeau breathing. Meanwhile, four RCMP officers organized themselves in a diamond-shaped formation called "immediate action rapid deployment," led by Const. Curtis Barrett, at the far end of the Hall of Honour, according to the CBC's sources. Zehaf-Bibeau turned and fired at Barrett, and Vickers dove to the ground while shooting at Zehaf-Bibeau. Barrett moved in and began firing. Zehaf-Bibeau went down, and Barrett recalled shooting Zehaf-Bibeau in the back of the head, according to the report. The OPP's report concludes that Zehaf-Bibeau was shot 31 times, according to the CBC's sources. The autopsy and ballistics report reveals that eight bullets remained in his body, four of them from the gun of Vickers. The report concludes that two of the shots would have been fatal without immediate medical intervention, including the last shot to the back of the head, CBC sources said. Postmedia News (Ottawa Citizen, A12); Canadian Press (iPolitics)

Ottawa asks court to keep files about imam secret
The government has asked the Federal Court for permission to withhold "sensitive" intelligence documents about an Iranian trained Montreal imam whose passport was revoked last year for national security reasons. Releasing the five Canadian Security Intelligence Service documents "could injure national security," the government argued in court filings that were themselves kept secret until a judge lifted the confidentiality of the case. (...) After Sbeiti challenged the decision in court, the government released official documents showing he had been described by the RCMP's Integrated National Security Enforcement Team as a "subject of interest in an ongoing investigation." (...) Federal security officials have been using passport seizures and revocations to deal with the increasing number of "high-risk

travellers'' - Canadians who have gone overseas to join such terror groups as the Islamic State of Iraq. Postmedia News (Gazette, A1, National Post, Calgary Herald, Windsor Star)

'10,000 times more powerful than morphine'

Connor was just 21 when he overdosed on fentanyl in his family's home in Calgary. He was among three students from his high school graduating class who died from overdoses, his mother, Yvonne, says. ''It blew me away because this kid absolutely loved life,'' said Yvonne, who asked that her last name not be used. ''It started as a choice, and then he got addicted to it; his personality grabbed on to it. It was a disease.'' Yvonne wants to help others from falling into the same trap. She was making plans last week to take her story into schools during the next academic year to warn students about street drugs. ''I want to tell them, don't say this can't happen to you, because it can,'' she says. Since Conner died in October 2013, fentanyl has grown into a frightening epidemic. The powerful narcotic already has been linked to 50 Alberta deaths during the first two months of this year. In many cases, the users think they are buying Oxy-Contin or heroin. They're wrong. It's fentanyl, and it's killing them. ''It's the new wave of concern in drug enforcement,'' RCMP Cpl. Eric Boechler of the B.C. clandestine lab unit says of fentanyl. In British Columbia during the past two years, there have been 150 deaths related to fentanyl, which was created in 1960 as a pain reliever. In many of the overdose deaths caused by fentanyl in B.C., the users took what would be a normal dose but, because it was spiked with fentanyl, it killed them. ''Two milligrams is a fatal dose,'' Boechler says. ''A paper-clip weighs about 1,000 milligrams. ''We've found fentanyl that's 10,000 times more powerful than morphine.'' ... Insp. Darcy Strang of the Alberta law enforcement response team says most of the pill pressing for North America is being done in Canada and then shipped south. Neither the RCMP nor the U. S. Drug Enforcement Administration would put a number on what percentage flows to the U.S. The dealers operating here are thought to be either resident Canadians or foreign nationals who have chosen to set up in this country because they can facilitate the manufacture of the product into pills. The U.S. Drug Enforcement Administration believes Mexican cartels are also involved. Postmedia News (National Post, Calgary Herald, Leader-Post)

Des écoles fouillées par les policiers

Dans le cadre d'une opération hautement inhabituelle, l'Équipe intégrée de la sécurité nationale pilotée par la Gendarmerie royale du Canada (GRC) a mené des perquisitions antiterroristes dans des établissements scolaires la semaine dernière, a appris La Presse. Les policiers ont notamment fouillé les casiers d'élèves du collège de Maisonneuve de Montréal, dont cinq ont pris l'avion vers la Turquie en janvier à destination de la Syrie. Quatre autres élèves du cégep ont été arrêtés à l'aéroport il y a trois semaines alors qu'ils s'apprêtaient à prendre un avion qui devait les amener vers le djihad en compagnie de six autres jeunes. (...) Les fouilles ont eu lieu dans le cadre d'une série de perquisitions menées mardi dernier dans la région de Montréal en lien avec la lutte contre le terrorisme. La GRC avait alors confirmé à La Presse qu'il s'agissait de «perquisitions en cours d'enquête», sans préciser si des arrestations étaient au programme. La Presse, A6 (Le Nouvelliste, 14, Le Soleil)

Commission says scam artists likely to target seniors

Scam artists are likely to seize on the trepidation of seniors in the wake of a new government policy that counts financial assets toward nursing care costs, warns the province's Financial and Consumer Services Commission. ''There is always the potential for financial scams, but the recent public discussions related to assets owned by seniors has raised the likelihood of financial exploitation and abuse,'' said commission CEO Rick Hancox. ''The trend is that scammers follow the headlines. ''You have a subject like this - where seniors' assets and how they could be used is obviously a headline story - so people come out of the woodwork.'' The Liberal government's controversial decision to include seniors' liquid financial assets, such as cash and savings, in determining how much they should pay for nursing home care has some New Brunswickers considering their financial options. Savings accounts, TFSAs, and GICs will now factor into the calculation. But retirement savings plans, the family home, car, cottage or boat will not be touched. The commission is now urging caution to seniors ''when approached by individuals offering unsolicited financial, investment or estate planning advice with respect to preserving or protecting their assets.''... RCMP spokeswoman Const. Jullie Rogers-Marsh said on Monday it's too early to say whether there will be a spike in crime involving seniors' assets, but added that the province's seniors are among the most vulnerable targets. ''People are always looking for opportunities to, unfortunately, defraud people

and they come up with these scams," Rogers-Marsh said. "What I think is important is that people are aware of them." Telegraph-Journal, A1 (Times & Transcript, Daily Gleaner)

Drugs seized from Renous prison visitor
Correctional Services Canada says staff at the Atlantic Institute in Renous confiscated a large package of drugs from a person visiting the prison. According to a news release issued by Correctional Services Canada, the seizure of the unnamed items occurred on May 17 when a visitor entered the maximum security prison. "This seizure is the result of the combined efforts of correctional officers and security intelligence officers. The contraband seized includes one vial containing two grams of hash oil," said the release. The individual was then arrested by the Blackville RCMP and may face criminal charges, the release said. Since April 2013, staff members at the Atlantic Institution have made 10 drug seizures valued at close to $104,000, which have resulted in the arrest of six visitors to the prison, the statement says. Daily Gleaner, A8

Menthol cigarette ban prompts quitting
Since the government has announced plans to ban all flavoured cigars, including menthol cigarettes, citing the legislative amendments will deter people from the harmful habit, some are saying they're right. Fin Mackay-Boyce has been smoking for six years with the past four being strictly menthol cigarettes. He says the ban will deter him from smoking altogether. "I will quit. I don't enjoy smoking regular cigarettes compared to menthols. If I'm travelling I might buy a pack if I'm craving but I think the trouble and cost of buying menthols in bulk or the dislike of normal cigarettes will keep me from smoking," he said. The prohibition on the sale of flavoured tobacco products will start on Jan. 1, 2016. Nova Scotia has implemented a similar ban, which has been challenged by Imperial Tobacco in court. The ban will also include the sale of e-cigarette and e-juices to people under 19 years of age… History shows that often prohibitions can open up illegal black markets. However, this is not a concern for the RCMP. Const. Jullie Rogers-Marsh, media relations officer with the RCMP, said the ban is currently not a concern for illegal activity. "We would look at it, and certainly keep an eye on it if there are things we need to do as a policing agency, but in general if there are ever any changes, we would certainly monitor it," she said. Telegraph-Journal, B3

ORGANIZATIONAL ISSUES / ENJEUX ORGANISATIONNELS

B.C. couple fights seizure of $130,000 in civil forfeiture case
David Johnson had just pulled out of his driveway, his three-year-old son in the back seat, when RCMP officers swarmed the vehicle and drew their guns. B.C. Supreme Court heard on Monday that the officers then searched the Johnson home at the end of a quiet cul-de-sac in Surrey, B.C., and Mr. Johnson and his wife were charged with running a marijuana grow-op. The Ministry of Children and Families took their son to live with his grandparents for about three months. Criminal charges were later dropped after a judge ruled the alleged grow-op was “relatively small” at 267 plants and, at nearly three years, the case had taken too long to get to trial. But five days after the ruling, the RCMP forwarded the file to B.C.’s Civil Forfeiture Office – a government agency that has been criticized for its aggressive attempts to seize homes, vehicles and cash connected to criminal offences, even from people who are not convicted or charged. The forfeiture office began proceedings to seize $130,000 that was removed from the house during the search. And so, nearly six years after the raid, the Johnsons were back in court on Monday. “It’s very stressful,” Mr. Johnson said outside court. “It just doesn’t end.” The Civil Forfeiture Office, in its notice of civil claim, accuses the couple of using a hydro bypass to steal electricity for the marijuana grow-op. It says the search was conducted after a complaint from B.C. Hydro to the RCMP. The notice of civil claim also suggests Mr. Johnson told a neighbour and the person to whom he later sold the house that he had a grow-op. Globe and Mail

Hometown rider honoured to be part of the RCMP Musical Ride
When the RCMP Musical Ride comes to Moncton on Thursday, one rider will be performing for her friends, her family and her hometown - a hometown that lost three of its officers one year ago. Const. Tiffany Donnelly will perform in Moncton on June 4 as part of the Ride's 2015 national tour. The event is scheduled on the anniversary of the shooting deaths of three Codiac Regional RCMP officers and the

injuring of two others. Donnelly grew up in Irishtown, just outside Moncton, joining the RCMP seven and a half years ago, in 2007. "I joined for the same reasons a lot of people do. I wanted to help people, I wanted to be able to see different parts of Canada. I wanted a job that was going to be interesting and challenging," the 33-year-old said from the tour bus, which was on its way to Sussex Monday afternoon for two evenings of performances. Times and Transcript, A1 (Telegraph-Journal)

RCMP investigate shooting

A shooting that occurred in Bouctouche last Friday is under investigation, say the Southeast District RCMP. Police received a call shortly after 8:45 p.m. on May 29 of an apparent single vehicle collision on Highway 475 near Chemin Desroches in Bouctouche, an RCMP press release states. The vehicle ran off the road and was on the beach near the water. When officers arrived on the scene, a 40-year-old Richibucto man was discovered on the side of the road with a single gunshot wound, the RCMP say. He was treated at Sainte-Anne-de-Kent Hospital and later transported to the Moncton Hospital with non-life-threatening injuries. The RCMP believes this is an isolated incident and the investigation, with the assistance of the Major Crime Unit, is ongoing. Times & Transcript, A3 (2015-06-02); CBC News (2015-06-01)

Mountie charged with forgery

A Moncton Mountie who was suspended from duty in March is now charged with forgery. Codiac Regional RCMP Const. Jonathan Cormier, 36, of Moncton, is facing two charges. Defence lawyer Bruce Phillips appeared on his behalf at the Moncton Law Courts on Monday and asked for time to seek disclosure. The case returns to court July 2. The allegations against Cormier, a general duty officer, relate to incidents that occurred in February in Moncton. The charges indicate another Mountie was the target of the forgery. Cormier is charged with knowingly making a false document by forging an email document with the intent that it be acted upon as genuine by Const. Pierre Alexandre Roy. That allegedly occurred between Feb. 19 and 26. He's also charged with knowingly causing Roy to act upon a forged document by providing two forged emails as if they were genuine. Both charges are summary offences, meaning they are less serious than if the Crown had proceeded with the indictable versions. The charges were laid in court on May 4 by RCMP Staff Sgt. Stephan Pouliot, who's based in Charlottetown. New Brunswick RCMP spokeswoman Const. Jullie Rogers-Marsh told the Times & Transcript on Monday that the matter was brought to their attention in the middle of March. "The RCMP received information that a member of Codiac Regional RCMP may have committed a criminal offence while carrying out their police duties," she said. RCMP Officer to C-51 Protester: "You Could be Branded a Terrorist"

An anonymously uploaded YouTube video seemingly shot during Saturday's "Stop C-51" Rally on Parliament Hill depicts an RCMP officer telling a protester that, as a result of the coming anti-terrorism bill, he "could be branded a terrorist...whenever you're attacking the Canadian economy." The officer, whose identity is unknown at this point, goes on to answer that "when the demo's down, you become citizens again," to the question "are we considered differently when we are demonstrating?" The practical implications of Bill C-51 are a matter of great debate and have been interpreted differently by various policy makers, academics and journalists. But the fact that a working RCMP officer tasked with policing protests believes the bill has the power to temporarily revoke a protester's rights and status as a Canadian citizen is worth noting. The media relations office of the RCMP's National Division has been approached for comment, and this post will be updated with their response if it should arrive. Canadaland Show (2015-06-01)

Tragédie de Moncton : les policiers déplorent toujours le manque d'armes et de formation

Des agents de la GRC qui sont intervenus il y a un an dans le quartier de Moncton-Nord, assiégé par Justin Bourque, estiment que la police fédérale a échoué à les armer et à les former adéquatement. Trois agents de la Gendarmerie royale du Canada ont perdu la vie et deux autres ont été blessés le 4 juin 2014 lorsqu'un homme lourdement armé a tiré sur eux. Le suspect a été arrêté au terme d'une chasse à l'homme de près de 30 heures et pendant laquelle les résidents d'un quartier de la ville ont été confinés dans leurs maisons. D'après des policiers qui ont parlé à La Presse Canadienne sous le couvert de l'anonymat, ils ne disposent toujours pas de carabines semi-automatiques et craignent pour leur sécurité. Les policiers craignent qu'en s'exprimant publiquement sur cette question, ils perdent leur

emploi. Pourtant, un rapport publié il y a quelques mois recommandait justement que les policiers soient mieux outillés, qu'ils reçoivent une meilleure formation et surtout, qu'ils soient plus lourdement armés. Radio-Canada (2015-06-01)

Former CFL player set to join the RCMP in Nova Scotia
A former CFL football player will be joining the Nova Scotia RCMP by June 6. Delroy Clarke will be starting his first post as an RCMP officer in Shelburne after playing professional football for six seasons for the Toronto Argos, Ottawa Redblacks and the Edmonton Eskimos as a cornerback. RCMP seem incapable of policing themselves as hundreds of harassment complaints emerge
An editorial states, "The allegations have become sadly familiar. They've spoiled the RCMP's once-proud legacy and tarnished its brass. One woman after another has come forward, and now hundreds are claiming to have experienced gender-based harassment and discrimination while working for the Royal Canadian Mounted Police, an institution that doesn't seem capable of policing itself. The harassment complaints are outlined in legal documents and have filled pages of newspapers, for years in some cases. It's time those long-standing claims were tested in court. Several cases alleging RCMP harassment have already been tried, while others are still inching their way through the justice system, including a giant, proposed class-action case that could involve 282 or more women, should it proceed. Monday, government lawyers and counsel for the lawsuit's original plaintiff, a former RCMP constable, appeared in B.C. Supreme Court chambers for a long-awaited application hearing. A judge will determine whether the matter can go to trial. The proposed class action was initiated by veteran RCMP officer Janet Merlo, a Newfoundland native who spent her entire 18-year career as a Mountie on Vancouver Island before retiring in 2010. She anticipated none of this: the alleged behaviours directed at her; the illnesses that beset her; her husband's reactions, an attempted suicide and the break-up of their marriage; going public with her claims; the notoriety; and writing a book. Merlo told a CBC radio host Monday the class action is "probably not the best way" to manage the specific allegations she makes, and which at least 280 other former and current female RCMP members have indicated they support. "But it's the only way," she added. She is right. While the RCMP has taken steps to address harassment issues in its ranks, it hasn't - and likely can't - tackle on its own the enormity of the problem, or every concern raised by hundreds of its female members, past and present. There is, according to Merlo's lawyer, "a systemic failure within the institution." It continues to plague the police force, and the allegations keep coming..." Postmedia News (National Post, Ottawa Citizen, Vancouver Sun, Calgary Herald)

Adding insult to fatal injury
An editorial states, "When one human being kills another, the public interest is generally best served if police disseminate a timely, fulsome account of the incident. Given the immediate and reasonable concerns that some citizens may have for their safety in the aftermath of a homicide, particularly one committed in public, police information speaks to peace of mind. And police most certainly have a responsibility to keep the peace. It is difficult, therefore, to accept or even understand why a growing legion of law enforcement agencies in Alberta and elsewhere in Canada refuses to release the names of some homicide victims, including people killed by police. In this province, the latter cases are referred to the Alberta Serious Incident Response Team (ASIRT), which conducts investigations, issues findings and can lay charges against law enforcement personnel. It can also choose whether it releases the name of a homicide victim, just as the RCMP and Edmonton Police Service can choose to do. There have been 11 officer-involved deaths in Alberta so far this year, and none of the victims has been identified by ASIRT, which is conducting investigations of all 11 deaths. "It's not that we're keeping it secret. It's just that the

names aren't released," executive director Susan Hughson told Journal columnist Paula Simons. As partial justification for what can rightly be termed censorship, Hughson cited cases of socalled "suicide by cop," in which the deceased has intentionally provoked police into causing his or her own death. People who commit suicide are not considered victims of crime and are therefore not identified, as it serves no public good. But it is highly presumptuous of Hughson or any other law enforcement official to assume or decide, prior to the conclusion of a thorough investigation, that a "suicide by cop" has occurred..." Edmonton Journal, A12

Blacksmith's monument to fallen officers helps community heal

An editorial states, "It was rather inspirational, and perhaps even a bit therapeutic, to visit Paul Fontaine's blacksmith shop to see a steel monument to our fallen Mounties taking shape. When I travelled out Heritage Wrought Iron shop in MacDougall Settlement a couple of weeks ago, I stood and watched for a while as Mr. Fontaine and his son Guy lifted large fabricated pieces of cut steel onto the sculpture and then weld them into place. I stood back a few feet, trying not to look at the bright blue flame as the welding rod struck the steel to form a new bond. There's something about the smell of a welding shop, where the smoke from cutting and welding hangs in the air, that inspires creativity. Mr. Fontaine is one of the few people in our region who still practises the ancient art of blacksmithing along with the more modern craft of cutting and welding steel plates. He's been doing it for many years and told me that building a monument to the three Codiac RCMP officers who were cut down in the line of duty last June was "dream job," a chance to do something truly meaningful and different. He told me the bread and butter of his business lies in fence rails, gates and interesting architectural elements hand-crafted from wrought iron. Take a walk around his shop and you can find all kinds of interesting works that have been beaten into shape on the huge anvil from red-hot wrought iron...." Times & Transcript, A9

Alberta's cloak of secrecy

An editorial states "The instinct of Alberta's police for pettifogging, pointless secrecy has now officially reached the point of generating poetry. On May 22, the Alberta Serious Incident Response Team (ASIRT), a provincial police agency that investigates other police forces, released the results of an inquiry into the RCMP's fatal 2013 shooting of a suspect on the Cold Lake Indian reserve. The document tells the unhappy story of a former convict who had continued to lead a violent existence, but who was determined not to go back to jail. The final confrontation is explained, and justified, very convincingly. The report contains all the detail one could desire - except for names. The cop who killed a man is the "Subject Officer"; the man he killed becomes the "Affected Person." And so you get the weird mini-biography of an abstraction, written in a style almost reminiscent of Kafka or Robert Musil. "The Affected Person was a fugitive with arrest warrants for serious personal injury offences ... "(before he was Affected, naturally). "The family of the Affected Person confirmed that he was living in the bush...." "The Affected Person told the witness that something was going to happen that day...." And, climactically, "The Subject Officer commanded the Affected Person to drop the knife, and when he immediately failed to do so, the Subject Officer fired two shots, striking the Affected Person in the chest." After a couple pages of this, the verb "affect" starts to take on a sinister cast: the police have Affected you when they put a couple new holes in you. This kind of ellipticalness seems particularly characteristic of Alberta for some reason. Maybe we just notice it more. After the Mayerthorpe Mountie shootings of 2005, the RCMP's K Division memorably insisted that it could not disclose James Roszko's record of arrests, trials, or criminal convictions - it was all covered by privacy law, even after his death. Even now, the publicly accessible knowledge of those details, which were a relevant factor in a quadruple murder, is an imperfect log of horrors scraped together by reporters. (...)" Postmedia News (National Post)

Gun bill ties RCMP hands

An opinion piece states, "(...) In February of last year, the RCMP reclassified thousands of semi-automatic rifles that had entered the country as non-restricted long guns, because they were in fact prohibited given their ability to be converted into a fully automatic firearm. The decision is entirely compliant with the law, which specifically prohibits automatic firearms, and with the 1993 Supreme Court ruling that says semi-automatic firearms that can be converted to fully automatic mode are equally prohibited - these weapons being "designed to kill and maim a large number of people rapidly and effectively. They serve no other purpose. They are not designed for hunting any animal but man." These included the full range of "Swiss Arms" models and various versions of the "CZ 858" family - one of which

was used in the September 2012 shooting at the Parti Québécois election celebration in Montreal. One man was killed and another injured, but the toll could have been much higher had the gun not jammed after the first shot. Instead of applauding the RCMP for having acted in the interest of public safety, Public Safety Minister Steven Blaney echoed the complaints of the gun lobby by criticizing the RCMP for their "arbitrary" decision and announced a two-year amnesty for their owners, accompanied by a public bulletin specifically addressed to gun owners stating that "our Conservative government is on your side and will always defend the rights of honest gun owners". A few months later, new firearms classification regulations were passed, prohibiting the re-classification of firearms beyond one year after the day on which the initial classification was made." Winnipeg Free Press, A7

OTHER / AUTRES

Post-9/11 spy rules expire in U.S.
Monday marked a milestone in the United States' fight against terrorism, with the expiry of several major provisions of the controversial 2001 Patriot Act. Among the key changes: For the first time since the aftermath of the 9/11 attacks, Americans' phone records are no longer being systematically collected by the U.S. government. That phone-metadata program operated in secrecy for years, before it was among the many surreptitious programs revealed to the world by the now-fugitive whistleblower Edward Snowden. (…) What's changed? The National Security Agency immediately suspended its phone-metadata program. It's now harder for law enforcement to access business records such as hotel and credit-card information, and obtain wiretaps for investigations. Said White House spokesman Josh Earnest: "[This] introduces unnecessary risk to the country and our citizens." Canadian Press (Times Colonist)

More questions than answers about new deradicalization centre
Almost three months after Mayor Denis Coderre announced the creation of a deradicalization centre in Montreal to great fanfare, neither the city nor the police can say when it will be opened, what or where it will be, or even who is on board. Applications for the centre's director position are being accepted. But the radicalization hotline, set up the same day to receive calls from worried parents or friends, has been ringing: It has received 125 calls since March 9, and the police have intervened on three occasions, according to a statement released by the Montreal police on Monday. The hotline has also received calls for help from five "outside" sources — notably Collège Maisonneuve, the CEGEP where 11 of 17 youths who left Quebec or were arrested at the airport en route to Syria or Iraq attended classes. Beef up number of Mounties abroad or lose ground on terrorism, organized crime
As the threat from terrorism and organized crime becomes more global, Canada's national police force is facing questions over whether to send more of its members abroad - in other words, take the fight to the bad guys before they land on our shores. A newly released internal report says the RCMP's "international footprint" is relatively small compared to its allies. While the RCMP has 55 liaison officers and criminal analysts abroad, Britain and Australia each have roughly twice as many. Unless the RCMP's international presence is beefed up, it runs the risk of being "unable to fully respond" to terrorism, drug trafficking, money laundering, illegal migration and cyber crime, the report warns. "The fact that combating criminality and instability in other countries leads to safer homes and communities in Canada should by now be beyond question, and ought to be both a cornerstone and raison d'etre of and for Canada's international policing efforts," says the report, completed by an RCMP analyst in late 2014 and obtained under access-to-information legislation. In an interview, RCMP Chief Supt. Eric Slinn said the number of deployments is constantly being evaluated. He noted the 55 personnel stationed abroad today are a "significant improvement" from the 38 members the force had just a few years ago. The fact that combating criminality and instability in other countries leads to safer homes and communities in Canada should by now be beyond question. "Quite candidly, I don't think we take a second seat behind anybody," he said. "We do in terms of numbers, but in our capabilities and our relationships and what we can leverage and get done, I feel very strongly we've got some solid people and we're doing a good job for Canadians." The release of the report comes at a time when public safety and intelligence officials are trying to keep tabs on roughly 180 people who left Canada and are suspected of engaging in terrorist activities abroad.

'Violent sexual offender' faces new charges

A man **Yellowknife** RCMP previously warned the public about and called a "violent sexual offender" now faces 10 new charges, including sexual assault, in Pangnirtung, Nunavut. Jonah Keyuajuk was subject of the rare public warning that said he poses "a risk of significant harm to the public" in August of last year when he was being released at the end of a jail sentence. Police applied to have a judge place strict conditions on his freedom after release. Within a day of being released here last summer, he was charged with and later convicted of violating his conditions. He was sentenced in December to eight months in jail. It's not clear when or where he was released. The man with scorpion tattoos on his neck was arrested again May 22, this time in his hometown of Pangnirtung, according to Nunavut RCMP. Keyuajuk is facing charges that include sexual interference and forcible confinement. Sexual interference is when a person touches directly or indirectly a person under 16 in a sexual manner. Nunavut RCMP spokesperson Const. Lurene Dillon did not answer a question about whether RCMP warned residents in Pangnirtung about Keyuajuk. (...)An e-mailed question to Yellowknife RCMP about whether Mounties here warned police in Nunavut about Keyuajuk was not answered. Yellowknifer

Parolee ditches ankle monitor

A federal inmate released on parole earlier this month had no intention of following any of the conditions attached to his release. "I told them right from the start, I wasn't going [to Saint John] and I didn't want to leave the institution," said Andrew Donald MacKenzie in **Moncton** provincial court on Thursday. MacKenzie was arrested Wednesday on a charge of being unlawfully at large while serving a sentence and pleaded guilty. Prosecutor Eric Lalonde said the federal inmate was released on parole from a prison in the region on June 3 and he was wearing an ankle monitor to track his movement. MacKenzie was supposed to take a specified route to Saint John where he had to live while on parole. Instead, he came to Moncton and ditched his tracking device. Police were notified and found the device in the parking lot of CF Champlain shopping mall. MacKenzie was at-large for several days but on June 8 a Mountie in the street crime unit spotted him walking on Pioneer Avenue in Moncton and arrested him. Times & Transcript, A3

Relatives grateful for RCMP's work

Family and friends of a little girl who died from a devastating brain injury 12 years ago says no matter what a jury decides about the man accused of killing her, they'll finally have closure. The jury began Thursday deliberating in the case of James Paul Turpin, 37, who's accused of killing two-year-old Kennedy Corrigan in **Central Blissville** in April 2004. Deliberations will continue Friday. He was charged last year with second-degree murder, and his trial has unfolded over the past four weeks in a Fredericton courtroom. Turpin claimed Kennedy slipped in the bathtub while he had sole care of her the morning of April 2, 2004, and she struck her head. He had been dating Kennedy's mother, Connie Corrigan, in early 2004, which is why he was alone with the girl and his own three-year-old daughter in the Corrigan home on the date in question (...)Tracy O'Toole, Connie's best friend, said the family was relieved the case finally went to trial after so long. "This is what we wanted and so much more," she said. O'Toole read a brief statement from Connie Corrigan, who thanked the RCMP, witnesses and prosecutors for the work they put into Kennedy's case. Daily Gleaner, A5

Historical gravestones vandalized

Vandals toppled over and broke historical gravestones marking early Island settlers in a **Cowichan Valley** cemetery last week, RCMP say. "It's inexcusable," said Cpl. Krista Hobday from the North Cowichan/Duncan RCMP. "These are historical items dating back to the mid-1800s." Sometime between June 6 and 8, vandals pushed over 13 gravestones at the Pioneer Cemetery on the corner of Pioneer and Herd Roads, Hobday said. Two of the markers were broken. The cemetery holds the graves of the earliest settlers in the area, she said. Unfortunately, it is also known to be a party spot. "In other cemeteries, family or someone might replace the gravestones, but who is going to replace these ones? They're a piece of our history." Times Colonist, A5

Battleford RCMP warn of attempted child abduction
Battleford RCMP are investigating a report of an attempted abduction of a child from a school yard in Battleford. The alleged incident was reported to have occurred some time between 2 to 2:15 p.m. on Thursday June 9th. Police says a 10-year old child was grabbed by an arm and directed to come with the suspect to a nearby vehicle. The child screamed and the man was reported to have let go of the child and fled in the vehicle. The child was not injured during this incident. 620 CKRM

Quatre carabines et 500 plants de marijuana saisis
Un homme âgé de 33 ans a été arrêté à la suite d'une perquisition qui a mené à la saisie de quatre armes à feu et d'une importante quantité de plants de marijuana. Lundi, des agents de la GRC ont exécuté un mandat de perquisition dans une résidence de **Bairdsville**, près de Perth-Andover. La police affirme avoir saisi plus de 500 plants de marijuana à diverses étapes de croissance, ainsi que de l'équipement pour faire pousser de la marijuana, à l'intérieur comme à l'extérieur. Selon la GRC, une fois à maturité, le nombre de plants saisis aurait pu permettre de produire plus de 250 000 cigarettes de marijuana. La police a aussi saisi quatre carabines. Acadie nouvelle, 5

Des parents de Surrey demandent l'aide de la police pour sauver leurs enfants des gangs
Dix-sept familles ont déjà utilisé la nouvelle ligne d'urgence de la Gendarmerie royale du Canada (GRC) de **Surrey** qui sert à outiller les parents pour tenir leurs enfants loin des gangs de rue. La ligne téléphonique, disponible 24 heures sur 24, a fait son entrée le mois passé à Surrey. Selon l'agent Bill Fordy, l'objectif est d'offrir un outil supplémentaire aux familles de Surrey qui s'inquiètent de voir leurs enfants impliqués au sein de gangs de rue. « Plusieurs parents nous ont joints pour demander l'aide de nos agents spécialisés auprès de la jeunesse », dit-il. Depuis janvier, il y a eu plus de 40 fusillades à Surrey qui seraient, selon la GRC, causées par des groupes liés au trafic de drogues. La plupart des personnes impliquées dans les fusillades sont des adolescents et des adultes dans la jeune vingtaine. Le ministre de la Sécurité publique de la Colombie-Britannique Mike Morris, engagé dans ce projet de ligne téléphonique, espère faire comprendre aux jeunes et aux familles qu'il est possible de se sortir de l'univers des groupes criminels. La GRC a procédé à plus de 18 nouvelles arrestations lors des trois dernières semaines, mais aucune n'a mené à des accusations. Radio-Canada; CBC News (2016-06-09)

RCMP arrest and charge third teen in brutal assault north of Winnipeg
RCMP say they have arrested a third suspect in the violent assault of two workers at an addictions centre north of **Winnipeg**. During the May 29 attack Jackie Healey, a 23-year-old work placement student, suffered a fractured skull, broken teeth and blindness in her left eye. The other victim, a support worker at the facility, has extensive damage to her face, jaw and eye. Two youths, aged 16 and 17, were charged late last month with aggravated assault and robbery. Police say a third teen has been arrested and charged, but declined to provide further details. The Manitoba government has said it will conduct a workplace safety investigation into the attack at the Behavioural Health Foundation in Selkirk. Canadian Press (Brandon Sun); CTV News; CBC News (2016-06-09)

Lockdown lifted at Lethbridge's Senator Buchanan School after gun scare
Multiple people are in custody and a lockdown has been lifted at Senator Buchanan School after a report of a firearm. **Lethbridge** police said officers were on scene as of 1:45 p.m. at a home along the 600 block of 11 Street North. By 3 p.m., police were clearing the scene and said the investigation was ongoing. Police said the public no longer needs to avoid the area. Global News; Calgary Herald (2016-06-09)

Muskrat Falls entrance blocked by protesters
A group of protesters stopped traffic at the gate to the **Muskrat Falls** construction site Thursday. "[We] are trying to protect our people, our culture and our land," Jerome Jack told the CBC. Jack says he has been working for the Innu First Nation as an impact benefit agreement coordinator, but his phone has been cut off and he's uncertain of his employment. "A lot of deals were going on behind closed doors without my knowledge, without my people's knowledge, without my elders' knowledge." Jack says the First Nation was recently presented with an environmental assessment, including a caribou study, which he says was conducted by a private organization hired by Nalcor. (…)The protesters eventually let traffic out but say they will not be letting people in. "It seems to be a very peaceful protest." said Hubert Loder,

who represents the project's unionized workers. RCMP were on site to monitor the protest. CBC News (2016-06-09)

Cops seek man with info on missing girl
Police are looking for a middle-aged man who they believe may have information about the disappearance of Meykala Bali. A press release stressed the individual, described as a male between 40- and 50-years-old with stocky build and muscular arms, is not a suspect in any possible wrongdoing. Nevertheless they wish to identify and speak to him. The RCMP has received numerous tips including the unknown adult male may have information related to the missing 16-year-old Sacred Heart High School student. Yorkton This Week (2016-06-09)

NATIONAL INQUIRY INTO MISSING AND MURDERED INDIGENOUS WOMEN AND GIRLS / ENQUETE NATIONALE SUR LES FEMMES ET LES FILLES AUTOCHTONES DISPARUES ET ASSASSINEES

Despite progress, domestic violence rates still high
Maria Hendrika has a penchant for sticking things through. If her long tenure with Regina Transition House wasn't enough, she has also been involved in the Provincial Association of Transition Houses and Services of Saskatchewan (PATHS) since its inception 30 years ago. The group was formed to provide a single voice for shelters, share best practices and set standards. (…) Saskatchewan has the "dubious distinction," as Hendrika called it, of having the highest rates of domestic violence and sexual assault as well. She wants to ensure that reports of assault are taken seriously and that there are safe ways for women to report. She would also like to see more attention paid to missing and murdered indigenous women. "This is a huge issue. People talk about murdered and missing like it's just a thing. No, these are people," said Hendrika. "These are daughters; these are wives." StarPhoenix, BR10

First Nations help with search for missing Enderby woman
Caitlin Potts and her family have been embraced by the Secwepemc people. Members of the Splatsin and other Shuswap bands gathered Tuesday to search for Potts, a 27-year-old originally from Alberta, who was reported missing in the Enderby area March 1. “This is a way to show we care for not only our people, but all people,” said Wayne Christian, Splatsin chief. (…) The search for Potts comes at the same time that the federal government is preparing for a national inquiry into missing and murdered indigenous women. “Our women are more prone to go missing than the average Canadian. Why is that?” said Shane Gottfriedson, regional chief of the Assembly of First Nations. Gottfriedson believes contributing factors are poverty and the generational impact of residential schools. “It’s up to us in our communities to look at strategies to protect our families and relatives,” he said. Salmon Arm Observer (2016-06-09)

FEDERAL & INTERNATIONAL OPERATIONS / OPÉRATIONS FÉDÉRALES ET INTERNATIONALES

RCMP's BlackBerry-cracking methods could be revealed in Quebec court
A Quebec court could today pull back the curtain on secretive police techniques, including how the RCMP intercepted BlackBerry text messages to prove a murder conspiracy plot, as a judge considers whether to lift a publication ban in a case involving the Montreal Mafia. The case stems from Project Clemenza, a police operation that resulted in scores of organized crime arrests in 2014. At the time, police announced they had intercepted more than one million BlackBerry messages tied to allegations of drug trafficking, kidnapping, arson, weapons and other violent offences. (…) Chief Supt. Jeff Adam, who oversees the RCMP's Technical Investigations Services, declined to discuss with CBC News the specific methods used. But given rapid changes in technology and public concern in the post-Snowden era, as mobile developers move toward more secure "end-to-end" encryption, he says investigators are finding their jobs increasingly difficult. "What we're seeing now is … the best evidence of people conspiring to commit a crime is lost to us. And that's what we call 'going dark,'" Adam said. CBC News

Opération Malaise sur l’exploitation sexuelle d’enfants: 2 arrestations vendredi

Deux autres suspects ont été arrêtés jeudi lors d'un nouveau volet de l'opération policière baptisée Malaise qui lutte contre l'exploitation sexuelle des enfants sur Internet. La Sûreté du Québec (SQ) rapporte que Jean Simoneau, 73 ans, de Magog, et Ross Perrin, 62 ans, de Montréal, qui faisaient l'objet de mandats d'arrestation, comparaîtront au tribunal vendredi au Palais de justice de Montréal. Ces deux hommes devront faire face à des accusations en lien avec des contacts sexuels qu'ils auraient eu avec des gens d'âge mineur et pour de l'exploitation sexuelle. (…) L'Équipe d'enquêtes sur l'exploitation sexuelle des enfants sur internet (ESEI), qui a procédé aux arrestations, regroupe des enquêteurs de la Sûreté du Québec et de la Gendarmerie royale du Canada. Presse canadienne (L'Actualité, Huffington Post, La Presse)

La F1 crée 4 fois plus d'offres d'escortes
Le nombre d'annonces d'escortes offrant des services sexuels sur le «Kijiji du sexe» a quadruplé à l'approche du Grand Prix de Montréal, d'après un outil d'analyse créé par un ex-policier. Pas moins de 1000 annonces ont été placées pour la grande région de Montréal dans la seule journée d'hier sur ce site dont nous tairons le nom pour ne pas nuire aux enquêtes policières. «La promotion est moussée pour le Grand Prix. C'est vraiment la manne pour les proxénètes», explique Paul Laurier, un ex-policier de la SQ qui a créé un outil d'analyse pour traquer les *pimps*. Les mots «Montréal», «Grand Prix», «F1» et «Pornstar» apparaissent maintenant en tête de liste des mots-clés les plus utilisés, ce qui n'était pas le cas il y a une semaine à peine. (…)Les policiers attendent toutefois de pied ferme ces escortes de l'extérieur et leurs proxénètes, ainsi que les clients qui pourraient requérir leurs services. (…)On accordera une attention particulière aux mineures victimes d'exploitation sexuelle, tant dans les commerces ou les hôtels que sur le web. La frontière canado-américaine et l'aéroport de Montréal seront aussi plus surveillés qu'à l'habitude. «Nos agents peuvent déceler si une voyageuse se trouve sous l'emprise d'une autre personne qui l'accompagne. On va mettre l'accent là-dessus», rapporte Dominique McNeely, porte-parole de l'Agence des services frontaliers du Canada. Des dizaines de policiers de la GRC seront aussi présents «dans des lieux stratégiques» pour appuyer le SPVM. Journal de Montréal, 27 (Journal de Québec)

Complaint against RCMP in limbo
A young woman who went to the police station in search of an acquaintance was struck in the face and legs by RCMP officers while in handcuffs, a year-old complaint alleges - one that remains unresolved to this day. The Jan. 7, 2015 incident, which was captured on video, prompted her lawyer Gary Wool to file a complaint on the woman's behalf with the Civilian Review and Complaints Commission for the RCMP, which investigates allegations from the public of Mountie wrongdoing. The woman was charged with assault causing bodily harm to a police officer, a charge withdrawn after the Crown prosecutor viewed the video at her lawyer's request. The Lethbridge Regional Police Service in Alberta was called in to carry out a criminal investigation. The complaint filed in May of last year is based on surveillance footage because the woman doesn't have a clear memory of what happened. The complainant, who Yellowknifer has been unable to contact and whose name has been withheld in records obtained, went to the city's RCMP building on 49 Avenue after being told someone she knew was being held by police. (…)She was handcuffed and taken to the booking area. Her shoulders were being held by Const. Miranda Porr and Const. Cory Wallace and her face was about three inches from a wall. (...)Three years ago Wallace admitted to a March 2013 assault against a prisoner in courthouse cells. However, the charge was stayed in court by the Crown after the officer attended a community justice hearing. (…)The complaint was taken seriously by the complaints commission. A cover page on the report sent to RCMP Commissioner Bob Paulson in Ottawa states the allegations "may require a code of conduct or criminal investigation." Yellowknifer

ASIRT looks into gunfire, alleged bid to ram into officer's car
An investigation is underway into the circumstances surrounding an RCMP officer firing his weapon Wednesday after a police vehicle was allegedly rammed. The Alberta Serious Incident Response Team, or ASIRT, said Thursday it was conducting an investigation into the events that unfolded when Spirit River RCMP responded to a report of a suspected impaired driver. RCMP said that an officer caught up

with the vehicle, a black Ram 3500, on Range Road 61 on Wednesday afternoon. The driver allegedly turned and sped toward the officer's Chevy Tahoe. The officer got out and the pickup accelerated toward the officer. ASIRT said only that an "incident occurred" that led to the police officer firing his gun. RCMP made no mention Wednesday of the officer firing his weapon. The suspect was later arrested without injury, ASIRT said. He has not been formally charged. Edmonton Journal, A11; Global News (2016-06-09)

Mountie trades gun for horse

The face of the RCMP in the NWT has left her post in Yellowknife to join the iconic RCMP Musical Ride. Const. Elenore Sturko's last day on the job in Yellowknife was June 3. She had been the Mounties' media liaison officer for Yellowknife and the NWT since September 2014. Sturko lived in Yellowknife back in 2004 when she worked for CBC North. In 2010, she left the media organization to join the RCMP and began her policing career in Langley, B.C. She was posted back in Yellowknife in 2012. The musical ride, based in Ottawa, is performed by a full troop of 32 riders and their horses. Their performance consists of intricate figures and drills choreographed to music. Sturko said she had to go on a five-week course to determine whether she is suitable for the musical ride. (...)It is not clear who, if anyone, is going to replace Sturko as media relations officer. Yellowknifer

Edmonton holds inaugural First Responders Day to show appreciation

When bad things happen, they're the first to step up. They walk into burning buildings, while others run away. They face down dangerous criminals, pull people from twisted car wrecks, rush them to hospital. On Thursday, Edmonton said thank you by commemorating June 9 as the city's first ever First Responders Day. (...)First responders with Edmonton police, emergency medical services, fire rescue, sheriffs, peace officers, the military fire department, corrections and the RCMP were all acknowledged. CBC News (2016-06-09)

Justice dept. pledges to save money

Manitoba's most popular baby names these days are Liam and Emily, Justice Minister Heather Stefanson revealed Thursday morning. Stefanson announced the information as the minister responsible for vital statistics, as she and critic Andrew Swan kicked off a civil and relatively tame first hour of committee hearings into Stefanson's departmental budget. (...)Stefanson said the province is spending $325,000 for three RCMP officers to serve as provincial police on Sioux Valley First Nation near Brandon, after that community opted out of Dakota-Ojibway policing. Justice is spreading an additional $232,000 among five agencies providing services to victims of crime, and $44,000 will allow retired justices of the peace to help clear up backlogs in traffic court. Winnipeg Free Press, A4

Windsor Yacht Club hopes high after $850,000 harbour project

Stormy weather didn't dampen the spirits of the members of the Windsor Yacht Club as they dedicated the newly refurbished harbour and blessed the fleet for the year. A weekend of festivities officially celebrated the $850,000 renovation project's completion Arts. JASON KRYK Windsor Yacht Club commodore Chris Colthurst drops a wreath into this spring. Work included a dredging of the harbour and the addition of new breakwalls, a perimeter harbour configuration that now allows larger boats to dock, and upgraded services. On hand Sunday for the Blessing of the Fleet were many of the club's 350 members along with Windsor Coun. Ed Sleiman and representatives from the Canadian and U.S. Coast Guards, the City of Windsor Harbour Master, Royal Canadian Mounted Police, Ontario Provincial Police, Windsor Fire and Rescue and the HMCS Hunter. Windsor Star, SR5

Phone service down in Fort Liard, N.W.T., including RCMP number

Phone customers in Fort Liard, N.W.T., are experiencing a disruption to local and long distance services, according to Northwestel. In a news release, the company says emergency services have been notified and technicians are heading to the community. Cellular phone and DSL internet services have not been affected. The local RCMP phone number has also been affected by the outage — calls to (867) 770-1111 are not being forwarded to dispatch in Yellowknife. The RCMP is asking people in Fort Liard to call Yellowknife RCMP detachment directly at (867) 669-1111 for any police-related services. The operators in Yellowknife are able to contact officers in Fort Liard. Northwestel says people should be prepared to be

without service for several hours, as repairs are completed. There's no word on the cause of the disruption. CBC News (2016-06-09)

New look at RCMP space
City council will take yet another look at the overcrowded Vernon/North Okanagan RCMP premises in the downtown and the possibility of a new building. "That was talked about last council and now we'll be talking about it in the coming months," confirmed Mayor Akbal Mund. City council gets a progress report Thursday on its five-year strategic plan. Goals and timelines will be reviewed, with the RCMP at the top of a long list of items. "Definitely, we need more space for the RCMP. That's been on the radar for the past 10 years," said Mund, making it clear new premises would not come soon and that the discussion will include whether a new building was needed or an expansion of the old one. Of key concern is money. "Obviously there will be funding issues. I mean looking at building costs, probably $56 million, so it's a ways away but you do have to plan for it." In Summerland, a new detachment was funded through a provincial grant – while in Kelowna, the new $48 million structure is being funded primarily by local taxpayers. "We need to now put it into a plan and see how, eventually, we'll fund that," said Mund. When asked if an RCMP building could precede a proposed new cultural facility that would house Greater Vernon's museum and art gallery, Mund said, "definitely not." "I mean we've already passed the arts and cultural plan so that's going to proceed a lot quicker than any RCMP building will." An email to RCMP Supt. Jim McNamara about conditions in the building was not returned. Castanet (2016-06-09)

Ceremony honours Const. Carl Dixon
A former RCMP officer was recently remembered at a ceremony in Sechelt, where he spent his RCMP career serving his own community. RCMP Const. Carl Dixon, a member of the shíshálh Nation, joined the force in 1977 and spent his 20-year career working in his home community of Sechelt. Coast Reporter (2016-06-09)

Third time lucky for RCMP soccer match
The long-awaited soccer game between Special Olympic athletes and the local RCMP went off without a hitch on Thursday June 2 at the Chatelech Secondary soccer field. Last year, the game didn't happen because of a police emergency. This year, on their second try, the game was called on account of the lightning storm that hit the Coast. The third time was lucky, and players, officers and spectators all had a blast. Coast Reporter (2016-06-09)

Above and beyond: Surrey RCMP recognizes heroism and outstanding contributions
DARING rescues, dangerous encounters, dogged determination, and dedication to those less fortunate. On Wednesday, June 8, Surrey RCMP's Officer in Charge held his annual awards ceremony where heroic actions and outstanding service to the community were honoured. "Every year, we take the time to celebrate the men and women who have demonstrated tremendous heroism and outstanding service to our community," said Assistant Commissioner Bill Fordy. "This is an opportunity to highlight the excellent work being done by those in our detachment and in our community who are making this city a great place to live, work, and play." Voice Online; The Now (2016-06-09)

LEGISLATION & POLICIES / LÉGISLATION ET POLITIQUES

Liquor board bosses, RCMP take part in planning for legalized marijuana market
Liquor board heads from across the country have quietly been meeting in New Brunswick with government officials from each province over the future sale of marijuana. The private gathering in Saint Andrews included a presentation from a top federal enforcement cop, panel discussions with industry growers, and research from policy experts in preparation for the sale, distribution and regulation of pot - now that Ottawa is moving toward legalization. The result of the multi-day meeting will now see liquor bosses move to brief their respective governments on the best practices they discussed at length with North America's top marijuana authorities. "Attendees were from the liquor boards, the Departments of Public Safety from each province and senior leaders from the beverage alcohol industry," said NB Liquor president and CEO Brian Harriman in an email. The Telegraph-Journal reported earlier this year that the NB Liquor boss has been heading research by liquor boards from across the country to prepare for

legalized pot. The annual summer meeting of the Canadian Association of Liquor Jurisdictions was then slated for New Brunswick, stretching from this past weekend until Wednesday, with an entire roster of marijuana players lined up to speak. That included RCMP Cpl. Shane Holmquist, a supervisor on the Federal Serious Organized Crime Section's marijuana enforcement team. (…)Harriman said the meeting had more than 200 attendees from across Canada. Provincial government spokeswoman Elaine Bell said it was actually the Department of Public Safety that hosted the Association of Liquor Administrations of Canada at the annual conference. "While the legalization of marijuana is a federal decision, the working group of officials from multiple departments and agencies continues its work in anticipation of legislation to be tabled by the federal government in the future," Bell said. The working group is gathering research and assessing policy implications, with a balanced focus on examining health and safety risks and identifying job and revenue-generation opportunities for the province." Prime Minister Justin Trudeau has proposed legalizing and regulating pot, also pledging to work with local authorities to come up with distribution methods, which could vary from province to province. Times & Transcript, A1 (Telegraph-Journal, Daily Gleaner)

Fentanyl a factor in more than half of fatal overdoses in B.C.
A powerful synthetic opioid that just years ago was largely restricted to hospitals and people living with chronic pain is now found in more than half of all illicit drug overdose deaths in British Columbia. From January to April, fentanyl was detected in 56 per cent of all deaths from overdoses of illicit drugs, according to new figures from the B.C. Coroners Service released on Thursday. This is up from 31 per cent last year, 25 per cent in 2014, 15 per cent in 2013 and less than 5 per cent in 2012. Health and police officials have feared for some time that illicit fentanyl, produced overseas and imported into Canada, is flooding the black market and things will get worse before they get better. A recent Globe and Mail investigation found that local traffickers can easily order the highly potent, low-cost drug online and have guaranteed shipment to Canada. It is then cut into street drugs such as heroin and oxycodone to make them go further and maximize profits. Chief coroner Lisa Lapointe said the number of deaths from illicit-drug overdoses in B.C., spurred by the growing presence of fentanyl, is now "much more significant than any other type of unnatural death in the province." From January through May this year, at least 308 people died of illicit drug overdoses - a 75 per cent increase over the same period last year (176). In comparison, for all of 2015, there were 300 deaths in incidents involving motor vehicles, and 122 homicides. "If this [illicit drug overdose] trend were to continue, we'd be looking at about 750 deaths this year," Ms. Lapointe said on Thursday. The 308 deaths represent 10.2 per 100,000 population - a rate not seen since 1998 (10 deaths per 100,000 population). The recent surge prompted B.C. health officials to declare a public health emergency in April. Globe and Mail, A1

Despite the crackdowns, marijuana entrepreneurs are betting on "edibles"
Virginia Maria Vidal started medicating with marijuana in 2003, after the birth of triplets left her with post-natal discomfort. She ran into trouble over the years, once being arrested, charged, and eventually acquitted of possessing 19 grams of pot. Even after obtaining a licence to use medical marijuana, the 45-year-old mother of six and caregiver to a grandparent with dementia found the smoke to be a nuisance and embarrassing. So she ground it into tea instead. (…) Ms. Vidal says the crackdowns aren't having a big impact on revenue – she also sells her product online and says demand is growing – but she's still worried. "It's going to be quite the battle," she says. "We need our Prime Minister to stand with us." Producing edibles in any form is illegal, however jurisdictions such as Vancouver and Victoria have chosen to ignore the law and regulate them instead. The federal laws are rarely enforced because the framework of regulations governing marijuana for medical purposes is evolving, and unlicensed producers continue to sell in stores or by mail. Last year, a Supreme Court judgment ruled that licensed patients couldn't be limited to consuming cannabis in smoking form only, but did not comment on the legality of edibles. Further, in February a federal court struck down restrictions preventing licensed patients from growing their own medical marijuana, giving the government six months to rewrite the laws. Globe and Mail

EDITORIALS & OPINIONS / ÉDITORIAUX ET LETTRES D'OPINIONS

Smoke shops not helping Dakota First Nations

An editorial states, "Earlier this week, several Dakota First Nation members who were charged for selling contraband tobacco lost a legal bid to have the case tossed out on the grounds that their people have no official treaty with Canada, and therefore the courts have no jurisdiction. As the Winnipeg Free Press reported, the two accused, - smoke shop owner Craig Blacksmith and employee Tammy Walters – were arrested during a 2014 raid by RCMP on Dakota Plains near Portage la Prairie. RCMP, the Dakota Ojibway Police Service and Manitoba Finance taxation officials seized 4,800n cartons, which amounted to 951,225 cigarettes. More than 1,840 tins of chewing tobacco, six firearms, one vehicle and an unspecified amount of cash were also seized. All told, finance officials calculated $292,572.68 of tax was avoided. (…) For anyone who has been following the ongoing and controversial issue of the non-treaty Dakota in western Manitoba, this argument – that Dakota Plains has no official treaty status in Canada, and therefore should not be subject to Canadian law – is a familiar refrain, one that has not seen much traction in our federal or provincial courts." Brandon Sun

Counterterrorism Plans Won't Be Effective Until Biases Are Addressed

An opinion piece by Monah Mazigh states, "Last federal budget, the government announced plans to create a counter terrorism office. This new initiative named as the Office of the Community Outreach and Counter-radicalization Co-ordinator would cost Canadian taxpayers $35 millions dollars. With an initial funding of $3 million in 2016-2017 and a $10 million a year in the subsequent years. According to the government, the office is supposed to "provide leadership on Canada's response to radicalization to violence." So far, no details have been disclosed about this office but Public safety Minister Ralph Goodale recently reiterated his strong commitment to it. In an op-ed, he published on "How to Fix Canada National Security Framework," he stated: "Thirdly, this summer we will launch a new national office and center of excellence for community outreach and engagement. Its purpose will be to develop and coordinate expertise in identifying those who could be vulnerable to the pressures and appeals of radicalization to violence, and to connect with them constructively in advance to head-off tragedies before they happen. As an open, pluralistic society, we need to get really good at this." As it can be understood from Mr. Ralph Goodale words, one of the tasks of the office would be to develop expertise in identifying some sort of "indicators" about people who are at risk of radicalization to violence. Indicators are defined as cognitive and behavioural changes in individuals and draw from them patterns about radicalization. For instance, someone who withdrew from his/her family or change his/her in behaviour in school in certain specific ways, these are considered as "indicators." Mr. Ralph Goodale doesn't use any word directly relating radicalization to Islam or Muslims in particular, but obviously it is everyone's mind that this office will be directed, if not entirely but in major part, for and about Muslims. And this is exactly why this approach won't be effective." Huffington Post (2016-06-09)

Quebec will soon have registry

Bill 64, which requires the registration of long guns, was adopted on Thursday at the National Assembly, on the eve of the adjournment of the current parliamentary session. Since its filing last December, the bill to provide Quebec with a firearms registry did not have unanimous approval among the population, particularly in rural areas where there are many hunters. The bill passed with 99 votes in favour and eight against. There were no abstentions. About a third of the Coalition Avenir Québec (CAQ) caucus, seven MNAs, voted against the bill, as well as Sylvie Roy, a former CAQ member from Arthabaska, who became an independent. Premier Philippe Couillard imposed party discipline on his MNAs in order to pass the bill, but not the CAQ; their caucus was divided on the issue. Some Liberals and members of the PQ had reservations, but all rallied in the end, passing the bill. The bill was tabled last December by Public Safety Minister Pierre Moreau, and it was his successor, Martin Coiteux, who brought it to fruition. The gun registry, once in place, probably in 2018, will replace the federal firearms registry that was abolished by former prime minister Stephen Harper. His decision triggered concerns in Quebec. Under Bill 64, any firearm on Quebec territory must be registered with a unique number, and shall be listed in a file. Montreal Gazette, A10; Presse canadienne (Voix de l'Est, Le Quotidien, Le Soleil, La Tribune); Agence QMI (Journal de Québec); CBC News; Presse Canadienne (Journal Métro, L'actualité) ; Canadian Press (CTV News) (2016-06-09)

Activist once linked to Ottawa bank firebombing posts pro-arson anniversary message
An activist once linked to the firebombing of a bank branch in a trendy Ottawa neighbourhood has published a blog post suggesting arson is a legitimate tactic for direct action. Matthew Morgan-Brown was one of three men charged in connection with the May 2010 firebombing of a Royal Bank of Canada outlet in Ottawa's Glebe neighbourhood. The bank attack was done partly in the name of Indigenous rights. (…) Morgan-Brown tagged several people on his Facebook page post including Roger Clement, a retired civil servant who was sentenced to three-and-a-half years in prison after he pleaded guilty to the firebombing. Clement was released in March 2013 after serving about two years of his sentence. He was also visited by CSIS, Canada's spy agency, while incarcerated. The second man, Claude Haridge, a known local antiwar activist, was under surveillance following the firebombing. This led OPP investigators to find over a thousand rounds of ammunition buried by Haridge in a forested area. APTN (2016-06-09)

TOP STORIES / ACTUALITÉS

Reports could hide true police activity
Clear gaps" in how the federal government reports invasive surveillance practices may hide the true scope of police activities, according to documents prepared for Canada's privacy watchdog. Although the number of authorized wiretaps has "plummeted" since 2002, a January briefing for Privacy Commissioner Daniel Therrien suggests those numbers may mask police surveillance practices. "It would be erroneous to infer from the drop in overall warrants issued that surveillance is affecting fewer individuals," reads the document, obtained under access to information law. "While federal authorities issued just over a hundred surveillance warrants last year (2014), they issued 792 notifications of surveillance to individuals previously targeted. From this, one can conclude more and more individuals are being named as targets in a warrant application. "With a single warrant from the Federal Court (police) may list dozens of individuals for surveillance targeting." Public Safety is required to issue a report each year about the number of warrants sought to put individuals under surveillance - "wiretap" warrants that allow police extraordinary powers to keep tabs on individuals. But police aren't just bugging the phones of bad guys anymore. New technology allows law enforcement agencies to conduct surveillance on a much wider scale. (…) Canada has also seen confirmed uses of "Stingray" technology, a device, called an IMSI catcher, that simulates a cellphone tower to force any mobile device in the area to connect to it. A recent Vice News investigation reported the RCMP has used IMSI catchers in public places for more than a decade, citing court documents. The Star requested an interview with both Therrien and Public Safety Minister Ralph Goodale for this article. Neither was available Wednesday or Thursday. But in an emailed response to the Star, a spokesman for Goodale said the minister is open to changing the system.

"Reporting is an important component of Canada's system accountability for security agencies," Scott Bardsley wrote. "We're open to consideration in this review (of national security oversight) of how to improve these elements to better achieve our two objectives (of) ensuring that our police and security agencies are being effective ... and safeguarding the values, rights and freedoms of Canadians in a plural, open, democratic society." The Guardian, A6 (The Telegram, Whitehorse Daily Star)

CONTRACT & ABORIGINAL POLICING / SERVICE DE POLICE CONTRACTUELS ET AUTOCHTONES

Boylston man charged after threatening RCMP with firearm
A 20-year-old man arrested after threatening citizens and RCMP officers in **Guysborough District** on July 13 has been remanded to the East Coast Forensic Hospital for assessment. William Anthony Pius George appeared in Port Hawkesbury Provincial Court on Friday. He is scheduled to be back in court on August 5 to answer to the charges. At 9 p.m. July 13, RCMP responded to a dispute on East Side Harbour Rd. where a man had broken the windows out of a residence and vehicles. Police arrived and were told by witnesses that he had threatened to kill individuals inside the residence and discharged a rifle multiple times prior to their arrival. According to RCMP, the man then threatened to kill police. RCMP officers moved the individuals inside the residence to a safe location and called in additional RCMP officers from neighbouring detachments and the Nova Scotia RCMP Emergency Response Team (ERT). The situation was resolved when the man surrendered to the RCMP just after 5 a.m., without incident. No one was injured. The individuals inside the residence and the accused are known to one another. George has been charged with uttering threats (8 counts), assault, careless use of a firearm, unauthorized possession of a firearm and mischief. Guysborough Journal

Police charge ex-boyfriend with murder
After Carol King's body was found in an abandoned farmyard near **Herschel**, Sask., her ex-boyfriend said he had nothing to do with her death. In an interview, he claimed he was "the fall guy" for the 2011 killing that rocked the small farming town. Almost five years later, that man, Joseph 'David' Caissie of Bluffton, Alta., is charged with first-degree murder. "We start with the people closest to the victim and attempt to clear them and work their way out. In this investigation, we were never able to clear Mr. Caissie," RCMP Staff Sgt. Murray Chamberlin told reporters at a news conference announcing the arrest. Carol King went missing on Aug. 6, 2011. Chamberlin said Caissie was taken into custody in Saskatoon without incident. He is also charged with offering indignity to human remains. Caissie is scheduled to appear Wednesday in Saskatoon provincial court. "We are extremely sad but extremely happy at the same time, and have a sense of relief knowing that charges have been laid," Carol King's family said in a statement. Caissie had been under the microscope of RCMP investigators for years, but had long proclaimed his innocence. Postmedia Network (StarPhoenix, A1, Leader-Post); Canadian Press (Edmonton Journal, Toronto Star, Red Deer Advocate) (2016-07-20); Global News; CTV News; Radio-Canada; 620 CKRM (2016-07-19)

Father says daughter 'fell through the cracks'
Kent Robinson just wanted his daughter to come home. Cynder Robinson, 17, lived on a northern reserve, away from family, for nearly a year. By the time he convinced her to return, it was too late. "Obviously it was a dangerous situation. I knew that right away," Robinson said. "I don't want to let it rest. I don't think my daughter should have ever been there." Cynder was found dead inside a home on the **Big Island Cree Nation** on Friday. RCMP called the death suspicious, but would not confirm a homicide investigation is underway. An autopsy was scheduled for Tuesday in Saskatoon. Cynder's father said he tried to get her to come home to Taber, Alberta for months, but because she was over 16, the RCMP and social services workers could not force her to return. "Cynder was a beautiful, beautiful soul. She just made the one mistake and it cost her life," Robinson said. Few details have emerged about what happened inside the home, but Robinson said his eldest daughter suffered from an arachnoid cyst that made her more susceptible to fatal head injuries. (...) He said he doesn't know for sure if his daughter was killed or if she died of natural causes. If someone did kill her, he wants justice, he said. "She was not a violent person. She knew she couldn't be a violent person because of her condition," he said. (...) Trevor Kahpeepatow, a Big Island band councillor, said it's not uncommon for non-band members to spend time on the reserve, although it is usually temporary. He said Cynder was a well-known face

around the reserve and that her death has hit hard. "It is a shock," he said He and the band council are working hard to make sure the reserve - which is technically a dry community - is a safe place, Kahpeepatow said, adding they are trying to get tough on the drinking rules and deal with some of the root problems in the community. StarPhoenix, A3

New Kelowna criminal gang is small but dangerous

When RCMP arrested a member of a new street gang in **Kelowna** this month, it was a significant blow to the organization. "They are what we consider a low level street gang (present) only in the immediate Kelowna area," Staff sgt. Lindsey Houghton of the B.C. Combined Forces Special Enforcement Unit says. "You can count their members on two hands." The gang came to light last week when a cache of guns, drugs and a vest bearing an unfamiliar crest was displayed to the media by local police after a warrant was executed at a home in West Kelowna. Two men and a woman were arrested and a seven-year-old child found inside the home was brought under the care of the Ministry of Child and Family Development. A 24-year-old West Kelowna woman was questioned and released. A 37-year-old West Kelowna man is expected to appear in court Oct. 13 on possible drug and firearms related charges and a 32-year-old West Kelowna man, Tyson Ashleigh Bone, remains in custody. Const. Jesse O'Donaghey said Bone is a member of a small, new gang called the Kelowna Warriors. "They've been around for about four years," Houghton confirmed on July 19. "Mostly street-level stuff like drugs but often times they are the most dangerous." Houghton says there are fewer than ten members and that membership changes quickly. "We see a lot of transiency at levels like this," he says. "They say they're in one group one day and then swear allegiance to another the next day." The vest taken from the West Kelowna home included three patches, a central logo and the name of the city and gang above and below. "In order to wear the three-piece patch you have to get the consent of whichever outlaw groups control the area. In Kelowna it's the Hells Angels." Houghton says although they likely have permission from the Angels to operate, there is no evidence of cooperation between the groups. InfoTel (2016-07-19)

Burnaby 'demoviction' protesters continue fight for affordable housing

Protesters occupying a building slated for redevelopment in **Burnaby**, B.C., are renewing their call for affordable housing as the building approaches its demise. "I hope the politicians, you know, do something or take it serious," said a man who has been living in the building who referred to himself only as Mohammed. "These are people, they are not trash on the street. They're being treated like trash."The protesters have occupied the building at 5025 Imperial Street since July 9. They previously told CBC the developer, Amacon, would begin removing hazardous materials last Monday to prepare for demolition in August. Burnaby RCMP have obtained a court injunction to clear out the group, which is operating under the name Alliance Against Displacement. CBC News

Four suspects face charges after drug bust

Four people are facing charges after Mounties seized approximately 200 fentanyl pills and other drugs during a traffic stop in southern Alberta on Sunday afternoon. **Pincher Creek** RCMP said they stopped a vehicle for a "serious traffic violation" at around 4 p.m. in the town about 200 kilometres south of Calgary. Inside the vehicle, police found a backpack containing approximately 200 fentanyl pills, three ounces of methamphetamine, nearly two ounces of crack cocaine, a small amount of marijuana and a large amount of cash. RCMP say there was also open liquor in the vehicle. Sebastion Aranzalez, 21, of Calgary, Ruairi McGinnity, 22, of Lethbridge, Christie Reed, 39, of Pincher Creek, and Sherri Lagrandeur, 40, also of Pincher Creek, are charged with possession of a controlled substance for the purpose of trafficking. Police say Aranzalez was also charged with driving with no licence and careless driving. All four were released with conditions ahead of their court appearances. Calgary Herald, A10

La GRC invite à la prudence

La GRC a demandé aux joueurs de Pokémon Go de faire preuve de «gros bon sens». Des amateurs de l'application mobile l'utilisent en conduisant pour couvrir du terrain plus rapidement et ainsi attraper plus de Pokémon, au détriment de leur sécurité et de celle des autres. La gendarme Isabelle Beaulieu rappelle que l'utilisation du cellulaire au volant est interdite au N.-B. et souligne que les agents circulent sur les routes de la province, aux aguets pour repérer les conducteurs distraits. Toute personne arrêtée en train d'utiliser un appareil électronique au volant d'un véhicule à moteur s'expose à une amende de

172,50$, en plus de voir soustraire trois points d'inaptitude à son permis de conduire. Elle demande aussi aux utilisateurs de ne pas s'introduire sur des terrains privés. Acadie Nouvelle, 5

RCMP 'apprehend' trespassing Squirtle and offer advice for playing Pokémon GO
RCMP officers in the small town of **Kindersley**, Sask., have caught a mischievous blue monster on private property and have the photos to prove it. At least that's according to a humorous post on the RCMP attachment's Facebook page addressing the latest pop culture craze known as Pokémon Go. The photo shows an RCMP officer holding a virtual image of a Pokémon character captured inside the wildly popular augmented reality mobile game, which was recently released in Canada. "In the late morning of July 18th, 2016 Kindersley RCMP were called to a possible trespasser on private property. When RCMP Cst. Hill arrived on scene of a private lot he encountered a light blue creature that resembled a turtle," the tongue-in-cheek post reads. "The little pip-squeak was very cooperative and was transported to the Kindersley RCMP Detachment where his family was called after he was taught how important it is to stay safe while playing #PokémonGo" The Kindersley RCMP is just one of several different police departments across North America responding to the new mobile app game. Players are encouraged in Pokémon Go to explore their local surroundings, including numerous real-world landmarks, in a quest to capture and battle various virtual monsters. "Yes, we have already gotten more than a handful of calls in relation to the game. We love PokemonGo just as much as you and if you feel the need to run around playing it this summer, that's cool, just be smart about it." The post ends by reminding players to always keep aware of their surroundings, respect private property and to not operate a motor vehicle while attempting to become a Pokémon master. Yahoo! News (2016-07-19)

RCMP not letting youth off the hook following prank bomb threat at Vernon mall
Police are sending a message after the latest incident of swatting — deceiving law enforcement with a phoney call — led to major disruptions at a **Vernon** mall. The prank resulted in numerous employees and patrons being evacuated from the Landing Plaza for several hours while police investigated. But it's not the first time emergency officials have been 'swatted.' Last year in Kamloops, several schools were locked down due to swatting pranks involving fake bomb threats. The same thing happened in Toronto, and a host of other cities. Sgt. Mike Moyer of Vernon RCMP says a youth was identified as the source of the prank call in Vernon and won't be let off the hook for the crime. Given the seriousness of the incident, Moyer says they will be recommending criminal charges, including mischief and possibly more, to Crown counsel. "Obviously, it scares a lot of people, especially with what's going on worldwide," Moyer says. "We, as the police, take these calls very seriously." Significant resources were deployed to the incident, including specialized RCMP units, the Vernon Fire Department, B.C. Ambulance Services and bylaw. Numerous businesses were forced to shut down, equating to thousands of dollars lost, Moyer says. And while the threat was a hoax and no one was hurt, Moyer says they want to make it clear pranks like this one are a crime and will not be tolerated. "We want to send a strong message," Moyer says. InfoTel (2016-07-19)

RCMP nab alleged drug traffickers
The **Wood Buffalo** RCMP Drug Unit arrested two individuals on July 15 after receiving a tip through Crime Stoppers of a male and female selling drugs in a Thickwood apartment building. Tristen Bradbury, 19 and Jennie Podanovitch, 19, both of Fort McMurray, were arrested Friday when they were leaving their Signal Road residence. RCMP spokesperson Cpl. George Cameron said officers opened an investigation after receiving the tip at the beginning of June. "There was enough evidence in order for the courts to grant a search warrant," Cameron said. Officers located 144 grams of cocaine, 49 grams of marijuana and 1.5 fentanyl pills after searching the apartment. Cameron couldn't give an exact amount, but estimated the drugs to be worth "thousands of dollars." Also inside the residence was a shotgun and ammunition and approximately $35,000 in cash believed to be proceeds from selling drugs. Bradbury and Podanovitch were both charged with possession of cocaine and marijuana for the purpose of trafficking, possession of fentanyl, possession of property obtained by crime, unauthorized possession of a firearm and unsafe storage of a firearm. Fort McMurray Today (2016-07-19)

Attempted child abductions in Carbon believed to be false: update
Drumheller RCMP has concluded their investigation into reports of attempted child abductions in the village of Carbon late last month and want to reassure parents in the community they believe there is no

further threat. Reports of three Carbon youth being approached and lured by two men in a vehicle were made to RCMP on June 29. After investigating and interviewing a male individual who was positively identified by RCMP, police feel the suspect holds no threat to the community and the reports may have resulted from both fabrication and fear from the three youths involved. Drumheller RCMP Constable Jason Gerard tracked down the individual and the suspect vehicle, but after interviewing him, felt the individual was incapable of the crime due to a mental illness related to an accident. "Judging from the stories from the three youths involved the stories and descriptions of the male didn't fit in. The descriptions range all around," said Cst. Gerard. Cst. Gerard said the man lives just outside of Carbon and is frequently in town. "I guess this person usually sits in town and uses the WiFi in one area of town, and he's one of those people that park in town and who people look at and think there's something weird about him. Stories can get blown out of proportion." Drumheller Mail (2016-07-19)

NATIONAL INQUIRY INTO MISSING AND MURDERED INDIGENOUS WOMEN AND GIRLS / ENQUETE NATIONALE SUR LES FEMMES ET LES FILLES AUTOCHTONES DISPARUES ET ASSASSINEES

Zoe Saldana producing film on Canada's missing indigenous women
A new documentary by a team of Los Angeles-based filmmakers – including Avatar star Zoe Saldana – is hoping to shed light on the disappearance and murders of as many as 4,000 indigenous women across Canada. "If this exact same story were being told in a country in Africa, I think we would be paying attention to it and we would be donating money to it," said Leslie Owen, the American producer-director behind Gone Missing. "But because it's in Canada, a first world nation, we don't want to see it in our own backyard." She began researching the story in 2015, after stumbling across a news story highlighting 1,200 cases of murdered and missing women that had been compiled by police bodies from across the country. "I was like, what does that mean?" Recent months have seen the number revised upwards, with one government minister estimating the number of missing and murdered indigenous women could be as high as 4,000 women. The Guardian (UK)

Leaked document appears to give broad powers to MMIW national inquiry
There will be five commissioners sitting on a national inquiry into missing and murdered Indigenous women (MMIW) and they appear to have the power to run the inquiry as they see fit, according to the Terms of Reference (ToR) obtained by *APTN National News*. The document, watermarked "sensitive and confidential," appears to be a template for a final version. It does not name the five commissioners. The ToR document also appears to address a pivotal question asked by MMIW family members and their advocacy groups: how much power will the commission have. "Authorize the Commissioners to adopt any procedures that they consider expedient for the proper conduct of the inquiry," the ToR states. But it doesn't elaborate on how much power that is or whether the commissioners will have the power to compel people to testify. The ToR does call for the inquiry to bring the "ongoing national tragedy" of MMIW to an end and examine the "systemic causes of violence against Indigenous women and girls in Canada" and make recommendations. That means looking at the "underlying social, economic, cultural, institutional and historical causes" that have led to more than 1,200 Indigenous women and girls to be murdered or go missing in the last 30 years. APTN News

FEDERAL & INTERNATIONAL OPERATIONS / OPÉRATIONS FÉDÉRALES ET INTERNATIONALES

Canada's electronic spy agency won't reveal if shared info leads to torture overseas
Canada's electronic spy agency won't say how often it shares information that could lead to someone being tortured in an overseas prison. The Communications Security Establishment – which monitors threats from foreign terrorists and spies – has censored documents that spell out the figures, even though the RCMP and Canadian Security Intelligence Service have revealed such numbers in the past. The reticence prompted Amnesty International Canada to say "much greater transparency" is needed from the Ottawa-based CSE. "At stake is Canada's compliance with crucial international human rights obligations

to prevent torture and ill-treatment," said Alex Neve, Amnesty's Canadian secretary general. The secretive CSE has been thrust into the national spotlight in recent years due to leaks by Edward Snowden, the former spy contractor who worked for the National Security Agency, CSE's American counterpart. It is also among a handful of Canadian agencies, including the RCMP, CSIS, the Canada Border Services Agency and National Defence, bound by a government instruction that allows it to share information with foreign partners – even when it means someone could be abused as a result of that exchange. Public Safety Minister Ralph Goodale said earlier this year the Liberals will review the "troubling set of issues" raised by the foreign-sharing policy, enacted by the previous Conservative government. Canadian Press (Global News)

Hells Angels a major force in B.C. despite recent loss

As B.C. Hells Angels mourn the recent death of a member of the West Point chapter, police say the biker gang remains a significant criminal force in the province. Bjorn Sylvest died July 3 while on a houseboat on the Shuswap Lake, Barb McLintock, of the B.C. Coroners Service, confirmed. "The death of Mr. Sylvest was reported to us and we are investigating," she said. Sylvest was remembered last week by his fellow Hells Angels and other friends at a service in south Surrey. And they paid tribute to the 35-year-old heavy-duty mechanic Thursday with a procession of 200 to 300 bikers riding from the White Rock Hells Angels clubhouse to the Among the mourners were bikers wearing patches of the Hells Angels, the Throttle Lockers, the Shadow Club, the Jesters, the Devil's Army, the Castaways, the Ironworkers Motorcycle Club and the Horsemen Brotherhood. While Sylvest's West Point chapter has taken a hit with his death, the Hells Angels "remain active in British Columbia and overall membership appears to have remained consistent over the last few years," RCMP Supt. Sandro Colasacco said in an interview. He said the current membership of the HA in B.C. is about 120 in nine chapters. "This number does fluctuate based on factors such as police enforcement initiatives and criminal charges," said Colasacco, intelligence officer for the RCMP's E Division. "Previous investigations have made it clear that some members of the Hells Angels are involved in illicit drug, weapons and violencerelated offences, including murder. It is for this reason that the Hells Angels and other outlaw motorcycle gangs remain a priority for the RCMP and our law enforcement partners." Une nouvelle fraude qui cible les immigrants

Pendant quelques minutes, la semaine dernière, Yoann a bien cru que le Canada allait l'expulser vers son pays d'origine, la France. Au bout du fil, un agent des services canadiens de l'immigration lui disait bel et bien que des policiers l'attendaient chez lui, prêts à l'embarquer dans le premier avion qui traverserait l'Atlantique. Sauf que Yoann a eu un doute quand il s'est rendu compte que l'employé en question ne parlait pas français et ne semblait avoir aucun collègue qui puisse s'exprimer dans cette langue. Son incertitude aura été bénéfique : le Français était bel et bien victime d'un type de fraude qui fait de plus en plus de victimes chez les immigrants installés au pays. De quatre plaintes en 2013, le nombre de signalements concernant la fraude d'immigration est passé à 1087 en 2015, selon des chiffres que le Centre canadien antifraude (CCAF) a transmis au Devoir. Depuis le début de l'année en cours, 554 Canadiens ont porté plainte pour cette raison, un chiffre qui laisse entendre que la quantité de signalements pourrait dépasser ceux compilés l'année précédente. En pertes, cela équivaut à plus de 416 000 $ depuis janvier. En général, le modus operandi des fraudeurs consiste à exiger des frais qui permettent d'éviter une prétendue expulsion du pays. " La fraude fonctionne. Les gens payent. C'est aussi simple que ça ", a répondu la caporale Josée Forest, de la Gendarmerie royale du Canada, quand on lui a demandé pourquoi les plaintes continuaient d'augmenter. Pire, les statistiques du CCAF montrent qu'environ 5 % de la population rapporte les cas de fraude. " Ce n'est pas beaucoup ", a commenté Mme Forest. Le Devoir, A3

Pot bust yields 400 plants

Police have seized five pounds of pot, 400 marijuana plants, growing equipment and cash after searching a Sturgeon County property this week. St. Albert RCMP say the amount of pot being grown could have produced hundreds of thousands of joints, which could have had a significant impact. Insp. Ken Foster said in a release he was concerned about the large amount of pot seized, noting it's indicative of a criminal trafficking operation rather than someone growing for personal use. "If these drugs were not seized, they would have impacted the well-being of our residents and our children in Morinville, Sturgeon

County, St. Albert and throughout the Edmonton region," he said. Cpl. Laurel Kading said police wanted to make clear this was a commercial operation rather than anything personal or medicinal, emphasizing the danger associated with this kind of unregulated operation. "A concern raised to me by one of our experts is there aren't any controls around those kinds of operations," she said. "You don't know if stuff has been added to make the plant grow differently, or could potentially be health hazards growing plants." Officers from several agencies worked together on the bust: St. Albert RCMP, Morinville RCMP, Fort Saskatchewan RCMP, and the Alberta Law Enforcement Response Teams. The Edmonton Police helicopter helped survey the scene during the search for officer safety. St Albert Gazette

Quarterly report: $155,770 in drugs seized by Valley police unit

The Valley Integrated Street Crime Enforcement Unit is taking thousands of dollars worth of drugs off of the streets. Kenneth Reade, acting chief of police for the Kentville Police Service, shared the unit's report for the quarter that concluded June 30 during a council advisory committee in Kentville July 11. In a three-month period, the unit executed 14 search warrants, and charged 16 people with 20 criminal code offences and 25 Narcotic Control Act violations. Twelve of the warrants were drug related and two were for Criminal Code matters. "There were $155,770 worth of drugs seized, $17,810 worth of other property seized, $22,007 in cash seized," said Reade.The quarterly report lists the drugs seized as: marijuana, cocaine, $137,000 worth of marijuana plants, hash, various prescription pills and Psilocybin. (…) The specialized law enforcement unit is comprised of members of the Kentville Police Service and Kings District RCMP and Windsor RCMP. Nova News Now

Épinglé avec 200 kg de cocaïne

Un résidant de la région de Québec est incarcéré depuis le début de février au Panama après avoir été arrêté en possession de plus de 200 kilos de cocaïne dans ce pays d'Amérique centrale. Le suspect, Steve Miller, a été appréhendé avec deux présumés complices, un Panaméen et un Colombien, lors d'une opération de la police nationale menée le 4 février dernier. L'affaire a fait les manchettes dans les journaux locaux, mais pas dans les médias québécois et canadiens. Lors de la frappe, les policiers panaméens ont découvert 212 kilos de cocaïne et quelques centaines de dollars en devises canadiennes et américaines. La drogue, qui était emballée dans des paquets d'un kilo chacun, avait été dissimulée dans un placard d'une résidence de Betania. Une camionnette, qui aurait servi à transporter la cocaïne, a aussi été saisie par les policiers. On ignore à quelle peine s'expose le présumé trafiquant québécois. La Presse a tenté plusieurs fois de communiquer avec une porte-parole du Ministère public panaméen, en vain. Ici, la Gendarmerie Royale du Canada a confirmé l'arrestation d'un Québécois pour une saisie de 212 kilos de cocaïne sans toutefois donner plus de détails. Selon nos sources, la drogue aurait été destinée aux Hells Angels québécois, en particulier ceux de la section de Trois-Rivières, une information qui n'a toutefois pas été confirmée par les principaux corps policiers du Québec. Au cours des dernières années, les Hells Angels du Québec ont planté leur drapeau ou renforcé leur influence en Amérique centrale, plaque tournante de l'importation de cocaïne vers le Canada, et dans les Antilles. En avril dernier, TVA a révélé que les Hells Angel du Québec auraient parrainé une nouvelle section que l'organisation internationale a fondée en Équateur. La Presse (La Tribune, 15, Le Nouvelliste, Le Soleil)

Who pays? New guide sets out rules for Trudeau travels

Justin Trudeau's frequent trips abroad — often with an entourage of family, officials and guests — raise tricky questions about who travels on the public dime and who does not. So the government recently "formalized" the rules, setting out who digs into their own pockets for travel expenses and who gets their bills picked up by taxpayers. One unexpected disclosure in the four-page guideline document, obtained by CBC News under the Access to Information Act, is the extent to which public money can underwrite the prime minister's personal travels, such as vacations or trips for the Liberal party. (…) In addition, one aide from the Prime Minister's Office is allowed to travel to "support" Trudeau on personal trips, again on the government dime. The principle is that the prime minister must have access to secure communications at all times, even during vacations, to respond effectively to crises, such as the recent attempted coup in Turkey. Privy Council Office spokeswoman Regine Beauplan says staff provide support during all travel by the prime minister, including "the creation of a temporary satellite equipped office that provides access to the secure equipment he needs to carry out his duties." The RCMP is responsible for all ground transportation if the Trudeau family travels for personal reasons, the guidelines say, and the government pays the entire bill without seeking reimbursement. CBC News (2016-07-19)

ORGANIZATIONAL ISSUES / ENJEUX ORGANISATIONNELS

Former Red Deer Mountie sentenced on assault charge
A Mountie whose career started in the Red Deer city detachment has been given a conditional discharge for punching a man he had arrested on suspicion of impaired driving. Const. Eric Pomerleau, currently on administrative duties with the Brooks RCMP, was tried and found guilty before Judge Gregory Lepp in Red Deer provincial court in June on an assault charge laid after the incident, which took place at the Red Deer city detachment on Nov. 7, 2012. Sentencing arguments were heard on Tuesday, with Calgary-based Crown prosecutor Photini Papadatou asking for a fine in the range of $500 to $1,000. Papadatou stressed that a police officer in charge of a prisoner is in a position of trust and that all police officers must be held to a higher standard than ordinary citizens. Defence counsel Robb Beeman, also from Calgary, asked for a conditional discharge, which would uphold the conviction without creating a criminal record for his client. Red Deer Advocate, A2 (2016-07-20); Canadian Press (Medicine Hat News); CBC News (2016-06-19)

Conduct hearing for Mountie postponed again
A B.C. RCMP conduct hearing, which had been scheduled for Monday, was postponed for the fourth time leaving the former Osoyoos Mountie in his fourth year of paid suspension awaiting the rescheduled date. Const. Amit Goyal, who last served with the Osoyoos RCMP detachment, has been suspended with pay since at least June 2013. His hearing was originally set for 2015 before being rescheduled repeatedly, and as of Tuesday, the RCMP conduct hearing schedule website showed Goyal's hearing was set to begin in Federal Court in Vancouver on July 25. But Staff Sgt. Julie Gagnon, with the RCMP national communication service in Ottawa, confirmed Tuesday that Goyal's hearing had been adjourned again until Sept. 13. He remains suspended with pay, she said. "Every effort is made for adjudication board hearings to be scheduled in a timely manner," Gagnon wrote in an email. "However, these hearings are formal, court-like processes. Much like judicial proceedings, hearing dates, times and locations are subject to change for any number of reasons." Goyal faces five allegations under the 1988 RCMP Regulations, according to the RCMP hearing schedule. The allegations include three counts under Section 39, which prohibits members from engaging in "any disgraceful and disorderly act or conduct," and two counts of Section 45 (b), which says a member must not "knowingly or wilfully make a false, misleading or inaccurate statement or report" to a superior officer about an investigation. Goyal also faces a civil lawsuit, filed in B.C. Supreme Court last year by former Osoyoos resident Steve Condon. In the suit, Condon claimed he suffered harassment and left Osoyoos because of Goyal and the RCMP. Postmedia Network (The Province, A13, Vancouver Sun)

Mystery of Hudson Brooks shooting death sparks emotional rally
A candlelight vigil for Hudson Brooks yesterday outside the South Surrey RCMP detachment turned into a raucous protest for the 20-year-old who was shot in a police encounter a year ago. A 100-strong crowd gathered near the detachment chanting and waving "Honk for Hudson" signs. At one point the vigil took a turn for the worst when a man driving by sparked a fight and police officers had to break up an obscenity-peppered shoving match.The circumstances surrounding Brooks's shooting on July 18, 2015, remain a mystery to people who loved him, mired in investigation and shrouded in suspicion. "You ruin our lives. You make us sit there and ruin our lives. It's the worse. How did my son die? I want to know," said Brooks's mother Jennifer. All the Independent Investigations Office (IIO) has told family is that Brooks was shot at 2:30 a.m. PT by the RCMP. Another officer ended up with a gunshot wound in her leg during the incident, but the only weapons found at the scene were police weapons. Neither the IIO, nor the RCMP has revealed what happened in the moments leading up to the shooting, and why, or how a weapon was drawn on the young man described as "quirky" and "happy" by those who knew him. It remains unclear whether Brooks was armed or not, but a IIO statement released earlier this year said: "Other than police issued equipment, nothing of significance was recovered from the scene." Man accused of ramming into RCMP cruiser released on bail

A provincial court judge agreed to unlock the door and throw away the key for a Colchester County man Tuesday. Kevin Dean Underwood, 48, was released on $1,000 bail until his return to Truro provincial court on Sept. 21 to face four charges related to ramming into an RCMP cruiser on Thursday. The conditions of his release preclude Underwood from possessing the key to or sitting in the driver's seat of any vehicle. The release conditions, read in court by defence lawyer David Mahoney and agreed to by Crown lawyer Alison Brown, also stipulate that the accused keep the peace and be of good behaviour. Underwood, whose 34 address listings have jumped from British Columbia to Kennetcook, Maitland, Truro, South Maitland, Upper Kennetcook, Five Mile Creek and Beaver Brook, is accused of twice smashing into the RCMP vehicle early Thursday afternoon on Princeport Road in southwestern Colcester County. An RCMP spokeswoman said that police were heading toward the Princeport Road area, about halfway between Truro and South Maitland and just off Highway 236, to set up a checkpoint when an officer noticed a small pickup truck with no licence plate and no box. The officer turned the cruiser around and deployed the emergency lights in an effort to pull the truck over. The pickup driver did not stop and instead turned back toward the police cruiser and rammed into it, police said. The driver then backed up and smashed into the police vehicle again. The driver tried to drive off in the pickup truck but was apprehended and arrested. The officer sustained minor injuries. Local Xpress (2016-07-19)

Cargair s'installe à Saint-Honoré

L'école de pilotage privée Cargair Max Aviation, dont le centre administratif est situé à Brossard, vient de mettre un pied à terre à l'aéroport de Saint-Honoré afin d'y former des dizaines de futurs pilotes d'origine chinoise. Le 13 juillet, l'entreprise, qui possède une quarantaine d'avions Cessna 152-172 et Piper Aztec multimoteur, a acquis la base opérationnelle d'Air Médic, spécialisée dans les transports médicaux aéroportés. Air Médic, qui continuera d'occuper le hangar, a décidé de déployer, à ce même aéroport, son nouvel hélicoptère bimoteur Agusta Westland GrandNew d'une valeur de huit millions$ équipé d'un système de lunettes de vision nocturne qui permettra d'effectuer des transports d'urgence dans un périmètre beaucoup plus étendu que le territoire de la région. Selon les informations obtenues par Le Quotidien, Air Médic a vendu pour la somme de 335 000$ sa base opérationnelle constituée d'un terrain et d'un hangar aéronautique situé au 104, rue No 1 à Saint-Honoré. (…) L'autre avantage indéniable de cet hélicoptère est que les trois systèmes de vision nocturne dont il est doté et qui sont uniquement permis à la GRC, la SQ et les Forces armées en plus d'Air Médic, permettent d'effectuer des sauvetages à toutes heures du jour entre La Tuque et les Iles-de-la-Madelaine. Le Quotidien, 2

RCMP on track with 2016-17 goals

The **Didsbury** detachment of the RCMP completed the first quarter of 2016-17 establishing priorities set by the four communities it serves in Mountain View County. The Mounties asked the towns of Didsbury, Carstairs and Cremona and Mountain View County as well as the Community Policing Advisory Committee to determine local policing priorities said detachment commander Sgt. Kim Pasloske. The detachment "is well on track" to achieve the goals set by the communities, she said. However, break, enter and theft "significantly increased" in the first quarter (April 1 to June 30). "As such, crime reduction will be a focus for this next quarter," Sgt. Pasloske said. At a media briefing July 14, Sgt. Pasloske said the detachment also took steps to increase the accuracy of the crime statistics it keeps so that year-to-year comparisons will be more helpful to understand the work of the detachment. The Town of Didsbury determined its priorities through a survey, Sgt. Pasloske said. Reduction of property crime and enforcement of laws for drug possession and distribution topped the survey. Carstairs wants increased police visibility, improved traffic safety, more police interaction with youth and crime prevention measures. Pasloske said that Didsbury and Carstairs have community peace (bylaw officers) and RCMP coordinate with them in joint operations. Didsbury Review (2016-07-19)

RCMP in Alberta county start positive ticket campaign

Young people in Sherwood Park, Alta. will be rewarded for good behaviour or helping others through a new ticketing campaign. "Strathcona County RCMP and Strathcona County Recreation, Parks and Culture have teamed up to create a positive ticket for youngsters who are observed following the law or doing a good deed in our community," Const. Chantelle Kelly said. "This could range from wearing a bike helmet, crossing at a crosswalk, picking up litter or helping a resident in need." Anyone who gets a ticket will be given single drop-in access to a rec centre (Millennium Place, Ardrossan Recreation Complex, Kinsmen Leisure Centre or Glen Allan Recreation Complex). "Together, the RCMP and Strathcona

County saw this as an opportunity to reward those who make healthy, positive choices in relation to their behaviour, decisions and actions," Sue Hutton, manager with Recreation, Parks & Culture, said. It's also an opportunity to build relationships between officers and youth, she said. The positive ticket campaign will continue all summer. Members of the Strathcona County RCMP Bike Patrol Unit and Patrol Units will be keeping an eye out for positive behaviour. Global News (2016-07-19)

Behind the scenes of the Musical Ride
Being part of an iconic Canadian symbol is unlike any experience Cst. Allison Barker has ever had. "No matter what kind of a day I've had when I get to the Musical Ride and see the people in the crowds it's all worthwhile," Barker said. "There is no better feeling than when I put on my Red Serge and climb up on that giant, black horse in his dress kit with the maple leaf on his rump." "Being part of that traditional display for our country is sheer bliss," she added, emotion catching her voice. "Getting the opportunity to do this job and share the experience with other Canadians is the happiest time." Growing up in Toronto, and spending her free time in a hunter show ring on a horse, Cst. Barker dreamed of being part of the RCMP Musical Ride. "It was always something I wanted to do," she said. "I also always wanted to be a police officer so joining the RCMP was the perfect fit." Each member of the RCMP Musical Ride has spent a minimum of two years in the field prior to joining the group. "People forget that we are police officers first and that when we are part of the ride, we are on duty," she said. (…)Sharing her love of her country and being part of a performance that is a true Canadian symbol is an experience Cst. Barker will treasure for the rest of her life. "To be part of something that is so positive is amazing," she said, her voice filling with emotion. "Even with all the rehearsals and time spent on tour it's a great experience. The hardest part of my day is when my face hurts from smiling so much." "I have the best job in Canada." Westman Journal (2016-07-19)

Community Connections wants you to fill the cruiser
Community Connections, the Revelstoke RCMP and Save-On-Foods are partnering in a fundraiser to collect donations for the food bank. The RCMP will have one of their cruisers parked outside of Save-On this Thursday, July 21 from 2–5 p.m. Officers will be collecting donations with the goal of filling up the police car and delivering the goods to the food bank. Revelstoke Review (2016-07-19)

LEGISLATION & POLICIES / LÉGISLATION ET POLITIQUES

City urged to act on pot shops
There are growing calls to shut down or regulate Ottawa's budding marijuana dispensary business, as new - and illegal - storefronts pop up around the city. Since the beginning of July, five more dispensaries have opened or plan to shortly, boosting the number in the city to nine. They are part of a wave of marijuana stores that have been opening across the country, in defiance of federal drug laws. Ottawa Coun. Mathieu Fleury says he has asked Ottawa's police chief to enforce the law and shut them down. He and other councillors who represent urban wards have also begun to discuss whether the city should regulate where the dispensaries operate. Coun. Riley Brockington, who is upset about a cannabis store about to open across the street from a school in his River Ward, said the city can't wait to act until the federal government makes recreational marijuana legal. The umbrella group for Ottawa's Business Improvement Areas invited two police officers to a recent meeting to provide information about the pot shops. The officers gave the same answer that a police spokesperson provided to the Citizen: They are aware of the dispensaries, and are investigating. With the legalization of recreational marijuana on the horizon, these businesses are "jumping the gun," says Christine Leadman, executive director of the Bank Street Business Improvement Area. Two marijuana shops have opened on Bank Street downtown, a situation that until recently would have "been unfathomable," Leadman said. "In my mind, the city police and bylaw should be shutting them down." But she's sympathetic about the difficulty the city may have in regulating the shops. "How do you build in (bylaw) planning for a business that's illegal?" The pot dispensaries are confounding police and municipal officials across the country. The federal government has promised to introduce legislation to legalize and "strictly regulate" recreational pot next spring. Ottawa Citizen, A1 (Ottawa Sun)

Park overdose death shines light on ongoing social issues facing the City of Langley

Langley RCMP have confirmed that a man died of an apparent drug overdose in Douglas Park last Wednesday evening. The death serves as a tragic reminder of the ongoing social issues the City is struggling with. Residents living in the area took to social media that evening, saying a yellow tarp had been draped over the deceased's body and police were on scene. Drug-related deaths were declared a public health emergency in B.C. in April. Since then, overdose deaths — many tied to fentanyl — have jumped 74 per cent compared to the same time last year. Langley City Mayor Ted Schaffer told the Times he has received numerous calls from people who are concerned about homeless issues, including camps set up in municipal parks, as well as anger over the growth of petty crime in the community. "I've never had so many calls from individuals as I have right now," said Schaffer on Thursday. The City is grappling with an increased number of people living on the streets and setting up tent cities on the Nicomekl floodplain and in other locations around town. On July 12, officers from the City's bylaw department entered the growing homeless camp on the floodplain. They filled a trailer and truck with items that had been collected by the people living in the camp. "We want people to feel safe. We want to get a handle on this before it gets out of control," said Schaffer. He said last weekend he sent Langley RCMP commander Supt. Murray Power three emails about residents' concerns and asked to meet with him. He also has had recent meetings with officers in charge of policing the downtown. Langley Times (2016-07-19)

Oh Canada! 10/22 rifle mags capable of more than 10 rounds may be prohibited
A Canadian gun magazine is reporting that stores in the Great White North are pulling bonus-capacity Ruger 10/22 mags under pressure from the Mounties. Calibre, which bills itself as "Canada's Firearm Magazine" this week ran a report that the Royal Canadian Mounted Police, responsible for enforcing the national gun laws in the land of the Maple Leaf, is circulating an internal memo declaring that *all* magazines for the 10/22 capable of loading more than 10 rounds are now considered prohibited. The tip came to *Calibre* from the Moncton fish & Game Association (MFGA) who noted : From what we have been told at the moment, these large capacity magazines will fit certain specific handguns (pistols) thereby creating a situation where the pistol capacity now exceeds the 10 round limit on handguns. Individuals, who for an example, have a Butler Creek 25 round magazine for their 10/22 must now have the magazine "pinned" to 10 rounds, leave the magazine at home, or turn it in for destruction by the RCMP. This does not affect those with Remington rim fire rifles or other manufacturers. Apparently this is unique to the Ruger 10/22. Guns.com (2016-07-19)

OPP charge two men in grow-op bust
Ontario Provincial Police have charged two Ottawa men after a raid on a commercial property in Beckwith, about 45 kilometres southwest of Ottawa, led to the discovery of a large-scale marijuana grow operation. According to police, an investigation into allegations of marijuana trafficking led to the July 11 raid when the two men were arrested. Police confiscated 2,012 plants in various stages of growth, 25 pounds of marijuana buds, 26 grams of cannabis resin (hash) and hydroponic growing equipment. Facing charges related to illegally growing marijuana are Adam Gunderson-Lord, 37, and John Armstrong, 36. Ottawa Citizen, A6

Six Nations host community for AFN General Assembly
Six Nations of the Grand River was pleased to be the host community to the Assembly of First Nations 2016 General Assembly. The three day conference brought together elected officials from Canada's reserve communities to discuss key issues under the banner of gaining momentum towards a nation to nation relationship with communities and the federal government. (…) RCMP commissioner Bob Paulson was also present at the AFN to discuss how to reconcile First Nations communities and citizens in Canada and the police. Paulson said the RCMP needs to work in partnership with Canada's Aboriginal Peoples in order to improve relations between the force and the country's indigenous communities. (…) The two sides have developed a joint protocol that spells out the force's goals of working to ensure indigenous people in Canada are safe, to address diverse needs of communities and to strengthen mutual respect, Paulson said. "I'm aware this protocol is simply words on paper, and words alone will not improve things," he said. "I'm here today to pledge we will put actions to these words so we can continue the healing, continue the building and improve these vital relationships in every way possible." Last December, Paulson raised eyebrows when British Columbia Grand Chief Doug Kelly asked him a pointed question about racism within the RCMP during an AFN session in Gatineau, Que. "I understand there are racists in my police force," Paulson reportedly replied. "I don't want them to be in my police force." It was important to invite the commissioner back to the July AFN meeting to discuss how to tackle officer misconceptions; Assembly of First Nations National Chief Perry Bellegarde told the gathering. "How can we work together to make sure that air is clear, that cloud is gone?" said Bellegarde. First Nations leaders

are aware there are "always going to be issues" that play out with police locally, regionally and nationally, he added. Two Row Times; Flin Flon Reminder (2016-07-20)

CONTRACT & ABORIGINAL POLICING / SERVICE DE POLICE CONTRACTUELS ET AUTOCHTONES

Licensed grow-ops busted over alleged ties to organized crime
Mounties in the Okanagan executed search warrants Wednesday on two licensed marijuana grow operations in the **Vernon** area. Police say while the operations are licensed to grow, they believe those running the facilities were trafficking the product and allege there are ties to organized crime. A police news release says officers had to discharge one of their shotguns to quickly open a secured door. Four people, two men and two women, have been arrested and are being investigated on allegations of production of a controlled substance for unlawful purposes and production for the purpose of trafficking. Canadian Press (The Province, A13) (2016-07-21); CFJC Today; Global News (2016-07-20)

Shots heard was RCMP
What was thought to be a shots fired incident in **Vernon** early Wednesday morning was actually the Rcmp serving drug warrants. Police officers converged on a number of locations, including Scott road by the Vernon airport. The loud bangs heard in the area were possibly shotgun rounds used to breach doorways, said Cpl. Dan Moskaluk. Castanet (2016-07-20)

Demoviction protesters removed from apartment
A group protesting so-called demovictions in **Burnaby**, B.C., has been evicted from an empty apartment building it has been occupying for 12 days. Natalie Knight says she and other protesters were asleep when about 20 RCMP officers smashed a window and came into the building Wednesday morning. The company that owns the building had a court injunction to remove the protesters, and police took all seven people out. Three, including Knight, were arrested, but she says they were released without being charged after signing an agreement saying they will stay away from the property. Canadian Press (The Province, A8); Canadian Press (Times Colonist, Williams Lake Tribune, Vancouver Sun) (2016-07-21); CBC News; CKNW; Global News (2016-07-20)

Un restaurant ferme sous haute surveillance policière
Un autre restaurant de **Moncton** semble avoir mis la clef dans la porte, du moins, pour quelque temps. Le Moncton Pizza and Grill de la rue Main, anciennement connu comme l'Alexandria's Pizza, était la scène d'activité policière, mercredi après-midi. Au moins six agents de la Gendarmerie royale du Canada ont été aperçus montant la garde devant la pizzeria, pendant que des employés chargeaient de l'équipement de cuisine dans un camion de transport. Le propriétaire du restaurant était tenu à l'écart pendant l'opération, a confirmé un policier. Un désaccord entre partenaires d'affaires semble être à l'origine de cette fermeture. Questionné sur place à savoir si le restaurant fermait ses portes définitivement, un des déménageurs a indiqué qu'il «sera difficile de rester ouvert sans équipement pour faire la nourriture». L'Acadie Nouvelle a tenté de contacter le propriétaire, mais nos efforts n'ont pas porté leurs fruits. Acadie Nouvelle, 5

Former Hells Angel faces new charges
A former Hells Angel who was once convicted of trying to take a loaded gun through airport security is wanted by police again. New charges were laid July 5 against Villy Roy Lynnerup. The 52-year-old is facing two assault charges, one count each of uttering threats to cause death or bodily harm, dangerous operation of a motor vehicle and mischief. All offences are alleged to have occurred June 19 in **Langley**. A warrant was issued for his arrest Monday. He is described as five-foot-nine and 260 pounds with brown hair and blue eyes. Postmedia Network (Vancouver Sun, A7, The Province)

Police find 1,700 marijuana plants in Malakwa residence
Drug-related charges are being sought against two Lower Mainland residents following a police search of a **Malakwa** residence. On July 10, Sicamous RCMP, with the assistance of the Vernon Police Dog Service and the Revelstoke forensic identification unit, executed a search warrant under the Controlled

Drugs and Substances Act at a Sommerville Husted Road residence in Malakwa. Cpl. J.R. Lechky reports around 1,700 marijuana plants were found inside the house and a shop on the property. "Charges of Cultivation of Marijuana are being forwarded to Crown counsel against two individuals from the Lower Mainland," said Lechky. Eagle Valley News (2016-07-20)

RCMP ask P.E.I. to help find marijuana grow ops

Warn Islanders not to intervene but call police during growing season. RCMP is asking the public to provide assistance in locating marijuana grow operations during this year's growing season on **P.E.I.** "Often people will notice unusual activity that can be an indicator that a grow operation is nearby and officers are happy to take your information and investigate," said Cpl. Andy Cook, drugs and organized crime awareness service of the RCMP on P.E.I. He said it can be a challenge to locate marijuana plants and grow operations when so much of the Island is used for agricultural purposes. "To monitor every field is impossible so officers are asking that you report anything that you consider suspicious in order that they can investigate. It's imperative that members of the public do not investigate themselves as fields or grows are sometimes set up with traps or can even be guarded," said Cook. The Guardian; Journal Pioneer (2016-07-20)

Riot contained at Burnaby youth prison

A riot apparently broke out at the youth prison in **Burnaby** in the early morning hours on Wednesday. The Ministry of Children and Family Development has released a statement about the incident, but details are vague. "There was a serious incident at the centre involving extensive damage – some due to fire – and police and fire officials attended," the emailed statement read. "There were no injuries to residents, staff or police. Youth were contained within the centre at all times. All youth are safe and accounted for. More information will be available shortly." The NOW asked a ministry spokesperson what actually happened, and he said more details are coming. In the meantime, the NOW has put calls into both the Burnaby RCMP and the fire department, but no one has replied yet. Burnaby Now (2016-07-20)

Man accused of killing ex-girlfriend says he's innocent

Even after years of police scrutiny, Joseph 'David' Caissie says he has nothing to do with the death of his ex-girlfriend, Carol King. "He's been steadfast in his resolve that he had nothing to do with this," defence lawyer Ron Piché said outside Saskatoon provincial court on Wednesday. Piché said his client intends to plead not guilty now that he has been charged with first-degree murder in King's death. Caissie made a brief court appearance, wearing street clothes and standing before a judge for less than five minutes. He was formally accused of killing King in the Saskatchewan hamlet of Herschel in August 2011. He is also accused of offering an indignity to human remains. His next scheduled court date is Aug. 3. Caissie was arrested Tuesday in Saskatoon. "We start with the people closest to the victim and attempt to clear them and work their way out. In this investigation, we were never able to clear Mr. Caissie," **RCMP** StaffSgt. Murray Chamberlin told reporters at a news conference announcing the arrest earlier this week. Piché said he has been in contact with Caissie "for about two or three years." Neither he nor Chamberlin would specify what led to the arrest nearly five years to the day after King disappeared. "These so-called cold files, they don't seem to spare any resources to try to pursue and reach a conclusion like this. I suspect you'll all know soon enough what the case entails," Piché said. Postmedia Network (Leader-Post, A6, StarPhoenix) (2016-07-21); StarPhoenix (2016-07-20)

RCMP searching for 17-year-old Mekayla Bali

The RCMP is asking for the public's help in locating missing 17-year-old Mekayla Bali. She was last seen at a **Yorkton**, Saskatchewan bus depot on April 12th. RCMP have broadened their search to include Alberta, Saskatchewan, and Manitoba. She is described as Caucasian, approximately 5 feet, two inches tall, and 114 pounds with blonde hair and blue eyes. 660 News (2016-07-20)

Firearms seized in arrest of murdered gangster's son

Police will be looking for links between a trove of firearms seized when the son of a now-dead gangster was arrested over the weekend and a series of recent shootings, **Prince George** RCMP said Wednesday. Ryan John Moore, 25, whose father was William "Billy" Moore, was arrested Saturday after RCMP were called to a report of a domestic disturbance at a Lorne Crescent home. Kathleen Rose Slater, 26, was also arrested. After subsequently obtaining search warrants, RCMP seized four handguns

- two fully loaded and one with a silencer - along with three long guns with ammunition, various bags of ammunition; two cans of bear spray and brass knuckles. Closed circuit cameras, a large amount of cash, four cell phones, illicit drugs including methamphetamine, cocaine and marijuana and drug trafficking paraphernalia were also among the items seized. "Investigators will be looking into the possibility that these weapons have been used in other offences including the recent spike in shootings in Prince George," RCMP said in a statement. Both Moore and Slater have been charged with several firearms and drug related offences. Police described Moore as a "high priority offender." His father was the president of the Prince George Renegades Motorcycle Club who was shot to death in 2005 in an apparent gang-related execution. No one has been arrested for the murder. Court records indicate Slater hails from Surrey where, according to the Surrey Now, she was one of two people arrested in 2011 in relation to the seizure a small arsenal of guns and ammo from a pair of storage units. Prince George Citizen (2016-07-20)

NATIONAL INQUIRY INTO MISSING AND MURDERED INDIGENOUS WOMEN AND GIRLS / ENQUETE NATIONALE SUR LES FEMMES ET LES FILLES AUTOCHTONES DISPARUES ET ASSASSINEES

Inquiry won't target police misconduct

The national inquiry into Canada's missing and murdered indigenous women will not have the authority to make findings of police misconduct or compel lawenforcement agencies to reopen cold cases, according to a draft of the terms of reference. The nine-page document, which the federal government circulated to the provinces and territories for review, says five people will be appointed to the commission, with one individual named chief commissioner. Sources have told The Globe that the following individuals are on the draft list: B.C. provincial court judge Marion Buller; former Native Women's Association of Canada (NWAC) president Michèle Audette, who lost her bid to represent the Liberals in a Quebec riding in last fall's federal election; Qajaq Robinson, a Nunavut-born civil litigation lawyer who speaks Inuktitut; Marilyn Poitras, a Métis law professor at the University of Saskatchewan; and a First Nations lawyer who served on the Human Rights Tribunal of Ontario. Justice Buller, who became B.C.'s first female First Nations judge in 1994, is said to be a contender to lead the commission. (…) The draft document, which is not dated and is watermarked "sensitive and confidential," says the commissioners will investigate and report on "systemic causes of violence against indigenous women and girls in Canada, including underlying social, economic, cultural, institutional and historical causes." (…) The Liberal government has so far committed $40-million over two years to conduct the inquiry into Canada's more than 1,181 missing and murdered indigenous women. Sources said Ottawa intends to dedicate further funding to help victims' relatives navigate the police complaints process if they question the quality of an investigation. The national inquiry will inevitably review policing - a key reason Ottawa is getting the provinces and territories to sign on to the terms of reference is to ensure matters outside federal jurisdiction, notably child welfare and provincial and municipal policing, are deemed to be squarely within the inquiry's scope. However, the draft terms of reference do not explicitly mandate the inquiry to delve into policing policies or practices. Globe and Mail, A1 (2016-07-21); CBC News; Radio-Canada; Huffington Post Québec (2016-07-20)

Three people reported missing by RCMP

Three people from Chilliwack are missing, according to local police who are seeking the public's help in locating the individuals. (…) Chilliwack RCMP is requesting the public's assistance in locating Ceda Tanner, 12, of Chilliwack. She has not been heard from since July 15, 2016. Tanner is described as: - Aboriginal female - Height: 5'5" tall - Weight: 140 lbs. - Brown hair - Brown eyes - Wearing black track pants with a white stripe, grey Batman t-shirt, and black runners. Chilliwack Times (2016-07-20)

Premiers meet with aboriginal leaders

Aboriginal leaders and Canadian premiers say there's no need to wait for an inquiry into missing and murdered aboriginal women to get to work on the issues behind the problem. "Governments don't have to wait for the outcome of the inquiry," said National Chief Perry Bellegarde of the Assembly of First Nations after a meeting with the premiers and territorial leaders Wednesday in Yukon. "Governments can make investments to end violence amongst our people, amongst indigenous women and girls, and to deal with investments in housing and education and training and daycare and shelter and detox centres and

wellness centres." The federal government is expected to release details about the inquiry shortly. The premiers are in Whitehorse for their annual summer meeting. They met with aboriginal leaders before two days of discussions about other issues, expected to include freer trade across jurisdictional boundaries. Yukon Premier Darrell Pasloski agreed improvements could be begin right away. "The federal government, the provinces, the territories, and the indigenous governments and leaders need to continue to act now, that we don't wait for the results of the inquiry before we begin to move forward. That was acknowledged by everybody in the room." Earlier in the day, provincial and territorial premiers said there is strong support for the planned inquiry. Alberta Premier Rachel Notley said individual provinces have specific concerns, but there is significant consensus among her colleagues. Quebec's Philippe Couillard said his province wants to ensure allegations of police sexual abuse of aboriginal women in his province are included. It would be better to have one inquiry rather than two parallel investigations, he said. The premiers and aboriginal leaders also discussed how to develop natural resources and their associated infrastructure, including pipelines, with the consent and participation of First Nations. Canadian Press (Times Colonist, A7, Edmonton Sun, A5, Red Deer Advocate, Toronto Sun, London Free Press, Kingston Whig-Standard, Edmonton Sun, Ottawa Sun, Calgary Sun, Winnipeg Sun, Chronicle Herald, CP24, CTV News, Our London); The Guardian (The Telegram); CBC News; Presse canadienne (La Presse)

Body found near Bella Coola identified as Dianne Pootlass
The body of a woman discovered two weeks ago near Bella Coola, B.C., has been identified as that of missing woman Dianne Pootlass. There were no signs of foul play, said a statement released by RCMP. The 41-year-old was reported missing to police after she was last seen by a family member on June 16. "An extensive air and ground search was conducted over several weeks in order to locate Dianne, but all search efforts met with negative result," wrote North District RCMP spokesperson Cpl. Dave Tyreman. Her body was located in the water in the North Bentinck Arm area by a boater on July 7. An autopsy was performed on July 11, which positively identified the deceased as Pootlass. CBC News; Coast Mountain News (2016-07-20)

Zoe Saldana making doc on Canada's missing indigenous women
A team of filmmakers including Avatar star Zoe Saldana are producing a documentary probing the disappearance of Canada's indigenous women. Gone Missing began life last year, when producer-director Leslie Owen happened upon a news story that highlighted 1,200 instances of murdered and missing women. Toronto Star (2016-07-20)

FEDERAL & INTERNATIONAL OPERATIONS / OPÉRATIONS FÉDÉRALES ET INTERNATIONALES

Torture - Le CSTC avare de détails
L'agence d'espionnage électronique du Canada refuse de préciser à quelle fréquence elle partage de l'information pouvant mener à la torture d'un individu dans une prison étrangère. Le Centre de la sécurité des télécommunications Canada (CSTC) -- qui analyse les menaces de terroristes et espions étrangers -- a censuré des documents présentant ces données, même si la Gendarmerie royale du Canada (GRC) et le Service canadien du renseignement de sécurité (SCRS) ont déjà révélé ces chiffres dans le passé. Cette réticence a poussé Amnistie internationale Canada à affirmer que le CSTC devait faire preuve d'une " plus grande transparence ". Le CSTC a été placé sous les projecteurs ces dernières années en raison des informations coulées par Edward Snowden, l'ancien sous-traitant de l'agence de sécurité nationale américaine (NSA), l'équivalent du CSTC au sud de la frontière. Le Centre fait également partie d'une poignée d'agences canadiennes -- dont la GRC, le SCRS, l'Agence des services frontaliers du Canada et la Défense nationale -- qui ont le droit de partager des informations avec des partenaires étrangers, même si cela signifie qu'une personne pourrait être torturée par la suite. Le ministre de la Sécurité publique, Ralph Goodale, a indiqué plus tôt cette année que les libéraux se pencheraient sur les problèmes liés à cette politique de partage d'information, mise en place par le gouvernement conservateur précédent. La Presse canadienne (Le Devoir, A4) (2016-07-21); La Presse (2016-07-20)

Europol hosts Virtual Currencies Conference to fight cybercrime and money laundering

Europol's European Cybercrime Centre (EC3) organized the third Virtual Currencies Conference on 14 and 15 July at its headquarters in The Hague, which brought together over 90 experts from various regions of the world. The two-day conference aimed to strengthen the fight against the abuse of virtual currencies for criminal transactions and money laundering. In addition, it also offered opportunities for closer cooperation and new partnerships to prevent and fight cybercrime and money laundering as well as facilitate asset recovery. In attendance were representatives from law enforcement authorities, in particular from EU Member States, several US law enforcement agencies, the Swiss Police Cybercrime Division and the Royal Canadian Mounted Police. Furthermore, leading experts from several commercial and non-for-profit organisations actively involved in facilitating the lawful use of virtual currencies also took part. Experts shared their insights into criminal trends and the latest techniques used by illegal entities to hide their financial tracks and cash out criminal proceeds using bitcoins and other digital currencies. The latest cutting-edge technology solutions for tracing blockchain transactions for criminal investigations were presented. Best practices and law enforcement techniques were also shared through concrete case examples. EconoTimes

L'opération NUNAKPUT 2016 a pris fin à Fort Simpson, dans les Territoires du Nord-Ouest
L'édition 2016 de l'opération NUNAKPUT prend fin aujourd'hui à Fort Simpson (Territoires du Nord-Ouest) après deux semaines de patrouilles maritimes et d'entraînements qui ont débuté le 5 juillet. Les patrouilles et les entraînements étaient axés sur les membres du 1er Groupe de patrouilles des Rangers canadiens, ainsi que sur des exercices de recherche et de sauvetage (SAR) auxquels ont participé des militaires des Forces armées canadiennes, des employés de divers ministères fédéraux et d'un organisme civil de recherche et de sauvetage. L'importance de cet entraînement a été confirmée durant l'édition 2016 de l'opération NUNAKPUT, alors que deux incidents réels ayant donné lieu à deux opérations de recherche distinctes pour retrouver des plaisanciers perdus sont survenus près de Lutselk'e, à environ 200 kilomètres à l'est de Yellowknife. Les efforts combinés de la GRC et des équipages et appareils de l'ARC, notamment un CC-130 Hercules basé à Winnipeg et un CC-138 Twin Otter basé à Yellowknife, ont permis de localiser et de secourir les plaisanciers. L'entraînement de SAR mené cette année dans le cadre de l'Op NUNAKPUT permet de s'assurer que les FAC et leurs partenaires maintiennent leur capacité d'intervenir lors d'incidents comme ceux-ci, accroissant ainsi la sécurité et la protection des Canadiens occupant le nord du territoire. 45eNord (2016-07-20)

ORGANIZATIONAL ISSUES / ENJEUX ORGANISATIONNELS

Mort de Michel Vienneau
Annick Basque, la compagne de Michel Vienneau, abattu par un policier municipal de Bathurst, signe une autre victoire importante. La Cour du Banc de la Reine ordonne que le dossier d'enquête de la GRC, ainsi que les rapports de toxicologie et d'autopsie de la victime, soient remis à Mme Basque. Néanmoins, dans sa décision du 11 juillet, le juge Larry Landry autorise que tout renseignement permettant d'identifier le dénonciateur à l'origine de l'intervention policière du 12 janvier 2015, de même que toute information relative aux mesures d'enquête de la GRC, soient masqués. Lors de la première audience tenue le 12 novembre, les procureurs généraux du Canada et du Nouveau-Brunswick refusaient de fournir les documents en question auxquels Annick Basque voulait avoir accès, dans le cadre de sa poursuite civile contre la Ville de Bathurst. Le procureur général du Canada affirmait que l'inspecteur de la GRC Larry Wilson, qui a mené l'enquête sur les circonstances du drame, collaborait toujours avec le service des poursuites publiques du Nouveau-Brunswick et que le dévoilement de ces documents pourrait éventuellement nuire au dépôt d'accusations criminelles. Le bureau du coroner donnait principalement les mêmes raisons pour refuser de dévoiler son rapport. Acadie Nouvelle, 5 (2016-07-21); Radio-Canada (2016-07-20)

Officer encourages residents to report tips to police
An RCMP officer in Bathurst says he may be able to shed some light on the reason why police were called recently about a suspicious vehicle at the Stonehaven wharf. RCMP Constable Jonathan Greer of the J Division Federal Operations is responsible for the RCMP's Coastal Airport Watch Program (CAWP) in the North Eastern corner of the province. He said police ask that residents tip them off to any unusual activity and that RCMP rely on calls like one made recently in Stonehaven. "Police depend on members

of the community to be our eyes and ears in their communities, to report anything they believe is suspicious in nature or 'not normal' for that area, and to help us prevent, detect and intercept individuals, vehicles and vessels," said Cst. Greer in an email. A complaint made to police recently at Stonehaven made national headlines when Louizandre Dauphin, who is black, was pulled over by RCMP after spending a few hours reading a book in his car near the Bathurst-area wharf. (...) Following the media coverage, some residents from the Stonehaven area have come out and said the racial allegation is unfair and residents in the rural area routinely report suspicious activity due to several thefts lately, and in the past number of years. Cst. Greer says "the CAWP encourages people to do exactly what the caller in this case did." He said theft isn't the only issue at wharfs and along coastal areas. "When police respond to a call of this nature, it could be to prevent a suicide, identify possible thieves, prevent a drug deal, intercept a potential importation of illegal drugs, human smuggling, etc." he said. Telegraph-Journal, A6

Halifax police assaulted at higher rate than Canadian average

For the last five years, police officers in Halifax have been assaulted at a higher rate than in any other city in Atlantic Canada, and at a far higher rate than the national average. According to an analysis of crime data obtained from Statistics Canada, from 2011 to 2015, Halifax has averaged a rate of 43.5 assaults on police officers per 100,000 people. St. John's, the next highest city in the Atlantic Canada, averaged 33. But that figure doesn't tell the whole story. While the St. John's rate of 41 assaults in 2010 was the second highest in the region; five years later their rate of assaults fell to 29. This is similar to the way rates of assault on police officers have dropped throughout Atlantic Canada. However, since 2011, Halifax's has remained relatively the same. In 2015, the rate of assaults in Halifax was 39. From 2011 to 2015 Halifax had 898 total incidents where police were assaulted. St. John's had 333. In 2011, officers in Halifax – including Halifax Regional Police and RCMP in the municipality – were 35 per cent more likely to be assaulted when compared to other Canadian regions. Five years later, the number has dropped to its lowest point at 30 per cent. Truro Daily

Pokemon Go takes N.S. by storm

From Alderney Landing and the Halifax waterfront to Peggy's Cove and Sydney, the hunt is on for Clefairy and Snorlax and Pikachu. Nova Scotian Pokemon Go enthusiasts are taking to the streets, inspired by the latest mobile digital craze over the cartoonish creatures visible only on smartphones through an app with a map-like interface - but players are urged to be careful. "There needs to be billboards with the Snorlax poster downtown. Congested sidewalks are not the place to stop in the middle of," warned Matt on the Facebook page Pokemon Go: Halifax. (...) At the RCMP, some research is underway about the game and its objectives, said Corp. Jennifer Clarke. "We would certainly encourage people to be aware of their surroundings at all times, and to be responsible with other people's private property - and to separate reality from the game, making sure they're not putting themselves in danger when they're out in the open," Clarke said. Chronicle Herald, A6

New resource for domestic violence victims in town

The town of Cochrane has hired more personnel to address a rising domestic violence problem in the community. In January, a domestic violence co-ordinator position was added to the Cochrane RCMP detachment. The new position will help assist with and review domestic violence cases in the community. “My position is here and if people have any questions with domestic violence, I am working and listening and want to help them out the best I can and if I can’t help them then I can help them find resources with the community partners we have to assist them,” said Cst. Courtney Currie, Cochrane’s first domestic violence co-ordinator. Currie has 10 years experience with the RCMP and has lived in Cochrane for the last four and a half years. She said she accepted the position because she wanted to “help people.” “I have seen where people are involved in domestic violence time and time again and I want to help them understand that it is something they shouldn’t be living with and it is not healthy in a relationship and I can understand if they want to continue in the relationship but something needs to change,” Currie said. “There is a lot of domestic violence in the area – the recession is probably not helping.” Cochrane Eagle

Police presence at west end of Salmon Arm a training exercise

It's not what it appeared to be. Reports of some type of police incident coming from passersby were, in reality, a police training exercise. RCMP officers from the Southeast District Emergency Response Team utilized buildings on a property across the Trans-Canada Highway from DeMille's Farm Market

near the Salmon River Bridge for a training exercise. The property is slated for demolition as part of a highway expansion project. Several police officers dressed in tactical gear as well as a large armoured vehicle were on the property. Sgt. Scott Lachapelle of the Salmon Arm RCMP said that the Emergency Response Team members on scene used the buildings to practise techniques for entry and other scenarios. Lachapelle said the location is used because officers do not have to be as concerned about damaging the buildings "We're not just simulating tearing a door down, we're going to try and tear it down to see how it works, so when we have to do it for real we know how it works," he said. Lachapelle and other members of the Salmon Arm RCMP observed the training exercise but did not participate. Salmon Arm Observer (2016-07-20)

Manitoba Stampede and Exhibition
The province's only professional rodeo is back in the saddle - the Manitoba Stampede and Exhibition runs this weekend, July 21-24, in Morris. Started in 1964, the Manitoba Stampede (put on by the Valley Agricultural Society) showcases classic rodeo activities such as bull riding, bronco-busting, tie-down roping, bareback riding, steer wrestling, ladies barrel racing, team roping and chariot and chuckwagon racing. The stampede also includes an agricultural fair - where patrons can learn all about the heritage of rural Manitoba - a beer garden, musical entertainment and a parade that begins Saturday at 10 a.m. This year, the RCMP Musical Ride will also be taking part, bringing 32 horses and riders that "provide the public with an opportunity to experience the heritage and traditions of the RCMP." It also raises money for local charities and initiatives across the country. The first recorded display of the Musical Ride was in 1901 in Regina - it's a performance in which horses and riders create intricate figures and do drills choreographed to music. The Musical Ride visits cities all across the country, and, in addition to the stampede, will be making 12 additional stops in Manitoba locations. Winnipeg Free Press, 8; Winnipeg Sun

RCMP Musical Ride charges into town
For the first time in 16 years, the RCMP Musical Ride will be making its return to Portage la Prairie. The cavalry will perform two shows at the PCU Centre July 26, showcasing intricate drills choreographed to music which require the utmost control, timing and coordination. Portage Daily Graphic (2016-07-20)

Flame of Hope run through downtown Whitehorse
Rachel Dawson smiles wide as she receives the freshly light Flame of Hope. The Special Olympic soccer player was the first to hold the flame at the start of the Law Enforcement Torch Run yesterday and she held it high. The torch is one-of-a-kind, carved by Owen Munro, a fellow special Olympian. It was passed hand to hand as Serge Michaud, Special Olympics Yukon and Torch Run Liason, addressed the group of about 50 law enforcement and Special Olympians in front of him. "This is the largest Law Enforcement Torch Run we've ever had in the Yukon," he said. "Congratulations all of you for signing up." (...) "Yukon Law Enforcement officers are proud to carry the torch to recognize over 90 amazing Yukon athletes with an intellectual disability" said Whitehorse RCMP Inspector, Dan Austin, LETR Director for Yukon. "Running through the streets of Whitehorse with the Flame of Hope is one of many ways we hope to increase awareness of Special Olympics Yukon." Whitehorse Daily Star, 19

City in favour of extra RCMP officer
At its Monday meeting, Courtenay council approved in principle a 2017/18 policing contract exceeding $6 million. It would provide for a full-time complement of 31.4 RCMP members — one member more than 2016/17. Courtenay is responsible for 90 per cent of the contract ($5,418,651). Comox Valley Record (2016-07-20)

RCMP begin bike patrols
Grande Prairie residents aren't the only ones enjoying the summer sun as RCMP bike patrol officers have hit the trails. This summer, residents will see officers patrolling parks, the downtown, and special events not only in an effort to curb crime, but also to build ties with the community. "It's an extension of our community policing units," said Cpl. Shawn Graham, supervisor for the bike patrol team. "It's a unit that's very visible and it's very community based, bike patrol members are visible in our park areas and they engage with local youth down there as well as other users in the park, to be visible so that (citizens) feel comfortable being at the park and (to see) that police are down there making patrols of the area." The

bike patrol has been in place for more than10 years with the core made up of five school resource officers, with the option of pulling about 10 members from a watch, if need be. Bike patrol members police in pairs and can perform traffic enforcement duties, look for lost children, and administer first aid. "Being a bike patrol officer is a really good feeling. I feel that we're able to get down into the parks where our members in the vehicles cannot. It's a great feeling of safety and security for members of the public just because we're on the trails looking out for their safety," said Const. Michelle Mosher. "We're having lots of positive comments, especially on Muskoseepi trails people have said how nice it is to see us on the trails and it makes them feel a lot better." Daily Herald Tribune (2016-07-20)

LEGISLATION & POLICIES / LÉGISLATION ET POLITIQUES

Raiding illegal pot shops not the answer, prof believes
Sending police to shut down pot shops is a "blunt instrument" in the face of the widespread social disobedience that has propelled hundreds of the illegal businesses to open across Canada, says Osgoode Hall Law School professor Alan Young. "The criminal law is always an ineffective way to make a change in a community," said Young, a specialist in marijuana law. "It's very slow, ponderous, and by the time you get a result, the legal landscape may have changed." Ottawa city councillors and merchant groups are debating what to do about the illegal marijuana dispensaries opening in town. There have been calls for police to enforce drug laws and shut them down. Everyone is looking closely at what's happening in other Canadian cities, especially Toronto and Vancouver. Toronto police cracked down after dozens of dispensaries sprang up this spring. Since late May, police and bylaw officers have raided 47 dispensaries, arresting more than 90 people and charging them with either drug trafficking, benefiting from the proceeds of crime, or zoning infractions. Ottawa Citizen, A3

Ahead of legalization, lobbyists for the marijuana industry jostle for a say in Ottawa
In another sign that Canada's booming marijuana industry has gone corporate, dozens of companies have registered as paid lobbyists ahead of Ottawa's plan to legalize the drug's recreational use next spring. As of March 19, the federal government's lobbyist registry listed 88 paid positions with interests in marijuana or cannabis. The companies named range from small, independent businesses like Vancouver's Eden Medicinal Society to large corporations, including the Loblaws chain of more than 2,000 supermarkets across Canada. An analysis by the *Straight* revealed the vast majority of lobbyists remain focused on medicinal marijuana, while 24 can be described as focusing entirely or partly on recreational cannabis. (…) According to CAMCD president Dieter MacPherson, one reason the lobbyist registry might be short on names from the dispensary industry is because storefront operators predict Ottawa will leave nuts-and-bolts regulations for the distribution of recreational marijuana up to the provinces. "The federal government and its legalization platform is going to be setting a stage that the provinces then get to dance on," he said on the phone from Victoria. "Lobbying dollars spent at the federal level may not be as effective." Straight.com (2016-07-20)

EDITORIALS & OPINIONS / ÉDITORIAUX ET LETTRES D'OPINIONS

Pot and a hard place
An editorial states, "Ottawa is now a Wild West of potrepreneurs. The city and police have been left in an awkward position by the federal Liberal government, which has sparked up a marijuana retail race but won't introduce legislation to legalize it until next spring. If legalization is going ahead, it needs to happen in a sensible, smart way. As local councillors note, we probably don't want stores - such as the nine dispensaries that have popped up across Ottawa already - selling weed across from local schools, just as we don't locate LCBOs or strip clubs there. The current situation is a mess. The recreational trade is illegal, yet there are no controls over who is peddling pot in our communities. (…) Cops are caught between the pot and a hard place. "The law is in force and it should be obeyed," Attorney General Jody Wilson-Raybould has said, meaning this commercial recreational trade is still illegal. So what are police to do? Moreover, if people are arrested, what is the Crown to do? The federal Liberals have created this frenzy of entrepreneurs, but the lag time for changing the law, and thus allowing for local regulation, is leaving cities and authorities in an untenable situation. We need clarity. The hazy approach by the feds is

only causing chaos. And it was entirely foreseeable - unless your head was in the clouds." Ottawa Sun, A18

Fentanyl is now a crisis
An editorial states, "The weekend spike in drug overdoses across Surrey's Whalley area would have been a national disaster had the subjects been victims of a mass shooting, a wild fire or a plane crash. Fraser Health medical staff faced a disaster-like 36 life-threatening cases in which people were stricken after ingesting illicit drugs likely laced with the deadly synthetic opioid fentanyl. Emergency workers handled the calamity with competence and nobody died. For their skill, they deserve thanks. The same is true for the health-care workers and police officers who then walked streets putting up warning notices, handing out pamphlets and talking to people about a growing and immediate risk. How serious is the problem? A report from the provincial coroner's service tracking detection of fentanyl in illicit drug overdose deaths shows a frightening expansion across both provincial geography - and demography. The number of overdose deaths in which fentanyl was detected jumped by 1,346 per cent from 2012 to the mid-point of 2016. For users under 19, more frequently users of other recreational drugs, the increase is 700 per cent. And the hazard is now provincewide. Of the 494 such deaths reported to the end of May, 214 were on Vancouver Island, in the Interior and across the north. Synthetics like fentanyl, 50 to 100 times more powerful - and toxic - than opiates like morphine or heroin, are increasingly popular with those who make and sell illicit drugs because they offer a cheaper ingredient which amplifies the potency of what they purvey. But lower costs and higher profits for traffickers mean vastly increased risk for unsuspecting users of street-purchased drugs. Fentanyl-implicated overdose deaths, for example, are already about 10 times the fatalities in the 2009 swine flu epidemic. The response by Fraser Health and Surrey RCMP deserves applause. But what next? If fentanyl shows up everywhere and in all forms of street drugs, everyone who ingests or injects illicit drugs is now at risk of a lethal overdose." Vancouver Sun, A10

Use Marijuana Tax Revenues To Treat Related Public Health Issues
An opinion piece by Bill Bogart, law professor at the University of Windsor, states, "The Task Force on Marijuana Legalization and Regulation is up and running. And run it will in order to have a detailed set of recommendations for its November deadline. It has lots of issues to consider as indicated by its discussion paper and beyond. Protection of children in the shift from criminalization to regulation must be paramount. Taxation raises a lot of questions. There's no doubt that marijuana, itself, and the industry and its employees, agents, etc. should be taxed. One of the main arguments for legalization and regulation is that it will impose levies on the cannabis industry, ending its illicit tax-free days. How much to tax is a critical issue: too low and the levies, even combined with other strategies, won't have much impact dampening harmful consumption; too high and the illicit market can creep back in (we've seen this happen with cigarettes). At any rate, taxation produces revenue for governments. What should be done with the flow derived from marijuana? Monies from taxes on cannabis could simply be directed to the general revenue pool of government. However, for two compelling reasons, the task force should recommend that any legislation regulating marijuana should stipulate that funds should be earmarked for public health issues related to cannabis. First, the goal of taxing drugs is to discourage harmful consumption. The money raised through those taxes will have more impact if it is used to support prevention and counselling than it will by becoming part of general revenues used for various purposes. Second, the taxes will more likely be supported by the public if they are used for these specific ends." Huffington Post (2016-07-20)

Les Hells Angels sous haute surveillance
Les autorités policières des deux côtés de la rivière des Outaouais seront aux aguets, au cours de la fin de semaine, alors que plus de 500 Hells Angels et membres de clubs affiliés de partout au Canada seront à Ottawa pour le Canada Run 2016, un rendez-vous obligatoire pour ces groupes de motards, tenu aux quatre ans. Les corps policiers des villes d'Ottawa et de Gatineau, de la Sûreté du Québec (SQ) et de la Police provinciale de l'Ontario (PPO) se préparent depuis plusieurs mois à cette visite, qui aura lieu du 22 au 24 juillet. Ils se mobiliseront pour surveiller le rassemblement, faire respecter le code de la sécurité routière, recueillir des informations et rafraîchir leurs albums de photos. «Cet événement se

traduira par une forte hausse du nombre de motocyclettes sur nos routes, a précisé l'inspecteur Michel Marin de la police d'Ottawa. Il s'agit donc d'un rappel à tous les usagers de la route de partager la chaussée et de respecter les limites de vitesse.» «Ce sera tolérance zéro, a continué l'inspecteur Marin. Si nous devons effectuer une arrestation, nous la ferons en tenant compte de la sécurité des agents et des participants à l'événement.» Les Hells et leurs sympathisants se réuniront dans le secteur rural de Carlsbad Springs, dans l'est de la ville, où la présence policière sera rehaussée. Les Nomads, un chapitre des Hells Angels, possèdent une base à Carlsbad Springs. Des membres de clubs-écoles comme les Red Devils et les Gatekeepers sont aussi attendus dans la région. Le Droit, 2 (La Presse); Ottawa Sun (Ottawa Citizen); London Free Press (2016-07-21); CTV News; CFRA News (2016-07-20)

Leading member of Hells Angels arrested

André Sauvageau, 57, a leading member of the Hells Angels, was arrested in a restaurant on the South Shore Wednesday. The Sûreté du Québec said Montreal's Joint Regional Squad made the arrest as part of Projects Magot and Mastiff, joint investigations with the SQ into drug trafficking conspiracies allegedly run by the Mafia, Hells Angels and street gangs. On Nov. 19, investigators arrested or issued warrants seeking 48 people - including Leonardo Rizzuto and Stefano Sollecito, whom police described as the heads of the Mafia in Montreal. Sauvageau is expected to appear Thursday at the Montreal courthouse to face charges of gangsterism, drug trafficking and instructing a person to commit a criminal offence. The SQ says investigations are ongoing. Two people are still being sought: Jesse McCarthy, 39, of Montreal, and Patrick Williams, 41, of Mascouche. Montreal Gazette, A4; Presse canadienne (Le Nouvelliste, Le Devoir); Journal de Montréal

Number of crimes reported to police jumps for first time in 12 years

Statistics Canada says the number of crimes reported to police went up last year for the first time in 12 years. The crime severity index, which measures the volume of reports and how serious they are, rose 5% in 2015. But the agency says that's still 31% lower than it was a decade ago. The overall crime rate also rose, by 3%, but Statistics Canada notes the last time a rate increase was reported was 2003. The agency says the rise in both measurements was due to more incidents of fraud, breaking and entering, robbery, and homicide. It says there were almost 1.9 million Criminal Code incidents, excluding traffic, reported in 2015, 70,000 more than the year before. TOP STORIES / ACTUALITÉS

A question of balance: civil liberties, security equal in battle against terrorism: PM
An alleged terrorist plot in Ontario that created anxieties over police monitoring of suspects hasn't shaken Prime Minister Justin Trudeau's emphasis on balancing civil liberties with public safety. In his first reaction to an alleged plot that led to the death of Aaron Driver in Strathroy, Ont., Trudeau said Tuesday that balancing individual rights with keeping Canadians secure from bombing threats has to be handled with care. "Canada is a country that values its freedom (and) its basic charter rights," he said during a stop in Bridgetown, N.S., for an infrastructure funding announcement. "All Canadians expect their government to do two things: to keep Canadians safe and to defend and uphold the values and rights that all Canadians hold dear." "Getting that balance right isn't always easy in the challenging situation we now live in but it's extremely important." (...) During the news conference, the prime minister said the wider response against domestic terrorism will be rolled out by Public Safety Minister Ralph Goodale as the Liberals continue plans to reform Bill C-51. During the last federal election, the Liberals pledged to guarantee that all Canadian Security Intelligence Service warrants respect the charter, that the right to lawful protests and advocacy aren't violated, and they pledged to "narrow overly broad definitions (in Bill C-51), such as defining 'terrorist propaganda' more clearly." They also said a Liberal government would limit the Communications Security Establishment's powers by requiring a warrant to engage in the surveillance of Canadians and emphasize community outreach to battle radicalization of youths. Canadian Press (Red Deer Advocate, A8, Cape Breton Post, Telegraph-Journal); Postmedia News (Ottawa Sun, A9, Winnipeg Sun, Toronto Sun, Edmonton Sun, Calgary Sun)

Trudeau se tourne vers le comité parlementaire
Le premier ministre Justin Trudeau estime que le comité parlementaire créé pour surveiller les activités des agences de renseignement aura à évaluer l'efficacité du travail de ces agences. La semaine dernière, la Gendarmerie royale du Canada (GRC) a intercepté un jeune Canadien qui préparait une attaque terroriste. Le jeune homme était connu des autorités canadiennes, mais c'est le FBI qui a alerté la GRC alors que l'homme préparait un attentat imminent. (...) «Cette situation de la semaine dernière et des situations semblables, c'est exactement le genre de choses sur lesquelles le comité de parlementaires aura à s'exprimer, aura à réfléchir», a-t-il ajouté. Le premier ministre s'attend à ce que ce comité offre «des conseils sur la manière dont on peut encore mieux assurer la sécurité des Canadiens, comme nous avons pu le faire la semaine dernière». Presse canadienne (Le Droit, 15, La Presse+, Le Soleil) (2016-08-17); Presse canadienne (Le Devoir) (2016-08-16)

Change terror tactics
The RCMP thought Martin Couture-Rouleau was on the right track when officers met the 25-year-old radicalized convert on Oct. 9, 2014. Despite a failed attempt to travel to Syria, he seemed to be coming around. Eleven days later, he drove to a strip mall frequented by uniformed soldiers in Saint-Jean-sur-Richelieu, Que., and killed Warrant Officer Patrice Vincent. Chased by police, he crashed his car and charged officers with a knife before he was shot dead. Following a similar scenario in Strathroy, Ont., on Aug. 10, which ended with the shooting death of ISIL supporter Aaron Driver as he was allegedly about to conduct a bombing, some experts are calling for changes to the way extremists are assessed. In the Couture-Rouleau and Driver cases, the assessments were ultimately wrong. Both men had come to the attention of the RCMP but were apparently thought to have softened their views and were not being closely monitored. Former Canadian government intelligence analyst Phil Gurski said the cases point to the need for more thorough and regular assessments of extremists on the radar of security agencies. He also said authorities must assume that extremists who claim to have reformed are liars until proven otherwise. "Absent that assumption, extremists will continue to dupe well-intentioned people," he wrote in a blog post Tuesday. In an interview, Gurski said terrorist groups like ISIL encourage their followers to use deception as a tactic. "My default position is that you have not deradicalized, you have not abandoned the cause, until you prove to the nth degree the contrary," he said. (...) The Violent Extremist Risk Assessment tool currently used is a guide that rates extremists based on whether they score low, medium or high on 25 categories such as use of extremist websites, direct contact with extremists and military training. But it "has some weaknesses," Prof. Dawson said. "It shows some potential but it's got some real limitations. ... Everyone recognizes that we really need to get serious about developing better assessment mechanisms." He said the office of community outreach and counter-radicalization that Public Safety Minister Ralph Goodale has announced would likely take on the task. "They're aware of this and this is probably one of the things they're going to be pouring a lot of resources into." Postmedia Network (National Post, A1, Front, Vancouver Sun, Windsor Star, Kingston Whig-Standard, StarPhoenix, Leader-Post, Montreal Gazette, Ottawa Citizen, London Free Press, Edmonton Journal, Calgary Herald)

Police chiefs want access to passwords
Canada's police chiefs want a new law that would force people to hand over their electronic passwords with a judge's consent. The Canadian Association of Chiefs of Police has passed a resolution calling for the legal measure to unlock digital evidence, saying criminals increasingly use encryption to hide illicit activities. There is nothing currently in Canadian law that would compel someone to provide a password to police during an investigation, RCMP Assistant Commissioner Joe Oliver told a news conference Tuesday. Oliver said criminals - from child abusers to mobsters - are operating online in almost complete anonymity with the help of tools that mask identities and messages, a phenomenon police call "going dark." "The victims in the digital space are real," Oliver said. "Canada's law and policing capabilities must keep pace with the evolution of technology." The chiefs' proposed password scheme is "wildly disproportionate," because in the case of a laptop computer it would mean handing over the "key to your whole personal life," said David Christopher, a spokesman for OpenMedia, a group that works to keep the Internet surveillance-free. "On the face of it, this seems like it's clearly unconstitutional." The police chiefs' resolution comes as the federal government begins a consultation on cybersecurity that will look at issues including the best way to balance online freedoms with the needs of police. The consultation runs until Oct. 15. Police demands for access to online communications and the concerns of civil libertarians about privacy rights have created tensions around the globe in recent years. The issue came to fore last year

when the U.S. Federal Bureau of Investigation went to court in a bid to crack the password of a terror suspect's iPhone following a mass shooting in San Bernardino, Calif. Canadian Press (Red Deer Advocate, A7, Guardian, Telegram, Chronicle-Herald, Cape Breton Post, Toronto Sun, Hamilton Spectator, Waterloo Region Record, Edmonton Sun, Toronto Star, Edmonton Journal, Leader-Post, Ottawa Citizen, National Post, times & Transcript); Canadian Press (Calgary Sun,A3, Calgary Herald); Presse canadienne (Acadie-Nouvelle, 12, Le Quotidien, La voix de l'est, Le Soleil) (2016-08-17); Presse canadienne (L'Actualité) ; Canadian Press (CTV News, News 1130, iPolitics); CHED 630 AM (2016-08-16)

CONTRACT & ABORIGINAL POLICING / SERVICE DE POLICE CONTRACTUELS ET AUTOCHTONES

King may have been on the move

Denecho King is believed to have hid in several locations throughout the city prior to being found in a housing unit on Sissons Court Saturday morning, police say. "We can confirm that we suspect he was moving to different locations during the three-day search, thus the police activity that was all over **Yellowknife**," RCMP civilian member Marie York-Condon stated in an e-mail Tuesday. The force declined an interview request. King, 23, had escaped Wednesday from the North Slave Correctional Centre. He was found in a home on Sissons, an area with multiple rowhouses, by police through "investigational techniques" and tips from the public. Between 25 to 30 RCMP officers were involved at the height of the search, police have stated. "We followed up on any and all sightings reported around the city, and followed the investigational leads," York-Condon stated. "Ultimately, this led us to King at the residence where he was apprehended." RCMP officers were going door to door around 8 a.m., Sissons Court resident Leroy Mantla said. Police confirmed King was in a unit and a crisis negotiator established contact with the occupants. How many people were inside remains unclear. By 9 a.m., officers with weapons drawn could be seen around the buildings as more officers arrived. About 30 minutes later, an officer began giving instructions to King over a loudspeaker. After about 30 minutes more, King left the unit through the front door and was led away in handcuffs to a waiting police truck. "Through the hard work and professional conduct of our RCMP members, we were able to bring this search to a successful conclusion without incident," Yellowknife RCMP detachment commander Insp. Matt Peggs stated in a news release. Northern News; Yellowknifer; Yellowknifer

Home searched by RCMP in terrorism investigation no longer of interest to police

A **London** family that has been in the hot seat for nearly a week -- since police swooped in and searched their Northwest London home without a warrant in connection with a terrorism investigation last week -- is in the clear. "As it stands, we have no ongoing interest in 43 Blanchard (Cres.)," RCMP spokesperson Louise Savard wrote in an email to the Free Press Tuesday. A day earlier, the RCMP would not answer any questions about their investigation of that home, an investigation they made public by announcing the address at a national news conference last Thursday. The family who lives there had "no communication" from the RCMP since their home was searched — without a warrant — and cleared the night terrorism suspect Aaron Driver died in a confrontation with police in Strathroy, their lawyer told the Free Press Monday. London Free Press (2016-08-16)

19K found inside Hamilton man's car on Trans-Canada Highway

A man from Hamilton, Ont., faces criminal charges after RCMP in **Manitoba** pulled a car over for speeding, only to find "stacks of cash" exceeding $19,000 in cash along with some marijuana inside. RCMP say they stopped a 2007 Cadillac on the Trans-Canada Highway near Headingley, which is just west of Winnipeg, around 1 p.m. CT on Aug. 11. Officers found a small quantity of marijuana and "stacks of cash in excess of $19,000" inside the vehicle, RCMP said in a news release Tuesday. Both the money and the car were seized. Police say they believe the cash was obtained through criminal activity. An RCMP spokesperson says the vehicle is being held as part of the investigation, which will determine whether or not it came from proceeds of crime. CBC News; Global News; Winnipeg Free Press; Radio-Canada (2016-08-16)

Peterborough plane crash probe continues, RCMP now involved

City police continue to work with the **York** Regional Police and the Transport Safety Board as the investigation into Friday morning's plane crash on Lansdowne St. continues. The RCMP is also involved, city police report. The level of local police involvement will be determined as the investigation continues, city police say. Peterborough Examiner (2016-08-16)

Surrey RCMP request public help to locate Maya Singh
Surrey RCMP are requesting the public's assistance in locating a high risk missing female, Maya Singh, who was last seen on August 10 (Wednesday) as she left her home in Surrey for another family's residence. It wasn't discovered until August 13 (Saturday) that she didn't make it to her destination and was reported to police as missing. Maya Singh is described as a 68-year-old South Asian Fijian female, 5'3 in height, 155 pounds with black shoulder length hair and brown eyes. She was last seen wearing a black-and-white striped hoody, pink top, and plaid pajama pants. Maya Singh was also seen carrying three large purses / handbags (see photos). Investigators of Surrey RCMP Missing Person's Unit have located surveillance photos from August 10, the day she was last seen. The photos come from a business in the 12100-block of 72nd Avenue in Surrey. Indo-Canadian Voice (2016-08-16)

NATIONAL INQUIRY INTO MISSING AND MURDERED INDIGENOUS WOMEN AND GIRLS / ENQUETE NATIONALE SUR LES FEMMES ET LES FILLES AUTOCHTONES DISPARUES ET ASSASSINEES

MMIW Red Dress Campaign heading to Prince George
There will be empty red dresses hanging in parts of the city on October 2nd, honouring missing and murdered indigenous women. Local organizer Tammy Meise saw the Red Dress display while in Vancouver in 2014. She wants to give a voice back to local women who've gone missing, especially one. "One of my childhood best friends, Kari Anne Gordon, she was murdered and she has become a statistic. When I saw the red dress project it impacted me, it literally took my breath away ... us that are mothers, that are sisters, that are daughters, that are aunties, have family and friends that have gone missing. When you actually talk to people and start making connections, it's actually amazing how it affects so many people." Meise presented the event to Council on Monday night. Councillors unanimously supported the event and met her request of waiving the Lheidli T'enneh Memorial Park liability costs and covering the Park rental fees. Council also gave Meise permission to hold a candlelit vigil at the Park that night and many, including Councillor Terri McConnachie, promised to be there. My Prince George Now (2016-08-16)

FEDERAL & INTERNATIONAL OPERATIONS / OPÉRATIONS FÉDÉRALES ET INTERNATIONALES

Driver killed by gunfire: Father: ISIS supporter's funeral won't be held at mosque in London, spokesperson says
An ISIS supporter who died during a confrontation with an RCMP tactical team outside his home in Strathroy, Ont. was killed by a police bullet, his family said Tuesday. Wayne Driver said an autopsy had determined that his son Aaron had been shot two times and that one of the bullets had struck his liver and travelled to his heart. The other hit his spleen, he said. The 24-year-old was allegedly in the final stages of preparing a terrorist attack on Aug. 10 when a police Emergency Response Team surrounded him. He detonated an explosive device and police opened fire. Following the incident, the RCMP said it was unsure whether Driver had died as a result of his own bomb or police bullets but the father said the autopsy had put that question to rest. "It was the police officer's bullet that killed him," the father told the National Post. "The bomb that exploded he could have walked away from with minor to severe injuries they said." (...) In his first reaction to the alleged terror plot, Prime Minister Justin Trudeau said a wider response to domestic terrorism would be rolled out by Public Safety Minister Ralph Goodale. "All Canadians expect their government to do two things: To keep Canadians safe and to defend and uphold the values and rights that all Canadians hold dear," he said during a stop in Bridgetown, N.S. "Getting that

balance right isn't always easy in the challenging situation we now live in but it's extremely important." Kingston Whig-Standard, B1/FRONT

Public Safety Minister Goodale Outlines Intention to Combat Radicalization
Public Safety Minister Ralph Goodale says Canada must do better to be a leader in understanding and countering violent radicalization. Goodale says the death of Aaron Driver in Strathroy, who was suspected of planning a terrorist attack, demonstrates the need for *"continued vigilance"* in responding to threats posed by those who have been radicalized to the point of wanting to harm or kill innocent people. While there are no official plans in place, he says the federal government is working to create a new national office for community outreach and engagement that will help combat radicalization. There is no word on when the office will open, or if multiple locations will be established across the country. Goodale made his comments after visiting a centre in Montreal on Monday that works to prevent radicalization leading to violence. Last Thursday, the RCMP revealed that it was the FBI and not the Mounties who discovered a video that led them to Aaron Driver in Strathroy, who police said had threatened to detonate an explosive in an urban centre. Driver died Wednesday night after a confrontation with police that saw a bomb detonated in a taxi cab that was called to take him to Citi Plaza in London. An investigation continues to determine if Driver died from the blast or from a police bullet. AM980 (2016-08-16)

Family tries to clear the air about ties with aspiring terrorist Driver
As Aaron Driver put the finishing touches on a planned terrorist attack last week, he gave no hint anything was wrong, except for confiding that he was feeling ill. "He says, 'I'm not feeling good.' He's sick. He coughs and says, 'I want to go to a hospital,' " a 60year-old friend recalled. A cook for his congregation, he had befriended Mr. Driver when the 24-year-old loner showed up at the local mosque in London, Ont., last year. For initiating this friendship, the cook felt at first like a good neighbour - until last Wednesday. That's when a police intervention made the cook and his family feel like suspected accomplices. As authorities scrambled to neutralize the threat posed by Mr. Driver, they also used some heavy-handed tactics to isolate the family's home. Female family members say police snipers even pointed a laser-scoped rifle at them as they exited their house with their hands up. Three days earlier, Mr. Driver had been at that very house, where the family says he was showing a gentler facet of his personality. On that Sunday, "he trimmed the bushes in the back, the roses and daisies," the cook's 52-year-old wife recalls. She was explaining that her husband and Mr. Driver had bonded over odd jobs. "He was a polite, well-mannered kid, very quiet and shy," she said. Speaking to The Globe and Mail in an hour-long interview, the family members, who knew Mr. Driver by his Islamic name of Harun, say they can't reconcile the police allegations with their interactions with the young man they knew. They asked to remain anonymous to minimize any further fallout from being publicly linked to an Islamic State-inspired extremist, but wanted to speak out to clear up any lingering misconceptions that they were privy to Mr. Driver's ideas or aims. Media reports and senior RCMP officers publicly mentioned the family's address as a secondary search site last week, but police now say it was a red herring. "That was an address that we had some understanding Aaron Driver had a connection to ... so we wanted to follow up," RCMP Superintendent Harvey Seddon said. Declining to discuss specific police tactics or weaponry in an interview, he said "the family doesn't need to be concerned about any cloud of suspicion. Globe and Mail, A1

Muslim rites for terror suspect
The family of the Strathroy terrorism suspect killed in a clash with police last week is making arrangements to give him a Muslim burial Thursday Members of Aaron Driver's family were in London this week and contacted the London Muslim Mosque, asking about funeral protocol, a spokesperson said. "They did reach out to us, inquiring about the protocol for a Muslim funeral. We gave them the lay of the land," said Nawaz Tahir. "We will help and support the family as much as we can." The funeral neither will be held at the mosque, nor have an imam presiding over it, but is expected to be a private family affair, Tahir said. It's scheduled for what would have been Driver's 25th birthday. Driver, 24, an ISIS sympathizer, was shot dead last Wednesday after detonating explosives in a taxi outside his sister's Strathroy home. Police moved in after being alerted by the U.S. Federal Bureau of Investigation to a martyrdom video Driver had made, vowing to attack a major Canadian urban centre. Until Tuesday, police hadn't said whether Driver was killed by the blast in the taxi or by police gunfire. An autopsy concluded he died of a gunshot, police confirmed. Driver's activities, including communicating with ISIS members, had put him on a federal watch list while he was living in Manitoba and led to him being placed under a court-

ordered peace bond that banned him from computer and cellphone communication and required him to live with his sister in Strathroy. Postmedia Network (London Free Press, A1, Front, Winnipeg Sun, Toronto Sun, Ottawa Sun, Edmonton Sun, Calgary Sun); Canadian Press (Red Deer Advocate, A8, Winnipeg Sun, Ottawa Sun, Toronto Sun, Times Colonist, Edmonton Sun, Calgary Sun, Daily Gleaner, Times & Transcript); Presse canadienne (Le Droit) (2016-08-17); National Post; CBC News; Canadian Press (London Free Press, Kingston Whig-Standard, CTV News); Radio-Canada (2016-08-16)

Expansion urged for programs that combat radicalization
After RCMP thwarted a major terror threat in Ontario last week, Mohamed El-Rafih knew that his community anti-radicalization initiatives were more urgently needed than ever. El-Rafih is best known in Calgary's Muslim community as the creator of an anti-radicalization program that he calls Fostering Youth Inclusiveness (or FYI). The program is a day camp for children aged five to 12 that aims to fight radicalization by tackling the feeling of isolation that some Muslim children experience while trying to integrate into Western society. Now, El-Rafih is gathering a group of local politicians, police, religious leaders and Muslim community members on Thursday to see how his programs can be expanded and brought to high schoolage youth. "The purpose behind this meeting is to look at the messaging (we've come up with), and to get everybody's opinion on ... whether it is going to help us against radicalization," said El-Rafih. "There's messaging for Muslims and there's a message for non-Muslims. The message for Muslims is on how there could be misinterpretations on misguided imams and misguided leaders that could make youth vulnerable to radicalization." (...)El-Rafih expects the Calgary police, RCMP and Darshan Kang, Liberal MP in the Calgary SkyView riding, to attend Thursday's meeting, and hopes their input can help craft an effective message that will help to prevent the radicalization of teenage Muslims. Postmedia Network (Calgary Herald, A11, Edmonton Journal, Calgary Sun)

Terrorism propaganda case referred straight to trial
The Public Prosecution Service of Canada says the case against a Fort St. John man charged with four terrorism-related offences will go directly to trial. Spokeswoman Elizabeth Armitage said the case of Othman Ayed Hamdan will proceed by direct indictment, meaning there will not be a preliminary inquiry. Hamdan was arrested in July 2015 and accused of posting Islamic State propaganda online. An RCMP statement at the time alleged the propaganda included inducement and instructions to commit murder in the name of jihad. None of the allegations has been proven in court. Hamdan was originally charged with three terrorism related charges in provincial court, but Armitage said those charges have been stayed. B.C. Supreme Court documents show he is now charged with counselling to commit murder for a terrorist group, counselling to commit assault causing bodily harm for a terrorist group, counselling to commit mischief for a terrorist group and instructing a person to carry out a terrorist activity. Canadian Press (Times Colonist, A5)

American Involvement In Canadian Terror Cases Must Be Questioned
While watching last week's RCMP press conference in the aftermath of Aaron Driver's death, many questions invaded my mind but were left unanswered. The RCMP's narrative of the events that transpired was repeated over and over in the media with very little questioning. Mike Cabana -- the deputy commissioner of the RCMP who stood alongside his colleagues in the conference room at the RCMP headquarters, apparently nervous and uncomfortable answering some questions -- is the same Mike Cabana that was involved in the case of Maher Arar. (...)By contrast, Ottawa resident Mohamed Harkat has been the object of a security certificate due to suspicions that he is an Al-Qaeda sleeper agent for more than a decade. Today, he continues to face the threat of being deported to torture by the Canadian government, and has worn a GPS electronic bracelet for more than six years while living under what amounts to house arrest. All his visitors must report to Canada Borders Services Agency (CBSA) and he must obtain the authorization of the CBSA to leave his house. For years, he couldn't use the Internet or even get near a computer. Huffington Post (2016-08-16)

Transfert d'armes en Libye
Le gouvernement fédéral a transmis à la Gendarmerie royale du Canada (GRC) les conclusions d'un rapport de l'Organisation des Nations unies (ONU), qui révèle qu'une entreprise canadienne aurait opéré le transfert illicite de véhicules blindés vers la Libye. En mars, un rapport de l'ONU a avancé que l'entreprise ontarienne Streit aurait transféré en 2012 des véhicules blindés de ses installations des

Émirats arabes unis vers la Libye, pourtant sous un embargo commercial qui y interdit la vente d'armements. Selon le comité de l'ONU concernant la Libye, tout transfert de véhicule blindé vers le pays de l'Afrique du Nord devrait être interdit. En 2014, des membres de ce comité ont rencontré des représentants de Streit, qui se sont défendus d'avoir agi illégalement. Or, selon la CBC, qui a eu accès à des avis de livraison et des reçus de vente, l'entreprise canadienne aurait continué de vendre des véhicules blindés à la Libye et au Soudan du Sud après avoir été avertie par l'ONU. Le Devoir, A5 (2016-08-17); Radio-Canada (2016-08-16)

Terrorisme : une audience à Fort St. John déplacée à Vancouver pour des raisons de sécurité
L'audience préliminaire d'un résident de Fort St. John qui fait face à des accusations de terrorisme a été déplacée à la dernière minute à Vancouver pour des raisons de sécurité. Othman Ayed Hamdam est confronté à six chefs d'accusation pour entre autres la publication en ligne de propagande du groupe armé État islamique et d'incitation à commettre un crime au nom du djihad. L'entrepreneur de 33 ans est détenu à Fort St. John depuis juillet 2015. À l'époque, la communauté musulmane locale avait dit ne pas connaître cet homme qui n'avait selon elle jamais fréquenté la mosquée. L'audience préliminaire doit décider si suffisamment d'éléments ont été réunis par la Gendarmerie royale du Canada (GRC) pour que le dossier de M. Hamdam soit présenté en Cour provinciale. Si ce procès avait lieu, il s'agirait du second cas de ce genre dans une affaire terroriste en Colombie-Britannique depuis l'adoption de la loi antiterroriste C-51. Celle-ci accorde davantage de pouvoirs au Service canadien du renseignement de sécurité pour contrecarrer des complots de grands actes de violence. Radio-Canada; Canadian Press (Globe and Mail) (2016-08-16)

Revocation of airport-security clearance was unfair
A government decision that stripped a woman of her airport-security clearance and put her out of work more than two years ago was unfair, incomprehensible and unreasonable, a Federal Court judge has ruled. In ordering the minister of transport to take another look at the case, Judge Susan Elliott slammed the government for treating Ayaan Farah in a shoddy fashion. The advisory group that recommended revoking the clearance did not carefully review documents, Elliott said in her written decision, while the director general of aviation security failed to "ensure the critical facts upon which she relies are very clear." Elliott quashed the revocation, saying the government had hidden behind the Privacy Act and failed Farah badly - especially in light of the "gravity of the consequences" to her. Farah expressed delight with the ruling, saying she hopes it will help others caught in a similar situation. "I hope this brings light to the fact that Transport Canada needs to do a better job regarding security-clearance decisions - cancelling people's clearance," Farah said in an interview Tuesday. "Transport Canada needs to change its policy." In April 2014, Transport Canada told Farah the RCMP had reported her having contact with criminals only identified as subjects A, B, and C. Police claimed that two of the individuals used Farah's car to go to a funeral for a known gang member - although she was not in the car and did not attend the service. RCMP also said police interacted with her while she was in A's company, but she said she had no memory of being stopped by police. She also said she did not know who the criminals were, although her lawyer suggested one might have been her brother. Canadian Press (Times Colonist, A8, Chronicle-Herald, Kingston Whig-Standard, Waterloo Region Record, Leader-Post, Ottawa Citizen, Calgary Herald)

ORGANIZATIONAL ISSUES / ENJEUX ORGANISATIONNELS

Driver hits RCMP car in Nanaimo detachment parking lot
RCMP are investigating after a driver steered their car into the rear parking lot of the Nanaimo detachment and collided with a police car Tuesday morning. Few details have been released but police said after entering the parking lot at about 8:30 a.m., the driver accelerated and hit a dumpster, knocking it aside and narrowly missing two officers, who were on foot. The vehicle then continue and collided with a police car that had three officers inside. Global News; Nanaimo News Bulletin (2016-08-16)

Free Our Finest hopes to raise $20,000 to support athletes training for Special Olympics
Law enforcement officers in the Red Deer area will once again demonstrate their dedication to Special Olympics by hoisting members atop scaffolding outside Walmart at Parkland Mall. Three officers will camp on scaffolding about five metres high, located to the left of the Walmart entrance, from 9 a.m. on

Friday to 4 p.m. on Sunday for Free Our Finest fundraising event. Participating agencies include RCMP, Alberta Corrections and Alberta Sheriffs. Committee member Brad Cotmen said the goal this year is to raise $20,000 and that money will stay in the Red Deer area to assist local athletes. "It's an extremely worthwhile event. All proceeds go to support Special Olympics for their training, their coaches, attending different events," Cotmen said. People can get their pictures taken with an old West-style prison trailer and other law enforcement vehicles, view demonstrations and take part in water fights, attend a barbecue lunch, buy merchandise, and make donations. Red Deer Advocate, A2

Musical Ride a great opportunity
An editorial states, "When the agricultural societies in Lincoln and West Lincoln merged, there were a lot of critics out there questioning the move. Much of the debate was sentimental and understandably so. The move meant a new chapter would begin for the two organizations which each had a tremendous history and presence in their respective communities. It also meant significant change, including the sale of the Beamsville Fairgrounds and the move of the fair from downtown Smithville to the current agriplex on the edge of West Lincoln... If you can't make it to RCMP Musical Ride be sure to save the date and make it to the fair Sept. 8-11. It will be a great chance to see this new facility and enjoy a community tradition." Niagara This Week (2016-08-16)

EDITORIALS & OPINIONS / ÉDITORIAUX ET LETTRES D'OPINIONS

How will PM tackle terror? Just watch him
An opinion piece states, "So far on terrorism, Justin Trudeau is more or less the prime minister Stephen Harper told us he would be. On the very day Trudeau became leader of the Liberal Party of Canada, in April 2013, he sat in Ottawa for an interview with Peter Mansbridge of the CBC. Two bombers had just detonated their home-brew contraptions at the Boston Marathon, killing three and wounding hundreds. How would you respond if you were prime minister, Mansbridge asked. "Over the coming days," Trudeau replied, "we have to look at the root causes." That language seemed custom- designed to ruffle Conservative feathers. But Trudeau was not done. "There is no question that this happened because there is someone who feels completely excluded. Completely at war with innocents . . . And our approach has to be, where do those tensions come from?" (...) In a long weekend news release, Goodale first reassured Canadians that the police had done their job well and that Canada's threat level is no higher than it has been for a year and a half. Then he added: "We have also budgeted for a new national office and centre of excellence for community outreach and counter-radicalization. "We need to get really good at this - to preserve our diversity and pluralism as unique national strengths." So if you want a government that conveys any view other than utter condemnation, this new Liberal government's language will seem wildly complicated. Goodale remains unbowed. "We need to know how to identify those who could be vulnerable to insidious influences that draw certain people - especially young people - toward extremism leading to violence," he wrote. "We need to understand what positive messages can counteract that poison." Toronto Star, A1

Kudos and questions in terrorist takedown
An editorial states, "Canada came very close to suffering a terrorist attack last week, but countless lives were saved when police disrupted the plan. The wouldbe terrorist, Aaron Driver, who was living in Strathroy under what was basically a restraining order, was killed. How he died isn't yet clear. The Ontario Provincial Police are investigating whether he died by police gunfire or from a bomb that went offin the back of a taxi, injuring the cabbie who had picked up Driver at the house in which he lived. The RCMP acknowledged the tragic outcome but noted correctly that had Driver not been stopped, the carnage would have been far, far worse. So let's take a moment to give our police and security authorities - whose actions are often challenged - full credit. In a fine example of cross-border co-operation, the operation began with a tip from the FBI, which had come across a martyrdom video. (...) Questions remain, of

course. We don't know how the FBI got the video, for example. Some wonder about the peace bond Driver was under and why an electronic monitoring bracelet had been removed. There's a tricky balance between monitoring for terrorism and respecting civil liberties; he had never been charged or convicted of a dangerous crime. Even if he had, severe conditions, particularly imprisonment, can further fast-track extremist tendencies. There are dicey political and policy issues ahead. The Liberals remain committed to reforming the Tories' anti-terrorism bill, C-51, but this incident adds complications. And the task has barely begun, although a bill to create a new national security oversight committee has been tabled." Kingston Whig-Standard, A4

Don't overestimate terrorist threat to Canada

An opinion piece states, "Last Wednesday Canada experienced another brush with global terrorism, when Aaron Driver was killed during a violent encounter with police in the sleepy southern Ontario town of Strathroy. No one but Driver was killed in the incident, but the fear-mongers were quick to tell Canadians that the intent of this deranged Islamic supporter of Daesh (also known as Islamic State, ISIS, and ISIL) was to commit mass murder during a workday rush hour. Scary stuff. According to the official version of events, it was the FBI that first discovered that Driver had made a recent martyrdom video and was about to launch an attack. It had to be the FBI because the Canadian Security Intelligence Service insists that it does not spy on Canadians. Driver had long publicly declared his sympathy for the Daesh cause and, as a result, had been arrested prior to signing a peace bond to secure his release. (…) First of all, Driver was a troubled youth who found popularity among Daesh sympathizers online. He was not a hard-core member of the Daesh evildoers. He had never even been to the Middle East, and the congregation at his local mosque tried to correct his skewed take on the Islamic faith. He did make some sort of bomb, but if the result was that exploding it in his own lap failed to kill him and left the taxi driver largely unhurt, it really wasn't much of a bomb. The intelligence and security services-both Canadian and American in this case (because Canadians don't spy on Canadians)-worked efficiently together. Driver did not get to carry out a terror attack. He was killed before he could even attempt the attack. No one was terrorized by his actions. Yet after Driver's death we were told of all the carnage he "would have" created, therefore making it imperative to impose stricter security measures and better monitoring to keep the public safe. (…) Canada remains very, very safe." Hill Times

Rift between Muslims and police deepens

An opinion piece by Amira Elghawaby, the communications director at the National Council of Canadian Muslims, states, "The past few weeks have deeply shaken whatever trust exists between Canadian Muslim communities and law enforcement agencies. First, news and video footage of the heartbreaking and unjustifiable death of a mentally ill Canadian-Somali man in Ottawa as a result of a police intervention. Then, a B.C. Supreme Court judge ruled that the RCMP were the key architects of a terrorism plot that was used to entrap two marginalized individuals who had recently converted to Islam. Both of these cases have spotlighted some troubling excesses in our country's security establishments. They further underscore the need for Canadians to continually question the unequal power balances in our society that can and do sometimes lead to violations of the human rights and dignity of fellow community members. (…) "We need a fundamental and transformative cultural change to policing attitudes and practices," argued criminology professor and policing expert Darryl Davies in a recent Ottawa Life Magazine article. The same conclusion might be drawn from the RCMP's role in manufacturing a terrorist plot, which points to deep flaws in how security agencies operate. Justice Catherine Bruce's ruling in the case against John Nuttall and Amanda Korody should serve as a wake-up call for our elected leaders. "There must be a balance between the need to protect the public from crime and what is tolerable police conduct in a free and democratic society," wrote Justice Bruce. There is clearly an urgent need for adequate checks, balances, and oversight of those who hold incredible power and authority. With the federal government's current consultations on the Anti-terrorism Act, the time for Canada to properly balance civil liberties with public safety is now. Trust is fundamental to our collective well-being. We need more of it, not less. As the authors of a 2016 Kanishka research study of Canadian Muslim concerns around counterterrorism policies discovered in their interviews, citizens are losing faith in the state." Toronto Star, A13

How much do we really know about the Canadian intelligence community?

An opinion piece states, "The Trudeau government is set to review the activities of Canada's spy agencies at a time when it appears Bill C-51 has empowered many of the more than 20 agencies and departments with surveilling powers to violate the Canadian Charter of Rights and Freedoms. Last year American whistle-blower Edward Snowden proclaimed that Canadian intelligence agencies have the "weakest oversight" in the Western world and compared the Canadian government's Bill C-51 to George W. Bush's post-9-11 U.S. Patriot Act... There should be an inquiry into the events that led to Driver's death. In essence he was "engaged and killed" for an action he had not yet carried out. Moreover, it appears the young man was under close surveillance by at least two different countries, making it difficult to imagine that authorities could not see it coming. However, putting aside those important questions for the moment, one thing is clear: the event gave Minister of Public Safety Ralph Goodale justification for the continued delay of the Liberals' election promise to reform C-51... Mapping the issue is helpful. Different agencies report to different ministries. The RCMP and CSIS, for example, report to the Minister of Public Safety, while The Canadian Security Establishment (CSE) reports to the Minister of National Defence. The Independent (Newfoundland & Labrador) (2016-08-16)

Countering extremism
A letter to the editor states, "Re: Young terror supporter had troubled upbringing (Aug. 30). I am absolutely shocked that the RCMP identified a homegrown extremist originally from Winnipeg who was planning to attack a public area in Canada. It is quite scary, in fact, to see the power of social media and how it is being manipulated to serve the interests of ideological extremist recruiters. Aaron Driver, a 24-year-old living in a town in Ontario, had shown support for ISIS in the past and was thus being monitored. I am thankful this situation did not escalate to an attack and was mitigated immediately. Although there may be many solutions to homegrown extremism, the most effective one is having a true and powerful counter-narrative. One example of such a narrative is the Ahmadiyya Muslim Youth Association, which is known for giving back to society through blood drives, food drives, city cleanups and much more. These counter-narratives will help put an end to homegrown extremism and continue to make Canada great..." Winnipeg Free Press (2016-08-16)

Fighting crime in the digital age
An opinion piece states, "This week, top police officials from coast to coast have descended on our nation's capital for the 111th annual Canadian Association of Chiefs of Police conference. The topic that will shape their discussion, Public Safety in a Digital Age: Real Victims - Real Crime, is timely, given that we're at an important societal juncture. So much of our daily lives now take place online: our wealth passes through jurisdictions in the form of ones and zeros; the most intimate details of our lives, whether they are held by government or industry, rest on servers located somewhere around the globe; and our critical infrastructure, whether it is managed by the public or private sector, is operated digitally. Given the recent media coverage of data breaches and many people's personal experiences with fraudulent phishing schemes, it's understandable that we, as consumers and citizens, want to erect the highest walls possible around our valuable digital assets. This is a natural human reaction, but it isn't a realistic societal response, given the magnitude of our online world." National Post, A8

OTHER / AUTRES

Mario Harel s'affaire déjà à la tâche
Le directeur du Service de police de la Ville de Gatineau, Mario Harel, est devenu le «chef des chefs» de police, d'un océan à l'autre. A peine 24 heures après son élection unanime à la tête de l'Association canadienne des chefs de police (ACCP), M. Harel s'est prononcé mardi sur les enjeux qui marqueront son mandat de deux ans, se réjouissant au passage de l'oreille attentive du nouveau gouvernement fédéral. M. Harel est passé de vice-président à numéro un de l'organisme représentant plus de 1000 membres, lors du congrès de l'ACCP, qui se termine à Ottawa ce mercredi. Il compte profiter de son siège pour marquer des points sur la colline parlementaire. «Avec l'arrivée du nouveau gouvernement, dit M. Harel, il y a un dialogue avec l'ensemble des décideurs qui touchent la sécurité publique. (Le gouvernement) écoute nos enjeux et on écoute ceux du gouvernement. Il y a une bonne communication avec les autorités. On sent qu'il y a une écoute et on sent un désir d'améliorer le cadre législatif dans le but d'améliorer la sécurité publique.» M. Harel sera président lorsque le gouvernement Trudeau

légalisera la marijuana, l'an prochain. Ce dossier fait partie des préoccupations à court terme de l'ACCP. Le Droit, 5

Deux fois plus de crimes contre des groupes religieux
Graffitis nazis sur une synagogue, tête de porc devant une mosquée, homosexuels agressés : plus de 250 crimes haineux ont été commis au Québec en 2014, dont près d'une centaine à Montréal. En un an, les crimes ciblant un groupe religieux ont doublé dans la province. Les communautés juive et musulmane sont préoccupées par le phénomène, mais n'observent pas de flambée sur le terrain. Le nombre de crimes haineux perpétrés au Québec était relativement stable dans les dernières années, et même en baisse au Canada. Or, 257 délits haineux ont été rapportés en 2014, un bond de 39 % par rapport à l'année précédente, a révélé le ministère de la Sécurité publique (MSP) dans un volumineux document rendu public lors de l'étude des crédits, en avril dernier. Depuis 2010, il n'y avait jamais eu plus de 200 crimes haineux pendant une année. Cette récente augmentation est « majoritairement attribuable à la hausse des délits motivés par la haine contre certaines religions », selon le MSP. En effet, ces crimes ont doublé entre 2013 et 2014 (48 contre 94). D'autre part, 80 crimes étaient guidés par la haine contre la « race ou l'ethnie » et 27 par l'orientation sexuelle de la personne. Le Ministère prévient toutefois qu'une « grande prudence est de mise dans l'interprétation des données [_] considérant qu'il est parfois complexe d'établir le caractère haineux d'un délit ». Les données de 2015 n'ont pas été compilées. À Montréal, 113 crimes haineux ont été répertoriés l'an dernier, une hausse de 24 % en un an. Pourtant, au moment de présenter la nouvelle escouade vouée aux crimes et incidents haineux, en mai dernier, le chef Philippe Pichet évoquait plutôt une moyenne d'environ 70 crimes haineux chaque année dans la métropole. Il avait aussi spécifié que le phénomène n'était pas en hausse. La Presse+

Windsor police host forum to fight sex slavery
Police, social service groups and others in the battle against human trafficking emerged from a roundtable discussion in Windsor Tuesday calling for a provincewide task force to fight the growing scourge. Progressive Conservative MPP Laurie Scott from Haliburton-Kawartha Lakes-Brock, who introduced the private member's bill known as Saving the Girl Next Door Act, said there are victims in virtually every city, neighbourhood and high school. "This is one of the largest growing crimes in Ontario, Canada and globally," said Scott, who travelled to Windsor for the discussion. "We have to recognize it's happening in our neighbourhoods and we have to help our children from these horrific situations." Windsor police hosted the roundtable, which brought together officers, community organizations and others with a stake in the fight against human trafficking. Scott, whose Bill 158 has passed second reading, said more than 90 per cent of victims in this country are Canadian-born. Scott added that Ontario has been designated as a hub for human trafficking in Canada, with 65 per cent of all cases occurring in the province. Shelley Gilbert from Legal Aid Windsor during a Windsor Police Service hosted roundtable discussion on Human Trafficking with community partners and MPP Laurie Scott from Haliburton-Kawartha Lakes-Brock. Montreal journalist ' spied on ' by police

A Montreal journalist whose iPhone was monitored by police for months says he was outraged to discover he had been " spied on " as part of what he calls an effort to identify his sources. " I was living in the fiction that police officers wouldn't dare do that, and in the fiction that judges were protecting journalists - and this type of police intrusion ," Patrick Lagace, a columnist for La Presse, said in an interview Monday " Clearly, I was naive ." The French-language newspaper said it learned at least 24 surveillance warrants were issued for Lagace's phone this year at the request of the Montreal Police ' s special investigations unit. That section is responsible for looking into crime in the police force. Three of those warrants reportedly authorized police to get the phone numbers for all Lagace ' s incoming and outgoing texts and calls, while another allowed them to track the phone ' s location via its GPS chip. The surveillance was ordered as part of an internal probe into allegations police anti-gang investigators fabricated evidence. Five police officers were arrested this summer and two were charged as a result. Lagace said police told him they obtained the courtauthorized warrants because they believed the target of one of their investigations was feeding him information. Canadian Press (London Free Press, N3, Leader-Post, Vancouver Sun, Edmonton Journal, Ottawa Citizen, Windsor Star, StarPhoenix, Waterloo Region Record, Calgary Herald, National Post); Montreal Gazette; Le Devoir; Globe and Mail; Toronto Star; La Voix de l'Est

Montreal Cops Have Tracked a Journalist's Cellphone for the Past Year

Montreal police, investigating the possibility of crooked cops on the force, obtained warrants to surveil a journalist's iPhone, and even obtained permission to use his GPS chip to track his whereabouts at all time. But the federal minister of public safety, Ralph Goodale, stopped short of discouraging police forces

from going to the courts to obtain judicial orders against journalists. Asked directly by NDP Member of Parliament Matthew Dubé on Monday about whether he'll issue a directive to create more formal rules around how police deal with journalists, Goodale would only say that *"we take the freedom of the press in this country very, very seriously."* Dubé raised the question after on Monday after Montreal newspaper La Presse published details on surveillances warrants, at least 24 in total, obtained to surveil journalist Patrick Lagacé. The MP also referenced another case, where federal police are working to obtain chat records from a VICE journalist's cell phone, as evidence that action needs to be taken. Vice News (2016-10-31)

SPVM: le ministre Coiteux est surpris par une procédure contre un journaliste
Le ministre de la Sécurité publique, Martin Coiteux, a exprimé sa surprise, lundi, en apprenant que la police a surveillé les appels téléphoniques d'un journaliste. M. Coiteux a entamé des vérifications pour établir si les procédures ont été respectées par le Service de police de la ville de Montréal (SPVM). «J'ai été très surpris et c'est pour ça qu'on fait des vérifications», a-t-il dit. La ministre de la Justice, Stéphanie Vallée, effectuera également une évaluation des procédures qui ont mené un tribunal à accorder à plusieurs reprises un mandat au SPVM, cette année... À Ottawa, le ministre de la Sécurité publique, Ralph Goodale, a affirmé que la situation est toujours délicate quand le journalisme et les enquêtes policières se rencontrent. «Il s'agit d'un cas qui relève des compétences provinciales, mais la position fédérale est d'affirmer que la liberté de presse est une valeur canadienne fondamentale», a-t-il dit. La Presse Canadienne (L'actualité) (2016-10-31)

Affaire Lagacé : Goodale prêt pour «une discussion sérieuse» sur les règles policières
À la lumière de l'affaire Patrick Lagacé, le ministre fédéral de la Sécurité publique Ralph Goodale se dit « certainement prêt à avoir une discussion de politique sérieuse » et « à entendre les représentations » des médias sur la façon dont les forces policières devraient concilier leurs enquêtes avec la protection des sources journalistiques et la liberté de presse. Le ministre Goodale, qui n'a pas voulu commenter le cas de Patrick Lagacé mais qui se dit « profondément préoccupé par ce genre de dossier », s'assurera prochainement auprès du commissaire de la GRC Bob Paulson que les directives fédérales en vigueur sont respectées dans les faits. Depuis 2003, une directive ministérielle demande aux forces policières de porter une « attention spéciale » au statut des médias dans le cadre d'enquêtes sur la sécurité nationale. « Au regard de ce dossier au Québec, qui est sous juridiction provinciale, c'est une question qui doit être posée [à la GRC]. Je n'ai pas encore eu l'occasion de le faire [hier], mais je le ferai [prochainement]. C'est une question juste de demander [à la GRC] de s'assurer que la directive ministérielle qui requiert un très haut standard soit appliquée dans les faits », dit le ministre Goodale en entrevue à La Presse. Le ministre Goodale, qui croit que la liberté de presse est « une valeur fondamentale » au Canada, n'a pas voulu s'avancer à savoir si des changements législatifs sont nécessaires afin de protéger la liberté de presse dans le cadre d'enquêtes policières. « Nous devons traiter de cet enjeu sérieusement et je suis certainement prêt à entendre les représentations [des médias et d'associations de journalistes comme la FPJQ] sur ce qui pourrait être un meilleur ensemble de règles », dit le ministre Goodale... La Sûreté du Québec a saisi en septembre l'ordinateur d'un journaliste du Journal de Montréal à la demande du Conseil de la magistrature en rapport avec un dossier traité par le conseil. Le ministre Goodale, qui n'a pas voulu commenter sur ces cas précis, fait valoir que « les cas vont suivre leur cours pour voir s'ils respectent les critères de la Cour suprême » en matière de protection du matériel et des sources journalistiques. La Presse (2016-10-31)

We're spied on more often than you think, journalists groups say
Canadians may be used to hearing about police tapping journalists' phones in China, or tailing them down the street in Turkey. But in Montreal, Canada? Unfortunately, say organizations like Canadian Journalists for Free Expression, it is happening a lot more than we think. "It's something we've been suspecting for a long time – that when this kind of power is in the hands of the police they will abuse it," said Tom Henheffer, executive director of CJFE. "I used to be cautious about drawing parallels with Canada and dictatorships like Turkey, China, Russia or Egypt. But the difference has started to erode, especially when it comes to privacy rights"... Montreal Gazette (2016-10-31)

CONTRACT & ABORIGINAL POLICING / SERVICE DE POLICE CONTRACTUELS ET AUTOCHTONES

Man arrested after costume gun scare at Camosun

What's thought to be a poorly-thought out Halloween costume caused a scare at Camosun College's Lansdowne campus Monday afternoon when a man was spotted in army fatigues and what looked to be a pistol strapped to his leg. A 28-year-old man has been arrested and **Saanich** police are recommending one charge of possession of a weapon for a dangerous purpose. Police responded to several reports of a man with a handgun on the Lansdowne campus around 3 p.m. Officers were on scene within four minutes and quickly arrested a man, said Saanich police spokesman acting Sgt. Jereme Leslie. A replica hand gun was seized. "We would like to remind people that carrying an imitation firearm is extremely dangerous, even at Halloween," Leslie said. "Responding to this incident put many people at possible risk." It's unclear if the man is a Camosun student. The man will appear in court in mid-December. (…) Victoria police took 12 people into cells for public intoxication between noon on Friday and noon on Monday, according to department spokesman Bowen Osoko. West Shore RCMP arrested two people for public intoxication Saturday night. Times Colonist, A3

Woman killed by son had informed police she was afraid of him

Statement heard at sentencing of Michael McCormick, who pleaded guilty to manslaughter. Ten days before she was killed, Pamella Dyer told police she was afraid of her adult son, Michael McCormick, because crystal meth made him delusional. "He thinks I'm not his mother, that I'm out to get him," Dyer told RCMP in a video recorded statement on July 10, 2014. "He's using meth," she said on the recording, played in **Victoria** Supreme Court Monday. "And when he is in that state, he is as strong as an ox and he has no mind." On July 20, 2014, Dyer, 64, was found lying dead in her Sooke home, at 2227 French Rd. McCormick was arrested and charged with second-degree murder on Sept. 17, 2014. McCormick, 38, was in B.C. Supreme Court for a sentencing hearing on Monday after pleading guilty to manslaughter in his mother's death. He entered the guilty plea on Oct. 11. Prosecutor Ruth Picha told Justice Brian Mackenzie that the Crown is seeking a prison sentence of 12 to 15 years. Picha said McCormick's addiction to crystal meth and personality disorders led to bizarre behaviour. But psychiatric examinations determined McCormick is not mentally ill. Times Colonist, A1/Front

Vader reversal cold comfort for McCann clan

"This has gone on a long time, to say the least," Justice Denny Thomas said with a grimace. That's an understatement. On Monday, Thomas vacated Travis Vader's two second-degree murder convictions, which he had handed down Sept. 15. In effect, he reversed himself and found Vader was not guilty of murder. But Thomas wasn't done. He then found the Alberta man guilty of two counts of manslaughter in the deaths of Lyle and Marie McCann, the **St. Albert** seniors who disappeared west of Edmonton while on a camping holiday in June 2010. (…) A more likely sentence, suggested Sankoff, could be around 15 years. Crown prosecutor Ashley Finlayson seemed sanguine Monday. "We felt justice would be done," he said calmly outside the courthouse. It may not look like justice to everyone. After 6-1/2years of blunders by the RCMP, the Crown prosecutors office and the trial judge, this case has taxed public patience and diminished public confidence in the administration of justice in Alberta. Edmonton Journal, A1/Front; * Globe and Mail

Jury watches video recording of Morningstar's police interview

Devin Morningstar told police investigators during a jailhouse interview, a video recording of which was shown to jurors Monday, that Marissa Shephard sent her young son away hours before Baylee Wylie was killed, telling people at her house she was worried for his safety. (…) In the video, played in Court of Queen's Bench, Morningstar was crying and unintelligible at times at the start of the video as he spoke to two police officers from the RCMP Major Crime Unit who visited him in jail two days after his arrest for murder. In the Dec. 20 video, Morningstar said he participated in the attack on Wylie but didn't kill him. "I know I deserve a punishment, but I did not murder that guy," he told **Codiac** RCMP Sgt. Jim MacPherson when the video was played for the jury Monday morning. "Who did?" asked the investigator. "Tyler," said the murder suspect. Times & Transcript, A1, Front

Inquest into police shooting death of Felix Taqqaugaq begins in Igloolik: Man was shot in his own home after officers say he threatened them with a weapon
More than four years after Felix Taqqaugaq was shot and killed by RCMP officers in his own home, his family and the community of **Igloolik**, Nunavut, will get some answers starting today. Taqqaugaq died March 20, 2012. A coroner's inquest into the death begins Tuesday morning in Igloolik and is scheduled to run until Nov. 11. It's a mandatory inquest since the death was police-related. Nunavut Chief Coroner Padma Suramala will preside over the inquest, which will detail the events surrounding Taqqaugaq's death, and the findings from the subsequent investigation by the Ottawa Police Service. The details of the investigation, which was completed last year, have not yet been made public. In March 2012, Taqqaugaq phoned in to the community radio station in Igloolik and started ranting. Family members said he suffered from mental health issues. After the rant, someone in the community called the RCMP and police went to his house to check on him. CBC News

RCMP nab 10 men for prostitution-related offences in Moncton
The **Codiac** RCMP arrested 10 men, aged 25 to 80, for attempting to obtain sexual services in Moncton in two separate busts earlier in October. The RCMP carried out two police operations Oct. 14 and 27 in the area of Dufferin Street targeting individuals attempting to buy services from sex trade workers. CBC News; CTV News (2016-10-31)

NATIONAL INQUIRY INTO MISSING AND MURDERED INDIGENOUS WOMEN AND GIRLS / ENQUETE NATIONALE SUR LES FEMMES ET LES FILLES AUTOCHTONES DISPARUES ET ASSASSINEES

Indigenous and Northern Affairs Minister speaks at Trinity College: Bennett talks Nation-to-Nation, endangered languages, re-Indigenizing urban spaces
Federal Indigenous and Northern Affairs Minister Carolyn Bennett spoke at Trinity College on October 28. The event was part of a series called Conversations with the Chancellor Bill Graham; it consisted of a brief introduction made by Trinity Provost Mayo Moran, a discussion period, and a question and answer period. A reception was held when the formal event finished. (…) The preservation of Indigenous languages was also discussed; Bennett reiterated that the endangered languages and the extreme importance of Indigenous education are the responsibility of the government. Throughout the conversation, specific examples of Indigenous concerns and issues arose. There was discussion on pipelines, the United Nations Declaration on the Rights of Indigenous Peoples, missing and murdered Indigenous women and girls, as well as the Trans-Pacific Partnership deal. (…) In terms of resolution, Bennett said that the government must change their "urban-Aboriginal strategy." Bennett explained how this relies on a "commitment to reconciliation." Varsity (U of T)

Alberta trucking company says racist slur sticker 'a joke'
A photo taken of a truck with a sticker above the front grill has gone viral on social media as a result of its derogatory language towards indigenous women. The sticker, which read "One Squaw Too Many," was spotted in the area of Grande Cache, Alta. and has some wondering if charges should be laid for hate speech. Grande Cache RCMP confirmed they received a complaint about the truck and have dealt with the matter, declining to go into anymore detail. No charges have been laid against the company. Sandra Jansen, MLA for Calgary-North West who shared the post on social media, said when she saw the post it made her blood boil. "There's absolutely nothing funny about this when across the country we're defining the parameters of the Missing and Murdered Indigenous Women Inquiry and talking about some serious endemic problems." she said. Metro News

FEDERAL & INTERNATIONAL OPERATIONS / OPÉRATIONS FÉDÉRALES ET INTERNATIONALES

'We are seniors, why you hit me and my wife?': Elderly couple speak out about RCMP arrest
The elderly couple caught on camera being violently arrested by Coquitlam RCMP last week is speaking out. The incident happened on the evening of Oct. 26 after police were called to a strata meeting that allegedly got out of control. The video, which was posted on YouTube, appears to show an officer

dragging a man down a staircase while another officer arrests a woman, who appears to fall at one point... Myung Ju Lee and his wife, Kap Su Lee, told Global News they spent the night in the hospital after ending up with bruises, cuts and scrapes as a result of the incident. "[The police] walked up and did not say anything. Just walked up and grabbed us," Myung Ju Lee said. Lee claims the strata meeting was not over and there had been no screaming or fighting when police entered and grabbed him and his wife... Lee believes the police officers involved should not only apologize but lose their jobs. Additionally the couple wants compensation for their physical and mental anguish due to the incident. The couple have given a statement to Coquitlam police and will be getting a lawyer. Global News (2016-10-31); AM 730

Complaints about elderly B.C. couple's arrest prompt federal investigation
Days after troubling footage emerged of Mounties arresting an elderly couple in Coquitlam, B.C., a federal agency is launching an investigation into the officers' conduct. The Civilian Review and Complaints Commission for the RCMP said it has received more than a dozen complaints from people expressing concerns about the YouTube video, which at one point shows an officer dragging a senior down a stairwell. "We've received approximately 15 complaints from concerned citizens," said Richard Evans, senior director for the independent agency. "Some were present at the scene and some were not." The incident, which took place after a heated strata meeting at a Best Western hotel, is already being investigated by the New Westminster Police Department, which will decide whether to recommend charges against the officers involved. But the Civilian Review and Complaints Commission's probe could potentially lead to changes in RCMP policy moving forward, Evans said. "Our investigation is designed to make findings and recommendations about [officers'] conduct to inform better policing practices," he told CTV News. "Issues like: Did they have the authority to arrest? Was the appropriate use of force used? Were the RMCP members there properly trained? Were they properly supervised? Was there a language issue?" CTV News

Ex-tax auditor acquitted in corruption case
One of the eight Canada Revenue Agency auditors charged in connection with an RCMP investigation into alleged corruption at the taxman's offices was acquitted at the Montreal courthouse Monday. Quebec Court Judge Christian Tremblay found Luigi Falcone not guilty on all four counts he has faced since 2012, when charges were laid against him in Project Cloche. The charges involved allegations that Falcone, 54, of Laval, Que., solicited a $50,000 bribe from a man who owned a restaurant in Notre-Dame-de-Grâce at the time. The owner, Mario Agostini, alleged that Falcone falsely claimed he had looked at his file at the Canada Revenue Agency, found out it was going to pursue him for $250,000 in undeclared revenue and warned he might go to jail. Agostini testified that he turned down Falcone's offer after consulting a lawyer and an accountant. Six witnesses testified for the Crown during the trial in February. Falcone gave evidence in his own defence. "Mr. Agostini is not credible and (was) unreliable concerning some of his testimony," Tremblay said before acquitting Falcone, who worked for CRA in 1990-2009. The judge even raised the possibility that Agostini misunderstood Falcone after asking his advice on what to do about the actual audit his restaurant was about to be subject to. Leader-Post, N6 (Windsor Star, National Post, Gazette)

Ottawa terror suspect granted bail again after allegedly breaching conditions
An Ottawa terror suspect has been released from custody after he was charged with breaching some of his bail conditions while awaiting the outcome of his case. The RCMP arrested Tevis Gonyou-McLean in August on a terrorism peace bond for his alleged support of ISIL and was later granted bail on several conditions that included wearing a GPS monitoring device on his ankle and a ban on possessing any terrorist logos. On Oct. 25, the 24-year-old was arrested again after police allege he failed to report to the John Howard Society's bail supervisory program and reside at his pre-approved address, and that he damaged his ankle bracelet, thereby allegedly committing mischief. But his Ottawa lawyer, Biagio Del Greco, said the breaches were the result of a "miscommunication" and said the damage to the bracelet occurred while his client was in police custody and was unintentional. None of the breaches were related to alleged terrorist activity. Ottawa Citizen (2016-10-31)

Former military members who were discharged over sexuality launch class-action suits

People discharged from service because of their sexuality say they suffered extreme psychological trauma from the experience. Frustrated by inaction from Ottawa, former members of the Canadian military who were discharged because of their sexuality are launching class-action lawsuits against the federal government. The plaintiffs seek redress for members of the Canadian Forces and the federal public service "who were investigated, targeted, sanctioned and/or who were discharged or terminated by the Government of Canada because of their sexual orientation, gender identity or gender expression," according to a statement of claim deposited Monday in Quebec Superior Court. (…)Beginning in the 1950s, security agencies sought to identify suspected homosexuals serving in the military and public service, including government agencies such as the CBC and the National Film Board. The investigations continued until the 1990s, when the Mulroney government ordered an end to the practice. At one point, the RCMP had the names of 9,000 people on file. Those targeted were subject to dismissal, demotion or other punishment. Many simply left the military or the public service rather than face investigation. Ms. Roy was dismissed from the military in 1984, after being labelled a sexual deviant because she is a lesbian. Globe and Mail

Les visages de la radicalisation
«Je suis là pour m'excuser.» Devant nous, un grand baraqué. Rempli de remords. La Fédération des Québécois de souche, c'est lui. Ou plutôt, c'était lui, quand il cultivait le nationalisme blanc, vraiment blanc. «Je suis le fondateur, le seul et unique. C'est parti de ma tête.» Et elle était rasée, cette tête, à l'époque skinhead. Lui, c'est Maxime Fiset, de Québec, aujourd'hui étudiant universitaire… qui a déjà pensé faire sauter une bombe comme celle du marathon de Boston. Il a aussi été modérateur pour un site Web très raciste. Lundi, il est sorti de l'ombre pour dire qu'il a tout balancé. La radicalisation violente, «c'est plus proche de nous qu'on pense», prévient-il. Il était rendu à un tel point que les policiers l'ont arrêté pour propagande haineuse. (…) C'était avant l'État islamique. C'était les talibans, Al-Qaida. Mubin Shaikh étudiait la religion. Il avait 19 ans. Il est parti du Canada en voyage initiatique au Pakistan. Pas dans des camps. Juste un voyage de jeune croyant, raconte-t-il. Et il a rencontré ses nouveaux voisins, des talibans de la ville de Quetta. «Ils sont encore là.» Il a appris quoi? «Que pour être un vrai musulman, il faut combattre. Au retour, il a rejoint d'autres extrémistes ici. Il a recruté dans des mosquées, des conférences islamistes. Puis il y a eu le 11 septembre 2001, les tours de New York qui tombent. Ça, c'était trop pour lui. Il est parti pour la Syrie (bien avant la guerre). «J'ai appris le vrai islam.» Revenu au Canada, il a vu un de ses amis se faire arrêter. Il a alors appelé les services secrets : «Ils m'ont recruté pour être agent infiltrateur. Pendant deux ans, j'ai été infiltré.» Il a aussi travaillé pour la GRC. L'arrestation du groupe des 18 de Toronto, inspiré par Al-Qaida, c'est un peu lui. Il jure que cet épisode policier est derrière, qu'il se concentre sur son doctorat en psychologie en Angleterre. Son sujet : comment contrer et prévenir l'extrémisme. La Presse

ORGANIZATIONAL ISSUES / ENJEUX ORGANISATIONNELS

Fort McMurray first responders recognized for battling 'The Beast'
Darby Allen still thinks about the wildfire that swept through Fort McMurray. The Wood Buffalo fire chief has good days and bad; the evacuation of 80,000 people from the city still plays on his mind, the thought of, "Could we have done more?" Monday was one of the good days, as he and his fellow first responders were recognized at the Alberta legislature for their work during the disaster. (…) In addition, companies without a firefighting plan or a lack of firefighting equipment on-site could also face a fine of $10,000 per offence. There will also be an increased focus on handing out tickets for careless use of campfires. Peace officers, forestry, fish and wildlife and conservation officers and RCMP officers will be able to hand out tickets from $150 to $1,000. Roughly 70 per cent of wildfires in the last five years were caused by people and RCMP have said they believe the Fort McMurray fire was caused by human activity. Edmonton Sun

Reticle range operating in 'soft opening' mode
Construction on a firing range north of Brockville is well under way, and the "world-class" training facility will be ready for a Spring 2017 opening, officials said Friday. Ottawa-based Reticle Ventures Canada Inc. is in the midst of building an instructional facility, unique in Canada, at the Brockville-1000 Islands Regional Tackaberry Airport in order to support first responders, law enforcement and select national security agencies and is in a "soft-opening phase right now." said the company's lawyer Bryce Geoffrey.

"We've built our 50-metre range," Geoffrey said, adding the Ontario Provincial Police, Royal Canadian Mounted Police and other law enforcement agencies have already been practicing on the firing ranges since early fall. "Things are going well. It's all going to be done in the spring." The site plan for the project includes a new 6,480 square-metre (21,600 sq.ft.) airplane hanger construction, a portable office, a future training facility building, a 50-metre outdoor firing range and "an identified sound barrier." Reticle plans to have federal security agencies as its clients, including the Canada Border Services Agency and Department of National Defence, as well as conservation officers, registered security companies, the Commissionaires of Canada and other clients. Reticle officials have said the aim is to run "a public safety and national security training facility." Brockville Recorder (2016-10-31)

RCMP not to blame for death of suspect who shot Golden Mountie: Police watchdog
The suspect who led police on a manhunt after shooting a Mountie near Golden died from head trauma and RCMP action or inaction was not to blame, B.C.'s police watchdog says. The provincial Independent Investigations Office launched a probe to determine whether there was any connection between the officers' actions and the death of Sheldon Kyle Thunderblanket, 40. Investigators concluded "there is no causal connection between death of the male affected person and actions or inactions of police," according to a Independent Investigations Office media release. Info News (2016-10-31)

RCMP vehicle involved in serious crash
An RCMP vehicle was involved in a serious crash Monday afternoon at one of the city's most notorious intersections. Emergency crews were called to the corner of Kenaston and McGillivray Boulevard for what appeared to be a two-vehicle crash. A light standard was seen sitting atop the police cruiser in the southbound lane of Kenaston. Front and side airbags were deployed. A van ended up in the westbound lane of McGillivray. No word yet on injuries. The intersection was highlighted eariler this year as having the second highest number of collisions in the city with 2,298 crashes between 2005 and 2014. Winnipeg Free Press; CTV News; CBC News (2016-10-31)

RCMP mourns one of its own
Insp. Tony Perry was found dead Friday morning in Happy-Valley-Goose Bay. Perry, who is originally from Deer Lake, joined the RCMP in 1988 and served in Nova Scotia until July 2015, when he was transferred to Newfoundland and Labrador. Most recently, Perry worked as a negotiator between police, aboriginal leaders and protesters at the Muskrat Falls hydroelectric project site. Foul play is not suspected. Western Star (2016-10-31)

Liberté de presse et protection des sources journalistiques - Les élus doivent passer aux actes
Un article d'opinion state, « Nous, dirigeants des principales salles de rédaction de Montréal, tenons à exprimer notre indignation et notre inquiétude face à l'espionnage électronique du journaliste Patrick Lagacé par la police de Montréal. Il est inacceptable que des enquêteurs aient pu obtenir accès aux données téléphoniques et à la géolocalisation d'un journaliste sans autre motif que d'identifier des sources journalistiques à l'intérieur du corps de police. Ce n'est pas le seul cas d'intrusion injustifiée des autorités policières dans le travail des journalistes. En juin, le premier ministre Justin Trudeau avait qualifié d"' inacceptable '' la filature par la GRC des journalistes Joël-Denis Bellavance et Gilles Toupin, de La Presse. Puis en septembre, l'Assemblée nationale a adopté à l'unanimité une motion pour '' rappeler l'importance du principe de protection des sources journalistiques '' après que la Sûreté du Québec eut perquisitionné l'ordinateur du journaliste Michaël Nguyen, du Journal de Montréal. Dans les trois cas, les élus ont soit dénoncé l'intervention policière, soit s'en sont dits fortement préoccupés. Des actions concrètes sont nécessaires pour protéger les sources journalistiques formellement. C'est essentiel pour la liberté de la presse, un droit fondamental consacré par la Charte canadienne des droits

et libertés et reconnu par la Cour suprême du Canada. La procédure pour obtenir un mandat de surveillance contre un journaliste doit être plus contraignante pour les corps policiers ». Le Devoir, A9

A bad precedent
An editorial states, "''Are you a journalist?'' tweeted American whistleblower Edward Snowden on Monday. ''The police spying on you specifically to ID your sources isn't a hypothetical,'' he warned. ''This is today.'' Snowden was referring to the case of Patrick Lagacé, a columnist at Montreal's La Presse newspaper, who revealed that police have been spying on him for months, tracking his whereabouts using his cellphone and monitoring his calls and texts. Montreal police suspected that a target of one of their internal investigations was leaking information to Lagacé and so applied for - and, bizarrely, received - a series of warrants to monitor the columnist. The state spying on a journalist suspected of no wrongdoing, in an apparent attempt to identify his sources, is unprecedented in Canadian history and poses a troubling threat to freedom of the press." Toronto Star, A10

OTHER / AUTRES

Faire notre travail
Tout a commencé par un texto de l'éditeur adjoint de La Presse, Éric Trottier. « Faut que je te parle, jeune homme. » C'était jeudi en fin d'après-midi, je venais de finir une répétition pour l'enregistrement de Deux hommes en or, l'émission que je coanime à Télé-Québec. Je rappelle donc Éric. Sur le bruit de fond caractéristique des conférences téléphoniques, il m'annonce qu'il est avec Patrick Bourbeau, l'avocat de La Presse. Me Bourbeau m'explique les détails de l'affaire. Les quatre policiers arrêtés en juillet_ Mon nom qui apparaît sur le radar des enquêteurs_ Une demande faite à un juge_ Un de nos procureurs qui parle à celui de la Couronne. Et mon téléphone, espionné pour ses métadonnées pendant six mois. Pendant six mois, la police de Montréal a pu avoir accès à tous les numéros qui entraient dans mon téléphone, à tous ceux que je composais. Pour des appels ou pour des textos. Si vous m'avez appelé entre le 13 janvier et le 7 juillet, si je vous ai appelé, si nous avons échangé des textos : la police de Montréal le sait. Ce fut plus fort que moi : dans le hall du Monument-National, j'ai lâché un gros juron du terroir québécois qui commence avec un T et qui finit avec un K. En majuscules. J'étais sous le choc. Sans être expert du droit des médias, j'ai tout de suite anticipé ce qui s'est confirmé par la suite : la police qui obtient le droit d'espionner un journaliste de la sorte, c'est du jamais-vu au Canada. Ça ne s'est pas vu pour trouver les sources d'articles traitant de sécurité nationale, de l'armée canadienne, de terrorisme. Mais le SPVM, lui, a obtenu le droit inusité de m'espionner pour des affaires de crimes de droit commun qui sont, dans le grand ordre des choses, stupéfiantes de banalité. La Presse, 4

UBC researchers create new method to classify dangerous sex offenders
UBC researchers have developed a new classification system that could help police solve sex crimes. Using classified anonymous police case files and court records, researchers at UBC's Okanagan campus uncovered new subtypes of high-risk sexual offenders that could give police insight into the behaviour of convicted sex offenders who have been released into the community. ''These are offenders who have an extremely-high probability of reoffending, but they have timed-out of the system and are released,'' says Kimberly Kaseweter, a PhD student at UBC. ''A lot of people don't understand that these high-risk sexual offenders are often treated the same way as non-violent offenders, once released, in regards to community supervision and treatment.'' Kaseweter, and UBC Okanagan psychology Professor Michael Woodworth, worked with former RCMP Staff Sergeant and psychologist Matt Logan, who helped facilitate access to the classified case files. Using details from the crime scenes, Kaseweter and Woodworth used a statistical technique called Latent Class analyses to uncover three distinct groups of these offenders--coercive child molesters, sadistic rapists, and stranger-focused offenders. Kaseweter says they used details of the crime scene and statistical models to reveal profiles that police can use to help identify the type the offender they are looking for. Then by using additional variables, such as use of weapon, violence, and sadism, police can narrow the search for probable suspects. EurekAlert! (2016-10-31)

Law enforcement agencies around the world collaborate on international Darknet marketplace enforcement operation

A globally coordinated law enforcement action against the buyers and sellers of illicit drugs and other illegal activities using Darknet global marketplaces was conducted Oct. 22 to 28. "Operation Hyperion" was initiated by U.S. federal law enforcement, the Five Eyes Law Enforcement Group (Australia, Canada, New Zealand, the United Kingdom and the United States) and members of Europol, the European Union's law enforcement agency, as the first step in developing a more unified global law enforcement response to the growing usage of the Darknet by individuals seeking to buy and sell illicit drugs and other illegal goods and services... Operation Hyperion resulted in a number of law enforcement leads on cases related to the buying and selling of illicit drugs and other goods on the Darknet. This operation will also help law enforcement agencies continue to combat the trafficking of illicit goods and services on the Darknet through the identification of new smuggling networks and trends... International partners included Europol the United Kingdom's National Crime Agency; Australian Federal Police; New Zealand Police and New Zealand Customs Service; Canada's Royal Canadian Mounted Police, Canada Post and Canada Border Services Agency; The Netherlands; French Customs National Intelligence and Investigations Directorate; Finnish Customs; Swedish Police Authority and Swedish Customs; Ireland's Garda National Drugs & Organised Crime Bureau; and Spain's Guardia Civil. Justin Trudeau says police surveillance of journalists 'troubling' in free democracy
Prime Minister Justin Trudeau called reports about surveillance of journalists in Quebec "troubling" Thursday and said he has received assurances from the RCMP and CSIS that no actions are taking place on their part that infringe the rights of reporters... Public Safety Minister Ralph Goodale said while he does not normally comment on any operations, he confirmed the activities being reported in Quebec are *"not applicable"* at the federal level. CBC News (2016-11-03)

UPDATE: Quebec to hold public inquiry into police surveillance of journalists
As Quebec announced plans Thursday to hold an inquiry into freedom of the press and police surveillance of journalists, Prime Minister Justin Trudeau said spying on reporters is not happening at the federal level. The Quebec government said a public inquiry will be held against the backdrop of revelations that various forces monitored reporters' phones. A panel of experts announced earlier this week will now have all the powers typically granted to a commission of inquiry, including being able to compel witnesses to testify, said Justice Minister Stephanie Vallee... Meanwhile, the controversy reverberated in Ottawa, where Trudeau said surveillance of journalists was not taking place. Trudeau told reporters he immediately contacted RCMP and CSIS leadership after news broke about the Quebec surveillance... In an interview on Montreal radio station 98.5FM, provincial police director Martin Prud'homme said he's asked lawyers to unseal the warrants to provide details about them... Vallee and Public Security Minister Martin Coiteux said the admission by provincial police played a part in the decision to expand the mandate. "Until yesterday (Wednesday), the epicentre, as far as I could tell, was primarily the SPVM (Montreal police)," Coiteux said. "But yesterday, we learned that the Surete du Quebec (provincial police) had also conducted such investigations involving journalists." Canadian Press

Leader says feds are not tracking journalists' phones
Prime Minister Justin Trudeau said today that reporters' mobile phones are not being tracked at the federal level. He said he received assurances to that effect from the heads of the national police force, the RCMP, and the domestic spy agency, CSIS...The leader of the opposition New Democratic Party, Tom Mulcair said in the House of Commons that he had raised the issue of police spying on reporters earlier this year and he asked the public safety minister whether he would hold a public inquiry at the federal level. The minister said no, but it was unclear whether that was no, there would not be an inquiry or no, spying was not going on at the federal level. RCI (2016-11-03)

Espionnage de journalistes: Trudeau ouvert à revoir le Code criminel
Le gouvernement fédéral doit s'interroger sur ce qu'il peut faire pour mieux protéger les sources journalistiques, affirme le premier ministre canadien Justin Trudeau, dans la foulée des nouvelles révélations d'espionnage de journalistes de la part de la Sûreté du Québec (SQ). M. Trudeau affirme cependant que les Canadiens peuvent être rassurés quant aux pratiques en vigueur à la Gendarmerie royale du Canada (GRC) et au Service canadien du renseignement de sécurité (SCRS). En conférence de presse jeudi midi, M. Trudeau a été interrogé sur la possibilité que son gouvernement revoit l'article 193 du Code criminel, évoqué par la SQ mercredi pour justifier l'espionnage des communications de six journalistes québécois en 2013. « Je sais que dans un monde où il y a quand même des dangers, nous nous devons d'être responsables dans notre fonctionnement », a-t-il ajouté. « Mais c'est fondamental à nos valeurs, à notre identité, en tant que pays libre et juste, que les journalistes puissent faire leur travail d'informer les Canadiens et donc de protéger leurs sources confidentielles. » M. Trudeau a par ailleurs révélé qu'il avait communiqué avec le commissaire de la GRC et les responsables du SCRS dans la foulée de cette affaire pour s'assurer qu'« aucune activité de ce type [ne] se passe au niveau fédéral ». CONTRACT & ABORIGINAL POLICING / SERVICE DE POLICE CONTRACTUELS ET AUTOCHTONES

Former Mountie on trial in Moncton for impaired driving
Arresting officer says Ronald Cleveland suggested he 'pretend that you never found me'. Former RCMP sergeant Ronald Cleveland is on trial in **Moncton** on a charge of impaired driving dating back to an incident in the early hours of March 21, 2014. Cleveland was released from the RCMP on a medical discharge earlier this year. Testifying Thursday, Const. Joel Arsenault described how uncomfortable he was arresting a superior officer. "Up until June 4, that was the worst day of my career," Arsenault said, referring to the day a few months later when three Codiac RCMP officers would be shot and killed by a lone gunman. Arsenault testified the RCMP had received a call about a possible drunk driver. The caller gave a license plate number that was traced back to Cleveland. Arsenault said he recognized his fellow RCMP member's name. CBC News

Halloween snatch and grab in Kelowna
A cashier in **Kelowna** was the victim of a snatch and grab on Halloween night. Shortly before 10 p.m., Monday, Oct. 31 a man entered the Esso in the 2300 block of Highway 97 North and asked for a pack of cigarettes, according to a Central Okanagan Crime Stoppers media release. "When the clerk turned to get them, the man reached under the lottery ticket glass and grabbed a tray of $3 lottery tickets," it says. Roughly 55 tickets including Crossword, Bingo, Lucky Lines, Holiday Homes and Solitaire were stolen. The suspect is between 30 and 35 years of age with a short beard and wearing beige pants. He also had on a grey hoodie with orange writing on the front. Infotel

Police seek details on suspect: RCMP-led homicide unit releases photo of 21-year-old man in hopes of gaining information from public

Homicide investigators are still trying to piece together the past of a young man who they believe drifted between Alberta and British Columbia before allegedly stabbing an **Abbotsford** high-school student to death in a random attack that has shocked the conservative suburb. On Thursday morning, the Lower Mainland's RCMP-led homicide unit released a photo of the 21-year-old suspect, which was captured by the security camera of a local Abbotsford business and shows the suspect just hours before he is alleged to have entered Abbotsford Senior Secondary School barefoot on Tuesday afternoon and stabbed two female students. In the photo, the slim young man wears running shoes, blue jeans, a camouflage hoodie and a backpack. Police are hoping the photo prompts more information from the public about the suspect, about whom they say they know very little. Spokeswoman StaffSergeant Jennifer Pound said the young man, who is in jail facing second-degree murder and aggravated assault charges, had no apparent connection to the community, the school or the two girls he is accused of stabbing. Globe and Mail

New Brunswick RCMP's first e-joints seizure earns man 2 years in prison
An **Ottawa** man was sent to prison on Thursday after being caught trafficking marijuana and e-joints in southeastern New Brunswick. Stephane J. André Fournier, 40, pleaded guilty in Moncton provincial court in late January to possessing marijuana, hydromorphone and cannabis resin. The prosecutor withdrew three counts of trafficking those substances. Judge Alfred Brien followed a joint recommendation on Thursday for two years in prison. Prosecutor Patrice Deschenes told the court that a Mountie pulled over a vehicle on the Trans-Canada Highway in River Glade on Oct. 7, 2015. Upon approaching the vehicle, the officer smelled fresh cannabis and further investigation resulted in the seizure of three briefcases containing 12 kilograms of marijuana, several e-joints or electronic marijuana vapour cigarettes that contained cannabis resin, along with some hydromorphone pills. He admitted to police he was transporting the illegal substances from Ottawa to Nova Scotia for re-sale. The defence told the court the offender committed the crimes out of economic necessity. "Clearly this was a bad decision on your part," said Brien. New Brunswick RCMP said after the arrest that it was their first seizure of e-joints in this province. Times & Transcript

Man killed in tanker explosion near Red Deer, Alberta
A 35-year-old man was killed by an explosion while working in an industrial park on the northwest edge of **Red Deer** Thursday afternoon. Blackfalds RCMP said it happened at around 1:40 p.m. at the Burnt Lake Industrial Park at J Moore Enterprises. A single tanker exploded, RCMP said, destroying the tanker and killing the man. 200 fentanyl pills seized in Saskatoon drug bust
Police said they have seized fentanyl pills and charged three people following a drug bust in **Saskatoon**. The bust happened after members of the Saskatoon integrated drug enforcement team spotted what they believed to be a drug transaction in the area of Taylor Street and St. George Avenue on Wednesday afternoon. Police arrested two men and said they seized 100 fentanyl pills and over $1,500 in cash. A home in the 100-block of Girgulis Crescent was then searched, where police said they seized an additional 100 fentanyl pills. Two men, 20 and 22, are facing charges of possession for the purpose of trafficking. The 22-year-old man is also facing charges of trafficking fentanyl and possession of the proceeds of crime. An 18-year-old woman is also charged with possession for the purpose of trafficking. Global News (2016-11-03)

RCMP release photo of homeless man charged in high school murder
Homicide investigators have released a photo of the 21-year-old man charged in the stabbing death of an **Abbotsford** high school student in hopes the public will come forward with information. Staff Sgt. Jennifer Pound says the photo of Gabriel Klein was captured on closed-circuit surveillance just hours before a deadly attack at Abbotsford Senior Secondary. Thirteen-year-old Letisha Reimer was killed after being attacked by a barefoot intruder in the school's atrium. Her 14-year-old friend, who cannot be named because of a publication ban, was seriously injured and remains in hospital. CTV News (2016-11-03)

Edmonton judge stays sex charge over unexplained loss of evidence by RCMP
An **Edmonton** judge has tossed out a sexual assault charge against an Edson-area man as a result of the “unexplained” loss by the RCMP of an audio-recorded statement from the alleged victim. In a ruling released this week, Court of Queen’s Bench Justice Denny Thomas issued a judicial stay of the 2015

sexual assault charge against the 21-year-old accused man. "Balancing the societal interest of having a full trial on the merits of this charge before a jury and the right of the accused to make full answer and defence, I conclude that this is one of those 'clearest of cases' where a stay should be granted to respect the rights of the accused," said Thomas in his written decision, The man had sought a stay of the charge, arguing the "unexplained" loss of key evidence by the Mounties was so prejudicial to his right to make full answer and defence that he would not get a fair trial. The Crown had conceded that the loss of the complainant's audio statement meant the prosecution had not met their disclosure obligation and it was therefore a breach of the accused's Charter rights, but had argued there was other evidence available to the defence which would have mitigated the prejudice to him. Edmonton Journal (2016-11-03)

Alberta vehicle theft suspect arrested after leading police on low-speed skid steer chase
Police have arrested a suspect in connection with a string of thefts of trucks, trailers and construction equipment east of **Edmonton**. The arrest came after a man driving a construction vehicle led Vegreville RCMP on a low-speed chase. It all began last Saturday around 4:45 p.m., when Mounties got a call about a suspicious man who had just parked a truck and trailer in a field southwest of Mundare. Police did a check and discovered the truck and trailer had been stolen from a business in the Nisku industrial park south of Edmonton. The person who called police then said the man who had dropped off the truck was leaving the scene in a John Deere skid steer, which was later determined also to have been stolen. RCMP found a man driving the skid steer on Range Road 17-0 and attempted to arrest him. The man fled in the equipment which, according to John Deere's website, has a maximum travel speed of about 20 kilometres per hour. Police said at one point during the low-speed pursuit, the driver attempted to ram a police vehicle. Global News (2016-11-03)

Ten drug dealers in dial-a-dope network allegedly operated by Mohamed Abdi Yusuf caught in Brooks, Alberta bust
Seven suspected drug dealers have been arrested and warrants have been issued for three others as ALERT (Alberta Law Enforcement Response Teams) shut down a drug trafficking network operating in Brooks, Alberta. ALERT's Medicine Hat organized crime team conducted the investigation in response to community concerns related to cocaine trafficking. ALERT worked hand-in-hand with RCMP Brooks and **Medicine Hat** Police Service on the three-month investigation. ALERT alleges that the group was operating as a dial-a-dope network with Mohamed Abdi Yusuf, 40, as the suspected ringleader. The group played a significant role in cocaine trafficking within Brooks and the project implicated the suppliers and street-level dealers. A total of 10 men are facing 20 drug-related charges. "This dial-a-dope group presented a challenge for uniformed members to investigate. However, by virtue of the partnership with ALERT and their specialized skill sets and resources, we were able to deliver a coordinated response and provide a safer community," said Sgt. Raimo Loo, RCMP Brooks. Indo-Canadian Voice

Needles found in chocolate bars
Sewing needles were found in two large-sized chocolate bars collected by **Cochrane** youth while trick-or-treating, Oct. 31. Cochrane RCMP are investigating the incident and in the meantime are asking people to step forward if they have been the victim of the tampering of candy during the annual Halloween costume dash for candy. According to the Cochrane RCMP, the complainant had been checking their children's Halloween candy and found a sewing needle in a large O'Henry bar and another sewing needle in a large Kit Kat bar. They had been trick-or-treating on the west side of Gleneagles. The exact location of where the bars were received is still under investigation and if there are any other incidents with tampered candy the RCMP are strongly encouraging it to be reported to help narrow down where this could have taken place at. Cochrane Times (2016-11-03)

Search for missing Codroy Valley hunting guide into 2nd day
A ground search will continue Thursday for a 49-year-old man who became separated from his hunting group Tuesday afternoon on **Newfoundland's** west coast. RCMP said a helicopter search continued until midnight Wednesday, and will be back in the air Thursday, weather permitting. Barachois Ground Search and Rescue, a Joint Rescue Co-ordination Centre helicopter and RCMP assisted in the search, which began shortly after the man was reported missing at 1 p.m. Wednesday. CBC News (2016-11-03)

NATIONAL INQUIRY INTO MISSING AND MURDERED INDIGENOUS WOMEN AND GIRLS / ENQUETE NATIONALE SUR LES FEMMES ET LES FILLES AUTOCHTONES DISPARUES ET ASSASSINEES

Thunder Bay cops face probe for all missing persons cases

Review broadened to focus on interaction with indigenous community. All indigenous missing persons and death investigations will be under the microscope of the Ontario police watchdog as it expands its "systemic review" of the Thunder Bay Police Services, looking for discriminatory conduct. The sweeping review, to be conducted by the Office of the Independent Police Review Director, was formally unveiled on Wednesday and begins immediately. The issue of police racism toward indigenous people has galvanized the country in wake of greater exposure to the issue of murdered and missing indigenous women and girls. Many indigenous families have not been satisfied with how police authorities handled their initial complaints about their loved ones, and how they followed up on them. Those concerns spill over into all aspects of the justice system and in cases of other indigenous death investigations. The incarceration of Adam Capay in segregation in a Thunder Bay cell for four years, without a trial, is a stark reminder of human rights inequalities. The systemic review will focus on the interaction between the police and indigenous people in Thunder Bay; if indigenous people have been "over-policed" or "under-policed," and if investigations have been carried out in a discriminatory manner, said Gerry McNeilly, the Independent Police Review director. Toronto Star; CBC News

Chief urges communities to live violence free

While the national inquiry into missing and murdered Indigenous women inches forward, leaders from the Esk'etemc First Nation are not waiting to make positive changes in their community and others.
"We choose to be proactive," Esk'etemc Chief Charlene Belleau told attendees at the recent First Nations Health Council caucus, held in Williams Lake last week. Despite the inquiry being called, Belleau said she feels like nothing has changed in the way missing and murdered Indigenous women cases are treated and feels communities themselves must choose to live violence-free. "Somehow it's our responsibility to do something about it." So far, that desire for change has translated into physically assisting in the search for missing woman and girls such as helping the Splatsin First Nation at Enderby search for Caitlin Potts June 7. Potts, originally from Alberta, was reported missing March 1. William Lake Tribune (2016-11-03)

LGBTQ Canadians Sue Government for Decades-Long Witch Hunt

In a Canadian military interrogation room in 1990, strapped to a polygraph machine and sensing unseen observers behind a two-way mirror, 21-year-old Canadian sailor Todd Ross finally broke down in tears and said out loud what he'd been unable to say even to himself: He was gay. The military gave Ross an ultimatum: accept an honourable discharge or perform "general duties"—grunt work—for the rest of his career. (…) According to government records, the RCMP spent decades following World War II investigating, surveilling, and questioning suspected gay and lesbian public servants, including members of the military, about their sexual orientation. At one point, the RCMP amassed a list of 9,000 people deemed suspect and subject to investigation. The Canadian government would often employ a device that would measure sweat and sexual reaction to certain words, phrases, and images—dubbed internally as the 'fruit machine'—to vet suspected LGBTQ government employees. The project was created through a government grant at the Carleton University Psychology Department. Vice News (2016-11-03)

Liberal government may not compensate men convicted under anti-gay laws, FOI suggests

Government officials say Canada's looming effort to purge criminal convictions for consensual homosexual acts could cost $4.1 million and face "nightmarish" bureaucratic hurdles, Daily Xtra has learned. Nevertheless, public servants told the government they would have been able to start the process by September 2016, according to documents released under access-to-information laws, raising questions as to why the review still hasn't started. On Feb 27, 2016, Prime Minister Justin Trudeau announced he would seek a posthumous pardon for Everett Klippert, who was labelled a dangerous offender for consensual gay sex. The next day, his spokesman said the government will review all convictions of "buggery" and "gross indecency" laws prior to 1969, when they were restricted to mostly

non-consensual activity. The government has only said publicly and to bureaucrats to look into cases before 1969, but there's no mention of afterwards. In 400 pages of exchanges obtained by Daily Xtra, Parole Board of Canada employees say roughly 6,000 sentences could be reviewed, with an RCMP search showing the oldest dating back to October 1939. "A manual review of each file would be needed to determine the circumstances surrounding the convictions," according to one memorandum. However, the Parole Board said in the documents that it would be ready, "to post information on its website for September 1, 2016 to inform individuals with the specific convictions that they may apply for clemency." The documents suggest the Liberals are interested in modelling an Australian program that involves cost-free reviews of convictions for people who feel they were charged because of homophobia, but bars them from any compensation. The documents also reveal that over 300 Canadians convicted under either charge have requested pardons on their own since 2000, with a success rate of 98 percent. The government did not respond to Daily Xtra's request for comment on the documents, which date from February to July 2016. The lack of a timeline and plan of action has frustrated activists...According to the documents, Public Safety Minister Ralph Goodale was leaning toward replicating how the Australian state of Victoria is expunging records. Daily Xtra (2016-11-03)

Feds holding Twitter consultation on national security
Public Safety Canada is holding a Twitter chat Thursday night to hear what Canadians think about national security and its responsibility to Canadians. The department in charge of the RCMP, the Canadian Security Intelligence Service and its oversight body, and the Canada Border Services Agency is asking people to tweet them using the hashtag #YourNatlSec starting at 8 p.m. ET to discuss accountability in national security. The social media discussion comes the same week the House public safety committee is starting its review of bill C-22, which will amend some of the laws changed under the Conservatives' highly contentious C-51. Public Safety Minister Ralph Goodale isn't participating in the Twitter chat. New Democrat justice critic Murray Rankin says he wants as many people as possible to participate. "Any effort to get Canadians engaged is great," he said. The department is holding national security townhalls across the country until Dec. 15. It's also is accepting input on its website too. CTV News (2016-11-03)

Feds forbid construction of new embassies on Sussex Drive
The federal government is forbidding the construction of new embassies on Ottawa's Sussex Drive following a stark RCMP assessment of the potential for "violent events" in the high-profile neighbourhood. Countries with diplomatic missions already located on the well-known boulevard include the United States, France, Kuwait, Saudi Arabia and South Africa. It is also home to Rideau Hall, where the Governor General lives, as well as the prime minister's residence at 24 Sussex. Justin Trudeau and his family are living in a house on the Rideau Hall grounds while federal officials consider badly needed renovations to the traditional address of Canada's leader. Foreign Affairs Minister Stephane Dion was advised of the ban on new embassies in January by Daniel Jean, then his deputy minister, records released under the Access to Information Act show. Jean has since been named national security adviser to the prime minister. "A recently concluded RCMP security assessment advises against any additional foreign embassies being located along Sussex Drive," says Jean's memo to Dion, obtained by The Canadian Press. "As a result, the department will no longer be approving requests by diplomatic missions to acquire land in the affected zone." Canadian Press (Daily Commercial News) (2016-11-03)

$100M radio network for first responders goes live
With the flip of a lever on a silver control box, a $100-million, state-of-the-art digital radio network for New Brunswick's first-responders went live on Thursday. It's called the New Brunswick trunk mobile radio project and it will allow 3,400 police, firefighters, paramedics, forest rangers, school bus drivers, and snowplow operators now - and up to 8,000 in the future - to communicate clearly, quickly, and easily. It replaces a 30-year-old system that lacked coverage in some parts of the province and didn't allow different agencies to talk to each other. (...)Larry Tremblay, RCMP assistant commissioner for J Division, said the new radio system will make communications between agencies smoother, more reliable and give wider coverage. "I can say this new system will enhance the safety of our police officers when they are

out on call, as well as the safety of other first-responders assisting them," he said. "Every call we answer carries risks for all involved and this new system will help reduce that risk by ensuring better communication." New Brunswick Fire Chiefs Association president Dan McCoy said information is one of the most important requirements when responding to a call. Daily Gleaner

Nanaimo sheriff rushed to hospital after exposure to fentanyl
The potentially lethal drug has become so rampant and led to so many fatal overdoses that the province has declared a health emergency and this incident reminds front line workers of the risk they run everyday. In the war on Fentanyl, Const. Justin Ickringill has gotten closer than any officer wants to be to the potentially lethal drug. "I was immediately light headed and dizzy," says the Nanaimo RCMP officer. "I had a racing heart and it caught me by surprise. (…)Monday a Nanaimo deputy sheriff became the latest front line worker to experience an accidental exposure to it. When conducting a gloved search of a prisoner at the RCMP detachment before transport to court she was exposed to the crystal-like substance in the pocket of a jacket being searched, and quickly became ill. "She was taken to the hospital in Nanaimo and the doctor determined that it was in fact Fentanyl that she was exposed to," says Dean Purdy of BCGEU's Corrections & Sheriff's Unit. "So from our standpoint it's a big concern for us because we would like to see some interim measures put into place so that we can try and prevent this." RCMP say fentanyl has now made its way into everything from marijuana, to cocaine and heroin. Chek News

Des francophones de la GRC intentent une action collective
Des francophones de la Gendarmerie royale du Canada veulent intenter une action collective contre leur employeur en raison de la discrimination et du harcèlement qu'ils disent subir à cause de leur langue. «Les opportunités d'avancement sont de beaucoup diminuées pour des policiers francophones, alors que dans l'autre sens, un unilingue anglophone peut accéder à un haut grade», s'insurge Paul Dupuis, un retraité de la police fédérale, à l'origine de ce recours. Cet ancien sergent d'état-major, qui a aussi été président de l'Association des membres de la police montée du Québec (AMPMQ), n'est pas tendre envers son ex-employeur. Dans la demande déposée au palais de justice de Montréal, il affirme avoir été victime «d'une campagne de harcèlement systématique» à cause de son militantisme pour ses droits linguistiques et de ses revendications pour créer un syndicat au sein de la police fédérale. «Après une campagne de harcèlement prolongée [...] M. Dupuis s'est senti de prendre sa retraite en 2016», peut-on lire dans le document de cour. Journal De Montreal; La Presse

Amnesty International calls for more police in Fort St. John, northeast B.C.
Resource development contributes to crime, putting Indigenous women and girls most at risk, Amnesty says. A new report from Amnesty International says police in northeast B.C. are not equipped to deal with the high rates of crime in the region, particularly when it comes to violence against Indigenous women and girls. The report also calls on RCMP to increase Indigenous cultural knowledge for its officers, and renews Amnesty's demand for the Site C dam project to be stopped. The report titled Out of Sight, Out of Mind provides an overview of the ways in which resource development in B.C.'s Peace River region — including fracking, coal mining and hydroelectric dams — affect vulnerable populations. "There is a downside to the scale of resource development in the northeast and the people who live there," said Craig Benjamin, who helped prepare the report for Amnesty. "Particularly, Indigenous women and girls are bearing a very heavy burden for hosting these products in their region." CBC News (2016-11-03)

Province, federal government in talks over RCMP staffing levels in Sask.
Conversations are ongoing between the two levels of government on the issue of RCMP staffing in Saskatchewan. In September it was reported that our province was under served by as much as 25 per cent. 980 CJME (2016-11-03)

RCMP nets handguns and rifles in amnesty
Gun owners responded to a what RCMP called a gun amnesty by turning in more than two dozen firearms to the local detachment. Kamloops RCMP wrapped up the program earlier this week. Cpl. Jodi Shelkie said five handguns were turned in, along with 27 rifles and shotguns, five pellet guns and five boxes of ammunition. Kamloops This Week; Merritt Herald (2016-11-03)

P.E.I. variety show to salute military, RCMP past and present

Military and RCMP members past and present will be feted with a special fundraiser variety show held at Holland College in Charlottetown next Wednesday. A crew of 60 people, including 40 performers, are putting together Salute!, which will raise money for the P.E.I. Military Family Resource Centre (MFRC). CBC News (2016-11-03)

Tax rate in Chilliwack jumping 3.5% to fund more RCMP
The public has been screaming for more police in Chilliwack to deal with rampant property crime. City council is taking a major leap forward in this direction hiring 10 new RCMP officers for 2017, as well as two RCMP information officers. Chilliwack Progress (2016-11-03)

Former Mountie on trial in Moncton for impaired driving
Former RCMP sergeant Ronald Cleveland is on trial in Moncton on a charge of impaired driving dating back to an incident in the early hours of March 21, 2014. Cleveland was released from the RCMP on a medical discharge earlier this year. CBC News (2016-11-03)

Nepean pot shop case highlights hazy enforcement rules for police
A knife point robbery didn't do it. Neither did a truck crashing through the store's front window. Nothing seemed to be able to shut down CannaGreen, a marijuana dispensary in a Nepean strip mall this summer, until the owner of the building slapped an eviction notice on the front of the store. But even then the bailiff hired to enforce the order said the owner of the pot shop got back into the store and kept selling. And that's when Ottawa police came on Wednesday to help the bailiff enforce the eviction and arrested a man for trespassing. Ottawa police have said they are hesitant to enforce trafficking charges against dispensaries, given the fact that they could be thrown out of court once federal legislation comes into effect. But the CannaGreen situation may provide the blueprint for how neighbourhoods and police deal with the proliferation of unregulated pot dispensaries that have popped up in the capital after the federal government signaled its intent to legalize marijuana: where the criminal laws are murky, municipal bylaws and provincial regulations can be used to shut stores down. CBC News

Calgary to ask Ottawa for a slice of pot pie
When marijuana legalization hits Canada in spring 2017, Calgary hopes it gets a cut of the new tax revenue that's sure to follow. On Thursday, a council committee approved official positions that the city will present to Ottawa as the federal government begins making decisions about how pot legislation should be crafted. Those policy positions include making sure the city has control over licensing, that people are allowed to grow a limited amount of cannabis at home, and that Calgary get a slice not just of any marijuana tax, but of all sin taxes. CBC News (2016-11-03)

Legal pot could boost economy
An editorial piece states, “It’s possible, even likely, that at some point next year, Ontarians will be able to search store shelves for ‘purple haze’, ‘blue dream’ and ‘kosher kush’ marijuana alongside their VQA merlots, sauvignon blancs and moscatos. Work is well underway to lay the foundation for marijuana legalization in this country, with legislation expected in the spring. Pot advocates have long argued legalization could give our economy a lift. A new report suggests that lift could surpass anyone’s wildest prophecy. A study produced by the Deloitte firm – titled Recreational Marijuana: Insights and Opportunities – suggests a legal marijuana industry in Canada could be worth an incredible $22.6 billion – more than the sales of wine, spirits and beer combined. Deloitte’s research values the recreational retail market for weed at between $5 billion and $8.7 billion annually. Tack on between $12.7 billion and $22.6 billion for the ancillary market (growers, specialty product makers, testing labs and security) and you have

what Deloitte calls "a bold new landscape" for businesses and governments. But that's not all." Simcoe (2016-11-03)

Canada's Budget Office Estimates Cannabis Market Worth Hundreds of Millions During Flagship Year

According to Canada's Parliamentary Budget Office, sales tax revenues from legal cannabis could be between $356 million and $959 million once the drug is legalized nationwide, as is expected this spring. The figures are based on legal per gram prices between $7.48 and $9.34 with only federal and provincial sales tax applied. Parliamentary Budget Officer Jean-Denis Fréchette notes that the office expects the revenues to, eventually, climb into the billions of dollars and that the new sector will create both new revenues and expenses for the government. "Different products, such as edibles and concentrates, may require entirely different approaches to taxation," the report states. "These variations, along with others, each have different implications for market incentives and fiscal revenues." The PBO projects that in 2018 — the likely first year of legal sales — Canadians will consume between 378 and 1,017 metric tons of cannabis and that the legal market will be largely driven by individuals who consume the drug daily or weekly. The office suggests that between 3.4 million and 6 million Canadians will consume cannabis at least once after it is legalized nationally. Ganjapreneur (2016-11-02)

Medical marijuana group one step closer to business

As Canadians reacted to news that Shoppers Drug Mart is exploring the possibility of selling medical marijuana in the near future, an independent retailer is finalizing the last steps in opening a medical marijuana dispencery within the Camrose area. Grant Gillott, the chief executive officer of htKa group — the acronym stands for honour, truth, knowledge and action — made a presentation to the Rotary Club of Camrose Oct. 17, discussing what the plans are heading forward. htKa have purchased a 66 acre lot outside the city limits, which Gillott said will leave lots of room for expansion as the market allows. "We see that as something that's almost inevitable," said Gillott. "We didn't want to get into a small site with a single building and try to do expansion and then have to go back through the application process." To reach the stage of owning land, htKa had to become certified with Health Canada in a five step process. The third step was to go through security clearance, that Gillott said took 22 months before they reached an 11 month review process, that they are currently finishing up. Now Gillott is ready to move forward, break ground and be licensed, and he hopes to be ready to go within the next 18 months. While many Canadians are still skeptical about the legalization of medical marijuana, Gillott said there are bussiness opportunities as as legal companies start moving forward. Camrose Canadian (2016-11-03)

Calgary wants seat at table when marijuana is legalized in Canada

The City of Calgary wants to make sure it has a seat at the table when marijuana is eventually legalized in Canada. The Trudeau government plans to introduce legislation in the spring of 2017. AM 640 (2016-11-03)

City mum on pot shop plans as council inquires about restrictions

Riley McGee is clearing the air: Marijuana for Truama isn't a one-stop pot shop or a dispensary. On Wednesday, city councillors asked if new pot dispensaries should be restricted like liquor stores, which would mean they wouldn't be able to locate near schools... He said Marijuana for Trauma won't get into the dispensary business when it becomes legal, noting the company went through a rezoning process to open at its current location. Metro News (2016-11-03)

Letter: Marijuana legalization could go up in smoke

A letter to the editor states, "To all you fellow human beings out there who may happen to read this — I do hope you will do what's right and speak out about the unfairness pertaining to this subject..." Penticton Western News (2016-11-03)

Muslim Toronto Police chaplain's views troubling

An opinion piece states, "He says Muslim women should obey their husbands. He even suggests a wife should make herself available and "not withhold this right from her husband without a valid excuse." Further to his dictates on wives' sexual obligations to their husbands, he argues that some scholars agree that if a woman "refuses without a valid reason, then she has committed a major sin." He even insists that women must seek permission from their husbands whenever they want to leave the house because the man is the "main decision-maker of the home." These are not edicts issued by Wahhabi clerics in Saudi Arabia, or by jihadis from ISIS or al-Qaida. The source is right here in Canada. Musleh Khan is the new Muslim chaplain hired by the Toronto Police to bridge gaps between law enforcement and the Muslim community and to provide religious and moral support to Muslim officers. The police union is justifiably concerned about his comments, made in a 2013 webinar entitled "The Heart of the Home: The Rights and Responsibilities of a Wife." Of course, people offended by these comments understand the importance of a relationship that requires both parties to respect each other's wishes. They are enlightened enough to see that Khan's comments promote a kind of sexual tyranny..." Postmedia Network (Toronto Sun, Edmonton Sun, Winnipeg Sun) (2016-11-03)

RCMP treatment of senior couple brutality
A letter to the editor states, "Just viewed the video again and brutality is the only way to describe dragging an old man down stairs by his feet. As for the treatment of the woman, it was stupidity. Neither of these are characteristics that should be tolerated in Canada's "finest". For comparison, look at video of the Kinder Morgan or Carmanah protests and what do you see? Protesters being "carried" by at least two officers — not dragged by their heels. This situation is an astounding revelation and, when tied to the recent sexual harassment/assault issues the RCMP have experienced, suggests that some authority, much higher than tiny New West's police force, should be conducting a pervasive review of the RCMP." Cowichan Valley (2016-11-03)

Commission d'enquête sur la surveillance des journalistes: à quoi s'attendre?
Un article d'opinion déclare « La mise en place de la commission devrait permettre de connaître l'étendue du problème et les manières d'y remédier... Le fait qu'un ministre de la Sécurité publique puisse, comme ce fut le cas en 2013 pour Stéphane Bergeron, appeler directement le grand patron de la SQ Mario Laprise pour s'enquérir d'une possible enquête -- même s'il ne savait pas que l'investigation toucherait ensuite des journalistes -- est troublant... » L'actualité (2016-11-03)

Here's what investigative journalists actually do
An editorial states, "On Thursday, Quebec announced a full public inquiry into freedom of the press and police surveillance of journalists, against the backdrop of revelations that various provincial police forces had extensively monitored reporters' phones - one of them for five years. Several of the reporters whom Quebec police spied on in recent years specialize in what's referred to as "investigative journalism." Here are some examples where digging by reporters has made a difference: Alleged police abuse: Last fall, Radio-Canada's Enquête investigative show aired a report alleging Sûreté du Québec officers in Val-d'Or subjected indigenous women to violence and other cruel behaviour and paid for sexual favours with money and cocaine. In the wake of the report, eight SQ officers were put on administrative leave and Quebec named a civilian observer to oversee the Montreal police investigation of the alleged abuse..." Auditor General flags 'unacceptable' Phoenix pay glitches, PS pension costs
Auditor General Michael Ferguson turned the spotlight on the pay problems of Canada's public servants and the risks of the growing liabilities of their pension plans with the present low interest rates in his latest audit observations on the federal government's books. Ferguson, who audits the government's financial statements, gave the 2016 Public Accounts a clean audit, but he flagged the delays and errors of the Phoenix pay system as "unacceptable" and praised the government for re-examining the assumptions in determining pension liabilities in the face of prolonged low interest rates. Ferguson uses these notes or observations in his audit opinion to highlight issues for MPs to watch. Ferguson, along with senior bureaucrats from Treasury Board and Finance appear at the Commons public accounts committee Thursday to discuss the Public Accounts. On pensions, Ferguson's 2014 report urged the government to re-examine the design of the three defined-benefit plans for Canada's public servants, military and RCMP to ensure it can manage risks that could affect the long-term affordability and "sustainability" of the plans (…) Ferguson said he will be watching the impact of Phoenix in his upcoming audit of the 2017 financial statements. He is also undertaking a major investigation into Phoenix and the whole pay transformation project — at the request of Public Services Minister Judy Foote — to find out how the project went off the rails. It's unclear when that report will be completed. Ottawa Citizen (2016-11-03)

Court says Canada spy agency illegally kept data
A Canadian court ruled Thursday that Canada's spy agency illegally kept phone numbers and email addresses of people they were not directly investigating over a 10-year period and wasn't forthright with judges who authorized the intelligence gathering. Federal Court Justice Simon Noel said the Canadian Security Intelligence Service should not have kept the information since it was not directly related to threats to Canada's security. The data involves the phone numbers, email address or IP addresses of family members or friends of those the spy agency investigates. The spy agency called it "associated data." CSIS said it used metadata — information associated with a communication, such as a telephone number or email address — but not the message itself. It said the program has been in place since 2006. Spy Service director Michel Coulombe said they have halted logging, storing, and analyzing the data in question and said he "deeply" regretted the judge's findings about breach of "duty of candor." Coulombe stressed all data collection was done under warrant. He noted the issue is the retention of non-threat related data. Canadian Public Safety Minster Ralph Goodale said he takes it seriously the spy agency was not forthright with the courts and said he would talk to senior executives of the spy agency. Goodale noted the laws that govern the spy agency are 30 years old and need to be updated to reflect new technologies. "Justice Noel did not dispute the potential value of "associated data" to the important work CSIS does in this challenging world, but he could not find existing legislative authority permitting its retention and use," Goodale said in a statement. News of the spy agency program comes as the provincial Quebec government announced they are calling a public inquiry into police surveillance of journalists amid revelations various forces in the province monitored reporters' phones. The province's two largest police forces said earlier this week that they had monitored the phones of six prominent journalists in 2013. Associated Press (Daily Mail UK); Reuters; Canadian Press (Mississaugau.com, The Record, Times Colonist, Toronto Star); CBC News; National Post; Wall Street Journal; Globe and Mail; Agence QMI (Journal de Québec, Journal de Montréal) ; Vice News; Motherboard; Agence France-Presse (L'Orient le Jour) (2016-11-03) (2016-11-03)

Edward Snowden Calls Police Spying on Quebec Journalists a 'Threat to Democracy'
In a speech to 600 people at McGill University in Montreal on Wednesday night, Edward Snowden described police spying on Quebec journalists a "threat to the traditional model of our democracy." Though it had been announced months ago, the timing of Snowden's conference was strangely appropriate. The event took place just hours after *La Presse* revealed the Sûreté du Québec (SQ), which is the provincial police force, had put at least six prominent journalists under surveillance. Two days earlier, the same Montreal daily had broken the story that its own star columnist, Patrick Lagacé, had been spied on by the Montreal police force (SPVM). Appearing live from Russia, where he's been living in exile since exposing top secret information about US intelligence and surveillance programs, Snowden did not mince words when discussing the behaviour of Quebec police. (…) Snowden reiterated that citizens should be leery of authoritarian measures defended by governments that argue their very survival

is under threat from terrorists. "There's no real evidence this is actually the case, but the politics of this fear have reshaped the way our laws are getting passed." Canada's Bill C-51, whose adoption in 2015 generated reams of criticism from legal experts and ordinary citizens worried about how it would erode Canadians' privacy and individual rights, was one such example, he said. During the election, Prime Minister Justin Trudeau promised to amend the law, most notably by scrapping some "problematic elements" like the overly vague proscription against terrorist propaganda and by "guaranteeing that all actions undertaken by the Canadian Security Intelligence Service are consistent with Canada's Charter of rights and freedoms." Skepticism about peace bonds after arrest of alleged ISIL supporter for second time in two weeks
An alleged ISIL supporter has been arrested in Ottawa for the second time in less than two weeks for violating the conditions of his release, raising new questions about terrorism peace bonds. Police picked up Tevis Gonyou-McLean, 24, on Saturday morning — just five days after a judge had freed him from custody following his arrest for multiple previous breaches of his release conditions. "He was arrested, I believe, yesterday morning on breaches," his lawyer Biagio Del Greco said in an interview Sunday. He said there were two alleged breaches this time, one of them for a curfew violation. The 24-year-old was required to observe a 10 p.m. to 6 a.m. curfew and wear an electronic GPS ankle bracelet. He appeared in court over the weekend and the matter was adjourned to Tuesday. The case is the latest to prompt concerns about terrorism peace bonds, which the RCMP has been using to restrict the activities of extremists and prevent them from leaving Canada to join terrorist groups... There have been 18 arrests on terrorism peace bonds since the beginning of 2015, according to the Public Prosecution Service of Canada. Nine terrorism peace bonds are pending in Ontario, Quebec and B.C. Two are currently active. In Toronto, Kadir Abdul, the brother of an ISIL fighter believed to have died in Syria, signed a peace bond in July after he was arrested in Turkey. An Edmonton youth is also subject to a terrorism peace bond. On Aug. 10, another Canadian arrested on a terrorism peace bond, Aaron Driver, 24, was killed by a police tactical team as the extremist convert was attempting to leave his home in Strathroy, Ont. to commit a suicide bombing. Public Safety Minister Ralph Goodale later said the Driver case showed the limits of the effectiveness of terrorism peace bonds and that changes may be needed, including mandatory de-radicalization counseling. National Post; Vancouver Sun

Another arrest for alleged ISIL supporter

Second foreign student sent home after gun threat

The second international student under investigation related to an alleged gun threat at Seycove secondary has been sent back to his home country. **North Vancouver** school district confirmed Wednesday that his student visa had been revoked and he has flown home under the supervision of the homestay agency acting as his custodial guardian. Another student was arrested on Oct. 25 when he allegedly threatened to "bring a gun to school and do harm to a teacher." The student was sent home less than 24 hours later. Later, on Oct. 26, police recovered a gun somewhere off of school grounds. Police had requested charges of possession of a prohibited firearm and uttering threats for the second boy, although the Crown declined. "Because Crown didn't approve charges, there is no more criminal investigation happening. It will still try to be determined how the gun surfaced," said Cpl. Richard De Jong, North Vancouver RCMP spokesman. "We still have a concern, obviously as police, how a young person can have access to a gun." Police could confirm that the gun did not come from any of the homestay families. All other aspects of the investigation aren't being disclosed, De Jong said. Both students were subject to background checks by the school district as well as screening by the Canada Border Services Agency and Citizenship and Immigration Canada, according to Deneka Michaud, North Vancouver school district spokeswoman. North Shore News (2016-11-04)

School stabbing tragedy sparks security calls in SD62

The brutal, senseless slaying of a student at **Abbotsford** secondary last week has sent shock waves throughout school districts across the province and beyond, said Jim Cambridge, superintendent for the Sooke School District. "Although it's an unusual event, everyone was just shocked by the randomness," Cambridge said regarding the attack on Nov. 1. that killed Letisha Reimer, 13, and seriously injured her 14-year-old friend. "It hits a nerve with every parent and educator in the province, because we treat student safety so seriously. Our hearts and prayers go out to those families." He has spoken to several parents that have expressed their anxiety about school safety since the attack. School District 62 is fortunate in that regard because a former RCMP officer has been in charge of school security for a number of years and goes over security plans regularly, Cambridge said. In addition, the district holds annual lockdown drills, as well as earthquake and fire drills and goes over hold and secure and parent release procedures of part of its overall emergency preparedness plan. Latest Surrey Shooting Leaves Two Indo-Canadian Men Dead

Vikram Toor and Ashim Raza were killed Friday night in a brazen shooting in the Fraser Heights area of **Surrey** next to an elementary school. Police believe the homicide is independent from other recent acts

of violence in the Lower Mainland. Two young Indo-Canadian men were killed after a drive-by shooting in Surrey Friday night, and police believe the incident is independent from other recent acts of violence around Metro Vancouver. The Integrated Homicide Investigation Team (IHIT) has identified the victims as Vikram Toor, 24, and Ashim Raza, 19. Surrey RCMP responded to calls of shots fired at about 7:20 p.m. at 110th Avenue and 159th Street in the Fraser Heights area. One of the men died at the scene and the other was taken to hospital, then died from his injuries. Investigators are still trying to determine if the shooting was targeted. (…) One neighbour told CTV News violence has been escalating in the area. "We only live half a block away from here, our kids go to school here," she said. "We thought we'd moved 16 years ago to a very nice neighbourhood, and a couple of years ago a man was killed right there." Bouquets of flowers were placed at the scene of the shooting on Saturday. More than 50 shootings have occurred in Surrey this year. Link Paper

Woman's death in custody exposes indigenous policing issues
Lena Anderson took her own life as she sat alone in the back of a police truck on the **Kasabonika Lake** First Nation on a cold late afternoon in February, 2013. Five members of a coroner's jury are now being asked to determine how she met her end – a mandatory procedure in Ontario when someone dies in police custody. Regardless of their findings, Ms. Anderson's case, along with the horrific deaths of two young men being held in a jail on the Kashechewan First Nation in 2006, serve as stark reminders that the right to a minimum standard of policing, and a basic level of security, do not exist everywhere in Canada. Indigenous communities with their own culturally sensitive police forces have no law to set requirements for officer training, mandatory equipment, use of force or codes of conduct. "At any given time, we have communities with no police, we have communities with one police officer working alone," Terry Armstrong, the chief of the Nishnawbe-Aski Police Service (NAPS), told the inquest. "If you were to ask me right now if it's safe, it's not safe." As it stands, indigenous policing is just another government program financed by Ottawa and the province of Ontario. The only way the communities of the Nishnawbe Aski Nation (NAN) will get security "backed by the rule of law" is if NAPS is covered by the Ontario Police Services Act, Mr. Armstrong said. Without the act, First Nations residents cannot demand that sufficient resources be applied to the job of keeping them safe. Detachments can be decrepit shacks – or non-existent. Police are not required to have radios or access to investigative services. There is nothing to say a lone officer should not be on call seven days a week, around the clock. Globe and Mail

Stolen semi found stuck in slough with murder suspect inside: Saskatchewan RCMP
A 26-year-old man is now facing a second-degree murder charge after RCMP launched a suspicious death investigation in Saskatchewan. At around 4:20 a.m. CT on Wednesday, RCMP received a complaint about a semi that had been stolen from a farm yard north of Kerrobert, Sask. The complainant also provided a description of a suspect. A short time later, another complaint was received by police about a sudden death at a residence in **Kerrobert**. Members attended and found Johan Klassen Sr., 53, deceased. Investigators determined the death was suspicious in nature and identified a person of interest who matched the previous description given. Kindersley RCMP said they immediately began searching for the semi and quickly found it stuck in a slough northwest of Luseland, Sask. The vehicle was in approximately 1.2 metres of water, about 30 metres from shore. The man inside the semi refused to exit. RCMP immediately contained the scene to ensure public safety and the emergency response team (ERT) was deployed to the scene to assist. At around 2 p.m., the man was taken into custody without incident. Sughar Daily; CTV News; 650 CKOM; Star Phoenix (2016-11-04)

Bomb threat Romeo jailed, ordered to pay $89,100
P.E.I. man who called in a bomb threat to Walmart in **Charlottetown** because he wanted his girlfriend to get the day off was sentenced to 60 days in jail and ordered to pay $89,100 in restitution. Logan Richard Arsenault, 19, appeared before Chief Judge Nancy Orr in provincial court in Charlottetown Friday after previously pleading guilty to calling in the bomb threat. In handing down the sentence, Orr said we don't live in a society where that type of behaviour is considered a joke. "It's never been a joke," she said. Arsenault used a payphone in Stratford on Aug. 2 to call in the bomb threat, saying he knew people who worked at the store and they needed to get out. The store was evacuated and closed for about six hours while Charlottetown police, an RCMP explosives unit, Island EMS and firefighters responded. NG News (2016-11-04)

Man charged for gym mischief
A man has been arrested in relation to a break-in that ended in the vandalism of a local school gymnasium. The incident took place in the early morning of Aug. 29, when a man entered Lakeland Ridge School, and was caught on surveillance video pulling a fire extinguisher off the wall. He then used the extinguisher to spray down the school gym, causing what the RCMP noted as "several thousands of dollars' worth" of repairs made necessary by the damage. A suspect turned himself into police on Oct. 29. Charges are pending against the 19-year-old man, from **Sherwood Park**, for one count of mischief under $5,000. He is scheduled to appear in Sherwood Park Provincial Court on Wednesday, Nov. 30 at 9:30 a.m. The man's identity has not been released by Strathcona County RCMP. Sherwood Parknews (2016-11-04)

Lawrencetown man arrested after indecent act complaints
A **Lawrencetown** man has been arrested and charged after RCMP received complaints about a man committing indecent acts in front of children. Annapolis County District RCMP started an investigation after receiving a complaint Tuesday afternoon about a man masturbating while fully undressed in front of a window as children walked by. A second similar complaint was received at about 8:30 the next morning. Assisted by the RCMP Internet Child Exploitation Unit and RCMP Technological Crime Unit, officers executed a search warrant at a Sunvalley Street residence. They arrested Chester Terry Thibodeau and charged him with three counts of committing an indecent act. Thibodeau has been remanded into custody after appearing in Annapolis Royal Provincial Court Thursday. He is scheduled to return Nov. 14 for a bail hearing. Chronicle Herald; Metro News (2016-11-04)

RCMP investigating separate indecent act incidents
A woman was shaken up but not injured when she was grabbed while jogging in **Spruce Grove** Thursday afternoon. RCMP said the woman was running near the soccer field on Heatherglen Drive around 4:30 p.m. when she was approached by the male suspect. She told police he talked to her briefly before grabbing her buttocks and shoulder and touching her face. He's described as 5'10", with a medium build and dark skin. The victim said he was wearing a black Nike jacket, black pants, a black hat, and thick black sunglasses. iNews 880 (2016-11-04)

Police seize drugs, handgun, cash during Sooke raid
Police seized drugs, a handgun, body armour and cash during a raid on a suspected drug house in Sooke. **Sooke** RCMP teamed up with the RCMP Island District General Investigation Section to execute a search warrant on a home in the 6700 block of Eustace Road in Sooke early Thursday. The raid followed a several-month investigation into drug trafficking. Police said they seized several ounces of cocaine, several pounds of psylocibin mushrooms, drug trafficking paraphernalia, a pistol and loaded magazine, a ballistic vest and more than $7,000 in cash. A 30-year-old man was arrested as a result of the investigation, and faces charges of possession of a controlled substance for the purpose of trafficking, unsafe storage of a restricted weapon, unlawful possession of body armour, and possession of prohibited weapons. The suspect remains in custody, but is expected to be released on bail. "This joint investigation has curtailed the activity of a high volume, and diversified drug trafficker who deals primarily to other dealers and users within the community of Sooke." said Staff Sgt. Jeff McArthur. Sooke News (2016-11-04)

Conception Bay South man arrested after child-luring investigation
A **Conception Bay South** man is facing charges of child luring after a five-month investigation. The 28-year-old man was arrested Friday without incident as a result of the investigation by the Combined Forces Special Enforcement Unit, an investigative unit comprising members of both the RCMP and the Royal Newfoundland Constabulary. CBC News (2016-11-04)

Felix Taqqaugaq inquest: Boy, 8, still afraid of RCMP after witnessing shooting
The coroner's inquest into the death of Felix Taqqaugaq went into the weekend with its most emotional testimony yet. The 30-year-old, diagnosed with schizophrenia, died in 2012 after being shot by police in his home in **Igloolik**, Nunavut. Neighbour Jacobie Amaroalik, who saw the whole incident through his window, struggled to get through his nearly two hours of testimony Friday. Speaking in Inuktitut through an interpreter, he broke down on the witness stand when he spoke about the impact the shooting has had

on his eight-year-old son, who also witnessed some of the events. "My young son does not want to go to school anymore. He knows the RCMP helps the breakfast program at the school and he does not want to see them," Amaroalik testified, sobbing. "It was very terrible for my young son because after seeing this incident, he would get a toy gun and pretend to shoot at the cops ever since then." CBC News (2016-11-06)

Fin de l'alerte Amber: deux enfants et leur mère retrouvés en Colombie-Britannique
La Gendarmerie royale du Canada (GRC) en Colombie-Britannique a mis fin à son alerte Amber après que deux enfants et une mère eurent été retrouvés sains et saufs à **Sicamous**, en Colombie-Britannique. L'alerte avait été déclenchée vendredi soir et les deux enfants, un garçon et une fillette, ont finalement été retrouvés à une station-service de Sicamous. La mère a été arrêtée. «L'enquête se poursuit et des accusations devraient être portées contre elle. Les enfants vont être réunis avec leur famille», a indiqué la GRC. Agence QMI (Journal de Montreal); CBC News (2016-11-05)

Manitoba RCMP respond to increase in road fatalities
Manitoba RCMP are reporting that nine people have died this past week on Manitoba roads and that officers are doing there best to not ever have this rate of fatalities repeated... RCMP say that everyone has a role to play and that Manitobans must wear their seatbelts, slow down and drive sober. Manitoba RCMP also recognize that enforcement is a critical part to changing driving behaviour, this year, there has been more enforcement and more impaired drivers taken off our roads. My Steinbach (2016-11-05)

NATIONAL INQUIRY INTO MISSING AND MURDERED INDIGENOUS WOMEN AND GIRLS / ENQUETE NATIONALE SUR LES FEMMES ET LES FILLES AUTOCHTONES DISPARUES ET ASSASSINEES

Sexual abuse haunts children in indigenous communities
Child sexual abuse is a disturbing reality in many of Canada's First Nations, Métis and Inuit communities, research is beginning to show. Extensive interviews with social scientists, indigenous leaders and victims undertaken over the past few months by The Canadian Press show that the prevalence of sexual abuse in some communities is shockingly high. Only now are prominent indigenous leaders speaking out publicly for the first time about the need for communities to take a hard look. The impact of childhood sexual abuse is expected to be a central issue raised when hearings begin early next year for the inquiry into missing and murdered aboriginal women. An interim report is due in November 2017. "Throughout the (pre-inquiry) hearings on missing and murdered indigenous women and girls, we certainly found the incidents of child abuse and the association of child abuse was very, very frequent, in both the descriptions of the victims and in the perpetrators," said federal Indigenous and Northern Affairs Minister Carolyn Bennett. Canadian Press (Toronto Star, A1, Ottawa Sun, Times & Transcript)

CBC adds oldest Manitoba case so far to MMIW database: 56 years later, still no answers: Flora Muskego was found frozen to death in 1960 near Norway House
Flora Muskego was found frozen to death in a snow drift near Norway House First Nation 56 years ago. Her family is still wondering what happened to the 22-year-old on Thursday, December 9, 1960. There was a small newspaper clipping from 1960 in the Winnipeg Free Press stating when Muskego was found and that she was last seen just the day before. It also said a coroner's inquest was pending on the police investigation. Muskego is buried in Norway House today. As part of continuing CBC's coverage of missing and murdered Indigenous women and girls, Muskego is the latest case to be added to its database and oldest case uncovered by CBC in the province of Manitoba. Sylvia Grier, 64, of Saskatoon remembers her aunt. "I remember how beautiful she was," said Grier, also a Norway House community member. At the young age of eight, Muskego introduced Grier to make-up. Grier remembers her aunt wearing beautiful clothes and always having nice shoes. CBC News (2016-11-04)

FEDERAL & INTERNATIONAL OPERATIONS / OPÉRATIONS FÉDÉRALES ET INTERNATIONALES

Animal Rights Groups, the KKK, and ISIS—the RCMP's New Guide To Extremism

For the past few years, the Canadian government has faced accusations that it's been asleep at the switch when it comes to stopping youth from being programmed by violent extremist groups. The Royal Canadian Mounted Police are striking back at that notion with a 140-page guide to radicalization, extremist groups operating in Canada, and terrorist groups abroad. The agency's Terrorism and Violent Extremism Awareness Guide, which was officially unveiled in October, "is intended for first responders, parents, colleagues or friends of persons at risk alike and is meant to help the reader to better understand and recognize the growing phenomenon of radicalization to violence." A large chunk of the report is just compiling resources on radicalization, offering different models that try to explain how someone might come around to violence and extremism based on their social, religious, and political beliefs. But the report also sheds light on exactly which domestic groups the RCMP are keeping an eye on. The report's language borrows heavily from internal security and intelligence assessments prepared by groups like the Canadian Security Intelligence Service and the Integrated Terrorism Assessment Centre... The RCMP also warns about the Internationalist Resistance (IR), which it describes as an "extremist anti-capitalist group." The classification is interesting, because the RCMP has spent the better part of a decade investigating a small group of Quebec Communists, accusing them of making up the central cell of the IR, and for carrying out three bombings throughout Quebec from 2004 to 2010. A VICE Canada investigation raised questions about that investigation and whether the RCMP really has the right culprits. The RCMP report also names Skinheads Against Racial Prejudice and Red and Anarchist Skinheads, both committed to anti-fascism and anti-racism, as being two radical groups. Vice News (2016-11-04)

Feds to appoint border crossing adviser

The federal government is set to appoint a special ministerial representative to look at border crossing issues faced by First Nations. In a joint letter written in response to a Senate committee study, Indigenous Affairs Minister Carolyn Bennett, Immigration Minister John McCallum and Public Safety Minister Ralph Goodale say the adviser and First Nations will discuss significant and complex challenges. It also says the resolution of these issues will require a "horizontal approach" involving several departments and agencies. The ministers say the results of the engagement between the representative and First Nations will shape the work of an interdepartmental committee of senior officials. The Senate committee on aboriginal peoples outlined border crossing issues in its June report. The committee said some First Nations believe they should have the right to freely cross the Canada-U.S. border, based on the 1794 Jay Treaty between Britain and the U.S. Canadian Press (Inside Ottawa Valley, CBC News); Presse Canadienne (Journal Métro) (2016-11-04)

Espionnage de journalistes - Ottawa ferme les yeux sur le passé

Aucun journaliste n'est actuellement surveillé par la GRC et le SCRS... mais Ottawa n'a pas idée si cette situation a pu se produire dans un passé récent. Le ministre de la Sécurité publique, Ralph Goodale, ne l'a pas demandé. Et il n'a pas l'intention de le faire : c'est le présent qui compte, dit-il. Pour M. Goodale, " la question porte sur ce qui se passe maintenant et nous pouvons offrir l'assurance que ce genre d'activité n'a pas lieu. Je ne sais rien sur les événements qui se sont produits lorsque nous [les libéraux] ne formions pas le gouvernement ", a indiqué le ministre en point de presse. Questionné à savoir s'il demanderait directement au patron du Service canadien du renseignement de sécurité (SCRS) si des mandats de surveillance ont pu être lancés dans les cinq dernières années, Ralph Goodale a répondu que c'était précisément la " responsabilité du directeur de répondre aux questions opérationnelles "... Lors de la période de questions, M. Goodale a indiqué trouver " très inquiétantes " les révélations qui ont marqué la semaine au Québec -- l'espionnage de plusieurs journalistes par le Service de police de la Ville de Montréal (SPVM) ou la Sûreté du Québec (SQ). Le Devoir, A7; La Presse, 1 (2016-11-05)

Retour sur une semaine sombre pour la liberté de presse

Pour les trois journalistes de Radio-Canada, il s'agit de tous leurs appels de novembre 2008 à octobre 2013, confirme la SQ. Cette procédure ne prévoyait pas d'écoute électronique. La SQ cherchait à faire la lumière sur des fuites d'éléments d'enquête provenant de l'écoute électronique en 2008 et 2009 du président de la Fédération des travailleurs du Québec (FTQ) de l'époque, Michel Arsenault - qui s'est plaint en 2013 de ces divulgations dans les médias... Jeudi, il a dit s'être assuré auprès de la Gendarmerie royale du Canada (GRC) et du Service canadien du renseignement de sécurité (SCRS) que de telles « activités » ne se passent pas « au niveau fédéral ». Rappelons que deux journalistes de La Presse ont été espionnés en 2007 par des agents de la GRC. Radio-Canada (2016-11-05)

'Unregulated field' of private police needs greater oversight, report warns
Private police have exploded in numbers in recent years, but Canada is lagging behind other countries in tracking their often-covert activities - something that experts warn could compromise privacy and public safety if growth continues unchecked. "There is little or no governance or oversight of private security firms in Canada, no mechanisms that require standardized reporting by private security firms, and only minimal standards in place for licensing, training and discipline of the various positions within the private security industry," reads a research report prepared for Public Safety Canada. Provincial and federal statutes, including privacy rules, govern surveillance and the collection and use of information. But the report finds lax licensing requirements and a lack of oversight are failing to keep the activities of private investigators, analysts and guards in check. "This has a number of consequences, including an inability to ensure that private security companies are not vulnerable to organized crime, unethical and/or illegal behaviour," the report said. The report, released to CBC News, comes amid news reports about questionable surveillance and data collection activities of Canadian police and spy agencies. Two Quebec police forces have come under fire for tracking the cellphones of journalists, while a federal court condemned the Canadian Security Intelligence Service for illegally retaining the metadata of people not under investigation. The report finds a "potential" for private security to play an important role in community safety. But it warns of the dangers of an expanding role in the national security apparatus that falls largely under the radar. Curt Griffiths, a criminologist at B.C.'s Simon Fraser University who co-authored the report, called the growing business of private security an "unregulated field." CBC News (2016-11-06)

Laws on protecting journalists' sources not being followed, says retired justice John Gomery
The creation of a commission of inquiry into spying by Quebec police on journalists is a necessary step, but the public shouldn't expect it to solve the problem, says retired Quebec Superior Court justice John Gomery. Gomery, who led the commission of inquiry into the federal sponsorship scandal between 2004 and 2006, said such bodies are essential to help restore public confidence in the rule of law. "A public inquiry is a good way to find out what happened, but as far as developing policy for the future, I'm not sure it's the best way to go," he told CBC News. Gomery said one of the commission's useful functions will be to shed light on the role played by justices of the peace in the growing scandal. CBC News (2016-11-04)

ORGANIZATIONAL ISSUES / ENJEUX ORGANISATIONNELS

Minister sides with RCMP on background checks
The justice minister of the NWT sides with the RCMP when it comes to giving information beyond criminal records to potential employers seeking background checks. Louis Sebert's remarks followed a demand from Yellowknife Centre MLA Julie Green for a stop to the practice. "Two days after getting (a) job, my constituent was let go. He has never been convicted of a criminal offence but the forms supplied by the RCMP detailed the things he was not convicted of," Green told the house. "My constituent lost a job he desperately needed because the police issued a form which confirms he has no criminal record, but which also says there is "adverse information" on file. This is not a conviction, it's a suspicion. This is outrageous." She asked Sebert if he would apply that principle to the Mounties and their policy. "The short answer is no. This act ... has been in force for 16 years now. I assume that Charter challenges have not been made or failed," Sebert said. NWT News

Mounties are recruiting
The RCMP is hiring. The Royal Canadian Mounted Police (RCMP) is recruiting police officers from all backgrounds who are physically fit, up for a challenge and ready to make a difference wherever they're posted. A career presentation will be held 6 p.m. Thursday, Nov. 24 at the RCMP Headquarters, 450 University Ave., Charlottetown. The presentation will offer the opportunity to meet with recruiters and hear real life career experiences from police officers who wear the RCMP uniform. A recruiting officer will also outline the process to apply, the benefits and rewards of a career in policing, provide advice and answer questions. There are approximately 18,500 police officers across Canada who work for the federal police

force of Canada. The RCMP is unique in the world providing policing services at the international, federal, provincial and municipal levels. Guardian, A4

Twilling ate RCMP Members Prepare Time Capsule
Members of the Twillingate RCMP detachment are creating a time capsule as they prepare to move into a new building in 2017. Constable Greg Bowie thought of the idea as a way to show future residents of the area a brief overview of the RCMP in Twillingate in 2016, as well as some information about the town that they serve. In the not too distant future the Twillingate RCMP will be ready to move from what is currently the oldest detachment in Newfoundland, to the newest. The idea of a time capsule seemed quite fitting for the occasion. Currently, the capsule will include a letter from Bowie with a brief history about himself and the other members he serves with. He plans to also include a current RCMP shoulder flash, a 2016 loonie, RCMP pin as well as newspaper clippings, both local and national from present day. They would also like to include photos or small mementos reflecting current life in Twillingate/Durrell. Bowie said the capsule is going to be very compact, as it will be packaged in a coffee can, therefore any donated items need to be small enough to fit inside. Pilot NL (2016-11-04)

Policing concerns in rural Saskatchewan prompt meeting of ministers - 'Public safety continues to be our challenge,' says Minister of Justice Gord Wyant
Saskatchewan's minister of justice says he went to the federal minister responsible for the RCMP over rural policing concerns. Gord Wyant said he and Minister of Public Safety Ralph Goodale agreed to have further meetings to discuss adequate RCMP deployment and resources allocated to this matter. "Public safety continues to be our challenge," said Wyant, adding that comments and concerns from the public prompted the meeting with the Saskatchewan MP. "We need to make sure that not only is the proper protection there, but people feel they are being protected," said Wyant. He said Goodale is doing a review of vacancy management. "I think that was a big concern that was expressed in rural Saskatchewan," said Wyant. CBC has reached out to Goodale for comment. CBC News; Radio-Canada (2016-11-04)

Quebec Mounties seek to launch discrimination lawsuit against RCMP
The association that represents RCMP members in Quebec is seeking to certify a class action lawsuit against the force on behalf of members across the country, alleging systemic harassment and discrimination against members by superiors. “There’s some cases that have been done privately but on behalf of all members, this has never been done,” said Frederic Serre, media officer for the Quebec Mounted Police Members Association. “You’re looking at power trips and unfortunately there’s a lot of it within the force … That’s what we’re trying to point out with this action.” Serre said that although it’s an association representing Quebec Mounties that’s seeking to launch the suit, the class action is meant to represent all RCMP members across Canada — not just those in Quebec or francophones. iPolitics; Global News (2016-11-04)

City of Richmond: Volunteer cops need gun training
The amount of time Richmond’s volunteer RCMP auxiliary constables are on the beat has dropped by 70 per cent this year, over 2014, after Mounties were ordered to have direct armed supervision of the complementary force and end all ride-along duties. Now, Richmond city council wants Ottawa to reinstate unsupervised duties for the unarmed auxiliary force and allow for firearms familiarization training. “We would like to see the auxiliary force back to what they used to be. It’s been a great resource to augment our police force,” said Coun. Bill McNulty. The city is backing a proposal by the Union of B.C. Municipalities to introduce a three-tier training program that would allow auxiliary constables to increase the number of duties they perform — such as public ceremonies, bike patrols and traffic and crowd control — without supervision. Richmond News (2016-11-04)

Grey OPP hosting counterfeit money detection seminar
Grey County OPP, together with the Bank of Canada and the Royal Canadian Mounted Police (RCMP), will be hosting a ‘Bank Note Counterfeit Detection Training’ session on Nov. 22 in Owen Sound. Businesses, together with the general public, are invited to attend this free training session to learn more about the security features on Canadian and US money; what to do should you receive a suspicious bank note; and discover tips and techniques for verifying and counting bank notes during cash transactions. All attendees will receive free training materials. Simcoe.com (2016-11-06)

LEGISLATION & POLICIES / LÉGISLATION ET POLITIQUES

MLA calls for clear direction from GNWT on legal marijuana
Kam Lake MLA Kieron Testart is calling on the territorial government to establish clear guidelines on legal marijuana. Testart said that the government needs to be proactive ahead of proposed federal legislation that would make legal the consumption and regulated sale of pot. "The market is adapting to pending changes, drawing in national and international investment that is already roughly created a medical marijuana industry valued at $200 million," Testart recently told the house. "Marijuana is now considered by the business community as a commodity of great potential, and not an illicit drug; nothing exemplifies this more than the announcement by Shoppers Drug Mart, Canada's largest pharmacy trade ... having formally applied to be a distributor of medical marijuana." Testart asked Health and Social Services Minister Glen Abernethy how the GNWT intends to manage marijuana sales once the law changes, including issues like age restrictions which could be as young as 19 or as old as 25. NWT News

Local Ottawa politicians applaud raids on marijuana dispensaries
Local politicians in Ottawa are applauding the closure of a string of marijuana dispensaries operating illegally in the city. Police arrested nine people and raided seven pot shops this week after mounting complaints from community members and councillors. "I'm happy with the level of response that OPS has put in," said Jody Mitic. "We were kind of tightening the screws a little bit on the [police] chief." CBC News (2016-11-05)

Police hope pot shop raids
Ottawa police raided six marijuana dispensaries Friday morning, closing a big chunk of the city's pot shops in one fell swoop... The targeted shops are operated by a B.C.-based outfit that moved into Ottawa this summer, opening dispensaries called Green Tree, WeeMedical and CannaGreen. Ottawa Citizen, A2 (2016-11-05)

EDITORIALS & OPINIONS / ÉDITORIAUX ET LETTRES D'OPINIONS

Current threat scenario is serious, requires a more adult conversation
An opinion piece states, "One of the great Canadian novels of the 20th century was Two Solitudes by Hugh MacLennan. It is the story of the troubles between Canada's two European founding nations-the French and the English (both had been preceded by the First Nations thousands of years earlier). The phrase "two solitudes" has entered Canadian English as a synopsis of the relations between the English and the French. Different languages, different backgrounds, different cultures, different ways of seeing the world. I couldn't help but think of this as I sat in a meeting room last Friday in the offices of the Canadian chapter of the Internet Society in Ottawa. I had been invited to a discussion on the intersections of rights and freedoms and the controversial C-51, the anti-terrorism bill that significantly increases some of the powers and capabilities of Canada's security and law enforcement agencies. I was the only person with any experience in those latter organizations (CSIS and CSE). The others in attendance were privacy advocates and lawyers. It was of no surprise to me that these participants, after paying what I saw as "lip service" to the necessity that our spies and cops have the tools to stop threats like terrorism, were uniformly critical of any more capabilities. I found myself time and time again disagreeing with their comments and realized how woefully ignorant they were of what CSIS and the RCMP do and how they do it, as well as why." Hill Times

It's not easy being a journalist's unnamed source in the Information Age
An opinion piece states, "Were I in a position of authority, I would probably hang up if contacted by a journalist. Not because I don't think people in positions of authority should speak to journalists - I do, and I'm grateful to all the people in positions of authority who haven't hung up on me over the years... In Canada, Mounties investigating a document leak have targeted journalists, and last week, reporters at La Presse in Montreal and at Radio-Canada discovered Quebec police, hunting for leakers in their own ranks, have been tracking and tapping their communications. (We have no idea how many other

journalists have been surveilled, but it's safe to assume it happens.)... Glenn Cowan, GRA Quantum's Canadian CEO, says such software allows phone, video or email communication without leaving any record: no metadata, no communications link to analyze, no tracking log, nothing...Cowan stresses that his firm does not regard law enforcement as a "threat actor," to use the language employed by the super-secret Communications Security Establishment in its advice to government employees on how to protect their communications..." CBC News (2016-11-05)

Should Canadian journalists assume they're being secretly watched by police?
An opinion piece states, "Journalists rely on whistleblowers to report wrongdoing, and whistleblowers trust journalists to keep their identities secret to protect their jobs, their families and sometimes even their personal safety. It's a relationship that's fundamental to holding those in power to account. That's why what happened this week was so remarkable. Not one but seven Quebec journalists, including some who work for CBC's French-language service Radio-Canada, learned they have been the subjects of secret surveillance by police in Quebec...The first revelation came Monday, when La Presse columnist Patrick Lagacé revealed that Montreal police confirmed they had been collecting metadata from his cellphone, effectively keeping tabs on every incoming and outgoing call...On Friday, I tweeted out what I believe many journalists were thinking upon hearing the news. A number of people responded that secret surveillance by police in Canada is something journalists should not only assume but accept. Goodgodmadge wrote: "Oh come on now, let's not be naive!" Some investigative journalists do work under the assumption that their conversations are listened to or their emails privately traced. But is there a danger in making that assumption? DS: So, Patrick, let me ask you first of all: What has this cost you? To have this level of surveillance of your activities? PL: A certain loss of innocence, I'd say. I really was living in this fairy tale - where journalists are not special citizens but you cannot spy on journalists as easily as what we've seen in this case..." CBC News (2016-11-05)

The worst part about the spying spree - it was legal
An opinion piece states, "Connect the dots between Quebec's police corps and the half-dozen or more investigative journalists who were put under surveillance over the past decade and you will find a gaggle of judges potentially derelict in their gatekeeping duties. In each of the spying episodes that have come to light over the past week, the police had to convince a judge to sanction the surveillance and, in some cases, to do so more than once..." Toronto Star (2016-11-05)

Spying eyes
An editorial states, "Taken in isolation, either case is concerning. But this week, we actually had two major law enforcement misconduct issues surface. The Canadian Security Intelligence Service, it turns out, has been collecting unrelated information it received as part of terrorism investigations (and was supposed to destroy), and instead loaded it into database systems that its legal overseers weren't even told existed. Meanwhile, in Quebec, police services were tracking some reporters' calls and texts for periods as long as five years, in an effort to catch and punish police whistleblowers. There's a huge problem here. And it's an oversight problem..." The Telegram, A15 (2016-11-05)

Surveillance des journalistes - La nouvelle chasse aux sorcières
Un article d'opinion déclare, « Le professeur Stéphane Leman-Langlois est un spécialiste de la police, du renseignement, du terrorisme, des technologies et du contrôle social. Il a récemment collaboré au livre "Transparent Lives" sur la surveillance au Canada. Il enseigne à l'Université Laval.\r\nAvez-vous été surpris par les récentes révélations sur l'ampleur de l'espionnage des journalistes québécois ? Pas du tout. Chaque fois que je parle de surveillance depuis des années et que je dis aux journalistes qu'ils sont les premières cibles, la plupart d'entre eux lèvent les yeux au plafond parce qu'ils n'y croient pas. Ils me traitent de parano parce que je suis dans les études de la surveillance. Je suis certain que le phénomène est d'une ampleur bien supérieure à ce qui vient d'être dévoilé. Je pense que les révélations de la SQ -- arrivées très, très rapidement et concernant, comme par hasard, des écoutes datant d'anciens directeurs de ce corps de police -- sont faites pour détourner l'attention. Mais bon, il va y avoir une commission d'enquête et, si elle peut lever des pierres, on va en trouver bien plus, de ces histoires de surveillance... » Le Devoir, B1 (2016-11-05)

Why spying on the press hurts democracy

An opinion piece states, "Revelations this week that two Quebec police forces spied on journalists by secretly monitoring their smartphones was widely condemned in Canada and abroad as an outrageous attack on press freedom. Critics from Edward Snowden to domestic and international media groups decried the police tactics as a spectacular assault in a country that is widely considered to be a gold standard for democracy..." Ottawa Citizen, B5 (2016-11-05)

Ottawa police raid pot shops across city
Ottawa police have arrested at least one person during Friday morning raids at marijuana dispensaries across the city. The raids at the Wee Medical Dispensary Society shop at 358 Rideau Street, and the Green Tree Medical Dispensary shops at 290 Montreal Road, 256 Bank Street and 352 Preston Street come following a volume of complaints about the growing number of dispensaries across the city. One person was seen being escorted out of the shop on Montreal Road by police and shuttled into a cruiser. Ottawa police tweeted that there were operations underway "at several locations in Ottawa" but refused to comment further "so as not to jeopardize ongoing investigations." The federal government has promised to introduce legislation to legalize marijuana by the spring of 2017 but possession, production and trafficking of marijuana remains illegal. CBC News; Ottawa Sun (2016-11-04)

Armed robbers hit Stittsville pot shop
One of Ottawa's remaining marijuana dispensaries was robbed at gunpoint on the weekend.
The robbery at Magna Terra Health Services on Iber Road in Stittsville on Saturday came after police raids last week closed seven of the 17 illegal pot shops in town. Three men robbed the dispensary at about 7:30 p.m. on Saturday, escaping with three large garbage bags of cannabis products and some cash, Ottawa police StaffSgt. Jamie Harper said. Two of the men concealed their faces with hoodies or neck warmers, and one had a silver handgun, he said. Store employees were not injured. "Obviously this was a planned attack," Harper said. He compared it to pharmacies that are robbed for fentanyl and other drugs with street value. "There is always a criminal element out looking for this type of product." There have been at least four robberies of Ottawa dispensaries this fall, as thieves target the dried weed, cannabis cookies, brownies and cash in the stores. Magna Terra in Stittsville has more security than other dispensaries do. Ottawa Citizen, Front/A1

Health Canada disputes police story on fentanyl
Police were alerted by both phone and mail in July that there was liquid fentanyl in Hamilton, says Health Canada. The statement is in direct contradiction to police claims that the vice and drug unit were notified the week of Oct. 31 about the lab results and that they were not physical documents that landed on an officer's desk. Torstar (Hamilton Spectator, A1; The Record) (2016-11-05)

Five arrests in Fentanyl bust
Five people were arrested and $20,000 in Fentanyl seized after a year-long investigation **in** St. Catharines. Since November 2015, members of the Niagara Regional Police St. Catharines street crime unit have been conducting a drug investigation involving two individuals who were allegedly responsible for selling large amounts of Fentanyl in the city... In total, $20,000 in Fentanyl was seized in addition to $1,450 in cash. St Catherines Standard (2016-11-05)

Ottawa Citizen
If you're coming to Ottawa for Canada Day this year, would you mind sending us your RSVP? Despite the anticipation around the July 1, 2017, celebration of the country's 150th anniversary - and likely the biggest Canada Day bash the national capital has ever seen - no one involved in its preparations seems to know just how many people might actually show up to for the party. Millions of dollars are being spent on the event, which is sure to pack downtown Ottawa for the crowning event of a year of various celebrations. That will affect everything from traffic flow to business to public transit, and it will require a big police presence to maintain public safety. (...) The Ottawa Police Service has produced an internal estimate for 2017 Canada Day attendance, but a spokesman said that estimate won't be released to the public. He said the RCMP should be able to provide an official number, but the Mounties refused to comment on

expected crowds or how the national police force is preparing to deal with them. RCMP spokeswoman Annie Delisle referred all questions about Canada Day attendance to Canadian Heritge. Ottawa Citizen

Montreal police were issued warrants to listen to journalists' conversations
Montreal police sought, and obtained, warrants to listen to the private conversations of two journalists at the French-language newspaper La Presse, according to court documents seen by the journalists. The revelation adds a new dimension to the ongoing controversy about police surveillance of journalists in Quebec. Nipawin RCMP issue Amber Alert for 7-year-old Sask. girl believed to be taken by father

Nipawin RCMP have activated an Amber Alert for seven-year-old Nia Eastman believed to have been taken by her father Adam Jay Eastman, 45, Wednesday night. RCMP said Nia was to be returned home to her mother by 7:00 p.m. A vehicle believed to be operated by her father was located on a rural property east of Smeaton, Sask., near Snowden around 10:00 p.m. Neither Nia nor Adam were found with the vehicle. Officers are searching the vicinity. Police have described Nia as 3'9" with shoulder-length blonde hair. She was last seen wearing pink eyeglasses, purple long-sleeved shirt with butterflies, pink skirt and purple leggings with silver trim at the bottom. 650 CKOM; Global News; Toronto Star; CBC News

Jury finds python owner not guilty in deaths of New Brunswick boys

A jury has found a New Brunswick man not guilty of criminal negligence causing death after his African rock python escaped its enclosure and killed two young boys three years ago. Four-year-old Noah Barthe and Connor Barthe, 6, died during a sleepover in Jean-Claude Savoie's apartment in August 2013. (…) Matchim said an investigation by the RCMP and two subsequent reviews concluded that charges were not appropriate. He said he received that assurance in writing. The lawyer said a new lead investigator was then appointed and suddenly is client found himself facing a charge. (…)He responded to the earlier testimony of RCMP officers about the python's aggressive behaviour after it was captured - hissing and

lunging at the glass of the enclosure. "A snake that responds like that is a very aggressive snake," he said. "It was an extreme response to human presence. This animal was dangerous." Truro Daily

Nanaimo city council calls for RCMP to investigate Mayor

If there was still any hope of Nanaimo council healing from their very public fractures, this new scandal will end that. "Well this is a really strange situation obviously and a situation that is really complex," says Coun. Bill McKay. As city council openly calls for RCMP to investigate Nanaimo Mayor Bill McKay for alleged corruption. "When you hide something everyone assumes its corruption and that's the allegation," says Coun. Jerry Hong. "Until he comes forward and presents it and shows it otherwise that's what the allegations are." It's the latest in a saga of dysfunctional chapters in this council's story that was seen publicly for the first time last March, when 7 city councillors signed a letter calling for McKay's resignation "You know the public asked why we did it. These are some of the things why," says Hong. Chek

First Nations police service recommends its own disbanding at suicide inquest

The suicide of a First Nations woman in the back of a police truck is causing Canada's largest Indigenous police service to do some soul searching. The Nishnawbe Aski Police Service, which covers 34 First Nations in northern Ontario, told an inquest into Lena Anderson's death that it has neither the resources nor the legal foundation to do its job properly. So it took the drastic step on Wednesday of asking the jury at the inquest to recommend the police force be disbanded if Ontario does not bring it under the province's Police Services Act by March 31, 2017. "Enough is enough," said Nishnawbe Aski Police Service (NAPS) board chair Mike Metatawabin. "We can't do this all the time where you promise something and then turn around and say you can't do it." Ontario's Ministry of Community Safety and Correctional Services says it plans to introduce legislation in the spring that will "modernize" the Police Services Act and that it is consulting with First Nations on "exploring a legislative framework for First Nations policing." CBC News

Four cattle dead after chased by four-by-four

Okotoks RCMP are looking for help to catch individuals responsible for the death of four cattle after they were chased by a vehicle on a rural property in the DeWinton area. Sometime on Oct. 7 someone opened the gate to a property west of Macleod Trail where the animals were grazing. The suspects drove a four-by-four vehicle onto the ranch land and used it to chase cattle for an unknown length of time."It looked like someone had come in and chased them," said Heather Mills, who owned the animals with her family. "From what we could see it looked like they had brought them up the fence line where we had a catch pen. I don't know if they were trying to steal them or if it was a cruel joke." She said they want people to be aware and watchful for anything suspicious. Mills said the loss of four animals will impact their farm. The cattle were insured, but they are working to see how much they will receive. "This is livelihood and it affects everyone in the long run if people are injuring animals," she said. "There isn't a large margin at the end of the day for what farmers get off their cattle." Mills said she and her husband received a phone call from someone living on a neighbouring property that there was a dead cow. They were in Calgary at the time and received a second call soon after about a second animal. Upon arriving, Mills she said they counted their herd and realized another was missing. After euthanizing another, in total four animals were dead. Western Wheel

Two men facing charges in kidnapping in mountain resort town of Jasper, Alta.

RCMP say two men have been charged after an armed kidnapping in Jasper Alta., on Saturday. Mounties say the complainant has taken into a vehicle by two males armed with firearms, but managed to jump out of the moving vehicle and ran into a nearby business for help. He was taken to hospital and treated for non-life threatening injuries. A few hours later, RCMP in nearby Hinton conducted a high-risk traffic stop and took one male into custody while another man turned himself in at the local detachment two days later. Otto Richard Latimer, 21, and Nathan Rodney Shevalier, 29, are charged with forcible confinement, uttering threats to cause death, possession of a weapon for a dangerous purpose and theft under $5000, along with additional charges for Shevalier. Lethbridge Herald

Details emerge of unsolved murder in Penticton

Details have emerged in civil court about an unsolved murder in Penticton that happened over a year ago. The ex-wife of the man shot to death in a motel last June is fighting to receive the life insurance

payout. Darren Leadbeater, 36, was reported as the victim of a June 4, 2015 shooting at the Golden Sands Resort Motel by Penticton RCMP, who have not put forward a suspect or any findings since. So far the only details that have materialized are through a Supreme Court lawsuit filed by Leadbeater's former spouse Leanne Bishop. According to public court documents obtained by the *Western News*, Manulife Financial was initially withholding the $205,000 life insurance policy Leadbeater had through his employer, with the only beneficiaries being Bishop and her children. The reasoning Manulife offered in their response to the claim was "(Manulife) sought confirmation from the authorities and/or police that (Bishop) was not involved in the death of Leadbeater." Penticton Western News (2016-11-09)

'I was trying to stop him': RCMP officer apologizes for shooting Felix Taqqaugaq
The RCMP officer who shot Felix Taqqaugaq in his Igloolik home in 2012 apologized to Taqqaugaq's family at a coroner's inquest on Tuesday. Const. Jason Trites testified by video from Halifax, and in responding to a question from Taqqaugaq's father, asked by the family's lawyer, he said he hopes the family gets closure from this inquest into his shooting death by police four years ago. "I just hope that they realize that nobody joins the RCMP in the hopes of ever shooting somebody," Trites said. "I've talked to many members who have gone their entire careers without pulling their pistol, and I envy them because I live with this every day." Trites said he's done his best to keep the incident from affecting him professionally, but he replays the shooting in his mind in his downtime when he's not on the job. "I just hope the family knows that they're not the only ones that were hurt by this," Trites said. "The things that I deal with, do affect my personal life. I'm definitely not the same person as I used to be before this incident." CBC News (2016-11-09)

Parks Canada issues wolf advisory after 'freaky' encounter at B.C. beach
Brent Woodland was almost finished his normal run with his dogs at dusk on Wickaninnish Beach, near Ucluelet, B.C. last week, when he saw something moving on the sand dunes. It was a large wolf, bigger than his 40-kilogram dogs, standing just two metres away. "It was stalking us. I don't know how long it had been watching us," said the 36-year-old Ucluelet resident. And it didn't back down, until a 911 call brought RCMP sirens blaring. After Woodland's wolf encounter, and two others that day in the Long Beach area of Pacific Rim National Park Reserve, Parks Canada has issued a wolf advisory and warning for the area, including advice on how to react to the aggressive, habituated wolves that seem a little too comfortable around people. CBC News (2016-11-09)

Mint employee guilty of smuggling $165K of gold in rectum
A former Royal Canadian Mint employee has been found guilty of smuggling $165,000 worth of gold from the building on Sussex Drive — apparently in his rectum, an Ottawa judge ruled Wednesday morning. Leston Lawrence "clearly had the opportunity" to steal the gold because he often worked alone and the security cameras would not have caught him slipping gold pucks into his pocket, Justice Peter Doody ruled. (...) Under RCMP surveillance, he was seen visiting the Ottawa Gold Buyers store at Westgate Mall on March 9, 2015. The RCMP found Lawrence sold a 24-karat gold puck to the store for $7,966.27, and had previously sold 17 similar pucks to the store for a grand total of $138,172.46. The RCMP also seized four gold pucks — roughly the diametre of golf balls with a total value of $27,278.84 — from Lawrence's bank safety deposit box on March 11, 2015, the ruling detailed. CBC News (2016-11-09)

Nanaimo RCMP seize 44 firearms during amnesty month
Mounties in Nanaimo say residents turned over 44 guns to authorities during a province-wide amnesty month. Half of the guns turned over were handguns, while the others were rifles and shotguns, police said. Hundreds of rounds of ammunition were also seized by Mounties. CTV News (2016-11-09)

Police raid controversial pot dispensary in Whitewood, Sask.
The owner of a controversial marijuana dispensary in Whitewood, Sask. is facing a string of charges after police raided his business on Tuesday. Jerry Matthew Martin, 45, sparked debate in his community last year after contributing funds from his medical marijuana dispensary to local emergency services, a kids' camp and facilities including the town library. At about 10 a.m. on Tuesday morning, Broadview RCMP launched a raid on both the business, Martin Medical Services, and a residence. Whitewood is 175 kilometres east of Regina. CBC News (2016-11-09)

First Nations police service recommends its own disbanding at suicide inquest
The suicide of a First Nations woman in the back of a police truck is causing Canada's largest Indigenous police service to do some soul searching. The Nishnawbe Aski Police Service, which covers 34 First Nations in northern Ontario, told an inquest into Lena Anderson's death that it has neither the resources nor the legal foundation to do its job properly. So it took the drastic step on Wednesday of asking the jury at the inquest to recommend the police force be disbanded if Ontario does not bring it under the province's Police Services Act by March 31, 2017. "Enough is enough," said Nishnawbe Aski Police Service (NAPS) board chair Mike Metatawabin. "We can't do this all the time where you promise something and then turn around and say you can't do it." NATIONAL INQUIRY INTO MISSING AND MURDERED INDIGENOUS WOMEN AND GIRLS / ENQUETE NATIONALE SUR LES FEMMES ET LES FILLES AUTOCHTONES DISPARUES ET ASSASSINEES

Calls for justice, communication, and cultural display at Amnesty Forum
While it wasn't a full house, the audience was engaged at Amnesty International's public forum in Fort St. John on Friday, Nov. 4. The forum acted as a venue to discuss the findings of Amnesty's report Out of Sight, Out Of Mind: Gender, Indigenous Rights, and Energy Development in Northeast B.C., and had five panelists on stage as voices for various aspects of the report. (…) Calls for justice for missing and murdered indigenous people were also raised. Inspector Mike Kurvers, detachment commander for the Fort St. John RCMP, spoke about the role of police in the community, particularly in dealing with the shadow population of transient workers who come through the area to work in the oil patch. "We are aware of it, we understand it, but from a police perspective it hasn't impacted the detachment to date. We still get the same number of calls and … treat each call on its own merits," Kurvers said. Alaska Highway News

Raising awareness of missing and murdered indigenous women in Canada
Brad Firth (Caribou Legs) has worn through 15 pairs of running shoes in five months. That is because he is running across the country from Vancouver to Newfoundland to raise awareness about the missing and murdered indigenous women in Canada. This run recently brought him to Shelburne County. The number of unsolved cases is high and is a problem. Firth's own sister was murdered and his idea to run across the country began in her memory but quickly spread to include all murdered and missing indigenous women. He runs in full warrior makeup. He said the reactions he's had by people have been wide and varied. (…) He said the biggest thing he would like to see destroyed is indifference surrounding the plight of the missing and murdered women. "How can we understand that indifference... how do we make our home safe again?" he said. "The more we honour the circle of life the more the circle of life honours us." Coast Guard (Nova News Now)

FEDERAL & INTERNATIONAL OPERATIONS / OPÉRATIONS FÉDÉRALES ET INTERNATIONALES

Surveillance: Thomas Mulcair veut que Goodale et Wilson Raybould s'expliquent
Le chef néo-démocrate, Thomas Mulcair, demande aux ministres de la Sécurité publique, Ralph Goodale, et de la Justice, Jody Wilson-Raybould, de rendre des comptes devant le Comité permanent de la sécurité publique sur la surveillance des citoyens et des journalistes. De passage à Montréal, mercredi, M. Mulcair a exigé que les deux ministres s'expliquent sur la tentative du ministère de la Justice d'empêcher que ne soit rendue publique l'information voulant que le Service canadien de renseignement de sécurité (SCRS) ait illégalement recueilli et conservé des données personnelles de citoyens canadiens pendant une décennie. Cette activité a récemment été jugée illégale par le juge Simon Noël de la Cour fédérale. Lors d'un point de presse devant l'édifice du quotidien La Presse, dont les journalistes Joël-Denis Bellavance et Gilles Toupin ont été illégalement surveillés par la GRC en 2007, M. Mulcair a

également demandé au ministre Goodale de préciser devant le comité la nature des activités des services policiers fédéraux visant des journalistes. Thomas Mulcair a noté que Ralph Goodale, tout comme le premier ministre Justin Trudeau, ont affirmé qu'il n'y avait aucune surveillance de journalistes «actuellement» et que M. Goodale a précisé que les policiers ne font «pas exactement» la même chose à Ottawa que ce qui a été mis au jour au Québec. Presse canadienne (L'Actualité) (2016-11-09)

Court told of cop's data hunt

Repeated bids to access police data that was allegedly sold by a city cop were described in court Wednesday by another officer. Staff Sgt. Jasbir Kainth told court he zeroed in on five days between March 10 and July 5, 2010 in which Det. Gerard Brand allegedly dug up information on people sought by a lending company trying to track down deadbeat debtors. He was paid $2,300 by the lending firm, contends Edmonton-based Crown lawyer Leah Boyd. "Were there any entries queried by Mr. Brand on that date?" asked Boyd, referring to June 16, 2010. (...) Kainth said he also sought out Brand's access record to the RCMP computer database shared with city police. "I asked for an audit of Brand's CPIC queries," he said, referring to the system known as the Canadian Police Information Centre. Two computers were seized from Brand's home along with other records to be analyzed. He's also accused of providing information on four people obtained through his employment for a friend. Calgary Sun, A18 (Calgary Herald)

Surrey mayor wants three tiers for RCMP auxiliary policing program

Surrey Mayor Linda Hepner said the city favours the third of three options governing the future of the RCMP's Auxiliary Constable Program. This option, which Hepner said is also the favoured choice of the Union of B.C. Municipalities, presents a three-tiered system which she says "allows us the broadest range of services." "I think it's a better option for both the city and the volunteers," Hepner told the Now. "It may very well take them into a career of law enforcement." The three options the RCMP is considering include settling with the status quo, setting up a community corps programs, or adopting a three-tiered program that would incorporate both options one and two. In January Surrey's roughly 80 volunteer cops – the largest contingent of roughly 1,500 auxiliaries across Canada – learned from RCMP headquarters in Ottawa that they would no longer be able to ride with Mounties, receive firearms familiarization training, and that their uniforms will be changed to better distinguish them from regular officers. Now Newspaper

Are Sask. RCMP detachments operating without backup? Minister wants to know - Sask. should have 925 RCMP working, under terms of agreement

Saskatchewan's Minister of Justice says anonymous sources within the RCMP have told him that some detachments in the province are operating without the expected numbers of officers. Gordon Wyant said Wednesday he has heard similar complaints, about RCMP staffing levels, from rural residents and leaders. Wyant said Saskatchewan's policing agreement notes 925 officers should be providing service in the province, but he has been told about staff shortages in some detachments. The shortages relate, he said, to unfilled vacancies. "Vacancies [in detachments] where there are a number of officers deployed, yet a number were on parental leave, sick leave, training or retirement leave, those kinds of things which weren't being back-filled," he said. "Those are the kinds of things that we became worried about. So, we've initiated a discussion with **the [federal] Minister of Public Safety."** CBC News (2016-11-09)

Rural municipalities eager for new policing strategy after Boushie shooting

Three months to the day after the shooting death of a 22-year-old indigenous man inflamed tensions across Saskatchewan, the province's rural municipalities say they want to work with government and the RCMP on a new policing strategy. Those discussions are expected to begin next week, when Saskatchewan Association of Rural Municipalities (SARM) representatives meet with Justice Minister Gordon Wyant, SARM president Ray Orb told reporters Wednesday in Saskatoon. "We know there are issues out there, so we need to address that," Orb said, referring to concerns about rural policing raised following the Aug. 9 death of Colten Boushie in a Biggar-area farmyard. Star-Phoenix (2016-11-09)

LEGISLATION & POLICIES / LÉGISLATION ET POLITIQUES

Tuesday's vote saw more U.S. states legalize pot: Why Canada could benefit
There could be an upside for Canada now that several U.S. states have decided to legalize marijuana, according to one of the architects of Canada's pot policy. On Tuesday night while Americans were electing Donald J. Trump as their next president, several states also had ballot questions about whether to legalize pot for recreational use. California, Nevada and Massachusetts all said yes. All three states plan to have possession of small quantities of marijuana legalized by Jan. 1, 2017. That means by early next year, more than one in five Americans will live in a state where marijuana is legal for adult use. So what does it mean for Canada? Bill Blair, parliamentary secretary to the minister of justice and former Toronto police chief, told CBC News he sees a couple of benefits. "I think we will have an opportunity to learn from them and I think there's also some encouraging signs that they'll be more investment in research and more information about how this can be safely and healthfully regulated," said Blair. Canadian officials have already taken a look at how legalization has worked in Colorado and Washington state as the Trudeau government prepares to table its own legislation in spring of 2017. Oregon, Alaska and Washington, D.C., have also already legalized the drug. With 97 per cent of the vote in, Maine voters were separated by less than a percentage point, leaning towards legalization. California's move is significant because it's the most populous U.S. state, clocking in at around 39 million people. CBC News

Latest U.S. marijuana votes could bolster Canada's legalization effort: law prof
Canada's effort to craft a legalized marijuana regime could be boosted by the move of four more U.S. states to approve recreational use of the drug, says a Halifax law professor. As it designs a new system, the Liberal government must address the fact Canada is a signatory to three international conventions that require criminalization of the production and possession of cannabis. (...) Currently someone convicted of simple possession of up to 30 grams of marijuana is eligible to apply for a pardon, now known as a record suspension, five years after their sentence is completed. An internal Public Safety Canada briefing note, released under the Access to Information Act, says the issue of record suspensions will be "important to consider during the marijuana legalization discussions." The federal task force's report *"may include recommendations on past convictions,"* said Scott Bardsley, a spokesman for Public Safety Minister Ralph Goodale. Until new legislation comes into effect, current laws and rules remain in place, Bardsley added. Canadian Press (Times Colonist)

No sale for medical marijuana business in St. John's
The owner of Health Cannabis on Water Street in St. John's says he has been put on notice by the Royal Newfoundland Constabulary: sell marijuana and risk criminal charges. The warning comes despite the federal government's promise of new legislation to come in spring 2017 - expected to legalize the business of marijuana and possession for more than just medical use. "They called my landlord a couple of days ago," said David Ferkul, who spoke with The Telegram Wednesday afternoon. "Then he gave us a number. I phoned them back. They waited a couple of days and I finally got the call today." He said the caution was also delivered in writing. A business for patients: Ferkul said Health Cannabis is a "members only" spot, with membership being limited to medical marijuana licence holders. The location is only open on weekends and potentially some other, unusual hours. "The new federal law states that you have to receive your (prescription) marijuana through mail order from one of the 36 licenced producers," he said, referring to a list of producers licenced by Health Canada (the list is available on the regulator's website). Telegram, A5

B.C. pot grower seeing green as more states legalize marijuana
As California, Nevada, Maine and Massachusetts appear set to join the growing list of states that have legalized recreational pot, one of B.C.'s biggest medical marijuana producers is seeing big opportunities in the American market. After several successful ballot initiatives south of the border this week, B.C. will soon be the only West Coast jurisdiction between the Bering Sea and Tijuana where toking up is still restricted to medical use. But the people behind Tilray, the federally licensed cannabis production facility on Vancouver Island, aren't concerned about losing their edge to rivals south of the border when Canada eventually legalizes pot. "I think Canadian companies have a huge advantage based on the very tight regulatory framework that exists in the medical cannabis program in Canada," Tilray president Brendan

Kennedy said Wednesday. That tight framework may have squeezed out many entrepreneurs interested in jumping into the legal medical marijuana business, but the lack of competition has allowed licensed producers like Tilray to grow quite large. Vancouver Sun, A5

Pot dispensary owner charged with trafficking after two raids in Whitewood
A marijuana dispensary owner has been charged with a range of offences after Broadview RCMP conducted two raids in Whitewood, about 175 km east of Regina, on Tuesday. An RCMP brief said that marijuana and property, including cellphones, computers, cash and three vehicles, were all seized during raids on a business - not named by RCMP but known to be Martin Medical Services on the 600 block of 3rd Ave. in Whitewood - and a private residence. Jerry Matthew Martin, 45, is charged with offences relating to the "operation of an unlawful marijuana dispensary," RCMP said. These include the trafficking and possession of marijuana and cannabis resin, possession of the proceeds of crime, trafficking in the proceeds of crime and laundering the proceeds of crime. After an appearance at provincial court in Broadview on Wednesday, Martin was released to reappear on Nov. 23. Martin and his lawyer, the Vancouver-based medical marijuana advocate Kirk Tousaw, could not be reached for comment. Star Phoenix, A7 (Leader-Post)

Mountain High: Jasper, Lake Louise lead country in marijuana charges
There's no denying it, Jasper loves its pot. According to a recent RCMP report, for every 100,000 people that visited Jasper last year there were 3,024 incidents involving the possession of cannabis. That puts Jasper in the second top spot in Canada for the most marijuana busts per capita, following Lake Louise with 3,675 incidents last year. "I thought it was surprising that we reached second in Canada, but right now we're pretty committed to getting drugs off the street—whichever drugs they might be," said Cst. Patrick Vallee, the media liaison officer for the Jasper RCMP detachment. According to Vallee, during the past few years the number of search warrants obtained by the local RCMP has increased, which in turn has led to an increase in drug seizures. Jasper Fitzhugh (2016-11-09)

EDITORIALS & OPINIONS / ÉDITORIAUX ET LETTRES D'OPINIONS

Zero tolerance for job horrors
An opinion piece states, "'To all the women who have been impacted by the force's failure to have protected your experience at work, and on behalf of every leader, supervisor or manager, every commissioner: I stand humbly before you today and solemnly offer our sincere apology.'' Those words, uttered by RCMP Commissioner Bob Paulson on Oct. 6, put on the public record what far too many female Mounties already knew for decades to be true: They were victims of workplace sexual harassment and abuse, some to such a degree careers were cut short and personal lives were ruined. The apology and accompanying multi-million-dollar financial settlement was preceded by separate class action lawsuits filed by two former RCMP officers, representing hundreds of women. Linda Davidson said she was sexually harassed by a male supervisor, when she was a young officer. Her legal claim stated she continued to face such attitudes as she rose through the ranks to become an inspector. Janet Merlo said she had to deal with sexist attitudes while on the force, even to the point of a manager asking why she didn't "keep her f---legs closed" when he learned she was pregnant. Both reported having to put up with sexual innuendos, comments and pranks. But both also said they blamed a minority of former colleagues for fostering such a toxic work environment. As the national police force took its first steps toward closure, a similar issue would come to light in Calgary." Winnipeg Sun

Where There's Smoke There's Fired?
An opinion piece states, "The federal Liberal government's winning election campaign included marijuana legalization. Working towards delivering on its platform, it has created a task force to provide advice on the design of a framework to legalize, regulate and restrict access to marijuana. But a review of the backgrounds of those appointed to the task force panel reveals there is no representation from safety-sensitive industries or anyone with expertise in occupational health and safety. This is problematic for the oil and gas industry, and for all industries with safety-sensitive workplaces. Employers have significant legislative obligations to ensure the safety of their workers. The Alberta Occupational Health and Safety Act outlines the legal obligation to maintain a safe work environment and to ensure the safety of workers.

There are similar obligations in occupational safety legislation in all provinces. These obligations must be taken into consideration when developing the policy framework to legalize marijuana." Alberta Oil

'I don't know that we can help you': RCMP boss 'consumed' with 'inability' to investigate in digital world

The RCMP is lobbying the Prime Minister's Office for new powers to bypass digital roadblocks in cases where national security threats and other "high priority" suspects hide online and operate anonymously beyond the reach of police. "I can safely say that there's criminal activity going on every day that's facilitated by technology that we aren't acting on," RCMP Commissioner Bob Paulson told CBC News and the Toronto Star in an exclusive interview. The problem is a major focus for Paulson, and one that only gets more urgent as technology advances and suspects find new ways to cover their digital tracks. "Because of our inability - and the future inability - to protect Canadians, both from garden variety criminality and from the national security threat, I see that as really significant," Paulson said. "I'm consumed with trying to make sure that we're able to mitigate the threat." But privacy advocates and civil liberties groups remain unconvinced that effort requires expanded investigative powers for police. (...) On June 23, the RCMP sent Prime Minister Justin Trudeau's national security adviser a briefing note that says Canada lacks strategies and laws to address the technological limitations of police investigations. The RCMP argues the U.S., Australia, the U.K. and New Zealand - members of our Five Eyes intelligence alliance - do much more than Canada to help their police forces deal with high-tech obstacles like encryption, and interception and storage of digital information. CBC News

Mounties lobbying for more power

The RCMP is lobbying Prime Minister Justin Trudeau for more powers - including access to digital information without warrants - to investigate suspects who are hiding behind uncrackable encryption on their digital devices, a Toronto Star/CBC investigation has found. "I can safely say that there's criminal

activity going on every day that's facilitated by technology that we aren't acting on," RCMP Commissioner Bob Paulson told the Toronto Star and CBC in an exclusive interview. "We're losing our ability, if we haven't lost it entirely, to bring the traditional investigative response to technologically facilitated crime because of the misunderstanding, in my view, of the privacy threat." The RCMP has reached a point, Paulson said, that Canadians should "think about where you go with that complaint because I don't know that we can help you." "And that's a terrible thing for a person who's in charge of a police force to say when citizens, when companies, when corporate Canada, or indeed when the government comes to us and says, 'Hey, we've been victimized on the Internet.'" An RCMP briefing document sent June 23 to Trudeau's national security adviser compares Canadian law enforcement's digital investigative capabilities with four western countries - and Canada stands alone. Toronto Star, A10

Protéger les sources, à la source
Un article d'opinion dit, « Le gouvernement fédéral profite pour l'instant du fait que les projecteurs sont braqués sur les patrons politiques des deux corps policiers impliqués dans le scandale de la surveillance des journalistes au Québec pour se tenir sur les lignes de côté. Le resserrement de la procédure pour l'obtention de mandats visant des journalistes et la commission d'enquête finalement mise sur pied par le gouvernement Couillard, ainsi que l'examen des procédures à la police de la Montréal (SPVM) demandée par Denis Coderre ont une portée limitée. C'est le gouvernement Trudeau qui a en main les leviers pour apporter des correctifs en amont en se basant sur les principes mis de l'avant par la Cour suprême. Un regroupement de journalistes, dont le chroniqueur Patrick Lagacé, à l'origine des récentes révélations là-dessus, l'a compris et interpellera justement aujourd'hui le gouvernement fédéral afin qu'il joue pleinement son rôle. C'est que la réponse du gouvernement libéral nous laisse jusqu'à maintenant sur notre appétit. Bien sûr, M. Trudeau parle de faits « troublants » et de son « ouverture » à apporter des correctifs au besoin. Le ministre responsable de la GRC et du Service canadien du renseignement de sécurité (SCRS), **Ralph Goodale**, trouve ça « ***inquiétant*** » et il rassure en disant que ses services ne se sont pas livrés à de telles pratiques, ce que les patrons des agences ont réitéré. Il considère que le cas Lagacé relève des compétences québécoises, ce qui n'est qu'en partie exact. Oublié par **M. Goodale**, l'épisode de la surveillance de deux autres journalistes de La Presse par la GRC dans l'affaire Charkaoui nous laisse croire qu'aucun corps policier n'est à l'abri d'un dérapage. En plus des voeux pieux exprimés par messieurs Trudeau et **Goodale**, le gouvernement libéral mise sur la vaste consultation sur la sécurité publique qui doit prendre fin à la mi-décembre pour obtenir des pistes de solution. On nous dit au bureau du **ministre** que « ***tout est sur la table*** ». Il faut savoir que nulle part dans les deux documents qui amorçaient la consultation il n'est question spécifiquement des sources journalistiques. C'est par la bande que ces sources seraient éventuellement mieux protégées, soit quand il est question que « tous les mandats du SCRS respectent la Charte canadienne des droits et libertés ». Et encore, on ne vise pas la GRC ici et on parle des mandats obtenus dans le cadre d'opérations liées à la sécurité nationale, rien à voir avec ce qui nous occupe actuellement. » Le Devoir, A3

CONTRACT & ABORIGINAL POLICING / SERVICE DE POLICE CONTRACTUELS ET AUTOCHTONES

Several charged in Medicine Hat ALERT bust
Eight people have been arrested, and three have been charged following a lengthy drug trafficking investigation in **Medicine Hat and Tilley**. On Nov. 8, the Medicine Hat Police, Brooks RCMP and members of the Alberta Law Enforcement Response Team team seized a pair of firearms, ammunition, cocaine and methamphetamines. ALERT also searched a rural residence outside of Tilley and seized more meth and another handgun. As a result of both searches, ALERT seized: 44-calibre handgun; 22-calibre rifle; Various rounds of ammunition; 57 grams of methamphetamine; 14 grams of cocaine; 34 cartons of contraband cigarettes; $3,550 cash proceeds of crime. In total, 20 charges have been laid against three people, with charges pending against another five. Calgary Herald, A11

RCMP follow up on new lead as they hunt for 'armed and dangerous' man in northwest Alberta
Police in **northwestern Alberta** are renewing a plea for help from the public as they continue a three-week-old search for an elusive man they consider "armed and dangerous." Peace Regional RCMP say Malcolm Henry Testawits is wanted on multiple charges including assaulting a police officer and robbery.

On Tuesday, Mounties said officers were investigating a theft of gas outside Brownvale, Alta. At around 1 a.m., they received a tip Testawits "may be connected to the theft and may possibly be in a specific rural area in the Grimshaw/ Peace River area." According to police, when officers followed up on the tip, they were unable to locate the man. Global News (2016-11-15)

Almost half of all cigarette butts at UBC are contraband

B.C. remains a significant market for untaxed contraband cigarettes, a study by the Western Convenience Stores Association shows. The majority, which are manufactured on First Nations reserves in Eastern Canada, are finding their way to students at B.C. high schools and universities. Every year the association conducts a study of contraband or illegal cigarettes found in B.C., Alberta, Saskatchewan and Manitoba to judge how pervasive the industry is in Western Canada. In B.C. it examined butts discarded at 50 locations, including government offices, universities, colleges and schools. (…) However, Andrew Klukas, president of the Western Convenience Stores Association, said the high prevalence of contraband cigarettes found at universities and schools shows students opt for cheaper products and the purveyors are specifically targeting youth. Unlike in the 1990s when high federal tobacco rates spurred the illegal importation of cigarettes from the U.S., mostly through the Akwasasne, Kahnawake and Six Nations reserves in Ontario and Quebec, most of the unbranded tobacco is now manufactured on those reserves, Klukas said. (…) The RCMP and Ontario and Quebec's provincial police have conducted frequent raids alleging the industry is tied to gangs and money-laundering. Klukas said despite its flat growth, B.C. is tied with Manitoba with the highest rates of contraband tobacco use in Western Canada. Saskatchewan has the lowest rate, at 11.7 per cent. But Alberta has also seen a significant growth over the last year, from nine per cent to 12.3 per cent, largely because of the slumping economy there and the Alberta government's decision to add $10 to the price of a carton in 2015, he said. The association estimates B.C. misses out on about $100 million annually in tax revenue. The contraband market is also a vector for criminal gangs to distribute other illegal products, he said. "RCMP inform us that there are over 100 criminal gangs in the distribution of these products and once they are out there, once you have a distribution network, it is not limited to just tobacco. Tobacco is the easy way to start a distribution network because the penalties are relatively low." Vancouver Sun, A1

Fentanyl can be deadly, new campaign warns

Dr. Brendan Hanley, the territory's chief medical health officer, and his team have launched a "Fentanyl can be deadly" awareness campaign to promote knowyoursource.ca and prevent fentanyl-related overdoses. There have been two fentanyl-related deaths in the **Yukon**, Hanley said today. The website originated with an initiative led by the Vancouver Police Department. Fentanyl is a synthetic opiate narcotic, a prescription drug used primarily by cancer patients in severe pain. It is roughly 50 to 100 times more toxic than morphine. The new campaign is in conjunction with National Addiction Awareness Week (Nov. 13-19). "Drug-related overdoses and deaths have become a very serious concern in Yukon," Hanley said in a statement. The campaign includes participation by the RCMP, Kwanlin Dün First Nation, Council of Yukon First Nations, the Blood Ties Four Directions Centre, FASSY, Many Rivers, the Yukon Hospital Corp. and territorial alcohol and drug services branch. They are working to raise awareness and provide education on the danger of fentanyl, which is also commonly prescribed for patients suffering from chronic pain, and other high-potency opioid drugs. Whitehorse Star, 3

Window shutter shot at S. Rutland Elementary over weekend

RCMP recovered evidence at South Rutland Elementary School showing damage to a window screen was caused by a small caliber firearm. On Nov. 14, shortly after 8 a.m., the **Kelowna** RCMP received a mischief report after school official's observed damage to the rear of South Rutland Elementary School in the 200 block of Mallach Road. School officials said the damage occurred sometime over the past weekend, between end of the school day on Thursday Nov. 10 and before the start of the school day of Monday Nov. 14. The damage was contained to a metal rolling shutter, which covers a classroom window at the rear of the school. RCMP made a full examination of the scene, with the assistance of both Police Dog Services and the Integrated Forensic Identification Services and recovered evidence that the damage caused is consistent with a small caliber firearm. Lake Country (2016-11-15)

Crime rides wave of theft

Kelowna's crime rate is up this year, thanks in large part to preventable property crimes. That was one of the conclusions reached during the RCMP's quarterly report to city council Monday. Kelowna's well-documented crime rate jumped in 2015, and acting top cop, Insp. Brent Mundle, said calls for service jumped during the third quarter of this year. Calls for service increased nearly 8.9 per cent – more than 3,900 – over 2015. Mundle said the biggest concern centres around property crime. Castanet (2016-11-15)

Police investigating death of seven-year-old Nia Eastman in Choiceland

An Amber Alert issued on Thursday had a tragic result with the discovery of the body of seven-year-old Nia Eastman, just hours after the body of her father, Adam Jay Eastman, was found near Snowden. Nia's body was found in a home in **Choiceland** shortly after noon on November 10, just a block from WM Mason School where she attended Grade One. Nia was reported missing after her father failed to return her home to her mother on November 9. He had picked her up after school and was to have returned her by 7 pm. Eastman's body was found on a quarter-section of land along Highway 55 near Snowden, dead of self-inflicted injuries. Federal Minister of Public Safety Ralph Goodale issued a statement on Nia's death on Thursday afternoon. "It was with great sadness that I learned that Nia Eastman was found deceased by the RCMP today following an Amber Alert," said Goodale in the statement. "It is heartbreaking to lose a child, and nothing can ever make that right. I wish to extend my heartfelt condolences to Nia's mother and family, her community and all those who have been touched by this tragedy. We are all grieving together this most terrible loss." Melfort Journal (2016-11-15)

Nia Eastman, father died by murder, suicide: RCMP

Autopsies on seven-year-old Nia Eastman and her father have determined the causes of death were homicide and suicide. In a statement released Tuesday, the RCMP said the specific causes of death will not be released, but there is no evidence anyone else was involved. Adam Jay Eastman was found dead on Nov. 10, the same day RCMP issued an Amber Alert to find seven-year-old Nia Eastman. She was later found dead inside a residence in **Choiceland, Sask**. Police say no charges will be laid. More to come... CTV News (2016-11-15)

Government of Saskatchewan app for smartphones doesn't issue Amber Alerts

The **Saskatchewan** government's emergency notification app for smartphones does not notify the public when an Amber Alert is initiated. The app notifies the public for emergency situations such as boil water advisories, tornado warnings and freezing rain. But according to a government spokesperson, although the app is capable of issuing missing person information, the administration of the Amber Alert program falls under the RCMP's jurisdiction. The government says for Amber Alerts to be included in the app, the RCMP would have to give them permission. The RCMP was expected to issue a statement on the matter on Tuesday. Canadian Press (Star-Phoenix) (2016-11-15)

RCMP need another 48 hours to review new Don Dunphy evidence

RCMP say they need more time to conduct interviews about new evidence relating to the death of Don Dunphy. The Dunphy commission said in a statement on Tuesday afternoon that RCMP say they will need another 48 hours to complete interviews regarding the new information, which was announced last week. On Nov. 8, the release of police reports into Dunphy's death were delayed after the commission said it found "new information" about the incident. Police cited concerns over "tainting" this new evidence, and asked the commission to delay the public release of the five reports expected to be issued last week. CBC News (2016-11-15)

Canada-wide warrant issued for murder suspect

RCMP issued a Canada-wide warrant for a man wanted for a murder in **Maskwacis**, near Ponoka. Officers responded to reports of a fight in which two men were attacked with edged weapons in the early morning hours of November 11, 2016. One man suffered non-life threatening injuries while the other man later died in hospital in Ponoka. A Canada-wide warrant has been issued for 26-year-old Allan Joseph Soosay for the following criminal offences: - Second Degree Murder; - Assault with a Weapon; - Assault Causing Bodily Harm. CTV News (2016-11-15)

Rash of crimes has Hay River wondering if more youth activities are needed - Community's youth centre shut down 2 years ago
The **Hay River** youth centre was a place for kids, even those who came from unstable home situations, to be kids. "It was a support network, but it was also just an outlet for them to shoot pool, play video games, hang out, use the skateboard park," says Kevin Wallington, who used to run the centre... It is unclear given the lack of available data whether crime has risen overall in Hay River following the youth centre's demolition, although the RCMP says it has seen an increase in property crime over the past 10 days. The RCMP was asked to provide crime numbers to help establish whether the current crime rate is out of the ordinary. The police instead referred CBC News to the Town of Hay River. The town, in turn, recommended CBC News contact the RCMP. CBC News (2016-11-15)

Before practice, the real thing for Arrowsmith Search and Rescue
Last week, area search and rescue teams were looking forward to some training at **Little Qualicum Falls** on Sunday. Little did they know they would be needed for a real-life rescue on Saturday in the hills above Nanoose Bay. A Victoria man was tired, cold but not seriously hurt after being rescued at Bonnell Falls. Arrowsmith Search and Rescue's Ken Neden told The NEWS the man was hiking with a friend on a trail near the falls and proceeded down a muddy slippery section with the aid of a rope that was in place... Neden said the man's friend called the RCMP for help who then called Arrowsmith Search and Rescue to assist at 3 p.m. Saturday. Parksville Qualicum Beach News (2016-11-15)

Mental-health workers to join Mounties in cars
Mental-health workers soon will be riding shotgun in some **Kelowna** police cars. A new policing initiative aims to pair such workers with RCMP officers in a bid to better help street people avoid criminal entanglements, city council heard Monday. Full details of the program, similar to ones already operating in some B.C. cities, will be announced soon, Kelowna RCMP Acting Supt. Brent Mundel told council. Councillors praised the RCMP for trying to work with social service agencies to curb what appears to be a local crime rate that's once again on a worrying rise. "The collaboration you're working on is phenomenal," Coun. Ryan Donn told Mundel. Coun. Gail Given said Kelowna's street population seems to have "grown quite considerably" during the past year. Dealing with challenges that flow from an increasing homeless and drug-involved population is the "top priority" for city council, Mayor Colin Basran said. Daily Courier (2016-11-14)

NATIONAL INQUIRY INTO MISSING AND MURDERED INDIGENOUS WOMEN AND GIRLS / ENQUETE NATIONALE SUR LES FEMMES ET LES FILLES AUTOCHTONES DISPARUES ET ASSASSINEES

B.C. limits on federal probe vex advocates
The B.C. government has issued an orderin-council that some legal advocates fear places new restrictions on the national inquiry into missing and murdered indigenous women. Attorney General Suzanne Anton said the order-in-council confirms the province's support for the inquiry by giving commissioners the power to examine relevant matters within B.C. "It gives them the authority that a provincial commission of inquiry would have," she said. But West Coast Women's Legal Education and Action Fund and the B.C. Civil Liberties Association both expressed concern Tuesday that the B.C. order comes with conditions attached. "I'm happy that they've committed to participating," said Kasari Govender, executive director of West Coast LEAF. "I'm less happy about the additional restrictions they placed on the terms of reference." She said the federal terms of reference already made clear that the inquiry will not reopen specific cases. The B.C. government's additional terms go beyond that by indicating that the commission "may not inquire into any matter respecting the exercise of prosecutorial discretion," she said. Times Colonist, A4

Officer guilty in wrongful arrest of First Nations woman
An Edmonton police officer has been ordered to participate in a reconciliation process with the First Nations woman he wrongfully arrested and charged in 2014. Const. David Olsson entered a guilty plea Tuesday to one charge of neglect of duty at a disciplinary hearing. It followed an investigation into the April 17, 2014, arrest and charging of Arlene Sams. Sams said in an interview she was in a bad state

when Olsson arrested her. She was intoxicated and struggling to cope after a recent assault. She said she was also on medical leave from her job as a land surveyor with the Government of Alberta, after being the target of racist bullying. (…) Sams was supported at the hearing by an aunt, activist Lewis Cardinal and Muriel Stanley Venne, founder of the Institute for the Advancement of Aboriginal Women. Venne said she sees parallels in Sams' case and the overarching issue of missing and murdered indigenous women. She said the incident reflects law enforcement's "overall indifference to aboriginal women" and speaks to the need for change. Postmedia Network (Edmonton Journal, A1, Edmonton Sun)

'Caribou legs' brings message to Paqtnkek
Inside the Paqtnkek First Nation community centre gymnasium, Nov. 2, there were eight red dresses being held up on a small stage like banners. One of the people holding a dress was Brad Firth, of the Gwichin First Nation in Inuvik, who people may know better as 'Caribou Legs.' Firth is on the final stretch of a run, which began in Vancouver, which will soon end in Newfoundland. Another red dress was being worn by Maryanne Junta, 16, of Eskasoni First Nation. Before 'Caribou Legs' took the microphone, Maryanne spoke about The Red Dress Project, and its role in raising awareness for missing and murdered Indigenous women. "The red dresses are a reminder of the staggering number of women who are no longer with us," she said." (…) The number of missing and murdered Indigenous women in Canada varies, from report to report, with some putting the number at more than 1,100; others at more than 4,000. Robyn Bourgeois of St. F.X.'s Coady International Institute, who has made missing and murdered Indigenous women central to her research, explained the discrepancy in the numbers. "You're going to see variance everywhere on this topic. If you're only looking at official police reports, you will find that the RCMP didn't record race, before 1980, and we cannot accurately know if someone is indigenous or not, unless it is stated in the report," Bourgeois said. Chronicle Herald, L16

Families, searchers focus of Instagram project
Writer Katherena Vermette's poetry and film about indigenous-led Winnipeg activists in the core North End neighbourhood is engaging a growing Instagram audience in an experimental National Film Board project. Each day since the beginning of October, "What Brings Us Here" has featured portraits of indigenous-led safety patrollers on North End streets and Drag the Red volunteers searching the river for evidence about unsolved missing person cases. Each photo is accompanied by the voices of volunteers, many of them family members of missing and murdered women and men. Postmedia Network (StarPhoenix, A3, Leader-Post)

Liberté de la presse: Trudeau doit agir au lieu de parler, dit un journaliste de Vice
Oui, Ben Makuch a entendu le premier ministre du Canada Justin Trudeau réitérer l'importance de la liberté de la presse dans la foulée des révélations des dernières semaines sur la demi-douzaine de journalistes québécois surveillés par les corps policiers. Sauf que le journaliste de Vice se bat depuis février 2015 devant les tribunaux contre la GRC qui veut saisir son matériel journalistique sur un présumé terroriste. «On m'a envoyé une citation à comparaître sous [le gouvernement] Harper et je suis allé en cour sous Trudeau. Rien n'a changé. Je ne vois pas de différence [entre les deux gouvernements]», dit Ben Makuch en entrevue avec La Presse. «En campagne, [Justin Trudeau] a dit que le journalisme était important et devait être respecté, mais les corps policiers fédéraux m'ont, sous sa surveillance, amené en cour pour que je donne de l'information et du matériel journalistique, dit le journaliste de 28 ans. [...]. Il n'est pas intervenu, il n'a rien dit.» L'histoire commence en février 2015, alors que Vice reçoit la visite de la Gendarmerie royale du Canada. La GRC veut obtenir ses entrevues et son matériel journalistique concernant un présumé terroriste du groupe État islamique, Farah Mohamed Shirdon, ancien résidant de Calgary qui a fait l'objet de nombreux reportages de Vice en 2014 et qui fait maintenant face à un procès criminel par contumace. Vice conteste la saisie du matériel journalistique. La Presse

Aaron Driver's device a killer, cops say
The cab driver who unknowingly picked up a bomb-carrying terrorist in Strathroy for a trip to London says he's alarmed, but not completely surprised, by new reports the explosive device was deadlier than initially suspected. "I realized that (its danger) at the time. All I know it was one hell of a big bang," former

Strathroy cab driver Terry Duffield said. An RCMP bomb analysis shows that the blast from the device, on its way to downtown London and perhaps Toronto, would have caused a high risk of death to anyone within 1.5 metres of the explosion and varying risks of injury up to 7.8 metres away. Injuries could have included lung damage and ruptured ear drums. That assessment doesn't include the impact from bomb fragments or the 139 ball bearings reportedly embedded in the device. "If what they're saying is true, I wouldn't be here talking to you today (if the bomb fully detonated). They would have went right through the seat," Duffield said. The RCMP did not answer questions from The Free Press. London Free Press (2016-11-15)

Edmonton man killed for stealing from gang members, murder trial told
A member of the White Boy Posse street gang ordered the 2012 execution of an Edmonton man because he was stealing drugs from gang members, a prosecutor told a jury Tuesday. Joshua Petrin, 31, is charged with first-degree murder in the death of Bryan Gower, 35, whose body was found on a country road near Lloydminster in September 2012. Two other men have already pleaded guilty in the killing. In his opening address to the jury, Crown prosecutor Jeff Rudiak told the jury of seven women and five men that Gower's murder was directed by Petrin. (…) RCMP Const. Lee Popescul testified when he arrived at the scene, he found Gower on the ground beside a black truck and a large pool of blood around his head. The trial is scheduled to last two weeks. CBC News; Postmedia Network (Edmonton Sun, A7, Edmonton Journal)

Suspicious package prompts evacuation of Red Deer RCMP headquarters
Police are investigating after a suspicious package was brought into the Red Deer RCMP's downtown detachment Monday, prompting road closures and a late-night evacuation. A section of 51st Avenue between 46th Street and 47th Street was closed for several hours after a resident discovered the suspicious package and brought it into the downtown headquarters. The explosives device unit was called in, and all non-essential staff were evacuated from the building. Officers canvassed the neighbourhood to advise businesses of the ongoing investigation. Officers "neutralized the device" shortly after 10 p.m. but police say they have yet to determine whether or not it was explosive. No one was hurt in the incident. The incident prompted RCMP to issue a reminder to the public. They say suspicious packages should be reported to police immediately, and should never be moved or touched. CBC News (2016-11-15)

Constable Amit Goyal in fourth year of paid suspension, conduct hearing delayed again
It's another delay of a conduct hearing for a Mountie into his fourth year of paid suspension. The conduct hearing for Constable Amit Goyal, formally of the Osoyoos RCMP detachment, has been postponed again until December, thanks to new information that's come to light. Goyal is in his fourth year of paid suspension, and this is the sixth time his RCMP conduct hearing has been rescheduled… Goyal was once an RCMP whistle-blower in a case that saw several senior Mounties criticized by superiors. CKNW (2016-11-15)

Fight involving Mounties in Prince Rupert, B.C., sparks internal probe
RCMP in Prince Rupert, B.C., have launched an internal investigation after cellphone video surfaced online apparently revealing a confrontation between officers and two teenagers. Police in the north coast city confirm in a news release that they responded to reports of a fight in progress shortly before 1 a.m. on Nov. 12. An ambulance was called when officers found an injured 16-year-old boy but they also say the teen became combative and tried to fight the attendants and police. According to police, an 18-year-old female bystander joined the fight and was taken into custody. Sgt. Jagdev Uppal says video of the incident has been distributed on social media and investigators are now trying to locate the person with the video and also want to speak with any other witnesses. A public complaint about the police response was filed on Nov. 14 and the RCMP release says an internal probe has begun. CBC News (2016-11-15)

LEGISLATION & POLICIES / LÉGISLATION ET POLITIQUES

Marijuana and driving worries former Mountie
New Brunswickers and Canadians alike have every reason to be concerned that roads could become more dangerous with the legalization of marijuana, says a retired RCMP assistant commissioner. Roger Brown, who spent three years as this province's top cop, said he doesn't believe the system or technology is in place to be able to do roadside checks to find out when people are at a certain limit with regard to the drug. "An impairment is an impairment, whether it be drugs or alcohol," Brown said in an interview. "I just don't think, right now, that we're in a position to be able to actually determine that yet." Legislation to legalize marijuana is expected to be introduced by the federal government in the spring of 2017. Daily Gleaner, A2

UWindsor prof says Canada should 'permit, but discourage' all drugs
An opinion piece states, "Last week, several American states voted to legalize recreational marijuana and Canada is expected to issue guidelines to do the same. But University of Windsor law professor Bill Bogart says Canada is not going far enough to end the War on Drugs. In his latest book, Off The Street: Legalizing Drugs, Bogart says Canada should move to "permit, but discourage" all recreational drugs. He spoke with Windsor Morning host Tony Doucette. In your book, you argue the War on Drugs has been a failure for both the economy and society. Why? The central goal of the war [on drugs] has been suppression of drug consumption and we know that goal has not been achieved. Meanwhile, the war has imposed enormous collateral costs. We put people in jail simply for taking a substance. We allow a market to be run by thugs. They sell tainted substances that make people sick and even kill them. Governments are deprived of a revenue stream from an industry — and it is an industry — and children are terribly exploited in any number of ways." CBC News

Legalized pot industry could import U.S. talent
Americans wishing to flee a Donald Trump presidency could work in Canada's soon-to-be-legalized pot industry, say two immigration lawyers who dedicated a how-to podcast for our neighbours to the south. Canada is the first G7 country that has committed to legalizing marijuana, announcing at the United Nations earlier this year that it would introduce new legislation by the spring of 2017, even though doing so would breach three international treaties signed by previous Canadian governments. A federal task force led by Canada's former deputy prime minister Anne McLellan is expected to report back by the end of November with recommendations on how to move forward. Many startup companies will be seeking the expertise required to get their businesses off the ground as Canada inches closer to legalizing marijuana, immigration lawyers Betsy Kane and Mark Holthe said. According to Kane, who is with the firm Capelle Kane in Ottawa, Canadian companies could easily tap into U.S. talent in a variety of occupations found under NAFTA. Pharmacists, biologists, chemists, biochemists, horticulturalists, plant breeders and even soil scientists will soon find themselves in "huge demand," Kane said. "These type of professionals should be seeking out opportunities immediately and in the next year because I think there is a lot of demand and these people will get immediate work permits with a simple offer from many of these startup marijuana companies." Ottawa Citizen, A5 (Ottawa Sun)

Marijuana could help treat drug addiction, mental health
Using marijuana could help some alcoholics and people addicted to opioids kick their habits, a UBC study has found. "Research suggests that people may be using cannabis as an exit drug to reduce the use of substances that are potentially more harmful, such as opioid pain medication," says the study's lead investigator Zach Walsh, an associate professor of psychology at UBC's Okanagan campus. This comprehensive systematic review of research on the medical cannabis use and mental health also found some evidence that cannabis may help with symptoms of depression, PTSD and social anxiety. However, the review concluded that cannabis use might not be recommended for conditions such as bipolar disorder and psychosis. EurekAlert

Canopy Growth becomes Canada's first marijuana unicorn, worth $1 billion
Medical marijuana producer Canopy Growth Corp. has become the first Canadian company in the sector valued at more than $1 billion after strong quarterly results sent the stock on a tear. The company was trading hands at $11.16 per share when stock markets closed in Toronto on Monday. That values the

company at almost $1.3 billion. As recently as July, the company was worth less than a third of that. But that was before seven U.S. states voted last week to legalize some form of either recreational or medical marijuana. (…) During a conference call to discuss the company's quarterly results, CEO Bruce Linton emphasized the company's efforts to expand its production capacity to keep up with demand. CBC News (2016-11-15)

CAA wants to prepare the public for stoned drivers
The Canadian Automobile Association is lobbying for a government-funded public education program to warn of the dangers of cannabis-impaired driving before Canada legalizes recreational pot. Police will also need more funding to learn how to recognize and investigate drug-impaired drivers, says the CAA. The Liberal government has promised to introduce legislation legalizing recreational marijuana next spring and a committee report on the process is expected at the end this month. The CAA helped fund a study by the Ottawa-based Traffic Injury Research Foundation that suggests legalization will pose "incredible challenges" for managing pot-impaired drivers. The study is sure to inflame the escalating propaganda war over marijuana's harms and benefits, because it is premised on the assumption that access to legal cannabis will increase traffic accidents. The CAA commissioned a poll that found almost two thirds of respondents are worried roads will become more dangerous after legalization. CTV News (Civilized.life) (2016-11-15)

EDITORIALS & OPINIONS / ÉDITORIAUX ET LETTRES D'OPINIONS

Government accountability in short supply
An editorial state, "Earlier this year the provincial Liberal government backed away from creating a Municipal Auditor General (MAG). This was after the former NDP government had set aside some $300,000 for creating and staffing such a service. A MAG had the approval of the Union of Nova Scotia Municipalities as well as the Cape Breton Regional Municipality (CBRM). In Richmond Co., ongoing investigations by the RCMP, the provincial Ombudsman and a Grant Thornton forensic audit all confirm the need for provincial oversight of municipal spending and expensing practices. MAG received enthusiastic support across Nova Scotia from taxpayers and many municipal leaders, including CBRM Mayor Cecil Clarke. Supporters believe the public would be better informed about irregularities, waste and corruption in the financial operations of their municipal governments. In addition to the Richmond Co. case, there have been cases of theft, fraud and corruption within some of the province's 50 municipalities. And still, many will likely go undetected." Cape Breton Post, A8

Washington offers look at pot future
An opinion piece states, "The first guy through the pot shop door Wednesday morning figured he had good reason to buy a joint. "I woke up to Trump as president," he said. Which, according to Washington state law, is a perfectly valid reason for getting high. Unlike Victoria, where the patrons of our three dozen or so (cough cough) medical marijuana dispensaries are supposed to be suffering from some sort of ailment, recreational pot is legal across the strait. It has been since the summer of 2014.That offers a glimpse of what Canada, where a federally appointed task force is due to report this month ahead of legalization legislation expected in the spring, might look like soon. The biggest surprise? The age of the consumers. Marijuana use by teens might not have changed, but the same can't be said of grey-hairs willing to buy, now that it's legal. "A lot of people are in their mid-50s to 70s," says Kelsi Hutchins, behind the counter at Mr. Buds, one of the three marijuana retailers allocated to Port Angeles by the state licensing authority. Patrons include plenty of Vancouver Islanders. "We're the closest store to the ferries," Hutchins says. "Probably 15 to 20 per cent of customers are tourists. Canadians especially." Prince George Citizen

Spy agency kept court in the dark about data
Canada's electronic spies were asked to brief the Federal Court on their intelligence-gathering activities, the Star has learned. But the Communications Security Establishment (CSE) declined to meet with

federal judges earlier this year, saying an ongoing constitutional challenge prevented them from doing so. The request came from the same judge that found CSE's partner agency, the Canadian Security Intelligence Service (CSIS), illegally kept information on innocent people for almost a decade. In a strongly worded ruling released this month, Justice Simon Noël found CSIS kept the court in the dark about a program to retain and analyze data about innocent people between 2006 and 2016. The ruling gave an unprecedented look at CSIS's Operational Data Analysis Centre, which for years had been storing data about "non-threat" individuals. While the information was intercepted legally, the court ruled it was illegal for CSIS to keep and analyze it indefinitely. The ruling came out of a briefing on the program by Noël for judges who approve CSIS warrants. In documents obtained by the Star, CSE chief Greta Bossenmaier was told that Noël requested a general educational briefing from her agency around the same time. But because of a constitutional challenge launched by the B.C. Civil Liberties Association (BCCLA) against CSE's intelligence activities, currently before the court, the agency declined Noël's invitation. Toronto Star, A10

Digital encryption is here to stay, says report from U.S. lawmakers

As Canadian police push for more power in the online world, documents obtained by the Star suggest that privacy-protecting encryption software is here to stay. A memo prepared for Daniel Therrien, the federal privacy commissioner, stated it would be difficult for any one country to weaken or ban encryption technology. The document, obtained under access to information law, summarizes a report from the U.S. committee on homeland security. "Encryption tools very much are now ubiquitous, globally distributed and irrevocable, which plainly no piece of domestic regulation or lawmaking will undo, given that two-thirds of encryption products are produced and sold by non-U.S. firms," the memo reads. In other words, if the bad guys want to hide their tracks, they'll have plenty of options even if Canada or the U.S. attempts to weaken or ban encryption. The RCMP are making a very public push for more powers to obtain Canadians' private information from telecommunication companies and to decode encrypted messages. RCMP Commissioner Bob Paulson told a joint Star/CBC investigation it has reached the point where if a citizen is a victim of a crime online, he's not sure the Mounties can help. But the report from the U.S. homeland security committee, summarized for Therrien in the memo, states that weakening encryption would probably compromise public safety rather than improve it. North of the border, meanwhile, the federal Liberals are examining Canada's national security framework, including such issues as encryption and warrantless access to Canadians' private information. Public Safety Minister Ralph Goodale, who is leading that consultation, has remained neutral on the issue pending the results of the exercise. "We have invited everyone with a view to come forward with their perspective. "Obviously, the police perspective is being advanced with a good deal of vigour and enthusiasm from their perspective of law enforcement," Goodale told the Star last week. Toronto Star, A1

CONTRACT & ABORIGINAL POLICING / SERVICE DE POLICE CONTRACTUELS ET AUTOCHTONES

'We've always been seen as a threat,' says former N.W.T. premier of RCMP surveillance revelations

A recently revealed program of police surveillance across Canada is "alarming" and a "threat to our own security," says former **N.W.T.** premier Stephen Kakfwi. He's "not surprised," however, to hear that more than 300 protesters, 89 of whom are Indigenous, were being watched by RCMP as part of surveillance program called Project SITKA, launched in 2014...Police Response. "When the RCMP is in receipt of information that indicates an individual or individuals are involved in a crime or may pose a threat to the safety and security of others, we are duty-bound to investigate. The RCMP did not specifically target Indigenous protestors," writes Cpl. Annie Delisle, Media Relations Officer for the RCMP. CBC News (2016-11-20)

Mi'kmaq woman concerned about Project SITKA

A Mi'Kmaq woman from **Elsipogtog** is concerned that her name is on a "watch list" compiled by RCMP intelligence services in the wake of a year-long investigation of dozens of Indigenous protesters, called Project SITKA. Amy Sock, a former defence attorney, mother, and an active member of Idle No More worries her time on the front lines of anti-shale gas protests in 2013 may have landed her on the list, although the RCMP refuses to say whether she is or not. CBC News (2016-11-20)

Man wanted by RCMP arrested on Muskowekwan First Nation

A man who was wanted by the RCMP on several outstanding warrants has been arrested. Darryl Raymond Longman was located by **Punnichy** RCMP at a residence on Muskowekwan First Nation on Sunday.He was taken into custody at 3 p.m, according to a press release. On Nov. 19, the RCMP had issued a release asking for information on Longman's whereabouts. The RCMP said Longman was known to frequent Regina, Muskowekwan First Nation and George Gordon First Nation. On Oct. 3, 2015 Longman was arrested and charged with dangerous operation of a vehicle, driving while being chased by police, driving drunk, refusing to provide a breath sample, driving without a drivers license and stealing a vehicle. Longman also had additional outstanding warrants for his arrest in connection with an incident which happened on June 6. He was charged with assault, assault with a weapon, uttering threats and failure to comply. Leader-Post; CTV News (2016-11-20)

Surrey RCMP searching for missing 15-year-old girl

Surrey RCMP are asking for the public's assistance in locating a missing 15-year-old girl. Police say Trinity McKenzie was last seen on Friday, Nov. 7 at home in Surrey. Family and police are now concerned for her health and well-being. Global News (2016-11-20)

Red Deer's top cop talks about tackling drugs, organized crime

It's no secret that drugs and organized crime are driving much of the crime activity in Red Deer. In part two of our feature story, new **Red Deer** RCMP Superintendent Ken Foster says he is condifent these troublesome issues can be dealt with effectively. Red Deer News Now (2016-11-19)

RCMP investigate daylight shooting in Burnaby

There is a heavy police presence in a south **Burnaby** neighbourhood following reports of a shooting. Nearby residents reported hearing shots fired around 11:30 a.m. One victim has been taken to Royal Columbian Hospital, and RCMP say a possible second victim may have also been treated in hospital. The incident occurred in the 7100 block of 14th Avenue, situated several blocks from the Edmonds SkyTrain tation and one block from an elementary school. Global News; CKNW (2016-11-19)

Punnichy, Sask. RCMP on lookout for 2 wanted men

Saskatchewan RCMP is asking the public for help locating two separate wanted men. Darryl Raymond Longman, 48, has outstanding warrants for his arrest. On Oct. 3, 2015, he was charged with Criminal Code offences such as operation of a motor vehicle while being pursued by a peace officer operating a

motor vehicle, impaired operation of a motor vehicle and taking a motor vehicle without consent. Global News; CTV News; CBC News; Leader-Post (2016-11-19)

RCMP request that Albertans please report their moldering dynamite
There may be something explosive lurking amongst the rolls of baler twine and tractor parts in that old barn down on the farm. According to **Alberta** RCMP, there is a large but unquantified amount of degraded and deteriorated dynamite on properties across the province as a result of historic rules that permitted farmers and ranchers easy access to explosives. Edmonton Journal; Agence QMI (TVA Nouvelle) (2016-11-19)

Four face drug charges following police search in Harbour Landing
Four adults are facing cocaine trafficking charges after police executed a Controlled Drugs and Substances Act search warrant in **Regina**'s Harbour Landing neighbourhood Wednesday. Regina's Combined Forces Special Enforcement Unit (CFSEU), with the assistance of the RCMP Integrated Organized Crime Unit, seized cocaine, cash and a loaded hand gun. Danieol Johnson, Kendall Robinson, Ali Mahdi and Mohammed Osman are all charged with possession of cocaine for the purpose of trafficking and proceeds of crime over $5,000. Leader-Post, A4 (2016-11-19)

Break-in at Manitoba Hydro compound
Steinbach RCMP are currently investigating a recent report of a break, enter and theft to the Manitoba Hydro compound located in the City of Steinbach, Manitoba. My Steinbach (2016-11-19)

Codiac RCMP locate both missing persons in Moncton
Police say both the 17-year-old boy and 23-year-old woman reported missing Nov. 17 in separate incidents in **Moncton** have been located. The boy had left the Moncton City Hospital of his own accord that day. The woman was located Saturday afternoon. Codiac RCMP thanked the public for their assistance. CBC News (2016-11-19)

Leduc RCMP appeal to public for help finding woman missing since Nov. 3
Leduc RCMP issued a plea to the public for information on a missing woman Saturday. Mounties said Deanna Millington left her family home in Leduc, Alta. on Nov. 3 and has not been seen since. Police said they are concerned for the woman's well being. Global News; CTV News (2016-11-19)

RCMP warn of email fraud
The RCMP has issued a warning about a recent email scam targeting businesses that perform wire transfers. That scam often involves businesses whose executives' email accounts are compromised or imitated. The fraudster then sends emails to an unsuspecting employee telling them to wire large sums of money to foreign accounts. Charlottetown Guardian, A3 (2016-11-19)

Inquiry into Don Dunphy death delayed by anonymous letter
Police are asking for the public's help in finding the author of an anonymous letter about the shooting death of Donald Dunphy. A press release from the RCMP says they found out about the letter on the evening of Nov. 7 from the inquiry into Dunphy's death and began investigating its contents and source the next morning. "The RCMP was informed by the commission of inquiry respecting the death of Donald Dunphy the new information in the form of an anonymous letter had come forward regarding the death of Mr. Dunphy. The following morning the RCMP obtained the letter and began an investigation into its origins and content," said RCMP Superintendent Pat Cahill at a news conference Friday. CBC News; VOCM News (2016-11-18)

RCMP testify in Burnaby school bookkeeper's trial
Police decided to focus on investigating questionable cheques instead of missing cash at Alpha Secondary between 2008 and 2010 because cash is harder to track, according to the RCMP's chief investigator in the case. Const. Anna Taylor testified Wednesday at the trial of former Alpha Secondary bookkeeper Jodi Fingarsen, who is accused of defrauding her **Burnaby** school of about $67,000 using cheques either fraudulently generated, signed or deposited. During her investigation, Taylor interviewed school staff who also complained of missing cash collected for things like school trips, dry grad

celebrations and Advanced Placement exams. "They did bring up the cash as well," said Taylor, "but from the police perspective, tracing physical cash is more difficult." Defence lawyer John Banks, however, suggested Taylor didn't investigate the missing cash because Alpha's system for collecting and accounting for cash was flawed. Burnaby Now (2016-11-18)

Swift Current RCMP looking for two missing teens
Swift Current Municipal RCMP are looking for two missing teenagers who haven't returned home or attended school this past week. Fourteen-year-old Amber Padley was reported missing to RCMP on Wednesday, Nov. 9. She's described as Caucasian, five feet six inches tall and 120 pounds with brown hair and blue eyes. Fifteen-year-old Austin Doerksen was reported missing to RCMP on Friday, Nov. 11. He's described as Caucasion, six feet two inches tall and 180 pounds with blonde hair and hazel eyes. CJME News (2016-11-18)

Missing girl found
Nakayo Poucette has been located and is safe. **Cochrane** RCMP were requesting assistance from the public to find a missing 16-year-old from Morley. Nakayo Faith Poucette, 16, from Stoney Nakoda First Nation was last in Morley on Nov. 7 when she attended a birthday party at her grandmother's residence on the reservation. Poucette was seen leaving the party with another young male under non-suspicious circumstances, according to the RCMP. Poucette is believed to be out in Morley and the RCMP do not think she is in any danger, according to Sgt. Darleen White with the Cochrane RCMP. Cochrane Eagle (2016-11-18)

RCMP charge teen in fake terrorist threat in Yellowknife but give no details
RCMP have arrested and charged a teen in **Yellowknife** in a fake terrorist threat. Mounties say the criminal charge resulted from an investigation by Alberta RCMP K Division that began on Nov. 1. Northwest Territories RCMP spokeswoman Marie York-Condon says no details about the hoax can be released, but may come out in court. She says the youth has been released on conditions and will appear at a later date in youth court in Yellowknife. York-Condon also says the next court date may not be released "considering the size of the community that the court is in and the amount of youth that may be appearing in court." She says there was no public safety risk when the alleged threat came to light. Canadian Press (CTV News) (2016-11-18)

IIU Investigates Arrest Involving RCMP Dog
Manitoba's police watchdog is investigating after a robbery suspect was brought down by an RCMP dog in Portage la Prairie on Wednesday. Mounties were called to an armed robbery in the city west of Winnipeg and arrested three people, however one man got away. Officers let the dog loose to chase after the man. The Independent Investigation Unit (IIU) did not go into details, but the suspect received an injury to his leg once the dog caught up to him. 680 CJOB (2016-11-18)

NATIONAL INQUIRY INTO MISSING AND MURDERED INDIGENOUS WOMEN AND GIRLS / ENQUETE NATIONALE SUR LES FEMMES ET LES FILLES AUTOCHTONES DISPARUES ET ASSASSINEES

'That was just my destiny'
Sharon Acoose remembers being groped as a child by an uncle who paid her in pocket change for her trouble - the earliest roots of a life scarred by sex work, drug use and jail time. "He would give me a quarter ... or a nickel or a dime, whatever he had," Acoose, 63, recalled during an interview with The Canadian Press. "You wouldn't believe all the candies that I bought." Despite the longest of odds, she managed to turn her life around, eventually becoming a professor of social work. Countless others who followed a similar trajectory are no longer alive to tell the tale. To this day, that same cycle is repeating itself with alarming frequency in indigenous communities across Canada, a CP investigation has found. And with its insidious links to suicide, violence and mental health problems, the issue of child sexual abuse is poised to be a key theme in next year's long-anticipated national inquiry into the tragic phenomenon of murdered and missing indigenous women. (...) Indeed, experiences of sexual and physical abuse among indigenous women and girls are so pervasive they are expected to overwhelm

next year's national inquiry, where commissioners will examine and report on the systemic causes of the violence. (...) In May 2014, the RCMP documented 1,181 murdered and missing women between 1980 and 2012. A year later, it said 32 additional aboriginal women had been murdered and 11 more had disappeared since it first reported on the issue. The force also cited an "unmistakable connection" between homicide and family violence. Aboriginal women are vulnerable precisely because they're aboriginal and women, said Dr. Yvonne Boyer, a Canada Research Chair at Manitoba's Brandon University. Boyer co-authored a report on trafficking of aboriginal women for the Public Safety Department in May 2014 that noted many of its participants suffered sexual abuse as a child, contributing to a pattern of exploitation that carried on into their adult years. Canadian Press (The Guardian, A8, Waterloo Record, Times & Transcript, Chronicle Herald, National Post, City News, Battlefords News-Optimist, Hamilton News, Weyburn This Week) (2016-11-21); (2016-11-21); Canadian Press (Ottawa Citizen; iPolitics; Mississauga.com; Waterloo Chronicle); Presse Canadienne (La Presse, Le Devoir) (2016-11-20)

UN urges Canada to work on barriers that still face women
A new report from the United Nations is calling on Canada to get to work on a number of barriers still facing women when it comes to gender equality and urging the government to take more concerted steps to stop violence against indigenous women and girls. The review - typically conducted every four or five years - by the Geneva-based Committee on the Elimination of Discrimination against Women covered a range of issues, from the gender pay gap to poverty and violence against women, as well as the use of solitary confinement in prisons. Prime Minister Justin Trudeau, who often calls himself a feminist, has said improving relationships with indigenous communities and working toward gender equality are key priorities for his government. And the report did note some progress, namely the equal representation in the federal cabinet. But the committee cited a range of concerns, among them the "continued high prevalence" of gender-based violence, particularly against indigenous women and girls. It also highlighted the "very low" number of cases of violence against women reported to police by victims, and low rates of prosecution and conviction against perpetrators. The report, posted on its website Friday, came as prosecutors in Quebec said no charges would be laid against police officers in Val-d'Or, after 21 indigenous women and seven men filed complaints against police that included sexual assault and excessive use of force. "It's difficult enough when you're dealing with violence in your personal life," said Francyne Joe, the interim president of the Native Women's Association of Canada. "If you can't go to police expecting to be protected, that's going to lead to such despair and depression and anger ... and disrupt any growing positive relationship with the policing system." Globe and Mail, A12

Caribou Legs reaches St. John's
Brad Firth - better known as Caribou Legs - was part-way through a run spanning five provinces last year, on a mission to protect lakes and rivers, when he got a call that would change his life. got some bad news from back home. That phone call was actually about my sister's death. So I was hit with this really sad story, and it took me a couple of hours to regain my strength, my balance, and continue running, because I didn't want to run any more," Firth said. After finding out his sister had been killed, he just wanted to go home and grieve - "not the right way, but I wanted to grieve angrily, because - just the way my sister died." (...) Caribou Legs, with the support of groups such as Sisters in Spirit, Warriors Against Violence and Culture Saves Lives, decided to set out on the road again. This time it would be to honour women, shine a spotlight on the country's missing and murdered indigenous women and girls, and prevent violence against women. The Telegram, A5; VOCM

Apology for anti-homosexual persecution should include compensation, government told
Ottawa's apology to Mounties, soldiers and other public servants whose careers were destroyed by anti-homosexual witch hunts will have to be accompanied by compensation, experts say. Prime Minister Justin Trudeau appointed Edmonton Centre MP Randy Boissonnault as a 'special advisor for LGBTQ issues' earlier this week with the goal of arranging an official apology to the thousands of gay and lesbians who were persecuted in the latter half of the 20th century. "We do not have a timeline to announce at this stage," Cameron Ahmad, press secretary to the Prime Minister's Office, said in an email

to iPolitics. The apology will have to include some form of compensation, said Matt James, an associate professor at the University of Victoria who specializes in political apologies and the Canadian Constitutionalism. James said he would not be surprised if representatives from the agencies involved in the persecution - the RCMP and Canadian Armed Forces - had a chance to vet the apology. "I'd be very interested to see, for example, if the apology attempts to make any kind of excuse in terms of national security or that these were things that other security agencies were doing at the time," he said. "I would expect [it's something] the RCMP or military representatives would want to see in there and something I expect the representatives in the LGBTQ community would not want ... So there will be some interesting choices the government will have to make around that." The government announced in April it would apologize and offer redress to LGBTQ employees of the federal public service and the Canadian Armed Forces persecuted by the RCMP. Many were charged with gross indecency before homosexuality was decriminalized in 1969. After decriminalization, federal government workers suspected of being gay or lesbian were often denied promotions or security clearances that would advance their careers. Military members could be dishonourably discharged from the service until 1992. Upwards of 9,000 people were affected. iPolitics

Un camp islamique financé par la Ville de Montréal

Montréal a versé 10 850 $ à une association islamiste pour prendre en charge 30 enfants réfugiés syriens même si elle est soupçonnée par la GRC d'avoir financé des groupes terroristes. Des jeunes syriens âgés de 5 à 14 ans, dont certains ne parlaient pas français ont été accueillis cet été au camp Sindbad organisé par le Centre communautaire Laurentien, une section de l'Association musulmane du Canada (MAC). Le MAC est l'antenne la plus officielle des Frères musulmans, rappellent deux experts. En janvier 2015, Le Journal révélait, d'après des documents de cour produits par la GRC, que MAC avait versé près de 300 000 $ à l'International Relief Fund for the Afflicted and Needy-Canada (IRFAN). En 2011, Revenu Canada a révoqué le statut d'oeuvre de bienfaisance de cet organisme, puis le fédéral l'a déclaré organisation terroriste en 2014. Il reproche à l'IRFAN d'avoir envoyé 14,6 M$ au Hamas entre 2005 et 2009. Le Hamas, un autre groupe terroriste selon Ottawa, vise la libération de la Palestine de l'occupation israélienne et l'instauration d'un gouvernement islamique. Malgré son interdiction, la GRC dit avoir aperçu en mars 2014 un collecteur de fonds de l'IRFAN dans les bureaux de MAC à Montréal. Le Journal de Québec, 25 (Le Journal de Montréal)

Legal changes in the works on opioid crisis

The federal government is eyeing a number of legislative changes to address Canada's opioid crisis, Health Minister Jane Philpott said Saturday at the conclusion of a summit examining the issue. The federal government is actively trying to turn the tide of the crisis, Philpott added, noting it will require a whole-of-government approach. "This is a topic I have been working with alongside the minister for public safety, the minister of justice and the minister of foreign affairs," she said. "In the coming months, there are a number of pieces of legislation that are going to address matters related to the opioid crisis and certainly we will do the work necessary." Addiction, overdose and deaths related to opioid use were the focus of discussions for health experts and ministers who gathered in Ottawa for a two-day summit to look at a national approach. On Saturday, B.C. Health Minister Terry Lake urged the federal government to waste no time in taking additional action to address Canada's opioid crisis, including setting up a nationally coordinated surveillance system to track overdoses and other drug-related harm. The province also wants the federal government to look at tools to stop the flow of fentanyl from China by stepping up diplomatic negotiations. "They need to properly equip the Canadian Border Services Agency and the RCMP with the tools and resources needed for border control and to get fentanyl off the streets," Lake said in a Saturday statement. British Columbia says 622 overdose deaths have happened in that province since January - more than double the number of people who died in car crashes last year. Waterloo Region Record, A3 (CTV News) (2016-11-21); Postmedia Network (Toronto Sun, A11; The Province, Vancouver Sun); Canadian Press (The Province, Vancouver Sun, Toronto Star, Times Colonist) (2016-11-20); Canadian Press(Maclean's; iPolitics; Global News; CTV News; Chronicle Herald); CBC News; Presse Canadienne (La Presse) (2016-11-19)

'This is all a work in progress'

The first time Donovan Locke had to perform an intervention with an aspiring extremist, the 14-yearold in question had been caught spouting white supremacist views at a Toronto high school. The parents were

notified, along with the Toronto Police Service, where Locke is an acting staff sergeant and a coordinator of a new project attempting to address radicalization in Canada's largest city... After police shot Islamic State of Iraq and the Levant supporter Aaron Driver as he was leaving his home in Strathroy, Ont., to conduct a suicide bombing Aug. 10, Public Safety Minister Ralph Goodale said there was *"little national coherence"* to counter-radicalization efforts in Canada and re-committed the government to opening an office to co-ordinate them nationally. Toronto has been quietly experimenting with its own approach, the National Post has learned. Launched as a pilot project by the Toronto police and the city, it has been kept under wraps until now. But in interviews with the Post, key officials spoke for the first time about what they were doing. "One of the things we chose to do here was not to engage the media," said James Ramer, Toronto's deputy police chief. But, "We're at the point now that we do want to advertise it." National Post, A6 (2016-11-19)

Taxpayers would have to foot bill for new high-tech police powers, wireless industry says
Canada's top telecommunications industry group says any government move to force its members to install equipment to intercept digital traffic and store data to aid police investigations would have to be covered by taxpayers. "We have always submitted that there should be a mechanism for the government to cover the costs or possibly law enforcement," said Kurt Eby, director of regulatory affairs and government relations for the Canadian Wireless Telecommunications Association. "Every time the government looks to add a layer such as this, there is going to be cost incurred." The federal government is holding public consultations on Canada's Anti-Terrorism Act, which includes proposals for new investigative powers for police to gather digital evidence... RCMP Commissioner Bob Paulson says nearly 70 per cent of telecommunications companies can't comply with interception orders from the courts. CBC News (2016-11-19)

ComicCon could help you become a spy
Do you enjoy going to ComicCon ? What about giveaway sunglasses or free popcorn ? More importantly: Can you keep a secret ? Then a job as a digital spy might just be for you. Or, at least, that ' s what the Communications Security Establishment (CSE) has in mind as it seeks the best and brightesttechies. An old-fashioned popcorn machine and free pairs of CSE-branded shades were part of the display at a government job fair Thursday at Ottawa ' s Shaw Centre. At the event, where the hashtag # secureyourfuture was prominently displayed, other agencies - including Public Safety Canada, the Canadian Security Intelligence Service (CSIS), the Canadian Forces, the Correctional Service of Canada and the Canada Border Security Agency - competed to woo curious job-hunters, more than one of whom was spotted eating a banana. Though the Royal Canadian Mounted Police displayed Batman-like combat gear on a mannequin, it was, subjectively, hard to compete with CSE ' s popcorn and shades. A CSE rep explained the agency had tried recruiting at a ComicCon event for the first time in Montreal this summer - you know, because a lot of, uh, tech-savvy people attend ComicCon. Postmedia Network (London Free Press, N4; Calgary Herald, National Post, * National Post) (2016-11-19)

Your cellphone password could hold the key in legal battle over collecting evidence
Here's the scenario: Police believe there is evidence on your cellphone or computer that could assist them in a criminal investigation. They ask that you provide your password or encryption key so they can search for clues. Currently, there is no law compelling you to comply with that request. But police in Canada, frustrated by evidence trails that lead to digital dead ends, are calling for a law that would make it a criminal offence to say no to a police officer carrying a judicial warrant. It's an idea designed to accomplish through a legal order what police are increasingly unable to accomplish technologically — getting inside digital devices containing what they believe is crucial evidence in criminal investigations. "It's a very radical proposal in Canadian law," said Micheal Vonn, executive director of the B.C. Civil Liberties Association. "It changes the basic nature of how we go about achieving the ends of criminal investigation, by compelling the person who is under investigation to participate in the investigation." Many privacy advocates — and even some in law enforcement — call the idea an abuse of both privacy protections and the rights of Canadians against self-incrimination. Police supporters counter that public safety — and the ability of police to respond to serious crimes — is already being dramatically eroded by disappearing evidence. Liberal Public Safety Minister Ralph Goodale: "(Police) are certainly concerned about the effect of new technology in an age accelerating digitization. They're concerned whether or not their legal tools are sufficient to cope with what they now have to deal with . . . .

Others in the academic community, in the open media community, have put forward the contrary opinion. And that's what this consultation is intended to solicit, and we will have to weigh all of that carefully to make sure that in our response, we produce a position that is consistent with Canadian's expectations." Toronto Star/CBC News (2016-11-18)

The McAdam file: Bribery, Chinese gangsters and betrayal
Brian McAdam was a seasoned Canadian diplomat when he was posted to Hong Kong in 1989. He became the high commission's immigration control officer two years later, and soon uncovered what he believed was a major scandal. Members of Chinese criminal gangs, known as Triads, were applying to enter Canada as entrepreneurs under the country's business immigration program. And many were getting visas. "What was very, very disturbing to me was I kept seeing all these connections of these people to certain people — politicians — in Canada, and the odd name in our embassy," McAdam says. He started writing reports — there were ultimately 32 — documenting the names of the gangsters who were getting into the country and related concerns. The reports caused panic in the immigration minister's office and at headquarters in Ottawa, McAdam alleges. "I was exposing incredible negligence. I was exposing incredible corruption. And I was exposing the flaws in our whole immigration system. "People in Ottawa didn't want to investigate anything. They just shut their eyes to everything." Most of his reports were destroyed, he says. McAdam returned to Ottawa in 1993, lured by the promise of a job in a new organized crime unit at Foreign Affairs. But when he showed up for work, the job didn't exist. He alleges the personnel manager urged him to take a retirement package, though he was just 51. Days later, he went on sick leave and never returned to work. In 1996, RCMP Cpl. Robert Read began investigating McAdam's allegations that employees at the Hong Kong mission had received bribes and that Triad criminal gangs had infiltrated an immigration computer system. After finding gaping holes in earlier RCMP investigations, Read urged his superiors to authorize a thorough investigation, but was taken off the case. Concerned that his bosses were suppressing his findings, Read went to the media with his concerns in 1999, which led to his dismissal from the RCMP in 2002. McAdam's allegations also sparked a joint RCMP-CSIS investigation known as Project Sidewinder, which probed the threat posed by the purchase of Canadian companies by Triad members or associates with links to the Chinese Intelligence Service. Ottawa Citizen (2016-11-18)

Why Spy on Reporters When You Can Spy on CEOs?
An opinion piece states, "Canadians have been shocked to learn that police in this country have for the second time this year admitted to spying on reporters. What makes the recent disclosures most ironic is not that police officers were the ultimate targets, or that spying was approved in the absence of an actual judge—but that much of the meta-data sought by Montreal police may have already existed on a government server, and could have been obtained without a warrant, thanks to the enactment of the Anti-Terrorism Act (known as "Bill C-51"). In fact, in his latest annual report to Parliament, Canada's Privacy Commissioner identified 58 such instances where Canadians' information was collected and shared without prior judicial approval in the first six months of this year alone. Whether it's the Communications Security Establishment (CSE) illegally collecting and sharing Canadians' metadata with foreign intelligence partners, the RCMP, Vancouver, and Toronto Police departments each individually mopping up entire city blocks full of cell phone information with Stingray surveillance devices, or the Canadian Security Intelligence Service (CSIS) building a secret database and intentionally concealing its existence from Federal Court Judges, Bill C-51 has emboldened all manner of police and security services to push the envelope and end-run Canada's Privacy Act." VICE News (2016-11-18)

Money-laundering watchdog cites 'significant' deficiencies at 100-plus B.C. real estate firms
Canada's anti-money laundering watchdog found "significant" or "very significant" levels of non-compliance at more than half of the B.C. real estate companies it examined over a four-and-a-half year period, its records show. The Financial Transactions and Reports Analysis Centre of Canada (FINTRAC), the federal agency mandated to detect and combat money laundering, examined about 220 real estate companies in B.C. between 2012 and mid-2016, finding 112 companies with "significant" levels of non-compliance and five with "very significant" non-compliance, according to records obtained by Postmedia News through an access to information request. In the past year, FINTRAC has ramped up scrutiny of real estate - particularly in B.C. In an operational brief this week intended for banks and real estate professionals, the agency highlighted the Canadian housing market's vulnerability to money laundering.

The 12-page FINTRAC brief also notes the "minimal" filing of suspicious transaction reports in Canadian real estate, with 127 reports filed on five million sales over 10 years. Vancouver Sun (2016-11-18)

Changing perceptions: How this Winnipeg artist's dramatic billboards aid police training
In early 2015, KC Adams' black and white portraits of indigenous people hung around the city on billboards, bus shacks and bulletin boards, demanding our attention. The twinned photos featured people scowling and hurt as Adams hurled racial insults at them, then smiling and radiant as she reminded them of happier times. The models self-selected their own labels on their second portraits: epithets like mother, dream chaser, soccer player and taxpayer... Metro: Do you have plans for a Perception round two? Do you think our city could still use more of a push in that direction? Adams: "I think we need to be constantly reminded about our responsibilities on truth and reconciliation and I think the work could potentially... be used as a tool maybe in educational systems. Interestingly enough, I was contacted in British Columbia by the RCMP training unit where they train their new recruits. Metro News (2016-11-20)

RCMP Biography Will Please Mountie Fans And Concern Critics
To hear biographer George Garrett tell it, Stirling McNeil was a character straight out of a 1930s movie. The handsome hero, a Manitoba kid, loses his factory job to a Depression-era layoffand joins the RCMP. He goes on to patrol the frozen north on 700-milelong dog sled trails, bringing sometimes rough but always fair justice to the trappers, miners and First Nations residents of Canada's north while establishing a reputation for even-handed treatment of all, old world courtliness and devotion to the law and the RCMP. He pioneers the use of airplanes for law enforcement in the north and rubs shoulders with a colourful gallery of fellow officers, felons and raffish local characters. Vancouver Sun, E7 (2016-11-19)

Mounties won't be charged after Surrey suspect suffers broken hip
The Criminal Justice Branch says three RCMP officers will not be charged after a suspect in Surrey suffered a broken hip. The branch says police were called to a basement suite in on Feb. 28, 2015, after reports that a tenant was "trashing" the unit. A statement from the branch says Mounties found an apparently intoxicated man who was naked, bleeding and swearing in a room littered with broken glass and furniture. The branch says the man initially complied with police and agreed to leave the residence, but then began pushing the officers who had to take him to the ground so he could be restrained. The statement says suspect's nose and forehead were cut after his head hit the ground, but an injury to his right hip wasn't immediately obvious, though it was later determined that he needed surgery. Potential charges of assault were considered, but the branch says the available evidence does not meet the standards to approve any charges. Canadian Press (Vancouver Sun; Info News) (2016-11-19)

Kamloops Mountie honoured for saving the life of his brother in blue
A member of the Kamloops RCMP was among 56 men and women who were recognized at the annual Police Awards in Victoria last night. Cst. Steve Marcil was honoured by Lieutenant Governor Judith Guichon and Solicitor General Mike Morris for his actions in saving the life of Corporal J.R. Michaud, who was shot during a traffic stop two years ago in Batchelor Heights. Marcil says, while the incident was unusual, it's all in a day's work for an RCMP member. CFJC (2016-11-18)

D'ex-agents de la GRC estiment avoir subi des représailles à la suite de gestes déplacés de supérieurs
Deux anciens agents de la Gendarmerie royale du Canada (GRC) dénoncent à leur tour les injustices du système de discipline interne du corps policier. En plus des disparités entre les infractions commises et les sanctions reçues, ils affirment que les plaignants sont souvent traités comme des parias par la GRC et que des plaintes infondées seraient parfois utilisées pour se venger entre employés. Il y a quelques années, la carrière de Linda Davidson dans la GRC semblait atteindre des sommets. Elle avait même été affectée à la protection du premier ministre de l'époque Stephen Harper, à Ottawa. Mais elle soutient, dans son témoignage à Radio-Canada/CBC, avoir plutôt vécu l'enfer, victime d'une agression sexuelle au travail par l'un de ses supérieurs. Radio-Canada (2016-11-18)

Un premier groupe d'entraide pour les veufs et les veuves à Moncton
Il est difficile d'imaginer ce qu'on peut ressentir à la perte d'un conjoint. Trouver un groupe d'entraide afin de mieux vivre son deuil est vital pour certains. Or, ce genre de groupe n'existait pas à Moncton jusqu'à aujourd'hui. Soaring Spirits Moncton Vivre avec le deuil a été mis sur pied par deux veuves, Christelle Léger et Nadine Larche. Mme Larche a perdu son conjoint, il y a plus de deux ans, lors de la fusillade du 4 juin 2014 à Moncton. Pour la mère de trois filles, le deuil est encore une épreuve difficile à surmonter, et ce, même si les choses semblent s'améliorer. «On peut dire que ça va mieux. Évidemment, j'ai encore des journées très difficiles. Comme maintenant, j'ai une petite fille malade à la maison toute seule. Il y a encore des journées difficiles, mais ça va mieux, ça va mieux», a confié Mme Larche à l'Acadie Nouvelle. Nadine Larche a été en mesure de trouver des appuis dans la grande famille de la GRC, rencontrant, lors de cérémonies, d'autres endeuillés avec qui elle a été capable de tisser des liens. Acadie Nouvelle (2016-11-18)

LEGISLATION & POLICIES / LÉGISLATION ET POLITIQUES

Marijuana tycoon says Canopy could survive 25 per cent Trudeau tax rate
The head of Canada's first publicly-listed marijuana producer said his company could still turn a profit even if Prime Minister Justin Trudeau's government decides to tax legal recreational weed at rates as high as 25 per cent. A task force is due to report this month on how Canada can build a legal weed market that squeezes out organized crime, protects minors, ensures quality and adds to revenue through taxes. Bruce Linton, chief executive officer of Canopy Growth Corp., says lawmakers will probably choose to control the distribution of recreational marijuana through government-run outlets such as liquor stores. "We can probably carry a tax burden of 25 per cent or so and end up in the consumers' hands on a still cost-competitive basis, with a superior product," Linton said in an interview at Bloomberg's Ottawa newsroom. Canopy, based in Smiths Falls, Ont., became the first marijuana producer to trade on a major North American stock exchange when it graduated to the Toronto Stock Exchange in July. It became the first publicly traded Canadian producer of the drug in 2014. The company's share price more than doubled this month, bringing its market value past $1.6 billion, on better-than-expected earnings and after U.S. elections widened the scope for legal marijuana. Canopy already produces medical marijuana under an existing legal regime. Linton says the company, which operates out of a former chocolate factory, can shift production to serve the recreational market when Trudeau's government makes that legal. Part of the appeal of the legal variety will be its quality control, Linton says. "When it's lawfully available from a reliable supply chain, which we know we can trust and believe in, there are a lot of people who might discontinue the use of say a glass of wine or a beer and try this." Canopy can also generate new formulations of medical marijuana to sell through pharmacies as legalization moves ahead, Linton said. Loblaw Cos., owner of the Shoppers Drug Mart pharmacy chain, has signalled it wants to sell medical marijuana. Postmedia Network (Leader-Post, B6, StarPhoenix, Vancouver Sun)

Ottawa pot dispensaries back in business after police raids
At least two illegal marijuana dispensaries in Ottawa have reopened after police raids closed them down earlier this month. Seven shops were shut down following complaints about the growing number of dispensaries in the city. Two Green Tree Medical Dispensary locations visited by CBC News on Sunday were open for business, although shop attendants refused to provide any sort of comment. "It's a reality," said Rideau-Vanier Coun. Mathieu Fleury. "Until we have the federal framework in place and better coordination provincially ... it's going to be that game of closing and opening." Fleury said he knows there are concerns in his ward about the illegal dispensaries and their effect on the community and people shouldn't stop giving their input on the issue because some of the dispensaries have reopened. "We have to continue to monitor, to enforce. Especially based on community complaints and community feedback and information gathering." On Nov. 4, two marijuana shops in Fleury's ward were raided by police but that hasn't deterred others from getting into the business. He said he's aware of two new shops that have opened recently but still thinks the raids were a good idea. "There's huge gains from the raids that have been put in place. I know that's contentious to say but the perception that these locations were offering legal marijuana is now clear that it is not. That element has been clarified." The federal government has promised to introduce legislation to legalize marijuana by the spring of 2017, but the possession, production and trafficking of marijuana remains illegal. CBC News

Feds closer to new policy on medical pot for vets
The Trudeau government is getting closer to having a new policy on medicinal marijuana for our veterans, who take the drug to treat conditions like PTSD. The veterans affairs department has been reviewing the issue of medical pot after concerns were raised earlier this year that the department is compensating vets for up to ten grams of marijuana a day. News 1130

Legal pot in Canada could sell for $5 a gram — or less
Uncle Ike's Budget Bud is the cheapest pot we've found anywhere. A product line of a Seattle, Wa.-based marijuana retailer, it lives up to its name at US$99 an ounce. That works out to $4.76 a gram Canadian, and it would put the cost of a joint in the $1.50-$2 range. Global News (2016-11-20)

Legalizing marijuana isn't apt to bring a windfall for governments
An opinion piece states, "Several economic myths have surrounded the legalization of marijuana. This has maintained the illusion that it would be a bonanza for federal and provincial treasuries because of the supposed enormous tax revenues that legalization would generate. The Parliamentary Budget Office in Ottawa is to be congratulated for blowing up some of these myths in its report, published this month,on projected marijuana tax revenues following legalization in Canada in 2017 or 2018..." Montreal Gazette (2016-11-20)

Du pot légal près de chez vous
D'ici à ce que le Canada arrive à la conclusion de sa longue démarche visant à légaliser la marijuana, les amateurs de cannabis du Québec, plus précisément ceux de la Beauce, pourraient avoir accès à une source légale de marijuana à des fins récréatives à quelques minutes de chez eux. La Presse (Le Soleil, 3; Le Quotidien) (2016-11-20)

Où acheter la marijuana une fois sa consommation légalisée?
Si la consommation de cannabis devient légale au Canada, la vente de cette substance devrait être bien encadrée, suggère un nouveau rapport de l'Institut national de santé publique du Québec. « On ne peut pas imaginer de distribution libre à but lucratif comme n'importe quel produit qu'on vend », affirme Réal Morin, médecin-conseil et coordonnateur du chantier cannabis à l'Institut. Le Dr Morin croit que la vente du cannabis devrait être confiée à une « agence gouvernementale de type monopole d'État ». En entrevue à l'émission 360 PM, il a précisé que cette organisation devrait avoir la prévention comme principale préoccupation et non pas une mission économique comme c'est le cas d'autres sociétés d'État. Radio-Canada (2016-11-20)

EDITORIALS & OPINIONS / ÉDITORIAUX ET LETTRES D'OPINIONS

RCMP overstating 'surveillance lag'
An opinion piece states, "The RCMP has been lobbying the government behind the scenes for increased surveillance powers on the faulty premise that their investigative powers are lagging behind those foreign police services. The centre piece of the RCMP's pitch is captured in an infographic that purports to show that foreign governments are legislating powers that are more responsive to investigative challenges posed by the digital world. On the basis of this comparison, the RCMP appears to have persuaded the federal government to transform a process intended to curb the excesses of Bill C-51 into one dominated by proposals for additional surveillance powers. The RCMP's lobbying effort misleadingly leaves an impression that Canadian law enforcement efforts are being confounded by digital activities. For example, in its comparative sample (which includes Australia, New Zealand, the United Kingdom and the United States) Canada is presented as the sole country lacking a legal obligation compelling Internet companies to design their services around state surveillance requirements. In fact, Canada already imposes this obligation on mobile service providers in spectrum licences. Furthermore, communications providers demonstrated to the government in 2013 that their networks are generally becoming intercept-ready even in the absence of a legal obligation to do so. The RCMP also misrepresents the legality of foreign surveillance powers. For example, a proposal to require the retention of communication interaction data is presented as "under discussion" in the U.K. In fact, this power has been found unconstitutional by the

U.K. divisional court and is currently on appeal to the EU's highest court, which has already struck down its predecessor legislation." Toronto Star, A11

Native policing

A letter to the editor states, "Re Either Fund Native Police, Or End Them (editorial, Nov. 15): While I expect the editorial questioning the skills and capacity of "native police" after the in-custody suicide of Lena Anderson was well-intentioned, may I point out that many indigenous Canadians have died in the custody of well-funded mainstream non-indigenous police forces? Take for example, Solomon Uyarasuk, a young Inuk man in Iglulik who, after being taken into RCMP custody in 2012, died alone in his cell where he had been left naked, but for his belt. Despite inquiry after inquiry into the deaths of indigenous people in custody, many of which have stated that hanging points should not exist in cells, he was left alone with a belt and a hanging point. Clearly, upstream solutions to complex mental health and societal problems are needed, but these repeated in custody scenarios are appallingly grievous." Globe and Mail, A10

Canada's national security oversight is among the weakest in the world: former human rights advocate

An opinion piece by Steven Zhou, Toronto writer and human rights advocate, states, "There doesn't seem to be much that Canada's intelligence and spy agencies can't do these days-and that includes breaking the law. While much of world remains anxious about the future of a Donald Trump presidency, Canadians should refocus their attention back home, and they should start with the country's bloated national security state. Experience shows that most of a country's establishment systems have likely transcended partisan lines and will remain immune to changes in political personality. National security seems to be one of these categories and its pervasive entrenchment within post-9/11 democracies has been demonstrated both in and outside of American borders. The Canadian security apparatus is a good example of how partisan changes usually have minimal impact on the larger system. There is no Canadian Edward Snowden to shed light on the extensive surveillance and policing machinations of CSIS or the Communication Security Establishment (CSE)... A federal court made national news last week by rebuking CSIS for essentially hiding a giant database full of private information belonging to law-abiding Canadians who pose no threat to public safety. Its watchdog group, the Security Intelligence Review Committee (SIRC), had previously asked CSIS to disclose the existence and full capabilities of this database to the courts, but the spy agency refused and kept things secret for a whole decade. The revelation has been an embarrassment for Public Safety Minister Ralph Goodale, who's been conducting a national consultation on how to reform Canada's security regimes. When asked why CSIS kept the database a secret from the courts, agency director Michel Coulombe simply said that he had no good explanation... There's precisely one person, the CSE Commissioner Jean-Pierre Plouffe, who's supposed to overlook the entire slew of intelligence-related activities that are carried out by the agency on a regular basis... Minister Goodale has promised swift action, but until those words actually manifest themselves into serious institutional change, then Canada will still remain the country with perhaps the weakest national security oversight in the Western world." CBC News (2016-11-20)

Give all officers training in mental-health skills

A letter to the editor states, "Re: "Police seek budget for mental health officers," Nov. 17. We do not need two mental health officers, we need the existing force, and all new recruits, trained in basic mental health and communication skills, as well as violence prevention. You need to have coverage for all times of the day, and two officers wouldn't cut it. As most normal police/civilian interactions are stressful, these courses would help here as well. With proper training, willing officers can help change the stigma of mental illness..." Times Colonist (2016-11-20)

Ottawa should be careful on expanded police powers

An editorial states, "Crime, like everything else, has been transformed by the digital age. Fraudsters, child pornographers and terrorists, among others, are becoming ever more expert in using digital technologies to commit their offences and cover their tracks. Not surprisingly, this has created new challenges for law enforcement. Police chiefs across Canada claim investigators do not have the tools to keep up. Many say concerns about privacy have scuttled their attempts to convince politicians to provide them with the cyber-surveillance powers they need to do their job. As Bob Paulson, commissioner of the Royal Canadian

Mounted Police, puts it, "We're losing our ability, if we haven't lost it entirely, to bring the traditional investigative response to technologically facilitated crime because of the misunderstanding, in my view, of the privacy threat." This week, Paulson shared with reporters from the Star and CBC News case files he says demonstrate the obstacles his force faces, an attempt to help the public understand the need for new police powers the federal government is currently floating... And that's to say nothing of security agencies themselves. The recent revelation that the Canadian Security Intelligence Service illegally spied on people suspected of no wrongdoing is a timely reminder that expanded powers must be accompanied by expanded oversight... In recent decades, and in particular with the passing of the overreaching Bill C-51, the trend has been to expand the powers of the security establishment without offering counterbalancing privacy protections or safeguards against abuse... The public consultation now underway won't mean much unless Canadians understand, yes, the challenges police face, but also the risks of their proposed remedies, including the threats to personal privacy and security posed by an ever-expanding surveillance state." Toronto Star (2016-11-18)

Ottawa should be careful on expanded police powers
An editorial states "Crime, like everything else, has been transformed by the digital age. Fraudsters, child pornographers and terrorists, among others, are becoming ever more expert in using digital technologies to commit their offences and cover their tracks. Not surprisingly, this has created new challenges for law enforcement. Police chiefs across Canada claim investigators do not have the tools to keep up. Many say concerns about privacy have scuttled their attempts to convince politicians to provide them with the cyber-surveillance powers they need to do their job. As Bob Paulson, commissioner of the Royal Canadian Mounted Police, puts it, 'We're losing our ability, if we haven't lost it entirely, to bring the traditional investigative response to technologically facilitated crime because of the misunderstanding, in my view, of the privacy threat.' This week, Paulson shared with reporters from the Star and CBC News case files he says demonstrate the obstacles his force faces, an attempt to help the public understand the need for new police powers the federal government is currently floating. The cases are no doubt disturbing, tales of child abusers and wannabe terrorists evading justice. But while they clearly illustrate new and thorny police challenges, they do not establish that the requested powers are necessary or proportionate or to what extent they would endanger privacy or even weaken security. Paulson is right that an informed public discussion about these difficult issues is necessary and that the evolving nature of cyber-crime is an important part of that discussion. But a closer look at the requested powers shows that Paulson's story is not the whole story." Toronto Star (2016-11-18)

The RCMP needs you scared - and the media seems happy to help
An opinion piece states "Long before email, metadata and GPS tracking, King Louis XIII's hatchetman Cardinal Richelieu said: 'If one would give me six lines written by the hand of the most honest man, I would find something in them to have him hanged.' Nothing's changed. The RCMP is back at the back door, lobbying the government for greater powers to access digital evidence - and now they're using the media to make their case. Recently, the RCMP self-selected 10 investigation files and fed summaries to the CBC and Toronto Star. Details that could compromise ongoing investigations (or be used by journalists to fact-check) were redacted. Both media outlets dutifully gave the Mounties the headline they wanted - one about how child predators, drug gangs and terrorists are escaping justice. The RCMP's proposed solution is, of course, more police power. It's always more police power. The RCMP wants laws that would compel suspects to hand over passwords, grant warrantless access to subscriber information and require telecommunication providers to build back-door intercept capabilities into their networks." iPolitics (2016-11-18)

OTHER / AUTRES

Pas d'accusations à Val-d'Or, deux à Schefferville, le DPCP s'explique
Jeudi, il a été révélé qu'Alain Juneau a été accusé d'agressions sexuelles contre des femmes autochtones ; des gestes qu'il aurait posés à Schefferville, entre 1992 et 1994, au moment où il travaillait comme policier pour la Sûreté du Québec (SQ) sur la Côte-Nord. Le DPCP devrait en faire l'annonce dans sa conférence de presse. Et il appert aussi qu'un policier autochtone de Schefferville ferait l'objet d'accusations, selon ce qu'a appris Radio-Canada. Octobre 2015, le Québec sous le choc. Rappelons

qu'en octobre 2015, la diffusion de témoignages accablants de femmes autochtones de Val-d'Or, disant avoir été victimes de violence sexuelle et d'abus de pouvoir de la part de policiers de la SQ, avait secoué l'ensemble du Québec. Ces révélations de l'émission Enquête de Radio-Canada avaient conduit le ministère de la Sécurité publique du Québec à confier au Service de police de la Ville de Montréal (SPVM) le soin d'enquêter sur les comportements allégués d'agents de la SQ. Le DPCP a par la suite analysé 37 dossiers qui lui avaient été remis par le SPVM. Hamilton's horror - Cops not naming names in child abuse scandal telling
One lone name stood out on the press release outlining those charged in the monstrous serial molestation of a little Hamilton girl. Can I remind you, she's seven. And while he was not directly connected to the little girl, the only name on that release was Geoffrey Burnet. And so far, he's the only one we have. According to cops, the girl's mother's boyfriend was allegedly offering her for sale on Craigslist. Seven people were arrested - no names. In the case of the mom and her boyfriend it's easy to see why there were no names. Postmedia Network (Winnipeg Sun, A7; Calgary Sun, Edmonton Sun) (2016-11-20)

Surge in domestic handgun trafficking
Danny Santapaga, a self-employed financial adviser, bought 14 guns on 10 different occasions over seven months. Plumber Graham Jovanovic purchased nine firearms over five weeks. University student Justin Green obtained 23 handguns during a 22-month period, including 15 from one store. Security guard Andrew Winchester acquired 47 handguns in a six-month buying binge. TOP STORIES / ACTUALITÉS

Digital encryption is here to stay, says report from U.S. lawmakers
As Canadian police push for more power in the online world, documents obtained by the Star suggest that privacy-protecting encryption software is here to stay. A memo prepared for Daniel Therrien, the federal privacy commissioner, stated it would be difficult for any one country to weaken or ban encryption technology. The document, obtained under access to information law, summarizes a report from the U.S. committee on homeland security. "Encryption tools very much are now ubiquitous, globally distributed and irrevocable, which plainly no piece of domestic regulation or lawmaking will undo, given that two-thirds of encryption products are produced and sold by non-U.S. firms," the memo reads. In other words, if the bad guys want to hide their tracks, they'll have plenty of options even if Canada or the U.S. attempts to weaken or ban encryption. The RCMP are making a very public push for more powers to obtain Canadians' private information from telecommunication companies and to decode encrypted messages. RCMP Commissioner Bob Paulson told a joint Star/CBC investigation it has reached the point where if a citizen is a victim of a crime online, he's not sure the Mounties can help. But the report from the U.S. homeland security committee, summarized for Therrien in the memo, states that weakening encryption would probably compromise public safety rather than improve it. North of the border, meanwhile, the federal Liberals are examining Canada's national security framework, including such issues as encryption and warrantless access to Canadians' private information. Public Safety Minister Ralph Goodale, who is leading that consultation, has remained neutral on the issue pending the results of the exercise. "We have invited everyone with a view to come forward with their perspective. "Obviously, the police perspective is being advanced with a good deal of vigour and enthusiasm from their perspective of law enforcement," Goodale told the Star last week. Toronto Star, A1

CONTRACT & ABORIGINAL POLICING / SERVICE DE POLICE CONTRACTUELS ET AUTOCHTONES

'We've always been seen as a threat,' says former N.W.T. premier of RCMP surveillance revelations

A recently revealed program of police surveillance across Canada is "alarming" and a "threat to our own security," says former **N.W.T.** premier Stephen Kakfwi. He's "not surprised," however, to hear that more than 300 protesters, 89 of whom are Indigenous, were being watched by RCMP as part of surveillance program called Project SITKA, launched in 2014...Police Response. "When the RCMP is in receipt of information that indicates an individual or individuals are involved in a crime or may pose a threat to the safety and security of others, we are duty-bound to investigate. The RCMP did not specifically target Indigenous protestors," writes Cpl. Annie Delisle, Media Relations Officer for the RCMP. CBC News (2016-11-20)

Mi'kmaq woman concerned about Project SITKA

A Mi'Kmaq woman from **Elsipogtog** is concerned that her name is on a "watch list" compiled by RCMP intelligence services in the wake of a year-long investigation of dozens of Indigenous protesters, called Project SITKA. Amy Sock, a former defence attorney, mother, and an active member of Idle No More worries her time on the front lines of anti-shale gas protests in 2013 may have landed her on the list, although the RCMP refuses to say whether she is or not. CBC News (2016-11-20)

Man wanted by RCMP arrested on Muskowekwan First Nation

A man who was wanted by the RCMP on several outstanding warrants has been arrested. Darryl Raymond Longman was located by **Punnichy** RCMP at a residence on Muskowekwan First Nation on Sunday.He was taken into custody at 3 p.m, according to a press release. On Nov. 19, the RCMP had issued a release asking for information on Longman's whereabouts. The RCMP said Longman was known to frequent Regina, Muskowekwan First Nation and George Gordon First Nation. On Oct. 3, 2015 Longman was arrested and charged with dangerous operation of a vehicle, driving while being chased by police, driving drunk, refusing to provide a breath sample, driving without a drivers license and stealing a vehicle. Longman also had additional outstanding warrants for his arrest in connection with an incident which happened on June 6. He was charged with assault, assault with a weapon, uttering threats and failure to comply. Leader-Post; CTV News (2016-11-20)

Surrey RCMP searching for missing 15-year-old girl

Surrey RCMP are asking for the public's assistance in locating a missing 15-year-old girl. Police say Trinity McKenzie was last seen on Friday, Nov. 7 at home in Surrey. Family and police are now concerned for her health and well-being. Global News (2016-11-20)

Red Deer's top cop talks about tackling drugs, organized crime

It's no secret that drugs and organized crime are driving much of the crime activity in Red Deer. In part two of our feature story, new **Red Deer** RCMP Superintendent Ken Foster says he is condifent these troublesome issues can be dealt with effectively. Red Deer News Now (2016-11-19)

RCMP investigate daylight shooting in Burnaby

There is a heavy police presence in a south **Burnaby** neighbourhood following reports of a shooting. Nearby residents reported hearing shots fired around 11:30 a.m. One victim has been taken to Royal Columbian Hospital, and RCMP say a possible second victim may have also been treated in hospital. The incident occurred in the 7100 block of 14th Avenue, situated several blocks from the Edmonds SkyTrain tation and one block from an elementary school. Global News; CKNW (2016-11-19)

Punnichy, Sask. RCMP on lookout for 2 wanted men

Saskatchewan RCMP is asking the public for help locating two separate wanted men. Darryl Raymond Longman, 48, has outstanding warrants for his arrest. On Oct. 3, 2015, he was charged with Criminal Code offences such as operation of a motor vehicle while being pursued by a peace officer operating a

motor vehicle, impaired operation of a motor vehicle and taking a motor vehicle without consent. Global News; CTV News; CBC News; Leader-Post (2016-11-19)

RCMP request that Albertans please report their moldering dynamite
There may be something explosive lurking amongst the rolls of baler twine and tractor parts in that old barn down on the farm. According to **Alberta** RCMP, there is a large but unquantified amount of degraded and deteriorated dynamite on properties across the province as a result of historic rules that permitted farmers and ranchers easy access to explosives. Edmonton Journal; Agence QMI (TVA Nouvelle) (2016-11-19)

Four face drug charges following police search in Harbour Landing
Four adults are facing cocaine trafficking charges after police executed a Controlled Drugs and Substances Act search warrant in **Regina**'s Harbour Landing neighbourhood Wednesday. Regina's Combined Forces Special Enforcement Unit (CFSEU), with the assistance of the RCMP Integrated Organized Crime Unit, seized cocaine, cash and a loaded hand gun. Danieol Johnson, Kendall Robinson, Ali Mahdi and Mohammed Osman are all charged with possession of cocaine for the purpose of trafficking and proceeds of crime over $5,000. Leader-Post, A4 (2016-11-19)

Break-in at Manitoba Hydro compound
Steinbach RCMP are currently investigating a recent report of a break, enter and theft to the Manitoba Hydro compound located in the City of Steinbach, Manitoba. My Steinbach (2016-11-19)

Codiac RCMP locate both missing persons in Moncton
Police say both the 17-year-old boy and 23-year-old woman reported missing Nov. 17 in separate incidents in **Moncton** have been located. The boy had left the Moncton City Hospital of his own accord that day. The woman was located Saturday afternoon. Codiac RCMP thanked the public for their assistance. CBC News (2016-11-19)

Leduc RCMP appeal to public for help finding woman missing since Nov. 3
Leduc RCMP issued a plea to the public for information on a missing woman Saturday. Mounties said Deanna Millington left her family home in Leduc, Alta. on Nov. 3 and has not been seen since. Police said they are concerned for the woman's well being. Global News; CTV News (2016-11-19)

RCMP warn of email fraud
The RCMP has issued a warning about a recent email scam targeting businesses that perform wire transfers. That scam often involves businesses whose executives' email accounts are compromised or imitated. The fraudster then sends emails to an unsuspecting employee telling them to wire large sums of money to foreign accounts. Charlottetown Guardian, A3 (2016-11-19)

Inquiry into Don Dunphy death delayed by anonymous letter
Police are asking for the public's help in finding the author of an anonymous letter about the shooting death of Donald Dunphy. A press release from the RCMP says they found out about the letter on the evening of Nov. 7 from the inquiry into Dunphy's death and began investigating its contents and source the next morning. "The RCMP was informed by the commission of inquiry respecting the death of Donald Dunphy the new information in the form of an anonymous letter had come forward regarding the death of Mr. Dunphy. The following morning the RCMP obtained the letter and began an investigation into its origins and content," said RCMP Superintendent Pat Cahill at a news conference Friday. CBC News; VOCM News (2016-11-18)

RCMP testify in Burnaby school bookkeeper's trial
Police decided to focus on investigating questionable cheques instead of missing cash at Alpha Secondary between 2008 and 2010 because cash is harder to track, according to the RCMP's chief investigator in the case. Const. Anna Taylor testified Wednesday at the trial of former Alpha Secondary bookkeeper Jodi Fingarsen, who is accused of defrauding her **Burnaby** school of about $67,000 using cheques either fraudulently generated, signed or deposited. During her investigation, Taylor interviewed school staff who also complained of missing cash collected for things like school trips, dry grad

celebrations and Advanced Placement exams. "They did bring up the cash as well," said Taylor, "but from the police perspective, tracing physical cash is more difficult." Defence lawyer John Banks, however, suggested Taylor didn't investigate the missing cash because Alpha's system for collecting and accounting for cash was flawed. Burnaby Now (2016-11-18)

Swift Current RCMP looking for two missing teens
Swift Current Municipal RCMP are looking for two missing teenagers who haven't returned home or attended school this past week. Fourteen-year-old Amber Padley was reported missing to RCMP on Wednesday, Nov. 9. She's described as Caucasian, five feet six inches tall and 120 pounds with brown hair and blue eyes. Fifteen-year-old Austin Doerksen was reported missing to RCMP on Friday, Nov. 11. He's described as Caucasion, six feet two inches tall and 180 pounds with blonde hair and hazel eyes. CJME News (2016-11-18)

Missing girl found
Nakayo Poucette has been located and is safe. **Cochrane** RCMP were requesting assistance from the public to find a missing 16-year-old from Morley. Nakayo Faith Poucette, 16, from Stoney Nakoda First Nation was last in Morley on Nov. 7 when she attended a birthday party at her grandmother's residence on the reservation. Poucette was seen leaving the party with another young male under non-suspicious circumstances, according to the RCMP. Poucette is believed to be out in Morley and the RCMP do not think she is in any danger, according to Sgt. Darleen White with the Cochrane RCMP. Cochrane Eagle (2016-11-18)

RCMP charge teen in fake terrorist threat in Yellowknife but give no details
RCMP have arrested and charged a teen in **Yellowknife** in a fake terrorist threat. Mounties say the criminal charge resulted from an investigation by Alberta RCMP K Division that began on Nov. 1. Northwest Territories RCMP spokeswoman Marie York-Condon says no details about the hoax can be released, but may come out in court. She says the youth has been released on conditions and will appear at a later date in youth court in Yellowknife. York-Condon also says the next court date may not be released "considering the size of the community that the court is in and the amount of youth that may be appearing in court." She says there was no public safety risk when the alleged threat came to light. Canadian Press (CTV News) (2016-11-18)

IIU Investigates Arrest Involving RCMP Dog
Manitoba's police watchdog is investigating after a robbery suspect was brought down by an RCMP dog in Portage la Prairie on Wednesday. Mounties were called to an armed robbery in the city west of Winnipeg and arrested three people, however one man got away. Officers let the dog loose to chase after the man. The Independent Investigation Unit (IIU) did not go into details, but the suspect received an injury to his leg once the dog caught up to him. 680 CJOB (2016-11-18)

NATIONAL INQUIRY INTO MISSING AND MURDERED INDIGENOUS WOMEN AND GIRLS / ENQUETE NATIONALE SUR LES FEMMES ET LES FILLES AUTOCHTONES DISPARUES ET ASSASSINEES

'That was just my destiny'
Sharon Acoose remembers being groped as a child by an uncle who paid her in pocket change for her trouble - the earliest roots of a life scarred by sex work, drug use and jail time. "He would give me a quarter ... or a nickel or a dime, whatever he had," Acoose, 63, recalled during an interview with The Canadian Press. "You wouldn't believe all the candies that I bought." Despite the longest of odds, she managed to turn her life around, eventually becoming a professor of social work. Countless others who followed a similar trajectory are no longer alive to tell the tale. To this day, that same cycle is repeating itself with alarming frequency in indigenous communities across Canada, a CP investigation has found. And with its insidious links to suicide, violence and mental health problems, the issue of child sexual abuse is poised to be a key theme in next year's long-anticipated national inquiry into the tragic phenomenon of murdered and missing indigenous women. (...) Indeed, experiences of sexual and physical abuse among indigenous women and girls are so pervasive they are expected to overwhelm

next year's national inquiry, where commissioners will examine and report on the systemic causes of the violence. (...) In May 2014, the RCMP documented 1,181 murdered and missing women between 1980 and 2012. A year later, it said 32 additional aboriginal women had been murdered and 11 more had disappeared since it first reported on the issue. The force also cited an "unmistakable connection" between homicide and family violence. Aboriginal women are vulnerable precisely because they're aboriginal and women, said Dr. Yvonne Boyer, a Canada Research Chair at Manitoba's Brandon University. Boyer co-authored a report on trafficking of aboriginal women for the Public Safety Department in May 2014 that noted many of its participants suffered sexual abuse as a child, contributing to a pattern of exploitation that carried on into their adult years. Canadian Press (The Guardian, A8, Waterloo Record, Times & Transcript, Chronicle Herald, National Post, City News, Battlefords News-Optimist, Hamilton News, Weyburn This Week) (2016-11-21); (2016-11-21); Canadian Press (Ottawa Citizen; iPolitics; Mississauga.com; Waterloo Chronicle); Presse Canadienne (La Presse, Le Devoir) (2016-11-20)

UN urges Canada to work on barriers that still face women
A new report from the United Nations is calling on Canada to get to work on a number of barriers still facing women when it comes to gender equality and urging the government to take more concerted steps to stop violence against indigenous women and girls. The review - typically conducted every four or five years - by the Geneva-based Committee on the Elimination of Discrimination against Women covered a range of issues, from the gender pay gap to poverty and violence against women, as well as the use of solitary confinement in prisons. Prime Minister Justin Trudeau, who often calls himself a feminist, has said improving relationships with indigenous communities and working toward gender equality are key priorities for his government. And the report did note some progress, namely the equal representation in the federal cabinet. But the committee cited a range of concerns, among them the "continued high prevalence" of gender-based violence, particularly against indigenous women and girls. It also highlighted the "very low" number of cases of violence against women reported to police by victims, and low rates of prosecution and conviction against perpetrators. The report, posted on its website Friday, came as prosecutors in Quebec said no charges would be laid against police officers in Val-d'Or, after 21 indigenous women and seven men filed complaints against police that included sexual assault and excessive use of force. "It's difficult enough when you're dealing with violence in your personal life," said Francyne Joe, the interim president of the Native Women's Association of Canada. "If you can't go to police expecting to be protected, that's going to lead to such despair and depression and anger ... and disrupt any growing positive relationship with the policing system." Globe and Mail, A12

Caribou Legs reaches St. John's
Brad Firth - better known as Caribou Legs - was part-way through a run spanning five provinces last year, on a mission to protect lakes and rivers, when he got a call that would change his life. got some bad news from back home. That phone call was actually about my sister's death. So I was hit with this really sad story, and it took me a couple of hours to regain my strength, my balance, and continue running, because I didn't want to run any more," Firth said. After finding out his sister had been killed, he just wanted to go home and grieve - "not the right way, but I wanted to grieve angrily, because - just the way my sister died." (...) Caribou Legs, with the support of groups such as Sisters in Spirit, Warriors Against Violence and Culture Saves Lives, decided to set out on the road again. This time it would be to honour women, shine a spotlight on the country's missing and murdered indigenous women and girls, and prevent violence against women. The Telegram, A5; VOCM

FEDERAL & INTERNATIONAL OPERATIONS / OPÉRATIONS FÉDÉRALES ET INTERNATIONALES

Apology for anti-homosexual persecution should include compensation, government told
Ottawa's apology to Mounties, soldiers and other public servants whose careers were destroyed by anti-homosexual witch hunts will have to be accompanied by compensation, experts say. Prime Minister Justin Trudeau appointed Edmonton Centre MP Randy Boissonnault as a 'special advisor for LGBTQ issues' earlier this week with the goal of arranging an official apology to the thousands of gay and lesbians who were persecuted in the latter half of the 20th century. "We do not have a timeline to announce at this stage," Cameron Ahmad, press secretary to the Prime Minister's Office, said in an email

to iPolitics. The apology will have to include some form of compensation, said Matt James, an associate professor at the University of Victoria who specializes in political apologies and the Canadian Constitutionalism. James said he would not be surprised if representatives from the agencies involved in the persecution - the RCMP and Canadian Armed Forces - had a chance to vet the apology. "I'd be very interested to see, for example, if the apology attempts to make any kind of excuse in terms of national security or that these were things that other security agencies were doing at the time," he said. "I would expect [it's something] the RCMP or military representatives would want to see in there and something I expect the representatives in the LGBTQ community would not want ... So there will be some interesting choices the government will have to make around that." The government announced in April it would apologize and offer redress to LGBTQ employees of the federal public service and the Canadian Armed Forces persecuted by the RCMP. Many were charged with gross indecency before homosexuality was decriminalized in 1969. After decriminalization, federal government workers suspected of being gay or lesbian were often denied promotions or security clearances that would advance their careers. Military members could be dishonourably discharged from the service until 1992. Upwards of 9,000 people were affected. iPolitics

Un camp islamique financé par la Ville de Montréal

Montréal a versé 10 850 $ à une association islamiste pour prendre en charge 30 enfants réfugiés syriens même si elle est soupçonnée par la GRC d'avoir financé des groupes terroristes. Des jeunes syriens âgés de 5 à 14 ans, dont certains ne parlaient pas français ont été accueillis cet été au camp Sindbad organisé par le Centre communautaire Laurentien, une section de l'Association musulmane du Canada (MAC). Le MAC est l'antenne la plus officielle des Frères musulmans, rappellent deux experts. En janvier 2015, Le Journal révélait, d'après des documents de cour produits par la GRC, que MAC avait versé près de 300 000 $ à l'International Relief Fund for the Afflicted and Needy-Canada (IRFAN). En 2011, Revenu Canada a révoqué le statut d'oeuvre de bienfaisance de cet organisme, puis le fédéral l'a déclaré organisation terroriste en 2014. Il reproche à l'IRFAN d'avoir envoyé 14,6 M$ au Hamas entre 2005 et 2009. Le Hamas, un autre groupe terroriste selon Ottawa, vise la libération de la Palestine de l'occupation israélienne et l'instauration d'un gouvernement islamique. Malgré son interdiction, la GRC dit avoir aperçu en mars 2014 un collecteur de fonds de l'IRFAN dans les bureaux de MAC à Montréal. Le Journal de Québec, 25 (Le Journal de Montréal)

Legal changes in the works on opioid crisis

The federal government is eyeing a number of legislative changes to address Canada's opioid crisis, Health Minister Jane Philpott said Saturday at the conclusion of a summit examining the issue. The federal government is actively trying to turn the tide of the crisis, Philpott added, noting it will require a whole-of-government approach. "This is a topic I have been working with alongside the minister for public safety, the minister of justice and the minister of foreign affairs," she said. "In the coming months, there are a number of pieces of legislation that are going to address matters related to the opioid crisis and certainly we will do the work necessary." Addiction, overdose and deaths related to opioid use were the focus of discussions for health experts and ministers who gathered in Ottawa for a two-day summit to look at a national approach. On Saturday, B.C. Health Minister Terry Lake urged the federal government to waste no time in taking additional action to address Canada's opioid crisis, including setting up a nationally coordinated surveillance system to track overdoses and other drug-related harm. The province also wants the federal government to look at tools to stop the flow of fentanyl from China by stepping up diplomatic negotiations. "They need to properly equip the Canadian Border Services Agency and the RCMP with the tools and resources needed for border control and to get fentanyl off the streets," Lake said in a Saturday statement. British Columbia says 622 overdose deaths have happened in that province since January - more than double the number of people who died in car crashes last year. Waterloo Region Record, A3 (CTV News) (2016-11-21); Postmedia Network (Toronto Sun, A11; The Province, Vancouver Sun); Canadian Press (The Province, Vancouver Sun, Toronto Star, Times Colonist) (2016-11-20); Canadian Press(Maclean's; iPolitics; Global News; CTV News; Chronicle Herald); CBC News; Presse Canadienne (La Presse) (2016-11-19)

'This is all a work in progress'

The first time Donovan Locke had to perform an intervention with an aspiring extremist, the 14-yearold in question had been caught spouting white supremacist views at a Toronto high school. The parents were

notified, along with the Toronto Police Service, where Locke is an acting staff sergeant and a coordinator of a new project attempting to address radicalization in Canada's largest city... After police shot Islamic State of Iraq and the Levant supporter Aaron Driver as he was leaving his home in Strathroy, Ont., to conduct a suicide bombing Aug. 10, Public Safety Minister Ralph Goodale said there was *"little national coherence"* to counter-radicalization efforts in Canada and re-committed the government to opening an office to co-ordinate them nationally. Toronto has been quietly experimenting with its own approach, the National Post has learned. Launched as a pilot project by the Toronto police and the city, it has been kept under wraps until now. But in interviews with the Post, key officials spoke for the first time about what they were doing. "One of the things we chose to do here was not to engage the media," said James Ramer, Toronto's deputy police chief. But, "We're at the point now that we do want to advertise it." National Post, A6 (2016-11-19)

Taxpayers would have to foot bill for new high-tech police powers, wireless industry says
Canada's top telecommunications industry group says any government move to force its members to install equipment to intercept digital traffic and store data to aid police investigations would have to be covered by taxpayers. "We have always submitted that there should be a mechanism for the government to cover the costs or possibly law enforcement," said Kurt Eby, director of regulatory affairs and government relations for the Canadian Wireless Telecommunications Association. "Every time the government looks to add a layer such as this, there is going to be cost incurred." The federal government is holding public consultations on Canada's Anti-Terrorism Act, which includes proposals for new investigative powers for police to gather digital evidence... RCMP Commissioner Bob Paulson says nearly 70 per cent of telecommunications companies can't comply with interception orders from the courts. CBC News (2016-11-19)

ComicCon could help you become a spy
Do you enjoy going to ComicCon ? What about giveaway sunglasses or free popcorn ? More importantly: Can you keep a secret ? Then a job as a digital spy might just be for you. Or, at least, that ' s what the Communications Security Establishment (CSE) has in mind as it seeks the best and brightesttechies. An old-fashioned popcorn machine and free pairs of CSE-branded shades were part of the display at a government job fair Thursday at Ottawa ' s Shaw Centre. At the event, where the hashtag # secureyourfuture was prominently displayed, other agencies - including Public Safety Canada, the Canadian Security Intelligence Service (CSIS), the Canadian Forces, the Correctional Service of Canada and the Canada Border Security Agency - competed to woo curious job-hunters, more than one of whom was spotted eating a banana. Though the Royal Canadian Mounted Police displayed Batman-like combat gear on a mannequin, it was, subjectively, hard to compete with CSE ' s popcorn and shades. A CSE rep explained the agency had tried recruiting at a ComicCon event for the first time in Montreal this summer - you know, because a lot of, uh, tech-savvy people attend ComicCon. Postmedia Network (London Free Press, N4; Calgary Herald, National Post, * National Post) (2016-11-19)

Your cellphone password could hold the key in legal battle over collecting evidence
Here's the scenario: Police believe there is evidence on your cellphone or computer that could assist them in a criminal investigation. They ask that you provide your password or encryption key so they can search for clues. Currently, there is no law compelling you to comply with that request. But police in Canada, frustrated by evidence trails that lead to digital dead ends, are calling for a law that would make it a criminal offence to say no to a police officer carrying a judicial warrant. It's an idea designed to accomplish through a legal order what police are increasingly unable to accomplish technologically — getting inside digital devices containing what they believe is crucial evidence in criminal investigations. "It's a very radical proposal in Canadian law," said Micheal Vonn, executive director of the B.C. Civil Liberties Association. "It changes the basic nature of how we go about achieving the ends of criminal investigation, by compelling the person who is under investigation to participate in the investigation." Many privacy advocates — and even some in law enforcement — call the idea an abuse of both privacy protections and the rights of Canadians against self-incrimination. Police supporters counter that public safety — and the ability of police to respond to serious crimes — is already being dramatically eroded by disappearing evidence. Liberal Public Safety Minister Ralph Goodale: "(Police) are certainly concerned about the effect of new technology in an age accelerating digitization. They're concerned whether or not their legal tools are sufficient to cope with what they now have to deal with . . . .

Others in the academic community, in the open media community, have put forward the contrary opinion. And that's what this consultation is intended to solicit, and we will have to weigh all of that carefully to make sure that in our response, we produce a position that is consistent with Canadian's expectations." Toronto Star/CBC News (2016-11-18)

The McAdam file: Bribery, Chinese gangsters and betrayal

Brian McAdam was a seasoned Canadian diplomat when he was posted to Hong Kong in 1989. He became the high commission's immigration control officer two years later, and soon uncovered what he believed was a major scandal. Members of Chinese criminal gangs, known as Triads, were applying to enter Canada as entrepreneurs under the country's business immigration program. And many were getting visas. "What was very, very disturbing to me was I kept seeing all these connections of these people to certain people — politicians — in Canada, and the odd name in our embassy," McAdam says. He started writing reports — there were ultimately 32 — documenting the names of the gangsters who were getting into the country and related concerns. The reports caused panic in the immigration minister's office and at headquarters in Ottawa, McAdam alleges. "I was exposing incredible negligence. I was exposing incredible corruption. And I was exposing the flaws in our whole immigration system. "People in Ottawa didn't want to investigate anything. They just shut their eyes to everything." Most of his reports were destroyed, he says. McAdam returned to Ottawa in 1993, lured by the promise of a job in a new organized crime unit at Foreign Affairs. But when he showed up for work, the job didn't exist. He alleges the personnel manager urged him to take a retirement package, though he was just 51. Days later, he went on sick leave and never returned to work. In 1996, RCMP Cpl. Robert Read began investigating McAdam's allegations that employees at the Hong Kong mission had received bribes and that Triad criminal gangs had infiltrated an immigration computer system. After finding gaping holes in earlier RCMP investigations, Read urged his superiors to authorize a thorough investigation, but was taken off the case. Concerned that his bosses were suppressing his findings, Read went to the media with his concerns in 1999, which led to his dismissal from the RCMP in 2002. McAdam's allegations also sparked a joint RCMP-CSIS investigation known as Project Sidewinder, which probed the threat posed by the purchase of Canadian companies by Triad members or associates with links to the Chinese Intelligence Service. Why Spy on Reporters When You Can Spy on CEOs?

An opinion piece states, "Canadians have been shocked to learn that police in this country have for the second time this year admitted to spying on reporters. What makes the recent disclosures most ironic is not that police officers were the ultimate targets, or that spying was approved in the absence of an actual judge—but that much of the meta-data sought by Montreal police may have already existed on a government server, and could have been obtained without a warrant, thanks to the enactment of the Anti-Terrorism Act (known as "Bill C-51"). In fact, in his latest annual report to Parliament, Canada's Privacy Commissioner identified 58 such instances where Canadians' information was collected and shared without prior judicial approval in the first six months of this year alone. Whether it's the Communications Security Establishment (CSE) illegally collecting and sharing Canadians' metadata with foreign intelligence partners, the RCMP, Vancouver, and Toronto Police departments each individually mopping up entire city blocks full of cell phone information with Stingray surveillance devices, or the Canadian Security Intelligence Service (CSIS) building a secret database and intentionally concealing its existence from Federal Court Judges, Bill C-51 has emboldened all manner of police and security services to push the envelope and end-run Canada's Privacy Act." VICE News (2016-11-18)

Money-laundering watchdog cites 'significant' deficiencies at 100-plus B.C. real estate firms

Canada's anti-money laundering watchdog found "significant" or "very significant" levels of non-compliance at more than half of the B.C. real estate companies it examined over a four-and-a-half year period, its records show. The Financial Transactions and Reports Analysis Centre of Canada (FINTRAC), the federal agency mandated to detect and combat money laundering, examined about 220 real estate companies in B.C. between 2012 and mid-2016, finding 112 companies with "significant" levels of non-compliance and five with "very significant" non-compliance, according to records obtained by Postmedia News through an access to information request. In the past year, FINTRAC has ramped up scrutiny of real estate - particularly in B.C. In an operational brief this week intended for banks and real estate professionals, the agency highlighted the Canadian housing market's vulnerability to money laundering.

The 12-page FINTRAC brief also notes the "minimal" filing of suspicious transaction reports in Canadian real estate, with 127 reports filed on five million sales over 10 years. Vancouver Sun (2016-11-18)

ORGANIZATIONAL ISSUES / ENJEUX ORGANISATIONNELS

Changing perceptions: How this Winnipeg artist's dramatic billboards aid police training
In early 2015, KC Adams' black and white portraits of indigenous people hung around the city on billboards, bus shacks and bulletin boards, demanding our attention. The twinned photos featured people scowling and hurt as Adams hurled racial insults at them, then smiling and radiant as she reminded them of happier times. The models self-selected their own labels on their second portraits: epithets like mother, dream chaser, soccer player and taxpayer... Metro: Do you have plans for a Perception round two? Do you think our city could still use more of a push in that direction? Adams: "I think we need to be constantly reminded about our responsibilities on truth and reconciliation and I think the work could potentially... be used as a tool maybe in educational systems. Interestingly enough, I was contacted in British Columbia by the RCMP training unit where they train their new recruits. Metro News (2016-11-20)

RCMP Biography Will Please Mountie Fans And Concern Critics
To hear biographer George Garrett tell it, Stirling McNeil was a character straight out of a 1930s movie. The handsome hero, a Manitoba kid, loses his factory job to a Depression-era layoffand joins the RCMP. He goes on to patrol the frozen north on 700-milelong dog sled trails, bringing sometimes rough but always fair justice to the trappers, miners and First Nations residents of Canada's north while establishing a reputation for even-handed treatment of all, old world courtliness and devotion to the law and the RCMP. He pioneers the use of airplanes for law enforcement in the north and rubs shoulders with a colourful gallery of fellow officers, felons and raffish local characters. Vancouver Sun, E7 (2016-11-19)

Mounties won't be charged after Surrey suspect suffers broken hip
The Criminal Justice Branch says three RCMP officers will not be charged after a suspect in Surrey suffered a broken hip. The branch says police were called to a basement suite in on Feb. 28, 2015, after reports that a tenant was "trashing" the unit. A statement from the branch says Mounties found an apparently intoxicated man who was naked, bleeding and swearing in a room littered with broken glass and furniture. The branch says the man initially complied with police and agreed to leave the residence, but then began pushing the officers who had to take him to the ground so he could be restrained. The statement says suspect's nose and forehead were cut after his head hit the ground, but an injury to his right hip wasn't immediately obvious, though it was later determined that he needed surgery. Potential charges of assault were considered, but the branch says the available evidence does not meet the standards to approve any charges. Canadian Press (Vancouver Sun; Info News) (2016-11-19)

Kamloops Mountie honoured for saving the life of his brother in blue
A member of the Kamloops RCMP was among 56 men and women who were recognized at the annual Police Awards in Victoria last night. Cst. Steve Marcil was honoured by Lieutenant Governor Judith Guichon and Solicitor General Mike Morris for his actions in saving the life of Corporal J.R. Michaud, who was shot during a traffic stop two years ago in Batchelor Heights. Marcil says, while the incident was unusual, it's all in a day's work for an RCMP member. CFJC (2016-11-18)

D'ex-agents de la GRC estiment avoir subi des représailles à la suite de gestes déplacés de supérieurs
Deux anciens agents de la Gendarmerie royale du Canada (GRC) dénoncent à leur tour les injustices du système de discipline interne du corps policier. En plus des disparités entre les infractions commises et les sanctions reçues, ils affirment que les plaignants sont souvent traités comme des parias par la GRC et que des plaintes infondées seraient parfois utilisées pour se venger entre employés. Il y a quelques années, la carrière de Linda Davidson dans la GRC semblait atteindre des sommets. Elle avait même été affectée à la protection du premier ministre de l'époque Stephen Harper, à Ottawa. Mais elle soutient, dans son témoignage à Radio-Canada/CBC, avoir plutôt vécu l'enfer, victime d'une agression sexuelle au travail par l'un de ses supérieurs. Radio-Canada (2016-11-18)

Un premier groupe d'entraide pour les veufs et les veuves à Moncton
Il est difficile d'imaginer ce qu'on peut ressentir à la perte d'un conjoint. Trouver un groupe d'entraide afin de mieux vivre son deuil est vital pour certains. Or, ce genre de groupe n'existait pas à Moncton jusqu'à aujourd'hui. Soaring Spirits Moncton Vivre avec le deuil a été mis sur pied par deux veuves, Christelle Léger et Nadine Larche. Mme Larche a perdu son conjoint, il y a plus de deux ans, lors de la fusillade du 4 juin 2014 à Moncton. Pour la mère de trois filles, le deuil est encore une épreuve difficile à surmonter, et ce, même si les choses semblent s'améliorer. «On peut dire que ça va mieux. Évidemment, j'ai encore des journées très difficiles. Comme maintenant, j'ai une petite fille malade à la maison toute seule. Il y a encore des journées difficiles, mais ça va mieux, ça va mieux», a confié Mme Larche à l'Acadie Nouvelle. Nadine Larche a été en mesure de trouver des appuis dans la grande famille de la GRC, rencontrant, lors de cérémonies, d'autres endeuillés avec qui elle a été capable de tisser des liens. Acadie Nouvelle (2016-11-18)

LEGISLATION & POLICIES / LÉGISLATION ET POLITIQUES

Marijuana tycoon says Canopy could survive 25 per cent Trudeau tax rate
The head of Canada's first publicly-listed marijuana producer said his company could still turn a profit even if Prime Minister Justin Trudeau's government decides to tax legal recreational weed at rates as high as 25 per cent. A task force is due to report this month on how Canada can build a legal weed market that squeezes out organized crime, protects minors, ensures quality and adds to revenue through taxes. Bruce Linton, chief executive officer of Canopy Growth Corp., says lawmakers will probably choose to control the distribution of recreational marijuana through government-run outlets such as liquor stores. "We can probably carry a tax burden of 25 per cent or so and end up in the consumers' hands on a still cost-competitive basis, with a superior product," Linton said in an interview at Bloomberg's Ottawa newsroom. Canopy, based in Smiths Falls, Ont., became the first marijuana producer to trade on a major North American stock exchange when it graduated to the Toronto Stock Exchange in July. It became the first publicly traded Canadian producer of the drug in 2014. The company's share price more than doubled this month, bringing its market value past $1.6 billion, on better-than-expected earnings and after U.S. elections widened the scope for legal marijuana. Canopy already produces medical marijuana under an existing legal regime. Linton says the company, which operates out of a former chocolate factory, can shift production to serve the recreational market when Trudeau's government makes that legal. Part of the appeal of the legal variety will be its quality control, Linton says. "When it's lawfully available from a reliable supply chain, which we know we can trust and believe in, there are a lot of people who might discontinue the use of say a glass of wine or a beer and try this." Canopy can also generate new formulations of medical marijuana to sell through pharmacies as legalization moves ahead, Linton said. Loblaw Cos., owner of the Shoppers Drug Mart pharmacy chain, has signalled it wants to sell medical marijuana. Postmedia Network (Leader-Post, B6, StarPhoenix, Vancouver Sun)

Ottawa pot dispensaries back in business after police raids
At least two illegal marijuana dispensaries in Ottawa have reopened after police raids closed them down earlier this month. Seven shops were shut down following complaints about the growing number of dispensaries in the city. Two Green Tree Medical Dispensary locations visited by CBC News on Sunday were open for business, although shop attendants refused to provide any sort of comment. "It's a reality," said Rideau-Vanier Coun. Mathieu Fleury. "Until we have the federal framework in place and better coordination provincially ... it's going to be that game of closing and opening." Fleury said he knows there are concerns in his ward about the illegal dispensaries and their effect on the community and people shouldn't stop giving their input on the issue because some of the dispensaries have reopened. "We have to continue to monitor, to enforce. Especially based on community complaints and community feedback and information gathering." On Nov. 4, two marijuana shops in Fleury's ward were raided by police but that hasn't deterred others from getting into the business. He said he's aware of two new shops that have opened recently but still thinks the raids were a good idea. "There's huge gains from the raids that have been put in place. I know that's contentious to say but the perception that these locations were offering legal marijuana is now clear that it is not. That element has been clarified." The federal government has promised to introduce legislation to legalize marijuana by the spring of 2017, but the possession, production and trafficking of marijuana remains illegal. CBC News

Feds closer to new policy on medical pot for vets
The Trudeau government is getting closer to having a new policy on medicinal marijuana for our veterans, who take the drug to treat conditions like PTSD. The veterans affairs department has been reviewing the issue of medical pot after concerns were raised earlier this year that the department is compensating vets for up to ten grams of marijuana a day. News 1130

Legal pot in Canada could sell for $5 a gram — or less
Uncle Ike's Budget Bud is the cheapest pot we've found anywhere. A product line of a Seattle, Wa.-based marijuana retailer, it lives up to its name at US$99 an ounce. That works out to $4.76 a gram Canadian, and it would put the cost of a joint in the $1.50-$2 range. Global News (2016-11-20)

Legalizing marijuana isn't apt to bring a windfall for governments
An opinion piece states, "Several economic myths have surrounded the legalization of marijuana. This has maintained the illusion that it would be a bonanza for federal and provincial treasuries because of the supposed enormous tax revenues that legalization would generate. The Parliamentary Budget Office in Ottawa is to be congratulated for blowing up some of these myths in its report, published this month,on projected marijuana tax revenues following legalization in Canada in 2017 or 2018..." Montreal Gazette (2016-11-20)

Du pot légal près de chez vous
D'ici à ce que le Canada arrive à la conclusion de sa longue démarche visant à légaliser la marijuana, les amateurs de cannabis du Québec, plus précisément ceux de la Beauce, pourraient avoir accès à une source légale de marijuana à des fins récréatives à quelques minutes de chez eux. La Presse (Le Soleil, 3; Le Quotidien) (2016-11-20)

Où acheter la marijuana une fois sa consommation légalisée?
Si la consommation de cannabis devient légale au Canada, la vente de cette substance devrait être bien encadrée, suggère un nouveau rapport de l'Institut national de santé publique du Québec. « On ne peut pas imaginer de distribution libre à but lucratif comme n'importe quel produit qu'on vend », affirme Réal Morin, médecin-conseil et coordonnateur du chantier cannabis à l'Institut. Le Dr Morin croit que la vente du cannabis devrait être confiée à une « agence gouvernementale de type monopole d'État ». En entrevue à l'émission 360 PM, il a précisé que cette organisation devrait avoir la prévention comme principale préoccupation et non pas une mission économique comme c'est le cas d'autres sociétés d'État. Radio-Canada (2016-11-20)

EDITORIALS & OPINIONS / ÉDITORIAUX ET LETTRES D'OPINIONS

RCMP overstating 'surveillance lag'
An opinion piece states, "The RCMP has been lobbying the government behind the scenes for increased surveillance powers on the faulty premise that their investigative powers are lagging behind those foreign police services. The centre piece of the RCMP's pitch is captured in an infographic that purports to show that foreign governments are legislating powers that are more responsive to investigative challenges posed by the digital world. On the basis of this comparison, the RCMP appears to have persuaded the federal government to transform a process intended to curb the excesses of Bill C-51 into one dominated by proposals for additional surveillance powers. The RCMP's lobbying effort misleadingly leaves an impression that Canadian law enforcement efforts are being confounded by digital activities. For example, in its comparative sample (which includes Australia, New Zealand, the United Kingdom and the United States) Canada is presented as the sole country lacking a legal obligation compelling Internet companies to design their services around state surveillance requirements. In fact, Canada already imposes this obligation on mobile service providers in spectrum licences. Furthermore, communications providers demonstrated to the government in 2013 that their networks are generally becoming intercept-ready even in the absence of a legal obligation to do so. The RCMP also misrepresents the legality of foreign surveillance powers. For example, a proposal to require the retention of communication interaction data is presented as "under discussion" in the U.K. In fact, this power has been found unconstitutional by the

U.K. divisional court and is currently on appeal to the EU's highest court, which has already struck down its predecessor legislation." Toronto Star, A11

Native policing

A letter to the editor states, "Re Either Fund Native Police, Or End Them (editorial, Nov. 15): While I expect the editorial questioning the skills and capacity of "native police" after the in-custody suicide of Lena Anderson was well-intentioned, may I point out that many indigenous Canadians have died in the custody of well-funded mainstream non-indigenous police forces? Take for example, Solomon Uyarasuk, a young Inuk man in Iglulik who, after being taken into RCMP custody in 2012, died alone in his cell where he had been left naked, but for his belt. Despite inquiry after inquiry into the deaths of indigenous people in custody, many of which have stated that hanging points should not exist in cells, he was left alone with a belt and a hanging point. Clearly, upstream solutions to complex mental health and societal problems are needed, but these repeated in custody scenarios are appallingly grievous." Globe and Mail, A10

Canada's national security oversight is among the weakest in the world: former human rights advocate

An opinion piece by Steven Zhou, Toronto writer and human rights advocate, states, "There doesn't seem to be much that Canada's intelligence and spy agencies can't do these days-and that includes breaking the law. While much of world remains anxious about the future of a Donald Trump presidency, Canadians should refocus their attention back home, and they should start with the country's bloated national security state. Experience shows that most of a country's establishment systems have likely transcended partisan lines and will remain immune to changes in political personality. National security seems to be one of these categories and its pervasive entrenchment within post-9/11 democracies has been demonstrated both in and outside of American borders. The Canadian security apparatus is a good example of how partisan changes usually have minimal impact on the larger system. There is no Canadian Edward Snowden to shed light on the extensive surveillance and policing machinations of CSIS or the Communication Security Establishment (CSE)... A federal court made national news last week by rebuking CSIS for essentially hiding a giant database full of private information belonging to law-abiding Canadians who pose no threat to public safety. Its watchdog group, the Security Intelligence Review Committee (SIRC), had previously asked CSIS to disclose the existence and full capabilities of this database to the courts, but the spy agency refused and kept things secret for a whole decade. The revelation has been an embarrassment for Public Safety Minister Ralph Goodale, who's been conducting a national consultation on how to reform Canada's security regimes. When asked why CSIS kept the database a secret from the courts, agency director Michel Coulombe simply said that he had no good explanation... There's precisely one person, the CSE Commissioner Jean-Pierre Plouffe, who's supposed to overlook the entire slew of intelligence-related activities that are carried out by the agency on a regular basis... Minister Goodale has promised swift action, but until those words actually manifest themselves into serious institutional change, then Canada will still remain the country with perhaps the weakest national security oversight in the Western world." CBC News (2016-11-20)

Give all officers training in mental-health skills

A letter to the editor states, "Re: "Police seek budget for mental health officers," Nov. 17. We do not need two mental health officers, we need the existing force, and all new recruits, trained in basic mental health and communication skills, as well as violence prevention. You need to have coverage for all times of the day, and two officers wouldn't cut it. As most normal police/civilian interactions are stressful, these courses would help here as well. With proper training, willing officers can help change the stigma of mental illness..." Times Colonist (2016-11-20)

Ottawa should be careful on expanded police powers

An editorial states, "Crime, like everything else, has been transformed by the digital age. Fraudsters, child pornographers and terrorists, among others, are becoming ever more expert in using digital technologies to commit their offences and cover their tracks. Not surprisingly, this has created new challenges for law enforcement. Police chiefs across Canada claim investigators do not have the tools to keep up. Many say concerns about privacy have scuttled their attempts to convince politicians to provide them with the cyber-surveillance powers they need to do their job. As Bob Paulson, commissioner of the Royal Canadian

Mounted Police, puts it, "We're losing our ability, if we haven't lost it entirely, to bring the traditional investigative response to technologically facilitated crime because of the misunderstanding, in my view, of the privacy threat." This week, Paulson shared with reporters from the Star and CBC News case files he says demonstrate the obstacles his force faces, an attempt to help the public understand the need for new police powers the federal government is currently floating... And that's to say nothing of security agencies themselves. The recent revelation that the Canadian Security Intelligence Service illegally spied on people suspected of no wrongdoing is a timely reminder that expanded powers must be accompanied by expanded oversight... In recent decades, and in particular with the passing of the overreaching Bill C-51, the trend has been to expand the powers of the security establishment without offering counterbalancing privacy protections or safeguards against abuse... The public consultation now underway won't mean much unless Canadians understand, yes, the challenges police face, but also the risks of their proposed remedies, including the threats to personal privacy and security posed by an ever-expanding surveillance state." Toronto Star (2016-11-18)

Ottawa should be careful on expanded police powers
An editorial states "Crime, like everything else, has been transformed by the digital age. Fraudsters, child pornographers and terrorists, among others, are becoming ever more expert in using digital technologies to commit their offences and cover their tracks. Not surprisingly, this has created new challenges for law enforcement. Police chiefs across Canada claim investigators do not have the tools to keep up. Many say concerns about privacy have scuttled their attempts to convince politicians to provide them with the cyber-surveillance powers they need to do their job. As Bob Paulson, commissioner of the Royal Canadian Mounted Police, puts it, 'We're losing our ability, if we haven't lost it entirely, to bring the traditional investigative response to technologically facilitated crime because of the misunderstanding, in my view, of the privacy threat.' This week, Paulson shared with reporters from the Star and CBC News case files he says demonstrate the obstacles his force faces, an attempt to help the public understand the need for new police powers the federal government is currently floating. The cases are no doubt disturbing, tales of child abusers and wannabe terrorists evading justice. But while they clearly illustrate new and thorny police challenges, they do not establish that the requested powers are necessary or proportionate or to what extent they would endanger privacy or even weaken security. Paulson is right that an informed public discussion about these difficult issues is necessary and that the evolving nature of cyber-crime is an important part of that discussion. But a closer look at the requested powers shows that Paulson's story is not the whole story." Toronto Star (2016-11-18)

The RCMP needs you scared - and the media seems happy to help
An opinion piece states "Long before email, metadata and GPS tracking, King Louis XIII's hatchetman Cardinal Richelieu said: 'If one would give me six lines written by the hand of the most honest man, I would find something in them to have him hanged.' Nothing's changed. The RCMP is back at the back door, lobbying the government for greater powers to access digital evidence - and now they're using the media to make their case. Recently, the RCMP self-selected 10 investigation files and fed summaries to the CBC and Toronto Star. Details that could compromise ongoing investigations (or be used by journalists to fact-check) were redacted. Both media outlets dutifully gave the Mounties the headline they wanted - one about how child predators, drug gangs and terrorists are escaping justice. The RCMP's proposed solution is, of course, more police power. It's always more police power. The RCMP wants laws that would compel suspects to hand over passwords, grant warrantless access to subscriber information and require telecommunication providers to build back-door intercept capabilities into their networks." iPolitics (2016-11-18)

Pas d'accusations à Val-d'Or, deux à Schefferville, le DPCP s'explique
Jeudi, il a été révélé qu'Alain Juneau a été accusé d'agressions sexuelles contre des femmes autochtones ; des gestes qu'il aurait posés à Schefferville, entre 1992 et 1994, au moment où il travaillait comme policier pour la Sûreté du Québec (SQ) sur la Côte-Nord. Le DPCP devrait en faire l'annonce dans sa conférence de presse. Et il appert aussi qu'un policier autochtone de Schefferville ferait l'objet d'accusations, selon ce qu'a appris Radio-Canada. Octobre 2015, le Québec sous le choc. Rappelons

qu'en octobre 2015, la diffusion de témoignages accablants de femmes autochtones de Val-d'Or, disant avoir été victimes de violence sexuelle et d'abus de pouvoir de la part de policiers de la SQ, avait secoué l'ensemble du Québec. Ces révélations de l'émission Enquête de Radio-Canada avaient conduit le ministère de la Sécurité publique du Québec à confier au Service de police de la Ville de Montréal (SPVM) le soin d'enquêter sur les comportements allégués d'agents de la SQ. Le DPCP a par la suite analysé 37 dossiers qui lui avaient été remis par le SPVM. Presse canadienne (Radio-Canada, Huffington Post); CBC News; TVA Nouvelles; La Presse; Le Devoir (2016-11-18); Globe and Mail, A3; Leader-Post, N3; Ottawa Sun, A16; Postmedia Network (London Free Press, N3; Montreal Gazette, Edmonton Journal, Windsor Star, Vancouver Sun, Calgary Herald); * Le Droit, 29 (2016-11-19)

Hamilton's horror - Cops not naming names in child abuse scandal telling
One lone name stood out on the press release outlining those charged in the monstrous serial molestation of a little Hamilton girl. Can I remind you, she's seven. And while he was not directly connected to the little girl, the only name on that release was Geoffrey Burnet. And so far, he's the only one we have. According to cops, the girl's mother's boyfriend was allegedly offering her for sale on Craigslist. Seven people were arrested - no names. In the case of the mom and her boyfriend it's easy to see why there were no names. Postmedia Network (Winnipeg Sun, A7; Calgary Sun, Edmonton Sun) (2016-11-20)

Surge in domestic handgun trafficking
Danny Santapaga, a self-employed financial adviser, bought 14 guns on 10 different occasions over seven months. Plumber Graham Jovanovic purchased nine firearms over five weeks. University student Justin Green obtained 23 handguns during a 22-month period, including 15 from one store. Security guard Andrew Winchester acquired 47 handguns in a six-month buying binge. Hamilton Spectator (2016-11-19)

Big Brother et « Five-eyes »

La consultation sur la sécurité nationale menée par le gouvernement Trudeau tire à sa fin et deux événements récents appellent les Canadiens à la plus grande vigilance pour la suite des choses. L'affaire de la surveillance des journalistes au Québec et le jugement de la Cour fédérale sur la collecte et la rétention de données personnelles par le Service canadien du renseignement de sécurité (SCRS) montrent bien que l'équilibre entre la sécurité et la protection de la vie privée reste au centre des préoccupations devant les demandes incessantes de pouvoirs accrus des autorités. Les libéraux ont promis en campagne d'« annuler les dispositions problématiques » du projet de loi C-51 adopté en vitesse après les attaques d'octobre 2014, législation qu'ils avaient appuyée avec réserve. Ils ont inclus cet engagement dans une consultation plus large basée sur un livre vert qui lance les discussions. Le gouvernement est déjà passé à l'action sur un aspect de la consultation, soit la supervision politique des agences et organismes chargés de la sécurité nationale. Le projet de loi C-22 prévoit la formation d'un Comité parlementaire sur la sécurité nationale et le renseignement. Tenus au secret, ses membres auront un accès sans précédent au Canada aux informations sur les opérations liées à la sécurité nationale. Le ministre de la Sécurité publique, Ralph Goodale, a expliqué son empressement en indiquant que le Canada était une « anomalie » en la matière par rapport à ses partenaires de ce club du renseignement qu'est le « Five-Eyes », qui regroupe aussi les États-Unis, la Grande-Bretagne, l'Australie et la Nouvelle-Zélande. Il s'est d'ailleurs rendu en début d'année à Londres, se disant inspiré par le modèle britannique, qui a le grand mérite selon lui de ne pas avoir donné lieu à des fuites qui auraient pu mettre en danger la sécurité nationale. La participation du Canada aux échanges du groupe Five-Eyes est d'ailleurs un élément central du contexte dans lequel les nouvelles normes canadiennes sur la sécurité nationale seront définies. C'est un aspect que les Canadiens doivent garder à l'esprit quand ils

évaluent les positions des autorités compétentes et des défenseurs de la vie privée. Étant donné l'attirance britannique du ministre Goodale, l'adoption jeudi dernier à Londres du projet de loi sur les pouvoirs d'investigation mérite l'attention. Fait intéressant, d'autres dispositions de la même loi se retrouvent parmi les hypothèses soumises aux Canadiens par le ministre Goodale dans son livre vert. C'est ainsi que les fournisseurs britanniques de services de communication (FSC) devront conserver pendant une année les données de navigation en ligne de leurs clients et que les enquêteurs pourront accéder sans mandat aux données de connexion. Les FSC seront contraints d'aider les autorités lors d'interceptions ciblées, en plus de devoir retirer sur demande leur propre chiffrement des données. Le Devoir, A3

Senator tables bill to protect source confidentiality

The relationship between a journalist and a confidential source is sacrosanct, according to a Parliamentarian who wants to enshrine that relationship in law. Amid a scandal over revelations that police in Quebec spied on several journalists, Conservative Senator Claude Carignan has introduced a private member's bill that aims to keep police from ferreting out reporters' sources. "It's a fundamental principle. It's very important to protect the journalist and also the whistleblower," Mr. Carignan, the Senate's opposition leader, told reporters in Ottawa on Tuesday. While Quebec recently announced a commission of inquiry into press-freedom issues, Prime Minister Justin Trudeau has resisted calls for a Canada-wide inquiry. But Mr. Carignan said Parliament cannot afford to wait. Bill S-231, the Journalistic Sources Protection Act, seeks to "protect the privilege of journalistic sources, and secrecy," he said. Last year, the RCMP ordered a Vice News reporter to surrender materials related to conversations with a Canadian member of the Islamic State. And the Mounties briefed Public Safety Minister Ralph Goodale last year about the fact that some detectives had shadowed a Quebec reporter who obtained a leaked CSIS document. Globe and Mail, A4

Watchdog wants rules for spies sharing info

Other national security agencies may be taking the same broad view of the law that led CSIS to illegally keep data on innocent people for almost a decade, the federal privacy watchdog says. Privacy commissioner Daniel Therrien said he's calling on Parliament for clearer rules about how spy- and law-enforcement agencies obtain, retain and destroy information on Canadians. Therrien said information-sharing powers granted in Bill C-51, the former Conservative government's controversial spying bill, need restrictions on what agencies can share and how long they can keep the information. "Security agencies, with (Bill C-51 powers) and with the absence of rules around retention, for instance, would be able to collect and retain information that they don't really need," Therrien told the Star outside a House of Commons committee Tuesday. "I don't dispute that CSIS needs to analyze information in order to do their job ... but once the analysis has been completed and the vast majority of people about whom they're collecting information are found not to be a threat, and that's the case, then they should destroy that information." "I don't think that's the kind of country we want, where the security services of the country hangs onto information on vast amounts of people in case it might be helpful one day," Therrien added. In his testimony before the access to information, privacy and ethics committee, Therrien noted Canadian spy agencies misusing powers is not a "theoretical" issue. He noted that CSIS was recently found by a federal court to have illegally kept data on an unknown number of innocent Canadians between 2006 and 2015. Therrien's comments come as the governing Liberals are in the midst of a wide-ranging review of Canada's national security agencies and issues of oversight for spies. They also come as Canada's national police force, the RCMP, are publicly arguing for expanded investigative powers in the online world. A spokesperson for Public Safety Minister Ralph Goodale said the minister looks forward to the Commons committee's report on Bill C-51's information-sharing powers and appreciates Therrien's insight into these issues. Toronto Star, A10

Territorial government preparing for federal marijuana legalization

The territorial government has formed an inter-departmental working group to prepare for the eventual legalization of marijuana across Canada. The group is also in discussions with the federal government, according to Department of Justice spokesperson Sue Glowach. The task force was established by the minister of Justice and Attorney General of Canada, the minister of Public Safety and Emergency Preparedness and the minister of Health, according to Glowach. She stated the task force's mandate is to inform the federal government's commitment legalize and regulate marijuana. The report is expected to

be released to federal ministers by the end of the month ahead of next April's anticipated marijuana legalization legislation. "The information on potential systems for production, distribution, promotion and taxation provided in the report should make it possible to determine what the role of the ... territories will be," she stated. CONTRACT & ABORIGINAL POLICING / SERVICE DE POLICE CONTRACTUELS ET AUTOCHTONES

Surrey's top cop concerned by ages of suspected shooters

The officer in charge of the **Surrey** RCMP says he's troubled that nine young people have been arrested in connection with a shootout in south Surrey. "To say anything other than the fact that they are youths would probably be saying too much," said Chief Supt. Dwayne McDonald. "I don't want to risk identifying them but youths involved in crimes such as that is definitely a concern for me and for the Surrey RCMP and for the city of Surrey." Several shots were fired in a hotel parking lot early Monday morning near King George Boulevard and 11th Avenue. One person was cut by broken glass but no one was seriously hurt. McDonald says he's heard false reports about the accused. "It was reported that some of the youths or many of the youths involved in yesterday's incident were part of our Wrap Program and that is not the case," he said. CBC News (2016-11-23); Times Colonist (2016-11-22)

Crime on decline in Surrey

Surrey's new top cop wants to change the perception that his expanding city is a hotbed of crime. "I believe, having lived and worked in Surrey for a number of years, the perception of crime in Surrey tends to be that crime is high," Chief Supt. Dwayne McDonald said Tuesday during a keynote address at a Surrey Board of Trade luncheon. "That's something that I want to address as an officer in charge." McDonald, appointed officer in charge of Surrey's RCMP detachment last month, pointed to the recently released third-quarter crime statistics as one reason for optimism. "We have work to do, but I'm pleased by the results," he said. According to the latest police statistics, there's been a 13 per cent decrease in violent crime, a slight decrease in property crime, a 38 per cent decrease in robberies, a 21 per cent drop in business break-and-enters, and a 17 per cent curtailment in incidences of theft under $5,000. Residential break-and-enters are up, however, and McDonald said that's an area police need to target. Province, A12 (Vancouver Sun)

Surrey police deny suspects were part of Wrap program

Surrey police deny that any suspects in a shooting Monday were participants in an anti-gang program for youth. On Monday, Kash Heed, a retired police officer and former B.C. MLA who served as minister of public safety and solicitor general, said a source had informed him that of the nine people arrested following a shootout in the parking lot of the Pacific Inn Resort and Conference Centre, five were students in Surrey schools and a person alleged to have had a gun was in Grade 8. Heed said three of the accused were involved in the Wraparound (Wrap) Program, a Surrey RCMP and school district initiative that works with at-risk youth to help them stay out of gangs and the criminal lifestyle. But following a keynote address Tuesday at the Surrey Board of Trade, Surrey RCMP Chief Supt. Dwayne Mc-Donald told reporters that none of the suspects was involved in Wrap. "It was a bit disappointing," Mc-Donald said. "It was factually inaccurate yesterday. It was reported that some of the youth or many of the youth involved in yesterday's incident were part of our Wrap program, and that is not the case. I won't get into too many details on that other than to say that that's inaccurate." As many as 20 shots were fired between two vehicles on Monday and one person was treated for minor injuries. Vancouver Sun, A11

Two tech initiatives launched to help keep Surrey safe

The **Surrey** RCMP and the City of Surrey on Tuesday announced the launch of two new technology initiatives under the City's new Public Safety Strategy. These initiatives will allow residents and businesses to become more engaged and play a larger role in keeping Surrey safe. The new Surrey RCMP App is a convenient, one-stop-shop for mobile device users to access information and resources on emerging crime trends, Surrey RCMP events, crime mapping, crime prevention and contact information. Users will also be able to view missing persons, most wanted persons, and photos of

unidentified suspects right from their phones to assist police and the community. Voice Online (2016-11-22)

Surrey launches public registry of CCTV cameras to cut crime
The City of **Surrey** has started rolling out its public safety strategy in collaboration with the RCMP and one of the latest additions could involve your home or business security camera. They're calling it Project IRIS and the idea is people will sign up online and tell the RCMP where their CCTV cameras are located. Police can then use that database to quickly track down security footage in the event of a crime. "I can tell you from experience that it is very common for most residents to have them and almost every business now," says RCMP Chief Superintendent Dwayne MacDonald. News 1130 (2016-11-22)

City of Surrey, RCMP prepare to launch 135A Street cleanup
Locals call it "the strip"; a notorious stretch of 135A Street between 106th and 108th Avenues where trafficking in drugs, sex, and stolen goods is commonplace. Now, the city and the RCMP are preparing to launch a comprehensive effort to address the various issues plaguing the area. "When we talk about 135A, we're really talking about a series of social issues," says Chief Superintendent Dwayne McDonald. "Certainly there is criminal activity that's involved there, but we're really dealing with a population which is venerable." McDonald stresses their approach will be more than law enforcement, and efforts will be made in collaboration with community partners to transition residents into the services they need. One of area's biggest issues is drug abuse. Of the 36 overdose cases reported in Surrey in the span of 48 hours this summer, most came from 135A Street. News 1130 (2016-11-22)

Police bust fentanyl lab in city's S.W
Two men have been charged after police busted a fentanyl powder reprocessing lab. **Calgary** police evacuated an apartment building in the 0-100 block of Westpark Link S.W. last week after officers found signs of the lab. Police initially entered the building on a search warrant for what was believed to be a heroin trafficking investigation. The RCMP Clandestine Laboratory Enforcement and Response Team was brought in to identify and remove the substances found in the residence. No one was injured as a result of the investigation. Police found 11 grams of methamphetamine, more than 26 gram of power cocaine, 65 grams of crack cocaine, 263 grams of fentanyl powder and 645 fentanyl pills as part of the search. Calgary Sun, A19 (Edmonton Journal, Calgary Herald) (2016-11-23); Canadian Press (Medicine Hat News); Calgary Herald (2016-11-22)

Alarm raised on fentanyl after overdose death
A **Nova Scotia** woman is raising awareness after her 21-year-old granddaughter's fentanyl overdose. Charly Ann Torikka, a young mother and Maple Ridge, B.C., resident, was found dead in bed by her boyfriend on Nov. 6. An autopsy report revealed fentanyl-laced cocaine was in her system, and her father used the media to warn others in B.C. about the drug. Now, the girl's grandmother, Lynda Koile, is doing the same on the East Coast. (…) RCMP spokeswoman Cpl. Jennifer Clarke said the department now has a supply of Naloxone, a drug that reverses or blocks the effects of opioids. "(It) is being distributed to employees across the province in stages. The first to receive the Naloxone kits are the employees who are the most likely to come into contact with it, then to those employees who are at a lower risk of contact," she wrote in a late October email. "We are actively rolling them out to the rest of the division." Chronicle-Herald, A1

Investigation into child's death delayed
A police investigation into the death of a four-year-old girl who died in care is waiting on paperwork, said an RCMP spokesman Tuesday. "There are different agencies involved here," said Sgt. Jack Poitras of **Edmonton**'s K Division. "Investigators are waiting for reports to come in." He said he couldn't release further information on what the reports are and doesn't know the timeline for the investigation. Serenity died on Sept. 27, 2014, while in kinship care, being looked after by family members. Her death prompted a review of the case by Alberta's child and youth advocate, who found that no workers had checked on Serenity or her two older half-siblings in almost a year before she died, despite reports she was unwell, malnourished and bruised. Medical records obtained by Postmedia showed Serenity weighed 18 pounds when she died. She was suffering from hypothermia and had multiple bruises, including around her genitals, when she arrived at hospital. Her hymen was gone. The Alberta medical examiner's report on

her death was completed almost two years after her death before being given to the RCMP, who asked that the report not be released. Poitras said the autopsy report will be withheld until the investigation is concluded. He added that due to the different agencies involved with children in care, it isn't uncommon for investigations to be delayed. Edmonton Sun, A9 (Calgary Herald, Edmonton Journal)

Youth charged over alleged terror threat
A youth arrested Thursday in **Yellowknife** faces a charge of making a hoax terrorism threat, RCMP stated in a news release. The youth, who cannot be identified, lives in the territory. An investigation started Nov. 1 that included the RCMP's Integrated National Security Enforcement Team in Alberta determined the threat was a hoax. It's unclear what the hoax allegation involves and RCMP aren't elaborating. "The rest of the information will come out in the court process," RCMP spokesperson Marie York-Condon stated in an e-mail. The youth's next court date was not known. Yellowknifer

Athol man arrested on child pornography charges
A 24-year-old Athol man has been charged with offences allegedly related to child pornography. The RCMP's Provincial Internet Child Exploitation Unit has charged Darryl Wayne Baxter with luring a child and six counts of breach of conditions. On Nov. 18, police searched a home in **Athol** and arrested Baxter at the scene without incident. He was held in custody pending an appearance in Amherst Provincial Court Tuesday. Chronicle-Herald, A5

Search for Chris Metallic continues four years later
Four years after a 20-year-old man was reported missing, **Sackville** RCMP continue to investigate the disappearance of Chris Metallic, and police officers will conduct new searches in the Sackville area in the coming days in hopes of getting more information that could help find him. Metallic was reported missing on Nov. 25, 2012, following a party at a residence in Sackville. A few days after his disappearance, footwear belonging to him was located off the Haute-Aboujagane Road. We continue to receive information about the disappearance of Chris Metallic. By conducting these new searches we will be following up on some of that information in order to see if it provides any more information about what happened to Chris. Sgt. Paul Gagné. Metallic is described as aboriginal, measuring six feet tall, and weighing about 180 pounds at the time of his disappearance. He has short, dark, black hair and was last seen wearing a shiny bright blue sweater and jeans. "We continue to receive information about the disappearance of Chris Metallic," says Sgt. Paul Gagné with the Sackville RCMP. "By conducting these new searches we will be following up on some of that information in order to see if it provides any more information about what happened to Chris." Times & Transcript, A8 (Guardian)

Claims of attacker in clown mask could lead to charges in Port Hardy
Port Hardy RCMP are preparing to bring mischief charges against a 19-year-old man suspected of clowning around with the law. The move follows a month-long investigation of a reported October assault where the man said he had been set upon by someone wearing a clown mask. Police allege the report was false and misled the detachment. The incident mirrors the "creepy clown" phenomenon in Canada and the United States that has seen people dress up as clowns to scare or surprise others. Victoria police had an experience with the phenomenon when a man possibly disguised with a clown mask was arrested in October for a burglary at Frank White's Dive Store. Port Hardy RCMP Cpl. Stuart Foster said every report received by the detachment is taken seriously. "Investigations such as these, where there are no witnesses and [they] allege a violent offence, are especially difficult and time-consuming to investigate," Foster said in a statement. He said specialized RCMP units were brought to Port Hardy to help investigators. "It is not only a waste of resources, it is a criminal offence and one for which we will seek charges," Foster said. Times Colonist

Jury Hears Of Suspected
An ex-girlfriend of an accused gangster boss killer told an **Edmonton** jury Tuesday she saw her boyfriend give a suspected gun to one of his drug thugs a few days before the killing. Testifying at the first-degree murder trial of Josh Petrin, Karissa Dow, 24, told jurors she dated Petrin from 2010 to November 2012 culminating in the birth of their daughter following his arrest. 'Patched' member Dow testified that Petrin, 33, revealed to her that he was a "patched" member and a "boss" with the "drug-dealing" White Boy Posse street gang and said he has a WBP tattoo on his arm. (…) Under cross-examination, Dow told

defence lawyer Markham Silver that she never saw Petrin hand anything to Halbauer and agreed she does not know what he might have given him. She also agreed that drugs were sometimes stashed in the same places where guns were. Dow also said in crossexamination that she was pressured to speak with the RCMP and told jurors that one Mountie threatened to have her jailed and to have her newborn baby taken away. She clarified to Rudiak that the officer told her after Petrin's arrest that they could take away her child. She also said the officer told her friends she was going to deliver the baby while in jail. She added her daughter was never taken away and she was never charged. Postmedia Network (Edmonton Sun, A5, Edmonton Journal)

Denecho King murder case moves to preliminary inquiry

A preliminary hearing for a man charged with second degree murder and attempted murder began Monday, almost two years after police found two men seriously injured in a downtown apartment building. John Wifladt, 39, succumbed to his injuries while Colin Digness, who is in his early 40s, was medevaced to **Edmonton** for further medical treatment. Denecho Noel Calvin King, 24, was charged with second degree murder and attempted murder months after police responded to the early morning incident Dec. 14, 2014, at the Sunridge Place apartment building on 51A Avenue. Eleven days have been set aside for NWT Territorial Court Judge Robert Gorin to hear evidence in the case and to decide whether it is strong enough to proceed to trial on the charges police announced against King on May 1, 2015. The Crown may call up to 40 people to testify, defence lawyer Jay Bran has previously said. Crown prosecutor Alex Godfrey was expected on Tuesday to call paramedics who transported the two men to hospital as the hearing continued. A publication ban was imposed on testimony and exhibits, such as photos of items in the apartment. The ban means little can be reported about what occurred. The preliminary inquiry began with testimony from five RCMP officers Monday in Courtroom 4, one of the smallest courtrooms in the building. There was added security, with two RCMP officers keeping watch. A third RCMP officer in a suit watched from the gallery as evidence was given. King also faces a charge in connection with an escape from the North Slave Correctional Centre on Aug. 10. King, wearing grey sweatpants, a white T-shirt with a graphic print, remained in leg shackles during the hearing as he sat beside his lawyer. He listened without any obvious reaction to the testimony of five RCMP officers, slumping in his chair as the hearing wore on through Monday afternoon. The public gallery remained largely empty on the first day of the hearing. Yellowknifer

Sask. community up in arms over RCMP carbine training

Drew Erickson thought he knew what he was getting into when he built his home in Stone Pointe Estates in 2011. Stone Pointe is an up-scale neighbourhood located east of **Regina**. The community has about sixty-five homes, many valued at more than a million dollars. For the last two summers, it has also had some very noisy neighbours. Across the road is the Regina Wildlife Federation and its gun range. At first, Erickson's family heard what they expected: small caliber fire and the odd shotgun. That all changed one summer morning in 2015. "We awoke, about a quarter after seven, to what sounded like automatic rifle fire, very loud, rapid succession." According to the Regina Police Service which uses the same weapon, C8 Carbines are noisier than typical rifles or shotguns because the projectile travels faster than the speed of sound. The gun fire could be heard in Emerald Park and White City two kilometres away. Erickson, who lives just a few hundred metres away, says it's like living in a war zone. He said the gunfire woke his wife, who is from South Africa, and sent her into a panic. "When she heard that noise when she was a kid, that meant somebody nearby was in peril," Erickson explained. It's not just his wife either. When the matter was brought before the RM by Erickson and a group of concerned community members, it was mentioned some members of the group had immigrated to Canada from a war-torn country. Erickson said a man and his wife heard the gunfire on their first day in the community. "She effectively thought she was back in a war zone," he said. "This is not why they came to Canada. This is not why they came to live in a rural community." Erickson says closing doors and windows does little good. He says the RCMP needs to find another range, away from the community. "Our community is at the point where we've done our time, we've taken our turn, this is two summers in a row, and if it's a third it's unnaceptable." CBC News

Body of missing Trail, B.C., senior found - Ida Cragnolini had dementia and had gone missing in the past

The body of a 70-year-old woman with dementia has been found. Ida Cragnolini went missing in **Trail B.C.** on Sunday, according to the RCMP. RCMP, search and rescue teams and members of the public

had been searching for Cragnolini after she left her residence near the Waneta Plaza shopping mall Sunday morning. She was last seen around 4 p.m. PT in the east Trail area. Her body was located before noon on Tuesday in the Miral Heights area not far from where she was last spotted, according to a family friend. CBC News (2016-11-22)

Nunavut police plan "comprehensive review" of coroner jury findings
The **Nunavut** RCMP plans to review and consider recommendations made by the recent coroner's inquest in Igloolik, reporting back to the Nunavut Coroner next year on progress made towards change. That news came in a Nov. 21 news release from the RCMP V Division in connection to the 25 recommendations made by a coroner's jury which looked into the March 2012 death of Felix Taqqaugaq in Igloolik. That news came in a Nov. 21 news release from the RCMP V Division in connection to the 25 recommendations made by a coroner's jury which looked into the March 2012 death of Felix Taqqaugaq in Igloolik. Nunatsiaq Online (2016-11-22)

Three busted as RCMP raids 'sophisticated' drug lab in Ajax
Three men are facing charges after the discovery of what police are describing as a "sophisticated" drug lab in **Ajax**. Investigators spent three days removing chemicals used in the production of ketamine from the residence, at 4 Bunting Court, RCMP said. A search warrant was executed at the house Nov. 18, Mounties said. Some of the chemicals found in Ajax have been linked to a company investigated by the RCMP earlier this month, police said. Two men associated with that company have been charged with selling chemicals knowing they would be used to produce illegal drugs. Inside Halton (2016-11-22)

RCMP Turn to Public to Help Solve Homicide From 2007
RCMP are turning to the public for clues in the 2007 killing of a grandmother in **Portage La Prairie**. Charlene Ward was discovered dead in her home more than nine years ago. On October 31, 2007, Ward went out with friends to Cat & Fiddle Nite Club in Portage La Prairie. She then returned to her home with friends for a party that ended at 8:00 AM the next morning. Ward's body was found about 45 minutes later in her home on 5th Avenue NE. RCMP ruled Ward's death a homicide but to date, no one has been arrested. Officers believe someone has information related to this crime and are asking anyone who can help find Ward's killer to contact them at the RCMP tipline. AM 900 CHML (2016-11-22)

Virden team's Mountie jerseys raise hundreds for charity
A **Manitoba** Junior Hockey League team in Virden, Man. thought their new jerseys would make people smile but had no idea how big of a hit they would actually be. Styled after a Mountie uniform, the Virden Oil Capitals' wore Red Serge shirts, black pants with yellow stripes and brown socks to mimic RCMP dress uniforms on Nov. 12. It was the second year in a row the team temporarily changed their jerseys to honour first responders in the province. "It seemed like the perfect fit," said Brandi Pollock, marketing coordinator with the Virden Oil Capitals, about the decision to recognize RCMP officers. "They came out and you could just see the looks on people's faces ... a lot of excitement." Now for sale on eBay, the team's special uniforms have more than a dozen bids each and are selling for hundreds more than the original asking bid of $80. CBC News (2016-11-22)

NATIONAL INQUIRY INTO MISSING AND MURDERED INDIGENOUS WOMEN AND GIRLS / ENQUETE NATIONALE SUR LES FEMMES ET LES FILLES AUTOCHTONES DISPARUES ET ASSASSINEES

Aboriginals seek inquiry into alleged abuse by police
Premier Philippe Couillard has promised to meet with indigenous leaders to discuss ways to investigate alleged "systemic racism" in Quebec. "We're aware of the enormous trauma in aboriginal communities, we're not trivializing it ... we'll find concrete ways to bring some answers," the premier said. Couillard made the remarks Tuesday at the National Assembly, where a dozen women stood wearing small, red felt dresses pinned to their shirts, reminiscent of the red square worn by student protesters in 2012. They said the red dress symbolizes the murdered and missing aboriginal women. The Couillard government has suggested that Canada's national inquiry into missing or murdered indigenous women is a sufficient vehicle for examining alleged abuse of aboriginal women by police forces. But on Tuesday, aboriginal

women argued Quebec's problems will be lost in a national inquiry. Montreal Gazette, A10; Le Devoir; TVA Nouvelles; La Presse Canadienne (L'actualité, Radio-Canada); La Presse; Huffington Post Québec

Anti-violence campaign to begin Friday
A coffee house, panel discussions, the Take Back The Night march and a family day are all part of the list of events on tap for this year's 12 Days to End Violence Against Women campaign. Set for Nov. 25 to Dec. 6, the annual campaign that's organized by a variety of local groups aims to draw attention to the issue of violence against women. Panelists will include Patricia Bacon, a human sexuality expert and executive director at the Blood Ties Four Directions Centre; Mark Rutledge, a White Ribbon Yukon member and father; and Sara Tillett, a counsellor at Golden Horn Elementary School. That will be the first of two panel discussions included in the campaign's schedule. The other one will focus on missing and murdered indigenous women in Canada and is scheduled for noon on Dec. 5 at Yukon College. Whitehorse Daily Star, 5

Elsipogtog hoops player takes a knee in support of missing and murdered aboriginal women
Quentin Sock has some personal experience with the issue of missing and murdered aboriginal women and girls. The 30-year-old student athlete at St. Thomas University, a member of the Elsipogtog First Nation, and the men's basketball team at the school, was one of the organizers of an awareness campaign/protest at the Tommies' Atlantic Collegiate Athletic Association basketball home game against the University of Kings College Blue Devils earlier this month in Fredericton. Before the playing of the national anthem prior to the game, the entire Tommies team quietly took a knee. Sock and team co-captain Jeremy Speller, a native of the Gesgapeplag First Nation in Quebec, bowed their heads and raised a red shawl, a symbol of the plight of missing and murdered aboriginal women across the country. They did so with the blessing of the university president, Dawn Russell, and the university community. Literature handed out with the program, quoting the Native Women's Association of Canada and the Government of Canada, noted that 16 per cent of all women murdered in Canada between 1980 and 2012 were of aboriginal descent and notes that, "the RCMP has identified that there may be 1,181 missing and murdered Aboriginal women and girls." Times & Transcript, D3

Aboriginal women repeat calls for inquiry into alleged abuse by police
Premier Philippe Couillard has promised to meet with indigenous leaders to discuss ways to investigate alleged "systemic racism" in Quebec. "We're aware of the enormous trauma in aboriginal communities, we're not trivializing it ... we'll find concrete ways to bring some answers," the premier said. Couillard made the remarks Tuesday at the National Assembly, where a dozen women stood wearing small, red felt dresses pinned to their shirts, reminiscent of the red square worn by student protesters in 2012. They said the red dress symbolizes the murdered and missing aboriginal women. "It's the province's responsibility to launch an independent inquiry," said Donna Larivière of Quebec Native Women, who categorically rejected the recent conclusions of a Montreal police investigation into Sûreté du Québec officers alleged to have abused aboriginal women in Val-d'Or. Montreal Gazette; CBC News (2016-11-22)

Enquête nationale : la relation entre les autochtones et les forces de l'ordre sera analysée, assure Michèle Audette
La commissaire de l'enquête nationale sur les femmes et les filles autochtones disparues et assassinée, Michèle Audette, assure que la relation entre les autochtones et les forces de l'ordre sera analysée par la commission. Depuis que le Directeur des poursuites criminelles et pénales (DPCP) a rendu publique sa décision de ne pas accuser les six policiers suspendus de Val-d'Or, plusieurs membres des Premières Nations réitèrent leur demande de tenir une commission d'enquête indépendante québécoise sur la relation entre leurs communautés et les forces de l'ordre. La commissaire Michèle Audette a accordé une entrevue à Annie-Claude Luneau mardi après-midi. Elle assure que l'étude des relations entre les peuples autochtones et les représentants des forces de l'ordre sera étudiée lors de la commission d'enquête nationale sur les femmes et les filles autochtones disparues et assassinées. Radio-Canada (2016-11-22)

The girls on Commercial Drive
The number of Missing and Murdered Indigenous Women (MMIW) continues to rise in Canada, and one local woman is working to educate the valley. Sherry Tinsley, owner of A Cut Above in Valemount, has

four red dresses and one empty post in the field beside her store on Commercial Drive. Rocky Mountain Goat News (2016-11-22)

'He's still a coward': Six Nations man who strangled woman pregnant with his baby leaves court a free man
Kent Owen Hill walked out of court a free man on Monday after pleading guilty to manslaughter and being sentenced to time served in the death of Tashina General and her unborn child... In an agreed statement of facts read by Brant County Crown attorney George Orsini, court heard that General met Hill when she was 16 and dating another player on the Six Nations lacrosse team... Orsini said the crime had a significant impact not just on Six Nations but on "other First Nations communities in this country." "They consider Tashina one of those missing and murdered aboriginal women." National Post (2016-11-22)

Aboriginal women repeat calls for public inquiry into police abuse
A dozen aboriginal women traveled to the National Assembly on Tuesday with small, red felt dresses pinned to their shirts, reminiscent of the red square worn by student protesters in 2012, and a message for parliamentarians. They said the red dress symbol is to remember all the murdered and missing aboriginal women. "It's the province's responsibility to launch an independent inquiry ... because we're talking about criminal acts," said Donna Larivière of Quebec Native Women, who categorically rejected the recent conclusions of a Montreal police investigation into Sûreté du Québec officers alleged to have abused aboriginal women in Val D'Or. Quebec's Director of criminal and penal prosecutions decided to forgo charges against the Val D'Or police but charged two retired SQ officers from Schefferville, as a result of the police investigation. "We don't believe in police investigating police," Larivière said. The Couillard government said last week it will let the national inquiry into missing or murdered indigenous women and girls continue the work. But on Tuesday, aboriginal women argued Quebec's problems will be lost in a national inquiry. Montreal Gazette (2016-11-22)

To Remember the Missing and the Murdered (and to Inspire New Music), a Marathon of One
In British Columbia, they call it the Highway of Tears. A 450-mile stretch of road along the Trans-Canada Highway has claimed the lives of dozens of young women, many of them indigenous, who have disappeared on this road or were murdered nearby. Across Canada, the numbers of missing and murdered indigenous young women over the last several decades is exponentially higher, with estimates as high as 4,000. It was the type of news that was hard to ignore in Manitoba, where Tracie Léost, the featured subject of a new video for Cass McCombs's "Run Sister Run" quickly became outraged. "Every second day it seemed like there was another story about a young First Nations female who had gone missing or murdered," Léost remembered recently by phone from Winnipeg, where she is now studying social work at the University of Regina. "And our prime minister at the time, Stephen Harper, denied that there needed to be an open inquiry into it. I kept bringing it up to my indigenous studies teacher until finally he said to me, 'If you want to see changes, why don't you do something about it?' " And so, in August 2015, Léost, a track and field athlete, set out on a four-day solo journey on foot, covering 115 kilometers in a solo run to raise awareness about what she viewed as an unsettling epidemic. Vogue (2016-11-22)

Rendu malade par le pot, il menace Trudeau
Favorable à la légalisation du cannabis, le premier ministre Justin Trudeau a été victime de menaces de mort d'un jeune Montréalais en proie à des troubles psychiatriques aggravés par la marijuana, cet été. «La drogue, je ne veux plus en prendre», a dit ce dernier devant un tribunal après avoir été déclaré criminellement nonresponsable de ces délits, puis enfermé dans un hôpital du-rant deux mois. Selon une décision récente de la Commission d'examen des troubles mentaux, le Montréalais, dont l'identité n'a pas été rendue publique, a acheminé un courriel au bureau du premier ministre, le 10 juin dernier. «Je te jure, Justin, je commence à m'entraîner pour te tuer si tu ne fais rien pour mon cas», a-t-il écrit dans un message confus. Sans réponse, il a ensuite téléphoné au bureau de M. Trudeau et réitéré ses menaces avant d'être arrêté par la GRC. Journal de Montréal, 15

Border agency touts drug, gun seizures

Loaded guns, stolen vehicles, child pornography, weed, booze and tobacco are all things that have been seized by the Canadian Border Services Agency in Atlantic Canada in the last quarter. The agency processed about three million travellers at its 50 service locations in the Atlantic region from April to October 2016. Details of its activities were released Tuesday. On Oct. 3, border officials at the the St. Stephen 3rd Bridge port of entry in New Brunswick searched a motorhome and found four tasers, five pepper spray canisters, a loaded 9mm handgun and a loaded .357 Magnum, which are prohibited weapons in Canada. A traveller got $2,300 in fines after pleading guilty the next day to failing to report weapons and providing untrue statements under the Customs Act. "It is important that anyone travelling to Canada understand that undeclared and prohibited firearms are not allowed in our country," said Calvin Christiansen, CBSA director general for the Atlantic region said in a news release. "We welcome our United States neighbours but remind them to leave their guns at home." On their way to inspect a vessel with three foreign nationals arriving in Shelburne, CBSA officials received a tip that a number of bags containing wine, rum, tobacco and marijuana were found in the woods in the region. Officers were able to determine that the bags belonged to the individuals on the vessel, and each traveller was charged with three offences under the Customs Act: non-report of alcohol, tobacco and marijuana; making false statements; and smuggling. They each pled guilty to non-reporting. Fines of $2,500 (for the captain), $1,000, and $500 were charged to the travellers. Total seizures from the hidden bags and boat totalled 39.9 litres of alcohol, 0.79 kg of tobacco and 17.46 grams of marijuana. CBSA officers, along with members of the Internet Child Exploitation unit of the Integrated Halifax Regional Police/RCMP Criminal Investigation Division unit, discovered child pornography on an electronic device belonging to a crew member while searching a vessel Aug. 16. Chronicle-Herald, A4

2 men charged with conspiracy to smuggle person into U.S. plead not guilty

Two New Brunswick men charged with conspiracy to smuggle a person across the Canada-United States border this summer have pleaded not guilty. Richard Cyr, 50, of Baker Brook, appeared in Edmundston provincial court on Monday and Oneil Devost, 67, of Edmundston, a well-known local country music singer, was represented by his lawyer. Both accused are scheduled to return to court on Jan. 24, 2017, to set a trial date. The charges are related to an incident in July when authorities became aware a 46-year-old woman had entered the United States illegally by crossing the St. John River from the Baker Brook area with a paddle boat, RCMP have said. CBC News (2016-11-22)

Accused UN killer tells undercover cop he dreamed about his arrest

Cory Vallee, a United Nations gang member and accused killer, had a dream he was going to be arrested the day before Mexican police raided his Guadalajara house and took him into custody. Vallee described the dream to an undercover cop posing as a criminal and planted in the accused killer's cell at the Richmond RCMP detachment on Aug. 17, 2014. A secretly recorded video of the conversation was played for B.C. Supreme Court Justice Janice Dillon at Vallee's murder trial Tuesday. "I started packing the day before I got arrested because I had a dream that I got arrested. I swear to God," Vallee said to the cop, whose identity is shielded by a court order. "I had a dream that someone was coming in my house and I woke up and thought I saw a shadow and they were trying to arrest me. It was like a nightmare." He said he started packing all his clothes, books and DVDs the same day. So when police arrived and shouted his name the following day, "everything was in boxes." Replied the undercover cop: "That is f-king trippy." The jail cell conversation took place about 2:40 a.m. after Vallee had been escorted back to Canada by two other RCMP officers. Vallee met the undercover cops at Vancouver airport when they were all placed in the same Canada Border Services Agency holding cell early on Aug. 17. He also said that going to jail won't be so bad, since he had already cut offall contact with family and friends years earlier when he went on the run. Vancouver Sun, A11 (Province), 1

First there was phishing, now we have 'smishing': Spammers are now texting us

If you received a text in the past day or so that dangles the dubious possibility of a big inheritance coming your way, don't worry. You're not alone. Island RCMP say it's just the latest installment of an annoying trend that's known as 'smishing.' "They're fishing for replies," said Cpl. Troy MacLean of Kings district RCMP. "With email, it's called phishing. With text messages, it's smishing." The suspect text appeared in recent days. With generous use of all-caps, the text appears to have been written by someone named Gordon Freeman. And Gordon, for whatever reasons, says he wants to share money with you. "It's urgent

please contact me for an unclaimed benefit payment," reads part of the text. "Ignore it," said MacLean. "Do not respond." Unfortunately, too many people do. About 200 people have been scammed more than $2 million so far this year, according to the federal government's Canadian Anti-Fraud Centre website. CBC News (2016-11-22)

Neutraliser Vito Rizzuto avant qu'il ne soit trop tard
« Lorsque nous avons débuté Colisée, Vito Rizzuto commençait à entrer dans une phase de légitimité. La façon dont il gérait ses investissements et dont il voyait son futur, nous avions le sentiment que si nous n'allions pas le chercher à ce moment, il serait devenu intouchable cinq ou dix ans plus tard. Seulement avec ses placements, il n'aurait plus eu besoin d'être impliqué dans les affaires criminelles », affirme James Malizia. L'actuel commissaire adjoint à la GRC était inspecteur à la Division C (Québec) de la police fédérale au début des années 2000. Il venait de terminer le dossier de Charles Guité, acteur du scandale des commandites, lorsqu'il est devenu le patron de l'Unité mixte d'enquête contre le crime organisé (UMECO). La GRC avait alors mis le parrain de la mafia canadienne, Vito Rizzuto, en tête de liste de ses priorités. La Presse+ (2016-11-22)

ORGANIZATIONAL ISSUES / ENJEUX ORGANISATIONNELS

Late Mountie honoured at YMCA Peace Breakfast
Peace was everything Lisa Gallagher's late husband fought for. Gallagher, addressing the annual YMCA Peace Breakfast on Tuesday morning, spoke to an audience of Metro Moncton politicians and volunteers about the legacy of her husband, former Codiac RCMP Sgt. Mark Gallagher, and what he taught her. Mark Gallagher died in Haiti in January 2010 when a devastating earthquake hit the country. He died the same day he arrived in the Caribbean nation to serve a six-month stint with a UN mission that was training a national police force. The retired RCMP member had spent the holiday season with his wife and two kids, but felt he still had more to give, and wanted to return to Haiti. "It was only that morning he was leaving, I realized what a brave man he had become," Lisa Gallagher said of her husband of 31 years. During her talk, Gallagher spoke at length about the idea that peace comes from respecting each person and understanding that they have value. Daily Gleaner, B3 (Times & Transcript)

Moncton woman sentenced for kicking Mountie in head
A Moncton woman will spend the next 18 months on probation after assaulting police officers and saying Justin Bourque should have shot more of them. Lia Olivia Chase, whose adoptive father is a retired Mountie, was in court for sentencing on six charges, including two counts of assaulting police, resisting arrest, uttering death threats and two counts of breaching an undertaking by consuming alcohol. Judge Irwin Lampert ordered her to take anger-management counselling, avoid drugs and alcohol, do 30 hours of community service and write a letter of apology to Codiac Regional RCMP. "I would only describe your behaviour as disgusting and disgraceful," said the judge. "To say that about the RCMP, after what's happened in this community in the last couple of years? And your father is a retired RCMP member?" Chase made no comment to the court when given the chance during her sentencing. The prosecutor told the court the incident occurred on Sept. 19, 2015 in Moncton. Her partner called police after a domestic incident, saying she was assaulting him and tearing up the apartment. When they arrived he said she was gone and he didn't want to pursue the matter. Police learned the woman was "wandering the streets intoxicated" and set out to find her. They heard she was hiding in Victoria Park but she fled when they approached. She fell and they found her lying on the ground, barefoot and crying. Times & Transcript, A6

Ex-RCMP recruiter charged with sex assault
A Winnipeg woman has filed a lawsuit alleging a former RCMP recruiter sexually assaulted her in his home. Court records confirm former Const. Michael Adam Timmer, 34, has been criminally charged with one count of sexual exploitation in connection with the alleged August 2014 incident. According to a statement of claim filed last week, the then-17-year-old female met Timmer at a career fair in January 2014. A month later, Timmer - whose image was used on RCMP recruitment posters, the lawsuit alleges - invited the teen to apply to attend a RCMP youth camp in Regina, where Timmer was to act as a chaperone. The teen attended the youth camp the following August. Within days of returning home, Timmer texted her and the two made arrangements to meet for coffee. As the coffee date ended, Timmer

kissed the teen "without her invitation or consent," the lawsuit alleges. Later that week, Timmer invited the teen to a party at his house. "Upon her arrival , it became apparent to (her) that no one else had been invited," says the lawsuit. Timmer then led the teen to his bedroom where he sexually assaulted her, the lawsuit alleges. The lawsuit also names the RCMP as a defendant, alleging the police service breached its position of trust by exposing the woman to "sexual conduct and harm" and took no steps to uncover the alleged abuse. "The RCMP in particular, in placing Timmer in charge of recruits and displaying him on the poster for recruiting as an inducement to the public, had a duty to investigate his character and personality and failed to do such," the lawsuit alleges. Winnipeg Sun, A5

Investigators examining death of man in Prince George jail
An investigation has been launched into the death of a man found unresponsive in a jail cell in Prince George. RCMP say officers responded Sunday night to reports of an intoxicated man causing a disturbance. He was arrested and taken to the police detachment, where he was placed into a cell. RCMP say the unidentified man was found unresponsive during a check at about 2 a.m. Monday and that emergency crews were called. Paramedics took over resuscitation efforts but the man was pronounced dead shortly before 3 a.m. The Independent Investigations Office is now looking into the case in an effort to determine whether there is a connection between police actions and the man's death. Vancouver Sun

Taser-armed police should carry automated defibrillators: Inquest
RCMP members who are equipped with Tasers should also carry an automated defibrillator and be properly trained to operate the device. That was one of the recommendations coming out of a coroners inquest that looked into the death of a Chilliwack man in 2015. Kevin Mukuyama died after police were called to an Oak Street home in February of last year, following reports that a man with a knife was acting irrationally. While attempting to arrest the 42-year-old man, police said, a struggle broke out and a "conducted energy weapon" was used to subdue him. Mukuyama died in hospital of "acute cocaine toxicity during restraint," the coroners report said, complicated by an underlying heart disease. Following a three-day inquest in Burnaby, the coroners jury issued a total of 14 recommendations. Among those was a call for better training of RCMP officers when responding to similar incidents. It called for a requirement that, "all officers certified to use a CEW be simultaneously trained in advanced emergency first aid, specifically including the use of an AED (automated external defibrillator)." Chilliwack Progress (2016-11-22)

LEGISLATION & POLICIES / LÉGISLATION ET POLITIQUES

Territorial government preparing for federal marijuana legalization
The territorial government has formed an inter-departmental working group to prepare for the eventual legalization of marijuana across Canada. The group is also in discussions with the federal government, according to Department of Justice spokesperson Sue Glowach. The task force was established by the minister of Justice and Attorney General of Canada, the minister of Public Safety and Emergency Preparedness and the minister of Health, according to Glowach. She stated the task force's mandate is to inform the federal government's commitment legalize and regulate marijuana. The report is expected to be released to federal ministers by the end of the month ahead of next April's anticipated marijuana legalization legislation. "The information on potential systems for production, distribution, promotion and taxation provided in the report should make it possible to determine what the role of the ... territories will be," she stated. Yellowknifer

Pour ou contre la légalisation de la marijuana?
C'est au printemps 2017 que le gouvernement Trudeau déposera son projet de loi pour légaliser la marijuana à des fins récréatives. D'ici le 30 novembre, le Groupe de travail sur la réglementation et la légalisation de la marijuana, présidé par Anne McLellan, déposera ses recommandations au gouvernement. Plus de 30 000 commentaires ont été émis depuis le début des consultations, dont 500 de différentes organisations. Pour ou contre la légalisation de la marijuana? Les partisans (Line Beauchesne, professeure de criminologie à l'Université d'Ottawa, et Philippe Hurteau, chercheur à l'Institut de recherche et d'informations socio-économiques) en débattent avec les opposants (Jean-Pierre

Chiasson, médecin spécialisé en toxicomanie et fondateur de la Clinique Nouveau Départ, et Claude Carignan, leader de l'opposition officielle au Sénat). Radio-Canada (2016-11-22)

La consommation de cannabis bondit de 25 % chez les Québécois et les Québécoises
Au moment où le processus de légalisation de la marijuana pour 2017 semble bien enclenché au Canada, des données publiées par l'Institut de la statistique du Québec (ISQ) révèlent que la consommation de cette drogue chez les personnes de 15 ans et plus a bondi au Québec de 25 % entre 2008 et 2015, passant de 12 à 15 %. L'étude de l'ISQ précise que cette hausse est surtout attribuable à la consommation dite « occasionnelle », soit une personne ayant consommé du cannabis moins d'une fois par mois ou d'une à trois fois par mois au cours des 12 mois ayant précédé l'enquête. L'enquête révèle par ailleurs que c'est dans la population des 18 à 24 ans que l'on retrouve la plus forte proportion de consommateurs occasionnels. Radio-Canada (2016-11-22)

Reining it in - Canada puts in new rules for prescribing medical marijuana to veterans
The Canadian government is slashing the limit on how much veterans can be prescribed under federal rules, from 10 grams per day to just three, and putting a hard cap on how much marijuana should cost, at $8.50 a gram. That brings the rules in line with Health Canada recommendations, and may help curb runaway costs for the Veterans Affairs Canada drug insurance program. VICE News wrote last week that the program was facing staggering cost overruns, while fears abound that veterans were being prescribed far more marijuana than needed. "This is just our starting point," promised Veterans Affairs Minister Kent Hehr in making the announcement. He blasted the previous government for dispensing marijuana to veterans "with no policy in place. "It's time to change that." The new rules are not absolute. Veterans who are currently receiving more than the three grams will be able to continue getting the drugs until May 21 of the coming year, and any veteran who wishes to continue receiving more of the plant will need a special exemption. Vice News; 45e Nord (2016-11-22)

Three of the seven Ottawa pot shops raided by police are back in business
Three of the seven pot shops that were closed by police in raids earlier this month have reopened. The WeeMedical Dispensary on St. Laurent Avenue was back in business Tuesday, after its sister Green Tree stores on Preston Street and Montreal Road opened on the weekend. The stores are low on stock, carrying only a few jars of dried weed. All of their cannabis products were seized by police during the raids on Nov. 4. The seven raided dispensaries were all operated by a B.C.-based outfit. The other four remain closed, including one on Bank and Hunt Club that was evicted by the landlord after the clerk sold pot from a hole carved into a boarded-up storefront. Both Green Tree stores were selling weed to customers over the age of 19 on Monday who filled out a form listing their name, address, doctor's name and "medical conditions." The form includes a waiver that customers use the products at their own risk and Green Tree is not liable for damages. Ottawa Citizen (2016-11-22)

Cannabis, dépendance et développement du cerveau
Un rapport final sur la légalisation de la marijuana sera remis aux ministres fédéraux avant la fin du mois. À l'occasion, Radio-Canada a abordé la question avec un infirmier spécialisé en toxicomanie. Jean Clermont-Drolet est en faveur d'une loi fédérale qui légaliserait et encadrerait l'utilisation du cannabis. Le cannabis thérapeutique qu'il juge d'ailleurs extrêmement utile chez certaines personnes qui souffrent de maladies chroniques. L'alcool est beaucoup plus dangereux que la marijuana en termes de dépendance, selon l'infirmier. Il explique que la consommation d'alcool remplace à long terme des substances produites naturellement par le cerveau, ce qui crée des symptômes « très physiques » lors d'un sevrage. Radio-Canada (2016-11-22)

EDITORIALS & OPINIONS / ÉDITORIAUX ET LETTRES D'OPINIONS

Big Brother sleeps easy
An opinion piece states, "The revelation that Montreal police secretly monitored several journalists' smartphones for months, ostensibly in hopes of discovering the source of internal information leaks, has brought home for many people the troubling reality of government snooping. The fact that thousands of students recently lined up to watch whist leblower Edward Snowden at a video conference at McGill

University is another sign of the public's growing concern about respect for the right to privacy. Indeed, it is not just journalists who are targeted by electronic surveillance. Revelations about the National Security Agency (NSA) in the United States also touch Canadians, since in the age of the Internet and social networks, telecommunications knows no borders. It is reasonable to imagine that practically all our communications could be intercepted, filtered and recorded by governments. This is now the world in which we live. Thanks to Snowden's revelations, Canadians know our federal government is actively helping the United States with surveillance programs of its own. For example, it was revealed in April that the RCMP had decrypted about one million private messages from BlackBerry smartphones. In addition, we know that the number of communications intercepted in Canada grew by a factor of 26 in 2015, without the authorities giving any reasons. This opacity is at the heart of the problem: "Big Brother" is completely lacking in transparency. A Federal Court ruling revealed recently that the Canadian Security Intelligence Service (CSIS) had acted illegally by conserving personal data for 10 years. It is alarming to discover just how unclear the limits imposed on surveillance agencies and police forces are. It is probably this lack of clarity that allowed Montreal's police force and the provincial Sûreté du Québec to put so many journalists under watch for such specious reasons." National Post, A11

De la colère à l'action

Un article d'opinion note, « S'il veut faire toute la lumière sur les violences subies par les femmes autochtones, le gouvernement Couillard doit commencer par ouvrir les yeux. Depuis une semaine, son plan d'action se résume ainsi : se cacher derrière la commission d'enquête fédérale, et ne pas faire grand-chose en même temps. M. Couillard a d'abord proposé une vague « table de concertation ». Mais avant de lancer cette idée, il aurait dû consulter les communautés touchées. Acculé au mur, il accepte maintenant de le faire. Il a parlé hier avec le chef de l'Assemblée des Premières Nations du Québec et du Labrador, et d'autres entretiens sont prévus dans les prochains jours. La pression augmente pour déclencher une enquête judiciaire québécoise sur les relations entre les femmes autochtones et les policiers (violences sexuelles, abus de pouvoir et autres formes de discrimination). Québec refuse de bouger, en invoquant que le fédéral fait déjà ce travail avec la nouvelle commission d'enquête lancée sur les femmes autochtones tuées et disparues. Cette excuse ne convainc pas. Certes, la commission fédérale se penchera entre autres sur le Québec, et son mandat inclut maintenant les violences sexuelles. Mais le Canada est un vaste pays, et le temps de la commission sera limité. Le gouvernement Couillard pourrait rétorquer que la commission pourra compléter cet examen, car les causes sont en partie déjà connues. Mais si c'est le cas, cela signifie qu'on les connaît aussi déjà assez pour trouver des solutions ! Or, Québec n'a encore rien proposé pour mieux former les policiers et protéger les femmes. Le refus de Québec aurait également été plus crédible si les policiers étaient eux aussi prêts à agir. Mais contrairement à la Gendarmerie royale du Canada, la Sûreté du Québec (SQ) refuse de reconnaître la discrimination envers les autochtones. » La Presse, 2

RCMP wary of Hells Angels' return to Maritimes
Andy Cook knows the Hells Angels, and what they bring with them. The bespectacled RCMP corporal has crossed paths with Canada's most notorious outlaw biker gang before, during stints in Ontario and British Columbia, and he is not happy they are setting up in Prince Edward Island, where he works now. "It doesn't sit well with me for them to be here," said the 20-year veteran Mountie. "I've seen them in action and they bring violence with them and they bring drug trafficking with them." The Angels were without a beachhead in the Maritimes since police smashed the former Halifax chapter in 2001. The raid led to the imprisonment of four of its seven members and the closing of the chapter after the clubhouse was seized by justice officials. But the gang has begun to re-assert itself, cementing its presence mainly through affiliate or so called "puppet clubs" in Nova Scotia, New Brunswick and P.E.I. A New Brunswick chapter of the Nomads is now "full patch H.A.," said Cook. Canadian Press (Chronicle Herald, A1, Montreal Gazette, Vancouver Sun, The Guardian, Cape Breton Post, Leader-Post, Windsor Star, National Post, Edmonton Journal, Calgary Herald, Daily Gleaner, Telegraph Journal, Times & Transcript, Ottawa Citizen); Globe and Mail

CONTRACT & ABORIGINAL POLICING / SERVICE DE POLICE CONTRACTUELS ET AUTOCHTONES

Wildfire, fentanyl top mountie issues

Claire Theobald sat down with deputy commissioner Marianne Ryan, commanding officer of the Royal Canadian Mounted Police in **Alberta**, to discuss the challenges faced and triumphs achieved by RCMP officers in 2016, and where their focus will be in 2017 (…) Q Is there any one event (from 2016) that stands out in your mind? A The (Fort McMurray fire) evacuation was absolutely outstanding. It felt like we were in a tinder box … I don't think anyone predicted the devastation the fire would take in Fort McMurray (…) Q The RCMP are no strangers to drug crimes, but this year saw the rise of deadly opioid abuse, including fentanyl and carfentanil. A I liken the fentanyl crisis to reverse Russian roulette, where the chamber is loaded and there is one blank. That's what you are playing with when you are involved in illicit drug use … do you want to keep playing that game? Q How is the RCMP addressing this opioid crisis? A On a national and international level, we are working with China and the (Canada Border Services Agency) on the illicit importation of what we call precursors, which are the chemicals used to make fentanyl. We've been involved through the ALERT teams in several high-profile seizures. It is a multi-faceted challenge and it is not just a law-enforcement issue, it is a community issue, and we continue to view it as a big priority for us and for all law enforcement in Alberta (…) Q The RCMP conducts surveillance on individuals identified as terrorist threats, but how else is the RCMP getting ahead of the issue? A Another key component that has proven to be a big success for us is the outreach program, and that's where we have highly skilled officers who can go into communities, establish that trust and respect, and develop those relationships so that people in the communities would be more open to talk to police about their concerns and the what-ifs. Q Technology seems to be as much of a blessing as it is a curse for the RCMP, creating new investigative tools while also opening new avenues for crime. Going forward, how is the RCMP keeping up with the growing issue of cybercrime? A Apart from fentanyl, it is going to be one of our biggest challenges. Postmedia (Calgary Herald, A5; Edmonton Journal, Calgary Sun, Edmonton Sun) (2016-12-27)

Yukon RCMP dealt with community tragedies and triumphs in 2016 - From horrific murders to the royal visit, the police saw life in the territory first hand

RCMP officers in Yukon faced various challenges in 2016, but also did much they can be proud of according to Supt. Brian Jones, the Officer in Charge of Criminal Operations for the **Yukon** RCMP. Jones said the past year was particularly tragic for the community of Watson Lake. "Unfortunately Watson Lake had a summer that I think many of the individuals in that community would like to forget," said Jones. In July an 11-year-old boy was killed after a collision with a vehicle. His death came just a week after the alleged murder of Watson Lake resident 36-year-old Andy Giraudel. A 22-year-old man was charged in his death. CBC News (2016-12-26)

RCMP warn of contaminated drugs

Three people in Fort Chipewyan overdosed on illegal drugs believed to be laced with fentanyl, police say. "There is a possibility that there are contaminated drugs on the street," Cpl. Erika Laird with the **Wood Buffalo** RCMP said Tuesday. On the night of Dec. 22, Fort Chipewyan RCMP were called to help a person suspected of overdosing. Just a few hours later, early on Dec, 23, Mounties were called to another suspected overdose, this time involving two people. All three received medical attention and have since recovered. Investigators believe all three had consumed another illicit drug without knowing it was contaminated with fentanyl, an opioid that can be 100 times more potent than morphine. Between January and September this year, 338 Albertans died from opioid-related overdoses. Fentanyl was responsible for 193 of those deaths. Postmedia Network (Edmonton Journal, A6, Edmonton Sun)

Possible changes coming to emergency services in Metro Edmonton

A new way of looking at policing, and the prospect of handling fire on a regional basis are two changes emergency services that could see in metro **Edmonton**. It's one of many ideas the mayors will work through after being mandated by municipal affairs minister Danielle Larivee. "In the mandate review for the regional board, they've asked us to take a closer look at regional services," Mayor Don Iveson confirmed in his annual year end interview with 630 CHED. (…)For police Iveson said it could be a mix, with RCMP working at Edmonton's new borders, and the Edmonton Police Service handling the vast majority of the city. "Sounds like it takes 16 RCMP officers to police the annexation area that we would potentially inherit through that process and Edmonton Police Service, because they deploy resources differently has said they need 60 rather than 16." "Perhaps in the more rural areas of the south side of the

city, maybe even in the north east where it's still more rural maybe it makes sense for us to contract with RCMP if they're able to deploy and cover that at a lower cost." News Talk 770

RCMP investigate suspicious death on Paul Band First Nation
Mounties were asking for tips from the public Monday night after a person was found dead on a First Nation west of Edmonton. A body was found in the area of Sundance Road on the **Paul Band First Nation** about 2:15 p.m. Monday, police said in a news release. Stony Plain RCMP said the death was suspicious, and have called in the Edmonton major crime unit to investigate. An autopsy is scheduled to take place in the coming days. Postmedia (Edmonton Journal; Edmonton Sun); CBC News (2016-12-27)

RCMP looking for missing Innisfail teen
Mounties out of **Innisfail** are looking for a 15 year old girl not seen since 10:30 Tuesday Morning. RCMP say they are worried about Starla Neufeld. They think she may have an injury and could require medical attention. Neufeld is 5'4" and about 125 lbs with a slim build and shoulder lenght reddish brown hair. She was last seen in Innisfail wearing a black hooded sweatshirt. 630 CHED (2016-12-27)

One of 2 missing females found by Surrey RCMP
Surrey RCMP have found one of the two young women who went missing over the holidays. The 15-year-old was found safe and sound, police say. Police continue to look for 24 year-old Ilse Mackie. CBC News (2016-12-27); Radio-Canada (2016-12-26)

Police ask for help to find missing Moncton teen
Codiac RCMP are seeking the public's help in finding a 15-year-old boy who has been missing since Thursday. Zackery Hill of Moncton was last seen by his family on Dec. 22. In a police press release, Hill is described as 5'2, weighing 104 pounds with green eyes and light brown hair. Mounties have been trying to locate him through known friends and acquaintances, but have not had any success. Anyone who has seen Hill since Dec. 22, or has information as to his whereabouts, is asked to call the RCMP. Times and Transcript, A4 (2016-12-26)

Colten Boushie shooting in review
The top crime story in the province in 2016 erupted in August on a farm in the rural municipality of Glenside. The shooting death of Colten Boushie, a 22-year old from **Red Pheasant First Nation**, sparked outrage among First Nation people and caused a social media firestorm...The case fueled racial tensions from the beginning, starting with a news release from the RCMP that described an initial confrontation on the property. Battlefords News-Optimist (2016-12-26)

Un policier récompensé pour son rôle dans la Grande traversée
La Gendarmerie royale du Canada (GRC) a récemment récompensé le bénévole responsable de la sécurité pour la Grande traversée (LGT), ce relais pan-canadien de jeunes cyclistes organisé par une équipe de bénévoles et le Conseil scolaire francophone de la Colombie-Britannique. Le gendarme Ivan Provost, le coordonateur national de la sécurité de la Grande traversée, a reçu une citation du commandant de la **Division C** de la GRC pour son dévouement. Encore une fois cette année, une équipe de bénévoles dévoués s'affairent à préparer un nouveau tracé de la Grande traversée (LGT) pour permettre à 280 jeunes de parcourir environ 300 kilomètres à vélo en trois jours. Pour la cinquième Grande traversée, le relais commencera à Victoria pour finir au Nouveau-Brunswick. Cela veut dire des dizaines et des dizaines de municipalités et de villes parcourues. Le gendarme Ivan Provost, des Laurentides au Québec, est responsable de faire approuver le trajet de la Grande traversée chaque année. Pour ce faire, il accomplit des mois de travail bénévole. « Ivan c'est notre liaison entre les villes, les municipalités, les provinces, les services de police et l'équipe qui fait l'itinéraire de LGT », explique le fondateur de la Grande traversée, Laurent Brisebois. Radio-Canada (2016-12-26)

RCMP make multiple arrests in child abduction investigation
On December 20, 2016, just before 5:30pm, **Blue Hills** RCMP were dispatched to a call of an abduction of an 11-year-old girl in Brandon, Manitoba. Police were provided a description of a vehicle, and within minutes, officers had located the vehicle heading eastbound at the intersection of Highway 1 and Highway 5. My Steinbach (2016-12-25)

New top cop spent part of childhood in Yukon
When he was in the sixth grade, Scott Sheppard used to bang on the door of the Whitehorse RCMP detachment and ask officers for stickers to put on his bike. "I sort of took on that iconic school kid's dream of one day being a Mountie," says Sheppard, who was recently named the new commanding officer of **Yukon** RCMP ("M" Division). The appointment, he says, "closes the loop in many ways." Sheppard, who's from B.C., but lived in the Yukon for two years as a child (his father worked here as a welder), always wanted to join the RCMP. Twenty-seven years ago, he was hired on in Kamloops. His first posting was in Manitoba. Over the years, Sheppard has received a Queen's Jubilee medal for his work. He has also presented on Olympic security programming to officials from the United Nations, Geneva, and INTERPOL. Whitehorse Star, 3 (2016-12-24)

Year-end warrant blitz nets Red Deer RCMP dozens of offenders
A year-end campaign to clear outstanding warrants by **Red Deer** RCMP netted 36 wanted offenders this week. During the sweep, police checked 199 people and residences, executing 83 warrants and laying 117 charges for offences ranging from aggravated assault to drug offences and theft, said Insp. Gerald Grobmeier. CBC News (Yahoo News); Red Deer Advocate (2016-12-24)

Investigation continues
Police believe the bomb threat in September that led to a provincewide evacuation of schools in **P.E.I.** originated in the U.S. RCMP Staff Sgt. Kevin Baillie told The Guardian Friday that the RCMP is working with law enforcement south of the border to try to establish exactly from where and from whom the bomb threat was made. "To date, we haven't laid any charges - certainly not ruling out that at some point we couldn't have the evidence to lay a charge - but to date we haven't positively identified who is responsible for the bomb threat," says Baillie. Police received a fax threatening bombs in multiple P.E.I. schools would be detonated on Sept. 21. Guardian (2016-12-24)

Two charged after police seize cocaine and pot
Police seized cocaine, marijuana and drug trafficking paraphernalia after searching a property in **southwest Edmonton** on Thursday. RCMP officers seized 253.3 grams of cocaine after executing a search warrant on a vehicle in southwest Edmonton. They subsequently arrested two people. At a residence, police then seized an additional 385.5 grams of cocaine, eight grams of marijuana, Canadian currency and items related to drug trafficking. Mounties from the Stony Plain, Spruce Grove and Enoch drug sections were involved in the joint investigation. Postmedia Network (Edmonton Journal) (2016-12-24)

RCMP allege influence peddling
Newly unsealed court documents give a greater glimpse into the extent of the RCMP's investigation into the **Winnipeg** police headquarters scandal. The $214-million downtown project has been the subject of a two-year investigation by RCMP, which began when officers executed a search warrant in December 2014 at Caspian Construction, the company contracted to build the police headquarters. The project included $79 million worth of cost overruns and was completed after three years of delays. In files presented by Mounties to a judge in order to obtain financial records, RCMP allege Armik Babakhanians, owner of Caspian Construction, used his relationship with the city's former project director on the project to influence the hiring of "his close associates." RCMP Const. Christopher Haskins, in a sworn affidavit, alleges Babakhanians and associates Peter Chang and Patrick Dubuc agreed to offer project director Ossama AbouZeid a $600,000 reward "for showing favour" to the trio. Postmedia Network (Winnipeg Sun) (2016-12-24)

Man faces child pornography charges
Police have charged a **Plympton** man with possession and distribution of child pornography. On Thursday, the RCMP Internet child exploitation unit executed a search warrant at a home in Plympton and arrested 55-year-old Daniel Joseph Melanson. Melanson has been charged with the distribution of child pornography, possession of child pornography, unsafe storage of a firearm and unauthorized possession of a firearm. Chronicle Herald (2016-12-24)

Comox Valley RCMP issue gift cards not tickets
"Good afternoon how are you? I'm Perry with the **Comox Valley** RCMP traffic section, do you have your driver's licence with you?" asked Comox Valley RCMP Constable Perry Snyder who had a driver pulled over near the 5th Street bridge in Courtenay. CHEK News (2016-12-24)

RCMP investigating suspicious death in Cambridge Bay - Police received report of deceased female in community Friday morning, treating death as suspicious
RCMP in **Cambridge Bay** are investigating after a woman was found deceased in the community Friday morning. According to an RCMP news release, officers received notice of a possible deceased female in the Nunavut community at about 10:30 a.m. Friday. Police then attended the location, confirmed the deceased female, and opened an investigation. In the release, police say they are treating the death as suspicious. Iqaluit's "V" Division Major Crime Unit and the Forensic Identification Unit, as well as the office of the chief coroner, will be assisting Cambridge Bay RCMP with the investigation. CBC News (2016-12-23)

NATIONAL INQUIRY INTO MISSING AND MURDERED INDIGENOUS WOMEN AND GIRLS / ENQUETE NATIONALE SUR LES FEMMES ET LES FILLES AUTOCHTONES DISPARUES ET ASSASSINEES

Panama Papers to pesticide problems: 10 memorable I-Team stories from 2016
... Unresolved: Investigating MMIW - Partnering with the CBC Indigenous Unit and our CBC colleagues across Canada, we took a closer look at 34 cases involving the deaths or disappearances of Indigenous women in which foul play had been ruled out. The families of the women didn't agree with those assessments, and as our investigations unfolded we found more unanswered questions. In fact, the one thing these cases seemed to have in common was that they all begged for more in-depth investigation. CBC News Winnipeg (2016-12-26)

Weighill talks crime, marijuana and MMIW in year-end interview
For the first time under Chief Clive Weighill's tenure, crime in Saskatoon is going up. This city has the highest murder rate in the country and thefts and break-ins are spiking. The StarPhoenix sat down with the city's police chief to talk crime and what's next for 2017... As the past president of the Canadian Association of Chiefs of Police, you've been tapped to be the liaison for the inquiry into missing and murdered indigenous women. What is the issue as you see it, and where should the inquiry go? A: Certainly it has caught the national attention because of the awareness and the issue itself. This is a huge issue, not only with missing and murdered indigenous women and girls, but also with men. This is a problem we've got in Canadian society with a huge marginalized population. There are reasons for that - the residential schools, colonization. But we are all left here now trying to deal with this. We have to start looking forward. I think one of the main things we have to look at is the root causes. What is causing this? In my opinion, it's poverty, it's (lack of) housing, it's racism, it's disadvantage. It's putting women and girls in vulnerable situations. So if we can't come to grips and solve those root causes we are going to continue to investigate cases of missing and murdered indigenous women..." StarPhoenix (2016-12-24)

PM wants 'huge issues' addressed
Much more needs to be done to confront the crime of sexual abuse of children in indigenous communities, says Prime Minister Justin Trudeau, who anticipates the national inquiry into missing and murdered indigenous women and girls will reveal "huge issues" that must be addressed. "I think part of what that national inquiry is going to reveal is there are deep challenges that we have to address that go beyond just lack of adequate policing or enforcement or justice systems," Trudeau said during a year-end roundtable interview with The Canadian Press. "There are huge issues that we have to work with as partners with indigenous leadership, indigenous communities." The issue of missing and murdered women is symptom of a constellation of social ills but a dominant theme is rampant childhood sexual abuse, say victims - including 59-year-old Bernie Williams, who wants the inquiry's commissioners to confront head-on what many say has been an open secret in indigenous communities for decades. Canadian Press (Chronicle Herald; Whitehorse Daily Star; Record; StarPhoenix) (2016-12-24)

Top 10 stories of 2016: First Nations fight for missing murdered women, other issues
The year 2016 saw local First Nations bands raising several issues and continuing to fight for their rights on numerous fronts. It's a fight that shows no sign of ending but this year in the Central Okanagan there were several events that raised the public profile. The Okanagan Indian Band held a rally over missing and murdered women, the Okanagan Nation Alliance re-introduced salmon into Okanagan Lake and the Westbank First Nation saw a historic change in leadership, making First Nations one of our top stories of 2016, coming in at No. 8. FEDERAL & INTERNATIONAL OPERATIONS / OPÉRATIONS FÉDÉRALES ET INTERNATIONALES

Terror tip ignored: Canuck cops jail man who warned of Berlin attack
A man who warned the RCMP that terrorists were set to launch an attack in Berlin - three days before a truck plowed into a German Christmas market - was jailed when his claim was dismissed as a "hoax." Stephen Clements, who spent five days in jail before receiving bail, was charged with hoax of terrorist activity last Saturday. Two days later the Berlin terror attack killed 12 people. Did the 57-year-old tipster have legitimate information about the impending horrific attack - or was it just a guess? "That would be one hell of a coincidence," one veteran GTA officer, who asked not to be identified, said Friday after learning of the man's arrest. Multiple sources confirmed a man contacted the German Consulate in Toronto on Dec. 16 claiming a terror attack was going to occur over the weekend. Postmedia Network (Winnipeg Sun; Ottawa Sun; Brantford Expositor) (2016-12-24)

Province's first anti-human trafficking director brings first-hand experience to the job
Ontario's first director of its anti-human-trafficking office brings to the job not only nearly two decades of work history in tackling the issue, but first-hand insight, having lived through the experience herself. "I was trafficked at 13," Jennifer Richardson says in an interview. "For three years. Across pretty much every province in Canada, and into the U.S. a little bit, by a quite organized group." Her own experience as a survivor of sex trafficking - where she endured physical and emotional abuse, along with manipulation - led her into the field. Her exit occurred in Montreal, after the police intervened in the wake of an assault (…) Human trafficking is defined as recruiting, transporting or exercising control over a person to exploit them, typically through sexual exploitation or forced labour. The majority of trafficking cases in Canada are domestic, rather than cross-border, and most reported domestic cases are sex trafficking, according to the RCMP. Ontario has about 65 per cent of the human-trafficking cases reported to police in the country, and the RCMP has said the province is a major hub for trafficking in Canada. The human cost is steep, as trafficking can inflict serious and long-term trauma on survivors. In response, the Ontario government said in June it will spend up to $72-million over four years in a new anti-trafficking strategy, becoming the third province in Canada to adopt a plan to fight human trafficking. Globe and Mail, A11 (2016-12-27)

Parents of Canadian man held hostage in Afghanistan speak out about new video
The parents of a Canadian man held hostage in Afghanistan say a recently released video of their son and his family marks the first time they've seen their two grandchildren, who were born in captivity. Canadian Joshua Boyle and his American wife, Caitlan Coleman, were kidnapped in 2012 while backpacking in northern Afghanistan. In the video uploaded to YouTube earlier this week, Coleman -- sitting next to her husband -- urges government on all sides to reach a deal to secure the family's freedom. Canadian Press (Guardian) (2016-12-24)

Liaisons dangereuses
Selon les recherches de notre Bureau d'enquête, l'une des visites de l'espion russe Evgueny Buryakov au pays correspond à un événement de l'Association d'affaires Canada-Russie-Eurasie, vouée à la promotion des liens économiques entre les deux nations. En mars 2013, il s'est rendu à Toronto pour une rencontre de cette organisation, en tant que représentant de la banque d'État russe Vnesheconombank, selon une infolettre retrouvée en ligne. Le but de son voyage était de «négocier avec des membres et des compagnies qui ont des projets en Russie et sont intéressées à collaborer», selon le document de

l'Association, connue sous son acronyme anglais CERBA. Agence QMI (Journal de Québec; Journal de Montréal); Agence QMI (Journal de Québec; Journal de Montréal) (2016-12-24)

Fears Growing Islamic State Successfully Weaponizing Refugees
Western security officials are increasingly worried that the Islamic State terror group may be a step ahead of their renewed efforts to stop terrorist infiltration of their countries... "When it comes to refugees being radicalized after they come to a host country, this is quite low in number, actually," according to Mubin Shaikh, a terrorism expert who has previously worked with the Canadian Security Intelligence Service. Voice of America News (2016-12-24)

The 'app of choice' for jihadists
When the Islamic State was seeking volunteers for a holiday killing spree in Europe, it sent word over its favourite social-media channel: the messaging service known as Telegram. "Christmas, Hanukkah, and New Years Day is very soon," began a Dec. 6 posting on one of the terrorist group's usual Telegram bulletin boards. "So let's prepare a gift for the filthy pigs/apes." ... The words and images flew across the globe over a network that terrorist leaders describe as ideal for their purposes: one that is highly discreet, with its heavy encryption and secret chat rooms, but also highly permissive, allowing violent jihadist groups to exchange ideas and spread propaganda with minimal interference. The same conclusion has been reached by terrorism analysts who say Telegram is now overwhelmingly preferred by extremist groups such as the Islamic State, in part because the company has failed to adopt the aggressive measures used by its competitors to kick terrorists off its channels. Canadian Press (Record) (2016-12-24)

'Cornbread Mafia' toast?
Canadian cops have arrested Kentucky crime kingpin, Johnny Boone, after he was on the run for eight years. Boone had been accused of running a marijuana empire in rural Kentucky, producing an estimated 182 tonnes... The U.S. Marshals released the following statement: "On December 22, after an extensive eight-year fugitive investigation into the location of John 'Johnny' Boone, information was developed that led the U.S. Marshals Service to a small town outside of Montreal, Canada. "This information was passed on to law enforcement in Canada and Boone was arrested today by Canadian law enforcement officials in Montreal." Sun Media Corporation (Toronto Sun) (2016-12-24)

Trois hommes de Saint-Jérôme arrêtés en Ontario avec trois tonnes de tabac de contrebande
Trois Québécois de Saint-Jérôme ont été arrêtés en Ontario cette semaine avec en leur possession trois tonnes de tabac haché fin de contrebande. Mardi, les membres du Groupe de travail régional de Cornwall (GTRC) ont intercepté un fourgon quittant une propriété riveraine de South Glengarry, en Ontario. Les trois hommes de Saint-Jérôme ont alors été appréhendés, ont annoncé les autorités vendredi matin. Jonathan Boulay, 22 ans; David Dore, 33 ans; Nancy Slavinsky, 42 ans comparaîtront à la Cour provinciale de Cornwall le 31 janvier 2017. Ils ont été libérés sur engagement. S'ils sont reconnus coupables, chacun d'eux pourrait se voir infliger une amende minimale de près de 800 000 $ pour les accusations de ressort fédéral et d'environ 1,4 million $ au provincial ou d'une peine d'emprisonnement. Le GTRC est une force policière mixte composée de la Gendarmerie Royale du Canada, de la Police provinciale de l'Ontario et du ministère des Finances de l'Ontario. Agence QMI (Journal de Montreal, TVA Nouvelles) (2016-12-23)

Lang tops Postmedia's list of best politicians
Yukon Senator Dan Lang has been named the best politician in 2016 by Postmedia in a recent column published across Canada in all SunMedia publications. "A lot of Canadians think senators don't do anything and that the Senate should be abolished," columnist Anthony Furey wrote. "They might change their tune if they knew more about what some of the hardworking members of the Upper Chamber were up to in 2016. "For example, Daniel Lang, the Conservative Senator representing Yukon. "Throughout the year, Lang was a tireless advocate on the terrorism file in his capacity as chair of the Senate Standing Committee on National Security and Defence. "He drew attention to the fact the RCMP knows about dozens of wannabe jihadists suspected of breaking the law but who, for some reason, haven't being charged. "'Why isn't anyone being charged for being involved in these activities?"' asked Lang, during committee testimony by CSIS head honchos. "'Why are we leaving them on the street? ... Am I missing

something here?' "Just the other week, Lang embarked on a campaign to get his colleagues' backing to amend Liberal legislation removing the government's power to strip dual nationals of their citizenship, if they're convicted of terrorism," Furey wrote. Whitehorse Daily Star, 4 (2016-12-27)

Les soldes d'après Noël, une mine d'or pour les fraudeurs
C'est le temps des soldes d'après Noël, une période de l'année où les consommateurs se tournent beaucoup vers Internet pour profiter des meilleures aubaines. Mais il n'y a pas que pour les consommateurs que les opportunités sont alléchantes. Les fraudeurs aussi en profitent! La nouvelle tendance, profiter de la hausse du nombre de transactions en ligne et cibler les acheteurs inattentifs ou pressés, pour leur soutirer des informations personnelles, estime la Gendarmerie royale du Canada (GRC). « Internet ouvre un éventail de possibilité pour les fraudeurs », explique le coordonnateur de l'escouade contre la fraude à la GRC, Guy-Paul Larocque. « On voit des anciennes fraudes recyclées grâce aux technologies du jour. Les chiffres sont de plus en plus alarmants. » La technique la plus commune est l'hameçonnage, un courriel bidon qui ressemble en tout point à celui d'un commerce, ou d'une institution financière et qui demande au destinataire d'entrer des informations personnelles. Radio-Canada (2016-12-27)

ORGANIZATIONAL ISSUES / ENJEUX ORGANISATIONNELS

Riding along again: RCMP changes policy on volunteers
The RCMP is pledging to reinstate some volunteer auxiliaries to their former role — but the policy will change depending on local departments' wishes. Earlier this year RCMP prevented auxiliaries from going on ride-alongs with regular officers and barred them from taking part in traffic stops, citing safety concerns. On Thursday, RCMP announced the program will re-launched — with certain changes. Auxiliaries will be divided into three 'tiers' of responsibility. Local RCMP divisions in consultation with provincial and territorial governments will chose local volunteers' level of participation and responsibility. That flexibility makes sense, says Coralee Reid, who represents the RCMP in Yukon. "Given the diversity of our country, locations where the RCMP operate and and different threat environments, a one-size-fits-all model was not feasible," she writes. The change is supported by Yukon Senator Dan Lang, who had criticized the RCMP for scaling back volunteers' roles. "I didn't understand from the get-go why the RCMP were doing what they were doing. Any costs are incurred by the provincial or territorial government, so the cost of the program to the RCMP was negligible," he says. Lang says auxiliaries provide important local knowledge, which is especially important to new members of the RCMP. CBC News (2016-12-23)

Officials under pressure to improve rural policing
The man who speaks for rural Saskatchewan has a target in his sights for 2017. Ray Orb, president of the Saskatchewan Association of Rural Municipalities (SARM), wants a way to gauge whether RCMP service improves in the next six to 12 months, and a plan for how to make sure it happens. "We have to have some kind of benchmark ... and see if what we're doing is actually working," Orb said in a recent interview. When it comes to policing the province's vast and sparsely populated expanses, Orb and a host of other public officials are under pressure. Rural residents say they feel increasingly vulnerable to the prying hands of thieves. What are normally widespread and very public complaints in recent months about slow RCMP response times and the Mounties' lack of visibility have added intensity and urgency to routine discussions on whether the RCMP is performing to expectations (…) Meanwhile, federal Public Safety Minister Ralph Goodale has also been drawn into the ongoing discussion, having met recently with the province's justice minister. Orb said he also hopes to bend Goodale's ear. However, Goodale isn't commenting to the press while an RCMP resourcing review launched in August continues its work. A final report is expected this winter. Underlying all this is a sense that something has to be done to quell the vigilante mood that's taking hold in rural Saskatchewan, evident with the launch of the Facebook page Farmers with Firearms. Postmedia (Leader-Post, A1; StarPhoenix) (2016-12-27)

Family of Mission woman left to die after RCMP mistake continues legal fight
The family of a woman who was murdered in Mission eight years ago has launched a fundraiser to support a legal fight they say is significant to all Canadians. “It’s a very important issue because it affects

every Canadian's rights to life," said Rosemarie Surakka, mother of Lisa Dudley. On the night of Sept. 18, 2008, Dudley and her partner, Guthrie McKay, were shot as they sat watching television in the living room of their home. The shooting was a drug-related hit targeting Dudley. A neighbour called police to report the gunshots, and an RCMP officer responded. He drove around without getting out of his car or speaking to the person who called 911. In 2011, the officer was reprimanded and docked one day of pay. A neighbour discovered the couple four days after the shootings. McKay was dead and Dudley was paralyzed. She died on the way to the hospital. A civil claim filed by Surakka against the Attorney General of Canada and the B.C. government alleges that Dudley was deprived of her right to life and security of person — which is guaranteed under Section 7 of the Canadian Charter of Rights and Freedoms — because the RCMP failed to properly respond to the 911 call the night Dudley and McKay were shot. Postmedia (Vancouver Sun, Vancouver Province) (2016-12-27)

Inside the RCMP's Underwater Recovery Team

They work in a murky world, where they are often sent out to search by touch alone. And a day's work can involve hunting for bodies - the victims of accidents or crimes - lost in lakes, rivers or the ocean. The members of the RCMP Underwater Recovery Team form a specialized unit that is on call across the Maritimes and beyond. Not for the faint of heart It's a small team with six members and more being trained, made up of regular officers who are called on whenever a search is needed in water. In the past year, that's involved about 20 call-outs. "Primarily we look for missing people or missing items underwater whether it's related to investigation [or] a piece of evidence," said RCMP Cpl. Mark Bishop. CBC News (2016-12-27)

Police not responsible for crash injuries

Sidney-North Saanich RCMP officers were not responsible for the injuries of a man involved in a fiery crash Friday, the province's police watchdog has found. Marten Youssef, spokesman for the Independent Investigations Office of B.C., said his office has given Sidney-North Saanich RCMP the go-ahead to continue investigating the case. Times Colonist, A4 (2016-12-27)

Crossfield to get full-time enhanced police officer

A full-time enhanced police officer will be heading to Crossfield in 2017. Within the 2017 operating and capital budget, Crossfield town council allocated funds for short-term enhanced policing and sent a request to Airdrie RCMP K-Division for a full-time position to open mid-year. The full-time officer would be a three-year commitment and Crossfield Chief Administrative Officer Ken Bosman said the town has been preparing financially for when it reaches a population of 5,000 and takes over its own policing. "It has always been part of our plan to gradually ramp up our enhanced policing budget," he said. "When we hit 5,000 people, it's not a big shock to the system (because) we're already there." The plan, Bosman said, was to have extended shifts that lined with the town's Peace Officer so there would be one or the other scheduled every day. Rocky View Weekly (2016-12-27)

Independent reviews sent to Crown

The Independent Investigations Office has sent two reports to the Crown for consideration of charges about separate and unrelated deaths involving RCMP officers. The office says one case involves the Jan. 29, 2015, shooting of Waylon Edey, 39, of Yahk. He died during a traffic stop in Castlegar. The other case involves Jacobus Jonker, 53, who died six days after an incident while he was in custody in Smithers on Feb. 15, 2015. He had been arrested at his home in Smithers a day earlier, but the IIO says he became unco-operative while in custody and lost consciousness during a struggle with officers. He died in a Victoria hospital on Feb. 21, 2015. Vancouver Sun, A7 (2016-12-26)

Indo-Canadian Mountie Cleared Of Misconduct Allegations

An Indo-Canadian RCMP officer facing allegations of misconduct has been cleared after being suspended with pay for more than three years. RCMP Const. Amit Goyal was serving in Osoyoos, B.C., when he was accused of five allegations under the RCMP Act, including making false or misleading statements to a member of a superior rank, reported Canadian Press. A statement from E Division Deputy Cmdr. Craig Callens says he withdrew the allegations after reviewing information from Goyal's lawyer that provided different theories that couldn't be disputed because of contradictory expert information. The Link (2016-12-24)

2016 a challenging year for the Fredericton Police Force
It was a year of challenges for the Fredericton Police Force. From firings to ongoing suspensions to rehirings, the city's 103-member department was seemingly pushed to its limit (…) Three RCMP officers were killed June 4, 2014, while responding to a report of a man with firearms in a residential neighbourhood in Moncton. Seventeen members of the Fredericton Police Force were deployed to the Codiac incident during an extensive search for the killer. Improved communications was one of the recommendations contained in the report on the murders prepared by retired RCMP assistant commissioner Alphonse MacNeil. "When you look at a province of 700,000-plus people and a lot of rural area and a lot of interagency co-operation that's required, that radio system is beautiful," Fitch said. "It's a huge, huge accomplishment." Daily Gleaner, A1 (2016-12-27)

LEGISLATION & POLICIES / LÉGISLATION ET POLITIQUES

The imitation game
A number of handguns sit on display at the Wascana Pistol Club. There are real firearms, as well as the air guns modelled after them. They include a Beretta 92 FS and a Colt Governmental 1911. Club president Kelly Moens and club member David Schmidt issue a challenge, asking which ones are the real deal. It's not so easy. (…) Air guns designed to look like real-life models of firearms are frequently brought up as a concern by police, but they are legal. (…) Det.-Cpl. Rich Fraser with the Regina Police Service estimates that 25 per cent to 30 per cent of the guns that get confiscated by police are air guns. Fraser is a member of the National Weapons Enforcement Support program (NWEST), which is a partnership between provincial and municipal police forces to combat gun crime in Canada. Fraser catalogues all firearms seized by Regina police. Despite the number of guns he sees, Fraser said air guns modelled after real firearms are "very convincing." Some air gun imitations of revolvers even include cartridges that store ammo, making it look like the gun is loaded with bullets. Police have also seen air guns made of clear plastic painted to look more real. Postmedia Network (Leader-Post, A1, Star Phoenix, Edmonton Sun, Calgary Sun)

Grip of drug addiction shapes new ideas to reduce risk of deadly fentanyl
Watching an addict fill a syringe with puddle water, former senior RCMP officer Raf Souccar imagined a radical shift in how Canada could deal with people in the grip of drug addition — by providing them with medical-grade heroin and giving them a chance to survive. "I've always thought of these people as victims," he said, recalling the scene in Vancouver's Downtown Eastside, where the man added heroin to the dirty water and injected the contents into his arm. "I've seen a guy injecting with a needle he was sharpening on the side of the curb," said Souccar, a former RCMP deputy commissioner who spent 35 years fighting the illicit drug trade and is now concerned about the death toll from the fentanyl overdose crisis, which has killed hundreds of people in Canada this year. The country's two supervised-injection sites, including Insite, are both in Vancouver. Addicts are provided with clean needles and a nurse who watches over them as they shoot up their own drugs. People who unwittingly overdose on fentanyl-laced substances are given another drug, naloxone, to reverse the effects and then sent to hospital. Souccar said addicts should be given medical-grade heroin along with housing and mental-health services to save overall health-care costs and money for policing, courts and incarceration. "I'm not advocating drug use. I'm saying in the situation of people who need help, we need to find a way to help them with quality-control products," Souccar said from Ottawa. Canadian Press (Edmonton Sun, A13, Calgary Sun, Chronicle Herald)

Vancouver boosts fines for pot shops but defiant retailers still selling
A steady surge in illegal pot shops has prompted many cities to turn to law enforcement to try and clamp down. In Toronto and Ottawa, police tried co-ordinated raids to crack down on illegal pot shops. In Montreal, police recently raided six marijuana storefronts - the day after they opened. But Vancouver's latest approach is different than many other cities, with local officials turning to zoning rules, licence fees and hefty fines to try and control the marijuana boom. Earlier this year, Vancouver became the first city in Canada to draft a set of bylaws that would regulate pot shops in the absence of federal laws, which are expected to be tabled next year. But the rules seeking to limit the city's growth of medical marijuana

businesses, brought in on June 24, have so far had limited success. (...)According to officials, the number of marijuana-related businesses grew by 100 per cent per year from mid-2013 to mid-2015. In the first six months of 2015 alone, the city said, the number of pot-related businesses increased from 60 to 100. CBC News

Quarter of adults would try pot if legal: poll
If marijuana is legalized in this province, nearly one-quarter of Manitoba adults say they're prepared to get some. Rich or poor, NDP or Progressive Conservative, man or woman, young or middle-aged - tens of thousands are likely to try some pot. The *Winnipeg Free Press*/Probe Research Inc. survey asked, "If marijuana becomes legal in Canada, how likely would you be to use it even just once?" Twenty-four per cent - nearly one-quarter of a million adult Manitobans - said they would be likely to use it. "That's a significant market," said Probe research associate Mary Agnes Welch. "It's a little more than I thought." Between one-quarter and one-fifth of respondents said they're open to using legalized marijuana. Those most likely to use it were renters (38 per cent), men between the ages of 18 and 34 (37 per cent) and those with some post-secondary education (32 per cent). More men (28 per cent) than women (20 per cent) and more Winnipeg residents (28 per cent) than rural Manitobans (19 per cent) would use it once, and more 18- to 34-year-olds (32 per cent) than 35- to 54-year-olds (26 per cent) would use it once. Those least likely - 15 per cent - were over the age of 55. Winnipeg Free Press

From dime bag to money bags, businesses look forward to recreational marijuana
It's Sunday afternoon and Toronto's Centre for Social Innovation is packed full of marijuana enthusiasts perusing tables of goods. Everything from marijuana-infused barbecue sauce to medicated body rubs is available at Green Market, where artisans peddle their various craft cannabis products. Such events, which sell to patients and casual users alike, operate within a foggy regulatory environment. Selling marijuana is illegal unless you are a large-scale producer licensed under Health Canada's medical marijuana regime. However, licensed producers are only permitted to sell dried cannabis flower and oils, in spite of a Supreme Court ruling last year that said Canadians have a right to access medical marijuana in all of its forms. "We only carry products that are inaccessible in the current legal medical program," says Lisa Campbell, Green Market co-founder and a marijuana consultant at Mobile Revolutions. "So for patients we are the only place they can find edibles - it's not available from any licensed producer." The year ahead is expected to be a pivotal one for Canada's burgeoning marijuana industry, as the federal government is planning to table legislation in the spring that will lay out the ground rules for a legal, recreational market. Canadian Press (Daily Gleaner, D4, Telegraph Journal)

Pot enforcement won't change until marijuana is legalized, says Regina police chief
Regina Police Chief Evan Bray says there are no plans to let up on policing marijuana while it's still illegal. Bray said there has been discussion about its impending legalization, one of the Liberal promises made in the 2015 federal election. But the law will continue to be enforced in Regina until it changes, according to the police chief. "Today, the law still says that [marijuana]'s illegal to possess," he said in a year-end interview with CBC News. Bray said police exercise discretion when it comes to the issue and will continue to do so. If someone was a danger to themselves or others, such as being behind the wheel of a vehicle while impaired by drugs, he said police would act on the matter. CBC News (2016-12-27)

Hazy Outlook - Work cut out for province on marijuana legalization
After two days of legal marijuana immersion therapy, Alberta's justice minister admits more questions than answers remain on how the province rolls out pot reforms. But a federal task force's recently unveiled recommendations - calling for cannabis sales outside liquor stores, mail order retail and a minimum age of 18 - have cleared some of the smoke. While an October trip to Denver - the epicentre of Colorado's cannabis legalization - was useful, what Alberta's post-prohibition landscape looks like remains dependent on Ottawa's still hazy blueprint, says Kathleen Ganley. What's clear, she says, is that the deepest anxieties centre around the welfare of the province's youngest citizens - and motorists - as the feds prepare to table legislation in the spring. "Our biggest concerns are to ensure the safety of our roads and children," said Ganley, calling Colorado's experience a mixed bag. "Things certainly didn't descend into disorder or solve all the world's problems." Because no cannabis equivalent exists to the roadside breathalyzer that measures alcohol impairment, it appears police will have to rely on their own

skills of observation in weeding out stoned drivers, she said. Postmedia Network (Edmonton Sun, A11; Calgary Herald) (2016-12-26)

Legal pot could spark Canada-U.S. conflicts - From border security issues to existing anti-drug treaties legalization will have fallout
Their position on marijuana is hardly the only difference between Canada's prime minister and the president-elect of the United States. But when Justin Trudeau's government introduces legislation to legalize cannabis this spring, it could spark problems between Canada and the U.S., particularly since Donald Trump has indicated he will keep pot illegal at the federal level. Here's a look at what could change in Canada-U.S. relations once Canadians start lighting up legally... Earlier this year, Public Safety Minister Ralph Goodale said Canadians banned from entering the U.S. because they've admitted to using pot was a "ludicrous situation" that needed to be addressed. Scott Bardsley, a spokesperson for the minister, said Goodale will continue to discuss with American officials the need for Canadians to be treated appropriately when they are entering the U.S. Canadian Press (Toronto Star, A33) (2016-12-26)

Lacing dog treats with cannabis is a growing business
Even for a puppy, Kat Donatello's black Labrador, Austin, was hyperactive. After experimenting with natural supplements on her older dog, Donatello slipped a special biscuit to Austin. "It just kind of took the edge off of him," she recalled. Hamilton Spectator (2016-12-26)

Legal pot will bring difficult challenges for police, says expert
The impending legalization of marijuana will be a "tough" cultural shift for police forces in 2017, according to a Fredericton crime expert. Michael Boudreau, a professor with the criminology and criminal justice department at St. Thomas University, said law enforcement will have to embrace a new culture when it comes to dealing with marijuana. Telegraph-Journal (Telegraph-Journal; Daily Gleaner; Times & Transcript) (2016-12-24)

Perth County OPP test new devices to help identify impaired drivers
Police are testing new devices to identify drug impaired drivers. Whether or not the impending legalization of recreational marijuana use will have an impact on drug-impaired driving remains to be seen. However, the timing of a pilot project to detect drug impairment could give police new resources as legislation legalizing recreational cannabis is introduced in Parliament this spring. The pilot project is being tested by OPP, including Perth County, Toronto, Vancouver, Gatineau, Halifax, and Yellowknife police forces as well as North Battleford RCMP. Police are testing two units that collect oral fluids. The Alere DDS2 website says the hand-held machine can detect up to six different drugs from one oral fluid sample. The Suretec DrugWipe claims reliability greater than 95% with test results in eight minutes or less. Stratford Beacon Herald (2016-12-23)

Don't legalize pot before figuring out how to deal with stoned drivers: poll
Over 80 per cent of Canadians think that it would be a mistake to legalize marijuana before we have a reliable system for testing stoned drivers, a poll shows. Driving while impaired by a drug is just as illegal as driving drunk, but testing drivers for cannabis is more challenging than testing them for alcohol. As well, there's no consensus about where a bloodstream limit for THC should be set for drivers. "Until Canadians are convinced that the legalization of marijuana isn't going to make our roads less safe, we should just put the brakes on legalizing marijuana until we've got this figured out," said Sean Simpson, vice-president of Ipsos Public Affairs, summarizing the poll's findings. Global News (2016-12-23)

EDITORIALS & OPINIONS / ÉDITORIAUX ET LETTRES D'OPINIONS

Does the loss of 755 B.C. lives to drug overdoses justify a public inquiry?
An opinion piece states, "In the summer of 2010, *Maclean's* magazine published an astonishing story about the RCMP's approach to supervised-injection sites. It outlined how the previous autumn, the Mounties and the B.C. Centre for Excellence in HIV/AIDS were in discussions to hold a joint news conference. There, they would each "declare their agreement that research shows the 'benefits' and 'positive impacts' of supervised injection sites for intravenous drug users", according to journalist John

Geddes. (…)The senior Mountie in B.C. at the time—then deputy commissioner Gary Bass—reportedly told Dr. Julio Montaner that RCMP headquarters in Ottawa would not permit the news conference to go ahead. The B.C. Centre for Excellence in HIV/AIDS subsequently filed a complaint to the Commission for Public Complaints Against the RCMP. This concerned the Mounties' efforts to discredit the centre's research. (…)According to *Maclean's*, senior B.C. RCMP officers were prepared in 2009 to acknowledge peer-reviewed research about supervised-injection sites. This research says, among other things, that these facilities save lives. However, someone in Ottawa appears to have prevented this public statement from being made." The Georgia Straight (2016-12-27)

Ragoût de «pot» de cochon?
Un article d'opinion par Dr Sylvain Charlebois note « Le pot est à la mode ces jours-ci, surtout à Ottawa. Un groupe de travail a récemment présenté un cadre de législation possible pour un Canada qui permettrait la consommation de la marijuana pour l'ensemble de la population. Pratiquement, depuis le lendemain de la victoire des libéraux à l'automne 2015, l'ensemble du secteur agroalimentaire attentait avec impatience les recommandations de ce groupe et le rapport déposé au début décembre n'a certes pas déçu l'industrie. Ce que plusieurs ne réalisent pas encore, c'est que le cannabis représente une petite mine d'or pour les secteurs de la transformation et de la distribution alimentaire au pays. Selon une étude publiée par Deloitte en octobre, le marché de la marijuana, une fois légalisé, pourrait générer plus de 22 milliards de dollars au Canada. C'est plus que les ventes combinées de vin, de bière et de spiritueux sur l'ensemble du territoire. Les ventes de cannabis à l'état pur représenteraient environ 8 milliards de revenus supplémentaires d'ici quelques années. Mais selon la même étude, plus de 14 milliards de revenus supplémentaires émaneraient de produits dérivés du cannabis. C'est énorme. Il est fort possible que 5 à 7% des produits alimentaires vendus au Canada d'ici 10 ans puissent contenir du cannabis, incluant le prêt-à-manger. Qui sait, une autre façon de déguster le ragoût de pattes de cochon, le pâté chinois, la tourtière ou bien les pets de soeur! » Le Quotidien, 12 (Le Nouvelliste, Le Droit)

Inside fentanyl crisis
An opinion piece by Staff Sgt. Conor King from the Victoria Police Department states, "I spent Christmas 2015 sitting at my kitchen table, smartphone in hand, tracking overdose deaths across Greater Victoria. Eight people had died in seven days, three in the preceding 24 hours. Two of them died on the street, one in a parkade, the rest at home. This included Miranda, the 22-year-old daughter of one of my co-workers at the Victoria Police Department. She died in her bedroom a few hours after opening Christmas presents with her mom and stepdad. In the weeks before Christmas, I had watched the number of overdoses rise across the city. We call it a cluster. It wasn't the first one I'd seen. That happened in the spring of 2013. (…) I called my friends at the RCMP. They invited me to an urgent meeting at their headquarters. Fifty cops and crime analysts from across Western Canada crowded into a briefing room. The U.S. Drug Enforcement Administration sent a team of chemists from Washington, D.C. That's not normal. I braced for bad news. On an oversized smartboard, we examined maps dotted with overdose clusters. Communities across North America were seeing overdoses spike. The chemists explained it was illicit fentanyl, cheaper than heroin and lethal in minute quantities. One held up a 500-milligram Tylenol tablet and said: "If this was fentanyl, it could kill 250 people." (…)People take enormous risks smuggling heroin. That risk is a strong deterrent. But what I was hearing from the RCMP was this: Unlike heroin, fentanyl is produced with ease by unscrupulous chemical companies in China and other countries, advertised on the Internet and shipped by commercial mail." Times Colonist, A1

Let's unite on opioid war
An editorial states, "If Alberta had as many drunk driving deaths as it did from opioids - 338 for the first nine months of the year, half of those tied to fentanyl - there would be all-party support for an enhanced strategy to put a stop to the carnage. There is a growing chorus of voices, though. Liberal Leader Dr. David Swann, who headed the NDP's mental health review, has been steadfast in his view the province needs to declare a public health emergency to combat the crisis. And now one of Alberta's top cops is pushing for more action. In an interview with the Canadian Press, Calgary Police Chief Roger Chaffin said the province has to take more aggressive action dealing with the "demand side" for the drugs. "We need to get these people out of the lifestyle they're in and get them into more healthy lifestyles, improve their families, improve their wellness in this community," he said. To him, that means more treatment spaces." Edmonton Sun, A14 (Calgary Sun)

Press freedom in Canada eroded by post-9/11 obsession with security
An opinion piece states "Canada's news media are still living under the entrenched legacy of Stephen Harper - like everything and everyone else in this country. The previous prime minister ushered in what the Paris-based press freedom organization Reporters Without Borders (known by its French acronym, RSF) refers to as a 'Dark Age' of Canadian journalism. Even with a change at the executive level, old habits that characterize the legacy of such an age haven't left Canada's institutions... The scary contrast here is with the increasing threat to investigative reporting or meaningful journalism in general in a post-9/11 age of heavy-handed security laws. This kind of legislation has created much more legal space for law enforcement and intelligence agencies to operate, sometimes virtually with impunity, in ways that, according to organizations like the Canadian Civil Liberties Association, 'violate the Canadian Charter of Rights and Freedoms.' Such a climate calls for more scrutiny by the press when it comes to monitoring centres of power. Yet Canadians are witnessing the exact opposite trend." CBC News (2016-12-26)

Jessica's favourite things from 2016 - Canada shifts its stance on personal data security
An opinion piece states "This past November, it came to light that the Canadian Security Intelligence Service (CSIS) had been illegally collecting Canadian data for over a decade. The federal government chastised the agency for its actions, and handed down a ruling stating that the intelligence service had breached its duty to inform the court of its mechanisms. The information had been collected for reasons other than national security threats, and therefore, should not have been retained by CSIS in the first place. This report accompanied several others in 2016 detailing the relationship between federal regulators and Canadian data. News that a Quebec police station tracked the smartphones of six journalists made headlines around the world and attracted commentary from history's most famous whistleblower, Edward Snowden. The reaction to these stories by federal courts and regulators demonstrates a more modern perspective on data than we've seen from Canadian governments in the past. It's encouraging for many Canadians to see that the legacy left by Bill C-51 needn't be a permanent one..." Mobile Syrup (2016-12-26)

Quebec's indigenous inquiry isn't quite what was sought
An opinion piece states, "Often a public inquiry is what the opposition demands when it has no ideas of its own to propose. And often it's the response of a government to pressure to Do Something. There has been pressure on the Couillard government to hold a public inquiry into allegations of abuse of indigenous women by police in Val-d'Or since the Radio-Canada investigative program Enquête first reported them in October 2015. The pressure, led by Quebec indigenous leaders, became more intense in the past month... Finally, last week, the federal commission of inquiry into missing and murdered indigenous women and girls, created in September, said it could not conduct the investigation into the situation in Val-d'Or on which the Couillard government had been counting. The federal commission suggested that instead Quebec conduct its own "complementary" inquiry. At that point, the Couillard government gave in. When the government announced the terms of the inquiry this week, aboriginal leaders were pleased. They may, however, have got more than they bargained for - or less..." Montreal Gazette (2016-12-24)

Les méritas 2016

Comme les enfants qui n'ont pas été sages sont susceptibles d'être déçus par le père Noël, les oubliés dans ma liste peuvent toujours rêver de faire mieux... l'an prochain... RALPH GOODALE. Méritas Gardien du fort. Les questions de sécurité ne semblent pas être la force du toujours positif Justin Trudeau. Face à la menace terroriste ou dans la sélection des réfugiés, le vieux routier Goodale apparaît comme une force rassurante. Je suis convaincu que sa sagesse se fait aussi entendre au Conseil des ministres.... » Agence QMI (Journal de Québec, 16; Journal de Montréal) (2016-12-24)

What should we expect from security intelligence services?
A blog post by Phil Gurski states "Earlier this morning the suspect in the Berlin Christmas market attack that killed 12 and wounded dozens more was shot to death by Italian police in Milan. An international manhunt ended successfully with the killing of Anis Amri, a Tunisian refugee who had spent time in Italy before moving on to Germany. He was known to Italian authorities for his violent behaviour while

imprisoned for vandalism. German authorities had sought to deport him to Tunisia but were hampered by questions over his nationality. He had also been on German intelligence radar for months. Islamic State has issued a video of Amri pledging allegiance to IS leader Abu Bakr al-Baghdadi. As is usual in the aftermath of terrorist attacks, questions are being asked about why the attack had not been foiled. German agencies in particular have been criticised and their capabilities are under scrutiny. The same happened in the wake of the Brussels attacks as well as here in Canada after the October 22, 2014 rush on Parliament Hill by Michael Zehaf-Bibeau. Inquiring minds want to know: just what the hell are our intelligence and law enforcement agencies doing with the billions we give them? I find all this hand wringing and armchair quarterbacking interesting – and hypocritical. Yes, I have a clear bias as someone who worked in security intelligence for three decades but if I try to see this as an interested outsider (which, truth be told, I am now that I have retired from CSIS), I still can't support the criticism levied on my former colleagues, both here and abroad." Borealis Threat and Risk (2016-12-23)

What legal weed needs: marijuana and the law
An opinion piece states "Against a background of considerable buzz, the Liberal government's task force on the future of marijuana in Canada has now released its much-anticipated report, A Framework for the Legalization and Regulation of Cannabis in Canada. The report provides helpful recommendations on how to responsibly legalize and regulate recreational marijuana use. The report is ambitious in scope, addressing everything from the packaging of edibles to the height of homegrown plants to environmental stewardship. It has been well-received, and for good reasons: While it may not be perfect, the report goes some way to redefining marijuana as matter of public health and not of criminal law. Now comes the hard part. The Trudeau government, along with the provinces, must now move from theory to practice and create a comprehensive legislative regime." iPolitics (2016-12-23)

OTHER / AUTRES

'It just shocks me'
Calgary's police chief says the Alberta government has to take more aggressive action on fentanyl if it wants to help addicts and families who are being destroyed. "It is a crisis," said Calgary Police Chief Roger Chaffin in an interview with The Canadian Press. "Look at the numbers of deaths. Numbers of homicides and traffic fatalities don't come anywhere near the deaths associated with these drugs." In the first 10 months of 2016, 338 Albertans died from opioid-related overdoses, with fentanyl linked to 193 of those deaths. "People are going to keep arguing about whether this is a crisis or not. It just shocks me," Chaffin said. "We're wasting all our energy arguing about whether this should be called a public health crisis or not. Spend your energy fixing the problem." Chaffin said there is a huge demand for highly addictive opiods such as fentanyl - a drug used as a painkiller for terminally ill cancer patients and 100 times more powerful than heroin - or its more powerful cousin carfentanyl. Reducing the supply increases the price and make its users more desperate, he said. Postmedia Network (The Guardian, A5, Whitehorse Daily Star, Red Deer Advocate, Leader-Post, Windsor Star, Montreal Gazette, National Post, Ottawa Sun, Vancouver Sun, Ottawa Citizen, Times Colonist, Waterloo Record, Edmonton Journal, Calgary Sun, Kingston Whig-Standard, Times & Transcript, Hamilton Spectator, Toronto Star, Globe and Mail); Postmedia Network (Calgary Herald, Calgary Sun)

'Perfect storm' testing police
A lagging economy and the presence of potent drugs and addictions in Calgary translated to a "perfect storm" in 2016 for the city and its police officers, according to Chief Roger Chaffin. The police chief cites drugs as the biggest issue the service faced during the past year - and one that has affected the very nature of policing. "You see highly motivated criminality around these drugs that's cause for many, many public safety concerns, and safety concerns for our officers," Chaffin said in an interview. Those concerns have put the local police service in situations it hasn't seen in its history, he added. The fact that officers fired their weapons in 10 separate incidents in 2016, including five fatal scenarios, is reflective of that different environment, according to the chief. Calgary Herald, A1

La SQ démantèle un premier laboratoire de fentanyl au Québec

La SQ a démantelé pour la première fois samedi dernier un laboratoire d'encapsulage de fentanyl. Les résultats d'analyse ont confirmé mardi qu'il s'agit bien de cette drogue " puissante et dangereuse ", a déclaré un porte-parole de la Sûreté du Québec (SQ). Un kilogramme de la substance a été saisi, deux cents grammes d'alprazolam, ainsi que deux presses à comprimés et une machine à encapsuler. Des saisies ont d'abord eu lieu à Longueuil, Boucherville et Saint-Roch-de-Richelieu, avant de mener les 35 policiers de cette escouade vers le laboratoire à Potton en Estrie. (…) Une recherche dirigée par Kate Smolina, de la Faculté de médecine de l'Université de la Colombie-Britannique, révèle que, de 2005 à 2012, la proportion de la population prenant des opioïdes pendant une période prolongée est passée de 2,0 à 2,4 %, ce qui représente une hausse relative de 19 %. " 2 %, ça peut paraître peu, mais c'est en fait considérable. En Colombie-Britannique, cela se traduit par environ 100 000 [personnes] ", explique Mme Smolina. Le Devoir, A3

Hausse des incendies criminels liés à la mafia

Les incendies criminels liés à la mafia montréalaise ont augmenté à Montréal en 2016, en particulier depuis le début de l'automne, laissant ainsi croire que le crime organisé italien connaît une autre période de recrudescence des luttes intestines qui la secouent depuis environ 10 ans. En cette année qui se termine, les enquêteurs de la section des incendies criminels de la police de Montréal ont par ailleurs été également très occupés avec plusieurs incendies qui ont éclaté dans des immeubles désaffectés, tellement qu'un nouveau bureau d'enquête vient d'être créé pour endiguer le phénomène. «Actuellement, selon notre analyse, je lis qu'il y a une lutte entre deux groupes de la mafia, dont le clan Rizzuto. C'est surtout lui qui est visé. On dirait que l'on veut tasser les Rizzuto, et ce sont des messages que l'on veut envoyer», a expliqué à La Presse le commandant de la section des crimes majeurs et économiques du SPVM, Juan Vargas. Voix de l'Est, 11

Chief looking out for patrol cops

As the year draws to a close, Brian Fitzpatrick sits down with new Regina Police Service Chief Evan Bray to find out how he's settling into his new role (…) But image aside, he must now oversee a staff of 586, getting them to buy into his plans from the bottom up. He said that making sure patrol units - what he calls the "core function" of the service - are adequately supported, and communicated with, will be one of his main 2017 goals (…) With surging methamphetamine use and the gun-based crime wave that has come with it, Bray said he wants to refocus on the travails of the men and women who "are being asked to make split-second decisions, and then ultimately are at risk every day and night that they come to work." These decisions are being made within a worsening environment. Yearly attempted murders have jumped from eight in December 2015 to 31 as of last month (…)From January to November there were 126 violent incidents involving a firearm, versus just 67 over the same months in 2015. On just one Tuesday in November, police responded to four gun-related incidents. Bray said patrol units often find their numbers dragged on by specialist units - plainclothes units, investigative units, etc. - meaning a force can easily lose sight of what its primary job is. For most RPS officers, it's not meeting the press in a fancy room. Postmedia (StarPhoenix, A1/FRONT; Leader-Post) (2016-12-27)

Police in Quebec City shoot, kill armed man

Quebec's police watchdog is investigating after a 39-year-old man died and a police officer was injured by a machete during a chase in Quebec City overnight Monday. According to the province's independent investigations bureau (BEI), around 2:30 a.m. police in Lévis initiated the chase and called Quebec City and Sûreté du Québec officers for assistance. Police laid down a spike strip but it didn't stop the car (…) The man proceeded to get out and struck an officer with a machete. Her injuries were minor. At least two police officers then opened fire on the man. He was pronounced dead in hospital. The BEI, which probes deaths or serious injuries involving police, has asked three members of the Montreal police force to assist with the investigation. CBC News; La Presse Canadienne (La Presse) (2016-12-27)

Une année marquée par des tragédies

L'année 2016 aura connu sa part d'événements tragiques et d'interventions policières, ce que les médias classent sous la rubrique des «faits divers»… Le mois d'octobre se termine, le 31, par un coup de tonnerre dans les médias: on apprend que le chroniqueur Patrick Lagacé, de La Presse et du 98,5 FM, a fait l'objet de 24 mandats de surveillance par lesquels le Service de police de la Ville de Montréal (SPVM) a eu accès aux métadonnées de son téléphone cellulaire et obtenu la possibilité de connaître sa position

par le biais du GPS. Les informations déboulent dans les jours suivants et on apprend finalement qu'une dizaine de journalistes ont fait l'objet de surveillance du SPVM ou de la Sûreté du Québec (SQ). L'affaire prend une telle ampleur que le gouvernement du Québec se voit obligé de décréter de nouvelles directives pour encadrer la délivrance de mandats et déclenche une commission d'enquête publique sur les pratiques policières, la délivrance de mandats et les interventions politiques auprès des corps policiers. Le Soleil, 22 (2016-12-26)

Guns, drugs, cash seized in 'significant' raid
London police say they're alarmed by the number of weapons seized in a jaw-dropping raid that netted three guns, hundreds of rounds of ammunition and more than $30,000 in illegal drugs Friday. Cops swooped down on Fleming Drive - site of a St. Patrick's Day riot in 2012 near Fanshawe College - and officers in the guns and drugs section raided a home. Sun Media Corporation (London Free Press) (2016-12-24)

Four Mississauga robberies solved with GTA-wide gang sweep: Police
Four retail robberies in Mississauga are among the 37 police say they have solved with a multi-jurisdictional investigation that saw 16 suspects arrested and warrants issued for another three. Mississauga.com (2016-12-23)

Thanks. I will include in Cyber.

I think this one should go in NS Consultation (came out last night and we included in TN, but I think it is worth re-including in the this morning's DMS):

Snowden says Trudeau afraid to kill anti-terrorism bill
Whistleblower. Hero. Traitor. Patriot. These words and more have been used to describe former cybersecurity contractor Edward Snowden, who in 2013 copied and distributed thousand of documents to reporters and whose stories of Western intelligence agencies — including Canada's Communications Security Establishment (CSEC) — shook the world. This morning Snowden told the the annual SecTor cyber security conference in Toronto that Prime Minister Justin Trudeau want to amend the controversial Bill C-51 anti-terrorism law and not repeal it because he "is afraid of being attacked for being soft on terrorism." Speaking by video from Russia, where he fled to avoid prosecution by U.S. authorities, Snowden said the legislation, needs three fixes: First, a judicial body should have oversight over federal intelligence agencies that has the power to prosecute authorities that have broken the law. Second, because intelligence agencies are trading personal information of citizens "like baseball cards" citizens should be told if the data sharing hasn't led to an arrest for criminal activity. And finally, what Snowden called the criminalization of speech through vague definitions of terrorism should be taken out of C -51. A lot of what police call terrorism is the activity of what he called "common criminals" or those who are trying to make a political point but don't constitute a "super criminal threat." NATIONAL SECURITY

File breach at electronic spy agency prompts mandatory privacy training
Canada's electronic spy agency introduced mandatory privacy awareness training for all employees in March following an internal breach involving personal information. When Greta Bossenmaier became chief of the Communications Security Establishment in February, the ultra-secret eavesdropping outfit was under intense public scrutiny over alleged spying on citizens. But less than two months into the job, Bossenmaier was informing the spy agency's staff of a privacy violation inside its own walls. "I seriously regret that we are in this situation and never want it to be repeated," Bossenmaier told employees in a March 20 email. "As such, we must use it as a learning opportunity so that we can prevent any further incidents from occurring." Documents leaked in 2013 by former American spy contractor Edward Snowden revealed the U.S. National Security Agency — a close CSE ally — had quietly obtained access to a huge volume of emails, chat logs and other information from major Internet companies, as well as massive amounts of data about telephone calls. As a result, civil libertarians, privacy advocates and opposition politicians have demanded assurances the CSE is not using its extraordinary powers to snoop on Canadians. The agency insists it scrupulously follows the law in protecting Canadians' privacy. Canadian Press (City News)

EMERGENCY MANAGEMENT / GESTION DES MESURES D'URGENCE

***Water shortage a wake-up call: Expert**
On a sunny afternoon in Stanley Park, cricket players run on parched yellow grass. A majestic fountain in the middle of Lost Lagoon sits dormant. A little girl approaches an inactive splash pad, squealing when its user-activated geysers suddenly gush water. Vancouver, often admired for its lush greenery and occasionally mocked for its torrential rain, has turned a dry, dusty brown as a savage drought sweeps Western Canada. And as residents adapt to the harshest water restrictions imposed in 12 years, experts and officials warn it's time to get used to turning off the taps. When asked how the province stacks up to other parts of the world in terms of water conservation, University of British Columbia watershed management profess or Hans Schreier doesn't mince words. "We're terrible," he says. "We're terrible, seriously. We are the second biggest water users. We have never worried about water. We have terrible regulations." "There are going to

be more floods and more drought," he warns. "We should start thinking about adapting to these conditions." Metro Vancouver chair Greg Moore says the region has been monitoring water for a century and this week marks only the second time it has had to impose Stage 3 restrictions. "We haven't seen this type of drought and consumption of water in our history," says Moore, who is also mayor of Port Coquitlam, a suburb east of Vancouver. Canadian Press (Kingston Whig-Standard, B1; Globe and Mail, Edmonton Journal, Leader-Post, Star Phoenix, Windsor Star, Edmonton Sun, London Free Press, Red Deer Advocate, Times and Transcript, Telegraph-Journal)

*** Wise to plan for drier West**

An editorial states "After a run of several wet years that saw several major flood emergencies, the spring and summer of 2015 have seen Saskatchewan literally dry up. The signs have been everywhere - evacuees fleeing huge wildfires in northern forests, parched and stunted crops in the grain belt, and brown, patchy lawns and "green spaces" in the cities. Reginans were asked to temporarily reduce their water use by 25 per cent a few weeks ago when the Buffalo Pound water treatment plant struggled with unusual algae blooms and water conditions on the lake that supplies this city and Moose Jaw with clean water. Saskatchewan isn't alone - drought conditions have also hit Alberta farmers and British Columbia is enduring recordbreaking heat and sparse rainfall that have resulted in more than 1,300 wildfires and led to significant water use restrictions in normally rainy Vancouver. "For sure, this is something we can expect to see with increasing regularity," Howard Wheater, director of the Global Institute for Water Security at the University of Saskatchewan recently warned." Star Phoenix, A6 (Leader-Post)

*** Silent Scanners**

Citizens who like listening in on police, fire department and ambulance calls are out of luck, now that most emergency services communications in Cape Breton are conducted on fully encrypted radios. The scanners have gone silent, for the most part, with the introduction of the second generation of Trunk Mobile Radio (TMR2) communications. Being unable to monitor police traffic can be dangerous for citizens, said one longtime listener who didn't want to be named. "You don't know what's going on in the city unless you have a scanner," said the citizen, who lives in Sydney's north end. "No offence to radios or newspaper, but you don't hear everything that goes on." Cape Breton Regional Police spokeswoman Desiree Vassallo said police haven't heard any complaints from citizens about the encryption system. She said police need secure communications, especially during sensitive operations when police don't want suspects or the public to know exactly where they are. Chronicle-Herald, A3

CYBER SECURITY / SÉCURITÉ CYBERNÉTIQUE

***Greece had secret plan for instant drachma switch**

A secret cell at the Greek finance ministry hacked into government computers and drew up elaborate plans for a system of parallel payments that could be switched from euros to the drachma at the "flick of a button." The disclosures caused a political storm in Greece and confirm just how close the country came to drastic measures before Prime Minister Alexis Tsipras gave in to demands from Europe's creditor powers, acknowledging that his own cabinet would not support such a dangerous confrontation. Yanis Varoufakis, the former finance minister, told investors that a five-man team worked for months on a contingency plan to create euro liquidity if the European Central Bank cut off emergency funding to Greece, as it in fact did after talks broke down and the ruling Syriza party called a referendum. London Daily Telegraph (Ottawa Citizen, C2; Edmonton Journal, Calgary Herald, Star Phoenix, Leader-Post, The Province, Windsor Star, Vancouver Sun)

*** Cracking down on hackers bad for innovation**

An opinion piece states "Every week seems to bring a new hacking story - the massive hacking attack on the U.S. government's databases and the attacks on the U.S. health-care system are just two of the bigger stories - so it's perhaps no surprise that the knee-jerk reaction is to take the fight directly to the hackers. By making the penalties tougher, by expanding the scope of federal anti-hacking statutes and making it easier to prosecute wrongdoers, it'll convince hackers that it's just not worth the risk, right? The problem is that simply toughening the laws on hackers by extending their scope and reach or extending the prison sentences of hackers is not going to help catch the real hackers - the criminalized, anonymous hackers who operate in places such as China. Instead, they're more likely to ensnare the likes of hacktivist heroes such as Aaron Swartz. Getting tough on hackers by extending the definition of what a hacker is would theoretically mean that people who even so much as retweet or click on a link with unauthorized information could be committing a felony. Moreover, the white hat hackers (the "good guys") could be ensnared as well, since their work, at its core, is indistinguishable from that of the black hat hackers (the "bad guys"). And that could have a chilling effect on innovation." Hamilton Spectator, A15

***Your car could be hacked, and that's no prank**

An editorial states " It's a scenario out of a Stephen King novel: A driver cruising along a busy highway suddenly finds his car taken over by an outside force. First it's just the radio, the wipers and the air conditioning behaving chaotically. Then - as an 18-wheeler bears down at high speed - the transmission shuts down. As you've no doubt noticed, more and more

everyday objects are being rigged with sensors and connected to the Internet. By 2020, 50 billion such devices may be online. This phenomenon, known as the Internet of Things, promises all sorts of benefits to companies and consumers alike. But many of the manufacturers involved have little experience with digital security, and few customers know how to properly protect their cars (or toothbrushes) from malicious hacking. As a result, commonplace items such as baby monitors, room locks and medical devices have already been hacked. Manufacturers should expect this to continue, and prepare for it to get worse before it gets better. That means making cybersecurity something more than an afterthought when designing new products. It also means being upfront with consumers about exactly what those products are doing and sharing online. Bloomberg (Hamilton Spectator, A14)

***Security is a private matter**

The Ashley Madison hack is the latest in a series of high profile data breaches that have plagued businesses and consumers. Other targets include Target, Home Depot, Sony, and JP Morgan Chase, to name but a few. Ashley Madison's customers are targets of cyber extortion. Hacker group The Impact Team claims to have breached the website's computer systems, gaining access to troves of sensitive personal information about its users. The Toronto-based service gained notoriety as a website that facilitates "discreet encounters between married individuals," boasting close to 38 million members. It has been threatened with the public disclosure of information on its users unless it shuts down. Reports have claimed the hackers are former employees of Ashley Madison, who used their insider knowledge to gain access to the personal data. But the hack could have been accomplished just as easily by utilizing a "zero day" attack, or simply because of lax security (as is often the case in data breaches). Companies, not their users, are ultimately responsible for the security of their websites. But there are several measures users of Ashley Madison could have taken to protect themselves. Since the article was in yesterday's 2pm, I feel like sending out a one-off now would be of little benefit. My thoughts on one-offs is that it should be for breaking or relatively recent news items. So, it would have made sense to have sent it out yesterday.

That said, we're going to top story the National Post piece this morning (same one that was in yesterday's 8pm product).

Snowden says Trudeau afraid to kill anti-terrorism bill
Whistleblower. Hero. Traitor. Patriot. These words and more have been used to describe former cybersecurity contractor Edward Snowden, who in 2013 copied and distributed thousand of documents to reporters and whose stories of Western intelligence agencies — including Canada's Communications Security Establishment (CSEC) — shook the world. This morning Snowden told the the annual SecTor cyber security conference in Toronto that Prime Minister Justin Trudeau want to amend the controversial Bill C-51 anti-terrorism law and not repeal it because he "is afraid of being attacked for being soft on terrorism." Speaking by video from Russia, where he fled to avoid prosecution by U.S. authorities, Snowden said the legislation, needs three fixes: First, a judicial body should have oversight over federal intelligence agencies that has the power to prosecute authorities that have broken the law. Second, because intelligence agencies are trading personal information of citizens "like baseball cards" citizens should be told if the data sharing hasn't led to an arrest for criminal activity. And finally, what Snowden called the criminalization of speech through vague definitions of terrorism should be taken out of C -51. A lot of what police call terrorism is the activity of what he called "common criminals" or those who are trying to make a political point but don't constitute a "super criminal threat." This came out last night and was included in TN… That said, I'm thinking it is worth reincluding in this morning's product. Could also one-off?

Just wanted to bounce this off someone.

Let me know your thoughts.

Subject: RT - CBC News - Power and Politics: Debate between national security experts Ray Boisvert and Errol Mendes on measures to track terror threats - 2015-01-16 - 18h25 ET

Rough Transcript

Station: CBC News – Power and Politics
Time/Heure: 18h25 EST
Date: 2015-01-16

Summary: *CBC News' Power and Politics featured a debate between national security experts Ray Boisvert and Errol Mendes on measures to track terror threats.*

>>> Hannah: Police say peace bonds are useful tool to help track terror suspects but they also say the legal requirements for obtaining them are so high that they are rarely granted. In fact, peace bonds have been ordered only eight time against terror suspects since 2001. And CBC news has learned that police tried but failed to get one for martin Couture-Rouleau weeks before he used his car to run down two soldiers in Quebec. Royal officer was killed in that attack. Comes with conditions, not owning weapons or restricting travel or associating with certain individuals. As the federal government prepares to table new anti-terror laws should it lower the bar for peace bonds to give police new powers or is it prudent to restrict their use to protect civil liberties? Joining me now to debate that, (Errol Mendes) Professor of International and Constitutional Law at the University of Ottawa. And by Skype from Toronto, Ray (Boisvert) is the former assistant director of intelligence at CSIS. He is now CE of ISAC integrated strategies. I want to start with you. What was your reaction to our story by our colleague Chris Hall that a prosecutor felt there wasn't enough evidence for a peace bond for martin Couture-Rouleau.

>> Interview: I wasn't shocked or surprised. Part of the issue, that's been a relatively long standing piece of criminal code of Canada related tool set. It has been very rarely used in the context of national security and in fact that part of the problem. I think there is probably lack of understanding, a lack of knowledge around national security issues amongst prosecutors because many crown councils deal with average day, every day things from high end to low end, from homicide to common assaults. Not that often are they sieged with this kind of complexity of an issue. So I think the threshold was probably difficult to achieve just naturally because you are dealing with whole bunch of new substance matter for the officers involved to convince the crown let alone convince judge subsequently p. I think that's part of the problem. But ultimately I think there is some potential to add this and to use it more frequently in that tool set. Aiming to sort of reduce the risks around terrorism.

>> Hannah: You want today jump in there.

>> Interview: Oh, absolutely. I'm confused as to why the prosecutor refused because you know, as you said, they have been eight bail bonds which were issued, six to the 18 terrorists in Toronto. And two which eventually were charged with major criminal offense. And when you look at the six that were given to the 18, they were fairly easily obtained, and brain Saunders who is the director of public prosecutions when he appeared before the senate security committee basically actually said that as far as he is concerned, the threshold that's in the law actually is lowered as far as he is he concerned. He actually said that as far as he is concerned, if he is convinced the judge can give it, he will give it. He will give his opinion. So I'm confused as to whether or not it's not a question of the law being changed, it's a question of whether the prosecutors did their job properly and whether the police presented the evidence properly.

>> Hannah: Now, Ray I see you nodding your head there.

>> Interview: I think it's a very fair comment. Both ends. A try apartheid system. Law enforcement officers bring forward information or charges against individuals. Prosecutors have to be satisfy adrenal chance of success and there is due process. Number of thing. There is a bit of check and balance, naturally in the system. And then thirdly convince judge that the evidence is compelling beyond a reasonable doubt and so on. I'm not a lawyer but ultimately I think in the first part

when the police are faced by the prosecution there is a gap. I think knowledge gap. May be simply a complex and I had velocity. I worked with criminal prosecutors in a previous life. I spoke to a number of them, not that long ago at western university at a seminar because they had a group in Ontario had no exposure to national security cases from espionage to terrorism. And I think they were probably pretty representative of the whole.

>> Hannah: So seems like it's a knowledge gap. So how do you fix the knowledge gap. Is it nor training?

>> Interview: Knowledge on the part of perhaps even parliament because when kneejerk reaction to say we need harsher laws. Where is the evidence? Amazing that the CBC had to produce this knowledge before we knew about it. That tells us that we are not being told the full story about what actually happening out there. And if, for example, the gaps where there is a gap of knowledge between the prosecutors and the police, let's fix it. To have a kneejerk reaction, harsh draconian laws, that could be done as a political ploy, to say we are strong on terrorism and the opposition may be weak on terrorism which I hope is not the case that's making political something which should not be made political. The safety of all Canadians at stake. Should find out based on the evidence what's needed and if the evidence produces that there is a need for changing of law so be it.

>> Hannah: Ray, you were talking about a knowledge gap there. Do you think you new legislation is needed? You I'm taking from what you are saying no?

>> Interview: I'm taking that we need to know the facts and need to know what the evidence is be we have this kneejerk reaction whenever there is a major incident we are going to toughen our laws.

>> Hannah: Sorry about that, Ray.

>> Interview: Fair enough. At the end of the day though you can't quite often prove a negative. A number of very effective national security cases that brought to bear and reduce some of those impacts. In other cases been tragic consequences such as we saw in Ottawa in October. Ultimately though as a practitioner, and I guess more narrowly from my perspective when I worked in that area i need as many flex and I believe diverse tools that I can get my hands on. As far down as perhaps some peace bond or control mechanism, something akin to if that Canadian travels overseas and we have reason to suspect that they are going to engage in violent activity, in other words commit murder in a horrible end need to be able to track them. I would call that draconian law. I think reflection of 21st century I think what we are facing right now. Take parts out, which part of the laws are we talking about and what kind of requirements are out there in terms of the intelligence organizations, what kind of laws and how do you apply those laws? The previous segment made that point very well. How do the judges fly that law properly?

>> Hannah: We were talking about the case in France, there was a kid who was drinking, said things, you know, I hope the same thing happens to you and got four years in prison. I don't think anybody would sit here and go that's probably something
--

>> Interview: Absolutely. And yes we face a big problem in terms of the foreign fighters, and we have to figure out how do we have kind of exit controls to make sure that we are not getting more and more of these people who go and come back. We need the evidence. And we don't need to just have kneejerk reactions wherever time there is an incident, we say let's have harsher laws.

>> Hannah: The problem with evidence, ray, and you might be able to come in on this too, problem with evidence, a lot of that evidence they are not giving.

>> Interview: This is part of the problem. We saw that through the security certificate process. We have seen in other trial. I know when I was involved in counter terrorism program trying to move intelligence into useable evidence is a big challenge. We came up with a whole bunch of ad hoc ways. One of the laws being proposed is help address that. I can't see any harm in that. Bring things out in the light of day and into the courts of law.

>> Hannah: Absolutely and if evidence is needed and you need more tools to get your evidence, no one disagrees with that. Because we don't want twelve journalists killed in our country just because they have had a cartoon printed. That being said, however, we absolutely need to figure out what is needed before we come to jump to conclusions and the last thing I would say is that i really hope that this is not being made into a political tool just to say we are tougher than the other parties. If that's the case, then we have to be careful as to what actually is being proposed.

>> Interview: And I think that's what the opposition clearly saying as well. Ray, just quickly, France is bringing in new anti-terror legislation. British Prime Minister David Cameron says intelligence agencies should have the power. So what do you respond to that?

>> Hannah: Well, you I'm hoping it's a question of as said about closing gaps. Some real conscious, concrete gaps that will affect security outcomes.

>> Interview: This is for encrypted internet communications.

>> Interview: Yeah, and I think ultimately that gets right down into the nugget of one of the most contentious issues, especially in the age of post Snowden revelations. So I'm of the view the end of the day security overseas will have to get at certain types of information, irrespective of what cloud it is sitting on irrespective of jurisdiction so they can connect dots hopefully prevent something from happening. This idea been perverted. A lot of scaremongering about the state listen to every conversation, every e-mail. It's poppycock. It is what it is. Going to be a difficult debate to have. I think that's what the French are talking about as much as anything.

>> Hannah: Thank you for having this debate on "Power & Politics" today. Appreciate your time.

>> Interview: You are very welcome.

Rough transcript

Station: CBC News
Time/heure: 16h17 ET
Date: 2015-02-25

Summary: *CBC News reports documents that have just emerged from U.S. whistleblower Edward Snowden reveal the agency has monitored millions of e-mails Canadians send to Ottawa. The B.C. Civil Liberties Association, says these new documents reveal the agency stores Canadian e-mails for days, months, some cases years. The Communications Security Establishment says it respects Canadian's privacy and insists anything it looks at and stores is used in its mission to protect government networks.*

A CBC news exclusive is raising questions today over how your e-mail correspondence with the federal government is monitored. New details are emerging about the activities of canada's electronic spy agency. Documents that have just emerged from u.S. Whistleblower edward snowden reveal the agency has monitored millions of e-mails canadians send to ottawa. With more on what's behind this, here's david seglins.

>> You'll need to register online.

>> Reporter: Pass ports, taxes, writing your m.P. So much of canadian's communication with government these days done online. All that traffic means that, for canada's electronic spy agency, it is a huge job defending ottawa against cyber attacks.

>> To complete your report online, simply log on

>> Reporter: Cbc news for the first time has seen top-secret documents obtained by the u.S. News site the intercept and show how widespread the monitoring is. In 12010, for example, they scanned each and every document to and from government. They screened the attachment looking for bugs, malware and hackers trying to break in. 400,000 e-mails screened every day. About 400 would trigger automated alerts. And analysts take a closer look. Of those, an average fourz each day prompt a warning to a government department or canada's allies.

>> There's much more that the canadian public should be told upfront.

>> Reporter: Michael vaughan, a lawyer with the b.C. Civil liberties association, says these new documents reveal the spy agency stores canadian e-mails for days, months, some cases years.

>> How long is this data being cam chured? Who actually has access it to while it's holding.

>> It's relevant to canadians.

>> Reporter: But this professor of computing says holding on to day that for the day that you discover you've been hacked.

>> You really want to go back and see how big a problem did this cause? How much did we lose because of this attack that we only just noticed?

>> Reporter: C.S.E. Says government systems are constantly threatened by malware, hackers and enemy nations. The agency says it respects canadian's privacy and insists anything it looks at and stores is used in its mission to protect government networks. Dave seglins, cbc news, toronto.

Station: CBC News
Time/Heure: 09h12 EST
Date: 2015-01-28

Summary: *CBC News provided an exclusive look into the Communications Security Establishment Canada's alleged monitoring of global file-sharing.*

>> CBC news has learned that Canada's little-known electronic spy agency is conducting mass surveillance on the world's internet file-sharing sites in its search for terrorists. Top-secret documents obtained by US whistleblower Edward Snowden reveal that Canada's communications security establishment, known as CSEC, is in fact watching millions of uploads and downloads of movies, photos, and music every day. While the agency insists it is not directly targeting Canadians, Dave Seglins tells us the program is raising questions about just how far Canada and its allies go in monitoring the net.

>> It's called project Levitation and according to these new documents, Canada is watching 102 of the world's internet file sharing sites, the kind used to share things like music, movies, and photos. Canada's sifting through ten to 15 million uploads and downloads every day, looking for extremists accessing propaganda videos, instructions on how to build a bomb. This surveillance expert reviewed the documents for CBC.

>> Canadians need to understand and have a debate about the extent which it's okay for their government to be watching everything they do. Is it okay in the pursuit of radical extremists and defending Canadians from possible harm that the government sets up a giant digital x-ray machine over everything that we do? Because that's effectively where we're headed right now.

>> Reporter: CBC got these documents from journalist Glenn Greenwald who first broke the Edward Snowden stories. He says this is an example of Canada taking the lead among its allies in conducting mass surveillance.

>> You could be finding a terrorist, although probably much more likely, you're finding a scientist or a journalist or a lawyer working on a case relating to some of those issues or a student who's interested in those issues or a citizen who's reading about them, so you subject huge numbers of people to all kinds of very invasive surveillance based upon suspicion that is completely unfounded.

>> Reporter: CSEC says it's within their legal mandate to find foreign terrorists. The agency says it's not targeting Canadians and if a Canadian citizen is incidentally caught up in the surveillance, they have measures in place to protect their privacy.

>> CBC news has learned that Canada's little-known electronic spy agency is conducting mass surveillance on the world's internet file-sharing sites in its search for terrorists. Top-secret documents obtained by US whistleblower Edward Snowden reveal that Canada's communications security establishment, known as CSEC, is in fact watching millions of uploads and downloads of movies, photos, and music every day. While the agency insists it is not directly targeting Canadians, Dave Seglins tells us the program is raising questions about just how far Canada and its allies go in monitoring the net.

>> It's called project Levitation and according to these new documents, Canada is watching 102 of the world's internet file sharing sites, the kind used to share things like music, movies, and photos. Canada's sifting through ten to 15 million uploads and downloads every day, looking for extremists accessing propaganda videos, instructions on how to build a bomb. This surveillance expert reviewed the documents for CBC.

>> Canadians need to understand and have a debate about the extent which it's okay for their government to be watching everything they do. Is it okay in the pursuit of radical extremists and defending Canadians from possible harm that the government sets up a giant digital x-ray machine over everything that we do? Because that's effectively where we're headed right now.

>> Reporter: CBC got these documents from journalist Glenn Greenwald who first broke the Edward Snowden stories. He says this is an example of Canada taking the lead among its allies in conducting mass surveillance.

>> You could be finding a terrorist, although probably much more likely, you're finding a scientist or a journalist or a lawyer working on a case relating to some of those issues or a student who's interested in those issues or a citizen who's reading about them, so you subject huge numbers of people to all kinds of very invasive surveillance based upon suspicion that is completely unfounded.

>> Reporter: CSEC says it's within their legal mandate to find foreign terrorists. The agency says it's not targeting Canadians and if a Canadian citizen is incidentally caught up in the surveillance, they have measures in place to protect their privacy.

Summary: *CBC News reported on Canada's electronic spy agency and its cyber warfare capabilities and how those powers may expand if Bill C-51 is passed.*

>> Heather: Good morning. I am Heather Hiscox. We begin this hour with new revelations about Canada's electronic spy agency.

>> Canadians may be surprised to learn about the capability Canada has.

>> Heather: Documents obtained by CBC News shows the depth of Canada's cyber tool box and its use around the world. The plan to expand Canada's ISIS mission. We look ahead as hearings resume on Parliament Hill on hand cuff laws... It is whether you like it or not. It is virtual battlefield where bill C-51 would allow the disruption of terror activities at home. CBC News has documents that reveal Canada has a powerful arsenal for cyber warfare. And the documents also show it is being used to spy on computer networks around the world.

>> The US, Britain. Now proof that Canada's security establishment is also in on international hanging and cyber warfare. These top secret documents obtained by Edward Snowden and analyzed by CBC and the US news site intercept shows that Canada has been hacking into networks in the Middle East and Mexico and other areas. But doing much more, from implanting bugs in computers to disrupting entire networks, cell phones, even attacking a country's infrastructure.

>> Canada may be surprised to learn about the cape believes Canada has. But ultimately it should come as no surprise that Canada would have these capabilities as a highly developed country that's at the apex of the national security pyramid.

>> The documents say Canada has yet to use some of the most destructive weapons, like those used in other areas but there are others that could be used, especially if bill c-51 passes, tools to disrupt communications, divert money transfers, all in a bid to disrupt terrorists or a threat to national security. Dave Seglins, CBC News, Toronto.

>> Heather: As Dave mentions, Bill C-51 would give more powers to Canada's spy agencies. Canada's lawyers are the latest to speak out against the legislation.

>> We will ask judges, the guardians of the constitution and the charter to authorize violations of charter in their absence and it is quite shocking.

>> Heather: Representatives of the Canadian bar are expected to appear before the Bill c-51 hearing this week.

Summary: *CBC News provides live coverage of a press conference by Minister of Public Safety Ralph Goodale and Minister of National Defence Harjit Sajjan.*

Taking you live unfolding in Ottawa. **Minister of Public Safety Ralph Goodale** on the screen and also Minister of National Defence Harjit Sajjan talking about sharing information with Canada's security allies. We will listen in live.

>> -- We are following the existing procedures in terms of review and disclosure. Today sirq released the annual report with respect to cis. And the commissioner released the report with respect to the security establishment and the communication security establishment within dnd. These are two annual reports that relate to events of more tharn a year ago. And they should have been filed last year, but that process was interrupted because of the election campaign and the fact that parliament was not sitting for a protracted period of time. And they are filed now. And so we have the overview reports on two of our major security intelligence agencies. And minister sajjan and I are here to respond to your questions

>> Reporter: We found out about the metadata sharing of information in 2013, that is when it was discovered. It was stopped at the beginningover 2014, but Canadians have not found out about this until today in 2016.

Was this because the former conservative government was not willing to share this information with Canadians?

>> I can't answer the question the reasons behind what the former government's reasons were, but when this was brought to my attention after meeting with the minister of international defence, and I also met with the commissioner directly. And have taken appropriate action. This is one of the reasons we have provided a technical brief on this. And we have accepted all the recommendations that the commissioner has laid out.

>> Reporter: What information have you stopped sharing?

>> I didn't hear the question.

>> Reporter: What kind of metadata.

>> The exact kind of metadata in the technical brief, because of the software deficiencies, that has been ceased since that at that time and will not be reactivated until we have the assurance that the safeguard of that privacy will be kept.

>> Reporter: We know that they were sharing information they weren't supposed to and Canadians' private data made it into foreign hands. We no a lot more of that thanks to Edward Snowden. Will you consider legislative measures to stop them from this data collection in the future?

>> It is important to note that the type of metadata that we are talking about, no content is included in that. And the important work that metadata in terms of identifying the type of threats that posed to Canada not just from a

counterterrorism perspective and also over 100 million types of malicious cyber attacks that come onto our Canadian institutions. And what they prevent and I have accepted all the recommendations. And we will be letting that go to plan.

>> Reporter: Is the only accountability mechanism, are you confident that the collection methods and backbone or mass collection apply with Canadian law?

Are you comfortable with the way they collect the data?

>> The collection is done in accordance with the national defence act. One of the important aspects for Canadians to know is the actual deficiency was identified by officials themselves who proactively brought that to the attention of the commissioner. And that is how seriously it is taken.

(Question inaudible)

>> Reporter: Is collecting mass information at least according to the reports that we have, mass information from all onned the world and that have to include Canada data. Are you comfortable with practices that tap the infrastructure of the internet?

>> This is the first time that there is a technical brief. And the first ever in history. And if we have more technical questions, they will be happy to answer that for you.

>> And if I could, let's put this all in the context where we find ourselves as a new government. We have undertaken a complete review of the security intelligence framework. That review will be proceeding over the next weeks and months. The objective here is to make sure that our security and policing agencies are effective in keeping Canadians safe. And secondly, that they are properly respecting Canadian rights and freedoms. And this review will result in a number of changes, including the creation of a parliamentary mechanism which is never existed before.

>> Reporter: On that issue, though, the report shows that cis is collecting metadata, and it is not destroying it. They do have a time frame before it gets rid of it cis is refusing to do so. Will you order them to stop this?

>> The work -- firstover all, it is important to recognize that cirq made it very clear that csis has followed the laws and direct ifrs that they are -- directives that they are supposed to.

In terms of the particular provision on metadata, what the criticism was that they had, according to cirq, they had not properly informed the federal court of the methodology they were using. For the, they conducted a seminar to assure the court so they were fully apprised of all the information that was necessary with respect to metadata. Csis has complied with the recommendation.

(Question inaudible)

>> Not to my knowledge, no.

(Question inaudible)

>> Well a certain type of metadata that we were talking about, we want to make sure that the software updates actually does what it's supposed to do. And that is why we passed off that portion of metadata sharing. It is very important that we do protect the privacy of Canadians while we actively look at the protection side from the counterterrorism work done. And as I stated, there are over 100 million types of malicious cyber attacks that occur on the infrastructure.

>> Reporter: What do you have to see to be convinced to start sharing again?

>> This is something we will have to present and will be some discussion on the type of computer software and the testing that will be done. Once I am satisfied, the commissioner will also be notified as well. And that appropriate comment will be started.

>> I wanted to make the point that in the review of the entire frame work, one of the people that we have consulted with and will continue to consult with closely is the privacy commissioner.

He all through this process will offer very valuable advice.

>> Reporter: Give us an idea of how many people, if you may, farnd you know, how many people, how many Canadians, would have been impacted by this?

>> We can't give you the actual number. By us trying to dig into that answer itself, we in itself will be violating the law and digging up that type of information.

(Question inaudible)

>> Reporter: Is there any guarantee that some of the information didn't end up in hands of countries that we would not voluntarily share with?

>> The agreements that we have in place are solid. We have the same type of agreements that will not be going to outside that realm. And more importantly, we do not share our -- we do not spy on each other's data.

>> Reporter: And any frustration with the metadata not being available for three years? Have they expressed concern that this is impeding their operations?

>> No, our allies are actually very supportive of the work that we do on a daily basis. It is ongoing and to invest to the agreement and very important agreement in the community in place.

>> Reporter: With the cabinet committee in place, you wl be giving authorization or review

>> The parliamentary committee. Off tau cabinet committee, too.

>> Reporter: Can you tell us what the structure or format will be? And will it lead to further authorizations that the report said was weather centering into some of the possible privacy concerns?

>> Obviously I can't discuss cabinet committee activity. That would be a violation of my oath as a councillor, but the cabinet committee structure is designed to insure at the highest level there is that kind of examination, knowledge, and oversight that needs to be provided.

It is one of the most senior committees of cabinet. And it will discharge the responsibilities properly on bhafr of all Canadians.

(Question inaudible)

>> Reporter: Will he have a plan to take with him next week to Rome about dealing with ISIS?

>> I am in discussions all the time with the minister regarding other options. And wefr discussions on this. We knows how I am thinking through the process. And there is ongoing discussions on that. Thank you.

>> Thanks, ministers.

>> Suhana: Lots of questions from or thors. And we were -- from reporters. Answers from the minister of defence harjit sajjan and Ralph Goodale about sharing metadata. There were software discrepancies and deficiencies regarding private information of Canadians being shared amongst other allies. And that has now been stopped. There is also a complete review that is coming from Ralph Goodale of that whole Canadian security framework. Still, not a lot of questions answered about how many Canadians was chaired. If you are not familiar with the term metadata, it is data about data to make it easier to summarize the basic information. But Cameron Macintosh knows way more than I do and joins us with more. What stood out for you?

>> Reporter: Well, I am learning about it. This is the information that the electronic communications around the world and will tell it where to go and an email or I.P. Address. And the Canadian security establishment, which is Canada's eyes and ears around the world to gather foreign intelligence tracks metadata.

The mandate is to not share information. And in 2013, it found some information that it was sharing with the five eyes -- the U.S., U.K., Australia, and new Zealand, and in some circumstances information that could have identified Canadian, not the content of the message, but to identify Canadians wasn't being properly minimized. And that information wasn't being removed from that information that went out to our partners. In 2013 this was discovered within the Canadian security establishment and stopped in 2014 and is becoming public today from the commissioner who oversees the Canadian security establishment and a ban on sharing this type of information will remain in place. And in speaking with

the minister for public safety saying they are looking to strike a parliamently committee to review all of Canada's security agencies and how they are operating.

>> Suhana: Thank you, cam. Cameron Mcintosh in ottawa. And Steve miles is back with a look at the markets.

Subject: RT: CBC News (Power & Politics) - Report on CSE's Project Levitation and interview with Canadian Privacy Commissionre Daniel Therrien - 2015-01-28, 17:04 ET

Rough Transcript

Station: CBC News – Power & Politics
Time/Heure: 17:05 ET
Date: 2015-01-28

Summary: *CBC News – Power & Politics reported on the Communication Security Establishment's Project Levitation, which is used to track terrorist activity online. Following this CBC News interviewed Daniel Therrien, the Privacy Commissioner of Canada regarding Canadians concerns about online privacy. Mr. Therrien was also asked questions regarding the upcoming anti-terrorism legislation to be tabled Friday.*

>> Evan: ... CBC News has learned that Canada's electronic spy agency is part of a five-country effort that sifts through millions of online videos and documents every day looking for extremist plots. Revealed in a document obtained by U.S. whistle blower Edward Snowden. Leading the CBC coverage of this, joining me live from Toronto now, Dave Seglins, can you outline briefly how this system works and what it's been finding?

>> Okay. So Canada spy agency access to huge numbers of data bases, data bases that whoever collected it, whether it was the NSA, the UK, we don't know. But they can go to file sharing sites but they're looking specifically for jihadi videos. Hostage videos or instructions on how to build a bomb. They scour millions upon millions. People accessing or sharing that kind of extremist literature or material. Then they can use these other data bases. It's not just this one set of data, but other data bases to piece together a person's internet history, Facebook ID. What this reveals is not just this program levitation, but the five eyes have capacity to recreate lots of internet history about you and I and anyone in the world.

>> Evan: Right. And so we heard about this debate about the meta data. Should Canadians be concerned about things like project levitation?

>> Well, the problem in all of this -- I mean, the goal is good most analysts would say. Let's track down the extremists. But does it go too far? Meta data isn't just useless information. It can be used to piece together people's behaviours, who you're talking to. It's actually quite revealing. The problem in all of this is that the law is really outdated. Operates under a law thrown together in a month after 9/11. Where did they get that law? Orders and council dated in the early 1990s. Quickly wrote it into legislation. Never -- most people in the early 90s didn't have an e-mail address or cellphone or Facebook or all of that. So there were all sorts of vague gaping holes in the law. It's not specific. All it says is do foreign intelligence, don't direct it at Canadians. Never contemplated the nuance of this kind of capability. Here where in 2015. Through the rear view mirror of time we find out the spy agencies have been using this meta data. The question is is it time for the law to be revisited? Number one to give a clearer sense of mandate, but on the oversight, is there a way more people -- Canada alone, the other one of the five eyes that doesn't have some sort of parliamentary or politician oversight. So I think the opposition parties are screaming for this. Certainly a number of security experts that we've talked to, cyber experts say it's high time Canada does this. The government is moving ahead to introduce new legislation, maybe about expanding powers. No word on what they're going to do on the over sight and law end of things.

>> Evan: That's where the rubber hits the road here. The government is about to introduce new legislation on security and this obviously gives us new insight into what exactly they're doing on that side. Thanks for that, Dave.

>>> Canadians are clearly concerned about their online security. The proof, the latest public opinion poll conducted by Canada's privacy watchdog, let's go to the source for that sitting next to me. Good to see you, sir.

>> Good evening.

>> Evan: Canada's security agency is working with five eyes and at their discretion they're supposed to be tracking extremists and terrorists, we just don't know the range of what they're doing. How concerned are Canadians about their privacy and this balance between security and privacy?

>> I think what the poll says is that Canadians are concerned at unprecedented level as to their privacy. 90% of Canadians are concerned and a 3rd of Canadians are extremely concerned about their privacy rights. That's a huge increase from our previous polling. And roughly 7 out of 10 Canadians feel they're losing control over their information.

>> Evan: 7 out of 10. 73%.

>> Evan: Half of the Canadians in this service know about surveillance for the purposes of national security. Most of those people felt those agencies should explain those activities to Canadians. I guess the question is are we being transparent enough about what we're doing?

>> So the percentage of people who want more transparency is actually 90%. 90% of Canadians wish their government to be more transparent. Clearly there needs to be an effort in that respect. And of course we have said a number of times, including after the events in October that although there are oversight mechanisms in Canada for CSIS, the RCMP, that the over sight regime needs to be enhanced to cover other agencies as well.

>> Evan: You heard this project we're just hearing about, project levitation, anti-terror project, sifting through millions of videos and documents. So-called metadata. As the privacy commissioner, what question does something like that raise for you?

>> This is a project about the collection of foreign intelligence which is governed by a separate regime, legislation that applies to C.S.E.C. C.S.E.C. has a lawful mandate to intercept foreign communications. And there is an over sight body that has reviewed activities similar to this. I'm not sure about this particular program, but that has regularly concluded that C.S.E.C. operations are lawful as they pertain to foreign intelligence. For intelligence in Canada, certainly these methods raise questions as to whether it is appropriate to collect bulk information, massive surveillance with a view to identifying new threats to national security. That is a very complicated and difficult question. You may remember that about a year ago, President Obama actually raised similar issues and tasked people in the U.S. administration to try to determine whether it is possible for the government to identify new security threats without going through massive surveillance or what he called bulk information. And our various views expressed on whether that is possible or not, certain experts view that. It is not possible other things that civil liberties should prevail. This is a very complicated issue, obviously. I would say maybe to end on this point that I look forward to the courts actually eventually looking at these issues. Currently two challenges under the charter to the C.S.E.C. legislation, which allows for this massive surveillance, which allows for surveillance based on administrative authorization as opposed to judicial authorization. So these issues are currently before the courts at the trial level. But eventually we should get judgments from the higher courts on this very important question.

>> Evan: I should say as the government is expected to table its anti-terrorist legislation on Friday, the U.S. Ambassador was on this program last week, saying we're encouraging the Canadian government for more sharing information. The Canadian governments collecting data on foreign people, right. But maybe the U.S. is collecting the same on Canadians and that's the sharing. So you just don't know what that means. How concerned are you? We're going into very important legislation. What are the key questions you have now going into the new anti-terror legislation on Friday?

>> Two main ones. First, you raise the issue of transparency and oversight. The legislation we haven't seen obviously. But apparently based on media reports will enhance information sharing between the departments. We'd hope to see enhanced information sharing comes with enhanced transparency and over sight. Point one. Point two: it is understandable that the government would want to monitor individuals who may be suspect of terrorism, but it's quite another thing to collect information and to share information about ordinary Canadians. People who are not suspected of anything with a view to identifying new threats. So that issue of what will happen under this legislation to sharing of information about non-suspects with a view to identifying new threats will be certainly something that I will look to.

>> Evan: One last question on oversight. We heard Dave talk about it. How robust is Canada's oversight on what our security intelligence agencies are doing compared to the UK or the United States? Do we need better oversight?

>> We have oversight for CSIS, RCMP. We do not have oversight for other agencies like the border services agency, who since 2001 are now involved. And we do not have parliamentary oversight. I think we're lagging behind.

>> Evan: Right. But the oversight -- not robust enough you think?

>> It's less robust than in other countries. An appointed body, not full time. Do you think that needs to be more robust?

>> When I say it's comparatively less robust, I'm referring to the fact that certain agencies are not covered like the border service agency and the fact that there's no parliamentary over sight.

>> Evan: That's dangerous.

>> Well, we certainly can do better and there are commissions of inquiry obviously after 9/11 that have recommended to consistently increase oversight. I'd encourage the government to look at these.

>> Evan: Your new poll shows Canadians are concerned. A top concern.

>> Concerned and want more transparency.

>> Evan: A very important issue. We'll be speaking about this a lot on Friday when the new legislation comes out. Thank you so much for that.

Subject: RT: CTV News - Interview w/ former CSIS & RCMP agent re. CSIS briefing notes on Russia/Chinese interest in Canadian state secrets - 2016-11-21 - 11h15 ET

Rough Transcript

Station: CTV News
Time/Heure: 11h15 ET
Date: 2016-11-21

Summary: *CTV News interviewed former CSIS and RCMP agent Ron Miles regarding CSIS briefing notes that identify Russian and Chinese interest in Canadian state secrets.*

>> Marcia: Canada's spy agency is warning that Russia and China are interested in our country's state secrets. Briefing notes from CSIS say the two countries are targeting classified information, as well as government officials and systems. For more on this I'm joined by Ron Miles, a former CSIS agent and former RCMP security service agent. He's with us this morning from Montreal. Good morning, thanks for being on our program.

>> Ron Miles: Good morning. It's a pleasure.

>> Marcia: So CSIS rarely identifies security threats by name. Why do you think they're openly calling out Russia and China?

>> Ron Miles: Well, a security service normally works in the shadows and it doesn't get a lot of publicity, to possibly they are looking for a little bit of good publicity. Russia and more lately China have been very aggressive in hacking, in spying on north America and the west in general. So possibly he's trying to build up a consensus amongst the population so that we become more aggressive in our defence.

>> Marcia: What would Russia and China want from Canada? What sort of information would they be seeking?

>> Ron Miles: Well, Canada is part of the western world, and the demands that, let's say, the old KGB or the Russia and China intelligence agencies, what would they want from us ranges from the classical military intelligence to -- influence. For instance, if you had somebody in the Canadian external affairs or in the American state department, they could influence the way that country decided it was going to handle a particular issue. More recently you have in the American election Russia's been accused of trying to influence the outcome of the election by leaking e-mails it supposedly hacked from Hillary Clinton, from Bernie Sanders. So they have a lot to gain by this spying to influence what's going on in the west.

>> Marcia: Are western countries spying on them?

>> Ron Miles: Oh, absolutely. I think the revelations of Edward Snowden showed that the west is just as aggressive against the east as the east against the west.

>> Marcia: All right, Ron Miles, former CSIS agent and former RCMP security service agent, thank you.

>> Ron Miles: Thank you very much. Have a good day.

>> Marcia: You too.

Subject: RT: CTV News - Interview with cyber security expert Chester Wisniewski regarding a report from Public Safety Canada warning about cyberthreats - 2016-09-23, 15:00 ET

Rough Transcript

Station: CTV News
Time/Heure: 15:00 ET
Date: 2016-09-23

Summary: *CTV News interviewed cyber security expert Chester Wisniewski regarding a report about Public Safety Canada warning about cyber threats.*

>> Todd: Also coming out of Ottawa today, we're hearing that major infrastructure technology here in Canada might be at risk of internal cyber attacks. That's according to internal memos from **Public Safety Canada** that were obtained by the Canadian Press. The notes warn operators of things like electric grids, transportation hubs, insiders might be able to cripple some of them if a virus was in their digital systems. The reason why someone on the inside would do this is because of a disgruntled employee. Someone angry with their employer. For more on this, let's bring in Chester Wisniewski, he is coming from Vancouver, and he's a cyber security expert. Good to have you on, Chester. What do you make of the insider threat?

>> Well, I hope it is just a good warning to remind companies to harden their infrastructure and it's not related to any specific intelligence that they have, that something might happen. But what we see often with national critical infrastructure like power grids and things, they are sort of built like a candy bar. They have the hard outside shell to resist foreign nation states hacking them, and all this kind of thing. But once you get on the inside, it's a soft gooey centre, and it's very easy for someone on the inside to take them apart.

>> In layman' terms when we talk about transportation hubs, electrical grids, the key infrastructure systems here, what might we see?

>> Well, you know, again, you know it may not event be disgruntled employees, as you mentioned at the start if a nation state wanted to disrupt Canadians lives, taking down the telecommunication grid would be a good way to do this. You consider tens of thousands of employees at every one of the companies, you could maybe find someone to buy off and would have access to systems they shouldn't. What **Public Safety Canada** is aiming for is to make the infrastructure more resilient by making sure that the inside of the systems only provide access to those that are required to access, rather than just (indiscernible) all of their staff.

>> Todd: I'm also curious what you think in terms of protection. You know, we had the huge hack against Yahoo coming out. That they announced on Thursday. We're hearing about this internal threats, as well, here in Canada. Can you defend yourself against this kind of thing?

>> Well, you're never going to be able to stop it entirely, right. When you have determined human adversaries who are really trying to get in and steal your information or disrupt your infrastructure, I don't think you can ever eliminate that as a threat. What we are trying to do is balance the risk here, and the government is looking at the risk and realizing there's not enough security on the inside of the critical infrastructure companies, perhaps. In order tower the risk, we need to take it more seriously, and invest a lot more money in it.

>> Todd: In terms of the controls over employee, too, if you start to talk about internal risks, internal threats, Chester, again what can we possibly do on that? How can you tell if someone is a threat?

>> Well, yeah. It's very difficult. I mean obviously you know with Ed Snowden and the NSA is a perfect example. They do lot of screenings. It's not like they don't do a background check when you go to work for a security agency. It's not like

someone causing harm. The key component is compartmentalization. Just because I work for the hydro authority doesn't mean I should be able to access all of the parts of the system or all databases, because I'm in the computer department, doesn't mean access to all accounts and all things. By compartmentalize things, you limit the risk that a person with malicious intent.

>> Todd: Chester, thank you for coming on from Vancouver.

>> Thank you.

Summary: *CTV News reports on the SIRC annual report and the CSE Commissioner's annual report.*

>>> Two watchdog reports are out today that are raising some alarms and red flags. They concern our country's security agencies, such as CSIS, Canada's primary spy agency, and also the CSE, Communications Security Establishment, which monitors communications. Among the findings that the electronic spy agency broke privacy laws by sharing information about Canadians with foreign partners and the CSE is not supposed to be doing that. Let's go to Mercedes Stephenson standing by in Ottawa with more on this. She certainly knows surveillance in this country, knows these agencies. Let's talk about the key findings here in these reports, Mercedes, the highlights for you.

>> Mercedes: So, Todd, let's start with the CSIS report. It properly identified insider threats. Think of Edward Snowden, people who might take secrets from inside and either sell them to another country, or put them on-line, like he did, and basically what they found is CSIS did not deal adequately with some incidents, one in particular, where there may have been somebody working for the agency who actually posed a threat to some of those national secrets, so they're saying they need to do more to make sure those secrets are safeguarded. Also finding some questions about the legal relationship between cis and the department of foreign affairs, something they're currently investigating under the cis act. Switching gears, let's take a look at the cse report. This is the one on signals intelligence for things like phone calls ande-mails. Now CSE belongs to the Department of National Defence, Todd, and under that they have a mandate to intercept foreign signals intelligence.

Part of what they collect is called metadata. That's basically information about who is sending messages, receiving them, where they might be coming from, but it's not the actual internal message itself. If you think about when you send an envelope in the mail, it would be the equivalent of reading the outside of that envelope. But here's the problem, in scooping up all the metadata that CSE does to evaluate, find threats to the country, sometimes Canadians' information gets caught up in that. That's exactly what happened in this case, and then it was transmitted to the so-called five eye, allied countries that we share intelligence with, like Australia and the United States. So back in 2014, the government quietly suspended that intelligence sharing, but Todd, it hasn't resumed yet because they're not satisfied that the appropriate safeguards are in place.

>> Todd: You and I have been having a conversation for years about these agencies, what they do, what they don't do, what they're allowed to do, what we know they are actually doing. How transparent are these agencies?

>> Mercedes: They're not transparent at all. I mean, we have a situation here where you have two watchdogs overseeing them, but particularly in the case of cis, the committee that is tasked with overseeing them can't have access to classified information. So you can imagine when you're talking about a spy agency, that's pretty limiting in terms of what they're able to get. It's only things the agency declassifies, and that in part is why the government has promised they're going to put together a parliamentary committee which will consistent of parliamentarians from the senate and the house of commons to oversee these agencies. That's what the United States, the U.K. And so many other countries do so you have actual elected officials able to hold people to account. The problem is that they're going to have to find a way to ensure secrets don't leak out of there, and also to provide a security clearance, Todd, for the people who are on this committee, because that's the only way they're going to be able to look at some of this classified information and assess it.

>> Todd: Very interesting, Mercedes Stephenson in Ottawa, thanks again for this.

Globe and Mail
Leaked Snowden document shows how 'sigint' nabbed a Canadian al- Qaeda operative
Saturday, 10 December 2016
Byline: Colin Freeze

Ottawa - Communications intercepted by U.S. and British spy agencies led to the arrest of the first al-Qaeda-inspired terrorist caught in Canada, according to a newly leaked document.
The memo, circulated within the U.S. National Security Agency more than a decade ago, provides a rare and detailed look at the world of intelligence-sharing.

In early 2004, a cell of British terrorists was caught scheming to explode a bomb in London. After Scotland Yard launched "Operation Crevice" to round up the conspirators , Canadian police simultaneously moved to arrest an Ottawa software engineer.

Momin Khawaja had helped build detonators for the conspirators. The suspects, including Mr. Khawaja, were twentysomething Westerners whose families had hailed from Pakistan. They had travelled to a terrorist training camp in that country and emerged from it wanting to bomb Britain for its role in the invasions of Iraq and Afghanistan.

Evidence included discussion of close co-operation between British and Canadian police. But prosecutors glossed over how "signals intelligence" (or sigint) captured long before the bust had laid a foundation for detectives.

The details are revealed in a document flowing from Edward Snowden, the fugitive former American contractor who took volumes of files from the NSA in 2013 to leak them to the media.

The Intercept, a news site, has extensive access to the Snowden archive. It has started publishing memos that circulated within the NSA "signals intelligence directorate" in the early 2000s.

The April, 19, 2004 NSA memo titled "SIGINT contribution to Operation Crevice" reads as follows:

"Since March 2003, the U.K.'s Security Service and police had been investigating an AQ (al-Qa'ida) support network based in the U.K. with links to a senior AQ operational planner in Pakistan."

The memo goes on to describe a British mastermind who had wanted to "mount an attack in the U.K. using a large improvised explosive device" and his "Pakistan-based contact [who] was attempting to obtain nuclear material for use in the device."

The eventual evidence at trials was that the British police who unfurled the plot discovered a storage shed containing a large bomb made of ammonium- nitrate, an explosive substance sold commercially as a fertilizer. No evidence of any capability to make a nuclear-material "dirty bomb" surfaced in any

courtroom, although some British media have reported that spies had caught wind of terrorists talking about that possibility.

The leaked memo says the NSA and its British counterpart, known as GCHQ, worked quickly to map out the conspirators' communications before providing investigative leads to Pakistani, British and Canadian agencies.

"Call records analysis and reporting expanded Security Service's network knowledge and helped to identify new telephone numbers of key targets in the U.K.," it says. "C2C (computer-to-computer) analysis provided new leads on a Canada-based individual within the network."

This was an allusion to Mr. Khawaja, who lived with his parents and whose day job was fixing computers for Canada's Foreign Affairs department.

Mr. Khawaja became the first terrorist to be arrested, tried and convicted under the Anti-Terrorism Act that Parliament passed in 2001. He is serving a life sentence.

The leaked NSA memo, which is to be officially declassified in 2032, says that "well over 100 Sigint reports were issued on Operation Crevice." Most came from GCHQ but "the NSA reporting contributed significant pieces to the jigsaw."

A Canadian agency called the Communications Security Establishment is a close NSA and GCHQ ally, but the Operation Crevice memo makes no mention of it. At that time, the Canadian agency was beginning to get secret authorizations from cabinet ministers to expand its powers.

CBC News
Trade tribunal looking into weather supercomputer contract
Monday, 12 December 2016
Byline: Alison Crawford

A trade tribunal is conducting an inquiry into how the federal government handled the purchase of a powerful new weather-forecasting supercomputer for Environment Canada.
Computer company Hewlett-Packard Canada alleges the government's IT department, Shared Services Canada, wrongly invoked a national security exception in the procurement process.

Hewlett-Packard is the latest in a long list of Canadian companies to allege the federal government routinely imposes such exceptions for no good reason.

"Government contracts are a huge business in Canada. This is a real market that a lot of businesses in Canada depend on to survive," said Chris McLeod, an Ottawa lawyer who specializes in international trade and public procurement.

A national security exception means buyers are exempt from trade rules that require all bidders to be treated equally and may mean equipment must be made in certain countries and data must be stored or processed within Canada.

Hewlett-Packard has also asked the Federal Court to determine if Shared Services Canada (SSC) applied the exception appropriately.

"The NSE (national security exception) applies to all procurements for SSC relating to email, networks and data centres ... by invoking a blanket NSE, Public Services and Procurement Canada has improperly and unlawfully sought to immunize itself from scrutiny and compliance with the procurement rules set out in domestic and international trade agreements," the company said in its submission.

Shared Services Canada says it cannot comment because the matter is before the courts.

Hewlett-Packard was among four qualified companies invited to bid on leasing the federal government a new supercomputer, storage cloud, storage networks, processors and software, over 8½ years with an option to renew the contract for 30 months. The contract includes two upgrades as well as maintenance and support.

In its Federal Court filing, Hewlett-Packard said it was told in June that its bid was non-compliant and had been disqualified.

Last week, CBC News reported SSC secretly awarded the $430 million contract to IBM Canada in May.

Blanket approval for exceptions

According to government documents and e-mails filed at Federal Court, SSC asked for and received blanket approval in the spring of 2012 to invoke a national security exception on virtually all its big purchases. That means procurements are excluded from the obligations of all domestic and international trade agreements signed by Canada, "including those that may come into force in the future," according to the internal government correspondence. The stated goal was to protect the IT supply chain from cyber threats.

The initial pitch for such a ban was made by Benoît Long, who was a senior executive at SSC.

"There is a significant risk that potential suppliers with relationships with foreign intelligence agencies hostile to Canada could tamper with system components (whether hardware or software) in advance of delivery to the Crown in order to facilitate future covert access," he wrote to Tom Ring, former assistant deputy minister of Public Works.

What followed was a high-level meeting with senior executives from Canada's spy agencies CSIS and CSEC, the Privy Council Office, Treasury Board and Shared Services. Two invitees from DND were absent but they, like all the others, signed attestations saying they agreed to the idea of invoking a blanket exception.

Soon after, Ring approved the plan.

"I agree to invoke the national security exception for all purposes to exempt the procurement of goods and services related to the Government of Canada's electronic mail (email) network, and data centre infrastructure, systems and services from the application of Canada's domestic and international trade agreements, including those that may come into force in the future," Ring wrote in his response to Long.

Ever since, SSC and Public Services and Procurement Canada have invoked national security exceptions on a whole host of federal contracts -- everything from night-vision binoculars and a new federal government email system, to data storage and supercomputers.

Tide could be turning

Not only do national security exceptions permit SSC and Public Services and Procurement Canada to limit who may bid on a contract, they also prevent people from seeking redress from any trade tribunal.

"All the rules go out the window and your ability to challenge these procurements goes out the window," lawyer McLeod told CBC News.

For years, companies in the same situation as Hewlett-Packard sought redress from the Canadian International Trade Tribunal (CITT), only to be told it had no jurisdiction when a national security exception had been invoked. After several years, though, the tribunal started to make noises about the integrity of the competitive procurement system.

"There's a potential that government actors may use the national security exception to avoid rules that they would otherwise be subject to instead of simply following their rules, even when there's no national security risk at play," said McLeod.

Tribunal is unhappy

In February 2016, the tribunal indicated it had had just about enough, when Toronto IT firm Eclipsys Solutions complained it was unfairly excluded from bidding on a SSC contract. While the CITT conceded it had no jurisdiction, the tribunal made it abundantly clear it wasn't happy about it.

"Opposing nothing more than the NSE applicability as a complete response to a supplier's grounds of complaint is an empty and silent response indeed; it leaves potentially unanswered doubts lingering as

to the transparency and fairness of the impugned procurement," wrote the tribunal's presiding member Serge Fréchette.

"The tribunal is concerned that relying on an authorization that is already several years old and is both 'blanket' in nature and open-ended into the future (i.e: with no specified end date) increases the risk that the NSE will be invoked automatically or by rote, or without proper considered justification, or altogether inappropriately."

Ground-breaking victory

McLeod's own client, M.D. Charlton, had also been excluded, by virtue of a national security exception, from a federal contract to provide the RCMP with night-vision binoculars.

And in August, McLeod successfully established for the first time that the government had improperly invoked a national security exception. The tribunal found the government "breached the trade agreements by failing to properly tailor the scope of the exception."

"There are lots of national security exceptions that are legitimate ... I'm the first one to say that. There are also situations where the national security exception invocation goes too far, [beyond] what's needed," McLeod said.

London Times
Prepare for cyberspace Pearl Harbor, warn experts
Saturday, 10 December 2016
Byline: Deborah Haynes

London - The potential for a "cyberspace Pearl Harbor" is growing as countries such as North Korea, Iran and Russia test the boundaries of internet warfare, security experts said last night.
Britain, the United States and their allies are also building and testing cyberweapons but, unlike with conventional arsenals, no one knows for sure what damage their adversaries can inflict with computer codes that their cyberwarriors have written.

Adding to the opaqueness of cyberwarfare, there are no international rules or principles governing the way that countries should behave in cyberspace, other than the overriding belief among western powers that all actions should adhere to international law.

The absence of agreement on when a cyberattack becomes an act of war has empowered nations to fire cyberweapons at each other in tit-for-tat skirmishes that only come to public attention when something too big to hide happens. "It is not quite conflict. It is not quite war," a former senior western intelligence official said. "It is the exchanges of fire across the border. It is really not helpful."

North Korean hackers, who are among the best in the world, recently used software to steal secrets from the South Korean military unit responsible for fending off cyberattacks, a major embarrassment for South Korea.

Iran, or "state-affiliated groups", apparently targeted the computers of an agency that runs Saudi Arabia's airports last month, wreaking havoc.

Even the US election campaign was alleged to have been affected by cybermeddling, thought to be linked to Russia, with huge leaks of data from the Democratic National Committee designed to undermine Hillary Clinton's presidential hopes. President Obama ordered a review into election hacking by the Russians yesterday.

John Bassett, a former senior official at GCHQ who now sits on the international advisory group PS21, a think tank, said: "Because you are apparently able to get away with it via cyber, people are willing to chance their arm far more.

"Eventually my concern is that one of these things goes horribly, horribly wrong and something dreadful happens, like someone unintentionally takes down the intensive care unit of a hospital."

One apocalyptic scenario would be using a computer virus to destroy a nation's entire electronic infrastructure, even making -- for a country such as Britain, France or the US -- nuclear weapons explode in their silos.

"We are a very, very long away from any evidence that the worst is at all achievable," Mr Bassett said. "Rather more credible is something very bad happening, such as a nation's air defences being taken down. That is where you get on to the cyber Pearl Harbor."

General Sir Richard Barrons, a former military officer and a leading authority on war in the information age, said: "Cyberspace could deliver strategic harm to the homeland and vital interests. People need to organise for that in a way that they have never had to in history."

Financial Post
Fintech as a Force for Social Good
Saturday, 10 December 2016
Byline: Adam Nanjee

Ottawa - For enterprises concerned about network security, identity verification has become a top-of-mind issue in an era of ubiquitous cyber- crime. But for millions around the world with no valid identification, standard computer access and identity authentication measures such as passwords pose a formidable barrier to not just public services, but also to the formal economy and traditional financial institutions.

When BioConnect, a Toronto-based biometric firm, launched seven years ago, its goal "was to solve the big problem of identity" posed by entities like banks that require customers to provide traditional paper documents to open accounts, explains vice president of strategic marketing and global alliances Bianca Lopes. She cites two telling statistics: according to CISCO, there are now 50 billion digitally connected devices globally, but there are also 2.5 billion human beings who are not considered people because they don't have ID. "These people can't enter the system," says Lopes.

BioConnect's technology suite allows the firm's customers to use a range of biometric identifiers - facial expressions, iris patterns, even cardiac rhythms - to identify users. Lopes sees the technology as key to providing mobile banking services in developing countries where many people have a smart phone but no physical way of connecting to a financial institution. "The technology allows these systems to see these people, so they can become part of the economy," she adds.

For Canada's rapidly globalizing financial technology (fintech) sector, such stories reveal the ways in which these mobile technologies produce both new revenue streams and social dividends.

Fintech firms have the capacity and the technology to develop widely accessible, competitive services that support socially positive activities instead of just boosting the banking sector's profit margins, says Canada>Sponsored>Brand&utm_content=YoungMoneyMoneyFintechAsAForceForSocialGo od-Sponsored-brand&utm_term=FinancialPost" target="_blank">Mogo (www.mogo.ca) founder Dave Feller. "Platforms that provide consumers with features like real-time updates on their Canada>Sponsored>Product&utm_content=YoungMoneyMoneyFintechAsAForceForSocial Good-Sponsored-creditscore&utm_term=FinancialPost" target="_blank">credit scores (www.mogo.ca) result in an overall financial awareness and produce social benefits in the form of fewer personal bankruptcies and reduced consumer debt. The more financially fit we are, the more likely we are to contribute," says Feller. "It has a ripple effect on society."

Outside Canada, the potential is even greater, particularly among the estimated

two billion people globally that currently have no access to banking services, according to the World Bank. While traditional banking services are unattainable, mobile banking is certainly within the realm of possibility. California-based market research firm, The Radicati Group, projects that 84 per cent of the world's population will be using mobile technology by the end of 2018.

"What if these people could access financial services online or through mobile devices?" asks Dinaro Ly, director of MaRS FinTech. "The result would be increased financial literacy and improved social inclusion on an international scale," he adds.

In order to go global, fintech ventures need access to international advisors who can help them gain an understanding of the local business landscape, assess market fit, and secure customer opportunities

Goldmoney, a fintech platform with a broad social goal, already has international traction. For several decades, gold has held its value much more consistently than all sorts of currencies, both strong and weak (while it fluctuates, overall gold has risen 10% per year against the Canadian dollar for 15 years running).

But gold hasn't been widely available as an investment vehicle in developing nations because it trades in minimum denominations that preclude small purchases, says Darrell MacMullin, CEO of Goldmoney Network. MacMullin's firm enables users to create savings accounts through which they can buy even a few cents worth of gold at a time. Founded in May 2015, the fintech startup now has 1.3 million accounts in 150 countries, with combined deposits worth $1.9 billion. George Soros was an early investor. "He liked the idea of providing upward mobility for two billion people around the world," says MacMullin."

Impak Finance is hoping to take the fintech-driven social dividend concept one step further. The firm, which was founded a year ago, will allow consumers to open savings accounts and direct their funds to organizations or companies that require loans to finance a range of socially or environmentally beneficial activities and businesses. "The project is to create a bank that will be a catalyst for the social impact ecosystem," says co-founder Paul Allard, adding that it will begin lending funds next year and introduce consumer savings accounts in 2018.

The company, which has raised $1 million in lending capital since October, relies on a more holistic risk algorithm to evaluate the creditworthiness of borrowers, but it also provides depositors with a say in the sorts of firms that they'd like to back. "You choose the sector where you want to see your money at work," he says, citing sectors such as cleantech or bio-agriculture.

Canadian fintech firms have some novel solutions, but if they hope to have greater social impact, they must leverage international partnerships.

As a global innovation hub, MaRS is a gateway to international markets for Canadian companies. Take the recently announced partnership between MaRS and NTT Data, the systems arm of the Japanese telecom and information technology giant, which promises to provide local fintech firms access to the Japanese market.

Under this partnership entrepreneurs working in the fintech sector will be invited to participate in a global business challenge that offers startups the opportunity to present solutions to economic problems like population decline and aging, environmental destruction, depletion of resources, and the rising cost of healthcare.

Winners will receive business development support from NTT Data to run a proof of concept, with the objective of commercializing their technology in the Japanese market.

"In order to go global, fintech ventures need access to international advisors who can help them gain an understanding of the local business landscape, assess market fit, and secure customer opportunities," says Ly.

In addition to partnering with NTT Data in Tokyo, MaRS has established a network of co-working spaces in key locations such as San Francisco, New York, Singapore, London, Shanghai, Tokyo, Sao Paulo and Hong Kong to give Canadian startups a base in these vital markets.

This story was created by Content Works, Postmedia's commercial content division, on behalf of Mogo.

Motherboard Blog
Terror Scanning Database For Social Media Raises More Questions than Answers
Saturday, 10 December 2016
Byline: Sarah Jeong

Ottawa - On Monday, Facebook, Microsoft, Twitter, and YouTube announced a new partnership to create a "shared industry database" that identifies "content that promotes terrorism." Each company will use the database to find "violent terrorist imagery or terrorist recruitment videos or images" on their platforms, and remove the content according to their own policies.
The exact technology involved isn't new. The newly announced partnership is likely modeled after what companies already do with child pornography. But the application of this technology to "terrorist content" raises many questions. Who is going to decide whether something promotes terrorism or not? Is a technology that fights child porn appropriate for addressing this particular problem? And most troubling of all--is there even a problem to be solved? Four tech companies may have just signed onto developing a more robust censorship and surveillance system based on a narrative of online radicalization that isn't well-supported by empirical evidence.

How the Tech Industry Built a System for Detecting Child Porn

Many companies--for example, Verizon, which runs an online backup service for customers' files--use a database maintained by the National Center for Missing and Exploited Children (NCMEC) to find child pornography. If they find a match, service providers notify the NCMEC Cyber Tipline, which then passes on that information to law enforcement.

The database doesn't contain images themselves, but rather, hashes--digital fingerprints that identify a file. This means that service providers can scan their servers without "looking" at anyone's files. Thanks to PhotoDNA, a technology donated by Microsoft, the hashes are made using biometric information inside the photos and videos, meaning that cropping or resizing the files won't necessarily change the hash value being used.

Monday's announcement marks the first time companies have sought to use this kind of technology to combat "terrorist content online." It's an odd match. The hash matching system appealed to many aspects of the fight against child pornography. For one thing it allowed companies to scan for files without finding out anything about non-matching files--so, arguably, without violating anyone's privacy, except with respect to possession of child porn. It also protected people from having to look at child porn in order to identify it--the very act of looking at child porn so it can be removed from the internet can be traumatic to the employees who are policing content on platforms.

Applying the Hash System to Terrorism

Neither of these specific upsides to the hash identification system seem to apply to "terrorist content," since the partnership appears to be aimed at publicly posted social media. (I asked Facebook via email whether the hash identification system would be applied to private messages between users, but did not hear back from the company). Furthermore, the companies have stated in their press release that a person on the other end will be looking at the content before taking it down. The press release implies, but does not explicitly say, that matching hits will not be provided to government officials, the way that hits for child pornography are.

Indeed, one of the useful things about the child pornography hash identification database is that it's managed by a single entity with specific knowledge and experience in the content at issue--that is, NCMEC. The industry database for "terrorist content" that's being proposed will be composed of hashes added by each platform, as they remove content as consistent with their own policies.

Facebook removes "content that expresses support" for groups involved in terrorism or organized crime. Even "supporting or praising leaders of those same organisations, or condoning their violent activities" is banned from the platform. So for example, a video that praises ISIS might get taken down by Facebook. The Facebook employee or contractor taking it down might choose to hash the video, and share the hash through the database. The database will flag the same video when it's uploaded on YouTube.

YouTube's terrorism policy, however, is different from Facebook's- -it prohibits terrorist recruitment videos and other content that intends to incite violence. Theoretically, the same video that gets banned from Facebook might pass muster on YouTube. And just because it's in the database doesn't mean that it'll automatically get taken down.

But Facebook, Twitter, and YouTube have all been vigorously criticized for their seemingly haphazard and inconsistent application of their existing policies, whether with respect to nudity, harassment, or copyright infringement. Identifying "terrorist content" implicates just as many tricky questions of judgment.

A video of a guy in a ski mask beheading an American journalist seems like a pretty straightforward case scenario, but the world is a lot more complicated than just ISIS and not-ISIS. Hamas is not only a major

political party that wins parliamentary elections in Palestine, it's also been designated as a terrorist organization by many countries, including the United States. The Kurdistan Workers' Party (sometimes called the PKK, short for Partiya Karkerên Kurdistanê) is also designated as a terrorist organization by the United States, even as the US has provided air support for their ground forces to fight ISIS.

"To me, you've built a hammer and now you're asking the world to look for nails."

If the State Department can't be consistent on who's a terrorist and who's not a terrorist, is it really a good idea to entrust that decision to tech companies that are strangely baffled by human nipples?

These worries aren't just speculative. Facebook has, in the past, been criticized for its apparent censorship of Palestinian journalists.

Experts worry that the inflammatory way that society and the media deals with terrorism, combined with a corporate-driven takedown process will result in illegitimate censorship. "To me, you've built a hammer and now you're asking the world to look for nails," said Andy Sellars, director of the Boston University / MIT Technology and Cyberlaw Clinic. "This is a system that encourages over-reporting."

Although the press release emphasizes that the database only flags content, and removal will not be automatic, Sellars said that he didn't see a world where tech companies would hesitate to remove content flagged as "terrorism- promoting."

And flagging content based on hashes focuses on the content, not the context or the message sent. Sellars pointed out that child pornography "is really the only place where media is contraband by its very definition." An ISIS recruitment video, on the other hand, shifts in meaning and effect when being shared by journalists, or by social scientists studying extremism.

This point is echoed by others. Hugh Handeyside, a staff attorney at the American Civil Liberties Union (ACLU) said, "This kind of digital hash system has been used to identify child pornogrpahy but child pornogrpahy and so called terrorism content are not really comparable. The first is always illegal, the second may be news."

And in a January 2016 interview for On the Media, John Horgan, a professor of psychology at Georgia State University who specializes in studying terrorist behavior, said: "Pedophilia and terrorism are quite different. I mean, there is no clear sense of what involvement in terrorism is. Terrorism can involve anything from browsing radical sites to donating money to questionable sites, to far more extreme activity of wanting to go overseas to become a foreign fighter or constructing bombs." (I emailed Horgan for further discussion but he did not respond in time for this article's publication).

Does "Content Promoting Terrorism" Lead to Actual Terrorism?

Technology built to address child porn might be a bad fit for combating "terrorist content," but even more troublingly, there isn't consensus on whether terrorists are converted by extremist content on the internet. In fact, there's a lot of evidence that says they aren't.

Handeyside at the ACLU said that "decisions about what constitute terroristic content are often based on theories about radicalization and violence that research and studies have debunked."

Horgan is similarly critical of the narrative of online radicalization. He said that there is no single profile of a terrorist, or what makes someone into a terrorist. In fact, it seems that "radicalization" might not even be part of the process.

"There is increasing evidence that suggests that people who become involved in terrorism don't necessarily hold radical views. At least not to begin with," Horgan said in January. "In many cases we see people's radical views developing as a result of spending time in a terrorist group. ... There are lots of examples of individuals I've interviewed who have said, 'Well, I didn't realize why I became involved in this movement until ... I wound up in prison.'"

'How dare you spend all of your time just engaging in social media. You need to get up off your backsides and come out here and join the fight.'

ISIS is certainly very active on social media, and their presence on platforms created by US companies may be alarming for people who otherwise feel like they are distant from the ongoing conflict abroad. But ISIS's social media presence doesn't necessarily translate to real world effects.

Horgan said that even ISIS acknowledges that for many of its supporters, their involvement both begins and ends online. "One of our researchers, Charlie Winter, discovered several senior female jihadis based in Syria complain to foreign supporters here in the United States, to say to them, 'How dare you spend all of your time just engaging in social media. You need to get up off your backsides and come out here and join the fight.'"

Potential Law Enforcement Exploitation of the Database

Monday's press release implies that the partnered companies are not going to be giving the government unfettered access to scan their platforms using the hash database.

"No personally identifiable information will be shared ... And each company will continue to apply its practice of transparency and review for any government requests," the press release reads. But it stops short of explicitly stating that it won't, for example, comply with a Foreign Intelligence Surveillance Act (FISA) order similar to the one that got Yahoo to build a scanner that searched the emails of all customers.

Indeed, in that particular case, an anonymous official told The New York Times that the government was scanning for a "digital signature" of a "communications method used by a state-sponsored, foreign terrorist organization" in the emails of all Yahoo mail users. It's not known whether the FISA order was for a hash value. (In fact, other sources have told Motherboard that the description given to the Times was wrong, and that the Yahoo scanning tool was more similar to a rootkit).

Facebook and Google have been criticized in the past for allowing the National Security Agency access to their users' data under the PRISM program, as exposed in the Snowden documents. Ever since the backlash around those revelations, many tech companies have become much more wary about their cooperation with the United States government--a development sometimes referred to as "the Snowden effect."

But even if you can now count on companies to resist forking over information without a legally binding government order, that doesn't say the government can't get a legally binding order that that gives it access to the newly constructed terror-image database and accompanying scanning capabilities.

Sellars, and other lawyers familiar with the law around electronic surveillance, say that a warrant to, for example, scan all of Facebook for a particular image, would lack "particularity"--a requirement under the Fourth Amendment, which bars unreasonable search and seizure. However, a FISA order might be a different story. The Electronic Frontier Foundation has, and continues to argue, that such orders would be unconstitutional, and there is some debate as to whether FISA or any law could legitimately authorize the order at issue in the Yahoo mail case. But the Yahoo mail case, and other ongoing cases raise troubling precedents for what the courts have allowed to pass muster.

"The ability to transfer this idea from the particular context of identification on online platforms, to a tool of surveillance, is perhaps the scariest thing," said Sellars. Whether and to what extent the government can hijack the technology that Silicon Valley is building for its own use remains to be seen. It's not clear that the law allows law enforcement or intelligence agencies to be able to scan entire social media platforms for particular images or videos. The only thing we know is that it's not just technically possible, but that four companies have partnered to build out the infrastructure to do it.

Le Monde
Archives Snowden : quand DGSE et DGSI étalaient leur rivalité
Saturday, 10 December 2016
Byline: Jacques Follorou

Paris - Les services français ont parfois préféré travailler avec les Britanniques et les Américains plutôt qu'entre eux
Dans l'ombre de la stratégie antiterroriste française se joue une autre guerre. Loin des déclarations gouvernementales assurant que l'ensemble de la communauté du renseignement unit ses forces, la rivalité historique entre les deux principaux services français, la Direction générale de la sécurité

extérieure (DGSE) et la Direction générale de la sécurité intérieure (DGSI) n'a, en réalité, jamais cessé. Au point de privilégier parfois les liens avec des services étrangers à la coopération entre directions françaises du renseignement.

" Les cousins ", comme ils s'appellent eux-mêmes, se jalousent depuis un siècle. Mais depuis 2008, début du programme d'investissement massif de la France dans la création d'une plate-forme nationale de renseignement technique gérée par la DGSE et mutualisée aux principaux services secrets français, la DGSI (qui s'appelait jusqu'en 2014 la Direction centrale du renseignement intérieur, DCRI), n'a eu de cesse de vouloir s'émanciper de la DGSE dans son utilisation des moyens techniques du renseignement.

Dépendante techniquement, la DGSI l'était aussi sur le plan humain : que pouvaient faire ses policiers face aux ingénieurs X-Télécoms de la direction technique de la DGSE? L'actuel patron de la DGSI, Patrick Calvar, a milité auprès des parlementaires comme du gouvernement pour finir par obtenir les moyens de diversifier ses recrutements, notamment en direction des ingénieurs ou d'informaticiens.

En 2015 et début 2016, ces querelles de territoires apparaissaient toujours lors du suivi des suspects par la DGSE et la DGSI. Ces deux services, malgré les alertes de l'autorité de contrôle des interceptions administratives, " branchaient " ou " débranchaient " des cibles dans le plus grand désordre, sans que l'information circule.

Bernard Bajolet, patron de la DGSE, confirmait, lors d'un colloque coorganisé, fin 2015, par la CIA, aux Etats-Unis, " le besoin d'une parfaite coopération entre les services pour se débarrasser des angles morts, en particulier pour le suivi des suspects à l'intérieur et à l'extérieur des frontières " . Un sujet sensible, puisque l'un des frères Kouachi, impliqué dans l'attaque contre Charlie Hebdo, avait ainsi pu disparaître des radars.

Statut de " senior sigint "Pour défendre son pré carré, la DGSE défend son titre officiel de leader, en France, en matière d'interceptions techniques (également appelé " senior sigint "), que le gouvernement lui a attribué en 2008.

De nouveaux documents extraits par Le Monde , en collaboration avec le site The Intercept , des archives d'Edward Snowden, ex-consultant de l'Agence nationale de sécurité (NSA) américaine confiées à Glenn Greenwald et Laura Poitras, montrent que les deux principaux services français ont été très empêtrés dans leur rivalité. Conséquence : ils ont parfois privilégié une coopération bilatérale avec la NSA ou avec son homologue britannique, le GCHQ, à celle qu'ils devaient avoir entre eux.

Une note de la NSA qui annonce la visite " le 18 juin 2013, de 9 heures à 14 heures " de Bernard Bajolet, nommé à la tête de la DGSE en avril 2013, illustre la volonté du renseignement extérieur d'interdire à la DCRI tout contact avec la NSA. Il est précisé qu'il souhaite rencontrer les principaux responsables de la NSA et évoquer son statut de " senior sigint ". En janvier 2014, M. Bajolet enfonçait le clou dans un texte paru dans la RevueDéfense nationale rappelant à qui voulait l'entendre que " la DGSE assure le rôle de chef de file national (senior sigint) en matière renseignement électronique " .

Car la DCRI a noué, comme la DGSE, d'étroites relations bilatérales avec des services étrangers, notamment le GCHQ. Celles-ci sont régulièrement évoquées dans la lettre d'information interne du GCHQ, dénommée " Frelnet ", frappée d'un très haut niveau de classification, " Top -Secret Strap 1 ", et consacrée aux relations avec les services secrets alliés.

" C'est regrettable "Plusieurs lettres du GCHQ en 2009 et début 2010 se félicitent des " échanges avec la DGSE " . La direction technique de la DGSE, dit que le GCHQ est " très désireuse de démontrer son savoir-faire " et note qu'elle " regrette parfois que l'on n'aille pas plus loin " . Il faut donc, mentionne l'un de ces lettres internes, faire en sorte de " répondre techniquement aux attentes de la DGSE " .

La DCRI n'est pas pour autant laissée pour compte. Bien au contraire. Visiblement à l'insu de la DGSE, le service secret technique britannique a monté, avec la DCRI, des " opérations de contre-espionnage " , dont une, qualifiée de " majeure " , contre une puissance étrangère.

Les moyens techniques très puissants des Britanniques ont été associés au savoir-faire de la DCRI sur le sol français. Elle serait, selon les informations du Monde , toujours en cours et considérée comme stratégique au regard des enjeux de sécurité international actuels. La DGSE n'en aurait appris l'existence que bien plus tard, selon une source gouvernementale.

Pour échapper aux regards de la DGSE, la DCRI a joué la carte de la NSA pour obtenir l'historique des communications d'un suspect ayant séjourné à l'étranger. Elle adressait alors sa requête à l'agence américaine qui lui retournait la réponse dans un cadre de coopération judiciaire via le FBI américain. C'est par ce biais que la NSA, à la demande de la DCRI, a livré, en 2012, l'ensemble des données de connexions à l'étranger de Mohamed Merah.

En février 2016, interrogé par Le Monde , le préfet Bernard Squarcini, chef de la DCRI de 2007 à 2012, admettait, sans fournir de détails : " C'est regrettable mais en matière de coopération, les services français coopèrent mieux avec leurs homologues étrangers qu'entre eux. "

South China Morning Post
E-commerce sites on mainland most targeted by hackers
Monday, 12 December 2016
Byline: Zen Soo

Beijing - Greater China is facing an increasing number of cyberattacks on online transactions, with e-commerce websites being the most vulnerable, according to a recent cybersecurity report.
The increasing number of attacks on e-commerce websites come as the trend of cross-border e-commerce continues to grow, with more consumers shopping online for the best deals, according to cybersecurity firm ThreatMetrix's "Cybercrime Report Q3 2016".

According to ThreatMetrix data, fraudulent log-in attempts comprise about 11.8 per cent of e-commerce transactions in Asia-Pacific, compared to 4 per cent in the finance industry as hackers become more interested in gathering user data to exploit people's identities down the road.

E-commerce sites often make it easy for customers to log in or create an account, forgoing extra layers of security such as two-factor authentication to create a frictionless shopping experience, said Alisdair Faulkner, chief products officer and co-founder of ThreatMetrix.

He added that e-commerce sites are often "sitting ducks" for such hackers because users often give such sites a wealth of personal information, including addresses and phone numbers, allowing hackers to compile "dossiers of information" for later use.

"With your identity, [hackers] could access your medical record, insurance, even your bank accounts. They could collect enough information, impersonate someone's identity and apply for a loan at a bank ... or commit tax fraud," he said.

These same e-commerce sites often lack strong authentication measures for customer log-ins, and often do not inform users about data breaches.

"E-commerce sites can't force customers to have more security," Faulkner said, adding that additional security measures may put off customers from buying from the merchant.

This is particularly true in countries like China, where more than 600 million people use smartphones. Merchants today often make it easier to create accounts or log in on their mobile devices, where screens and keyboards are much smaller than on a desktop computer.

In particular, the greater China region faces an extremely high number of automated bot attacks, which can be combined with identity or device spoofing in large scale cyberattacks, according to the report.

"There are no uniform standards around privacy ... we don't have the same level of guidelines for people's identities and how it's protected [compared to financial information] because data is typically treated as not encrypted whereas credit card data is," Faulkner said.

He said that credit card data is much less valuable than identity and personal information, because hackers only make a one-time gain from credit card fraud whereas impersonating an identity may be more lucrative in the long run.

The Asia-Pacific region sees more than 200,000 identity abuse attacks daily, according to ThreatMetrix data, an increase of about 50 per cent from last year.

"Anybody in Asia could be getting these attacks - they just don't experience it directly," Faulkner said.

He added that companies like ThreatMetrix compile digital profiles of mobile devices and how they are used to help companies and merchants determine if transactions are legitimate or suspicious.

Suspicious transactions would get flagged by ThreatMetrix in real-time, allowing companies to manually review them and decide if they should allow a transaction to go through.

CBC News
Federal government's Canada.ca project 'off the rails'
Tuesday, 13 December 2016
Byline: Staff reporter

The federal government's bid to merge 1,500 departmental and agency websites into a single site, Canada.ca, is a year behind schedule and almost 10 times over budget. And experts warn it is on track to be another failed government IT project, like the Phoenix pay system.
"It's gone off the rails. It's a disaster," said one government source with knowledge of the project who spoke on condition of anonymity.

CBC spoke with a number of government workers who are also familiar with the project in different departments and they all expressed similar evaluations.

The Canada.ca initiative was launched in 2013 with the goal of making it easier for people to find and use government information online. A $1.54-million contract for a new content management system, where all government websites would be moved, was awarded to Adobe in 2015.

The original deadline to have all active web content moved to the single portal was this month. But in June, it was pushed back to December 2017, which was the initial deadline for the migration of all archived content.

The contract with Adobe is now above $9.4 million, according to government figures.

The actual migration of the websites is up to the departments themselves and is to be done within existing budgets and staffing. Since 2015, eight of the largest departments have budgeted or spent more than $28 million on this project.

Those departments include: Employment and Social Development; Immigration, Refugees and Citizenship; Health; Environment; Canada Revenue Agency; National Defence; Fisheries and Oceans; and Global Affairs.

According to the government, only 10,000 web pages have been moved to date. There are more than 17 million Government of Canada web pages in total.

"If it's cost them already 10 times their existing budget to migrate only 0.05 per cent of the content for the Government of Canada, we're talking about it ultimately costing hundreds of millions of dollars. It's not a small price ticket," said Mike Gifford, CEO of Ottawa-based web development company Open Concept, who has written articles criticizing the government's approach to Canada.ca.

New deadline 'impossible'

Based on the current timeline, Gifford said he thinks the December 2017 deadline is unrealistic. He's not alone.

"Absolutely impossible to achieve," said Timothy Lethbridge, who teaches software engineering and computer science at the University of Ottawa. "And I'm sure many people inside the project know it."

There's also a good chance of the project failing altogether, Lethbridge said, because large IT projects are exponentially more complex. "As a project of this size gets bigger, the probability of failure goes up."

If the government spread the work out over a number of years and spent a billion dollars, it might be able to make the migration a success, Lethbridge said. But he questioned whether taxpayers would be getting value for money at that point.

This is not the first large government IT project to run into problems.

The government will spend at least $50 million this year to try to fix problems with the new Phoenix pay system, which has seen thousands of public servants underpaid, overpaid or not paid at all.

The initiative to transform the government's email system has been stalled for months because of problems with new software.

And Shared Services Canada, the agency created in 2011 to modernize IT-related services in government, has been slammed for its many missteps, particularly by the auditor general.

"There's a trend," said Robin Galipeau, managing partner of OpenPlus, a content architecture company. "There's definitely something going on there. Large renewal projects in IT are failing in government."

OpenPlus, along with Dell and Microsoft, submitted a bid to create the new CMS for Canada.ca.

Ministers refuse to comment

According to OpenPlus Chief Technology Officer Joel Brockbank, the federal government continues to erroneously believe there are one-size-fits-all software solutions for its IT goals.

"There never is," he said. "It's like your cross-trainer running shoes. It's not good for anything that you do."

The key to not having large IT projects fail, Brockbank said, is to simply not do them. Instead, such projects should be done in stages or "bite-size chunks."

None of the ministers whose departments are involved in the Canada.ca migration project were willing to comment when contacted by CBC News.

Treasury Board President Scott Brison, Social Development Minister Yves Duclos and Public Services and Procurement Minister Judy Foote all declined requests. As did Michel Laviolette, the director general of Service Canada, and John Messina, the federal government's chief information officer.

"That tells me they have something to hide," said Debi Daviau, president of the Professional Institute of the Public Service of Canada, the union representing many of the government's IT workers.

"If they're unwilling to be transparent about the decisions they make, that calls those decisions into question."

Yonhap News Agency
Military investigators raid cyber command in hacking probe
Tuesday, 13 December 2016
Byline: Staff reporter

Seoul - Military investigators have raided South Korea's cyber command as part of their investigation into the first hacking of the command's intranet that is being blamed on North Korea, military officials said Tuesday.
"The Defense Security Command is thoroughly looking into how the cyberattacks took place, what confidential information has been leaked and if there was any professional negligence," a military official told Yonhap News Agency.

He confirmed that military prosecutors were overseeing the raid while the Defense Security Command was collecting documents in a raid to the cyber command on Tuesday.

In September, the defense ministry recognized that a total of 3,200 computers, including 700 linked with the intranet, were contaminated with malware a month after the latest cyberattack took place.

The ministry found in October some military documents were hacked while refusing to provide details. The computer used by Defense Minister Han Min-koo also turned out to have been compromised.

Last week, the ministry said the IP addresses linked to the attack were traced to a location in China that has been used by North Korean hackers.

As one of the military's two integration servers was jointly linked to the internet and the intranet, it allowed the hackers to gain access to the intranet, it said.

The cyber command separated the affected server from the whole network to avoid the spread of viruses in October, two months after the initial hacking attempt was made in August.

It marked the first time that the data of South Korea's cyber command has been compromised. South Korea set up the command in January 2010 as part of its efforts to counter external hacking attempts on the country's military.

North Korea -- which has thousands of cyberwarfare personnel -- has a track record of waging cyberattacks on South Korea and the United States in recent years, though it has flatly denied any involvement.

Yonhap News Agency
Acting President Hwang redoubles calls for robust cyberdefense
Tuesday, 13 December 2016
Byline: Song Sang-ho

Seoul - South Korea's Acting President and Prime Minister Hwang Kyo- ahn on Tuesday redoubled calls for robust cyberdefense against North Korea, saying cyberwarfare with the provocative state has already begun.
Following a suspected hacking by Pyongyang of Seoul's cybercommand intranet, Hwang and South Korean security officials have repeatedly stressed the need to prepare against the North's surreptitious cyberattacks which could be as devastating as physical military strikes.

"As evidenced in the recent hack of the (South's) defense ministry, North Korea has attempted to mount cyberattacks on major government facilities, and (this shows) cyberwarfare has already begun," he said during the first regular Cabinet meeting since he took over as acting president last Friday after President Park Geun-hye was impeached over a corruption scandal.

"Related ministries, including the ministries of defense and future planning, must devise thorough measures to prevent any recurrence (of hacking incidents) and take special caution not to allow any minor mistakes to threaten our security," he added.

The defense ministry said last week that a total of 3,200 computers, including 700 linked with the intranet, were infected with malware in August. The computer used by Defense Minister Han Min-koo was also affected, officials said.

In recent years, Seoul has been pushing to bolster its cyberdefense capabilities as Pyongyang has launched a host of attacks on South Korean corporate and government websites by mobilizing its specially trained personnel, including those based in China and other foreign countries.

The reclusive regime has denied responsibility for its cyberattacks including the latest one, upbraiding Seoul for "fabricating" claims about online attacks.

Hwang, in particular, ordered the government to check the nation's financial, traffic, broadcasting and energy networks, and other major national facilities to verify if they are exposed to any cybersecurity threats.

On the economic front, Hwang said that the country's economic fundamentals remain strong as Seoul has striven to maintain a consistent policy despite political uncertainties sparked by the corruption scandal.

The acting president also urged economic officials to keep close tabs on the financial and foreign exchange markets, as he pointed to the potential negative ramifications from a possible United States interest hike.

"I call on you to closely monitor the market situation and respond to it in a timely and resolute manner," he said.

Hwang went on to urge the Cabinet ministers to make concerted efforts to protect the socially vulnerable, including children from low-income families and senior citizens, particularly during the winter season.

Later in the day, Hwang held a luncheon meeting with senior professors and journalists as part of his efforts to solicit their views on ways to bring the nation, gripped by the scandal, back on track.

Hwang renewed his pledge to focus on forestalling any government vacuum and restoring stability in state governance.

Meanwhile, Hwang stepped up efforts to tackle a series of pending issues that can affect the wellbeing of citizens, as he strives to project an image of a trustworthy -- albeit temporary -- leader.

On the day, he directed Agriculture Minister Kim Jae-soo to convene a meeting of senior government officials and civilian experts, dedicated to containing avian influenza (AI), on a daily basis to better tackle the highly contagious virus.

He also instructed top officials from provincial governments to hold their own daily meetings separately to help stem the spread of the bird flu that has ravaged chicken farms across the country since mid-November.

Visiting police stations in Seoul, he called on officers to tighten their crackdown on crimes targeting women and other vulnerable individuals, particularly in the nighttime. He also ordered the police to "root out" violent or drunk drivers, saying they could cause large-scale accidents involving many casualties.

Regarding the heavy snowfall expected for some parts of the country between Tuesday night and Wednesday afternoon, Hwang directed related ministers to take the necessary steps to minimize any possible damage or inconvenience to citizens.

Japan News
Attacks by Anonymous against Japan rising
Tuesday, 13 December 2016
Byline: Staff reporter

Cyber-attacks against Japan apparently carried out by international hacker group Anonymous have been increasing since September.
Last autumn, a number of government websites and other sites came under attack. However, the recent attacks are different from sophisticated cyber-attacks that aim to steal information. Experts call for people to respond calmly by taking necessary steps in advance without fearing them too much.

Late at night on Sept. 3, the website of the Hiroshima National Peace Memorial Hall for the Atomic Bomb Victims became inaccessible. Shortly after, a group saying it was Anonymous and opposed to dolphin hunting and other issues posted a statement online claiming responsiblity.

An official at the memorial hall said in bewilderment, "We have nothing to do with dolphin hunting."

It is believed a series of Anonymous attacks called Operation Killing Bay started around 2013 in protest against Japan's whale hunting and the annual dolphin hunts in Taiji, Wakayama Prefecture, in September.

Last year, to protest against the dolphin hunting in Taiji, distributed denial of service (DDoS) attacks were launched against government offices websites and infrastructure operators such as airports. DDoS attacks are aimed at rendering websites and other online services unavailable by sending a huge amount of data to the server.

According to police, the number of cyber-attacks Anonymous is believed to be involved in has grown since September. There were no cyber- attack-related website problems from May to August, but 29 incidents were confirmed in September, followed by 26 in October. From Nov. 1 to Nov. 27, there were 53 cases, bringing the total from September to Nov. 27 to 108.

In comparison, incidents ranged between the 10s and 20s each month from September to November last year, but rose to 56 in December.

"Their aim is not to make websites unavailable, but to promote their presence," said Nobuhiro Tsuji, senior security researcher at SoftBank Technology Corp.

This year, the targets of the attacks have conspicuously been small organizations and shops such as izakaya Japanese pubs, and groups totally unrelated to dolphin hunting. "The hackers could be different from last year, and their resources could be smaller," Tsuji said.

'Respond coolly'

When Anonymous started around 2006, it advocated the establishment of the freedom of the internet and made political appeals through legally permitted activities such as street demonstrations.

Currently, however, Anonymous tends to carry out cyber-attacks with the aid of unknown individuals who respond to invitations on Twitter and other websites. Participants are increasingly committing cyber-attacks for fun.

The website of the Kasumigaura river office of the Land, Infrastructure, Transport and Tourism Ministry came under attack in 2012. Anonymous is believed to have confused Kasumigaura with Tokyo's bureaucratic district of Kasumigaseki. The incident was indicative of the group's sloppy management.

Anonymous' main attack method, DDoS, can be committed without significant expertise. Basically, there is no way to defend against such attacks. It is a matter of waiting for an attack to cease, although measures have recently been developed to mitigate damage.

"Compared to cyber-attacks aimed at stealing information, DDoS attacks are not so sophisticated. In most cases, the websites attacked went down and that was it," said Masakatsu Morii, a professor at Kobe University specializing in information and telecommunications engineering.

Some observers point out that such cyber- attacks could increase ahead of the 2020 Tokyo Olympics and Paralympics. Morii said, "It is important that companies and organizations take necessary measures calmly. If they are attacked, they should respond coolly without overreacting."

The Australian Financial Review
Lone wolves and data dumps a problem (Canada)
Tuesday, 13 December 2016
Byline: Jonathan Porter

Sydney - Constant reconnaissance probes by nation states, attacks by computer network robber barons and lone wolves and data dumps from disgruntled workers - that is digital Australia's bleak picture painted for a cyber security forum in Sydney recently.
And without constant vigilance and fine-tuning of our cyber defences, the problem will only get worse.

"A lot of nation states and militaries are investing in capabilities that can be used to target utilities; power, water resource and energy providers," Major-General Stephen Day, former head of cyber at the

Department of Defence who was the inaugural head of the Australian Cyber Security Centre, told the Australian Computer Society Cyber Forum in Sydney.

"There is no question reconnaissance is going on right now."

The glimpse behind the curtain at Australia's cyber defenders came during the question and answer period at the end of the forum, attended by some of the world's leading experts in the field.

An attendee put to the panel that an emerging risk was not lone wolf attackers "but of a state-sponsored cyber-attack sometimes from friendly countries we consider allies" and asked what was being done to mitigate the risk.

Day agreed that state-sponsored attacks were a "significant risk", particularly if people looked down the track a few years.

He added that there was also a "significant challenge with organised crime".

"We looked at the sectors that mattered most to our nation either from an economic prosperity perspective or from a national security perspective and put them in a priority order and looked at those sectors that were likely to be targeted by organised crime or by nation states and then we directed our organisational energy to help those sectors.

"So if, for example, you are in the utilities sector or critical infrastructure sector you will have had more experience of government contacting and working with you than the retail sector or the banking sector where you are likely to meet the police more than the national security base."

Victorian minister for Small Business, Innovation and Trade Philip Dalidakis said that while Day's statements were "sexy" and would generate headlines "the one thing everyone in the room has to be extremely cognisant of is that the overwhelming majority of attacks occur from within".

"Yes, we need to be able to stop attacks from the outside of the firewall but the fact of the matter is the two greatest attacks we have seen of data theft from inside were from Bradley Manning and (Edward) Snowden," he told the forum.

"There are a range of companies that will swear black and blue that they have got algorithms that will help flag anomalies within the system - people accessing certain types of data that they haven't done for ages - (or) if you have got your networks categorised under different security levels - people trying to access levels [other] than their security classification. Ultimately it comes down to people and training, each organisation has to have people who are trained appropriately who can deal with it when - it's not a matter of if - it occurs."

Some of the greatest risks in organisations were the IT divisions themselves, he says.

"People who have the administrative access rights and passwords are sometimes the ones who are undertaking a whole range of activities that people on the rest of the network are banned from doing - including downloading huge amounts of illegal data. Which is, of course, one of the ways people get in.

"So don't go away from this thinking that if you focus on external you are protected because your internal [network] is 80 per cent of your risk."

On the intelligence side, he said he could speak more freely than other panel members because he was not a representative of the federal government.

Dalidakis said the nation was well served by the Five Eyes agreement on signals intelligence sharing with the US, Canada, New Zealand and the United Kingdom.

Fellow panel member Sandra Ragg, assistant secretary for cyber policy in the Department of the Prime Minister and Cabinet, said the nation did need to improve its cyber defences.

"The first thing we can do is improve our cyber defences.

"People focus on state- sponsored threats but cybercrime is a huge piece of the threat to our economy."

Politico
Is Trump's Twitter account a national security threat?
Tuesday, 13 December 2016
Byline: Nahal Toosi

Washington - Donald Trump has years of experience launching Twitter wars. But now, as he prepares to take the highest office in the country, there are growing fears that his tweets could spur a genuine national security crisis.
Intelligence and defense specialists believe the president-elect's use of the popular and powerful social media network is already being used by foreign agencies to analyze his personality, track his habits and detect clues about what to expect from a Trump-led American government.

And that's just based on what Trump writes on Twitter. It's not even counting the vulnerabilities that could arise if overseas hackers invade his phone and digital accounts.

"We've never had a president that's shared so much of themselves, not just what they're saying, but their psychological ticks in such an overt manner, and you can be sure that foreign actors are studying that, too," said P.W. Singer, a defense expert and co-author of "Cybersecurity and Cyberwar." "We're beginning to see what excites him, what angers him, what sets him off. We've never had this ability to read so much on what a president is thinking."

Trump, who prefers mobile phones to computers, is highly attached to his Twitter account (@realDonaldTrump), using the platform to share his thoughts deep into the night. Days after his stunning election victory, he was reportedly worried he would not be able to keep his Android phone upon reaching the Oval Office, suggesting he plans to keep tweeting even after he's sworn in. During his first sitdown interview as president-elect, he told "60 Minutes" that he would be "very restrained" in his Twitter use while in office, before using his account to rail against The New York Times the same day the interview aired.

Trump's following of 17.2 million is likely to expand as he takes office, and his disdain for the mainstream media may bolster his desire to keep up his direct outreach to the public through Twitter.

For the most part, the president-elect has used Twitter to comment on people and institutions on the domestic front, or to defend himself against their criticisms. His tweets are believed to have even influenced the stock market, including on Monday, when his criticism of Lockheed Martin's F-35 program was followed by a drop in the aerospace company's market value. On several occasions, however, Trump has ventured into the international realm.

In recent days, amid lingering Chinese anger over Trump's decision to break U.S. protocol and speak directly to the president of Taiwan, Trump, using two tweets, wrote: "Did China ask us if it was OK to devalue their currency (making it hard for our companies to compete), heavily tax our products going into.. their country (the U.S. doesn't tax them) or to build a massive military complex in the middle of the South China Sea? I don't think so!" On Monday, he used Twitter to sow doubts about claims he's not hard enough on Russia.

Granted, foreign intelligence agencies will likely look at all of Trump's public utterances -- his speeches, interviews, written press releases -- as well as those of his aides to try to understand one of the more unusual men ever to win the White House. (U.S. intelligence analysts do similar studies of foreign leaders, especially in countries such as Iran and North Korea, whose governments are considered hostile and with whom U.S. communication is limited.)

But so far, at least, Twitter has proven one of the purest distillations of Trump around -- a raw version of a businessman-turned-politician keen on ignoring the traditional conventions of the presidency.

Twitter's 140-character limit on tweets appears to appeal to Trump's short attention span and his preference for rapid-fire interactions. But 140 characters often don't leave space for much context, explanation or nuance. So what Trump writes may come across as more forthright and harsher than what foreign governments are accustomed to in the diplomatic arena. The risk for a misunderstanding is, therefore, higher.

Foreign analysts following Trump's Twitter may not be inclined to simply take everything he writes at face value, especially when it comes to highly sensitive subjects. But, using sophisticated data tools, they

may look for patterns that, over time, can help them better predict if Trump is being serious. In all likelihood, many intelligence specialists overseas have probably already done such analyses based on Trump's more than 34,000 tweets so far.

"If Trump's comments accurately reflect his intent, then we're giving the opponents a head start in dealing with the incoming presidential administration," a former U.S. intelligence officer said of Trump's Twitter habits. "If his comments are meant to conceal other intentions, then we're doing a pretty good job in misleading our adversaries."

A foreign government may check to see if Trump uses certain types of words before he takes certain types of actions. If Trump keeps tweeting during his presidency, a foreign entity may analyze what types of things he writes before making a policy announcement. (If Trump were to enable Twitter's geo-location services, that could also grab the attention of overseas actors, though it doesn't appear he uses that feature.) Even a lengthy silence from Trump could be a signal of some sort, sources connected to the intelligence community told POLITICO.

In August, David Robinson, a data scientist, published an analysis of Trump's tweets using digital tools.

It indicated that there were at least two people tweeting out under Trump's account. The tweets from an Android phone appeared to be coming from the Manhattan billionaire himself -- they were angrier and more negative. The ones from an iPhone were more quotidian, sharing announcements and photos; those were likely posted by one or more Trump campaign aides. (Some tweets may have been written by a staffer trying to sound like Trump.)

"A lot of 'emotionally charged' words, like 'badly', 'crazy', 'weak', and 'dumb', were overwhelmingly more common on Android," Robinson wrote, meaning it was Trump who was probably behind those particular tweets.

The U.S. has occasionally found itself in diplomatic dust-ups thanks to Twitter.

In September, during President Barack Obama's visit to China, the Defense Intelligence Agency tweeted "Classy as always China" after the American leader was deprived of a normal red-carpet arrival due to a dispute over which stairs he could use to leave his plane. The Pentagon-based agency later deleted the tweet and apologized.

Four years earlier in Egypt, during the brief presidency of Muslim Brotherhood leader Mohamed Morsi, the U.S. Embassy in Cairo slapped the Islamist organization's English-language Twitter account after it expressed concern for the safety of U.S. diplomats amid violent protests near their building.

"Thanks. By the way, have you checked out your own Arabic feeds? I hope you know we read those too," the embassy tweeted, implying the Brotherhood was using a very different tone in its non-English messages. The Americans later deleted the tweet.

Although Twitter has been around for most of Barack Obama's presidency, the outgoing president has been careful in using the medium. He was allowed to start using his own official account, @POTUS, only a couple of years ago: in May 2015, he sent out an inaugural tweet. The @POTUS account will be made available to Trump once he is sworn in.

The @BarackObama account is run by Organizing for Action, a liberal group that has long supported the president. It was not immediately clear if Obama would take over that account once he leaves office, but he's used it in the past, signing tweets he composed with a "-bo".

The White House Communications Agency, a military division that handles presidential communications security, referred questions about Trump's Twitter account and plans to safeguard his digital devices to the president-elect's transition team. The transition team did not respond to a request for comment. To date, it's not clear if Trump's phone conversations with foreign leaders are fully secured, though his team has said precautions have been taken.

Even as foreign capitals sift through Trump's tweets, there are questions about whether the social media company should take away his account for calling out individual Americans on Twitter. Trump's targets have included an Indianapolis union leader and a college student, who have faced death threats and harassment as a result.

When asked for comment about whether Trump should be booted off the platform, a spokesperson for the company replied: "The Twitter Rules apply to all accounts."

Reuters
Top U.S. spy agency has not embraced CIA assessment on Russia hacking - sources
Tuesday, 13 December 2016
Byline: Jonathan Landy, Mark Hosenball

Washington - The overseers of the U.S. intelligence community have not embraced a CIA assessment that Russian cyber attacks were aimed at helping Republican President-elect Donald Trump win the 2016 election, three American officials said on Monday.
While the Office of the Director of National Intelligence (ODNI) does not dispute the CIA's analysis of Russian hacking operations, it has not endorsed their assessment because of a lack of conclusive evidence that Moscow intended to boost Trump over Democratic opponent Hillary Clinton, said the officials, who declined to be named.

The position of the ODNI, which oversees the 17 agency-strong U.S. intelligence community, could give Trump fresh ammunition to dispute the CIA assessment, which he rejected as "ridiculous" in weekend remarks, and press his assertion that no evidence implicates Russia in the cyber attacks.

Trump's rejection of the CIA's judgment marks the latest in a string of disputes over Russia's international conduct that have erupted between the president- elect and the intelligence community he will soon command.

An ODNI spokesman declined to comment on the issue.

"ODNI is not arguing that the agency (CIA) is wrong, only that they can't prove intent," said one of the three U.S. officials. "Of course they can't, absent agents in on the decision-making in Moscow."

The Federal Bureau of Investigation, whose evidentiary standards require it to make cases that can stand up in court, declined to accept the CIA's analysis - a deductive assessment of the available intelligence - for the same reason, the three officials said.

The ODNI, headed by James Clapper, was established after the Sept. 11, 2001, attacks on the recommendation of the commission that investigated the attacks. The commission, which identified major intelligence failures, recommended the office's creation to improve coordination among U.S. intelligence agencies.

In October, the U.S. government formally accused Russia of a campaign of cyber attacks against American political organizations ahead of the Nov. 8 presidential election. Democratic President Barack Obama has said he warned Russian President Vladimir Putin about consequences for the attacks.

Reports of the assessment by the CIA, which has not publicly disclosed its findings, have prompted congressional leaders to call for an investigation.

Obama last week ordered intelligence agencies to review the cyber attacks and foreign intervention in the presidential election and to deliver a report before he turns power over to Trump on Jan. 20.

The CIA assessed after the election that the attacks on political organizations were aimed at swaying the vote for Trump because the targeting of Republican organizations diminished toward the end of the summer and focused on Democratic groups, a senior U.S. official told Reuters on Friday.

Moreover, only materials filched from Democratic groups - such as emails stolen from John Podesta, the Clinton campaign chairman - were made public via WikiLeaks, the anti-secrecy organization, and other outlets, U.S. officials said.

"THIN REED"

The CIA conclusion was a "judgment based on the fact that Russian entities hacked both Democrats and Republicans and only the Democratic information was leaked," one of the three officials said on Monday.

"(It was) a thin reed upon which to base an analytical judgment," the official added.

Republican Senator John McCain said on Monday there was "no information" that Russian hacking of American political organizations was aimed at swaying the outcome of the election.

"It's obvious that the Russians hacked into our campaigns," McCain said. "But there is no information that they were intending to affect the outcome of our election and that's why we need a congressional investigation," he told Reuters.

McCain questioned an assertion made on Sunday by Republican National Committee Chairman Reince Priebus, tapped by Trump to be his White House chief of staff, that there were no hacks of computers belonging to Republican organizations.

"Actually, because Mr. Priebus said that doesn't mean it's true," said McCain. "We need a thorough investigation of it, whether both (Democratic and Republican organizations) were hacked into, what the Russian intentions were. We cannot draw a conclusion yet. That's why we need a thorough investigation."

In an angry letter sent to ODNI chief Clapper on Monday, House Intelligence Committee Chairman Devin Nunes said he was "dismayed" that the top U.S. intelligence official had not informed the panel of the CIA's analysis and the difference between its judgment and the FBI's assessment.

Noting that Clapper in November testified that intelligence agencies lacked strong evidence linking Russian cyber attacks to the WikiLeaks disclosures, Nunes asked that Clapper, together with CIA and FBI counterparts, brief the panel by Friday on the latest intelligence assessment of Russian hacking during the election campaign.

Suspected Russian cyberattack waged on Clinton campaign just days before vote
Monday, 12 December 2016
Byline: Michael Isikoff

Washington - In the closing days of the 2016 election campaign, hackers believed to be working for Russian intelligence launched a new wave of attacks on Hillary Clinton's campaign and the Democratic National Committee -- a previously unreported cyberoffensive that heightened concerns, now endorsed by the CIA, that the Russian government was seeking to influence the outcome of the election in favor of Donald Trump, according to sources familiar with the investigations into the attempted intrusions.
The attacks came in the form of so-called "phishing" emails sent to nearly a dozen campaign and committee staffers in a renewed effort at penetrating their networks, said Dmitri Alperovitch, the co-founder and chief technology officer of CrowdStrike, the cybersecurity firm hired by the DNC to repel

attacks on its network. Staffers at that point were alert enough to reject entreaties to click on the unsolicited email messages that would have allowed the hackers into their computers, he said.

But at least one top Clinton campaign staffer, communications director Jennifer Palmieri, told Yahoo News on Sunday that she received an alert from Google in mid- October informing her that her personal Gmail account had been targeted by a "foreign state" actor and that her password needed to be changed.

"They were targeting us throughout the election," said another former senior Clinton campaign staffer, who asked not to be identified. "They never stopped trying to get back in."

The disclosure of the late campaign attack could fuel a mounting controversy over U.S. intelligence findings that link Russian intelligence to the cyberattacks for the express purpose of throwing the election as part of a campaign, orchestrated in Moscow, to defeat Clinton.

The Washington Post reported Saturday that the CIA has briefed members of Congress on an assessment that the Russians targeted Democratic political organizations and campaign officials as part of a specific effort to defeat Clinton and elect Trump. This goes beyond an earlier public finding that U.S. intelligence officials were "confident" that the Russian government was behind the cyberattacks, but did not ascribe a motive for the Russians doing so.

One piece of damning evidence behind the new finding is that the CIA and the FBI have both identified specific individuals associated with or close to the Russian government who provided the DNC emails to WikiLeaks, which began publishing them in July, a senior law enforcement official told Yahoo News. Despite reports of a clash between the CIA and the FBI over the motive behind Russia's intelligence service in launching the operation, the differences are more a matter of "degree" and emphasis, with the FBI believing there may have been "mixed" motives for the Russian effort, the official said. Still, "we all agree they did these things," the official said.

But President-elect Trump doubled down on his rejection of the intelligence findings in an interview with Fox News anchor Chris Wallace that aired Sunday, dismissing any conclusion that points to Russian government involvement.

"I think it's ridiculous," Trump told Chris Wallace in interview that aired on "Fox News Sunday," his first Sunday show sit-down since winning the election. "I don't believe it."

"If you look at the story and you take a look at what they said, there's great confusion," Trump added. "Nobody really knows, and hacking is very interesting. Once they hack, if you don't catch them in the act you're not going to catch them. They have no idea if it's Russia or China or somebody. It could be somebody sitting in a bed someplace. I mean, they have no idea."

Alperovitch of CrowdStrike, the cybersecurity firm that first publicly linked the cyberattacks to Russian intelligence, said Sunday that he was "puzzled" by Trump's remarks and assumes he has not yet been fully briefed on the matter. (CrowdStrike, whose principals include Shawn Henry, the former chief of the FBI's cyber division, was initially hired by the DNC to investigate the cyberattacks and defend its network last May.)

"At this point, the matter of attribution on the intrusions has been settled,"Alperovitch said. "There is nobody that looks at the evidence who disputes this." Asked his level of confidence in his firm's findings, he responded "100 percent."

Much of the evidence, he said, revolves around the nature of the sophisticated tools used by the attackers on the DNC and forensic evidence showing strong similarities to Russian cyberattacks that have occurred in Ukraine and other Eastern European countries -- as well as to intrusions of the Joint Chiefs of Staff, the White House and the State Department and other U.S. government agencies. "The digital fingerprints are of the same origin," said Alperovitch.

CrowdStrike initially identified two sets of attackers on the DNC's servers: One, dubbed "Cozy Bear," was associated with the Russian FSB (the successor to the Soviet KGB) and which first breached the DNC's network in the summer of 2015. Another, dubbed "Fancy Bear," has been associated with Russia's military intelligence service, the GRU. The latter infiltrated the DNC's network in late April of this year in what turned into a far more devastating attack, resulting in the disclosure of 20,000 internal DNC emails to WikiLeaks -- an act, according to Alperovitch, of "information warfare." (He acknowledged that a third Russian intelligence service, the SVR, which has responsibility for foreign intelligence operations, may also have been involved.)

"When we look at this over 10 years -- literally hundreds of intrusions -- [and] you look at the tradecraft, you look at the victims, it all points to Russian intelligence services," Alperovitch said.

In addition, he said, there was another separate cyberattack discovered in late September from an undetermined party that penetrated DNC computers with software containing sensitive voter analytic data that was being provided in regular memos to Clinton campaign manager Robby Mook, the sources said.

The breach was detected by CrowdStrike, and the cyberinvaders were expelled from a cloud server housing the data; this server was distinct from the DNC's internal computer network that had been previously breached, he said. But the intruders were never identified, and it was never determined whether the data -- containing detailed reports on voter registration and estimates of likely voter participation in the November election -- was ever actually stolen.

Alperovitch said he doesn't know whether these hackers were associated with Russian intelligence; they used different methods and publicly available cybertools to pull it off -- also he said the DNC never authorized his firm to conduct a full investigation. But he said the late October "phishing" attacks on the

DNC and the Clinton campaign resembled the earlier Fancy Bear attacks, leading him to conclude they were likely the work of the GRU.

Moreover, attacks by the Cozy Bear intruders have continued throughout the fall, targeting multiple organizations, including think tanks and universities whose scholars work on Russian policy issues, he said.

And even more recently, he said, there was evidence that the separate "Fancy Bear" hackers are now also attacking political organizations in Germany and elsewhere in Europe in an apparent attempt to meddle in their elections as well. (The chief of German domestic intelligence said last week that there has been a recent increase in "aggressive cyberespionage" against German politicians and warned about "growing evidence for attempts to influence the [German] federal elections next year."

"These activities have not stopped," said Alperovitch. "Now that they were executed [in the United States] and they have a successful playbook, I fully expect they are going to continue."

Press TV
Iranian Army unveils new indigenous combat, reconnaissance drones
Tuesday, 13 December 2016

Tehran - The Iranian Army's Ground Forces has unveiled two domestically-designed and -manufactured drones on the final day of major military exercises code-named Mohammad Rasoulallah IV (Mohammad, the Messenger of God IV) in southeastern Iran.
One of the two aircraft, code- named Oghab (Eagle), is a combat drone capable of carrying air-to-surface missiles.

The other, code-named Shahin (Falcon) and developed and manufactured under a project code-named Shahid Mohsen Ghotaslou, can collect information on the positions and movements of enemy forces on reconnaissance missions. It boasts a flight endurance of 24 hours.

General Seyyed Kamal Peyambari, the spokesman for the military drills, said the jamming and combat techniques of drones were also fully tested at various altitudes on Tuesday, with the participation of military commanders and defense experts.

Peyambari noted that sophisticated and innovative weapons such as super- caliber 107mm rocket launchers, optimized versions of the 62.5mm PSG-1 and Dragunov semi-automatic sniper rifles, a jammer with an effective range of 800 meters, drone jammers, and cellular satellite phone jammers were put to practice on the last day of the drills as well.

Various and extensive psychological war techniques such as drills using 122mm flyer-carrying rockets, tactical radios and directional sound systems were also put to the test for the first time.

The senior Iranian military figure further noted that hand-launched drones as well as land minelayers were also tried out.

Peyambari added that electronic warfare, armored, infantry, mechanized infantry, commando, and intelligence units present at the Mohammad Rasoulallah IV military exercise, which covered an area of 220,000 square kilometers, successfully carried out their operations on the third day of the drills.

Iran has conducted major military drills in recent years to enhance the defense capabilities of its Armed Forces and to test modern military tactics and state-of-the-art equipment. Each year, the country inaugurates a host of new projects and hardware developed with reliance on domestic capabilities.

The Islamic Republic maintains that its defense power is driven by deterrence and poses no threat to any other country.

Legion: Meet the hackers who broke into Twitter accounts (Canada).
Tuesday, 13 December 2016

New Delhi - A hackers' group called Legion has repeatedly breached the Twitter accounts of some well-known Indians, including Congress vice- president Rahul Gandhi and prominent journalist Barkha Dutt. Legion has not posted any classified information on the hacked accounts but has threatened to expose email communications among Congress party leaders in the New Year. Earlier this month, they on his Twitter handle, vowing to bring to justice the fugitive industrialist who has defaulted on at least Rs 7,000 crore bank loans.

Here is some detail about the hackers' group: What is Legion? It is a coalition of like-minded hackers based out of five countries - the United States, Sweden, Canada, Thailand and Romania, according to the Delhi police's cybercrime cell. The group seeks to expand its activities, leaving its email id -- legion_group@sigaint.org - for more hackers to join their campaign.

Are they connected with Legion of Doom of the 1980s? The group does not appear to have any links with the hackers' group Legion of Doom (LoD) that targeted rich and famous people's email accounts in the mid-1980s. LoD remained active till early 2000s. However, the two groups appear to share ideological goals in targeting what they say are the rich and corrupt. LoD was founded by US-based hacker Lex Luthor after he broke away from the Knights of Shadow.

Why do they hack people's accounts? Legion fancies itself as cyber vigilantes working to expose the corrupt. But the group is yet to bolster their anti-corruption crusader credentials, given that it has so far offered very little valuable information.

How does Legion operate? Legion communicates through email servers and browsers that are shielded against surveillance. In other words, it does not use Google Chrome or Internet Explorer but a browser called The Onion Router (TOR), which is difficult to track (provides anonymity) and allows a user to communicate directly with another one. This is also called the darknet, a platform often used by activists and journalists seeking to avoid a surveillance dragnet.

Are there other such hackers' groups? Yes. Anonymous is another loosely associated international network of activist and hacktivists which started operating in 2003. The group's website describes it as "an Internet gathering" with "a very loose and decentralised command structure that operates on ideas rather than directives". The group became known for crashing websites of governments, corporates and religious groups. Anonymous members (known as "Anons") use the Guy Fawkes mask as their emblem.

IoT continues to pose a key cyber security threat
Tuesday, 13 December 2016
Byline: Mohammed Al-Moneer

Riyadh - The cyber landscape changes dramatically year after year. If you blink, you may miss something; whether that's a noteworthy hack, a new attack vector or new solutions to protect your business. Sound cyber security means trying to stay one step ahead of threat actors.
In the spirit of looking toward the future, I wanted to grab my crystal ball and take my best guess at what will be the big story lines in cyber security in 2017.

1. IoT continues to pose a major threat. In late 2016, all eyes were on IoT-borne attacks. Threat actors were using Internet of Things devices to build botnets to launch massive distributed denial of service (DDoS) attacks. In two instances, these botnets collected unsecured "smart" cameras. As IoT devices proliferate, and everything has a Web connection -- refrigerators, medical devices, cameras, cars, tires, you name it -- this problem will continue to grow unless proper precautions like two-factor authentication, strong password protection and others are taken.

Device manufactures must also change behavior. They must scrap default passwords and either assign unique credentials to each device or apply modern password configuration techniques for the end user during setup.

2. DDoS attacks get even bigger. We recently saw some of the largest DDoS attacks on record, in some instances topping 1 Tbps. That's absolutely massive, and it shows no sign of slowing. Through 2015, the largest attacks on record were in the 65 Gbps range.

Going into 2017, we can expect to see DDoS attacks grow in size, further fueling the need for solutions tailored to protect against and mitigate these colossal attacks.

3. Predictive analytics gains ground. Math, machine learning and artificial intelligence will be baked more into security solutions. Security solutions will learn from the past, and essentially predict attack vectors and behavior based on that historical data. This means security solutions will be able to more accurately and intelligently identify and predict attacks by using event data and marrying it to real-world attacks.

4. Attack attempts on industrial control systems. Similar to the IoT attacks, it's only due time until we see major industrial control system (ICS) attacks. Attacks on ecommerce stores, social media platforms and others have become so commonplace that we've almost grown cold to them. Bad guys will move onto bigger targets: dams, water treatment facilities and other critical systems to gain recognition.

5. Upstream providers become targets. The DDoS attack launched against DNS provider Dyn, which resulted in knocking out many major sites that use Dyn for DNS services, made headlines because it highlighted what can happen when threat actors target a service provider as opposed to just the end customers.

These types of attacks on upstream providers causes a ripple effect that interrupts service not only for the provider, but all of their customers and users. The attack on Dyn set a dangerous precedent and will likely be emulated several times over in the coming year.

6. Physical security grows in importance. Cyber security is just one part of the puzzle. Strong physical security is also necessary. In 2017, companies will take notice, and will implement stronger physical security measures and policies to protect against internal threats and theft and unwanted devices coming in and infecting systems.

7. Automobiles become a target. With autonomous vehicles on the way and the massive success of sophisticated electric cars like Teslas, the automobile industry will become a much more attractive target for attackers. Taking control of an automobile isn't fantasy, and it could be a real threat next year.

8. Point solutions no longer do the job. The days of Frankensteining together a set of security solutions has to stop. Instead of buying a single solution for each issue, businesses must trust security solutions from best-of-breed vendors and partnerships that answer a number of security needs. Why have 12 solutions when you can have three? In 2017, your security footprint will get smaller, but will be much more powerful.

9. The threat of ransomware grows. Ransomware was one of the fastest growing online threats in 2016, and it will become more serious and more frequent in 2017. We've seen businesses and individuals pay thousands of dollars to free their data from the grip of threat actors. The growth of ransomware means we must be more diligent to protect against it by not clicking on anything suspicious. Remember: if it sounds too good to be true, it probably is.

10. Security teams are 24/7. The days of security teams working 9-to-5 are long gone. Now is the dawn of the 24/7 security team. As more security solutions become services-based, consumers and businesses will demand the security teams and their vendors be available around the clock. While monitoring tools do some of the work, threats don't stop just because it's midnight, and security teams need to be ready to do battle all day, every day. Those are 10 things we see happening in the cyber security space next year.

Iran's Ground Force Unveils New Drone during Massive Drills
Tuesday, 13 December 2016

Tehran - The Iranian Ground Force unveiled a new drone named 'Farpad' during the massive wargames codenamed 'Mohammad Rasoulallah (PBUH) 4' in the Southeastern parts of the country on Monday morning. The hand- launched drone is run by autopilot and can fly maximum 45 minutes to the range of 20km.
Also during the second day of the three-day drills, the Iranian Ground Force unveiled a jamming system which is capable of confronting Unmanned Aerial Vehicles (UAVs) in a range of 3km and can force it to land after taking its control. The system is also portable by individuals.

In another development in the wargames, the home-made Toufan missiles whose range and destruction and precision-striking power have been improved were fired by helicopters and hit simulated enemy's targets precisely.

Also, the latest sniper gun manufactured for the Iranian Ground Force, 'Taher', with a range of 1.2km was unveiled on Monday. The gun weighs 4.4kg (without scope and magazine) and is 1.28m in length.

Meantime, the 209 (Cobra) and 214 helicopters of the Iranian Ground Force's air force units fired several rockets at two floating targets in Makran region (in the Sea of Oman) and destroyed them.

Also, two Mirage fighter jets of the Iranian Air Force participated in the drills for the first time and used air-based weapons in operations against the simulated enemy.

The massive 'Mohammad Rasoulallah (PBUH) 4' wargames started in the Southeastern parts of the country on Sunday morning.

"On the first day of the drills, rapid reaction units from other geographical regions of the country were transferred to the operational regions via air and ground in the shortest possible time," Spokesman of the drills General Seyed Kamal Payambari told reporters yesterday.

He said that the drills are being held in the strategic Southeastern parts of the country in a range of over 220,000km with the participation of different units of Ground Force, logistic forces of the Air Force and Khatam ol-Anbia Air Defense Base.

According to General Payambari, assessment of the Iranian forces' preparedness in the tactical fields and decreasing the time for their rapid reaction against threats as well as using new defense systems are among the goals pursued in the wargames.

Meantime, Army Airborne Commander Brigadier-General Houshang Yari announced on Sunday that dozens of different types of helicopters are flying over the wargames zone.

"Tens of different types of 206, 214, 209 (Cobra) and Chinook helicopters are present in the drills zone," General Yari told reporters today.

"During the drills, the command, track, control and close fire support missions as well as numerous heliborne operations will be carried out by the Airborne helicopters," he added.

General Yari said that the drills will also be a touchstone to assess the agility and power to overhaul and maintain helicopters.

Fars News Agency
Civil Defense Official Warns of New US Cyber Attack against Iran
Tuesday, 13 December 2016

Tehran - A senior member of Iran's Civil Defense Organization warned that Washington has hatched plots to launch new cyber operations against the country's infrastructures.
"At present, the US has launched a project named Nitro Zeus with the aim of attacking Iran's defense and telecommunication infrastructures," Alireza Karimi said on Monday, addressing a conference in Tehran.

"Based on studies that we have carried out, the project is assessed to be much more dangerous than the Stuxnet project," he added.

His remarks came after Deputy Head of Iran's Civil Defense Organization Brigadier General Mohammad Hassan Mansourian underlined in October his organization's full preparedness to confront the cyberattack and cultural invasion threats.

"Iran's Civil Defense Organization can defuse cyberattacks and cultural invasions," Brigadier General Mansourian said. He underlined that the advanced countries are currently making huge investments in the field of civil defense.

Mansourian underscored that the cyberattack and cultural invasion should only be responded by the national civil defense system.

In May 2015, Head of Iran's Civil Defense Organization Brigadier General Gholamreza Jalali announced that the country has set up cyber defense workgroups to better coordinate measures for defending nuclear facilities against enemies' cyber attacks.

"The country's vital cyber infrastructures have been identified and separate cyber workgroups have been formed in all fields," Jalali told reporters in Tehran.

"For instance a cyber defense workgroup was set up in the nuclear field for Natanz nuclear installations and no serious incident has threatened this section in the past two years," he added.

In relevant remarks in October 2014, Jalali revealed that a US cyberattack on Iran's nuclear enrichment facility in Natanz failed due to his organization's tough defensive measures.

"The first cyberattack, codenamed Olympic Games, was carried out on Natanz and was declared by the US President, but it met our heavy (defensive) response," Jalali told reporters in a press conference in Tehran.

The senior commander said the US changed its cyber commander following the failure in the cyberattack on Natanz, adding that the US general was forced to retire several months ago "due to the wrong information and data that he had presented to President Obama". And this was the result of our direct confrontation with them, General Jalali added.

The US was the principal player in the most sophisticated cyber-attack ever known and has been orchestrating a campaign against Iran designed to undermine the country's nuclear program.

The New York Times came up with an in-depth report on June 1, 2012 saying that from the very first month Barack Obama took over as US President, he secretly ordered increasingly sophisticated attacks on Iran's computer systems that run the country's main nuclear enrichment facilities.

The disclosures about Obama's role in the cyberwar against Iran appear to show beyond doubt that the US, with the help of Israel, was behind the Stuxnet virus attack on Iran's centrifuge machines - used to enrich uranium. The revelation then indicated that Washington and Tel Aviv were also behind the Flamer and Duqu virus attacks discovered by experts in May 2012.

Codenamed Olympic Games, the attacks were spearheaded by the US government under the Bush administration. Stuxnet targeted Siemens industrial equipment to spin hundreds of centrifuges beyond their breaking points and eventually disable Iran's nuclear efforts.

According to the report, Obama decided to speed up the attacks, even after the worm escaped from Iran's Natanz plant in 2010 and later ended up on the Internet.

During a meeting following the worm's escape, Obama even considered that the worm should be stopped thinking that America's most ambitious attempt to slow the progress of Iran's nuclear efforts had been fatally compromised. Should we shut this thing down? Obama asked members of the President's national security team.

However, he finally decided to go ahead with the cyberattacks. What followed thereafter was the Natanz plant being hit by several newer versions of the worm.

The report is said to be based on 18 months of interviews with current and former American, European and Israeli officials involved in the program as well as with outside experts, who provided contradictory assessments of how successful the attack was in slowing down Iran's progress of developing nuclear weapons.

While internal Obama administration estimates claim the effort was delayed by 18 months to two years, some other experts, both inside and outside the government, said that Iran's enrichment levels had steadily recovered. A year later, Iran enriched uranium to the 20-percent grade, way beyond the 5-percent purity level that was done in Natanz in 2012.

Le Télégramme
Cybersécurité. La Bretagne au coeur du combat
Tuesday, 13 December 2016
Byline: Journaliste maison

Bruz, France - Jean-Yves Le Drian, ministre de la Défense, a dévoilé au centre DGA Maîtrise de l'information à Bruz (35), près de Rennes, la doctrine des armées en matière de cybersécurité. « L'émergence d'un nouveau milieu, d'un champ de bataille cyber, doit nous amener à repenser profondément notre manière d'aborder l'art de la guerre (...), comme l'aviation au début du XXe siècle », a-t-il assuré, soulignant : « En temps de guerre, l'arme cyber pourra être la réponse, ou une partie de la réponse, à une agression armée, qu'elle soit de nature cyber ou non ». La doctrine présentée ce lundi, qui repose sur trois piliers - renseignement, protection/défense et lutte informatique offensive - est l'une des plus élaborées énoncées en Europe, avec celle du Royaume-Uni. Concrètement, la France pourra recourir au combat numérique comme à une arme classique de type missile pour riposter à une attaque, aussi bien cyber que conventionnelle. « Nos capacités cyber offensives doivent nous permettre de nous introduire dans les systèmes ou les réseaux de nos ennemis, afin d'y causer des dommages, des interruptions de service ou des neutralisations temporaires ou définitives », a relevé le ministre.

Un bataillon de 2.600 « combattants numériques »

Un commandement des opérations cyber, placé sous la responsabilité directe du chef d'État-Major des armées, va être créé, dès janvier 2017. Il disposera d'un état-major resserré qui supervisera 2.600 « combattants numériques » . Les armées pourront « neutraliser » des infrastructures utilisées pour attaquer des intérêts français mais aussi « riposter » plus largement à une attaque cyber, a expliqué Jean-Yves Le Drian.

« Si une attaque cyber s'apparente à un acte de guerre, une riposte adéquate s'imposera (...) dans une logique de conflit ouvert », a-t-il souligné. Si l'attaque transite par un État qui « n'aurait pas empêché une telle utilisation, la responsabilité de cet État pourrait être mise en jeu », a-t-il averti.

Le Monde
Un an après sa création, la commission chargée du contrôle du renseignement
Tuesday, 13 December 2016
Byline: Jacques Follorou

Paris - Un an après sa création, la commission chargée du contrôle du renseignement affirme son indépendance
L'avis de la Commission nationale de contrôle des techniques de renseignement, née en octobre 2015 pour faire contrepoids aux puissants moyens de surveillance accordés aux services secrets, n'est que consultatif mais le premier ministre l'a suivi dans la plupart des cas.

Pour son premier rapport annuel, présenté mardi 13décembre, la Commission nationale de contrôle des techniques de renseignement (CNCTR), née, le 3octobre 2015, pour faire contrepoids aux puissants moyens de surveillance accordés aux services secrets français dans la loi du 24juillet 2015 sur le renseignement, jouait une part de sa crédibilité.

Nommé président de cette nouvelle instance indépendante, Francis Delon, ex-secrétaire général de la défense nationale et l'un des pères fondateurs de la plateforme nationale du renseignement technique qui alimente depuis 2008 la communauté française du renseignement, devait prouver que les premiers soupçons de grande proximité avec l'Etat étaient infondés. Il devait, de plus, montrer que dans une période où l'émotion pèse sur les décisions politiques, il saurait résister aux pressions l'invitant à ne pas s'opposer aux libertés prises avec le droit.

La CNCTR est chargée de contrôler de l'utilisation d'une douzaine de moyens de surveillance par les services de renseignement français. L'avis de la CNCTR, composée de dix-sept membres, dont trois ingénieurs, n'est que consultatif. Le premier ministre, seule autorité décisionnaire en la matière, l'a néanmoins suivi dans la plupart des cas. La procédure dite d'urgence, qui permet de s'exonérer du point de vue de la CNCTR, n'a été déclenchée qu'à une reprise selon le rapport qui ne fournit aucun détail opérationnel.

8538 interceptions de sécurité validées

En un an, la CNCTR a visé 48208 demandes de collecte de données de connexion, qui portent parfois sur de simples recherches de numéros dans des annuaires. Elle a donné un avis favorable à 2127 demandes de géolocalisation et elle a validé 8538 interceptions de sécurité, des écoutes téléphoniques, alors que l'instance qui existait auparavant, la Commission nationale de contrôle des interceptions de sécurité (CNCIS), née de la loi de 1991, en avait contrôlé un peu plus de 7000 lors de sa dernière année.

La CNCTR reste très discrète sur les 7711 fois où «d'autres techniques» ont été déployées avec son aval. S'agissait-il de pose de balises, de sonorisation d'appartements, de recueil ou de collecte de données informatiques? On n'en saura rien. La CNCTR explique qu'elle est tenue par la loi qui lui interdit de révéler des capacités opérationnelles. Elle signale néanmoins que faute d'achèvement du chantier de «centralisation des données recueillies» par ces nouvelles techniques, elle n'a pas encore une vision sur leur utilisation sur tout le territoire.

6,9% des demandes renvoyées aux services

En matière d'avis défavorables, on note une augmentation par rapport au temps de la CNCIS qui ne donnait son avis que sur les interceptions de sécurité et les données de connexions. La CNCTR a renvoyé aux services 6,9% des demandes contre environ 1% à l'époque de la CNCIS. Avant la loi de juillet2015, les services de renseignement usaient d'un grand nombre de ces moyens intrusifs, balises, sonorisation de lieux, etc. sans demander l'autorisation à quiconque, en toute illégalité. Les avis défavorables de la CNCTR portent essentiellement sur ces outils, désormais légaux, mais particulièrement attentatoires à la vie privée.

Si la CNCTR s'est vue, de fait, reprocher par les services un surcroît de «paperasse», elle a surtout pu éprouver la réalité de son indépendance lors des tentatives du gouvernement de passer outre ses prérogatives. Ce fut ainsi le cas avec l'article851-2 sur le recueil de données de connexions en temps réel attachées à une personne sur l'ensemble de ses moyens de communication.

La loi sur le renseignement du 24juillet 2015 disposait que cette collecte ne pouvait être effectuée que «sur une personne préalablement identifiée comme présentant une menace» . Le gouvernement et le chef de l'Etat ont tenté, en janvier, d'utiliser ce moyen pour mettre sous surveillance des listes entières de suspects, notamment les fameux fichés «S» pour islam radical, soit près de 14000 personnes. M.Delon a bloqué cette requête considérant qu'elle n'est pas conforme à la loi qui impose que chaque demande doit être individualisée et justifiée.

Pour contourner ce refus de valider «des surveillances groupées et simplifiées», le gouvernement, soutenu par un législateur, davantage soucieux d'étendre la surveillance d'Etat que de jouer son rôle de contre-pouvoir, a, depuis, modifié à deux reprises le périmètre de cet article de loi. Dans le cadre des lois sur la prorogation de l'Etat d'urgence, le Parlement a d'abord élargi la surveillance aux personnes «pouvant constituer une menace» . Et fin juillet, il a étendu la collecte de données de connexion en temps réel à l'entourage de la personne surveillée dès lors qu'il existait simplement «des raisons

sérieuses de penser» qu'espionner ces gens au sein de cercles familiaux, amicaux, professionnels ou occasionnels puisse avoir un intérêt.

L'«exception hertzienne»

Si les parlementaires n'ont pas été d'une grande aide pour la CNCTR, elle a, en revanche, trouvé dans le Conseil constitutionnel un soutien inattendu pour tenter d'étendre son contrôle sur un pan entier des surveillances en France qui restaient jusque-là interdites, les communications hertziennes. Qualifiée d' «exception hertzienne» par la CNCTR, cette dérogation du droit consacrée par la loi de 1991 sur les interceptions puis prorogée dans la loi de juillet de 2015, a pris fin lors de sa censure, le 21octobre, par le Conseil constitutionnel.

Se félicitant de la décision du Conseil de vouloir faire entrer la surveillance par voie hertzienne dans le droit commun et d'avoir été chargée par lui de veiller à son application d'ici au vote d'une nouvelle loi, au plus tard le 31décembre 2017, la CNCTR a, au moins jusqu'à cette date, le pouvoir de viser chaque demande d'interceptions effectuée par cette technique. Souhaitant poursuivre son avantage, la CNCTR demande, dans son rapport, d'être «consultée sur l'éventuelle nouvelle législation» .

Le Temps (Suisse)
ID Quantique se déploie à l'international
Tuesday, 13 December 2016
Byline: Dejan Nikolic

Londres - Le numéro un mondial de la cryptographie quantique et de la génération de nombres aléatoires ouvre un bureau à Londres, signe un partenariat stratégique avec le géant coréen SK Telecom et s'attaque au marché chinois
ID Quantique (IDQ), pépite issue des laboratoires de physique appliquée de l'Université de Genève, s'offre un déploiement sans précédent. L'actuel numéro un mondial de la cryptographie quantique et de la génération de nombres aléatoires étend tout d'abord ses activités à la Grande-Bretagne. A travers notamment un contrat consistant à sécuriser les échanges d'informations entre l'un des sites de BT (anciennement British Telecommunications) et Cambridge.

IDQ ouvre également une officine britannique, afin de prendre part à une plateforme scientifique nationale de 384 millions de francs sur cinq ans. « Huit grandes universités du pays ainsi que le secteur privé et public participent à ce programme », précise Grégoire Ribordy, fondateur d'IDQ, qui imagine affecter cinq collaborateurs à Londres d'ici à un an.

Parallèlement à cette nouvelle tête de pont britannique, IDQ signe une alliance avec SK Telecom, le principal opérateur de Corée du Sud (29,45 millions de clients, soit environ 50% du marché local, pour près de 15 milliards de francs de chiffre d'affaires l'an passé). Ce rapprochement avec la major de l'un des pays les plus connectés de la planète est assorti d'une levée de fonds de plus de 4 millions de francs.

Soit la troisième injection de capital en quinze ans, les deux précédentes rondes ayant permis d'engranger respectivement un million (2004) et quatre millions (2014).

La fibre commerciale

L'entreprise carougeoise, lancée en 2001 et qui affiche une croissance moyenne de 30% par an, emploie aujourd'hui une cinquantaine de salariés, soit plus du double qu'en 2014. Son dernier tour de financement, auquel participent d'autres investisseurs stratégiques, est destiné à renforcer sa suprématie à l'échelle planétaire. Et d'asseoir son développement en Asie.

« L'une des filiales de SK Telecom fabrique des puces pour smartphones intégrant des nombres aléatoires, relève Grégoire Ribordy. Ce dispositif bon marché, qui permet de réduire la vulnérabilité des appareils, est en passe de révolutionner le monde de la téléphonie mobile. » Un boîtier traditionnel, de taille standard, coûte environ 1000 francs. Avec la technologie sud-coréenne embarquée, générer des clés ou des mots de passe exclusifs coûtera jusqu'à 100 fois moins cher.

Promesses quinquennales

Dans la foulée, IDQ inaugure son entrée sur le marché chinois. Via une coentreprise avec China Quantum Technologies (CQT), une société pionnière dans les technologies quantiques, à l'origine du plus important réseau commercial en la matière. Soit entre les villes de Shanghai et de Hangzhou, un tronçon de communication ultra-sécurisé d'environ 200 km. « Les contrats ont été signés il y a un mois », se félicite Grégoire Ribordy, sur le point d'ouvrir avec son partenaire chinois une usine dans la province du Zhejiang.

Le nouveau site de production, appelé à fonctionner avant fin 2017 avec un effectif de 50 collaborateurs, doit notamment permettre à CQT d'accéder au savoirfaire genevois en participant à la fabrication notamment de produits d'appel destinés aux casinos et aux paris en ligne. En échange de quoi, IDQ se voit offrir une porte d'entrée sur le potentiel commercial chinois.

La cryptographie quantique est l'un des cinq axes du 13e plan quinquennal de Pékin, définis comme étant d'importance stratégique cruciale pour la nation. Le prix d'un appareil de cryptage, qui c oûte actue llement 50 000 francs pièce, « sera divisé par dix grâce aux volumes du marché chinois », estime Grégoire Ribordy.

Toutefois, les spécialistes se heurtent pour l'heure à un obstacle technique de poids: par voie terrestre, le système ne fonctionne que de point à point, jusqu'à cent kilomètres au maximum. Au-delà, trop de photons sont perdus par diffusion en raison des imperfections de la fibre. Il faut alors aménager des noeuds intermédiaires pour que la particule qui compose la lumière, et qui sert à envoyer les clés de chiffrement nécessaires au décodage de l'information, soit impossible à intercepter. Le maillage Shanghai-Hangzhou, qui garantit que toute tentative d'espionnage provoque l'autodestruction du signal, en compte par exemple cinq.

Mais la Chine rêve d'inaugurer, d'ici à 2030, un système d'échange de données inviolable à l'échelle mondiale. Pékin a ainsi lancé le 15 août dernier le premier satellite de communication indéchiffrable à longue distance (près de 2500 km). Seul hic: l'instrument en orbite doit être orienté de manière extrêmement précise vers les stations au sol. « Ce sera comme lancer une pièce de monnaie d'un avion volant à 100 km d'altitude et espérer qu'elle vienne se ficher exactement dans la fente d'une tirelire cochon en rotation », avait alors expliqué Wang Jianyu, le responsable en chef de cette percée technologique de Pékin.

Lannion. Nouvelle Breizh cyber valley
Tuesday, 13 December 2016
Byline: Journaliste maison

Lannion, France - Marie-Hélène Clam et Riwan Marhic Après Rennes et Bruz (35), la journée cybersécurité du ministre de la Défense, Jean-Yves Le Drian, s'est achevée sur le site de Nokia, à Lannion (22). Il s'y est vu confirmer la création de 500 emplois d'ingénieur Recherche et Développement d'ici à la fin 2018, dont une grande partie à Lannion, ciblée pôle mondial pour ce secteur.
« Lannion sera le centre mondial pour Nokia concernant la recherche en cybersécurité », a lancé Marc Rouanne, le numéro deux du groupe Nokia. Devant un Jean-Yves Le Drian acquis à la cause puisque lanceur du Pact Cybersécurité dès 2012, le dirigeant a confirmé le recrutement de 500 ingénieurs Recherche et Développement dont 300 jeunes diplômés. À lui seul, le site de Lannion accueillera une centaine de ces ingénieurs amenés à travailler sur la 4G, la 5G, l'internet des objets et bien sûr la cybersécurité. « Nokia est aussi sponsor de la première formation informatique et cyberdéfense de l'École nationale supérieure d'ingénieurs de Bretagne-Sud (ENSIBS) à Vannes, aide au codéveloppement des start-up locales et des acteurs européens », a ajouté Arnaud Laforge, directeur du site.

Scanner le trafic pour détecter les espions

Une heure durant, le ministre a pu assister à des démonstrations : du chiffrement des données à la détection des espions, appliqués aux domaines militaire et civil. « Les pare-feu, qui servent à se protéger des intrusions extérieures par internet, sont inutiles car plus d'un million d'appareils sont déjà infectés, a expliqué Giuseppe Targia, directeur de la sécurité chez Nokia. Certains pirates peuvent déjà avoir accès à nos machines. Notre solution basée sur la reflectométrie permet de vérifier en continu s'il y a des irrégularités au sein de notre réseau, juste en observant le comportement de nos appareils ».Adopté par la Banque de France, ce système permet de scanner le trafic automatiquement et de détecter des pertes de données dues à un réseau vieillissant ou à une interception des données, donc à de l'espionnage. Espionnage rendu possible grâce à des dispositifs coûtant moins de 10 achetés sur internet, que les pirates placent dans les boîtiers de fibre optique. Pour s'en protéger, l'équipementier développe un nouveau type de boîtier sécurisé qui sera opérationnel, fin 2017. Autre innovation, le réseau ultra-compact. Ce gros sac à dos permet d'établir des communications fiables en quelques minutes, n'importe

où dans le monde. Déjà utilisé par les Marines américains, il peut être fixé à un drone ou à un ballon et bénéficie d'une couverture téléphonique et internet à 70 km à la ronde. En plus de son usage militaire, il sera mis à disposition des ONG ou des pompiers en cas de catastrophe naturelle.

« Comme des anticorps »

« La meilleure défense que nous connaissions, c'est le système immunitaire humain. Alors on s'en est inspiré pour notre cybersécurité : quand il y a un problème, le réseau réagit vite et apprend de ce problème pour s'en prémunir à l'avenir, comme des anticorps », résume Giuseppe Targia. Des innovations qui ont impressionné Jean-Yves Le Drian. « C'est quasiment une cyber armée qui se met en place en Bretagne. Dans le contexte de menace terroriste et avec 50 milliards d'objets connectés d'ici à 2025, il s'agit pour la France de garder de l'avance pour préserver son leadership sur ce domaine. Et Lannion en sera une Breizh cyber valley ».

Le Figaro
Le Conseil national du numérique hausse le ton face au fichier TES
Tuesday, 13 December 2016
Byline: Elisa Braun

Paris - Le fichage des Français au sein d'une base de données unique inquiète l'organe indépendant Non, c'est non. Le Conseil national du numérique (CNNum) reste intransigeant sur le fichier TES, qui permet au gouvernement de regrouper les données personnelles (sexe, couleur des yeux, taille, photo, empreintes digitales, filiation, nationalité...) de près de 60 millions de Français. Le CNNum en avait déjà demandé la suspension le 7 novembre dernier dans une lettre ouverte au gouvernement, où il déplorait les risques de dérives créées par un tel dispositif.

La nouvelle prise de position du CNNum publiée lundi et qui résulte des contributions recueillies par sa plateforme de consultation et d'auditions d'experts, est encore moins tendre avec le gouvernement. Outre la demande réitérée de suspension du fichier, le Conseil préconise dans son rapport l'instauration d'un débat public sur les sujets de l'identité administrative et l'identité en ligne. Il insiste également sur l'«urgence à instaurer une nouvelle gouvernance des choix technologiques au sein de l'État».

Un contre-exemple symptomatique

Au-delà de la polémique, le fichier TES apparaît selon le CNNum comme «le symptôme d'un processus décisionnel qui, en matière technologique, n'intègre pas suffisamment les exigences d'une vision politique de long terme». Au fil des pages du rapport, le Conseil mentionne les nombreux risques de dérives que constitue un tel fichier dans un contexte d'attaques cybersécuritaries accrues. Il recommande d'édicter un cadre général pour ce type de décision, et suggère notamment l'obligation de fournir des études d'impact approfondies et de tenir des débats publics.

L'organe consultatif recommande de renforcerle rôle d'instances spécialisées comme la Commission nationale informatique et libertés (Cnil), la direction interministérielle du numérique et du système d'information et de communication de l'État (Dinsic) et de l'agence nationale de la sécurité des systèmes d'information, l'Anssi.

Une querelle sans fin

Le fichage des Français a rouvert les fractures créées par le projet de loi sur le Renseignement, l'an dernier. Si le fichier TES est censé simplifier les formalités d'obtention et de renouvellement des titres d'identité, ainsi qu'éviter la fraude documentaire, certains opposants ont dénoncé son caractère attentatoire à la vie privée. Dans un contexte d'État d'urgence prolongé et de mesures prises contre le terrorisme, ce fichier TES a aussi été critiqué pour sa potentielle utilisation à des fins de renseignement.

Bernard Cazeneuve - alors ministre de l'Intérieur et à l'initiative du décret - a écarté cette possibilité devant la commission des Lois de l'Assemblée, le 9 novembre. Il n'a en revanche pas su lever les doutes de certains parlementaires, concernant les risques de sécurité liés à la concentration en un même fichier d'autant de données sensibles. Le ministère de l'Intérieur a consenti à rendre optionnel le versement des empreintes biométriques dans la base de données. Le ministère a également saisi la Dinsic (Direction interministérielle du numérique et du système d'information et de communication de l'État) et de l'Anssi (Agence nationale de la sécurité des systèmes d'information) afin d'évaluer le risque d'attaque informatique.

Lors d'une récente audition à la commission des lois du Sénat, les dirigeants de ces deux institutions n'ont pas fait mystère de leur intention d'amender le projet de l'Intérieur. Guillaume Poupard, directeur de l'ANSSI, s'est inquiété des risques géopolitiques: «Que se passerait-il si quelqu'un voulait déstabiliser la France non pas via une attaque très visible, mais en distillant des erreurs de-ci, de-là au sein du fichier?», rappelant que «ce genre d'armes est de plus en plus utilisé dans le cadre de conflits avoués ou pas entre grands États». «Je crois qu'il faut remettre à plat tout cela pour que le débat puisse reprendre sur des fondamentaux plus solides», a plaidé Henri Verdier, directeur du Dinsic. À la différence des deux instances, le CNNum, qui souhaite pour sa part repenser intégralement le fichier TES, reste pour sa part un organe purement consultatif.

La Tribune (France)
Surveillance spatiale : la France reste dans la cour des Etats- Unis et de la Russie
Tuesday, 13 December 2016
Byline: Michel Cabirol

Paris - La direction générale de l'armement a notifié le contrat de modernisation du système de surveillance de l'espace Graves à l'ONERA et à la PME Degreane Horizon. Un enjeu crucial pour la France qui peut ainsi suivre dans l'espace les satellites espions.

Le ministère de la Défense lance la modernisation du système de surveillance de l'espace Graves comme l'avait annoncé La Tribune (lien : http://www.latribune.fr/entreprises- finance/industrie/aeronautique-defense/surveillance-spatiale-la-france- modernise-le-systeme-graves-a-minima-602219.html). La direction générale de l'armement (DGA) a notifié un contrat pouvant s'élever jusqu'à 40 millions d'euros, qui comprend une tranche ferme et des tranches optionnelles, à deux cocontractants : le centre français de la recherche aéronautique spatiale et de défense l'ONERA et la PME électronique Degreane Horizon, spécialisée dans l'acquisition et l'émission de données sensibles. Cette filiale du groupe Vinci était depuis 2003 un des fournisseurs du centre de recherche français sur ce programme. La DGA a toutefois confié à l'ONERA la responsabilité du maintien des performances du système puis de son amélioration.

La tranche ferme de ce programme de rénovation court sur une période de cinq ans (huit ans si on rajoute toutes les tranches optionnelles). Elle représente plus de la moitié de la valeur du contrat, selon le chef de projet du système Graves au sein de l'ONERA, Florent Muller. Le système Graves est essentiellement installé sur trois sites, l'un à Dijon (le site d'émission avec les grande antennes), un autre sur le plateau d'Albion (site de réception) et, enfin, à Lyon Mont-Verdun, où le centre opérationnel de surveillance militaire des objets spatiaux (COSMOS), traite les données du système Graves (exploitation).

Graves, un système de renseignement stratégique

Mis en service depuis 2005 pour le compte de l'armée de l'air, le système Graves (pour Grand Réseau Adapté à VEille Spatiale) est un programme unique en Europe. Seuls les États-Unis et la Russie ont officiellement un programme équivalent alors qu'un cercle très restreint de pays, comme la Chine par exemple, pourraient en posséder un également. A ce jour, il est capable "de cataloguer des objets de la gamme du mini-satellite jusqu'à 1.000 km d'altitude", souligne Florent Muller. Soit un engin de la taille d'une machine à laver.

"Les données générées permettent de calculer à tout instant la position de l'ensemble des satellites suivis", précise-t-il. Actuellement, Graves détecte et catalogue tous les jours plus de 2.500 objets. C'est l'armée de l'air qui assure la mise à jour quotidienne du catalogue. Car pour rester catalogué, un objet doit être détecté tous les jours.

« La France a été le troisième pays au monde, après les Américains et les Russes, à se doter d'un tel système, avait expliqué en juin 2015 dans une interview accordée à la Tribune le PDG de l'ONERA, Bruno Sainjon. L'ONERA a conçu Graves, a piloté sa réalisation et l'a transféré à l'armée de l'air en 2005. Ce programme a notamment permis des échanges de données avec les États-Unis. Et, en avril 2015, cette coopération s'est renforcée, les deux ministères de la Défense voulant désormais échanger des informations classifiées". »

Ce système de renseignement militaire stratégique, un outil extrêmement précieux pour la France, peut notamment suivre à une altitude de moins de 1.000 kilomètres les satellites espions, qui survolent la France et observent les sites sensibles. Ce qui permet à l'armée de l'air de cataloguer pratiquement tous

les satellites espions alliés et ennemis ainsi que d'autres engins spatiaux. "Graves permet de détecter les menaces qui pèsent sur nos propres moyens spatiaux", confirme Florent Muller.

L'armée de l'air a d'ailleurs reconnu avoir identifié en 2012, puis 2013 et, enfin, en 2015, des engins spatiaux qui se sont approchés de satellites militaires français. Ces satellites sont d'ailleurs restés à leur contact pendant une période relativement longue. Très certainement pour les écouter. Il détecte également les vols en formation de satellites. En outre, Graves permet d'éviter d'éventuelles collisions entre des débris spatiaux et les satellites français en les déplaçant le cas échéant.

Enfin, le système concourt à la protection des populations face aux rentrées atmosphériques à risques (engins spatiaux, comètes...). Car plus de 12.000 satellites artificiels et objets divers, dont la taille est supérieure à dix centimètres, orbitent autour de la Terre.

Graves pourrait identifier des micro-satellites

Malgré sa robustesse et sa simplicité, le système Graves, un prototype qui était innovant en 2005, doit être aujourd'hui modernisé, les équipements ayant vieilli. Cette opération de rénovation permettra désormais d'assurer la pérennité de Graves "jusqu'en 2030", estime Florent Muller. Dans ce contexte, la tranche ferme du contrat confié à l'ONERA et à Degreane Horizon comprend en grande partie le traitement des obsolescences du système ainsi que quelques améliorations de ses performances, notamment du calculateur de traitement de signal.

« Certaines performances seront accrues grâce notamment à des interventions au niveau des antennes de réception et du traitement du signal, supportées par un nouveau calculateur", explique l'ONERA dans son communiqué. »

Plus précisément, l'ONERA sera en charge de la rénovation et des améliorations des sites de réception et d'exploitation. La filiale de Vinci modernisera pour sa part à l'identique les systèmes d'émissions en gérant les obsolescences.

Avec les tranches conditionnelles, de nouvelles améliorations du système sont prévues. En parallèle du lancement de la tranche ferme, l'ONERA effectuera des études techniques opérationnelles pour définir quelles pourraient être les options pour améliorer Graves. "A l'issue de ces études, un certain nombre d'options accessibles pourra être ainsi notifié en parallèle de la tranche ferme", confirme Florent Muller.

L'ONERA vise notamment l'amélioration de l'observation d'objets spatiaux plus petits. Et de passer "de façon progressive avec les options les plus complètes" de la détection de mini-satellites (inférieur à 500 kg) à celles de micro-satellites (inférieur à 150 kg). Dans sa nouvelle configuration, Graves détectera beaucoup plus d'objets spatiaux qu'actuellement si les tranches conditionnelles du contrat sont levées.

Un outil de souveraineté

Entre une modernisation a minima et une modernisation plus ambitieuse, le ministère de la Défense n'a pas encore tout à fait tranché en découpant le programme de modernisation de Graves en plusieurs tranches, dont des tranches optionnelles. Cet outil de souveraineté permet pourtant de discuter d'égal à égal - ou presque - avec les États-Unis. Ce qui n'est pas rien et confirme bien que la France est depuis 2005 dans le club très fermé des puissances dotées de capacités autonomes de surveillance de l'espace. Au ministère de la Défense de décider de l'ampleur de cette opération cruciale pour l'indépendance de la France en matière de surveillance spatiale une fois les recommandations de l'ONERA émises.

Développé sous contrat de la DGA, le système Graves est constitué d'un radar bistatique spécifique associé à un système de traitement automatisé qui permet la création et le maintien à jour d'une base de données des paramètres orbitaux des satellites qu'il détecte. Fruit de la collaboration des spécialistes des départements Électromagnétisme et radar (DEMR) et Conception et évaluation des performances des systèmes (DCPS) de l'ONERA, le radar du système Graves a été spécifiquement conçu pour la surveillance de l'espace.

Le Petit Bleu de Lot-et-Garonne
Cybersécurité : la France muscle son arsenal
Tuesday, 13 December 2016
Byline: Journaliste maison

Paris - Le combat numérique va devenir une arme à part entière des armées françaises, aussi bien offensive que défensive, face à une cybermenace qui vise de plus en plus les intérêts vitaux des États. «L'émergence d'un nouveau milieu, d'un champ de bataille cyber, doit nous amener à repenser profondément notre manière d'aborder l'art de la guerre», a déclaré hier le ministre de la Défense Jean-Yves Le Drian, en dévoilant la doctrine des armées françaises en matière de cybersécurité.

Dans un monde de plus en plus interconnecté, les cyberattaques venant d'États, hackers, groupes terroristes ou criminels se multiplient, a relevé le ministre.

Elles peuvent paralyser des infrastructures vitales (réseaux téléphoniques, centrales électriques, transport..) tout comme des cibles militaires en tentant de pénétrer les systèmes embarqués d'aéronefs, bâtiments de guerre ou blindés.

«L'arme cyber peut avoir des effets tout à fait comparables à l'armement plus conventionnel», a averti Jean-Yves Le Drian en inaugurant les nouveaux locaux de DGA Maîtrise de l'information, qui réunit les cyberexperts de la Défense à Bruz (Ile-et-Vilaine) près de Rennes.

Face à ces menaces, les armées verrouillent de plus en plus leurs systèmes d'information - ils sont protégés par des «murailles» et des «patrouilles» qui traquent les intrus - mais intègrent aussi désormais le cyber comme une arme offensive.

«En temps de guerre, l'arme cyber pourra être la réponse, ou une partie de la réponse, à une agression armée, qu'elle soit de nature cyber ou non», a énoncé M. Le Drian.

Concrètement, la France pourra recourir au combat numérique comme à une arme classique de type missile pour riposter à une attaque aussi bien cyber que conventionnelle.

Un commandement des opérations cyber, le CYBERCOM, placé sous la responsabilité directe du chef d'état-major des armées, va être pour cela créé en janvier 2017.

Il disposera d'un état- major resserré qui surpervisera 2.600 «combattants numériques» d'ici 2019.

Le Figaro
20.282 personnes espionnées en un an sur le territoire français
Tuesday, 13 December 2016
Byline: Christophe Cornevin

Paris - Dans son premier rapport d'activité dévoilé mardi matin, la Commission nationale de contrôle des techniques de renseignement (CNCTR) évalue que 47% des personnes surveillées l'ont été dans des dossiers terroristes et 29% au titre de la «lutte contre la criminalité organisée» ainsi que de la «prévention des violences collectives».
Entre le 3 octobre 2015 et le 2 octobre dernier, quelque 20.282 personnes ont été espionnées par les services français. En dévoilant mardi matin son premier rapport d'activité, la Commission nationale de contrôle des techniques de renseignement (CNCTR) a évalué le nombre d'hommes et de femmes qui ont fait l'objet d'une surveillance. Celle-ci passe par l'emploi de la technique la moins intrusive, à savoir l'obtention des «fadettes» (facturations détaillées) de la personne ciblée jusqu'à des moyens plus lourds, telles que la sonorisation ou l'installation de moyens vidéo dans les domiciles en passant par les interceptions de sécurité, la géolocalisation, l'accès en temps réel aux données de connexion» ou encore l'emploi - encore parcimonieux - des «Imsi catchers» permettant de siphonner à distance les données de connexion des téléphones mobiles.

Les algorithmes, c'est-à-dire la «boite noire», tant contestée censée assurer un recueil massif de données, ne devraient être mis en ouvre qu'au printemps prochain. «Pour l'heure, ils n'ont pas pu être mis en place pour des raisons de moyens techniques», précise-t-on à la CNCTR.

47% dans les radars de l'antiterrorisme

Au nombre de ceux ayant «fait l'objet d'une technique de renseignement au moins», le rapport de la CNCTR révèle que «9624 personnes, soit 47% du total, ont été surveillées au titre de la prévention du terrorisme» et que 5848 autres, soit 29% du total, ont été ciblées dans des dossiers de lutte contre la criminalité organisée ainsi que «la prévention de violences collectives de nature à porter gravement atteinte à la paix publique».

La CNCTR, qui se dit «particulièrement vigilante sur ce point», considère que «cette finalité ne saurait être interprétée comme permettant la pénétration d'un milieu syndical ou politique ou la limitation du droit constitutionnel de manifester ses opinions, y compris extrêmes, tant que le risque d'une atteinte grave à la paix publique n'est pas avéré.» Nombre d'observateurs y ont vu une disposition visant les zadistes mais aussi les no-borders, les blacks blocks ou encore les hooligans.

Les autres 24% de personnes placées dans les radars des services, qu'ils soient Français ou étrangers, ont été soupçonnés de porter atteinte à «l'indépendance nationale, l'intégrité du territoire et la défense nationale», d'espionnage industriel ou encore d'être liés à la «prolifération des armes de destructions massives».

8538 avis sur des demandes d'interceptions de sécurité

La démarche, tout à fait inédite dans le panorama feutré de l'espionnage, ne permet «aucun point de comparaison avec l'étranger», précise le conseiller d'État Francis Delon, président de la CNCTR qui, en aparté, ne se dit «pas particulièrement surpris» par le chiffre.

Cette instance indépendante, qui bénéficie d'un budget de 2,9 millions d'euros, vérifie la validité des techniques déployées de la DGSE, de la DGSI, de Tracfin ou encore de la Direction du renseignement militaire.

Depuis le 3 octobre 2015, la CNCTR a rendu 8538 avis sur des demandes d'interceptions de sécurité, contre 7703 l'année précédente. Le nombre des géolocalisations en temps réel a quant à lui bondi de 87% pour atteindre les 2127 demandes en 2016. Observant dans son rapport que «la prévention du terrorisme a, pour la première fois, été le fondement légal le plus fréquemment invoqué», la CNCTR ne constate cependant aucune explosion de la surveillance liée à la menace islamiste.

Composée de neuf «sages» - quatre hauts magistrats, quatre parlementaires et un expert en Télécoms - et d'une secrétaire de 17 personnes dont deux ingénieurs, elle s'est réunie de manière collégiale à 180 reprises à raison de trois fois par semaine pour examiner des cas individuels et mener des dossiers de fonds. Au terme des examens, la CNCTR a retoqué 6,9% des demandes.

New York Times
G.O.P. Feud Looms as Leaders Back Russia Inquiries
Tuesday, 13 December 2016
Byline: Jennifer Steinhauer

Washington - The top two Republicans in Congress said on Monday that they supported investigations into possible Russian cyberattacks to influence the American election, setting up a potential confrontation with President-elect Donald J. Trump in his first days in office.

"Any foreign breach of our cybersecurity measures is disturbing, and I strongly condemn any such efforts," said Senator Mitch McConnell, Republican of Kentucky and the majority leader, adding, "The Russians are not our friends."

Mr. McConnell's support for investigating American intelligence findings that Moscow intervened in the election on Mr. Trump's behalf could presage friction between the Republicans who control Congress, and who have long taken a hard line against Russia, and the president-elect, who has mocked the findings.

Mr. McConnell also went out of his way to address Mr. Trump's claim that the C.I.A. could not be trusted because of flawed intelligence before the Iraq war.

"Let me say that I have the highest confidence in the intelligence community," Mr. McConnell said, "and especially the Central Intelligence Agency. The C.I.A. is filled with selfless patriots, many of whom anonymously risk their lives for the American people."

The top Republican in the House, Speaker Paul D. Ryan of Wisconsin, said he supported a continuing investigation by Representative Devin Nunes of California, the chairman of the House Intelligence Committee. In a statement, Mr. Ryan said: "As I've said before, any foreign intervention in our elections is entirely unacceptable. And any intervention by Russia is especially problematic because, under President Putin, Russia has been an aggressor that consistently undermines American interests."

Congressional Republicans announced their support for inquiries after Mr. Trump railed for much of the weekend against the intelligence findings. But their remarks, especially Mr. Ryan's, were far from fiery, reflecting both a fear of offending Mr. Trump, who has taken many positions against traditional Republican orthodoxy, and the Republicans' belief that Democrats have selectively leaked intelligence information for political gain.

Critics from both parties are questioning Mr. Trump's apparent choice of Rex W. Tillerson, the chief executive of Exxon Mobil, as secretary of state, particularly because of his longstanding business connections with Russia and his close relationship with President Vladimir V. Putin, whom he has known for two decades. Mr. Trump said in a Twitter post on Monday night that he would make a formal announcement on the job on Tuesday morning.

Senators Lindsey Graham of South Carolina and Marco Rubio of Florida, both Republicans, have expressed concern about the reports of cyberattacks, as have numerous Democrats. But Mr. Rubio, in an apparent reference to Mr. Tillerson, went a step further on Monday, writing on Twitter, "Being a 'friend of Vladimir' is not an attribute I am hoping for from a #SecretaryOfState."

Mr. McConnell said the Senate investigation would be led by Senator Richard M. Burr, Republican of North Carolina, the chairman of the Intelligence Committee. Senator John McCain, Republican of

Arizona, the chairman of the Armed Services Committee, will add a subcommittee to look into cyberattacks, led by Mr. Graham.

"The first thing we want to establish is, 'Did the Russians hack into our political system?'" Mr. Graham said in an interview on Monday. "Then you work outward from there. I have a high degree of confidence Russia did this."

Mr. Nunes, a member of Mr. Trump's transition team, said in a statement that the Intelligence Committee had been "conducting vigorous oversight of the investigations into election-related cyberattacks."

Mr. Nunes also noted that his committee would be scrutinizing the review of the Russian effort to influence the election ordered last week by President Obama.

Democrats have used the latest intelligence findings to renew their calls for an urgent inquiry. John D. Podesta, Hillary Clinton's campaign chairman, demanded on Monday that all information about Russia's meddling be declassified, and that the Obama administration explain what it knows about the hacking and when it knew it.

"We now know that the C.I.A. has determined Russia's interference in our elections was for the purpose of electing Donald Trump," Mr. Podesta wrote in a statement. "This should distress every American. Never before in the history of our republic have we seen such an effort to undermine the bedrock of our democracy."

Three Senate Democrats -- Benjamin L. Cardin of Maryland, Dianne Feinstein of California and Patrick J. Leahy of Vermont -- called on Monday for the creation of an independent, nonpartisan commission to comprehensively investigate allegations of Russian interference in the 2016 election.

But Mr. McConnell stopped short of calling for a special select committee, saying that the Senate Intelligence Committee was "more than capable of conducting a complete review" of the matter.

While he stopped short of saying whether he agreed that Russia had interfered in the election in support of Mr. Trump, Mr. McConnell said, "We need to approach all these on the assumption the Russians do not wish us well."

Mr. McCain was less equivocal, saying Monday that there was "no doubt about the hacking" by Russian intelligence services. He called the hacking of the Democratic National Committee and related accounts "another form of warfare" in an appearance on "CBS This Morning" with Senator Chuck Schumer of New York, the incoming Democratic leader.

And one week before the Electoral College meets to ratify Mr. Trump's election victory, 10 electors have demanded their own intelligence briefing on Russian efforts to elect Mr. Trump.

For his part, Mr. Trump was dismissive of the intelligence findings and suggested that Democrats were simply stirring controversy. "Can you imagine if the election results were the opposite and WE tried to play the Russia/CIA card. It would be called conspiracy theory!" Mr. Trump said in a Twitter post on Monday.

The White House press secretary, Josh Earnest, said that the administration would support a congressional review. He also rejected the notion that the administration had failed to adequately highlight the Russian efforts before the election, saying it had extensively briefed Congress all year about Russian electoral meddling.

"There has been intensive cooperation between the intelligence community and other national security agencies, and members of Congress in both parties, both before and after the election," Mr. Earnest said. "The briefings have been provided in a variety of settings, both classified and unclassified."

Even beyond the conclusions of the intelligence community, Mr. Trump's campaign had widely known and extensive ties to the Russian government. A campaign manager, Paul Manafort, had worked for the Russian-backed government in Ukraine, and Mr. Trump's choice for national security adviser, Lt. Gen. Michael T. Flynn, had consulted for a Russian-backed media group, Mr. Earnest noted.

Mr. Earnest said that Congress had a "special responsibility" to investigate the ties between the Trump campaign and the Russian government, because those connections were widely known before the election. He added that, for Capitol Hill Republicans, how to "reconcile their political strategy and their patriotism is something they're going to have to explain."

Wired
Trump Ignoring US Intelligence Creates Risks Beyond Russian Hacking
Monday, 12 December 2016
Byline: Andy Greenberg

New York - Observers and alumni of America's intelligence community have already fretted over Donald Trump's impending control of the world's most powerful spy agencies. They've worried that he could abuse their heady surveillance capabilities, turn them on his personal enemies, revamp the NSA's mass surveillance programs, and strip away domestic privacy protections once in charge. But before Trump has even taken office, he's already found a less expected way to abuse the US intelligence community: Ignore, contradict, and insult it.
Trump's relationship--or lack thereof-- with US intelligence agencies isn't just a cause for political spectacle. According to national security experts and former intelligence agency staffers, it could have serious consequences that go well beyond the current dispute over Russian hacking.

The Russia Rift

On Friday, the Washington Post and New York Times reported that the CIA has confirmed that the Russian government repeatedly hacked and leaked Democratic Party documents throughout the presidential election season with the express intention of aiding Trump's campaign. That conclusion goes a significant step beyond earlier intelligence reports that had merely pinned the attacks on the Kremlin without naming its motive.

In response, the Trump transition team offered a brusque rejection of that finding: "These are the same people that said Saddam Hussein had weapons of mass destruction," read the Trump team's statement.

That abrupt dismissal of the intelligence community's findings follows months of Trump's assertions that no one can know the source of the last year's long series of political hacks--despite a publicly released report from the Office of the Director of National Intelligence and the Department of Homeland Security stating that Vladimir Putin's state- sponsored hackers were behind those breaches. "It could be some guy in his home in New Jersey," Trump maintained in a Time interview earlier last week.

The remarks build on what may be the most troubling recent revelation of all, that Trump has declined the traditional daily intelligence briefing given to presidents and presidents-elect. Instead, he receives the briefing only about once a week. "I get it when I need it," he told Fox News Sunday. "You know, I'm, like, a smart person."

That dismissal and disregard of the intelligence agencies' fact-finding represents a disturbing potential preview of the next four years, say former members of the US intelligence community who spoke with WIRED. They worry that it threatens to politicize the intelligence community's work, pushing it toward conclusions that will please the president rather than inform him. They say the growing rift demoralizes staffers, leading to a loss of valuable talent, and that it could leave the commander-in-chief himself dangerously ignorant of crucial world events.

Susan Hennessey, a former NSA lawyer who is now with the Brookings Institution, says that since Trump was elected, she's spoken with former colleagues who are still in the intelligence community who have been "stunned" to hear Trump's repeated rejections of their findings. "It's not outrage, although that might be under the surface," she says of her former colleagues' response. "It's real uncertainty and a sense of fear...shock, bewilderment, wondering what's going to happen next."

Playing Politics

Trump's kneejerk comparison of the Russian hacking report to the faulty intel on Saddam Hussein's weapons of mass destruction takes that dismay to another level, says one former CIA official who helped to write the president's daily briefing under both Obama and Bush. "We've never seen something like this before. It's pretty ballsy," says the former agency official, who requested anonymity because he's not authorized by his current employer to speak about political issues. "From dismissing

the briefings to dismissing the current assessment on the Russia stuff, it seems like he's still in campaign mode. He's politicizing the intel, and that's a problem."

"Every administration has problems with some intelligence," says Patrick Skinner, a former CIA official under Bush and Obama who now works for the security consulting firm the Soufan Group. "But it really shouldn't be public. The open disdain Trump has shown for the agencies is unprecedented."

Trump's transition team didn't respond to WIRED's request for comment.

To be fair, Trump isn't the only skeptic of the intelligence agencies' findings. Neither the leaked CIA assessment that Kremlin hackers were motivated to help Trump nor the intelligence community's October report attributing the attacks to Russia have been backed up with published evidence. That's led Democratic members of congress Elijah Cummings and Eric Swalwell to demand a commission to independently investigate the hacking incidents. President Obama has directed intelligence agencies to conduct a renewed investigation into the attacks. And Republican Senators John McCain and Lindsay Graham joined with Democrats Chuck Schumer and Jack Reed to call for a congressional investigation into the hacker intrusions, splitting with Trump and other Republican leaders who have ignored or dismissed the Russian hacking reports.

In an interview on the CBS show Face the Nation Sunday, Senator McCain clarified that he doesn't doubt Russia was the source of the breaches of targets like the Democratic National Committee and the Democratic Congressional Campaign Committee, but still wants to better understand the motive of those attacks, and whether they targeted Republicans, too. What he doesn't dispute is that Russia was the source. "Now whether they intended to interfere to the degree that they were trying to elect a certain candidate, I think that's the subject of investigation," McCain said. "But facts are stubborn things. They did hack into this campaign."

Trump's doubt of the intelligence agencies' findings isn't the first sign that the divisiveness of the last year's presidential campaign has led to new, partisan distrust of the intelligence community's work, argues Dave Aitel, a former NSA staffer who now runs the security firm Immunity. That doubt had already surfaced with FBI director James Comey's public statements about the bureau's investigation of Hillary Clinton's private email server. The Clinton campaign and Democratic leaders have criticized Comey's behavior, accusing him of influencing the electoral process by writing a letter to Congress about new emails that surfaced in that investigation just weeks ahead of election day. "Our intelligence community has become a political football, and that's something that should never occur," says Aitel. "You need to have trust, and we don't have trust."

Broader Threats

Aitel says that lack of confidence in intelligence agencies' findings and politicization of their work has left his former colleagues increasingly "jaded." And he says that problem of low morale, already sunken after public response to the revelations of NSA leaker Edward Snowden, could lead to a dangerous brain

drain from key agencies. "They don't complain, they don't whine to the press, they just leave," argues Aitel. "Then you get talent shortfalls, and then you get mission failures, which are bombs blowing up in American cities."

Compounding those issues are fears that Trump will continue to ignore his own intelligence apparatus, making uninformed decisions on the world stage, says ex-CIA officer Skinner. Some members of Trump's transition team have reportedly accepted daily intelligence briefings, including his pick for defense secretary, General James Mattis, and vice-president elect Mike Pence. But a president who wields ultimate executive power without that information could be dangerous, says Skinner. "If you close your eyes, the threat is still there: North Korea still exists, ISIS still exists," says Skinner. "These things are complex. You can't counter North Korea with gut feelings."

The rejection feeds back into the morale issue as well. "There's a firm belief in the intelligence community that the president having this information is a really important thing," says ex-NSA lawyer Hennessey. "When you have a boss essentially saying they don't believe or value your work--an outright rejection based on absolutely no evidence--there's a profound sense of uncertainty."

Beyond Trump's specific rejection of any inconvenient finding, Hennessey says it's that larger dismissal of the intelligence community that's most troubling. "If an intelligence agency produces a piece of evidence that's ignored, people can be killed," she says. "The consequences could be as dire as you can possibly imagine."

Radio Free Europe
Cyberattacks On Finance Ministry, Treasury
Monday, 12 December 2016
Byline: Christopher Miller

Kyiv - Ukrainian authorities are still looking for the culprits nearly a week after troublesome cyberattacks against official financial institutions that appeared to be designed to inflict maximum chaos on end- of-the-year payments.
But the head of staff of the Ukrainian Security Service (SBU) identified the so-called malware used in the December 6 attack as the same disruptive software employed in an unprecedented incident a year earlier, blamed on Russia, that cut off power to hundreds of thousands of homes in Ukraine.

Hundreds of thousands of hryvnyas' worth of remittances were delayed or stopped completely over the course of two days after hackers knocked the websites and payment systems of the Ministry of Finance, State Treasury, and pension fund offline, according to statements posted to those sites and local reports.

The National Police are leading the investigation and have discussed the case with the SBU, Oleksandr Tkachuk, chief of staff of the SBU, told RFE/RL on December 12.

The Finance Ministry, which described the incident as a "coordinated professional hacking attack," also claimed the attack had damaged its network equipment.

Tkachuk confirmed that "some data was destroyed and access to networks was blocked."

He said authorities were not prepared to discuss many details publicly because it would take time to fully assess them, adding that attribution in the cybersecurity sphere is a tricky business.

Tkachuk said the attack appeared to bear some similarity to a December 2015 attack against the Prykarpattyaoblenergo power company in Ukraine's western Ivano-Frankivsk region that cut power to hundreds of thousands of homes.

Critical Infrastructure

Ukrainian officials blamed that cyberattack on Russia and speculated that it might have been retaliation for Kyiv cutting off electricity one month earlier to Crimea, which Russia seized from Ukraine in early 2014.

But experts at the time warned that the greater message might be that hackers had the power to shut down critical infrastructure -- something that cybersecurity experts had long feared but never seen in practice.

Elizabeth Sherwood-Randall, a deputy secretary at the U.S. Department of Energy, also blamed Russia for the December 2015 cyberattack.

In that case, the hackers used malicious software called KillDisk, which deletes or overwrites data in system files, causing computers to crash.

KillDisk was also used in the December 6 attacks, the SBU's Tkachuk told RFE/RL.

Relations between Kyiv and Moscow soured after Russia forcibly annexed Crimea in March 2014, and Russia has been accused by Kyiv and Western powers of backing a separatist conflict in eastern in Ukraine that has killed more than 9,750 people.

Kyiv has on several occasions blamed Russia for cyberattacks -- including one on Ukraine's election system ahead of the presidential vote in May 2014 -- that it claims are part of Moscow's greater "hybrid war," a military strategy that combines conventional warfare, irregular warfare, and cyberwarfare.

CBC News
Federal government's Canada.ca project 'off the rails'
Tuesday, 13 December 2016
Byline: Staff reporter

The federal government's bid to merge 1,500 departmental and agency websites into a single site, Canada.ca, is a year behind schedule and almost 10 times over budget. And experts warn it is on track to be another failed government IT project, like the Phoenix pay system.
"It's gone off the rails. It's a disaster," said one government source with knowledge of the project who spoke on condition of anonymity.

CBC spoke with a number of government workers who are also familiar with the project in different departments and they all expressed similar evaluations.

The Canada.ca initiative was launched in 2013 with the goal of making it easier for people to find and use government information online. A $1.54-million contract for a new content management system, where all government websites would be moved, was awarded to Adobe in 2015.

The original deadline to have all active web content moved to the single portal was this month. But in June, it was pushed back to December 2017, which was the initial deadline for the migration of all archived content.

The contract with Adobe is now above $9.4 million, according to government figures.

The actual migration of the websites is up to the departments themselves and is to be done within existing budgets and staffing. Since 2015, eight of the largest departments have budgeted or spent more than $28 million on this project.

Those departments include: Employment and Social Development; Immigration, Refugees and Citizenship; Health; Environment; Canada Revenue Agency; National Defence; Fisheries and Oceans; and Global Affairs.

According to the government, only 10,000 web pages have been moved to date. There are more than 17 million Government of Canada web pages in total.

"If it's cost them already 10 times their existing budget to migrate only 0.05 per cent of the content for the Government of Canada, we're talking about it ultimately costing hundreds of millions of dollars. It's not a small price ticket," said Mike Gifford, CEO of Ottawa-based web development company Open Concept, who has written articles criticizing the government's approach to Canada.ca.

New deadline 'impossible'

Based on the current timeline, Gifford said he thinks the December 2017 deadline is unrealistic. He's not alone.

"Absolutely impossible to achieve," said Timothy Lethbridge, who teaches software engineering and computer science at the University of Ottawa. "And I'm sure many people inside the project know it."

There's also a good chance of the project failing altogether, Lethbridge said, because large IT projects are exponentially more complex. "As a project of this size gets bigger, the probability of failure goes up."

If the government spread the work out over a number of years and spent a billion dollars, it might be able to make the migration a success, Lethbridge said. But he questioned whether taxpayers would be getting value for money at that point.

This is not the first large government IT project to run into problems.

The government will spend at least $50 million this year to try to fix problems with the new Phoenix pay system, which has seen thousands of public servants underpaid, overpaid or not paid at all.

The initiative to transform the government's email system has been stalled for months because of problems with new software.

And Shared Services Canada, the agency created in 2011 to modernize IT-related services in government, has been slammed for its many missteps, particularly by the auditor general.

"There's a trend," said Robin Galipeau, managing partner of OpenPlus, a content architecture company. "There's definitely something going on there. Large renewal projects in IT are failing in government."

OpenPlus, along with Dell and Microsoft, submitted a bid to create the new CMS for Canada.ca.

Ministers refuse to comment

According to OpenPlus Chief Technology Officer Joel Brockbank, the federal government continues to erroneously believe there are one-size-fits-all software solutions for its IT goals.

"There never is," he said. "It's like your cross-trainer running shoes. It's not good for anything that you do."

The key to not having large IT projects fail, Brockbank said, is to simply not do them. Instead, such projects should be done in stages or "bite-size chunks."

None of the ministers whose departments are involved in the Canada.ca migration project were willing to comment when contacted by CBC News.

Treasury Board President Scott Brison, Social Development Minister Yves Duclos and Public Services and Procurement Minister Judy Foote all declined requests. As did Michel Laviolette, the director general of Service Canada, and John Messina, the federal government's chief information officer.

"That tells me they have something to hide," said Debi Daviau, president of the Professional Institute of the Public Service of Canada, the union representing many of the government's IT workers.

"If they're unwilling to be transparent about the decisions they make, that calls those decisions into question."

Yonhap News Agency
Military investigators raid cyber command in hacking probe
Tuesday, 13 December 2016
Byline: Staff reporter

Seoul - Military investigators have raided South Korea's cyber command as part of their investigation into the first hacking of the command's intranet that is being blamed on North Korea, military officials said Tuesday.
"The Defense Security Command is thoroughly looking into how the cyberattacks took place, what confidential information has been leaked and if there was any professional negligence," a military official told Yonhap News Agency.

He confirmed that military prosecutors were overseeing the raid while the Defense Security Command was collecting documents in a raid to the cyber command on Tuesday.

In September, the defense ministry recognized that a total of 3,200 computers, including 700 linked with the intranet, were contaminated with malware a month after the latest cyberattack took place.

The ministry found in October some military documents were hacked while refusing to provide details. The computer used by Defense Minister Han Min-koo also turned out to have been compromised.

Last week, the ministry said the IP addresses linked to the attack were traced to a location in China that has been used by North Korean hackers.

As one of the military's two integration servers was jointly linked to the internet and the intranet, it allowed the hackers to gain access to the intranet, it said.

The cyber command separated the affected server from the whole network to avoid the spread of viruses in October, two months after the initial hacking attempt was made in August.

It marked the first time that the data of South Korea's cyber command has been compromised. South Korea set up the command in January 2010 as part of its efforts to counter external hacking attempts on the country's military.

North Korea -- which has thousands of cyberwarfare personnel -- has a track record of waging cyberattacks on South Korea and the United States in recent years, though it has flatly denied any involvement.

Yonhap News Agency
Acting President Hwang redoubles calls for robust cyberdefense
Tuesday, 13 December 2016
Byline: Song Sang-ho

Seoul - South Korea's Acting President and Prime Minister Hwang Kyo- ahn on Tuesday redoubled calls for robust cyberdefense against North Korea, saying cyberwarfare with the provocative state has already begun.
Following a suspected hacking by Pyongyang of Seoul's cybercommand intranet, Hwang and South Korean security officials have repeatedly stressed the need to prepare against the North's surreptitious cyberattacks which could be as devastating as physical military strikes.

"As evidenced in the recent hack of the (South's) defense ministry, North Korea has attempted to mount cyberattacks on major government facilities, and (this shows) cyberwarfare has already begun," he said during the first regular Cabinet meeting since he took over as acting president last Friday after President Park Geun-hye was impeached over a corruption scandal.

"Related ministries, including the ministries of defense and future planning, must devise thorough measures to prevent any recurrence (of hacking incidents) and take special caution not to allow any minor mistakes to threaten our security," he added.

The defense ministry said last week that a total of 3,200 computers, including 700 linked with the intranet, were infected with malware in August. The computer used by Defense Minister Han Min-koo was also affected, officials said.

In recent years, Seoul has been pushing to bolster its cyberdefense capabilities as Pyongyang has launched a host of attacks on South Korean corporate and government websites by mobilizing its specially trained personnel, including those based in China and other foreign countries.

The reclusive regime has denied responsibility for its cyberattacks including the latest one, upbraiding Seoul for "fabricating" claims about online attacks.

Hwang, in particular, ordered the government to check the nation's financial, traffic, broadcasting and energy networks, and other major national facilities to verify if they are exposed to any cybersecurity threats.

On the economic front, Hwang said that the country's economic fundamentals remain strong as Seoul has striven to maintain a consistent policy despite political uncertainties sparked by the corruption scandal.

The acting president also urged economic officials to keep close tabs on the financial and foreign exchange markets, as he pointed to the potential negative ramifications from a possible United States interest hike.

"I call on you to closely monitor the market situation and respond to it in a timely and resolute manner," he said.

Hwang went on to urge the Cabinet ministers to make concerted efforts to protect the socially vulnerable, including children from low-income families and senior citizens, particularly during the winter season.

Later in the day, Hwang held a luncheon meeting with senior professors and journalists as part of his efforts to solicit their views on ways to bring the nation, gripped by the scandal, back on track.

Hwang renewed his pledge to focus on forestalling any government vacuum and restoring stability in state governance.

Meanwhile, Hwang stepped up efforts to tackle a series of pending issues that can affect the wellbeing of citizens, as he strives to project an image of a trustworthy -- albeit temporary -- leader.

On the day, he directed Agriculture Minister Kim Jae-soo to convene a meeting of senior government officials and civilian experts, dedicated to containing avian influenza (AI), on a daily basis to better tackle the highly contagious virus.

He also instructed top officials from provincial governments to hold their own daily meetings separately to help stem the spread of the bird flu that has ravaged chicken farms across the country since mid-November.

Visiting police stations in Seoul, he called on officers to tighten their crackdown on crimes targeting women and other vulnerable individuals, particularly in the nighttime. He also ordered the police to

"root out" violent or drunk drivers, saying they could cause large-scale accidents involving many casualties.

Regarding the heavy snowfall expected for some parts of the country between Tuesday night and Wednesday afternoon, Hwang directed related ministers to take the necessary steps to minimize any possible damage or inconvenience to citizens.

Japan News
Attacks by Anonymous against Japan rising
Tuesday, 13 December 2016
Byline: Staff reporter

Cyber-attacks against Japan apparently carried out by international hacker group Anonymous have been increasing since September.
Last autumn, a number of government websites and other sites came under attack. However, the recent attacks are different from sophisticated cyber-attacks that aim to steal information. Experts call for people to respond calmly by taking necessary steps in advance without fearing them too much.

Late at night on Sept. 3, the website of the Hiroshima National Peace Memorial Hall for the Atomic Bomb Victims became inaccessible. Shortly after, a group saying it was Anonymous and opposed to dolphin hunting and other issues posted a statement online claiming responsiblity.

An official at the memorial hall said in bewilderment, "We have nothing to do with dolphin hunting."

It is believed a series of Anonymous attacks called Operation Killing Bay started around 2013 in protest against Japan's whale hunting and the annual dolphin hunts in Taiji, Wakayama Prefecture, in September.

Last year, to protest against the dolphin hunting in Taiji, distributed denial of service (DDoS) attacks were launched against government offices websites and infrastructure operators such as airports. DDoS attacks are aimed at rendering websites and other online services unavailable by sending a huge amount of data to the server.

According to police, the number of cyber-attacks Anonymous is believed to be involved in has grown since September. There were no cyber- attack-related website problems from May to August, but 29 incidents were confirmed in September, followed by 26 in October. From Nov. 1 to Nov. 27, there were 53 cases, bringing the total from September to Nov. 27 to 108.

In comparison, incidents ranged between the 10s and 20s each month from September to November last year, but rose to 56 in December.

"Their aim is not to make websites unavailable, but to promote their presence," said Nobuhiro Tsuji, senior security researcher at SoftBank Technology Corp.

This year, the targets of the attacks have conspicuously been small organizations and shops such as izakaya Japanese pubs, and groups totally unrelated to dolphin hunting. "The hackers could be different from last year, and their resources could be smaller," Tsuji said.

'Respond coolly'

When Anonymous started around 2006, it advocated the establishment of the freedom of the internet and made political appeals through legally permitted activities such as street demonstrations.

Currently, however, Anonymous tends to carry out cyber-attacks with the aid of unknown individuals who respond to invitations on Twitter and other websites. Participants are increasingly committing cyber-attacks for fun.

The website of the Kasumigaura river office of the Land, Infrastructure, Transport and Tourism Ministry came under attack in 2012. Anonymous is believed to have confused Kasumigaura with Tokyo's bureaucratic district of Kasumigaseki. The incident was indicative of the group's sloppy management.

Anonymous' main attack method, DDoS, can be committed without significant expertise. Basically, there is no way to defend against such attacks. It is a matter of waiting for an attack to cease, although measures have recently been developed to mitigate damage.

"Compared to cyber-attacks aimed at stealing information, DDoS attacks are not so sophisticated. In most cases, the websites attacked went down and that was it," said Masakatsu Morii, a professor at Kobe University specializing in information and telecommunications engineering.

Some observers point out that such cyber- attacks could increase ahead of the 2020 Tokyo Olympics and Paralympics. Morii said, "It is important that companies and organizations take necessary measures calmly. If they are attacked, they should respond coolly without overreacting."

The Australian Financial Review
Lone wolves and data dumps a problem (Canada)
Tuesday, 13 December 2016
Byline: Jonathan Porter

Sydney - Constant reconnaissance probes by nation states, attacks by computer network robber barons and lone wolves and data dumps from disgruntled workers - that is digital Australia's bleak picture painted for a cyber security forum in Sydney recently.
And without constant vigilance and fine-tuning of our cyber defences, the problem will only get worse.

"A lot of nation states and militaries are investing in capabilities that can be used to target utilities; power, water resource and energy providers," Major-General Stephen Day, former head of cyber at the Department of Defence who was the inaugural head of the Australian Cyber Security Centre, told the Australian Computer Society Cyber Forum in Sydney.

"There is no question reconnaissance is going on right now."

The glimpse behind the curtain at Australia's cyber defenders came during the question and answer period at the end of the forum, attended by some of the world's leading experts in the field.

An attendee put to the panel that an emerging risk was not lone wolf attackers "but of a state-sponsored cyber-attack sometimes from friendly countries we consider allies" and asked what was being done to mitigate the risk.

Day agreed that state-sponsored attacks were a "significant risk", particularly if people looked down the track a few years.

He added that there was also a "significant challenge with organised crime".

"We looked at the sectors that mattered most to our nation either from an economic prosperity perspective or from a national security perspective and put them in a priority order and looked at those sectors that were likely to be targeted by organised crime or by nation states and then we directed our organisational energy to help those sectors.

"So if, for example, you are in the utilities sector or critical infrastructure sector you will have had more experience of government contacting and working with you than the retail sector or the banking sector where you are likely to meet the police more than the national security base."

Victorian minister for Small Business, Innovation and Trade Philip Dalidakis said that while Day's statements were "sexy" and would generate headlines "the one thing everyone in the room has to be extremely cognisant of is that the overwhelming majority of attacks occur from within".

"Yes, we need to be able to stop attacks from the outside of the firewall but the fact of the matter is the two greatest attacks we have seen of data theft from inside were from Bradley Manning and (Edward) Snowden," he told the forum.

"There are a range of companies that will swear black and blue that they have got algorithms that will help flag anomalies within the system - people accessing certain types of data that they haven't done for ages - (or) if you have got your networks categorised under different security levels - people trying to access levels [other] than their security classification. Ultimately it comes down to people and training,

each organisation has to have people who are trained appropriately who can deal with it when - it's not a matter of if - it occurs."

Some of the greatest risks in organisations were the IT divisions themselves, he says.

"People who have the administrative access rights and passwords are sometimes the ones who are undertaking a whole range of activities that people on the rest of the network are banned from doing - including downloading huge amounts of illegal data. Which is, of course, one of the ways people get in.

"So don't go away from this thinking that if you focus on external you are protected because your internal [network] is 80 per cent of your risk."

On the intelligence side, he said he could speak more freely than other panel members because he was not a representative of the federal government.

Dalidakis said the nation was well served by the Five Eyes agreement on signals intelligence sharing with the US, Canada, New Zealand and the United Kingdom.

Fellow panel member Sandra Ragg, assistant secretary for cyber policy in the Department of the Prime Minister and Cabinet, said the nation did need to improve its cyber defences.

"The first thing we can do is improve our cyber defences.

"People focus on state- sponsored threats but cybercrime is a huge piece of the threat to our economy."

Politico
Is Trump's Twitter account a national security threat?
Tuesday, 13 December 2016
Byline: Nahal Toosi

Washington - Donald Trump has years of experience launching Twitter wars. But now, as he prepares to take the highest office in the country, there are growing fears that his tweets could spur a genuine national security crisis.
Intelligence and defense specialists believe the president-elect's use of the popular and powerful social media network is already being used by foreign agencies to analyze his personality, track his habits and detect clues about what to expect from a Trump-led American government.

And that's just based on what Trump writes on Twitter. It's not even counting the vulnerabilities that could arise if overseas hackers invade his phone and digital accounts.

"We've never had a president that's shared so much of themselves, not just what they're saying, but their psychological ticks in such an overt manner, and you can be sure that foreign actors are studying that, too," said P.W. Singer, a defense expert and co-author of "Cybersecurity and Cyberwar." "We're beginning to see what excites him, what angers him, what sets him off. We've never had this ability to read so much on what a president is thinking."

Trump, who prefers mobile phones to computers, is highly attached to his Twitter account (@realDonaldTrump), using the platform to share his thoughts deep into the night. Days after his stunning election victory, he was reportedly worried he would not be able to keep his Android phone upon reaching the Oval Office, suggesting he plans to keep tweeting even after he's sworn in. During his first sitdown interview as president-elect, he told "60 Minutes" that he would be "very restrained" in his Twitter use while in office, before using his account to rail against The New York Times the same day the interview aired.

Trump's following of 17.2 million is likely to expand as he takes office, and his disdain for the mainstream media may bolster his desire to keep up his direct outreach to the public through Twitter.

For the most part, the president-elect has used Twitter to comment on people and institutions on the domestic front, or to defend himself against their criticisms. His tweets are believed to have even influenced the stock market, including on Monday, when his criticism of Lockheed Martin's F-35 program was followed by a drop in the aerospace company's market value. On several occasions, however, Trump has ventured into the international realm.

In recent days, amid lingering Chinese anger over Trump's decision to break U.S. protocol and speak directly to the president of Taiwan, Trump, using two tweets, wrote: "Did China ask us if it was OK to devalue their currency (making it hard for our companies to compete), heavily tax our products going into.. their country (the U.S. doesn't tax them) or to build a massive military complex in the middle of the South China Sea? I don't think so!" On Monday, he used Twitter to sow doubts about claims he's not hard enough on Russia.

Granted, foreign intelligence agencies will likely look at all of Trump's public utterances -- his speeches, interviews, written press releases -- as well as those of his aides to try to understand one of the more unusual men ever to win the White House. (U.S. intelligence analysts do similar studies of foreign leaders, especially in countries such as Iran and North Korea, whose governments are considered hostile and with whom U.S. communication is limited.)

But so far, at least, Twitter has proven one of the purest distillations of Trump around -- a raw version of a businessman-turned-politician keen on ignoring the traditional conventions of the presidency.

Twitter's 140-character limit on tweets appears to appeal to Trump's short attention span and his preference for rapid-fire interactions. But 140 characters often don't leave space for much context, explanation or nuance. So what Trump writes may come across as more forthright and harsher than

what foreign governments are accustomed to in the diplomatic arena. The risk for a misunderstanding is, therefore, higher.

Foreign analysts following Trump's Twitter may not be inclined to simply take everything he writes at face value, especially when it comes to highly sensitive subjects. But, using sophisticated data tools, they may look for patterns that, over time, can help them better predict if Trump is being serious. In all likelihood, many intelligence specialists overseas have probably already done such analyses based on Trump's more than 34,000 tweets so far.

"If Trump's comments accurately reflect his intent, then we're giving the opponents a head start in dealing with the incoming presidential administration," a former U.S. intelligence officer said of Trump's Twitter habits. "If his comments are meant to conceal other intentions, then we're doing a pretty good job in misleading our adversaries."

A foreign government may check to see if Trump uses certain types of words before he takes certain types of actions. If Trump keeps tweeting during his presidency, a foreign entity may analyze what types of things he writes before making a policy announcement. (If Trump were to enable Twitter's geo-location services, that could also grab the attention of overseas actors, though it doesn't appear he uses that feature.) Even a lengthy silence from Trump could be a signal of some sort, sources connected to the intelligence community told POLITICO.

In August, David Robinson, a data scientist, published an analysis of Trump's tweets using digital tools.

It indicated that there were at least two people tweeting out under Trump's account. The tweets from an Android phone appeared to be coming from the Manhattan billionaire himself -- they were angrier and more negative. The ones from an iPhone were more quotidian, sharing announcements and photos; those were likely posted by one or more Trump campaign aides. (Some tweets may have been written by a staffer trying to sound like Trump.)

"A lot of 'emotionally charged' words, like 'badly', 'crazy', 'weak', and 'dumb', were overwhelmingly more common on Android," Robinson wrote, meaning it was Trump who was probably behind those particular tweets.

The U.S. has occasionally found itself in diplomatic dust-ups thanks to Twitter.

In September, during President Barack Obama's visit to China, the Defense Intelligence Agency tweeted "Classy as always China" after the American leader was deprived of a normal red-carpet arrival due to a dispute over which stairs he could use to leave his plane. The Pentagon-based agency later deleted the tweet and apologized.

Four years earlier in Egypt, during the brief presidency of Muslim Brotherhood leader Mohamed Morsi, the U.S. Embassy in Cairo slapped the Islamist organization's English-language Twitter account after it expressed concern for the safety of U.S. diplomats amid violent protests near their building.

"Thanks. By the way, have you checked out your own Arabic feeds? I hope you know we read those too," the embassy tweeted, implying the Brotherhood was using a very different tone in its non-English messages. The Americans later deleted the tweet.

Although Twitter has been around for most of Barack Obama's presidency, the outgoing president has been careful in using the medium. He was allowed to start using his own official account, @POTUS, only a couple of years ago: in May 2015, he sent out an inaugural tweet. The @POTUS account will be made available to Trump once he is sworn in.

The @BarackObama account is run by Organizing for Action, a liberal group that has long supported the president. It was not immediately clear if Obama would take over that account once he leaves office, but he's used it in the past, signing tweets he composed with a "-bo".

The White House Communications Agency, a military division that handles presidential communications security, referred questions about Trump's Twitter account and plans to safeguard his digital devices to the president-elect's transition team. The transition team did not respond to a request for comment. To date, it's not clear if Trump's phone conversations with foreign leaders are fully secured, though his team has said precautions have been taken.

Even as foreign capitals sift through Trump's tweets, there are questions about whether the social media company should take away his account for calling out individual Americans on Twitter. Trump's targets have included an Indianapolis union leader and a college student, who have faced death threats and harassment as a result.

When asked for comment about whether Trump should be booted off the platform, a spokesperson for the company replied: "The Twitter Rules apply to all accounts."

Reuters
Top U.S. spy agency has not embraced CIA assessment on Russia hacking - sources
Tuesday, 13 December 2016
Byline: Jonathan Landy, Mark Hosenball

Washington - The overseers of the U.S. intelligence community have not embraced a CIA assessment that Russian cyber attacks were aimed at helping Republican President-elect Donald Trump win the 2016 election, three American officials said on Monday.
While the Office of the Director of National Intelligence (ODNI) does not dispute the CIA's analysis of Russian hacking operations, it has not endorsed their assessment because of a lack of conclusive

evidence that Moscow intended to boost Trump over Democratic opponent Hillary Clinton, said the officials, who declined to be named.

The position of the ODNI, which oversees the 17 agency-strong U.S. intelligence community, could give Trump fresh ammunition to dispute the CIA assessment, which he rejected as "ridiculous" in weekend remarks, and press his assertion that no evidence implicates Russia in the cyber attacks.

Trump's rejection of the CIA's judgment marks the latest in a string of disputes over Russia's international conduct that have erupted between the president- elect and the intelligence community he will soon command.

An ODNI spokesman declined to comment on the issue.

"ODNI is not arguing that the agency (CIA) is wrong, only that they can't prove intent," said one of the three U.S. officials. "Of course they can't, absent agents in on the decision-making in Moscow."

The Federal Bureau of Investigation, whose evidentiary standards require it to make cases that can stand up in court, declined to accept the CIA's analysis - a deductive assessment of the available intelligence - for the same reason, the three officials said.

The ODNI, headed by James Clapper, was established after the Sept. 11, 2001, attacks on the recommendation of the commission that investigated the attacks. The commission, which identified major intelligence failures, recommended the office's creation to improve coordination among U.S. intelligence agencies.

In October, the U.S. government formally accused Russia of a campaign of cyber attacks against American political organizations ahead of the Nov. 8 presidential election. Democratic President Barack Obama has said he warned Russian President Vladimir Putin about consequences for the attacks.

Reports of the assessment by the CIA, which has not publicly disclosed its findings, have prompted congressional leaders to call for an investigation.

Obama last week ordered intelligence agencies to review the cyber attacks and foreign intervention in the presidential election and to deliver a report before he turns power over to Trump on Jan. 20.

The CIA assessed after the election that the attacks on political organizations were aimed at swaying the vote for Trump because the targeting of Republican organizations diminished toward the end of the summer and focused on Democratic groups, a senior U.S. official told Reuters on Friday.

Moreover, only materials filched from Democratic groups - such as emails stolen from John Podesta, the Clinton campaign chairman - were made public via WikiLeaks, the anti-secrecy organization, and other outlets, U.S. officials said.

"THIN REED"

The CIA conclusion was a "judgment based on the fact that Russian entities hacked both Democrats and Republicans and only the Democratic information was leaked," one of the three officials said on Monday.

"(It was) a thin reed upon which to base an analytical judgment," the official added.

Republican Senator John McCain said on Monday there was "no information" that Russian hacking of American political organizations was aimed at swaying the outcome of the election.

"It's obvious that the Russians hacked into our campaigns," McCain said. "But there is no information that they were intending to affect the outcome of our election and that's why we need a congressional investigation," he told Reuters.

McCain questioned an assertion made on Sunday by Republican National Committee Chairman Reince Priebus, tapped by Trump to be his White House chief of staff, that there were no hacks of computers belonging to Republican organizations.

"Actually, because Mr. Priebus said that doesn't mean it's true," said McCain. "We need a thorough investigation of it, whether both (Democratic and Republican organizations) were hacked into, what the Russian intentions were. We cannot draw a conclusion yet. That's why we need a thorough investigation."

In an angry letter sent to ODNI chief Clapper on Monday, House Intelligence Committee Chairman Devin Nunes said he was "dismayed" that the top U.S. intelligence official had not informed the panel of the CIA's analysis and the difference between its judgment and the FBI's assessment.

Noting that Clapper in November testified that intelligence agencies lacked strong evidence linking Russian cyber attacks to the WikiLeaks disclosures, Nunes asked that Clapper, together with CIA and FBI counterparts, brief the panel by Friday on the latest intelligence assessment of Russian hacking during the election campaign.

Suspected Russian cyberattack waged on Clinton campaign just days before vote
Monday, 12 December 2016
Byline: Michael Isikoff

Washington - In the closing days of the 2016 election campaign, hackers believed to be working for Russian intelligence launched a new wave of attacks on Hillary Clinton's campaign and the Democratic

National Committee -- a previously unreported cyberoffensive that heightened concerns, now endorsed by the CIA, that the Russian government was seeking to influence the outcome of the election in favor of Donald Trump, according to sources familiar with the investigations into the attempted intrusions. The attacks came in the form of so-called "phishing" emails sent to nearly a dozen campaign and committee staffers in a renewed effort at penetrating their networks, said Dmitri Alperovitch, the co-founder and chief technology officer of CrowdStrike, the cybersecurity firm hired by the DNC to repel attacks on its network. Staffers at that point were alert enough to reject entreaties to click on the unsolicited email messages that would have allowed the hackers into their computers, he said.

But at least one top Clinton campaign staffer, communications director Jennifer Palmieri, told Yahoo News on Sunday that she received an alert from Google in mid- October informing her that her personal Gmail account had been targeted by a "foreign state" actor and that her password needed to be changed.

"They were targeting us throughout the election," said another former senior Clinton campaign staffer, who asked not to be identified. "They never stopped trying to get back in."

The disclosure of the late campaign attack could fuel a mounting controversy over U.S. intelligence findings that link Russian intelligence to the cyberattacks for the express purpose of throwing the election as part of a campaign, orchestrated in Moscow, to defeat Clinton.

The Washington Post reported Saturday that the CIA has briefed members of Congress on an assessment that the Russians targeted Democratic political organizations and campaign officials as part of a specific effort to defeat Clinton and elect Trump. This goes beyond an earlier public finding that U.S. intelligence officials were "confident" that the Russian government was behind the cyberattacks, but did not ascribe a motive for the Russians doing so.

One piece of damning evidence behind the new finding is that the CIA and the FBI have both identified specific individuals associated with or close to the Russian government who provided the DNC emails to WikiLeaks, which began publishing them in July, a senior law enforcement official told Yahoo News. Despite reports of a clash between the CIA and the FBI over the motive behind Russia's intelligence service in launching the operation, the differences are more a matter of "degree" and emphasis, with the FBI believing there may have been "mixed" motives for the Russian effort, the official said. Still, "we all agree they did these things," the official said.

But President-elect Trump doubled down on his rejection of the intelligence findings in an interview with Fox News anchor Chris Wallace that aired Sunday, dismissing any conclusion that points to Russian government involvement.

"I think it's ridiculous," Trump told Chris Wallace in interview that aired on "Fox News Sunday," his first Sunday show sit-down since winning the election. "I don't believe it."

"If you look at the story and you take a look at what they said, there's great confusion," Trump added. "Nobody really knows, and hacking is very interesting. Once they hack, if you don't catch them in the act you're not going to catch them. They have no idea if it's Russia or China or somebody. It could be somebody sitting in a bed someplace. I mean, they have no idea."

Alperovitch of CrowdStrike, the cybersecurity firm that first publicly linked the cyberattacks to Russian intelligence, said Sunday that he was "puzzled" by Trump's remarks and assumes he has not yet been fully briefed on the matter. (CrowdStrike, whose principals include Shawn Henry, the former chief of the FBI's cyber division, was initially hired by the DNC to investigate the cyberattacks and defend its network last May.)

"At this point, the matter of attribution on the intrusions has been settled,"Alperovitch said. "There is nobody that looks at the evidence who disputes this." Asked his level of confidence in his firm's findings, he responded "100 percent."

Much of the evidence, he said, revolves around the nature of the sophisticated tools used by the attackers on the DNC and forensic evidence showing strong similarities to Russian cyberattacks that have occurred in Ukraine and other Eastern European countries -- as well as to intrusions of the Joint Chiefs of Staff, the White House and the State Department and other U.S. government agencies. "The digital fingerprints are of the same origin," said Alperovitch.

CrowdStrike initially identified two sets of attackers on the DNC's servers: One, dubbed "Cozy Bear," was associated with the Russian FSB (the successor to the Soviet KGB) and which first breached the DNC's network in the summer of 2015. Another, dubbed "Fancy Bear," has been associated with Russia's military intelligence service, the GRU. The latter infiltrated the DNC's network in late April of this year in what turned into a far more devastating attack, resulting in the disclosure of 20,000 internal DNC emails to WikiLeaks -- an act, according to Alperovitch, of "information warfare." (He acknowledged that a third Russian intelligence service, the SVR, which has responsibility for foreign intelligence operations, may also have been involved.)

"When we look at this over 10 years -- literally hundreds of intrusions -- [and] you look at the tradecraft, you look at the victims, it all points to Russian intelligence services," Alperovitch said.

In addition, he said, there was another separate cyberattack discovered in late September from an undetermined party that penetrated DNC computers with software containing sensitive voter analytic data that was being provided in regular memos to Clinton campaign manager Robby Mook, the sources said.

The breach was detected by CrowdStrike, and the cyberinvaders were expelled from a cloud server housing the data; this server was distinct from the DNC's internal computer network that had been previously breached, he said. But the intruders were never identified, and it was never determined

whether the data -- containing detailed reports on voter registration and estimates of likely voter participation in the November election -- was ever actually stolen.

Alperovitch said he doesn't know whether these hackers were associated with Russian intelligence; they used different methods and publicly available cybertools to pull it off -- also he said the DNC never authorized his firm to conduct a full investigation. But he said the late October "phishing" attacks on the DNC and the Clinton campaign resembled the earlier Fancy Bear attacks, leading him to conclude they were likely the work of the GRU.

Moreover, attacks by the Cozy Bear intruders have continued throughout the fall, targeting multiple organizations, including think tanks and universities whose scholars work on Russian policy issues, he said.

And even more recently, he said, there was evidence that the separate "Fancy Bear" hackers are now also attacking political organizations in Germany and elsewhere in Europe in an apparent attempt to meddle in their elections as well. (The chief of German domestic intelligence said last week that there has been a recent increase in "aggressive cyberespionage" against German politicians and warned about "growing evidence for attempts to influence the [German] federal elections next year."

"These activities have not stopped," said Alperovitch. "Now that they were executed [in the United States] and they have a successful playbook, I fully expect they are going to continue."

Press TV
Iranian Army unveils new indigenous combat, reconnaissance drones
Tuesday, 13 December 2016

Tehran - The Iranian Army's Ground Forces has unveiled two domestically-designed and -manufactured drones on the final day of major military exercises code-named Mohammad Rasoulallah IV (Mohammad, the Messenger of God IV) in southeastern Iran.
One of the two aircraft, code- named Oghab (Eagle), is a combat drone capable of carrying air-to-surface missiles.

The other, code-named Shahin (Falcon) and developed and manufactured under a project code-named Shahid Mohsen Ghotaslou, can collect information on the positions and movements of enemy forces on reconnaissance missions. It boasts a flight endurance of 24 hours.

General Seyyed Kamal Peyambari, the spokesman for the military drills, said the jamming and combat techniques of drones were also fully tested at various altitudes on Tuesday, with the participation of military commanders and defense experts.

Peyambari noted that sophisticated and innovative weapons such as super- caliber 107mm rocket launchers, optimized versions of the 62.5mm PSG-1 and Dragunov semi-automatic sniper rifles, a jammer with an effective range of 800 meters, drone jammers, and cellular satellite phone jammers were put to practice on the last day of the drills as well.

Various and extensive psychological war techniques such as drills using 122mm flyer-carrying rockets, tactical radios and directional sound systems were also put to the test for the first time.

The senior Iranian military figure further noted that hand-launched drones as well as land minelayers were also tried out.

Peyambari added that electronic warfare, armored, infantry, mechanized infantry, commando, and intelligence units present at the Mohammad Rasoulallah IV military exercise, which covered an area of 220,000 square kilometers, successfully carried out their operations on the third day of the drills.

Iran has conducted major military drills in recent years to enhance the defense capabilities of its Armed Forces and to test modern military tactics and state-of-the-art equipment. Each year, the country inaugurates a host of new projects and hardware developed with reliance on domestic capabilities.

The Islamic Republic maintains that its defense power is driven by deterrence and poses no threat to any other country.

Hindustan Times
Legion: Meet the hackers who broke into Twitter accounts (Canada).
Tuesday, 13 December 2016

New Delhi - A hackers' group called Legion has repeatedly breached the Twitter accounts of some well-known Indians, including Congress vice- president Rahul Gandhi and prominent journalist Barkha Dutt. Legion has not posted any classified information on the hacked accounts but has threatened to expose email communications among Congress party leaders in the New Year. Earlier this month, they on his Twitter handle, vowing to bring to justice the fugitive industrialist who has defaulted on at least Rs 7,000 crore bank loans.

Here is some detail about the hackers' group: What is Legion? It is a coalition of like-minded hackers based out of five countries - the United States, Sweden, Canada, Thailand and Romania, according to the Delhi police's cybercrime cell. The group seeks to expand its activities, leaving its email id -- legion_group@sigaint.org - for more hackers to join their campaign.

Are they connected with Legion of Doom of the 1980s? The group does not appear to have any links with the hackers' group Legion of Doom (LoD) that targeted rich and famous people's email accounts in the mid-1980s. LoD remained active till early 2000s. However, the two groups appear to share

ideological goals in targeting what they say are the rich and corrupt. LoD was founded by US-based hacker Lex Luthor after he broke away from the Knights of Shadow.

Why do they hack people's accounts? Legion fancies itself as cyber vigilantes working to expose the corrupt. But the group is yet to bolster their anti-corruption crusader credentials, given that it has so far offered very little valuable information.

How does Legion operate? Legion communicates through email servers and browsers that are shielded against surveillance. In other words, it does not use Google Chrome or Internet Explorer but a browser called The Onion Router (TOR), which is difficult to track (provides anonymity) and allows a user to communicate directly with another one. This is also called the darknet, a platform often used by activists and journalists seeking to avoid a surveillance dragnet.

Are there other such hackers' groups? Yes. Anonymous is another loosely associated international network of activist and hacktivists which started operating in 2003. The group's website describes it as "an Internet gathering" with "a very loose and decentralised command structure that operates on ideas rather than directives". The group became known for crashing websites of governments, corporates and religious groups. Anonymous members (known as "Anons") use the Guy Fawkes mask as their emblem.

Saudi Gazette
IoT continues to pose a key cyber security threat
Tuesday, 13 December 2016
Byline: Mohammed Al-Moneer

Riyadh - The cyber landscape changes dramatically year after year. If you blink, you may miss something; whether that's a noteworthy hack, a new attack vector or new solutions to protect your business. Sound cyber security means trying to stay one step ahead of threat actors.
In the spirit of looking toward the future, I wanted to grab my crystal ball and take my best guess at what will be the big story lines in cyber security in 2017.

1. IoT continues to pose a major threat. In late 2016, all eyes were on IoT-borne attacks. Threat actors were using Internet of Things devices to build botnets to launch massive distributed denial of service (DDoS) attacks. In two instances, these botnets collected unsecured "smart" cameras. As IoT devices proliferate, and everything has a Web connection -- refrigerators, medical devices, cameras, cars, tires, you name it -- this problem will continue to grow unless proper precautions like two-factor authentication, strong password protection and others are taken.

Device manufactures must also change behavior. They must scrap default passwords and either assign unique credentials to each device or apply modern password configuration techniques for the end user during setup.

2. DDoS attacks get even bigger. We recently saw some of the largest DDoS attacks on record, in some instances topping 1 Tbps. That's absolutely massive, and it shows no sign of slowing. Through 2015, the largest attacks on record were in the 65 Gbps range.

Going into 2017, we can expect to see DDoS attacks grow in size, further fueling the need for solutions tailored to protect against and mitigate these colossal attacks.

3. Predictive analytics gains ground. Math, machine learning and artificial intelligence will be baked more into security solutions. Security solutions will learn from the past, and essentially predict attack vectors and behavior based on that historical data. This means security solutions will be able to more accurately and intelligently identify and predict attacks by using event data and marrying it to real-world attacks.

4. Attack attempts on industrial control systems. Similar to the IoT attacks, it's only due time until we see major industrial control system (ICS) attacks. Attacks on ecommerce stores, social media platforms and others have become so commonplace that we've almost grown cold to them. Bad guys will move onto bigger targets: dams, water treatment facilities and other critical systems to gain recognition.

5. Upstream providers become targets. The DDoS attack launched against DNS provider Dyn, which resulted in knocking out many major sites that use Dyn for DNS services, made headlines because it highlighted what can happen when threat actors target a service provider as opposed to just the end customers.

These types of attacks on upstream providers causes a ripple effect that interrupts service not only for the provider, but all of their customers and users. The attack on Dyn set a dangerous precedent and will likely be emulated several times over in the coming year.

6. Physical security grows in importance. Cyber security is just one part of the puzzle. Strong physical security is also necessary. In 2017, companies will take notice, and will implement stronger physical security measures and policies to protect against internal threats and theft and unwanted devices coming in and infecting systems.

7. Automobiles become a target. With autonomous vehicles on the way and the massive success of sophisticated electric cars like Teslas, the automobile industry will become a much more attractive target for attackers. Taking control of an automobile isn't fantasy, and it could be a real threat next year.

8. Point solutions no longer do the job. The days of Frankensteining together a set of security solutions has to stop. Instead of buying a single solution for each issue, businesses must trust security solutions from best-of-breed vendors and partnerships that answer a number of security needs. Why have 12 solutions when you can have three? In 2017, your security footprint will get smaller, but will be much more powerful.

9. The threat of ransomware grows. Ransomware was one of the fastest growing online threats in 2016, and it will become more serious and more frequent in 2017. We've seen businesses and individuals pay thousands of dollars to free their data from the grip of threat actors. The growth of ransomware means we must be more diligent to protect against it by not clicking on anything suspicious. Remember: if it sounds too good to be true, it probably is.

10. Security teams are 24/7. The days of security teams working 9-to-5 are long gone. Now is the dawn of the 24/7 security team. As more security solutions become services-based, consumers and businesses will demand the security teams and their vendors be available around the clock. While monitoring tools do some of the work, threats don't stop just because it's midnight, and security teams need to be ready to do battle all day, every day. Those are 10 things we see happening in the cyber security space next year.

Fars News Agency
Iran's Ground Force Unveils New Drone during Massive Drills
Tuesday, 13 December 2016

Tehran - The Iranian Ground Force unveiled a new drone named 'Farpad' during the massive wargames codenamed 'Mohammad Rasoulallah (PBUH) 4' in the Southeastern parts of the country on Monday morning. The hand- launched drone is run by autopilot and can fly maximum 45 minutes to the range of 20km.
Also during the second day of the three-day drills, the Iranian Ground Force unveiled a jamming system which is capable of confronting Unmanned Aerial Vehicles (UAVs) in a range of 3km and can force it to land after taking its control. The system is also portable by individuals.

In another development in the wargames, the home-made Toufan missiles whose range and destruction and precision-striking power have been improved were fired by helicopters and hit simulated enemy's targets precisely.

Also, the latest sniper gun manufactured for the Iranian Ground Force, 'Taher', with a range of 1.2km was unveiled on Monday. The gun weighs 4.4kg (without scope and magazine) and is 1.28m in length.

Meantime, the 209 (Cobra) and 214 helicopters of the Iranian Ground Force's air force units fired several rockets at two floating targets in Makran region (in the Sea of Oman) and destroyed them.

Also, two Mirage fighter jets of the Iranian Air Force participated in the drills for the first time and used air-based weapons in operations against the simulated enemy.

The massive 'Mohammad Rasoulallah (PBUH) 4' wargames started in the Southeastern parts of the country on Sunday morning.

"On the first day of the drills, rapid reaction units from other geographical regions of the country were transferred to the operational regions via air and ground in the shortest possible time," Spokesman of the drills General Seyed Kamal Payambari told reporters yesterday.

He said that the drills are being held in the strategic Southeastern parts of the country in a range of over 220,000km with the participation of different units of Ground Force, logistic forces of the Air Force and Khatam ol-Anbia Air Defense Base.

According to General Payambari, assessment of the Iranian forces' preparedness in the tactical fields and decreasing the time for their rapid reaction against threats as well as using new defense systems are among the goals pursued in the wargames.

Meantime, Army Airborne Commander Brigadier-General Houshang Yari announced on Sunday that dozens of different types of helicopters are flying over the wargames zone.

"Tens of different types of 206, 214, 209 (Cobra) and Chinook helicopters are present in the drills zone," General Yari told reporters today.

"During the drills, the command, track, control and close fire support missions as well as numerous heliborne operations will be carried out by the Airborne helicopters," he added.

General Yari said that the drills will also be a touchstone to assess the agility and power to overhaul and maintain helicopters.

Fars News Agency
Civil Defense Official Warns of New US Cyber Attack against Iran
Tuesday, 13 December 2016

Tehran - A senior member of Iran's Civil Defense Organization warned that Washington has hatched plots to launch new cyber operations against the country's infrastructures.
"At present, the US has launched a project named Nitro Zeus with the aim of attacking Iran's defense and telecommunication infrastructures," Alireza Karimi said on Monday, addressing a conference in Tehran.

"Based on studies that we have carried out, the project is assessed to be much more dangerous than the Stuxnet project," he added.

His remarks came after Deputy Head of Iran's Civil Defense Organization Brigadier General Mohammad Hassan Mansourian underlined in October his organization's full preparedness to confront the cyberattack and cultural invasion threats.

"Iran's Civil Defense Organization can defuse cyberattacks and cultural invasions," Brigadier General Mansourian said. He underlined that the advanced countries are currently making huge investments in the field of civil defense.

Mansourian underscored that the cyberattack and cultural invasion should only be responded by the national civil defense system.

In May 2015, Head of Iran's Civil Defense Organization Brigadier General Gholamreza Jalali announced that the country has set up cyber defense workgroups to better coordinate measures for defending nuclear facilities against enemies' cyber attacks.

"The country's vital cyber infrastructures have been identified and separate cyber workgroups have been formed in all fields," Jalali told reporters in Tehran.

"For instance a cyber defense workgroup was set up in the nuclear field for Natanz nuclear installations and no serious incident has threatened this section in the past two years," he added.

In relevant remarks in October 2014, Jalali revealed that a US cyberattack on Iran's nuclear enrichment facility in Natanz failed due to his organization's tough defensive measures.

"The first cyberattack, codenamed Olympic Games, was carried out on Natanz and was declared by the US President, but it met our heavy (defensive) response," Jalali told reporters in a press conference in Tehran.

The senior commander said the US changed its cyber commander following the failure in the cyberattack on Natanz, adding that the US general was forced to retire several months ago "due to the wrong information and data that he had presented to President Obama". And this was the result of our direct confrontation with them, General Jalali added.

The US was the principal player in the most sophisticated cyber-attack ever known and has been orchestrating a campaign against Iran designed to undermine the country's nuclear program.

The New York Times came up with an in-depth report on June 1, 2012 saying that from the very first month Barack Obama took over as US President, he secretly ordered increasingly sophisticated attacks on Iran's computer systems that run the country's main nuclear enrichment facilities.

The disclosures about Obama's role in the cyberwar against Iran appear to show beyond doubt that the US, with the help of Israel, was behind the Stuxnet virus attack on Iran's centrifuge machines - used to enrich uranium. The revelation then indicated that Washington and Tel Aviv were also behind the Flamer and Duqu virus attacks discovered by experts in May 2012.

Codenamed Olympic Games, the attacks were spearheaded by the US government under the Bush administration. Stuxnet targeted Siemens industrial equipment to spin hundreds of centrifuges beyond their breaking points and eventually disable Iran's nuclear efforts.

According to the report, Obama decided to speed up the attacks, even after the worm escaped from Iran's Natanz plant in 2010 and later ended up on the Internet.

During a meeting following the worm's escape, Obama even considered that the worm should be stopped thinking that America's most ambitious attempt to slow the progress of Iran's nuclear efforts had been fatally compromised. Should we shut this thing down? Obama asked members of the President's national security team.

However, he finally decided to go ahead with the cyberattacks. What followed thereafter was the Natanz plant being hit by several newer versions of the worm.

The report is said to be based on 18 months of interviews with current and former American, European and Israeli officials involved in the program as well as with outside experts, who provided contradictory assessments of how successful the attack was in slowing down Iran's progress of developing nuclear weapons.

While internal Obama administration estimates claim the effort was delayed by 18 months to two years, some other experts, both inside and outside the government, said that Iran's enrichment levels had steadily recovered. A year later, Iran enriched uranium to the 20-percent grade, way beyond the 5-percent purity level that was done in Natanz in 2012.

Cybersécurité. La Bretagne au coeur du combat
Tuesday, 13 December 2016
Byline: Journaliste maison

Bruz, France - Jean-Yves Le Drian, ministre de la Défense, a dévoilé au centre DGA Maîtrise de l'information à Bruz (35), près de Rennes, la doctrine des armées en matière de cybersécurité. « L'émergence d'un nouveau milieu, d'un champ de bataille cyber, doit nous amener à repenser profondément notre manière d'aborder l'art de la guerre (...), comme l'aviation au début du XXe siècle », a-t-il assuré, soulignant : « En temps de guerre, l'arme cyber pourra être la réponse, ou une partie de la réponse, à une agression armée, qu'elle soit de nature cyber ou non ». La doctrine présentée ce lundi, qui repose sur trois piliers - renseignement, protection/défense et lutte informatique offensive - est l'une des plus élaborées énoncées en Europe, avec celle du Royaume-Uni. Concrètement, la France pourra recourir au combat numérique comme à une arme classique de type missile pour riposter à une attaque, aussi bien cyber que conventionnelle. « Nos capacités cyber offensives doivent nous permettre

de nous introduire dans les systèmes ou les réseaux de nos ennemis, afin d'y causer des dommages, des interruptions de service ou des neutralisations temporaires ou définitives », a relevé le ministre.

Un bataillon de 2.600 « combattants numériques »

Un commandement des opérations cyber, placé sous la responsabilité directe du chef d'État-Major des armées, va être créé, dès janvier 2017. Il disposera d'un état-major resserré qui supervisera 2.600 « combattants numériques » . Les armées pourront « neutraliser » des infrastructures utilisées pour attaquer des intérêts français mais aussi « riposter » plus largement à une attaque cyber, a expliqué Jean-Yves Le Drian.

« Si une attaque cyber s'apparente à un acte de guerre, une riposte adéquate s'imposera (...) dans une logique de conflit ouvert », a-t-il souligné. Si l'attaque transite par un État qui « n'aurait pas empêché une telle utilisation, la responsabilité de cet État pourrait être mise en jeu », a-t-il averti.

Le Monde
Un an après sa création, la commission chargée du contrôle du renseignement
Tuesday, 13 December 2016
Byline: Jacques Follorou

Paris - Un an après sa création, la commission chargée du contrôle du renseignement affirme son indépendance
L'avis de la Commission nationale de contrôle des techniques de renseignement, née en octobre 2015 pour faire contrepoids aux puissants moyens de surveillance accordés aux services secrets, n'est que consultatif mais le premier ministre l'a suivi dans la plupart des cas.

Pour son premier rapport annuel, présenté mardi 13décembre, la Commission nationale de contrôle des techniques de renseignement (CNCTR), née, le 3octobre 2015, pour faire contrepoids aux puissants moyens de surveillance accordés aux services secrets français dans la loi du 24juillet 2015 sur le renseignement, jouait une part de sa crédibilité.

Nommé président de cette nouvelle instance indépendante, Francis Delon, ex-secrétaire général de la défense nationale et l'un des pères fondateurs de la plateforme nationale du renseignement technique qui alimente depuis 2008 la communauté française du renseignement, devait prouver que les premiers soupçons de grande proximité avec l'Etat étaient infondés. Il devait, de plus, montrer que dans une période où l'émotion pèse sur les décisions politiques, il saurait résister aux pressions l'invitant à ne pas s'opposer aux libertés prises avec le droit.

La CNCTR est chargée de contrôler de l'utilisation d'une douzaine de moyens de surveillance par les services de renseignement français. L'avis de la CNCTR, composée de dix-sept membres, dont trois ingénieurs, n'est que consultatif. Le premier ministre, seule autorité décisionnaire en la matière, l'a

néanmoins suivi dans la plupart des cas. La procédure dite d'urgence, qui permet de s'exonérer du point de vue de la CNCTR, n'a été déclenchée qu'à une reprise selon le rapport qui ne fournit aucun détail opérationnel.

8538 interceptions de sécurité validées

En un an, la CNCTR a visé 48208 demandes de collecte de données de connexion, qui portent parfois sur de simples recherches de numéros dans des annuaires. Elle a donné un avis favorable à 2127 demandes de géolocalisation et elle a validé 8538 interceptions de sécurité, des écoutes téléphoniques, alors que l'instance qui existait auparavant, la Commission nationale de contrôle des interceptions de sécurité (CNCIS), née de la loi de 1991, en avait contrôlé un peu plus de 7000 lors de sa dernière année.

La CNCTR reste très discrète sur les 7711 fois où «d'autres techniques» ont été déployées avec son aval. S'agissait-il de pose de balises, de sonorisation d'appartements, de recueil ou de collecte de données informatiques? On n'en saura rien. La CNCTR explique qu'elle est tenue par la loi qui lui interdit de révéler des capacités opérationnelles. Elle signale néanmoins que faute d'achèvement du chantier de «centralisation des données recueillies» par ces nouvelles techniques, elle n'a pas encore une vision sur leur utilisation sur tout le territoire.

6,9% des demandes renvoyées aux services

En matière d'avis défavorables, on note une augmentation par rapport au temps de la CNCIS qui ne donnait son avis que sur les interceptions de sécurité et les données de connexions. La CNCTR a renvoyé aux services 6,9% des demandes contre environ 1% à l'époque de la CNCIS. Avant la loi de juillet2015, les services de renseignement usaient d'un grand nombre de ces moyens intrusifs, balises, sonorisation de lieux, etc. sans demander l'autorisation à quiconque, en toute illégalité. Les avis défavorables de la CNCTR portent essentiellement sur ces outils, désormais légaux, mais particulièrement attentatoires à la vie privée.

Si la CNCTR s'est vue, de fait, reprocher par les services un surcroît de «paperasse», elle a surtout pu éprouver la réalité de son indépendance lors des tentatives du gouvernement de passer outre ses prérogatives. Ce fut ainsi le cas avec l'article851-2 sur le recueil de données de connexions en temps réel attachées à une personne sur l'ensemble de ses moyens de communication.

La loi sur le renseignement du 24juillet 2015 disposait que cette collecte ne pouvait être effectuée que «sur une personne préalablement identifiée comme présentant une menace» . Le gouvernement et le chef de l'Etat ont tenté, en janvier, d'utiliser ce moyen pour mettre sous surveillance des listes entières de suspects, notamment les fameux fichés «S» pour islam radical, soit près de 14000 personnes. M.Delon a bloqué cette requête considérant qu'elle n'est pas conforme à la loi qui impose que chaque demande doit être individualisée et justifiée.

Pour contourner ce refus de valider «des surveillances groupées et simplifiées», le gouvernement, soutenu par un législateur, davantage soucieux d'étendre la surveillance d'Etat que de jouer son rôle de contre-pouvoir, a, depuis, modifié à deux reprises le périmètre de cet article de loi. Dans le cadre des lois sur la prorogation de l'Etat d'urgence, le Parlement a d'abord élargi la surveillance aux personnes «pouvant constituer une menace» . Et fin juillet, il a étendu la collecte de données de connexion en temps réel à l'entourage de la personne surveillée dès lors qu'il existait simplement «des raisons sérieuses de penser» qu'espionner ces gens au sein de cercles familiaux, amicaux, professionnels ou occasionnels puisse avoir un intérêt.

L'«exception hertzienne»

Si les parlementaires n'ont pas été d'une grande aide pour la CNCTR, elle a, en revanche, trouvé dans le Conseil constitutionnel un soutien inattendu pour tenter d'étendre son contrôle sur un pan entier des surveillances en France qui restaient jusque-là interdites, les communications hertziennes. Qualifiée d' «exception hertzienne» par la CNCTR, cette dérogation du droit consacrée par la loi de 1991 sur les interceptions puis prorogée dans la loi de juillet de 2015, a pris fin lors de sa censure, le 21octobre, par le Conseil constitutionnel.

Se félicitant de la décision du Conseil de vouloir faire entrer la surveillance par voie hertzienne dans le droit commun et d'avoir été chargée par lui de veiller à son application d'ici au vote d'une nouvelle loi, au plus tard le 31décembre 2017, la CNCTR a, au moins jusqu'à cette date, le pouvoir de viser chaque demande d'interceptions effectuée par cette technique. Souhaitant poursuivre son avantage, la CNCTR demande, dans son rapport, d'être «consultée sur l'éventuelle nouvelle législation» .

Le Temps (Suisse)
ID Quantique se déploie à l'international
Tuesday, 13 December 2016
Byline: Dejan Nikolic

Londres - Le numéro un mondial de la cryptographie quantique et de la génération de nombres aléatoires ouvre un bureau à Londres, signe un partenariat stratégique avec le géant coréen SK Telecom et s'attaque au marché chinois
ID Quantique (IDQ), pépite issue des laboratoires de physique appliquée de l'Université de Genève, s'offre un déploiement sans précédent. L'actuel numéro un mondial de la cryptographie quantique et de la génération de nombres aléatoires étend tout d'abord ses activités à la Grande-Bretagne. A travers notamment un contrat consistant à sécuriser les échanges d'informations entre l'un des sites de BT (anciennement British Telecommunications) et Cambridge.

IDQ ouvre également une officine britannique, afin de prendre part à une plateforme scientifique nationale de 384 millions de francs sur cinq ans. « Huit grandes universités du pays ainsi que le secteur

privé et public participent à ce programme », précise Grégoire Ribordy, fondateur d'IDQ, qui imagine affecter cinq collaborateurs à Londres d'ici à un an.

Parallèlement à cette nouvelle tête de pont britannique, IDQ signe une alliance avec SK Telecom, le principal opérateur de Corée du Sud (29,45 millions de clients, soit environ 50% du marché local, pour près de 15 milliards de francs de chiffre d'affaires l'an passé). Ce rapprochement avec la major de l'un des pays les plus connectés de la planète est assorti d'une levée de fonds de plus de 4 millions de francs. Soit la troisième injection de capital en quinze ans, les deux précédentes rondes ayant permis d'engranger respectivement un million (2004) et quatre millions (2014).

La fibre commerciale

L'entreprise carougeoise, lancée en 2001 et qui affiche une croissance moyenne de 30% par an, emploie aujourd'hui une cinquantaine de salariés, soit plus du double qu'en 2014. Son dernier tour de financement, auquel participent d'autres investisseurs stratégiques, est destiné à renforcer sa suprématie à l'échelle planétaire. Et d'asseoir son développement en Asie.

« L'une des filiales de SK Telecom fabrique des puces pour smartphones intégrant des nombres aléatoires, relève Grégoire Ribordy. Ce dispositif bon marché, qui permet de réduire la vulnérabilité des appareils, est en passe de révolutionner le monde de la téléphonie mobile. » Un boîtier traditionnel, de taille standard, coûte environ 1000 francs. Avec la technologie sud-coréenne embarquée, générer des clés ou des mots de passe exclusifs coûtera jusqu'à 100 fois moins cher.

Promesses quinquennales

Dans la foulée, IDQ inaugure son entrée sur le marché chinois. Via une coentreprise avec China Quantum Technologies (CQT), une société pionnière dans les technologies quantiques, à l'origine du plus important réseau commercial en la matière. Soit entre les villes de Shanghai et de Hangzhou, un tronçon de communication ultra-sécurisé d'environ 200 km. « Les contrats ont été signés il y a un mois », se félicite Grégoire Ribordy, sur le point d'ouvrir avec son partenaire chinois une usine dans la province du Zhejiang.

Le nouveau site de production, appelé à fonctionner avant fin 2017 avec un effectif de 50 collaborateurs, doit notamment permettre à CQT d'accéder au savoirfaire genevois en participant à la fabrication notamment de produits d'appel destinés aux casinos et aux paris en ligne. En échange de quoi, IDQ se voit offrir une porte d'entrée sur le potentiel commercial chinois.

La cryptographie quantique est l'un des cinq axes du 13e plan quinquennal de Pékin, définis comme étant d'importance stratégique cruciale pour la nation. Le prix d'un appareil de cryptage, qui c oûte actue llement 50 000 francs pièce, « sera divisé par dix grâce aux volumes du marché chinois », estime Grégoire Ribordy.

Toutefois, les spécialistes se heurtent pour l'heure à un obstacle technique de poids: par voie terrestre, le système ne fonctionne que de point à point, jusqu'à cent kilomètres au maximum. Au-delà, trop de photons sont perdus par diffusion en raison des imperfections de la fibre. Il faut alors aménager des noeuds intermédiaires pour que la particule qui compose la lumière, et qui sert à envoyer les clés de chiffrement nécessaires au décodage de l'information, soit impossible à intercepter. Le maillage Shanghai-Hangzhou, qui garantit que toute tentative d'espionnage provoque l'autodestruction du signal, en compte par exemple cinq.

Mais la Chine rêve d'inaugurer, d'ici à 2030, un système d'échange de données inviolable à l'échelle mondiale. Pékin a ainsi lancé le 15 août dernier le premier satellite de communication indéchiffrable à longue distance (près de 2500 km). Seul hic: l'instrument en orbite doit être orienté de manière extrêmement précise vers les stations au sol. « Ce sera comme lancer une pièce de monnaie d'un avion volant à 100 km d'altitude et espérer qu'elle vienne se ficher exactement dans la fente d'une tirelire cochon en rotation », avait alors expliqué Wang Jianyu, le responsable en chef de cette percée technologique de Pékin.

Lannion. Nouvelle Breizh cyber valley
Tuesday, 13 December 2016
Byline: Journaliste maison

Lannion, France - Marie-Hélène Clam et Riwan Marhic Après Rennes et Bruz (35), la journée cybersécurité du ministre de la Défense, Jean-Yves Le Drian, s'est achevée sur le site de Nokia, à Lannion (22). Il s'y est vu confirmer la création de 500 emplois d'ingénieur Recherche et Développement d'ici à la fin 2018, dont une grande partie à Lannion, ciblée pôle mondial pour ce secteur.
« Lannion sera le centre mondial pour Nokia concernant la recherche en cybersécurité », a lancé Marc Rouanne, le numéro deux du groupe Nokia. Devant un Jean-Yves Le Drian acquis à la cause puisque lanceur du Pact Cybersécurité dès 2012, le dirigeant a confirmé le recrutement de 500 ingénieurs Recherche et Développement dont 300 jeunes diplômés. À lui seul, le site de Lannion accueillera une centaine de ces ingénieurs amenés à travailler sur la 4G, la 5G, l'internet des objets et bien sûr la cybersécurité. « Nokia est aussi sponsor de la première formation informatique et cyberdéfense de l'École nationale supérieure d'ingénieurs de Bretagne-Sud (ENSIBS) à Vannes, aide au codéveloppement des start-up locales et des acteurs européens », a ajouté Arnaud Laforge, directeur du site.

Scanner le trafic pour détecter les espions

Une heure durant, le ministre a pu assister à des démonstrations : du chiffrement des données à la détection des espions, appliqués aux domaines militaire et civil. « Les pare-feu, qui servent à se protéger des intrusions extérieures par internet, sont inutiles car plus d'un million d'appareils sont déjà infectés, a expliqué Giuseppe Targia, directeur de la sécurité chez Nokia. Certains pirates peuvent déjà avoir accès à nos machines. Notre solution basée sur la reflectométrie permet de vérifier en continu s'il y a des

irrégularités au sein de notre réseau, juste en observant le comportement de nos appareils ».Adopté par la Banque de France, ce système permet de scanner le trafic automatiquement et de détecter des pertes de données dues à un réseau vieillissant ou à une interception des données, donc à de l'espionnage. Espionnage rendu possible grâce à des dispositifs coûtant moins de 10 achetés sur internet, que les pirates placent dans les boîtiers de fibre optique. Pour s'en protéger, l'équipementier développe un nouveau type de boîtier sécurisé qui sera opérationnel, fin 2017. Autre innovation, le réseau ultra-compact. Ce gros sac à dos permet d'établir des communications fiables en quelques minutes, n'importe où dans le monde. Déjà utilisé par les Marines américains, il peut être fixé à un drone ou à un ballon et bénéficie d'une couverture téléphonique et internet à 70 km à la ronde. En plus de son usage militaire, il sera mis à disposition des ONG ou des pompiers en cas de catastrophe naturelle.

« Comme des anticorps »

« La meilleure défense que nous connaissions, c'est le système immunitaire humain. Alors on s'en est inspiré pour notre cybersécurité : quand il y a un problème, le réseau réagit vite et apprend de ce problème pour s'en prémunir à l'avenir, comme des anticorps », résume Giuseppe Targia. Des innovations qui ont impressionné Jean-Yves Le Drian. « C'est quasiment une cyber armée qui se met en place en Bretagne. Dans le contexte de menace terroriste et avec 50 milliards d'objets connectés d'ici à 2025, il s'agit pour la France de garder de l'avance pour préserver son leadership sur ce domaine. Et Lannion en sera une Breizh cyber valley ».

Le Figaro
Le Conseil national du numérique hausse le ton face au fichier TES
Tuesday, 13 December 2016
Byline: Elisa Braun

Paris - Le fichage des Français au sein d'une base de données unique inquiète l'organe indépendant Non, c'est non. Le Conseil national du numérique (CNNum) reste intransigeant sur le fichier TES, qui permet au gouvernement de regrouper les données personnelles (sexe, couleur des yeux, taille, photo, empreintes digitales, filiation, nationalité...) de près de 60 millions de Français. Le CNNum en avait déjà demandé la suspension le 7 novembre dernier dans une lettre ouverte au gouvernement, où il déplorait les risques de dérives créées par un tel dispositif.

La nouvelle prise de position du CNNum publiée lundi et qui résulte des contributions recueillies par sa plateforme de consultation et d'auditions d'experts, est encore moins tendre avec le gouvernement. Outre la demande réitérée de suspension du fichier, le Conseil préconise dans son rapport l'instauration d'un débat public sur les sujets de l'identité administrative et l'identité en ligne. Il insiste également sur l'«urgence à instaurer une nouvelle gouvernance des choix technologiques au sein de l'État».

Un contre-exemple symptomatique

Au-delà de la polémique, le fichier TES apparaît selon le CNNum comme «le symptôme d'un processus décisionnel qui, en matière technologique, n'intègre pas suffisamment les exigences d'une vision politique de long terme». Au fil des pages du rapport, le Conseil mentionne les nombreux risques de dérives que constitue un tel fichier dans un contexte d'attaques cybersécuritaries accrues. Il recommande d'édicter un cadre général pour ce type de décision, et suggère notamment l'obligation de fournir des études d'impact approfondies et de tenir des débats publics.

L'organe consultatif recommande de renforcerle rôle d'instances spécialisées comme la Commission nationale informatique et libertés (Cnil), la direction interministérielle du numérique et du système d'information et de communication de l'État (Dinsic) et de l'agence nationale de la sécurité des systèmes d'information, l'Anssi.

Une querelle sans fin

Le fichage des Français a rouvert les fractures créées par le projet de loi sur le Renseignement, l'an dernier. Si le fichier TES est censé simplifier les formalités d'obtention et de renouvellement des titres d'identité, ainsi qu'éviter la fraude documentaire, certains opposants ont dénoncé son caractère attentatoire à la vie privée. Dans un contexte d'État d'urgence prolongé et de mesures prises contre le terrorisme, ce fichier TES a aussi été critiqué pour sa potentielle utilisation à des fins de renseignement.

Bernard Cazeneuve - alors ministre de l'Intérieur et à l'initiative du décret - a écarté cette possibilité devant la commission des Lois de l'Assemblée, le 9 novembre. Il n'a en revanche pas su lever les doutes de certains parlementaires, concernant les risques de sécurité liés à la concentration en un même fichier d'autant de données sensibles. Le ministère de l'Intérieur a consenti à rendre optionnel le versement des empreintes biométriques dans la base de données. Le ministère a également saisi la Dinsic (Direction interministérielle du numérique et du système d'information et de communication de l'État) et de l'Anssi (Agence nationale de la sécurité des systèmes d'information) afin d'évaluer le risque d'attaque informatique.

Lors d'une récente audition à la commission des lois du Sénat, les dirigeants de ces deux institutions n'ont pas fait mystère de leur intention d'amender le projet de l'Intérieur. Guillaume Poupard, directeur de l'ANSSI, s'est inquiété des risques géopolitiques: «Que se passerait-il si quelqu'un voulait déstabiliser la France non pas via une attaque très visible, mais en distillant des erreurs de-ci, de-là au sein du fichier?», rappelant que «ce genre d'armes est de plus en plus utilisé dans le cadre de conflits avoués ou pas entre grands États». «Je crois qu'il faut remettre à plat tout cela pour que le débat puisse reprendre sur des fondamentaux plus solides», a plaidé Henri Verdier, directeur du Dinsic. À la différence des deux instances, le CNNum, qui souhaite pour sa part repenser intégralement le fichier TES, reste pour sa part un organe purement consultatif.

La Tribune (France)
Surveillance spatiale : la France reste dans la cour des Etats- Unis et de la Russie

Tuesday, 13 December 2016
Byline: Michel Cabirol

Paris - La direction générale de l'armement a notifié le contrat de modernisation du système de surveillance de l'espace Graves à l'ONERA et à la PME Degreane Horizon. Un enjeu crucial pour la France qui peut ainsi suivre dans l'espace les satellites espions.
Le ministère de la Défense lance la modernisation du système de surveillance de l'espace Graves comme l'avait annoncé La Tribune (lien : http://www.latribune.fr/entreprises- finance/industrie/aeronautique-defense/surveillance-spatiale-la-france- modernise-le-systeme-graves-a-minima-602219.html). La direction générale de l'armement (DGA) a notifié un contrat pouvant s'élever jusqu'à 40 millions d'euros, qui comprend une tranche ferme et des tranches optionnelles, à deux cocontractants : le centre français de la recherche aéronautique spatiale et de défense l'ONERA et la PME électronique Degreane Horizon, spécialisée dans l'acquisition et l'émission de données sensibles. Cette filiale du groupe Vinci était depuis 2003 un des fournisseurs du centre de recherche français sur ce programme. La DGA a toutefois confié à l'ONERA la responsabilité du maintien des performances du système puis de son amélioration.

La tranche ferme de ce programme de rénovation court sur une période de cinq ans (huit ans si on rajoute toutes les tranches optionnelles). Elle représente plus de la moitié de la valeur du contrat, selon le chef de projet du système Graves au sein de l'ONERA, Florent Muller. Le système Graves est essentiellement installé sur trois sites, l'un à Dijon (le site d'émission avec les grande antennes), un autre sur le plateau d'Albion (site de réception) et, enfin, à Lyon Mont-Verdun, où le centre opérationnel de surveillance militaire des objets spatiaux (COSMOS), traite les données du système Graves (exploitation).

Graves, un système de renseignement stratégique

Mis en service depuis 2005 pour le compte de l'armée de l'air, le système Graves (pour Grand Réseau Adapté à VEille Spatiale) est un programme unique en Europe. Seuls les États-Unis et la Russie ont officiellement un programme équivalent alors qu'un cercle très restreint de pays, comme la Chine par exemple, pourraient en posséder un également. A ce jour, il est capable "de cataloguer des objets de la gamme du mini-satellite jusqu'à 1.000 km d'altitude", souligne Florent Muller. Soit un engin de la taille d'une machine à laver.

"Les données générées permettent de calculer à tout instant la position de l'ensemble des satellites suivis", précise-t-il. Actuellement, Graves détecte et catalogue tous les jours plus de 2.500 objets. C'est l'armée de l'air qui assure la mise à jour quotidienne du catalogue. Car pour rester catalogué, un objet doit être détecté tous les jours.

« La France a été le troisième pays au monde, après les Américains et les Russes, à se doter d'un tel système, avait expliqué en juin 2015 dans une interview accordée à la Tribune le PDG de l'ONERA, Bruno Sainjon. L'ONERA a conçu Graves, a piloté sa réalisation et l'a transféré à l'armée de l'air en 2005. Ce programme a notamment permis des échanges de données avec les États-Unis. Et, en avril 2015, cette

coopération s'est renforcée, les deux ministères de la Défense voulant désormais échanger des informations classifiées". »

Ce système de renseignement militaire stratégique, un outil extrêmement précieux pour la France, peut notamment suivre à une altitude de moins de 1.000 kilomètres les satellites espions, qui survolent la France et observent les sites sensibles. Ce qui permet à l'armée de l'air de cataloguer pratiquement tous les satellites espions alliés et ennemis ainsi que d'autres engins spatiaux. "Graves permet de détecter les menaces qui pèsent sur nos propres moyens spatiaux", confirme Florent Muller.

L'armée de l'air a d'ailleurs reconnu avoir identifié en 2012, puis 2013 et, enfin, en 2015, des engins spatiaux qui se sont approchés de satellites militaires français. Ces satellites sont d'ailleurs restés à leur contact pendant une période relativement longue. Très certainement pour les écouter. Il détecte également les vols en formation de satellites. En outre, Graves permet d'éviter d'éventuelles collisions entre des débris spatiaux et les satellites français en les déplaçant le cas échéant.

Enfin, le système concourt à la protection des populations face aux rentrées atmosphériques à risques (engins spatiaux, comètes...). Car plus de 12.000 satellites artificiels et objets divers, dont la taille est supérieure à dix centimètres, orbitent autour de la Terre.

Graves pourrait identifier des micro-satellites

Malgré sa robustesse et sa simplicité, le système Graves, un prototype qui était innovant en 2005, doit être aujourd'hui modernisé, les équipements ayant vieilli. Cette opération de rénovation permettra désormais d'assurer la pérennité de Graves "jusqu'en 2030", estime Florent Muller. Dans ce contexte, la tranche ferme du contrat confié à l'ONERA et à Degreane Horizon comprend en grande partie le traitement des obsolescences du système ainsi que quelques améliorations de ses performances, notamment du calculateur de traitement de signal.

« Certaines performances seront accrues grâce notamment à des interventions au niveau des antennes de réception et du traitement du signal, supportées par un nouveau calculateur", explique l'ONERA dans son communiqué. »

Plus précisément, l'ONERA sera en charge de la rénovation et des améliorations des sites de réception et d'exploitation. La filiale de Vinci modernisera pour sa part à l'identique les systèmes d'émissions en gérant les obsolescences.

Avec les tranches conditionnelles, de nouvelles améliorations du système sont prévues. En parallèle du lancement de la tranche ferme, l'ONERA effectuera des études techniques opérationnelles pour définir quelles pourraient être les options pour améliorer Graves. "A l'issue de ces études, un certain nombre d'options accessibles pourra être ainsi notifié en parallèle de la tranche ferme", confirme Florent Muller.

L'ONERA vise notamment l'amélioration de l'observation d'objets spatiaux plus petits. Et de passer "de façon progressive avec les options les plus complètes" de la détection de mini-satellites (inférieur à 500 kg) à celles de micro-satellites (inférieur à 150 kg). Dans sa nouvelle configuration, Graves détectera beaucoup plus d'objets spatiaux qu'actuellement si les tranches conditionnelles du contrat sont levées.

Un outil de souveraineté

Entre une modernisation a minima et une modernisation plus ambitieuse, le ministère de la Défense n'a pas encore tout à fait tranché en découpant le programme de modernisation de Graves en plusieurs tranches, dont des tranches optionnelles. Cet outil de souveraineté permet pourtant de discuter d'égal à égal - ou presque - avec les États-Unis. Ce qui n'est pas rien et confirme bien que la France est depuis 2005 dans le club très fermé des puissances dotées de capacités autonomes de surveillance de l'espace. Au ministère de la Défense de décider de l'ampleur de cette opération cruciale pour l'indépendance de la France en matière de surveillance spatiale une fois les recommandations de l'ONERA émises.

Développé sous contrat de la DGA, le système Graves est constitué d'un radar bistatique spécifique associé à un système de traitement automatisé qui permet la création et le maintien à jour d'une base de données des paramètres orbitaux des satellites qu'il détecte. Fruit de la collaboration des spécialistes des départements Électromagnétisme et radar (DEMR) et Conception et évaluation des performances des systèmes (DCPS) de l'ONERA, le radar du système Graves a été spécifiquement conçu pour la surveillance de l'espace.

Le Petit Bleu de Lot-et-Garonne
Cybersécurité : la France muscle son arsenal
Tuesday, 13 December 2016
Byline: Journaliste maison

Paris - Le combat numérique va devenir une arme à part entière des armées françaises, aussi bien offensive que défensive, face à une cybermenace qui vise de plus en plus les intérêts vitaux des États. «L'émergence d'un nouveau milieu, d'un champ de bataille cyber, doit nous amener à repenser profondément notre manière d'aborder l'art de la guerre», a déclaré hier le ministre de la Défense Jean-Yves Le Drian, en dévoilant la doctrine des armées françaises en matière de cybersécurité.

Dans un monde de plus en plus interconnecté, les cyberattaques venant d'États, hackers, groupes terroristes ou criminels se multiplient, a relevé le ministre.

Elles peuvent paralyser des infrastructures vitales (réseaux téléphoniques, centrales électriques, transport..) tout comme des cibles militaires en tentant de pénétrer les systèmes embarqués d'aéronefs, bâtiments de guerre ou blindés.

«L'arme cyber peut avoir des effets tout à fait comparables à l'armement plus conventionnel», a averti Jean-Yves Le Drian en inaugurant les nouveaux locaux de DGA Maîtrise de l'information, qui réunit les cyberexperts de la Défense à Bruz (Ile-et-Vilaine) près de Rennes.

Face à ces menaces, les armées verrouillent de plus en plus leurs systèmes d'information - ils sont protégés par des «murailles» et des «patrouilles» qui traquent les intrus - mais intègrent aussi désormais le cyber comme une arme offensive.

«En temps de guerre, l'arme cyber pourra être la réponse, ou une partie de la réponse, à une agression armée, qu'elle soit de nature cyber ou non», a énoncé M. Le Drian.

Concrètement, la France pourra recourir au combat numérique comme à une arme classique de type missile pour riposter à une attaque aussi bien cyber que conventionnelle.

Un commandement des opérations cyber, le CYBERCOM, placé sous la responsabilité directe du chef d'état-major des armées, va être pour cela créé en janvier 2017.

Il disposera d'un état- major resserré qui surpervisera 2.600 «combattants numériques» d'ici 2019.

Le Figaro
20.282 personnes espionnées en un an sur le territoire français
Tuesday, 13 December 2016
Byline: Christophe Cornevin

Paris - Dans son premier rapport d'activité dévoilé mardi matin, la Commission nationale de contrôle des techniques de renseignement (CNCTR) évalue que 47% des personnes surveillées l'ont été dans des dossiers terroristes et 29% au titre de la «lutte contre la criminalité organisée» ainsi que de la «prévention des violences collectives».
Entre le 3 octobre 2015 et le 2 octobre dernier, quelque 20.282 personnes ont été espionnées par les services français. En dévoilant mardi matin son premier rapport d'activité, la Commission nationale de contrôle des techniques de renseignement (CNCTR) a évalué le nombre d'hommes et de femmes qui ont fait l'objet d'une surveillance. Celle-ci passe par l'emploi de la technique la moins intrusive, à savoir l'obtention des «fadettes» (facturations détaillées) de la personne ciblée jusqu'à des moyens plus lourds, telles que la sonorisation ou l'installation de moyens vidéo dans les domiciles en passant par les interceptions de sécurité, la géolocalisation, l'accès en temps réel aux données de connexion» ou encore l'emploi - encore parcimonieux - des «Imsi catchers» permettant de siphonner à distance les données de connexion des téléphones mobiles.

Les algorithmes, c'est-à-dire la «boite noire», tant contestée censée assurer un recueil massif de données, ne devraient être mis en ouvre qu'au printemps prochain. «Pour l'heure, ils n'ont pas pu être mis en place pour des raisons de moyens techniques», précise-t-on à la CNCTR.

47% dans les radars de l'antiterrorisme

Au nombre de ceux ayant «fait l'objet d'une technique de renseignement au moins», le rapport de la CNCTR révèle que «9624 personnes, soit 47% du total, ont été surveillées au titre de la prévention du terrorisme» et que 5848 autres, soit 29% du total, ont été ciblées dans des dossiers de lutte contre la criminalité organisée ainsi que «la prévention de violences collectives de nature à porter gravement atteinte à la paix publique».

La CNCTR, qui se dit «particulièrement vigilante sur ce point», considère que «cette finalité ne saurait être interprétée comme permettant la pénétration d'un milieu syndical ou politique ou la limitation du droit constitutionnel de manifester ses opinions, y compris extrêmes, tant que le risque d'une atteinte grave à la paix publique n'est pas avéré.» Nombre d'observateurs y ont vu une disposition visant les zadistes mais aussi les no-borders, les blacks blocks ou encore les hooligans.

Les autres 24% de personnes placées dans les radars des services, qu'ils soient Français ou étrangers, ont été soupçonnés de porter atteinte à «l'indépendance nationale, l'intégrité du territoire et la défense nationale», d'espionnage industriel ou encore d'être liés à la «prolifération des armes de destructions massives».

8538 avis sur des demandes d'interceptions de sécurité

La démarche, tout à fait inédite dans le panorama feutré de l'espionnage, ne permet «aucun point de comparaison avec l'étranger», précise le conseiller d'État Francis Delon, président de la CNCTR qui, en aparté, ne se dit «pas particulièrement surpris» par le chiffre.

Cette instance indépendante, qui bénéficie d'un budget de 2,9 millions d'euros, vérifie la validité des techniques déployées de la DGSE, de la DGSI, de Tracfin ou encore de la Direction du renseignement militaire.

Depuis le 3 octobre 2015, la CNCTR a rendu 8538 avis sur des demandes d'interceptions de sécurité, contre 7703 l'année précédente. Le nombre des géolocalisations en temps réel a quant à lui bondi de 87% pour atteindre les 2127 demandes en 2016. Observant dans son rapport que «la prévention du terrorisme a, pour la première fois, été le fondement légal le plus fréquemment invoqué», la CNCTR ne constate cependant aucune explosion de la surveillance liée à la menace islamiste.

Composée de neuf «sages» - quatre hauts magistrats, quatre parlementaires et un expert en Télécoms - et d'une secrétaire de 17 personnes dont deux ingénieurs, elle s'est réunie de manière collégiale à 180 reprises à raison de trois fois par semaine pour examiner des cas individuels et mener des dossiers de fonds. Au terme des examens, la CNCTR a retoqué 6,9% des demandes.

New York Times
G.O.P. Feud Looms as Leaders Back Russia Inquiries
Tuesday, 13 December 2016
Byline: Jennifer Steinhauer

Washington - The top two Republicans in Congress said on Monday that they supported investigations into possible Russian cyberattacks to influence the American election, setting up a potential confrontation with President-elect Donald J. Trump in his first days in office.
"Any foreign breach of our cybersecurity measures is disturbing, and I strongly condemn any such efforts," said Senator Mitch McConnell, Republican of Kentucky and the majority leader, adding, "The Russians are not our friends."

Mr. McConnell's support for investigating American intelligence findings that Moscow intervened in the election on Mr. Trump's behalf could presage friction between the Republicans who control Congress, and who have long taken a hard line against Russia, and the president-elect, who has mocked the findings.

Mr. McConnell also went out of his way to address Mr. Trump's claim that the C.I.A. could not be trusted because of flawed intelligence before the Iraq war.

"Let me say that I have the highest confidence in the intelligence community," Mr. McConnell said, "and especially the Central Intelligence Agency. The C.I.A. is filled with selfless patriots, many of whom anonymously risk their lives for the American people."

The top Republican in the House, Speaker Paul D. Ryan of Wisconsin, said he supported a continuing investigation by Representative Devin Nunes of California, the chairman of the House Intelligence Committee. In a statement, Mr. Ryan said: "As I've said before, any foreign intervention in our elections is entirely unacceptable. And any intervention by Russia is especially problematic because, under President Putin, Russia has been an aggressor that consistently undermines American interests."

Congressional Republicans announced their support for inquiries after Mr. Trump railed for much of the weekend against the intelligence findings. But their remarks, especially Mr. Ryan's, were far from fiery, reflecting both a fear of offending Mr. Trump, who has taken many positions against traditional Republican orthodoxy, and the Republicans' belief that Democrats have selectively leaked intelligence information for political gain.

Critics from both parties are questioning Mr. Trump's apparent choice of Rex W. Tillerson, the chief executive of Exxon Mobil, as secretary of state, particularly because of his longstanding business connections with Russia and his close relationship with President Vladimir V. Putin, whom he has known for two decades. Mr. Trump said in a Twitter post on Monday night that he would make a formal announcement on the job on Tuesday morning.

Senators Lindsey Graham of South Carolina and Marco Rubio of Florida, both Republicans, have expressed concern about the reports of cyberattacks, as have numerous Democrats. But Mr. Rubio, in an apparent reference to Mr. Tillerson, went a step further on Monday, writing on Twitter, "Being a 'friend of Vladimir' is not an attribute I am hoping for from a #SecretaryOfState."

Mr. McConnell said the Senate investigation would be led by Senator Richard M. Burr, Republican of North Carolina, the chairman of the Intelligence Committee. Senator John McCain, Republican of Arizona, the chairman of the Armed Services Committee, will add a subcommittee to look into cyberattacks, led by Mr. Graham.

"The first thing we want to establish is, 'Did the Russians hack into our political system?'" Mr. Graham said in an interview on Monday. "Then you work outward from there. I have a high degree of confidence Russia did this."

Mr. Nunes, a member of Mr. Trump's transition team, said in a statement that the Intelligence Committee had been "conducting vigorous oversight of the investigations into election-related cyberattacks."

Mr. Nunes also noted that his committee would be scrutinizing the review of the Russian effort to influence the election ordered last week by President Obama.

Democrats have used the latest intelligence findings to renew their calls for an urgent inquiry. John D. Podesta, Hillary Clinton's campaign chairman, demanded on Monday that all information about Russia's meddling be declassified, and that the Obama administration explain what it knows about the hacking and when it knew it.

"We now know that the C.I.A. has determined Russia's interference in our elections was for the purpose of electing Donald Trump," Mr. Podesta wrote in a statement. "This should distress every American. Never before in the history of our republic have we seen such an effort to undermine the bedrock of our democracy."

Three Senate Democrats -- Benjamin L. Cardin of Maryland, Dianne Feinstein of California and Patrick J. Leahy of Vermont -- called on Monday for the creation of an independent, nonpartisan commission to comprehensively investigate allegations of Russian interference in the 2016 election.

But Mr. McConnell stopped short of calling for a special select committee, saying that the Senate Intelligence Committee was "more than capable of conducting a complete review" of the matter.

While he stopped short of saying whether he agreed that Russia had interfered in the election in support of Mr. Trump, Mr. McConnell said, "We need to approach all these on the assumption the Russians do not wish us well."

Mr. McCain was less equivocal, saying Monday that there was "no doubt about the hacking" by Russian intelligence services. He called the hacking of the Democratic National Committee and related accounts "another form of warfare" in an appearance on "CBS This Morning" with Senator Chuck Schumer of New York, the incoming Democratic leader.

And one week before the Electoral College meets to ratify Mr. Trump's election victory, 10 electors have demanded their own intelligence briefing on Russian efforts to elect Mr. Trump.

For his part, Mr. Trump was dismissive of the intelligence findings and suggested that Democrats were simply stirring controversy. "Can you imagine if the election results were the opposite and WE tried to play the Russia/CIA card. It would be called conspiracy theory!" Mr. Trump said in a Twitter post on Monday.

The White House press secretary, Josh Earnest, said that the administration would support a congressional review. He also rejected the notion that the administration had failed to adequately highlight the Russian efforts before the election, saying it had extensively briefed Congress all year about Russian electoral meddling.

"There has been intensive cooperation between the intelligence community and other national security agencies, and members of Congress in both parties, both before and after the election," Mr. Earnest said. "The briefings have been provided in a variety of settings, both classified and unclassified."

Even beyond the conclusions of the intelligence community, Mr. Trump's campaign had widely known and extensive ties to the Russian government. A campaign manager, Paul Manafort, had worked for the Russian-backed government in Ukraine, and Mr. Trump's choice for national security adviser, Lt. Gen. Michael T. Flynn, had consulted for a Russian-backed media group, Mr. Earnest noted.

Mr. Earnest said that Congress had a "special responsibility" to investigate the ties between the Trump campaign and the Russian government, because those connections were widely known before the election. He added that, for Capitol Hill Republicans, how to "reconcile their political strategy and their patriotism is something they're going to have to explain."

Wired
Trump Ignoring US Intelligence Creates Risks Beyond Russian Hacking
Monday, 12 December 2016
Byline: Andy Greenberg

New York - Observers and alumni of America's intelligence community have already fretted over Donald Trump's impending control of the world's most powerful spy agencies. They've worried that he could abuse their heady surveillance capabilities, turn them on his personal enemies, revamp the NSA's mass surveillance programs, and strip away domestic privacy protections once in charge. But before Trump

has even taken office, he's already found a less expected way to abuse the US intelligence community: Ignore, contradict, and insult it.
Trump's relationship--or lack thereof-- with US intelligence agencies isn't just a cause for political spectacle. According to national security experts and former intelligence agency staffers, it could have serious consequences that go well beyond the current dispute over Russian hacking.

The Russia Rift

On Friday, the Washington Post and New York Times reported that the CIA has confirmed that the Russian government repeatedly hacked and leaked Democratic Party documents throughout the presidential election season with the express intention of aiding Trump's campaign. That conclusion goes a significant step beyond earlier intelligence reports that had merely pinned the attacks on the Kremlin without naming its motive.

In response, the Trump transition team offered a brusque rejection of that finding: "These are the same people that said Saddam Hussein had weapons of mass destruction," read the Trump team's statement.

That abrupt dismissal of the intelligence community's findings follows months of Trump's assertions that no one can know the source of the last year's long series of political hacks--despite a publicly released report from the Office of the Director of National Intelligence and the Department of Homeland Security stating that Vladimir Putin's state- sponsored hackers were behind those breaches. "It could be some guy in his home in New Jersey," Trump maintained in a Time interview earlier last week.

The remarks build on what may be the most troubling recent revelation of all, that Trump has declined the traditional daily intelligence briefing given to presidents and presidents-elect. Instead, he receives the briefing only about once a week. "I get it when I need it," he told Fox News Sunday. "You know, I'm, like, a smart person."

That dismissal and disregard of the intelligence agencies' fact-finding represents a disturbing potential preview of the next four years, say former members of the US intelligence community who spoke with WIRED. They worry that it threatens to politicize the intelligence community's work, pushing it toward conclusions that will please the president rather than inform him. They say the growing rift demoralizes staffers, leading to a loss of valuable talent, and that it could leave the commander-in-chief himself dangerously ignorant of crucial world events.

Susan Hennessey, a former NSA lawyer who is now with the Brookings Institution, says that since Trump was elected, she's spoken with former colleagues who are still in the intelligence community who have been "stunned" to hear Trump's repeated rejections of their findings. "It's not outrage, although that might be under the surface," she says of her former colleagues' response. "It's real uncertainty and a sense of fear...shock, bewilderment, wondering what's going to happen next."

Playing Politics

Trump's kneejerk comparison of the Russian hacking report to the faulty intel on Saddam Hussein's weapons of mass destruction takes that dismay to another level, says one former CIA official who helped to write the president's daily briefing under both Obama and Bush. "We've never seen something like this before. It's pretty ballsy," says the former agency official, who requested anonymity because he's not authorized by his current employer to speak about political issues. "From dismissing the briefings to dismissing the current assessment on the Russia stuff, it seems like he's still in campaign mode. He's politicizing the intel, and that's a problem."

"Every administration has problems with some intelligence," says Patrick Skinner, a former CIA official under Bush and Obama who now works for the security consulting firm the Soufan Group. "But it really shouldn't be public. The open disdain Trump has shown for the agencies is unprecedented."

Trump's transition team didn't respond to WIRED's request for comment.

To be fair, Trump isn't the only skeptic of the intelligence agencies' findings. Neither the leaked CIA assessment that Kremlin hackers were motivated to help Trump nor the intelligence community's October report attributing the attacks to Russia have been backed up with published evidence. That's led Democratic members of congress Elijah Cummings and Eric Swalwell to demand a commission to independently investigate the hacking incidents. President Obama has directed intelligence agencies to conduct a renewed investigation into the attacks. And Republican Senators John McCain and Lindsay Graham joined with Democrats Chuck Schumer and Jack Reed to call for a congressional investigation into the hacker intrusions, splitting with Trump and other Republican leaders who have ignored or dismissed the Russian hacking reports.

In an interview on the CBS show Face the Nation Sunday, Senator McCain clarified that he doesn't doubt Russia was the source of the breaches of targets like the Democratic National Committee and the Democratic Congressional Campaign Committee, but still wants to better understand the motive of those attacks, and whether they targeted Republicans, too. What he doesn't dispute is that Russia was the source. "Now whether they intended to interfere to the degree that they were trying to elect a certain candidate, I think that's the subject of investigation," McCain said. "But facts are stubborn things. They did hack into this campaign."

Trump's doubt of the intelligence agencies' findings isn't the first sign that the divisiveness of the last year's presidential campaign has led to new, partisan distrust of the intelligence community's work, argues Dave Aitel, a former NSA staffer who now runs the security firm Immunity. That doubt had already surfaced with FBI director James Comey's public statements about the bureau's investigation of Hillary Clinton's private email server. The Clinton campaign and Democratic leaders have criticized Comey's behavior, accusing him of influencing the electoral process by writing a letter to Congress about new emails that surfaced in that investigation just weeks ahead of election day. "Our intelligence community has become a political football, and that's something that should never occur," says Aitel. "You need to have trust, and we don't have trust."

Broader Threats

Aitel says that lack of confidence in intelligence agencies' findings and politicization of their work has left his former colleagues increasingly "jaded." And he says that problem of low morale, already sunken after public response to the revelations of NSA leaker Edward Snowden, could lead to a dangerous brain drain from key agencies. "They don't complain, they don't whine to the press, they just leave," argues Aitel. "Then you get talent shortfalls, and then you get mission failures, which are bombs blowing up in American cities."

Compounding those issues are fears that Trump will continue to ignore his own intelligence apparatus, making uninformed decisions on the world stage, says ex-CIA officer Skinner. Some members of Trump's transition team have reportedly accepted daily intelligence briefings, including his pick for defense secretary, General James Mattis, and vice-president elect Mike Pence. But a president who wields ultimate executive power without that information could be dangerous, says Skinner. "If you close your eyes, the threat is still there: North Korea still exists, ISIS still exists," says Skinner. "These things are complex. You can't counter North Korea with gut feelings."

The rejection feeds back into the morale issue as well. "There's a firm belief in the intelligence community that the president having this information is a really important thing," says ex-NSA lawyer Hennessey. "When you have a boss essentially saying they don't believe or value your work--an outright rejection based on absolutely no evidence--there's a profound sense of uncertainty."

Beyond Trump's specific rejection of any inconvenient finding, Hennessey says it's that larger dismissal of the intelligence community that's most troubling. "If an intelligence agency produces a piece of evidence that's ignored, people can be killed," she says. "The consequences could be as dire as you can possibly imagine."

Radio Free Europe
Cyberattacks On Finance Ministry, Treasury
Monday, 12 December 2016
Byline: Christopher Miller

Kyiv - Ukrainian authorities are still looking for the culprits nearly a week after troublesome cyberattacks against official financial institutions that appeared to be designed to inflict maximum chaos on end- of-the-year payments.
But the head of staff of the Ukrainian Security Service (SBU) identified the so-called malware used in the December 6 attack as the same disruptive software employed in an unprecedented incident a year earlier, blamed on Russia, that cut off power to hundreds of thousands of homes in Ukraine.

Hundreds of thousands of hryvnyas' worth of remittances were delayed or stopped completely over the course of two days after hackers knocked the websites and payment systems of the Ministry of Finance, State Treasury, and pension fund offline, according to statements posted to those sites and local reports.

The National Police are leading the investigation and have discussed the case with the SBU, Oleksandr Tkachuk, chief of staff of the SBU, told RFE/RL on December 12.

The Finance Ministry, which described the incident as a "coordinated professional hacking attack," also claimed the attack had damaged its network equipment.

Tkachuk confirmed that "some data was destroyed and access to networks was blocked."

He said authorities were not prepared to discuss many details publicly because it would take time to fully assess them, adding that attribution in the cybersecurity sphere is a tricky business.

Tkachuk said the attack appeared to bear some similarity to a December 2015 attack against the Prykarpattyaoblenergo power company in Ukraine's western Ivano-Frankivsk region that cut power to hundreds of thousands of homes.

Critical Infrastructure

Ukrainian officials blamed that cyberattack on Russia and speculated that it might have been retaliation for Kyiv cutting off electricity one month earlier to Crimea, which Russia seized from Ukraine in early 2014.

But experts at the time warned that the greater message might be that hackers had the power to shut down critical infrastructure -- something that cybersecurity experts had long feared but never seen in practice.

Elizabeth Sherwood-Randall, a deputy secretary at the U.S. Department of Energy, also blamed Russia for the December 2015 cyberattack.

In that case, the hackers used malicious software called KillDisk, which deletes or overwrites data in system files, causing computers to crash.

KillDisk was also used in the December 6 attacks, the SBU's Tkachuk told RFE/RL.

Relations between Kyiv and Moscow soured after Russia forcibly annexed Crimea in March 2014, and Russia has been accused by Kyiv and Western powers of backing a separatist conflict in eastern in Ukraine that has killed more than 9,750 people.

Kyiv has on several occasions blamed Russia for cyberattacks -- including one on Ukraine's election system ahead of the presidential vote in May 2014 -- that it claims are part of Moscow's greater "hybrid war," a military strategy that combines conventional warfare, irregular warfare, and cyberwarfare.

CBC News
Federal government's Canada.ca project 'off the rails'
Tuesday, 13 December 2016
Byline: Staff reporter

The federal government's bid to merge 1,500 departmental and agency websites into a single site, Canada.ca, is a year behind schedule and almost 10 times over budget. And experts warn it is on track to be another failed government IT project, like the Phoenix pay system.
"It's gone off the rails. It's a disaster," said one government source with knowledge of the project who spoke on condition of anonymity.

CBC spoke with a number of government workers who are also familiar with the project in different departments and they all expressed similar evaluations.

The Canada.ca initiative was launched in 2013 with the goal of making it easier for people to find and use government information online. A $1.54-million contract for a new content management system, where all government websites would be moved, was awarded to Adobe in 2015.

The original deadline to have all active web content moved to the single portal was this month. But in June, it was pushed back to December 2017, which was the initial deadline for the migration of all archived content.

The contract with Adobe is now above $9.4 million, according to government figures.

The actual migration of the websites is up to the departments themselves and is to be done within existing budgets and staffing. Since 2015, eight of the largest departments have budgeted or spent more than $28 million on this project.

Those departments include: Employment and Social Development; Immigration, Refugees and Citizenship; Health; Environment; Canada Revenue Agency; National Defence; Fisheries and Oceans; and Global Affairs.

According to the government, only 10,000 web pages have been moved to date. There are more than 17 million Government of Canada web pages in total.

"If it's cost them already 10 times their existing budget to migrate only 0.05 per cent of the content for the Government of Canada, we're talking about it ultimately costing hundreds of millions of dollars. It's not a small price ticket," said Mike Gifford, CEO of Ottawa-based web development company Open Concept, who has written articles criticizing the government's approach to Canada.ca.

New deadline 'impossible'

Based on the current timeline, Gifford said he thinks the December 2017 deadline is unrealistic. He's not alone.

"Absolutely impossible to achieve," said Timothy Lethbridge, who teaches software engineering and computer science at the University of Ottawa. "And I'm sure many people inside the project know it."

There's also a good chance of the project failing altogether, Lethbridge said, because large IT projects are exponentially more complex. "As a project of this size gets bigger, the probability of failure goes up."

If the government spread the work out over a number of years and spent a billion dollars, it might be able to make the migration a success, Lethbridge said. But he questioned whether taxpayers would be getting value for money at that point.

This is not the first large government IT project to run into problems.

The government will spend at least $50 million this year to try to fix problems with the new Phoenix pay system, which has seen thousands of public servants underpaid, overpaid or not paid at all.

The initiative to transform the government's email system has been stalled for months because of problems with new software.

And Shared Services Canada, the agency created in 2011 to modernize IT-related services in government, has been slammed for its many missteps, particularly by the auditor general.

"There's a trend," said Robin Galipeau, managing partner of OpenPlus, a content architecture company. "There's definitely something going on there. Large renewal projects in IT are failing in government."

OpenPlus, along with Dell and Microsoft, submitted a bid to create the new CMS for Canada.ca.

Ministers refuse to comment

According to OpenPlus Chief Technology Officer Joel Brockbank, the federal government continues to erroneously believe there are one-size-fits-all software solutions for its IT goals.

"There never is," he said. "It's like your cross-trainer running shoes. It's not good for anything that you do."

The key to not having large IT projects fail, Brockbank said, is to simply not do them. Instead, such projects should be done in stages or "bite-size chunks."

None of the ministers whose departments are involved in the Canada.ca migration project were willing to comment when contacted by CBC News.

Treasury Board President Scott Brison, Social Development Minister Yves Duclos and Public Services and Procurement Minister Judy Foote all declined requests. As did Michel Laviolette, the director general of Service Canada, and John Messina, the federal government's chief information officer.

"That tells me they have something to hide," said Debi Daviau, president of the Professional Institute of the Public Service of Canada, the union representing many of the government's IT workers.

"If they're unwilling to be transparent about the decisions they make, that calls those decisions into question."

Yonhap News Agency
Military investigators raid cyber command in hacking probe
Tuesday, 13 December 2016
Byline: Staff reporter

Seoul - Military investigators have raided South Korea's cyber command as part of their investigation into the first hacking of the command's intranet that is being blamed on North Korea, military officials said Tuesday.
"The Defense Security Command is thoroughly looking into how the cyberattacks took place, what confidential information has been leaked and if there was any professional negligence," a military official told Yonhap News Agency.

He confirmed that military prosecutors were overseeing the raid while the Defense Security Command was collecting documents in a raid to the cyber command on Tuesday.

In September, the defense ministry recognized that a total of 3,200 computers, including 700 linked with the intranet, were contaminated with malware a month after the latest cyberattack took place.

The ministry found in October some military documents were hacked while refusing to provide details. The computer used by Defense Minister Han Min-koo also turned out to have been compromised.

Last week, the ministry said the IP addresses linked to the attack were traced to a location in China that has been used by North Korean hackers.

As one of the military's two integration servers was jointly linked to the internet and the intranet, it allowed the hackers to gain access to the intranet, it said.

The cyber command separated the affected server from the whole network to avoid the spread of viruses in October, two months after the initial hacking attempt was made in August.

It marked the first time that the data of South Korea's cyber command has been compromised. South Korea set up the command in January 2010 as part of its efforts to counter external hacking attempts on the country's military.

North Korea -- which has thousands of cyberwarfare personnel -- has a track record of waging cyberattacks on South Korea and the United States in recent years, though it has flatly denied any involvement.

Yonhap News Agency
Acting President Hwang redoubles calls for robust cyberdefense
Tuesday, 13 December 2016
Byline: Song Sang-ho

Seoul - South Korea's Acting President and Prime Minister Hwang Kyo- ahn on Tuesday redoubled calls for robust cyberdefense against North Korea, saying cyberwarfare with the provocative state has already begun.
Following a suspected hacking by Pyongyang of Seoul's cybercommand intranet, Hwang and South Korean security officials have repeatedly stressed the need to prepare against the North's surreptitious cyberattacks which could be as devastating as physical military strikes.

"As evidenced in the recent hack of the (South's) defense ministry, North Korea has attempted to mount cyberattacks on major government facilities, and (this shows) cyberwarfare has already begun," he said during the first regular Cabinet meeting since he took over as acting president last Friday after President Park Geun-hye was impeached over a corruption scandal.

"Related ministries, including the ministries of defense and future planning, must devise thorough measures to prevent any recurrence (of hacking incidents) and take special caution not to allow any minor mistakes to threaten our security," he added.

The defense ministry said last week that a total of 3,200 computers, including 700 linked with the intranet, were infected with malware in August. The computer used by Defense Minister Han Min-koo was also affected, officials said.

In recent years, Seoul has been pushing to bolster its cyberdefense capabilities as Pyongyang has launched a host of attacks on South Korean corporate and government websites by mobilizing its specially trained personnel, including those based in China and other foreign countries.

The reclusive regime has denied responsibility for its cyberattacks including the latest one, upbraiding Seoul for "fabricating" claims about online attacks.

Hwang, in particular, ordered the government to check the nation's financial, traffic, broadcasting and energy networks, and other major national facilities to verify if they are exposed to any cybersecurity threats.

On the economic front, Hwang said that the country's economic fundamentals remain strong as Seoul has striven to maintain a consistent policy despite political uncertainties sparked by the corruption scandal.

The acting president also urged economic officials to keep close tabs on the financial and foreign exchange markets, as he pointed to the potential negative ramifications from a possible United States interest hike.

"I call on you to closely monitor the market situation and respond to it in a timely and resolute manner," he said.

Hwang went on to urge the Cabinet ministers to make concerted efforts to protect the socially vulnerable, including children from low-income families and senior citizens, particularly during the winter season.

Later in the day, Hwang held a luncheon meeting with senior professors and journalists as part of his efforts to solicit their views on ways to bring the nation, gripped by the scandal, back on track.

Hwang renewed his pledge to focus on forestalling any government vacuum and restoring stability in state governance.

Meanwhile, Hwang stepped up efforts to tackle a series of pending issues that can affect the wellbeing of citizens, as he strives to project an image of a trustworthy -- albeit temporary -- leader.

On the day, he directed Agriculture Minister Kim Jae-soo to convene a meeting of senior government officials and civilian experts, dedicated to containing avian influenza (AI), on a daily basis to better tackle the highly contagious virus.

He also instructed top officials from provincial governments to hold their own daily meetings separately to help stem the spread of the bird flu that has ravaged chicken farms across the country since mid-November.

Visiting police stations in Seoul, he called on officers to tighten their crackdown on crimes targeting women and other vulnerable individuals, particularly in the nighttime. He also ordered the police to

"root out" violent or drunk drivers, saying they could cause large-scale accidents involving many casualties.

Regarding the heavy snowfall expected for some parts of the country between Tuesday night and Wednesday afternoon, Hwang directed related ministers to take the necessary steps to minimize any possible damage or inconvenience to citizens.

Japan News
Attacks by Anonymous against Japan rising
Tuesday, 13 December 2016
Byline: Staff reporter

Cyber-attacks against Japan apparently carried out by international hacker group Anonymous have been increasing since September.
Last autumn, a number of government websites and other sites came under attack. However, the recent attacks are different from sophisticated cyber-attacks that aim to steal information. Experts call for people to respond calmly by taking necessary steps in advance without fearing them too much.

Late at night on Sept. 3, the website of the Hiroshima National Peace Memorial Hall for the Atomic Bomb Victims became inaccessible. Shortly after, a group saying it was Anonymous and opposed to dolphin hunting and other issues posted a statement online claiming responsiblity.

An official at the memorial hall said in bewilderment, "We have nothing to do with dolphin hunting."

It is believed a series of Anonymous attacks called Operation Killing Bay started around 2013 in protest against Japan's whale hunting and the annual dolphin hunts in Taiji, Wakayama Prefecture, in September.

Last year, to protest against the dolphin hunting in Taiji, distributed denial of service (DDoS) attacks were launched against government offices websites and infrastructure operators such as airports. DDoS attacks are aimed at rendering websites and other online services unavailable by sending a huge amount of data to the server.

According to police, the number of cyber-attacks Anonymous is believed to be involved in has grown since September. There were no cyber- attack-related website problems from May to August, but 29 incidents were confirmed in September, followed by 26 in October. From Nov. 1 to Nov. 27, there were 53 cases, bringing the total from September to Nov. 27 to 108.

In comparison, incidents ranged between the 10s and 20s each month from September to November last year, but rose to 56 in December.

"Their aim is not to make websites unavailable, but to promote their presence," said Nobuhiro Tsuji, senior security researcher at SoftBank Technology Corp.

This year, the targets of the attacks have conspicuously been small organizations and shops such as izakaya Japanese pubs, and groups totally unrelated to dolphin hunting. "The hackers could be different from last year, and their resources could be smaller," Tsuji said.

'Respond coolly'

When Anonymous started around 2006, it advocated the establishment of the freedom of the internet and made political appeals through legally permitted activities such as street demonstrations.

Currently, however, Anonymous tends to carry out cyber-attacks with the aid of unknown individuals who respond to invitations on Twitter and other websites. Participants are increasingly committing cyber-attacks for fun.

The website of the Kasumigaura river office of the Land, Infrastructure, Transport and Tourism Ministry came under attack in 2012. Anonymous is believed to have confused Kasumigaura with Tokyo's bureaucratic district of Kasumigaseki. The incident was indicative of the group's sloppy management.

Anonymous' main attack method, DDoS, can be committed without significant expertise. Basically, there is no way to defend against such attacks. It is a matter of waiting for an attack to cease, although measures have recently been developed to mitigate damage.

"Compared to cyber-attacks aimed at stealing information, DDoS attacks are not so sophisticated. In most cases, the websites attacked went down and that was it," said Masakatsu Morii, a professor at Kobe University specializing in information and telecommunications engineering.

Some observers point out that such cyber- attacks could increase ahead of the 2020 Tokyo Olympics and Paralympics. Morii said, "It is important that companies and organizations take necessary measures calmly. If they are attacked, they should respond coolly without overreacting."

The Australian Financial Review
Lone wolves and data dumps a problem (Canada)
Tuesday, 13 December 2016
Byline: Jonathan Porter

Sydney - Constant reconnaissance probes by nation states, attacks by computer network robber barons and lone wolves and data dumps from disgruntled workers - that is digital Australia's bleak picture painted for a cyber security forum in Sydney recently.
And without constant vigilance and fine-tuning of our cyber defences, the problem will only get worse.

"A lot of nation states and militaries are investing in capabilities that can be used to target utilities; power, water resource and energy providers," Major-General Stephen Day, former head of cyber at the Department of Defence who was the inaugural head of the Australian Cyber Security Centre, told the Australian Computer Society Cyber Forum in Sydney.

"There is no question reconnaissance is going on right now."

The glimpse behind the curtain at Australia's cyber defenders came during the question and answer period at the end of the forum, attended by some of the world's leading experts in the field.

An attendee put to the panel that an emerging risk was not lone wolf attackers "but of a state-sponsored cyber-attack sometimes from friendly countries we consider allies" and asked what was being done to mitigate the risk.

Day agreed that state-sponsored attacks were a "significant risk", particularly if people looked down the track a few years.

He added that there was also a "significant challenge with organised crime".

"We looked at the sectors that mattered most to our nation either from an economic prosperity perspective or from a national security perspective and put them in a priority order and looked at those sectors that were likely to be targeted by organised crime or by nation states and then we directed our organisational energy to help those sectors.

"So if, for example, you are in the utilities sector or critical infrastructure sector you will have had more experience of government contacting and working with you than the retail sector or the banking sector where you are likely to meet the police more than the national security base."

Victorian minister for Small Business, Innovation and Trade Philip Dalidakis said that while Day's statements were "sexy" and would generate headlines "the one thing everyone in the room has to be extremely cognisant of is that the overwhelming majority of attacks occur from within".

"Yes, we need to be able to stop attacks from the outside of the firewall but the fact of the matter is the two greatest attacks we have seen of data theft from inside were from Bradley Manning and (Edward) Snowden," he told the forum.

"There are a range of companies that will swear black and blue that they have got algorithms that will help flag anomalies within the system - people accessing certain types of data that they haven't done for ages - (or) if you have got your networks categorised under different security levels - people trying to access levels [other] than their security classification. Ultimately it comes down to people and training,

each organisation has to have people who are trained appropriately who can deal with it when - it's not a matter of if - it occurs."

Some of the greatest risks in organisations were the IT divisions themselves, he says.

"People who have the administrative access rights and passwords are sometimes the ones who are undertaking a whole range of activities that people on the rest of the network are banned from doing - including downloading huge amounts of illegal data. Which is, of course, one of the ways people get in.

"So don't go away from this thinking that if you focus on external you are protected because your internal [network] is 80 per cent of your risk."

On the intelligence side, he said he could speak more freely than other panel members because he was not a representative of the federal government.

Dalidakis said the nation was well served by the Five Eyes agreement on signals intelligence sharing with the US, Canada, New Zealand and the United Kingdom.

Fellow panel member Sandra Ragg, assistant secretary for cyber policy in the Department of the Prime Minister and Cabinet, said the nation did need to improve its cyber defences.

"The first thing we can do is improve our cyber defences.

"People focus on state- sponsored threats but cybercrime is a huge piece of the threat to our economy."

Is Trump's Twitter account a national security threat?
Tuesday, 13 December 2016
Byline: Nahal Toosi

Washington - Donald Trump has years of experience launching Twitter wars. But now, as he prepares to take the highest office in the country, there are growing fears that his tweets could spur a genuine national security crisis.
Intelligence and defense specialists believe the president-elect's use of the popular and powerful social media network is already being used by foreign agencies to analyze his personality, track his habits and detect clues about what to expect from a Trump-led American government.

And that's just based on what Trump writes on Twitter. It's not even counting the vulnerabilities that could arise if overseas hackers invade his phone and digital accounts.

"We've never had a president that's shared so much of themselves, not just what they're saying, but their psychological ticks in such an overt manner, and you can be sure that foreign actors are studying that, too," said P.W. Singer, a defense expert and co-author of "Cybersecurity and Cyberwar." "We're beginning to see what excites him, what angers him, what sets him off. We've never had this ability to read so much on what a president is thinking."

Trump, who prefers mobile phones to computers, is highly attached to his Twitter account (@realDonaldTrump), using the platform to share his thoughts deep into the night. Days after his stunning election victory, he was reportedly worried he would not be able to keep his Android phone upon reaching the Oval Office, suggesting he plans to keep tweeting even after he's sworn in. During his first sitdown interview as president-elect, he told "60 Minutes" that he would be "very restrained" in his Twitter use while in office, before using his account to rail against The New York Times the same day the interview aired.

Trump's following of 17.2 million is likely to expand as he takes office, and his disdain for the mainstream media may bolster his desire to keep up his direct outreach to the public through Twitter.

For the most part, the president-elect has used Twitter to comment on people and institutions on the domestic front, or to defend himself against their criticisms. His tweets are believed to have even influenced the stock market, including on Monday, when his criticism of Lockheed Martin's F-35 program was followed by a drop in the aerospace company's market value. On several occasions, however, Trump has ventured into the international realm.

In recent days, amid lingering Chinese anger over Trump's decision to break U.S. protocol and speak directly to the president of Taiwan, Trump, using two tweets, wrote: "Did China ask us if it was OK to devalue their currency (making it hard for our companies to compete), heavily tax our products going into.. their country (the U.S. doesn't tax them) or to build a massive military complex in the middle of the South China Sea? I don't think so!" On Monday, he used Twitter to sow doubts about claims he's not hard enough on Russia.

Granted, foreign intelligence agencies will likely look at all of Trump's public utterances -- his speeches, interviews, written press releases -- as well as those of his aides to try to understand one of the more unusual men ever to win the White House. (U.S. intelligence analysts do similar studies of foreign leaders, especially in countries such as Iran and North Korea, whose governments are considered hostile and with whom U.S. communication is limited.)

But so far, at least, Twitter has proven one of the purest distillations of Trump around -- a raw version of a businessman-turned-politician keen on ignoring the traditional conventions of the presidency.

Twitter's 140-character limit on tweets appears to appeal to Trump's short attention span and his preference for rapid-fire interactions. But 140 characters often don't leave space for much context, explanation or nuance. So what Trump writes may come across as more forthright and harsher than

what foreign governments are accustomed to in the diplomatic arena. The risk for a misunderstanding is, therefore, higher.

Foreign analysts following Trump's Twitter may not be inclined to simply take everything he writes at face value, especially when it comes to highly sensitive subjects. But, using sophisticated data tools, they may look for patterns that, over time, can help them better predict if Trump is being serious. In all likelihood, many intelligence specialists overseas have probably already done such analyses based on Trump's more than 34,000 tweets so far.

"If Trump's comments accurately reflect his intent, then we're giving the opponents a head start in dealing with the incoming presidential administration," a former U.S. intelligence officer said of Trump's Twitter habits. "If his comments are meant to conceal other intentions, then we're doing a pretty good job in misleading our adversaries."

A foreign government may check to see if Trump uses certain types of words before he takes certain types of actions. If Trump keeps tweeting during his presidency, a foreign entity may analyze what types of things he writes before making a policy announcement. (If Trump were to enable Twitter's geo-location services, that could also grab the attention of overseas actors, though it doesn't appear he uses that feature.) Even a lengthy silence from Trump could be a signal of some sort, sources connected to the intelligence community told POLITICO.

In August, David Robinson, a data scientist, published an analysis of Trump's tweets using digital tools.

It indicated that there were at least two people tweeting out under Trump's account. The tweets from an Android phone appeared to be coming from the Manhattan billionaire himself -- they were angrier and more negative. The ones from an iPhone were more quotidian, sharing announcements and photos; those were likely posted by one or more Trump campaign aides. (Some tweets may have been written by a staffer trying to sound like Trump.)

"A lot of 'emotionally charged' words, like 'badly', 'crazy', 'weak', and 'dumb', were overwhelmingly more common on Android," Robinson wrote, meaning it was Trump who was probably behind those particular tweets.

The U.S. has occasionally found itself in diplomatic dust-ups thanks to Twitter.

In September, during President Barack Obama's visit to China, the Defense Intelligence Agency tweeted "Classy as always China" after the American leader was deprived of a normal red-carpet arrival due to a dispute over which stairs he could use to leave his plane. The Pentagon-based agency later deleted the tweet and apologized.

Four years earlier in Egypt, during the brief presidency of Muslim Brotherhood leader Mohamed Morsi, the U.S. Embassy in Cairo slapped the Islamist organization's English-language Twitter account after it expressed concern for the safety of U.S. diplomats amid violent protests near their building.

"Thanks. By the way, have you checked out your own Arabic feeds? I hope you know we read those too," the embassy tweeted, implying the Brotherhood was using a very different tone in its non-English messages. The Americans later deleted the tweet.

Although Twitter has been around for most of Barack Obama's presidency, the outgoing president has been careful in using the medium. He was allowed to start using his own official account, @POTUS, only a couple of years ago: in May 2015, he sent out an inaugural tweet. The @POTUS account will be made available to Trump once he is sworn in.

The @BarackObama account is run by Organizing for Action, a liberal group that has long supported the president. It was not immediately clear if Obama would take over that account once he leaves office, but he's used it in the past, signing tweets he composed with a "-bo".

The White House Communications Agency, a military division that handles presidential communications security, referred questions about Trump's Twitter account and plans to safeguard his digital devices to the president-elect's transition team. The transition team did not respond to a request for comment. To date, it's not clear if Trump's phone conversations with foreign leaders are fully secured, though his team has said precautions have been taken.

Even as foreign capitals sift through Trump's tweets, there are questions about whether the social media company should take away his account for calling out individual Americans on Twitter. Trump's targets have included an Indianapolis union leader and a college student, who have faced death threats and harassment as a result.

When asked for comment about whether Trump should be booted off the platform, a spokesperson for the company replied: "The Twitter Rules apply to all accounts."

Reuters
Top U.S. spy agency has not embraced CIA assessment on Russia hacking - sources
Tuesday, 13 December 2016
Byline: Jonathan Landy, Mark Hosenball

Washington - The overseers of the U.S. intelligence community have not embraced a CIA assessment that Russian cyber attacks were aimed at helping Republican President-elect Donald Trump win the 2016 election, three American officials said on Monday.
While the Office of the Director of National Intelligence (ODNI) does not dispute the CIA's analysis of Russian hacking operations, it has not endorsed their assessment because of a lack of conclusive

evidence that Moscow intended to boost Trump over Democratic opponent Hillary Clinton, said the officials, who declined to be named.

The position of the ODNI, which oversees the 17 agency-strong U.S. intelligence community, could give Trump fresh ammunition to dispute the CIA assessment, which he rejected as "ridiculous" in weekend remarks, and press his assertion that no evidence implicates Russia in the cyber attacks.

Trump's rejection of the CIA's judgment marks the latest in a string of disputes over Russia's international conduct that have erupted between the president- elect and the intelligence community he will soon command.

An ODNI spokesman declined to comment on the issue.

"ODNI is not arguing that the agency (CIA) is wrong, only that they can't prove intent," said one of the three U.S. officials. "Of course they can't, absent agents in on the decision-making in Moscow."

The Federal Bureau of Investigation, whose evidentiary standards require it to make cases that can stand up in court, declined to accept the CIA's analysis - a deductive assessment of the available intelligence - for the same reason, the three officials said.

The ODNI, headed by James Clapper, was established after the Sept. 11, 2001, attacks on the recommendation of the commission that investigated the attacks. The commission, which identified major intelligence failures, recommended the office's creation to improve coordination among U.S. intelligence agencies.

In October, the U.S. government formally accused Russia of a campaign of cyber attacks against American political organizations ahead of the Nov. 8 presidential election. Democratic President Barack Obama has said he warned Russian President Vladimir Putin about consequences for the attacks.

Reports of the assessment by the CIA, which has not publicly disclosed its findings, have prompted congressional leaders to call for an investigation.

Obama last week ordered intelligence agencies to review the cyber attacks and foreign intervention in the presidential election and to deliver a report before he turns power over to Trump on Jan. 20.

The CIA assessed after the election that the attacks on political organizations were aimed at swaying the vote for Trump because the targeting of Republican organizations diminished toward the end of the summer and focused on Democratic groups, a senior U.S. official told Reuters on Friday.

Moreover, only materials filched from Democratic groups - such as emails stolen from John Podesta, the Clinton campaign chairman - were made public via WikiLeaks, the anti-secrecy organization, and other outlets, U.S. officials said.

"THIN REED"

The CIA conclusion was a "judgment based on the fact that Russian entities hacked both Democrats and Republicans and only the Democratic information was leaked," one of the three officials said on Monday.

"(It was) a thin reed upon which to base an analytical judgment," the official added.

Republican Senator John McCain said on Monday there was "no information" that Russian hacking of American political organizations was aimed at swaying the outcome of the election.

"It's obvious that the Russians hacked into our campaigns," McCain said. "But there is no information that they were intending to affect the outcome of our election and that's why we need a congressional investigation," he told Reuters.

McCain questioned an assertion made on Sunday by Republican National Committee Chairman Reince Priebus, tapped by Trump to be his White House chief of staff, that there were no hacks of computers belonging to Republican organizations.

"Actually, because Mr. Priebus said that doesn't mean it's true," said McCain. "We need a thorough investigation of it, whether both (Democratic and Republican organizations) were hacked into, what the Russian intentions were. We cannot draw a conclusion yet. That's why we need a thorough investigation."

In an angry letter sent to ODNI chief Clapper on Monday, House Intelligence Committee Chairman Devin Nunes said he was "dismayed" that the top U.S. intelligence official had not informed the panel of the CIA's analysis and the difference between its judgment and the FBI's assessment.

Noting that Clapper in November testified that intelligence agencies lacked strong evidence linking Russian cyber attacks to the WikiLeaks disclosures, Nunes asked that Clapper, together with CIA and FBI counterparts, brief the panel by Friday on the latest intelligence assessment of Russian hacking during the election campaign.

Yahoo News
Suspected Russian cyberattack waged on Clinton campaign just days before vote
Monday, 12 December 2016
Byline: Michael Isikoff

Washington - In the closing days of the 2016 election campaign, hackers believed to be working for Russian intelligence launched a new wave of attacks on Hillary Clinton's campaign and the Democratic

National Committee -- a previously unreported cyberoffensive that heightened concerns, now endorsed by the CIA, that the Russian government was seeking to influence the outcome of the election in favor of Donald Trump, according to sources familiar with the investigations into the attempted intrusions. The attacks came in the form of so-called "phishing" emails sent to nearly a dozen campaign and committee staffers in a renewed effort at penetrating their networks, said Dmitri Alperovitch, the co-founder and chief technology officer of CrowdStrike, the cybersecurity firm hired by the DNC to repel attacks on its network. Staffers at that point were alert enough to reject entreaties to click on the unsolicited email messages that would have allowed the hackers into their computers, he said.

But at least one top Clinton campaign staffer, communications director Jennifer Palmieri, told Yahoo News on Sunday that she received an alert from Google in mid- October informing her that her personal Gmail account had been targeted by a "foreign state" actor and that her password needed to be changed.

"They were targeting us throughout the election," said another former senior Clinton campaign staffer, who asked not to be identified. "They never stopped trying to get back in."

The disclosure of the late campaign attack could fuel a mounting controversy over U.S. intelligence findings that link Russian intelligence to the cyberattacks for the express purpose of throwing the election as part of a campaign, orchestrated in Moscow, to defeat Clinton.

The Washington Post reported Saturday that the CIA has briefed members of Congress on an assessment that the Russians targeted Democratic political organizations and campaign officials as part of a specific effort to defeat Clinton and elect Trump. This goes beyond an earlier public finding that U.S. intelligence officials were "confident" that the Russian government was behind the cyberattacks, but did not ascribe a motive for the Russians doing so.

One piece of damning evidence behind the new finding is that the CIA and the FBI have both identified specific individuals associated with or close to the Russian government who provided the DNC emails to WikiLeaks, which began publishing them in July, a senior law enforcement official told Yahoo News. Despite reports of a clash between the CIA and the FBI over the motive behind Russia's intelligence service in launching the operation, the differences are more a matter of "degree" and emphasis, with the FBI believing there may have been "mixed" motives for the Russian effort, the official said. Still, "we all agree they did these things," the official said.

But President-elect Trump doubled down on his rejection of the intelligence findings in an interview with Fox News anchor Chris Wallace that aired Sunday, dismissing any conclusion that points to Russian government involvement.

"I think it's ridiculous," Trump told Chris Wallace in interview that aired on "Fox News Sunday," his first Sunday show sit-down since winning the election. "I don't believe it."

"If you look at the story and you take a look at what they said, there's great confusion," Trump added. "Nobody really knows, and hacking is very interesting. Once they hack, if you don't catch them in the act you're not going to catch them. They have no idea if it's Russia or China or somebody. It could be somebody sitting in a bed someplace. I mean, they have no idea."

Alperovitch of CrowdStrike, the cybersecurity firm that first publicly linked the cyberattacks to Russian intelligence, said Sunday that he was "puzzled" by Trump's remarks and assumes he has not yet been fully briefed on the matter. (CrowdStrike, whose principals include Shawn Henry, the former chief of the FBI's cyber division, was initially hired by the DNC to investigate the cyberattacks and defend its network last May.)

"At this point, the matter of attribution on the intrusions has been settled,"Alperovitch said. "There is nobody that looks at the evidence who disputes this." Asked his level of confidence in his firm's findings, he responded "100 percent."

Much of the evidence, he said, revolves around the nature of the sophisticated tools used by the attackers on the DNC and forensic evidence showing strong similarities to Russian cyberattacks that have occurred in Ukraine and other Eastern European countries -- as well as to intrusions of the Joint Chiefs of Staff, the White House and the State Department and other U.S. government agencies. "The digital fingerprints are of the same origin," said Alperovitch.

CrowdStrike initially identified two sets of attackers on the DNC's servers: One, dubbed "Cozy Bear," was associated with the Russian FSB (the successor to the Soviet KGB) and which first breached the DNC's network in the summer of 2015. Another, dubbed "Fancy Bear," has been associated with Russia's military intelligence service, the GRU. The latter infiltrated the DNC's network in late April of this year in what turned into a far more devastating attack, resulting in the disclosure of 20,000 internal DNC emails to WikiLeaks -- an act, according to Alperovitch, of "information warfare." (He acknowledged that a third Russian intelligence service, the SVR, which has responsibility for foreign intelligence operations, may also have been involved.)

"When we look at this over 10 years -- literally hundreds of intrusions -- [and] you look at the tradecraft, you look at the victims, it all points to Russian intelligence services," Alperovitch said.

In addition, he said, there was another separate cyberattack discovered in late September from an undetermined party that penetrated DNC computers with software containing sensitive voter analytic data that was being provided in regular memos to Clinton campaign manager Robby Mook, the sources said.

The breach was detected by CrowdStrike, and the cyberinvaders were expelled from a cloud server housing the data; this server was distinct from the DNC's internal computer network that had been previously breached, he said. But the intruders were never identified, and it was never determined

whether the data -- containing detailed reports on voter registration and estimates of likely voter participation in the November election -- was ever actually stolen.

Alperovitch said he doesn't know whether these hackers were associated with Russian intelligence; they used different methods and publicly available cybertools to pull it off -- also he said the DNC never authorized his firm to conduct a full investigation. But he said the late October "phishing" attacks on the DNC and the Clinton campaign resembled the earlier Fancy Bear attacks, leading him to conclude they were likely the work of the GRU.

Moreover, attacks by the Cozy Bear intruders have continued throughout the fall, targeting multiple organizations, including think tanks and universities whose scholars work on Russian policy issues, he said.

And even more recently, he said, there was evidence that the separate "Fancy Bear" hackers are now also attacking political organizations in Germany and elsewhere in Europe in an apparent attempt to meddle in their elections as well. (The chief of German domestic intelligence said last week that there has been a recent increase in "aggressive cyberespionage" against German politicians and warned about "growing evidence for attempts to influence the [German] federal elections next year."

"These activities have not stopped," said Alperovitch. "Now that they were executed [in the United States] and they have a successful playbook, I fully expect they are going to continue."

Press TV
Iranian Army unveils new indigenous combat, reconnaissance drones
Tuesday, 13 December 2016

Tehran - The Iranian Army's Ground Forces has unveiled two domestically-designed and -manufactured drones on the final day of major military exercises code-named Mohammad Rasoulallah IV (Mohammad, the Messenger of God IV) in southeastern Iran.
One of the two aircraft, code- named Oghab (Eagle), is a combat drone capable of carrying air-to-surface missiles.

The other, code-named Shahin (Falcon) and developed and manufactured under a project code-named Shahid Mohsen Ghotaslou, can collect information on the positions and movements of enemy forces on reconnaissance missions. It boasts a flight endurance of 24 hours.

General Seyyed Kamal Peyambari, the spokesman for the military drills, said the jamming and combat techniques of drones were also fully tested at various altitudes on Tuesday, with the participation of military commanders and defense experts.

Peyambari noted that sophisticated and innovative weapons such as super- caliber 107mm rocket launchers, optimized versions of the 62.5mm PSG-1 and Dragunov semi-automatic sniper rifles, a jammer with an effective range of 800 meters, drone jammers, and cellular satellite phone jammers were put to practice on the last day of the drills as well.

Various and extensive psychological war techniques such as drills using 122mm flyer-carrying rockets, tactical radios and directional sound systems were also put to the test for the first time.

The senior Iranian military figure further noted that hand-launched drones as well as land minelayers were also tried out.

Peyambari added that electronic warfare, armored, infantry, mechanized infantry, commando, and intelligence units present at the Mohammad Rasoulallah IV military exercise, which covered an area of 220,000 square kilometers, successfully carried out their operations on the third day of the drills.

Iran has conducted major military drills in recent years to enhance the defense capabilities of its Armed Forces and to test modern military tactics and state-of-the-art equipment. Each year, the country inaugurates a host of new projects and hardware developed with reliance on domestic capabilities.

The Islamic Republic maintains that its defense power is driven by deterrence and poses no threat to any other country.

Hindustan Times
Legion: Meet the hackers who broke into Twitter accounts (Canada).
Tuesday, 13 December 2016

New Delhi - A hackers' group called Legion has repeatedly breached the Twitter accounts of some well-known Indians, including Congress vice- president Rahul Gandhi and prominent journalist Barkha Dutt. Legion has not posted any classified information on the hacked accounts but has threatened to expose email communications among Congress party leaders in the New Year. Earlier this month, they on his Twitter handle, vowing to bring to justice the fugitive industrialist who has defaulted on at least Rs 7,000 crore bank loans.

Here is some detail about the hackers' group: What is Legion? It is a coalition of like-minded hackers based out of five countries - the United States, Sweden, Canada, Thailand and Romania, according to the Delhi police's cybercrime cell. The group seeks to expand its activities, leaving its email id -- legion_group@sigaint.org - for more hackers to join their campaign.

Are they connected with Legion of Doom of the 1980s? The group does not appear to have any links with the hackers' group Legion of Doom (LoD) that targeted rich and famous people's email accounts in the mid-1980s. LoD remained active till early 2000s. However, the two groups appear to share

ideological goals in targeting what they say are the rich and corrupt. LoD was founded by US-based hacker Lex Luthor after he broke away from the Knights of Shadow.

Why do they hack people's accounts? Legion fancies itself as cyber vigilantes working to expose the corrupt. But the group is yet to bolster their anti-corruption crusader credentials, given that it has so far offered very little valuable information.

How does Legion operate? Legion communicates through email servers and browsers that are shielded against surveillance. In other words, it does not use Google Chrome or Internet Explorer but a browser called The Onion Router (TOR), which is difficult to track (provides anonymity) and allows a user to communicate directly with another one. This is also called the darknet, a platform often used by activists and journalists seeking to avoid a surveillance dragnet.

Are there other such hackers' groups? Yes. Anonymous is another loosely associated international network of activist and hacktivists which started operating in 2003. The group's website describes it as "an Internet gathering" with "a very loose and decentralised command structure that operates on ideas rather than directives". The group became known for crashing websites of governments, corporates and religious groups. Anonymous members (known as "Anons") use the Guy Fawkes mask as their emblem.

Saudi Gazette
IoT continues to pose a key cyber security threat
Tuesday, 13 December 2016
Byline: Mohammed Al-Moneer

Riyadh - The cyber landscape changes dramatically year after year. If you blink, you may miss something; whether that's a noteworthy hack, a new attack vector or new solutions to protect your business. Sound cyber security means trying to stay one step ahead of threat actors.
In the spirit of looking toward the future, I wanted to grab my crystal ball and take my best guess at what will be the big story lines in cyber security in 2017.

1. IoT continues to pose a major threat. In late 2016, all eyes were on IoT-borne attacks. Threat actors were using Internet of Things devices to build botnets to launch massive distributed denial of service (DDoS) attacks. In two instances, these botnets collected unsecured "smart" cameras. As IoT devices proliferate, and everything has a Web connection -- refrigerators, medical devices, cameras, cars, tires, you name it -- this problem will continue to grow unless proper precautions like two-factor authentication, strong password protection and others are taken.

Device manufactures must also change behavior. They must scrap default passwords and either assign unique credentials to each device or apply modern password configuration techniques for the end user during setup.

2. DDoS attacks get even bigger. We recently saw some of the largest DDoS attacks on record, in some instances topping 1 Tbps. That's absolutely massive, and it shows no sign of slowing. Through 2015, the largest attacks on record were in the 65 Gbps range.

Going into 2017, we can expect to see DDoS attacks grow in size, further fueling the need for solutions tailored to protect against and mitigate these colossal attacks.

3. Predictive analytics gains ground. Math, machine learning and artificial intelligence will be baked more into security solutions. Security solutions will learn from the past, and essentially predict attack vectors and behavior based on that historical data. This means security solutions will be able to more accurately and intelligently identify and predict attacks by using event data and marrying it to real-world attacks.

4. Attack attempts on industrial control systems. Similar to the IoT attacks, it's only due time until we see major industrial control system (ICS) attacks. Attacks on ecommerce stores, social media platforms and others have become so commonplace that we've almost grown cold to them. Bad guys will move onto bigger targets: dams, water treatment facilities and other critical systems to gain recognition.

5. Upstream providers become targets. The DDoS attack launched against DNS provider Dyn, which resulted in knocking out many major sites that use Dyn for DNS services, made headlines because it highlighted what can happen when threat actors target a service provider as opposed to just the end customers.

These types of attacks on upstream providers causes a ripple effect that interrupts service not only for the provider, but all of their customers and users. The attack on Dyn set a dangerous precedent and will likely be emulated several times over in the coming year.

6. Physical security grows in importance. Cyber security is just one part of the puzzle. Strong physical security is also necessary. In 2017, companies will take notice, and will implement stronger physical security measures and policies to protect against internal threats and theft and unwanted devices coming in and infecting systems.

7. Automobiles become a target. With autonomous vehicles on the way and the massive success of sophisticated electric cars like Teslas, the automobile industry will become a much more attractive target for attackers. Taking control of an automobile isn't fantasy, and it could be a real threat next year.

8. Point solutions no longer do the job. The days of Frankensteining together a set of security solutions has to stop. Instead of buying a single solution for each issue, businesses must trust security solutions from best-of-breed vendors and partnerships that answer a number of security needs. Why have 12 solutions when you can have three? In 2017, your security footprint will get smaller, but will be much more powerful.

9. The threat of ransomware grows. Ransomware was one of the fastest growing online threats in 2016, and it will become more serious and more frequent in 2017. We've seen businesses and individuals pay thousands of dollars to free their data from the grip of threat actors. The growth of ransomware means we must be more diligent to protect against it by not clicking on anything suspicious. Remember: if it sounds too good to be true, it probably is.

10. Security teams are 24/7. The days of security teams working 9-to-5 are long gone. Now is the dawn of the 24/7 security team. As more security solutions become services-based, consumers and businesses will demand the security teams and their vendors be available around the clock. While monitoring tools do some of the work, threats don't stop just because it's midnight, and security teams need to be ready to do battle all day, every day. Those are 10 things we see happening in the cyber security space next year.

Iran's Ground Force Unveils New Drone during Massive Drills
Tuesday, 13 December 2016

Tehran - The Iranian Ground Force unveiled a new drone named 'Farpad' during the massive wargames codenamed 'Mohammad Rasoulallah (PBUH) 4' in the Southeastern parts of the country on Monday morning. The hand- launched drone is run by autopilot and can fly maximum 45 minutes to the range of 20km.
Also during the second day of the three-day drills, the Iranian Ground Force unveiled a jamming system which is capable of confronting Unmanned Aerial Vehicles (UAVs) in a range of 3km and can force it to land after taking its control. The system is also portable by individuals.

In another development in the wargames, the home-made Toufan missiles whose range and destruction and precision-striking power have been improved were fired by helicopters and hit simulated enemy's targets precisely.

Also, the latest sniper gun manufactured for the Iranian Ground Force, 'Taher', with a range of 1.2km was unveiled on Monday. The gun weighs 4.4kg (without scope and magazine) and is 1.28m in length.

Meantime, the 209 (Cobra) and 214 helicopters of the Iranian Ground Force's air force units fired several rockets at two floating targets in Makran region (in the Sea of Oman) and destroyed them.

Also, two Mirage fighter jets of the Iranian Air Force participated in the drills for the first time and used air-based weapons in operations against the simulated enemy.

The massive 'Mohammad Rasoulallah (PBUH) 4' wargames started in the Southeastern parts of the country on Sunday morning.

"On the first day of the drills, rapid reaction units from other geographical regions of the country were transferred to the operational regions via air and ground in the shortest possible time," Spokesman of the drills General Seyed Kamal Payambari told reporters yesterday.

He said that the drills are being held in the strategic Southeastern parts of the country in a range of over 220,000km with the participation of different units of Ground Force, logistic forces of the Air Force and Khatam ol-Anbia Air Defense Base.

According to General Payambari, assessment of the Iranian forces' preparedness in the tactical fields and decreasing the time for their rapid reaction against threats as well as using new defense systems are among the goals pursued in the wargames.

Meantime, Army Airborne Commander Brigadier-General Houshang Yari announced on Sunday that dozens of different types of helicopters are flying over the wargames zone.

"Tens of different types of 206, 214, 209 (Cobra) and Chinook helicopters are present in the drills zone," General Yari told reporters today.

"During the drills, the command, track, control and close fire support missions as well as numerous heliborne operations will be carried out by the Airborne helicopters," he added.

General Yari said that the drills will also be a touchstone to assess the agility and power to overhaul and maintain helicopters.

Civil Defense Official Warns of New US Cyber Attack against Iran
Tuesday, 13 December 2016

Tehran - A senior member of Iran's Civil Defense Organization warned that Washington has hatched plots to launch new cyber operations against the country's infrastructures.
"At present, the US has launched a project named Nitro Zeus with the aim of attacking Iran's defense and telecommunication infrastructures," Alireza Karimi said on Monday, addressing a conference in Tehran.

"Based on studies that we have carried out, the project is assessed to be much more dangerous than the Stuxnet project," he added.

His remarks came after Deputy Head of Iran's Civil Defense Organization Brigadier General Mohammad Hassan Mansourian underlined in October his organization's full preparedness to confront the cyberattack and cultural invasion threats.

"Iran's Civil Defense Organization can defuse cyberattacks and cultural invasions," Brigadier General Mansourian said. He underlined that the advanced countries are currently making huge investments in the field of civil defense.

Mansourian underscored that the cyberattack and cultural invasion should only be responded by the national civil defense system.

In May 2015, Head of Iran's Civil Defense Organization Brigadier General Gholamreza Jalali announced that the country has set up cyber defense workgroups to better coordinate measures for defending nuclear facilities against enemies' cyber attacks.

"The country's vital cyber infrastructures have been identified and separate cyber workgroups have been formed in all fields," Jalali told reporters in Tehran.

"For instance a cyber defense workgroup was set up in the nuclear field for Natanz nuclear installations and no serious incident has threatened this section in the past two years," he added.

In relevant remarks in October 2014, Jalali revealed that a US cyberattack on Iran's nuclear enrichment facility in Natanz failed due to his organization's tough defensive measures.

"The first cyberattack, codenamed Olympic Games, was carried out on Natanz and was declared by the US President, but it met our heavy (defensive) response," Jalali told reporters in a press conference in Tehran.

The senior commander said the US changed its cyber commander following the failure in the cyberattack on Natanz, adding that the US general was forced to retire several months ago "due to the wrong information and data that he had presented to President Obama". And this was the result of our direct confrontation with them, General Jalali added.

The US was the principal player in the most sophisticated cyber-attack ever known and has been orchestrating a campaign against Iran designed to undermine the country's nuclear program.

The New York Times came up with an in-depth report on June 1, 2012 saying that from the very first month Barack Obama took over as US President, he secretly ordered increasingly sophisticated attacks on Iran's computer systems that run the country's main nuclear enrichment facilities.

The disclosures about Obama's role in the cyberwar against Iran appear to show beyond doubt that the US, with the help of Israel, was behind the Stuxnet virus attack on Iran's centrifuge machines - used to enrich uranium. The revelation then indicated that Washington and Tel Aviv were also behind the Flamer and Duqu virus attacks discovered by experts in May 2012.

Codenamed Olympic Games, the attacks were spearheaded by the US government under the Bush administration. Stuxnet targeted Siemens industrial equipment to spin hundreds of centrifuges beyond their breaking points and eventually disable Iran's nuclear efforts.

According to the report, Obama decided to speed up the attacks, even after the worm escaped from Iran's Natanz plant in 2010 and later ended up on the Internet.

During a meeting following the worm's escape, Obama even considered that the worm should be stopped thinking that America's most ambitious attempt to slow the progress of Iran's nuclear efforts had been fatally compromised. Should we shut this thing down? Obama asked members of the President's national security team.

However, he finally decided to go ahead with the cyberattacks. What followed thereafter was the Natanz plant being hit by several newer versions of the worm.

The report is said to be based on 18 months of interviews with current and former American, European and Israeli officials involved in the program as well as with outside experts, who provided contradictory assessments of how successful the attack was in slowing down Iran's progress of developing nuclear weapons.

While internal Obama administration estimates claim the effort was delayed by 18 months to two years, some other experts, both inside and outside the government, said that Iran's enrichment levels had steadily recovered. A year later, Iran enriched uranium to the 20-percent grade, way beyond the 5-percent purity level that was done in Natanz in 2012.

Cybersécurité. La Bretagne au coeur du combat
Tuesday, 13 December 2016
Byline: Journaliste maison

Bruz, France - Jean-Yves Le Drian, ministre de la Défense, a dévoilé au centre DGA Maîtrise de l'information à Bruz (35), près de Rennes, la doctrine des armées en matière de cybersécurité. « L'émergence d'un nouveau milieu, d'un champ de bataille cyber, doit nous amener à repenser profondément notre manière d'aborder l'art de la guerre (...), comme l'aviation au début du XXe siècle », a-t-il assuré, soulignant : « En temps de guerre, l'arme cyber pourra être la réponse, ou une partie de la réponse, à une agression armée, qu'elle soit de nature cyber ou non ». La doctrine présentée ce lundi, qui repose sur trois piliers - renseignement, protection/défense et lutte informatique offensive - est l'une des plus élaborées énoncées en Europe, avec celle du Royaume-Uni. Concrètement, la France pourra recourir au combat numérique comme à une arme classique de type missile pour riposter à une attaque, aussi bien cyber que conventionnelle. « Nos capacités cyber offensives doivent nous permettre

de nous introduire dans les systèmes ou les réseaux de nos ennemis, afin d'y causer des dommages, des interruptions de service ou des neutralisations temporaires ou définitives », a relevé le ministre.

Un bataillon de 2.600 « combattants numériques »

Un commandement des opérations cyber, placé sous la responsabilité directe du chef d'État-Major des armées, va être créé, dès janvier 2017. Il disposera d'un état-major resserré qui supervisera 2.600 « combattants numériques » . Les armées pourront « neutraliser » des infrastructures utilisées pour attaquer des intérêts français mais aussi « riposter » plus largement à une attaque cyber, a expliqué Jean-Yves Le Drian.

« Si une attaque cyber s'apparente à un acte de guerre, une riposte adéquate s'imposera (...) dans une logique de conflit ouvert », a-t-il souligné. Si l'attaque transite par un État qui « n'aurait pas empêché une telle utilisation, la responsabilité de cet État pourrait être mise en jeu », a-t-il averti.

Le Monde
Un an après sa création, la commission chargée du contrôle du renseignement
Tuesday, 13 December 2016
Byline: Jacques Follorou

Paris - Un an après sa création, la commission chargée du contrôle du renseignement affirme son indépendance
L'avis de la Commission nationale de contrôle des techniques de renseignement, née en octobre 2015 pour faire contrepoids aux puissants moyens de surveillance accordés aux services secrets, n'est que consultatif mais le premier ministre l'a suivi dans la plupart des cas.

Pour son premier rapport annuel, présenté mardi 13décembre, la Commission nationale de contrôle des techniques de renseignement (CNCTR), née, le 3octobre 2015, pour faire contrepoids aux puissants moyens de surveillance accordés aux services secrets français dans la loi du 24juillet 2015 sur le renseignement, jouait une part de sa crédibilité.

Nommé président de cette nouvelle instance indépendante, Francis Delon, ex-secrétaire général de la défense nationale et l'un des pères fondateurs de la plateforme nationale du renseignement technique qui alimente depuis 2008 la communauté française du renseignement, devait prouver que les premiers soupçons de grande proximité avec l'Etat étaient infondés. Il devait, de plus, montrer que dans une période où l'émotion pèse sur les décisions politiques, il saurait résister aux pressions l'invitant à ne pas s'opposer aux libertés prises avec le droit.

La CNCTR est chargée de contrôler de l'utilisation d'une douzaine de moyens de surveillance par les services de renseignement français. L'avis de la CNCTR, composée de dix-sept membres, dont trois ingénieurs, n'est que consultatif. Le premier ministre, seule autorité décisionnaire en la matière, l'a

néanmoins suivi dans la plupart des cas. La procédure dite d'urgence, qui permet de s'exonérer du point de vue de la CNCTR, n'a été déclenchée qu'à une reprise selon le rapport qui ne fournit aucun détail opérationnel.

8538 interceptions de sécurité validées

En un an, la CNCTR a visé 48208 demandes de collecte de données de connexion, qui portent parfois sur de simples recherches de numéros dans des annuaires. Elle a donné un avis favorable à 2127 demandes de géolocalisation et elle a validé 8538 interceptions de sécurité, des écoutes téléphoniques, alors que l'instance qui existait auparavant, la Commission nationale de contrôle des interceptions de sécurité (CNCIS), née de la loi de 1991, en avait contrôlé un peu plus de 7000 lors de sa dernière année.

La CNCTR reste très discrète sur les 7711 fois où «d'autres techniques» ont été déployées avec son aval. S'agissait-il de pose de balises, de sonorisation d'appartements, de recueil ou de collecte de données informatiques? On n'en saura rien. La CNCTR explique qu'elle est tenue par la loi qui lui interdit de révéler des capacités opérationnelles. Elle signale néanmoins que faute d'achèvement du chantier de «centralisation des données recueillies» par ces nouvelles techniques, elle n'a pas encore une vision sur leur utilisation sur tout le territoire.

6,9% des demandes renvoyées aux services

En matière d'avis défavorables, on note une augmentation par rapport au temps de la CNCIS qui ne donnait son avis que sur les interceptions de sécurité et les données de connexions. La CNCTR a renvoyé aux services 6,9% des demandes contre environ 1% à l'époque de la CNCIS. Avant la loi de juillet2015, les services de renseignement usaient d'un grand nombre de ces moyens intrusifs, balises, sonorisation de lieux, etc. sans demander l'autorisation à quiconque, en toute illégalité. Les avis défavorables de la CNCTR portent essentiellement sur ces outils, désormais légaux, mais particulièrement attentatoires à la vie privée.

Si la CNCTR s'est vue, de fait, reprocher par les services un surcroît de «paperasse», elle a surtout pu éprouver la réalité de son indépendance lors des tentatives du gouvernement de passer outre ses prérogatives. Ce fut ainsi le cas avec l'article851-2 sur le recueil de données de connexions en temps réel attachées à une personne sur l'ensemble de ses moyens de communication.

La loi sur le renseignement du 24juillet 2015 disposait que cette collecte ne pouvait être effectuée que «sur une personne préalablement identifiée comme présentant une menace» . Le gouvernement et le chef de l'Etat ont tenté, en janvier, d'utiliser ce moyen pour mettre sous surveillance des listes entières de suspects, notamment les fameux fichés «S» pour islam radical, soit près de 14000 personnes. M.Delon a bloqué cette requête considérant qu'elle n'est pas conforme à la loi qui impose que chaque demande doit être individualisée et justifiée.

Pour contourner ce refus de valider «des surveillances groupées et simplifiées», le gouvernement, soutenu par un législateur, davantage soucieux d'étendre la surveillance d'Etat que de jouer son rôle de contre-pouvoir, a, depuis, modifié à deux reprises le périmètre de cet article de loi. Dans le cadre des lois sur la prorogation de l'Etat d'urgence, le Parlement a d'abord élargi la surveillance aux personnes «pouvant constituer une menace» . Et fin juillet, il a étendu la collecte de données de connexion en temps réel à l'entourage de la personne surveillée dès lors qu'il existait simplement «des raisons sérieuses de penser» qu'espionner ces gens au sein de cercles familiaux, amicaux, professionnels ou occasionnels puisse avoir un intérêt.

L'«exception hertzienne»

Si les parlementaires n'ont pas été d'une grande aide pour la CNCTR, elle a, en revanche, trouvé dans le Conseil constitutionnel un soutien inattendu pour tenter d'étendre son contrôle sur un pan entier des surveillances en France qui restaient jusque-là interdites, les communications hertziennes. Qualifiée d' «exception hertzienne» par la CNCTR, cette dérogation du droit consacrée par la loi de 1991 sur les interceptions puis prorogée dans la loi de juillet de 2015, a pris fin lors de sa censure, le 21octobre, par le Conseil constitutionnel.

Se félicitant de la décision du Conseil de vouloir faire entrer la surveillance par voie hertzienne dans le droit commun et d'avoir été chargée par lui de veiller à son application d'ici au vote d'une nouvelle loi, au plus tard le 31décembre 2017, la CNCTR a, au moins jusqu'à cette date, le pouvoir de viser chaque demande d'interceptions effectuée par cette technique. Souhaitant poursuivre son avantage, la CNCTR demande, dans son rapport, d'être «consultée sur l'éventuelle nouvelle législation» .

Le Temps (Suisse)
ID Quantique se déploie à l'international
Tuesday, 13 December 2016
Byline: Dejan Nikolic

Londres - Le numéro un mondial de la cryptographie quantique et de la génération de nombres aléatoires ouvre un bureau à Londres, signe un partenariat stratégique avec le géant coréen SK Telecom et s'attaque au marché chinois
ID Quantique (IDQ), pépite issue des laboratoires de physique appliquée de l'Université de Genève, s'offre un déploiement sans précédent. L'actuel numéro un mondial de la cryptographie quantique et de la génération de nombres aléatoires étend tout d'abord ses activités à la Grande-Bretagne. A travers notamment un contrat consistant à sécuriser les échanges d'informations entre l'un des sites de BT (anciennement British Telecommunications) et Cambridge.

IDQ ouvre également une officine britannique, afin de prendre part à une plateforme scientifique nationale de 384 millions de francs sur cinq ans. « Huit grandes universités du pays ainsi que le secteur

privé et public participent à ce programme », précise Grégoire Ribordy, fondateur d'IDQ, qui imagine affecter cinq collaborateurs à Londres d'ici à un an.

Parallèlement à cette nouvelle tête de pont britannique, IDQ signe une alliance avec SK Telecom, le principal opérateur de Corée du Sud (29,45 millions de clients, soit environ 50% du marché local, pour près de 15 milliards de francs de chiffre d'affaires l'an passé). Ce rapprochement avec la major de l'un des pays les plus connectés de la planète est assorti d'une levée de fonds de plus de 4 millions de francs. Soit la troisième injection de capital en quinze ans, les deux précédentes rondes ayant permis d'engranger respectivement un million (2004) et quatre millions (2014).

La fibre commerciale

L'entreprise carougeoise, lancée en 2001 et qui affiche une croissance moyenne de 30% par an, emploie aujourd'hui une cinquantaine de salariés, soit plus du double qu'en 2014. Son dernier tour de financement, auquel participent d'autres investisseurs stratégiques, est destiné à renforcer sa suprématie à l'échelle planétaire. Et d'asseoir son développement en Asie.

« L'une des filiales de SK Telecom fabrique des puces pour smartphones intégrant des nombres aléatoires, relève Grégoire Ribordy. Ce dispositif bon marché, qui permet de réduire la vulnérabilité des appareils, est en passe de révolutionner le monde de la téléphonie mobile. » Un boîtier traditionnel, de taille standard, coûte environ 1000 francs. Avec la technologie sud-coréenne embarquée, générer des clés ou des mots de passe exclusifs coûtera jusqu'à 100 fois moins cher.

Promesses quinquennales

Dans la foulée, IDQ inaugure son entrée sur le marché chinois. Via une coentreprise avec China Quantum Technologies (CQT), une société pionnière dans les technologies quantiques, à l'origine du plus important réseau commercial en la matière. Soit entre les villes de Shanghai et de Hangzhou, un tronçon de communication ultra-sécurisé d'environ 200 km. « Les contrats ont été signés il y a un mois », se félicite Grégoire Ribordy, sur le point d'ouvrir avec son partenaire chinois une usine dans la province du Zhejiang.

Le nouveau site de production, appelé à fonctionner avant fin 2017 avec un effectif de 50 collaborateurs, doit notamment permettre à CQT d'accéder au savoirfaire genevois en participant à la fabrication notamment de produits d'appel destinés aux casinos et aux paris en ligne. En échange de quoi, IDQ se voit offrir une porte d'entrée sur le potentiel commercial chinois.

La cryptographie quantique est l'un des cinq axes du 13e plan quinquennal de Pékin, définis comme étant d'importance stratégique cruciale pour la nation. Le prix d'un appareil de cryptage, qui c oûte actue llement 50 000 francs pièce, « sera divisé par dix grâce aux volumes du marché chinois », estime Grégoire Ribordy.

Toutefois, les spécialistes se heurtent pour l'heure à un obstacle technique de poids: par voie terrestre, le système ne fonctionne que de point à point, jusqu'à cent kilomètres au maximum. Au-delà, trop de photons sont perdus par diffusion en raison des imperfections de la fibre. Il faut alors aménager des noeuds intermédiaires pour que la particule qui compose la lumière, et qui sert à envoyer les clés de chiffrement nécessaires au décodage de l'information, soit impossible à intercepter. Le maillage Shanghai-Hangzhou, qui garantit que toute tentative d'espionnage provoque l'autodestruction du signal, en compte par exemple cinq.

Mais la Chine rêve d'inaugurer, d'ici à 2030, un système d'échange de données inviolable à l'échelle mondiale. Pékin a ainsi lancé le 15 août dernier le premier satellite de communication indéchiffrable à longue distance (près de 2500 km). Seul hic: l'instrument en orbite doit être orienté de manière extrêmement précise vers les stations au sol. « Ce sera comme lancer une pièce de monnaie d'un avion volant à 100 km d'altitude et espérer qu'elle vienne se ficher exactement dans la fente d'une tirelire cochon en rotation », avait alors expliqué Wang Jianyu, le responsable en chef de cette percée technologique de Pékin.

Le Télégramme
Lannion. Nouvelle Breizh cyber valley
Tuesday, 13 December 2016
Byline: Journaliste maison

Lannion, France - Marie-Hélène Clam et Riwan Marhic Après Rennes et Bruz (35), la journée cybersécurité du ministre de la Défense, Jean-Yves Le Drian, s'est achevée sur le site de Nokia, à Lannion (22). Il s'y est vu confirmer la création de 500 emplois d'ingénieur Recherche et Développement d'ici à la fin 2018, dont une grande partie à Lannion, ciblée pôle mondial pour ce secteur.
« Lannion sera le centre mondial pour Nokia concernant la recherche en cybersécurité », a lancé Marc Rouanne, le numéro deux du groupe Nokia. Devant un Jean-Yves Le Drian acquis à la cause puisque lanceur du Pact Cybersécurité dès 2012, le dirigeant a confirmé le recrutement de 500 ingénieurs Recherche et Développement dont 300 jeunes diplômés. À lui seul, le site de Lannion accueillera une centaine de ces ingénieurs amenés à travailler sur la 4G, la 5G, l'internet des objets et bien sûr la cybersécurité. « Nokia est aussi sponsor de la première formation informatique et cyberdéfense de l'École nationale supérieure d'ingénieurs de Bretagne-Sud (ENSIBS) à Vannes, aide au codéveloppement des start-up locales et des acteurs européens », a ajouté Arnaud Laforge, directeur du site.

Scanner le trafic pour détecter les espions

Une heure durant, le ministre a pu assister à des démonstrations : du chiffrement des données à la détection des espions, appliqués aux domaines militaire et civil. « Les pare-feu, qui servent à se protéger des intrusions extérieures par internet, sont inutiles car plus d'un million d'appareils sont déjà infectés, a expliqué Giuseppe Targia, directeur de la sécurité chez Nokia. Certains pirates peuvent déjà avoir accès à nos machines. Notre solution basée sur la reflectométrie permet de vérifier en continu s'il y a des

irrégularités au sein de notre réseau, juste en observant le comportement de nos appareils ».Adopté par la Banque de France, ce système permet de scanner le trafic automatiquement et de détecter des pertes de données dues à un réseau vieillissant ou à une interception des données, donc à de l'espionnage. Espionnage rendu possible grâce à des dispositifs coûtant moins de 10 achetés sur internet, que les pirates placent dans les boîtiers de fibre optique. Pour s'en protéger, l'équipementier développe un nouveau type de boîtier sécurisé qui sera opérationnel, fin 2017. Autre innovation, le réseau ultra-compact. Ce gros sac à dos permet d'établir des communications fiables en quelques minutes, n'importe où dans le monde. Déjà utilisé par les Marines américains, il peut être fixé à un drone ou à un ballon et bénéficie d'une couverture téléphonique et internet à 70 km à la ronde. En plus de son usage militaire, il sera mis à disposition des ONG ou des pompiers en cas de catastrophe naturelle.

« Comme des anticorps »

« La meilleure défense que nous connaissions, c'est le système immunitaire humain. Alors on s'en est inspiré pour notre cybersécurité : quand il y a un problème, le réseau réagit vite et apprend de ce problème pour s'en prémunir à l'avenir, comme des anticorps », résume Giuseppe Targia. Des innovations qui ont impressionné Jean-Yves Le Drian. « C'est quasiment une cyber armée qui se met en place en Bretagne. Dans le contexte de menace terroriste et avec 50 milliards d'objets connectés d'ici à 2025, il s'agit pour la France de garder de l'avance pour préserver son leadership sur ce domaine. Et Lannion en sera une Breizh cyber valley ».

Le Figaro
Le Conseil national du numérique hausse le ton face au fichier TES
Tuesday, 13 December 2016
Byline: Elisa Braun

Paris - Le fichage des Français au sein d'une base de données unique inquiète l'organe indépendant Non, c'est non. Le Conseil national du numérique (CNNum) reste intransigeant sur le fichier TES, qui permet au gouvernement de regrouper les données personnelles (sexe, couleur des yeux, taille, photo, empreintes digitales, filiation, nationalité...) de près de 60 millions de Français. Le CNNum en avait déjà demandé la suspension le 7 novembre dernier dans une lettre ouverte au gouvernement, où il déplorait les risques de dérives créées par un tel dispositif.

La nouvelle prise de position du CNNum publiée lundi et qui résulte des contributions recueillies par sa plateforme de consultation et d'auditions d'experts, est encore moins tendre avec le gouvernement. Outre la demande réitérée de suspension du fichier, le Conseil préconise dans son rapport l'instauration d'un débat public sur les sujets de l'identité administrative et l'identité en ligne. Il insiste également sur l'«urgence à instaurer une nouvelle gouvernance des choix technologiques au sein de l'État».

Un contre-exemple symptomatique

Au-delà de la polémique, le fichier TES apparaît selon le CNNum comme «le symptôme d'un processus décisionnel qui, en matière technologique, n'intègre pas suffisamment les exigences d'une vision politique de long terme». Au fil des pages du rapport, le Conseil mentionne les nombreux risques de dérives que constitue un tel fichier dans un contexte d'attaques cybersécuritaries accrues. Il recommande d'édicter un cadre général pour ce type de décision, et suggère notamment l'obligation de fournir des études d'impact approfondies et de tenir des débats publics.

L'organe consultatif recommande de renforcerle rôle d'instances spécialisées comme la Commission nationale informatique et libertés (Cnil), la direction interministérielle du numérique et du système d'information et de communication de l'État (Dinsic) et de l'agence nationale de la sécurité des systèmes d'information, l'Anssi.

Une querelle sans fin

Le fichage des Français a rouvert les fractures créées par le projet de loi sur le Renseignement, l'an dernier. Si le fichier TES est censé simplifier les formalités d'obtention et de renouvellement des titres d'identité, ainsi qu'éviter la fraude documentaire, certains opposants ont dénoncé son caractère attentatoire à la vie privée. Dans un contexte d'État d'urgence prolongé et de mesures prises contre le terrorisme, ce fichier TES a aussi été critiqué pour sa potentielle utilisation à des fins de renseignement.

Bernard Cazeneuve - alors ministre de l'Intérieur et à l'initiative du décret - a écarté cette possibilité devant la commission des Lois de l'Assemblée, le 9 novembre. Il n'a en revanche pas su lever les doutes de certains parlementaires, concernant les risques de sécurité liés à la concentration en un même fichier d'autant de données sensibles. Le ministère de l'Intérieur a consenti à rendre optionnel le versement des empreintes biométriques dans la base de données. Le ministère a également saisi la Dinsic (Direction interministérielle du numérique et du système d'information et de communication de l'État) et de l'Anssi (Agence nationale de la sécurité des systèmes d'information) afin d'évaluer le risque d'attaque informatique.

Lors d'une récente audition à la commission des lois du Sénat, les dirigeants de ces deux institutions n'ont pas fait mystère de leur intention d'amender le projet de l'Intérieur. Guillaume Poupard, directeur de l'ANSSI, s'est inquiété des risques géopolitiques: «Que se passerait-il si quelqu'un voulait déstabiliser la France non pas via une attaque très visible, mais en distillant des erreurs de-ci, de-là au sein du fichier?», rappelant que «ce genre d'armes est de plus en plus utilisé dans le cadre de conflits avoués ou pas entre grands États». «Je crois qu'il faut remettre à plat tout cela pour que le débat puisse reprendre sur des fondamentaux plus solides», a plaidé Henri Verdier, directeur du Dinsic. À la différence des deux instances, le CNNum, qui souhaite pour sa part repenser intégralement le fichier TES, reste pour sa part un organe purement consultatif.

La Tribune (France)
Surveillance spatiale : la France reste dans la cour des Etats- Unis et de la Russie

Tuesday, 13 December 2016
Byline: Michel Cabirol

Paris - La direction générale de l'armement a notifié le contrat de modernisation du système de surveillance de l'espace Graves à l'ONERA et à la PME Degreane Horizon. Un enjeu crucial pour la France qui peut ainsi suivre dans l'espace les satellites espions.
Le ministère de la Défense lance la modernisation du système de surveillance de l'espace Graves comme l'avait annoncé La Tribune (lien : http://www.latribune.fr/entreprises- finance/industrie/aeronautique-defense/surveillance-spatiale-la-france- modernise-le-systeme-graves-a-minima-602219.html). La direction générale de l'armement (DGA) a notifié un contrat pouvant s'élever jusqu'à 40 millions d'euros, qui comprend une tranche ferme et des tranches optionnelles, à deux cocontractants : le centre français de la recherche aéronautique spatiale et de défense l'ONERA et la PME électronique Degreane Horizon, spécialisée dans l'acquisition et l'émission de données sensibles. Cette filiale du groupe Vinci était depuis 2003 un des fournisseurs du centre de recherche français sur ce programme. La DGA a toutefois confié à l'ONERA la responsabilité du maintien des performances du système puis de son amélioration.

La tranche ferme de ce programme de rénovation court sur une période de cinq ans (huit ans si on rajoute toutes les tranches optionnelles). Elle représente plus de la moitié de la valeur du contrat, selon le chef de projet du système Graves au sein de l'ONERA, Florent Muller. Le système Graves est essentiellement installé sur trois sites, l'un à Dijon (le site d'émission avec les grande antennes), un autre sur le plateau d'Albion (site de réception) et, enfin, à Lyon Mont-Verdun, où le centre opérationnel de surveillance militaire des objets spatiaux (COSMOS), traite les données du système Graves (exploitation).

Graves, un système de renseignement stratégique

Mis en service depuis 2005 pour le compte de l'armée de l'air, le système Graves (pour Grand Réseau Adapté à VEille Spatiale) est un programme unique en Europe. Seuls les États-Unis et la Russie ont officiellement un programme équivalent alors qu'un cercle très restreint de pays, comme la Chine par exemple, pourraient en posséder un également. A ce jour, il est capable "de cataloguer des objets de la gamme du mini-satellite jusqu'à 1.000 km d'altitude", souligne Florent Muller. Soit un engin de la taille d'une machine à laver.

"Les données générées permettent de calculer à tout instant la position de l'ensemble des satellites suivis", précise-t-il. Actuellement, Graves détecte et catalogue tous les jours plus de 2.500 objets. C'est l'armée de l'air qui assure la mise à jour quotidienne du catalogue. Car pour rester catalogué, un objet doit être détecté tous les jours.

« La France a été le troisième pays au monde, après les Américains et les Russes, à se doter d'un tel système, avait expliqué en juin 2015 dans une interview accordée à la Tribune le PDG de l'ONERA, Bruno Sainjon. L'ONERA a conçu Graves, a piloté sa réalisation et l'a transféré à l'armée de l'air en 2005. Ce programme a notamment permis des échanges de données avec les États-Unis. Et, en avril 2015, cette

coopération s'est renforcée, les deux ministères de la Défense voulant désormais échanger des informations classifiées". »

Ce système de renseignement militaire stratégique, un outil extrêmement précieux pour la France, peut notamment suivre à une altitude de moins de 1.000 kilomètres les satellites espions, qui survolent la France et observent les sites sensibles. Ce qui permet à l'armée de l'air de cataloguer pratiquement tous les satellites espions alliés et ennemis ainsi que d'autres engins spatiaux. "Graves permet de détecter les menaces qui pèsent sur nos propres moyens spatiaux", confirme Florent Muller.

L'armée de l'air a d'ailleurs reconnu avoir identifié en 2012, puis 2013 et, enfin, en 2015, des engins spatiaux qui se sont approchés de satellites militaires français. Ces satellites sont d'ailleurs restés à leur contact pendant une période relativement longue. Très certainement pour les écouter. Il détecte également les vols en formation de satellites. En outre, Graves permet d'éviter d'éventuelles collisions entre des débris spatiaux et les satellites français en les déplaçant le cas échéant.

Enfin, le système concourt à la protection des populations face aux rentrées atmosphériques à risques (engins spatiaux, comètes...). Car plus de 12.000 satellites artificiels et objets divers, dont la taille est supérieure à dix centimètres, orbitent autour de la Terre.

Graves pourrait identifier des micro-satellites

Malgré sa robustesse et sa simplicité, le système Graves, un prototype qui était innovant en 2005, doit être aujourd'hui modernisé, les équipements ayant vieilli. Cette opération de rénovation permettra désormais d'assurer la pérennité de Graves "jusqu'en 2030", estime Florent Muller. Dans ce contexte, la tranche ferme du contrat confié à l'ONERA et à Degreane Horizon comprend en grande partie le traitement des obsolescences du système ainsi que quelques améliorations de ses performances, notamment du calculateur de traitement de signal.

« Certaines performances seront accrues grâce notamment à des interventions au niveau des antennes de réception et du traitement du signal, supportées par un nouveau calculateur", explique l'ONERA dans son communiqué. »

Plus précisément, l'ONERA sera en charge de la rénovation et des améliorations des sites de réception et d'exploitation. La filiale de Vinci modernisera pour sa part à l'identique les systèmes d'émissions en gérant les obsolescences.

Avec les tranches conditionnelles, de nouvelles améliorations du système sont prévues. En parallèle du lancement de la tranche ferme, l'ONERA effectuera des études techniques opérationnelles pour définir quelles pourraient être les options pour améliorer Graves. "A l'issue de ces études, un certain nombre d'options accessibles pourra être ainsi notifié en parallèle de la tranche ferme", confirme Florent Muller.

L'ONERA vise notamment l'amélioration de l'observation d'objets spatiaux plus petits. Et de passer "de façon progressive avec les options les plus complètes" de la détection de mini-satellites (inférieur à 500 kg) à celles de micro-satellites (inférieur à 150 kg). Dans sa nouvelle configuration, Graves détectera beaucoup plus d'objets spatiaux qu'actuellement si les tranches conditionnelles du contrat sont levées.

Un outil de souveraineté

Entre une modernisation a minima et une modernisation plus ambitieuse, le ministère de la Défense n'a pas encore tout à fait tranché en découpant le programme de modernisation de Graves en plusieurs tranches, dont des tranches optionnelles. Cet outil de souveraineté permet pourtant de discuter d'égal à égal - ou presque - avec les États-Unis. Ce qui n'est pas rien et confirme bien que la France est depuis 2005 dans le club très fermé des puissances dotées de capacités autonomes de surveillance de l'espace. Au ministère de la Défense de décider de l'ampleur de cette opération cruciale pour l'indépendance de la France en matière de surveillance spatiale une fois les recommandations de l'ONERA émises.

Développé sous contrat de la DGA, le système Graves est constitué d'un radar bistatique spécifique associé à un système de traitement automatisé qui permet la création et le maintien à jour d'une base de données des paramètres orbitaux des satellites qu'il détecte. Fruit de la collaboration des spécialistes des départements Électromagnétisme et radar (DEMR) et Conception et évaluation des performances des systèmes (DCPS) de l'ONERA, le radar du système Graves a été spécifiquement conçu pour la surveillance de l'espace.

Cybersécurité : la France muscle son arsenal
Tuesday, 13 December 2016
Byline: Journaliste maison

Paris - Le combat numérique va devenir une arme à part entière des armées françaises, aussi bien offensive que défensive, face à une cybermenace qui vise de plus en plus les intérêts vitaux des États. «L'émergence d'un nouveau milieu, d'un champ de bataille cyber, doit nous amener à repenser profondément notre manière d'aborder l'art de la guerre», a déclaré hier le ministre de la Défense Jean-Yves Le Drian, en dévoilant la doctrine des armées françaises en matière de cybersécurité.

Dans un monde de plus en plus interconnecté, les cyberattaques venant d'États, hackers, groupes terroristes ou criminels se multiplient, a relevé le ministre.

Elles peuvent paralyser des infrastructures vitales (réseaux téléphoniques, centrales électriques, transport..) tout comme des cibles militaires en tentant de pénétrer les systèmes embarqués d'aéronefs, bâtiments de guerre ou blindés.

«L'arme cyber peut avoir des effets tout à fait comparables à l'armement plus conventionnel», a averti Jean-Yves Le Drian en inaugurant les nouveaux locaux de DGA Maîtrise de l'information, qui réunit les cyberexperts de la Défense à Bruz (Ile-et-Vilaine) près de Rennes.

Face à ces menaces, les armées verrouillent de plus en plus leurs systèmes d'information - ils sont protégés par des «murailles» et des «patrouilles» qui traquent les intrus - mais intègrent aussi désormais le cyber comme une arme offensive.

«En temps de guerre, l'arme cyber pourra être la réponse, ou une partie de la réponse, à une agression armée, qu'elle soit de nature cyber ou non», a énoncé M. Le Drian.

Concrètement, la France pourra recourir au combat numérique comme à une arme classique de type missile pour riposter à une attaque aussi bien cyber que conventionnelle.

Un commandement des opérations cyber, le CYBERCOM, placé sous la responsabilité directe du chef d'état-major des armées, va être pour cela créé en janvier 2017.

Il disposera d'un état- major resserré qui surpervisera 2.600 «combattants numériques» d'ici 2019.

20.282 personnes espionnées en un an sur le territoire français
Tuesday, 13 December 2016
Byline: Christophe Cornevin

Paris - Dans son premier rapport d'activité dévoilé mardi matin, la Commission nationale de contrôle des techniques de renseignement (CNCTR) évalue que 47% des personnes surveillées l'ont été dans des dossiers terroristes et 29% au titre de la «lutte contre la criminalité organisée» ainsi que de la «prévention des violences collectives».
Entre le 3 octobre 2015 et le 2 octobre dernier, quelque 20.282 personnes ont été espionnées par les services français. En dévoilant mardi matin son premier rapport d'activité, la Commission nationale de contrôle des techniques de renseignement (CNCTR) a évalué le nombre d'hommes et de femmes qui ont fait l'objet d'une surveillance. Celle-ci passe par l'emploi de la technique la moins intrusive, à savoir l'obtention des «fadettes» (facturations détaillées) de la personne ciblée jusqu'à des moyens plus lourds, telles que la sonorisation ou l'installation de moyens vidéo dans les domiciles en passant par les interceptions de sécurité, la géolocalisation, l'accès en temps réel aux données de connexion» ou encore l'emploi - encore parcimonieux - des «Imsi catchers» permettant de siphonner à distance les données de connexion des téléphones mobiles.

Les algorithmes, c'est-à-dire la «boite noire», tant contestée censée assurer un recueil massif de données, ne devraient être mis en ouvre qu'au printemps prochain. «Pour l'heure, ils n'ont pas pu être mis en place pour des raisons de moyens techniques», précise-t-on à la CNCTR.

47% dans les radars de l'antiterrorisme

Au nombre de ceux ayant «fait l'objet d'une technique de renseignement au moins», le rapport de la CNCTR révèle que «9624 personnes, soit 47% du total, ont été surveillées au titre de la prévention du terrorisme» et que 5848 autres, soit 29% du total, ont été ciblées dans des dossiers de lutte contre la criminalité organisée ainsi que «la prévention de violences collectives de nature à porter gravement atteinte à la paix publique».

La CNCTR, qui se dit «particulièrement vigilante sur ce point», considère que «cette finalité ne saurait être interprétée comme permettant la pénétration d'un milieu syndical ou politique ou la limitation du droit constitutionnel de manifester ses opinions, y compris extrêmes, tant que le risque d'une atteinte grave à la paix publique n'est pas avéré.» Nombre d'observateurs y ont vu une disposition visant les zadistes mais aussi les no-borders, les blacks blocks ou encore les hooligans.

Les autres 24% de personnes placées dans les radars des services, qu'ils soient Français ou étrangers, ont été soupçonnés de porter atteinte à «l'indépendance nationale, l'intégrité du territoire et la défense nationale», d'espionnage industriel ou encore d'être liés à la «prolifération des armes de destructions massives».

8538 avis sur des demandes d'interceptions de sécurité

La démarche, tout à fait inédite dans le panorama feutré de l'espionnage, ne permet «aucun point de comparaison avec l'étranger», précise le conseiller d'État Francis Delon, président de la CNCTR qui, en aparté, ne se dit «pas particulièrement surpris» par le chiffre.

Cette instance indépendante, qui bénéficie d'un budget de 2,9 millions d'euros, vérifie la validité des techniques déployées de la DGSE, de la DGSI, de Tracfin ou encore de la Direction du renseignement militaire.

Depuis le 3 octobre 2015, la CNCTR a rendu 8538 avis sur des demandes d'interceptions de sécurité, contre 7703 l'année précédente. Le nombre des géolocalisations en temps réel a quant à lui bondi de 87% pour atteindre les 2127 demandes en 2016. Observant dans son rapport que «la prévention du terrorisme a, pour la première fois, été le fondement légal le plus fréquemment invoqué», la CNCTR ne constate cependant aucune explosion de la surveillance liée à la menace islamiste.

Composée de neuf «sages» - quatre hauts magistrats, quatre parlementaires et un expert en Télécoms - et d'une secrétaire de 17 personnes dont deux ingénieurs, elle s'est réunie de manière collégiale à 180 reprises à raison de trois fois par semaine pour examiner des cas individuels et mener des dossiers de fonds. Au terme des examens, la CNCTR a retoqué 6,9% des demandes.

New York Times
G.O.P. Feud Looms as Leaders Back Russia Inquiries
Tuesday, 13 December 2016
Byline: Jennifer Steinhauer

Washington - The top two Republicans in Congress said on Monday that they supported investigations into possible Russian cyberattacks to influence the American election, setting up a potential confrontation with President-elect Donald J. Trump in his first days in office.
"Any foreign breach of our cybersecurity measures is disturbing, and I strongly condemn any such efforts," said Senator Mitch McConnell, Republican of Kentucky and the majority leader, adding, "The Russians are not our friends."

Mr. McConnell's support for investigating American intelligence findings that Moscow intervened in the election on Mr. Trump's behalf could presage friction between the Republicans who control Congress, and who have long taken a hard line against Russia, and the president-elect, who has mocked the findings.

Mr. McConnell also went out of his way to address Mr. Trump's claim that the C.I.A. could not be trusted because of flawed intelligence before the Iraq war.

"Let me say that I have the highest confidence in the intelligence community," Mr. McConnell said, "and especially the Central Intelligence Agency. The C.I.A. is filled with selfless patriots, many of whom anonymously risk their lives for the American people."

The top Republican in the House, Speaker Paul D. Ryan of Wisconsin, said he supported a continuing investigation by Representative Devin Nunes of California, the chairman of the House Intelligence Committee. In a statement, Mr. Ryan said: "As I've said before, any foreign intervention in our elections is entirely unacceptable. And any intervention by Russia is especially problematic because, under President Putin, Russia has been an aggressor that consistently undermines American interests."

Congressional Republicans announced their support for inquiries after Mr. Trump railed for much of the weekend against the intelligence findings. But their remarks, especially Mr. Ryan's, were far from fiery, reflecting both a fear of offending Mr. Trump, who has taken many positions against traditional Republican orthodoxy, and the Republicans' belief that Democrats have selectively leaked intelligence information for political gain.

Critics from both parties are questioning Mr. Trump's apparent choice of Rex W. Tillerson, the chief executive of Exxon Mobil, as secretary of state, particularly because of his longstanding business connections with Russia and his close relationship with President Vladimir V. Putin, whom he has known for two decades. Mr. Trump said in a Twitter post on Monday night that he would make a formal announcement on the job on Tuesday morning.

Senators Lindsey Graham of South Carolina and Marco Rubio of Florida, both Republicans, have expressed concern about the reports of cyberattacks, as have numerous Democrats. But Mr. Rubio, in an apparent reference to Mr. Tillerson, went a step further on Monday, writing on Twitter, "Being a 'friend of Vladimir' is not an attribute I am hoping for from a #SecretaryOfState."

Mr. McConnell said the Senate investigation would be led by Senator Richard M. Burr, Republican of North Carolina, the chairman of the Intelligence Committee. Senator John McCain, Republican of Arizona, the chairman of the Armed Services Committee, will add a subcommittee to look into cyberattacks, led by Mr. Graham.

"The first thing we want to establish is, 'Did the Russians hack into our political system?'" Mr. Graham said in an interview on Monday. "Then you work outward from there. I have a high degree of confidence Russia did this."

Mr. Nunes, a member of Mr. Trump's transition team, said in a statement that the Intelligence Committee had been "conducting vigorous oversight of the investigations into election-related cyberattacks."

Mr. Nunes also noted that his committee would be scrutinizing the review of the Russian effort to influence the election ordered last week by President Obama.

Democrats have used the latest intelligence findings to renew their calls for an urgent inquiry. John D. Podesta, Hillary Clinton's campaign chairman, demanded on Monday that all information about Russia's meddling be declassified, and that the Obama administration explain what it knows about the hacking and when it knew it.

"We now know that the C.I.A. has determined Russia's interference in our elections was for the purpose of electing Donald Trump," Mr. Podesta wrote in a statement. "This should distress every American. Never before in the history of our republic have we seen such an effort to undermine the bedrock of our democracy."

Three Senate Democrats -- Benjamin L. Cardin of Maryland, Dianne Feinstein of California and Patrick J. Leahy of Vermont -- called on Monday for the creation of an independent, nonpartisan commission to comprehensively investigate allegations of Russian interference in the 2016 election.

But Mr. McConnell stopped short of calling for a special select committee, saying that the Senate Intelligence Committee was "more than capable of conducting a complete review" of the matter.

While he stopped short of saying whether he agreed that Russia had interfered in the election in support of Mr. Trump, Mr. McConnell said, "We need to approach all these on the assumption the Russians do not wish us well."

Mr. McCain was less equivocal, saying Monday that there was "no doubt about the hacking" by Russian intelligence services. He called the hacking of the Democratic National Committee and related accounts "another form of warfare" in an appearance on "CBS This Morning" with Senator Chuck Schumer of New York, the incoming Democratic leader.

And one week before the Electoral College meets to ratify Mr. Trump's election victory, 10 electors have demanded their own intelligence briefing on Russian efforts to elect Mr. Trump.

For his part, Mr. Trump was dismissive of the intelligence findings and suggested that Democrats were simply stirring controversy. "Can you imagine if the election results were the opposite and WE tried to play the Russia/CIA card. It would be called conspiracy theory!" Mr. Trump said in a Twitter post on Monday.

The White House press secretary, Josh Earnest, said that the administration would support a congressional review. He also rejected the notion that the administration had failed to adequately highlight the Russian efforts before the election, saying it had extensively briefed Congress all year about Russian electoral meddling.

"There has been intensive cooperation between the intelligence community and other national security agencies, and members of Congress in both parties, both before and after the election," Mr. Earnest said. "The briefings have been provided in a variety of settings, both classified and unclassified."

Even beyond the conclusions of the intelligence community, Mr. Trump's campaign had widely known and extensive ties to the Russian government. A campaign manager, Paul Manafort, had worked for the Russian-backed government in Ukraine, and Mr. Trump's choice for national security adviser, Lt. Gen. Michael T. Flynn, had consulted for a Russian-backed media group, Mr. Earnest noted.

Mr. Earnest said that Congress had a "special responsibility" to investigate the ties between the Trump campaign and the Russian government, because those connections were widely known before the election. He added that, for Capitol Hill Republicans, how to "reconcile their political strategy and their patriotism is something they're going to have to explain."

Wired
Trump Ignoring US Intelligence Creates Risks Beyond Russian Hacking
Monday, 12 December 2016
Byline: Andy Greenberg

New York - Observers and alumni of America's intelligence community have already fretted over Donald Trump's impending control of the world's most powerful spy agencies. They've worried that he could abuse their heady surveillance capabilities, turn them on his personal enemies, revamp the NSA's mass surveillance programs, and strip away domestic privacy protections once in charge. But before Trump

has even taken office, he's already found a less expected way to abuse the US intelligence community: Ignore, contradict, and insult it.
Trump's relationship--or lack thereof-- with US intelligence agencies isn't just a cause for political spectacle. According to national security experts and former intelligence agency staffers, it could have serious consequences that go well beyond the current dispute over Russian hacking.

The Russia Rift

On Friday, the Washington Post and New York Times reported that the CIA has confirmed that the Russian government repeatedly hacked and leaked Democratic Party documents throughout the presidential election season with the express intention of aiding Trump's campaign. That conclusion goes a significant step beyond earlier intelligence reports that had merely pinned the attacks on the Kremlin without naming its motive.

In response, the Trump transition team offered a brusque rejection of that finding: "These are the same people that said Saddam Hussein had weapons of mass destruction," read the Trump team's statement.

That abrupt dismissal of the intelligence community's findings follows months of Trump's assertions that no one can know the source of the last year's long series of political hacks--despite a publicly released report from the Office of the Director of National Intelligence and the Department of Homeland Security stating that Vladimir Putin's state- sponsored hackers were behind those breaches. "It could be some guy in his home in New Jersey," Trump maintained in a Time interview earlier last week.

The remarks build on what may be the most troubling recent revelation of all, that Trump has declined the traditional daily intelligence briefing given to presidents and presidents-elect. Instead, he receives the briefing only about once a week. "I get it when I need it," he told Fox News Sunday. "You know, I'm, like, a smart person."

That dismissal and disregard of the intelligence agencies' fact-finding represents a disturbing potential preview of the next four years, say former members of the US intelligence community who spoke with WIRED. They worry that it threatens to politicize the intelligence community's work, pushing it toward conclusions that will please the president rather than inform him. They say the growing rift demoralizes staffers, leading to a loss of valuable talent, and that it could leave the commander-in-chief himself dangerously ignorant of crucial world events.

Susan Hennessey, a former NSA lawyer who is now with the Brookings Institution, says that since Trump was elected, she's spoken with former colleagues who are still in the intelligence community who have been "stunned" to hear Trump's repeated rejections of their findings. "It's not outrage, although that might be under the surface," she says of her former colleagues' response. "It's real uncertainty and a sense of fear...shock, bewilderment, wondering what's going to happen next."

Playing Politics

Trump's kneejerk comparison of the Russian hacking report to the faulty intel on Saddam Hussein's weapons of mass destruction takes that dismay to another level, says one former CIA official who helped to write the president's daily briefing under both Obama and Bush. "We've never seen something like this before. It's pretty ballsy," says the former agency official, who requested anonymity because he's not authorized by his current employer to speak about political issues. "From dismissing the briefings to dismissing the current assessment on the Russia stuff, it seems like he's still in campaign mode. He's politicizing the intel, and that's a problem."

"Every administration has problems with some intelligence," says Patrick Skinner, a former CIA official under Bush and Obama who now works for the security consulting firm the Soufan Group. "But it really shouldn't be public. The open disdain Trump has shown for the agencies is unprecedented."

Trump's transition team didn't respond to WIRED's request for comment.

To be fair, Trump isn't the only skeptic of the intelligence agencies' findings. Neither the leaked CIA assessment that Kremlin hackers were motivated to help Trump nor the intelligence community's October report attributing the attacks to Russia have been backed up with published evidence. That's led Democratic members of congress Elijah Cummings and Eric Swalwell to demand a commission to independently investigate the hacking incidents. President Obama has directed intelligence agencies to conduct a renewed investigation into the attacks. And Republican Senators John McCain and Lindsay Graham joined with Democrats Chuck Schumer and Jack Reed to call for a congressional investigation into the hacker intrusions, splitting with Trump and other Republican leaders who have ignored or dismissed the Russian hacking reports.

In an interview on the CBS show Face the Nation Sunday, Senator McCain clarified that he doesn't doubt Russia was the source of the breaches of targets like the Democratic National Committee and the Democratic Congressional Campaign Committee, but still wants to better understand the motive of those attacks, and whether they targeted Republicans, too. What he doesn't dispute is that Russia was the source. "Now whether they intended to interfere to the degree that they were trying to elect a certain candidate, I think that's the subject of investigation," McCain said. "But facts are stubborn things. They did hack into this campaign."

Trump's doubt of the intelligence agencies' findings isn't the first sign that the divisiveness of the last year's presidential campaign has led to new, partisan distrust of the intelligence community's work, argues Dave Aitel, a former NSA staffer who now runs the security firm Immunity. That doubt had already surfaced with FBI director James Comey's public statements about the bureau's investigation of Hillary Clinton's private email server. The Clinton campaign and Democratic leaders have criticized Comey's behavior, accusing him of influencing the electoral process by writing a letter to Congress about new emails that surfaced in that investigation just weeks ahead of election day. "Our intelligence community has become a political football, and that's something that should never occur," says Aitel. "You need to have trust, and we don't have trust."

Broader Threats

Aitel says that lack of confidence in intelligence agencies' findings and politicization of their work has left his former colleagues increasingly "jaded." And he says that problem of low morale, already sunken after public response to the revelations of NSA leaker Edward Snowden, could lead to a dangerous brain drain from key agencies. "They don't complain, they don't whine to the press, they just leave," argues Aitel. "Then you get talent shortfalls, and then you get mission failures, which are bombs blowing up in American cities."

Compounding those issues are fears that Trump will continue to ignore his own intelligence apparatus, making uninformed decisions on the world stage, says ex-CIA officer Skinner. Some members of Trump's transition team have reportedly accepted daily intelligence briefings, including his pick for defense secretary, General James Mattis, and vice-president elect Mike Pence. But a president who wields ultimate executive power without that information could be dangerous, says Skinner. "If you close your eyes, the threat is still there: North Korea still exists, ISIS still exists," says Skinner. "These things are complex. You can't counter North Korea with gut feelings."

The rejection feeds back into the morale issue as well. "There's a firm belief in the intelligence community that the president having this information is a really important thing," says ex-NSA lawyer Hennessey. "When you have a boss essentially saying they don't believe or value your work--an outright rejection based on absolutely no evidence--there's a profound sense of uncertainty."

Beyond Trump's specific rejection of any inconvenient finding, Hennessey says it's that larger dismissal of the intelligence community that's most troubling. "If an intelligence agency produces a piece of evidence that's ignored, people can be killed," she says. "The consequences could be as dire as you can possibly imagine."

Radio Free Europe
Cyberattacks On Finance Ministry, Treasury
Monday, 12 December 2016
Byline: Christopher Miller

Kyiv - Ukrainian authorities are still looking for the culprits nearly a week after troublesome cyberattacks against official financial institutions that appeared to be designed to inflict maximum chaos on end- of-the-year payments.
But the head of staff of the Ukrainian Security Service (SBU) identified the so-called malware used in the December 6 attack as the same disruptive software employed in an unprecedented incident a year earlier, blamed on Russia, that cut off power to hundreds of thousands of homes in Ukraine.

Hundreds of thousands of hryvnyas' worth of remittances were delayed or stopped completely over the course of two days after hackers knocked the websites and payment systems of the Ministry of Finance, State Treasury, and pension fund offline, according to statements posted to those sites and local reports.

The National Police are leading the investigation and have discussed the case with the SBU, Oleksandr Tkachuk, chief of staff of the SBU, told RFE/RL on December 12.

The Finance Ministry, which described the incident as a "coordinated professional hacking attack," also claimed the attack had damaged its network equipment.

Tkachuk confirmed that "some data was destroyed and access to networks was blocked."

He said authorities were not prepared to discuss many details publicly because it would take time to fully assess them, adding that attribution in the cybersecurity sphere is a tricky business.

Tkachuk said the attack appeared to bear some similarity to a December 2015 attack against the Prykarpattyaoblenergo power company in Ukraine's western Ivano-Frankivsk region that cut power to hundreds of thousands of homes.

Critical Infrastructure

Ukrainian officials blamed that cyberattack on Russia and speculated that it might have been retaliation for Kyiv cutting off electricity one month earlier to Crimea, which Russia seized from Ukraine in early 2014.

But experts at the time warned that the greater message might be that hackers had the power to shut down critical infrastructure -- something that cybersecurity experts had long feared but never seen in practice.

Elizabeth Sherwood-Randall, a deputy secretary at the U.S. Department of Energy, also blamed Russia for the December 2015 cyberattack.

In that case, the hackers used malicious software called KillDisk, which deletes or overwrites data in system files, causing computers to crash.

KillDisk was also used in the December 6 attacks, the SBU's Tkachuk told RFE/RL.

Relations between Kyiv and Moscow soured after Russia forcibly annexed Crimea in March 2014, and Russia has been accused by Kyiv and Western powers of backing a separatist conflict in eastern in Ukraine that has killed more than 9,750 people.

Kyiv has on several occasions blamed Russia for cyberattacks -- including one on Ukraine's election system ahead of the presidential vote in May 2014 -- that it claims are part of Moscow's greater "hybrid war," a military strategy that combines conventional warfare, irregular warfare, and cyberwarfare.

Canadian Press
Trudeau must meet public's digital demands for inclusion, transparency: memos
Tuesday, 05 January 2016
Byline: Jim Bronskill

OTTAWA _ Justin Trudeau's advisers are warning that the federal government needs to do a better job of connecting with Canadians _ especially online _ in order to keep pace with ever-evolving public expectations.
The new landscape is being shaped by policy complexity, rapid technological change, limited finances and increasing demands for citizen involvement, say internal briefing memos prepared for the prime minister.

More and more, people expect the government to include them early and often in the design of policy and programming choices that affect them, say the notes, obtained by The Canadian Press under the Access to Information Act.

"There is a gap in Canada between how citizens communicate with each other and with private sector service providers (e.g. banks) and their experience with the federal government," says one memo.

In order to remain relevant to Canadians, the government needs to focus on delivering high-quality, factual digital content.

However, government is often bogged down by red tape, the need for signoffs from various layers of management and barriers to effectively spending money and assigning people to tasks, the notes say.

The memos point out other problems and hurdles:

_ the access-to-information system that allows people to make formal requests for government files is "time-consuming and expensive to administer";

_ Canadians are "broadly concerned and uncertain" of how the government uses their personal information, whether it be for law enforcement, national security or other purposes;

_ the government is grappling with cyberthreats to its information holdings from so-called 'hacktivists,' criminals and others.

The notes suggest updating the outmoded 2006 federal communications policy to reflect the "voracious demand" from Canadians for online information and the rising use of mobile devices.

Information published on the prime minister's website and social media accounts must be factually accurate and non-partisan _ tenets that should be enshrined in a new communications policy, the advisers say.

Government advertising is seen to be "partisan in nature" at times, another shortcoming that must be addressed in the revised policy, the notes stress.

The Conservative government was pilloried by critics for lavish multimillion-dollar ad campaigns that seemed to convey little useful information.

The Privy Council Office is already working with Treasury Board officials to ensure potential amendments to the policy include "clear accountabilities for non- partisanship" when it comes to ads.

These days, many policy problems _ from climate change to terrorism and security _ develop and shift rapidly and unexpectedly, with little time for government to analyze and respond effectively, the notes say.

The federal public service is responding by trying to support innovation across government and highlighting successful pilot projects and new approaches.

For example, Heath Canada is using number-crunching tools to assess and predict whether imported consumer goods are likely to comply with health standards before they enter Canada.

The Trudeau government "could consider making a high-level, public commitment" to encourage departments to take such new paths, the notes say.

However, other challenges lie in attracting young, skilled workers to the public service and ensuring federal agencies are free of harassment and discrimination.

Feds must work with partners to limit threats to safety: Transport Canada
Tuesday, 05 January 2016
Byline: Amanda Connolly

Emerging safety threats in the transportation sector will require greater cooperation between the federal government and its provincial, municipal, international and private sector partners, newly released Transport Canada documents say.
The transition briefing documents -- notes prepared by senior bureaucrats for an incoming minister after a change in government -- were published online Monday by Transport Canada, among other departments.

The Transport Canada briefings outline several key concerns for Liberal Transportation Minister Marc Garneau as he adjusts to his new portfolio, among them the need to move away from "rigid regulatory

structures" to better respond to attacks on airlines and the formulation of new laws and regulations to ensure safe use of new technologies like drones and driverless cars.

According to the document, transportation remains a target despite the shift from global terror attacks to lone-wolf style attacks, and that it is bringing new costs and privacy concerns for transportation providers and travellers.

"Mitigating the risks from such random, decentralized sources generates new costs for industry and government, and new inconveniences and personal privacy concerns for travellers," it says.

The notes also say risks are becoming more difficult to predict and that "modern, effective and efficient oversight systems" will be key to mitigating the risks posed to transportation from attackers and other dangers.

In particular, it suggests that there needs to be less focus on "rigid regulatory structures" and more focus on identifying flexible alternatives that will let regulators respond to rapidly changing threat environments, noting that being able to access and manage data will be "critical" to facilitating that process.

As well, Canada needs to get better at regulating new "disruptive technologies" like drones and driverless cars -- or risk being left behind as the emerging technological sector grows.

"Oversight of unmanned aerial vehicles (UAVs) and driverless cars in particular may require new regulation and legislation to ensure commercial and private use is safe and secure," the document says. "Need faster development of policies and regulatory frameworks to support growth potential of these sectors or risk being left behind."

One of the challenges for the government in regulating the sector is the speed at which new technologies are being developed, the briefing notes say.

As well, the need to work with other countries to harmonize regulations has been challenging for regulators.

Overall, the document argues that government needs to take a proactive role in communicating risks and working with partners to create regulations to address emerging threats and comes on the heels of heated debate throughout the election about what steps the government should take to keep Canadians safe from attacks by extremists.

It also follows an initiative by transportation officials to step up regulation of drones: as iPolitics reported last summer, Transport Canada said that it intends to introduce new regulations in 2016 for drones weighing less than 25 kilograms that are operated within sight of the controller.

Those rules will likely see small drones treated more like cars: it's expected users will need to obtain a pilot permit and be at least 16 years of age to operate the drones -- or 14 years old if they have adult supervision.

Operators of the smaller model drones would also be required to obtain training as part of the permitting process and pass a Transport Canada written exam, which would be created specifically for UAVs, and the drones would have to be registered and marked.

Canadian Press/Presse Canadienne
Military investigating alleged security breach at intelligence centre
Tuesday, 05 January 2016

HALIFAX - Military police in Halifax are investigating an alleged security breach at one of the Royal Canadian Navy's most sensitive security operations.

According to court documents, military investigators allege that between 2004 and 2009 a web designer working at HMCS Trinity -- the military's principal East Coast intelligence centre -- used Defence Department networks to improperly store secret files.

A search warrant filed in provincial court alleges the actions of a man identified only as "Mr. Zawidski" violated a section of the federal Security Information Act that deals with wrongful communication of information.

None of the allegations has been proven in court and a military spokesman couldn't confirm whether charges have been laid.

The warrant says military police seized four hard drives, a laptop computer, some CDs and floppy disks from Zawidski's Halifax office at HMCS Dockyard in September following a complaint about a possible security breach.

The document says Zawidski's personal network drive contained 1,086 secret documents, dated between 2004 and 2009.

The Cipher Brief
Cyber Espionage
Monday, 04 January 2016
Byline: John Sipher

Comment - For years, I slept fitfully after a "friend" told me that it wasn't the noisy mosquitos buzzing in my ears at night that were a problem. Instead, it was the female mosquitos that made no noise at all but

laid eggs in your ears at night. That image wrecked my sleep until the Internet helped me to dispel the myth years later.
The cyber threat is a little like the silent mosquito. The biggest dangers are the ones that you will never know about.

However, if you follow the public discourse on the nature of the cyber threat to the U.S., it seems that the bulk of the dialogue has to do with the issue of hackers and the thousands of daily thwarted attacks against government and private computer systems. It is almost as if the danger is easily detected, and a better password and up-to- date antivirus software can solve the problem.

However, the far bigger threat is from foreign intelligence and terrorist groups, who have the talent, resources, and wherewithal to do serious damage to U.S. interests - damage we may never realize until it is too late. While we publically frame the problem by citing how many attacks are observed every day, the far bigger problem is hidden. An intelligence organization's job is to pick your pocket without you ever knowing anything is amiss. You won't make it very far as an intelligence officer if your adversary becomes aware of your activities.

Of the capable organizations that are determined to do us harm, perhaps the most competent, dedicated, and focused is Russia's Special Communications Service, the Russian equivalent of the U.S. National Security Agency (NSA).

Russia doesn't do many things well (dancing bears, perhaps). Spying, however, is a Russian specialty honed by decades of experience controlling its population and stealing from the West. The U.S. has been their main enemy since WWII and remains so today. Indeed, while we more often hear about Chinese cyber activities, the Russian cyber espionage enterprise is far more sophisticated and capable than its Chinese counterpart, according to statements by U.S. intelligence officials.

Unlike in the U.S., the Russian espionage effort is central to its foreign policy, and its offensive cyber capability is a particularly powerful weapon that is used to challenge the U.S. across the board. Indeed, the Russian NSA equivalent is used for - among other things - cyber warfare, espionage, counterintelligence, internal control of its citizens, disinformation, and propaganda. Russia's cyber attacks - both blatant and stealthy - are used to achieve geopolitical ends and to maintain an asymmetric ability to damage the U.S.

The Russians have shown a willingness to use the cyber weapons at their disposal, and have done so effectively. In 2007, the Russians swamped Estonian computer systems to express their anger at perceived Estonian disrespect of Russian symbols. A year later, they combined sophisticated cyber intrusions with their military attack against Georgian forces. More recently, they used offensive cyber tools to support their aggressive annexation of Crimea and eastern Ukraine. We even witnessed Russian cyber probing of top U.S. financial institutions in 2013.

Internally, the Russians use cyber weapons to maintain control over their population. By law, all private encryption equipment in Russia is required to be licensed by Russian Intelligence. Likewise, all internet providers in Russia have to install hardware/equipment provided by the Russian NSA equivalent (and pay for it themselves). There is no such thing as privacy in Russia.

While the U.S. Government is probably the biggest target of Russian cyber spying, you can be confident that they go after anyone and anything that can help them get what they need. They surely steal directly from Yahoo, Google, Facebook, and social media platforms. If they want to collect compromising information on a person in a bank, military unit, national laboratory, or nuclear power plant, you can be sure that they are swimming in e-mail and personal data that can help them craft an approach to that individual.

At the same time, the Russians are collecting the capability to understand and possibly disrupt our power grid, air traffic control, oil and gas infrastructure, and transit networks. Additionally, recent reports cite a significant increase in Russian submarine surveillance activity in the vicinity of the strategic underwater fiber cables that facilitate commercial and classified communications. This aggressive effort has intensified fears of Russian efforts to tap or cut these critical deep sea communication conduits that carry trillions of dollars a day in global business.

The only real way to protect ourselves from this kind of sophisticated cyber warfare is a robust public-private partnership between our intelligence and law enforcement services, and those companies that provide the backbone of our computer networks. In this sense, perhaps the most damaging of Edward Snowden's many traitorous acts was to destroy the trust between the private sector and our security professionals. We are now talking past each other, and the Russians, Chinese, Iranians, and others are having a field day. Until those key relationships and trust is restored, we will remain in a vulnerable state.

So, the next time you hear a story about hackers attacking various computer networks, think of the buzzing mosquito, and remember that there is probably something much more dangerous happening away from public notice.

Note: John Sipher is a senior project leader at the McChrystal Group. John retired in 2014 after a 28-year career in the Central Intelligence Agency's National Clandestine Service.

Dutch will not force "backdoors" on businesses: no limits to encryption
Monday, 04 January 2016
Byline: Zack Newmark

The Hague - The Dutch cabinet has no plans to force businesses to build in "backdoors" for investigative agencies to snoop on data, Security and Justice Minister Ard van der Steur told parliament on Monday.

The ruling coalition sees the privacy and security provided by encryption methods as being more important than making it easier for authorities to access information.
Van der Steur noted that more businesses and individuals are making use of encryption. "That is important for the confidence people have in digital products and services, and for the Dutch economy from the perspective of the fast developing digital society," the minister said in a letter.

Simultaneously, he said that encryption often hinders investigations, particularly into child pornography, cyber attacks, support of foreign military operations and terrorism. "[Encryption] makes it difficult, slow or impossible to gain timely insight into communications for the purpose of safeguarding national security and the investigation into criminal offenses," he stated.

"The above-mentioned legitimate access to data and communications through investigation, intelligence and security services, however, constitutes an infringement on the confidential communications of citizens."

The minister also said that forcing firms to install a backdoor creates an opening for criminals and terrorists to access data that can then be used in an illicit act.

Gulf News
Social media campaign highlights Taiz plight
Tuesday, 05 January 2016
Byline: Saeed Al Batati

Al Mukalla - Yemeni activists have turned to social media networks to draw the world's attention to the plight of tens of thousands of people who live under Al Houthis siege in the city of Taiz and pressure the militants to allow international organisations to enter aid to the city.
Activists who initiated #endtaizsiege hashtag on Saturday say that the online campaign have reached over a thousand of people online.

Latifa Ali, a Yemeni journalist based in the United States, told Gulf News that she and many other activists decided to turn to social media after diplomatic and military efforts failed to end months of crippling blockade on the city. "Due to the disregard of the international community, we turned to other alternatives."

The activists widely shared photos of people from the city climbing rough and mountainous roads carrying vital food and medical supplies. "We want to put pressure on Al Houthis to open a corridor for humanitarian aid so that it can reach residents in the besieged city."

Despite the calls for mercy, Iran-backed Al Houthis have tightened their siege and intensified their shelling of Taiz.

Mohammad Al Qubati, a medic and the head of the Supreme Medical Committee, told Gulf News that nothing has changed on the ground and the city is still experiencing a devastating humanitarian crisis.

"Injured people die in hospital emergency rooms because there is neither medical oxygen cylinders or medicine. We were forced into sending an appeal to residents who might use oxygen cylinders to treat relatives to send them to local hospital."

Al Qubati said that they carry the dead and injured people on donkeys because ambulances cannot move due to shortage of fuel and the intensity of the shelling.

"We have recently managed to collect 20 oxygen cylinders from locals. But each hospital in the city needs between 170 to 200 cylinders. Drugs that are carried on the donkeys and camels spoil before arriving in hospitals because of the sun heat." At least five civilians are killed every day from shelling and fighting, he said.

The densely populated city has been on the frontline of the continuing civil war between government forces and Al Houthi militants and their allied forces since March.

Resistance fighters loyal to president Abd Rabbo Mansour Hadi are in control of the city's main districts but Al Houthis control the suburbs.

Meanwhile, on the ground, army commanders battling Al Houthi militants in the southern Al Shourejah region said they foiled an assault by Al Houthi militants to recapture the region in the province of Taiz.

"The warplanes targeted Al Houthis gatherings in many places in Al Shourejah an destroyed Katyusha rockets and mortar shells launchers." a senior army officer who preferred to anonymous because he was not authorised by his seniors to brief reporters told Gulf News from the battlefield. Across the country, warplanes from a Saudi-led coalition escalated air raids on military sites controlled by Al Houthis and their allied forces after the ceasefire was officially ended on Saturday.

Residents in the capital reported huge explosions on Sunday and Monday in the Special Security camp, Al Daylami air base and many other areas.

The warplanes also attacked an air defence camp in the western city of Hodeida. According to local media reports, the coalition jet hit Sanhan, a Saleh stronghold and his hometown in the Sana'a province. Saudi Arabia formed a coalition with some allied Arab countries early last year and began in March bombing Al Houthis militants who were quickly advancing in many provinces. The coalition blunted their expansion and helped the exiled government to return to the port city of Aden.

London Times
Hackers thwart online efforts to trap Jihadists
Tuesday, 05 January 2016
Byline: Fiona Hamilton

London - Teams of hackers who are taking down online jihadist accounts may be harming counter-terrorism efforts, one of Europe's most senior law enforcement chiefs has warned.
Rob Wainwright, the director of Europol, told The Times that the hackers, who are disabling thousands of pro-Islamic State accounts, may be thwarting the work of police and intelligence agencies.

British and European security services regularly monitor jihadist websites and may allow them to continue operating online if they are providing useful information about the whereabouts of Islamists and their plans. Hacking collectives such as Anonymous have declared war on the jihadists after the terrorist attack in Paris and have threatened to take down thousands of their internet accounts. Law enforcement agencies now fear that the hackers could be doing more harm than good. Mr Wainwright said that Europol and Scotland Yard already had teams dedicated to assessing jihadist online activity and disabling their social media accounts when appropriate. They were best placed to make such decisions, he said.

"Sometimes the timings of the social media account takedowns [by the authorities] will be deliberate, and part of wider concerted action," he said. "The point is that where it is done in an independent way, clearly unconnected with what we are doing, we lose control of it. We can't therefore ensure that the intended effect is the right one."

Mr Wainwright said that Europol did not want to encourage hackers, whose crimes were often investigated.

Security experts agreed that interference by hackers could cause problems, but said that their knowledge should be used by the intelligence services. Will Geddes, managing director of International Corporate Protection, said that Anonymous had a fantastic pool of capability. "They could be massively helpful in fighting against terrorism and radicalisation," he said.

Ukraine Utility Cyber Attack Wider Than Reported: Experts
Tuesday, 05 January 2016
Byline: Staff report

Frankfurt - A central European security software firm said on Monday that a cyber attack last month in Ukraine was broader than initially reported last week when the nation's secret police blamed a power outage on Russia.

Western Ukraine power company Prykarpattyaoblenergo reported an outage on Dec. 23, saying the area affected included regional capital Ivano- Frankivsk. Ukraine's SBU state security service responded by blaming Russia and the energy ministry in Kiev set up a commission to investigate the matter.

While Prykarpattyaoblenergo was the only Ukraine electric firm that reported an outage, similar malware was found in the networks of at least two other utilities, said Robert Lipovsky, senior malware researcher at Bratislava-based security company ESET. He said they were ESET customers, but declined to name them or elaborate.

"The reported case was not an isolated incident," he said.

Prykarpattyaoblenergo publicly blamed its outage on "interference" in the working of its system. The Kremlin did not respond to a request for comment.

Researchers with computer security firms Trend Micro and iSight Partners said ESET's assessment that the attackers sought to infect other utilities appeared credible, shedding new light on evidence that this is the first power outage proven to have been caused by a cyber attack. Experts have warned for years, with growing urgency, that electric utilities are vulnerable to cyber attacks that could cut power.

"This is the first time we have proof and can tie malware to a particular outage," said Trend Micro senior researcher Kyle Wilhoit. "It is pretty scary."

Cyber firm iSight Partners said that ESET's report of multiple attacks is consistent with its own analysis.

"There is pretty strong consensus that there was a blackout caused by a computer network attack," said iSight's director of cyber espionage analysis, John Hultquist.

Experts with ESET, iSight and Trend Micro told Reuters the attackers used a malicious software platform known as "BlackEnergy" to access utility networks, planting a related piece of malware, "KillDisk," on targeted systems.

KillDisk can delete or overwrite data files.

Researchers say they have yet to determine whether KillDisk's job was to knock out power or simply conceal the attack.

Cyber criminals have been using versions of BlackEnergy since 2007. Over the past two years, there has been widespread reports that a Moscow-backed group, Sandworm, was using it for targeted attacks.

The Hindustan Times
Hackers Eye Spies

Tuesday, 05 January 2016

New Delhi - Community to monitor officers leaking info to international spies gearing up to keep a close eye on serving and retired defence personnel to ensure they are not passing information to international spies on the virtual world.
The move by hacking community is to ensure that no information is being leaked via social networking websites, which can be used against the nation. The step was taken after reports of defence personnel's involvement in the ISI spy racket surfaced.

The Crime Branch of Delhi Police on Monday arrested IAF airman Ranjith KK, who was honey trapped by ISI agency by creating a fake profile on Facebook. He had been talking to " pretty woman" Damini McNaught for the last several months on Facebook and was passing sensitive details related to the Air Force.

Recently, security agencies arrested serving and retired defence personnel from various locations who were leaking information to Pakistani security agency ISI. " We will follow the modus operandi used by international agents. We will track Indian officers and will try to get information from them.

The moment they pass any information, we will alert the security agency giving proof against them," said a hacker who claims to be a part of ethical hacking community Anonymous- India.

There are close to 2,000 retired and serving officers who are under the scanner of security agencies for suspectedly passing information for money or through honey trap.

Admitting the process of tracking is illegal, hackers said the move is in national interest. " It is an illegal and a time taking process but the underground community is ready for surveillance to shield the country from outsiders," said a hacker on the condition of anonymity.

Cyber experts claim that international spies from countries like Pakistan, US and China have maximum interest in gathering information from India.

The international spying agencies, in order to make their spying activities seamless, untraceable and invisible, also carry out high- tech attacks which compromise the computer and network, but they carry out targeted attack on social media so that they get insider classified information.

"Spies have created many fake profiles on social media. These profiles are of different nature which includes different sex, age, cast and nationality with distinct interests.

They use it according to their targets. A dedicate team of spies is working to track vulnerable people on social media," said cyber crime expert Kislay Choudhary, who works closely with Delhi and Noida police.

"As a person discloses that he works for Army, Navy or the Air Force, he/ she comes on the radar of international spies who start following them on the virtual world.

By some means, which includes honey trap, they start interacting with the user. Spies also keep a track of their interest or hobbies to make a conversation and get friendly," Choudhary explained.

Experts claim spies from countries like Pak, US and China have maximum interest in gathering info from India Community to monitor officers leaking info to international spies.

Saudi Defense Ministry's Website Hacked in Protest at Sheikh Nimr's Execution
Tuesday, 05 January 2016

Tehran - A group of young Saudi hackers took down the website of Saudi Arabia's Defense Ministry to show their protest at the execution of prominent Shiite cleric Sheikh Nimr Baqir al-Nimr by the kingdom. The Saudi defense ministry's website was hacked on Sunday night by a group of Young Saudis called 'Brave Youth Fighting Religious Taboos' and it was inaccessible for several hours.

The hackers said their cyberattack on the defense ministry's website was meant as a retribution for the execution of Sheikh Nimr by the Riyadh government.

"We will continue defending the religious sanctities and also targeting the enemies and oppressors involved in the killing of the freedom-seekers and revolutionaries," the hackers said in a statement issued after hacking the website.

Saudi Arabia announced on Saturday that it had executed the prominent Shiite Muslim cleric. Hours later, Sunni and Shiite Muslims from across the world rushed to condemn his execution, vowing revenge.

In a relevant development in May, the internal Internet network belonging to the Saudi Foreign Ministry had come under a cyber-attack.

The cyber-attack disclosed over 1 million secret and classified documents of the Saudi government which showed the kingdom's hostile and devilish policies against other countries of the world, including their support for the terrorists in Syria and Iraq.

The National (UAE)
When hacking got personal in 2015 (Canada).
Tuesday, 05 January 2016
Byline: Peter Nowak

Abu Dhabi - If there is any lesson that using the internet in 2015 taught us, it's that it's getting increasingly difficult to avoid having our personal data stolen by hackers.
From children's toys and hotels to mobile phone companies and insurance brokerages, virtually no one was safe from malicious breaches. And, if anything, hacking became a little more personal - and a little meaner - in 2015.

In June, hackers stole the records of at least 22 million United States government workers stored with the Office of Personnel Management. The full repercussions of the breach - considered the most damaging in US national security so far - aren't yet known, but analysts are worried about the potential for blackmail of government employees by enemy powers armed with the sensitive information.

The US-based healthcare providers Anthem and Excellus BlueCross BlueShield had 80 million and 10 million customer records leaked, respectively, in September and February. Birth dates, addresses and social security numbers were included, exposing millions to potential identity theft and fraud. Law-enforcement officials failed to identify the perpetrators.

The records of 2.4 million customers, including up to 900,000 credit card numbers, were stolen from the UK electronics retailer Carphone Warehouse in August. Even LastPass, an online tool that helps users manage their many different passwords, was hit in June. The breached data was encrypted and the company said damage was minimal, but users were, nevertheless, urged to change their passwords. The list goes on and on

Many of the victims in the disparate breaches were forced to deal with identity theft and financial turmoil, and the only thing that kept the breaches from wreaking a sort of collective mass havoc was - seemingly - the hackers' own good graces. But even those, if they exist at all, appear to be running out.

In July, hackers calling themselves The Impact Team announced they had stolen data from adultery-enabling website Ashley Madison. The group threatened to release the information, which included the names and home addresses of the site's 39 million members, unless it shut down immediately.

When the Toronto-based parent company, Avid Life Media, did not comply, the hackers dumped gigabytes worth of usernames and credit card transactions, plus sensitive emails from executives.

Among the revelations in those correspondences was the fact that company founder, Noel Biderman, a married man, had multiple affairs despite previous denials about infidelity. Examination of the data also revealed that most of the site's female users were fake and that the company failed to delete user accounts even after charging fees to do so.

The fallout for users was more pronounced. Heads rolled as judges, politicians and teachers were outed as members. Families split up and fears of blackmail spread fast. A New Orleans pastor and Ashley Madison user, fearing he too would lose his job, committed suicide.

Adultery is an ethical issue, but regardless of where one stands on it, at the heart of the breach lies the fact that the Ashley Madison hackers appointed themselves moral arbiters of the site and - by extension - its users. Avid Life Media is facing a US$567 million class-action lawsuit and will probably never recover the trust of its users, even if it is claiming to have added four million new members since the breach. But the social ramifications for its users, imparted by self-appointed judges, marked it as a different kind of hack.

Ethically motivated breaches against wrongdoing companies, governments or institutions have been happening for years but in 2015, their perpetrators seemed to care less about the everyday people caught in their wake, and not just in the Ashley Madison case.

Bombastic and divisive US presidential candidate Donald Trump was also targeted last year, with his hotel chain announcing in October that it had been the victim of a year-long breach. Hackers may have gained access to thousands of customer credit card numbers during that period, the chain said.

While Mr Trump may have suffered a personal knock to his brand and reputation, as the hackers desired, the true victims - the ones who likely had to deal with the financial fallout of having their data stolen - were guilty of no crime other than staying in hotels bearing his name.

Hackers in September also went after Patreon, a Kickstarter-like crowdfunding site used by independent artists and creators to support their small-scale initiatives. The perpetrators and motives are unknown, but Patreon is the veritable opposite of the corporations normally targeted by hacktivists. Why they would want to harm independent creators trying to eke out a living through online donations is a disturbing question.

Closing out the year, hackers in November stole 4.8 million records from Hong Kong-based toy maker VTech, leaking the names, genders and birthdays of more than 200,000 children. One of the individuals who claimed responsibility later said he just wanted the company made aware of security failings that allowed the hack to be fixed. Whether the hacker was aware that thousands of children had been exposed to potential miscreants is unknown.

There's little doubt that data breaches were one of the biggest stories of 2015 and, unfortunately, they will not be going away.

But with hackers increasingly appointing themselves arbiters of the moral behaviour of institutions and individuals, and the effects of their actions having more profound social effects than just simple financial damages, authorities are heading into this year facing more pressure to take action against what is a growing epidemic.

Canadian Press
Top courts threaten federal government with legal action over new IT rules
Thursday, 07 January 2016
Byline: Jordan Press
Section: general

OTTAWA _ Newly released documents show the country's highest court is ready to launch a legal battle with the federal government over new IT rules which the Supreme Court of Canada fears would threaten its independence.
The Supreme Court is not alone in these concerns: the Federal Court, Federal Court of Appeal, Court Martial Appeal Court and Tax Court are all prepared to launch a constitutional challenge against having the government's super-IT department involved in their digital affairs.

The federal Liberals are now left to decide how to handle an issue created by a decision of the previous Conservative government that came into effect during the federal election.

That decision forced the courts to go through Shared Services Canada for all IT purchases, such as servers, routers and software, rather than letting them make the procurements on their own. The courts had that power until Sept. 1, when the new rules kicked in and made them a "mandatory client" of Shared Services Canada, which oversees purchases and digital services for 43 of the heaviest IT users in the federal government.

The move approved by the Conservative cabinet in May 2015 was supposed to save money, since Shared Services Canada buys in bulk for the federal government, and improve digital security, because Shared Services Canada buys from safe suppliers.

Briefing material provided to Prime Minister Justin Trudeau shortly after he took office shows the courts were worried that having a government department involved in their IT services "and the perceived implications for control of their data" infringed on judicial independence.

"They must maintain control of their data, not only because of concerns about confidentiality, but also because an independent judiciary cannot tolerate having its sensitive information controlled by a separate branch of government," reads part of Trudeau's briefing on urgent issues facing the new government.

In an August letter to the government's top bureaucrat, officials for the courts argued that they shouldn't be subject to Shared Services Canada's oversight and should be exempt like agents of Parliament, including the auditor general, privacy commissioner and information commissioner.

If the government doesn't backtrack on the cabinet decision, the country's top judges "are prepared to take legal action," Trudeau was warned.

The advice Trudeau received in the secret briefing material has been blacked out from the documents obtained by The Canadian Press under the Access to Information Act.

A spokeswoman for Public Services Minister Judy Foote, who oversees Shared Services Canada, has yet to respond to questions about what the Liberals plan to do with the courts' complaint.

Shared Services Canada, in an email, would only say that everything the agency does is "aligned with all legislative and legal requirements," including "the need to maintain judicial independence." The department didn't say how exactly that works.

The Guardian (London)
Web services firm CloudFlare accused by Anonymous of helping Isis
Thursday, 07 January 2016
Byline: Alex Hern
Section: general

London - Anonymous has attacked web services startup CloudFlare for providing protection against cyberattacks to pro-Isis websites.
The company protects customers against the distributed denial of service (DDoS) attacks popular amongst groups like Anonymous by routing connections through its own content delivery network. By weeding out malicious connections, it prevents DDoS attacks from succeeding in their goal of overwhelming a website with traffic so that it collapses.

But according to members of Anonymous, which has reaffirmed its yearlong "war" against Isis following the Paris attacks, that technology is also being used by pro-Isis websites to protect themselves against the hacktivist collective's attempts to bring down their servers.

The week before the Paris attacks, Ghost Security, an Anonymous- affiliated "counter-terrorism network", counted almost 40 websites that use CloudFlare's services to protect their content. According to GhostSec, 34 were propaganda websites, four were discussion forums, and two offered technical services.

Such accusations are nothing new to CloudFlare, which has long argued that it is not its job to police content on its network. In August 2013, in response to similar allegations from James Cook, a reporter at the Kernel magazine, the company's chief executive Matthew Princepublished a blogpost laying out its view on free speech on its network.

Prince wrote: "A website is speech. It is not a bomb. There is no imminent danger it creates and no provider has an affirmative obligation to monitor and make determinations about the theoretically harmful nature of speech a site may contain ...

"If we were to receive a valid court order that compelled us to not provide service to a customer then we would comply with that court order. We have never received a request to terminate the site in question from any law enforcement authority, let alone a valid order from a court."

In response to the latest criticism from Anonymous, Prince has redoubled his stance. "I did see a Twitter handle said that they were mad at us," he told The Register. "I'd suggest this was armchair analysis by kids - it's hard to take seriously. Anonymous uses us for some of its sites, despite pressure from some quarters for us to take Anonymous sites offline."

"Even if we were hosting sites for Isis, it wouldn't be of any use to us ... I should imagine those kinds of people pay with stolen credit cards and so that's a negative for us."

Those statements are now prompting a further call amongst Anonymous members to boycott the company altogether.

The Guardian has not received a response to a request for comment from Cloudflare.

Wall Street Journal
NSA Safeguards to be considered
Thursday, 07 January 2016
Byline: Adam Entous
Section: general

Washington - The U.S. House Intelligence Committee will consider whether new safeguards are needed for handling communications intercepted by the NationalSecurity Agency that involve U.S. lawmakers or other Americans, the top Democrat on the panel said on Wednesday.
The move follows a report in The Wall Street Journal about how the NSA targeted Israeli communications during the 2015 congressional debate over a nuclear accord with Iran. The Journal said the NSA targeted the communications of Israeli Prime Minister Benjamin Netanyahu and other senior Israeli officials, and, in so doing, swept up the contents of some of their private conversations with lawmakers and Jewish-American groups.

At the request of the committee's chairman, Rep. Devin Nunes (R., Calif.), members of the panel on Wednesday received a classified briefing from intelligence agencies about how they handled intercepted Israeli communications "to, from or about" lawmakers, officials said.

Current and former U.S. officials declined to say whether the communications in question were between Israeli officials and U.S. lawmakers directly, or whether they were Israeli officials discussing their contacts with members of Congress after the fact, or both.

CNN.com
Top intel officials say NSA didn't spy on members of Congress
Thursday, 07 January 2016
Byline: Dierdre Walsh
Section: general

Washington - Top U.S. intelligence officials told the House Intelligence Committee Wednesday that the National Security Agency did not spy on any members of Congress during last year's contentious Iran nuclear debate.
The testimony came in response to concerns raised by the panel about a Wall Street Journal report last month that said the U.S., while surveilling U.S. allies, also snooped on some members of Congress, according to members of the House Intelligence Committee who attended a classified briefing on the matter.

"They were not listening to or monitoring representatives or members of Congress," Utah Republican Rep. Chris Stewart, who serves on the panel, told CNN.

The Journal reported that the NSA conducted surveillance of Israeli Prime Minister Benjamin Netanyahu and inadvertently picked up conversations with members of Congress about the controversial nuclear agreement with Iran that Congress debated over the summer and fall. Netanyahu was a strong critic of the deal, and he and his administration communicated with members on Capitol Hill regularly during the negotiations and around the vote on legislation to allow the deal's implementation.

The Journal detailed how the NSA's surveillance of Netanyahu and other top foreign leaders who are close allies of the U.S. continued, even after President Barack Obama insisted more than two years ago that he would end the practice.

On Wednesday, James Clapper, the director of the National Intelligence Committee, and NSA Director Adm. Mike Rogers told members of the House Intelligence Committee that no conversations including members were monitored.

The top Democrat on the Intelligence Committee, Rep. Adam Schiff, D-California, told CNN in a written statement that "There is no evidence that the intelligence community was spying on members, or that the laws and procedures governing any incidental collection on members of Congress were violated in any way."

Citing the classified nature of the briefing, members declined to discuss any issues surrounding any reported monitoring of Netanyahu.

After the Journal's report, House Intelligence Committee Chairman Devin Nunes announced his committee would investigate after the holiday recess, and Wednesday's classified briefing was the first opportunity to press Clapper and Rogers about the details of the report.

Stewart told CNN that officials admitted they didn't know the source of the Journal story, but were doing their own formal investigation to determine the source.

Another Democrat on the committee declined to get into specifics, but said he was satisfied after the session.

"I've been briefed on the matter. I asked tough questions of the panelists and am satisfied that all procedures were followed by the Intelligence Community," California Democratic Rep. Eric Swalwell told CNN after the closed door briefing, adding, "I will continue to be vigilant in making sure that all citizens and their constitutional rights are protected."

A source close to the House intelligence panel said the committee received a lot of the information it requested from the intelligence community about the allegations in the Journal story, and it has not decided what further steps it will take on the matter.

Reuters
U.S. power companies told to review defenses after Ukraine cyber attack
Thursday, 07 January 2016
Byline: Jim Finkle
Section: general

Boston - A quasi-governmental U.S. electric industry group last week advised members to review network defenses following reports that 80,000 customers of a Western Ukraine utility lost power for six hours following a cyber attack.
The Electricity Information Sharing and Analysis Center, or E-ISAC, urged members to "do a better job" at implementing multiple layers of defense against potential cyber attacks, saying the incident at Ukraine's Prykarpattyaoblenergo electricity provider appeared to be the result of a "coordinated effort by a malicious actor."

The nine-page confidential document, reviewed by Reuters, did not identify deficiencies in the U.S. grid that could lead to similar attacks.

Security experts said businesses in many sectors were closely following the Ukraine incident because it was a watershed event: the first known cyber attack to take down an electric grid. It was also one of just a handful of known cyber attacks that have damaged any kind of physical infrastructure.

Kimberly Mielcarek, a spokeswoman for E-ISAC, said that the organization would continue to provide more data as it pursued an investigation with help of the federal government.

"There is no credible evidence that the incident could affect North American grid operations and no plans to modify existing regulations or guidance based on this incident," she said in an emailed statement.

Prykarpattyaoblenergo reported an outage on Dec. 23. Ukraine's SBU state security service blamed Russia and the energy ministry set up a commission to investigate. A ministry spokesman said on Wednesday that the results will not be released until after Jan. 18.

The Kremlin has not responded to requests for comment.

The U.S. Central Intelligence Agency, Department of Homeland Security, Federal Bureau of Investigation and White House National Security Council all declined to comment on efforts to probe the incident.

The E- ISAC report identified systems integrator Galician Computer Co as having worked for Prykarpattyaoblenergo and two other utilities that were reported to have been targeted in the attack but did not experience outages: Chernivtsioblenergo and Kyivoblenergo.

"The integrator is the single point of connection between various regional electrical entities in the Ukraine that were exposed to this attack," the report said.

Galician Computer Co told Reuters via email that it had provided software to only one of the three firms and was not involved in running any of the plants.

"According to reports from employees at that regional power firm, attacks were definitely carried out and led to blackouts," the statement said. "We do not have any other information regarding this incident."

Fox News
Clinton's private email account exploits FOIA loophole, report says
Thursday, 07 January 2016
Byline: Catherine Herridge, Pamela Browne
Section: general

Washington - Hillary Clinton's unorthodox use of a private email account and personal server for government business exploited a loophole in the State Department's FOIA, or Freedom of Information Act, process, according to the findings of the first Inspector General report to stem from her email scandal.
Congress asked the Office of Inspector General, the State Department's independent watchdog, to investigate the issue following the revelation that Mrs. Clinton did not use a government email account while secretary of state.

Fox News reviewed the 25-page report and its findings before they were made publicly available.

The report reads in part:

"FOIA neither authorizes nor requires agencies to search for Federal records in personal email accounts maintained on private servers or through commercial providers (for example Gmail, Yahoo, and Hotmail.) Furthermore, the FOIA Analyst has no way to independently locate Federal records from such accounts unless employees take steps to preserve official emails in Department record keeping systems."

The report strongly suggests that it relies on employees at all levels to follow the regulations, and when personal email is used, to forward copies to a State Department account so that it can be captured.

"Under current law and Department policy, employees who use personal email to conduct official business are required to forward or copy email from a personal account to their respective Department accounts within 20 Days."

Clinton did not have a State Department email address to which she could forward message traffic from her personal account, and it remains unclear whether she provided all her State Department business emails to the State Department or federal courts, where FOIA lawsuits have been filed.

The report also found that the State Department wait time for Freedom of Information Act Requests far exceeds that of other departments. For example, FOIA requires agencies to respond to requests within 20 working days, and "some requests involving the Office of the Secretary have taken more than 500 days to process."

The State Department is also criticized for practices that "do not consistently meet statutory and regulatory requirements for completeness and rarely meet requirements for timeliness."

Given Clinton's use of a private account, where more than 1,000 classified emails have been identified, including at least two at the Top Secret level, it appeared ironic that the report states employees had not been reminded of their FOIA responsibilities "...since March 2009, when former Secretary Clinton sent a message commemorating Freedom of Information Day."

The OIG report makes four recommendations, including that the Office of the Secretary should fully comply with FOIA requirements. The department said it agreed with the recommendations and changes had been made.

State Department spokesperson John Kirby said in response late Wednesday, ?"The Department is committed to transparency, and the issues addressed in this report have the full attention of Secretary Kerry and the Department's senior staff. While the volume of State Freedom of Information Act requests has tripled since 2008, our resources to respond have not kept pace.

"That said, we know we must continue to improve our FOIA responsiveness and are taking additional steps to do so. That's why Secretary Kerry asked the State Inspector General to undertake this review in March, and it's why he appointed a Transparency Coordinator this Fall."

Le Soleil
L'armée garde un oeil sur La Meute
Thursday, 07 January 2016
Byline: Jean-Michel Genois Gagnon
Section: general

Québec - L'armée surveille de près les membres des Forces armées canadiennes (FAC) inscrits dans le groupe Facebook La Meute.
Dévoilé par Le Soleil à la fin du mois de décembre, le regroupement «secret» compte aujourd'hui plus de 16 000 invités (membres et observateurs). Son fondateur, Eric Corvus, un vétéran des Forces armées canadiennes, avait souligné lors de son entrevue que le groupe avait été créé pour «protéger nos terres, nos valeurs, nos fondements, notre liberté, notre sécurité ainsi que l'avenir de nos enfants contre l'envahisseur islamique».

Pour l'heure, aucune enquête n'a été ouverte par la police militaire concernant certains membres des FAC inscrits sur la page Web. «On [la police militaire] s'intéresse aux cas les plus graves qui peuvent mener à des accusations de nature criminelle», stipule le major Mercier. Cela ne signifie toutefois pas que les militaires inscrits ne s'exposent pas à des sanctions. «On est au courant de la situation. On connaît le site et on l'observe. Il n'y a pas d'enquête comme telle de la police militaire, mais il peut y avoir plusieurs autres types d'enquêtes. Ça peut être des enquêtes disciplinaires, des enquêtes sommaires ou des enquêtes administratives», précise-t-il. «Cela relève davantage de la chaîne de commandement de l'individu.»

Les Forces armées canadiennes ne sont pas en mesure de chiffrer le nombre de militaires inscrits sur le groupe et ne possèdent aucune politique particulière qui restreindrait un membre des FAC à participer à un forum dans les médias sociaux. Néanmoins, «les militaires des FAC sont tenus de respecter les normes les plus élevées en matière de conduite professionnelle et personnelle. Le ministère de la Défense nationale et les FAC ne tolèrent pas la discrimination», a écrit l'armée dans un échange de courriels.

«Si la participation ou les activités d'un membre des FAC sur un site Web ou une page de Facebook remettent en question la pertinence du maintien en service d'un militaire, ce dernier peut faire l'objet de mesures administratives ou de mesures disciplinaires. Chaque incident sera évalué au cas par cas. Les résultats de mesures administratives sont confidentiels, en vertu de la Loi sur la protection des renseignements personnels», ajoute le FAC.

Deux plaintes

Inquiète de voir que le groupe La Meute prend de l'expansion, une personne avec qui Le Soleil a discuté a déposé deux plaintes au cours des dernières semaines contre le regroupement, l'une à la Gendarmerie royale du Canada (GRC) et l'autre à la Sûreté du Québec. «Ce que je dénonce, c'est le fait que c'est un groupe qui devient lui-même des extrémistes. Ils dénoncent les musulmans qui sont extrémistes, qui veulent radicaliser le peuple. Mais ils le deviennent eux-mêmes en ayant des propos haineux sur leur page. Ce n'est pas tous les musulmans qui sont pareils.»

La GRC n'a pas voulu confirmer si une enquête a été ouverte.

Afin de clarifier la position du groupe, Eric Corvus a tenu à publier un message le 2 janvier sur la page Facebook La Meute. «À tous ceux qui croient et désirent que La Meute ait été créée afin de nous conduire vers l'anarchie, briser des vitres, mettre le feu, prendre les armes, je vous prierais de prendre le temps d'analyser votre perception, car il n'en est rien. Nous ne sommes pas un berceau de la haine.»

La page Facebook La Meute a été créée à l'automne par un ancien militaire qui a été déployé en Afghanistan en 2004 et en 2007. Il souffre depuis d'un trouble de stress post-traumatique, pour lequel il est suivi. La Meute souhaite éventuellement obtenir son statut d'organisation à but non lucratif.

Jerusalem Post
Will Iran win the technology war?
Thursday, 07 January 2016
Byline: Shlomo Maital
Section: general

Jerusalem - Military Intelligence chief Maj.- Gen. Herzl Halevi bears a heavy burden. This "philosopher general," as a New York Times journalist once called him, is responsible for tracking the deeds, words and even thoughts of Israel's foes, alerting political and military leaders to potential threats. Halevi's undergraduate degree is in philosophy.
He told the The Times, "Through the years, I used philosophy much in a practical manner... philosophers spoke about how to balance, how to prioritize...this is something I find very helpful."

In an unusual closed lecture he gave on October 29 for Tel Aviv's College of Management, the usually reticent and understated general, formerly head of the elite Sayeret Matkal commando unit and tabbed as a leading candidate to become the next chief of staff, said, "If you ask me whether we'll have a war with Iran over the next 10 years, I'll give you a surprising answer. We are already at war with Iran. We're having a technological war with Iran. Our engineers are fighting Iranian engineers today and it's becoming increasingly significant."

He told the daily Haaretz that he was pessimistic. "Today, we have the advantage. Iran is closing in on it. Since the 1979 Iranian revolution, the number of universities and university students in Iran has

increased 20-fold, compared with three and a half times for Israel." Enrollment in science, technology, engineering and math in Iran is skyrocketing, he said.

In other words - in this technology war, Israel is losing. I read about Halevi's speech just after reading two reports prepared by my S. Neaman Institute colleagues at the Technion in Haifa comparing human capital in science and technology in Israel, Iran and Turkey. These reports update an earlier study done in 2011.

New data show that for Israel, in the past decade, science and technology university students per 1,000 persons remained constant at 14, while in Iran, that figure is 25, having doubled in 10 years. Between 2007 and 2014, the number of Israeli universities ranked (in the widely used "Shanghai" list) in the top 100 in the world in science fell from four to three, while Iran managed to place a university in the top 100 for the first time.

Iran has a staggering number of science and engineering college students - over two million, an increase of 161 percent since 2004. For the same period, the comparable number for Israel rose only 20 percent, to 107,000.

According to data of Thomson-Reuters, a global information company based in New York and Toronto, Iran has the world's fastest- growing scientific output, measured by peer- reviewed articles in international journals. In December 2013, Iran put a monkey named Fargam ("auspicious" in Farsi) into orbit and returned him safely to earth. Rockets capable of launching satellites can also carry military payloads great distances.

Ironically, the economic sanctions imposed on Iran by the West appear to have been a major factor in Iran's burgeoning science. According to the just issued UNESCO science report "Towards 2030," "The sanctions... have accelerated the shift from a resource-based economy to a knowledge economy by challenging policymakers to look beyond extractive industries to the country's human capital for wealth creation... between 2006 and 2011 the number of firms declaring R&D activities more than doubled." The UNESCO report notes that Iran ranked seventh worldwide for the volume of scientific papers related to nanotechnology.

I spoke to Dr. Daphne Getz, senior research fellow at Technion's S. Neaman Institute, who led the preparation of all the 2011 and 2015 studies, and asked her about Iran's rapid progress.

The Jerusalem Report: Four years ago, you and your team analyzed the Thomson- Reuters Web of Science database and showed how Turkey and Iran are closing the science and technology gap with Israel. The press reported this study widely. Now, four years later, you and your team have issued two new reports on the same topic, providing detailed statistical evidence. Was there any official reaction to your 2011 report? Are our political leaders asleep, or are they aware of the threat posed by Israel's losing its technological advantage?

Getz: "The report was circulated to all the relevant government ministries. I received responses from two ministries, Education and Defense. Education - from the Chief Scientist, who asked to meet with me, to discuss the possibility of requesting a study of readiness of high school grads for university science and technology studies, and how we can prepare them for such studies, in math, physics and computer science. In the end, owing to bureaucratic obstacles, no such study was ordered.

"I also heard from the Defense Ministry. I met with two senior officials of the ministry, who came to interview me regarding our findings. They told me that, in their unit, our report was compulsory reading. I was impressed that the data in it was taken very seriously, but they did not share with me the actions undertaken (or not undertaken) in response to the trends that we described."

In the West, Iran's Shi'ite Ayatollahs are widely mocked and scorned. Top of the list is the leader of the Islamic Republic of Iran, Ayatollah Sayyid Ali Khamenei. But Khamenei has decreed that Iran will turn into a major scientific power in the future and his book "The Bliss of Knowledge" (now out in English) is a road map showing how this will be achieved.

Can one imagine Rabbi Aharon Leib Shteinman, head of the Council of Torah Sages, playing a similar role, when ultra- Orthodox schools do not even teach math and science?

The Jerusalem Report: "In Israel, we tend to see our ultra- religious as anti-science. Their schools, for instance, teach math and science poorly or not at all. And we assume that Iran is the same. But Iran's Supreme Council of the Cultural Revolution, led by clerics and ayatollahs, has announced: "The revival of the great Islamic civilization is contingent upon allout progress in science." The ayatollahs, led by Khamenei, have actually been the driving force behind Iran's progress in science. Do your data support the Supreme Council's statement that Iran is indeed massively backing its science, technology and math programs with huge resources?"

Getz: "In Iran, there is no contradiction between science and technology and religion - the opposite is the case. The religious leaders say that Islam is in favor of science and Khamenei, the supreme ayatollah, claims in his speeches that true Islam walks hand in hand with science and technology.

Ayatollah Mohammad Khatami, when he ruled, published in 2005 his vision for 20 years in the future - a road map for economic, political, cultural, and social development whose goal was to transform Iran into a nation with an economy based on knowledge rather than on petroleum. The investment in education and in universities is part of this plan, as are the goals for increasing gross expenditure on R&D as a percentage of GDP and the increase in national investment in R&D per capita.

These investments and supporting policies have led to an increase in the number of students in science and engineering; have stimulated scientific research, and have increased R&D output that finds expression in the steep rise in the number of scientific publications and in the improvement in their quality. In high schools, students are directed to learn scientific disciplines, and this results in achievements in examinations and impressive showings in international competitions in science. Our

findings show that the strengthening of achievements in science that we identified in 2011 have continued to this day. Iranian universities not included in the top 500 universities in the world, according to the Shanghai rankings, today appear among the top 100-200 universities in the world in science and engineering."

The Jerusalem Report: "One of the most interesting indicators your studies provide is that of the Science Olympiads [The International Science Olympiads are a group of worldwide annual competitions in various areas of science designed for the four to six best high-school students from each participating country selected through internal National Science Olympiads.] Iran attaches huge importance to these Olympiads; Khamenei himself met with Iran's student contestants. You show that Israel's performance index in this contest for youths is far inferior to that of Iran and Turkey. What is this measure and is it really significant? Does it tell us something about how Iran prioritizes science? Is Israel truly trying its best to identify scientific talent very early and develop it?"

Getz: "The International Olympiads in science compare the achievements of teams of four to six outstanding high-school students from various countries, who compete in math, physics, chemistry, and biology. If we take, for instance, the achievements of Israel, Iran and Turkey in the math Olympiad in 2015, the six contestants from Iran reached 7th place out of 104 countries, winning three gold medals, two silver medals and one bronze. Six contestants from Turkey came 20th, with five gold medals, and Israel's team placed only 40th, with one gold medal, no silver medals and one bronze."

Getz drew my attention to Prof. Maryam Mirzakhani, a math professor at Stanford University born and raised in Iran, who last year became the first woman in the prize's 80-year history to win the coveted Fields Medal, described as the Nobel Prize for mathematics. Mirzakhani won gold medals for Iran in the Math Olympiads in 1994 and 1995, and later studied at Iran's Sharif University of Technology There is another key area in which Iran has overtaken Israel - science policy leadership.

In his two years in office, Iran's President Hassan Rouhani has built a cabinet full of PhD technocrats. One of his youngest cabinet ministers is Sorena Sattari, 43, a mechanical engineer, vice president for science and technology. Sattari says he seeks to link science more tightly to the economy and claims he will imbue Iran with "entrepreneurial spirit. He doles out $600 million yearly in low- interest loans to 1,650 start-ups, perhaps imitating Israel's Chief Scientist grants.

Sattari's counterpart in Israel is Minister of Science, Technology and Space Ophir Akunis, 42, whose degree is in Political Science. Akunis is young, ambitious, energetic ? a rising star in the Likud party. But he lacks academic knowledge of the subject his ministry administers.

Contrast that background with Israel's first minister of science, Prof. Yuval Ne'eman, whose work on the classification of the basic particle known as the hadron should have won him a Nobel Prize, together with Caltech Prof. Murray Gell-Mann.

The "Towards 2030" UNESCO report notes that in Israel "there is a visible ageing of scientists and engineers in some fields, including physical sciences and engineering. The shortage of professional staff will be a major handicap for the national innovation system, as the growing demand for engineers and technical professionals begins to outpace supply."

Getz tells me what she believes should be done. We need an urgent coordinated strategic plan, she says, linking the Economics, Education, Defense and Science Ministries to strengthen Israel's science and technology capabilities and to maintain the technological advantage over nations dedicated to wiping us out.

In Arthur Miller's play "Death of a Salesman," salesman Willy Loman's wife Linda pleads for more respect for her husband, "attention, attention must be finally paid..." Those ringing words apply strongly to the efforts of Iran, Turkey, Saudi Arabia, and other neighboring Islamic countries to close the science and technology gap with Israel.

Israel has many excellent think tanks, like the one at which I work. They alert Israel's leaders to areas of deep concern.

But are their data, words and reports falling on deaf ears, like the words of Linda Loman? Is attention being paid, even when the Military Intelligence chief himself forcefully sounds the alarm?

Le Monde
Le gouvernement néerlandais défend le chiffrement des données
Thursday, 07 January 2016
Byline: Journaliste maison
Section: general

La Haye - C'est une position à contre-courant de celle de la plupart des gouvernements européens que défend désormais le gouvernement néerlandais. Après les attentats ces dernières semaines à Paris et à San Bernardino, le débat sur le chiffrement des données et des communications a été relancé, et plusieurs pays, comme la Grande-Bretagne ou la Chine, ont annoncé leur volonté de légiférer sur la question. Objectif: que les entreprises technologiques permettent aux autorités d'accéder, sans décision de justice, aux données chiffrées de leurs utilisateurs -par exemple en contraignant les services Web à installer des «portes dérobées» dans leurs logiciels.
C'est tout l'inverse que viennent de défendre, dans un texte publié lundi 4janvier , le ministre de la sécurité et de la justice néerlandais, Ard van der Steur, et le ministre des affaires économiques, Henk Camp. Dans cette déclaration, ils soulignent «l'importance d'un chiffrement robuste (...) pour la protection des données des citoyens, des entreprises, du gouvernement et de l'économie néerlandaise tout entière.»

Le texte affirme aussi que le chiffrement est «important pour l'exercice de la liberté d'expression» , celle des citoyens, précise-t-il, mais aussi des journalistes, «en permettant des communications confidentielles» . Les deux ministres vont plus loin, assurant même que l'affaiblissement du chiffrement représente un danger, puisqu'il « expose le trafic Internet à l'espionnage des criminels, des terroristes et d'agences de renseignement étrangères ».

Quelques «entorses» possibles

Malgré ces affirmations, le gouvernement se réserve le droit à quelques «entorses» à ces principes, pour une « cause légitime» . Une formulation très vague, ouverte à tout type d'interprétation.

Cette déclaration a été applaudie par les défenseurs des libertés numériques, comme Rejo Zenger, un des représentants de l'organisation néerlandaise Bits of Freedom, interrogé par Le Monde : «Le gouvernement a conclu, à raison, qu'une telle vulnérabilité pouvait être utilisée par n'importe qui. Il est techniquement impossible de créer une vulnérabilité que seuls les enquêteurs de la police et les services secrets d'un seul pays puissent utiliser.» Pour lui, la position néerlandaise s'explique par l'importance accordée au numérique par les citoyens et le gouvernement:

«Aux Pays-Bas, nous avons une importante infrastructure numérique. La plupart des gens disposent d'une connexion à haut débit et beaucoup font leurs courses en ligne, achètent des livres et des machines à laver sur des sites d'e-commerce. Le gouvernement a ses propres besoins: les citoyens déclarent leurs impôts en ligne, le renseignement chiffre les secrets d'Etat, l'armée sécurise l'information. Tout cela ne peut fonctionner que si nous avons confiance dans la sécurité de l'infrastructure numérique.»

Depuis les révélations d'Edward Snowden en2013 sur la surveillance massive de la NSA , les géants du Web ont renforcé le chiffrement des données de leurs utilisateurs. Au grand dam de nombreux gouvernements, qui considèrent que cela complique le travail des agences de renseignement, notamment pour repérer de potentiels terroristes. Un débat relancé ces dernières semaines, même si rien n'indique dans l'état actuel des enquêtes que les terroristes impliqués dans les attentats de Paris et San Bernardino aient eu recours à des techniques de chiffrement.

La position des Pays-Bas fait donc office d'exception. Ce n'est d'ailleurs pas la première fois que le pays s'intéresse au sujet du chiffrement: le mois dernier, le Parlement a décidé de financer à hauteur de 500000 euros le développent d'OpenSSL, une série d'outils de chiffrement libres et gratuits.

Wall Street Journal
Bugs in Wi-Fi Hookups Cripple Web Security
Tuesday, 19 January 2016
Byline: Jennifer Valentino-DeVries

New York - In late 2014, a small Massachusetts software company got an ominous email: A computer-security researcher said a flaw in one of its programs put millions world-wide at risk of being hacked. Engineers at the company, Allegro Software Development Corp., analyzed the flaw in the program, which can help users access the controls of home Internet routers. They quickly realized something strange: They had fixed this bug nearly 10 years earlier. But it lived on, even in new devices.

The reason: A component maker had included the 2002 version of Allegro's software with its chipset and hadn't updated it. Router makers used those chips in more than 10 million devices. The router makers said they didn't know a later version of Allegro's software fixed the bug.

The router flaw highlights an enduring problem in computer security: Fixing bugs once they have been released into the world is sometimes difficult and often overlooked. The flaw's creator must develop a fix, or "patch." Then it often must alert millions of technically unsophisticated users, who have to install the patch.

The chain can break at many points: Patches aren't distributed. Users aren't alerted or neglect to apply the patch. Hackers exploit any weak link.

In the case of the routers, Allegro said it couldn't apply the patch, because it doesn't have access to the devices. The company urges manufacturers to use the latest version of its software but can't require them to do so. "Nobody does that," said Loren Shade, vice president of marketing. "We've thought about it, but it's kind of hard to enforce."

To shed light on the problem, The Wall Street Journal commissioned a security researcher to test 20 popular Internet routers purchased new in the second half of 2015.

Ten arrived with known, documented security weaknesses. Tod Beardsley, a researcher at security company Rapid7 Inc. who conducted the tests, said the vulnerable routers had outdated "firmware," the programs that run a device. Four others had old firmware that had subsequent updates that Mr. Beardsley said could contain undocumented security problems.

Half of the group of 20 didn't let users easily check for new software during the standard setup process. Instead, users had to search on the Web or run optional programs. In addition, two routers incorrectly told users that updated software wasn't available, when in fact it was, and one directed users to download software that had a severe, documented security flaw.

The Journal's findings dovetail with those of Shahar Tal, a researcher formerly at Check Point Software Technologies Ltd. who helped find the Allegro bug, dubbed "Misfortune Cookie" because it allows hackers to attack the router using malicious Web cookies.

In scans over the Internet this spring, Mr. Tal found that 79% of the routers that initially contained Misfortune Cookie were still vulnerable, five months after the problem had been disclosed in public announcements and to the device makers.

Router makers are cutting corners by not checking the security of their products and failing to make efforts to keep customers informed of updates, he said. They "aren't paying the price for bad security," Mr. Tal said. "They're trying to cut prices by a dollar and win that contract from service provider X. Security isn't on their mind."

Router makers contacted by the Journal said security was important to them, and most said they had plans to improve how users are notified of new software-- which often depends on a user noticing an update on the router's website. But several also said routers more than a couple of years old are less likely to get fixed.

Home routers are an easy target because manufacturers compete largely on price, for devices that typically sell for less than $100. Customers acquire the routers either from retailers or from Internet-service providers. Once routers are sold, manufacturers have little incentive to update them to improve security. Routers can remain in use for years after what manufacturers term their "end of life," meaning they no longer issue updates.

The same problem is evident in smartphones and the growing market for Internet-connected computers in everything from printers to television sets.

Security researchers recently showed how they could hijack an email account through a refrigerator by attacking the link it used to display the owner's Google calendar on the door's touch screen. Other researchers have demonstrated they can change the settings on Internet-connected medical devices, managed remotely by nurses and doctors, that infuse medicines into patients.

The Federal Trade Commission last year warned that companies entering these markets "may not have experience" with security. For users, the commission said, "It may be difficult or impossible to update the software or apply a patch."

Alphabet Inc.'s Google regularly updates its Android mobile-operating system, which runs roughly three-fourths of the world's smartphones, to patch security holes. But it generally relies on device makers and telecom carriers to distribute the new software. Device makers don't always distribute it, particularly for cheaper phones or those more than a year old.

University of Cambridge researchers in October said more than 85% of 20,000 Android devices they studied had at least one of 11 known critical vulnerabilities, largely because of "inaction by some manufacturers and network operators." That could allow a hacker to take control of a phone, usually through a malicious app.

A Google spokeswoman said the company is working with manufacturers and carriers to distribute updates more quickly. Google also said it has made efforts to keep harmful apps, which hackers typically use to exploit a weakness in a device, off its Play Store. It said fewer than 1% of Android devices have installed a potentially harmful app.

Software on Apple Inc. devices is more commonly up-to-date, because Apple manufactures iPhones and iPads and controls more of the update process.

Automatic updates

Microsoft Corp. in late 2004 activated automatic updates by default on Windows machines. Some software, such as Google's Chrome Web browser, updates itself every few weeks.

Such efforts help more-secure software spread faster. Mozilla Corp. said more than 70% of users of its Firefox Web browser are on the latest version within 20 days of its release; since 2013, Firefox has updated on its own when the user restarts. Before that, when the browser prompted users to upgrade every few months, it took more than a year to get that many users on the newest software.

As security improves on personal computers, hackers seek other ways into networks. Routers make an inviting target.

Once in control of a router, hackers can access almost anything a user sends over the Internet, sometimes even if it is encrypted. In one incident reported in 2014, hackers hijacked routers to siphon off bank-account details from Polish consumers. Researchers in Spain last year tested 22 routers and found that each had at least one security vulnerability.

Researchers at Internet- technology company Akamai Technologies Inc. said criminals also increasingly offer to infiltrate routers and use them to overwhelm targeted websites for a fee. Attack instigators may want to gain an advantage in online games, punish companies for bad service, camouflage another attack or extort money, said Eric Kobrin, Akamai's director of information security. Such router- type attacks were rare a year ago but in 2015 accounted for 10% to 20% of denial-of-service attacks, he said.

Mr. Kobrin said a group called Lizard Squad used routers and other home devices to direct malicious traffic that knocked gaming networks for Microsoft's Xbox and Sony Corp.'s PlayStation offline for hours on Christmas Day 2014.

None of the routers tested by the Journal was vulnerable to these types of attacks out of the box, with default settings in place. The Journal's tests found at least one flaw that has been used by hackers. "The Moon" worm was documented spreading among Linksys routers in 2014. A new Linksys E1200 N300 router purchased in July 2015 and tested by the Journal shipped with software from 2013 that still had the vulnerability the worm exploited.

Belkin International Inc., which owns the Linksys brand, initially said the 2013 software wasn't vulnerable to the bug, but after discussions with the Journal it acknowledged that users should update to newer software to protect from the hack. The company said all new routers are now shipping to stores with the later software.

Users can update device software to address such vulnerabilities, but most of the devices tested by the Journal didn't notify owners that new software was available. Two routers-- one made by Belkin and one by Netgear Inc.-- incorrectly told users there was no update.

In a statement, Netgear said new routers might arrive with old versions of firmware because it can take months for a router to get from a factory to a consumer. The router that incorrectly said an update wasn't available didn't work "as expected," Netgear said. Follow-up tests after the Journal contacted Netgear showed the router correctly indicated an update was available.

Belkin said its router couldn't find the update because the updated software hadn't been properly loaded on its computers. The company made the software available after being contacted by the Journal.

Another router, made by D-Link Systems Inc., directed U.S. users to download a version of the software that still contained a bug with the highest severity level in the National Institute of Standards and Technology's National Vulnerability Database. The bug had been fixed by D-Link in May, but the patch was made available only on international D-Link sites and an obscure Internet forum.

After being contacted by the Journal, D-Link said in December that the company hadn't put the fixed firmware on its U.S. site because it had been conducting a "validation test" to confirm "that the firmware is succeeding." The update was put on the U.S. site in early January.

"I was surprised at the level of problems users would have just updating" the software, said Mr. Beardsley, the Rapid7 researcher who conducted the Journal's tests.

The tests found other security weaknesses. All but two of the 20 routers tested used insecure, widely known passwords by default and didn't require users to change them. All 20 used network settings that security researchers say can be easily guessed by hackers.

The routers tested by Mr. Beardsley had fixed two problems regularly cited by security researchers in the past: None had remote administration settings enabled by default, and none was easily accessible over the Internet by openings that hackers regularly probe.

The Journal's tests didn't look for new vulnerabilities. Instead, they focused on known problems, to highlight weaknesses in the security chain. The Misfortune Cookie flaw was more prevalent in routers sold abroad than in the U.S., researchers said.

Mr. Tal, the researcher who found the bug, said he became interested in studying Allegro's software when he realized how widely it was used -- and that the most-common version was from 2002. He and fellow researchers saw it on more than 200 models from dozens of router manufacturers but didn't understand why it was so prevalent.

They eventually linked the software to MediaTek Inc., which had supplied chips for the vulnerable routers. MediaTek said the faulty software had been incorporated into the chip by a company it acquired and that maintenance fell through the cracks until 2014, when MediaTek learned about the Misfortune Cookie flaw.

"Once we were alerted, we acted quickly to minimize impact and remedy the issue for customers," by working with router makers to update the firmware, a MediaTek spokesman said.

Huawei Technologies Co., for example, published a fix for its two routers affected by Misfortune Cookie in December 2014, soon after being contacted by the researchers. In a statement, Huawei said it "expresses appreciation" to the researchers for disclosing the bug and urged people to download the latest firmware from the company's website.

TP-Link Technologies Co. initially had 23 affected models, according to the researchers. More than a year after the bug was publicized, the company's support site showed that three of the models had updates to address the vulnerability. TP-Link said seven additional models were scheduled to be updated before early February, but that other models were considered "end of life" and wouldn't be updated. The company is "prioritizing support for newer products, of which a larger portion are likely to still be in service," a company spokesman said.

But security pros say people often use these types of devices for a long time. Routers "are things you just set up and don't think about," said Mr. Tal, the researcher. "They stay out there for years and years until they break."

Ottawa Citizen
Burkina Faso attack shows need to boost information-gathering: Sajjan
Tuesday, 19 January 2016
Byline: Lee Berthiaume

ST. ANDREWS, N.B. - Defence Minister Harjit Sajjan says better intelligence capabilities, as well as co-operation with Canada's allies, are essential for preventing the types of terror attacks that have struck Burkina Faso and other parts of the world.
Six Canadians were killed over the weekend when militants linked to al-Qaida stormed a hotel in Ouagadougou, the capital of Burkina Faso in West Africa. Days earlier, a Canadian was killed during an attack by Islamic State-inspired terrorists in Indonesia.

Speaking on the sidelines of a three-day retreat between Prime Minister Justin Trudeau and his cabinet ministers, Sajjan said Canada has "to get better at our intelligence capabilities in other parts of the world so that we have a better chance of preventing attacks like this from happening.

"This only happens if we start working in greater co-operation with our intelligence partners," he added. "Which means not just the military, but also the police forces as well."

Intelligence co-operation between Canada and its allies has been the subject of massive controversy in recent years, particularly after U.S. whistleblower Edward Snowden revealed that American and Canadian spy agencies have been running massive intelligence-gathering operations.

The previous Conservative government also enacted controversial anti-terror legislation, Bill C-51, that increased the scope and powers of Canada's intelligence operations. The Liberals promised during the election to amend the law, but haven't said how. Instead, they have promised broad consultations first.

Sajjan, who is responsible for the ultra-secret Communications Security Establishment, which is Canada's electronic spy agency, said "the safety of Canadians will always be paramount," but also that there "has to be a balance."

"There can be a fine balance with security, and when it comes to preventing these types of attacks and co-operation between agencies, it does not have to infringe on Canadian rights," Sajjan said. "We can actually do this better. It's just a matter of being better co-ordinated."

Canadian Press
'Troubling' Conservative torture policy up for review, Goodale says
Tuesday, 19 January 2016
Byline: Jim Bronskill

OTTAWA _ The Trudeau Liberals will review controversial directives enacted by the Harper government that allow for the sharing of information even when it might lead to torture, says the public safety minister.

The ``troubling set of issues'' raised by the foreign information-sharing policy ``will be raised in the course of our consultations'' on the overall national security direction of the new government, Ralph Goodale said in a recent interview with The Canadian Press.

The news follows pressure from human-rights and privacy advocates to conduct a wide-ranging examination of security policies introduced by the Conservatives, whisked from office in the October election.

The federal policy on foreign information-sharing has been roundly criticized for effectively condoning the torture of people in overseas prisons, contrary to international law and Canada's United Nations commitments.

A four-page 2010 framework document, released under the Access to Information Act, says when there is a ``substantial risk'' that sending information to, or soliciting information from, a foreign agency would result in torture _ and it is unclear whether the risk can be managed through assurances or other means _ the matter should be referred to the responsible deputy minister or agency head.

In deciding what to do, the agency head will consider factors including the threat to Canada's national security and the nature and imminence of the threat; the status of Canada's relationship with _ and the human rights record of _ the foreign agency; and the rationale for believing that sharing the information would lead to torture.

Critics say when there is a serious risk of torture, there should be no sharing _ period.

The Canadian Security Intelligence Service, the RCMP, the Canada Border Services Agency, National Defence and the Communications Security Establishment, Canada's electronic spy agency, are bound by the federal policy on sharing information with foreign agencies.

``That's a very troubling set of issues,'' Goodale said, adding the government intends to develop a response ``that reflects what Canadians want.''

``We'll be listening very carefully for the messages from Canadians on that subject.''

Goodale said the Liberal government is open to a general rethinking of national security legislation, not just a few changes the party has promised to the omnibus bill known as C-51.

The government plans to give Canadians their say before deciding what changes to make.

Globe and Mail
Chinese soldiers implicated in U.S. military hacking case
Tuesday, 19 January 2016

Byline: Colin Freeze

Two Chinese government soldiers were part of a hacking conspiracy allegedly carried out by a Chinese resident of Canada to steal secrets relating to components of F-35s and other American warplanes, according to court-filed documents.
Prosecution "books of record," recently released by a Vancouver court following a request from The Globe and Mail, make explicit Chinese military ties that were not publicly alleged when this rare cyberespionage prosecution was launched in 2014.

The case centres on Su Bin, a 50-year-old Chinese aviation industry entrepreneur residing in Vancouver, and the two unnamed "co-conspirators" revealed to be Chinese soldiers.

Despite their military connection, it remains unclear whether the alleged scheme was statesponsored, or whether the conspirators were essentially soldiers moonlighting to enrich themselves.

Prime Minister Justin Trudeau is considering a visit to China this spring to talk about free trade. In recent years, both U.S.

President Barack Obama and former prime minister Stephen Harper have gone public with concerns about Chinese cyberespionage.

While most countries spy, China is feared to be in a class of its own when it comes to using hackers to steal military and commercial secrets. Four years ago, now-retired American spymaster Keith Alexander claimed that cybercrime costs the United States hundreds of billions of dollars each year.

In June, 2014, such fears were given a human face. That's when Canadian police arrested Mr. Su on a U.S. warrant that charged him with being part of an illegal hacking conspiracy. The ongoing extradition case against him relies on intercepted e-mail exchanges, in which Mr. Su allegedly helped to focus the hacking efforts of the two Chinese co-conspirators.

The allegation is that the conspirators worked together to identify and raid secure databases belonging to U.S. military contractors who make jets for the Pentagon.

Mr. Su allegedly directed the two hackers toward the e-mail accounts of American aviation engineers whose accounts he felt to be worth breaking into; from there, the China-based hackers mined corporate networks for engineering manuals related to F-35, C- 17 and F-22 military jets, documents show. During such breaches, the co- conspirators allegedly circled back to Mr. Su with long lists of files, to ask him what documents they should try to take.

The original U.S. charging documents released in 2014 mention the two "unindicted co-conspirators," but only as people "affiliated with multiple organizations and entities." No mention was then made of potential ties to China's People's Liberation Army (PLA).

Yet materials recently released to The Globe explicitly describe them as "two Chinese military officers." And U.S. authorities say they know this because they intercepted an e-mail attachment bearing a digital image of one coconspirator's "Chinese military identification showing his photograph, name, rank, military unit, and year and month of birth." He is also said to have used certain "monikers or nicknames" within the Chinese military.

Other intercepted photos allegedly show the other conspirator's "Hong Kong identification" and a picture of him wearing a Chinese military uniform.

No names are revealed in the documents. It is not clear why U.S. prosecutors minimized the military connection at first, nor why they declined to lay charges against the two co-conspirators if their identities are known. "I'm going to decline to comment on the matter at this time, as the extradition proceeding is ongoing in Canada," said Thom Mrozek, a U.S. Justice Department spokesman.

Mr. Su's extradition hearing took place in Vancouver last July.

According to news reports, Canadian Crown lawyers did refer in passing to the two co-conspirators as Chinese military officers, but gave no additional information. In September, a Canadian judge ordered Mr. Su extradited, but he remains in Vancouver pending an appeal to be heard later this year.

Most of the e-mails intercepted in the case were sent between 2009 and 2012. Some speak of bids to sell stolen data; at one point, Mr. Su allegedly tells his coconspirators that it is hard to collect "big money." At another, he tells them a certain Chinese aviation company is likely "too stingy" to pay them much.

This illustrates how both profit and patriotism motivate spying done on China's behalf. Observers have long pointed out that Beijing leverages two types of hackers: squads of PLA soldiers whose full-time jobs are to hack away at the West's secrets, and also unaffiliated, arms-length hackers who sell their wares to Chinese firms. What the Su Bin prosecution suggests is that the soldiers and freelancers are, at times, the same people.

"The problem has always been the hackers seem to do the same work from 9 to 5, and then 5 to midnight when they got home," says Adam Segal, a New Yorkbased scholar who is releasing a book next month called The Hacked World Order. "So it's very hard to very clearly say this guy is a freelancer, this guy is a PLA hacker. Sometimes they are doing it under the direction of the PLA, sometimes they are doing it as freelancers to make money."

Chinese hacking "is going to continue to be a big issue" in coming years, Mr. Segal says, despite a recent détente. In September, Chinese President Xi Jinping met with Mr. Obama, and the two nations publicly pledged to curtail cyber activities aimed at stealing commercial trade secrets. No mention was made,

however, of the kinds of spying that aim to secure a military edge - or to blunt that of a potential adversary.

Mr. Su is not accused of being a hacker himself. But, according to the documents, engineers and executives with Boeing, Lockheed Martin and Airbus are preparing to testify that his e-mail trails show that he helped the Chinese hackers take bona fide engineering documents off secure servers; this work, they will say, essentially gave China a free ride on aspects of jet projects that cost the U.S. military billions to develop.

While the China-based hackers allegedly used a network of Internet "hop points" to hide the trail of the stolen data, Mr. Su himself appears to have violated some rudimentary Internet-secrecy principles.

For example, he allegedly talked to his co-conspirators using Gmail and Hotmail services based in the United States, services which U.S. federal agents readily searched once they got the warrants to do so. At one point, he allegedly e- mailed his conspirators a password for an encrypted document - saying that the password was his phone number, then going the extra step of typing out that phone number.

Mr. Su appears to have moved to Vancouver from Beijing only a short while before his arrest.

In 2012, The Wall Street Journal profiled Mr. Su as a resident of Beijing, describing him as an army officer's son who had become a multimillionaire Chinese aerospace entrepreneur. Mr. Su was quoted as saying that he and his family were heading to Canada because he didn't like living under Chinese rule.

The newly released documents say Mr. Su carried a Canadian permanent resident card and also a business card saying he had worked as a project manager for a "test flight academy in Africa."

Most of his other personal documentation described him as the founder of Lode Tech, a Chinabased company that bought and sold harness cables used in the aviation industry.

Motherboard (Vice)
'Teens' Who Hacked CIA Director Also Hit White House Official
Tuesday, 19 January 2016
Byline: Lorenzo Franceschi-Bicchierai

New York - The hacking group that has been targeting government officials since October, when it broke into the AOL email account of CIA Director John Brennan, has claimed yet another victim.
This time, the victim is President Barack Obama's senior advisor on science and technology John Holdren, Motherboard has learned. One of the cybercriminals linked to the group that hacked Brennan broke into Holdren's home telephone and email account and set it so that all the calls would get forwarded to the Free Palestine Movement. This is exactly what happened to US Director of National Intelligence James Clapper last week.

On Monday, one of the members of the hacking group, which is known as Crackas With Attitude, or CWA, sent me an email to tell me about his latest feat.

"If you don't believe me you can call the home phone," he said, before sending me a phone number that belongs to Holdren, according to public records.

When I called the number, the founder of the Free Palestine Movement Paul Larudee picked up the phone. Larudee said that the same person who called him last week to tell him that he would receive calls directed at Clapper called him again on Monday morning.

"I did it again," said the hacker, according to Larudee, who told me he recognized the voice of the hacker.

One of the CWA hackers, known as Cubed, told me that the person who broke into Holdren's account was somebody called Fearz, or @fearhax, who identifies himself as an ex-member of CWA on his bio. Cracka, another CWA hacker, also told me that it was Fearz who was able to get into Holdren's account with a spear phishing (a term for getting information by deceiving via a targeted attack) his wife. (Cracka also said CWA has disbanded, but it appears its members are still in touch with each other and share information.)

"[Fearz] sent [Holdren's wife] Cheryl an email claiming to be John LOL," Cracka told me in an online chat, adding that the phishing emails said "something like 'Hey honey, do you have the password for our joint Xfinity account? I lost it.'"

Then Cheryl sent the password to the hacker, according to Cracka, allowing him to get into their Comcast Xfinity account.

The White House declined to comment, but confirmed that Holdren, who's the Director of the Office of Science and Technology Policy (OSTP), was targeted. "We are aware of this issue and have reported it to law enforcement," a spokesperson for the White House OSTP told Motherboard.

The FBI did not respond to Motherboard's request for comment.

The hackers also provided what they claimed was Holdren's cellphone number. When I called it, a person claiming to be John Holdren picked it up. However, he declined to comment until I proved who I was, and asked me to send him an email to his personal Gmail account. But he didn't respond to my email, nor another subsequent call.

Holdren is just the last in a long series of victims.

Cracka and his associates first became notorious when they hacked Brennan's email. But since then, they have targeted several government officials, including FBI's Deputy Director Mark Giuliano, James Clapper, and the former intelligence execute Vonna Weir Heaton.

Cracka told me on Monday that the group hacked several other government officials, including some the group never publicly bragged about. He mentioned Amy Hess, the FBI's executive assistant director for science and technology, White House Communications Director Jen Psaki, White House Chief of Staff Denis McDonough, the Deputy Secretary of State Tony Blinken, and the White House Deputy National Security Advisor Avril Haines.

Their month-long hacking spree prompted the FBI to issue an alert last year, warning politicians and police officers of the risk of getting "doxed" by a "hacktivist" group.

The hackers also appeared to have gained access to a slew of law enforcement tools and databases. In November, the hackers published more than 2,000 names belonging mostly to US law enforcement agents. Cracka told me that they found Holdren's wife's email address in one of the databases they were able to download in November.

"That was the best breach everrr [sic]," Cracka said.

The hackers have always claimed to be doing this to protest against the US government, and to support the cause of a free Palestine. In fact, Cracka asked me to include a statement in this article.

"Fuck zionist fucks and bomb Israel leaders," he said.

ABC (Australia)
Australia not prepared for cyber war
Tuesday, 19 January 2016
Byline: Francis Keany

A new report warns Australia is not adequately prepared for cyber war, with the nation "badly lagging" behind overseas counterparts and the Defence Force also at risk.
Research by the Australian Centre for Cyber Security (ACCS) said Australian government and civilian organisations were well behind China and the United States, which have gone to great lengths to prepare themselves.

The report released by Professor Greg Austin called for a "rapid catch-up in Australian capabilities for military security in the information age", warning Australia's response to the threats that have emerged in cyberspace has been "slow and fragmented".

Another report by the ACCS has also warned the Australian Defence Force (ADF) has not done enough to test its ability to ward off cyber attacks against weapons systems.

While Australia has relied on the United States for its security needs for the past 60 years, the report warned that support would be limited when it came to cyber warfare.

This is despite Australia's involvement in the Five Eyes intelligence alliance.

"The reliance by middle powers such as Australia on the United States for extended deterrence may not have as much impact in cyber space as for kinetic operations," Professor Austin said.

He said while there was public debate about the future of Australia's naval, air and ground capabilities, there has been "no effort in public by the government to benchmark Australian national security needs in cyber space in the same way".

"The country has had a high-profile national debate about whether we need a national capability to build naval combat ships and submarines, but we have been silent on the type of national cyber innovation system we need for future warfare."

The report said Australia at this stage was not prepared for a "medium-intensity war" that would include a sophisticated attack in cyber space.

"We need first of all an open and public debate on our military, security and civil needs in cyber space and how well our emerging capabilities match those needs," it said.

"We would have to admit, as so many specialists have argued, that we are badly lagging."

ADF weapons systems 'vulnerable'

A separate study, also released by the ACCS, has warned the ADF needs to do more to ensure its current weapons systems can withstand a cyber attack.

The report, by retired Group Captain Keith Joiner from the RAAF, said Australia's preparedness was about "six years" behind the United States.

"Consequently, the ADF is likely to be blind to the operational vulnerabilities of their major complex systems and platforms to cyber attack," Dr Joiner said.

The paper called for increased funding to enable the ADF to conduct cyber-survivability trials.

"The ADF needs to give the same attention to testing and evaluating the vulnerability to cyber attacks of its legacy systems as it affords to testing and evaluating vulnerabilities to conventional threats," it said.

The comments come as the Federal Government prepares to release its defence white paper, which is expected in coming months.

China likely to be 'far ahead' within 20 years

Professor Austin's study warned Australia risks being overtaken by China in relation to its defences against cyber attacks; and that it might already be too late to prevent it from happening.

"On current indications, within 20 years, China's civil, economic and military capabilities in cyber space will likely be very far ahead of Australia's, whereas today both countries might be judged to be both laggard countries," it said.

"Australia must now prepare to respond to the likely impact over the longer term of Beijing's higher commitment in the past 15 years to transformation through military cyber S&T (Science and Technology) compared with the Australian Government's lack of commitment in key areas of policy over the same period."

Professor Austin suggested Australia follow the path of China and provide its reservists with training on cyber warfare.

"China is exceptionally well placed to develop the most powerful and best-organised cyber militias in the world. It does not now have such a strong capability but it has taken steps along this path."

Innovation the key to 'cyber survivability'

Professor Austin called for a national innovation strategy, as well as a blueprint for "cyber survivability" if there is a direct military confrontation with a major power.

He also recommended increased investment in IT and education, to encourage more graduates into the field.

"Cyberspace governs all economic, social, scientific, business and medical activity dependent on any sort of computerised record keeping or more complex analysis," he said.

"Cyberspace unifies all domains of warfare, especially its political control and its political impacts."

Prime Minister Malcolm Turnbull has vowed to make innovation a cornerstone of his leadership.

Straits Times
Security agencies outline plans to tackle threats

Tuesday, 19 January 2016

Singapore is boosting the capabilities of its security agencies to deal with a range of threats, from terrorism to cyber crime.
The Singapore Armed Forces is developing know-how such as unmanned systems and robotics, and the police are installing cameras at HDB estates and public areas to deter criminal and terror activity.

These broad plans to keep Singapore safe and secure were outlined by the Defence, Foreign Affairs and Home Affairs ministries yesterday, in addenda to President Tony Tan Keng Yam's address to Parliament.

Speaking at the opening of Parliament last Friday, Dr Tan said Singapore can remain sovereign only if its people are able to determine their own fate.

Deputy Prime Minister and Coordinating Minister for National Security Teo Chee Hean, who oversees the National Security Coordination Secretariat, said yesterday that strengthening social resilience is also crucial.

"In the event of a crisis, it is not just the security agencies that will be called to respond. Our society as a whole will also be tested," he said. "We must ensure that we can bounce back from any incident, and emerge stronger and more united."

Several other ministries will release their plans this week. MPs will then debate these policies when Parliament sits for a week from next Monday.

Saudi Gazette
GCC warned to be on high alert against rising cyber security threat
Tuesday, 19 January 2016

Jeddah - Businesses need to be on high alert in the GCC to combat the growing threat from computer hackers, an IT transformation management expert warned Monday.
Morten Meltinis, IT expert at PA Consulting Group, said a number of recent scares have underlined why security must be high on the business agenda in the GCC to counter the increasing risk of cyber breaches.

PA said organizations need to understand their own weaknesses and increase their combined security knowledge, in the process making employees guardians of digital assets, rather than the potential source of risks.

"The UAE, for instance, is rising on the global list of countries with a high risk of having your computer infected and thereby vulnerable to being hacked," said Meltinis. "According to Kaspersky Labs, the UAE is in the second highest risk group of five."

Earlier this year, PA Consulting Group issued a three-point cyber security strategy for healthcare providers in the GCC from its Abu Dhabi regional headquarters. Another PA report in the UK said police analysts forecast the time spent on dealing with cybercrime will treble.

"One of the biggest problems is that many organizations do not know where they are vulnerable - they take the standard precautions without really knowing what is needed and what the threats are they are trying to protect themselves against," said Meltinis.

"It's crucial that employees know how to avoid the most common mistakes, and raising the lower bar of a company's combined security knowledge will eliminate many risks."

"If employees are given an understanding of where the organization is vulnerable they can act as custodians rather than be security risks themselves. Instead of applying very strict rules upon employees, companies should educate them so they understand what the threat is and the behaviors expected of them."

PA Consulting Group highlights the common use of a single password / email combination for multiple purposes as a major security risk. "Passwords should not be so complicated that the user has to write them down, but we also recommend educating employees about using unique username and password combinations for their personal and professional digital assets that they really care about," said Meltinis.

National Post
Beefing Up our cyber defences
Wednesday, 20 January 2016
Byline: Imran Ahmad, Marlon Hylton And Bernice Karn
Section: oped

With cyber attacks steadily increasing in sophistication, frequency and magnitude, we must ask ourselves whether Canada is ready to meet the challenge these threats pose to our economy, national security and the overall wellbeing of Canadians. Unfortunately, when compared to the United States, the United Kingdom or Germany, Canada is clearly lagging in terms of cyber readiness.
This is in part due to a lack of Canada-specific data on the types of cyber attacks affecting the public and private sectors in this country. While the pending mandatory data breach notification provisions under the Personal Information Protection and Electronic Documents Act will likely help in this regard, the notification requirement will be limited to personal information and won't cover cyber attacks involving the theft of intellectual property, trade secrets or other types of critical business information.

Within this environment, it's understandable that the public and private sectors have struggled to develop an effective and comprehensive cyber strategy.

Nevertheless, last month alone, several positive developments within the public and private sectors signalled a real effort to move the yardsticks on Canada's cyber preparedness. The first was Prime Minister Justin Trudeau's mandate to his minister of public safety to lead a review of existing measures to protect critical infrastructure - utilities, transportation, financial sector, telecommunications, etc. - from cyber threats. Shortly thereafter, the Canadian Council of Chief Executives announced that it was establishing the Canadian Cyber Threat Exchange, a member-funded, not-for-profit organization focused on helping Canadian businesses and consumers protect themselves against cyber attacks.

Another private-sector initiative was the Canadian Advanced Technology Alliance survey on how Canadian businesses are responding to cyber threats. The survey results will provide a useful benchmark for businesses to critically assess their cybersecurity readiness. Finally, the Investment Industry Regulatory Organization of Canada just published a best practices guide to help the investment industry adopt a voluntary, risk-based cybersecurity framework that emphasizes the need for preparing effective cyber threat response plans.

These developments are clearly all positive steps in the right direction, but they need to fall within a broader national framework.

In the meantime, Canadian organizations remain highly vulnerable to cyber attacks and the legal implications that follow. That is why corporate directors and officers must ensure their organization's cyber defences are up and that the organization is ready to effectively respond, should a cyber attack occur. Neglecting these oversight responsibilities can very easily expose directors to litigation for breach of their fiduciary duties. This is particularly true now, as many new class action lawsuits are being

launched in Canada over data breaches resulting from cyber attacks - a trend we anticipate will continue to grow in the coming years.

In an effort to ensure they meet their legal obligations to protect the data and information entrusted to them, organizations can and should take concrete steps to improve their cyber defences. Recognizing that a successful cyber attack can have a serious impact on an organization's reputation, result in years of litigation and affect business continuity, including loss of revenue, the following steps can be quickwins that any organization can implement:

Know Where You Stand Map the organization's networks and IT systems, including gaining a clear understanding of what the key business functions are, as well as where the organization's critical data (i.e., the "Crown Jewels") resides and how it is protected.

Deploy Cyber Monitoring Build a cyber-monitoring team tasked with meeting regularly to assess threat levels, discuss how to address gaps and make recommendations to management and the board of directors. The team should include key legal, business and c-suite executive stakeholders. Audit and Test Cybersecurity measures should be audited and tested on a regular basis and results should be regularly reported to management and the board. This will ensure that the leadership team is aware of any potential cyber threats, that they understand the organization's cyberrisk profile and can assess the effectiveness of current defences and are able to call for necessary remedial steps. Train Employees Many cyber attacks are successful because employees did not receive appropriate cyber-security training. Employees need to understand the importance of protecting customer and business information and have solid grounding on how to make good judgments when faced with a potential cyber threat.

Have a Cyber Attack Response Plan Organizations have to expect that they will at some point be the victim of a successful cyber attack, with their network and data being compromised. The key to an effective response plan is to map out the key legal and business issues that will need to be addressed, how the organization will respond to each issue and who should lead and be accountable for each stage within the response plan.

As Canadians recognize that cyber threats within our connected society are the new norm, they can take some solace in the fact that the public and private sectors are taking steps to confront the problem.

That said, the key question remains whether we will be able to develop an effective national cyber-security framework before the next attack compromises the personal information of Canadians, cripples our critical infrastructure or otherwise negatively impacts our economy.

Toronto-based lawyers Imran Ahmad, Marlon Hylton and Bernice Karn are members of Cassels Brock Blackwell LLP's cyber- security practice.

The Guardian (London)
Alan Turing, James Bond and London Spy: how MI5 became Britain's most inclusive employer
Tuesday, 19 January 2016
Byline: Richard Norton-Taylor

Column - If you had walked past MI5's headquarters in central London earlier today, you might have noticed the rainbow flag flying above the building. It is not the first time - it flew there on the day of London's Pride festival last summer. But this time it was raised to mark the accolade of Stonewall's employer of the year: Britain's Security Service came top in the annual Stonewall Workplace Equality Index. The index measures an organisation's work in tackling discrimination and creating an inclusive workplace for lesbian, gay, bi and trans people.
MI5 in particular, it might be argued, needs to be inclusive. Much of its work, as it director general Andrew Parker, said, "goes on by necessity out of view". Its employees cannot talk about their work with outsiders. They need a workplace that is tolerant and welcoming, and an esprit de corps that encourages diversity.

Historically, when homosexuality was illegal, spying might have been a particularly attractive career for people used to hiding their personal - as well as political - proclivities. They could keep secrets, and tell lies. Perhaps the most notorious gay spies were Guy Burgess and Anthony Blunt, two members of the Cambridge ring whose circle was imbued with sexual liberation, of all kinds. (There was one exception. The ascetic John Cairncross told me years after he was exposed as the "Fifth Man" that he did not take to the fellow members of the spy ring because of their class - which protected them from exposure - and lifestyle.)

Now even James Bond, the most highly charged heterosexual of all spies, is confronted in Skyfall with a flirtatious gay scene when villain Raoul Silva, played by Javier Bardem, undoes Bond's shirt and strokes his chest while Bond is tied to a chair. "First time for everything?" he asks. Daniel Craig's Bond, replies: "What makes you think this is my first time?"

In 1954, Alan Turing, the codebreaking genius of wartime Bletchley Park, the forerunner of GCHQ, died in an apparent suicide after battling with his sexuality and being sentenced to chemical castration. More than 50 years later, Gareth Williams, the GCHQ maths genius, was found dead in his London flat while seconded to MI6. His death , unsurprisingly, is often thought to have been an inspiration for the recent BBC2 series, London Spy. The similarities between Williams and Alex, played by Edward Holcroft, are pretty clear - although writer Tom Rob Smith has said his character is a work of fiction. Nevertheless, these are cases - one fact, the other fiction - when their employers did not face up to a duty of care in a profession which can be uniquely lonely.

MI5 now has a LGBT "champion" to promote diversity, an 80-plus-strong LGBT network, and a "reverse mentoring" scheme for staff who want to develop their understanding of diversity. Staff are offered

"unconscious bias training". Meanwhile MI6, Bond's employer, uses Stonewall's logo on recruitment ads appealing for people who are "able to get on with diverse groups".

Until the early 90s, MI5 - like the Secret Intelligence Service, MI6 - prevented gay people from security-sensitive posts on the grounds they were vulnerable to blackmail. MI5 heading Stonewall's table will be leaving many of Britain's former security chiefs aghast - and be a lesson to any of them still in post, trying to hold fast to their service's old and damaging ethos.

The Register (UK)
For fsck's SAKKE: GCHQ-built phone voice encryption has massive backdoor - researcher
Wednesday, 20 January 2016
Byline: Kieren McCarthy

London - The UK government's official voice encryption protocol, around which it is hoping to build an ecosystem of products, has a massive backdoor that would enable the security services to intercept and listen to all past and present calls, a researcher has discovered.
Dr Steven Murdoch of University College London has posted an extensive blog post digging into the MIKEY-SAKKE spec in which he concludes that it has been specifically designed to "allow undetectable and unauditable mass surveillance."

He notes that in the "vast majority of cases" the protocol would be "actively harmful for security."

Murdoch uses the EFF's scorecard as a way of measuring the security of MIKEY-SAKKE, and concludes that it only manages to meet one of the four key elements for protocol design, namely that it provides end-to-end encryption.

However, due to the way that the system creates and shares encryption keys, the design would enable a telecom provider to insert themselves as a man-in-the-middle without users at either end being aware. The system would also allow a third party to unencrypt past and future conversations. And it does not allow for people to be anonymous or to verify the identity of the person they are talking to.

In other words, it would be the perfect model for the security services, who can apply pressure to a telecom company and then carry out complete surveillance on an unidentified individual.

While it is surprising that the official UK government system would have such a significant backdoor, it is perhaps less surprising when you consider who developed the spec: the information security arm of the UK listening post GCHQ, the Communications-Electronics Security Group (CESG).

The CESG - and the UK's civil service - started pushing the approach late last year and has incorporated it into a product spec called Secure Chorus. It has also set itself up as an evaluator of other products and is

trying to market its approach commercially by pushing it as "government-grade security." One example of a product already going through this evaluation is Cryptify Call, available for iOS and Android.

There is increasing demand for voicecall encryption. Unlike instant messaging, which effectively allowed companies to start from scratch and so has resulted in a number of highly secure products, phonecalls run over older infrastructure and almost always pass through telecom companies, usually in an unencrypted form (although the information may be encrypted while in transit).

MIKEY-SAKKE is unusual in that unlike most secure messaging and phone systems, it makes no effort at all to protect the identity of the people communicating with one another, providing easy-to- access maps of metadata.

That metadata can be used to specifically identify individuals and then, using the backdoor, access all their calls past and present. In other words, it is the perfect spying system.

Murdoch highlights in his post a number of occasions in which the UK security services have successfully compromised mobile phone networks - instances that were revealed by Edward Snowden - and notes that this is likely only the tip of the iceberg.

If at first you don't succeed

He also notes that GCHQ tried 20 years ago to introduce a similar protocol but that a "notable difference" exists between that effort and this MIKEY-SAKKE approach: "While the GCHQ protocol was explicitly stated to support key escrow to facilitate law enforcement and intelligence agency access, this controversial aspect has not been included in the description of MIKEY-SAKKE and instead the efficiency over EDH is emphasised."

Or in other words, the UK government doesn't want you to know that it can spy on everything you say.

Murdoch notes that things don't have to be this way - there are other products and protocols that provide a much higher level of security. Some, for example, protect past messages from being unencrypted, so even if someone does gain access to your encryption keys, they are limited to current calls. Others make it much harder for telcos to access unencrypted data as it flows through their system.

The hardest aspect, however, is ensuring that when initial contact is made with someone in order to exchange key encryption information, there isn't a person in the middle. One system to do this is to have people physically read out two words that appear on a device and have the other person hear and verify them before starting an encrypted conversation. However, Murdoch notes that even this approach is not foolproof; an attacker could simply impersonate the other caller.

In short then, unless you want to give telcos and government agencies unrestricted access to your phonecalls, it's best not to buy into the MIKEY-SAKKE / Secure Chorus claims of security.

Fox News
Inspector General: Clinton emails had intel from most secretive, classified programs
Tuesday, 19 January 2016
Byline: Catherine Herridge, Pamela Browne

Washington - Hillary Clinton's emails on her unsecured, homebrew server contained intelligence from the U.S. government's most secretive and highly classified programs, according to an unclassified letter from a top inspector general to senior lawmakers.
Fox News exclusively obtained the unclassified letter, sent Jan. 14 from Intelligence Community Inspector General I. Charles McCullough III. It laid out the findings of a recent comprehensive review by intelligence agencies that identified "several dozen" additional classified emails -- including specific intelligence known as "special access programs" (SAP).

That indicates a level of classification beyond even "top secret," the label previously given to two emails found on her server, and brings even more scrutiny to the presidential candidate's handling of the government's closely held secrets.

"To date, I have received two sworn declarations from one [intelligence community] element. These declarations cover several dozen emails containing classified information determined by the IC element to be at the confidential, secret, and top secret/sap levels," said the IG letter to lawmakers with oversight of the intelligence community and State Department. "According to the declarant, these documents contain information derived from classified IC element sources."

Intelligence from a "special access program," or SAP, is even more sensitive than that designated as "top secret" - as were two emails identified last summer in a random sample pulled from Clinton's private server she used as secretary of state. Access to a SAP is restricted to those with a "need-to-know" because exposure of the intelligence would likely reveal the source, putting a method of intelligence collection -- or a human asset -- at risk. Currently, some 1,340 emails designated "classified" have been found on Clinton's server, though the Democratic presidential candidate insists the information was not classified at the time.

"There is absolutely no way that one could not recognize SAP material," a former senior law enforcement with decades of experience investigating violations of SAP procedures told Fox News. "It is the most sensitive of the sensitive."

Executive Order 13526 -- called "Classified National Security Information" and signed Dec. 29, 2009 -- sets out the legal framework for establishing special access programs. The order says the programs can only be authorized by the president, "the Secretaries of State, Defense, Energy, and Homeland Security, the Attorney General, and the Director of National Intelligence, or the principal deputy of each."

The programs are created when "the vulnerability of, or threat to, specific information is exceptional," and "the number of persons who ordinarily will have access will be reasonably small and commensurate with the objective of providing enhanced protection for the information involved," it states.

According to court documents, former CIA Director David Petraeus was prosecuted for sharing intelligence from special access programs with his biographer and mistress Paula Broadwell. At the heart of his prosecution was a non-disclosure agreement where Petraeus agreed to protect these closely held government programs, with the understanding "unauthorized disclosure, unauthorized retention or negligent handling ... could cause irreparable injury to the United States or be used to advantage by a foreign nation." Clinton signed an identical non-disclosure agreement Jan. 22, 2009.

Fox News is told that the recent IG letter was sent to the leadership of the House and Senate intelligence committees and leaders of the Senate Foreign Relations Committee, as well as the Office of the Director of National Intelligence (ODNI) and State Department inspector general.

Representatives for the ODNI and intelligence community inspector general had no comment.

In a statement, State Department spokesman John Kirby said, "The State Department is focused on and committed to releasing former Secretary Clinton's emails in a manner that protects sensitive information. No one takes this more seriously than we do."

The intelligence community IG was responding in his message to a November letter from the Republican chairmen of the Senate intelligence and foreign relations committees that questioned the State Department email review process after it was wrongly reported the intelligence community was retreating from the "top secret" designation.

As Fox News first reported, those two emails were "top secret" when they hit the server, and it is now considered a settled matter.

The intelligence agencies now have their own reviewers embedded at the State Department as part of the Freedom of Information Act (FOIA) process. The reviewers are identifying intelligence of a potentially classified nature, and referring it to the relevant intelligence agency for further review.

There is no formal appeals process for classification, and the agency that generates the intelligence has final say. The State Department only has control over the fraction of emails that pertain to their own intelligence.

While the State Department and Clinton campaign have said the emails in questions were "retroactively classified" or "upgraded" - to justify the more than 1,300 classified emails on her server - those terms are meaningless under federal law.

The former federal law enforcement official said the finding in the January IG letter represents a potential violation of USC 18 Section 793, "gross negligence" in the handling of secure information under the Espionage Act.

Ottawa Citizen
Canada hard-pressed to deliver on offer to aid intelligence in Iraq
Wednesday, 20 January 2016
Byline: David Pugliese

Defence Minister Harjit Sajjan has been touting the potential for Canada's military to help gather intelligence in Iraq in the battle against Islamic extremists.
But with no recent history of meaningful involvement in Iraq or Syria, a scarcity of Arabic speakers, and a lack of intelligence- gathering equipment such as drones, how much of a contribution can Canada's military make?

In late December, Sajjan told journalists that the Liberal government is considering contributing an intelligence capability to the war against the Islamic State, including helping improve the abilities of Iraqi security forces to target extremists. He suggested the Canadian Forces have technology to play this role, but didn't specify whether that would be equipment on the ground or in the air.

In other interviews, the minister has said that Canada's intelligence capabilities are second to none and the government was looking at how to increase that in the Iraq war.

Sajjan, a former officer who dealt with military intelligence during the Afghan war, has emphasized understanding the political and tribal dynamics of ongoing wars.

But the Canadian Forces don't have extensive background in Iraq, having concentrated most of their efforts for more than a decade on Afghanistan.

The Canadian military only has a handful of linguists who speak Arabic. Its intelligence organization acknowledges it has no idea of how many serving in its ranks speak languages used in Iraq or Syria.

"While the Canadian Armed Forces does maintain rosters of members with ability in languages other than English and French, we do not specifically track the number of Arabic speakers within the Intelligence Branch," Defence Department spokesman Evan Koronewski said in an email.

But he added, "all intelligence officers and operators are highly trained and provide commanders with valuable support to decisionmaking, planning and operations." The federal government's electronic spy agency, the Communications Security Establishment, could play more of a role, but it is already monitoring phone calls and emails of Islamic extremists.

The Canadian military doesn't have any long-range drones, such as those used by the U.S. and Britain to gather intelligence or target and kill ISIL leaders.

Shortly before entering the war in the fall of 2014, the RCAF put out feelers to Canada's aerospace industry on whether it could provide drones or intelligence-gathering aircraft on short notice.

Companies told the military it could be done but the RCAF never progressed further on that issue.

It wasn't the first time, however, the RCAF has conducted a lastminute search for intelligence equipment to support a war effort. During the Libyan conflict in 2011, senior Canadian military leaders pitched the idea of spending up to $600 million for armed drones to take part in the war but the Conservatives decided against that.

Although Public Services and Procurement Canada asked aerospace companies on Friday for information about drones they could provide, the RCAF has pointed out that is a capability for the longer term, and such aircraft, if purchased, wouldn't be available until after 2019.

One intelligence-related capability the Liberal government could provide is the RCAF's CP-140 surveillance aircraft.

Prime Minister Justin Trudeau has said his government will follow through with its plan to withdraw the six CF-18 fighter jets. Canada has been asked by the U.S. to leave the two CP-140s that are now flying surveillance missions over Iraq. The RCAF has at least four more of those aircraft, which have been modified with advanced surveillance equipment. The Liberals could boost that contribution, sources say.

Meanwhile, Sajjan wouldn't say why Canada won't be at a meeting in Paris this week in which counterparts from seven countries will discuss the fight against the Islamic State. The Washington Post cited an unnamed U.S. official saying the meeting would involve countries with "the most skin in the game."

But Sajjan minimized the importance of the meeting, saying he is regularly updated on the situation.

"Meetings happen all the time.

There's a number of other meetings that happen that you may not actually be aware of," he said. "I have a couple of meetings that are going to be coming up in the next few weeks to talk about ISIL."

The Courier-Mail
Turnbull calls for cyber war
Wednesday, 20 January 2016
Byline: Simon Benson

Washington - Malcolm Turnbull will ask US President Barack Obama to broaden the war against Islamic terrorists from the battlefield into cyberspace, when they meet at the White House today.
While the military campaign against ISIS was making gains, the Prime Minister yesterday warned the Western world was losing the social media propaganda war.

It is expected that Mr Turnbull will seek to promote Australia as taking a lead global role in cyber warfare.

"(ISIS) may have an archaic and barbaric ideology, but its use of technology and social media in particular is very sophisticated and agile," he said in a speech yesterday to the Washington- based Centre for Strategic and Independent Studies.

"(ISIS's) threat to sweep across continents like the armies of Mohammed, to stable their horses in the Vatican, are crazed delusions.

"We should not amplify them."Mr Turnbull has dramatically sharpened his language on terrorism since arriving in Washington on his first official visit to the US, which follows criticism that he has not been hawkish enough on terrorism since refusing extra troops.

Al Jazeera
Opinion: Sponsor Syrian Refugee - Canada's top Google search
Wednesday, 20 January 2016
Byline: Antonia Zerbisias
Section: Opinion

Last September, after the photograph of three-year-old Alan Kurdi's body on that Turkish beach hit the world's front pages, the top Google search term in Canada was, "How to sponsor a Syrian?"
The news media here, in the midst of covering a federal election campaign, jumped all over the Kurdi story. Not just because it was tragic, nor because of the Kurdi family's Canadian connection through the toddler's Vancouver-based aunt, but because the country, bitterly divided over the former Conservative government's attitudes towards Muslims, suddenly didn't recognise itself as the welcoming, multicultural nation it had long believed itself to be.

And so, on TV, online and in print, there were stories on how many refugees were expected, how few the Stephen Harper regime had approved, and how Canadians, individually, in groups and as part of community organisations, could sponsor Syrian refugee families.

Then, on October 19, 2015, the Harper Conservatives were defeated and the Liberal government under Justin Trudeau swept to power.

Immigration organisations such as Lifeline Syria were flooded with phone calls. Settlement services scrambled to produce handbooks and hold seminars on sponsorship. Children began competing in a "1,000 Schools Challenge" to each bring in a family.

People banded together in "Groups of Five" to raise the estimated $30,000 it takes to privately sponsor families of four. Churches, mosques and synagogues partnered to bring in refugees. Business stepped up, with funding, free mobile phones and furniture.

Property companies reserved hundreds of apartments. One entrepreneur pledged more than $1m to sponsor 50 families.

During the election campaign, Trudeau had promised to settle 25,000 refugees by the end of the year. That would prove to be impossible. Refugees can't row in crowded dinghies or stream over borders here as they do in Europe. They must come in by plane. It takes logistics. Which is why, despite the enthusiasm of many Canadians, the goal of 25,000 was trimmed to 10,000 by December 31, with the remainder due to land by March 2016.

True, many Canadians were resistant, split especially following the November bombings in Paris. So, while the media were running feel-good stories about the sponsor application rush, anybody scanning the comments sections would find very different attitudes indeed.

In early December, however, when Trudeau turned up at Toronto's Pearson International Airport to greet the first arrivals and help them into warm coats, the country's collective heart melted, its national pride burst.

Sure there were bumps. A sponsorship group in Oakville, Ontario found doors slammed shut when it sought housing for its refugee family.

In Vancouver, in what has been deemed a "hate crime", 15 men, women and children were pepper-sprayed at a welcome ceremony. The New Year's Eve sexual assault rampage allegedly committed by recent arrivals in Cologne triggered a wave of fear and loathing. But the planes kept landing.

According to Canada Immigration and Citizenship, as of January 14, 10,790 refugees have arrived, about half of them Christian, approximately half privately sponsored. Private groups are still submitting some 200 sponsorship applications a week.

Last Wednesday, Joe Jacobs' Syrian family landed. The Muslim couple and their eight children, who range in age from weeks-old to 17 years, had fled Daraa in southwestern Syria where the father was a baker. They arrived to shiver in sub-zero weather but to bask in a warm welcome.

"Our group was supposed to get 24 to 48 hours' notice that they were coming but we got a phone call saying that they were waiting at the hotel; we had to be there within the hour," Jacobs tells Al Jazeera. "Luckily we had made preparations ahead of time."

The Toronto teacher is part of a "Group of Five" that connected through their children's school. They raised money from others and contributed their own funds to bring in the family whose identity they are protecting. They are committed for one year to aid the newcomers with everything from finding housing, schools, jobs and language lessons to introducing them to the city and culture.

Jacobs is realistic about the challenges ahead: "You have to provide the support part but you can't be too paternalistic about it. You don't want to treat them as the wretched people of the earth. It is such a difficult position to be placed in where you're dependent on people where you really shouldn't have needed to be and you're expected to be so grateful. And I think that a danger with the whole programme a bit is that Canadians are trying to be very generous but need to be careful that these people are not treated as playthings; that these people should have what they need."

As for what he calls the "euphoria" and media frenzy over Canada's apparent acceptance of refugees, Jacobs is wary.

"It seems to be all about us," he observes. "There seems to be a lot of focus on how wonderful we are to be doing this sort of thing when, for example, part of the discussion for our [refugee] family is, 'How are we going to help these people to rise out of a certain level of poverty here in Canada?' These families have a really tough row to hoe ahead and I'm not sure how much Canada and the Canadians who are sponsoring are understanding of that."

What worries Jacobs is not so much that the refugees adjust to Canada - although that's critical - but that Canada adjusts to them.

"Last week, when we all were getting on a bus, the driver was like 'Holy ****!' and was just looking at them; it was such a negative reaction," he recalls. "The family didn't understand but we certainly saw that a negative view is out there. I don't know how predominant it is, but it has the potential to grow when the euphoria dies down."

Jane Philpott, the health minister, seemed unconcerned last week when she declared: "The integration phase is ultimately the most important phase, to make sure that these Syrian refugees become well integrated into Canadian culture, that they understand our cultural values and practices.

"The question to me is more can the people of Montreal and Toronto handle this?" Jacobs says. "It's not so much whether the system can. It's whether Canada allows these people to live in poverty or will support them to become economically integrated members of society. "And if they don't, the question then becomes why did we say we're going to accept them?"

The Australian
Cyber world the new frontline in terror war
Wednesday, 20 January 2016
Byline: David Crowe

Washington - Australia and the US are preparing a wider front in the fight against terrorism as they negotiate ways to implement "cyber warfare" campaigns to disrupt -Islamic State's propaganda -machine and stymie its efforts to recruit jihadists.
Malcolm Turnbull will discuss the tactics with counter-terrorism experts in Washington DC amid growing concern the US and its -allies are not doing enough to -defeat the terrorist group on the battlefield and online.

The talks will follow the Prime Minister's meeting with President Barack Obama to map out the next phase of the military campaign, including the prospect of retaking Mosul from the terrorists who overran Iraq's second-largest city last May.

"The discussion on cyber goes to how can we take the fight back to them," the US ambassador to Australia, John Berry, said in Washington DC.

"How can we isolate them? Why are we giving them access to this institution called the internet that we created?" Amid a domestic political -dispute over whether Australia is doing enough in the military fight against Islamic State, Mr Turnbull gained clear support from the US on the criticism levelled against him.

In Iraq, the spokesman for the joint Coalition operations, Colonel Steve Warren, said the US was looking to all countries to contribute more to the campaign but that Australia already made a larger contribution than others countries.

"On the list of people who need to step up, the Australians are at the very bottom of that," Colonel Warren said in Iraq. "They've stepped up already. But it's time to see others." In the US, Mr Berry dismissed claims that Australia had rejected a request for more troops. "Some of the reporting on what was -requested is mistaken," he said.

"The request was for all of our 60 nation partners to identify areas where each of them, in their sovereign capacity, believed they could best contribute to the ongoing fight against ISIL.

"It misreports to say the United States requested additional troops. We did not. There was no such request." Mr Turnbull yesterday met Defence Secretary Ashton Carter during talks at the Pentagon about military strategy, including the hope of retaking Mosul.

Mr Turnbull backed the idea of a formal partition of parts of Iraq and Syria. "The border between Syria and Iraq is just a line on the map. -Neither country can be secured without a settlement in the other," Mr Turnbull said at the Centre for Strategic and International Studies in Washington DC.

"Unless the Sunni populations in Syria and Iraq can be reconciled with a new and inclusive order, then ISIL or a successor extremist group will have a ready recruiting ground.

"The enmities are so deep, the wrongs so shocking, that every -option should be on the table -- from an institutionalised power sharing to some form of partition."

Montréal - Radio-Canada lance une plateforme sécurisée pour lanceurs d'alerte
L'idée est tellement bonne et tellement simple qu'on se demande pourquoi aucun média québécois ne l'a eue auparavant : Radio-Canada (RC) annoncera officiellement aujourd'hui, mercredi, le lancement d'une plateforme numérique consacrée au transfert sécurisé de données. Le moyen de communication sécurisé, premier du genre pour un média québécois, est librement mis à la disposition des lanceurs d'alerte pour transmettre des informations sensibles aux médias.

L'idée est tellement bonne et tellement simple qu'on se demande pourquoi aucun média québécois ne l'a eue auparavant : Radio-Canada (RC) annoncera officiellement aujourd'hui, mercredi, le lancement d'une plateforme numérique consacrée au transfert sécurisé de données. Le moyen de communication sécurisé, premier du genre pour un média québécois, est librement mis à la disposition des lanceurs d'alerte pour transmettre des informations sensibles aux médias.

" C'est un outil de plus pour les journalistes qui s'ajoute aux bonnes vieilles enveloppes brunes, aux clés USB, aux disques durs externes, aux courriels envoyés d'adresses anonymes ", dit Marie-Maude Denis, journaliste et coanimatrice de l'émission Enquêtes d'ICI Radio-Canada Télé. " D'abord, il y a une très forte préoccupation pour la protection des sources, une valeur suprême pour nous, les journalistes d'enquête. Ensuite, pour un informateur qui désire rester anonyme, le choix d'un média peut parfois se faire en fonction de la confiance envers une organisation de presse. "

La plateforme baptisée Source anonyme est le résultat de l'Accélérateur d'idées. Avec ce concours interne intermittent, RC propose à ses employés de soumettre des plans pour bonifier leurs pratiques. Deux projets ont terminé la course l'an dernier, un sur les nouvelles formes de narration et celui-là sur les sources.

" Du point de vue des rapports entre sources et journalistes, nous faisons vraiment passer Radio-Canada au XXIe siècle, dit Xavier Kronström Richard, cofondateur avec Thomas Le Jouan du RC Lab et de l'Accélérateur d'idées. C'est un moyen dans l'air du temps, lié à la cybersurveillance par exemple. "

L'étincelle est venue de là. " J'ai soumis ce projet pour informateurs dans la foulée des événements qui ont entouré les révélations d'Edward Snowden ", explique l'idéatrice Catherine Mathys, chroniqueuse à l'émission de radio La sphère et blogueuse sur Triplex. L'informaticien américain a révélé l'ampleur des programmes de surveillance de masse américano- britanniques. " Quand j'ai soumis l'idée, aucun média au Canada n'avait une telle plateforme. Le temps que je devienne une des cinq finalistes du concours, le Globe and Mail avait lancé sa plateforme. Il en existe ailleurs dans le monde. Mais bon, moi, je proposais juste que RC se dote de cet outil pour nos équipes d'enquête. "

En quoi cet outil numérique s'avère-t-il particulièrement intéressant ? Marie-Maude Denis répond avec l'exemple d'un envoi massif de données. Pas vraiment un cas fictif comme le prouvent les Offshore Leaks qui ont coulé vers un consortium de 36 médias (dont RC), des masses d'infos sur les paradis fiscaux depuis 2013.

" Notre plateforme peut peut-être inciter des informateurs à nous transmettre ce genre de données extrêmement volumineuses, dit la reporter et animatrice. C'est donc une offre supplémentaire pour communiquer avec nous en utilisant un processus très, très sérieux d'homologation de la sécurité. "

Comment ça marche

Le fonctionnement semble simple. Un bouton placé sur le site de l'émission Enquêtes mène à sourceanonyme.radio-canada.ca. La page d'accueil explique l'utilisation de la messagerie SecureDrop, " technologie en code ouvert développée par Aaron Swartz et gérée par la fondation Freedom of the Press ". Pour l'instant, la mécanique est en anglais, mais RC développe une version en français avec la Fondation basée en Californie.

L'utilisateur doit télécharger gratuitement le navigateur Tor, l'ouvrir et suivre les instructions pour finalement recevoir un code unique pour la transmission des informations sensibles. Les instructions recommandent de le mémoriser et ne l'écrire " nulle part ". Une station informatique sert à décrypter les messages et " seul un nombre restreint de responsables " y a accès.

" Sur notre site, nous aidons les gens à transmettre des informations de manière anonyme et nous, de notre côté, nous avons une station qui reçoit les messages cryptés sans identifier l'émetteur, résume Xavier K. Richard. C'est un peu une boîte de courriels mais où tout est crypté de part et d'autre. "

Cela établi, rien n'assure la sécurité pleine et entière, blindée et étanche. " Il n'y a aucun moyen de communication, aussi sécuritaire soit-il, qui est confidentiel à 100 %, et nous le disons sur notre plateforme, dit Mme Mathys. Une brèche est toujours possible, ne serait-ce qu'à partir de l'ordinateur

de l'informateur. On n'a pas de pouvoir là-dessus. Mais la plateforme est très, très sécuritaire. Elle est utilisée par une vingtaine de médias dans le monde et c'est une des ressources les plus fiables. "

Ce qui rappelle finalement l'importance de protéger socialement les lanceurs d'alerte. Le récent rapport de la commission Charbonneau sur la collusion dans l'industrie de la construction au Québec en faisait une recommandation.

" Les mesures pour protéger les sources journalistiques sont essentielles et pourtant insuffisantes en ce moment, dit Mme Denis. Le gouvernement [du Québec] a commencé à discuter d'un projet pour protéger les sources, mais il est très, très limité. Les journalistes sont unanimes pour reconnaître qu'on manque de protection vis-à-vis des personnes qui prennent parfois énormément de risques pour dénoncer certaines situations. Nous, comme journalistes, on accompagne ces gens parfois pendant des années, en prenant de très grands risques, souvent par altruisme, pour aider la société à voir plus clair. Alors tout mécanisme de protection supplémentaire des lanceurs d'alerte sera applaudi. "

Faut-il finalement voir dans la création de Source anonyme un effet pervers de l'assèchement d'une grande talle des enquêtes avec le dépôt du rapport de la commission Charbonneau ? " La talle n'est pas sèche : je peux vous dire que c'est encore bien irrigué par en dessous ", répond Marie- Claude Denis en rigolant. Catherine Mathys ajoute que son projet date d'avant la fin des travaux de la Commission.

The National (UAE)
Cyber attacks will get violent in the future, UAE security expert warns
Wednesday, 20 January 2016
Byline: Caline Malek

Dubai - The next wave of -cyber attacks will attempt to take human lives, according to a senior officer at the telecommunications operator du.
Although the country was taking steps to establish better protection against attacks on critical national infrastructure, Tamer El Bahey, who is the senior director of security monitoring and operations at du, said more investment was needed for detecting and responding to incidents.

"In the evolution of cyber attacks, we started from those that caused annoyance to people. Then we moved to those that would disrupt network and services on organisations," he said.

"Now, we are in the era of attacks where most information is exposed. Credit card information is being stolen and we should anticipate the worst."

Mr El Bahey, who addressed an audience at Intersec in Dubai on Tuesday, said such new attacks would involve hacking remote devices.

"For example, you can disable a car's brakes or engine while it is moving or a pacemaker in hospitals, which would play with configuration and cause death to patients," he said.

"There are lots of attacks against critical national infrastructure like one that happened in Australia where they hacked into the water system and started to release untreated water into the water stream.

"So imagine if someone released poisonous chemicals into the water stream of people and they got seriously sick and died."

Matthew Cochran, chairman of Defence Marketing Services Council in Abu Dhabi, said the threat level was growing.

"There is a lack of cyber security awareness and many of the things that people must be aware of are things like access control," he said.

"It's not about physical access control any more. It's about your mobile device and anything that's connected to the internet. The internet brings great possibilities but also, if unchecked, could bring new threats that we haven't seen; and that will start with the telecommunications and network security."

The UAE's National Electronic Security Authority is taking strict measures to counter such threats.

"In the UAE, we use a lot of technology," Mr El Bahey said. "The UAE is now establishing these kinds of controls, telling people they need to make sure their critical national infrastructure [must] be protected, resilient and can absorb these kinds of attacks. It is leading in the Middle East and the Gulf."

Simon Williams, global business continuity manager at National Bank of Abu Dhabi, said the UAE was well prepared for any attack but there was no room for complacency.

"We need to identify critical infrastructure and it should be the focus of our investment," Mr El Bahey said.

"We need to better invest in detection and incident--response capabilities. Prevention isn't working or helping any more. We need to balance the investment because 85 per cent is invested by the industry in preventive controls while just 15 per cent on detective and incident response. We need to have a fair share between the two."

Chosun Ilbo
Latest Cyber Attack Traced to N.Korea
Wednesday, 20 January 2016

A recent cyber attack on South Korean government agencies has been traced to North Korea as expected.Police said the IP addresses of the senders of spam e-mails on Jan. 13-14, right after the North's latest nuclear test, were the same as those used in a cyber attack against Korea Hydro and Nuclear Power in 2014.The e-mails containing malicious code purported to come from Cheong Wa Dae and targeted thousands of government employees here. Police said the IP addresses have been traced to the northeastern Chinese province of Liaoning that borders North Korea and match those used in the cyber attack against the nuclear agency in 2014.In 2014, the hackers threatened to paralyze nuclear power plants and leaked some reactor blueprints to the public.Police said the latest attack was something known as "two-track phishing e-mails" where hackers hide malware in second e-mails that are sent after recipients respond to the uncompromised first e- mails.

Times of India
IB intercept hints at terror strike on Jan 23
Wednesday, 20 January 2016
Byline: Rohan Dua

Chandigarh - Three weeks after the Pathankot terror attack, an Intelligence Bureau (IB) intercept of a Bangladeshi mobile number has sent security agencies into a tizzy. The coded phrase -- "doctor medicine lekar jayega" -- was intercepted on January 15 twice by IB sleuths on a telecom gateway. Gateway alerts Indian authorities of all incoming calls from Pakistan and Bangladesh based on a specific area or series of numbers.
The alert, sent to all state police chiefs on Monday, says that Bangladesh-based Islamist group Hizb ut-Tahrir (HuT) is planning to carry out terror strikes at 23 locations across India, including Gurdaspur and Pathankot. "The group is planning bomb and suicide attacks on January 23," it reads. "In view of this, the field staff must be sensitized to take all necessary preventive and precautionary measures including review and strengthening of security of Army, Air Force, BSF and other vital installations."

It adds that this time malls, bazaars and educational institutes could be on the group's radar. According to the alert, HuT, which has a significant presence in Pakistan and Bangladesh, is planning these strikes with assistance from Jaish-e-Muhammed (JeM) and Lashkar-e-Taiba (LeT).

The alert hints at growing strength of HuT's armed wing called Harakat ul-Muhojirinfi Britaniya that trains its cadres in chemical, bacteriological, and biological warfare.

Punjab Police officers are taking this alert seriously for multiple reasons. For starters, it gives specific details. Also officials had recently found a GPS device outside the barracks of the Railway Police Force (RPF) office in Ferozepur -- another district of Punjab that shares a border with Pakistan -- which had Bangladesh time pre-fed in it. Bangladesh time is half an hour ahead of India. The device has sent to Forensic Science Laboratory, Chandigarh.

"This may me just coincidental but our men were surprised to find an abandoned device with Bangladesh time," said a senior Punjab Police cop. This is the second high alert after the December 27 IB note that warned of a "spectacular" attack by at least 15 terrorists of JeM and LeT just ahead of the Pathankot strike.

Clinton Takes On Top Intelligence Watchdog
Thursday, 21 January 2016
Byline: Josh Rogin

Column - Hillary Clinton's presidential campaign Wednesday accused the intelligence community's top oversight official of conspiring with Republicans in the Senate to leak sensitive information about her personal e-mail server. That's a risky move, considering that it has produced no hard evidence of a conspiracy and the accused parties are denying it.
The public dispute between the former Secretary of State and the Inspector General of the Intelligence Community reached new heights following Tuesday's report by Fox News on a letter sent by inspector general I. Charles McCullough to Senate Intelligence Committee Chairman Richard Burr and Senate Foreign Relations Committee Chairman Bob Corker. In the letter, McCullough stated that he had received sworn declarations from two separate intelligence agencies that cover "several dozen e-mails" on Clinton's private server. These e-mails were determined by these agencies to contain information that should have been treated as secret, top secret, and "SAP," an abbreviation that refers to "special access programs," which are among the most sensitive in the government.

Clinton campaign spokesman Brian Fallon told me in an interview Wednesday that the campaign believes that McCullough and the Republican senators worked behind the scenes to orchestrate a series of events that would lead to the disclosure of those declarations.

"It is suspect from the beginning that the intelligence community inspector general is continuing to reveal materials and surface allegations while the Justice Department review is going on," Fallon said. "It's completely fair to suspect that the intelligence community inspector general is not operating in good faith." He provided no hard evidence to support these assumptions, however.

Now that the FBI is investigating the handling of information found on Clinton's server, Fallon said, the intelligence community inspector general should stay out of it and let the Justice Department do its work. But McCullough's letter shows he intends to keep trying to influence the outcome.

According to the Clinton campaign, the inspector general and the Republican senators have separate agendas in wanting to influence the public debate over whether or not Clinton's e-mail server contained highly classified information. The Republicans simply want to hurt Clinton's political aspirations, Fallon said. But the inspector general's move, Fallon said, is part of a campaign to influence a bureaucratic battle between the intelligence community and the State Department.

The State Department and intelligence agencies disagreed last August over whether two e-mails found on Clinton's server should have been treated as "top secret." The State Department said the information that the e-mails contained was not classified when the messages were sent, but the intelligence agencies said the information was always classified and should have been treated as such. The State Department asked James Clapper, the director of national intelligence, to adjudicate that dispute.

In November, a Politico report stated that intelligence officials reviewing those two e-mails were leaning toward the State Department's opinion. Following that report, Burr and Corker wrote to McCullough to ask for an update and McCullough responded. Fallon alleges that the timing of the letters is evidence enough of a conspiracy to leak the information.

"It looks like Clapper's office will undercut McCullough," Fallon said. "McCullough is trying to litigate this with Clapper and have his own view of these two e-mails upheld."

Burr told me in a short interview Wednesday that his committee was just following up with the intelligence community inspector general about his progress in getting information from the intelligence agencies. He denied leaking McCullough's letter or working with McCullough behind the scenes in any way.

"I can tell you there's no conspiracy or collusion between Bob Corker and I and the inspector general," Burr said. "The Clinton campaign would be wrong."

Deb Chapman, spokesperson for the intelligence community inspector general's office, declined to comment on the Clinton campaign's allegations, but said that McCullough stands by the information contained in his letter to Burr and Corker, a copy of which Fox News obtained.

"Catherine Herridge's article was spot on," she said, referring to Fox News's intelligence correspondent. "It's all accurate."

For a major political candidate and former cabinet official to publicly accuse an inspector general of the intelligence community of intentional leaking and collusion with their political opponents is remarkable, if not unprecedented. McCullough, an attorney and former FBI agent, was unanimously confirmed for his position in 2011 and received praise from senators on both sides of the aisle.

"No one should make such an accusation without evidence," Steven Aftergood, who directs the project on government secrecy at the Federation of American Scientists, told me. "If there is evidence of collusion or partisanship, it should be presented. If there is no such evidence, the accusation should not be made."

Whether or not the information in the e- mails is really top secret is unknowable because the e-mails are not public, Aftergood said. Several reports Wednesday quoted anonymous officials saying the information in question was not particularly sensitive because it referred to public news reports about the U.S. drone program. That program is highly classified but often discussed in the press.

"CIA considers everything about the targeted killing program to be highly classified covert action," Aftergood said. "But the State Department can consider information in the press to be unclassified."

Even passing on news clippings about a classified program can be considered mishandling of classified information, but it's a case-by-case evaluation and the lines are murky, said Aftergood. Usually, deference is given to the agency that originated the information, in this case the CIA and another as yet unnamed agency.

For Fallon and the Clinton team, their inability to publicly discuss the content of the e-mails is key to their grievance: How can Clinton defend herself from leaks without talking about what was on her server? The intelligence community inspector general's office has a corresponding problem: It can't fend off Clinton's accusations of partisanship and collusion because it is enjoined from commenting on political matters.

Clinton's calculation seems clear: By framing the controversy over the private e-mail server as a good-faith dispute between two government bureaucracies, she can divert attention from her own culpability in placing so much sensitive information in her own house. But that strategy depends on the State Department standing by her.

That may be changing, at least in public. Whereas in August, department officials said they were confident their own review of the e- mails revealed no information marked classified at the time it was sent, their public line is now less definitive.

"Our FOIA review process is still ongoing. Once that process is complete, if it is determined that information should be classified as Top Secret we will do so," State Department spokesman John Kirby told me in a statement.

Intelligence officials, even inspectors general, are not immune from politics, both internal and partisan. But Clinton's team simply cannot prove that McCullough is leaking against them. Her campaign can only muddy the waters and delay until the FBI finishes its work. If the Clinton campaign decides then to go after the FBI, it will be picking a fight with an even more formidable opponent.

The Intercept
The White House Asked Social Media Companies to Look for Terrorists. Here's Why They'd #Fail.
Thursday, 21 January 2016
Byline: Jenna McLaughlin

Column - The White House asked internet companies during a counterterrorism summit earlier this month to consider using their technology to help "detect and measure radicalization."
"Should we explore ways to more quickly and comprehensively identify terrorist content online so that online service providers can remove it if it violates their terms of service?" asked a White House briefing document that outlined the main topics of conversation for the meeting. The document, which was obtained by The Intercept, is now posted online.

The briefing suggested that the algorithm Facebook uses to spot and prevent possible suicides might be a helpful model for a technology to locate terrorists, asking: "Are there other areas where online providers have used technology to identify harmful content and remove it? ... Something like Facebook's suicide process flow?"

Government officials also want to use such an algorithm for law enforcement purposes. "Are there technologies that could make it harder for terrorists to use the internet ... or easier for us to find them when they do?" read the briefing.

"We are interested in all options to better identify terrorist networks, or indications of impending plots. ... Are there ways to glean from changes in patterns of use of these platforms involvement in preparations for violence?"

An increasingly large proportion of terrorism investigations these days start with tweets or posts, generally flagged by family members or informants. Civil libertarians worry that the FBI is using protected speech to identify potential subjects of entrapment. But the FBI's concern is that it's not seeing everything it needs to see.

And at the same time, there's increased pressure for social media companies to deny radical groups an open platform for speech.

No wonder the government wants an algorithm.

But there are some major problems with trying to use computer code to find "terrorists" or "terrorist" content.

First of all, it doesn't work. Many experts, including people with law enforcement, academic, and scientific backgrounds, agree that it's practically impossible to boil down the essential predictive markers that make up a terrorist who is willing and capable of carrying out an attack and then successfully pick him out of a crowd.

"Many believe that data mining is the crystal ball that will enable us to uncover future terrorist plots. But even in the most wildly optimistic projections, data mining isn't tenable for that purpose," wrote Bruce Schneier, prominent cryptologist and fellow at Harvard's Berkman Center for Internet and Society, in 2006.

Despite hyped-up cable news coverage and fearmongering messages from government officials, terrorism is an incredibly rare event in the United States. According to the New America Foundation's attack tracker, there have been a total of nine "violent jihadist attacks" on U.S. soil since September 11, 2001, resulting in 45 deaths.

Algorithms are good at some things -- like correctly concluding that your credit card has been stolen. But that's because it happens so commonly, there are not many variables, and incidents follow a predictable pattern.

"Something as unique and rare as terrorism -- that's what makes this different from credit card fraud," Schneier told The Intercept.

Consider medical testing, Schneier said. "When a disease is very rare, if your test tests positive, it's almost always wrong, because your chances of having that disease are one in a million."

Think about that for a minute: Imagine you're trying to determine who has that incredibly rare disease, and it can be spotted by genetic testing.

Say your test is 90 percent accurate in determining whether someone suffers from that disease. That means it is also wrong 10 percent of the time. One out of 10 of your patients will test positive, even though chances are that none of them have the disease.

Out of a million people, 10,000 would test positive -- but chances are only one would really have the disease. And you wouldn't know which one.

Now imagine the odds are one in 100 million, amid many hundreds of millions of social media postings. Imagine how many posts would be deleted or referred to law enforcement in error.

And keep in mind there's no real way to come up with a test for terrorism that's even 90 percent accurate. There's not even a good statistical database of people charged for terrorism-related crimes, just for starters.

False positives when using algorithms to spot suspected credit card fraud have little cost. "A call to the customer from a credit issuer will reassure the customer whether he or she is correctly targeted or not," said Jim Harper, a senior fellow at the Cato Institute, during a Senate Judiciary Committee hearing on data mining in 2007.

But "identifying" terrorists is a different matter. "Because of the statistical impossibility of catching terrorists through data mining, and because of its high costs in investigator time, taxpayer dollars, lost privacy, and threatened liberty, I conclude that data mining does not work in the area of terrorism," Harper said.

"Of course there's no way for software to identify and remove terrorists or terrorist content from online media," Phil Rogaway, a computer science professor at UC Davis, wrote in an email to The Intercept. "A group of humans would routinely disagree if a given email or post constitutes terrorist content, so how on earth is a program to make such a determination?"

A 2008 government study also concluded that counterterrorism data-mining programs seeking patterns in personal information, like travel records, phone records, and website browsing history, were ineffective and should be evaluated for privacy impacts.

Local "fusion centers" designed to share intelligence and data on terrorism and report back to the Department of Homeland Security were described by Senate investigators in 2012 as "oftentimes shoddy, rarely timely, sometimes endangering citizens' civil liberties and Privacy Act protections, occasionally taken from already-published public sources, and more often than not unrelated to terrorism."

And what if such an algorithm is put into action, and starts automatically deleting posts?

In the briefing document, the administration asks whether "technologies used for the prevention of spam" might be useful in locating and removing terrorist content.

But a filter like that could easily snatch up First Amendment protected speech.

"Censorship has never been an effective method of achieving security, and shuttering websites and suppressing online content will be as unhelpful as smashing printing presses," said former FBI agent Michael German, a fellow at the Brennan Center for Justice.

I shared some passages from the White House briefing with him. "These passages make clear that the government continues to cling to long-disproven, simplistic theories of terrorist radicalization, which suggest that the exposure to extreme ideas leads to terrorist violence," he wrote in an email to The Intercept. "If ideas are identified as the problem, the only solution can be the suppression of those expressing such sentiments."

Algorithms that filter content are "a really powerful tool for a more authoritarian government," said Schneier.

"Electronic monitoring and censorship can be effective for chilling political dissent, removing much content that authority frowns upon, and making people fearful of discussing political subjects online," UC Davis' Rogaway wrote in an email. "China already does this quite effectively."

The government briefing does acknowledge that "respecting U.S. First Amendment commitments to human rights such as freedom of expression" would be important in any sort of system of identifying and reporting radical online posts.

But overall, the briefing document "reveals a troubling amount of magical thinking on the part of government officials," German wrote. "It seems they are going to continue ignoring the vast amount of research that describes terrorism as a complex behavior that can only be understood in the context of

the political situation in which it arises, and continue investing in snake-oil salesmen who promise a simple solution that identifies the 'bad guys' right before they strike."

The Local (Sweden)
Ecuador: Sweden to question Assange 'soon'
Thursday, 21 January 2016

Stockholm - WikiLeaks founder Julian Assange could face questions from Swedish prosecutors "in the coming days" at his hideout at the Ecuadoran embassy in London, the President of Ecuador has said. Rafael Correa did not give a date for the interrogation over a 2010 rape allegation in Sweden, which Assange denies, but said it would happen "very soon".

"We hope in the coming days Mr Julian Assange will be interrogated by Ecuadoran authorities on the basis of questions and requests from Swedish prosecutors," the president told a press conference on Wednesday.

Assange fled to the embassy in 2012 to escape extradition proceedings.

The 44-year- old Australian refuses to travel to Sweden to answer the allegation, saying he fears he would then face extradition to the United States and trial over the leaking of hundreds of thousands of classified US military and diplomatic documents in 2010.

After a three-year stalemate, Ecuador and Sweden signed a legal cooperation deal last month that clears the way for Assange to be interrogated at the embassy.

U.S. discloses zero-day exploitation practices
Thursday, 21 January 2016
Byline: Chase Gunter

Washington - The federal government has confirmed that it uses undisclosed software bugs not only in espionage and intelligence gathering, but also in the course of law enforcement activities.
In November 2015, the government released a redacted version of the Vulnerabilities Equities Process, the policy that lets agencies such as the National Security Agency and FBI decide whether to announce the flaws to vendors for patching. Just weeks ago, the government argued that acknowledging its exploitation of the software flaws, known as zero-day vulnerabilities, would damage national security.

Now the government has rescinded some of those redactions in its first official acknowledgment of "defensive, offensive and/or law enforcement-related [and] prosecutorial" uses of the vulnerabilities beyond counterterrorism efforts. The disclosure comes in response to a Freedom of Information Act

lawsuit filed by the Electronic Frontier Foundation seeking the release of documents on the U.S. government's use of such flaws for intelligence gathering.

"This is the first confirmation that [the Vulnerabilities Equities Process] is used for law enforcement, which was an open secret," said EFF staff attorney Andrew Crocker. The surveillance isn't used for "just national security or intelligence gathering."

The government has long been suspected of discovering and stockpiling flaws in commercial code to gather information for potential use in cyber warfare, although the government has denied doing so.

If alerted to the existence of the vulnerabilities, software companies could quickly create a security patch. However, by not alerting developers, government agencies leave the vulnerabilities open for their own covert access -- and potentially for any malefactors capable of exploiting the flaws. That means the government must choose between protecting its surveillance access and protecting U.S. software against hacking, which can have "far-reaching consequences for both information security and user privacy," according to EFF's FOIA request.

The less-redacted document also discloses the government's policy for deciding what to do when a vulnerability is discovered. NSA is supposed to report the vulnerability to the company unless there is "a clear national security or law enforcement" reason not to. The decision about whether and what to publicize is solely at the agencies' discretion.

Furthermore, although the process was finalized in 2010, it was not effectively implemented, which led to a 2013 presidential review board's recommendation "to prioritize disclosure over offensive hacking."

The remaining redacted information likely includes which agencies have been involved in discussions about zero-day disclosures, according to EFF. The government is still withholding that information in the name of national security. EFF has a February court date to contest that claim.

Wall Street Journal
U.S. Tech Firms Take Fight Over Encryption to Davos
Thursday, 21 January 2016
Byline: Sam Schechner

Davos - Tensions are rising between governments and big U.S. technology companies over widening surveillance demands, part of a broader debate over how to reconcile online privacy with the fight against terrorism.
The battle will surface this week at the World Economic Forum, after a year in which terrorist groups including Islamic State killed hundreds in attacks around the world -- in some cases, officials say, using popular online tools to recruit followers and communicate.

Governments, particularly in Europe, want U.S. tech firms to turn over more information to them directly. Law-enforcement and intelligence officials say firms should build ways to turn over conversations into encrypted chat programs like Facebook Inc.'s WhatsApp.

Tech firms respond that weakening encryption could damage security on the Internet, and say new laws demanding access would put them in an impossible position.

"You could be placed in a situation where you have to decide what law to break," said Brad Smith, Microsoft Corp.'s chief legal officer, who is among the executives debating surveillance at Davos. "It isn't a comfortable place to be."

Countries usually can demand information about people only within their borders. But many of the biggest online services are based -- and store their data -- in the U.S., raising questions of jurisdiction.

Since 2013, when former U.S. NationalSecurity Agency contractor Edward Snowden leaked documents alleging widespread government snooping by the U.S. and allied countries, American tech companies have become vocal opponents of surveillance policies that could scare away privacy-conscious users.

Some firms have started encrypting mobile phones by default, often in ways that mean the firms don't have keys to decrypt them.

Now, amid evidence that plotters in the Nov. 13 attacks in Paris had at least downloaded encrypted chat applications, law- enforcement authorities have renewed calls for firms to re-engineer those programs to allow them to be decrypted. They contend investigations are being thwarted because of encryption.

Telecommunications executives, which have had to contend with surveillance requests for some time, say the decision should be left to governments. "I don't think it is Silicon Valley's decision to make about whether encryption is the right thing to do," AT&T Chief Executive Randall Stephenson said Wednesday.

Silicon Valley companies are lobbying officials in Davos. They contend that changing their architecture to thwart encryption would open their systems to hackers -- and not stop criminals from building their own end-to-end encryption systems anyway.

"You can do what you want from a policy perspective, but you can't stop mathematics," said Javier Aguera, chief scientist of Silent Circle, which offers encrypted communication apps and phones.

American tech firms say they already cooperate with authorities outside the U.S., but that their hands are tied by U.S. law.

In general, they will turn over only limited personal information about users to certain U.S.-allied countries, executives say. They direct European authorities to channel more-detailed requests to the U.S. government through bilateral treaties in a process that can take months.

Some other requests, like requests for information about devices, can go directly through local authorities because they are often about device thefts or taxes, Apple says.

In Davos, several executives said they are pushing for governments to adopt a new system to expedite cross- border requests. Such a system, which would require new treaties and eventually could entail a new multilateral data-sharing accord, would aim to avoid legal conflicts like that posed by a proposed U.K. law that would require tech firms to turn over data directly to U.K. authorities.

"The answer is an interlocking legal system between countries," said one tech executive. "There are legitimate surveillance needs here."

Crimes involving technology are on the rise like never before: police
Friday, 22 January 2016

Sudbury - Sudbury police say they're struggling to keep up with cybercrime in the city -- something the chief says all police forces in the world are having difficulty with.
Cybercrime isn't just computer hacking anymore, Paul Pedersen said. The majority of the cybercrime police see now are things like trafficking, theft, and harassment -- all done with the use of technology.

Just a few years ago they were seizing desktop computers, but they're now having to solve crimes through people's online profiles and smart phones.

"We've got stalking -- which everybody can understand. But we now have harassment coming in the form of texts, in the form of email messages," Pedersen said.

"And where that complicates things for us is the ability to pull that information off of computers, store that data, and then disclose that data."

Police report that one-to-two per cent of all cybercrime in Canada is being reported -- and that means it's harder for them to know what they're up against.

"We keep talking about cybercrime as an emerging crime," Pedersen continued.

"But the reality is it's alive and well in all of our communities and certainly here in Sudbury."

Greater Sudbury Police Detective Sergeant Blair Ramsay told CBC News the growth of cybercrime is "the same as everywhere else ... it's growing. It's involved in a lot of crimes."

"We've increased our forensic analysts from two to three," he continued. The team involves two investigators and a victim identification officer.

How is an unknown victim identified from a photo?

"We dig into the image. Work with Adobe. Look at the background of the image, look for clues," Ramsay said.

"You'd be surprised by what you can find."

Common cyber crimes involve identity theft, criminal harassment, threats, child exploitation and drug dealing.

And scammers.

"We have had some cases of people reporting they have been extorted for money," Ramsay said, noting that people on dating websites are being asked to send "compromising" photos of themselves, only to be later blackmailed.

What can people do to protect themselves?

Ramsay said the Canadian Anti-Fraud Centre has a lot of good safety tips, which can be found here.

"If you think you're being targeted for an online scam, search it [online]," he said.

"If you think you're targeted, generally somebody else has too, and you'll see a lot of results."

Ramsay said tips to keep children safe online can be found at cybertip.ca.

People can also contact local police for more information.

The Hill
Security researcher: Ukraine power grid facing new wave of cyberattacks
Friday, 22 January 2016
Byline: Katie Bo Williams

Washington - Ukrainian power plants are still facing an onslaught of cyberattacks in the wake of a malware-caused blackout in December, according to a U.S. security firm.
"[On January 19th], we discovered a new wave of these attacks, where a number of electricity distribution companies in Ukraine were targeted again following the power outages in December," malware researcher Robert Lipovsky wrote in a post on the blog We Live Security.

But the kind of malware used in this latest wave of attacks is not the same code that left 80,000 people in the western regions of Ukraine without power last month, Lipovsky notes.

"What's particularly interesting is that the malware that was used this time is not BlackEnergy, which poses further questions about the perpetrators behind the ongoing operation," he wrote.

"The malware is based on a freely-available open-source backdoor -- something no one would expect from an alleged state-sponsored malware operator."

The incident in December, believed to be the first time a blackout was caused by a cyberattack, has been widely attributed to Russia.

The Ukrainian security service, SBU, was swift to blame Russia for planting malware to cause the blackout. Relations between the two nations have been in a steep decline since Russia annexed Crimea last year and began supporting pro-Russian separatists in Ukraine.

"We found that the [malware] came from Russia," SBU said. "It was an attempt to interfere in the system. But it was discovered and prevented."

The U.S.'s Industrial Control Systems Cyber Emergency Response Team is assisting Ukraine in investigating the blackout, but it has neither confirmed that the malware was the principle culprit behind the blackout nor attributed the attack to Russia.

The team "can confirm that a BlackEnergy 3 variant was present in the system," but "based on the technical artifacts, we cannot confirm a causal link between the power outage with the presence of the malware," the agency said earlier this month.

Lipovsky warns that the latest wave of attacks, far from confirming Russia as the culprit, "suggests that the possibility of false flag operations should also be considered.

"We currently have no evidence that would indicate who is behind these cyberattacks and to attempt attribution by simple deduction based on the current political situation might bring us to the correct answer, or it might not," Lipovsky wrote.

The Economist
Of warrants and watchers
Friday, 22 January 2016

London - Spies need secrecy and the public wants privacy. So finding the right legal framework in which the intelligence and security agencies can do their work, including--when necessary--intruding into people's private lives, is inherently tricky.
Britain's laws on bugging and snooping are out of date. Written in a pre-internet era, they give sweeping powers to the home secretary to authorise the interception and collection of electronic information, and the planting of bugs (in spookspeak, "equipment interference"). Without a stronger legal basis, these powers could fall foul of European judges on human-rights and data-protection grounds.

Moreover, until the revelations by Edward Snowden, a fugitive American intelligence contractor now living in Moscow, most people had no idea of the reach of Britain's digital spy agency, the Government Communications Headquarters (GCHQ), and how close its ties are with America's National Security Agency. The Snowden revelations infuriated digital-privacy advocates and also alarmed the technology industry, which feels squeezed between government demands and its customers' expectations.

The draft bill on investigatory powers going through Parliament attempts to sort out this mess. It follows the failure two years ago of a previous bill, dubbed the "snoopers' charter", and the hurried passage of a stopgap bill that expires this summer. The bill is under scrutiny by a joint committee of peers and MPs, which will report on February 11th.

Arguments rage over both form and content. Critics say the consultation is too hurried for one of the most important pieces of legislation in recent years. They object to the vagueness of some of the language (including new bits of jargon such as "internet connection records", which could mean the complete history of somebody's activity on the internet). The definition of these terms, and of such words as "urgent", "necessary" and "proportionate", will be contained in codes of practice, yet to be published.

For some, the fact that GCHQ has long had the capabilities it now avows is no reason to accept them. The bulk collection of information, they say, breaches privacy. Overly zealous spooks might link databases, and trawl them looking for patterns, drawing conclusions purely on the basis of inference, with no redress for those concerned. The data could be passed to (or pinched by) other countries, notably America, which could then decide, say, to put innocent people on no- fly lists. British Muslims already complain of costly, humiliating and unexplained last-minute blocks on trips to America, apparently based on their behaviour on the internet. Warehouses of sensitive data are magnets for criminals and other malefactors.

Critics of the bill also worry about a conflict of laws, under which Britain might oblige them to hand over data about their clients even when another country expressly prohibits this. Big technology companies such as Google, Facebook and Apple have written to the parliamentary committee to highlight this danger, though they declined to send their bosses to give evidence in person.

Some of this is posturing. The bill does not mandate the creation of a central database of everybody's internet history. Nor, contrary to some claims, will it force technology companies to install back doors in their encryption software to meet requests from GCHQ. Most supposedly encrypted products are already transparent to their providers: it is only by analysing its users' e-mails and browsing activity, for example, that Google is able to sell advertisements tailored to their tastes.

The law authorises GCHQ to ask for help. But when it comes across genuinely uncrackable encryption ("end-to- end", in industry jargon), it has other options, such as planting software on the device concerned. The tech companies, say cynics, are pretending to show how fiercely they resist government requests, while remaining happy to co-operate in private.

The purported conflict of laws is somewhat overblown as well. GCHQ will not force a company to break other countries' laws (risking an embarrassing public spat). The bigger worry for the government is how to protect the agency's intelligence capabilities from judges in Luxembourg and Strasbourg, whose view of espionage is rooted not in the British tradition of royal prerogative and empire, but in continental memories of totalitarianism.

For this reason the bill introduces a new idea. The home secretary's warrants will be reviewed by judges, who will check them for lawfulness and reasonableness. The creation of these commissioners was recommended in a report last year by David Anderson, a lawyer who is the independent scrutineer of Britain's anti-terrorist legislation. The spooks have no objection. Their activities are already scrutinised retrospectively by commissioners. They would also like their warrants to have more legal force in foreign eyes.

The committee is now debating the commissioners' hiring, firing and remit. It is also mulling evidence from lawyers and media-freedom campaigners. Communications between lawyers and their clients enjoy almost bulletproof legal protection: spies too should be told explicitly to steer clear of them. Journalists fret that sources (especially whistle-blowers) may have insufficient protection.

Another issue is a provision in the bill requiring "communication service providers" (ie, internet and telecoms firms) to store customers' internet records. It is unclear what this will mean in practice, how intrusive it will be, what it will cost and whether, since people get on the internet in many different ways, it can even work.

The biggest divide is not over the technicalities of intelligence oversight, but in attitudes to what spies do. Some believe the agencies to be overmighty, beguiling politicians with tales of derring-do and lobbying zealously for their cause in the media. Such worries are not groundless. Parliament's intelligence and security committee was surprised and annoyed by a drooling series of articles that resulted after GCHQ gave the Times unprecedented access to its headquarters in Cheltenham.

Yet nobody has evidence that GCHQ acts unlawfully or menacingly under the existing system. Most Britons--and most politicians--think the spooks do a good job and, beset by fears of terrorism, crime, child abuse and foreign spies, want a legal structure that lets them keep at it.

The Register (UK)
GCHQ spies quashed this phone encryption because it was too good against snoopers
Friday, 22 January 2016
Byline: Kieren McCarthy

London - The researcher who discovered that the UK government's phone encryption standard has a huge backdoor installed has made another discovery: GCHQ's rejection of a better encryption standard because it didn't allow for undetectable spying.
Dr Steven Murdoch has updated his original post on the MIKEY-SAKKE standard, developed by UK listening post GCHQ, to include a document from the 3GPP standardization group that was responsible for the 3G mobile phone standard and which also developed the 4G and LTE standards (i.e., what your phone currently uses).

That document stems from a meeting back in 2010 and outlines how a representative from the National Technical Assistance Centre (NTAC) - GCHQ's decryption and data analysis arm - worked to reject the MIKEY-IBAKE standard because it could produce a slight delay in people's phone calls when they were being intercepted.

"Due to the timing and interaction required to perform the man-in-the-middle attack during call setup, there will be additional latency in call setup," it reads. "This will be especially pronounced when large numbers of surveillance subjects are active in one region or one switch."

It goes on to note that the IBAKE standard would mean if an individual's connection was tapped, it could interfere with other authentication efforts, i.e., someone might notice they were under surveillance. And it noted that the standard would make it difficult to go back retroactively and listen to past conversations.

Jigsaw pieces

Although the document is not new - it was published on the whistleblower Cryptome website back in 2014 - its relevance has only just come to light thanks to the UK government's efforts to push the MIKEY-SAKKE standard for the latest end-to-end phone encryption products.

That effort is not limited to government departments: it is also being marketed to the broader commercial world through a product spec it has called Secure Chorus by highlighting its "government-grade security." It has also set itself up as an evaluator of other products, one example being Cryptify Call, available for iOS and Android.

MIKEY-SAKKE is mentioned possibly for the first time in the 2010 rejection of the IBAKE approach. The document notes: "In light of these requirements, UK government has developed a similar scheme, MIKEY-SAKKE, which supports 3GPP SA3 LI requirements and has additional benefits such as low latency."

That standard that the UK government specifically developed to allow for full and unnoticeable surveillance is the same one that six years later it is now trying to push into the expanding commercial market for more secure phone calls. It is notable that it makes no mention of the ability to invisibly intercept calls in its description of the protocol.

In short: the security services are trying to get people to hardwire the same standards that make it possible to intercept existing phone calls into products that are specifically designed to avoid that exact scenario.

Well, you can't blame them for trying.

Fox News
Clinton emails so secret some lawmakers can't read them
Thursday, 21 January 2016
Byline: Catherine Herridge

Washington - Some of Hillary Clinton's emails on her private server contained information so secret that senior lawmakers who oversee the State Department cannot read them without fulfilling additional security requirements, Fox News has learned.
The emails in question, as Fox News first reported earlier this week, contained intelligence classified at a level beyond "top secret." Because of this designation, not all the lawmakers on key committees reviewing the case have high enough clearances.

A source with knowledge of the intelligence review told Fox News that senior members of the Senate Foreign Relations Committee, despite having high-level clearances, are among those not authorized to read the intelligence from so-called "special access programs" without taking additional security steps -- like signing new non-disclosure agreements.

These programs are highly restricted to protect intelligence community sources and methods.

As Fox News previously reported, a Jan. 14 letter from Intelligence Community Inspector General I. Charles McCullough III to senior lawmakers said an intelligence review identified "several dozen" additional classified emails -- including specific intelligence from "special access programs" (SAP).

That indicates a level of classification beyond even "top secret," the label previously given to two emails found on her server, and brings even more scrutiny to the Democratic presidential candidate's handling of the government's closely held secrets.

Fox News is told that the reviewers who handled the SAP intelligence identified in Clinton's emails had to sign additional non-disclosure agreements even though they already have the highest level of clearance -- known as TS/SCI or Top Secret/Sensitive Compartmented information. This detail was first reported by NBC News.

This alone seems to undercut the former secretary of state's and other officials' claims that the material is "innocuous."

In an interview with NPR, Clinton claimed the latest IG finding doesn't change anything and suggested it was politically motivated.

"This seems to me to be, you know, another effort to inject this into the campaign, it's another leak," she said. "I'm just going to leave it up to the professionals at the Justice Department because nothing that this says changes the fact that I never sent or received material marked classified."

Despite Clinton's claims, it is the content that is classified; the markings on the documents do not affect that.

A former Justice Department official said there is another problem -- warnings from State Department IT employees and others that she should be using a government account.

"If you have a situation where someone was knowingly violating the law and that they knew that what they were doing was prohibited by federal law because other people were saying, you're violating the law, knock it off, and they disregarded that advice and they went ahead, that's a very difficult case to defend," Thomas Dupree said.

Times of Israel
Defense against Cyber Pirates
Friday, 22 January 2016

Jerusalem - Sabotage by cyber-attack is the latest threat to governments and industries all over the world, and the shipping industry is no exception. Andrew Ginter, VP of Industrial Security at Waterfall Security Solutions, in a conversation about the increasing threat of cyber attacks at sea, and how ship-owners can protect their vessels
Picture the scene. The ship has run aground in shallow water. It shouldn't have been anywhere near the sandbank it's resting on, but the crew were unable to control it. It's now listing badly and valuable cargo is falling overboard. The mystified captain is muttering something. The camera zooms in on him and we listen. "We must have been hacked," he's saying. "We must have been hacked." If this were the opening scene of the next James Bond film, most of us would think it a perfectly credible incident - and we'd be right, because it is.

Sabotage by cyber-attack is the latest threat to governments and industries all over the world, and the shipping industry is no exception. We all have enemies, be they political, economic or simply plain criminal, and the more equipment we connect to one network or another, the more vulnerable we become.

Ships today are completely computerized. In our continued attempts to reduce costs by increasing efficiency, more and more functions are being automated or remotely controlled, and gigabytes of data are collected every day to help us monitor the performance of our equipment. Navigation is heavily automated. Equipment usage is monitored to reduce costs through predictive maintenance. Everything from vessel position, speed and heading to fuel usage, hull stress and engine condition are monitored automatically for use in advanced optimization and prediction algorithms. Everything is connected to the network, so we can see what's going on and adjust it for optimum performance. Even the containers can be equipped with communications technology now, to give us 24/7 feedback on their comfort levels, from temperature to humidity to good vibrations. Systems can be fitted which remotely control and adjust the temperature of refrigerated containers.

The problem is, once we introduce connectivity into our operations to make it possible to interact remotely with a motion sensor in a container or, more importantly, a navigation device in a ship's control network, we make it possible for someone else to interact with our equipment, too.

"The trade off between increased efficiency and increased vulnerability is one that businesses in many industries are failing to take into account," says Andrew Ginter, VP industrial security, Waterfall Security Solutions. "We see the benefits more clearly than we see the risks."

One barrier to understanding is visibility. The most visible attacks are common viruses, malware and attacks by insiders. There's a new generation of attackers out there now, though, who work hard at invisibility. Most victims have no idea they have been compromised until months after the fact, if ever.

A more subtle barrier is the difference between espionage and sabotage. Over the last five years most of the high- profile cyber attacks were espionage attacks - stealing information. The big risk to shipping is not espionage, however, but cyber sabotage.

"Most security practitioners are much more aware of espionage risks than sabotage risks," says Ginter. "As a result we install security systems that are reasonably good at preventing the theft of data, but do little to prevent equipment damage, or worse. The prevention of cyber sabotage needs a different approach," he stresses.

"Common wisdom has it that a control system can be secured with a firewall and a bit of encryption," continues Ginter. Unfortunately, there is more wishful thinking than wisdom here. "Firewalls forward messages between networks, and they do what they can to identify and eliminate attack messages, but no firewall is or can ever be perfect. All firewalls forward some attack messages into protected networks."

In practice, all software can be hacked, Ginter explains, because all software has bugs, and many bugs are security vulnerabilities. "I wrote software for 25 years," he says. "I did not deliberately put bugs into every piece of software I wrote, but every piece of software I wrote still had bugs."

This is why intrusion detection is fundamental to defending against cyber espionage. If every message through the firewall could contain an attack, and all software can be hacked, then intrusion detection is critical. We need to assume we will be compromised, we need to search out those compromised computers, and we need to erase those computers and restore them from clean backups.

This approach fails us in the world of cyber sabotage, however. We cannot take a grounded ship and "restore it from backup." Fundamentally, intrusion detection takes time; recent studies show that it takes months to find the average intrusion. For all of that time, an invisible intruder has remote control of our vessel: falsifying data and mis-operating equipment. This is unacceptable.

While reports of stolen bank details and credit card numbers are becoming commonplace on our TV news, we don't hear so much about cyber attacks on infrastructure or industrial assets, but this doesn't mean they're not happening. If we were a multinational industry giant with customers all over the world, how likely would we be to admit that our security had been breached if we were not legally bound to disclose breaches?

Worse, attackers with no desire to be discovered are likely to disguise their interventions to look like random system failures, so their victims never know they were attacked. "This is why we don't hear about attacks," confirms Ginter, "but if you look at surveys, 70 to 80 per cent of people say they have been compromised in the last 12 months and an even greater number expect to be compromised next year."

Where have these threats come from? Why are attackers now starting to target infrastructure rather than data? There is an element of 'because they can' in there, because our headlong rush towards connectivity has made it possible for them to attack us, but the big question is about motive. What do they have to gain? There will always be terrorists with political motives and pirates with ransom demands, but the new breed of cyber attacker is more likely to be looking for an economic advantage over a rival, or to make a killing on the stock market. There has to be a profit motive.

It is generally accepted today that organised crime is behind the most visible attacks on home computers and corporate systems, because they have proven paths to profit from such attacks. "The average credit card number is worth 25 cents on the black market," says Ginter. "The average bank account number and password is worth between a dollar and a hundred dollars, depending on how much money is in the account. There's a whole industry for laundering the money, and more recently, a whole industry has been developed around stealing corporate secrets. The question that people are asking now is, how soon will an industry be developed around simulating random failures on ships or at other industrial sites to manipulate markets, or for other profit motives? Many are also asking, is this happening already, silently?"

Ginter has an example from close to home that illustrates the potential threat very well. "I live in Alberta in Canada," he says. "A pipeline that used to send gasoline from east to west across the country was recently reversed and now sends crude oil back east for refining. Alberta now has local refiners that can provide us with gasoline. But in the middle of last summer, at the time of peak gasoline consumption, the biggest refinery in the region mysteriously went down. In spite of the worldwide collapse in oil prices, we were paying through the nose for gasoline.

"The refinery didn't tell us why it went down," he continues. "It didn't have to. News reports talked about some kind of equipment failure. But think about it - if someone broke into the refinery's network and caused some equipment to fail without leaving obvious traces of cyber attack behind, and then went long on gasoline futures in our geography and made a killing on the commodities market, would anybody notice? These guys are very good at what they do. This kind of opportunity is something that if

organised crime isn't doing it today, we're certainly worried about it happening in the future. These guys are professionals. They're going to cover their tracks.

"So the question is, who profits when a ship is delayed by mechanical problems or computer problems with its navigational systems? Everything on the ship is delayed, so what's on the vessel? Is it something that somebody can profit by? Can they go short on the shipping company or can they go short on the company that owns the goods? If goods are delayed it may affect someone's profits for the quarter. This is the kind of thing that people are worried about. Where there's opportunity, somebody is going to take advantage."

Somebody took advantage in 2013 in an attack on the US retailer, Target, which resulted in costly court proceedings over the insurance claim, and incalculable damage to the company's reputation. How did they do that? "This was a data theft attack, but the attackers used the same kind vulnerability that we see with control systems on ships and in every industry," says Ginter. "They got into Target through a vendor. The attackers did not come after Target. They were just poking around, systematically breaking into one business after another to see what profit they could make. Then they broke into a vendor that provided Target with refrigeration and HVAC hardware and services. They stole remote access credentials from the refrigeration vendor and used them to log into Target. They didn't have to break through the Target firewall - they just logged in like any other user. How many vendors have remote access to our ships?"

Security awareness and preparedness vary greatly according to geography, says Ginter. "In North America there are regulations in the power sector. If the bad guys want to target the North American power sector they're going to come up against NERC CIP [the North American Electric Reliability Corporation's Critical Infrastructure Protection standards]. Now, NERC CIP is far from perfect, but it is much better than nothing. In much of the rest of the world, there is nothing."

If you get your regulations right in the first place, compliance will bring best practices into play. The question though, is how can best practices become standard practices for industries that are not regulated? "I don't see any rules emerging for the shipping industry," says Ginter. "There's no body that can enforce rules like that."

There have already been attempted attacks on the US power grid by the terrorist organisation ISIS, though these initial attacks were described by authorities as "low capability" attacks. Attack capabilities can be purchased, however, and ISIS has money. "These simple attacks are going to become more sophisticated," says Ginter. "All it takes is a little money for ISIS to buy world class attack capabilities to come after the grid, and they have plenty of money."

While the next target depends on the specific motivation of the next cyber attacker, it would be a mistake to base our security defence on the likelihood of an attack. What's unlikely today may be more likely tomorrow, but tomorrow may be too late to prevent the attack.

"Prudent security practitioners defend against well-known attack capabilities," says Ginter. "They do not defend against the motive of the moment. They do not look around and say 'how many ships were stranded last year in the middle of the ocean like this?' Motives can change in a heartbeat. Somebody can suddenly get a bee in their bonnet and decide to come after us. Capabilities evolve much more slowly. So industrial sites today are looking at the capabilities in the threat environment and defending against them before someone develops a motive to use those capabilities against their sites."

If our organization is lucky enough not to have been targeted by a cyber attacker yet, what approach to security are we going to take? Are we going to look at the statistics of ships being attacked in this way and respond according to our perception of likelihood, or are we going to put protections in place before serious harm is done?

For those looking for credible sabotage- oriented protection, there are solutions available. Waterfall Security Solutions is a cyber security specialist that produces hardware-enforced security products, focused on preventing the cyber sabotage of ICS (industrial control system) networks. The hardware part of the solution is called a unidirectional gateway.

"We have a family of products but our flagship product is the unidirectional gateway," says Ginter. "The gateways enable safe network integration. The gateways let businesses monitor their control system equipment, but make it physically impossible to send any attack back in to those critical networks.

"We claim 100 per cent protection against network attacks coming from external networks," he continues. "While there is no technology that can prevent absolutely all attacks, these silent, online, network-based attacks are the workhorse of cyber sabotage, and are the specific risk that comes with increased network connectivity. Our gateways eliminate that specific threat vector entirely."

When a unidirectional gateway becomes the only connection between a more trusted network and a less trusted network, he explains, data travels only one way, so nothing gets back in to the ICS network. Waterfall makes the data available for anyone who needs it, by replicating industrial databases and devices. "Anyone who wants the real-time data can ask the replicas and get the same answer they would have had by asking the live systems," Ginter explains. "They get the same answer from the replica as the control system equipment would have given them, without ever sending a message to the control system and putting that equipment at risk."

Waterfall Security Solutions produces a family of products that are based on or complement its unidirectional gateways. The Waterfall FLIP is a kind of gateway that can reverse orientation on a schedule, to provide continuous monitoring and occasional batch updates of shipboard systems, such as security updates or weather forecasts. Inbound/outbound gateways can provide continuous updates of onboard systems through separate, independent replications, without ever introducing the kinds of attack paths that always come with firewalls. Application data control add-ons apply fine-grained policy-based controls to data in motion between networks. All of these products frustrate modern, silent, remote-control cyber sabotage attack capabilities, as well as a host of older, more mundane attacks.

The 2015 "Safety and Shipping Review" by Allianz identified cyber sabotage attacks on shipping as "a major concern." Cyber sabotage attack capabilities have become much more sophisticated in the course of the last decade. Attackers use powerful software tools, and like all software, attack tools become more and more capable as new versions are released. Basic security hygiene, such as firewalls, anti-virus systems, security updates, encryption and long passwords, provide little protection against modern attacks by criminals or 'hacktivists'.

"In the shipping industry, we need to take inspiration from control system cyber security standards and regulations in other industries," says Ginter. The French ANSSI standards for critical infrastructure protection prohibit firewalls at the boundaries of the most important control system networks, permitting only unidirectional gateways. The North American NERC CIP standards provide relief from one third of the security regulations when unidirectional gateways are used instead of firewalls at large power plants. The ISA, IEC, NIST and many other standards all position unidirectional gateways as stronger than firewall protections for control system security programs.

"We have a window of opportunity now, to protect the control systems and navigation systems on our vessels, before we start suffering very serious losses," concludes Ginter. "Increased automation and connectivity brings increased opportunities and profits, but only if we address the risks."

The Economist
Snoopers and scrutiny
Thursday, 21 January 2016
Byline: Editorial Board

Editorial - Few balances are harder to strike than those involved in running a spy agency. After a terrorist attack, voters demand action and politicians respond by granting their spies greater powers to bug and snoop, as with America's Patriot Act in 2001 and the wide-ranging surveillance law passed after the attacks in France last year. Yet these very powers can, if abused, distort the political system, chill freedom of expression and tilt the scales of justice. When the full extent of clandestine activities come to light, as with Edward Snowden's revelations about America's National Security Agency, many feel queasy and demand that the spooks are reined in again.
So a lot is riding on Britain's attempt to update the law governing the domestic activities of its spy agencies. The draft bill will make explicit how the electronic-intelligence agency, GCHQ, may (with a warrant) plant bugs on computers and other devices, collect and analyse bulk information (such as mobile-phone activity and web-browsing records) and read private messages. Get the details right, and Britain can provide a model of how to balance security and freedom; get them wrong, and centuries of freedom might shrivel.

The bill's biggest success is its self-restraint. It does not require firms to weaken the encryption they sell to customers, as politicians in several countries, including Britain, would like. If people want security on

the internet, they have no alternative to strong encryption. The agencies have other means of collecting data, including bugging phones and computers.

The draft bill is also right to require companies to retain, at least for a time, data about mobile-phone and internet activity that may, subject to a warrant, be of use to future investigations. Intelligence agencies need to be able to look back at the history of a suspected terrorist's contacts and movements.

Elsewhere, however, the bill could be better. It rightly strengthens GCHQ's powers to pursue terrorists, gangsters and foreign spies. And it offers extra safeguards: new judicial commissioners will review warrants which, as now, will be issued by the home secretary. Politicians should have ultimate responsibility; if things go wrong, they carry the can. But the bill will work best if it is backed by a consensus. For that reason it needs to reassure those who fear that politicians may abuse their powers. Instead of holding their posts at the prime minister's behest, the commissioners should be appointed as judges are and their dismissal should require a vote in Parliament. To avoid "capture", they should serve a single fixed term.

In addition, the proposed system merely requires the commissioners to check that a warrant has been issued lawfully and reasonably--broadly the same standard applicable to judicial review of other government decisions. But the extra secrecy with which intelligence agencies operate means that is not enough. The commissioners need a reserve power to weigh warrants on their merits. Also missing is explicit protection for lawyers' communications with their clients.

Just as important as the nuts and bolts of the new law is its implementation. GCHQ's demands may be legal, but if they are too costly or intrusive, companies dealing with technology and data will simply move abroad. For all these reasons, other countries should watch Britain closely.

Wall Street Journal
NSA Chief Says U.S. at 'Tipping Point' on Cyberweapons
Thursday, 21 January 2016
Byline: Damian Paletta

Washington - The U.S. military has spent five years developing advanced cyberweapon and digital capabilities and is likely to deploy them more publicly soon, the head of the Pentagon's U.S. Cyber Command said Thursday.
Adm. Mike Rogers, who is also director of the National Security Agency, said U.S. policy makers have largely agreed on rules of engagement for when cyberweapons can be used for defense.

There is still an open discussion, however, about when cyberweapons should be used for "offense," such as carrying out attacks against a group or foreign country.

"You can tell we are at the tipping point now," Adm. Rogers said. "The capacity and the capability are starting to come online [and] really starting to pay off in some really tangible capabilities that you will start to see us apply in a broader and broader way."

Still, Adm. Rogers stopped short of specifying how exactly these cyberpowers could be deployed in coming months.

Despite a series of high-profile cyberattacks in the past two years, including a large-scale breach at Sony Pictures Entertainment Inc. in late 2014 and the theft of millions of records from the U.S. Office of Personnel Management in 2015, Adm. Rogers suggested many Americans have become complacent, since they don't see the rise of cyber armies and cybercriminals affecting their daily lives.

That could change fast, he said, if a cyberattack achieves large-scale destruction, particularly in a fashion resembling a more traditional weapon. Analysts have said these sorts of acts could including attacking a country's electrical grid or knocking a nation's financial system offline.

"I'm watching capability when I go, 'Wow, if the intent were to change, we'd have some real challenges here,' and intent can change really quickly," he said. "I would urge us not to draw the conclusion that there is nothing here we really need to worry about. I would argue it's going to get worse before it gets better."

Adm. Rogers, who has led the NSA and Cyber Command for two years, was brought in to stabilize the agency after a furor over the far-reaching surveillance program disclosed by former contractor Edward Snowden. The NSA has seen some of its powers clipped, most notably when Congress last year banned bulk collection of telephone records.

Adm. Rogers has said the agency needs to do more to restore public confidence, and he has been adamant that the government needs to develop specific rules about the emerging digital battlefield.

Following the OPM breach, which some U.S. officials attributed to Chinese hackers, many lawmakers have said the White House and Pentagon need to clarify rules of engagement and make them public. These could include specific punishments and retaliatory actions, as a way to deter future attacks.

Adm. Rogers said policy makers have been working to develop "the same kind of standards" for responding to cyberattacks that they use for other warfare.

The NSA director also said the agency will launch a reorganization this year to better mesh its two tasks--digital spying and data collection on the one hand and protecting information on the other.

"We have got to integrate much more," he said. "This traditional approach we had...built walls of granite between them."

The Intercept
NSA Chief Stakes Out Pro-Encryption Position, in Contrast to FBI
Thursday, 21 January 2016
Byline: Jenna McLaughlin

Washington - National Security Agency Director Adm. Mike Rogers said Thursday that "encryption is foundational to the future," and arguing about it is a waste of time.
Speaking to the Atlantic Council, a Washington, D.C., think tank, Rogers stressed that the cybersecurity battles the U.S. is destined to fight call for more widespread use of encryption, not less. "What you saw at OPM, you're going to see a whole lot more of," he said, referring to the massive hack of the Office of Personnel Management involving the personal data about 20 million people who have gotten background checks.

"So spending time arguing about 'hey, encryption is bad and we ought to do away with it' ... that's a waste of time to me," he said, shaking his head.

"So what we've got to ask ourselves is, with that foundation, what's the best way for us to deal with it? And how do we meet those very legitimate concerns from multiple perspectives?"

Other government officials -- most notably FBI Director James Comey -- have been crusading for a way that law enforcement can get access to encrypted data.

But technologists pretty much universally agree that creating some sort of special third-party access would weaken encryption to the point that it would threaten every internet transaction we make, from online banking to filling out our health records to emailing our friends and significant others. A hole in encryption for special FBI access would be a hole that criminals could sneak through, too.

While there's been a lot of talk about giving up some privacy for security, Rogers said both are paramount.

"Concerns about privacy have never been higher. Trying to get all those things right, to realize that -- it isn't about one or the other," he said. He does not think that "security is the imperative and that ought to drive everything." Nor should privacy, he continued. "We've got to meet these two imperatives. We've got some challenging times ahead of us, folks."

Comey, who formerly advocated for a way to get law enforcement access without weakening encryption, recently switched tactics. Now he is pressuring companies to change their business models and simply not offer true end-to-end encryption to their customers.

The White House has decided not to pursue legislation to outlaw unbreakable end-to-end encryption, following pressure from privacy advocates and scientists. But the intelligence community's top lawyer,

Bob Litt, privately advised the administration that a major terrorist attack could be an opportune moment to do so.

And the White House has not issued a statement in defense of encryption, to the frustration of Apple CEO Tim Cook, among others.

Meanwhile, Sens. Richard Burr, R-N.C., and Dianne Feinstein, D- Calif., are reportedly planning their own proposed legislation to require law enforcement access.

Rogers' comments could indicate a split on this issue between the intelligence community and domestic law enforcement.

The previous NSA director, Michael Hayden, said in January that he thinks Comey is on the wrong side of this debate. "I disagree with Jim Comey. I actually think end-to-end encryption is good for America," he said.

Hayden has also spoken about how U.S. intelligence agencies have figured out how to get the information they need without weakening encryption -- such as using metadata, which shows who is contacting whom. Another former NSA boss, Mike McConnell, has also spoken out against trying to install backdoors in encryption.

Left unsaid is the fact that the FBI and NSA have the ability to circumvent encryption and get to the content too -- by hacking. Hacking allows law enforcement to plant malicious code on someone's computer in order to gain access to the photos, messages, and text before they were ever encrypted in the first place, and after they've been decrypted. The NSA has an entire team of advanced hackers, possibly as many as 600, camped out at Fort Meade.

CBC.CA
Crimes involving technology are on the rise like never before: police
Friday, 22 January 2016

Sudbury - Sudbury police say they're struggling to keep up with cybercrime in the city -- something the chief says all police forces in the world are having difficulty with.
Cybercrime isn't just computer hacking anymore, Paul Pedersen said. The majority of the cybercrime police see now are things like trafficking, theft, and harassment -- all done with the use of technology.

Just a few years ago they were seizing desktop computers, but they're now having to solve crimes through people's online profiles and smart phones.

"We've got stalking -- which everybody can understand. But we now have harassment coming in the form of texts, in the form of email messages," Pedersen said.

"And where that complicates things for us is the ability to pull that information off of computers, store that data, and then disclose that data."

Police report that one-to-two per cent of all cybercrime in Canada is being reported -- and that means it's harder for them to know what they're up against.

"We keep talking about cybercrime as an emerging crime," Pedersen continued.

"But the reality is it's alive and well in all of our communities and certainly here in Sudbury."

Greater Sudbury Police Detective Sergeant Blair Ramsay told CBC News the growth of cybercrime is "the same as everywhere else ... it's growing. It's involved in a lot of crimes."

"We've increased our forensic analysts from two to three," he continued. The team involves two investigators and a victim identification officer.

How is an unknown victim identified from a photo?

"We dig into the image. Work with Adobe. Look at the background of the image, look for clues," Ramsay said.

"You'd be surprised by what you can find."

Common cyber crimes involve identity theft, criminal harassment, threats, child exploitation and drug dealing.

And scammers.

"We have had some cases of people reporting they have been extorted for money," Ramsay said, noting that people on dating websites are being asked to send "compromising" photos of themselves, only to be later blackmailed.

What can people do to protect themselves?

Ramsay said the Canadian Anti-Fraud Centre has a lot of good safety tips, which can be found here.

"If you think you're being targeted for an online scam, search it [online]," he said.

"If you think you're targeted, generally somebody else has too, and you'll see a lot of results."

Ramsay said tips to keep children safe online can be found at cybertip.ca.

People can also contact local police for more information.

The Hill
Security researcher: Ukraine power grid facing new wave of cyberattacks
Friday, 22 January 2016
Byline: Katie Bo Williams

Washington - Ukrainian power plants are still facing an onslaught of cyberattacks in the wake of a malware-caused blackout in December, according to a U.S. security firm.
"[On January 19th], we discovered a new wave of these attacks, where a number of electricity distribution companies in Ukraine were targeted again following the power outages in December," malware researcher Robert Lipovsky wrote in a post on the blog We Live Security.

But the kind of malware used in this latest wave of attacks is not the same code that left 80,000 people in the western regions of Ukraine without power last month, Lipovsky notes.

"What's particularly interesting is that the malware that was used this time is not BlackEnergy, which poses further questions about the perpetrators behind the ongoing operation," he wrote.

"The malware is based on a freely-available open-source backdoor -- something no one would expect from an alleged state-sponsored malware operator."

The incident in December, believed to be the first time a blackout was caused by a cyberattack, has been widely attributed to Russia.

The Ukrainian security service, SBU, was swift to blame Russia for planting malware to cause the blackout. Relations between the two nations have been in a steep decline since Russia annexed Crimea last year and began supporting pro-Russian separatists in Ukraine.

"We found that the [malware] came from Russia," SBU said. "It was an attempt to interfere in the system. But it was discovered and prevented."

The U.S.'s Industrial Control Systems Cyber Emergency Response Team is assisting Ukraine in investigating the blackout, but it has neither confirmed that the malware was the principle culprit behind the blackout nor attributed the attack to Russia.

The team "can confirm that a BlackEnergy 3 variant was present in the system," but "based on the technical artifacts, we cannot confirm a causal link between the power outage with the presence of the malware," the agency said earlier this month.

Lipovsky warns that the latest wave of attacks, far from confirming Russia as the culprit, "suggests that the possibility of false flag operations should also be considered.

"We currently have no evidence that would indicate who is behind these cyberattacks and to attempt attribution by simple deduction based on the current political situation might bring us to the correct answer, or it might not," Lipovsky wrote.

The Economist
Of warrants and watchers
Friday, 22 January 2016

London - Spies need secrecy and the public wants privacy. So finding the right legal framework in which the intelligence and security agencies can do their work, including--when necessary--intruding into people's private lives, is inherently tricky.
Britain's laws on bugging and snooping are out of date. Written in a pre-internet era, they give sweeping powers to the home secretary to authorise the interception and collection of electronic information, and the planting of bugs (in spookspeak, "equipment interference"). Without a stronger legal basis, these powers could fall foul of European judges on human-rights and data-protection grounds.

Moreover, until the revelations by Edward Snowden, a fugitive American intelligence contractor now living in Moscow, most people had no idea of the reach of Britain's digital spy agency, the Government Communications Headquarters (GCHQ), and how close its ties are with America's National Security Agency. The Snowden revelations infuriated digital-privacy advocates and also alarmed the technology industry, which feels squeezed between government demands and its customers' expectations.

The draft bill on investigatory powers going through Parliament attempts to sort out this mess. It follows the failure two years ago of a previous bill, dubbed the "snoopers' charter", and the hurried passage of a stopgap bill that expires this summer. The bill is under scrutiny by a joint committee of peers and MPs, which will report on February 11th.

Arguments rage over both form and content. Critics say the consultation is too hurried for one of the most important pieces of legislation in recent years. They object to the vagueness of some of the language (including new bits of jargon such as "internet connection records", which could mean the complete history of somebody's activity on the internet). The definition of these terms, and of such words as "urgent", "necessary" and "proportionate", will be contained in codes of practice, yet to be published.

For some, the fact that GCHQ has long had the capabilities it now avows is no reason to accept them. The bulk collection of information, they say, breaches privacy. Overly zealous spooks might link databases, and trawl them looking for patterns, drawing conclusions purely on the basis of inference, with no redress for those concerned. The data could be passed to (or pinched by) other countries, notably America, which could then decide, say, to put innocent people on no- fly lists. British Muslims already complain of costly, humiliating and unexplained last-minute blocks on trips to America, apparently based on their behaviour on the internet. Warehouses of sensitive data are magnets for criminals and other malefactors.

Critics of the bill also worry about a conflict of laws, under which Britain might oblige them to hand over data about their clients even when another country expressly prohibits this. Big technology companies such as Google, Facebook and Apple have written to the parliamentary committee to highlight this danger, though they declined to send their bosses to give evidence in person.

Some of this is posturing. The bill does not mandate the creation of a central database of everybody's internet history. Nor, contrary to some claims, will it force technology companies to install back doors in their encryption software to meet requests from GCHQ. Most supposedly encrypted products are already transparent to their providers: it is only by analysing its users' e-mails and browsing activity, for example, that Google is able to sell advertisements tailored to their tastes.

The law authorises GCHQ to ask for help. But when it comes across genuinely uncrackable encryption ("end-to- end", in industry jargon), it has other options, such as planting software on the device concerned. The tech companies, say cynics, are pretending to show how fiercely they resist government requests, while remaining happy to co-operate in private.

The purported conflict of laws is somewhat overblown as well. GCHQ will not force a company to break other countries' laws (risking an embarrassing public spat). The bigger worry for the government is how to protect the agency's intelligence capabilities from judges in Luxembourg and Strasbourg, whose view of espionage is rooted not in the British tradition of royal prerogative and empire, but in continental memories of totalitarianism.

For this reason the bill introduces a new idea. The home secretary's warrants will be reviewed by judges, who will check them for lawfulness and reasonableness. The creation of these commissioners was recommended in a report last year by David Anderson, a lawyer who is the independent scrutineer of Britain's anti-terrorist legislation. The spooks have no objection. Their activities are already scrutinised retrospectively by commissioners. They would also like their warrants to have more legal force in foreign eyes.

The committee is now debating the commissioners' hiring, firing and remit. It is also mulling evidence from lawyers and media-freedom campaigners. Communications between lawyers and their clients enjoy almost bulletproof legal protection: spies too should be told explicitly to steer clear of them. Journalists fret that sources (especially whistle-blowers) may have insufficient protection.

Another issue is a provision in the bill requiring "communication service providers" (ie, internet and telecoms firms) to store customers' internet records. It is unclear what this will mean in practice, how intrusive it will be, what it will cost and whether, since people get on the internet in many different ways, it can even work.

The biggest divide is not over the technicalities of intelligence oversight, but in attitudes to what spies do. Some believe the agencies to be overmighty, beguiling politicians with tales of derring-do and lobbying zealously for their cause in the media. Such worries are not groundless. Parliament's intelligence and security committee was surprised and annoyed by a drooling series of articles that resulted after GCHQ gave the Times unprecedented access to its headquarters in Cheltenham.

Yet nobody has evidence that GCHQ acts unlawfully or menacingly under the existing system. Most Britons--and most politicians--think the spooks do a good job and, beset by fears of terrorism, crime, child abuse and foreign spies, want a legal structure that lets them keep at it.

The Register (UK)
GCHQ spies quashed this phone encryption because it was too good against snoopers
Friday, 22 January 2016
Byline: Kieren McCarthy

London - The researcher who discovered that the UK government's phone encryption standard has a huge backdoor installed has made another discovery: GCHQ's rejection of a better encryption standard because it didn't allow for undetectable spying.
Dr Steven Murdoch has updated his original post on the MIKEY-SAKKE standard, developed by UK listening post GCHQ, to include a document from the 3GPP standardization group that was responsible for the 3G mobile phone standard and which also developed the 4G and LTE standards (i.e., what your phone currently uses).

That document stems from a meeting back in 2010 and outlines how a representative from the National Technical Assistance Centre (NTAC) - GCHQ's decryption and data analysis arm - worked to reject the MIKEY-IBAKE standard because it could produce a slight delay in people's phone calls when they were being intercepted.

"Due to the timing and interaction required to perform the man-in-the-middle attack during call setup, there will be additional latency in call setup," it reads. "This will be especially pronounced when large numbers of surveillance subjects are active in one region or one switch."

It goes on to note that the IBAKE standard would mean if an individual's connection was tapped, it could interfere with other authentication efforts, i.e., someone might notice they were under surveillance. And it noted that the standard would make it difficult to go back retroactively and listen to past conversations.

Jigsaw pieces

Although the document is not new - it was published on the whistleblower Cryptome website back in 2014 - its relevance has only just come to light thanks to the UK government's efforts to push the MIKEY-SAKKE standard for the latest end-to-end phone encryption products.

That effort is not limited to government departments: it is also being marketed to the broader commercial world through a product spec it has called Secure Chorus by highlighting its "government-grade security." It has also set itself up as an evaluator of other products, one example being Cryptify Call, available for iOS and Android.

MIKEY-SAKKE is mentioned possibly for the first time in the 2010 rejection of the IBAKE approach. The document notes: "In light of these requirements, UK government has developed a similar scheme, MIKEY-SAKKE, which supports 3GPP SA3 LI requirements and has additional benefits such as low latency."

That standard that the UK government specifically developed to allow for full and unnoticeable surveillance is the same one that six years later it is now trying to push into the expanding commercial market for more secure phone calls. It is notable that it makes no mention of the ability to invisibly intercept calls in its description of the protocol.

In short: the security services are trying to get people to hardwire the same standards that make it possible to intercept existing phone calls into products that are specifically designed to avoid that exact scenario.

Well, you can't blame them for trying.

Fox News
Clinton emails so secret some lawmakers can't read them
Thursday, 21 January 2016
Byline: Catherine Herridge

Washington - Some of Hillary Clinton's emails on her private server contained information so secret that senior lawmakers who oversee the State Department cannot read them without fulfilling additional security requirements, Fox News has learned.
The emails in question, as Fox News first reported earlier this week, contained intelligence classified at a level beyond "top secret." Because of this designation, not all the lawmakers on key committees reviewing the case have high enough clearances.

A source with knowledge of the intelligence review told Fox News that senior members of the Senate Foreign Relations Committee, despite having high-level clearances, are among those not authorized to read the intelligence from so-called "special access programs" without taking additional security steps -- like signing new non-disclosure agreements.

These programs are highly restricted to protect intelligence community sources and methods.

As Fox News previously reported, a Jan. 14 letter from Intelligence Community Inspector General I. Charles McCullough III to senior lawmakers said an intelligence review identified "several dozen" additional classified emails -- including specific intelligence from "special access programs" (SAP).

That indicates a level of classification beyond even "top secret," the label previously given to two emails found on her server, and brings even more scrutiny to the Democratic presidential candidate's handling of the government's closely held secrets.

Fox News is told that the reviewers who handled the SAP intelligence identified in Clinton's emails had to sign additional non-disclosure agreements even though they already have the highest level of clearance -- known as TS/SCI or Top Secret/Sensitive Compartmented information. This detail was first reported by NBC News.

This alone seems to undercut the former secretary of state's and other officials' claims that the material is "innocuous."

In an interview with NPR, Clinton claimed the latest IG finding doesn't change anything and suggested it was politically motivated.

"This seems to me to be, you know, another effort to inject this into the campaign, it's another leak," she said. "I'm just going to leave it up to the professionals at the Justice Department because nothing that this says changes the fact that I never sent or received material marked classified."

Despite Clinton's claims, it is the content that is classified; the markings on the documents do not affect that.

A former Justice Department official said there is another problem -- warnings from State Department IT employees and others that she should be using a government account.

"If you have a situation where someone was knowingly violating the law and that they knew that what they were doing was prohibited by federal law because other people were saying, you're violating the law, knock it off, and they disregarded that advice and they went ahead, that's a very difficult case to defend," Thomas Dupree said.

Times of Israel
Defense against Cyber Pirates
Friday, 22 January 2016

Jerusalem - Sabotage by cyber-attack is the latest threat to governments and industries all over the world, and the shipping industry is no exception. Andrew Ginter, VP of Industrial Security at Waterfall Security Solutions, in a conversation about the increasing threat of cyber attacks at sea, and how ship-owners can protect their vessels
Picture the scene. The ship has run aground in shallow water. It shouldn't have been anywhere near the sandbank it's resting on, but the crew were unable to control it. It's now listing badly and valuable cargo is falling overboard. The mystified captain is muttering something. The camera zooms in on him and we listen. "We must have been hacked," he's saying. "We must have been hacked." If this were the opening scene of the next James Bond film, most of us would think it a perfectly credible incident - and we'd be right, because it is.

Sabotage by cyber-attack is the latest threat to governments and industries all over the world, and the shipping industry is no exception. We all have enemies, be they political, economic or simply plain criminal, and the more equipment we connect to one network or another, the more vulnerable we become.

Ships today are completely computerized. In our continued attempts to reduce costs by increasing efficiency, more and more functions are being automated or remotely controlled, and gigabytes of data are collected every day to help us monitor the performance of our equipment. Navigation is heavily automated. Equipment usage is monitored to reduce costs through predictive maintenance. Everything from vessel position, speed and heading to fuel usage, hull stress and engine condition are monitored automatically for use in advanced optimization and prediction algorithms. Everything is connected to the network, so we can see what's going on and adjust it for optimum performance. Even the containers can be equipped with communications technology now, to give us 24/7 feedback on their comfort levels, from temperature to humidity to good vibrations. Systems can be fitted which remotely control and adjust the temperature of refrigerated containers.

The problem is, once we introduce connectivity into our operations to make it possible to interact remotely with a motion sensor in a container or, more importantly, a navigation device in a ship's control network, we make it possible for someone else to interact with our equipment, too.

"The trade off between increased efficiency and increased vulnerability is one that businesses in many industries are failing to take into account," says Andrew Ginter, VP industrial security, Waterfall Security Solutions. "We see the benefits more clearly than we see the risks."

One barrier to understanding is visibility. The most visible attacks are common viruses, malware and attacks by insiders. There's a new generation of attackers out there now, though, who work hard at invisibility. Most victims have no idea they have been compromised until months after the fact, if ever.

A more subtle barrier is the difference between espionage and sabotage. Over the last five years most of the high- profile cyber attacks were espionage attacks - stealing information. The big risk to shipping is not espionage, however, but cyber sabotage.

"Most security practitioners are much more aware of espionage risks than sabotage risks," says Ginter. "As a result we install security systems that are reasonably good at preventing the theft of data, but do little to prevent equipment damage, or worse. The prevention of cyber sabotage needs a different approach," he stresses.

"Common wisdom has it that a control system can be secured with a firewall and a bit of encryption," continues Ginter. Unfortunately, there is more wishful thinking than wisdom here. "Firewalls forward messages between networks, and they do what they can to identify and eliminate attack messages, but no firewall is or can ever be perfect. All firewalls forward some attack messages into protected networks."

In practice, all software can be hacked, Ginter explains, because all software has bugs, and many bugs are security vulnerabilities. "I wrote software for 25 years," he says. "I did not deliberately put bugs into every piece of software I wrote, but every piece of software I wrote still had bugs."

This is why intrusion detection is fundamental to defending against cyber espionage. If every message through the firewall could contain an attack, and all software can be hacked, then intrusion detection is critical. We need to assume we will be compromised, we need to search out those compromised computers, and we need to erase those computers and restore them from clean backups.

This approach fails us in the world of cyber sabotage, however. We cannot take a grounded ship and "restore it from backup." Fundamentally, intrusion detection takes time; recent studies show that it takes months to find the average intrusion. For all of that time, an invisible intruder has remote control of our vessel: falsifying data and mis-operating equipment. This is unacceptable.

While reports of stolen bank details and credit card numbers are becoming commonplace on our TV news, we don't hear so much about cyber attacks on infrastructure or industrial assets, but this doesn't mean they're not happening. If we were a multinational industry giant with customers all over the world, how likely would we be to admit that our security had been breached if we were not legally bound to disclose breaches?

Worse, attackers with no desire to be discovered are likely to disguise their interventions to look like random system failures, so their victims never know they were attacked. "This is why we don't hear about attacks," confirms Ginter, "but if you look at surveys, 70 to 80 per cent of people say they have been compromised in the last 12 months and an even greater number expect to be compromised next year."

Where have these threats come from? Why are attackers now starting to target infrastructure rather than data? There is an element of 'because they can' in there, because our headlong rush towards connectivity has made it possible for them to attack us, but the big question is about motive. What do they have to gain? There will always be terrorists with political motives and pirates with ransom demands, but the new breed of cyber attacker is more likely to be looking for an economic advantage over a rival, or to make a killing on the stock market. There has to be a profit motive.

It is generally accepted today that organised crime is behind the most visible attacks on home computers and corporate systems, because they have proven paths to profit from such attacks. "The average credit card number is worth 25 cents on the black market," says Ginter. "The average bank account number and password is worth between a dollar and a hundred dollars, depending on how much money is in the account. There's a whole industry for laundering the money, and more recently, a whole industry has been developed around stealing corporate secrets. The question that people are asking now is, how soon will an industry be developed around simulating random failures on ships or at other industrial sites to manipulate markets, or for other profit motives? Many are also asking, is this happening already, silently?"

Ginter has an example from close to home that illustrates the potential threat very well. "I live in Alberta in Canada," he says. "A pipeline that used to send gasoline from east to west across the country was recently reversed and now sends crude oil back east for refining. Alberta now has local refiners that can provide us with gasoline. But in the middle of last summer, at the time of peak gasoline consumption, the biggest refinery in the region mysteriously went down. In spite of the worldwide collapse in oil prices, we were paying through the nose for gasoline.

"The refinery didn't tell us why it went down," he continues. "It didn't have to. News reports talked about some kind of equipment failure. But think about it - if someone broke into the refinery's network and caused some equipment to fail without leaving obvious traces of cyber attack behind, and then went long on gasoline futures in our geography and made a killing on the commodities market, would anybody notice? These guys are very good at what they do. This kind of opportunity is something that if

organised crime isn't doing it today, we're certainly worried about it happening in the future. These guys are professionals. They're going to cover their tracks.

"So the question is, who profits when a ship is delayed by mechanical problems or computer problems with its navigational systems? Everything on the ship is delayed, so what's on the vessel? Is it something that somebody can profit by? Can they go short on the shipping company or can they go short on the company that owns the goods? If goods are delayed it may affect someone's profits for the quarter. This is the kind of thing that people are worried about. Where there's opportunity, somebody is going to take advantage."

Somebody took advantage in 2013 in an attack on the US retailer, Target, which resulted in costly court proceedings over the insurance claim, and incalculable damage to the company's reputation. How did they do that? "This was a data theft attack, but the attackers used the same kind vulnerability that we see with control systems on ships and in every industry," says Ginter. "They got into Target through a vendor. The attackers did not come after Target. They were just poking around, systematically breaking into one business after another to see what profit they could make. Then they broke into a vendor that provided Target with refrigeration and HVAC hardware and services. They stole remote access credentials from the refrigeration vendor and used them to log into Target. They didn't have to break through the Target firewall - they just logged in like any other user. How many vendors have remote access to our ships?"

Security awareness and preparedness vary greatly according to geography, says Ginter. "In North America there are regulations in the power sector. If the bad guys want to target the North American power sector they're going to come up against NERC CIP [the North American Electric Reliability Corporation's Critical Infrastructure Protection standards]. Now, NERC CIP is far from perfect, but it is much better than nothing. In much of the rest of the world, there is nothing."

If you get your regulations right in the first place, compliance will bring best practices into play. The question though, is how can best practices become standard practices for industries that are not regulated? "I don't see any rules emerging for the shipping industry," says Ginter. "There's no body that can enforce rules like that."

There have already been attempted attacks on the US power grid by the terrorist organisation ISIS, though these initial attacks were described by authorities as "low capability" attacks. Attack capabilities can be purchased, however, and ISIS has money. "These simple attacks are going to become more sophisticated," says Ginter. "All it takes is a little money for ISIS to buy world class attack capabilities to come after the grid, and they have plenty of money."

While the next target depends on the specific motivation of the next cyber attacker, it would be a mistake to base our security defence on the likelihood of an attack. What's unlikely today may be more likely tomorrow, but tomorrow may be too late to prevent the attack.

"Prudent security practitioners defend against well-known attack capabilities," says Ginter. "They do not defend against the motive of the moment. They do not look around and say 'how many ships were stranded last year in the middle of the ocean like this?' Motives can change in a heartbeat. Somebody can suddenly get a bee in their bonnet and decide to come after us. Capabilities evolve much more slowly. So industrial sites today are looking at the capabilities in the threat environment and defending against them before someone develops a motive to use those capabilities against their sites."

If our organization is lucky enough not to have been targeted by a cyber attacker yet, what approach to security are we going to take? Are we going to look at the statistics of ships being attacked in this way and respond according to our perception of likelihood, or are we going to put protections in place before serious harm is done?

For those looking for credible sabotage- oriented protection, there are solutions available. Waterfall Security Solutions is a cyber security specialist that produces hardware-enforced security products, focused on preventing the cyber sabotage of ICS (industrial control system) networks. The hardware part of the solution is called a unidirectional gateway.

"We have a family of products but our flagship product is the unidirectional gateway," says Ginter. "The gateways enable safe network integration. The gateways let businesses monitor their control system equipment, but make it physically impossible to send any attack back in to those critical networks.

"We claim 100 per cent protection against network attacks coming from external networks," he continues. "While there is no technology that can prevent absolutely all attacks, these silent, online, network-based attacks are the workhorse of cyber sabotage, and are the specific risk that comes with increased network connectivity. Our gateways eliminate that specific threat vector entirely."

When a unidirectional gateway becomes the only connection between a more trusted network and a less trusted network, he explains, data travels only one way, so nothing gets back in to the ICS network. Waterfall makes the data available for anyone who needs it, by replicating industrial databases and devices. "Anyone who wants the real-time data can ask the replicas and get the same answer they would have had by asking the live systems," Ginter explains. "They get the same answer from the replica as the control system equipment would have given them, without ever sending a message to the control system and putting that equipment at risk."

Waterfall Security Solutions produces a family of products that are based on or complement its unidirectional gateways. The Waterfall FLIP is a kind of gateway that can reverse orientation on a schedule, to provide continuous monitoring and occasional batch updates of shipboard systems, such as security updates or weather forecasts. Inbound/outbound gateways can provide continuous updates of onboard systems through separate, independent replications, without ever introducing the kinds of attack paths that always come with firewalls. Application data control add-ons apply fine-grained policy-based controls to data in motion between networks. All of these products frustrate modern, silent, remote-control cyber sabotage attack capabilities, as well as a host of older, more mundane attacks.

The 2015 "Safety and Shipping Review" by Allianz identified cyber sabotage attacks on shipping as "a major concern." Cyber sabotage attack capabilities have become much more sophisticated in the course of the last decade. Attackers use powerful software tools, and like all software, attack tools become more and more capable as new versions are released. Basic security hygiene, such as firewalls, anti-virus systems, security updates, encryption and long passwords, provide little protection against modern attacks by criminals or 'hacktivists'.

"In the shipping industry, we need to take inspiration from control system cyber security standards and regulations in other industries," says Ginter. The French ANSSI standards for critical infrastructure protection prohibit firewalls at the boundaries of the most important control system networks, permitting only unidirectional gateways. The North American NERC CIP standards provide relief from one third of the security regulations when unidirectional gateways are used instead of firewalls at large power plants. The ISA, IEC, NIST and many other standards all position unidirectional gateways as stronger than firewall protections for control system security programs.

"We have a window of opportunity now, to protect the control systems and navigation systems on our vessels, before we start suffering very serious losses," concludes Ginter. "Increased automation and connectivity brings increased opportunities and profits, but only if we address the risks."

The Economist
Snoopers and scrutiny
Thursday, 21 January 2016
Byline: Editorial Board

Editorial - Few balances are harder to strike than those involved in running a spy agency. After a terrorist attack, voters demand action and politicians respond by granting their spies greater powers to bug and snoop, as with America's Patriot Act in 2001 and the wide-ranging surveillance law passed after the attacks in France last year. Yet these very powers can, if abused, distort the political system, chill freedom of expression and tilt the scales of justice. When the full extent of clandestine activities come to light, as with Edward Snowden's revelations about America's National Security Agency, many feel queasy and demand that the spooks are reined in again.
So a lot is riding on Britain's attempt to update the law governing the domestic activities of its spy agencies. The draft bill will make explicit how the electronic-intelligence agency, GCHQ, may (with a warrant) plant bugs on computers and other devices, collect and analyse bulk information (such as mobile-phone activity and web-browsing records) and read private messages. Get the details right, and Britain can provide a model of how to balance security and freedom; get them wrong, and centuries of freedom might shrivel.

The bill's biggest success is its self-restraint. It does not require firms to weaken the encryption they sell to customers, as politicians in several countries, including Britain, would like. If people want security on

the internet, they have no alternative to strong encryption. The agencies have other means of collecting data, including bugging phones and computers.

The draft bill is also right to require companies to retain, at least for a time, data about mobile-phone and internet activity that may, subject to a warrant, be of use to future investigations. Intelligence agencies need to be able to look back at the history of a suspected terrorist's contacts and movements.

Elsewhere, however, the bill could be better. It rightly strengthens GCHQ's powers to pursue terrorists, gangsters and foreign spies. And it offers extra safeguards: new judicial commissioners will review warrants which, as now, will be issued by the home secretary. Politicians should have ultimate responsibility; if things go wrong, they carry the can. But the bill will work best if it is backed by a consensus. For that reason it needs to reassure those who fear that politicians may abuse their powers. Instead of holding their posts at the prime minister's behest, the commissioners should be appointed as judges are and their dismissal should require a vote in Parliament. To avoid "capture", they should serve a single fixed term.

In addition, the proposed system merely requires the commissioners to check that a warrant has been issued lawfully and reasonably--broadly the same standard applicable to judicial review of other government decisions. But the extra secrecy with which intelligence agencies operate means that is not enough. The commissioners need a reserve power to weigh warrants on their merits. Also missing is explicit protection for lawyers' communications with their clients.

Just as important as the nuts and bolts of the new law is its implementation. GCHQ's demands may be legal, but if they are too costly or intrusive, companies dealing with technology and data will simply move abroad. For all these reasons, other countries should watch Britain closely.

Wall Street Journal
NSA Chief Says U.S. at 'Tipping Point' on Cyberweapons
Thursday, 21 January 2016
Byline: Damian Paletta

Washington - The U.S. military has spent five years developing advanced cyberweapon and digital capabilities and is likely to deploy them more publicly soon, the head of the Pentagon's U.S. Cyber Command said Thursday.
Adm. Mike Rogers, who is also director of the National Security Agency, said U.S. policy makers have largely agreed on rules of engagement for when cyberweapons can be used for defense.

There is still an open discussion, however, about when cyberweapons should be used for "offense," such as carrying out attacks against a group or foreign country.

"You can tell we are at the tipping point now," Adm. Rogers said. "The capacity and the capability are starting to come online [and] really starting to pay off in some really tangible capabilities that you will start to see us apply in a broader and broader way."

Still, Adm. Rogers stopped short of specifying how exactly these cyberpowers could be deployed in coming months.

Despite a series of high-profile cyberattacks in the past two years, including a large-scale breach at Sony Pictures Entertainment Inc. in late 2014 and the theft of millions of records from the U.S. Office of Personnel Management in 2015, Adm. Rogers suggested many Americans have become complacent, since they don't see the rise of cyber armies and cybercriminals affecting their daily lives.

That could change fast, he said, if a cyberattack achieves large-scale destruction, particularly in a fashion resembling a more traditional weapon. Analysts have said these sorts of acts could including attacking a country's electrical grid or knocking a nation's financial system offline.

"I'm watching capability when I go, 'Wow, if the intent were to change, we'd have some real challenges here,' and intent can change really quickly," he said. "I would urge us not to draw the conclusion that there is nothing here we really need to worry about. I would argue it's going to get worse before it gets better."

Adm. Rogers, who has led the NSA and Cyber Command for two years, was brought in to stabilize the agency after a furor over the far-reaching surveillance program disclosed by former contractor Edward Snowden. The NSA has seen some of its powers clipped, most notably when Congress last year banned bulk collection of telephone records.

Adm. Rogers has said the agency needs to do more to restore public confidence, and he has been adamant that the government needs to develop specific rules about the emerging digital battlefield.

Following the OPM breach, which some U.S. officials attributed to Chinese hackers, many lawmakers have said the White House and Pentagon need to clarify rules of engagement and make them public. These could include specific punishments and retaliatory actions, as a way to deter future attacks.

Adm. Rogers said policy makers have been working to develop "the same kind of standards" for responding to cyberattacks that they use for other warfare.

The NSA director also said the agency will launch a reorganization this year to better mesh its two tasks--digital spying and data collection on the one hand and protecting information on the other.

"We have got to integrate much more," he said. "This traditional approach we had...built walls of granite between them."

The Intercept
NSA Chief Stakes Out Pro-Encryption Position, in Contrast to FBI
Thursday, 21 January 2016
Byline: Jenna McLaughlin

Washington - National Security Agency Director Adm. Mike Rogers said Thursday that "encryption is foundational to the future," and arguing about it is a waste of time.
Speaking to the Atlantic Council, a Washington, D.C., think tank, Rogers stressed that the cybersecurity battles the U.S. is destined to fight call for more widespread use of encryption, not less. "What you saw at OPM, you're going to see a whole lot more of," he said, referring to the massive hack of the Office of Personnel Management involving the personal data about 20 million people who have gotten background checks.

"So spending time arguing about 'hey, encryption is bad and we ought to do away with it' ... that's a waste of time to me," he said, shaking his head.

"So what we've got to ask ourselves is, with that foundation, what's the best way for us to deal with it? And how do we meet those very legitimate concerns from multiple perspectives?"

Other government officials -- most notably FBI Director James Comey -- have been crusading for a way that law enforcement can get access to encrypted data.

But technologists pretty much universally agree that creating some sort of special third-party access would weaken encryption to the point that it would threaten every internet transaction we make, from online banking to filling out our health records to emailing our friends and significant others. A hole in encryption for special FBI access would be a hole that criminals could sneak through, too.

While there's been a lot of talk about giving up some privacy for security, Rogers said both are paramount.

"Concerns about privacy have never been higher. Trying to get all those things right, to realize that -- it isn't about one or the other," he said. He does not think that "security is the imperative and that ought to drive everything." Nor should privacy, he continued. "We've got to meet these two imperatives. We've got some challenging times ahead of us, folks."

Comey, who formerly advocated for a way to get law enforcement access without weakening encryption, recently switched tactics. Now he is pressuring companies to change their business models and simply not offer true end-to-end encryption to their customers.

The White House has decided not to pursue legislation to outlaw unbreakable end-to-end encryption, following pressure from privacy advocates and scientists. But the intelligence community's top lawyer,

Bob Litt, privately advised the administration that a major terrorist attack could be an opportune moment to do so.

And the White House has not issued a statement in defense of encryption, to the frustration of Apple CEO Tim Cook, among others.

Meanwhile, Sens. Richard Burr, R-N.C., and Dianne Feinstein, D- Calif., are reportedly planning their own proposed legislation to require law enforcement access.

Rogers' comments could indicate a split on this issue between the intelligence community and domestic law enforcement.

The previous NSA director, Michael Hayden, said in January that he thinks Comey is on the wrong side of this debate. "I disagree with Jim Comey. I actually think end-to-end encryption is good for America," he said.

Hayden has also spoken about how U.S. intelligence agencies have figured out how to get the information they need without weakening encryption -- such as using metadata, which shows who is contacting whom. Another former NSA boss, Mike McConnell, has also spoken out against trying to install backdoors in encryption.

Left unsaid is the fact that the FBI and NSA have the ability to circumvent encryption and get to the content too -- by hacking. Hacking allows law enforcement to plant malicious code on someone's computer in order to gain access to the photos, messages, and text before they were ever encrypted in the first place, and after they've been decrypted. The NSA has an entire team of advanced hackers, possibly as many as 600, camped out at Fort Meade.

Get smarter about foreign intelligence
Wednesday, 27 January 2016
Byline: Alistair Hensler

Re: Canada is increasing its intelligence efforts, Jan. 20.
In his opinion piece, Wesley Wark has proposed various ways that Canada could increase its intelligence efforts to support our allies in the fight against ISIL. In so doing, Wark has identified the numerous disparate government departments and agencies that are engaged in collecting foreign intelligence.

Therein lies the principal problem with Canada's foreign intelligence efforts: there is no central organization to manage and correlate the government's foreign intelligence operations. Canada is the only G7 country without a centralized foreign intelligence collection capability. If the government is serious about becoming a "smart power," as Wark states, it must address this deficiency. The task is onerous but not impossible. The first step is to define foreign intelligence and identify all those government resources, financial and personnel, currently engaged in analyses, collation and distribution. There will be surprises. For example, Foreign Affairs, which has historically blocked the creation of a centralized foreign intelligence capability, maintains resources for that purpose; others include Canadian Security Intelligence Service and National Defence.

The second step is to transfer those resources into a new centralized agency which would have the Communications Security Establishment, the primary foreign intelligence collector, as its cornerstone. This new agency would become the sole collector of foreign intelligence on behalf of the government. Having one agency has the added benefit of facilitating government oversight of foreign intelligence operations, which does not occur under the current diverse organizational structure.

The time is right for a major shift in the Canadian foreign intelligence community so we can contribute in a meaningful way to the fight against ISIL and other terrorist organizations.

Five things to take away from government's National Defence performance report
Wednesday, 27 January 2016
Byline: Staff reporter

OTTAWA _ The federal government released departmental performance reports this week, including one for National Defence, which spent $18.4 billion in the budget year that ended last March. Here are five interesting and unusual facts from the annual disclosure tabled in Parliament.

_ The House of Commons voted to appropriate $20.4 billion for the military, but as in past years, a substantial amount _ $1.9 billion _ was not spent. Of that, $1.3 billion was for purchases of new planes, ships and vehicles that had been budgeted but was either unavailable _ or delayed by the former Conservative government _ until future years. Not all of the surplus funds have to go back to the federal treasury.

_ A significant number of full- time military members were unable to be deployed on operations _ both at home and abroad _ because of dental issues. The report says 5.4 per cent of those deemed ineligible required ongoing dental care, while 15.4 per cent did not show up for their annual dental fitness exams. National Defence says it will have to proactively remind personnel of their obligations.

_ A lot of public attention is paid to the Canadian Security Intelligence Service spy agency (CSIS) and the Communications Security Establishment (CSE), Canada's electronic spy agency, but not many people realize the Canadian military maintains a large defence intelligence system. Last year, it produced more than 5,000 reports, which it shared not only with the top brass but with government departments. The branch also spent $202.4 million in hopes of providing "credible, timely, and integrated analysis of defence intelligence issues."

_ The army may have service problems with its trucks, but the Royal Canadian Air Force managed an overall fleet serviceability rate of 93 per cent for its jets, fixed-wing planes and helicopters. That's despite having some aircraft that are more than 50 years old. The department report notes, however, that spare parts "remain a concern for certain fleets," and they've only be able to maintain serviceability rates by robbing "parts from other aircraft, which increases maintenance requirements."

_ National Defence spent $113 million less than expected on international combat operations last year. It's not because the air force was being stingy with the bombs. Rather, the former Conservative government built the cost of winding down the bombing campaign against the Islamic State of Iraq and the Levant into its budget projections. National Defence says the incremental cost of the war against ISIL _ the cost over and above buying and maintaining the military equipment _ was $70 million between April 2014 and March 2015.

Globe and Mail
U.S. takeover of network carrying sensitive federal data raises security concerns
Wednesday, 27 January 2016
Byline: Steven Chase

A U.S. takeover of a national fibre optic network in Canada that carries sensitive federal government telecommunications traffic is raising security concerns that the United States will find it easier to gain access to confidential Canadian data.
In a transaction that closed this month, Manitoba Telecom Services Inc.'s Allstream unit has been bought by U.S.- based Zayo Group.

Allstream, with its coast-to-coast Internet backbone network, is under contract to carry data for 43 Canadian departments and agencies, including the Department of National Defence, the RCMP and Canada Revenue Agency.

In 2013, the Harper government blocked a deal to sell Allstream to Egypt's Accelero Capital Holdings on the grounds of national security. Ottawa said it kept Allstream out of foreign hands because it "provides critical telecommunications services to businesses and governments, including the government of Canada."

Manitoba Telecom and Zayo announced the deal in November, and the Trudeau government declined to conduct an official national security review.

"The 45-day period during which the government could raise national security concerns has passed," said Stéfanie Power, a spokeswoman for the Department of Innovation, Science and Economic Development, which screens foreign takeovers through its investment review division.

Critics say the net result of the deal is that a foreign entity now owns and controls a network carrying extremely confidential Internet traffic for Ottawa. No other major domestic network supplier to the federal government is foreign owned and controlled.

The Allstream takeover was announced weeks after Prime Minister Justin Trudeau took office. The period for review by Ottawa ended in early January.

Michael Geist, an expert in Internet law at the University of Ottawa, says U.S. ownership of a Canadian Internet backbone makes it easier for Washington to obtain access to the data it carries, either through the courts or covertly.

"Any time you have a U.S.based entity that owns a Canadian network, it increases the risk that U.S. authorities will have easier access to the information that runs on that network," Prof. Geist said.

Legislation such as the U.S. Patriot Act gives the United States power to compel a U.S. company to produce information, including communication possessed by a foreign subsidiary.

"It's not limited to the U.S Patriot Act. U.S. authorities have a number of legal mechanisms that allow them to try to gain access and [this] is unquestionably made easier when the entity that they are dealing with is U.S. based," Prof. Geist said.

Manitoba Telecom's chief corporate and strategy officer, Paul Beauregard, said his company worked long and hard to provide sufficient information to satisfy the government that "Zayo would be an appropriate purchaser from a security perspective."

Innovation Minister Navdeep Bains defended Ottawa's conduct in this case, saying every foreign investment is "subject to a due diligence process."

He declined to explain why the Liberals decided against a formal national security review, saying these are ordered only when the government feels "investment could be injurious to national security."

Washington has made it clear it considers data held by U.S. companies abroad part of its purview.

Microsoft is appealing an order by a U.S. court in 2014 to turn over e-mails on company servers in Ireland. Last fall, U.S. government lawyer Justin Anderson told Reuters News that U.S. law enforcement believes it can obtain electronic information held by U.S. companies with a valid warrant, regardless of where the data are stored. "It's not a question of ownership," Mr. Anderson said, likening it to seizing account records from a bank. "It's about custody and control."

Conservative foreign affairs critic Tony Clement slammed the Liberals for skipping a national security review and said he wants to know what protections Canada has obliged Zayo to enact to prevent interception of crucial data.

"The Trudeau cabinet declined to do even the very least to examine whether Canada's national interests are being affected by this transaction. This is a very bad precedent," he said. "Canadians deserve to know what safeguards the government of Canada is putting into place to ensure the protection of sensitive and proprietary information."

An executive with Zayo Group said the company also provides telecommunication and data services elsewhere outside the United States, including for customers in northern Europe.

"They all take their data security very seriously ... so we are used to operating in that environment," said Dave Jones, executive vice-president of security and IT. "Security is very important to Zayo."

Asked to gauge the risk that the U.S. government could demand access to data on Zayo's new Canadian network, Mr. Jones said "it's not something we can comment on specifically."

Ray Boisvert, a former assistant director of intelligence at the Canadian Security Intelligence Service, said Ottawa appears to be betting a major ally will not take advantage.

"Generally speaking, friends don't spy on friends," Mr. Boisvert said.

Andrew Clement, a professor in University of Toronto's faculty of information, said spying revelations from whistleblower Edward Snowden should breed skepticism among Canadian decision-makers about what kind of surveillance spying the United States might undertake. "A significant part of the Canadian Internet backbone has just transferred to U.S. ownership.

This is critical infrastructure from a Canadian sovereignty point of view," Prof. Clement said.

The Courier-Mail
Social media deal to cut terror hype
Wednesday, 27 January 2016
Byline: Staff reporter

Federal Government agencies are expanding their ties with Facebook, Google and Twitter in a bid to stop terrorist propaganda infiltrating Australian youths.
The Government is also continuing to review programs that provide teachers with information to spot teens who are at risk of being radicalised.

Multiple school-aged children are undergoing government deradicalisation programs after they were found to be considering going to the Middle East as jihadists.

The preventive measures, launched by former prime minister Tony Abbott and continued under Malcolm Turnbull, are now a critical part of Australia's national security policy.

The Courier-Mail understands that government min-isters and agency heads have held multiple meetings with the -online media giants, which are deactivating profiles and accounts that spread propaganda.

Counter-Terrorism Minister Michael Keenan confirmed the Government was in regular contact with the giants."We work with social media companies, including Google, Twitter and Facebook, and with operational agencies to tear down violent extremist material," he said.

The Australian
Terror documents 'on teen's phone'
Wednesday, 27 January 2016
Byline: Mark Schliebs

Sameh Bayda last used the -encrypted messaging service Telegram at 5.12am on Wednesday, January 13. A few hours later, counter--terrorism police raided his house.
Seizing the teenager's phone, which he had used to access that encrypted app, they found three documents allegedly containing written instructions, including from terrorist group al-Qa'ida, "connected with the preparation for a terrorist act".

One of these, written in Arabic, provided "instruction on how to carry out a successful stabbing attack", a court was told yesterday. Another, also in Arabic, -detailed "how to make an improvised explosive device".

The 18-year-old former Granville Boys High School student faces the prospect of up to 15 years in prison.

Mr Bayda's neighbours in Guildford in western Sydney said they feared the damage he might have done to himself and his "beautiful" family.

While Mr Bayda's use of -Telegram did not spark the police raid -- investigators had become increasingly concerned about his activities over recent weeks -- sources said it marked a shift in the tactics alleged extremists used.

Communications sent using encrypted services such as Telegram cannot easily be read by police.

The company's website says it is more secure than its "mass--market" competitors, using "end-to-end encryption (that) leave no trace on our servers, support self-destructing messages and don't allow forwarding".

Two days after Mr Bayda's brick duplex house was raided, Telegram founder Pavel Durov tweeted that his company was -removing up to 10 accounts linked to Islamic State every day.

At this point, it is not clear what the documents on Mr Bayda's phone contained, although the authorities say such material is being widely circulated between -extremists online.

What court documents tendered yesterday describe as "a PDF document in English published by the proscribed terrorist organisation al-Qa'ida in the Arabian Peninsula" is thought to be a copy of the group's online propaganda magazine Inspire.

At least one senior Islamic State member, Junaid Hussain, who is also known to have used Telegram, last year sent out -instructions on how to build -improvised explosives similar to those used in the 2013 Boston Marathon attack.

Hussain was reportedly killed in a drone strike in Raqqa in Syria in August. On the evidence before the court, the case against Mr Bayda rests largely on the material found on his mobile phone. Police do not allege he was planning a specific attack, but have charged him with "knowingly collect/make documents connected with terrorism".

Court documents say he was "reckless" as to the connection of the images in the documents to terrorism.

He is not thought to be directly connected to any known extremist group in Sydney, although the links between these individuals can often be indirect or unclear. Despite this, the police were worried.

Neighbours said the house had been visited by detectives last year, around the time of a co-ordinated series of counter-terrorism raids across the city codenamed Operation Appleby.

During the January 13 raid, Mr Bayda was served with a firearms prohibition order, allowing police to search him and his home without first obtaining a court warrant.

Then, on Monday afternoon, the 18-year-old was arrested. Taken into custody just before 3pm, he was refused bail.

He declined to appear in court yesterday and is due to face court again next week.

A photograph of Mr Bayda, one of four children, posted online shows a bearded, soft-faced teenager wearing fluorescent work gear. In October, he registered himself as the sole director of Westside Painting and Decorating Pty, and began advertising himself online as a "licensed and insured painter" with "over five years of experience".

Although he deleted his Facebook account last year, a YouTube channel established in the name of "Sameh Bayda" includes tributes to Osama bin Laden and a Kuwaiti suicide bomber who targeted -Syrian troops and Hezbollah members in Syria last year.

Two weeks ago, the same YouTube channel shared a video featuring Islamic preacher Junaid Thorne. "Look right, left and centre, what do you see? All you see is our ummah (community) suffering from multiple and several wounds to its body," Mr Thorne says in the film.

Appealing to Muslim youth, Mr Thorne says: "If you don't get up and make a change to better the situation of our ummah, nothing will change." No one answered the door at Mr Bayda's Guildford duplex yesterday, although one neighbour, Arthur Solo, described the family as "one of the most beautiful" he had met.

"From what I've seen of the boy, it's all just bravado," Mr Solo said. "The boy must realise the gravity of it. That's what I fear, the disservice he's done to himself, his family and the other Middle Eastern people around here."

London Times
Russian hoaxers behind bomb threats to pupils
Wednesday, 27 January 2016
Byline: Nicola Woolcock

London - A Russian group using Twitter has reportedly claimed responsibility for a series of bomb hoaxes that led to thousands of children being evacuated from schools in Britain and France yesterday.

Schools in London, the West Midlands, Cornwall and Paris were targeted but it is not known if the incidents were linked. Three of the six schools evacuated in the Midlands had suffered similar hoaxes last week.

Police said that there was no credible threat behind the calls, but they caused widespread disruption. The Russian group is said to have invited pupils to get in touch if they wanted to "get out of school".

The account, Evacuators 2K16, has since been deleted but has been blamed for instigating another bomb hoax in America.

The profile for @Ev4cuati0nSquad, which has been suspended, apparently said: "We are six individuals based internationally. For bomb threat requests please email us."

The group reportedly said it hated authority and loved to cause mayhem, according to the Daily Mail. It said people could send in requests for their school, work or business to be sent a bomb threat, and asked for payments in Bitcoin, the virtual payment.

Prices varied from $5 for a school to $50 for a major sports event.

An American news website said that the group was responsible for string of bomb threats at a police station, supermarket, hospital and shop yesterday, a week after similar pre-recorded threats at schools. They were all in the small town of Weymouth in Massachusetts.

Four schools were targeted in London, according to the Metropolitan police, in separate threats made yesterday morning. They all claimed that a suspicious device had been left at the premises, and pupils were evacuated. The calls are being treated as malicious communications by detectives.

West Midlands police said the calls were made in quick succession at about 9am to four schools in Sandwell, one in Dudley and one in south Birmingham.

It comes after similar phone threats to four schools in the Black Country last week after which hundreds of pupils were evacuated before police confirmed that the calls were hoaxes. Six schools in central Paris were evacuated yesterday after they received anonymous calls that bombs had been hidden in the buildings, police and the school authorities said.

Gulf Times
Kaspersky warns of regional threat from cyber criminals and terrorists
Wednesday, 27 January 2016
Byline: Dean Carroll

Undisclosed placeline - The Russian, who claimed his mission was to "save the world" from cyber criminals and terrorists, has warned the region's leaders to take the threat very seriously in the run up to major events such as Expo 2020 in Dubai and the 2022 football world cup in Qatar. Speaking exclusively to Gulf Business, Kaspersky Labs chief executive officer Eugene Kaspersky claimed that malware was becoming evermore sophisticated as traditional crime gangs and terrorists started to employ hackers.
"There are both global threats and regional threats," he said. "Globally, it is really about energy in the form of power plants and grids. If there is no power, then nothing else works in whatever country you are in - it's a problem for any nation. Then of course, you have major critical areas that could be attacked such as financial services and transportation.

"In this region, there is a dependence on the oil and gas sector. You also produce aluminium here through local systems and there are desalination plants to provide fresh water. Attacks on these systems would be very painful for the economy and damaging for national security."

Asked to describe the worst-case scenario in terms of potential attacks on critical infrastructure, he insisted that there had already been major incidents that could almost be classied as cyber-terrorism or cyber-war. The attack on Saudi Aramco "being an example". Kaspersky said: "For two weeks, the company was paralyzed.

"We are very vulnerable. We depend on technology; you cannot now get back to the time when humans were solely responsible for managing everything. Computers are faster than us humans and they consume less power. They don't sleep, they have no vacations and no holidays - and they are less expensive.

"The computers made the world faster and better but at the same time they are vulnerable. We fixed many of the old problems through computers but now we have a new set of problems. The worst-case scenario is if the bad guys attack these vulnerabilities or there are mistakes leading to serious problems with our critical infrastructure."

Touching upon the need to regulate the digital world in order to better control the threat from rogue actors, the CEO said total freedom on the internet was "dangerous".

Haaretz
Islamic Terrorists Increasingly Embracing Cyberwarfare
Wednesday, 27 January 2016
Byline: Danna Harman

Jerusalem - The forces of militant Islam today may be medieval in their philosophies, Prime Minister Benjamin Netanyahu warned Tuesday - but they are increasingly modern in their methods.

"These militants are using the technologies that we use," he said, addressing the crowd of international cyber technology experts gathered at the Tel Aviv Trade Fair and Convention Center for the Cybertech 2016 conference.

The two-day annual event drew some 3,000 participants, organizers say, including representatives of leading multinational and Israeli corporations and startups, investors and entrepreneurs from the various fields of cybersecurity, as well as government and military officials from around the world. Among those present were U.S. Deputy Secretary of Homeland Security Alejandro Mayorkas and Colonel Andre Lourenco Eiras, head of Brazil's Cyber Defense Program, who is charged with cyber protection for the upcoming Olympics in that country.

"We are facing... a force that challenges modernity, and that force is a savage... primitive medievalism that seeks to take our world back to the dark ages of humanity, over a thousand years ago," said Netanyahu.

"This is one of those few times in history in which the forces that seem to take humanity back are using some of the forces that take humanity forward. And this presents a greater challenge to us," continued the prime minister, echoing a similar warning he made last week at the World Economic Forum in Davos.

Netanyahu boasted that Israel was on the forefront of that fight, as one of the top five major cyber powers in the world, and accounting for about 10 percent of global sales in the cyber- security business. But, still, he admitted, in the cyber war against the "the forces of medievalism," Israel could not stand alone. "There is a critical need for like-minded governments to have serious discussions about cooperation in the broader international realm," he said.

This theme of cooperation was repeated during sessions on the first day of the conference: "In cybersecurity there are no borders," stressed Zionist Union MK Erel Margalit, who heads Israel's Cyber-Security Lobby in the Knesset. "If you want to be secure and open and private, you need to cooperate," he reiterated, chairing a panel discussion on the need for a task force "among friends."

On the question of what such cooperation might look like, Netanyahu, and others, were less detailed: "I do not seek to have a universal code, because it will work for cyber peacekeeping just like the UN works for international peacekeeping - it doesn't," said Netanyahu.

"What we need is a meeting of international leaders to discuss what could be done among countries that want to maintain freedom and safety in their societies," said Netanyahu, suggesting the establishment of "international standards" to increase cybersecurity. "This is something that has yet to be done, but I've been speaking about this with world leaders," he said.

Gustav Lindstorm, head of the emerging security challenges program at the Geneva Center for Security Policy, added that it was quite clear to all that the only way to fight cyber threats - be they in arenas of finance, national defense or any other - was for countries to cooperate.

"The multi- stakeholder model is indispensable," he stressed, speaking on a panel about international cooperation and shared responsibility. "Cybersecurity cannot be achieved by a single stakeholder, structure or organization. There is simply no way."

Speaking after Netanyahu at the opening plenary session, Gil Shwed, the founder and CEO of Check Point Software Technologies, said that while advances in cybersecurity have been great, cyber threats are growing at an even more alarming rate.

"We tend to think about cybersecurity threats in the way we think of conventional threats. But it's different," he said, explaining that in cyberspace it's often unclear who are the enemies, what their motives are or what weapons they have in their arsenals. If, said Shwed, in conventional warfare, one could rely on intelligence, deterrence and retaliation - in cyberspace, these were both harder to get right, and also not enough. "By the time the malware is inside - damage is already done," he said. "We need to be one more step ahead."

Washington Free Beacon
Chinese Military Revamps Cyber Warfare, Intelligence Forces
Wednesday, 27 January 2016
Byline: Bill Gertz

Washington - A recent Chinese military reorganization is increasing the danger posed by People's Liberation Army cyber warfare and intelligence units that recently were consolidated into a new Strategic Support Force.
The announcement of the military reorganization made on Dec. 31 by the Chinese government provided few details of what has changed for three military intelligence units formerly under the now-defunct General Staff Department.

However, U.S. officials and China analysts say the major cyber warfare and intelligence-gathering groups were elevated into the new Strategic Support Force, a military service-level force equal in standing to China's army, navy, air force and missile services.

They include the 3rd Department, or 3PLA, that is believed to have as many as 100,000 cyber warfare hackers and signals intelligence troops under its control. The group includes highly-trained personnel who specialize in network attacks, information technology, code-breaking, and foreign languages.

Five members of a 3PLA hacking group were indicted by the Justice Department for commercial cyber attacks against American companies in 2014.

The 4th Department, China's separate military electronic intelligence and electronic warfare service, is also part of the new support force. Additionally, the traditional military spy service devoted to human spying known as 2PLA was combined into the new support force.

"From a strategic perspective, the PLA will now be able to move forward with the concept of integrated network electronic warfare and better manage the use of satellites for [intelligence, surveillance, and reconnaissance]," said former military intelligence officer Larry Wortzel.

James Lewis, a cyber specialist with the Center for Strategic and International Studies, said the new force will enhance the capacity of the PLA.

"They have a ways to go, but this is their effort to compete with the U.S. in the information domain," Lewis said. "It fits with their improved [anti-satellite] and cyber attack capabilities."

The 3PLA was identified by the National Security Agency as one of China's most aggressive cyber spying agencies.

Classified documents made public last year revealed that the NSA estimates 3PLA hackers conducted more than 30,000 cyber attacks aimed at gathering defense industrial secrets. More than 500 of the cyber attacks were gauged to involve "significant intrusions" of defense networks.

Compromises included the theft of secrets regarding the F-35 and F-22 jets, the B-2 bomber, and space-based laser systems.

The NSA learned details of the operations by conducting its own cyber penetration in 2009 of a network connected to 3PLA computers.

Adm. Mike Rogers, commander of the U.S. Cyber Command, said large-scale hacking has numbed many Americans to a threat that is growing.

"If you look at the trends, if you look at the activity, for example, that we see within critical infrastructure in the United States, power and other things, you see nation states, individuals, and actors within those systems," Rogers said last week.

"To date we have not seen on any significant scale a desire to take that access and employ it as a way to bring the system down," he said.

"But what happens when that changes? Because as military, I've always thought about threat as a combination of capability and intent. I'm watching capability where I go, wow. If the intent were to change we have some real challenges here. And intent can change very quickly."

Chinese military expert Yin Zhuo told the state-run People's Daily newspaper that foreign forces continue to conduct cyber attacks on Chinese government, military and civilian facilities and the new Strategic Support Force will focus on the threat.

"It is imperative that we possess a corresponding defense force," he said. "The Strategic Support Force will play an important role in safeguarding our nation's financial security and protecting our people's safety in daily lives."

The overall functions of the Strategic Support Force are targeting detection and reconnaissance, satellite and space operations, electronic warfare and cyber warfare. "All these are new domains that will determine whether our military can win victories on future battlefields," Yin said.

The force will be integrated within other military groups and will provide "potent battlefield support for joint operation actions of multiple services and arms so as to achieve the goal of winning local wars under informatized conditions," Yin said.

U.S. intelligence officials disclosed to the Washington Free Beacon last year that China has sharply increased funding for cyber warfare capabilities.

The funding increase--an estimated 30 percent more devoted to cyber warfare and cyber spying--follows Beijing's assessments that its capabilities lag behind those of the United States.

The buildup of cyber warfare capabilities was described by officials as a long term, strategic buildup of digital warfare capabilities.

By contrast with China, the U.S. Cyber Command currently has around 6,000 people engaged in both cyber defense and cyber attack preparations. The NSA, which conducts the bulk of cyber intelligence-gathering, employs a force of at least 40,000 people.

Wortzel, the former military intelligence officer, said the new force combines the electronic warfare and countermeasures capabilities of 4PLA with the signals intelligence capabilities of 3PLA, along with control of satellites and space-based intelligence, surveillance, and reconnaissance.

The cyber warfare, collection and defense responsibilities had been divided between 3PLA and 4PLA. "Now they apparently will be consolidated in the Strategic Support Force," Wortzel said, noting that the civilian Ministry of State Security will probably keep its separate cyber and intelligence gathering capabilities.

Lewis, the CSIS cyber expert, said the PLA reorganization is "probably good news on the cyber espionage front."

"It gives Xi the control to tamp down PLA spying--he seems to want to do this after calculating that the gain now isn't worth the friction," Lewis said. "But it's bad news for warfighting as they are reorganizing with one opponent in mind."

In September, Chinese leader Xi Jinping announced that China's military needed "a new strategy for information warfare amid a global military revolution."

The 3PLA headquarters is located in Beijing's Haidian district and its branch offices are located in Shanghai, Qingdao, Sanya, Chengdu, and Guangzhou. The Shanghai office is said to be focused exclusively on targeting the United States.

The five PLA hackers indicted by the Justice Department, who remain wanted by the FBI, were part of a 3PLA agency called Unit 61398, which has been identified as a major cyber attack unit behind the theft of large amounts of U.S. government and private sector data, ranging from secrets related to the F-35 jet to corporate secrets about nuclear power generation.

Peter Mattis, a China analyst with the Jamestown Foundation, said the new military reorganization is the most significant change since the PLA was reorganized in the 1950s and likely will integrate the resources of the 2PLA, 3PLA and 4PLA into various regional and functional military headquarters.

"Although no specific announcements have thus far been made about the intelligence apparatus, it seems unreasonable to think the PLA's intelligence system will go untouched," Mattis stated in an article published in War on the Rocks.

China's most senior intelligence officer in the past has been the deputy chief of the General Staff Department, who played a key role in the ruling Communist Party decision-making on domestic and foreign affairs. That position will likely now be taken by the chief of the Strategic Support Force. China has not identified the new leader.

China's government relies heavily on the use of strategic intelligence, based on the precepts of the ancient strategist Sun Tzu who said the acme of skill was defeating your enemy without shooting.

"The biggest question about the reorganization of intelligence is how the PLA will do within the intelligence apparatus to increase jointness--one of the stated goals of the reforms," Mattis stated.

"Plenty of evidence suggests the Chinese military wants intelligence more connected to operational decision-making."

Times of Israel
Israel's Electric Authority hit by 'severe' cyber-attack
Wednesday, 27 January 2016

Byline: Tamar Pileggi

Jerusalem - Israel's Electric Authority is currently being targeted by a "severe cyber-attack," Energy Minister Yuval Steinitz said Tuesday, adding that steps are being taken to counter the assault. Addressing the Cybertech Conference in Tel Aviv, Steinitz said the attack was discovered on Monday, and that his ministry was "already handling it," along with the Israel National Cyber Bureau.

"The virus was already identified and the right software was already prepared to neutralize it," he said. "We had to paralyze many of the computers of the Israeli Electricity Authority. We are handling the situation and I hope that soon, this very serious event will be over ... but as of now, computer systems are still not working as they should."

"This is a fresh example of the sensitivity of infrastructure to cyberattacks, and the importance of preparing ourselves in order to defend ourselves against such attacks," he said. Steinitz did not say whether Israel has identified any suspects behind the attack.

The Electricity Authority is a department in the Ministry of Energy, and is a separate entity to the Israel Electric Corporation, the country's state-owned utility company.

In mid-July, the Israel's National Cyber Authority warned that the country would be targeted by a massive cyberattack.

Government ministries and security agencies were alerted to look for any changes in their computer systems, and security officials were instructed to prepare for "any possible scenario," the Israeli daily Haaretz reported.

The warning went into effect immediately and included computer systems and cellular phones, according to the report.

Over the last two years, Israel has been targeted by a number of cyberattacks. Officials estimated hackers affiliated with Hezbollah and the Iranian government were behind the infiltration attempts.

In April, members of the Anonymous hacking group defaced dozens of Israeli websites in what it warned would be an "electronic holocaust." Dubbed OpIsrael, the anti-Israel hackers targeted websites of the Israeli government and organizations, Facebook pages and gained access to personal emails. The annual attacks have thus far not caused disruption of Internet services in Israel, and failed to bring down any major governmental websites.

In response, Israel has invested resources to streamline its offensive and defensive cyber capabilities, and announced last month the establishment of a new IDF corps responsible for all such cyber activity.

Israel has also become a center of cybersecurity research and development, with multinationals from the US, Europe and Asia setting up R&D labs to develop better and more effective cyberdefense strategies and technologies.

Israeli cybersecurity firms are said to export $3 billion in knowledge, services and solutions each year, developing many of the technologies the world will need in the coming years to protect banks, infrastructure and government servers.

Jerusalem Post
Israel's electrical grid attacked in massive cyber attack (Canada).
Wednesday, 27 January 2016

Jerusalem - As Israelis cranked up their heaters during the current cold snap, the Public Utility Authority was attacked by one of the largest cyber assaults that the country has experienced, Minister of Infrastructure, Energy and Water Yuval Steinitz said on Tuesday.
"Yesterday we identified one of the largest cyber attacks that we have experienced," Steinitz said at the CyberTech 2016 conference at the Tel Aviv Trade Fair and Convention Center.

Steinitz said that attack was dealt with by his ministry and the National Cyber Bureau and that it was under control.

The incident occurred during two consecutive days of record-breaking winter electricity consumption, with the Israel Electric Corporation reporting a demand of 12,610 megawatts on Tuesday evening as temperatures dipped to below-freezing levels.

"I can tell you that the virus was identified and software was activated to neutralize it," Steinitz said. "This is a fresh example of what we need to be prepared to face at any time," he added.

Hundreds of international delegations were attending the CyberTech 2016 Conference. The third annual event drew state leaders, representatives of leading multinational and Israeli corporations and startups, investors and entrepreneurs in the field of cyber security.

A US delegation led by Homeland Security Deputy Secretary Alejandro Mayorkas, a large Japanese representation, a group of Canadian banking executives and a delegation organized by the International Monetary Fund from developing countries were among those expected to attend what is referred to as the largest exhibition of cyber technologies outside the United States.

Fox News
FBI going 'right to the source' in Clinton email probe, interviewing intel agencies
Tuesday, 26 January 2016

Byline: Catherine Herridge, Pamela Browne

Washington - The FBI is going straight to the source in its investigation of classified emails that crossed Hillary Clinton's personal server, speaking with the intelligence agencies - and in some cases, the individuals - that generated the information, two intelligence sources familiar with the probe told Fox News.

Investigators are meeting with the agencies and individuals to determine the classification level in the emails. The step speaks to the diligence with which the bureau is handling the investigation, despite the former secretary of state's claims that the matter boils down to a mere interagency dispute.

"This is not merely a difference of opinion between the State Department and the Department of Justice," one intelligence source, who is not authorized to speak on the record, told Fox News, referring to comments on the Sunday talk shows and by the Clinton campaign downplaying the FBI's investigation. "The bureau will go directly to depose specific individuals in agencies who generated the highly classified materials."

The source added, "At the end of the day it will be a paper case. Emails never disappear because computers never forget."

A former senior FBI intelligence officer, while not directly involved in the Clinton email investigation, previously told Fox News it was standard practice for the bureau to go directly to the originating source because it is cleaner and maintains the integrity of the investigation.

"You want to go right to the source," Timothy Gill Sr., a former senior FBI intelligence officer, said. "Investigative protocol would demand that."

Fox News first reported that intelligence beyond "Top Secret" known as "SAP," or "Special Access Programs," was identified in the Clinton emails on her unsecured private server. Access to SAP is restricted to only those with a "need to know" because exposure of the intelligence would likely reveal a human asset or method of collection. The findings were shared with the Senate Intelligence and Foreign Affairs committees in a Jan. 14 letter from the intelligence community inspector general.

Fox News also confirmed that at least one email contained intelligence from human spying, known as "HCS-0," which is code for highly sensitive human intelligence operations.

The FBI investigation is centered around Clinton and members of her staff to determine if they deliberatively trafficked and shared information from highly classified sources onto an unsecure private email system.

"The bureau does not waive its primacy in espionage cases," the intelligence source said, referring to USC 18 793 and 794. "The security investigation is now part and parcel with the criminal [public

corruption] investigation." The source said both tracks are being pursued "vigorously" and there is a sense of "incredulity as to what is being discovered."

Violations of US 18 Section 793 fall under "gross mishandling" of national defense information. Potential violations under Section 794, "gathering or delivering defense information to aid" a foreign government, are more serious and challenging to prove.

Howard Krongard, former inspector general of the State Department, told Fox News, "I continue to believe the question of how [and from whom] material actually got from the classified network to Hillary Clinton's server is the key to the puzzle."

It is not possible to "cut and paste" from a classified network to an unclassified system, like Clinton's personal email account, to perform what is known in intelligence circles as "jumping the gap."

Paul Sperry, a media fellow at the Hoover Institution, reported Saturday in the New York Post that Clinton and her top aides "had access to a Pentagon-run classified network that goes up to the Secret level as well as a separate system used for Top Secret communications."

Former intelligence and law enforcement officers say one of the most likely scenarios is that an individual who had access to classified information summarized it in their own words or provided details during exchanges via email, which is a criminal violation and goes against non-disclosure agreements.

"The spillage could occur by somebody basically ignoring those guidelines it would have to be that way. There's no possible way she could transfer media off of an SCI high system ... onto an unclassified server," said Dan Maguire, a special operations veteran who spent 46 years handling highly classified information and being deeply engaged on special access programs.

"I think it reflects, probably two things -- perhaps an ignorance on the part of the individuals involved who've been doing this who are trying to please their boss and don't recognize the sensitivity and how that impacts on national security, and then an element of arrogance to even think or consider that you would pass information on an unclassified file server," Maguire said.

A review of the Clinton emails has found at least 1,340 containing classified information. A State Department challenge to two emails, classified at the "Top Secret" level failed, as Fox News first reported in December. The agency that gets the information in effect owns the information, and has final say over its classification.

In its most recent statement on classified information found on Clinton's server, the Clinton campaign described the issue as an "interagency dispute."

Spokesman Brian Fallon said, "It does not change the fact that these emails were not classified at the time they were sent or received. It is alarming that the intelligence community IG, working with

Republicans in Congress, continues to selectively leak materials in order to resurface the same allegations and try to hurt Hillary Clinton's presidential campaign. The Justice Department's inquiry should be allowed to proceed without any further interference."

Wall Street Journal
The Data Breach You Haven't Heard About
Wednesday, 27 January 2016
Byline: Rep. Will Hurd
Section: oped

Op-ed - A security breach recently discovered at software developer Juniper Networks has U.S. officials worried that foreign hackers have been reading the encrypted communications of U.S. government agencies for the past three years. Yet compared with the uproar over the Office of Personnel Management breach, first disclosed last June, this recent breach has gone largely unnoticed.
On Dec. 17 the California-based Juniper Networks announced that an unauthorized backdoor had been placed in its ScreenOS software, and a breach was possible since 2013. This allowed an outside actor to monitor network traffic, potentially decrypt information, and even take control of firewalls. Days later the company provided its clients -- which include various U.S. intelligence entities -- with an "emergency security patch" to close the backdoor.

The federal government has yet to determine which agencies are using the affected software or if any agencies have used the patch to close the backdoor. Without a complete inventory of compromised systems, lawmakers are unable to determine what adversaries stole or could have stolen.

If government systems have yet to be fixed then adversaries could still be stealing sensitive information crucial to national security. The Department of Homeland Security is furiously working to determine the extent to which the federal government used ScreenOS. But Congress still doesn't know the basic details of the breach.

Yet this vital information should not be difficult to obtain. After all, U.S. banks that use this software for encryption were forced to share the extent of their use to the Securities and Exchange Commission only hours after the compromise was disclosed. It is government agencies that are dragging their feet.

This is why I and my colleagues on the House Committee on Oversight and Government Reform recently wrote a letter to the heads of 24 federal agencies demanding an inventory of their systems running the affected software, and whether or not they have installed the patch. If they fail to respond they will be called before Congress to explain why they couldn't produce this basic information -- even though the 2002 Federal Information Security Management Act requires government bodies to monitor and protect the data they possess.

Once we learn which agencies were using the faulty software, finish patching all the systems and conduct a damage assessment, we need to examine why this older version of ScreenOS, last updated in 2011, was being used in the first place. This product is considered a legacy system that many users have replaced with better technology, yet the U.S. government hadn't bothered to update to a newer, more-secure system.

Sadly, this isn't surprising. Last year, according to the U.S. Government Accountability Office, the federal government spent over $80 billion on IT procurement and 80% of those funds were for legacy systems -- outdated technology or software similar to ScreenOS. This practice of not keeping up with the times renders our nation's IT infrastructure less efficient and exponentially more vulnerable.

Finally, this incident shows that backdoors to bypass encryption -- even those requested by law enforcement or mandated by lawmakers -- are extremely dangerous. There is no way to create a backdoor that is not vulnerable to this kind of breach. Encryption is essential to our national security and economy; we should be focused on strengthening it not weakening it.

Note: Rep. Hurd, a Republican from Texas, sits on the House Homeland Security Committee and is chairman of the IT Subcommittee on Oversight and Government Reform.

US News and World Report
NSA Water, Electricity Supply Safe as 'Off Now' Push Ends in Failure
Tuesday, 26 January 2016
Byline: Steven Nelson

Washington - An effort in state legislatures across the country to pull the plug - literally - on the National Security Agency has ended in failure, with mass surveillance opponents lamenting over spineless colleagues and the national group behind the push looking to support more bite-size reforms.
The almost completely abandoned effort aimed to deny water and electricity to the spy agency following Edward Snowden's 2013 disclosures about the NSA's bulk collection of U.S. phone records and Internet surveillance programs.

Through legislation, state politicians sought to ban state and local governments from providing "material support" to the NSA, including services from public utilities. Bills in Maryland, home to the agency's Fort Meade headquarters, and Utah, location of a massive NSA data storage facility, threatened water deals with local governments that are essential to agency operations.

The ambitious legislative campaign attracted wide media coverage, but failed to achieve victory.

Former Maryland Del. Michael Smigiel, the Republican sponsor of his state's legislation, recalls five of his seven cosponsors promptly jumping ship in 2014. "I just found out the NSA is in my district," he recalls one of the men telling him.

In Utah, Rep. Marc Roberts, also a Republican sponsor, says he won't reintroduce the bill this year, concluding its failure "means people would rather give up their liberty for a little bit of security" and that there's broad skepticism about states' power to curb NSA operations.

Bills in other states - including Alaska, Arizona, Indiana, Iowa, Mississippi, Missouri, Oklahoma, South Carolina, Texas, Tennessee and Washington - also have failed. A bill in California passed, but after being made toothless.

The bills generally said states and their political subdivisions cannot supply material support to federal agencies that collect citizens' metadata without individualized warrants, and often included a ban on using evidence gathered in such a way in state courts.

Mike Maharrey, a spokesman for the Tenth Amendment Center, which crafted the model legislation used by state legislators, says the center has turned its focus toward enlisting support for privacy reforms that "aren't quite as aggressive" but still can have a "big impact up the chain."

Last year, there were more than a dozen material support-banning bills, he says. Now, he knows of just one, in Michigan, and he isn't particularly optimistic about its chances.

"There's a great deal of willingness and openness and eagerness about taking action at the state level," Maharrey says. "There obviously is an appetite for this, but we have come to realize just how powerful the law enforcement and, in the case of the NSA, the military lobby is."

Maharrey's group now is promoting draft legislation from the American Civil Liberties Union that would restrict the use of phone location-tracking Stingray devices, limit warrantless access to communications and establish state rules for drones and license plate readers. The ACLU announced last week its privacy legislation already had been introduced in 16 states.

"We're still working to figure out how to bring enough pressure from the bottom on these institutions to make them bend," Maharrey says. "We've definitely created a foundation for something we will continue into the future. We're just looking at other ways to move the ball forward."

Some sponsors of the more ambitious legislation, meanwhile, have looked to higher office. Ted Lieu, a Democrat, sponsored California's successful yet weakened bill, and was elected to Congress shortly afterward. Smigiel, who lost a low-vote legislative primary, now is seeking to knock off U.S. Rep. Andy Harris, R-Md., by running on a libertarian platform against the famously anti-marijuana lawmaker ahead of an April primary.

Smigiel says he's getting support from pot reformers and supporters of autonomy for the District of Columbia, which a Harris budget amendment barred from regulating recreational marijuana sales

despite 70 percent of district voters casting ballots for legalization. A poll Smigiel commissioned found him crushing Harris, though it also presented respondents with questions about Harris' record.

If elected to Congress, Smigiel sees himself working with fellow libertarians such as Reps. Thomas Massie, R-Ky., and Justin Amash, R-Mich., and likeminded Democrats to tackle NSA surveillance.

Though Congress passed and President Barack Obama last year signed the USA Freedom Act, ending the government's automatic bulk collection and storage of domestic U.S. call records, deeper reform, such as a ban on "backdoor" searches of Internet communications of Americans, remains stuck despite such an effort passing the House of Representatives twice.

Smigiel says he's alarmed at the lack of action from elected officials, particularly given recent revelations that members of Congress were affected by the executive branch's monitoring of Israel's campaign against the recent Iran nuclear deal.

"The result has been exactly what you see: an emboldening of the agency to continue its spying on Americans and on Congress," he says.

Reuters
South Korea says suspects North Korea may have attempted cyber attacks
Wednesday, 27 January 2016

South Korea said on Wednesday it suspected North Korea of attempting cyber attacks against targets in the South, following a nuclear test by the North this month that defied United Nations sanctions. South Korea has been on heightened military and cyber alert since the Jan. 6 test, which Pyongyang called a successful hydrogen bomb test, although U.S. officials and experts doubt that it managed such a technological advance.

"At this point, we suspect it is an act by North Korea," Jeong Joon-hee, a spokesman of the South's Unification Ministry, told a news briefing, when asked about reports that the North might have attempted cyber attacks.

Authorities were investigating, Jeong said, but did not provide further details.

Last week, South Korean President Park Geun-hye said the scope of threats from North Korea was expanding to include cyber warfare and the use of drones to infiltrate the South.

North Korea has been using balloons to drop propaganda leaflets in the South, amid heightened tension on the Korean peninsula since the nuclear test.

Since the test, there have been unconfirmed news reports that the computer systems of some South Korean government agencies and companies had been infected with malicious codes that might have been sent by the North.

Defectors from the North have previously said the country's spy agency, run by the military, operates a sophisticated cyber-warfare unit that attempts to hack, and sabotage, enemy targets.

South Korea and the United States blamed North Korea for a 2014 cyber attack on Sony Pictures that crippled its systems and led to the leaks of unreleased films and employee data.

At the time, the company was set to release the film, "The Interview", featuring a fictional plot to assassinate North Korean leader Kim Jong Un.

North Korea has denied the allegation.

In 2013, cybersecurity researchers said they believed North Korea was behind a series of attacks against computers at South Korean banks and broadcasting companies.

Times of India
Chinese investors bet big on India, internet giants pour funds into digital startups
Wednesday, 27 January 2016
Byline: Samidha Sharma & Boby Kurian

New Delhi - The drought is turning into a deluge. For years, Chinese investment in India remained a trickle -- $1.2 billion between 2000 and September 2015, which was only 0.47% of the total foreign direct investment inflow. While China became India's largest trading partner in 2008, investment flow from the country remained hostage to national security concerns.
That looks set to change significantly given the spate of announcements in the last few weeks. Wanda, China's largest commercial real estate developer, announced investment worth $10 billion in Haryana. SAIC Motor, China's largest carmaker, proposes to buy GM's Gujarat facility. About 100 small and medium Chinese enterprises have promised investments worth $1 billion.

In the startup space, Chinese companies are no more restricted to proposals, but have been making aggressive and widespread investments. The new year began with China's online travel company Ctrip picking up a strategic stake in Makemytrip and Baidu unveiling discussions with multiple Indian internet startups for investments. This comes in the backdrop of Alibaba's high profile investments in Snapdeal and Paytm last year. Another Chinese internet giant Tencent Holdings started investing when it took a wager on Bangalore-based healthcare startup Practo last year.

"Chinese internet companies have recognized the big potential in India's digital startups where there are similarities in learning curves and experiences," Frank Hancock, managing director, advisory, Barclays

said. He pointed out that the broader FDI investments have pivoted towards the east with Japan competing with the US and the UK among the top three sources of capital. "In that context, the incremental Chinese private investments are important from a signaling perspective," Hancock said.

A recent Credit Suisse report highlighted that India's internet and e-commerce journey bears close similarity with that of China, with a lag of 8-10 years. "The presence of such investors on the boards of investee companies enables access to insightful market advice and winning business models," said Anup Vikal, CFO, Snapdeal, which has attracted investments from Alibaba, Taiwan's Foxconn and Japanese telecoms & internet giant Softbank.

Besides the strategic investors, Hillhouse Capital, one of the largest China-based investment funds, picked up a stake in online classifieds player Cardekho last year, and took positions in the domestic public markets. More significant, though little known, are the investments by State Administration of Foreign Exchange (SAFE), a fully-owned subsidiary of People's Bank of China, in some of India's pedigree large cap stocks. SAFE, entrusted with managing China's estimated $3.5 trillion foreign reserves, started taking positions in Indian public equities at least two quarters back, several top bankers in Mumbai said in recent conversations.

Between January 1, 2015 and January 22 this year, investors from Asia chose 48 Indian startups to provide financial backing. The 22 companies, from countries including Japan, China, South Korea, Taiwan, Singapore and Malaysia, participated in funding rounds worth $3.4 billion in this period. Chinese companies Alibaba, Tencent, Ctrip, Didi Kuaidi, Hillhouse Capital and Tybourne (Hong Kong) were significant investors.

Most of China's cash reserves are said to be invested in dollar and euro denominated assets though it has started taking risk exposures in other geographies as well. While Chinese investor interest around Indian internet startups has gathered momentum, it is yet to translate into other sectors which the dragon has eyed for some years now.

Take, for instance, Fosun, arguably, the largest Chinese private conglomerate and the most active overseas acquirer. Fosun -- with interests spanning from pharma to real estate to internet -- started scouting for investments in India more than two years ago but hasn't struck any deals yet.

This is where some bankers forsee "the mutual dislike" between Indian and Chinese businesses, which are rooted in cultural differences and historical prejudices. "Private businesses in the two countries vary vastly, and love to look down upon each other," a senior banker said on condition of anonymity. Then there are whispers about India preferring neutral money from Japan and Canada to build its infrastructure.

Still, there isn't much doubt that China, and broadly the east, is becoming a large source of capital for new-age Indian entrepreneurs. "So far the US internet companies have had a lock on the India market. However, about a year ago, the Chinese internet conglomerates started to stitch things together in India

with strategic bets. Their approach is very long-term which bodes well for Indian startups who were dependent on very few deep-pocketed funds for writing the larger cheques," says Avnish Bajaj, MD at Matrix Partners India, an active investor in early stage tech companies like Quikr, Practo and Ola among others.

Hancock of Barclays said he would expect Chinese investors to top up their US counterparts. "I would see large Chinese private investments in the country's internet leaders which are already vetted by US venture capital and private equity funds," he explained, suggesting a slightly cautious Chinese action in a sector where Japan's SoftBank has become a prolific investor.

Outside the digital economy, bankers said, Japan has clearly signaled its intent for aggressive investments in infrastructure as it wants India to be a geopolitical counterweight to China. They, however, are counting on Chinese investments into Indian healthcare and real estate gathering steam. Mainland China's biggest property developer Wanda's fresh proposal of $10 billion investment in Haryana follows earlier announced joint ventures with Anil Ambani's Reliance Group to develop integrated townships in Navi Mumbai and Hyderabad.

As China joins Japan, Taiwan and South Korea to pump FDI into India, much depends on how its private businesses muscle up in the face of a slump after an extended economic miracle.

Globe and Mail
Scientists raise alarm over inadequate supercomputers
Wednesday, 03 February 2016
Byline: Ivan Semeniuk
Section: general

Canada's national computer capacity needs expensive and ongoing upgrades from Ottawa to provide country with the digital muscle required to operate in the world's top tier, scientists say
Scientists across Canada who need access to fast and powerful supercomputers to conduct their federally funded research say they are falling behind their international competitors, or having to switch to less ambitious projects because the country's digital research infrastructure is insufficient to meet their needs.

The problem is so acute, those affected say, that fixing it will require Ottawa to pour tens of millions more into Canada's national computer capacity each year, and rethink how the system is supported in the long term.

What's needed is not simply more data storage but also computational capacity - the ability to crunch through reams of calculations to do things like analyze genetic variants across an entire population or simulate the Earth's climate. The challenge is exacerbated by the rapid turnover of digital technology, and by growing demand from researchers anxious to leverage the power of big data and highperformance computing to make breakthroughs.

Compute Canada, the organization tasked with supporting university-based researchers with their digital needs, says that the growing reliance on computation in many areas of science means that it is no longer able to provide its biggest users with the digital muscle they need to operate in the world's top tier.

The organization projects that more modest users of its services could be running into similar barriers in the next couple of years.

Since only researchers with federal funding can apply to Compute Canada, the digital bottleneck means the government is, in some cases, paying for science that it can't support.

Meanwhile, the nation's digital infrastructure faces a coming tsunami of demand through a range of large-scale research projects that the government has already committed to.

"We're alarmed," said Compute Canada's president, Mark Dietrich.

"Important big science initiatives threaten to overwhelm our already stretched capabilities." For Peter Tieleman, a University of Calgary chemist who draws on Compute Canada's resources more than any other individual scientist to model the behaviour of cell membranes and their interactions with

molecules including candidate drugs, the limitations mean that he has to divide his projects across different computer systems and forgo investigations that simply cannot be done in Canada.

"Personalized medicine is only going to be personalized if we're able to analyze data at the level of the individual," said Dr. Tieleman, referring to a trend in medical research to tailor potential treatments for disease to a patient's unique genetic characteristics.

In recent weeks, Compute Canada has faced ire and distress from researchers over its allocation of computer resources for 2016. Many applicants received far less than expected, while others have been cut off entirely.

"It's the hardest year we've had - and last year was already bad," said Dugan O'Neil, chief science officer for the organization.

Among those whose allocation was reduced to zero is Scott Ormiston, a professor of mechanical engineering at the University of Manitoba. As a consequence, one of Dr. Ormiston's graduate students, who is developing software to reveal fluid and gas interactions in pipes - a topic that is relevant for averting nuclear accidents - may be unable to complete his PhD, already overdue because of diminished computer resources.

"I don't know what to do. All my plans are in jeopardy," said the student, Foad Hassaninejadfarahani, whose funding has now run out.

Although there is widespread agreement that Canada's research-computing and datamanagement tools need an upgrade, opinions vary about whether advanced computing is a pressing problem.

"It's not something that, today, is keeping me awake at night," said Feridun Hamdullahpur, who chairs the Leadership Council for Digital Infrastructure, a university-led group that reports to the federal government.

Dr. Hamdullahpur, who is president of the University of Waterloo, said he is not aware of any researchers on his campus who have been hampered by a lack of access to computational capacity, though he added that the future might bring such constraints.

The council, which meets Thursday in Ottawa, is scheduled to hear from Compute Canada about the organization's concerns.

Others say the problem is long standing and has already cost Canada its ability to attract top researchers in some fields.

"It's a pretty terrible situation," said Robert Thacker, a cosmologist at St. Mary's University in Halifax who uses supercomputers to study the formation of galaxies and the large-scale structure of the universe.

Dr. Thacker said the last time his group was able to publish computationally based work on par with that going on in the United States and Europe was in 2008. He added that his department recently lost its bid to attract a rising star in the field to a faculty position in part because of Canada's limited computational resources. Instead, the researcher, a Canadian scientist who was working abroad, accepted an offer in the United States.

Sabrina Foran, a spokesperson for the federal Department of Innovation, Science and Economic Development, said the government is working to develop a new digital research infrastructure strategy. A funding boost to Compute Canada was announced last year by the Conservative government in the lead-up to the federal election, but scientists say this will merely replace aging systems without adding more capacity.

Toronto Star
Shared IT agency yet to show its worth
Wednesday, 03 February 2016
Byline: Alex Boutilier
Section: general

OTTAWA -- The federal government's $1.9-billion IT department is having trouble showing if it's saving Ottawa any money and is beset with delays, according to the auditor general's report.
Shared Services Canada was created in 2012 to centralize and improve the federal government's scattered IT landscape, while cutting costs by delivering tech support centrally.

Trouble is, the department doesn't have a way of actually measuring if they're improving services or cutting costs.

"They don't really have a baseline that documents whose going to do what, what levels of services should the departments expect to have, what type of information should they expect to receive, to give them an indication of how their systems are being managed," said Auditor General Michael Ferguson.

"I think the task that they set for themselves from the beginning was ambitious and complex, so really I think it's up to them to demonstrate how they're going to meet that goal.

. . . They have a big job ahead of themselves."

Ferguson's audit found that SSC had no process to determine costs or measure progress and savings, and the agency's senior management were briefed with unclear or inaccurate reports about progress.

The auditor general's office tabled its fall 2014-15 reports to Parliament Tuesday, dealing with issues from dangerous and illegal exports slipping by border guards, the lack of progress on government considering gender-based analysis, and a series of concerning issues with the First Nations Health Authority in British Columbia.

But the issue most likely to dog the new Liberal government is the costly problems in modernizing Ottawa's technology.

SSC was created in 2012 under the previous Conservative government with a mandate to consolidate the government's IT services under one roof.

Tony Clement, the former minister responsible for Treasury Board who announced SSC's creation in 2011, declined a request for comment.

Globe and Mail
Challenges plague Ottawa's push to centralize IT services, Auditor says
Wednesday, 03 February 2016
Byline: Michelle Zilio
Section: general

OTTAWA - The federal department in charge of centralizing the government's information-technology systems has made limited progress in doing so, knocking out communications for emergency workers in Saskatchewan on one occasion, and is having trouble proving that its efforts are actually saving money, a new report by Canada's Auditor-General says.
In the report tabled in Parliament on Tuesday, Auditor-General Michael Ferguson found that Shared Services Canada, which became a department in 2012, has encountered challenges in its mandate to modernize, standardize and consolidate the e- mail, data centre and network services for 43 federal departments by 2020.

Shared Services Canada "did not set clear and concrete expectations of what departments would receive in terms of ongoing service, support and information," Mr. Ferguson said in a prepared statement. "It is also unable to accurately demonstrate cost savings achieved through the transformation of government IT services."

The report also found that Shared Services did not outline "clear and concrete expectations" for how it would deliver services and "rarely" provided enough information to departments to help them meet government IT security policies, guidelines and standards.

The department's problems were made clear in a case study from March 24, 2014, when all first responders - police, fire and emergency medical services - in Saskatchewan lost radio voice communications for 40 minutes. First responders were forced to use their personal cellphones to

communicate with each other, but reception was spotty or non-existent in some areas. The outage linked back to Shared Services, which managed the emergency radio services, and accidentally rendered a crucial feature of the radio network unavailable while making changes to the network.

Mr. Ferguson said Shared Services' problems originated with its implementation, and the department continues to struggle with ambitious and complex goals.

"They didn't put in place things like service-level agreements with the 43 departments and organizations that they provide services to," he told reporters. "So that starts them out in a situation where they don't really have a baseline that documents who's going to do what, what level of services should the departments expect to have, what type of information should they expect to receive to give them an in indication of how their systems are being managed."

New Democratic MP David Christopherson said the big question is whether the current effort to create government-wide technology can be fixed or should be scrapped.

"I would think that, given the mess that it is right now, that it may very well make more sense for them to start all over," he said.

But Public Services Minister Judy Foote said the government is committed to completing the IT transformation process by 2020.

The audit also found the department did not have consistent financial practices to prove that savings were being generated. For instance, Shared Services did not take individual departmental implementation cost estimates, ranging from $500,000 to $5-million each, into account when determining savings that would be achieved by moving to a new e-mail system.

As a part of its e-mail transformation initiative, Shared Services Canada had planned to migrate 500,000 e-mail mailboxes to the new service by the end of March, 2015. But, according to the audit, the department reported to its senior management that it had migrated only 3,000 by that date.

Speaking to reporters on Tuesday, Ms. Foote said "the cost is not the issue for us right now," as "the delivery of services is what's really important for Canadians."

Wait for disability benefits too long

Canadians with terminal illnesses and grave medical conditions are waiting too long to be approved for federal disability benefits, and a tribunal that was created to speed appeals when disability claims are denied has made the system even slower, the Auditor- General says.

Although Employment and Social Development Canada usually approves or rejects claims for Canada Pension Plan (CPP) disability benefits within an acceptable amount of time, an audit released on

Tuesday found the department's promise to take no more than 48 hours to process claims for people with terminal illnesses was being met in just 7 per cent of cases.

And just 59 per cent of people who have grave illnesses such as liver cancer, Alzheimer's disease or paranoid schizophrenia are getting their applications for benefits approved within the department's standard of 30 days, said the audit, which examined the claims-approvals process over five years ending in 2014-15.

"These are people who have worked in the Canadian work force and they've made their contributions to the CPP and this is one of the benefits that they expect to be there when they need it," Auditor-General Michael Ferguson said of those applying for disability benefits. "So the department needs to treat this as a service for people and make that whole system better."

The audit found that the application process for CPP disability benefits is extremely cumbersome - the application kit contains eight documents totalling 42 pages.

In addition, the audit said the Social Security Tribunal, which was established in 2014 to increase the speed and efficiency of the existing process for hearing appeals of rejected claims, was actually bogging things down. From 2011-12 to 2014-15, the average time an appellant waited for a decision increased from 402 days to 884 days.

When the department took a second look at 5,414 appeals that were in a backlog as of December, 2014, it overturned one-third of the original decisions. A random sample of those reversed decisions examined by the auditors found many were overturned without any substantial new evidence. The claim of one applicant was denied six times before it was approved.

The auditors said this suggests the department needs to do more to ensure its original decisions are consistent and appropriate.

Treasury Board President Scott Brison told reporters the problems unearthed by the Auditor-General apply to the actions of the previous Conservative government.

"It would be very easy for us as ministers of the current government, the new government, to simply lay blame. We're not doing that," Mr. Brison said. "We're actually taking action and are actually going to move forward, working with Canadians."

Section: general

Implementing Prime Minister Justin Trudeau's grand to-do list is a hive of civil servants who will play an influential role in shaping Canadian policy, priorities, values, and history.
Newly elected Prime Minister Justin Trudeau has a grand policy to-do list. Some call it lofty, while many call it 'ambitious.' Regardless, it's going to take a lot of work to see to fruition and the bulk of the weight will fall on the public service. They're the ones providing the expertise necessary to make informed, strategic and wise policy decisions. They have the spirited and innovative thinking required for Canada to stay competitive in an increasingly fast-paced and globalized world; and are a dedicated and steadfast force to loyally implement decisions and deliver services in a timely and reliable fashion.

Here are the ones to watch in 2016, the most influential civil servants, and how they'll wield power in this new political environment.

The Deputies

A deputy minister carries a great deal of responsibility as the senior civil servant in a government department. The DM takes political direction from the appointed minister, but responsibility for the day-to- day operations, program development, budget, and employee management of the department lie with the deputy minister.

In the newly- named Department of Global Affairs, the foreign affairs file is managed by deputy minister Daniel Jean, who has held the position since late 2013 after an extensive international career in the foreign service. Working in immigration, he was posted to the U.S., Hong Kong, and Port-au-Prince twice (including during the coup that unseated Jean-Bertrand Aristide).

Mr. Jean will likely make good use of that international experience, as he faces a challenging policy agenda. The Liberal government must make tough international decisions regarding how to contribute to the fight against the Islamic State, how to properly integrate 25,000 Syrian refugees within Canada's border, deciding what kind of role Canada should have as international peacekeepers, as well as how to navigate ongoing tensions with Russia.

Mr. Jean will be working closely with Malcolm Brown, who was named special adviser to the Clerk of the Privy Council on the Syrian Refugee Initiative by Mr. Trudeau in early November, after serving as the DM of International Development.

Also within the Global Affairs department is International Trade deputy minister Christine Hogan. Ms. Hogan has been a public servant since 1988, and is valuable in that she's negotiated and led policy reforms in areas ranging from the environment and energy to international development and defence. In terms of international trade policy, Ms. Hogan will be advising the Trudeau team on issues like the Trans-Pacific Partnership, locking down the Canada-European Union trade agreement, China's ongoing push for a free trade deal, and Canada and Mexico's trade sanctions against the United States for foreign beef and pork labelling requirements.

Perhaps the DM who will face the most change under the new government, and will be given a great deal of responsibility, is Michael Martin, deputy minister at Environment and Climate Change Canada. In contrast to the previous government's lacklustre approach to sustainable environment priorities, Mr. Trudeau campaigned strongly on making Canada a steward for climate change awareness and environmental protection. Mr. Martin will be busy this year stewarding Canada's response to the recent UN climate change agreement signed in Paris.

Another filet hat will be implementing a very different policy agenda is the one managed by Colleen Swords, DM of Indigenous and Northern Affairs Canada. The Oct. 19 election was considered a landmark for Canada's Indigenous communities; a record 10 aboriginal MPs were elected, and First Nations communities experienced the highest voter turnout in history.

Mr. Trudeau promised to call a national inquiry into missing and murdered Indigenous women and girls within 100 days of being elected, improve education and clean drinking water in First Nations communities, implement all of the recommendations made by the Truth and Reconciliation Commission and a review on all Indigenous-related legislation passed by the Harper government. Ms. Swords will be front and centre of all it, helping her minister, Carolyn Bennett, on the file.

Perhaps one of the most tenured of the current crowd of deputy ministers is John Knubley, deputy minister of Industry, who has held his position in Industry Canada since September 2012. But Mr. Knubley's portfolio is about to be shaken up.

The Science, Technology and Innovation Council (STIC) released a report in 2015 stating that Canada has fallen behind its allies in recent years in terms of investing into research and development-- dropping almost $1-billion between 2006-2013. After the release of the report, Mr. Knubley told the press that there wasn't a whole lot of evidence that billions of dollars spent by the Canadian government on research tax credits and more than 70 industrial support programs have had much of an impact on industrial innovation. But going forward, he may have a government that takes a new, innovating and collaborative approach to finding creative solutions to boost industrial development in Canada.

Other deputy ministers to keep an eye on are Bill Pentney, Justice DM, who has risen through the bureaucratic ranks over the past 25 years. The former University of Ottawa professor served as the general counsel and director of legal services at the Canadian Human Rights Commission, which will be an asset considering the Liberal government's rehabilitative approach to crime. He will also be working closely with Ms. Swords on the missing and murdered Indigenous women inquiry, and will have a slew of legislative initiatives to shepherd as the Trudeau government moves ahead with the legalization of marijuana, repealing Bill C-51, the controversial Anti-terrorism Act, addressing hand gun laws and responding to the Supreme Court's decision on physician-assisted suicide.

Jean-François Tremblay, Infrastructure and Communities deputy minister since July 2015, brings experience from a previous role as deputy secretary to the Cabinet (operations) in the Privy Council

Office. Mr. Tremblay will be crucial in helping the Liberal government consult with provinces, territories, and municipalities in order to create what they call an "integrated, intermodal national transportation strategy, that serves large and small communities,"--a promise they committed to fulfilling within two years of taking office. Mr. Trudeau also said his government will develop a predictable and reliable transportation funding commitment for at least 10 years, which Mr. Tremblay will be helping to lead.

Paul Rochon, DM Finance, was appointed by Stephen Harper in April 2014--a surprise to some, as he was a veteran within the finance department and an experienced economist, but was still a newbie to the upper echelons of the bureaucracy. He had only been a deputy minister at international development for less than a year when he was shuffled into the role. Mr. Rochon, who made his mark as Canada's lead negotiator at Group of 20 finance ministers' meetings, will be tasked with implementing the new economic policies of the Liberal government, including dropping the middle income-tax bracket from 22 to 20.5 per cent as well as creating a new tax bracket: 33 per cent on income over $200,000.

On the defence file, DM John Forster will face some complex work, including what kind of military role Canada will play in the global fight against ISIS, how to fi x a procurement system that many consider broken, and how engaged Canada should be in peacekeeping efforts going forward. Mr. Forster, appointed DM of Defence in February 2015, has experience working on intricate, internationally-focused files with serious, life-and-death ramifications. Mr. Forster was shuffled from his position as the head of Canada electronic spy agency, the Communications Security Establishment.

Janice Charette was only Canada's top bureaucrat for about 15 months before the prime minister appointed Michael Wernick to the top job. It's no suprise the new government did so, as is usually the case with new incoming political masters, but she will remain a senior adviser because she's proven to indispensable as the Liberals found their feet. With a frantic post-election schedule of international travel, hiring political staffers took a backseat to the urgent matters of the day, and the Liberals leaned heavily on public servants in the early weeks. Ms. Charette accompanied Prime Minister Justin Trudeau on his first trip abroad, to the G20 in Turkey and the Asia Pacific Economic Cooperation Summit in the Philippines, and she met with him and his top advisers every day and will likely remain in a senior role.

The Security

Replacing Mr. Forster at the notoriously secret spy agency is Greta Bossenmaier, who shoulders a great deal of responsibility at a time when public scrutiny on the security of Canadians and the boundaries of surveillance are both high.

The agency monitors global data, including cyber and airwaves, for intelligence from outside Canada's border. Ms. Bossenmaier certainly has international experience, having worked as deputy minister of the Afghanistan Task Force in the Privy Council Office, and associate deputy minister of foreign affairs.

Her counterpart at the Canadian Security Intelligence Service (CSIS), Michel Coulombe, has been the director since October 2013, and was a significant appointment considering it was the first time a

director was assigned from within the service. Mr. Coulombe, a veteran who has worked as an intelligence office since 1986--just two years after CSIS was formed--has international experience, having overseen CSIS's operations abroad as assistant director of foreign collection.

Together, their plates will be loaded with high-pressure work this year. With the Liberal government committing to resettling 25,000 Syrian refugees in Canada by the end of February 2016, and in the shadow of the Paris attacks in November 2015, many Canadians have concerns about domestic security. Mr. Coulombe and Ms. Bossenmaier will be working closely with both RCMP Commissioner Bob Paulson and Richard Fadden, National Security Adviser to the Prime Minister, in their efforts to keep Canadians both at home and abroad safe.

The Diplomats

Perhaps one of Canada's best diplomats is the one we keep posted right in Ottawa: Governor General David Johnston. The former lawyer and president of the University of Waterloo is known to be well-liked and highly-respected (both by government and Canadians), and has earned a reputation for being genuine, down to earth and approachable. The GG makes himself available through Twitter interaction and Skype sessions--recently Skyping with aboriginal students from Atlantic Canada.

One of the most influential foreign dignitaries in Ottawa's diplomatic circle is the representative from Canada's closest ally, the United States. Bruce Heyman has been U.S. President Barack Obama's man in Ottawa since March 2014, but was known to have an unusually cool relationship with the former prime minister, mostly due--pundits say--to the U.S.'s refusal to approve the Keystone XL pipeline.

While Prime Minister Trudeau has voiced disappointment over President Obama's decision to reject the oil pipeline project, he also stressed that it would not hurt relations with Canada's neighbour. Meanwhile, Mr. Heyman has showed signs of excitement and optimism when asked about working with the new prime minister, singing his praise to The Canadian Press, saying: Mr. Trudeau is "a good man. He's smart, he's affable, he's caring. ... He's going to be a great representative for your country." The northern neighbours currently have a lot of mutual bilateral policies to attend to, including climate change targets, combating the threats posed by ISIL, border crossing facilitation, and regulatory harmonization.

Another major influential diplomat going forward will be Chinese Ambassador to Canada Luo Zhaohui, who is actively promoting China's economic growth and encouraging the Canadian government to boost bilateral trade and lock in a free trade agreement as soon as possible.

Keepers of the Money

Aside from the title of Auditor General of Canada, Michael Ferguson also has an unofficial and rather comical designation: the angriest man in Canada. Most photos of the man who keeps the government spending inline shows him scowling at the camera, his eyes showing skepticism and mistrust; really, a

good person to hold Parliament accountable for the spending of public funds. Auditor General since November 2011, Mr. Ferguson was appointed after working as the deputy minister of Finance of New Brunswick.

Canada's other main monetary adviser is Stephen Poloz, Governor of the Bank of Canada. Mr. Poloz provides the Canadian government analysis of the national and global economy, and makes recommendations about how to strengthen Canada's economic activity. Many observers say he will have more freedom to give transparent and honest advice under the Trudeau government. After not ruling out negative interest rates last December, Mr. Poloz will be an influential player in navigating the uncertain economic climate. One sector that was previously a major booster of the Canadian economy was energy, but with the so-called oil crash, there have been changes in that area as well.

Peter Watson, chair of the National Energy Board, will be forced to adjust to those new realities, as well as navigate a potentially tense relationship with Mr. Trudeau, who campaigned on a promise to conduct a full review of Canada's environmental assessment practices, including a reform of the arms-length regulating board.

Ottawa Citizen
Shared Services a costly failure
Wednesday, 03 February 2016
Byline: James Bagnall
Section: column

It's little wonder that so many federal government departments dislike or distrust Shared Services Canada, the computer services agency established in 2011.The portrait offered Tuesday by Auditor General Michael Ferguson in his biannual audit suggests the agency conducts its operations with a sloppy disregard for both the quality and quantity of services it provides to 43 departments.
This is all the more astonishing given Shared Services' sweeping mandate - which is to develop a single email system for the entire federal government, consolidate nearly 500 data centres to seven, and streamline the government's telecommunications services.

Although the agency has a generous annual budget in excess of $1.4 billion and more than 6,100 employees, Ferguson noted it fell well short of the standards expected by the departments it serves. Indeed, were this a private sector firm, it would have lost its customers years ago.

Among the major shortcomings:

Shared Services is running late on the implementation of its major projects, particularly the one involving email services. Ferguson noted that as of March 31, 2015 - when the email project was originally meant to be finished - only 3,000 out of more than 500,000 mailboxes had migrated to the new Canada.ca form. And just 100 out of 15,600 applications to new data centres had been upgraded.

¦¦ Shared Services has claimed that consolidating information technology will produce significant savings but failed to note the significant implementation costs borne by the various federal departments it works with. Of the departments surveyed by Ferguson, the unaccounted costs ranged from $500,000 to $5 million per department - and this was related just to the common email project. ¦¦Although Shared Services was launched nearly five years ago, only now has it committed to let its 43 "partner" departments know how it will actually deliver computer infrastructure services. Its selfimposed deadline is Dec. 31, 2016. ¦¦The auditor general sampled 50 out of 3,000 business arrangements signed with departments about what services Shared Service will provide and discovered "none

SHARED SERVICES FROM A1 BY THE of the agreements contained commitments to fulfil and report on security expectations."

The latter point is especially revealing. Over the next few years, Shared Services is meant to help departments migrate more than 15,000 applications - ranging from human resources to accounting - to the proposed new data centres. From the departments' point of view, this is an opportunity to upgrade software and run things more efficiently.

However, Ferguson's auditors discovered the service level agreements did not actually spell out the responsibilities for Shared Services or its partners. Not only that, they concluded, the agreements "were used mainly to recover costs for services that were deemed new or optional and therefore not covered by funds already appropriated from partners for information technology services." In short, Shared Services was looking after its own priorities.

Shockingly, Shared Services provided reports to partner departments for just 10 per cent of the agreements and even these did not cover all the services committed to by the agency.

Indeed, the profile that emerges from Ferguson's audit is of a relatively young federal agency whose raison d'être is customer service - but which doesn't appear to have a clue what that means.

The Liberal government, asked Tuesday about the agency's failure, said simply that Shared Services, created under the Conservatives, was "not set up to succeed." Public Services and Procurement Minister Judy Foote pledged, without detail, stronger leadership. jbagnall@postmedia.com

NUMBERS

2012 Year Shared Services Canada was established with a mandate to consolidate the federal government's sprawling IT assets.

43 Number of partner agencies and departments for SSC.

$209M Yearly savings SSC claims to be responsible for.

$1.9B Amount Shared Services Canada spends each year.

485 Number of data centres SSC is supposed to consolidate (to just seven) by 2020.

Globe and Mail
Where privacy and security intersect, will police and intelligence (finally) work together?
Wednesday, 03 February 2016
Byline: David Omand
Section: oped

Concerns that two of Canada's intelligence agencies, the Canadian Security Establishment (CSE) and the Canadian Security Intelligence Services (CSIS), broke the rules by sharing intercepted data with Canada's allies, will further spur public debate about how to strengthen public oversight and accountability mechanisms for Canada's intelligence gathering agencies. Since the revelations of Edward Snowden that authorities can access personal communications from mobile devices and computers, the public the world over has become sensitized to issues of online privacy.
At the same time, terrorist atrocities have continued. The murder in Burkino Faso of six Quebeckers along with many others follows the 2015 Paris attack on journalists working for Charlie Hebdo, on a Jewish synagogue, on British and other European tourists murdered on a Tunisian beach, the downing of a Russian airliner, the Bataclan theatre massacre in Paris, and the San Bernardino killings. The Internet is filled with ultra-violent jihadi images from Syria. Criminal activities of human traffickers result in refugees being drowned trying to reach Europe. Every week brings new cyber attacks on our financial system and infrastructure. Presidents Assad and Putin remind us of the dangers that authoritarian regimes can pose.

The year 2016 must be one of reconciliation in which democracies work out a social compact to allow their authorities lawfully to obtain the digital intelligence needed to keep us safe and secure, but under strong safeguarding norms of proper behaviour towards information on the Internet that ensure respect for our rights to privacy and free speech. One norm should be to have independent judicial and parliamentary oversight of intelligence activity towards which Canada seems to be moving under the leadership of Ralph Goodale, Minister of Public Safety. Another norm should be commitment by nations to do nothing that might weaken the security of the systems upon which the Internet relies and might reduce our confidence in it as a secure medium to do business.

An interesting early test case is the United Kingdom. The U.K. Parliament has now embarked on scrutiny of a comprehensive Investigative Powers Bill placing all forms of digital intelligence gathering by the British authorities, inside and outside the country, under the rule of law, providing for judicially approved warrants after examination of the necessity and proportionality of the case for the activity, and strengthening oversight. It does not include "back-door" provisions to weaken encryption, which the intelligence agencies did not ask for, but powers are sought to have Internet communications records retained for a year by the companies. A question still to be answered is how far the Internet

companies (many of course giant American corporations) will co- operate with governments like the U.K. to provide the police and intelligence agencies with information on the communications of their suspects. Not all companies may for commercial and technical reasons feel able to retain the data that long, but most I suspect want to help the fight against terrorism and serious crime, such as child abuse, but only with a clear legal route as provided for in the U.K. Bill.

The U.K. government seems to have taken to heart the judgments of the British Courts and other independent reviews that GCHQ (the British partner of CSE) does conduct all its activities within U.K. law, but the way the law was being applied in the past was, to put it mildly, obscure to the public. A U.K. court therefore ruled the British government had not met the proper standard of the rule of law, under which citizens must be able to understand how the law bears on them. The comprehensive bill now under parliamentary scrutiny is the result, a gold standard in terms of transparency.

We will need to wait to see whether police and intelligence agencies working under such strict conditions, and with both parliamentary and judicial oversight, can actually acquire the pre-emptive intelligence needed to keep the public safe and secure. Previous generations of intelligence officers might have doubted this was possible. I know that the present generation of intelligence leadership is determined to make it work. For all our sakes, we must hope they succeed.

Sir David Omand is a former director of GCHQ, the UK signals intelligence and cyber security agency.

Australian Associated Press
Hackers could be behind phone threats
Wednesday, 03 February 2016
Byline: Jacqueline Le
Section: general

Melbourne - Threatening phone calls to schools across Australia could be the work of teenage hackers using online programs to make untraceable calls and create computer-generated voice messages. They could also be the work of criminals, but authorities remain tight-lipped about their investigations, even as schools across Australia on Wednesday received threatening phone calls for the fourth time in a week.

Schools in Queensland and NSW also received threatening phone calls again on Wednesday.

Victoria Police are investigating whether some may have originated from a selective Melbourne school, but a technology researcher says someone could have falsified the call origin to make it look like it had come from Nossal High School.

Not much is publicly known about the calls other than they are automated, and threatening.

"We don't know who is behind it, or what tools they are using," University of Melbournehacking researcher Suelette Dreyfus told AAP on Wednesday.

"We don't know anything about them, if they're in Australia or overseas."

It's possible an account on an online phone service may have been hacked and used to make the calls.

A hoax of this nature and scale suggests whoever is behind it has good technology skills, Dr Dreyfus says.

"I'm surprised at how rapid-fire these calls are - to so many different places, and in such a short amount of time - and how it's affecting so many children," she said.

But each time a hoax call is made, the perpetrator risks exposing information about themselves or their location.

"If the hackers or hoaxers have been bad about their operational security, then I think it might be a relatively short time before police are knocking on their doors," Dr Dreyfus said.

"But if they've been very good about it, it could be quite some time."

Since Friday, an undisclosed number of schools in Australia and overseas have received threatening phone calls, which have prompted emergency evacuations.

"The question is, are these guys real criminals, are they teenage hackers who are hoaxing people?," Dr Dreyfus said.

"Either way, they're causing a lot of stress to parents who are probably very worried about the safety of their children."

Last Friday an automated message warned schools a bomb was on their premises, and on Tuesday the threats were either about a bomb, or that shooting would occur.

The principal of Berwick Lodge Primary in Melbourne - which received a threatening phone call on Friday - said if disruption is the aim, it is working.

"We come to work wondering whether the next call is going to be one of these threats," Henry Grossek said.

"We're mentally exhausted."

New York Times
Deal Struck to Balance U.S.-Europe Data Fears

Wednesday, 03 February 2016
Byline: Mark Scott
Section: general

New York - European officials on Tuesday agreed to a deal with the United States that would let Google, Amazon and thousands of other businesses continue moving people's digital data, including social media posts and financial information, back and forth across the Atlantic.
With billions of dollars of business potentially at stake, the data-transfer deal was the result of more than three months of often tense negotiations between United States and European Union policy makers, who have clashed over what level of privacy individuals can expect when companies and government agencies follow ever-expanding digital footprints.

Part of the challenge is balancing individuals' privacy concerns with national security obligations, particularly in light of mounting fears about international terrorism.

The agreement announced on Tuesday aims to address those privacy concerns and strike that balance by including written guarantees by the United States -- to be reviewed annually -- that American intelligence agencies would not have indiscriminate access to Europeans' digital data when it is sent across the Atlantic. Whether that provision will reassure privacy-rights groups remains to be seen.

Many obstacles still await the deal, which must be officially approved by the European Union's 28 member states. National data protection regulators have yet to give their support to the pact, and European privacy-rights advocates are preparing to file legal challenges seeking to overturn it.

The data-transfer agreement, replacing a 15-year- old pact that Europe's highest court struck down in October, is intended to let the free flow of digital data -- the lifeblood of many global businesses -- continue as usual.

In seeking to ensure the continued free flow of data, the deal announced on Tuesday could especially benefit big American companies like Google, Facebook and Amazon that tend to dominate Internet searches, social media and digital commerce in Europe. But it is also meant to let nontech companies like the drug maker Pfizer and the industrial conglomerate General Electric continue to send customer and employee data between the United States and Europe.

Europe's privacy watchdogs had demanded that European and American officials agree to a new deal by Jan. 31. Although negotiators missed that deadline, they had been meeting almost continuously in Brussels since Sunday to reach an agreement. They were driven by a sense of urgency, as industry executives and trade bodies on both sides of the Atlantic worried that the means for transferring data between two of the world's largest economies remained in jeopardy.

Most sensitive, perhaps, were provisions demanded by the European Commission, the executive arm of the European Union, aimed at limiting how American intelligence agencies collect data on Europeans when companies send their personal information to the United States.

The American negotiators, in response, agreed to provide the annual written assurances.

These guarantees, European officials said, will be reviewed each year, with American and European policy makers meeting to ensure that the strict privacy rights of Europe's more than 500 million citizens are respected by United States agencies.

"We will hold the U.S. accountable on the commitments that they have made," Vera Jourova, the European Union's justice commissioner who has led the negotiating team, said on Tuesday.

The new deal "is a major achievement for privacy and for businesses on both sides of the Atlantic," Penny Pritzker, the United States Commerce secretary, said in a statement on Tuesday. "It provides certainty that will help grow the digital economy."

Both sides will now spend the next two weeks completing the details of the new pact, which is to be called the E.U.-U.S. Privacy Shield. If formally approved, it would go into effect by early April.

But the deal's first hurdle comes on Wednesday, when Europe's increasingly powerful national privacy agencies plan to pass their own judgment on how data can be safely transferred outside the European Union.

Many of these agencies, which can investigate and issue fines to companies that they suspect of misusing people's digital information, remain skeptical that rules protecting Europeans' data will be upheld in the United States. And some of these monitors have said that they will support further restrictions on how companies can move the data if they suspect it may be misused.

"We are part of the game," Isabelle Falque-Pierrotin, France's privacy chief, said in an interview last month in Paris. "If you provide these services, then you have to protect people's privacy rights."

Ms. Falque-Pierrotin is the chairwoman of the Pan-European body that will announce its assessment on Wednesday.

The agreement drew praise on Tuesday from DigitalEurope, a group representing trade associations and multinational tech companies doing business in Europe, including Apple, Google and Microsoft.

John Higgins, the group's director general, called in a statement for national privacy agencies "to view this signal from the European Commission as a sign of good faith and to hold off with any potential enforcement action until the new agreement has been fully implemented."

Privacy groups, though, expressed concern that the data- transfer deal does not comply with European law, which views an individual's right to privacy almost on par with freedom of expression.

Several consumer groups have said that they will file complaints with European privacy agencies to challenge the new agreement, while others have called on the United States to improve its own privacy laws to match those currently available in Europe.

"The problem is that the U.S. remains unchanged," said Marc Rotenberg, president of the Electronic Privacy Information Center in Washington.

Despite these expected challenges, some European officials on Tuesday defended the new safe harbor agreement.

In particular, the European Commission highlighted how the United States had proposed greater oversight on the access American intelligence agencies have to Europeans' data.

The United States also agreed to establish an ombudsman in the State Department to act as a first point of contact for Europeans if they believed American government agencies had misused their data.

Access granted to American intelligence agencies had become a sticking point in light of revelations by Edward J. Snowden, the former NationalSecurity Agency contractor, about that agency's surveillance of foreign citizens.

During the most recent talks in Brussels, which involved officials from the United States Commerce Department and the Federal Trade Commission, among others, American negotiators had argued that United States law provided greater oversight and supervision of American intelligence agencies' use of personal data than rules now in place across the European Union, according to several officials who spoke on the condition of anonymity because they were not authorized to speak publicly.

National security arguments had become more vehement following the terrorist attacks in Paris last November, those officials said. United States ambassadors had defended the integrity of oversight of American intelligence agencies in discussions with senior politicians in countries like France, Germany and Britain in recent weeks, according to the officials who asked to remain anonymous.

But European Commission, which does not have the power to rule on its member states' national security practices, had demanded written guarantees.

"This isn't going to be a one-off decision by the commission," said Ms. Jourova, the European justice commissioner. "We have achieved effective protection of Europeans' rights."

London Times

Drones will spy from the stratosphere
Wednesday, 03 February 2016
Byline: Deborah Haynes
Section: general

London - Britain will buy the world's first highaltitude drone to spy from the stratosphere for months at a time.
The solar-powered Zephyr aircraft will be used by special forces and regular soldiers as part of a £2 billion boost to intelligence-gathering capabilities, defence sources said. The Ministry of Defence is to spend £10.6 million on two prototypes to be built in the UK. Test flights are expected next year.

"They will be able to fly higher and for longer to gather constant, reliable information over vast areas," Michael Fallon, the defence secretary, said The aircraft flies at 70,000ft, twice the height of a commercial airliner, but weighs only 30kg (66lb). The Zephyr, which travels at about 30mph (48km/h), is called a high altitude pseudo-satellite because it is a cross between a drone and a satellite.

It holds the record for the longest flight -- 14 days -- for an unrefuelled aircraft and could remain airborne for months thanks to its solar batteries.

It carries communications equipment that will enable soldiers standing 400 miles apart to talk via radio. Cameras will provide unprecedented continuous coverage of terrain.

The programme has been developed by Airbus Group in Farnborough. Its design is so commercially sensitive that even the blueprint for the two propellers on its front is top secret.

Press Trust of India
Password-stealing 'dorkbot' prowling in Indian cyberspace
Wednesday, 03 February 2016
Section: general

New Delhi - Cyber security sleuths have alerted Indian internet users against the malicious activity of an online virus called 'dorkbot' which perpetrates itself through social networking sites and steals sensitive personal data and passwords of a user.
The malware, a variant of online virus and worm, has been specifically seen affecting operating systems running on Windows in the recent past. "It has been observed that the variants of malware named as 'dorkbot' targeting windows operating systems, are spreading.

"The malware belongs to the family of worms having backdoor functionality and spreads through various vectors including drive-by-download attacks, social networking sites and compromised websites with browser exploits via removable drives in the form of auto-run exploits or by means of malicious

links in instant messaging chats or internet relay chats," a latest advisory issued by the Computer Emergency Response Team of India (CERT-In) said.

The CERT-In is the nodal agency to combat hacking, phishing and to fortify security-related defences of the Indian Internet domain.

The deadly virus, with almost a dozen aliases, is capable of stealing sensitive information from infected machine including stored passwords, browser data, cookies and has a smart and lethal potential to take complete control of the affected system, it said.

Christian Science Monitor
Hard lessons emerge from cyberattack on Ukraine's power grid
Wednesday, 03 February 2016
Byline: Jack Detsch
Section: general

Boston - A cyberattack linked to a December blackout in Ukraine signals new dangers for critical infrastructure operators such as power suppliers and other utilities, experts said Monday.
The fact is that many supervisory control and data acquisition (SCADA) systems - the type compromised in the Ukrainian attacks and utilized at countless other power facilities - aren't designed to be secure against digital attacks, said security researcher Peiter Zatko, also known by his hacker nom de gare Mudge.

"They were designed to be in isolated environments that don't talk with the outside world," said Mr. Zatko. "You didn't want these to be connected to the Internet."

Zatko spoke at an event Monday cosponsored by Passcode and Harvard University's Belfer Center for Science and International Affairs to further explore the Ukraine cyberattack that many experts believe led to power outages for some 80,000 customers in the western region of Ivano-Frankivsk for nearly six hours.

The incident has sent shockwaves throughout the critical infrastructure sector in the US and beyond, and follows recent reports of hackers linked to Iran breaching networks at a dam outside Rye, N.Y., and at the major power supplier Calpine Corp. Renewed concerns about digital threats to the power grid have also led the Pentagon's Defense Advanced Research Projects Agency (DARPA) to devote $77 million to helping utilities defend against and recover from future cyberattacks.

A former security researcher at DARPA, Zatko said that many critical infrastructure companies have simply ignored security patches for industrial networks and that often companies making software for these facilities aren't security conscious enough. "The developers writing the code aren't thinking about security."

It also appears that Ukrainian facilities involved in the attack weren't following industry guidelines that could prevent hackers from gaining access to essential systems. Reuters recently reported that power utilities in Ukraine ignored their own rules regarding "air gaps" - separating critical control systems from the Internet - before December's attack.

Analysts still aren't certain of the exact timeline of the Ukraine attack. But according to research from SANS Institute, a nonprofit that specializes in cybersecurity training, attackers breached SCADA systems at the facilities, deployed malware to infect and damage servers, and attacked call centers at the utilities with a distributed denial of service attack.

Oleh Sych, a consultant to Ukrainian government officials investigating the attack, told Reuters that hackers probably used phishing e-mails designed to trick power operators into clicking on malicious documents, thus allowing them access to the network.

The cybersecurity intelligence firm iSightPartners said the group behind the attack could be connected to the Russia-linked Sandworm Team, which conducts cyberespionage operations. While many experts agree that the cyberattack led to the power outage, there's still no consensus about how the hackers actually shut down parts of the power grid.

"We've never had to deal with a cyberattack against the grid that took the power down," said Robert M. Lee, chief executive officer of Dragos Security and an instructor for the SANS Institute, who participated in the Monday event. "If [the US power grid] was ever impacted in more than one region, we couldn't recover that easily."

In a survey of 500 security leaders at critical infrastructure firms conducted by TrendMicro and the Organization of American States in 2015, 53 percent of responses indicated that attacks had increased over the past year. But despite the uptick in reports of breaches into utilities, experts said on Monday that cyber threat intelligence in the critical infrastructure sector has not improved much - as has been the case with companies in other industries.

"The thing that bothers me is that we're not looking into those environments," said Lee. "It's not trivial to take down the power grid."

Minnesota Public Radio (MPR)
Group sues feds for documents on Minnesota counterterrorism program
Wednesday, 03 February 2016
Byline: Mukhtar Ibrahim
Section: general

Minneapolis - A New York-based advocacy group is suing two federal agencies over a controversial counterterrorism program focused on Muslim communities in several states, including Minnesota. The Brennan Center for Justice at New York University School of Law said it went to court to challenge the United States Justice Department and Department of Homeland Security after exhausting other efforts to get records on the Countering Violent Extremism program, or CVE.

The Justice Department in 2014 launched CVE pilots in Minneapolis, Los Angeles and Boston, calling it a way to bring religious and community leaders and law enforcement officials together to counter efforts by ISIS and other terror groups to recruit fighters in the U.S.

Some Minnesota Muslims have questioned the pilot's intent and raised concerns that it's simply a way to gather intelligence. U.S. Attorney for Minnesota Andrew Luger, who leads the CVE program in Minnesota, has told his Somali community task force he would not use the program that way.

Brennan Center officials say they began asking federal authorities more than a year ago for documents on the CVE program detailing its policies, procedures, funding and constitutional safeguards. They said they received some documents related to the Los Angeles and Boston programs, but none about Minnesota.

The group is particularly troubled about efforts in the Twin Cities "to use CVE to monitor Somali-American children in school," said Brennan Center attorney Michael Price.

"Our concern here is that the current iteration of CVE will have some negative impacts on Muslim communities including stigmatization, reinforcing Islamophobic stereotypes, facilitating covert intelligence gathering and suppressing decent," Price said.

Luger's office declined comment on the lawsuit.

It's unclear if there are rules prohibiting law enforcement agencies from gathering intelligence from Muslim communities, Price said. With the lawsuit, he added, the center is trying to determine the rules governing the government's participation in the CVE program and how the program operates.

In a report to lawmakers released Monday, the Department of Public Safety outlined several strategies that it said will guide a "successful approach in Minnesota to counter radicalization and terrorist recruitment."

The agency recommended collaboration with schools and establishing programs that would identify individuals who are "on the path to violent extremism."

"These programs may identify reliable and consistent sources to make referrals such as schools, places of worship, social workers, or doctors; divert those who have begun the process of radicalization and

may be on the path to violent extremism; and provide an opportunity for such individuals to transition back into mainstream society within their community," the report said.

DPS also calls on training community members to identify youth who may be at risk for recruitment.

In St. Paul, the police department has its own CVE effort focused on Minnesota's East African community. It recently received a $100,000 grant from the State Homeland Security Program, which funds state programs focused on terrorism prevention.

Many efforts in countering violent extremism have largely relied on the idea that it's possible to identify people on the verge of becoming radicals, but there's no "typical trajectory that a person follows to become a terrorist," Price said.

"What teenager isn't a little disaffected or exhibits signs of alienation?" he added. "I think that describes most teenagers."

Times of Israel
In cyber car hacks, loose lips can kill, says expert
Wednesday, 03 February 2016
Byline: David Shamah
Section: general

Jerusalem - With a crowded playing field in the cyber-security business, companies and experts seek ways to stand out. For cyber experts, that often means being the first to discover a new virus, security breach, or other hole that needs to be plugged up.
That's the way the business is supposed to work, said Yoni Heilbronn of Israeli Internet of Things security firm Argus; but there are rules.

"You can't go public with a vulnerability without informing the company that has the security breach, so they can repair it," he said on the sidelines of last week's CyberTech 2016 event in Tel Aviv. "If you do reveal the weaknesses of a device or system without giving the team responsible a chance to mitigate it, you could be putting the money or even lives of people at risk. It's not just unethical - it's dangerous."

Especially in the business Argus deals with - the connected car business. With more vehicles than ever connected to the Internet - either through an in-vehicle communications system or via a connection to a driver's smartphone - the opportunities for hackers to mess with cars is greater than ever.

Argus has developed a solution that analyzes communication packets (the segments of data) that come into and go out of the vehicle, determining if the packets are associated with the kind of behavior expected (e.g., signals from specific IP addresses, commands that make sense given the current activity

of the vehicle, etc.). Suspect connections can be blocked or traced, preventing hackers from remotely grabbing control of a vehicle's steering or braking system.

Argus supplies car manufacturers, their Tier 1 suppliers and aftermarket connectivity providers with ready-to-embed technology that can be seamlessly integrated into any vehicle product line for any connected vehicle anywhere in the world without changes to the vehicle's architecture, said Heilbronn. Among the company's customers are some of the top Tier 1 auto part and component suppliers, like Lear Electronics, Delphi, Bosch, and others.

That such remote vehicle hacking is possible was proven beyond a shadow of a doubt last July, when white-hat hackers Charlie Miller and Chris Valasek took control of a Chrysler Jeep vehicle being driven at top speed by Wired journalist Andy Greenberg. Miller and Valasek turned the radio on full- blast, ran the air-conditioner, and even took control of the accelerator - scaring Greenberg to the point where he was forced to "drop any semblance of bravery, grab my iPhone with a clammy fist, and beg the hackers to make it stop."

Heilbronn doesn't know if Miller and Vaselek informed Chrysler in advance of what they were going to do or how they were planning to do it. But one person who did not reveal his intentions to a targeted company was Corey Thuen of Digital Bond Labs, who Progressive Insurance said did not inform it of a security flaw in a dongle it distributed to insured drivers to report on their on-road driving habits and behavior, qualifying them for a safe driving discount. After finding a security flaw in the dongle, he went public.

Contacted by business magazine Forbes for comment, Progressive said that "if an individual has credible evidence of a potential vulnerability related to our device, we would prefer that the person would first disclose that potential vulnerability to us so that we could evaluate it and, if necessary, correct it before the vulnerability could be exploited. While it's unfortunate that Mr. Thuen didn't share his findings with us privately in advance, we would welcome his confidential and detailed input so that we can properly evaluate his claims." Forbes noted that Thuen told them that he tried to reach the dongle's manufacturer Xirgo in advance, but received no response.

In any event, there's a right way and a wrong way to reveal cyber-safety problems, and Argus "would never reveal things in that manner, out of concern for the safety of the public," said Heilbronn. And Argus has a great deal of opportunity to do the right cyber-thing. "There are only a handful of companies in the world doing cyber-security for connected cars, and we are the biggest one," he said.

The company has been in touch with any number of manufacturers and Tier-1 suppliers about security issues; in 2014, for example, it revealed a problem with a connected-car solution made by Zubie, which, upon hearing of the problem, immediately dealt with it - and it was only then that Argus told the story.

"Once we detected Zubie's security gap we duly notified Zubie with full details of our findings as required by our responsible disclosure policy," said Heilbronn. It's not about reputation or profits, but about keeping hackers from pushing the envelope too far.

"Very often we will hear about hackers who tried to duplicate exploits that were tried and succeeded," said Heilbronn. "When it comes to money or identity theft, as painful as that is, it usually does not put the lives of people at risk; with all the hassle involved, banks and other institutions are insured, so the public, while inconvenienced, usually gets compensated. In hacking of connected vehicles, things are different - and any exploit that succeeds could end up endangering the lives of drivers and others who are on the road with them.

"Who knows if any of the many car accidents that take place each year are the result not of failed brakes and the like, but of hacking?" added Heilbronn. "There are a lot of dangerous people out there - hackers, hacktivists, criminals, and terrorists - who are potentially capable of doing this. By 2020, there will be as many as 400 million connected vehicles on the road - meaning that there will a lot more hacking opportunities. We should not be giving these people material to work with."

Bloomberg View
Europe's New 'Privacy Shield' Looks Leaky
Wednesday, 03 February 2016
Byline: Noah Feldman
Section: column

Column - The European Union and the United States reached a new deal Tuesday on privacy protections for Europeans' data that gets sent to U.S. servers. The agreement, to be called Privacy Shield, replaces an agreement repudiated by the European Court of Justice in October. That's good news for major corporations like Facebook and Google that want continued access to their European users' data. But the new agreement requires scrutiny itself, which European regulators and probably the ECJ are going to give it. Notwithstanding the powerful business interests at stake, there's reason to think that the agreement may have loopholes that make it difficult for those bodies to uphold.

The arrangement from 2000, called Safe Harbor, was struck down by the ECJ essentially on the ground that American companies were giving the National Security Agency access to Europeans' data. The question before the European court was whether data transferred to the U.S. receives an "adequate level of protection" under the EU's Data Protection Directive.

The answer was no -- and for complicated reasons. The court acknowledged that under U.S. law, statutory and constitutional requirements trumped the Safe Harbor agreement. It went on to say that, based on the revelations of former NSA contractor Edward Snowden, the level of privacy protection provided in practice by the U.S. wasn't high enough to satisfy European standards. The agreement was therefore rejected.

It's crucial to realize that the ECJ judgment included the recognition that, under EU law, it's all right for a government to peek at consumers' private data under some circumstances. What the court was saying, was that U.S. law wasn't protective enough to satisfy European standards. It looked to a judgment by the High Court of Ireland, holding said that "the revelations made by Edward Snowden had demonstrated a 'significant over-reach' on the part of the NSA and other federal agencies."

In particular, the Irish court was concerned that European citizens "have no effective right to be heard" by U.S. courts if the privacy of their data is breached by security agencies because the breach takes place in secret.

The ECJ had to admit that EU law doesn't contain "a definition of the concept of an adequate level of protection." But it concluded that adequacy must mean "a level of protection of fundamental rights and freedoms that is essentially equivalent to that guaranteed within the European Union."

In other words, if U.S. privacy protection was weaker than EU protection, the agreement must be invalidated. The new agreement must be assessed against this background to see if it will pass legal muster.

The highlight of the deal, emphasized by the European Commission in its announcement, is what's supposed to be "written assurance" from the U.S. that Europeans' data will be protected. Under the agreement, the U.S. director of national intelligence will certify that Europeans' data won't be subject to "mass surveillance." That sounds better than the old agreement, which didn't include an explicit promise from the intelligence community.

But the DNI will almost surely be able to make this promise in very general terms. And, in practice, even targeted American surveillance might still be much broader and less privacy-protecting than anything European countries typically allow. The U.S. says it will review data proportionately, which means something specific in Europe but could well mean something different in the U.S.

What's more, under U.S. law, there's ordinarily little or no protection for data belonging to foreigners so long as it's outside the U.S. That law hasn't changed. It seems at least possible that the NSA might simply try to target Europeans' data before it gets transferred to the U.S. If it's doing so covertly, no one will know about it to complain.

Another provision of the new agreement creates an ombudsman for Europeans to raise data privacy concerns. This is presumably intended as a means of recourse and to satisfy the Irish court's worry about secrecy. But he or she probably won't have access to the U.S.'s secret interpretations of law or secret surveillance.

A further provision says that U.S. companies must agree to robust privacy protections before transferring data. That should probably keep them from voluntarily transferring data to the NSA in violation of privacy regulations. But if U.S. law requires the transfer, they'll still have to comply.

All this means is that there's plenty of room for the ECJ to find that Privacy Shield is inadequate like its predecessor. But will it?

That depends in part on how strongly the EU rates its negotiating position. No one in the European political elite really wants to give up on Facebook or Amazon. And no EU bureaucrat really thinks the U.S. will change its national security laws to please the EU.

The new agreement is a pragmatic compromise meant to preserve legal formality and the fig leaf of data privacy without upsetting national security either for the U.S. or for European intelligence services that might like a chance to see their own citizens' data.

The ECJ may not want to upset this delicate balance. In that case, it can assess the new agreement generously. That would solve the practical problem. Bu the disparity between European and American conceptions of privacy will remain.

The Guardian (London)
Google to divert extremist searches to anti-radicalisation websites
Wednesday, 03 February 2016
Byline: Ben Quinn
Section: general

London - Users of Google who put extremist-related entries into the search engine are to be directed towards anti-radicalisation links under a pilot programme, MPs have been told by an executive for the company. The initiative, aimed at countering the online influence of groups such as Islamic State, is running alongside another pilot scheme designed to make videos posted by extremists easier to identify. The schemes were mentioned by Anthony House, senior manager for public policy and communications at Google, who was appearing alongside counterparts from Twitter and Facebook at a home affairs select committee hearing on countering extremism. "We should get the bad stuff down, but but it's also extremely important that people are able to find good information, that when people are feeling isolated, that when they go online, they find a community of hope, not a community of harm," he said.

All three were challenged by MPs about the extent of their companies' roles in combating the use of social media by groups such as Isis for propaganda and recruitment purposes.

Committee chairman Keith Vaz asked how many people are in the sites' "hit squads" that monitor content. He was told Twitter, which has 320 million users worldwide, has "more than 100" staff. The Facebook and Google executives did not give a number.

Simon Milner, Facebook's policy director for UK and Ireland, Middle East, Africa and Turkey, said that the site has become a "hostile place" for Isis: "Keeping people safe is our number one priority. Isis is part of that, but it's absolutely not the only extremist organisation or behaviour that we care about." He added that Facebook recognised from research that people did not typically get radicalised exclusively online - rather, it was a combination of real-world and online contact - and was working as a result with groups in society such as Imams.

The three were also questioned about the thresholds they apply on notifying authorities about terrorist material identified by staff or users. Labour MP Chuka Umunna asked: "What is the threshold beyond which you decide ... that you must proactively notify the law enforcement agencies?"

House and Milner said their threshold was "threat to life", while Nick Pickles, UK public policy manager at Twitter, told the MPs: "We don't proactively notify. Because Twitter's public, that content is available, so often it's been seen already."

Pickles also stressed that decisions on whether to notify account holders that they were under investigation were "context specific" and insisted that Twitter worked with authorities to ensure that they do not disrupt investigations.

London Daily Telegraph
Google to deliver wrong search results to would-be jihadis
Wednesday, 03 February 2016
Byline: David Barrett
Section: general

London - Jihadi sympathisers who type extremism-related words into Google will be shown anti-radicalisation links instead, under a pilot scheme announced by the internet giant.
The new technology means people at risk of radicalisation will be presented with internet links which are the exact opposite of what they were searching for.

Dr Anthony House, a senior Google executive, revealed the pilot scheme in evidence to MPs scrutinising the role of internet companies in combating extremism.

"We are working on counter-narratives around the world. This year one of the things we're looking at is we are running two pilot programmes," said Dr House.

"One is to make sure these types of views are more discoverable. The other is to make sure when people put potentially damaging search terms into our search engine they also find these counter narratives."

Governments and other agencies have recognised the importance of "counter-narratives" in combating extremism online - such as propaganda videos by Islamic State of Iraq and the Levant, also known as Isis- by encouraging moderate Muslims or other groups to challenge terrorist ideologies.

Dr House told the Commons' home affairs select committee that Google removed 14 million videos from its YouTube site in 2014 for a range of reasons including terrorist content and for breaking other rules.

The company received 100,000 "flags" from members of the public about content they consider inappropriate.

Nick Pickles, from Twitter, said the micro-blogging site has taken down tens of thousands of violent extremist accounts in the last 12 months.

Twitter, which has 320 million users, employs "more than 100" people working in teams to deal with inappropriate use of the site, he said.

Keith Vaz MP, the committee chairman, asked Dr House and Simon Milner, of Facebook, how many people they employed in "hit squads" to remove terrorist and extremist material.

However, both companies declined to reveal figures publicly.

A Google spokeswoman said the pilot project referred to by Dr House would bring up counter-narrative messages in "AdWords" - the sponsored links which are returned at the top of a Google search - and not the search results themselves.

Dr House said later: "We offer Google AdWords Grants to NGOs so that meaningful counter-speech ads can be surfaced in response to search queries like 'join Isis'."

USA Today
Congress shouldn't force encryption 'backdoors,' says key House Democrat
Tuesday, 02 February 2016
Byline: Erin Kelly
Section: general

Washington - Congress is unlikely to pass legislation to force U.S. tech companies to build "backdoors" into encrypted devices to allow the government to gather information on suspected terrorists, the senior Democrat on the House Intelligence Committee said Tuesday.
"I don't think a legislative solution at this point is feasible or even desirable," Rep. Adam Schiff, D-Calif., told reporters at a breakfast hosted by the Christian Science Monitor.

Schiff said he would prefer that lawmakers work with the tech industry to try to come up with solutions. He said it makes little sense to force American companies to let the government break the encryption that keeps their customers' data private when terrorists and criminals can just turn to products made by foreign companies.

"I think the encryption issue is really a global challenge," he said.

Congress is struggling with how to handle the complex issue in the wake of last November's attacks in Paris, where investigators believe that some of the terrorists used encrypted phone apps to communicate via the "Dark Web."

Senate Intelligence Committee Chairman Richard Burr, R-N.C., and Vice Chair Dianne Feinstein, D- Calif., have indicated that they will introduce legislation that would require tech companies to provide a backdoor into encrypted communication when law enforcement officials obtain a court order to investigate a specific person.

Companies such as Apple and Google -- responding to consumer demands for privacy -- have developed smart phones and other devices with encryption that is so strong that even the companies can't break it. Silicon Valley opposes any effort by Congress to mandate backdoors into encryption, warning that it would have the unintended result of making Americans more vulnerable to hackers and identity thieves.

"I think that's going to be very tough to move forward with," Schiff said of the proposed Senate bill. "At present, we really lack a consensus (in Congress)."

House Homeland Security Committee Chairman Michael McCaul, R-Texas, and Sen. Mark Warner, D-Va., are offering an alternative bill that would create a commission made up of tech industry executives, law enforcement and intelligence officials, college professors and other experts to try to come up with recommendations.

"I think a commission is fine, but it may be a bit redundant," Schiff said.

Schiff and House Intelligence Committee Chairman Devin Nunes, R-Calif., have already asked the National Academy of Sciences to issue a report on whether it is technologically possible to come up with ways for law enforcement and intelligence agencies to conduct legitimate investigations without sacrificing privacy or opening the door to hackers.

As terrorist groups such as the Islamic State increasingly use social media to recruit new members, the U.S. government needs to turn to outside groups to help fight back on Twitter and other sites, Schiff said.

"The area where we have really fallen down is in the area of countering the message (from terrorists)," he said. "The government is the wrong messenger."

Instead, the government should turn to "more credible sources" within the Muslim community who can talk to people about what Islam really stands for and how the terrorists have perverted the religion's message, Schiff said.

"The government can't respond to 20,000 tweets from ISIS," he said. "We need the help of millions of Muslims."

Schiff also said he doesn't believe Congress will repeal a controversial provision of the Patriot Act anti-terrorism law that is set to expire next year.

Lawmakers are considering whether to change or repeal Section 702 of the law, which allows the National Security Agency to target the communications of people in other nations and capture the content of e-mails, instant messages, Facebook messages, web browsing history, and more without a warrant. Although it targets foreigners, it also sweeps up the data of Americans with whom they communicate even if the Americans aren't suspected of any wrongdoing.

Last year, Congress voted to approve the USA Freedom Act, which ended the NSA's mass surveillance of Americans' phone records under Section 215 of the Patriot Act. But Schiff said Section 702 is seen as much more effective at catching terrorists than the phone metadata program ever was.

"Section 702...has been very consequential," Schiff said. "The case for it is much stronger."

The House Judiciary Committee on Tuesday was scheduled to hold a closed session on the issue.

Les Echos
Une cybercriminalité de plus en plus professionnelle
Wednesday, 03 February 2016
Byline: Julie Le Bolzer
Section: general

Non identifié - L'année a été marquée par la professionnalisation de la cybercriminalité.
Avec la montée en puissance d'un djihad 2.0, le développement d'un marché de la vulnérabilité informatique et l'émergence d'une cyberdiplomatie.

Il innove, se diversifie, se globalise... Bref, le cybercrime se porte bien. Que ce soit dans le secteur bancaire (détournement de transactions), dans le Web (piratage d'applications), dans l'environnement matériel (prise de contrôle à distance d'une voiture ou encore d'un fusil) et même dans l'espace (interceptions de données émises par un satellite), l'année passée a eu son lot d'attaques astucieuses, toujours plus créatives...

Des équipes de spécialistes

« Les attaques n'émanent plus d'individus isolés, il s'agit d'équipes de spécialistes. Nous sommes face à des cybercriminels de plus en plus performants et de plus en plus connectés entre eux : ils multiplient les interactions et partagent leurs expertises », précise Alain Juillet qui fut directeur du renseignement de la DGSE puis responsable de la cellule Intelligence économique à Matignon, aujourd'hui président du Club des directeurs de sécurité des entreprises (voir l'interview sur lesechos.fr).

Un business très rentable

Par ailleurs, les cyberattaques semblent toujours plus rentables pour les hackers. Illustration que les criminels n'oeuvrent pas seulement pour la beauté du geste mais aussi et surtout à des fins mercantiles, « leurs gains ont atteint des sommets en 2015 : jusqu'à plusieurs dizaines de millions d'euros » , pointe Fabien Cozic, directeur d'enquêtes chez Red Team. « Les entreprises doivent prendre conscience que le risque cyber est celui qui peut leur coûter le plus cher : plus cher qu'un incendie, qu'un échec de lancement de produit, qu'une erreur comptable... » insiste Alain Juillet.

Le cyber-risque est désormais intégré par une majorité d'organisations et les conséquences d'une attaque sont scrutées avec attention... et sur le long terme. « L'attaque qui a frappé l'entreprise américaine Target remonte à décembre 2013, pourtant les conséquences les plus importantes ne se font jour que maintenant, constate le colonel Eric Freyssinet, chef de la division de Lutte contre la cybercriminalité au pôle judiciaire de la Gendarmerie nationale. D'où la nécessité de prévenir, c'est-à-dire être conscient des risques, de mettre en oeuvre les moyens de s'en prémunir, de se préparer à gérer l'incident et à en maîtriser les conséquences. » Une autre grande tendance s'est dégagée l'an passé : le développement d'un véritable marché des « zero-day » (voir encadré) et, plus globalement, du commerce de l'exploitation de la vulnérabilité informatique, comme l'a souligné le Clusif dans son « Panorama 2015 de la cybercriminalité » .

100.000 tweets quotidiens

La tragique actualité a fait apparaître un autre phénomène : le rôle fondamental d'Internet et des réseaux sociaux dans les diverses attaques qui ont notamment touché la France. « A des attaques ter

roristes djihadistes terrestres, des vagues de cyberattaques font quasiment toujours échos », observe-t-on à la Direction centrale de la police judiciaire (DCPJ). Ce fait n'est pas nouveau : dans son panorama daté de 2004, le Clusif alertait déjà sur le fait que la Toile était utilisée par les terroristes. « Là où la donne change, c'est que Daech s'est entouré de spécialistes de la communication, des médias, de la vidéo et des réseaux sociaux : plus de 100.000 tweets émaneraient actuellement chaque jour de djihadistes », souligne François Paget, secrétaire général du Clusif. La cybercriminalité est aussi géopolitique. Un exemple avec le cas récent de piratage de l'Office de gestion du personnel américain (OPM), qui concernait les données personnelles de plus de 20 millions d'agents du gouvernement américain. Rendue publique en juillet 2015, cette attaque a été attribuée à la Chine par les Etats-Unis. « Les deux pays se sont alors retrouvés autour d'une table pour ne´gocier et trouver un terrain d'entente :

arrestations d'hackers en Chine, de´finition de lignes de bonne conduite sur le commerce... Cela en termes tre`s diplomatiques », souligne Loïc Guézo, cybersecurity strategist chez Trend Micro Inc.

Enfin, 2015 a vu se confirmer le risque lié aux objets connectés (lire l'interview ci-dessous). Mais dans ce domaine, le pire pourrait être à venir : le volume d'objets connectés ne va cesser de croître. Surtout, ils devraient être rejoints très bientôt par les objets autonomes qui pourraient, à leur tour, nous surprendre avec de nouveaux risques et de nouvelles formes d'attaques.

Washington Post
National Security Agency plans major reorganization
Tuesday, 02 February 2016
Byline: Ellen Nakashima
Section: general

Washington - The National Security Agency, the largest electronic spy agency in the world, is undertaking a major reorganization, merging its offensive and defensive organizations in the hope of making them more adept at facing the digital threats of the 21st century, according to current and former officials.
In place of the Signals Intelligence and Information Assurance directorates, the organizations that historically have spied on foreign targets and defended classified networks against spying, the NSA is creating a Directorate of Operations that combines the operational elements of each.

"This traditional approach we have where we created these two cylinders of excellence and then built walls of granite between them really is not the way for us to do business," said agency Director Michael S. Rogers, hinting at the reorganization -- dubbed NSA21 -- that is expected to be publicly rolled out this week.

"We've gotta be flat," he told an audience at the Atlantic Council last month. "We've gotta be agile."

Some lawmakers who have been briefed on the broad parameters consider restructuring a smart thing to do because an increasing amount of intelligence and threat activity is coursing through global computer networks.

"When it comes to cyber in particular, the line between collection capabilities and our own vulnerabilities -- between the acquisition of signals intelligence and the assurance of our own information -- is virtually nonexistent," said Rep. Adam B. Schiff (Calif.), the ranking Democrat on the House Intelligence Committee. "What is a vulnerability to be patched at home is often a potential collection opportunity abroad and vice versa."

But there have been rumblings of discontent within the NSA, which is based at Fort Meade, Md., as some fear a loss of influence or stature.

Some advocates for the comparatively small Information Assurance Directorate, which has about 3,000 people, fear that its ability to work with industry on cybersecurity issues will be undermined if it is viewed as part of the much larger "sigint" collection arm, which has about eight times as many personnel. The latter spies on overseas targets by hacking into computer networks, collecting satellite signals and capturing radio waves.

"The NSA21 initiative will ensure the National Security Agency continues to be the preeminent signals intelligence and information assurance organization in the world," said Jonathan Freed, director of strategic communications at the NSA. "These core missions are critical as we position NSA to face complex and evolving threats to the nation. Out of respect for our workforce, we cannot comment on any details or speculation before the plan is announced."

The change comes about a year after the CIA did its own revamping, ending divisions that have been in place for decades and creating new centers that team analysts with operators. The NSA's new directorate of operations also will place analysts with operators.

Rogers in a speech in December characterized the change as "among the most comprehensive" at the NSA since the late 1990s. He began the effort about a year ago, giving a team of employees from across the agency what he called the "director's charge." Among the major questions they were asked were: How can the agency better innovate?

And how "do we inculcate collaboration and integration" in operations?

For instance, said one former U.S. official familiar with the plan, both information assurance and foreign intelligence gathering rely on similar processes for data analysis and depend on each other. "But the challenge is they are very much two different cultures," the official said. "Unless you've worked on both sides of the house, you don't inherently trust each other."

The Information Assurance Directorate (IAD) seeks to build relationships with private-sector companies and help find vulnerabilities in software -- most of which officials say wind up being disclosed. It issues software guidance and tests the security of systems to help strengthen their defenses.

But the other side of the house at NSA, which looks for vulnerabilities that can be exploited to hack a foreign network, is much more secretive.

"You have this kind of clash between the closed environment of the sigint mission and the need of the information assurance team to be out there in the public and be seen as part of the solution," said a second former official. "I think that's going to be a hard trick to pull off."

Richard George, a former technical director for the IAD, said he saw how techniques that the defense side developed have helped the offense and vice versa. "It's got to be really useful to have those groups

closer together where they'll be sharing ideas and techniques more frequently," said George, now a senior cyber adviser at Johns Hopkins University's Applied Physics Lab.

Former NSA director Michael V. Hayden undertook one of the other major reorganizations, creating the Signals Intelligence Directorate (SID) in 2000 by merging two directorates -- Operations and Technology. He said he opted not to fold in the IAD,. "From the outside perspective," he said, "I needed an organization that was, and was seen to be, committed to defense."

At the time, he added, IAD needed to be strengthened and adapted to the cyber age. "Keeping it separate allowed me more direct visibility into that," he said. "That said, as the cyber mission matured, the operational and technological aspects of the SID and IAD missions merged more and more."

By 2005, as cyber threats were growing, Hayden decided to create a new organization that would enable the agency to leverage the intelligence it was getting from spying on overseas networks to help it defend against intrusions into the government's classified networks. The National Threat Operations Center (NTOC) was an experiment in combining offense and defense. "It was wildly successful," the first former official said.

NTOC dispelled the myth, the official said, that one person cannot operate under two sets of legal authorities -- offensive and defensive. "I can actually sit at my desk and one minute be using sigint data and authorities .?.?. and the next minute I could be using IA data and authorities and my mission is not changing," the official said. "You need checks and balances. You need to know what authority you're using at any given time, but it's possible."

Still, some congressional aides briefed on the broad outlines of the plan have expressed concern about mixing funding for intelligence activities and funding for cybersecurity activities.

One area where the sigint side is ahead of information assurance is in using big data analytic tools to manipulate large volumes of information quickly. "What we want to do is take advantage of that knowledge, to apply it as needed to the IA analysis," the first former official said.

Under the reorganization plan, there also will be separate directorates of Capabilities and of Research.

"One of the fundamental tenets you'll see us outline as we try to position NSA for .?.?. the environment I think we're going to see five, 10 years from now is a much more integrated approach to doing business," Rogers said at the Atlantic Council. "I don't like these stovepipes of SID and IAD. I love the expertise. And I love when we work together. But I want the integration to be at a much lower level, and much more foundational."

Services partagés Canada Loin de remplir ses objectifs, selon le Vérificateur général
Wednesday, 03 February 2016
Byline: Paul Gaboury
Section: general

Ottawa - Services partagés Canada a fait peu de progrès à l'égard de son plan visant la transformation des services informatiques de 43 ministères fédéraux. De plus, il a mal géré la sécurité des systèmes et est incapable de prouver les économies que ses initiatives doivent générer.
Dans un rapport déposé mardi, le vérificateur général du Canada, Michael Ferguson, soutient que le ministère, qui a un budget annuel de près de 2 milliards$, a fourni peu d'information sur le rendement des services et la sécurité de l'infrastructure.

«Tous les partenaires consultés ont souligné que le manque de rapports sur la sécurité les préoccupait parce qu'ils restent responsables de la sécurité globale de leurs programmes et de leurs services», écrit le vérificateur général.

Le ministère a aussi de la difficulté à calculer le total exact des économies, puisqu'il n'a pas pris en compte les coûts assumés par les autres ministères pendant la transition vers les nouveaux services. «Par conséquent, le total des économies financières réalisées par le gouvernement reste en grande partie inconnu», note M. Ferguson.

Peu de progrès

L'audit a révélé que peu de progrès ont été réalisés dans la transformation des services de courriels. À la fin mars 2015, environ 3000 boîtes de courriels avaient été transférées au nouveau service, alors qu'il avait été prévu qu'à cette date, plus de 500000 boîtes devaient l'être.

De plus, 436 des 485 centres de données étaient toujours en activité, alors que la cible était de réduire le nombre à sept d'ici 2020. Enfin, 100 des quelque 15600 applications avaient été transférées aux nouveaux centres de données, et seulement 300 des 23400 serveurs avaient été éliminés.

Anonymous s'attaque aux sites de Daech
Tuesday, 02 February 2016
Byline: Journaliste maison

Section: general

Madrid - Les hackers entravent l'enquête de la police espagnole sur un jihadiste marocain
Le collectif Anonymous a entravé une enquête de la Guardia civil espagnole sur un présumé jihadiste marocain par ses attaques lancées contre les sites web de l'organisation terroriste « Daech » .

Selon les médias espagnols, les attaques de ces hakers contre les sites web à caractère jihadiste après les attentats de Paris en novembre dernier, ont compliqué l'enquête des forces de sécurité espagnoles sur un Marocain suspecté d'être en relation avec l'Etat islamique.

Mais en dépit de tout cela, a précisé Europa Press, ces dernières ont pu appréhender Salim (A) en décembre dernier.

Selon la même source, ce natif au Maroc, âgé de 32 ans et qui dirige une sandwicherie à Pampelune (commune de la communauté de Navarre en Espagne), était le jour des attentats terroristes de Paris en train de suivre avec d'autres personnes un match de foot entre l'Espagne et l'Angleterre quand son téléphone portable a commencé à recevoir des informations sur ce qui se passait en France. Il a donc changé de canal « rapidement » mais il n'a pu s'empêcher de manifester sa joie à propos de ce qui advenait.

En trois ans seulement, il est passé du partage de la musique rap via les réseaux sociaux à leur utilisation pour diffuser sa vision du terrorisme et en faire l'apologie. La même source a indiqué que le changement a été également physique, car Salim porte depuis sa radicalisation une barbe version jihadiste.

Il partageait avec d'autres personnes des vidéos contenant des discours des jihadistes, des exécutions, des attentats et entraînements militaires. Mais la goutte qui a fait déborder le vase, a consisté en le fait qu'une personne non identifiée utilisait l'ADSL du local dirigé par Salim pour chercher des informations sur l'aéroport de Bruxelles et des hôtels à Antalya en Turquie.

Ce qui a incité les experts de la Guardia civil à renforcer leur surveillance et à acquérir l'intime conviction que Salim avait pour tâche d'embrigader et de recruter des jihadistes.

Par ailleurs, le journal espagnol El Pais a affirmé il y a quelques jours que 16 jihadistes marocains ayant résidé dans la péninsule ibérique sont morts en Syrie.

Il s'agit d'Ismael Afalah, Hakim Benajiba, Redouane Ben Sbih, Abdelaziz Chamout, Nourredine El Metoubi, Bilal El Helka, Abdelaziz El Morabet, Abdellah Mustapha El Sharif, Mustapha Ennassar, Mohamed Katoubi, Mustapha Oulguor, Ayoub Tribak, Jawad Taufik, Haj Tabbai, Mouhsine Mechihdan et Youssef Monbriktob.

La même source a également indiqué que 9 Espagnols d'origine marocaine ont trouvé la mort dans des combats en Syrie, affirmant que 139 combattants ont quitté l'Espagne pour rallier les groupes terroristes

en Syrie et en Libye dont 26 d'entre eux sont retournés au pays alors que 15 autres ont été emprisonnés.

Yonhap News Agency
S. Korea holds National Security Council meeting
Wednesday, 03 February 2016
Section: general

South Korea held a National Security Council meeting Wednesday to deal with North Korea's planned rocket launch, an official said.
Cheong Wa Dae, South Korea's presidential office, plans to announce South Korea's position at 8:30 a.m., presidential spokesman Jeong Yeon-guk told reporters.

Jeong said Tuesday that South Korea is taking necessary measures over the North's planned launch of a long-range rocket.

The North has notified U.N. agencies that it will launch an Earth observation satellite sometime between Feb. 8-25, confirming concerns that the communist nation is readying for a banned long-range rocket launch just a few weeks after its fourth nuclear test.

Yonhap News Agency
S. Korea taking necessary measures over N.K. rocket launch plan: Cheong Wa Dae
Wednesday, 03 February 2016
Section: general

South Korea is taking measures necessary to cope with North Korea's planned launch of a long-range rocket, Cheong Wa Dae said Tuesday.
Presidential spokesman Jeong Yeon-guk made the remark to Yonhap News Agency, saying the country is "keeping a close eye on moves related to North Korea's long-range missile launch."

The North has notified U.N. agencies that it will launch an earth observation satellite Feb. 8-25. That confirmed the concern that the communist nation is readying for a banned long-range rocket launch just a few weeks after its fourth nuclear test.

Yonhap News Agency
Two Aegis destroyers to monitor N. Korea's missile launch
Wednesday, 03 February 2016
Section: general

South Korea's military has put two of its three Aegis destroyers on a mission to detect and track North Korea's missile as the communist country appears to be gearing up for a long-range missile launch, a military source said Wednesday.
The North has informed international maritime, aviation and telecommunication agencies that it will launch a rocket to put satellite 'Kwangmyongsong' into orbit, taking a preparatory step to launch a long-range missile.

The outside world denounces the satellite launch as a pretext for testing a ballistic missile, which the North is developing in defiance of the United Nations Security Council.

"The military has increased the number of Aegis destroyers from one to two in preparation against the possibility of North Korea's long-range missile," the military official said.

Now, one is standing by in the Yellow Sea and the other is waiting in the waters south of Jeju Island, the official said.

Special features of the Navy's destroyers equipped with the U.S.-developed Aegis Combat System include a multi-function radar system that can detect ballistic missiles coming from some 1 kilometer away.

It took 54 seconds for the Sejong the Great Aegis destroyer to catch North Korea's long-range missile launched in December 2012.

The locations of the two deployed warships are meant to track the first and second stages of North Korea's multi-stage missile when it is launched.

Along with the destroyers, South Korea has also given a mission to the early warning and control aircraft 'Peace Eye' and the anti-ballistic radar 'Green Pine' as the country is bracing for the missile launch, according to other officials.

Reuters
North Korea tells UN agencies it plans satellite launch
Wednesday, 03 February 2016
Section: general

North Korea told U.N. agencies on Tuesday it plans to launch a satellite as early as next week, a move that could advance the country's long-range missile technology after its fourth nuclear test on Jan. 6. News of the planned launch between Feb. 8 and Feb. 25 drew fresh U.S. calls for tougher U.N. sanctions already under discussion in response to North Korea's nuclear test. State Department spokesman John Kirby said the United Nations needed to "send the North Koreans a swift, firm message."

Pyongyang has said it has a sovereign right to pursue a space programme by launching rockets, although the United States and other governments worry that such launches are missile tests in disguise.

"We have received information from DPRK regarding the launch of earth observation satellite 'Kwangmyongsong' between 8-25 February," a spokeswoman for the International Maritime Organization, a U.N. agency, told Reuters by email.

The International Telecommunication Union, another U.N. agency, told Reuters North Korea had informed it on Tuesday of plans to launch a satellite with a functional duration of four years, in a non-geostationary orbit.

It said the information provided by North Korea, whose official name is the Democratic People's Republic of Korea, was incomplete, and that it was seeking more details.

U.S. officials said last week that North Korea was believed to be making preparations for a test launch of a long-range rocket, after activity at its test site was observed by satellite.

The White House said on Tuesday that any satellite launch by North Korea would be viewed as "another destabilizing provocation." U.S. Assistant Secretary of State Daniel Russel, the senior U.S. diplomat for East Asia, told reporters it "argues even more strongly" for tougher U.N. sanctions.

Russel said a launch, "using ballistic missile technology," would be an "egregious violation" of North Korea's international obligations.

He said it showed the need "to raise the cost to the leaders through the imposition of tough additional sanctions and of course by ensuring the thorough and rigorous enforcement of the existing sanctions."

Russel said negotiations were "active" at the United Nations and that the United States and North Korea's main ally China "share the view that there needs to be consequences to North Korea for its defiance and for its threatening behaviours."

"Our diplomats are in deep discussion in New York about how to tighten sanctions, how to respond to violations," he said.

Asked about China's cautious response to U.S. calls for stronger and more effective sanctions on Pyongyang and Beijing's stress on the need for dialogue, Russel said:

"Yet another violation by the DPRK of the U.N. Security Council resolution, coming on the heels of its nuclear test, would be an unmistakable slap in the face to those who argue that you just need to show patience and dialogue with the North Koreans, but not sanctions."

White House spokesman Josh Earnest said China had "unique influence over the North Korean regime" and added: "we ... certainly are pleased to be able to work cooperatively and effectively with the Chinese to counter this threat."

Earlier on Tuesday, China's envoy for the North Korean nuclear issue arrived in the capital Pyongyang, the North's KCNA news agency reported.

North Korea last launched a long-range rocket in December 2012, sending an object it described as a communications satellite into orbit.

Western and Asian experts have said that launch was part of an effort to build an intercontinental ballistic missile.

North Korea has shown off two versions of a ballistic missile resembling a type that could reach the U.S. West Coast, but there is no evidence the missiles have been tested.

Pyongyang is also seen to be working to miniaturise a nuclear warhead to mount on a missile, but many experts say it is some time away from perfecting such technology.

North Korea said it successfully tested a hydrogen bomb last month but this was met with scepticism by U.S. and South Korean officials and nuclear experts. They said the blast was too small for it to have been a full-fledged hydrogen bomb.

Jakarta Post
Police to probe terrorist propaganda videos
Wednesday, 03 February 2016
Section: general

Police have said they will investigate several propaganda videos allegedly circulated by the Islamic State (IS) group via the internet.
Several videos had been brought to the attention of the police, National Counterterrorism Agency (BNPT) chief Comr. Gen. Saud Usman Nasution said on Tuesday, adding that the force would study them to gauge their authenticity and provenance.

Saud said the police's cybercrime division would handle the investigation, as it was not under the BNPT's jurisdiction. "They have a special team. It's not under our remit, but the remit of the police," Saud said on Tuesday as quoted by kompas.com.

The videos in question appear to contain threats, in Indonesian, against police and government officials. The security officers believe that the videos were released by IS.

The extremist group also recently released a threatening video to the Malaysian government, which is currently stepping up operations to detect and detain suspected IS-affiliated individuals.

As previously reported by The Straits Times, in a video in the Malay language, the Malaysia-Indonesia IS unit -the Katibah Nusantara - said it would take revenge for the capture of its members.

Entitled "Mesej Awam Kepada Malaysia" (A Public Message for Malaysia), the video warns: "If you catch us, we will only increase in number, but if you let us be, we will draw closer to our goal of bringing back the rule of the caliphs."

Washington Post
The British want to come to America -- with wiretap orders and search warrants
Friday, 05 February 2016
Byline: Ellen Nakashima, Andrea Peterson

Washington - If U.S. and British negotiators have their way, MI5, the British domestic security service, could one day go directly to American companies like Facebook or Google with a wiretap order for the online chats of British suspects in a counter-terrorism investigation.
The transatlantic allies have quietly begun negotiations this month on an agreement that would enable the British government to serve wiretap orders directly on U.S. communication firms for live intercepts in criminal and national security investigations involving its own citizens. Britain would also be able to serve orders to obtain stored data, such as emails.

The previously undisclosed talks are driven by what the two sides and tech firms say is an untenable situation in which foreign governments such as Britain cannot quickly obtain data for domestic probes because it happens to be held by companies in the United States. The two countries recently concluded a draft negotiating document, which will serve as the basis for the talks. The text has not been made public, but a copy was reviewed by The Washington Post.

The British government would not be able to directly obtain the records of Americans, if a U.S. citizen or resident surfaced in an investigation. And it would still have to follow the country's legal rules to obtain warrants.

Any final agreement will need congressional action, through amendments to surveillance laws such as the Wiretap Act and the Stored Communications Act.

Senior administration officials say they have concluded that British rules for data requests have "robust protections" for privacy and that they will not seek to amend them. But British and U.S. privacy advocates argue that civil liberties safeguards in Britain are inadequate.

The negotiating text was silent on the legal standard the British government must meet to obtain a wiretap order or a search warrant for stored data. Its system does not require a judge to approve search and wiretap warrants for surveillance based on probable cause, as is done in the United States. Instead, the home secretary, who oversees police and internal affairs, approves the warrant if that cabinet member finds that it is "necessary" for national security or to prevent serious crime and that it is "proportionate" to the intrusion.

If U.S. officials or Congress do not seek changes in the British standards, "what it means is they're going to allow a country that doesn't require independent judicial authorization before getting a wiretap to continue that practice, which seems to be a pretty fundamental constitutional protection in the United States," said Eric King, a privacy advocate and visiting lecturer in surveillance law at Queen Mary University of London. "That's being traded away."

Senior administration officials said that they are seeking to relieve the pressure on U.S. companies caught in a "conflict of laws." The United States bars American firms from providing intercepts to anyone but its government after U.S. law enforcement has obtained a court order. Britain wants to directly compel the production of the data and has already passed legislation to make that happen.

To obtain stored emails, a foreign government must rely on a mutual legal assistance treaty (MLAT) by which the country makes a formal diplomatic request for the data and the Justice Department then seeks a court order on its behalf -- a process that is said to take an average of 10 months.

"This has been an issue with the U.K. and other countries for a number of years," said one senior administration official, who like several others spoke on the condition of anonymity to discuss the negotiations. "Because of technological changes, the U.K. can no longer access data in the U.K. like they used to be able to, and more and more, U.K. nationals -- including criminals in their country -- are using providers like Google, Facebook, Hotmail. The more they are having challenges getting access to the data, the more our U.S. providers are facing a conflict of laws."

Administration officials and officials from several tech firms said the stakes are high if no agreement is reached.

They fear that if the trend continues, more foreign governments will force U.S. firms to host their data in those countries -- a practice known as "data localization." They also fear passage of laws, like the one in Britain that has not yet been enforced, requiring foreign firms doing business in their country to comply with their surveillance orders, even if the orders conflict with U.S. law.

"We're reaching a moment where the status quo is no longer workable," said an official at a major tech firm. "We're concerned about the mounting frustration and the inability of foreign governments, including the U.K., to receive responsive data in law enforcement investigations in a timely manner."

Up to now, he said, U.S. firms have "held their ground" when pressured to turn over data or conduct wiretaps in conflict with U.S. law. "Increasingly, that's not something we'll be able to do," he said.

Last week, the White House gave the State Department the green light to begin the formal negotiations. Officials stressed that they were in the very early stages of the talks, which probably will go on for months. They said they will seek to ensure that any agreement protects civil liberties.

But Gregory Nojeim, senior counsel at the Center for Democracy & Technology, a Washington-based privacy group, said: "I'm very concerned that this agreement could represent a dumbing down of surveillance standards that have always pertained in the United States. Enabling foreign governments to conduct wiretapping in the United States would be a sea change in current law. I don't see Congress going down that road."

Senior administration officials said that the goal is to help a close ally investigate serious crimes -- something that the United States has a shared interest in.

One potential example: London police are investigating a murder-for-hire plot, and the suspects are using Hotmail to communicate, and there's no connection to the United States other than the fact that the suspects' emails are on a Microsoft server in Redmond, Wash. Today, the police would have to use the MLAT process and wait months.

"Why should they have to do that?" said the administration official. "Why can't they investigate crimes in the U.K., involving U.K. nationals under their own laws, regardless of the fact that the data happens to be on a server overseas?"

Jennifer Daskal, a national security law professor at American University and a former Justice Department official, said before U.S. firms are asked to turn over data, they should be assured that the legal standard for the request is sufficiently high. It need not mimic precise U.S. standards, she said, but should at least require that requests be targeted, subject to independent review and privacy protections that weed out irrelevant information. If not in the agreement, Congress should mandate requirements, said Daskal, who is part of a coalition of privacy groups, companies and academics working on the issue.

A second administration official said that U.S. officials have concluded that Britain "already [has] strong substantive and procedural protections for privacy." He added: "They may not be word for word exactly what ours are, but they are equivalent in the sense of being robust protections."

As a result, he said, Britain's legal standards are not at issue in the talks. "We are not weighing into legal process standards in the U.K., no more than we would want the U.K. to weigh in on what our orders look like," he said.

British Home Office officials declined to comment directly on the talks. "We are clear about the need for law enforcement and the security and intelligence agencies to have the powers they need in the digital age, subject to strict safeguards and world-leading oversight arrangements," a representative said in a statement to The Post.

The agreement is intended to be reciprocal, so that the U.S. government could directly request wiretaps or stored data of a British provider as long as the target is American and not a British citizen.

The Independent (UK)
British government to fight UN ruling that it 'arbitrarily detained' WikiLeaks founder
Friday, 05 February 2016
Byline: Lizzie Dearden

London - The British Government is fighting a United Nations ruling that accused it of "arbitrarily detaining" Julian Assange in violation of his fundamental human rights.
The UN Working Group on Arbitrary Detention called on the UK and Sweden to immediately end the WikiLeaks founder's "deprivation of liberty" and compensate him.

But a spokesperson for the British Government said it would "formally contest" the findings and denied that Mr Assange's stay at the Ecuadorian Embassy in London constituted arbitrary detention.

"This changes nothing. We completely reject any claim that Julian Assange is a victim of arbitrary detention," he added.

"The opinion of the UN Working Group ignores the facts and the well-recognised protections of the British legal system.

"He is, in fact, voluntarily avoiding lawful arrest by choosing to remain in the Ecuadorean embassy."

The spokesperson said that as a rape allegation against Mr Assange is still being investigated in Sweden and subject to a European arrest warrant, the UK has a legal obligation to extradite him.

Britain is also not subject to the 1954 Caracas Convention, meaning it does not have to recognise diplomatic asylum.

"We are deeply frustrated that this unacceptable situation is still being allowed to continue," the Government spokesperson added.

"Ecuador must engage with Sweden in good faith to bring it to an end.

"Americas Minister Hugo Swire made this clear to the Ecuadorean Ambassador in November, and we continue to raise the matter in Quito."

When the findings were leaked on Thursday, Mr Assange said he would leave the Embassy if the panel ruled against him and accept arrest by British police.

"However, should I prevail and the state parties be found to have acted unlawfully, I expect the immediate return of my passport and the termination of further attempts to arrest me," he said in a statement.

Swedish prosecutors want to question him over allegations of rape stemming from a working visit he made to the country in 2010, when revelations made by WikiLeaks on the Iraq and Afghanistan wars were reverberating around the world.

But Mr Assange fears Sweden will extradite him to authorities in the US where he could be put on trial over the publication of thousands of classified military and diplomatic documents.

He has consistently denied the rape allegations but refused to return to Sweden and eventually sought refuge in the Ecuadorean embassy in London, where he has lived since June 2012.

Bloomberg View
Silicon Valley Should Join the War on Terrorism
Friday, 05 February 2016
Byline: Senator John McCain

Comment - Islamic State and other terrorist groups espouse a primitive ideology and rely on medieval tactics, but they use distinctly modern tools: social media and communications platforms designed to evade our most advanced efforts to fight terrorism.
By taking advantage of widely available encryption technologies, terrorists and common criminals alike can carry out their agendas in cyber safe havens beyond the reach of our intelligence agency tools and law enforcement capabilities. This is unacceptable. Americans of course need access to technology that keeps our personal and business communications private, but this must be balanced with concerns over national security.

Some technologists and Silicon Valley executives argue that any efforts by the government to ensure law- enforcement access to encrypted information will undermine users' privacy and make them less secure. This position is ideologically motivated and profit-driven, though not without merit. But, by speaking in absolute terms about privacy rights, they bring the discussion to a halt, while the security threat evolves. Top cryptologists have reasonably cautioned that "new law enforcement requirements are likely to introduce unanticipated, hard to detect security flaws," but this is not the end of the analysis. We recognize there may be risks to requiring such access, but we know there are risks to doing nothing.

To be clear, encryption is often a very good thing. It increases the security of our online activities, provides the confidence necessary for economic growth through the Internet, and protects our privacy by securing some of our most important personal information, such as financial data and health records. Yet as with many technological tools, terrorist organizations are using encryption with alarming success.

For example, "end-to-end" encryption -- which allows communications and data shared across devices and platforms to be seen only by the individual holding the receiving device -- protects information even from a lawful court order backed by probable cause. Apple, Google and other companies have recently made this level of encryption the default setting on many phones and operating systems. The result will be digital crime scenes to which law enforcement has no access.

Encryption technology is easy to get hold of and doesn't require much sophistication to use. Islamic State knows this, and keeps close tabs on which technologies to direct its followers to in order to evade government surveillance. A recent article in the journal Foreign Affairs called it "the first terrorist group to hold both physical and digital territory: in addition to the swaths of land it controls in Iraq and Syria, it dominates pockets of the internet with relative impunity."

This isn't just a problem in Iraq and Syria. The jihadists' followers and adherents use encryption to hide their communications within the U.S. FBI Director James Comey recently testified that the attackers in last year's Garland, Texas, shootings exchanged more than 100 text messages with an overseas terrorist, but law enforcement is still blinded to the content of those texts because they were encrypted.

In October, President Barack Obama announced that he would not seek legislation requiring government access to such data -- a capability that would have been routine for law enforcement before the age of advanced encryption. The administration is instead asking for the industry's voluntary assistance in modifying technology to meet our security needs. Progress in this outreach to industry has been made, Comey said in November, and "venom has been drained out of the conversation."

But this is not enough. Efforts to eliminate cyber safe havens must not be marked by the same half-measures that have defined this administration's military fight against Islamic State. The president needs to define a coherent strategy to address the increasing use of encrypted communications by those who wish America and its allies ill.

This would mean building coalitions, domestically and internationally, to update laws and international conventions that allow law enforcement agencies across the world lawful access to digital criminal evidence.

As part of this effort, Congress should consider legislation that would require U.S. telecommunications companies to adopt technological alternatives that allow them to comply with lawful requests for access to content, but that would not prescribe what those systems should look like. This would allow companies to retain flexibility to design their technologies to meet both their business needs and our national security interests. Such a proposal would be similar to legislation enacted in the 1990s that ensured law enforcement agencies are able to lawfully wiretap without mandating how those systems ought to be designed.

We have to encourage companies and individuals who rely on encryption to recognize that our security is threatened, not encouraged, by technologies that place vital information outside the reach of law enforcement. Developing technologies that aid terrorists like Islamic State is not only harmful to our security, but it is ultimately an unwise business model.

The threat posed by the status quo is unacceptable. The use of technology by terrorist groups to recruit members, spread hateful ideology and plot attacks will only expand. But, just as Islamic State's growth

through the establishment of safe havens in Iraq and Syria was not inevitable, the group's ability to use technology to the same end does not need to be either.

Overseas hackers linked to threats
Friday, 05 February 2016
Byline: Steve Rice

Canberra - Bomb threats that have shaken schools in South Australia and around the nation may have emanated from overseas or from the so-called dark web.
Authorities are understood to believe sophisticated hackers are behind the attacks, which have now hit much of the country since last Friday and appear to be designed to cause unnecessary disruption and inconvenience.

NSW Police have previously said the threats appeared to have come from overseas, with no credible evidence they could be carried out in Australia.

There is also no indication that terror groups are responsible and counter-terrorism officers are not involved in investigations. Other intelligence suggests the attacks are believed to have emerged from the dark web - a vast layer of the worldwide web favoured by criminals because it is not easily accessible to ordinary internet users - with someone accepting money for sending automated recorded messages to school phones.

Dozens of schools in Victoria, Queensland, NSW and the ACT have been targeted in the past week. Schools across Britain, US, France, Netherlands, Sweden, Norway, Japan and Guam have received similar threats but authorities have not confirmed any links. They also have not been able to establish whether an international group of hackers called Evacuation Squad, which claimed responsibility for attacks on Twitter, was responsible.

An Australian Federal Police spokeswoman said investigators were aware of threats made to schools in several states and territories, adding: "The AFP takes all threats such as this seriously and can assure the community its cybercrime operations area is working with partner law enforcement agencies in Australia and overseas to actively pursue those who make threats.

"State and territory police are working in partnership with education departments and other key stakeholders on responding to such threats.

"This is a timely reminder to the Australian public that authorities take these incidents very seriously.

"Making such threats is a serious criminal offence and every effort will be made to identify the person or persons responsible."South Australia Police warned yesterday those responsible for making such threats

faced serious charges Anyone with information about the hoaxes should contact Crime Stoppers on 1800 333 000.

Radical shift for Google searches
Friday, 05 February 2016
Byline: Rob Harris

Canberra - Google will attempt to divert Australian online searches for extremist material towards warnings about radicalisation.
Search engine and social media companies, including Facebook and Twitter, will join a Federal Government-led campaign pushing potential extremists towards a "counter-narrative".

Online firms are facing increased pressure tackle the propaganda put online by Islamic State militants and supporters who try to radicalise young people.

In the US this week, Google revealed it is undertaking a pilot program to divert searches for IS-related material towards sites to debunk the propaganda.

More than 50,000 IS-related accounts exist on Twitter alone. Facebook said it had also become a "hostile place" for IS and that keeping people safe was its "number one priority".

Minister Assisting the Prime Minister for Counter Terrorism, Michael Keenan, will hold discussions with the online giants later this month.

He urged parents, community leaders, teachers and friends to watch for warning signs that someone they know might be radicalising, and to be particularly wary about their online activities. "The online environment is being exploited by violent extremists to spread their propaganda and recruit others and their targets are getting younger and younger," Mr Keenan said.

"Just as parents and families have gained greater understanding of the dangers posed by online sexual predators, there needs to be increased awareness that extremists are using similar tactics to recruit and motivate susceptible individuals, particularly young people." The Commonwealth has committed $21 million to countering violent extremism online.

It has expanded relationships with companies such as Google and Facebook in a bid to eradicate terrorist propaganda targeting Australian youths.

Twitter is understood to have removed "tens of thousands" of extremist accounts in the past year and has more than 100 staff monitoring content around the world.

The Federal Government is also reviewing programs that provide teachers with information to spot teens at risk of being radicalised.A number of school-aged children in Melbourne are also -undergoing deradicalisation programs after they were found to be considering going to the Middle East as jihadists.

Haaretz
Israel's Military Censor Takes on Dozens of Bloggers, Facebook Pages
Friday, 05 February 2016
Byline: Gili Cohen

Jerusalem - Chief Military Censor Col. Ariella Ben-Avraham recently officially contacted some 30 bloggers and administrators of Facebook pages requesting that they submit items for review by the censor ahead of publication, provided they concern areas requiring review, according to the emergency regulations in force since the state's founding.
There are several dozen subjects on this list - mainly having to do with the military or security, or information about the enemy - that media outlets are required to submit to the censor for review. Failure to submit such items to the censor constitutes an offense and defense regulations enable the censor to file a complaint with law enforcement.

Up to now, the censor has examined the sensitivity of information prior to publication mainly with the major media outlets, but also with rescue organizations, cities near the front lines and more. Now the military censor is asking dozens of operators of Internet sites that have a relatively large following to proceed similarly. These pages are mainly ones that give news flashes online, forums dealing with the army and security, blogs that describe themselves as dealing with the news, and certain popular Facebook pages.

Yossi Gurevitch who runs the "George's Friends" page, which calls itself a "blog for social, political and media criticism," wrote on his Twitter account Wednesday that the military censor informed him that it "must see posts and status updates" that he writes about the Israel Defense Forces and the security establishment ahead of time. Gurevitch said he did not intend to heed this demand and was also going to see whether there were any legal steps he could take against it.

Ben-Avraham also contacted dozens of operators of popular public Facebook pages that have at least several thousand followers. The censor wanted to obtain information on how to contact the people who manage these Web pages.

In recent years, the censor has tried to adapt to the developments in the world of communications, and began monitoring social networks such as Facebook and Twitter, as well as blogs. In the past the former chief censor, Brig. Gen. Sima Vaknin-Gil, said, "I have no intention of entering into the personal diary of every citizen, and I want to make it clear that we are not looking at the Facebook pages of private individuals."

Up to now, the censor only took retroactive action against publications of material considered harmful to national security. The censor's computerized monitoring systems were used to examine online publications by established media outlets and others. But now the censor is asking independent publishers to submit their reports on matters concerning the military and security for prior review, before publication. This is a policy change that the censor says is required for adapting to the Internet age. The censor's office stressed that they are not monitoring private pages, but only ones that are defined as public (and appear as "media" in the social networks).

The censor in Israel operates in accordance with the 1945 Emergency Regulations, which require media outlets to submit to it, prior to publication, any material requested by the censor. Data from the censor's office shows that on average, 70 percent of the information requested is submitted in accordance with the aforementioned list of topics. Of all the reports that were not submitted to the censor, said Vaknin-Gil, only a very few would potentially have harmed national security.

In an article she published in the Military Advocate General's journal "Law and Military" about six months ago, Vaknin-Gil proposed changing the model for applying censorship since it is no longer in keeping with the changes wrought by the Internet, and also advocated that new legislation be enacted regarding the censor's activity, which would include a curtailing of the censor's authority.

Dr. Tehilla Shwartz Altshuler, head of the media reform program at the Israel Democracy Institute, called the censor's directive "extremely borderline, in terms of the law based on the Emergency Regulations."

"On the face of it, it looks like adding insult to injury: Not only do the defense regulations constitute an anti- democratic arrangement that does not recognize the right to free expression, the censor is now asking to expand these bad arrangements to the digital world, instead of fixing them. It is unreasonable that the system chooses to expand [the censor's] authority instead of using it in proper measure, under the perception that the world of 2016 can continue to operate in the reality of the beginning of the 20th century."

The military censor responded: "The fundamental value of freedom of expression, its importance and the need to correctly balance it with safeguarding national security, is always at the forefront of the censor's mind, and this applies to Internet publications too. The authorities of the censor, which are defined in the law and subject to the oversight of the Supreme Court, apply to every type of publication regarding national security, whether it be through traditional media outlets or another type of publication.

"The censor does not block the publication of all security-related information, but only of material that it is deemed will almost certainly harm national security. From time to time, the censor contacts relevant parties in order to underline the obligation to submit items concerning security for review prior to publication. In the past week, a number of Facebook pages that define themselves as news or breaking news pages were contacted in this way. No requests were made to remove any material.

"Let it be made very clear that these are not private profiles. They are all public profiles that define themselves as 'media' and are open to public scrutiny."

Times of Israel
Hack attacks on electricity, water systems already here, says expert
Friday, 05 February 2016
Byline: David Shamah

Jerusalem - You don't have to be paranoid to imagine that one day soon hackers will gain control of an important infrastructure system, like a water distribution system or a power plant - as apparently happened in Ukraine in December, where what are suspected to be Russian hackers used malware to cause a blackout in the country's Ivano-Frankivsk and other regions.
But what many people should be fearful of is the apparently blasé attitude of many government officials and even industry workers to protecting those infrastructure systems, said Irit Potter, CEO of Israeli security consulting group IP-Sec.

"Governments in the developing world are spending a lot of money to upgrade their communications infrastructure, developing connected smart cities and systems to improve the lives of residents - but security is barely a second thought for many of them," said Potter on the sidelines of the CyberTech 2016 event in Tel Aviv last week. "We work in many places in Latin America, and we see first-hand how a lax attitude leads to lax security."

Thousands of people from Israel and around the world converged at Cybertech 2016 to check out the latest in Israeli cyber-defense and detection technology - but that tech can only protect if it is implemented. For various reasons, the need for serious cyber-security has not yet been absorbed in many places in the developing world, said Potter. "In some countries there is more awareness but it is localized, perhaps on a specific server or department. There is no overall awareness and policy-setting in many of these places."

Certainly not for SCADA (supervisory control and data acquisition) systems, the systems that are usually part of closed networks that traditionally are used to control infrastructure. When an electric company needs to reroute power to different substations, it will use its closed SCADA network to make that change. Unconnected to any other networks - much less the Internet - and accessible only from specific computers, the SCADA systems were considered safe from hackers.

That traditional perception is part of the problem, said Potter. "In many cases, the only way to invade a SCADA network is to physically tap into communications equipment at the site of a substation or other facility, or to take over the power plant itself. But with the innovations involved in smart city technology, it hasn't yet sunk in for many administrators that their SCADA networks are now just as vulnerable as the Internet - and maybe more at risk."

The Ukraine hack, reported first by computer security specialist ESET, is a perfect example of how this works, said IP-Sec vice- president Moshe Raz.

"Part of the new trend in connected SCADA networks is a conversion from the traditional UNIX systems, which are hard to learn and difficult for hackers to gain control of, to the new user-friendly Windows systems."

According to ESET, that is apparently what happened in Ukraine; hackers used social engineering to get power plant workers to open infected Microsoft Office documents, which deliver malware that make their way to control systems.

That, the group said, appears to be what caused the December 23, 2015 blackouts. Security officials were able to find the virus and stop it from spreading.

"Although in Ukraine, Christmas is traditionally not celebrated on December 24th and 25th, a group of cyber- criminals has chosen this time of year to deliver a dark 'present' to a few hundred thousand people and many more might have also been this 'lucky', had the malware not been detected," ESET said, adding that it was likely Ukraine, and other places, would have to wrestle with this threat in the future as well.

That, finally, may wake up officials to the importance of security - and especially training personnel at infrastructure and other important facilities to deal with security issues, said Potter.

IP-Sec, which has been in business since 2004, does just that, and is considered one of the top security consulting firms in the world on SCADA defense. "We train personnel to identify threats, and help them learn what to do about those threats," said Potter. Among it customers in Israel are the large majority of large enterprises and government offices - "one of our smaller customers in Israel is the Tel Aviv Stock Exchange," said Potter - and the group works with governments around the world, and especially in Latin America, to train workers to deal with cyber-attacks.

"We work with organizations for about a year, setting up scenarios that they will have to face in real life, and help them learn how to deal with them on their own," said Potter. "In addition, we monitor their systems, alerting them on when there is a problem, and advising them on what action to take." Eventually, it's expected that the team will be able to handle things on their own. "Each security scenario is custom-designed for customers, so they can get a good sense of what they are up against."

Even with this intensive training, teams don't always get it - so one of IP-Sec's important activities is showing those in charge the bottom line costs of ignoring cyber-security. "Hackers cost companies money - even lives, if systems in places like hospitals are harmed - and for various reasons, not all public officials make the connection between cyber-security and financial security. We make sure they understand that. Once they do, you can believe they are a lot more amenable about ensuring the safety of their systems."

Khaleej Times
Baghdad in bid to silence Daesh's online propaganda machine
Friday, 05 February 2016

Dubai - Iraq is trying to persuade satellite firms to halt Internet services in areas under Daesh's rule, seeking to deal a major blow to the group's potent propaganda ma-chine which relies heavily on social media to inspire its followers to wage war. Social media apps like Twitter and Telegram are scrambling to limit Daesh's cyber-activities. So far that has proven to be a cat-and-mouse-game, with the group re-emerging through other accounts with videos showing beheadings and extolling the virtues of living in a caliphate. For Iraq then, the key is to stop the militant group from accessing the web at all - a feat, which if achieved, could sever a significant part of a propaganda campaign that has inspired deadly attacks in the West. Mobile networks are largely in-operable in the Daesh-held swathes of Iraq, areas which also have little fixed-line broadband infrastructure.
Militants instead use satellite dishes to connect to the web, or illicit microwave dishes that hook them into broadband networks in government-held areas, three telecoms industry sources said. There are many challenges for the Iraqi authorities: within the satellite Internet industry, no one assumes responsibility for identifying and vetting end users, the territory under Daesh's often shifts, and a complex web of middlemen makes it tough to pinpoint who is selling militants Internet capacity. The group has control over or operates in parts of western Iraq and northern and central Syria which have a population of up to 5 million people, according to the International Institute for Strategic Studies, most of them in Iraq.

To connect to the web via a satellite, all that is required is a V-sat terminal - a small dish receiver and a modem - and an Internet subscription. Daesh uses "the V-sat system to access the Internet in areas it controls," an Iraqi communications ministry official said. "What's still difficult for us is controlling V-sat receivers which connect directly to satellites providing Internet services that cover Iraq." In the Daesh-held northern city of Mosul, V-sat units can be bought for about $2,000-$3,000 at a sprawling electronics market near the university. The official said Iraq was in talks with satellite companies covering Iraq to halt Internet services to Daesh-controlled areas, adding that he had received "positive sig-nals" from them, but "the process is complicated and needs more time and procedures.

"Even if Iraq cuts off Daesh from satellite Internet, the group can re-main online through illegal networks set up by businessmen in towns such as Kirkuk, Arbil and Duhok. These entrepreneurs buy data capacity from fixed broadband providers, passing through many middle-men first. They connect this to microwave dishes, which have a range of about 40 kilometres to eventually reach end users in Daesh-controlled areas, said the three industry sources. "It's two hops via microwave dishes to Mosul," said the third industry source." Their activities have very little chance of being detected. If you can buy a certain amount of capacity for $100 in Arbil and sell it on for $500, it's good business."

Christian Science Monitor
How NSA reorganization could squander remaining trust
Friday, 05 February 2016
Byline: Jason Healey

Column - The coming reorganization of the National Security Agency may be a smart move for the agency but it'll hurt America's long-term national security interests.
At a recent talk at the Washington think tank Atlantic Council, NSA director Adm. Michael Rogers said he wanted to better integrate the agency's Information Assurance Directorate - its defensive arm that protects US systems and information - and the Signals Intelligence Directorate - the offensive branch that carries out spying operations.

The reorganization is needed, he said, because with these two separate divisions "we created these two amazing cylinders of excellence and then we built walls of granite between them."

As a veteran of the NSA, I suspect this reorganization will be good for the agency. But it is unlikely to create an agency that is more open, more trusted, or more able to work with America's true cyber defenders in the private sector.

There are significant reasons to believe that what may help the NSA will be bad for the US - or actually anyone who uses the Internet.

The NSA's cyberdefense team, widely seen the best in the US government (and maybe the world), needs to work publicly, openly, and internationally. But if further integrated with NSA's spies, it will be forever compromised.

The Information Assurance Directorate is respected for its technical skills, but many critics and observers see it as tainted because of what Edward Snowden - a former NSA contractor who turned government leaker - revealed about the agency's signals division.

The clearest example of that tarnish is evidence that the NSA intentionally weakening a cryptographic standard, handicapping all of our security for a better chance to breach adversaries. That meant that the needs of the spies were prioritized over those meant to defend the rest of us. And that's something that will likely continue in the reorganized agency.

Who in Silicon Valley or Europe will be able to trust that kind of organization?

Even with a separate information division, many companies and privacy advocates were convinced the newly passed information sharing act was simply another vector for passing along data to NSA's digital spies. With the two parts of the agency more integrated, such concerns will be even harder to dismiss.

Likewise, if a multinational company calls NSA now for technical help, as Google and Sony have done in the past, can executives really assure their boardrooms that their corporate data won't end up in a spy's database?

Gen. Michael Hayden, one of Rogers's predecessors, specifically kept the Information Assurance Directorate separate, as he "needed an organization that was, and was seen to be, committed to defense."

The separation within the agency, from this perspective, isn't about creating stovepipes but building a firewall to protect our privacy and the information division's independence.

In fact, the technologists and cyberdefenders in Information Assurance have long needed to be integrated less with secretive the agency's spies, and more with other parts of the government and the private sector. A better option would have been splitting off Information Assurance as the core of a truly independent and robust cyber department or agency.

That option is now closed. Once the cards are shuffled into the deck, they will be all but impossible to separate.

Note: Jason Healey is senior research scholar at Columbia University's School of International and Public Affairs and senior fellow at the Atlantic Council. He began his career as a US Air Force signals intelligence officer in Alaska, NSA, and the Pentagon.

The National (UAE)
The cutting edge of technology on show at Drones for Good competition
Friday, 05 February 2016
Byline: Nadeem Hanif

Dubai - Drones that can fly and travel under water, as well as support rescue efforts, are among the finalists of this year's UAE Drones for Good competition.
In the national category of the semi-finals at the Dubai Internet City on Thursday, Buildrone's construction and repair aerial robot drone, ReefRover's drone for studying underwater ecosystems, and FlyLab's drone for the education sector advanced into the finals.

The creators of FlyLab's drone are Ibrahim and Mohammed El Badawi. The siblings built the machine with off-the-shelf parts to help students gain knowledge about the environment and support classroom learning.

"During our display, we used the drone to measure the atmosphere by taking various readings," said Ibrahim. "But the great thing is that this technology can be used in a whole range of subjects like physics, art and other sciences."

The ReefRover team's drone was designed to aid marine research, while Buildrone impressed the judges with their machine that can detect damage to pipelines and conduct repairs. The eventual winner will take home Dh1 million.

Saif Al Aleeli, the competition's coordinator general, said innovation was key to building the future and using technology in the service of humanity.

"The drones sector is certainly in its early stages but we are confident it will evolve as a major contributor to the world economy." said Mr Al Aleeli, who is also the chief executive of the Dubai Museum of the Future Foundation.

In the international category, which carries a top prize of US$1 million (Dh3.67m), 19 teams from around the world on Thursday competed amid the buzz of rotor blades in the air.

Loon Copter's multi-rotor drone from America, 4Front Robotics' USAR Robot drone from Canada, and SenseLab's SaveME drone from Greece advanced into the finals.

Oakland University's Loon Copter drone was the most unique of its rivals, thanks to its ability to fly and travel under water like a submarine.

"We believe it's the world's first flying and swimming drone and we've already had interest from law enforcement about the concept," said Osamah Rawashdeh, the team leader and an associate professor of electrical and computer engineering at the university.

Besides surveying pipelines, the drone can also assist in search-and-rescue missions.

SenseLab's project transforms a smartphone into a little drone to support people in emergency situations, particularly those who are trapped, lost or wounded.

Its rival, 4Front Robotics's drone, is able to fly and navigate in highly confined spaces, and provide high resolution data in a matter of hours. The finals will take place on Saturday.

Wall Street Journal

A Cyberwar Update: Gen. Michael Hayden says recent government moves to protect cyberspace are too little, too late

Wednesday, 10 February 2016

Byline: John Bussey

Section: general

Interview - We're in a global cyberwar in which our corporate secrets are our chief prize. Are we up for the fight?
To get a clearer answer, The Wall Street Journal's John Bussey spoke with Gen. Michael Hayden, principal of Chertoff Group and former director of the Central Intelligence Agency and NationalSecurity Agency. Here are edited excerpts of the discussion.

MR. BUSSEY: We got some news last month. There's some legislation meant to increase cooperation between the government and business. Tell us about the bill and whether or not it helps CIOs protect corporate secrets.

GEN. HAYDEN: We're talking about CISA, the Cybersecurity Information Sharing Act. Good news, a step in the right direction. But it's too long in coming, it's too small a step. And it reveals that within any realistic planning horizon, you are largely responsible for your own defense in the cyber domain.

The government, our government will be permanently late for your cybersecurity. Look, your armed forces view cyber as a domain. Land, sea, air, space, cyber. It's a new domain. You and I have decided that this domain is so wonderful, empowering, we're going to take things we used to keep down here in a safe, in a drawer, in a wallet, and put it up here where it's largely undefended. This is the largest ungoverned space in recorded human history. There is no rule of law up here.

As taxpayers, you and I are going to want our government to defend us up here the way we have become accustomed to relying on the government for defending us down here. But there's the general sclerosis of government, and the technology is going to move much faster than any government can move. Then we have not yet decided what it is we want or what it is we will allow the government to keep us safe. You're going to have to be responsible for your safety [in the cyber domain] in a way in which you have not been required to be responsible for your safety [in the physical domain] since the closing of the American frontier in 1890.

MR. BUSSEY: It does seem that before the war on cybersecurity can be fought as a nation, we have to resolve the civil war internally over privacy.

GEN. HAYDEN: Yeah. And that's a multigenerational thing. We haven't arrived at a national consensus. In the American system, when the government doesn't show up, we generally pick up the burden ourselves. So, the good news is there's a lot of private-sector activity designed to keep us safe.

Let me explain this another way. When I think about a national-security problem, generally my instincts are the government is the prime mover. If you're into Civil War history, Gen. Grant or Gen. Lee says, "You, sir, your corps is the main body. And you, gentlemen, you will conform your movements to the movements of the main body." In government, I assumed that in cyberdefense, the main body was the government, and you shall conform your movements with the movements of the main body. In the cyber domain, you are the main body. What our government has to teach itself is that the government needs, in all but a few exceptional cases, to conform its movements to the movements of the main body, you.

MR. BUSSEY: One of the things that the private sector is doing is to look again at encryption.

GEN. HAYDEN: The issue here is end-to-end unbreakable encryption, should American firms be allowed to create such a thing. You've got Jim Comey, the director of the FBI, saying, "I am really going to suffer if I can't read Tony Soprano's email or if I've got to ask Tony for the PIN number before I get to read Tony's emails." I get it. There is an unarguable downside to unbreakable encryption. On the other side is the question: On balance, is America more or less secure with unbreakable end-to-end encryption, regardless of whether Jim can read Tony's emails?

I think Jim Comey's wrong. Jim's logic is based on the belief that he remains the main body and you should accommodate your movements to the movements of him, which is the main body. And I'm telling you, with regard to the cyber domain, he's not. You are.

MR. BUSSEY: Tell us how the landscape of threat is evolving or changing.

GEN. HAYDEN: The stealing-your-data stuff is there, and it's getting worse. Beyond that, [people are trying] not just to steal data, but to create effects. So you've got Stuxnet, which is the destruction of a thousand centrifuges at Natanz in Iran. I view it as an unalloyed good, but it was done using a weapon comprised of ones and zeros to create physical destruction.

Leon Panetta spent a lot of time in his last year or two in government talking about cyber Pearl Harbor, digital 9/11, catastrophic attack. I don't think that's what we have to worry about. I'm not frightened about the Chinese turning out all the lights east of the Mississippi. I'm not worried about that superpower, catastrophic attack.

I'm worried about the isolated, nothing to lose, "Ah, what the hell? Let's go see what happens," nation state who goes after a North American enterprise to create physical destruction to show that they can. The Sony attack is the poster child for that.

Times of Israel

Iran said to hack former Israeli army chief-of-staff, access his entire computer

Wednesday, 10 February 2016

Byline: Staff Report

Section: general

Jerusalem - A cyber-hacker working for Iran hacked the computer of a former IDF chief-of-staff, an Israeli television report said Tuesday, and gained access to the unnamed army chief's entire computer database.
The hacker was named by Channel 10 as Yaser Balaghi. He was said to have subsequently bragged about the hack, but he also inadvertently left behind a means to trace his identity. That error prompted Iran to halt the hacking operation, which targeted 1,800 people worldwide, including Israeli army generals, human rights activists in the Persian Gulf and scientists.

The Times of Israel reported on the Iranian hacking operation two weeks ago, after an Israeli cyber-security firm, Check Point, revealed its existence. Tuesday's Channel 10 report also cited information from Check Point.

Gil Shwed, CEO of Check Point Software Technologies, told Israel Radio in late January that the attack began two months earlier and that its targets received email messages aimed at sending spyware into their computers.

More than a quarter of the recipients opened the emails and thus unknowingly downloaded spyware, allowing the hackers to steal information from their hard drives.

Over the last two years, Israel has been targeted by a number of cyber-attacks. Officials say hackers affiliated with Hezbollah and the Iranian government were behind some of the infiltration attempts.

Also in late January, Energy Minister Yuval Steinitz revealed that Israel's Electric Authority was being targeted by a "severe cyber- attack," although he did not say where it was coming from.

In June, the Israeli ClearSky cyber-security company said it had discovered an ongoing wave of cyber attacks originating from Iran on targets in Israel and the Middle East, with Israeli generals again among the targets. The goal is "espionage or other nation-state interests," the firm said.

The hackers use techniques such as targeted phishing -- in which hackers gather user identification data using false web pages that look like real and reputable ones -- to hack into 40 targets in Israel and 500 worldwide, said ClearSky. In Israel the targets have included retired generals, employees of security consulting firms and researchers in academia.

Shwed warned that the pace of cyber-attacks is accelerating faster than the pace of investment in cyber safety.

Israel is second only to the United States in cyber-security technology, according to Gadi Tirosh, managing partner at Jerusalem Venture Partners, which has been one of the country's most active investors in the field.

There are currently 173 companies in Israel big enough to be backed by venture capital companies and other major investors. That does not include the hundreds of others that are bootstrapped or relying on other sources of funds; altogether, there are 430 cyber companies currently operating in Israel, according to a report released earlier this month by the Israel Venture Capital (IVC) Research Center, with an average of 52 new cyber startups established annually since 2000.

Wall Street Journal

Hackers Breach IRS Computer Systems

Wednesday, 10 February 2016

Byline: Laura Saunders, Richard Rubin

Section: general

Washington - The Internal Revenue Service said Tuesday it identified an automated attack on its computer systems aimed at gaining information that could be used to steal tax refunds.
The news came the same day the administration announced a proposal to boost cybersecurity in the federal government, though the plan's request for extra funds has an uncertain future in Congress.

The IRS said identity thieves last month used personal data of taxpayers that was stolen elsewhere in an attempt to generate e-file PIN numbers that could be used to file fraudulent returns and claim refunds.

E-file PIN numbers are used by some individuals to file their tax returns. The numbers are different from Identity Protection PIN numbers, which the IRS gives victims of tax-identification theft to protect them from future issues.

The agency said it identified unauthorized attempts to obtain e-file PINs for 464,000 Social Security numbers, of which 101,000 successfully accessed an e-file PIN.

No personal taxpayer data was disclosed by IRS systems, the agency said. It is notifying affected taxpayers by mail that their personal information was used by criminals. The IRS said it is protecting their accounts against tax ID theft.

An agency spokesman said identity thieves would typically need much more data than an e-file PIN to file a fraudulent return. The agency also said the incident isn't related to last week's outage of IRS tax processing systems.

Over the past year, the IRS, state tax officials and tax-preparation firms have conducted a campaign to combat the growing problem of tax-refund fraud, a crime in which thieves use stolen personal information to file a return claiming a fraudulent refund.

In 2015, hackers stole the personal information of more than 330,000 taxpayers from the IRS's "Get Transcript" database, which provided data from prior returns.

Meantime, White House officials said they plan to enact a range of initiatives this year they believe will strengthen federal computer networks against cyberattacks.

Obama administration officials are instituting what they call a cybersecurity national action plan, which would create a federal chief information security officer, establish a new commission that looks for ways to protect computer networks, and increase coordination among federal officials who focus on privacy issues.

The officials also will look to overhaul outdated government computer systems they believe are too easy for hackers to penetrate.

The plan would include an expansion of training and recruiting for federal jobs that focus on cybersecurity, as well as an education-loan forgiveness program for people who remain in certain posts.

"The federal government -- which is obligated to protect the information provided to it by the American people -- has a unique responsibility to lead," President Barack Obama wrote in an op-ed article in Tuesday's Wall Street Journal. "But the fact is we still don't have in place all the tools we need, including ones many businesses rely on every day."

Some parts of the plan can be implemented unilaterally, but the White House is seeking a 35% increase in the cybersecurity budget to secure $19 billion in funding for many of the programs next fiscal year.

Times of Israel

Pro-Palestinian hacker dumps data of thousands of Fed workers

Wednesday, 10 February 2016

Byline: Staff Report

Section: general

Jerusalem - An anonymous pro-Palestinian hacker released the employee information of thousands of people who work at the U.S. Justice Department and the Department of Homeland Security.
On Sunday and Monday, the hacker dumped data including employees' email addresses, phone numbers and job titles. The data was released via a Twitter account; the Twitter message included the hashtag #FreePalestine.

Government officials told The New York Times that the information appeared to be culled from internal government directories.

On Sunday, the hacker first made his intentions known to the technology news website Motherboard, which received a copy of the encrypted list before it was publicly released. Motherboard called some of those phone numbers at random and reached the people who were listed or their voicemail boxes, as well as the operations center of the FBI.

Among the job titles on the list were contractors, biologists, special agents, task force officers, technicians, intelligence analysts and language specialists.

The hacker told Motherboard that he first compromised the account of a Department of Justice employee and eventually hacked into the department's entire intranet.

In October, pro-Palestinian hackers hacked into the email account of CIA director John Brennan and hackers forwarded the calls of the director of national intelligence, James Clapper, to the Free Palestine Movement.

Saudi Gazette

WhatsApp voice call ban decision not ours: CITC

Wednesday, 10 February 2016

Byline: Staff Report

Section: general

Riyadh - The decision to ban WhatsApp voice call in the Kingdom was taken by the WhatsApp Company itself, according to the Communications and Information Technology Commission (CITC).
The Kingdom's telecom regulator clarified in a statement on Tuesday that the voice call service is not available in many countries, including some Gulf Cooperation Council (GCC) states, and this was because of the failure of the company in complying with the regulations prevailing in these states, the Saudi Press Agency reported.

The CITC's statement came in reaction to the reports being circulated in some media outlets about halting the WhatsApp voice call service in the Kingdom.

The commission also underscored its keenness in making available of the latest communications and IT services to the users, strictly in line with the rules and regulations prevailing in the Kingdom.

The call facility on WhatsApp, which was blocked earlier was suddenly resumed on Saturday. The service was blocked on March 15 last year in the Kingdom after pressure by telecom companies claiming it was creating big losses to them.

Fars News Agency

New Generation of Air-Based Cruise Missiles Delivered to Iranian Air Force

Wednesday, 10 February 2016

Section: general

Tehran - The Iranian defense ministry delivered its home-made and high-precision air-launched cruise missile, 'Nasr', to the Air Force on Tuesday.

"The missile is designed to attack and destroy specific targets," Defense Minister Brigadier General Hossein Dehqan said, addressing a ceremony to deliver the missiles to the Air Force today.

Noting that Nasr will increase the operational and tactical capabilities of the Air Force, he said the air-lauched missile can be mounted and fired from fighter jets in midair.

In relevant remarks in August, the defense minister had outlined plans to equip Iran-made drones with Nasr cruise missiles.

Dehqan made the remarks in Tehran, addressing the inauguration ceremony of the Nasr missile production line.

"Using the air-based Nasr missile by the Army and the Islamic Revolution Guards Corps (IRGC)'s Air Forces will remarkably increase their operational and tactical power," he said.

Dehqan said that the Nasr missile is equipped with a high-precision radar which enables it to trace and intercept targets, adding that after being fired from fighter jets, Nasr doesn't need any backup and the fighter jet can leave the danger zone immediately.

Noting that the Nasr missile can be mounted on different types of fighter jets, he announced Iran's future plan to equip its home-made drones with the air-based missile.

In recent years, Iran has made great achievements in the defense sector and gained self-sufficiency in essential military hardware and defense systems.

The country has repeatedly made it clear that its military might is merely based on the state's defense doctrine of deterrence and that it poses no threat to other countries.

In March, the Iranian defense ministry started the mass- delivery of different ballistic missiles, including Qadr, Qiam, Fateh 110 and Khalij-e Fars missiles, as well as Mersad air defense system to the IRGC and Khatam ol-Anbia Air Defense Base.

"The honorable specialists of the Defense Ministry's Aerospace Organization displayed the defense industry' power and capability in providing the Armed Forces' needs to the most advanced missile equipment by supplying them with Qadr, Qiam, Fateh 110 and Khalij-e Fars (Persian Gulf) ballistic missiles and Mersad air defense system and showed that the different and comprehensive sanctions of the enemies imposed strictly and specially on our defense sector have totally failed to undermine their resolve and determination," Dehqan said at the time, addressing a ceremony held to mark the delivery of the new missile systems to the IRGC and Khatam Ol-Anbia Air Defense Base.

"These missiles can strike and destroy enemy targets with a high precision capability and provide for a wide range of the Armed Forces' needs to missiles with different ranges," he added.

Dehqan underlined that all these missiles have been built by Iranian specialists, and said, "Today the Armed Forces enjoy such a high degree of defensive capabilities that they can counter back any kind of threat posed from beyond the borders of the Islamic Republic of Iran."

He also described enemies' threats of military action against Iran as media hype for internal use.

Qadr is a 2000km-range, liquid-fuel and ballistic missile which can reach territories as far as Israel. Qiam is also a new type of surface to surface and cruise missile.

The Fateh-110 is a short-range, road-mobile, solid-propellant, high- precision ballistic missile with advanced navigation and control systems.

The Fateh-110 has been designed and developed by the Iranian experts in the Defense Ministry's Aerospace Organization and has not been modeled on any foreign product.

The supersonic Khalij-e Fars (Persian Gulf) missile, which carries a 650-kilogram payload, is smart and immune to interception, and features high-precision systems.

The supersonic ballistic missile is the most advanced and most important missile of the IRGC Navy.

The distinctive feature of the missile lies in its supersonic speed and trajectory. While other missiles mostly traverse at subsonic speeds and in cruise style, Khalij-e Fars moves vertically after launch, traverses at supersonic speeds, finds the target through a smart program, locks on the target and hit it.

The range of the solid-fuel missile is 300km and it can be fired from triple launchers.

The missile could successfully hit a mobile target one-tenth of an aircraft carrier in its early tests.

Also, Mersad Air Defense Missile System is a completely indigenized system developed by the Iranian experts and technicians to promote the country's combat power.

The system has already passed field tests and is used as part of the country's integrated air defense network.

The Mersad system equipped with Shahin missiles is capable of tracing and targeting any enemy aircraft at 70 to 150km altitude and is considered as a mid-altitude system among the country's missile shields.

Full effect of digital currencies such as Bitcoin yet to be seen, Dubai summit hears

Wednesday, 10 February 2016

Byline: Staff Report

Section: general

Dubai - Cryptocurrencies, such as Bitcoin, are set to revolutionise how people pay for goods and services and move money around the world, according to the co-founder and president of Blockchain, a digital wallet and software company.
Cryptocurrencies are digital currencies exchanged over the internet and mainly used outside existing banking and government institutions.

Nicolas Carey, speaking on the second day of the World Government Summit, said the way we pay for items over the internet was changing, reported the state news agency, Wam.

"There is a great deal of talk about financial inclusion, but there are 2.5 billion people on Earth who do not have access to a bank account," Mr Carey said. "Even in the United States, one of the wealthiest countries in the world, 20.1 per cent of households are underbanked and 33 per cent of millennials do not expect to have a bank account in the next five years.

"If you combine all these people, with everyone who has access to the internet over smartphones, you can see the potential for cryptocurrencies.

"Digital is part of everyone's DNA. Digital money is a natural extension to the digital world. It offers frictionless and borderless transactions that are more open and more equal," Mr Carey said. More than US$1 billion (Dh3.67bn) has been invested in Bitcoin technology, he said.

In 2010 the first Bitcoin transaction took place when 10,000 Bitcoins were used to buy two pizzas. At today's exchange rate, Mr Carey said, the two pizzas would be worth $5 million.

Le directeur du renseignement américain reconnaît s'intéresser aux objets connectés

Wednesday, 10 February 2016

Byline: Journaliste maison

Section: general

Washington - « L'Internet des objets » représente un trésor de données pour les agences de surveillance et d'espionnage.
« A l'avenir, les services de renseignement pourraient tirer parti de l'Internet des objets pour identifier, surveiller ou localiser des suspects, découvrir des indicateurs potentiels, ou obtenir des mots de passe. »
Lors de son audition par le Sénat américain, mardi 9 février, le directeur national du renseignement, James Clapper, a eu un rare moment de franchise concernant la manière dont les services de renseignement états-uniens envisagent d'utiliser le développement des objets connectés - ce que l'on appelle aussi «l'Internet des objets».

Aux Etats-Unis, les objets connectés ont connu ces dernières années un fort développement. Les thermostats intelligents Nest (rachetés par Alphabet) proposent ainsi de contrôler son chauffage à distance, ou de manière automatisée - et de nombreuses marques de réfrigérateur proposent des fonctions allant de la gestion automatique de la température à... l'établissement d'une liste de courses en ligne en fonction de vos habitudes alimentaires et du degré de remplissage du congélateur.

Grande quantité de données collectées

Ces objets collectent une très grande quantité d'informations, potentiellement utilisables par des services de renseignement. Un rapport publié le 1er février par le centre de recherche Berkman de l'université Harvard estime même que la quantité de données rassemblées par ces objets en font l'une des pistes privilégiées pour que les agences de renseignement puissent contourner les protections mises en place sur de plus en plus de moyens de communication «classiques».

Ces dernières années, des failles de sécurité concernant plusieurs fabriquants d'objets connectés ont été révélées, le plus souvent après la publication en ligne d'informations personnelles de leurs utilisateurs. A la fin de 2015, par exemple, le fabriquant de jouets connectés Vtech avait reconnu avoir été la cible d'un important piratage, qui avait abouti au vol de données personnelles de nombreux utilisateurs de ses produits.

Appels menaçants à des lycées: le suspect va être présenté à un juge

Wednesday, 10 February 2016

Byline: Journaliste maison

Section: general

Paris - Un lycéen dijonnais de 18 ans, féru d'informatique, qui avait été interpellé dans l'enquête sur des appels anonymes menaçants à des lycées parisiens, va être présenté mercredi à un juge d'instruction, a-t-on appris de source judiciaire.
Selon une source proche du dossier, en garde à vue, ce jeune homme qui s'est présenté comme un sympathisant de la démarche des Anonymous, s'est désolidarisé de ces alertes infondées à la bombe et a nié toute implication.

Il a créé un serveur qui permet d'anonymiser les envois et de brouiller les pistes sur internet, susceptible d'être utilisé par des "pirates" de la toile.

Les enquêteurs de l'Office central de lutte contre la cybercriminalité (OCLCTIC) de la PJ ont trouvé sa trace à partir d'un tweet revendiquant ces appels.

Ce message avait été envoyés par un expéditeur, nommé "Evacuation Squad", pseudo qui cacherait en fait un groupe de "hackers".

Ce tweet a permis de remonter à l'adresse IP (numéro d'identification de la connexion internet, ndlr) du lycéen dijonnais.

Mais il "ne cautionne pas les alertes à la bombe", infondées, qui se sont multipliées contre des lycées parisiens, selon une source proche du dossier.

"Il refuse de collaborer avec les services techniques de police concernant l'exploitation de son matériel informatique", a ajouté une source policière.

Il aurait été prévenu, par un moyen qu'il n'avait pas divulgué peu avant la fin de sa garde à vue, que son serveur avait pu être utilisé pour revendiquer ces appels malveillants.

Interrogé par l'AFP, le père du suspect a expliqué que son fils était en relation avec "des centaines" de personnes dans le monde et affirmé qu'il n'était "pas du genre à s'attaquer à des lycées avec des alertes à la bombe".

"Ce n'est pas un hacker, un hacker vient pour casser ou pirater, lui c'est un joueur expérimental qui entre dans un système, met un drapeau pour montrer qu'il était là comme un astronaute met un drapeau sur la Lune et il s'en va", a expliqué son père. Il a décrit son fils comme "un virtuose de l'informatique".

Les appels contre des établissements scolaires se sont multipliés ces dernières semaines dans un contexte de menace terroriste très élevée, après les attentats du 13 novembre.

Lundi 1er février et pour la troisième fois en quelques jours, des lycées et collèges français avaient reçu des menaces anonymes par téléphone, entraînant la mise à l'abri des élèves, voire leur évacuation.

D'autres établissements en province avaient également reçu des messages menaçants. A chaque fois, la police n'avait rien trouvé et les lycées avaient repris leur fonctionnement habituel.

Un scénario similaire s'était produit la semaine dernière au Royaume-Uni. Mais l'enquête française ne porte pas sur ces faits.

Pékin victime des bravades de Kim Jong-un

Wednesday, 10 February 2016

Byline: Philippe Mesmer et Harold Thibault

Section: general

Pyongyang - Face à son voisin du Nord, la Corée du Sud veut déployer un système antimissile fourni par Washington
Pyongyang est en passe de réussir à dégrader un peu plus les relations déjà difficiles entre Washington et Pékin. A la suite du lancement par la Corée du Nord, dimanche 7 février, d'une fusée, ce que tous ses voisins interprètent comme un test déguisé de missile balistique, la Corée du Sud est désormais prête à déployer sur son territoire un système de radars et de missiles américain, capable d'intercepter un vecteur balistique nord-coréen en phase de descente.

Le président américain, Barack Obama, a confirmé, lundi, sur la chaîne CBS, que des consultations sont en cours " pour la première fois " . " Nous aimerions que cela se fasse vite " , a précisé Peter Cook, le porte- parole du Pentagone, au sujet du système antimissile baptisé " THAAD ", pour Terminal High Altitude Area Defense.

Pékin juge qu'une telle infrastructure d'interception pourrait également affaiblir sa propre dissuasion nucléaire. Rien n'empêche de tourner à terme le système THAAD contre l'arsenal nucléaire chinois. " La Chine ne voit pas le système THAAD comme une question de radar ou de missile, juge Kim Heung-kyu, spécialiste de la Chine à l'université sud-coréenne Ajou , mais comme une alliance -régionale entre les Etats-Unis, le- -Japon et la Corée du Sud. "

" Sentiment d'échec "Les autorités chinoises ont -convoqué dès dimanche l'ambassadeur sud-coréen à Pékin. La porte-parole du ministère des affaires étrangères chinois, Hua Chunying, a déclaré : " En quête de sa propre sécurité, un pays ne devrait pas altérer les intérêts sécuritaires de l'autre. " En cela, la Chine ne sort pas vainqueur de l'essai nucléaire et du tir nord-coréens. " Le sentiment d'échec est grand, car elle n'a pas réussi à convaincre le Nord d'y renoncer et souffre de voir le Sud se rapprocher en conséquence des Etats-Unis ", constate Shi Yinhong, professeur de relations internationales à l'Université du peuple, à Pékin.

La Chine avait pourtant déployé d'importants efforts pour tenter de convaincre son allié nord-coréen de renoncer à ce tir. " S'il y a une chose que la Chine ne veut pas voir, ce sont des essais , juge Mathieu Duchâtel, sous-directeur du programme Asie du European Council on Foreign Relations . Cela pousse la Corée du Sud à demander davantage aux Etats-Unis pour sa défense. Le Japon aussi est plus - actif, le tout dans un contexte stratégique qui se détériore. "

Le représentant spécial chinois pour les affaires coréennes, Wu Dawei, s'était rendu à Pyongyang le 2 février; un " effort diplomatique très sérieux " au cours duquel M. Wu avait indiqué avoir " dit ce qu'il y avait à dire et fait ce qu'il y avait à faire " . Visiblement sans effet puisque, le même jour, Pyongyang, témoignant de son peu de considération pour la démarche chinoise, avait informé l'Organisation maritime internationale de l'imminence de son tir. " La priorité de la Corée du Nord est sécuritaire, face au Sud et aux Etats-Unis. Sur ce terrain, elle ne se sent pas protégée par la Chine et ne l'écoute donc pas " , relève Cai Jian, directeur du centre d'études coréennes de l'université Fudan, à Shanghaï.

L'impuissance chinoise à peser sur les décisions nord-coréennes et sa réticence à se prononcer pour des sanctions après l'essai nucléaire du 6 janvier alimentent par ailleurs les frustrations de Séoul. En janvier, quand le ministre sud-coréen de la défense a tenté de joindre son homologue chinois pour discuter de l'essai nucléaire nord-coréen, il n'a eu aucune réponse. " Les meilleurs partenaires sont ceux qui vous tiennent la main dans les moments difficiles " , a souligné, une semaine plus tard, la présidente sud-coréenne, Park Geun-hye.

Auparavant, Mme Park avait accepté de ne pas pousser plus avant les discussions sur le THAAD, la Chine ayant averti que cela affecterait les relations bilatérales. Depuis sa prise de fonctions en 2013, elle a rencontré à six reprises son homologue chinois, Xi Jinping. Séoul a ainsi tenté de maintenir l'équilibre entre priorité économique et nécessité sécuritaire. La Chine est son premier partenaire commercial et devrait, selon les estimations de Séoul, lui envoyer huit millions de visiteurs en 2016.

Mais, pour ce qui est de se protéger, elle mise sur les 28 500 militaires américains stationnés sur son territoire. " Il serait ridicule, pour un pays souverain comme la Corée du Sud, de ne pas renforcer sa défense face à une menace grandissante comme celle des missiles nucléaires nord- coréens " ,estime Park Chang-kwon, de l'Institut coréen des analyses de défense, un organisme public sud-coréen. La presse sud-coréenne, pourtant généralement proche du pouvoir, n'hésite plus à parler d'une " décomposition " du lien avec Pékin, voire d'une véritable " claque " pour la présidente Park.

Le déploiement du système THAAD intéresse aussi le Japon. En novembre 2015, le ministre de la défense, Gen Nakatani, avait évoqué cette option. Et le 8 février, l'agence de presse japonaise Kyodo a évoqué la relance de discussions sur la coopération nippo-sud-coréenne dans le domaine du renseignement militaire. Séoul a toutefois démenti, affirmant qu'il fallait d'abord avoir l'appui de la population pour un tel accord, tout en admettant que cette option était envisagée.

Les Etats-Unis peuvent désormais retourner contre eux l'argumentaire des Chinois : leur politique de modération et d'incitation aux réformes économiques n'a pas convaincu Pyongyang d'abandonner sa quête de l'arme nucléaire. Selon cette vision, Pékin ne peut donc s'en prendre qu'à lui-même si ses voisins, Sud-Coréens ou Japonais, se tournent encore davantage vers Washington.

Washington Times

Islamic State supporters share Snowden video to explain need for encryption

Wednesday, 10 February 2016

Byline: Andrew Blake

Section: general

Washington - Islamic State supporters are using Edward Snowden and his revelations about the U.S. government's surveillance capabilities to urge followers of the terror group to adopt digital security practices, including the use of strong encryption.
Proponents of the Islamic State, also known as ISIS, started circulating a propaganda video across the Internet in recent days which contains several clips from Citizenfour, the 2014 film about Mr. Snowden and the U.S. National Security Agency, along with advice for evading the NSA's eavesdropping abilities.

Among the scenes from the Academy Award-winning documentary included in the 13-minute upload are clips in which the former government contractor describes the NSA's ability to gather digital communications anywhere on Earth; retired intelligence expert Bill Binney is also shown discussing mass

data analysis, and Jacob Appelbaum, a journalist and activist, describes how the NSA uses that information to make determinations about individuals based off of their interactions.

"This is just a drop in the ocean," reads an English-language translation of a title card that appears at the end of the video, as reported first by Vocativ on Monday. "Our enemies are monitoring us day and night, collecting our information and targeting us. This is very dangerous. Carelessness and negligence in digital security cannot be tolerated."

The video, "The Electronic War And The Negligence Of The Supporters Of Mujahedeen," concludes by directing viewers to a website, written in Arabic, which links to several articles and pages containing tutorials and information about digital security, encryption and the Islamic State. It's credited to "Technical Islamic State" and appears to have been created last July, but likely could see a resurgence in readers with the recent boost online from pro-Islamic State groups.

Vocativ reported that the video is the product of the Afaq Agency, "an ISIS-affiliated group focused on issues related to hacking and cyber security," and was discovered using the website's "deep web technology." Isdarat, a site that hosts Islamic State propaganda on both the deep web and the more widely accessed "surface" web, began hosting the video on Saturday. The Vocativ article makes no mention of Isdarat, but claims the video was shared this week by the Afaq Agency's account on Telegram, a social networking application popular among Islamic State supporters, and has since spread across social media.

Regardless of its origin, the video is making waves in the midst of a heated debate between lawmakers in Washington and the Silicon Valley tech sector with respect to regulating encryption. A national security discussion has intensified in recent weeks over whether or not Internet companies should be forced to decrypt digital communications for investigators that are otherwise protected by strong end-to-end encryption, and was among the main topics at a Senate Intelligence Committee hearing on Capitol Hill on Tuesday.

"I'm not sure we've exhausted all the possibilities here technologically," Director of National Intelligence James Clapper testified while discussing solutions to the government's so-called "going dark" debacle. "I would hope that we have not yet exhausted what can be done voluntarily."

Several members of the Obama administration have blamed Mr. Snowden in the past for allegedly having aided terrorists as a result of his unauthorized disclosures, including Chris Inglis, NSA's deputy director at the time the leaks were first reported.

"Having disclosed all of those methods, or at least some degree of those methods, it would be impossible to imagine that, as intelligent as they are in the use of technology, in the employment of communications for their own purposes, it's impossible to imagine that they wouldn't understand how they might be at risk to intelligence services around the world, not the least of which is the U.S. And

they necessarily do what they think is in their best interest to defend themselves," Mr. Inglis previously told The Washington Times.

The Guardian (London)

US intelligence chief: we might use the internet of things to spy on you

Wednesday, 10 February 2016

Byline: Spencer Ackerman, Sam Thielman

Section: general

New York - The US intelligence chief has acknowledged for the first time that agencies might use a new generation of smart household devices to increase their surveillance capabilities.
As increasing numbers of devices connect to the internet and to one another, the so-called internet of things promises consumers increased convenience - the remotely operated thermostat from Google-owned Nest is a leading example. But as home computing migrates away from the laptop, the tablet and the smartphone, experts warn that the security features on the coming wave of automobiles, dishwashers and alarm systems lag far behind.

In an appearance at a Washington thinktank last month, the director of the National Security Agency, Adm Michael Rogers, said that it was time to consider making the home devices "more defensible", but did not address the opportunities that increased numbers and even categories of connected devices provide to his surveillance agency.

However, James Clapper, the US director of national intelligence, was more direct in testimony submitted to the Senate on Tuesday as part of an assessment of threats facing the United States.

"In the future, intelligence services might use the [internet of things] for identification, surveillance, monitoring, location tracking, and targeting for recruitment, or to gain access to networks or user credentials," Clapper said.

Clapper did not specifically name any intelligence agency as involved in household- device surveillance. But security experts examining the internet of things take as a given that the US and other surveillance services will intercept the signals the newly networked devices emit, much as they do with those from cellphones. Amateurs are already interested in easily compromised hardware; computer programmer John Matherly's search engine Shodan indexes thousands of completely unsecured web-connected devices.

Online threats again topped the intelligence chief's list of "worldwide threats" the US faces, with the mutating threat of low-intensity terrorism quickly following. While Clapper has for years used the equivocal term "evolving" when asked about the scope of the threat, he said Tuesday that Sunni violent extremism "has more groups, members, and safe havens than at any other point in history".

The Islamic State topped the threat index, but Clapper also warned that the US-backed Saudi war in Yemen was redounding to the benefit of al-Qaida's local affiliate.

Domestically, "homegrown extremists" are the greatest terrorist threat, rather than Islamic State or al-Qaida attacks planned from overseas. Clapper cited the San Bernardino and Chattanooga shootings as examples of lethal operations emanating from self-starting extremists "without direct guidance from [Isis] leadership".

US intelligence officials did not foresee Isis suffering significant setbacks in 2016 despite a war in Syria and Iraq that the Pentagon has pledged to escalate. The chief of defense intelligence, Marine Lt Gen Vincent Stewart, said the jihadist army would "probably retain Sunni Arab urban centers" in 2016, even as military leaders pledged to wrest the key cities of Raqqa and Mosul from it.

Contradicting the US defense secretary, Ashton Carter, Stewart said he was "less optimistic in the near term about Mosul", saying the US and Iraqi government would "certainly not" retake it in 2016.

The negative outlook comes as Carter traveled on Tuesday to meet with his fellow defense chiefs in Brussels for a discussion on increasing their contributions against Isis.

On the Iran nuclear deal, Clapper said intelligence agencies were in a "distrust and verify mode", but added: "We have no evidence thus far that they're moving toward violation."

Clapper's admission about the surveillance potential for networked home devices is rare for a US official. But in an overlooked 2012 speech, the then CIA director David Petraeus called the surveillance implications of the internet of things "transformational ... particularly to their effect on clandestine tradecraft".

During testimony to both the Senate armed services committee and the intelligence panel, Clapper cited Russia, China, Iran, North Korea and the Islamic State as bolstering their online espionage, disinformation, theft, propaganda and data-destruction capabilities. He warned that the US's ability to correctly attribute the culprits of those actions would probably diminish with "improving offensive tradecraft, the use of proxies, and the creation of cover organizations".

Clapper suggested that US adversaries had overtaken its online capabilities: "Russia and China continue to have the most sophisticated cyber programs."

The White House's new cybersecurity initiative, unveiled on Tuesday, pledged increased security for nontraditional networked home devices. It tasked the Department of Homeland Security to "test and certify networked devices within the 'Internet of Things'." It did not discuss any tension between the US's twin cybersecurity and surveillance priorities.

Connected household devices are a potential treasure trove to intelligence agencies seeking unobtrusive ways to listen and watch a target, according to a study that Harvard's Berkman Center for Internet and Society released last week. The study found that the signals explosion represented by the internet of things would overwhelm any privacy benefits by users of commercial encryption - even as Clapper in his testimony again alleged that the growth of encryption was having a "negative effect on intelligence gathering".

The report's authors cited a 2001 case in which the FBI had sought to compel a company that makes emergency communications hardware for automobiles - similar by description to OnStar, though the company was not named - to assist agents in Nevada in listening in on conversations in a client's car.

In February 2015, news reports revealed that microphones on Samsung "smart" televisions were "always on" so as to receive any audio that it could interpret as an instruction.

"Law enforcement or intelligence agencies may start to seek orders compelling Samsung, Google, Mattel, Nest or vendors of other networked devices to push an update or flip a digital switch to intercept the ambient communications of a target," the authors wrote.

L'Express

L'oeil caché du contre-terrorisme

Wednesday, 10 February 2016

Byline: E.P.

Section: general

Paris - La très secrète société américaine Palantir ne réserve pas son système d'analyse des données à la CIA. Elle tente de le vendre à la France comme arme anti-attentats.
L'oeil de Palantir Technologies se tourne vers le royaume de France. Pour les fans du Seigneur des anneaux, le nom de Palantir évoque aussitôt l'orbe sombre destiné à voir l'avenir dans ce roman d'heroic fantasy. Cofondée en 2004 par Alex Karp et Peter Thiel, la société, parmi les plus secrètes de la Silicon Valley, a reçu le soutien de la CIA via son fonds In-Q-Tel, afin notamment d'épauler les services de

renseignement dans la lutte contre le terrorisme. Sa technologie d'analyse massive des données aurait même aidé à retrouver Ben Laden. Une information jamais démentie... ni confirmée. Pas étonnant que l'entreprise tente aujour - d'hui de pénétrer en France, pays touché à deux reprises par des attentats en 2015. « Nous les avons rencontrés et avons évalué leur logiciel. Mais utiliser une solution américaine, de surcroît financée par la CIA, pose des problèmes de souveraineté nationale », indique-t-on au ministère de l'Intérieur.

La société met pourtant les bouchées doubles pour se développer en dehors des Etats-Unis. Un bureau a été ouvert à Londres à la fin de 2009 et une filiale a vu le jour à Paris au printemps dernier, implantée sur les Champs- Elysées. Selon des documents déposés au Royaume- Uni, Palantir a réalisé en 2014 un chiffre d'affaires de 33,4 millions d'euros, en croissance de 43 %. Mais convaincre la Direction générale de la sécurité intérieure (DGSI) est chose malaisée. Les Américains assurent que leur technologie est capable d'aider les analystes humains dans leur enquête, grâce à des outils informatiques et à une intelligence artificielle d'une puissance inédite. Le logiciel peut ainsi fouiller dans des bottes d'informations issues de multiples sources, afin d'y trouver les épingles du contre-terrorisme. Il permet de visualiser les contacts d'un suspect, ses transferts d'argent ou ses appels téléphoniques et de les comparer avec des schémas antérieurs d'attaques.

« Nous espérons que les données de santé ne sont pas concernées »

« Je n'ai pas rencontré M. Cazeneuve, indique Peter Thiel, président de Palantir Technologies. Mais nous avons des discussions avec tous les gouvernements d'Europe de l'Ouest qui souhaitent lutter contre le terrorisme. Tous ont besoin d'agir rapidement car, s'ils ne font rien, d'autres attaques surviendront et les partis populistes prospéreront. »

Pour s'implanter en France, Palantir s'appuie, selon nos informations, sur un premier client de renom, le n° 1 mondial de l'assurance, Axa. Le groupe présidé par Henri de Castries a créé en 2013 Data Innovation Lab, un laboratoire consacré à l'exploitation des données en vue d'évaluer le risque dans l'assurance automobile ou celle de l'habi - tation. Cette récente collaboration inquiète les pouvoirs publics : « Nous ne savons pas à quoi ont accès les Américains, glisse un conseiller gouverne - mental. Nous espérons que les données de santé ne sont pas concernées. »

La start-up opaque, valorisée 20 milliards de dollars, avait déjà suscité quelques remous. Elle aurait, selon La Lettre A, répondu à deux appels d'offres de l'Etat français à la fin de l'année dernière. Le premier concerne le Secrétariat général pour la modernisation de l'action publique (SGMAP) et le second la Direction générale des finances publiques (DGFIP) afin de traiter les données fiscales et de lutter contre la fraude. « Je ne suis pas au courant, a indiqué le ministre des Finances, Michel Sapin. Nous avons déjà des technologies similaires. » Pas facile de se faire une place en France.

Sen. Feinstein Says Terrorists Only Need The Internet and Encryption To Attack

Tuesday, 09 February 2016

Byline: Lorenzo Franceschi-Bicchierai

Section: general

New York - The ongoing and seemingly endless debate over encryption technologies appears to have reached its most ridiculous apex.
On Tuesday, Sen. Dianne Feinstein (D-CA), said that all ISIS needs to carry out a terrorist attack in a Western country is an internet connection and an encrypted chat app. And no, she wasn't talking about a cyberattack.

Feinstein's comment came during a Senate hearing on national security threats in Washington D.C., while she was talking about the dangers of ISIS, or ISIL, and its supposed use of encryption to communicate and organize.

"While the coalition's air campaign is helping to deny ISIL some territorial safe havens and financial resources, how do we degrade it and destroy it if all they need to carry out an attack in the West is an internet connection and an encrypted message application?" Feinstein said during her opening remarks.

Feinstein's comment is perhaps the most grotesque attack on encryption since that of a Massachusetts prosecutor, who said last year that encryption would help perverts take inappropriate pictures of women wearing skirts, and get away with it. But ridiculous comments aside, her words highlight once more that numerous US politicians, as well as US government officials, are not giving up on their tirade against the rise of encryption.

Ever since Apple and Google announced that their new mobile operating systems would use encryption by default (Google later backed out of its promise) in September of 2014, a growing group of critics led by the FBI warned that these measures would make it hard, if not impossible, for cops and feds to do their job. The FBI Director James Comey, perhaps the most visible face in this ongoing crypto war, famously said that widespread use of encryption would "lead us all to a very dark place" where child molesters and terrorists get away with their crimes.

Yet, just as it's been happening in the last 17 months, nobody seemed willing, or capable, to propose an actual feasible solution. Comey said, once again, that he doesn't want a backdoor (nor a "golden key"), but didn't say what he wants other that tech companies to comply with court orders. US spy chief James Clapper said he "would hope" that tech companies and law enforcement haven't "exhausted" what can be done "voluntarily," but didn't specify what he'd like tech companies to do voluntarily.

The solution to the encryption debate remains fleeting, but what's clear is that the crypto war is not going to end any time soon.

Le Huffington Post (France)

Une cyberguerre enclenchée par Daech causerait beaucoup de dégâts

Wednesday, 10 February 2016

Byline: Antoine Böhm

Section: general

Non identifié - On a beaucoup écrit sur les capacités de Daech à mener une guerre numérique. L'essentiel des commentaires se focalise sur l'usage, peu créatif, des réseaux sociaux et d'internet comme d'un pur véhicule de propagande: Daech ne faisait que transmettre des communiqués, mettre en ligne des vidéos particulièrement macabres, et recruter de nouveaux membres. Il n'y avait qu'une légère différence, une différence de degré dans la technique, entre Al-Qaida et Daech: le deuxième utilisait Internet comme un véritable moyen de communication, quand le premier se cantonnait à en faire une vitrine de ses actions.
Peu de personnes, sinon les états-majors de renseignement et les forces de cyberguerre, ont évalué à sa juste mesure la menace qui planait: celle d'une véritable guerre portée contre un État par les canaux numériques. Il est possible de faire autant de dommages par la cyberguerre qu'en une guerre avec pourtant bien moins d'effectifs et de moyens. Ce manque de perspective vient d'une méconnaissance du fonctionnement d'internet : beaucoup pensent encore qu'un virus ne fait qu'envoyer des mails frauduleux, et que ces mails ne servent qu'à obtenir les codes de votre carte de crédit. Il est aujourd'hui possible d'éteindre pour quelques jours un service ou une entreprise, de mener un État à la faillite, de paralyser les systèmes bancaires, les réseaux d'électricité, les moyens de communication, les transports ou les services d'urgence par des techniques encore assez rudimentaires, avec très peu d'hommes -de hackers- aux commandes, et pour un coût dérisoire.

Il y eut des précédents. En 2007, entre le 27 avril et l'automne suivant, une série d'attaques a été menée par les Nashi, un groupe de hackers ultranationalistes russes proches du Kremlin, sur les sites

gouvernementaux d'Estonie. Elle fut lancée au prétexte d'une défense des communautés russophones face au gouvernement estonien qui avait fait déplacer un monument aux morts de l'Armée rouge près d'un cimetière militaire, à la périphérie de Tallinn. Début mai, il devient impossible d'obtenir des documents depuis les serveurs informatiques des sites nationaux, mais aussi à l'administration de travailler et de communiquer. Les banques sont à leur tour ciblées, privant les Estoniens des opérations bancaires courantes, de régler leurs factures ou d'acheter des billets de train ou d'avion. Les pompes à essence s'assèchent, puisqu'il est impossible de gérer les stocks, d'acheter et d'acheminer du carburant. Les Estoniens ne peuvent plus entrer ni sortir du pays, pendant quelques jours, pas plus qu'ils ne peuvent aller d'une ville à l'autre.

D'autres attaques prennent pour cibles les compagnies d'électricité: les ascenseurs cessent de fonctionner, ce d'autant plus qu'ils sont gérés à distance par des serveurs informatiques. De manière sporadique l'éclairage public est coupé, ainsi que les centrales alimentant Tallinn. Les chaînes de télévision et de radio ont cessé d'émettre, les ordinateurs sont éteints, la capitale est plongée dans une nuit noire. Pendant une très longue heure, le 2 mai, les urgences sont déconnectées. Dans le même temps, des militants pro-russes sont descendus dans les rues, tandis que les habitants de Tallinn se demandent ce qu'il se passe: est-ce une manifestation? une émeute? une nouvelle invasion de l'Estonie par l'armée russe? Menée plus avant, avec de véritables factions séditieuses, l'attaque aurait été meurtrière, sanglante, et aurait pu conduire au coup d'État.

Cette attaque fut conduite de manière extrêmement simple par les Nashi, par un moyen à la portée de n'importe quel groupe insurrectionnel : elle procède par déni de service (DoS), c'est-à-dire par une multiplication des requêtes informatiques sur un serveur jusqu'à ce qu'il sature. Les Nashi infectent un ordinateur à distance, par le biais d'un virus d'abord inactif. Au 27 avril, ils font réveiller l'ensemble des machines, et leur ordonnent de toutes se connecter au même site en même temps, de le réactualiser sans cesse, jusqu'à ce que le serveur visé rejette toute tentative de connexion. Si vous aviez un ordinateur branché à internet en 2007, il est tout à fait probable que vous y ayez participé à votre insu. Cette technique, appelée Botnet, est largement employée par Anonymous, et pourrait tout à fait être récupérée par un groupe tel que Daech. Cela est d'autant plus probable que, comme vient de le révéler Jean-Paul Rouiller, ancien des services secrets suisses et fondateur du Geneva Centre for Training and Analysis of Terrorism (GCTAT), un des membres d'Anonymous, "un ingénieur informaticien suisse récemment converti à l'islam" aurait rejoint Daech pour y monter un groupe de hackers.

L'on se trompe en croyant que Daech ne possède pas la technologie nécessaire pour mener des attaques internet de grande ampleur en Occident et, plus encore, de penser qu'elles puissent être moins virulentes que les attentats : en 2008, la Russie a cloué l'aviation géorgienne de Tbilissi au sol et engagé une véritable guerre de l'information par ce biais; en février 2011, les États-Unis ont réussi à stopper le programme nucléaire iranien en introduisant le virus Stuxnet dans les centrifugeuses de Natanz, les faisant exploser par d'infinies variations de température. Il est possible de faire exploser une centrale nucléaire avec un virus. En 2013, Barack Obama avait fait valoir que la principale menace pesant sur la défense des États-Unis était précisément un virus se concentrant sur les centres névralgiques du pays:

les serveurs contrôlant la distribution d'électricité et les centrales, et les serveurs ultra-protégés de Wall Street.

Dans la majeure partie des cas, une attaque DoS ou de type Stuxnet requiert très peu d'hommes sur le terrain, et des moyens financiers extrêmement réduits pour une grande efficacité. Cinq ingénieurs mercenaires parmi les meilleurs, n'ayant d'autre appât que le gain, et sans même d'accointance avec Daech, peuvent conduire un État à la faillite, comme une quarantaine de hackers activistes, dans une opération planifiée et bien réglée peuvent mettre à sac une capitale européenne.

Toronto Star

Gmail not immune to FOI requests

Wednesday, 10 February 2016

Byline: David Rider

Section: general

Ottawa - Ontario's Information and Privacy watchdog will soon remind politicians and civil servants that using Gmail, Hotmail or BlackBerry Messenger will not hide official communications from freedom-of-information requests.
"I would acknowledge that there may be information that should have been disclosed but hasn't been because of a lack of knowledge of what the rules are," commissioner Brian Beamish said in an interview Tuesday.

"If the email is dealing with government or agency or municipal business, it is subject to the legislation. It doesn't matter what device or account it is sent from."

The Star reported last week that Beamish's office ordered an Oshawa city councillor to disclose a 2013 email, involving a $5.9-million land deal, written on her personal account.

The issue exploded into U.S. headlines with revelations that Democratic nominee hopeful Hillary Clinton not only used private email for State Department business but had her own unsecured home server.

It is well known in Ontario political circles that some elected officials and their staff members use personal email, BBM and other online tools, including Google Calendar, for some official business.

Beamish said that, in the wake of discussions generated by the Oshawa story, his office is preparing guidelines to reinforce past assertions that work emails, regardless of how they're sent, are subject to Ontario's Freedom of Information and Protection of Privacy Act and a similar act covering municipal governments.

"I have no doubt that there is still a lack of knowledge of that out there," Beamish said. "We could probably do a better job at getting that message out."

The commissioner, who succeeded Ann Cavoukian in 2014, said he senses information and privacy officers in government offices understand the rules, but that some officials asked to turn over their relevant correspondence do not.

Just because an email is subject to the act doesn't mean the public will learn its contents.

Transparency advocates say Canada is behind some other countries in this respect. Politicians and bureaucrats routinely invoke exemptions that can see pages of released information blacked out in whole or part.

The Oshawa case was also notable because it was a city councillor, not a mayor or civil servant, forced to disclose an official communication.

Beamish acknowledged that most requests for councillors' communications are denied.

Generally, emails, letters and the like are not subject to the act when they are "political" - including communications with constituents and lobbyists.

Communications about official business, when they are acting as cabinet ministers, as parliamentary secretary or, at city hall, a committee chair, are fair game.

Beamish last year repeated Cavoukian's three-year-old call for Ontario Premier Kathleen Wynne's government to amend freedom-of-information laws to improve public access to communications generated by the municipal councillors they elect.

Mark Cripps, a spokesman for Municipal Affairs Minister Ted McMeekin, told the Star the minister recently met with Beamish about his suggested reforms. However, the government, including the Government and Consumer Services Ministry that oversees the acts, is still determining "the best path forward."

The Australian

Sub crew data 'too secret to reveal'

Wednesday, 10 February 2016

Byline: Cameron Stewart

Section: general

Canberra - The navy has slapped the first secret classification on the number of Australian submarine commanders and crew, claiming that revealing the figure would give foreign intelligence services too much information about the nat-ion's defence during growing strategic tension in the region.
The move comes as the navy faces a critical shortage of qualified submarine commanders, raising claims it is aimed at hiding bad news rather than for genuine security concerns.

The Australian understands the navy has failed to boost its ranks of qualified submarine commanders in the past five years, with a number of them failing the highly demanding "Perisher" command training course that qualifies them to captain a submarine.

As a result, the current Collins-class submarine commanding officers are a "Dad's Army". Four of the five commanders gained their Perisher qualifications between 15 and 24 years ago, two were lured back after retiring from the navy and another was recruited from the British Royal Navy.

The navy admitted in 2013 that it was concerned it had only 16 Perisher-qualified submarine officers, only a small handful of whom were actually available to command a submarine because others were too senior. Since then, only one extra officer has passed the course, meaning the navy has barely enough commanders available for its Collins-class fleet.

When independent senator Nick Xenophon recently asked the navy how many qualified submarine commanders it had, he was told the figure was classified despite it having been revealed at defence estimates hearings previously in 2013, 2011 and 2009.

Defence says it has changed its policy on national security grounds because of the growing number of foreign submarines in the region. China has recently embarked on an aggressive push to increase the size and capabilities of its submarine fleet.

A Defence spokesman said: "Regional nations continue to grow and develop their own submarine capabilities. This competitive environment reinforces the imperative to protect the capabilities and vulnerabilities of the Australian Submarine Force from foreign intelligence exploitation.

"Submarine workforce numbers, including the number of command qualified officers have been deemed sensitive as this data would assist intelligence agencies to assess the strength of the Australian

submarine force (and) in identifying the number of submarines that Australia could support and operate." Senator Xenophon said it was outrageous that Defence would suddenly classify these figures. "Defence can't use the cloak of nat-ional security to hide their failings in planning for our future defence needs," he said. "They need to fix the problem rather than try to submerge the truth from coming out. They can't make secret something that has been out in the open previously." The decision to classify the number of qualified submarine commanders is not particularly effective, given they are all listed by name on an honour board at the HMAS Stirling naval base in Perth. Their names and graduation dates are also listed in a recent book, A History of Australian Submarines, by Michael White.

The lack of qualified submarine commanders reflects the navy's inability to attract and promote enough prospective candidates. It also reflects the high failure rate -- often 50 per cent -- of the Dutch-run Perisher commander course in which candidates learn to command a submarine in sophisticated simulated war games involving surface ships, submarines and warplanes.

As well as commanders, the navy has struggled to train and attract enough submarine crews to man its four active submarines.

Navy chief Tim Barrett said in October there was still a sizeable shortfall of qualified submariners. The navy is taking steps to improve its recruitment of submariners, including substantial extra cash payments and a submarine workforce growth strategy to improve recruitment and retention.

Defence says a new employment package to begin this year includes seven enhanced conditions including extra payments "to assist with improving retention and to re-attract personnel back to the submarine workforce".

Senator Xenophon said it was a concern for the navy that its submarine commanders were such veterans and this showed there were too few new commanders coming through the system. "With no new blood in the system, our defence capability with become anaemic," he said.

Of the five current Collins-class commanders, HMAS Farncomb commander Ian Bray achieved Perisher qualifications in 1992, while HMAS Waller commander Richard Lindsey passed the course in 1998. HMAS Rankin commander Douglas Theobald qualified in 2000 while HMAS Sheean commander Jason Cuples passed Perisher in 2001. The most recently graduated Collins-class commander is HMAS Dechaineux's Robin Dainty in 2007.

Yonhap News Agency

Russia expresses concern to S. Korean envoy over THAAD decision

Wednesday, 10 February 2016

Section: general

Russia's Foreign Ministry on Tuesday expressed concerns to South Korea's ambassador over Seoul's decision to begin formal consultations on bringing in the U.S. THAAD missile defense system to the country to defend against North Korean threats.
Russian Deputy Foreign Minister Igor Morgulov conveyed the concern during a meeting with Amb. Park Ro-byug, the ministry said.

Shortly after North Korea's missile launch on Sunday, South Korea and the U.S. jointly announced they would begin official discussions on the possible placement of the U.S. Terminal High Altitude Area Defense (THAAD) missile defense system in South Korea.

Like China, Russia has opposed the possible deployment of THAAD, seeing it as a threat to their security interests.

The U.S. has repeatedly said that the system is aimed only at deterring North Korean threats.

Yonhap News Agency

National Assembly adopts resolution denouncing N.K. missile launch

Wednesday, 10 February 2016

Section: general

The National Assembly Wednesday endorsed a resolution censuring North Korea's recent rocket launch, demanding additional retaliation measures from the Seoul government.
The resolution, which was put to a vote during an extra session, was passed 241-0, with seven abstentions, three days after the North fired off a long-range rocket and placed a satellite into orbit.

The resolution urges Pyongyang to stop weapons development and become a responsible member of the international community, stressing repeated provocations will only deepen the impoverished regime's isolation.

"North Korea's long-range missile launch, in addition to the fourth nuclear test, is a clear violation of the U.N. resolutions," it said.

South Korean lawmakers also said they will cooperate with the government and the international community to come up with strong countermeasures to stop the recurrence of such provocations.

It marks the second resolution denouncing the North since the assembly unanimously passed a resolution condemning its fourth nuclear test last month.

South Korea is currently working with the U.S., Japan and other regional powers for the swift adoption of a U.N. resolution to slap strong sanctions on North Korea.

North Korea has already been under U.N. sanctions for its three previous nuclear tests: in 2006, 2009 and 2013.
Reuters

North Korea satellite in stable orbit but not transmitting - U.S. sources

Wednesday, 10 February 2016

Section: general

North Korea's recently launched satellite has achieved stable orbit but is not believed to have transmitted data back to Earth, U.S. sources said of a launch that has so far failed to convince experts that Pyongyang has significantly advanced its rocket technology.
Sunday's launch of what North Korea said was an earth observation satellite angered the country's neighbours and the United States, which called it a missile test. It followed Pyongyang's fourth nuclear test in January.

"It's in a stable orbit now. They got the tumbling under control," a U.S. official said on Tuesday.

That is unlike the North's previous satellite, launched in 2012, which never stabilized, the official said. However, the new satellite was not thought to be transmitting, another source added.

U.S. President Barack Obama spoke with the leaders of South Korea and Japan by phone on Monday night and reassured them of Washington's support, while also calling for a strong international response to the launch, the White House said.

Obama will also address North Korea's "provocations" when he hosts the leaders of the Association of Southeast Asian Nations in California early next week, aides said.

The United States and China, Pyongyang's only major ally, are negotiating the outline of a new U.N. sanctions resolution that diplomats hope will be adopted this month.

The U.N. Security Council has imposed sanctions against North Korea for its nuclear tests and long-range rocket launches dating back to 2006, banning arms trade and money flow that can fund the country's arms programme.

But a confidential U.N. report, seen by Reuters, concluded that North Korea continues to export ballistic-missile technology to the Middle East and ship arms and materiel to Africa in violation of U.N. restrictions.

The report by the U.N. Security Council's Panel of Experts on North Korea, which monitors implementation of sanctions, said there were "serious questions about the efficacy of the current United Nations sanctions regime."

Western diplomats told Reuters that restricting North Korean access to international ports is among the measures Washington is pushing Beijing to accept in the wake of the Jan. 6 nuclear test and the weekend rocket launch.

"PROVOCATIVE, DISTURBING AND ALARMING"

Missile experts say North Korea appears to have repeated its earlier success in putting an object into space, rather than broken new ground. It used a nearly identical design to the 2012 launch and is probably years away from building a long-range nuclear missile, the experts said.

Vice Admiral James Syring, director of the U.S. Missile Defense Agency, told reporters that North Korea's launch was "provocative, disturbing and alarming," but could not be equated with a test of an intercontinental ballistic missile.

He said North Korea had never attempted to flight test the KN-08 intercontinental ballistic missile it is developing.

Syring said U.S. missile defences would be able to defend against the new North Korean missile given efforts to improve the reliability of the U.S. system and increase in the number of ground-based U.S. interceptors from 30 to 44.

"I'm very confident that we're, one, ahead of it today, and that the funded improvements will keep us ahead of ... where it may be by 2020," he said.

The latest North Korea rocket was based on engines taken from its massive stockpile of mid-range missiles based on Soviet-era technology and electrical parts too rudimentary to be targeted by a global missile control regime, experts said.

South Korea's defence ministry believes the three- stage rocket, named Kwangmyongsong, had a potential range of 12,000 km (7,457 miles), Yonhap news agency reported, similar to that of the 2012 rocket and putting the U.S. mainland in reach.

"I suspect the aim of the launch was to repeat the success, which itself provides considerable engineering knowledge," said Michael Elleman, a missile expert at the International Institute for Strategic Studies.

Separately, U.S. National Intelligence Director James Clapper said on Tuesday that North Korea could begin to recover plutonium from a restarted nuclear reactor within weeks.

Clapper said that in 2013, following its third nuclear test, the North had announced its intention to "refurbish and restart" facilities at its Yongbyon nuclear complex.

"We assess that North Korea has followed through on its announcement by expanding its Yongbyon enrichment facility and restarting the plutonium production reactor," Clapper said in prepared testimony to the Senate Armed Services Committee.

Sunday Telegraph (UK)

Hunt for LinkedIn terrorist

Sunday, 14 February 2016

Byline: Robert Verkaik

Section: general

London - A dangerous British terrorist who helped recruit the Isil executioner "Jihadi John" is being hunted by the security services after fleeing to Turkey and setting up an account with LinkedIn, the business networking site.
Rabah Tahari, from Birmingham, is the leader of a jihadist group linked to al-Qaeda who the Home Office claim founded a terrorist militia in Syria four years ago which recruited many British fighters. Now British and Turkish security services are concerned that he has fled the battlefield and moved to Turkey, where he gave away his location when he joined LinkedIn.

Fears are mounting that Tahari, 44, will make his way back to Europe to carry out terrorist attacks. Tahari has taken part in key operations in Syria where he and his fighters were trained in a range of weapons. It is estimated that up to 50 British jihadists are hiding out in Turkey, where they can plan terror attacks against the West without fear of coalition bombing raids.

Wall Street Journal

Tensions Rise Over Refugees

Saturday, 13 February 2016

Byline: Miriam Jordan

Section: general

Boise, Idaho - For decades, refugees have augmented the workforce of this sparsely populated state. Refugees operate machines at the research- and-development facility for memory chips at Boise-based Micron Technology Inc. About a third of workers at Chobani Inc.'s yogurt plant in Twin Falls, the nation's largest, are refugees.

But since terror attacks in Paris and San Bernardino by people at least inspired by Islamic extremists, there has been a backlash against settling refugees here and elsewhere, particularly from Iraq and Syria. That has created tension between politicians sensitive to their constituents' concerns and business leaders who say that the state needs the newcomers to keep thriving.

"I hope that will go away," said Tim Komberec, chief executive of Idaho-based Empire Airlines, of anti-refugee rhetoric, at an event convened to tackle the state's labor shortage. "We need workers in this state." He said his company values a diverse workforce.

Home to 1.6 million people, Idaho is among the states with the largest number of refugees relative to overall population, having absorbed nearly 30,000 from 53 countries since Vietnamese evacuees first arrived in the 1970s. Since 2008, the state has received about 1,000 refugees annually -- mostly from Africa, Asia and the Middle East -- out of 70,000 that have been resettled in the country each year. About 70% have been sent to Boise, the capital, with the rest going to Twin Falls, its commercial hub. Idaho recently has received refugees from Iraq, Somalia and Bhutan, among others.

"Refugees have become a valuable workforce," said Bob Naerebout, executive director of the Idaho Dairymen's Association, a lobbying group.

Still, Idaho Gov. Butch Otter is among about two dozen governors, primarily Republicans, who have called for at least a temporary halt to the refugee program over fears that it could allow terrorists to sneak into America.

"I have never seen this much attention in Idaho to refugee resettlement from elected officials or the general public," said Patrice Haller, assistant director of the Idaho Office of Refugees, which coordinates resettlement in the state.

President Barack Obama has agreed to take 85,000 people fleeing their homelands, including 10,000 Syrians, in the fiscal year that ends Sept. 30. Alabama and Texas have sued the federal government to stop refugee settlement in the wake of the terror attacks.

Proponents say refugees are the most thoroughly vetted of any travelers, undergoing background checks, multiple interviews, iris scans and other screening. Critics say Washington lacks control over the process, which involves the United Nations and U.S. subcontractors, as well as U.S. intelligence agencies.

Idaho's unemployment rate of 3.9% is well below the national rate, and its year-on-year job growth of 4.4% in December was the fastest of any state. But Idaho says over the next decade it will see a widening gap between job growth and the growth of its working-age population. It has a shortage of workers in high-tech, manufacturing and other sectors, and among transplants to the state are many retirees.

Many refugees have university degrees and often fill higher-tech jobs. While working at a Wal-Mart for six months, Mudhafar Poules, an Iraqi computer programmer, prepared a resume and brushed up on his English. Last July, he landed an IT position at Boise State University.

In Twin Falls, they have been a diverse and committed part of Chobani's workforce, a spokesman said. Snack maker Clif Bar & Co. has begun hiring workers, including immigrants, for a baking facility set to start operating this spring, according to a spokeswoman.

Republican state Rep. Stephen Hartgen praised refugees' work ethic, saying they have started businesses, toiled in dairies, and joined the school board and police force in his district. But now, he said, "The security concern is real; people are conflicted."

The state remains divided. In January, about 150 people lined a hall at the Idaho Capitol to show support for refugees, while about as many gathered in a Capitol auditorium to hear two guest speakers who criticized the U.S. refugee program and highlighted the jihadist threat.

College student Elia Sherman, standing at the Capitol event, said refugees bring diversity. "We want an inclusive community," she said.

Inside the auditorium, Frank Marcos, a retired baseball-league scout, said, "I'm concerned about individuals wanting to do us harm."

Meanwhile, refugees continue filling jobs in Idaho, including Rasha Al-Zaidi, a 33-year-old Iraqi mother of two girls whose family arrived in Boise 18 months ago.

Ms. Al-Zaidi, who was a hospital pharmacist in Baghdad, got counseling from a program that helps refugees transfer skills to the U.S. workplace. After interning at Ladd Family Pharmacy last year, Ms. Al-Zaidi was hired full-time as a pharmacy technician, earning $14 an hour.

Said pharmacy owner Elaine Ladd: "There is a shortage of people with the skills I need; Rasha deserved an opportunity."

French teen link to school bomb threats

Saturday, 13 February 2016

Byline: Katrina Stokes

Section: general

Canberra - A teenager linked to school bomb threats across the world, including in Adelaide, is being quizzed by anti-terror police in France.
Vincent Lauton, 18, is being held in connection with hoax threats in Europe, Asia, the US and Australia.

The threats - allegedly with the message "You Will Die" - have led to mass evacuations. More than 20 South Australian schools have been targeted in the past week, including at least two yesterday.

Lauton is known to be a hacker and is described as a "sophisticated computer operative", according to French police. He is linked to the "Evacuators 2K16" bomb hoaxers, who called on children to tweet if they wanted their school shut down.

Heavily armed police descended on Lauton's family home in the village of Marsannay le Bois, near Dijon, on Monday. He was taken to a Paris police station and his custody extended under emergency powers in place since the jihadist shootings and bombings that killed 130 people in Paris on November 13.

Lauton is reportedly the administrator of the darkness.su domain where the other alleged hoaxers are operating.

Sources said police arrested him in connection with the investigation into telephoned hoax bomb threats that forced schools in Paris to be evacuated. He was tracked down through his internet IP address.

Police and investigation sources said computer equipment had been taken from the house he shares with his parents for examination.

Between January 26 and February 1, schools in France and England received pre- recorded phone calls telling staff bombs had been planted. Police found no evidence of any explosive devices.

"The probe is trying to establish if there is a link between calls targeting high schools in Paris and threats against schools in other parts of the country, mainly in Lyon. We can't rule anything out," a judiciary source said.Schools in Adelaide including Adelaide High, Magill Primary, Norwood Morialta High and Banksia Park International High School have received hoax bomb threats in the past two weeks, causing mass student evacuations and classroom lockdowns.

The Daily Telegraph

GCHQ wins legal backing for hacking

Saturday, 13 February 2016

Byline: Tom Whitehead

Section: general

London - A fifth of GCHQ intelligence comes from hacking into phones and computers, the agency has revealed, as it won a human-rights victory in defence of its once-secret technique.
The spy agency admitted last year that it regularly hacks into electronic devices - known as equipment interference - to gather data on suspects. It was forced to defend the power before the Investigatory Powers Tribunal after a civil-liberties group and internet companies claimed that it breached human-rights laws. But the panel, which hears challenges against the security and intelligence agencies, yesterday ruled the methods were lawful. In submissions to the hearing, it emerged that in 2013 about 20 per cent of GCHQ intelligence reports contained information derived from hacking.

The tactic, also known as computer network exploitation, allows authorities to interfere with electronic devices such as smartphones, tablets and PCs to obtain data.

Operations range from using a target's login credentials to access information on a computer, to remotely installing a piece of software to obtain the desired intelligence and covertly downloading the contents of a mobile phone.

The methods are seen as an increasingly crucial tool as advanced encryption makes it more difficult for security services to keep track of terrorists.

The tribunal concluded that the legal regime under which warrants are issued for the agency to carry out equipment interference in the UK is compatible with European Convention on Human Rights articles.

Washington Post

British teen arrested in hacking of U.S. intelligence officials

Saturday, 13 February 2016

Byline: Matt Zapotosky & Ellen Nakashima

Section: general

Washington - British authorities have arrested a 16-year-old suspected of being involved with a group that hacked into the private email accounts of high-ranking U.S. intelligence officials, according to U.S. officials and British police.
The teen is said to be connected to the cohort that calls itself Crackas With Attitude, which has claimed to have broken into the private email accounts of CIA Director John O. Brennan and Director of National Intelligence James R. Clapper. What part the teen played is unclear, and U.S. officials, who spoke on the condition of anonymity to discuss the case, said they are still investigating the roles of others.

Spokespeople for the FBI and Justice Department declined to comment. The South East Regional Organized Crime Unit - a British police force cooperative - confirmed in a statement it arrested a 16-year-old boy Tuesday on suspicion of three computer-related charges, but it would not comment on links to the hacking of American officials. The group said the boy was released on bail until June.

The teen's arrest and connection to the hacks on U.S. intelligence officials were first reported by CNN.

FBI agents and federal prosecutors in the Eastern District of Virginia have been investigating Crackas With Attitude for months, working to build a case that they hope might land at least some of them in a U.S. courtroom. The group has been outspoken about its cyber mischief, providing reporters with evidence that members successfully broke into the personal files of top U.S. intelligence officials.

The group is also thought to have leaked the names and work email addresses and phone numbers of thousands of Homeland Security and FBI employees. In that case, none of the email addresses and numbers was personal, but they still could be of use to overseas intelligence agencies.

The teen's arrest is a significant development in the case, although as yet, no one is facing any U.S. charges.

A person claiming to be an American high school student told the New York Post last year that he used "social engineering" to dupe Verizon workers into turning over Brennan's personal information and AOL into resetting his password. The person apparently accessed Brennan's personal email account, which contained a 47-page application for a top-secret security clearance.

Early this year, a person going by the nickname "Cracka" told the magazine Motherboard that he had accessed a series of accounts linked to Clapper, including his home telephone and Internet, his personal email and his wife's Yahoo email account.

Vice News Canada

A Former Special Forces Soldier is Setting Up a Massive Private Military Facility in Ontario

Saturday, 13 February 2016

Byline: Sandro Frenguelli

Section: general

Ottawa - On the surface, Brockville is just another quaint small town in Ontario. Situated in the Thousand Islands, residents enjoy tasteful concerts and exhibits at the historic Brockville Arts Centre and tourism writeups will inevitably refer to the town of 20,000 as "charming."
But just out of town, Steve Day, a former special forces soldier, wants to show people the best way to breach buildings and take down targets using assault rifles, shotguns, and semi-automatic pistols.

The retired lieutenant- colonel and former commander of Canada's secretive JTF-2 special operations unit and his company, Reticle Ventures Canada, plan to invest $50 million to transform a 400-acre section of Tackaberry Airport into Canada's most advanced private training facility for militaries and first responders.

"This is going to be an innovation arena for leading-edge soldier systems technology," says Day, whose specialty was combat engineering.

Brockville is the landlord and the owner of the property, but the airport also falls within the jurisdiction of neighboring Elizabethtown- Kitley. Brockville will sign the lease agreement, while Elizabethtown must approve the site plan.

Plans for the facility, which is partially operational and is slated for a grand opening at the beginning of April, include a 10,000-square foot schoolhouse, a 50-meter outdoor firing range, a 25-meter indoor firing range and an aircraft hangar. Reticle also wants to construct a "simulation village" to give students as much realism as possible when learning how to deal with urban assaults and hostage situations on Canadian soil.

The military contracting industry isn't especially new to Canada. There are several aerospace contractors and other specialty manufacturers based here and London, Ontario-based General Dynamics landed a controversial $15-billion deal to supply Saudi Arabia with light armoured vehicles. However, Brockville residents, among others in Canada, are witnessing the growth a little known offshoot: a private military training business.

Tundra Strategies, based in Stayner, Ontario, and Millbrook Tactical, based in Stittsville, Ontario, have both worked with the Canadian Department of National Defence (DND). Millbrook has trained DND

employees in the use of firearms and Tundra has taught drivers how to keep their vehicles shiny-side up in conflict zones.

"We have trained the OPP, RCMP, military, and government agencies. We can't keep up with business at the moment," says Francois Paquette, president of Millbrook Tactical.

Reticle's Brockville project, however, represents an ambitious departure for Canada's private military training industry. Paquette says, "Nothing like this exists in the Canadian private sector." Tundra, for example, runs a training facility of its own but it just has classrooms for theory based learning. For practical training, they use local off-site facilities. The Tackaberry site will see straight-up live-fire exercises. As such, the facility is proving worrisome to quite a few people in the community.

"It doesn't seem to make sense to have bullets flying around at a small municipal airport," says Brant Burrow, a member of the Elizabethtown-Kitley Residents Association.

Tackaberry is a special case: training amenities will be on-site while the airport itself will stay operational as a public airport.

This means that those looking to be trained in the art of war will have to play nice with those trying to land their Cessnas. Rob Smith, an Elizabethtown-Kitley councillor, says, "Reticle is building earth berms between the firing point, the runway, and the airport buildings that will be tall enough to obstruct the line of sight."

Though the above mentioned features, along with strict government safety guidelines, are designed to provide protection from projectiles and noise, residents are still troubled. During Reticle's own on-site ammunition sound tests last summer, nearby residents thought they were in the middle of a war zone, says Burrow.

"There just seems to be a risk there even if the risk is low. I don't dispute that there might be a one-in-a-million chance of a stray bullet hitting a plane or a person or what have you. It may be a low risk but the consequences are dire of that one incident," he adds.

Day is hoping to attract Canadian first responders and to repatriate Canadian dollars spent on sending our men and women abroad to train. He says that he has also had ample interest from private domestic and international clients, which has raised yet more concern for residents. "Just exactly who is Reticle going to be training here? What if someone gets a hold of a gun that shouldn't have one?" asks Burrow.

Brockville has yet to sign the lease agreement with Steve Day, and, according to Mayor David Henderson, the city has imposed its standard noise bylaws on the agreement. And while everything about the project seems to be moving forward, Burrow assures me that he is going to continue being vigilant. "We're in it for the long haul. We are not against these facilities by any means. We are not against Reticle. We said right from the beginning that it's a good project, but it's the wrong place."

Reticle's project is likely to change the face of the Canadian private military training industry for the simple fact that nothing like this exists here. The one-stop shop model of tactical training made famous by sprawling US compounds, like Academi's Moyock, North Carolina facility, is moving north of the border. In the very near future, innocent and idyllic Brockville could be playing host to a much more hardcore tourist.

Comment: The past few weeks have offered a sobering reality check for anyone who actually believes Liberal governments differ from Conservative governments when it comes to holding the nation's spies to account.
What we've seen and heard are the same tired excuses offered up by ministers with the same titles, trying to explain away the inexcusable while mouthing the same vague promises to finally keep our spooks in check.

First, we learned that CSIS was up to its old, dirty tricks when it was revealed that the civilian spy service repeatedly obtained the tax records of an unknown number of Canadians without troubling to get a warrant from a judge.

We were told not to get too bent out of shape about it, since this shady trafficking in Canadians' confidential tax information was the work of a "rogue" Canada Revenue Agency official who has since left the CRA, voluntarily or involuntarily. (The lone gunman strikes again.)

Then, we were belatedly informed that the super-secret electronic snoops working at the Communications Security Establishment (CSE) illegally shared the supposedly private "metadata" of an untold number of Canadians with a spate of foreign spy agencies. This, we were told, was the result of a technical glitch.

Eva Plunkett, former Inspector General for CSIS, has heard these cockamamie cover stories before, and she still isn't buying any of it. In report after report, Plunkett warned Canadians and a revolving cast of

Public Safety ministers that leaving too much power in the hands of even well-intentioned spies is not only dangerous, it leads inevitably to these sorts of illegal shortcuts.

"That's often the explanation -- 'Oh, it was inadvertent or misplaced,'" Plunkett told iPolitics in an exclusive interview last week. "These are words these agencies often use. They have a problem with being frank ... (with) saying, 'This is what happened and we will be honest about it.'"

(Plunkett retired in 2012 shortly before Stephen Harper shuttered her tiny operation because accountability-allergic spymasters complained that she was a bothersome burr in their hides.)

Plunkett says that Prime Minister Justin Trudeau needs to seize the moment by doing what successive Liberal and Conservative governments have failed to do: establish real and robust parliamentary oversight -- not after-the-fact review bodies -- to train a keen eye on these extraordinarily powerful intelligence services.

"There's an opportunity now to do something that might be effective in terms of oversight," Plunkett said. "I'm a believer in a Parliamentary committee. That would be a good thing."

Public Safety Minister Ralph Goodale appears to be a believer too ... with a convenient caveat. At a hastily-arranged press conference late last month, a slightly rattled Goodale -- with Defence Minister Harjit Sajjan in tow (he's responsible for CSE) -- repeated his pledge to set up a parliamentary "mechanism" to ensure that the spooks are "properly respecting Canadian rights and freedoms."

What many missed in Goodale's polished statement was the absence of any acknowledgement or condemnation of the fact that these intelligence agencies broke the damn law. Goodale and Sajjan don't need to wait for the findings of their "review" of Canada's national security infrastructure to act. They can call in the Mounties right now. They should.

Failing to do so means sending the same message to Canadians their predecessors sent -- that our intelligence services operate somewhere beyond the law, immune from the consequences that ordinary people face.

Word is that Goodale's parliamentary "mechanism" to watch the watchers may resemble those already in place in a variety of Commonwealth countries, including Australia, Great Britain and New Zealand.

The problem -- as the Toronto Star's Thomas Walkom recently pointed out -- is that these mechanisms often provide only an illusion of accountability. The so-called parliamentary leashes -- to the degree they exist on paper -- tend to be rather loose.

Plunkett says that without the proper resources, expertise, money, political will and legal power, no mechanism Goodale comes up with will amount to more than window dressing.

"You have to have a group of experienced researchers that know the subject matter, that know how to do the analysis and (have) no fear in bringing forward negative information," she said.

Plunkett insists that a parliamentary committee will work only if Goodale establishes a well-staffed, well-funded "independent office" that reports its findings to the committee for further review. "Parliamentarians obtain the information, but they don't actually do any of the detailed work themselves, beyond posing questions."

Some media-friendly academics welcomed Goodale's appointment as Public Safety minister as a sign that this government is committed to oversight. Like Plunkett, I'm not convinced. Recall that Prime Minister Trudeau kept Richard Fadden on as his national security advisor. Fadden was Harper's loyal national security advisor when he told a Senate committee that CSIS already has too many eyes prying into its business.

And earlier this week, Trudeau took up Harper's cowardly court fight to withhold a federal apology and compensation for three Canadians tortured in the Middle East (despite having championed their pursuit of justice while in Opposition) -- in part to protect the identities of CSIS officers implicated in their cases.

Sunny ways? Or just the same old methods of operating beyond the law, in the dark?

Andrew Mitrovica is a writer and journalism instructor. For much of his career, Andrew was an investigative reporter for a variety of news organizations and publications including the CBC's fifth estate, CTV's W5, CTV National News -- where he was the network's chief investigative producer -- the Walrus magazine and the Globe and Mail, where he was a member of the newspaper's investigative unit. During the course of his 23-year career, Andrew has won numerous national and international awards for his investigative work.

IRS crash was technical, not cyber

Monday, 15 February 2016

Byline: Kevin McCoy

Section: general

Washington - The computer outage that halted IRS tax return processing for more than a day resulted from not just one hardware failure but two, the tax agency says.

An electrical voltage regulator on the computer server that handles tax returns for millions of Americans started to fail on Feb.3, Terence Milholland, the IRS' chief technology officer, testified at a Thursday hearing of the House Committee on Oversight and Government Reform.

As a technician worked to address the problem, a backup voltage regulator also failed, he said. Approximately 30 hours elapsed before the IRS was able to fix the regulators and resume normal service.

Seeking to allay any fears that something more sinister might have been to blame, Milholland said, "This was, with absolute certainty, not a cyberattack. It was a failure of mechanical devices."

The episode marked the latest in a series of computer problems that have embarrassed the IRS, and, in some cases, raised the risk that personal information could be accessed, used to steal taxpayers' identities, file fraudulent tax returns and collect refunds.

The tax agency this week disclosed that it detected unauthorized efforts to gain access to e-file personal identification numbers for more than 450,000 Social Security numbers in late January. Approximately 101,000 of those efforts succeeded in accessing an e- file ID number, the IRS said.

No personal taxpayer information on the computer system was compromised, the tax agency said. IRS personnel are now mailing affected taxpayers alerts about the problem.

"Until the IRS takes steps to improve its security program deficiencies and fully implement all security program areas in compliance with (Department of Homeland Security-directed) requirements, taxpayer data will remain vulnerable to inappropriate and undetected use, modification or disclosure," a September 2015 inspector general report concluded.

Colombia Reports

Twitter suspends accounts of Colombia's ELN rebels

Monday, 15 February 2016

Byline: Staff report

Section: general

Bogota - Social media platform Twitter has shut down the official account of Colombia's second largest rebel group, the ELN, just when the guerrillas were stepping up violence ahead of possible formal peace talks.
The guerrillas used their accounts, @ELN_Colombia and @ELN_Ranpal, to disseminate political propaganda and updates on the preliminary talks with the Colombian government.

However, over the past week, the ELN has been promoting an "armed strike," a shutdown of economic activity across Colombia. Violations of these imposed guerrilla shutdowns are commonly retaliated, for example by burning trucks or buses that refuse to adhere to the strike.

According to weekly Semana, the ELN ban was due to the fact that Twitter considered this a call to violence, a violation of the social media platform's rules, and the fact the ELN is considered a terrorist group by the US government and not formally engaged in peace talks.

The Twitter Rules disallows users to "make threats of violence or promote violence, including threatening or promoting terrorism."

Additionally, the social media platform's guidelines also "do not allow accounts whose primary purpose is inciting harm towards others on the basis of these categories."

The ELN's website, hosted by a radically leftist server provider in Spain, is accessible as usual. The group is not active on Facebook, the world's largest social media platform.

Twitter did not block the accounts used by Colombia's largest rebel group, the FARC, which has been engaged in peace talks since late 2012 and has mainly been dedicated to the promotion of these peace talks and the publication of their demands.

New App Helps Young Iranians Dodge "Morality Police" Checkpoints

Monday, 15 February 2016

Byline: Staff Report

Section: general

Undisclosed placeline - An anonymous Iranian team of app developers have come up with a new smartphone application that helps Iranians dodge the Islamic Republic's "morality police" known in

Persian as "Ershad" or guidance. The app widely spread among young, tech-savvy population but has quickly fallen foul of the authorities.
The data for the Gershad app is crowdsourced. It depends on reports from users to help others being stopped at checkpoints set up by the morality police, who enforce Islamic dress and behavior codes. Users can tag their location on a Google map with an icon of a bearded man, enabling others to steer clear of them. When the number decreases, the alert will fade gradually from the map.

Gershad is a contraction of the full title of the Gashte Ershad (guidance patrol), which is part of efforts to eliminate Western culture from the country following the Islamic revolution which overthrew a Western-backed king in 1979.

Ershad's notoriety comes out of their role to check for "immoral behavior"--women wearing too much makeup or failing to cover their heads, men too much influenced with Western fashion, or unmarried men and women traveling together are a few examples. The Ershad can issue warnings, demand formal written statements of "repentance," or arrest and prosecute people at their discretion.

The app's developers explained their motives in a statement on their web page saying: "Why do we have to be humiliated for our most obvious right which is the right to wear what we want? Social media networks and websites are full of footage and photos of innocent women who have been beaten up and dragged on the ground by the Ershad patrol agents."

The app was blocked by the authorities soon after it was released for Android devices on Monday but many Iranians bypass Internet restrictions by using a Virtual Private Network.

It is already trending on social media and has received almost 800 reviews on the Google Play app store, nearly all of them positive, although Google Play does not show how many times Gershad had been downloaded.

Gershad is seen by some as a "social movement" setting a precedent for "digital protest" with Iranians turning to technology to evade checks on their everyday lives. This step has surfaced as elections in Iran come into view and the country emerges from years of isolation following the lifting of international sanctions imposed over its nuclear program.

"This is an innovative idea and I believe it will lead to many other creative apps which will address the gap between society and government in Iran," said Hadi Ghaemi, executive director of the International Campaign for Human Rights in Iran.

Ghaemi said the app's developers were based outside Iran but had grown up in the country and experienced the problem firsthand.

"It's really an indigenous product... these are the kind of people who have been stopped at checkpoints," he said.

"It's showing a trend in digital protest... I see it as a precedent for future apps of its kind," said Amir-Esmaeil Bozorgzadeh, a Dubai-based consultant for app makers in the Iranian market.

Smartphone messaging applications are popular among young Iranians who use apps to share news and jokes that would not be allowed in the tightly controlled traditional media.

Many Iranians, especially the young, are hoping that an easing of cultural restrictions follow the lifting of sanctions and the elections on Feb. 26.

However, so far, thousands of moderate and reformist candidates have been barred from standing in the elections.

Bras de fer pour le contrôle des données des Européens

Monday, 15 February 2016

Byline: Lucie Ronfaut

Section: general

Non identifié - Le ciel leur est presque tombé sur la tête. Le 6 octobre, la Cour de justice de l'Union européenne a déclaré illégal le système dit « Safe Harbor » , qui régissait les transferts de données entre les États-Unis et l'Europe. Au travers de cette invalidation, la justice européenne s'est attaquée à l'empire des grandes entreprises américaines du Web, qui hébergent souvent les données de leurs clients européens dans des centres situés aux États-Unis. Trop dangereux pour la Cour, qui a rappelé dans sa décision les révélations d'Edward Snowden sur la surveillance de la NSA. Comment garantir que les données stockées par Facebook, Google ou Microsoft ne soient pas de nouveaux espionnées par le gouvernement américain ? Même après la négociation d'un nouvel accord pour remplacer le Safe Harbor, appelé « Privacy Shield » , la question demeure.
La solution avancée par les géants du Web est simple : déménager leurs serveurs en dehors des États-Unis. Les plans de construction de data centers en Europe se multiplient. Apple a annoncé début 2015 un investissement d'1,7 milliard d'euros dans la construction de deux centres en Irlande et au Danemark. Microsoft va lui aussi inaugurer trois data centers en Allemagne et en Angleterre. Google va investir 600 millions d'euros aux Pays-Bas. Facebook, enfin, a ouvert une infrastructure à Luleå, en Suède.

La France hors jeu

Depuis l'affaire Snowden, la pression s'était accrue sur les géants du Web pour qu'ils assurent une meilleure protection des données de leurs utilisateurs. « L'annonce de nos nouveaux data centers en Europe après l'invalidation du Safe Harbor est une coïncidence » , confirme Bernard Ourghanlian, directeur technique et sécurité chez Microsoft France. Le géant américain de l'informatique dispose déjà de deux data centers en Europe, en Irlande et aux Pays-Bas. Les deux nouveaux centres allemands seront gérés par une filiale de l'opérateur Deutsche Telekom, en accord avec la loi allemande. De cette manière, Microsoft n'aura pas accès aux données stockées et ne pourra pas être forcé à les transmettre.

La France, elle, ne bénéficie pas encore des attentions des géants du Web. La faute à un cadre juridique trop instable en matière d'hébergement de données. Plusieurs lois concernant directement l'activité des data centers (loi de programmation militaire, loi renseignement...) ont été votées en peu de temps, certaines toujours en attente de décrets d'application. « Il n'y a pas de volonté particulière d'éviter la France » , assure Bernard Ourghanlian. « Mais on ne peut pas prendre de décisions si les règles du jeu ne sont pas claires. » La loi renseignement, adoptée en juin 2015, avait été critiquée par les hébergeurs français, qui craignaient de perdre la confiance de clients étrangers. Poste frontalier de Dhehiba: Installation d'un scanner de véhicules

Sunday, 14 February 2016

Byline: N.H.

Section: general

Dhehiba, Tunisie - Les autorités tunisiennes accélèrent la mise en place des moyens de contrôle aux frontières avec la Libye. Un scanner vient d'être installé à Dhehiba.
Afin de renforcer le contrôle et d'optimiser la surveillance des personnes à ses frontières sud avec la Libye,la Tunisie vient d'installer un scanner pour la surveillance des véhicules de petite cylindrée au passage frontalier de Dhehiba (gouvernorat de Médenine).

Ces équipements sont installés en prévision d'une éventuelle intervention militaire internationale contre les camps de l'Etat islamique (Daêch) et des autres organisations terroristes basés en Libye et qui pourrait provoquer un afflux massif de réfugiés vers la Tunisie.

Il est à rappeler que suite à l'attentat de Tunis, contre un bus présidentiel, le 24 novembre 2015, des scanners avaient été mis en place au poste frontalier de Ras Jedir, le 10 décembre 2015, pour y

renforcer la surveillance. Ces scanners sont destinés à contrôler les poids lourds et à prévenir, notamment, l'entrée d'armes et de produits explosifs pouvant être utilisés par les groupes terroristes.

N. Korea hackers behind massive spam emails to S. Korea: police chief

Monday, 15 February 2016

Section: general

North Korean hackers sent massive amounts of spam emails to South Korean public organizations last month, South Korea's police chief said Monday, the latest in a series of cyberattacks against the South in recent years.
"We are at a stage to be assured that it was committed by a North Korean hacking organization," said Kang Sin-myeong, commissioner-general of the National Police Agency, announcing the interim outcome of their probe into the case.

The hackers allegedly sent emails disguised as being sent by either the presidential office or the foreign ministry related to North Korea's recent nuclear test.

The Internet Protocol address -- the online equivalent of a street address or phone number -- used to send the spam emails was traced to China's northeastern province of Liaoning bordering North Korea. The network can be used wirelessly from North Korean territory, according to police.

It is the same Internet network behind a cyberattack on South Korea's nuclear power operator in 2014, according to Kang. North Korea is suspected of orchestrating the attack, though it has denied the charges.

Police said similar emails pretending to be from the presidential office or other government bodies have been sent from June 2015 to a total of 759 people.

After probing into 460 of the recipients' occupations, police said 87.8 percent have jobs related to North Korea.

"Looking at the probe results, there is a trace of an intentional and deliberate targeting process that cannot be deemed as a coincidence," Kang said.

Police also said some words in the mails are used only in North Korea.

Although South and North Koreans speak the same language, South Koreans do not understand some North Korean expressions.

The police chief said no major damage to national security has been confirmed due to the attack.

Police said they are planning to conduct an international joint investigation as they found two European servers used to send other spam mails disguised as a notice from a major South Korean portal site.

North Korea has a track record of waging cyber attacks on South Korea and the United States in recent years, though it has flatly denied any involvement.

The latest hacking attempt came amid heightened tensions on the Korean Peninsula after North Korea claimed in January that it successfully carried out its first hydrogen bomb test.

In response, South Korea is working with the U.S. and other regional powers to punish the communist country for its nuclear test and long-range missile launch that shortly followed the January provocation.

Toronto Sun
Trudeau government to take on cybersecurity threats
Friday, 19 February 2016
Byline: David Akin

Ottawa - With Internet-based child sex-ploitation crimes skyrocketing, the Justin Trudeau government intends to launch a "credible and comprehensive" review this spring of cybersecurity threats in Canada. Officials with Public Safety Canada said Thursday that while the details of that review are still being hammered out by Public Safety Minister Ralph Goodale, a review will determine how Canada can best deal with everything from online predators to digital jihadists.

Kathy Thompson, the assistant deputy minister in charge of the Community Safety and Countering Crime Branch at Public Safety Canada, said while the crime rate continues to decline across the country, "there are some exceptions. One of those exceptions is child sexual exploitation over the Internet -- that is going up exponentially, year over year."

Thompson made her remarks at the House of Commons Public Safety and National Security Committee, where MPs are looking for topics their group can zero in on during the current parliamentary session.

A cybersecurity review that looks at legal gaps and shortcomings in police resources could form a plan for the way the Trudeau government approaches law-and-order issues.

"It is our intent to conduct a review that is going to be credible and comprehensive and reaches out to all stakeholders across Canada. And also to our international partners," said Monik Beauregard, the senior assistant deputy minister at Public Safety's national and cyber-security branch.

Liberal MP Marco Mendocino, a former Crown prosecutor who played a key role in putting some of the Toronto 18 terrorists in jail, told the committee he is particularly concerned about financial crime -- the use of computers and telecom networks by organized criminals, including terrorists, to move and hide money -- as well as the use of social media as a breeding ground for online hatred and incitement.

"The fact that we are now so invested in cyberspace can make us vulnerable," said Mendocino.

He wanted to know what the top public safety issues were for Canada's most senior security bureaucrats.

Child sex- ploitation is right at the top of the list, Thompson said.

"That is one of the areas that's keeping us awake. We're working very actively on that. We're partnering not just in Canada but internationally," said Thompson.

Thompson said identify theft and intellectual property crime are two other areas where the crime rate has been rising because of the widespread adoption of the Internet.

Canadian Press
Canada's electronic spy service to take more prominent role in ISIS fight
Friday, 19 February 2016
Byline: Murray Brewster

Ottawa - The Communications Security Establishment, Canada's electronic spy service, is set to play a more prominent role in the war against the Islamic State of Iraq and the Levant, The Canadian Press has learned.
Multiple sources familiar with the plans, speaking on condition of anonymity owing to the sensitivity of the matter, say the government is deploying a capability that only a "handful of countries" in the world can provide.

CSE is part of the so-called "Five Eyes" community, along with the U.S. National Security Agency -- the NSA.

CSE spokesman Ryan Foreman acknowledged the agency is helping the Canadian Armed Forces under the umbrella of Operation Impact, the name of Canada's anti-ISIL mission in the Middle East, but refused to discuss specifics.

"While we are proud of our contributions to CAF's missions, CSE is obligated to respect the Security of Information Act, and cannot address specific operational questions," Foreman said.

Defence Minister Harjit Sajjan has for weeks been signalling that the military will introduce a "more robust" intelligence-gathering regime, one that allies -- chastened by the withdrawal of the six CF-18s -- are happy to be bring to the fight.

Separately, Public Safety Minister Ralph Goodale confirmed Thursday that the Canadian Security Intelligence Service will also play a stepped-up role in the fight against the Islamic State, but he also refused to be specific.

"We are providing new and additional intelligence capabilities in the region and while by its very nature I cannot elaborate, CSIS will have a role to play," Goodale said.

"It will certainly be an increased role to accomplish larger objectives."

The defence conference where Goodale and Sajjan were speaking heard Thursday about how CSIS agents cultivated human sources in Afghanistan.

But CSE played a pivotal role alongside the Canadian Army during the Afghan war, providing by its own admission half of the crucial battlefield intelligence on Taliban militants, their movements and the locations of key commanders.

The information was used to plan military operations and for targeted capture or kill missions by special forces. But one official, speaking on condition of anonymity, said Canadians would provide targeting only and not take part in any "direct action."

Although he's been eager to trumpet the "doubling" of the intelligence effort, Sajjan has been decidedly opaque about what that means, even last week when he announced the retooled mission.

"Enhanced intelligence capability will help protect our forces in theatre as well as those of our coalition and host nation partners," Sajjan said.

"Therefore, we will significantly increase the resources we dedicate to intelligence, both in northern Iraq and theatre-wide. Our intelligence capabilities will help the coalition and Iraqi security forces develop a more sophisticated picture of the threat and improve our ability to target, degrade and defeat ISIL."

What that likely means in practical terms, according to sources and intelligence experts, is the involvement of the secretive CSE and specialists from the 21st Electronic Warfare Regiment.

It also means deploying Canadian intelligence officers into the highly secure all-source intelligence centre in Kuwait, and potentially hacking ISIL computers and smartphones.

When pressed, Sajjan refused to discuss the details.

"Unfortunately, I'm not going to talk (about it) in public for operational security reasons," he said.

"The last thing you want to be able to do is show your hand to (ISIL) and let them know what type of capability you are bringing in, but we have very unique capabilities for the coalition, and what I will say is capabilities for theatre-wide for the entire coalition and then we have very specific capabilities for our troops in the north as well."

Bill Robinson, a blogger and expert on signals intelligence, said it is a matter of public record that the military and CSE have an integrated operational model for field operations, which proved highly successful in Afghanistan.

"It was a pretty substantial contribution on the intelligence side," said Robinson, who noted that signals kept watch over not only the movement of Taliban units and commanders, but also provided early warning of threats -- such as the planting of roadside bombs -- and even kept tabs on local Afghan government officials.

Deploying a similar capability to northern Iraq would, in Robinson's estimation, be a significant step-up in terms of the fight.

"It's a plausible argument that this is a contribution that would be valued just as much as the fighter-bombers," he said. "Increasingly, I think this kind of warfare is down to intelligence."

It is likely filling a gap that the Americans are unable to cover themselves, Robinson added.

Throughout the war against the Islamic State, U.S. commanders have repeatedly called for more intelligence data, mostly in the form of extra drone flights. Washington was forced to strip the remote-controlled aircraft from operations in Afghanistan, according to published reports.

Documents leaked by former NSA contractor Edward Snowden indicate "that in the Horn of Africa and Afghanistan, they were not getting all the signal intelligence they wanted," Robinson said.

That's one of the reasons Canada deployed its own capability to Kandahar during the war, he added.

The game could be upped even further with the purchase of special tactical intelligence surveillance planes, similar to the King Air turboprop aircraft used by special forces in Afghanistan under a contract with the U.S. Army. The federal government quietly floated a letter of interest in September to see if defence contractors could deliver three aircraft.

In addition, Robinson says Canadian intelligence officers are highly valued in multi-national intelligence hubs like the one in Kuwait, because they "are cleared into the Five Eyes community."

Toronto Star
Has Apple secretly leaked your data to government?
Friday, 19 February 2016
Byline: Frederick Ghahramani

OpEd: Apple CEO Tim Cook's now widely shared "Message to our Customers" is an attempt to make the best PR move in a bad situation.
Were Apple to comply with the FBI's request to access information locked on a suspected San Bernardino shooter's phone, it probably wouldn't be the first time that the government has deputized Apple to breach its customers' privacy.

According to documents revealed by Edward Snowden in 2013, Apple was one of the participants in the U.S. National Security Agency's PRISM program, giving authorities access to its customers' information including their emails, messages and photos.

Apple for its part has denied any such involvement, but given the secretive nature of the United States Foreign Intelligence Surveillance Court (FISA Court), Apple and other technology companies would be prohibited to publicly acknowledge their involvement in such programs.

Hence the frustrating catch-22 - is Apple really a champion of privacy rights? Or is all this bluster just an act to score PR points with their customers, despite the fact that legislative conditions already exist to force Apple to co-operate in secret?

Maybe we'll never know, and it probably doesn't matter, because the real lesson that can be learned from this episode is the importance of open source software.

While Apple has invested heavily in encryption and security, most of its systems and applications are closed. For all we know, Apple could already have been secretly compelled to program backdoors into its popular services such as iCloud and iMessage - even against the wishes of its CEO.

In fact, rumours such as this one have been circulating for quite some time. If true, this means that millions of customers could already have had their privacy invaded without ever knowing and, more importantly, the decision to do so would be adjudicated in a secret court, completely out of Apple's hands.

In contrast, in an open source model, the source code of an application is available to the general public, and a global community of curious engineers (there are millions of us) could effectively "look under the hood" to ensure that no backdoors existed. Such transparency can only be achieved in an open-source environment, and Apple has historically chosen to operate contrary to this model.

The second and more important lesson is that situations such as this distil the abstract concept of encryption into frightfully political sound bites. Recently, John J. Escalante, chief of detectives for Chicago's police department, went so far as to suggest that "Apple will become the phone choice for the pedophile."

The truth about encryption is obviously far more nuanced. Encryption is not a dirty word, nor is it something that's only useful to terrorists and pedophiles. Consider going a day without encryption - being unable to use your credit card, withdraw funds from an ATM, or simply make a mobile phone call - and you quickly realize how any legislation that weakens encryption would have far-reaching social, political and economic consequences.

It has been argued that mathematically crippling encryption systems to grant the government a so-called "master key" would be a good way to protect our safety and security. That's a strange case to make when most people would never agree to give the police a master key to open every house in the country (even if pedophiles and terrorists also live in some of those houses).

Furthermore, such arguments naively assume that only the "good guys" would retain (or devise) such master keys. At a time when accidental data losses by governments around the world have become an all too common occurrence, it's no wonder Apple is concerned about being forced to grant the government such access.

The U.S. government has painted not just Apple but the entire technology industry into a corner. The industry's answer needs to lie in advances in encryption technology and open source software. Given the opaque and Byzantine nature of the security apparatuses in both the U.S. and Canada, it will soon be impossible to decipher who's been compelled to do what or when - no matter what their press release states.

Frederick Ghahramani is the CEO and founder of just10.com, an ad- free private social network.

Globe and Mail
Museveni temporarily bans social media and has rival arrested, while police fire tear gas to disperse protesting voters
Friday, 19 February 2016
Byline: Geoffrey York

Johannesburg - Authorities blocked access to social media and police arrested an opposition leader as Uganda's President sought to extend his 30- year grip on power in a bitterly contested election on Thursday.
President Yoweri Museveni, who seized power in 1986 and is heavily favoured to win the latest election, said the temporary ban on Facebook and Twitter on election day was necessary because some Ugandans were "telling lies" and "misusing" social media.

"There must be steps taken for security, to stop so many creating trouble," the President told Ugandan media. "You know how they misuse them, telling lies. If you want a right, then use it properly."

Police fired tear gas to disperse voters who protested long delays in providing ballots and election materials at some voting stations. The main opposition leader, Kizza Besigye, was arrested for the second time in four days.

He was charged with "criminal trespass" when he went to the gates of an unmarked police-intelligence building, which he alleged was a vote-rigging centre.

Mr. Museveni, 71, is just the latest African leader to attempt to orchestrate the continuation of his rule, despite growing calls for term limits. At least 15 leaders across Africa have served more than two terms or announced plans to do so. In a youthful continent where the average age is 19, many leaders are elderly and unwilling to give up any power. The average age of the 10 oldest African presidents is 78. The oldest, Robert Mugabe of Zimbabwe, turns 92 on Sunday.

Mr. Museveni himself had once scathingly criticized African leaders for their tendency to cling endlessly to power. In 1986, after a five-year bush war in which he led his guerrilla army to victory, he proclaimed: "The problem of Africa in general and Uganda in particular is not the people, but leaders who want to overstay in power." But once he got a taste of power, Mr. Museveni seemed to forget those words. He became increasingly dominant in a system that revolved around his personal rule, backed by the military. In 2005, he allowed multi-party elections for the first time, but he also scrapped term limits, allowing himself to rule indefinitely. He is also now expected to get rid of the constitutional age limit of 75.

Mr. Besigye, his former ally and personal physician, has run unsuccessfully against Mr. Museveni in three past elections, often suffering harassment by the police. He has been repeatedly arrested, roughed up or confined to house arrest. On Monday, he was tear- gassed again when police broke up an opposition rally.

Mr. Museveni has always exploited the advantages of power to ensure that the opposition has little chance of beating him. A recent study by an independent civil society group found that he has spent more than $7-million (U.S.) on his current presidential election campaign. That's 12 times more than the amount spent by his top two opponents combined, the study found.

His supporters, including a controversial unit of pro-regime "Crime Preventers," have routinely used intimidation tactics against the opposition. A police chief, for example, warned that the "Crime Preventers" would be armed with guns and ready for "war" against anti-government protesters. A senior member of the ruling party told opponents that the government will "kill your children" if they protest the election results this week.

The ban on social media was sharply criticized by humanrights groups and diplomats. But it was part of a larger trend of harassment of the media, including physical attacks on journalists and the closing of radio stations.

Though the Museveni government is often criticized for human-rights abuses and crackdowns on the opposition, it has benefited from the strong support of the United States, which sees Uganda as a key ally in the fight against Islamist radicals in Somalia. In recent years, Uganda has become one of the top African recipients of U.S. security assistance.

Official results of Thursday's election are expected to be released by Saturday. Votecounting was continuing on Thursday night, sometimes by the light of lamps and cellphones in darkened voting stations. Early provisional results, from less than 5 per cent of voting stations, showed Mr. Museveni in the lead.

Tech giant defends privacy by refusing to give in to government order to hack its own phones
Friday, 19 February 2016

Editorial: Apple Inc.'s refusal to help the United States government hack into the iPhone of a dead terrorism suspect is a difficult but necessary decision. In the end, the tech company has to weigh a concrete threat to its customers' privacy against the ambiguous needs of the police.
Apple and companies like it build smartphones and tablets with the promise to customers that the personal information they keep on their devices will be protected from hackers and prying eyes. It is a critical aspect of the companies' sales pitches, and also a responsibility in the digital age.

Once a customer has purchased one of Apple's most recent phones and tablets, its contents are inaccessible even to the company that manufactured it without the user's permission. Any repeated attempt at access that isn't authorized by the user causes the devices to automatically erase all of their contents.

A judge in California, however, has ordered Apple to bypass this security system on the iPhone of Syed Farook, who along with his wife killed 14 people in a mass shooting in San Bernardino in December. The FBI asked for the order because it believes - though it does not know for certain - that there could be information on the phone that will help explain the shooters' motives and possibly lead to accomplices. The police are on a fishing expedition, looking for any clues, anywhere.

Apple won't comply for a simple reason: If it creates a bypass around the security system of one iPhone, it is necessarily doing so for all iPhones. This would be a violation of its promise to protect customers' privacy.

In fact, it would blow a hole in expectations of privacy. Once such a breach is made, it can't be unmade. Customers would know it and might lose confidence in Apple products, along with those of any other manufacturer met with a similar government order.

There is also the broader issue of governments' rapacious hunger for private citizens' personal data. If Apple yields to the U.S. government, there can be little doubt that other governments will come demanding the same thing. All they will need to do is raise the charged issue of fighting terrorism to make their case.

It's better, then, for Apple to keep saying no. It has co-operated with the FBI as much as it can, but should go no further.

L'Oncle Sam veut voir dans votre iPhone
Friday, 19 February 2016
Byline: Pierre Martin

Opinion - Le jeu du chat et de la souris entre les services de renseignement et les défenseurs de la vie privée expose quelques dilemmes et contradictions de la lutte contre le terrorisme.
Après les attentats de San Bernardino, les enquêteurs ont récupéré l'iPhone d'un des meurtriers. Le FBI exige qu'Apple lui fournisse le moyen de débloquer l'accès aux données précieuses qu'il pourrait contenir. Le fabricant refuse.

Apple allègue ne pas pouvoir désactiver la sécurisation du téléphone, mais l'entreprise craint surtout qu'une telle clé puisse tomber entre des mains malveillantes ou que ce cas constitue un précédent pour des régimes répressifs ailleurs dans le monde.

Un dilemme cornélien

De plus en plus, la menace terroriste provient d'individus radicalisés de l'intérieur des sociétés occidentales plutôt que de groupes extérieurs. Ce changement incite les États à accentuer la surveillance interne, au détriment du droit à la vie privée de leurs citoyens.

Il n'y a pas de solution évidente, mais à ceux qui croient qu'aucune limite ne peut être imposée à l'action antiterroriste de l'État, il faut rappeler que ce phénomène représente encore un risque assez minime. Le Nord-Américain moyen a plus de chances d'être frappé par la foudre que d'être victime d'un attentat islamiste.

Personne à l'abri des contradictions

Il est louable qu'Apple défende avec vigueur la vie privée de ses clients, mais il n'en demeure pas moins que le fabricant tire un énorme bénéfice de la vente de ses produits à des usagers qui ont intérêt à rester discrets.

La palme de l'hypocrisie, dans cette histoire, ne va toutefois pas à Apple. Elle revient plutôt à une certaine droite qui proclame que l'État a perdu toute légitimité pour agir, tout en soutenant que la branche de l'État la plus obscure et la moins redevable de ses actions devrait avoir carte blanche pour tenir ses citoyens à l'oeil.

Ottawa Citizen
Laser strikes on aircraft a growing threat to safety
Friday, 19 February 2016
Byline: Andrew Duffy

Ottawa - A Transport Canada database reveals that 33 laser strikes were reported by aircraft in the National Capital Region during the past year - part of an alarming trend that places pilots and their passengers at risk.
The latest incidents occurred in January when three planes were targeted in Ottawa's skies, including an Air Canada Jazz flight from New York City and a nighttime Ornge air ambulance flight.

The incidents are outlined in the federal government's Civil Aviation Daily Occurrence Reporting System (CADORS), which acts as the repository for all safety and security-related incidents in Canadian airspace.

Although Transport Canada tries to ensure the accuracy of the reports, it still considers them preliminary and "subject to change."

The number of laser strikes on aircraft has been rising sharply in recent years.

Last year, according to a Citizen analysis of the CADORS database, there were 663 laser strikes directed at aircraft in Canada - a 32 per cent increase from 2014. The numbers have been climbing since 2008 when 80 laser incidents were reported by pilots in Canadian airspace.

Capt. Dan Adamus, Canada board president for the Air Line Pilots Association, International, called laser attacks a serious concern. "When it happens, there's a big green glow - it's usually a green laser - that fills the cockpit," Adamus said. "You can be looking for the runway, and you catch this light out of the corner of your eye, and your natural tendency is to look towards it."

Two pilots in the United States, he said, have lost their medical clearance to fly after suffering eye damage from cockpit laser strikes.

In Canada, pointing a laser at an aircraft is an offence under the federal Aeronautics Act, and those convicted can face up to five years in prison and a $100,000 fine.

Adamus wants the federal government to make laser interference with an aircraft an offence under the Criminal Code, and launch the kind of public awareness campaign conducted by the F.B.I., which offered $10,000 for information that led to arrests.

"They have to get the word out," he said, "because nine times out of 10, I think it's curious people with a laser, saying, 'I wonder if this will reach that aircraft.' " Adamus also wants the government to better regulate the sale of lasers, and limit the power output of hand-held pointers - sometimes known as laser pens - to 5 milliwatts or less. More powerful devices should be tightly controlled, he said, and come with explicit warnings about the danger they pose. Transport Canada says it is working closely with police, other government departments and the aviation industry to reduce the number of laser incidents. The high-intensity light strikes are considered particularly dangerous during the takeoff and landing phases of a flight, when pilots can least afford to be distracted or temporarily blinded.

In the Ottawa region, medevac helicopters, small planes and commercial jets have all been targeted. Last April, an Ornge helicopter flying from Pembroke Regional Hospital to the Children's Hospital of Eastern Ontario reported being hit by a green laser coming from the vicinity of the Champlain Bridge.

One month later, the pilot of an Air Transat Airbus en route from Toronto to Venice said the plane's cabin was lit up by a green laser as it cruised at 31,000-feet over Ottawa. That same month, a WestJet Boeing 737, originating in Calgary, reported that it was targeted three times by a green laser as it approached Ottawa International Airport.

Ten of the local incidents reported last year involved members of the Ottawa Flying Club, one of whom was targeted by a green laser for a full 20 seconds.

Bryce Hanna, general manager of the club, said laser strikes pose "a fundamental safety issue" since many small aircraft have a single pilot on board. "There's no one to take the controls so potentially the aircraft could even be lost because of that," Hanna said.

Laser strikes are an international problem. This month, the Alitalia flight crew taking Pope Francis to Mexico reported a laser beam coming from the ground as the plane prepared to land in Mexico City. Days later, a Virgin Atlantic flight en route to New York from London turned back after laser light struck the eyes of the co-pilot.

The incident prompted the British Airline Pilots Association to demand that the government categorize powerful laser pointers as "offensive weapons" to aid in a police crackdown on their use against planes.

The Hindustan Times
Deloitte expands its Cyber Intelligence Centre in Gurgaon (Canada).
Friday, 19 February 2016

Kolkata - Deloitte India on Thursday announced the expansion of its Cyber Intelligence Centre (CIC) in Gurgaon. This facility integrates technology with industry insights to provide round-the-clock business-focused cyber and operational security.
Krishan Pal Gurjar, Minister of State for Social Justice Empowerment, Government of India, was the Chief Guest for the occasion. Other dignitaries at the inauguration ceremony included P.R. Ramesh, Chairman, N. Venkatram, CEO, Deloitte India along with the India board and Executive Committee members of Deloitte India firm.

With 24x7 coverage, the CIC has the capability to monitor and assess threats specific to clients, enabling Deloitte to effectively mitigate risk and strengthen cyber resilience. Deloittes Gurgaon CIC will be part of a globally interconnected set of cyber intelligence centres to provide leading insights and services to its clients. Speaking about CIC, Shree Parthasarathy, Partner, Deloitte India, said,

The pervasiveness of technology throughout major business processes coupled with the brand and regulatory impact of a cyber-breach or attack, clearly makes cyber risk a boardroom issue. With always-on, always-connected systems, exposure to cyber threat increases, creating the need for businesses to get access to timely and actionable threat intelligence.

Our CIC is one of the largest in the region and is linked to Deloittes existing Cyber Intelligence Centres in Australia, Japan, UK, Spain, Canada and the United States to bring a collective set of capabilities to our clients based in India.

The CIC propels our Cyber capability to the next level and helps solidify our presence in the market as a global leader in Cyber Risk Services. Said Amry Junaideen, President, Enterprise Risk Services, Deloitte India: Threats posed to organizations by Cybersecurity-related issues have increased rapidly. So many organizations have suffered significant brand impact, financial loss, and systems outages due to Cybersecurity issues.

With new attack potentials and insider threats on the rise, securing proprietary information and other critical business assets is becoming exponentially more difficult for Indian enterprises. As a rapidly growing market, India holds immense potential for Deloitte to make meaningful impact for our clients. We believe the CICpositions us well to address the cyber risk priorities of organizations in all industries with a full suite of business- focused security solutions, he added.

Jerusalem Post
Reports of IDF airstrikes against Syria cause waves in cyberspace
Friday, 19 February 2016
Byline: Noam Amir, Maariv Hashavua

Jerusalem - Foreign reports attributing strikes against the Syrian regime to the IDF may only rarely elicit a military response, such as a barrage of rockets, however they certainly result in a direct threat to Israel's security systems.
A military source confirmed this week that in some instances where Israel has been fingered for a particular military operation, such as the strike which killed notorious terrorist Samir Kuntar last year, an immediate reaction has been seen in cyberspace.

In the case of Kuntar, a day after his death a group of hackers carried out a successful attack on the Israel Air Force (IAF) website.

According to sources in Israel, a group of hackers operating from a long distance overseas and styling itself "Qalamoun boys" was behind the attack on the IAF site. While it may be true that the attack caused no damage to the army in any significant way, and the attackers were repelled quickly, it appears to the IDF that in a general sense hackers are often curious about circulating rumors of Israeli strikes, and look for ways to confirm or deny the reports by breaking into the IDF's systems.

According to the military source, there is no paucity of attacks against the Israeli military. "Enemies want to know what's going on here," he said. "At the end of the day, computers and information systems do hold secrets, but there is a very low probability of success of such an intrusion because the cyber capabilities of the IDF are very high."

In the world today there are five major cyber powers. Israel is one of them, the other four being the US, Iran, Germany and the UK. In the case of the alleged IAF attacks against Syria, the regime does not address the foreign reports at all. Instead, it will do anything within its power to keep the ambiguity regarding incidents such as these in place. However, under the radar, they hope that one of the world cyber powers will try to access the information.

Iran is of course one of these players, having carried out attacks of increasing quality and frequency in recent years, particularly between 2013-2014.

The significant decrease in cyber attacks in 2015 has been attributed, among other factors, to the nuclear agreement. During the tumultuous years of 2013 and 2014, the region was hot, with all sides attempting to extract information. However the signing of the agreement seemed to calm the flurry of attacks in both directions.

It is very possible that Wednesday night, with the publication of further reports of an attack on Syria, that there has been a raised alert in the preparedness of the IDF. Even if the army is not expecting to deal with a barrage of missiles, at least in cyberspace it will be bracing for combat, as there are those who will be looking for verification, making cyberspace one of the most fascinating areas of the world.

The military like to call this space "the most crowded playing field in the Middle East." Even without swings and sandboxes, cyberspace is equally as fascinating as the conventional threats faced by the IDF.

Washington Times
PLA on cyberwarfare buildup
Thursday, 18 February 2016
Byline: Bill Gertz

Washington - A Chinese military official revealed last month that Beijing plans to rapidly build a new People's Liberation Army cyberwarfare force in response to U.S. military cyberforces.
Col. Li Minghai of the PLA's National Defense University wrote in the Communist Party-affiliated Global Times newspaper that a new cyberwarfare force is needed to counter the United States as the Pentagon is building up its cyberattack capabilities.

"It is more necessary for us to build a brand new 'operation force,'" said Col. Li, identified as deputy director of the NDU's Center for Cyberspace Security.

As a sign of the sensitivity of the report, Chinese censors quickly removed the posting in Chinese from the Global Times website shortly after it appeared Jan. 21.

Col. Li is one of China's most senior cyberwarfare specialists, and his remarks provide some of the first clues to Beijing's military priorities in future cyberwarfare operations. Military cyberoperations are among China's most closely guarded secrets.

The 3rd Department of the PLA general staff, known as 3PLA, is China's main military cyberwarfare force and is said to have up to 100,000 cyberwarriors. A copy of the colonel's translated article was obtained by Inside the Ring.

Col. Li stated that the U.S. military's cybersecurity strategy for the past four years has emphasized offensive electronic attacks on information systems and regards China as "one of the greatest threats to the United States' cybersecurity."

Noting that current cyberthreats to China are "not sensational or alarmist talk," Col. Li said reforms to PLA cyberforces should not be limited to "tinkering," but require "the rebuilding of a new- breed cyberforce in our country."

"We should apply the brand-new development model in the information age to remold our cyberwarfare preparedness against the threat of the United States' new cyberstrategy and guarantee our nation's cybersecurity," he said.

A key feature will be what is described as a "winning mechanism" for warfare in the cyberspace domain.

"In the 21st century, seizing control of cyberspace is of decisive significance, like seizing control of the sea in the 19th century and seizing control of the air in the 20th century," Col. Li wrote. "Cyberoperations in the future will follow the new battlefield rules determined by the winning mechanisms of 'real-time sensing, sensitive response, source destruction and chain cutoff, joint winning.'"

Also, cyberpower must be combined with conventional military power "with winning being based on information power."

Cyberwarfare troops will target information technology infrastructure networks like the Internet, telecommunications systems and computer systems, including imbedded processors and controllers in major sectors.

A third priority for the cyberwarfare force will be adding more trained military hackers.

"At present, our country still lacks high-end specialists with both knowledge about network technology and knowledge about military command, so it is imperative that we step up the efforts for building the cyberoperation force," Col. Li concluded.

Publication of the report coincided with China's creation of a Strategic Support Force, announced Dec. 31, that will include dedicated cyberwarfare forces, along with space warfare units.

Cybersecurity expert Joe McReynolds disclosed last year that China's cyberwarfare forces were outlined for the first time in a Chinese military paper. The PLA cyberwar force has three elements, including a cadre of dedicated military specialists devoted to network warfare that conduct cyberattacks and defense, Mr. McReynolds told The Daily Beast.

Other forces include teams of specialists working in civilian intelligence, police and security organs who conduct military cyberoperations. Last are units outside government that will be mobilized for network warfare.

Press Trust of India
Government to ask Twitter to block accounts with Hafiz Links
Friday, 19 February 2016

New Delhi - Security agencies will approach Twitter India to block all accounts having links with Lashkar-e-Taiba founder Hafiz Saeed and Jamaat-ud-Dawa which are often found to be spreading venom against India.
There are several accounts which have links with LeT's front outfit, Jamaat-ud-Dawa, as well as terror mastermind Saeed and it has become necessary to shut these down as quickly as possible, officials said.

"We are approaching Twitter India which in turn will tell its US-based parent company to deactivate the accounts. Hopefully, it will be done soon," a official said.

Earlier, Twitter had blocked several accounts operated by Jamaat-ud-Dawa, headed by Saeed, following requests from security agencies in different countries, including India and the US. However, such accounts again cropped up after a gap of several months.

A fake account of Saeed had recently asked Pakistanis to support the JNU students who are protesting against the registration of a case of sedition against JNUSU president Kanhaiya Kumar. It had also asked users to trend the topic #PakStandWithJNU with the posts sparking a huge controversy.

Last Sunday, Home Minister Rajnath Singh had said the event organised at JNU to protest against the hanging of Parliament attack convict Afzal Guru had the backing of Saeed.

Even though the Home Ministry clarified that Singh's statement was based on inputs from different agencies, it was reportedly made in the wake of the posts on the fake Saeed Twitter account.

Gulf News
Tech giants support Apple in privacy fight
Friday, 19 February 2016
Byline: Staff Report

Dubai - Apple chief Tim Cook has picked a fight with the United States government and Silicon Valley is joining his side.
Apple Inc.'s chief executive officer took his stand after the Federal Bureau of Investigation won a court order to make Apple help investigators unlock an iPhone used by Syed Rizwan Farook, one of the shooters in a deadly December 2 attack in San Bernardino, California.

From Google Inc. to Facebook Inc., the industry's biggest names rallied around Cook after he vowed to resist the court order. Cook described the request as an "unprecedented step that threatens the security of our customers" and called for a public debate.

The escalation with the FBI, which has been pushing for access to mobile devices since Apple tightened its encryption in late 2014, galvanised the firm's US peers and forced them to choose between helping the government fight crime and protecting their customers' privacy. The decision in the Apple case could apply to the broader tech industry and it may spur requests from China and other nations that want similar abilities to access users' encrypted content.

Reform Government Surveillance, a group representing firms including Google, Facebook, Microsoft Corp. and Twitter Inc., have issued a statement reiterating that, while it's "extremely important" to deter crime and terrorism, no company should be required to build backdoors to their own technology.

National Security Agency whistleblower Edward Snowden has also backed Apple, tweeting that the company's stance was defending the rights of its customers.

"We're here to say to Apple, "We're going to back you all the way," ' said Electronic Frontier Foundation (EFF) chief Cindy Cohn outside a San Francisco store. When about two dozen privacy advocates stood shoulder to shoulder in front of the downtown San Francisco Apple store on Wednesday, it may have been the first time a demonstration was held in support of the tech company.

"Silicon Valley stands with Apple," Bret Taylor, co-founder of Quip and former chief technology officer of Facebook and co-creator of Google Maps, posted on Twitter. Steven Sinofsky, an ex-executive at Microsoft, called for "broad support from full stack of technology companies."

Khaleej Times

Re-strategising IT security

Friday, 19 February 2016

Byline: Aji Joseph

Dubai - Digital industrial espionage is becoming a greater threat for companies in all industries. An additional danger is presented by numerous secret services, with an aim of spying on businesses and organisations. What should companies, the potential victims, do? They must work harder than ever to protect themselves and their data from increasingly complex attacks in order to avoid the kind of corporate disadvantage, which might even threaten their very existence.

There are various forms of attack which have the declared aim of spying on business secrets. Malware is introduced into databases, applications and systems. Transmitted data is spied on and read at network connections. Trojans can make their way into companies with completely innocent software purchases. Software updates can also be used as a transmission vehicle for spying programs. If there are no proper defence mechanisms available, attackers can spy on business secrets as long as they like without the company noticing.

The attackers can usually leave the network in the same way as they got in - unnoticed by the victims. Annual losses to corporate espionage are estimated to be billions.

The EU published a report on industrial espionage as early as 2001. The list includes two suspected cases against France. These were in relation to the delivery of high-speed trains to South Korea. The French manufacturer Alstom (TGV) was said to have gained a competitive advantage over the competitor Siemens (ICE) by means of industrial espionage.

In 2013, France came under suspicion again. The New York Times reported on the country's alleged industrial espionage programme, which had the aim of obtaining technical secrets from the USA.

In 2015, the newspaper Libération reported that approximately one hundred French companies, including all companies listed in the French stock market index CAC 40, had been spied on. The report was based on information provided in US documents supplied by Wikileaks. The German Federal Intelligence Service (BND) was also in the headlines for several weeks. It has been accused of having helped the US secret service NSA to spy on European institutions and companies.

Although defence mechanisms such as signature-based anti-virus software, firewall and network monitoring software are still required, they are no longer sufficient.

Only a comprehensive shield can help in the face of the intensified threat. It must cover the entire company, include all the necessary IT security services, maintain an overview of all security incidents, be adaptable to new threat scenarios and detect unknown forms of attack.

Though today several IT experts and managers have the expertise and skills to manage cyber risk/ attacks; you need an intelligence-based approach - one that uses knowledge combined with tools - 24x7 to identify threats and protect your assets. In view of this and the high human resources and financial costs; companies have to consider whether they can operate on their own or they should use specialist expertise and tools.

To manage IT security more effectively and efficiently; it's time for organisations to refocus and re-strategize their overall IT security shield - to reduce time until risk is detected and therewith reduce potential damage of attacks.

Companies should consider outsourcing their IT security monitoring needs to highly specialised experts and therewith ensure their infrastructure is monitored every hour - seven days a week ensuring a more proactive approach in protecting their company assets. At the same time this should offer significant cash savings for a company in the long run such as a reduction of costs for purchasing and managing a vast number of complex stand-alone IT security solutions.

Bloomberg News
Secret Memo Details U.S.'s Broader Strategy to Crack Phones
Friday, 19 February 2016
Byline: Michael Riley, Jordan Robertson

Washington - Silicon Valley celebrated last fall when the White House revealed it would not seek legislation forcing technology makers to install "backdoors" in their software -- secret listening posts where investigators could pierce the veil of secrecy on users' encrypted data, from text messages to video chats. But while the companies may have thought that was the final word, in fact the government was working on a Plan B.
In a secret meeting convened by the White House around Thanksgiving, senior national security officials ordered agencies across the U.S. government to find ways to counter encryption software and gain access to the most heavily protected user data on the most secure consumer devices, including Apple Inc.'s iPhone, the marquee product of one of America's most valuable companies, according to two people familiar with the decision.

The approach was formalized in a confidential National Security Council "decision memo," tasking government agencies with developing encryption workarounds, estimating additional budgets and identifying laws that may need to be changed to counter what FBI Director James Comey calls the "going dark" problem: investigators being unable to access the contents of encrypted data stored on mobile devices or traveling across the Internet. Details of the memo reveal that, in private, the government was honing a sharper edge to its relationship with Silicon Valley alongside more public signs of rapprochement.

On Tuesday, the public got its first glimpse of what those efforts may look like when a federal judge ordered Apple to create a special tool for the FBI to bypass security protections on an iPhone 5c belonging to one of the shooters in the Dec. 2 terrorist attack in San Bernardino, California that killed 14 people. Apple Chief Executive Officer Tim Cook has vowed to fight the order, calling it a "chilling" demand that Apple "hack our own users and undermine decades of security advancements that protect our customers." The order was not a direct outcome of the memo but is in line with the broader government strategy.

White House spokesman Josh Earnest said Wednesday that the Federal Bureau of Investigation and Department of Justice have the Obama administration's "full" support in the matter. The government is "not asking Apple to redesign its product or to create a new backdoor to their products," but rather are seeking entry "to this one device," he said.

Security specialists say the case carries enormous consequences, for privacy and the competitiveness of U.S. businesses, and that the National Security Council directive, which has not been previously reported, shows that technology companies underestimated the resolve of the U.S. government to access encrypted data.

"My sense is that people have over-read what the White House has said on encryption," said Robert Knake, a senior fellow at the Council of Foreign Relations who formerly served as White House Director of Cybersecurity Policy. "They said they wouldn't seek to legislate 'backdoors' in these technologies. They didn't say they wouldn't try to access the data in other ways."

"Backdoors" refer to security holes that are intentionally inserted into software to create the equivalent of a skeleton key for law enforcement -- what wiretapping systems are for telephone lines, for instance. The problem with backdoors in computer networks is they create vulnerabilities for any hacker to find.

What the court is ordering Apple to do, security experts say, does not require the company to crack its own encryption, which the company says it cannot do in any case. Instead, the order requires Apple to create a piece of software that takes advantage of a capability that Apple alone possesses to modify the permanently installed "firmware" on iPhones and iPads, changing it so that investigators can try unlimited guesses at the terror suspect's PIN code with high-powered computers. Once investigators get the PIN, they get the data.

Knake said that the Justice Department's narrowly crafted request shows both that FBI technical experts possess a deep understanding of the way Apple's security systems work and that they have identified potential vulnerabilities that can provide access to data the company has previously said it can't get.

In this case, the government wants Apple's help in exploiting such weaknesses. But experts say they could find ways to do it themselves, and the NSC "decision memo" could lead to more money and legal authorization for a smorgasbord of similar workarounds.

National Security Council spokesman Mark Stroh declined to comment on the memo. But he provided a statement from a senior Obama administration official: "We should not preemptively conclude that technical and policy options to address this challenge are out of reach. While creating mechanisms for accessing encrypted information does create vulnerabilities, there may be technical and process steps that can be implemented to limit such risks."

The memo was approved by the NSC's Deputies Committee, according to the people familiar with it. While the deputies' committee changes depending on the subject matter, it typically includes at least a dozen sub-cabinet level officials, among them the deputy attorney general, the vice chairman of the joint chiefs of staff, and the deputy national security adviser.

Such memos can have lasting impact. A similar decision memo was used in the early years of the Iraq war to address the problem of Improvised Explosive Devices, which were then killing hundreds of U.S servicemen. The response ultimately led to new anti-IED technology and expanded intelligence capabilities to disrupt the cells building and planting the bombs.

Silicon Valley and Washington have had a decades-long distrust of each other over encryption, stemming from a failed Clinton administration push in the 1990s for a government backdoor in telecommunications networks. In that case, the National Security Agency developed a technology called the Clipper Chip, which the White House approved as a government standard. Security experts assailed it as insecure and a violation of privacy.

Security experts say the U.S.'s insistence on finding ways to tap into encrypted data comes in direct conflict with consumers' growing demands for privacy.

"The government's going to have to get over it," said Ken Silva, former technical director of the National Security Agency and currently a vice president at Ionic Security Inc., an Atlanta-based data security company. "We had this fight 20 years ago. While I respect the job they have to do and I know how hard the job is, the privacy of that information is very important to people."

In addition to the demands against Apple, the FBI will almost certainly seek more money and expanded legal authorization to track suspects and access encrypted data, without the involvement of companies that make the technologies, several experts say. Intelligence services already have sophisticated tools for cracking encryption, and the White House's efforts will likely lead to broader use of those techniques across the government, even in ordinary criminal investigations that don't involve foreign intelligence or national security.

The workarounds could involve trying to force companies like Apple to develop their own tools to help law enforcement or enlisting government hackers to find previously unknown software vulnerabilities that enable the decryption of large amounts of data flowing across networks.

Apple infuriated law enforcement when it announced in 2014 that it would encrypt data stored on users' iPhones and iPads with a PIN code that the company could not access, even if ordered to by a judge. Prior to that decision, the FBI and local police agencies routinely sent seized devices to Apple to extract data relevant to their investigations.

To security experts, creating hacking tools -- capabilities to gain access to encrypted data -- is simply a matter of money and focused effort.

"My guess is you could spend a few million dollars and get a capability against Android, spend a little more and get a capability against the iPhone. For under $10 million, you might have capabilities that will work across the board," said Jason Syversen, a former manager of advanced cyber security programs at the Defense Advanced Research Projects Agency (DARPA), and now the CEO and co-founder of Siege Technologies in Manchester, New Hampshire.

This week's federal court order undermines years of effort by Apple to design a system that makes accessing encrypted data impossible without the participation of the phone's legitimate user. Company officials appeared to believe the enhanced encryption would remove Apple from the efforts of any government to sabotage the security of their customers. Instead, federal agents have detailed in a public document several ways in which that encryption can be bypassed.

"Apple has two options now: They can go back to the judge and say this isn't possible. Or they can service the warrant," said James Lewis, a senior cyber security fellow at the Center for Strategic and International Studies in Washington. "I don't think they can say it's not possible, because it looks like it is."

New York Times
A Web Crime on the Rise: Hackers Lock Out Users and Demand a Ransom
Friday, 19 February 2016
Byline: Stacy Cowley, Liam Stack

New York - It sounds like the plot of a Hollywood thriller, but the all-too-real scenario played out this month at a large Los Angeles hospital: Hackers seized control of critical computer systems and the hospital paid a $17,000 ransom to release them.
So-called ransomware attacks have increased significantly in the past year, security experts say, and the hospital, Hollywood Presbyterian Medical Center, is not the first to fall victim.

The Titus Regional Medical Center, a small hospital in Mount Pleasant, Tex., experienced a similar attack last month, which knocked its core electronic medical record system offline. It, too, paid the ransom, according to Shannon Norfleet, a hospital spokeswoman.

Those in the security industry say such attacks are becoming more prevalent, but are rarely made public.

"We get over 100 calls and emails a month from different organizations that have had some form of ransomware impact their environment," said Charles Carmakal, who oversees breach investigations for clients of Mandiant, a consulting unit of the security firm FireEye. "Nobody talks to the media about it."

In a statement released Wednesday, Allen Stefanek, the president of Hollywood Presbyterian, described the two- week battle that his hospital fought to regain control of its data after a malware attack was detected on Feb. 5.

The attack did not disrupt medical care or compromise the personal information of employees or patients, he said. Instead, it blocked hospital employees from using email and other forms of electronic communication by using encryption to lock them out of the system.

Mr. Stefanek said hospital administrators were told that if they wanted to gain access to their network again, they would have to pay the attackers, who would then give them the decryption key. Mr. Stefanek said that the hospital had contacted the authorities when the malware attack was first detected.

"The quickest and most efficient way to restore our systems and administrative functions was to pay the ransom and obtain the decryption key," Mr. Stefanek said. "In the best interest of restoring normal operations, we did this."

Heath care providers are required to tell patients of any breaches that compromise their personal information or health data, but a typical ransomware attack would not fall into that category. The attackers do not need to gain access to the underlying data in order to encrypt it and prevent others from viewing it.

Once compromised, an organization has little choice but to pay up or say farewell to its data, according to Levi Gundert, who oversees information security strategy for Recorded Future, a threat analysis firm.

"There's really no workarounds for it," he said. "It's very frustrating for both law enforcement and the victims themselves."

Hollywood Presbyterian's attackers demanded their payment in the

form of 40 Bitcoins, a difficult-to-trace currency that has become the currency of choice for online criminals.

Ransomware attacks are on the rise, industry researchers say, because they work. A research team at Dell gathered data from one ransom-payment server and found that it collected $1.1 million in a six-month period. McAfee Labs, Intel's security research unit, detected 638,000 new ransomware variants in 2014. Last year, that number shot up to nearly 3.8 million.

Many ransomware attacks are random, and comparatively low-tech and blunt. Victims are most often infected by clicking a malicious link in an email or by malware delivered through a web browser, frequently hidden in advertisements. The average payment demanded is just $300, according to the security firm Symantec, a sum that is within reach for the individuals and small businesses that most often fall prey to these schemes.

But Mr. Carmakal said he was seeing a growing number of attackers targeting businesses and other organizations with deeper pockets. In those attacks, the hackers may go to greater lengths to remove data -- not just lock access to it -- and threaten to release it publicly if they are not paid.

"Automated malware doesn't know if an organization has $100,000 or not. A human knows," he said. "We've seen an uptick in those kinds of attacks over the past year. We've seen attackers ask for $10,000 to seven-figure values to delete the data" in their possession.

As ransomware attacks grow more frequent, they are increasingly hitting organizations that deal in public safety and other critical functions. Over the past year, the attacks have affected police departments and school districts across the country.

Health care organizations seem to be particularly vulnerable to hacking attacks because they have been slower to embrace sophisticated backup systems and other security measures than other industries, like financial services, said Katherine Keefe, the head of breach response services at Beazley, an insurance company.

Her team investigated 1,200 breaches last year, about half of them at health care providers. The rate of ransomware attacks has noticeably increased in the last six to eight months, she said.

"The criminals see that there's money to be made, and I think they believe they can hold organizations over a barrel," Ms. Keefe said.

The cost of an attack goes far beyond the usually modest sum demanded for ransom. It took Hollywood Presbyterian 10 days to restore its systems, Mr. Stefanek said.

Laura Eimiller, a spokeswoman for the Federal Bureau of Investigation in Los Angeles, said the agency had begun an inquiry into the attack, but she provided no further details.

USA Today
Apple faces uphill battle
Friday, 19 February 2016
Byline: Brad Heath

Washington - The U.S. Justice Department's demand that Apple help it break into a locked iPhone is the latest in a series of legal disputes with tech companies over users' privacy that has been going on for more than a decade.
Nearly all of those contests ended the same way.

"Historically, the judiciary has been very deferential to law enforcement," University of California-Hastings law professor Ahmed Ghappour said. "And history could be very indicative of how this will play out."

The latest episode began this week, when a federal magistrate judge in California ordered Apple to help FBI agents break into the locked iPhone used by Syed Rizwan Farook, one of the armed attackers in December's massacre in San Bernardino, Calif. Apple CEO Tim Cook said the company would fight the order, and Apple has refused to help unlock at least one other locked phone.

For tech companies, such battles have often not gone well.

In 2007, Yahoo balked at a secret order from the Foreign Intelligence Surveillance Court requiring it to turn over customer records to the NationalSecurity Agency. The company relented when a judge on the surveillance court threatened to impose a fine of $250,000 a day -- and double it every week. A federal appeals court upheld the surveillance court's order.

In 2013, a federal judge held the founder of Lavabit -- an email service that had been used by former NSA contractor Edward Snowden - - in contempt for not turning over the electronic key the company used to encrypt users' communications. Lavabit founder Ladar Levison eventually gave the key to the FBI but did so by printing it out in very small type.

Most such disputes have involved federal agents seeking access to troves of information tech companies keep about their users -- everything from contents of emails to records that can precisely track the location of someone's cellphone. The fight with Apple comes with one important difference.

Instead of asking the computer maker to turn over information, a federal magistrate ordered the company to create software for the FBI that would bypass some security features on newer versions of the iOS operating system. The order requires Apple to add an electronic signature to the new software, so Farouk's phone will recognize it.

"The fight here is that the software the government wants does not exist. They're trying to force engineers to write a special version of iOS, then sign it," said Christopher Soghoian, the American Civil Liberties Union's principal technologist. He said such an order raises the prospect that the FBI could force makers to push compromised versions of their software directly to users' phones and computers in a way that would be difficult to detect.

Apple has also rebuffed efforts to help agents unlock older versions of the iPhone, using tools it had already created for the job.

Last year in Brooklyn, federal prosecutors asked a magistrate to force Apple to unlock a phone running iOS 7, so they could use the phone's contents in a drug case. The company declined, even though it had "repeatedly assisted law enforcement officers in federal criminal cases by extracting data from passcode-locked iPhones pursuant to court orders," prosecutors said in a court filing.

Apple has argued that complying with the request would be burdensome. A judge has yet to decide whether to force Apple to comply.

Justice Department lawyers told a different federal judge in Brooklyn last year that the government has the ability to crack newer versions of the iPhone on its own. "The lack of a passcode is not fatal to the government's ability to obtain the records," Assistant U.S. Attorney Karen Koniuszy wrote in a court filing.

Apple Standoff Escalates Local Cases
Friday, 19 February 2016
Byline: Nicole Hong. Pervaiz Shallwani

New York - State and local law-enforcement authorities are looking to follow the lead of the Federal Bureau of Investigation in its standoff with Apple Inc. over access to the contents of a terror suspect's smartphone.
Earlier this week, a federal magistrate judge in California ordered Apple to help the government unlock a passcode on the phone used by one of the suspects in the attack last year in San Bernardino, Calif., which killed 14 people. Apple has said it would fight the judge's order.

On Thursday, Manhattan District Attorney Cyrus Vance said his office is in the process of determining which cases involving encrypted smartphones they should bring before a New York state judge for a similar review.

Mr. Vance called the Apple case "the most visible example of how Silicon Valley's decisions are thwarting criminal investigations and impeding public safety." Other district attorneys may be following Mr. Vance's moves.

Jake Wark, a spokesman for the Suffolk County district attorney's office in Boston, said that although the office hasn't yet taken steps to bring a specific case for judicial review, "We can't rule that out. It may be a question of finding the right case."

The fight between Washington and Silicon Valley is exposing law enforcement's long-simmering concerns over the challenges posed by encryption during investigations. Federal and local law-enforcement officials are increasingly voicing frustration with encrypted smartphones, which they say provide a haven for criminals and hinder investigations by keeping potentially valuable evidence out of reach.

The battle over encrypted smartphones is part of a broader debate that dates back over a decade. Following the attacks on Sept. 11, 2001, Congress won broad support to pass the USA Patriot Act, which became the legal underpinning for roving wiretaps on terrorism suspects and bulk collection of phone records by the NationalSecurity Agency.

Over time, however, concerns about privacy and civil liberties escalated, reaching an apex following the 2013 disclosures of government surveillance by former national-security contractor Edward Snowden. Last June, Congress approved a new bill called the USA Freedom Act, which curbed the government's spying powers and reined in the NSA's bulk collection.

Moves by the telecom industry to address privacy concerns, especially the creation of stronger encryption on devices, have sparked outrage from law enforcement.

"There is not an investigation today at the local, state or federal level that doesn't touch a cyber platform," said Don Mihalek, who represents Secret Service members in the Federal Law Enforcement Officers Association. "Encryption has made it impossible now for law enforcement to do their jobs."

Apple's defiance, meanwhile, is garnering support from privacy advocates who say complying with the order could hurt the personal privacy of Americans and make smartphone users more vulnerable to hacks.

"This case is not about that one phone," said Alex Abdo, a staff attorney at the American Civil Liberties Union. "This case is about the government trying to establish an illegal precedent that it can force a U.S. company to hack its users' devices."

Supporters of Apple have said that giving the government even limited access to encrypted iPhones and similar devices will just spur criminals to communicate on other encrypted platforms.

Federal Bureau of Investigation Director James Comey has said that terrorists made a more concerted effort after the Snowden revelations to shield their communications on encrypted devices.

Since September 2014, when Apple began encrypting its new phones by default, approximately 25% of the 670 Apple devices (with the iOS 8 operating system or higher) examined by the Manhattan district attorney office's cybercrime lab were encrypted and not accessible, Mr. Vance said Thursday.

In a recent speech, Mr. Comey said encryption hindered the investigation into the attack last May of people at an exhibit featuring cartoons of the Prophet Muhammad in Garland, Texas, where the two shooters were both killed after they opened fire.

The morning of the attack, one of the shooters exchanged 109 messages with a known terrorist overseas using an encrypted mobile messaging app, Mr. Comey said. The terrorist group Islamic State has claimed responsibility for the Texas shooting.

"All the judicial orders in the world are not going to tell us what they said that morning," Mr. Comey said.

Although encryption in terrorism investigations has gained the most attention, officials say the issue now has a nexus to all sorts of crimes, including drug trafficking, kidnappings and child pornography. In New York, officials are struggling to access an encrypted iPhone 5 used by an associate during a shooting in the Bronx two weeks ago that injured two police officers. New York Police Department Commissioner William Bratton said Thursday that the encrypted iPhone was "impeding" the case from going forward.

Mr. Bratton said fixing the issue is going to require more significant rulings by the courts, including likely the Supreme Court, and legislation from Congress and state legislatures. He said both sides were early on in the process.

"The Constitution guarantees no absolute right to privacy," Mr. Bratton said. "It guards against unreasonable search and seizure. How is what we are talking at all unreasonable?"

Local law enforcement in Louisiana say an encrypted smartphone may be the last lead for solving the murder of Brittany Mills, a 28-year-old who was shot to death last April. In a typical investigation with an encrypted phone, investigators either try to ask the iPhone user to give up the passcode or search for any data in the user's cloud, according to Hillar Moore, the district attorney in Baton Rouge, La. Neither option was available in Ms. Mills's case.

"The frustrating part about this is the bad guys know that no one can get in beyond search warrants," Mr. Moore said. "They brag that cops can't touch their phones. They're using the phone as a shield to allow them to deal drugs, traffic women and threaten national security."

How Using The 'Cloud' Undercuts Encryption
Friday, 19 February 2016
Byline: Jack Nicas

New York - While the increasing use of encryption helps smartphone users protect their data, another sometime related technology, cloud computing, can undermine those protections.

The reason: encryption can keep certain smartphone data outside the reach of law enforcement. But once the data is uploaded to companies' computers connected to the Internet -- referred to as "the cloud" -- it may be available to authorities with court orders.

Major cloud-computing suppliers, including smartphone providers such as Alphabet Inc.'s Google, Microsoft Corp. and Apple Inc., routinely comply with court orders and search warrants to turn over data that in many cases would have been harder for law enforcement to obtain had users kept it solely on their devices.

"The safest place to keep your data is on a device that you have next to you," said Marc Rotenberg, head of the Electronic Privacy Information Center. "You take a bit of a risk when you back up your device. Once you do that it's on another server."

Encryption and cloud computing "are two competing trends," Mr. Rotenberg said. "The movement to the cloud has created new privacy risks for users and businesses. Encryption does offer the possibility of restoring those safeguards, but it has to be very strong and it has to be under the control of the user."

Apple is fighting a government request that it help the Federal Bureau of Investigation unlock the iPhone of Syed Rizwan Farook, the shooter in the December terrorist attack in San Bernardino, Calif.

The FBI believes the phone could contain photos, videos and records of text messages that Mr. Farook generated in the final weeks of his life.

The data produced before then? Apple already provided it to investigators, under a court search warrant. Mr. Farook last backed up his phone to Apple's cloud service, iCloud, on Oct. 19.

Encryption scrambles data to make it unreadable until accessed with the help of a unique key. The most recent iPhones and Android phones come encrypted by default, with a user's passcode activating the unique encryption key stored on the device itself. That means a user's contacts, photos, videos, calendars, notes and, in some cases, text messages are protected from anyone who doesn't have the phone's passcode. The list includes hackers, law enforcement and even the companies that make the phones' software: Apple and Google.

However, Apple and Google software prompt users to back up their devices on the cloud. Doing so puts that data on the companies' servers, where it is more accessible to law enforcement with court orders.

Apple says it encrypts data stored on its servers, though it holds the encryption key. The exception is so-called iCloud Keychain data that stores users' passwords and credit-card information; Apple says it can't access or read that data.

Officials appear to be asking for user data more often. Google said that it received nearly 35,000 government requests for data in 2014 and that it complies with the requests in about 65% of cases.

Apple's data doesn't allow for a similar comparison since the company reported the number of requests from U.S. authorities in ranges in 2013.

Whether they back up their smartphones to the cloud, most users generate an enormous amount of data that is stored outside their devices, and thus more accessible.

New York Times
For Apple's C.E.O., a Journey to Bulwark for Digital Privacy
Friday, 19 February 2016
Byline: Katie Benner, Nicole Perlroth

San Francisco - Letters from around the globe began pouring into the inbox of Timothy D. Cook not long after the publication of the first revelations from Edward J. Snowden about mass government surveillance
Do you know how much privacy means to us? they asked Apple's chief executive. Do you understand?

Mr. Cook did. He was proud that Apple sold physical products -- phones, tablets and laptops -- and did not traffic in the intimate, digital details of its customers' lives.

That stance crystallized on Tuesday when Mr. Cook huddled for hours with lawyers and others at Apple's headquarters to figure out how to respond to a federal court order requiring the company to let the United States government break into the iPhone of one of the gunmen in a San Bernardino, Calif., mass shooting. Late Tuesday, Mr. Cook took the fight public with a letter to customers that he personally signed.

"We feel we must speak up in the face of what we see as an overreach by the U.S. government," wrote Mr. Cook, 55. "Ultimately, we fear that this demand would undermine the very freedoms and liberty our government is meant to protect."

Mr. Cook's standoff with law enforcement officials is indicative of his personal evolution from a behind-the-scenes operator at Apple to one of the world's most outspoken corporate executives. During that time, he has moved a once secretive Silicon Valley company into the center of highly charged social and legal issues. While Mr. Cook's predecessor, Apple co-founder Steven P. Jobs, was considered a business icon, he never took aggressive positions on such matters as Mr. Cook now has.

Being at loggerheads with the United States government is risky for Apple and may draw a torrent of public criticism of the world's most valuable company at a time when its growth rate has significantly decelerated.

Yet people who know Mr. Cook said he did not believe he had a choice but to be vocal. Mr. Cook, who became Apple's chief executive in 2011, has long said that businesses and their leaders should think of

themselves as important members of civic society. In September, he emphasized that this responsibility "has grown markedly in the last couple of decades or so as government has found it more difficult to move forward."

Mr. Cook "says what he believes, especially in difficult situations," said Don Logan, the former chairman of Time Warner Cable who has been friends with Mr. Cook since he became chief executive of Apple, bonding over their shared alma mater, Auburn University. Of Mr. Cook's opposition to the court order, Mr. Logan said: "Tim is currently dealing with a very difficult situation and he knows the decision he has made has lots of ramifications, good or bad. But he wants to do the right thing."

Apple declined to make Mr. Cook available for an interview. The company is preparing to file an opposition brief against the court order.

Mr. Cook's ideas about civic duty were partly formed during his childhood in rural Alabama. In a speech at the United Nations in 2013, he recounted how Ku Klux Klansmen had once burned a cross on the lawn of a black family's home and how he yelled for them to stop. "This image was permanently imprinted in my brain, and it would change my life forever," he said.

At Apple, which he joined as a senior executive in 1998, Mr. Cook was a quiet figure for much of the period when he worked for Mr. Jobs, a showman who prized secrecy at the company. After Mr. Jobs stepped down because of ailing health, Mr. Cook began making Apple more open, publishing an annual report on suppliers and working conditions for more than a million factory workers.

In 2014, Mr. Cook revealed he was gay, a move widely seen as making a statement about gay rights. Last year, he wrote an editorial decrying religious freedom laws that had been proposed in more than two dozen states that would let people skirt anti-discrimination laws that conflicted with their religious beliefs.

His outspokenness has drawn criticism, with some investors questioning how nonbusiness initiatives -- including some of Apple's environmental moves -- would contribute to the company's bottom line. Mr. Cook responded at a shareholder meeting that it is important for Apple to do things "because they're just and right."

Privacy has long been a priority for Mr. Cook. At a tech conference in 2010, he said Apple "has always had a very different view of privacy than some of our colleagues in the Valley." He cited the iPhone's feature that shows where a phone -- and presumably its user -- is and said fears about abuse and stalking had compelled the company to let consumers decide whether or not their apps could use their location data.

Mr. Cook's views on privacy hardened over time as customers globally began entrusting more personal data to Apple's iPhones. At the same time, Apple was growing tired of requests from government officials worldwide asking the company to unlock smartphones.

Each data-extraction request was carefully vetted by Apple's lawyers. Of those deemed legitimate, Apple in recent years required that law enforcement officials physically travel with the gadget to the company's headquarters, where a trusted Apple engineer would work on the phones inside Faraday bags, which block wireless signals, during the process of data extraction.

Processing these requests was extremely tedious. More worrisome, the data stored on its customers iPhones was growing more personal, including photos, messages and bank, health and travel data.

And some government officials were not exactly instilling confidence in Apple's engineers. In one case, after law enforcement officials rushed a phone to Apple's headquarters for data extraction, the engineers discovered their target had not enabled the device's passcode feature.

So Mr. Cook and other Apple executives resolved not only to lock up customer data, but to do so in a way that would put the keys squarely in the hands of the customer, not the company. By the time Apple rolled out a new mobile operating system, iOS7, in September 2013, the company was encrypting all third-party data stored on customers' phones by default.

"People have a basic right to privacy," Mr. Cook has said.

By then, Mr. Snowden's disclosures about how the NationalSecurity Agency had cozied up to some tech companies and hacked others to gain user data were reverberating worldwide. The disclosures included revelations of a comprehensive, decade-long Central Intelligence Agency program to compromise Apple's products; C.I.A. analysts tampered with the products so the government could collect app makers' data. In other cases, the agency was embedding spy tools in Apple's hardware, and even modifying an Apple software update that allowed government analysts to record every keystroke.

Letters from alarmed Apple customers started flooding into Mr. Cook's inbox, fortifying his stance on privacy. Apple's eighth mobile operating system, iOS8, which rolled out in September 2014, made it basically impossible for the company's engineers to extract any data from mobile phones and tablets.

For officials at the world's law enforcement agencies, the new software was a clear signal that Apple was growing defiant. A month after iOS8's release, James Comey, the director of the F.B.I., told an audience at the Brookings Institution that Apple had gone "too far" with the expanded encryption, arguing that the operating system effectively sealed off any chance of tracking kidnappers, terrorists and criminals.

Government agencies began to press Apple and other tech companies for so-called back doors that could bypass strong security measures. With tensions rising, some form of technical compromise -- whether in the form of a chip, a back door or a key -- was off the table by 2015.

At Apple, Mr. Cook and others continued to work with investigators to the extent the company could and complied with court orders. Last October, a federal judge in New York said the government was overstepping its boundaries by using a centuries-old law, the All Writs Act, as the basis for its request that Apple open an iPhone for a drug investigation. Apple's lawyer sided with the judge in the case. The matter has not been resolved.

After December's San Bernardino attack, Apple worked with the F.B.I. to gather data that had been backed up to the cloud from a work iPhone issued to one of the assailants, according to court filings. When investigators also wanted unspecified information on the phone that had not been backed up, the judge this week granted the order requiring Apple to create a special tool to help investigators more easily crack the phone's passcode and get into the device.

Apple had asked the F.B.I. to issue its application for the tool under seal. But the government made it public, prompting Mr. Cook to go into bunker mode to draft a response, according to people privy to the discussions, who spoke on condition of anonymity. The result was the letter that Mr. Cook signed on Tuesday, where he argued that it set a "dangerous precedent" for a company to be forced to build tools for the government that weaken security.

"Compromising the security of our personal information can ultimately put our personal safety at risk," he wrote. "That is why encryption has become so important to all of us."

Far from backing down from the fight, Mr. Cook has told colleagues that he still stands by the company's longstanding plans to encrypt everything stored on Apple's myriad devices, services and in the cloud, where the bulk of data is still stored unencrypted.

"If you place any value on civil liberties, you don't do what law enforcement is asking," Mr. Cook has said.

Wall Street Journal
Apple Has More Leeway Than Carriers
Friday, 19 February 2016
Byline: Ryan Knutson

Washington - For U.S. phone companies like AT&T Inc. and Verizon Communications Inc., the notion of resisting a court order like Apple Inc. Chief Executive Tim Cook recently did is probably inconceivable. The reason is legal.

In 1994, Congress passed the Communications Assistance for Law Enforcement Act, which required that carriers build surveillance capability into their networks. That law was later expanded to cover voice calls placed over the Internet, but not all Internet communication. Other attempts to further expand the law to cover technology companies such as Apple have failed.

Mr. Cook earlier this week said Apple would oppose a federal judge's order to help the Justice Department unlock a phone used by a gunman in the San Bernardino attack, which killed 14 people last December.

These days, the nation's telecom carriers receive thousands of information requests from the government and law enforcement in both national security, and civil and criminal matters.

In the last six months of 2015, Verizon and AT&T combined received more than a quarter-million requests from law- enforcement agencies in civil and criminal matters and as many as 998 requests in the first six months of 2015 to access customer accounts for national-security reasons, according to transparency reports published by the companies.

By comparison, Apple says it received 971 law-enforcement requests for account data stored in users' iCloud or iTunes accounts. In the first half of 2015, the latest data available, and provided at least some data to 81% of them. As many as 499 additional requests were related to national security, according to Apple's transparency report.

With much communications traffic shifting from the phone networks to data packets on the Internet, monitoring is becoming more complicated.

"Back in the day, it was AT&T -- they had everything, so you just talked to AT&T," said Michael Sussmann, a former Justice Department official who is now a partner at Perkins Coie LLP.

AT&T CEO Randall Stephenson on Thursday reiterated comments he made last month that Congress should determine whether law enforcement should have the ability to access encrypted data on cellphones.
