Congress "should decide the proper balance between public safety and personal privacy," Mr. Stephenson said in an emailed statement. "The rapid pace of technological innovation is challenging laws crafted in a very different era for totally different, and much less complex situations. Recent developments, in particular, bring home the need for legal clarity."

Senate Intelligence Committee Chairman Richard Burr (R., N.C.) has decided against a proposal circulating quietly on Capitol Hill to create criminal penalties for companies that decline to comply with court orders to decipher encrypted communications, a spokeswoman said Thursday night.

San Bernardino shooter Syed Rizwan Farook was provided a phone by his employer, which was allegedly subscribed to Verizon, according to government's legal filings. Verizon declined to comment on Mr. Farook's phone.

But the information that Verizon would be able to provide would only be records of phone and text messages placed over its network. The carrier can't provide access to vast amounts of other data, such as message content or calls made over mobile apps like WhatsApp, Skype or the blue iMessages sent between two iPhones.

Phone carriers can see when data is traveling over their networks on a service like WhatsApp or Facebook, but they can't see the content, experts say. That includes the "metadata," such as the time a message is sent, or who it is sent to.

The government and law-enforcement agencies can ask phone and Internet companies to turn over any customer information they possess, such as Facebook for messages retained on their services, and increasingly the government is asking tech companies to do so. But there is no requirement for phone companies or Internet firms as to how long the content of such data is to be stored. The requirement on phone companies is that the government has the ability to intercept traffic in real time.

Apple says it can provide customer data stored in its iCloud service, such as phone backups that can include stored photos, email, documents, contacts, calendars, and bookmarks. In the San Bernardino case, Apple has provided such data for Mr. Farook until Oct. 19, the last time his phone synced to his iCloud. That means there 44 days of data -- such as iMessages and FaceTime calls -- that may only exist on his locked iPhone.

Los Angeles Times
Battle lines drawn over encryption
Friday, 19 February 2016
Byline: Paresh Dave, Tracey Lien

Los Angeles - As hackers prove time and again that they can and will invade our digital lives, Apple Inc. has strengthened its security system to make its services nearly impossible to penetrate -- even for top cops.
Those seemingly airtight protections are great for the company's millions of customers, and rival device makers have rushed to emulate Apple. But as tech companies build virtual fortresses, authorities are mounting a battle to make sure the tech industry doesn't completely shut them out -- as it contends Apple has done by making its iPhone impossible for the FBI to crack.

At the heart of the issue is encryption, a way to secure a digital file by scrambling its contents so that it can be read only by someone who has the key. Tech firms are increasingly encrypting their software, and Apple has been at the forefront.

But sealing off the personal information of customers extends to everyone -- the good guys and the bad guys. That's uncharted territory for tech companies, government agencies and consumers, leaving everyone struggling to figure out how far, exactly, encryption protections should extend.

"We need privacy and security, and frankly Apple has done a better job than most," said Mark Mollineaux Pollitt, adjunct professor at Syracuse University and former director of the FBI's Regional Computer Forensic Laboratory Program. "We shouldn't punish them for doing that. We should find a way to broaden that and make that more effective, but we have to realize there are instances where we have to breach that security to protect all of us."

But not everyone sees it as a gray area, where exceptions can be made for extreme cases like terrorism or child pornography.

This week, Apple Chief Executive Tim Cook took a defiant stance, saying his company would fight a court order in the San Bernardino terror investigation that asks the company to develop, for the first time, software that would allow authorities to circumvent the passcode on the encrypted phone.

Apple's decision isn't without critics, who say courts should be the arbiter of where the line is drawn.

"Apple is obstructing the course of law enforcement and effectively aiding terrorists," said Vivek Wadhwa, a corporate governance fellow at Stanford University. "They changed the technology, so they have to keep up with the ability to unlock the device if the government asks them do it. That's not unreasonable."

As it is, the FBI is publicly admitting that it is locked out, said Jeff Kelley, an iOS developer at software firm Detroit Labs who builds apps for iPhones, iPods, iPads and Mac OS.

"If you're Apple, you couldn't ask for a better ad for iPhone encryption."

That's a nightmare for the FBI.

The agency wants to retrieve whatever resides on the iPhone 5c of Syed Rizwan Farook, one of the two slain shooters who killed 14 people in the Dec. 2 attack.

But the smartphone's iOS operating system is locked by a numeric passcode, likely four digits long. The FBI potentially has only 10 guesses before the phone's contents self-destruct.

Older versions of the operating system provided ways for Apple and even law enforcement to access at least some contents on the phone, even if it was password-protected. For example, older iPhone models were susceptible to unlimited password guessing. In other cases, Apple held a master key, and authorities could ship the company an iPhone and get a DVD or hard drive back with the data from it.

But Apple, in effect, threw away its master key when it deployed a new version of iOS in 2014. Farook's phone runs one of the newer iOS versions.

Adding to the FBI's problems is that Apple is judge, jury and executioner when deciding what software runs on an iPhone: An app or program won't work without a special signature from Apple.

The set-up is aimed at stopping viruses or malware from infecting iPhones, and it also gives Apple latitude to ban apps it doesn't want to support, including for competitive or cultural reasons.

That's significantly more control than Google exercises over smartphones running its open-source Android operating system. Many Android phones support so-called unsigned programs, providing one of the key doors through which law enforcement has been able to extract data from locked phones.

About 80% of the world's smartphones run Android, and about 15% run iOS, according to various estimates.

In general, hardware makers have been making stricter security settings a default on their devices. But while those measures and more have deflected thieves, they left room for law enforcement to acquire data when needed.

Not so with Apple. Besides encryption, the company in 2013 introduced Touch ID, a fingerprint scanner that allows users to unlock their phones by pressing their fingers on the device's home button.

This week's court order requires the FBI and Apple to work in tandem to develop a tool that preserves the data on Farook's phone while allowing an app devised by the FBI to input an unlimited number of passcodes until it guesses the right one.

"That has never before been seen," said Kevin Bocek, vice president of threat intelligence and security strategy at cybersecurity company Venafi. "Apple has very aggressively maintained security, and this is the way the government is going to get around it."

Generating the new software for the FBI wouldn't be trivial, but it's certainly doable, experts said.

Apple would need to make the special code run on the iPhone's short-term memory to ensure it doesn't tamper photos, text messages and other potentially critical evidence, said Dan Guido, chief executive of security start-up Trail of Bits.

The code would get rid of the barriers that normally arise when someone tries too many times to guess a user's passcode. Last, it would have to include a funnel for automated guessing, freeing the FBI from manually entering potentially tens of thousands of numeric combinations.

Even though it's technically capable of carrying out the FBI's orders, Apple and its supporters reject the notion that this would be a one-time thing.

Jonathan Zdziarski, one of the top experts on iPhone security, said the work doesn't end there. If Apple ends up creating a tool, it would need to be tested, including by outside forensic specialists, to stand up to legal scrutiny if evidence retrieved from the phone is ever used in court. That vetting process could drag on for months and risks exposing the tool to people with malicious intent.

There's fear that once a safe-cracking tool is developed, law enforcement agencies from all over the world will repeatedly request its use.

"They've brought a phone that would be easy to justify developing a tool for -- a terrorist's -- but it will be much easier for a court to compel Apple to use it in the future once it's out there," Zdziarski said.

Apple could update iOS to stop the tool developed for Farook's iPhone from working on other ones by requiring consumer consent to run it, but the precedent of making it is irreversible, technologists say.

"You can rationalize it, these are known bad people, this is a known domestic terrorism case and it's one iPhone," said Oren Falkowitz, chief executive of security firm Area 1 Security and a former director of technology and data science programs at U.S. Cyber Command. "But it has implications for all technologies across the globe. We have to be doing more to strengthen the security of the Internet ... or we'll suffer consequences, ... greater than whatever information might be on this one phone."

New York Times
Apple's Strong Stand on Encryption
Friday, 19 February 2016
Byline: Editorial Board

Editorial - It is understandable that federal investigators want to unlock an iPhone used by one of the attackers who killed 14 people in San Bernardino, Calif., in December. And it's understandable that the government would turn to Apple for help. But Apple is doing the right thing in challenging the federal court ruling requiring that it comply.
In an order issued on Tuesday, Magistrate Judge Sheri Pym says Apple must create new software that would bypass security features on the iPhone used by the terrorist, Syed Rizwan Farook. That would allow the Federal Bureau of Investigation to unlock the device and retrieve the pictures, messages and other data on it. Her ruling was based on the All Writs Act of 1789, which is used to require people or businesses not involved in a case to execute court orders. Another federal magistrate judge in New York is considering a similar request to unlock an iPhone in a narcotics case.

Law enforcement agencies have a legitimate need for evidence, which is all the more pressing in terrorism cases. But the Constitution and the nation's laws limit how investigators and prosecutors can collect evidence. In a 1977 case involving the New York Telephone Company, the Supreme Court said the government could not compel a third party that is not involved in a crime to assist law enforcement

if doing so would place "unreasonable burdens" on it. Judge Pym's order requiring Apple to create software to subvert the security features of an iPhone places just such a burden on the company.

Apple has already given the F.B.I. data from the phone that was backed up and stored on its iCloud service; the last backup was made about a month before the attacks. But the company's chief executive, Timothy Cook, has said that requiring it to create software to bypass a feature that causes the phone to erase its data if 10 incorrect passwords are entered would set a dangerous precedent and could undermine the security of its devices. The Department of Justice has argued that the software would be used on that phone only and notes that Apple has previously helped law enforcement unlock phones. The company changed how it encrypts phones after the surveillance revelations by Edward Snowden.

But writing new code would have an effect beyond unlocking one phone. If Apple is required to help the F.B.I. in this case, courts could require it to use this software in future investigations or order it to create new software to fit new needs. It is also theoretically possible that hackers could steal the software from the company's servers.-

There are certainly other ways for law enforcement agencies to collect evidence. They already have the power to get data stored on online services like iCloud and Google's Gmail through search warrants. And they can get records of phone calls and text messages from companies like Verizon and AT&T. A recent study published by Harvard's Berkman Center for Internet and Society concluded that the proliferation of Internet-connected sensors, cameras and other devices provides the government ever-expanding opportunities to collect information about people.

Even if the government prevails in forcing Apple to help, that will hardly be the end of the story. Experts widely believe that technology companies will eventually build devices that cannot be unlocked by company engineers and programmers without the permission of users. Newer smartphones already have much stronger security features than the iPhone 5c Mr. Farook used.

Some officials have proposed that phone and computer makers be required to maintain access or a "back door" to encrypted data on electronic devices. In October, the Obama administration said it would not seek such legislation, but the next president could have a different position.

Congress would do great harm by requiring such back doors. Criminals and domestic and foreign intelligence agencies could exploit such features to conduct mass surveillance and steal national and trade secrets. There's a very good chance that such a law, intended to ease the job of law enforcement, would make private citizens, businesses and the government itself far less secure.

Wall Street Journal
U.S. Clash With Apple Was Months in Making
Friday, 19 February 2016
Byline: Devlin Barrett, Daisuke Wakabayashi

Washington - At a congressional hearing on Feb. 9, Federal Bureau of Investigation Director James Comey discussed obstacles of prying open electronic devices such as smartphones, zeroing in on a case in point: the San Bernardino, Calif., terrorist attack.
"We still have one of those killers' phones that we have not been able to open," he said. "It's been over two months now, and we're still working on it."

Although few realized it at the time, Mr. Comey's comments were a shot across the bow of Apple Inc. The company had been refusing for weeks to help the FBI unlock the phone used by Syed Rizwan Farook, one of the perpetrators of the attack, according to people familiar with matter.

Justice Department officials had even considered filing court papers against Apple a month earlier, only to hold off in the hope of gaining more cooperation.

The standoff, a precedent-setting case on privacy and security in the digital age, culminated this week when a judge ordered Apple to help the FBI circumvent passcode protection on the phone and Apple said it would fight the order. That set the stage for a possible landmark decision on the relationship between government and technology companies. The industry has steadfastly resisted the government's demands for help in unlocking encrypted communications.

It is a legal battle that holds risks for both sides. State and local law-enforcement authorities are already looking to follow the lead of the FBI in its face-off with Apple. On Thursday, Manhattan District Attorney Cyrus Vance said his office is in the process of determining which cases involving encrypted smartphones it should bring before a New York state judge for a similar review.

The legal fight between the Justice Department and Apple over encryption had been building for months. When Mr. Farook and his wife walked into a holiday party for his co-workers on Dec. 2 and began firing -- killing 14 people and injuring 22 -- the government and technology companies had already been feuding publicly and privately over how encryption puts some data beyond the reach of criminal investigators.

In a meeting more than a year ago, the No. 2 Justice Department official told Apple that some day there would be a crucial case involving a locked phone and a missing or murdered child. It would be better for Apple to help on encryption issues before such a case, rather than after, then-deputy attorney general James Cole told an Apple lawyer.

While a terror attack is a different scenario, several federal law-enforcement officials said this week the San Bernardino case was just the kind of thing they had warned about.

Apple executives believed they had worked extensively with law enforcement on the San Bernardino matter. The government's legal documents note that Apple had turned over phone information that Mr. Farook backed up on its iCloud service through mid- October, a month and a half before the attack.

Apple CEO Tim Cook and his colleagues viewed the government's request to create software to get around its own security as a step too far. Apple feels very strongly about two tenets -- data must be encrypted, and its software can't have any "back doors" allowing government access -- Mr. Cook said last year at The Wall Street Journal's technology conference.

Apple's position dovetails with its business interests. It has used its vocal stance on privacy to distinguish itself from rivals that make money on ads targeted at users based on their online data.

And two-thirds of Apple's business comes from outside the U.S., where sentiment about government surveillance is different. Europeans, for example, value privacy highly, and have expressed growing concerns about the control U.S. tech companies exercise over personal data. Government access to user data is also a concern in countries with authoritarian governments.

In the San Bernardino case, a search turned up Mr. Farook's work iPhone. It was owned by San Bernardino County, but the county didn't know the passcode. FBI agents worked to retrieve data on it, including data backed up to cloud storage.

But Mr. Farook had apparently turned off his cloud-storage backup function about Oct. 19, suggesting there still was information on the phone. The FBI and Apple discussed the issue in December without reaching an agreement on how Apple might help open the phone.

Justice Department lawyers prepared in early January to file court papers seeking to force Apple to help, said people familiar with the matter. Some officials weren't optimistic but felt it was worth sending a warning.

At the last minute, prosecutors decided there was a technical question to resolve with Apple, so the two sides kept talking. The technical issue took a few more weeks to sort out. Then the federal government told Apple again it was planning to file court papers to force the company to cooperate.

Privately, government officials hoped Mr. Comey's allusion to the San Bernardino phone before Congress on Feb. 9 would send a signal to Apple that the Justice Department would soon go public with its concerns about the case and the broader issue of encrypted phones.

Percolating in the background was a case with similar issues: In Brooklyn, a federal magistrate judge had asked Apple in late 2015 if there were legal grounds to reject a prosecutor's request for a similar order concerning a drug suspect.

Apple lawyer Marc Zwillinger wrote to Magistrate Judge James Orenstein saying, "Apple has received additional requests similar to the one underlying the case before this court." The judge hasn't decided the matter.

USA Today
Are Android devices more easily hacked than iPhones?
Friday, 19 February 2016
Byline: Brett Molina, Elizabeth Weise

Washington - If Syed Rizwan Farook had carried a phone running on the Android or Windows operating system, the FBI may not have needed to ask anyone for help getting in.
Of the three main phone operating systems, only Apple builds the ability to have the phone erased after a certain number of failed passcode attempts into its operating system, security experts say.

Apple's use of an "Erase Data" feature connected to passcodes is one of the security features that separates it from other smartphones on the market.

That separation became a part of the national discussion Tuesday when a federal judge required Apple to create software to disable the feature that erases the data on the iPhone after 10 failed login attempts.

The FBI wants to get past the feature in Farook's phone to see if there is information on it that will give the agency insight into the mass shooting attack by Farook and his wife Tashfeen Malik in December.

In a letter to customers posted on Apple's website, CEO Tim Cook says the company will fight the order, comparing the request to creating a "backdoor" on all iPhones.

Disabling Apple's "Erase Data" feature, which is what the FBI wants the company to do, would allow it to use a "brute force" attack, entering countless passcodes until they discovered the correct one and gain access to the phone.

The functionality can be added to Android and Windows phones, but it's difficult and meant for system administrators, said Filip Chytr, director of threat intelligence for Avast Software, a Prague- based computer security company.

Google, the creator of Android software, and Microsoft did not respond to a request for information for this report.

Android does include a Remote Wipe option, where a user can remotely erase the contents of their smartphone.

Third-party apps which bring this functionality to Android and Windows phones are readily available but require extra work on the user's part as they're not a built-in functionality that's easily turned on.

In encryption, the encoding of what's on the phone so it's not readable by anyone without the proper code keys, Apple is ahead of the game.

Apple has made encryption the default on its phones since the 3GS. Android only began making it the default with its most recent phone.

New York Times
Line in the Sand Over iPhones Was Over a Year in the Making
Friday, 19 February 2016
Byline: Multiple reporters

Washington - Time and again after the introduction of the iPhone nearly a decade ago, the Justice Department asked Apple for help opening a locked phone. And nearly without fail, the company agreed. Then last fall, the company changed its mind. In a routine drug case in a Brooklyn federal court, prosecutors sought a court order demanding that Apple unlock a methamphetamine dealer's iPhone 5S running old, easy-to-unlock software. The company acknowledged that it could open the phone, as it had before. But this time, it pushed back.

"We're being forced to become an agent of law enforcement," the company's lawyer, Marc Zwillinger, protested in court.

That stance foreshadowed this week's showdown between the Obama administration and Apple over the locked iPhone belonging to one of the suspects in the San Bernardino, Calif., shooting rampage. By the time of Mr. Zwillinger's statement, Apple and the government had been at odds for more than a year, since the debut of Apple's new encrypted operating system, iOS 8, in late 2014.

The new technology repeatedly stymied investigators -- the New York authorities said on Thursday that they had been locked out of 175 iPhones in cases they were pursuing. But both sides held out hope for a compromise that would avoid the type of confrontation that occurred this week when a federal magistrate judge ordered Apple to comply with the Justice Department's request.

With last October's court filing, the confrontation became all but inevitable. The company left no doubt that it would fight any effort to crack its new, encrypted phones. The only real question was what crime the government would use to press its case.

Apple's stance that day in Brooklyn caught the Justice Department off guard. Despite the issue with iOS 8, the company had continued to cooperate. In the first half of 2015 alone, the company provided data

in response to more than 3,000 law enforcement requests, Apple said. And company lawyers gave prosecutors no indication that the drug case against Jun Feng would be any different.

Mr. Feng, 45, claimed to have forgotten his passcode, making his cooperation a moot point even if he were willing to extend it, according to a government filing. Unlike the phone in the San Bernardino case, Mr. Feng's ran iOS 7, an older version of Apple's operating system that does not automatically encrypt its data. The Justice Department figured it would have the information from Mr. Feng's phone within a day.

Mr. Zwillinger said the drug case would be Apple's line in the sand. "Customer data is under siege from a variety of different directions," he said. "Never has the privacy and security of customer data been as important as it is now."

It was a delicate period for the Obama administration, which was focused on finding a way to break into the new encrypted iPhones. The F.B.I., in particular, was lobbying hard to win support for that idea in the face of skepticism from Silicon Valley, Congress and the public.

Timothy D. Cook, Apple's chief executive, described data privacy as a human rights issue. Backed by leading technologists, Mr. Cook argued that if the company designed a way to defeat encryption for the United States government, that tool would be exploited by hackers or foreign governments like China.

Under the attorney general Eric H. Holder Jr., the Justice Department was sympathetic to that point of view, even in the face of an aggressive campaign from the F.B.I. director, James B. Comey. Mr. Holder favored meeting with technology executives in the hope of finding common ground, current and former Justice Department officials said.

Others in the department strongly disagreed. National security and criminal prosecutors argued that, with the introduction of the encrypted iOS 8, Apple (along with Google, which had started its own encrypted Android phone software) had made thumbing its nose at the government a business strategy. The only hope, these prosecutors argued, was a court fight or an act of Congress requiring companies to provide the government unencrypted data.

Local law enforcement officials, too, were sounding alarms. "This has become, ladies and gentlemen, the Wild West in technology," Cyrus R. Vance Jr., the district attorney in Manhattan, said at a news conference Thursday, echoing complaints he and others have made for many months. "Apple and Google are their own sheriffs. There are no rules."

When the attorney general Loretta E. Lynch and her deputy, Sally Q. Yates, took office last year, the F.B.I. and its law enforcement allies found more receptive ears. Ms. Yates, in particular, took up the issue, giving speeches and testifying before Congress alongside Mr. Comey.

Despite the campaign, the White House showed no appetite for legislation. And Apple showed no signs of budging. In a few instances, the two sides appeared bound for a court fight, only to resolve it at the last moment. Last summer, Apple refused to give the Justice Department real-time access to iMessages -- the company's proprietary text messages -- in a gun case. The matter nearly escalated, but Apple eventually turned over some messages that had been backed up to the company's iCloud servers. It was not all that the government wanted, but authorities viewed it as a sign of cooperation.

Such compromises forestalled a major court showdown, but increased the frustration at the Justice Department. Several current and former career prosecutors involved in the issue said they viewed it as hypocritical that Apple encouraged its customers to save its data to iCloud -- which it would turn over to the government -- but regarded the cellphone as sacrosanct.

Then came the Feng case. By refusing to help, the Justice Department thought Apple was sending a clear signal. If it would no longer cooperate with requests to help unlock old phones, there was little chance it would give in and build a way to unlock the new encrypted phones running iOS 8.

"Forcing Apple to extract data in this case, absent clear legal authority to do so, could threaten the trust between Apple and its customers and substantially tarnish the Apple brand," Mr. Zwillinger said.

By that time, 90 percent of Apple devices were running iOS 8 or newer versions. The F.B.I. warned that it was only a matter of time before its agents were locked out of a phone in a case with lives at stake.

The San Bernardino attacks, which killed 14 people, presented the F.B.I. with a seemingly perfect test case. One of the shooters, Syed Rizwan Farook, was killed by the police and left behind a locked, encrypted iPhone 5c. The F.B.I. has not been able to unlock it.

Mr. Farook's phone is protected by a password that Apple says it does not keep and Apple says it cannot break the encryption without the password. The F.B.I. wants to write a program to send the phone an unlimited combination of passwords until it finds one that works.

But Apple built its phones to protect against that tactic. Each wrong guess causes a short delay, which would significantly slow the F.B.I.'s effort. After too many incorrect guesses, the phone will automatically erase its memory.

The authorities are still interested in more than just Mr. Farook's phone. On Thursday, a team of F.B.I. agents raided the Southern California home of his brother, Syed Raheel Farook, and carted off boxes of belongings. The authorities would not say what they were searching for.

But there is no telling what is on Mr. Farook's phone -- maybe clues to accomplices or his inspiration, maybe nothing -- but nobody in the government questioned the need for obtaining access to that data. From a public relations standpoint, Apple had been on the side of privacy advocates and civil libertarians. This case put the company on the side of a terrorist.

"They need to figure that out now before there is that bigger body count. So this is as good a test case as any to have that fight," said Ron Hosko, who until 2014 led the F.B.I.'s criminal division. "Crack that thing for me now, Tim Cook, because it's only going to get worse."

This week, the Justice Department got its wish when Apple was ordered to override its defenses, even if it meant building a tool that did not exist.

Law enforcement officials cheered the ruling, though they acknowledged that the fight was not over. Apple promised to appeal. In New York, William Bratton, the police commissioner, held up a phone that he said was used by an associate of a man who shot and wounded two police officers in the Bronx recently.

"Despite having a court order, we cannot access this iPhone," Mr. Bratton said. "Just one example, a very significant example in which two of my officers were shot, that impeding that case going forward is our inability to get into this device."

The case in Brooklyn continues, even though Mr. Feng has already pleaded guilty. While the Justice Department sees the San Bernardino incident as its ideal test case, Apple is hoping for a legal win in Brooklyn.

Judge James Orenstein has given the company reason to be hopeful. In the past, he has been skeptical of the way the government uses an 18th-century law -- the All Writs Act -- that the Justice Department is now claiming gives it the authority to force Apple to unlock the phones. He once even described the Justice Department's use of it as a "Hail Mary play."

But he has yet to rule.

Wall Street Journal
The FBI vs. Apple
Friday, 19 February 2016
Byline: Editorial Board

Editorial - The encryption cold war that for two years has pitted Silicon Valley against law enforcement finally turned hot this week, as a California judge ordered Apple to unlock an iPhone used by the San Bernardino terrorists. Perhaps public safety and modern digital security methods were bound to collide, but the danger as always in such conflicts is that both sides end up annihilated.
The Federal Bureau of Investigation is attempting to bypass the security system on an iPhone recovered from Syed Rizwan Farook, who with his wife Tashfeen Malik killed 14 people and injured 22 others. The problem is that no one knows the phone's password.

Apple has turned over information that Farook stored to its cloud servers, but he did not back up his phone for several weeks proceeding the attack. The FBI wants to retrieve this encrypted data that exists only on the device itself, which potentially include text messages, photos, location tracking or connections to the Islamic State or perhaps even other terror cells that could be operating in the U.S.

Apple's iOS operating system is designed to automatically erase local data after too many incorrect passcode attempts. Because iPhones can only run software with Apple's proprietary cryptographic signature, the FBI wants Apple to create and upload a custom version of iOS to Farook's device that overrides this mechanism. The bureau can then hook up an external computer that will make unlimited guesses to unlock the phone's contents, known as "brute forcing." Magistrate Judge Sheri Pym agreed.

In a public letter, Apple CEO Tim Cook refused to comply with this "unprecedented use of the All Writs Act of 1789 to justify an expansion of its authority" and said the company would appeal. "The U.S. government has asked us for something we simply do not have, and something we consider too dangerous to create. They have asked us to build a backdoor to the iPhone," he wrote.

Yet the reality seems to be more complicated than either Mr. Cook or the FBI allow. The encryption debate began in 2014 when Apple released a feature that generates random security "keys" that are unknown to Apple and in combination with the user's passcode to decrypt the device's data. Without such mathematical formulas, the data are unreadable.

This two-step "full disk" encryption process makes iPhones more secure, but it also means Apple can't unlock its own products. Neither can Google after adopting the same practice. Encrypted communication platforms have been available since the early 1990s, but Apple and Google have now made them the default for the 96% of global customers who use their operating systems.

The fear among law enforcement and the national-security agencies is that jihadists and criminals are going dark. FBI chief James Comey and Manhattan District Attorney Cy Vance warn they are losing the capacity to execute bona fide search warrants granted under the Fourth Amendment. So they support a mandate that the U.S. tech industry install a master security key -- the "backdoor" Mr. Cook invokes -- to unlock any device.

The CEO has a strong case when he says that backdoors create more problems than they solve. Introducing security vulnerabilities that third parties like cops and spooks can use as needed can also be exploited by hackers, crooks and spies. Nations can mandate backdoors, but there will always be some encrypted channels outside of their jurisdiction where the likes of ISIS can plot. The result would be weaker products for law-abiding consumers that leave U.S. companies less competitive with little security benefit.

Stronger cybersecurity is more important than ever in a world of corporate espionage, millions of compromised credit-card numbers and the stolen identities at the Office of Personnel Management. Encryption may lead to fewer antiterror intercepts, though the universe of signals that can be tapped has expanded radically and on balance more secure phones are a major advance for human freedom. Ask the Chinese pastors or Russian dissidents who are targeted by authoritarian regimes and want encrypted iPhones.

One question is whether the San Bernardino terror case should be an exception to Mr. Cook's strong argument against backdoors. In this case Apple is not being ordered to create a universal backdoor for all phones, and some digital security experts believe it is technologically possible to assist the FBI in the San Bernardino investigation with a unique iOS to brute-force this single device.

"Apple does not dispute that it has, in prior instances, complied with data extraction demands that have been contained in the body of search warrants or, less often, All Writs Act orders," Apple conceded in a New York court filing last year. The government is citing this to show that its request is reasonable.

But in those cases the company's engineers have never been conscripted to create a new architecture to defeat their own security measures. Apple believes that if it caves even once, every prosecutor in America will be lining up for forensic help with misdemeanors. A supposedly one-time emergency fix in an antiterror case could well become a de facto backdoor in practice over time.

There's also the question of whether the government currently has the legal authority to force Apple to become the government's agent. Safe manufacturers are not obligated to crack their own locks when the FBI calls. Apple contends the All Writs Act has never been used to compel what the government now wants from Apple, and the question is far from clear-cut. The litigation to settle this could take months or years.

It's an understatement to say that Apple is taking a risk by challenging the Administration in a high-profile domestic terror incident with unpredictable politics. "Apple chose to protect a dead ISIS terrorist's privacy over the security of the American people," said Arkansas Republican Tom Cotton, and Donald Trump has been no more subtle.

But for the same reason, the Administration ought to have resolved the situation confidentially before it reached legal and political Defcon One. Terror cases by their nature are different from run-of-the-mill law enforcement, and San Bernardino requires more than the government's typical show of incompetence.

The White House never supplied Congress with specific backdoor statutory language even as Mr. Comey made the public rounds, only for President Obama to renounce any attempt at forging a legislative

solution. Yet spokesman Josh Earnest defended the FBI and Justice Department on Wednesday. Is there a grownup in the White House?

So a word on behalf of Michael McCaul, the Chairman of the House Homeland Security Committee, who has proposed convening an expert panel on technology and security in the modern era. Blue-ribbon commissions are usually a form of Beltway escapism, but in this case a detailed report and recommendations from leading minds in technology, law, computer science, police and intelligence could help shape a rough consensus -- or at least establish a common set of facts. Such a halfway house might also help calm political tempers and marginalize the absolutists.

A mature democracy -- if America still is one -- ought to be able to work out these crucial matters of national security through legislative deliberation. The public interest on encryption is best served with a rational debate, not the ad hoc nuclear legal exchange that the Administration is inviting.

Wrong bite of the Apple
Friday, 19 February 2016
Byline: Editorial Board

Editorial - Until Tuesday, Apple appeared to be winning its fight with law enforcement. President Obama announced last year that he would not pursue legislation forcing tech companies to give law enforcement access to users' encrypted data. But on Tuesday, the FBI persuaded a judge to order Apple to create software that would help federal investigators crack into the iPhone 5C that Syed Rizwan Farook used before he shot up a San Bernardino, Calif., banquet room in December. Apple immediately promised to fight the order.
In essence, the FBI is attempting to explore and establish the limits of its legal powers to combat terrorism - as well as more mundane domestic crimes - under existing laws, in the absence of action by Congress and the White House. We think that's the wrong call. The nation should not ask the courts to strike a balance between device security and law enforcement access. The political branches of government should do that.

The FBI relied on the two-century-old All Writs Act, a law that helps the government execute search warrants, to compel Apple to create hacking software for Farook's phone. The order was nominally tailored to Farook's specific device, but its implications are larger. To what extent is it reasonable to force companies to write code and harm their international reputations for data security - and, therefore, their business models - in order to help the U.S. government hack into suspects' phones? Should this be a routine investigative tool, or reserved for extraordinary situations, or beyond the pale? Farook's is an extreme case, but it is easy to foresee the government attempting to apply All Writs to

less important investigations. What sorts of software can the government compel tech companies to write?

The answers to these questions have major implications for online safety and security. The more government-ordered hacking techniques are developed and used, the more likely they eventually will fall into the hands of malicious actors. This risk seems small but is difficult to estimate. Even if technology companies and the government kept the techniques they developed secret, their hacking activities would still threaten the technology ecosystem. Fearful of government-mandated malware, fewer people might accept automatic updates from software companies. This would make devices more vulnerable. The anti-terrorism benefits, meanwhile, would wane over time, as high-level terrorist groups turned to software from places beyond the reach of U.S. law enforcement.

The public has reason to be frustrated that investigators cannot execute valid search warrants; this is a worrying impediment to legitimate law enforcement. We believe Apple should help search for a workable solution. If there is a Paris-style attack in the United States, decisions may be imposed on it in a far less benign atmosphere. But the decisions should be made by Congress.

Meanwhile, Apple's role as a leading exponent of data security brings special responsibilities. Whatever U.S. officials decide, the policy will be the legitimate product of a democratic government and the rule of law. That will not be true in countries such as China, where dictators would use anti- terrorism tools to crack down on dissenters. We hope that Apple will fight as hard to safeguard its users' privacy from authoritarian abuse.

Motherboard (Vice)
Police Arrest Second Alleged Member of Teen Group that Hacked CIA Director
Thursday, 18 February 2016
Byline: Lorenzo Franceschi-Bicchierai

New York - The grip seems to be tightening around the infamous group of teenage hackers that's been targeting US government agencies and high- level officials for months.
On Tuesday, police in Scotland arrested a 15- year-old boy from Glasgow, whom a source told Motherboard is one of the main members of the hacking group known as "Crackas With Attitude," or CWA. The teenager, according to the source, is the hacker known as "Cubed."

The arrest of the teenage hacker comes only a week after UK police, working with the FBI, arrested another alleged member of the group, a 16-year-old boy suspected of being Cracka, another main member of the group. Following the arrest of the boy in the UK, other members of the group, including Cubed, pledged to keep hacking and threatened the US government with more attacks.

A close friend of the arrested hacker confirmed he was the CWA member known as Cubed. The close friend spoke to Motherboard on condition of anonymity.

"I hope he's okay, he was like a brother to me," the source said.

A spokesperson from Police Scotland confirmed the arrest of a boy suspected of hacking crimes, but declined to answers questions on whether he was one of the members of the hacking group.

"Following a search of a property in the Glasgow area on Tuesday the 16th of February, a 15-year old male was arrested in connection with alleged offenses under the Computer Misuse Act 1990," the spokesperson said in a prepared statement. "He has since been released from custody and he is subject of a report to the procurator fiscal."

The arrest was first reported by the local tabloid the Daily Record on Thursday. The paper also reported that FBI agents flew to Glasgow to question the boy. Before that, on Wednesday morning (US time) another member of CWA tweeted that Cubed had been arrested.

The member, known as IncursioSubter, did not respond to a request for comment. Other members of the group declined to comment as well.

In a phone call, an FBI spokesperson didn't respond to questions regarding the arrest. And a spokesperson from the South East Regional Organised Crime Unit (SEROCU), the UK agency who arrested the teenager suspected of being Cracka, also declined to comment.

In October, Cracka and Cubed claimed to have broken into the AOL email account of John Brennan. This was just the first in a long list of attacks on high profile officials such as FBI's executive assistant Amy Hess, US spy chief James Clapper, a former senior executive at the National Geospatial-Intelligence Agency, and President Barack Obama's senior advisor on science and technology John Holdren.

More recently, the hackers were also apparently involved in a breach at the US Department of Justice, which ended up with the dump of almost 29,000 names, titles, email addresses and phone numbers from the FBI and the Department of Homeland Security.

The Daily Record (Scotland)
FBI swoop on schoolboy Scots hacker accused of breaking into their top-secret computer system
Thursday, 18 February 2016
Byline: Stephen Stewart

Glasgow - FBI agents swooped on a Scots schoolboy accused of trying to hack into their top-secret computer system.
Operatives from the US crimebusting agency travelled to Glasgow after detectives arrested the 15- year-old on Tuesday and searched his home.

It is understood the FBI agents sat in as Police Scotland officers interviewed the boy, who could face extradition and imprisonment in the United States.

A source said: "The boy is believed to have hacked into the FBI's computer systems.

"Agents then travelled to Scotland to sit in on him being questioned by detectives. He could be extradited to the US where he would face a long jail term."

Police confirmed that the boy had been arrested and later released.

A spokesman said: "Following a search of a property in the Glasgow area on Tuesday, February 16, a 15-year-old male was arrested in connection with alleged offences under the Computer Misuse Act 1990.

"He has since been released and is the subject of a report to the procurator fiscal. It would be inappropriate to comment further at this time."

A source close to the case said the boy's family were shocked at the turn of events, adding: "He comes from a respectable family."

The Glasgow operation comes just months after a Scot was dubbed the most dangerous hacker of all time by activist group Anonymous.

IT whizz Gary McKinnon, 49 - who has Asperger's syndrome - broke into 97 Pentagon and NASA computers, stealing passwords, deleting files and shutting down net-works on military bases.

He faced trial in the US and up to 70 years in jail if convicted - but Home Secretary Theresa May blocked his extradition under human rights laws.

In December, Anonymous labelled McKinnon the best-ever "black hat" hacker - the term for hackers who indulge in illegal activity.

Just days ago, police in the East Midlands arrested the alleged teenage mastermind of cyber attacks targeting US government officials

It is not known if the Glasgow teenager's case is linked to those events.

Reuters
Islamic State finds 'diminishing returns' on Twitter: report
Thursday, 18 February 2016

Washington - The Islamic State's English-language reach on Twitter has stalled in recent months amid a stepped-up crackdown against the extremist group's army of digital proselytizers, who have long relied on the site to recruit and radicalize new adherents, according to a study being released on Thursday. Suspensions of English-speaking users affiliated with Islamic State from June to October 2015 have limited the group's growth and in some cases devastated the viral reach of specific users, according to the report from George Washington University's Program on Extremism, which analyzed a list of accounts promoted by the militant group.

The report found that easily discoverable English accounts sympathetic to Islamic State was usually under 1,000, and that those users' activity was mostly insular, limited to interacting with each other. Islamic State has seized control of wide swaths of Iraq and Syria and claimed credit for attacks in Paris in November that killed 130. The U.S. and other governments consider it a terrorist organization.

Twitter Inc. has long been criticized by government officials for its relatively lax approach to policing content, even as other Silicon Valley companies like Facebook Inc. began to more actively police their platforms.

Under intensified pressure from the White House, presidential candidates and some civil society groups, Twitter announced earlier this month it had shut down more than 125,000 terrorism-related accounts since the middle of 2015, most of them linked to the Islamic State group.

In a blog post, the company said that while it only takes down accounts reported by other users it had increased the size of teams monitoring and responding to reports and has decreased its response time "significantly."

J.M. Berger, a co-author of the report, said Twitter is still less active than many of its rivals but that part of that is due to its relative youth as a company.

"Each company has been dragged into this kicking and screaming," he said in an interview.

Reporting of Twitter accounts affiliated with Islamic State is a steady, low-level activity generally, but occasionally events lead to "periodic purges," Berger said.

The study took place prior to the Paris attacks, which the researchers said likely led to a heavy wave of suspensions mostly in French and Arabic networks.

The average tweets per day measured across the lifetime of an account also declined during the monitored interval, from a peak of approximately 14.5 in June to a low of 5.5 by October, the report found. The average number of followers was measured between 300 and 400.

La Dépêche du Midi (Toulouse)

Amende pour le webmaster indélicat
Friday, 19 February 2016
Byline: J.R.

Albi, France - T.R., webmaster gaillacois de 31 ans et papa d'un enfant de 4 ans, comparaissait hier à la barre du tribunal correctionnel d'Albi présidé par la présidente Brigitte Schildknecht pour «accès frauduleux dans un système de traitement automatisé de données et collecte de données à caractère personnel par un moyen frauduleux », des faits commis courant septembre 2014 au préjudice du conseil général du Tarn puisque c'est, on s'en souvient, son site internet qui avait fait l'objet de nombreuses cyberattaques à cette époque. Une époque, rappelons-le quand même fortement marquée alors par «la bataille de Sivens entre Zadistes et pro- barrage. Le prévenu est un sympathisant zadiste et ne s'en cache pas mais réfute toute intention frauduleuse. «Je ne me suis jamais introduit sur le site du conseil général et je n'ai jamais collecté la moindre donnée».
«Pourtant, lui rétorque la présidente, les enquêteurs de la direction générale de la sécurité intérieure (DGSI) qui ont perquisitionné chez vous et avec qui vous avez passé quelques heures en garde à vue parlent de 100 000 requêtes suspectes.» «J'en ai seulement fait 150 depuis mon adresse IP (IP pour Internet Protocol), reconnaît T.R. à la barre. D'ailleurs, je ne me suis jamais caché. Je n'ai pas mis d'image et encore moins de vidéo sur ce site. J'ai juste mis un lien dans une barre d'adresse du site. Après, je n'y suis pour rien si durant cette période, les Anonymous dont je ne fais absolument pas partie, ont attaqué le site du Département. La seule chose que je n'aurais pas dû faire est de repartager des données du conseil général. Mais jamais je ne pensais qu'un simple copier/coller allait me conduire à la barre d'un tribunal.»

L'avocate du Département du Tarn s'insurgera ensuite «contre les préjudices subis avec un serveur piraté et remplacé, trente sites web affectés, des usagers pénalisés et réclamera 20 700 euros, 10 700 euros et 6 000 euros respectivement aux titres des préjudices technique, d'atteinte à l'image et opérationnel sans oublier 3 000 euros au titre de l'article 475-1.»

Selon Pascal Suhard, vice- procureur de la République, on reconnaît volontiers que vous n'appartenez pas aux Anonymous mais vous minimisez votre responsabilité en parlant d'une bêtise que vous n'auriez pas dû faire. Je requiers à votre encontre deux mois de prison avec sursis.»

Guillaume Pressec, avocat de T.R., demandera purement et simplement la relaxe de son client arguant que «les deux infractions retenues contre lui ne sont pas caractérisées. Il n'a en effet dénaturé aucun site. Il n'est par ailleurs pas poursuivi pour avoir inséré une vidéo sur ce site. Ensuite, on lui reproche du vol informatique. Or, il n'a jamais collecté frauduleusement de données. Elles étaient en vente libre sur internet. Il n'a fait qu'un copier/coller. Ce dossier est celui des fantômes, les Anonymous, condamnées pour certains par d'autres juridictions.»

Pas de prison avec sursis pour T.R. qui écope de plusieurs amendes pour un montant total de 4 000 euros.

Trudeau government to take on cybersecurity threats
Friday, 19 February 2016
Byline: David Akin

Ottawa - With Internet-based child sex-ploitation crimes skyrocketing, the Justin Trudeau government intends to launch a "credible and comprehensive" review this spring of cybersecurity threats in Canada. Officials with Public Safety Canada said Thursday that while the details of that review are still being hammered out by Public Safety Minister Ralph Goodale, a review will determine how Canada can best deal with everything from online predators to digital jihadists.

Kathy Thompson, the assistant deputy minister in charge of the Community Safety and Countering Crime Branch at Public Safety Canada, said while the crime rate continues to decline across the country, "there are some exceptions. One of those exceptions is child sexual exploitation over the Internet -- that is going up exponentially, year over year."

Thompson made her remarks at the House of Commons Public Safety and National Security Committee, where MPs are looking for topics their group can zero in on during the current parliamentary session.

A cybersecurity review that looks at legal gaps and shortcomings in police resources could form a plan for the way the Trudeau government approaches law-and-order issues.

"It is our intent to conduct a review that is going to be credible and comprehensive and reaches out to all stakeholders across Canada. And also to our international partners," said Monik Beauregard, the senior assistant deputy minister at Public Safety's national and cyber-security branch.

Liberal MP Marco Mendocino, a former Crown prosecutor who played a key role in putting some of the Toronto 18 terrorists in jail, told the committee he is particularly concerned about financial crime -- the use of computers and telecom networks by organized criminals, including terrorists, to move and hide money -- as well as the use of social media as a breeding ground for online hatred and incitement.

"The fact that we are now so invested in cyberspace can make us vulnerable," said Mendocino.

He wanted to know what the top public safety issues were for Canada's most senior security bureaucrats.

Child sex- ploitation is right at the top of the list, Thompson said.

"That is one of the areas that's keeping us awake. We're working very actively on that. We're partnering not just in Canada but internationally," said Thompson.

Thompson said identify theft and intellectual property crime are two other areas where the crime rate has been rising because of the widespread adoption of the Internet.

Canadian Press
Canada's electronic spy service to take more prominent role in ISIS fight
Friday, 19 February 2016
Byline: Murray Brewster

Ottawa - The Communications Security Establishment, Canada's electronic spy service, is set to play a more prominent role in the war against the Islamic State of Iraq and the Levant, The Canadian Press has learned.
Multiple sources familiar with the plans, speaking on condition of anonymity owing to the sensitivity of the matter, say the government is deploying a capability that only a "handful of countries" in the world can provide.

CSE is part of the so-called "Five Eyes" community, along with the U.S. National Security Agency -- the NSA.

CSE spokesman Ryan Foreman acknowledged the agency is helping the Canadian Armed Forces under the umbrella of Operation Impact, the name of Canada's anti-ISIL mission in the Middle East, but refused to discuss specifics.

"While we are proud of our contributions to CAF's missions, CSE is obligated to respect the Security of Information Act, and cannot address specific operational questions," Foreman said.

Defence Minister Harjit Sajjan has for weeks been signalling that the military will introduce a "more robust" intelligence-gathering regime, one that allies -- chastened by the withdrawal of the six CF-18s -- are happy to be bring to the fight.

Separately, Public Safety Minister Ralph Goodale confirmed Thursday that the Canadian Security Intelligence Service will also play a stepped-up role in the fight against the Islamic State, but he also refused to be specific.

"We are providing new and additional intelligence capabilities in the region and while by its very nature I cannot elaborate, CSIS will have a role to play," Goodale said.

"It will certainly be an increased role to accomplish larger objectives."

The defence conference where Goodale and Sajjan were speaking heard Thursday about how CSIS agents cultivated human sources in Afghanistan.

But CSE played a pivotal role alongside the Canadian Army during the Afghan war, providing by its own admission half of the crucial battlefield intelligence on Taliban militants, their movements and the locations of key commanders.

The information was used to plan military operations and for targeted capture or kill missions by special forces. But one official, speaking on condition of anonymity, said Canadians would provide targeting only and not take part in any "direct action."

Although he's been eager to trumpet the "doubling" of the intelligence effort, Sajjan has been decidedly opaque about what that means, even last week when he announced the retooled mission.

"Enhanced intelligence capability will help protect our forces in theatre as well as those of our coalition and host nation partners," Sajjan said.

"Therefore, we will significantly increase the resources we dedicate to intelligence, both in northern Iraq and theatre-wide. Our intelligence capabilities will help the coalition and Iraqi security forces develop a more sophisticated picture of the threat and improve our ability to target, degrade and defeat ISIL."

What that likely means in practical terms, according to sources and intelligence experts, is the involvement of the secretive CSE and specialists from the 21st Electronic Warfare Regiment.

It also means deploying Canadian intelligence officers into the highly secure all-source intelligence centre in Kuwait, and potentially hacking ISIL computers and smartphones.

When pressed, Sajjan refused to discuss the details.

"Unfortunately, I'm not going to talk (about it) in public for operational security reasons," he said.

"The last thing you want to be able to do is show your hand to (ISIL) and let them know what type of capability you are bringing in, but we have very unique capabilities for the coalition, and what I will say is capabilities for theatre-wide for the entire coalition and then we have very specific capabilities for our troops in the north as well."

Bill Robinson, a blogger and expert on signals intelligence, said it is a matter of public record that the military and CSE have an integrated operational model for field operations, which proved highly successful in Afghanistan.

"It was a pretty substantial contribution on the intelligence side," said Robinson, who noted that signals kept watch over not only the movement of Taliban units and commanders, but also provided early warning of threats -- such as the planting of roadside bombs -- and even kept tabs on local Afghan government officials.

Deploying a similar capability to northern Iraq would, in Robinson's estimation, be a significant step-up in terms of the fight.

"It's a plausible argument that this is a contribution that would be valued just as much as the fighter-bombers," he said. "Increasingly, I think this kind of warfare is down to intelligence."

It is likely filling a gap that the Americans are unable to cover themselves, Robinson added.

Throughout the war against the Islamic State, U.S. commanders have repeatedly called for more intelligence data, mostly in the form of extra drone flights. Washington was forced to strip the remote-controlled aircraft from operations in Afghanistan, according to published reports.

Documents leaked by former NSA contractor Edward Snowden indicate "that in the Horn of Africa and Afghanistan, they were not getting all the signal intelligence they wanted," Robinson said.

That's one of the reasons Canada deployed its own capability to Kandahar during the war, he added.

The game could be upped even further with the purchase of special tactical intelligence surveillance planes, similar to the King Air turboprop aircraft used by special forces in Afghanistan under a contract with the U.S. Army. The federal government quietly floated a letter of interest in September to see if defence contractors could deliver three aircraft.

In addition, Robinson says Canadian intelligence officers are highly valued in multi-national intelligence hubs like the one in Kuwait, because they "are cleared into the Five Eyes community."

Toronto Star
Has Apple secretly leaked your data to government?
Friday, 19 February 2016
Byline: Frederick Ghahramani

OpEd: Apple CEO Tim Cook's now widely shared "Message to our Customers" is an attempt to make the best PR move in a bad situation.
Were Apple to comply with the FBI's request to access information locked on a suspected San Bernardino shooter's phone, it probably wouldn't be the first time that the government has deputized Apple to breach its customers' privacy.

According to documents revealed by Edward Snowden in 2013, Apple was one of the participants in the U.S. National Security Agency's PRISM program, giving authorities access to its customers' information including their emails, messages and photos.

Apple for its part has denied any such involvement, but given the secretive nature of the United States Foreign Intelligence Surveillance Court (FISA Court), Apple and other technology companies would be prohibited to publicly acknowledge their involvement in such programs.

Hence the frustrating catch-22 - is Apple really a champion of privacy rights? Or is all this bluster just an act to score PR points with their customers, despite the fact that legislative conditions already exist to force Apple to co-operate in secret?

Maybe we'll never know, and it probably doesn't matter, because the real lesson that can be learned from this episode is the importance of open source software.

While Apple has invested heavily in encryption and security, most of its systems and applications are closed. For all we know, Apple could already have been secretly compelled to program backdoors into its popular services such as iCloud and iMessage - even against the wishes of its CEO.

In fact, rumours such as this one have been circulating for quite some time. If true, this means that millions of customers could already have had their privacy invaded without ever knowing and, more importantly, the decision to do so would be adjudicated in a secret court, completely out of Apple's hands.

In contrast, in an open source model, the source code of an application is available to the general public, and a global community of curious engineers (there are millions of us) could effectively "look under the hood" to ensure that no backdoors existed. Such transparency can only be achieved in an open-source environment, and Apple has historically chosen to operate contrary to this model.

The second and more important lesson is that situations such as this distil the abstract concept of encryption into frightfully political sound bites. Recently, John J. Escalante, chief of detectives for Chicago's police department, went so far as to suggest that "Apple will become the phone choice for the pedophile."

The truth about encryption is obviously far more nuanced. Encryption is not a dirty word, nor is it something that's only useful to terrorists and pedophiles. Consider going a day without encryption - being unable to use your credit card, withdraw funds from an ATM, or simply make a mobile phone call - and you quickly realize how any legislation that weakens encryption would have far-reaching social, political and economic consequences.

It has been argued that mathematically crippling encryption systems to grant the government a so-called "master key" would be a good way to protect our safety and security. That's a strange case to make when most people would never agree to give the police a master key to open every house in the country (even if pedophiles and terrorists also live in some of those houses).

Furthermore, such arguments naively assume that only the "good guys" would retain (or devise) such master keys. At a time when accidental data losses by governments around the world have become an all too common occurrence, it's no wonder Apple is concerned about being forced to grant the government such access.

The U.S. government has painted not just Apple but the entire technology industry into a corner. The industry's answer needs to lie in advances in encryption technology and open source software. Given the opaque and Byzantine nature of the security apparatuses in both the U.S. and Canada, it will soon be impossible to decipher who's been compelled to do what or when - no matter what their press release states.

Frederick Ghahramani is the CEO and founder of just10.com, an ad- free private social network.

Globe and Mail
Museveni temporarily bans social media and has rival arrested, while police fire tear gas to disperse protesting voters
Friday, 19 February 2016
Byline: Geoffrey York

Johannesburg - Authorities blocked access to social media and police arrested an opposition leader as Uganda's President sought to extend his 30- year grip on power in a bitterly contested election on Thursday.
President Yoweri Museveni, who seized power in 1986 and is heavily favoured to win the latest election, said the temporary ban on Facebook and Twitter on election day was necessary because some Ugandans were "telling lies" and "misusing" social media.

"There must be steps taken for security, to stop so many creating trouble," the President told Ugandan media. "You know how they misuse them, telling lies. If you want a right, then use it properly."

Police fired tear gas to disperse voters who protested long delays in providing ballots and election materials at some voting stations. The main opposition leader, Kizza Besigye, was arrested for the second time in four days.

He was charged with "criminal trespass" when he went to the gates of an unmarked police-intelligence building, which he alleged was a vote-rigging centre.

Mr. Museveni, 71, is just the latest African leader to attempt to orchestrate the continuation of his rule, despite growing calls for term limits. At least 15 leaders across Africa have served more than two terms or announced plans to do so. In a youthful continent where the average age is 19, many leaders are elderly and unwilling to give up any power. The average age of the 10 oldest African presidents is 78. The oldest, Robert Mugabe of Zimbabwe, turns 92 on Sunday.

Mr. Museveni himself had once scathingly criticized African leaders for their tendency to cling endlessly to power. In 1986, after a five-year bush war in which he led his guerrilla army to victory, he proclaimed: "The problem of Africa in general and Uganda in particular is not the people, but leaders who want to overstay in power." But once he got a taste of power, Mr. Museveni seemed to forget those words. He became increasingly dominant in a system that revolved around his personal rule, backed by the military. In 2005, he allowed multi-party elections for the first time, but he also scrapped term limits, allowing himself to rule indefinitely. He is also now expected to get rid of the constitutional age limit of 75.

Mr. Besigye, his former ally and personal physician, has run unsuccessfully against Mr. Museveni in three past elections, often suffering harassment by the police. He has been repeatedly arrested, roughed up or confined to house arrest. On Monday, he was tear- gassed again when police broke up an opposition rally.

Mr. Museveni has always exploited the advantages of power to ensure that the opposition has little chance of beating him. A recent study by an independent civil society group found that he has spent more than $7-million (U.S.) on his current presidential election campaign. That's 12 times more than the amount spent by his top two opponents combined, the study found.

His supporters, including a controversial unit of pro-regime "Crime Preventers," have routinely used intimidation tactics against the opposition. A police chief, for example, warned that the "Crime Preventers" would be armed with guns and ready for "war" against anti-government protesters. A senior member of the ruling party told opponents that the government will "kill your children" if they protest the election results this week.

The ban on social media was sharply criticized by humanrights groups and diplomats. But it was part of a larger trend of harassment of the media, including physical attacks on journalists and the closing of radio stations.

Though the Museveni government is often criticized for human-rights abuses and crackdowns on the opposition, it has benefited from the strong support of the United States, which sees Uganda as a key ally in the fight against Islamist radicals in Somalia. In recent years, Uganda has become one of the top African recipients of U.S. security assistance.

Official results of Thursday's election are expected to be released by Saturday. Votecounting was continuing on Thursday night, sometimes by the light of lamps and cellphones in darkened voting stations. Early provisional results, from less than 5 per cent of voting stations, showed Mr. Museveni in the lead.

Tech giant defends privacy by refusing to give in to government order to hack its own phones
Friday, 19 February 2016

Editorial: Apple Inc.'s refusal to help the United States government hack into the iPhone of a dead terrorism suspect is a difficult but necessary decision. In the end, the tech company has to weigh a concrete threat to its customers' privacy against the ambiguous needs of the police.
Apple and companies like it build smartphones and tablets with the promise to customers that the personal information they keep on their devices will be protected from hackers and prying eyes. It is a critical aspect of the companies' sales pitches, and also a responsibility in the digital age.

Once a customer has purchased one of Apple's most recent phones and tablets, its contents are inaccessible even to the company that manufactured it without the user's permission. Any repeated attempt at access that isn't authorized by the user causes the devices to automatically erase all of their contents.

A judge in California, however, has ordered Apple to bypass this security system on the iPhone of Syed Farook, who along with his wife killed 14 people in a mass shooting in San Bernardino in December. The FBI asked for the order because it believes - though it does not know for certain - that there could be information on the phone that will help explain the shooters' motives and possibly lead to accomplices. The police are on a fishing expedition, looking for any clues, anywhere.

Apple won't comply for a simple reason: If it creates a bypass around the security system of one iPhone, it is necessarily doing so for all iPhones. This would be a violation of its promise to protect customers' privacy.

In fact, it would blow a hole in expectations of privacy. Once such a breach is made, it can't be unmade. Customers would know it and might lose confidence in Apple products, along with those of any other manufacturer met with a similar government order.

There is also the broader issue of governments' rapacious hunger for private citizens' personal data. If Apple yields to the U.S. government, there can be little doubt that other governments will come demanding the same thing. All they will need to do is raise the charged issue of fighting terrorism to make their case.

It's better, then, for Apple to keep saying no. It has co-operated with the FBI as much as it can, but should go no further.

Journal de Montréal
L'Oncle Sam veut voir dans votre iPhone
Friday, 19 February 2016
Byline: Pierre Martin

Opinion - Le jeu du chat et de la souris entre les services de renseignement et les défenseurs de la vie privée expose quelques dilemmes et contradictions de la lutte contre le terrorisme.
Après les attentats de San Bernardino, les enquêteurs ont récupéré l'iPhone d'un des meurtriers. Le FBI exige qu'Apple lui fournisse le moyen de débloquer l'accès aux données précieuses qu'il pourrait contenir. Le fabricant refuse.

Apple allègue ne pas pouvoir désactiver la sécurisation du téléphone, mais l'entreprise craint surtout qu'une telle clé puisse tomber entre des mains malveillantes ou que ce cas constitue un précédent pour des régimes répressifs ailleurs dans le monde.

Un dilemme cornélien

De plus en plus, la menace terroriste provient d'individus radicalisés de l'intérieur des sociétés occidentales plutôt que de groupes extérieurs. Ce changement incite les États à accentuer la surveillance interne, au détriment du droit à la vie privée de leurs citoyens.

Il n'y a pas de solution évidente, mais à ceux qui croient qu'aucune limite ne peut être imposée à l'action antiterroriste de l'État, il faut rappeler que ce phénomène représente encore un risque assez minime. Le Nord-Américain moyen a plus de chances d'être frappé par la foudre que d'être victime d'un attentat islamiste.

Personne à l'abri des contradictions

Il est louable qu'Apple défende avec vigueur la vie privée de ses clients, mais il n'en demeure pas moins que le fabricant tire un énorme bénéfice de la vente de ses produits à des usagers qui ont intérêt à rester discrets.

La palme de l'hypocrisie, dans cette histoire, ne va toutefois pas à Apple. Elle revient plutôt à une certaine droite qui proclame que l'État a perdu toute légitimité pour agir, tout en soutenant que la branche de l'État la plus obscure et la moins redevable de ses actions devrait avoir carte blanche pour tenir ses citoyens à l'oeil.

Ottawa Citizen
Laser strikes on aircraft a growing threat to safety
Friday, 19 February 2016
Byline: Andrew Duffy

Ottawa - A Transport Canada database reveals that 33 laser strikes were reported by aircraft in the National Capital Region during the past year - part of an alarming trend that places pilots and their passengers at risk.
The latest incidents occurred in January when three planes were targeted in Ottawa's skies, including an Air Canada Jazz flight from New York City and a nighttime Ornge air ambulance flight.

The incidents are outlined in the federal government's Civil Aviation Daily Occurrence Reporting System (CADORS), which acts as the repository for all safety and security-related incidents in Canadian airspace.

Although Transport Canada tries to ensure the accuracy of the reports, it still considers them preliminary and "subject to change."

The number of laser strikes on aircraft has been rising sharply in recent years.

Last year, according to a Citizen analysis of the CADORS database, there were 663 laser strikes directed at aircraft in Canada - a 32 per cent increase from 2014. The numbers have been climbing since 2008 when 80 laser incidents were reported by pilots in Canadian airspace.

Capt. Dan Adamus, Canada board president for the Air Line Pilots Association, International, called laser attacks a serious concern. "When it happens, there's a big green glow - it's usually a green laser - that fills the cockpit," Adamus said. "You can be looking for the runway, and you catch this light out of the corner of your eye, and your natural tendency is to look towards it."

Two pilots in the United States, he said, have lost their medical clearance to fly after suffering eye damage from cockpit laser strikes.

In Canada, pointing a laser at an aircraft is an offence under the federal Aeronautics Act, and those convicted can face up to five years in prison and a $100,000 fine.

Adamus wants the federal government to make laser interference with an aircraft an offence under the Criminal Code, and launch the kind of public awareness campaign conducted by the F.B.I., which offered $10,000 for information that led to arrests.

"They have to get the word out," he said, "because nine times out of 10, I think it's curious people with a laser, saying, 'I wonder if this will reach that aircraft.' " Adamus also wants the government to better regulate the sale of lasers, and limit the power output of hand-held pointers - sometimes known as laser pens - to 5 milliwatts or less. More powerful devices should be tightly controlled, he said, and come with explicit warnings about the danger they pose. Transport Canada says it is working closely with police, other government departments and the aviation industry to reduce the number of laser incidents. The high-intensity light strikes are considered particularly dangerous during the takeoff and landing phases of a flight, when pilots can least afford to be distracted or temporarily blinded.

In the Ottawa region, medevac helicopters, small planes and commercial jets have all been targeted. Last April, an Ornge helicopter flying from Pembroke Regional Hospital to the Children's Hospital of Eastern Ontario reported being hit by a green laser coming from the vicinity of the Champlain Bridge.

One month later, the pilot of an Air Transat Airbus en route from Toronto to Venice said the plane's cabin was lit up by a green laser as it cruised at 31,000-feet over Ottawa. That same month, a WestJet Boeing 737, originating in Calgary, reported that it was targeted three times by a green laser as it approached Ottawa International Airport.

Ten of the local incidents reported last year involved members of the Ottawa Flying Club, one of whom was targeted by a green laser for a full 20 seconds.

Bryce Hanna, general manager of the club, said laser strikes pose "a fundamental safety issue" since many small aircraft have a single pilot on board. "There's no one to take the controls so potentially the aircraft could even be lost because of that," Hanna said.

Laser strikes are an international problem. This month, the Alitalia flight crew taking Pope Francis to Mexico reported a laser beam coming from the ground as the plane prepared to land in Mexico City. Days later, a Virgin Atlantic flight en route to New York from London turned back after laser light struck the eyes of the co-pilot.

The incident prompted the British Airline Pilots Association to demand that the government categorize powerful laser pointers as "offensive weapons" to aid in a police crackdown on their use against planes.

The Hindustan Times
Deloitte expands its Cyber Intelligence Centre in Gurgaon (Canada).
Friday, 19 February 2016

Kolkata - Deloitte India on Thursday announced the expansion of its Cyber Intelligence Centre (CIC) in Gurgaon. This facility integrates technology with industry insights to provide round-the-clock business-focused cyber and operational security.
Krishan Pal Gurjar, Minister of State for Social Justice Empowerment, Government of India, was the Chief Guest for the occasion. Other dignitaries at the inauguration ceremony included P.R. Ramesh, Chairman, N. Venkatram, CEO, Deloitte India along with the India board and Executive Committee members of Deloitte India firm.

With 24x7 coverage, the CIC has the capability to monitor and assess threats specific to clients, enabling Deloitte to effectively mitigate risk and strengthen cyber resilience. Deloittes Gurgaon CIC will be part of a globally interconnected set of cyber intelligence centres to provide leading insights and services to its clients. Speaking about CIC, Shree Parthasarathy, Partner, Deloitte India, said,

The pervasiveness of technology throughout major business processes coupled with the brand and regulatory impact of a cyber-breach or attack, clearly makes cyber risk a boardroom issue. With always-on, always-connected systems, exposure to cyber threat increases, creating the need for businesses to get access to timely and actionable threat intelligence.

Our CIC is one of the largest in the region and is linked to Deloittes existing Cyber Intelligence Centres in Australia, Japan, UK, Spain, Canada and the United States to bring a collective set of capabilities to our clients based in India.

The CIC propels our Cyber capability to the next level and helps solidify our presence in the market as a global leader in Cyber Risk Services. Said Amry Junaideen, President, Enterprise Risk Services, Deloitte India: Threats posed to organizations by Cybersecurity-related issues have increased rapidly. So many organizations have suffered significant brand impact, financial loss, and systems outages due to Cybersecurity issues.

With new attack potentials and insider threats on the rise, securing proprietary information and other critical business assets is becoming exponentially more difficult for Indian enterprises. As a rapidly growing market, India holds immense potential for Deloitte to make meaningful impact for our clients. We believe the CICpositions us well to address the cyber risk priorities of organizations in all industries with a full suite of business- focused security solutions, he added.

Jerusalem Post
Reports of IDF airstrikes against Syria cause waves in cyberspace
Friday, 19 February 2016
Byline: Noam Amir, Maariv Hashavua

Jerusalem - Foreign reports attributing strikes against the Syrian regime to the IDF may only rarely elicit a military response, such as a barrage of rockets, however they certainly result in a direct threat to Israel's security systems.
A military source confirmed this week that in some instances where Israel has been fingered for a particular military operation, such as the strike which killed notorious terrorist Samir Kuntar last year, an immediate reaction has been seen in cyberspace.

In the case of Kuntar, a day after his death a group of hackers carried out a successful attack on the Israel Air Force (IAF) website.

According to sources in Israel, a group of hackers operating from a long distance overseas and styling itself "Qalamoun boys" was behind the attack on the IAF site. While it may be true that the attack caused no damage to the army in any significant way, and the attackers were repelled quickly, it appears to the IDF that in a general sense hackers are often curious about circulating rumors of Israeli strikes, and look for ways to confirm or deny the reports by breaking into the IDF's systems.

According to the military source, there is no paucity of attacks against the Israeli military. "Enemies want to know what's going on here," he said. "At the end of the day, computers and information systems do hold secrets, but there is a very low probability of success of such an intrusion because the cyber capabilities of the IDF are very high."

In the world today there are five major cyber powers. Israel is one of them, the other four being the US, Iran, Germany and the UK. In the case of the alleged IAF attacks against Syria, the regime does not address the foreign reports at all. Instead, it will do anything within its power to keep the ambiguity regarding incidents such as these in place. However, under the radar, they hope that one of the world cyber powers will try to access the information.

Iran is of course one of these players, having carried out attacks of increasing quality and frequency in recent years, particularly between 2013-2014.

The significant decrease in cyber attacks in 2015 has been attributed, among other factors, to the nuclear agreement. During the tumultuous years of 2013 and 2014, the region was hot, with all sides attempting to extract information. However the signing of the agreement seemed to calm the flurry of attacks in both directions.

It is very possible that Wednesday night, with the publication of further reports of an attack on Syria, that there has been a raised alert in the preparedness of the IDF. Even if the army is not expecting to deal with a barrage of missiles, at least in cyberspace it will be bracing for combat, as there are those who will be looking for verification, making cyberspace one of the most fascinating areas of the world.

The military like to call this space "the most crowded playing field in the Middle East." Even without swings and sandboxes, cyberspace is equally as fascinating as the conventional threats faced by the IDF.

Washington Times
PLA on cyberwarfare buildup
Thursday, 18 February 2016
Byline: Bill Gertz

Washington - A Chinese military official revealed last month that Beijing plans to rapidly build a new People's Liberation Army cyberwarfare force in response to U.S. military cyberforces.
Col. Li Minghai of the PLA's National Defense University wrote in the Communist Party-affiliated Global Times newspaper that a new cyberwarfare force is needed to counter the United States as the Pentagon is building up its cyberattack capabilities.

"It is more necessary for us to build a brand new 'operation force,'" said Col. Li, identified as deputy director of the NDU's Center for Cyberspace Security.

As a sign of the sensitivity of the report, Chinese censors quickly removed the posting in Chinese from the Global Times website shortly after it appeared Jan. 21.

Col. Li is one of China's most senior cyberwarfare specialists, and his remarks provide some of the first clues to Beijing's military priorities in future cyberwarfare operations. Military cyberoperations are among China's most closely guarded secrets.

The 3rd Department of the PLA general staff, known as 3PLA, is China's main military cyberwarfare force and is said to have up to 100,000 cyberwarriors. A copy of the colonel's translated article was obtained by Inside the Ring.

Col. Li stated that the U.S. military's cybersecurity strategy for the past four years has emphasized offensive electronic attacks on information systems and regards China as "one of the greatest threats to the United States' cybersecurity."

Noting that current cyberthreats to China are "not sensational or alarmist talk," Col. Li said reforms to PLA cyberforces should not be limited to "tinkering," but require "the rebuilding of a new- breed cyberforce in our country."

"We should apply the brand-new development model in the information age to remold our cyberwarfare preparedness against the threat of the United States' new cyberstrategy and guarantee our nation's cybersecurity," he said.

A key feature will be what is described as a "winning mechanism" for warfare in the cyberspace domain.

"In the 21st century, seizing control of cyberspace is of decisive significance, like seizing control of the sea in the 19th century and seizing control of the air in the 20th century," Col. Li wrote. "Cyberoperations in the future will follow the new battlefield rules determined by the winning mechanisms of 'real-time sensing, sensitive response, source destruction and chain cutoff, joint winning.'"

Also, cyberpower must be combined with conventional military power "with winning being based on information power."

Cyberwarfare troops will target information technology infrastructure networks like the Internet, telecommunications systems and computer systems, including imbedded processors and controllers in major sectors.

A third priority for the cyberwarfare force will be adding more trained military hackers.

"At present, our country still lacks high-end specialists with both knowledge about network technology and knowledge about military command, so it is imperative that we step up the efforts for building the cyberoperation force," Col. Li concluded.

Publication of the report coincided with China's creation of a Strategic Support Force, announced Dec. 31, that will include dedicated cyberwarfare forces, along with space warfare units.

Cybersecurity expert Joe McReynolds disclosed last year that China's cyberwarfare forces were outlined for the first time in a Chinese military paper. The PLA cyberwar force has three elements, including a cadre of dedicated military specialists devoted to network warfare that conduct cyberattacks and defense, Mr. McReynolds told The Daily Beast.

Other forces include teams of specialists working in civilian intelligence, police and security organs who conduct military cyberoperations. Last are units outside government that will be mobilized for network warfare.

Press Trust of India
Government to ask Twitter to block accounts with Hafiz Links
Friday, 19 February 2016

New Delhi - Security agencies will approach Twitter India to block all accounts having links with Lashkar-e-Taiba founder Hafiz Saeed and Jamaat-ud-Dawa which are often found to be spreading venom against India.
There are several accounts which have links with LeT's front outfit, Jamaat-ud-Dawa, as well as terror mastermind Saeed and it has become necessary to shut these down as quickly as possible, officials said.

"We are approaching Twitter India which in turn will tell its US-based parent company to deactivate the accounts. Hopefully, it will be done soon," a official said.

Earlier, Twitter had blocked several accounts operated by Jamaat-ud-Dawa, headed by Saeed, following requests from security agencies in different countries, including India and the US. However, such accounts again cropped up after a gap of several months.

A fake account of Saeed had recently asked Pakistanis to support the JNU students who are protesting against the registration of a case of sedition against JNUSU president Kanhaiya Kumar. It had also asked users to trend the topic #PakStandWithJNU with the posts sparking a huge controversy.

Last Sunday, Home Minister Rajnath Singh had said the event organised at JNU to protest against the hanging of Parliament attack convict Afzal Guru had the backing of Saeed.

Even though the Home Ministry clarified that Singh's statement was based on inputs from different agencies, it was reportedly made in the wake of the posts on the fake Saeed Twitter account.

Gulf News
Tech giants support Apple in privacy fight
Friday, 19 February 2016
Byline: Staff Report

Dubai - Apple chief Tim Cook has picked a fight with the United States government and Silicon Valley is joining his side.
Apple Inc.'s chief executive officer took his stand after the Federal Bureau of Investigation won a court order to make Apple help investigators unlock an iPhone used by Syed Rizwan Farook, one of the shooters in a deadly December 2 attack in San Bernardino, California.

From Google Inc. to Facebook Inc., the industry's biggest names rallied around Cook after he vowed to resist the court order. Cook described the request as an "unprecedented step that threatens the security of our customers" and called for a public debate.

The escalation with the FBI, which has been pushing for access to mobile devices since Apple tightened its encryption in late 2014, galvanised the firm's US peers and forced them to choose between helping the government fight crime and protecting their customers' privacy. The decision in the Apple case could apply to the broader tech industry and it may spur requests from China and other nations that want similar abilities to access users' encrypted content.

Reform Government Surveillance, a group representing firms including Google, Facebook, Microsoft Corp. and Twitter Inc., have issued a statement reiterating that, while it's "extremely important" to deter crime and terrorism, no company should be required to build backdoors to their own technology.

National Security Agency whistleblower Edward Snowden has also backed Apple, tweeting that the company's stance was defending the rights of its customers.

"We're here to say to Apple, "We're going to back you all the way," ' said Electronic Frontier Foundation (EFF) chief Cindy Cohn outside a San Francisco store. When about two dozen privacy advocates stood shoulder to shoulder in front of the downtown San Francisco Apple store on Wednesday, it may have been the first time a demonstration was held in support of the tech company.

"Silicon Valley stands with Apple," Bret Taylor, co-founder of Quip and former chief technology officer of Facebook and co-creator of Google Maps, posted on Twitter. Steven Sinofsky, an ex-executive at Microsoft, called for "broad support from full stack of technology companies."

Khaleej Times

Re-strategising IT security

Friday, 19 February 2016

Byline: Aji Joseph

Dubai - Digital industrial espionage is becoming a greater threat for companies in all industries. An additional danger is presented by numerous secret services, with an aim of spying on businesses and organisations. What should companies, the potential victims, do? They must work harder than ever to protect themselves and their data from increasingly complex attacks in order to avoid the kind of corporate disadvantage, which might even threaten their very existence.

There are various forms of attack which have the declared aim of spying on business secrets. Malware is introduced into databases, applications and systems. Transmitted data is spied on and read at network connections. Trojans can make their way into companies with completely innocent software purchases. Software updates can also be used as a transmission vehicle for spying programs. If there are no proper defence mechanisms available, attackers can spy on business secrets as long as they like without the company noticing.

The attackers can usually leave the network in the same way as they got in - unnoticed by the victims. Annual losses to corporate espionage are estimated to be billions.

The EU published a report on industrial espionage as early as 2001. The list includes two suspected cases against France. These were in relation to the delivery of high-speed trains to South Korea. The French manufacturer Alstom (TGV) was said to have gained a competitive advantage over the competitor Siemens (ICE) by means of industrial espionage.

In 2013, France came under suspicion again. The New York Times reported on the country's alleged industrial espionage programme, which had the aim of obtaining technical secrets from the USA.

In 2015, the newspaper Libération reported that approximately one hundred French companies, including all companies listed in the French stock market index CAC 40, had been spied on. The report was based on information provided in US documents supplied by Wikileaks. The German Federal Intelligence Service (BND) was also in the headlines for several weeks. It has been accused of having helped the US secret service NSA to spy on European institutions and companies.

Although defence mechanisms such as signature-based anti-virus software, firewall and network monitoring software are still required, they are no longer sufficient.

Only a comprehensive shield can help in the face of the intensified threat. It must cover the entire company, include all the necessary IT security services, maintain an overview of all security incidents, be adaptable to new threat scenarios and detect unknown forms of attack.

Though today several IT experts and managers have the expertise and skills to manage cyber risk/ attacks; you need an intelligence-based approach - one that uses knowledge combined with tools - 24x7 to identify threats and protect your assets. In view of this and the high human resources and financial costs; companies have to consider whether they can operate on their own or they should use specialist expertise and tools.

To manage IT security more effectively and efficiently; it's time for organisations to refocus and re-strategize their overall IT security shield - to reduce time until risk is detected and therewith reduce potential damage of attacks.

Companies should consider outsourcing their IT security monitoring needs to highly specialised experts and therewith ensure their infrastructure is monitored every hour - seven days a week ensuring a more proactive approach in protecting their company assets. At the same time this should offer significant cash savings for a company in the long run such as a reduction of costs for purchasing and managing a vast number of complex stand-alone IT security solutions.

Bloomberg News
Secret Memo Details U.S.'s Broader Strategy to Crack Phones
Friday, 19 February 2016
Byline: Michael Riley, Jordan Robertson

Washington - Silicon Valley celebrated last fall when the White House revealed it would not seek legislation forcing technology makers to install "backdoors" in their software -- secret listening posts where investigators could pierce the veil of secrecy on users' encrypted data, from text messages to video chats. But while the companies may have thought that was the final word, in fact the government was working on a Plan B.
In a secret meeting convened by the White House around Thanksgiving, senior national security officials ordered agencies across the U.S. government to find ways to counter encryption software and gain access to the most heavily protected user data on the most secure consumer devices, including Apple Inc.'s iPhone, the marquee product of one of America's most valuable companies, according to two people familiar with the decision.

The approach was formalized in a confidential National Security Council "decision memo," tasking government agencies with developing encryption workarounds, estimating additional budgets and identifying laws that may need to be changed to counter what FBI Director James Comey calls the "going dark" problem: investigators being unable to access the contents of encrypted data stored on mobile devices or traveling across the Internet. Details of the memo reveal that, in private, the government was honing a sharper edge to its relationship with Silicon Valley alongside more public signs of rapprochement.

On Tuesday, the public got its first glimpse of what those efforts may look like when a federal judge ordered Apple to create a special tool for the FBI to bypass security protections on an iPhone 5c belonging to one of the shooters in the Dec. 2 terrorist attack in San Bernardino, California that killed 14 people. Apple Chief Executive Officer Tim Cook has vowed to fight the order, calling it a "chilling" demand that Apple "hack our own users and undermine decades of security advancements that protect our customers." The order was not a direct outcome of the memo but is in line with the broader government strategy.

White House spokesman Josh Earnest said Wednesday that the Federal Bureau of Investigation and Department of Justice have the Obama administration's "full" support in the matter. The government is "not asking Apple to redesign its product or to create a new backdoor to their products," but rather are seeking entry "to this one device," he said.

Security specialists say the case carries enormous consequences, for privacy and the competitiveness of U.S. businesses, and that the National Security Council directive, which has not been previously reported, shows that technology companies underestimated the resolve of the U.S. government to access encrypted data.

"My sense is that people have over-read what the White House has said on encryption," said Robert Knake, a senior fellow at the Council of Foreign Relations who formerly served as White House Director of Cybersecurity Policy. "They said they wouldn't seek to legislate 'backdoors' in these technologies. They didn't say they wouldn't try to access the data in other ways."

"Backdoors" refer to security holes that are intentionally inserted into software to create the equivalent of a skeleton key for law enforcement -- what wiretapping systems are for telephone lines, for instance. The problem with backdoors in computer networks is they create vulnerabilities for any hacker to find.

What the court is ordering Apple to do, security experts say, does not require the company to crack its own encryption, which the company says it cannot do in any case. Instead, the order requires Apple to create a piece of software that takes advantage of a capability that Apple alone possesses to modify the permanently installed "firmware" on iPhones and iPads, changing it so that investigators can try unlimited guesses at the terror suspect's PIN code with high-powered computers. Once investigators get the PIN, they get the data.

Knake said that the Justice Department's narrowly crafted request shows both that FBI technical experts possess a deep understanding of the way Apple's security systems work and that they have identified potential vulnerabilities that can provide access to data the company has previously said it can't get.

In this case, the government wants Apple's help in exploiting such weaknesses. But experts say they could find ways to do it themselves, and the NSC "decision memo" could lead to more money and legal authorization for a smorgasbord of similar workarounds.

National Security Council spokesman Mark Stroh declined to comment on the memo. But he provided a statement from a senior Obama administration official: "We should not preemptively conclude that technical and policy options to address this challenge are out of reach. While creating mechanisms for accessing encrypted information does create vulnerabilities, there may be technical and process steps that can be implemented to limit such risks."

The memo was approved by the NSC's Deputies Committee, according to the people familiar with it. While the deputies' committee changes depending on the subject matter, it typically includes at least a dozen sub-cabinet level officials, among them the deputy attorney general, the vice chairman of the joint chiefs of staff, and the deputy national security adviser.

Such memos can have lasting impact. A similar decision memo was used in the early years of the Iraq war to address the problem of Improvised Explosive Devices, which were then killing hundreds of U.S servicemen. The response ultimately led to new anti-IED technology and expanded intelligence capabilities to disrupt the cells building and planting the bombs.

Silicon Valley and Washington have had a decades-long distrust of each other over encryption, stemming from a failed Clinton administration push in the 1990s for a government backdoor in telecommunications networks. In that case, the National Security Agency developed a technology called the Clipper Chip, which the White House approved as a government standard. Security experts assailed it as insecure and a violation of privacy.

Security experts say the U.S.'s insistence on finding ways to tap into encrypted data comes in direct conflict with consumers' growing demands for privacy.

"The government's going to have to get over it," said Ken Silva, former technical director of the National Security Agency and currently a vice president at Ionic Security Inc., an Atlanta-based data security company. "We had this fight 20 years ago. While I respect the job they have to do and I know how hard the job is, the privacy of that information is very important to people."

In addition to the demands against Apple, the FBI will almost certainly seek more money and expanded legal authorization to track suspects and access encrypted data, without the involvement of companies that make the technologies, several experts say. Intelligence services already have sophisticated tools for cracking encryption, and the White House's efforts will likely lead to broader use of those techniques across the government, even in ordinary criminal investigations that don't involve foreign intelligence or national security.

The workarounds could involve trying to force companies like Apple to develop their own tools to help law enforcement or enlisting government hackers to find previously unknown software vulnerabilities that enable the decryption of large amounts of data flowing across networks.

Apple infuriated law enforcement when it announced in 2014 that it would encrypt data stored on users' iPhones and iPads with a PIN code that the company could not access, even if ordered to by a judge. Prior to that decision, the FBI and local police agencies routinely sent seized devices to Apple to extract data relevant to their investigations.

To security experts, creating hacking tools -- capabilities to gain access to encrypted data -- is simply a matter of money and focused effort.

"My guess is you could spend a few million dollars and get a capability against Android, spend a little more and get a capability against the iPhone. For under $10 million, you might have capabilities that will work across the board," said Jason Syversen, a former manager of advanced cyber security programs at the Defense Advanced Research Projects Agency (DARPA), and now the CEO and co-founder of Siege Technologies in Manchester, New Hampshire.

This week's federal court order undermines years of effort by Apple to design a system that makes accessing encrypted data impossible without the participation of the phone's legitimate user. Company officials appeared to believe the enhanced encryption would remove Apple from the efforts of any government to sabotage the security of their customers. Instead, federal agents have detailed in a public document several ways in which that encryption can be bypassed.

"Apple has two options now: They can go back to the judge and say this isn't possible. Or they can service the warrant," said James Lewis, a senior cyber security fellow at the Center for Strategic and International Studies in Washington. "I don't think they can say it's not possible, because it looks like it is."

New York Times
A Web Crime on the Rise: Hackers Lock Out Users and Demand a Ransom
Friday, 19 February 2016
Byline: Stacy Cowley, Liam Stack

New York - It sounds like the plot of a Hollywood thriller, but the all-too-real scenario played out this month at a large Los Angeles hospital: Hackers seized control of critical computer systems and the hospital paid a $17,000 ransom to release them.
So-called ransomware attacks have increased significantly in the past year, security experts say, and the hospital, Hollywood Presbyterian Medical Center, is not the first to fall victim.

The Titus Regional Medical Center, a small hospital in Mount Pleasant, Tex., experienced a similar attack last month, which knocked its core electronic medical record system offline. It, too, paid the ransom, according to Shannon Norfleet, a hospital spokeswoman.

Those in the security industry say such attacks are becoming more prevalent, but are rarely made public.

"We get over 100 calls and emails a month from different organizations that have had some form of ransomware impact their environment," said Charles Carmakal, who oversees breach investigations for clients of Mandiant, a consulting unit of the security firm FireEye. "Nobody talks to the media about it."

In a statement released Wednesday, Allen Stefanek, the president of Hollywood Presbyterian, described the two- week battle that his hospital fought to regain control of its data after a malware attack was detected on Feb. 5.

The attack did not disrupt medical care or compromise the personal information of employees or patients, he said. Instead, it blocked hospital employees from using email and other forms of electronic communication by using encryption to lock them out of the system.

Mr. Stefanek said hospital administrators were told that if they wanted to gain access to their network again, they would have to pay the attackers, who would then give them the decryption key. Mr. Stefanek said that the hospital had contacted the authorities when the malware attack was first detected.

"The quickest and most efficient way to restore our systems and administrative functions was to pay the ransom and obtain the decryption key," Mr. Stefanek said. "In the best interest of restoring normal operations, we did this."

Heath care providers are required to tell patients of any breaches that compromise their personal information or health data, but a typical ransomware attack would not fall into that category. The attackers do not need to gain access to the underlying data in order to encrypt it and prevent others from viewing it.

Once compromised, an organization has little choice but to pay up or say farewell to its data, according to Levi Gundert, who oversees information security strategy for Recorded Future, a threat analysis firm.

"There's really no workarounds for it," he said. "It's very frustrating for both law enforcement and the victims themselves."

Hollywood Presbyterian's attackers demanded their payment in the

form of 40 Bitcoins, a difficult-to-trace currency that has become the currency of choice for online criminals.

Ransomware attacks are on the rise, industry researchers say, because they work. A research team at Dell gathered data from one ransom-payment server and found that it collected $1.1 million in a six-month period. McAfee Labs, Intel's security research unit, detected 638,000 new ransomware variants in 2014. Last year, that number shot up to nearly 3.8 million.

Many ransomware attacks are random, and comparatively low-tech and blunt. Victims are most often infected by clicking a malicious link in an email or by malware delivered through a web browser, frequently hidden in advertisements. The average payment demanded is just $300, according to the security firm Symantec, a sum that is within reach for the individuals and small businesses that most often fall prey to these schemes.

But Mr. Carmakal said he was seeing a growing number of attackers targeting businesses and other organizations with deeper pockets. In those attacks, the hackers may go to greater lengths to remove data -- not just lock access to it -- and threaten to release it publicly if they are not paid.

"Automated malware doesn't know if an organization has $100,000 or not. A human knows," he said. "We've seen an uptick in those kinds of attacks over the past year. We've seen attackers ask for $10,000 to seven-figure values to delete the data" in their possession.

As ransomware attacks grow more frequent, they are increasingly hitting organizations that deal in public safety and other critical functions. Over the past year, the attacks have affected police departments and school districts across the country.

Health care organizations seem to be particularly vulnerable to hacking attacks because they have been slower to embrace sophisticated backup systems and other security measures than other industries, like financial services, said Katherine Keefe, the head of breach response services at Beazley, an insurance company.

Her team investigated 1,200 breaches last year, about half of them at health care providers. The rate of ransomware attacks has noticeably increased in the last six to eight months, she said.

"The criminals see that there's money to be made, and I think they believe they can hold organizations over a barrel," Ms. Keefe said.

The cost of an attack goes far beyond the usually modest sum demanded for ransom. It took Hollywood Presbyterian 10 days to restore its systems, Mr. Stefanek said.

Laura Eimiller, a spokeswoman for the Federal Bureau of Investigation in Los Angeles, said the agency had begun an inquiry into the attack, but she provided no further details.

USA Today
Apple faces uphill battle
Friday, 19 February 2016
Byline: Brad Heath

Washington - The U.S. Justice Department's demand that Apple help it break into a locked iPhone is the latest in a series of legal disputes with tech companies over users' privacy that has been going on for more than a decade.
Nearly all of those contests ended the same way.

"Historically, the judiciary has been very deferential to law enforcement," University of California-Hastings law professor Ahmed Ghappour said. "And history could be very indicative of how this will play out."

The latest episode began this week, when a federal magistrate judge in California ordered Apple to help FBI agents break into the locked iPhone used by Syed Rizwan Farook, one of the armed attackers in December's massacre in San Bernardino, Calif. Apple CEO Tim Cook said the company would fight the order, and Apple has refused to help unlock at least one other locked phone.

For tech companies, such battles have often not gone well.

In 2007, Yahoo balked at a secret order from the Foreign Intelligence Surveillance Court requiring it to turn over customer records to the NationalSecurity Agency. The company relented when a judge on the surveillance court threatened to impose a fine of $250,000 a day -- and double it every week. A federal appeals court upheld the surveillance court's order.

In 2013, a federal judge held the founder of Lavabit -- an email service that had been used by former NSA contractor Edward Snowden - - in contempt for not turning over the electronic key the company used to encrypt users' communications. Lavabit founder Ladar Levison eventually gave the key to the FBI but did so by printing it out in very small type.

Most such disputes have involved federal agents seeking access to troves of information tech companies keep about their users -- everything from contents of emails to records that can precisely track the location of someone's cellphone. The fight with Apple comes with one important difference.

Instead of asking the computer maker to turn over information, a federal magistrate ordered the company to create software for the FBI that would bypass some security features on newer versions of the iOS operating system. The order requires Apple to add an electronic signature to the new software, so Farouk's phone will recognize it.

"The fight here is that the software the government wants does not exist. They're trying to force engineers to write a special version of iOS, then sign it," said Christopher Soghoian, the American Civil Liberties Union's principal technologist. He said such an order raises the prospect that the FBI could force makers to push compromised versions of their software directly to users' phones and computers in a way that would be difficult to detect.

Apple has also rebuffed efforts to help agents unlock older versions of the iPhone, using tools it had already created for the job.

Last year in Brooklyn, federal prosecutors asked a magistrate to force Apple to unlock a phone running iOS 7, so they could use the phone's contents in a drug case. The company declined, even though it had "repeatedly assisted law enforcement officers in federal criminal cases by extracting data from passcode-locked iPhones pursuant to court orders," prosecutors said in a court filing.

Apple has argued that complying with the request would be burdensome. A judge has yet to decide whether to force Apple to comply.

Justice Department lawyers told a different federal judge in Brooklyn last year that the government has the ability to crack newer versions of the iPhone on its own. "The lack of a passcode is not fatal to the government's ability to obtain the records," Assistant U.S. Attorney Karen Koniuszy wrote in a court filing.

Apple Standoff Escalates Local Cases
Friday, 19 February 2016
Byline: Nicole Hong. Pervaiz Shallwani

New York - State and local law-enforcement authorities are looking to follow the lead of the Federal Bureau of Investigation in its standoff with Apple Inc. over access to the contents of a terror suspect's smartphone.
Earlier this week, a federal magistrate judge in California ordered Apple to help the government unlock a passcode on the phone used by one of the suspects in the attack last year in San Bernardino, Calif., which killed 14 people. Apple has said it would fight the judge's order.

On Thursday, Manhattan District Attorney Cyrus Vance said his office is in the process of determining which cases involving encrypted smartphones they should bring before a New York state judge for a similar review.

Mr. Vance called the Apple case "the most visible example of how Silicon Valley's decisions are thwarting criminal investigations and impeding public safety." Other district attorneys may be following Mr. Vance's moves.

Jake Wark, a spokesman for the Suffolk County district attorney's office in Boston, said that although the office hasn't yet taken steps to bring a specific case for judicial review, "We can't rule that out. It may be a question of finding the right case."

The fight between Washington and Silicon Valley is exposing law enforcement's long-simmering concerns over the challenges posed by encryption during investigations. Federal and local law-enforcement officials are increasingly voicing frustration with encrypted smartphones, which they say provide a haven for criminals and hinder investigations by keeping potentially valuable evidence out of reach.

The battle over encrypted smartphones is part of a broader debate that dates back over a decade. Following the attacks on Sept. 11, 2001, Congress won broad support to pass the USA Patriot Act, which became the legal underpinning for roving wiretaps on terrorism suspects and bulk collection of phone records by the NationalSecurity Agency.

Over time, however, concerns about privacy and civil liberties escalated, reaching an apex following the 2013 disclosures of government surveillance by former national-security contractor Edward Snowden. Last June, Congress approved a new bill called the USA Freedom Act, which curbed the government's spying powers and reined in the NSA's bulk collection.

Moves by the telecom industry to address privacy concerns, especially the creation of stronger encryption on devices, have sparked outrage from law enforcement.

"There is not an investigation today at the local, state or federal level that doesn't touch a cyber platform," said Don Mihalek, who represents Secret Service members in the Federal Law Enforcement Officers Association. "Encryption has made it impossible now for law enforcement to do their jobs."

Apple's defiance, meanwhile, is garnering support from privacy advocates who say complying with the order could hurt the personal privacy of Americans and make smartphone users more vulnerable to hacks.

"This case is not about that one phone," said Alex Abdo, a staff attorney at the American Civil Liberties Union. "This case is about the government trying to establish an illegal precedent that it can force a U.S. company to hack its users' devices."

Supporters of Apple have said that giving the government even limited access to encrypted iPhones and similar devices will just spur criminals to communicate on other encrypted platforms.

Federal Bureau of Investigation Director James Comey has said that terrorists made a more concerted effort after the Snowden revelations to shield their communications on encrypted devices.

Since September 2014, when Apple began encrypting its new phones by default, approximately 25% of the 670 Apple devices (with the iOS 8 operating system or higher) examined by the Manhattan district attorney office's cybercrime lab were encrypted and not accessible, Mr. Vance said Thursday.

In a recent speech, Mr. Comey said encryption hindered the investigation into the attack last May of people at an exhibit featuring cartoons of the Prophet Muhammad in Garland, Texas, where the two shooters were both killed after they opened fire.

The morning of the attack, one of the shooters exchanged 109 messages with a known terrorist overseas using an encrypted mobile messaging app, Mr. Comey said. The terrorist group Islamic State has claimed responsibility for the Texas shooting.

"All the judicial orders in the world are not going to tell us what they said that morning," Mr. Comey said.

Although encryption in terrorism investigations has gained the most attention, officials say the issue now has a nexus to all sorts of crimes, including drug trafficking, kidnappings and child pornography. In New York, officials are struggling to access an encrypted iPhone 5 used by an associate during a shooting in the Bronx two weeks ago that injured two police officers. New York Police Department Commissioner William Bratton said Thursday that the encrypted iPhone was "impeding" the case from going forward.

Mr. Bratton said fixing the issue is going to require more significant rulings by the courts, including likely the Supreme Court, and legislation from Congress and state legislatures. He said both sides were early on in the process.

"The Constitution guarantees no absolute right to privacy," Mr. Bratton said. "It guards against unreasonable search and seizure. How is what we are talking at all unreasonable?"

Local law enforcement in Louisiana say an encrypted smartphone may be the last lead for solving the murder of Brittany Mills, a 28-year-old who was shot to death last April. In a typical investigation with an encrypted phone, investigators either try to ask the iPhone user to give up the passcode or search for any data in the user's cloud, according to Hillar Moore, the district attorney in Baton Rouge, La. Neither option was available in Ms. Mills's case.

"The frustrating part about this is the bad guys know that no one can get in beyond search warrants," Mr. Moore said. "They brag that cops can't touch their phones. They're using the phone as a shield to allow them to deal drugs, traffic women and threaten national security."

Wall Street Journal
How Using The 'Cloud' Undercuts Encryption
Friday, 19 February 2016
Byline: Jack Nicas

New York - While the increasing use of encryption helps smartphone users protect their data, another sometime related technology, cloud computing, can undermine those protections.

The reason: encryption can keep certain smartphone data outside the reach of law enforcement. But once the data is uploaded to companies' computers connected to the Internet -- referred to as "the cloud" -- it may be available to authorities with court orders.

Major cloud-computing suppliers, including smartphone providers such as Alphabet Inc.'s Google, Microsoft Corp. and Apple Inc., routinely comply with court orders and search warrants to turn over data that in many cases would have been harder for law enforcement to obtain had users kept it solely on their devices.

"The safest place to keep your data is on a device that you have next to you," said Marc Rotenberg, head of the Electronic Privacy Information Center. "You take a bit of a risk when you back up your device. Once you do that it's on another server."

Encryption and cloud computing "are two competing trends," Mr. Rotenberg said. "The movement to the cloud has created new privacy risks for users and businesses. Encryption does offer the possibility of restoring those safeguards, but it has to be very strong and it has to be under the control of the user."

Apple is fighting a government request that it help the Federal Bureau of Investigation unlock the iPhone of Syed Rizwan Farook, the shooter in the December terrorist attack in San Bernardino, Calif.

The FBI believes the phone could contain photos, videos and records of text messages that Mr. Farook generated in the final weeks of his life.

The data produced before then? Apple already provided it to investigators, under a court search warrant. Mr. Farook last backed up his phone to Apple's cloud service, iCloud, on Oct. 19.

Encryption scrambles data to make it unreadable until accessed with the help of a unique key. The most recent iPhones and Android phones come encrypted by default, with a user's passcode activating the unique encryption key stored on the device itself. That means a user's contacts, photos, videos, calendars, notes and, in some cases, text messages are protected from anyone who doesn't have the phone's passcode. The list includes hackers, law enforcement and even the companies that make the phones' software: Apple and Google.

However, Apple and Google software prompt users to back up their devices on the cloud. Doing so puts that data on the companies' servers, where it is more accessible to law enforcement with court orders.

Apple says it encrypts data stored on its servers, though it holds the encryption key. The exception is so-called iCloud Keychain data that stores users' passwords and credit-card information; Apple says it can't access or read that data.

Officials appear to be asking for user data more often. Google said that it received nearly 35,000 government requests for data in 2014 and that it complies with the requests in about 65% of cases.

Apple's data doesn't allow for a similar comparison since the company reported the number of requests from U.S. authorities in ranges in 2013.

Whether they back up their smartphones to the cloud, most users generate an enormous amount of data that is stored outside their devices, and thus more accessible.

New York Times
For Apple's C.E.O., a Journey to Bulwark for Digital Privacy
Friday, 19 February 2016
Byline: Katie Benner, Nicole Perlroth

San Francisco - Letters from around the globe began pouring into the inbox of Timothy D. Cook not long after the publication of the first revelations from Edward J. Snowden about mass government surveillance
Do you know how much privacy means to us? they asked Apple's chief executive. Do you understand?

Mr. Cook did. He was proud that Apple sold physical products -- phones, tablets and laptops -- and did not traffic in the intimate, digital details of its customers' lives.

That stance crystallized on Tuesday when Mr. Cook huddled for hours with lawyers and others at Apple's headquarters to figure out how to respond to a federal court order requiring the company to let the United States government break into the iPhone of one of the gunmen in a San Bernardino, Calif., mass shooting. Late Tuesday, Mr. Cook took the fight public with a letter to customers that he personally signed.

"We feel we must speak up in the face of what we see as an overreach by the U.S. government," wrote Mr. Cook, 55. "Ultimately, we fear that this demand would undermine the very freedoms and liberty our government is meant to protect."

Mr. Cook's standoff with law enforcement officials is indicative of his personal evolution from a behind-the-scenes operator at Apple to one of the world's most outspoken corporate executives. During that time, he has moved a once secretive Silicon Valley company into the center of highly charged social and legal issues. While Mr. Cook's predecessor, Apple co-founder Steven P. Jobs, was considered a business icon, he never took aggressive positions on such matters as Mr. Cook now has.

Being at loggerheads with the United States government is risky for Apple and may draw a torrent of public criticism of the world's most valuable company at a time when its growth rate has significantly decelerated.

Yet people who know Mr. Cook said he did not believe he had a choice but to be vocal. Mr. Cook, who became Apple's chief executive in 2011, has long said that businesses and their leaders should think of

themselves as important members of civic society. In September, he emphasized that this responsibility "has grown markedly in the last couple of decades or so as government has found it more difficult to move forward."

Mr. Cook "says what he believes, especially in difficult situations," said Don Logan, the former chairman of Time Warner Cable who has been friends with Mr. Cook since he became chief executive of Apple, bonding over their shared alma mater, Auburn University. Of Mr. Cook's opposition to the court order, Mr. Logan said: "Tim is currently dealing with a very difficult situation and he knows the decision he has made has lots of ramifications, good or bad. But he wants to do the right thing."

Apple declined to make Mr. Cook available for an interview. The company is preparing to file an opposition brief against the court order.

Mr. Cook's ideas about civic duty were partly formed during his childhood in rural Alabama. In a speech at the United Nations in 2013, he recounted how Ku Klux Klansmen had once burned a cross on the lawn of a black family's home and how he yelled for them to stop. "This image was permanently imprinted in my brain, and it would change my life forever," he said.

At Apple, which he joined as a senior executive in 1998, Mr. Cook was a quiet figure for much of the period when he worked for Mr. Jobs, a showman who prized secrecy at the company. After Mr. Jobs stepped down because of ailing health, Mr. Cook began making Apple more open, publishing an annual report on suppliers and working conditions for more than a million factory workers.

In 2014, Mr. Cook revealed he was gay, a move widely seen as making a statement about gay rights. Last year, he wrote an editorial decrying religious freedom laws that had been proposed in more than two dozen states that would let people skirt anti-discrimination laws that conflicted with their religious beliefs.

His outspokenness has drawn criticism, with some investors questioning how nonbusiness initiatives -- including some of Apple's environmental moves -- would contribute to the company's bottom line. Mr. Cook responded at a shareholder meeting that it is important for Apple to do things "because they're just and right."

Privacy has long been a priority for Mr. Cook. At a tech conference in 2010, he said Apple "has always had a very different view of privacy than some of our colleagues in the Valley." He cited the iPhone's feature that shows where a phone -- and presumably its user -- is and said fears about abuse and stalking had compelled the company to let consumers decide whether or not their apps could use their location data.

Mr. Cook's views on privacy hardened over time as customers globally began entrusting more personal data to Apple's iPhones. At the same time, Apple was growing tired of requests from government officials worldwide asking the company to unlock smartphones.

Each data-extraction request was carefully vetted by Apple's lawyers. Of those deemed legitimate, Apple in recent years required that law enforcement officials physically travel with the gadget to the company's headquarters, where a trusted Apple engineer would work on the phones inside Faraday bags, which block wireless signals, during the process of data extraction.

Processing these requests was extremely tedious. More worrisome, the data stored on its customers iPhones was growing more personal, including photos, messages and bank, health and travel data.

And some government officials were not exactly instilling confidence in Apple's engineers. In one case, after law enforcement officials rushed a phone to Apple's headquarters for data extraction, the engineers discovered their target had not enabled the device's passcode feature.

So Mr. Cook and other Apple executives resolved not only to lock up customer data, but to do so in a way that would put the keys squarely in the hands of the customer, not the company. By the time Apple rolled out a new mobile operating system, iOS7, in September 2013, the company was encrypting all third-party data stored on customers' phones by default.

"People have a basic right to privacy," Mr. Cook has said.

By then, Mr. Snowden's disclosures about how the NationalSecurity Agency had cozied up to some tech companies and hacked others to gain user data were reverberating worldwide. The disclosures included revelations of a comprehensive, decade-long Central Intelligence Agency program to compromise Apple's products; C.I.A. analysts tampered with the products so the government could collect app makers' data. In other cases, the agency was embedding spy tools in Apple's hardware, and even modifying an Apple software update that allowed government analysts to record every keystroke.

Letters from alarmed Apple customers started flooding into Mr. Cook's inbox, fortifying his stance on privacy. Apple's eighth mobile operating system, iOS8, which rolled out in September 2014, made it basically impossible for the company's engineers to extract any data from mobile phones and tablets.

For officials at the world's law enforcement agencies, the new software was a clear signal that Apple was growing defiant. A month after iOS8's release, James Comey, the director of the F.B.I., told an audience at the Brookings Institution that Apple had gone "too far" with the expanded encryption, arguing that the operating system effectively sealed off any chance of tracking kidnappers, terrorists and criminals.

Government agencies began to press Apple and other tech companies for so-called back doors that could bypass strong security measures. With tensions rising, some form of technical compromise -- whether in the form of a chip, a back door or a key -- was off the table by 2015.

At Apple, Mr. Cook and others continued to work with investigators to the extent the company could and complied with court orders. Last October, a federal judge in New York said the government was overstepping its boundaries by using a centuries-old law, the All Writs Act, as the basis for its request that Apple open an iPhone for a drug investigation. Apple's lawyer sided with the judge in the case. The matter has not been resolved.

After December's San Bernardino attack, Apple worked with the F.B.I. to gather data that had been backed up to the cloud from a work iPhone issued to one of the assailants, according to court filings. When investigators also wanted unspecified information on the phone that had not been backed up, the judge this week granted the order requiring Apple to create a special tool to help investigators more easily crack the phone's passcode and get into the device.

Apple had asked the F.B.I. to issue its application for the tool under seal. But the government made it public, prompting Mr. Cook to go into bunker mode to draft a response, according to people privy to the discussions, who spoke on condition of anonymity. The result was the letter that Mr. Cook signed on Tuesday, where he argued that it set a "dangerous precedent" for a company to be forced to build tools for the government that weaken security.

"Compromising the security of our personal information can ultimately put our personal safety at risk," he wrote. "That is why encryption has become so important to all of us."

Far from backing down from the fight, Mr. Cook has told colleagues that he still stands by the company's longstanding plans to encrypt everything stored on Apple's myriad devices, services and in the cloud, where the bulk of data is still stored unencrypted.

"If you place any value on civil liberties, you don't do what law enforcement is asking," Mr. Cook has said.

Wall Street Journal
Apple Has More Leeway Than Carriers
Friday, 19 February 2016
Byline: Ryan Knutson

Washington - For U.S. phone companies like AT&T Inc. and Verizon Communications Inc., the notion of resisting a court order like Apple Inc. Chief Executive Tim Cook recently did is probably inconceivable. The reason is legal.

In 1994, Congress passed the Communications Assistance for Law Enforcement Act, which required that carriers build surveillance capability into their networks. That law was later expanded to cover voice calls placed over the Internet, but not all Internet communication. Other attempts to further expand the law to cover technology companies such as Apple have failed.

Mr. Cook earlier this week said Apple would oppose a federal judge's order to help the Justice Department unlock a phone used by a gunman in the San Bernardino attack, which killed 14 people last December.

These days, the nation's telecom carriers receive thousands of information requests from the government and law enforcement in both national security, and civil and criminal matters.

In the last six months of 2015, Verizon and AT&T combined received more than a quarter-million requests from law- enforcement agencies in civil and criminal matters and as many as 998 requests in the first six months of 2015 to access customer accounts for national-security reasons, according to transparency reports published by the companies.

By comparison, Apple says it received 971 law-enforcement requests for account data stored in users' iCloud or iTunes accounts. In the first half of 2015, the latest data available, and provided at least some data to 81% of them. As many as 499 additional requests were related to national security, according to Apple's transparency report.

With much communications traffic shifting from the phone networks to data packets on the Internet, monitoring is becoming more complicated.

"Back in the day, it was AT&T -- they had everything, so you just talked to AT&T," said Michael Sussmann, a former Justice Department official who is now a partner at Perkins Coie LLP.

AT&T CEO Randall Stephenson on Thursday reiterated comments he made last month that Congress should determine whether law enforcement should have the ability to access encrypted data on cellphones.

Congress "should decide the proper balance between public safety and personal privacy," Mr. Stephenson said in an emailed statement. "The rapid pace of technological innovation is challenging laws crafted in a very different era for totally different, and much less complex situations. Recent developments, in particular, bring home the need for legal clarity."

Senate Intelligence Committee Chairman Richard Burr (R., N.C.) has decided against a proposal circulating quietly on Capitol Hill to create criminal penalties for companies that decline to comply with court orders to decipher encrypted communications, a spokeswoman said Thursday night.

San Bernardino shooter Syed Rizwan Farook was provided a phone by his employer, which was allegedly subscribed to Verizon, according to government's legal filings. Verizon declined to comment on Mr. Farook's phone.

But the information that Verizon would be able to provide would only be records of phone and text messages placed over its network. The carrier can't provide access to vast amounts of other data, such as message content or calls made over mobile apps like WhatsApp, Skype or the blue iMessages sent between two iPhones.

Phone carriers can see when data is traveling over their networks on a service like WhatsApp or Facebook, but they can't see the content, experts say. That includes the "metadata," such as the time a message is sent, or who it is sent to.

The government and law-enforcement agencies can ask phone and Internet companies to turn over any customer information they possess, such as Facebook for messages retained on their services, and increasingly the government is asking tech companies to do so. But there is no requirement for phone companies or Internet firms as to how long the content of such data is to be stored. The requirement on phone companies is that the government has the ability to intercept traffic in real time.

Apple says it can provide customer data stored in its iCloud service, such as phone backups that can include stored photos, email, documents, contacts, calendars, and bookmarks. In the San Bernardino case, Apple has provided such data for Mr. Farook until Oct. 19, the last time his phone synced to his iCloud. That means there 44 days of data -- such as iMessages and FaceTime calls -- that may only exist on his locked iPhone.

Los Angeles Times
Battle lines drawn over encryption
Friday, 19 February 2016
Byline: Paresh Dave, Tracey Lien

Los Angeles - As hackers prove time and again that they can and will invade our digital lives, Apple Inc. has strengthened its security system to make its services nearly impossible to penetrate -- even for top cops.
Those seemingly airtight protections are great for the company's millions of customers, and rival device makers have rushed to emulate Apple. But as tech companies build virtual fortresses, authorities are mounting a battle to make sure the tech industry doesn't completely shut them out -- as it contends Apple has done by making its iPhone impossible for the FBI to crack.

At the heart of the issue is encryption, a way to secure a digital file by scrambling its contents so that it can be read only by someone who has the key. Tech firms are increasingly encrypting their software, and Apple has been at the forefront.

But sealing off the personal information of customers extends to everyone -- the good guys and the bad guys. That's uncharted territory for tech companies, government agencies and consumers, leaving everyone struggling to figure out how far, exactly, encryption protections should extend.

"We need privacy and security, and frankly Apple has done a better job than most," said Mark Mollineaux Pollitt, adjunct professor at Syracuse University and former director of the FBI's Regional Computer Forensic Laboratory Program. "We shouldn't punish them for doing that. We should find a way to broaden that and make that more effective, but we have to realize there are instances where we have to breach that security to protect all of us."

But not everyone sees it as a gray area, where exceptions can be made for extreme cases like terrorism or child pornography.

This week, Apple Chief Executive Tim Cook took a defiant stance, saying his company would fight a court order in the San Bernardino terror investigation that asks the company to develop, for the first time, software that would allow authorities to circumvent the passcode on the encrypted phone.

Apple's decision isn't without critics, who say courts should be the arbiter of where the line is drawn.

"Apple is obstructing the course of law enforcement and effectively aiding terrorists," said Vivek Wadhwa, a corporate governance fellow at Stanford University. "They changed the technology, so they have to keep up with the ability to unlock the device if the government asks them do it. That's not unreasonable."

As it is, the FBI is publicly admitting that it is locked out, said Jeff Kelley, an iOS developer at software firm Detroit Labs who builds apps for iPhones, iPods, iPads and Mac OS.

"If you're Apple, you couldn't ask for a better ad for iPhone encryption."

That's a nightmare for the FBI.

The agency wants to retrieve whatever resides on the iPhone 5c of Syed Rizwan Farook, one of the two slain shooters who killed 14 people in the Dec. 2 attack.

But the smartphone's iOS operating system is locked by a numeric passcode, likely four digits long. The FBI potentially has only 10 guesses before the phone's contents self-destruct.

Older versions of the operating system provided ways for Apple and even law enforcement to access at least some contents on the phone, even if it was password-protected. For example, older iPhone models were susceptible to unlimited password guessing. In other cases, Apple held a master key, and authorities could ship the company an iPhone and get a DVD or hard drive back with the data from it.

But Apple, in effect, threw away its master key when it deployed a new version of iOS in 2014. Farook's phone runs one of the newer iOS versions.

Adding to the FBI's problems is that Apple is judge, jury and executioner when deciding what software runs on an iPhone: An app or program won't work without a special signature from Apple.

The set-up is aimed at stopping viruses or malware from infecting iPhones, and it also gives Apple latitude to ban apps it doesn't want to support, including for competitive or cultural reasons.

That's significantly more control than Google exercises over smartphones running its open-source Android operating system. Many Android phones support so-called unsigned programs, providing one of the key doors through which law enforcement has been able to extract data from locked phones.

About 80% of the world's smartphones run Android, and about 15% run iOS, according to various estimates.

In general, hardware makers have been making stricter security settings a default on their devices. But while those measures and more have deflected thieves, they left room for law enforcement to acquire data when needed.

Not so with Apple. Besides encryption, the company in 2013 introduced Touch ID, a fingerprint scanner that allows users to unlock their phones by pressing their fingers on the device's home button.

This week's court order requires the FBI and Apple to work in tandem to develop a tool that preserves the data on Farook's phone while allowing an app devised by the FBI to input an unlimited number of passcodes until it guesses the right one.

"That has never before been seen," said Kevin Bocek, vice president of threat intelligence and security strategy at cybersecurity company Venafi. "Apple has very aggressively maintained security, and this is the way the government is going to get around it."

Generating the new software for the FBI wouldn't be trivial, but it's certainly doable, experts said.

Apple would need to make the special code run on the iPhone's short-term memory to ensure it doesn't tamper photos, text messages and other potentially critical evidence, said Dan Guido, chief executive of security start-up Trail of Bits.

The code would get rid of the barriers that normally arise when someone tries too many times to guess a user's passcode. Last, it would have to include a funnel for automated guessing, freeing the FBI from manually entering potentially tens of thousands of numeric combinations.

Even though it's technically capable of carrying out the FBI's orders, Apple and its supporters reject the notion that this would be a one-time thing.

Jonathan Zdziarski, one of the top experts on iPhone security, said the work doesn't end there. If Apple ends up creating a tool, it would need to be tested, including by outside forensic specialists, to stand up to legal scrutiny if evidence retrieved from the phone is ever used in court. That vetting process could drag on for months and risks exposing the tool to people with malicious intent.

There's fear that once a safe-cracking tool is developed, law enforcement agencies from all over the world will repeatedly request its use.

"They've brought a phone that would be easy to justify developing a tool for -- a terrorist's -- but it will be much easier for a court to compel Apple to use it in the future once it's out there," Zdziarski said.

Apple could update iOS to stop the tool developed for Farook's iPhone from working on other ones by requiring consumer consent to run it, but the precedent of making it is irreversible, technologists say.

"You can rationalize it, these are known bad people, this is a known domestic terrorism case and it's one iPhone," said Oren Falkowitz, chief executive of security firm Area 1 Security and a former director of technology and data science programs at U.S. Cyber Command. "But it has implications for all technologies across the globe. We have to be doing more to strengthen the security of the Internet ... or we'll suffer consequences, ... greater than whatever information might be on this one phone."

New York Times
Apple's Strong Stand on Encryption
Friday, 19 February 2016
Byline: Editorial Board

Editorial - It is understandable that federal investigators want to unlock an iPhone used by one of the attackers who killed 14 people in San Bernardino, Calif., in December. And it's understandable that the government would turn to Apple for help. But Apple is doing the right thing in challenging the federal court ruling requiring that it comply.
In an order issued on Tuesday, Magistrate Judge Sheri Pym says Apple must create new software that would bypass security features on the iPhone used by the terrorist, Syed Rizwan Farook. That would allow the Federal Bureau of Investigation to unlock the device and retrieve the pictures, messages and other data on it. Her ruling was based on the All Writs Act of 1789, which is used to require people or businesses not involved in a case to execute court orders. Another federal magistrate judge in New York is considering a similar request to unlock an iPhone in a narcotics case.

Law enforcement agencies have a legitimate need for evidence, which is all the more pressing in terrorism cases. But the Constitution and the nation's laws limit how investigators and prosecutors can collect evidence. In a 1977 case involving the New York Telephone Company, the Supreme Court said the government could not compel a third party that is not involved in a crime to assist law enforcement

if doing so would place "unreasonable burdens" on it. Judge Pym's order requiring Apple to create software to subvert the security features of an iPhone places just such a burden on the company.

Apple has already given the F.B.I. data from the phone that was backed up and stored on its iCloud service; the last backup was made about a month before the attacks. But the company's chief executive, Timothy Cook, has said that requiring it to create software to bypass a feature that causes the phone to erase its data if 10 incorrect passwords are entered would set a dangerous precedent and could undermine the security of its devices. The Department of Justice has argued that the software would be used on that phone only and notes that Apple has previously helped law enforcement unlock phones. The company changed how it encrypts phones after the surveillance revelations by Edward Snowden.

But writing new code would have an effect beyond unlocking one phone. If Apple is required to help the F.B.I. in this case, courts could require it to use this software in future investigations or order it to create new software to fit new needs. It is also theoretically possible that hackers could steal the software from the company's servers.-

There are certainly other ways for law enforcement agencies to collect evidence. They already have the power to get data stored on online services like iCloud and Google's Gmail through search warrants. And they can get records of phone calls and text messages from companies like Verizon and AT&T. A recent study published by Harvard's Berkman Center for Internet and Society concluded that the proliferation of Internet-connected sensors, cameras and other devices provides the government ever-expanding opportunities to collect information about people.

Even if the government prevails in forcing Apple to help, that will hardly be the end of the story. Experts widely believe that technology companies will eventually build devices that cannot be unlocked by company engineers and programmers without the permission of users. Newer smartphones already have much stronger security features than the iPhone 5c Mr. Farook used.

Some officials have proposed that phone and computer makers be required to maintain access or a "back door" to encrypted data on electronic devices. In October, the Obama administration said it would not seek such legislation, but the next president could have a different position.

Congress would do great harm by requiring such back doors. Criminals and domestic and foreign intelligence agencies could exploit such features to conduct mass surveillance and steal national and trade secrets. There's a very good chance that such a law, intended to ease the job of law enforcement, would make private citizens, businesses and the government itself far less secure.

Wall Street Journal
U.S. Clash With Apple Was Months in Making
Friday, 19 February 2016
Byline: Devlin Barrett, Daisuke Wakabayashi

Washington - At a congressional hearing on Feb. 9, Federal Bureau of Investigation Director James Comey discussed obstacles of prying open electronic devices such as smartphones, zeroing in on a case in point: the San Bernardino, Calif., terrorist attack.
"We still have one of those killers' phones that we have not been able to open," he said. "It's been over two months now, and we're still working on it."

Although few realized it at the time, Mr. Comey's comments were a shot across the bow of Apple Inc. The company had been refusing for weeks to help the FBI unlock the phone used by Syed Rizwan Farook, one of the perpetrators of the attack, according to people familiar with matter.

Justice Department officials had even considered filing court papers against Apple a month earlier, only to hold off in the hope of gaining more cooperation.

The standoff, a precedent-setting case on privacy and security in the digital age, culminated this week when a judge ordered Apple to help the FBI circumvent passcode protection on the phone and Apple said it would fight the order. That set the stage for a possible landmark decision on the relationship between government and technology companies. The industry has steadfastly resisted the government's demands for help in unlocking encrypted communications.

It is a legal battle that holds risks for both sides. State and local law-enforcement authorities are already looking to follow the lead of the FBI in its face-off with Apple. On Thursday, Manhattan District Attorney Cyrus Vance said his office is in the process of determining which cases involving encrypted smartphones it should bring before a New York state judge for a similar review.

The legal fight between the Justice Department and Apple over encryption had been building for months. When Mr. Farook and his wife walked into a holiday party for his co-workers on Dec. 2 and began firing -- killing 14 people and injuring 22 -- the government and technology companies had already been feuding publicly and privately over how encryption puts some data beyond the reach of criminal investigators.

In a meeting more than a year ago, the No. 2 Justice Department official told Apple that some day there would be a crucial case involving a locked phone and a missing or murdered child. It would be better for Apple to help on encryption issues before such a case, rather than after, then-deputy attorney general James Cole told an Apple lawyer.

While a terror attack is a different scenario, several federal law-enforcement officials said this week the San Bernardino case was just the kind of thing they had warned about.

Apple executives believed they had worked extensively with law enforcement on the San Bernardino matter. The government's legal documents note that Apple had turned over phone information that Mr. Farook backed up on its iCloud service through mid- October, a month and a half before the attack.

Apple CEO Tim Cook and his colleagues viewed the government's request to create software to get around its own security as a step too far. Apple feels very strongly about two tenets -- data must be encrypted, and its software can't have any "back doors" allowing government access -- Mr. Cook said last year at The Wall Street Journal's technology conference.

Apple's position dovetails with its business interests. It has used its vocal stance on privacy to distinguish itself from rivals that make money on ads targeted at users based on their online data.

And two-thirds of Apple's business comes from outside the U.S., where sentiment about government surveillance is different. Europeans, for example, value privacy highly, and have expressed growing concerns about the control U.S. tech companies exercise over personal data. Government access to user data is also a concern in countries with authoritarian governments.

In the San Bernardino case, a search turned up Mr. Farook's work iPhone. It was owned by San Bernardino County, but the county didn't know the passcode. FBI agents worked to retrieve data on it, including data backed up to cloud storage.

But Mr. Farook had apparently turned off his cloud-storage backup function about Oct. 19, suggesting there still was information on the phone. The FBI and Apple discussed the issue in December without reaching an agreement on how Apple might help open the phone.

Justice Department lawyers prepared in early January to file court papers seeking to force Apple to help, said people familiar with the matter. Some officials weren't optimistic but felt it was worth sending a warning.

At the last minute, prosecutors decided there was a technical question to resolve with Apple, so the two sides kept talking. The technical issue took a few more weeks to sort out. Then the federal government told Apple again it was planning to file court papers to force the company to cooperate.

Privately, government officials hoped Mr. Comey's allusion to the San Bernardino phone before Congress on Feb. 9 would send a signal to Apple that the Justice Department would soon go public with its concerns about the case and the broader issue of encrypted phones.

Percolating in the background was a case with similar issues: In Brooklyn, a federal magistrate judge had asked Apple in late 2015 if there were legal grounds to reject a prosecutor's request for a similar order concerning a drug suspect.

Apple lawyer Marc Zwillinger wrote to Magistrate Judge James Orenstein saying, "Apple has received additional requests similar to the one underlying the case before this court." The judge hasn't decided the matter.

USA Today
Are Android devices more easily hacked than iPhones?
Friday, 19 February 2016
Byline: Brett Molina, Elizabeth Weise

Washington - If Syed Rizwan Farook had carried a phone running on the Android or Windows operating system, the FBI may not have needed to ask anyone for help getting in.
Of the three main phone operating systems, only Apple builds the ability to have the phone erased after a certain number of failed passcode attempts into its operating system, security experts say.

Apple's use of an "Erase Data" feature connected to passcodes is one of the security features that separates it from other smartphones on the market.

That separation became a part of the national discussion Tuesday when a federal judge required Apple to create software to disable the feature that erases the data on the iPhone after 10 failed login attempts.

The FBI wants to get past the feature in Farook's phone to see if there is information on it that will give the agency insight into the mass shooting attack by Farook and his wife Tashfeen Malik in December.

In a letter to customers posted on Apple's website, CEO Tim Cook says the company will fight the order, comparing the request to creating a "backdoor" on all iPhones.

Disabling Apple's "Erase Data" feature, which is what the FBI wants the company to do, would allow it to use a "brute force" attack, entering countless passcodes until they discovered the correct one and gain access to the phone.

The functionality can be added to Android and Windows phones, but it's difficult and meant for system administrators, said Filip Chytr, director of threat intelligence for Avast Software, a Prague- based computer security company.

Google, the creator of Android software, and Microsoft did not respond to a request for information for this report.

Android does include a Remote Wipe option, where a user can remotely erase the contents of their smartphone.

Third-party apps which bring this functionality to Android and Windows phones are readily available but require extra work on the user's part as they're not a built-in functionality that's easily turned on.

In encryption, the encoding of what's on the phone so it's not readable by anyone without the proper code keys, Apple is ahead of the game.

Apple has made encryption the default on its phones since the 3GS. Android only began making it the default with its most recent phone.

New York Times
Line in the Sand Over iPhones Was Over a Year in the Making
Friday, 19 February 2016
Byline: Multiple reporters

Washington - Time and again after the introduction of the iPhone nearly a decade ago, the Justice Department asked Apple for help opening a locked phone. And nearly without fail, the company agreed. Then last fall, the company changed its mind. In a routine drug case in a Brooklyn federal court, prosecutors sought a court order demanding that Apple unlock a methamphetamine dealer's iPhone 5S running old, easy-to-unlock software. The company acknowledged that it could open the phone, as it had before. But this time, it pushed back.

"We're being forced to become an agent of law enforcement," the company's lawyer, Marc Zwillinger, protested in court.

That stance foreshadowed this week's showdown between the Obama administration and Apple over the locked iPhone belonging to one of the suspects in the San Bernardino, Calif., shooting rampage. By the time of Mr. Zwillinger's statement, Apple and the government had been at odds for more than a year, since the debut of Apple's new encrypted operating system, iOS 8, in late 2014.

The new technology repeatedly stymied investigators -- the New York authorities said on Thursday that they had been locked out of 175 iPhones in cases they were pursuing. But both sides held out hope for a compromise that would avoid the type of confrontation that occurred this week when a federal magistrate judge ordered Apple to comply with the Justice Department's request.

With last October's court filing, the confrontation became all but inevitable. The company left no doubt that it would fight any effort to crack its new, encrypted phones. The only real question was what crime the government would use to press its case.

Apple's stance that day in Brooklyn caught the Justice Department off guard. Despite the issue with iOS 8, the company had continued to cooperate. In the first half of 2015 alone, the company provided data

in response to more than 3,000 law enforcement requests, Apple said. And company lawyers gave prosecutors no indication that the drug case against Jun Feng would be any different.

Mr. Feng, 45, claimed to have forgotten his passcode, making his cooperation a moot point even if he were willing to extend it, according to a government filing. Unlike the phone in the San Bernardino case, Mr. Feng's ran iOS 7, an older version of Apple's operating system that does not automatically encrypt its data. The Justice Department figured it would have the information from Mr. Feng's phone within a day.

Mr. Zwillinger said the drug case would be Apple's line in the sand. "Customer data is under siege from a variety of different directions," he said. "Never has the privacy and security of customer data been as important as it is now."

It was a delicate period for the Obama administration, which was focused on finding a way to break into the new encrypted iPhones. The F.B.I., in particular, was lobbying hard to win support for that idea in the face of skepticism from Silicon Valley, Congress and the public.

Timothy D. Cook, Apple's chief executive, described data privacy as a human rights issue. Backed by leading technologists, Mr. Cook argued that if the company designed a way to defeat encryption for the United States government, that tool would be exploited by hackers or foreign governments like China.

Under the attorney general Eric H. Holder Jr., the Justice Department was sympathetic to that point of view, even in the face of an aggressive campaign from the F.B.I. director, James B. Comey. Mr. Holder favored meeting with technology executives in the hope of finding common ground, current and former Justice Department officials said.

Others in the department strongly disagreed. National security and criminal prosecutors argued that, with the introduction of the encrypted iOS 8, Apple (along with Google, which had started its own encrypted Android phone software) had made thumbing its nose at the government a business strategy. The only hope, these prosecutors argued, was a court fight or an act of Congress requiring companies to provide the government unencrypted data.

Local law enforcement officials, too, were sounding alarms. "This has become, ladies and gentlemen, the Wild West in technology," Cyrus R. Vance Jr., the district attorney in Manhattan, said at a news conference Thursday, echoing complaints he and others have made for many months. "Apple and Google are their own sheriffs. There are no rules."

When the attorney general Loretta E. Lynch and her deputy, Sally Q. Yates, took office last year, the F.B.I. and its law enforcement allies found more receptive ears. Ms. Yates, in particular, took up the issue, giving speeches and testifying before Congress alongside Mr. Comey.

Despite the campaign, the White House showed no appetite for legislation. And Apple showed no signs of budging. In a few instances, the two sides appeared bound for a court fight, only to resolve it at the last moment. Last summer, Apple refused to give the Justice Department real-time access to iMessages -- the company's proprietary text messages -- in a gun case. The matter nearly escalated, but Apple eventually turned over some messages that had been backed up to the company's iCloud servers. It was not all that the government wanted, but authorities viewed it as a sign of cooperation.

Such compromises forestalled a major court showdown, but increased the frustration at the Justice Department. Several current and former career prosecutors involved in the issue said they viewed it as hypocritical that Apple encouraged its customers to save its data to iCloud -- which it would turn over to the government -- but regarded the cellphone as sacrosanct.

Then came the Feng case. By refusing to help, the Justice Department thought Apple was sending a clear signal. If it would no longer cooperate with requests to help unlock old phones, there was little chance it would give in and build a way to unlock the new encrypted phones running iOS 8.

"Forcing Apple to extract data in this case, absent clear legal authority to do so, could threaten the trust between Apple and its customers and substantially tarnish the Apple brand," Mr. Zwillinger said.

By that time, 90 percent of Apple devices were running iOS 8 or newer versions. The F.B.I. warned that it was only a matter of time before its agents were locked out of a phone in a case with lives at stake.

The San Bernardino attacks, which killed 14 people, presented the F.B.I. with a seemingly perfect test case. One of the shooters, Syed Rizwan Farook, was killed by the police and left behind a locked, encrypted iPhone 5c. The F.B.I. has not been able to unlock it.

Mr. Farook's phone is protected by a password that Apple says it does not keep and Apple says it cannot break the encryption without the password. The F.B.I. wants to write a program to send the phone an unlimited combination of passwords until it finds one that works.

But Apple built its phones to protect against that tactic. Each wrong guess causes a short delay, which would significantly slow the F.B.I.'s effort. After too many incorrect guesses, the phone will automatically erase its memory.

The authorities are still interested in more than just Mr. Farook's phone. On Thursday, a team of F.B.I. agents raided the Southern California home of his brother, Syed Raheel Farook, and carted off boxes of belongings. The authorities would not say what they were searching for.

But there is no telling what is on Mr. Farook's phone -- maybe clues to accomplices or his inspiration, maybe nothing -- but nobody in the government questioned the need for obtaining access to that data. From a public relations standpoint, Apple had been on the side of privacy advocates and civil libertarians. This case put the company on the side of a terrorist.

"They need to figure that out now before there is that bigger body count. So this is as good a test case as any to have that fight," said Ron Hosko, who until 2014 led the F.B.I.'s criminal division. "Crack that thing for me now, Tim Cook, because it's only going to get worse."

This week, the Justice Department got its wish when Apple was ordered to override its defenses, even if it meant building a tool that did not exist.

Law enforcement officials cheered the ruling, though they acknowledged that the fight was not over. Apple promised to appeal. In New York, William Bratton, the police commissioner, held up a phone that he said was used by an associate of a man who shot and wounded two police officers in the Bronx recently.

"Despite having a court order, we cannot access this iPhone," Mr. Bratton said. "Just one example, a very significant example in which two of my officers were shot, that impeding that case going forward is our inability to get into this device."

The case in Brooklyn continues, even though Mr. Feng has already pleaded guilty. While the Justice Department sees the San Bernardino incident as its ideal test case, Apple is hoping for a legal win in Brooklyn.

Judge James Orenstein has given the company reason to be hopeful. In the past, he has been skeptical of the way the government uses an 18th-century law -- the All Writs Act -- that the Justice Department is now claiming gives it the authority to force Apple to unlock the phones. He once even described the Justice Department's use of it as a "Hail Mary play."

But he has yet to rule.

Wall Street Journal
The FBI vs. Apple
Friday, 19 February 2016
Byline: Editorial Board

Editorial - The encryption cold war that for two years has pitted Silicon Valley against law enforcement finally turned hot this week, as a California judge ordered Apple to unlock an iPhone used by the San Bernardino terrorists. Perhaps public safety and modern digital security methods were bound to collide, but the danger as always in such conflicts is that both sides end up annihilated.
The Federal Bureau of Investigation is attempting to bypass the security system on an iPhone recovered from Syed Rizwan Farook, who with his wife Tashfeen Malik killed 14 people and injured 22 others. The problem is that no one knows the phone's password.

Apple has turned over information that Farook stored to its cloud servers, but he did not back up his phone for several weeks proceeding the attack. The FBI wants to retrieve this encrypted data that exists only on the device itself, which potentially include text messages, photos, location tracking or connections to the Islamic State or perhaps even other terror cells that could be operating in the U.S.

Apple's iOS operating system is designed to automatically erase local data after too many incorrect passcode attempts. Because iPhones can only run software with Apple's proprietary cryptographic signature, the FBI wants Apple to create and upload a custom version of iOS to Farook's device that overrides this mechanism. The bureau can then hook up an external computer that will make unlimited guesses to unlock the phone's contents, known as "brute forcing." Magistrate Judge Sheri Pym agreed.

In a public letter, Apple CEO Tim Cook refused to comply with this "unprecedented use of the All Writs Act of 1789 to justify an expansion of its authority" and said the company would appeal. "The U.S. government has asked us for something we simply do not have, and something we consider too dangerous to create. They have asked us to build a backdoor to the iPhone," he wrote.

Yet the reality seems to be more complicated than either Mr. Cook or the FBI allow. The encryption debate began in 2014 when Apple released a feature that generates random security "keys" that are unknown to Apple and in combination with the user's passcode to decrypt the device's data. Without such mathematical formulas, the data are unreadable.

This two-step "full disk" encryption process makes iPhones more secure, but it also means Apple can't unlock its own products. Neither can Google after adopting the same practice. Encrypted communication platforms have been available since the early 1990s, but Apple and Google have now made them the default for the 96% of global customers who use their operating systems.

The fear among law enforcement and the national-security agencies is that jihadists and criminals are going dark. FBI chief James Comey and Manhattan District Attorney Cy Vance warn they are losing the capacity to execute bona fide search warrants granted under the Fourth Amendment. So they support a mandate that the U.S. tech industry install a master security key -- the "backdoor" Mr. Cook invokes -- to unlock any device.

The CEO has a strong case when he says that backdoors create more problems than they solve. Introducing security vulnerabilities that third parties like cops and spooks can use as needed can also be exploited by hackers, crooks and spies. Nations can mandate backdoors, but there will always be some encrypted channels outside of their jurisdiction where the likes of ISIS can plot. The result would be weaker products for law-abiding consumers that leave U.S. companies less competitive with little security benefit.

Stronger cybersecurity is more important than ever in a world of corporate espionage, millions of compromised credit-card numbers and the stolen identities at the Office of Personnel Management. Encryption may lead to fewer antiterror intercepts, though the universe of signals that can be tapped has expanded radically and on balance more secure phones are a major advance for human freedom. Ask the Chinese pastors or Russian dissidents who are targeted by authoritarian regimes and want encrypted iPhones.

One question is whether the San Bernardino terror case should be an exception to Mr. Cook's strong argument against backdoors. In this case Apple is not being ordered to create a universal backdoor for all phones, and some digital security experts believe it is technologically possible to assist the FBI in the San Bernardino investigation with a unique iOS to brute-force this single device.

"Apple does not dispute that it has, in prior instances, complied with data extraction demands that have been contained in the body of search warrants or, less often, All Writs Act orders," Apple conceded in a New York court filing last year. The government is citing this to show that its request is reasonable.

But in those cases the company's engineers have never been conscripted to create a new architecture to defeat their own security measures. Apple believes that if it caves even once, every prosecutor in America will be lining up for forensic help with misdemeanors. A supposedly one-time emergency fix in an antiterror case could well become a de facto backdoor in practice over time.

There's also the question of whether the government currently has the legal authority to force Apple to become the government's agent. Safe manufacturers are not obligated to crack their own locks when the FBI calls. Apple contends the All Writs Act has never been used to compel what the government now wants from Apple, and the question is far from clear-cut. The litigation to settle this could take months or years.

It's an understatement to say that Apple is taking a risk by challenging the Administration in a high-profile domestic terror incident with unpredictable politics. "Apple chose to protect a dead ISIS terrorist's privacy over the security of the American people," said Arkansas Republican Tom Cotton, and Donald Trump has been no more subtle.

But for the same reason, the Administration ought to have resolved the situation confidentially before it reached legal and political Defcon One. Terror cases by their nature are different from run-of-the-mill law enforcement, and San Bernardino requires more than the government's typical show of incompetence.

The White House never supplied Congress with specific backdoor statutory language even as Mr. Comey made the public rounds, only for President Obama to renounce any attempt at forging a legislative

solution. Yet spokesman Josh Earnest defended the FBI and Justice Department on Wednesday. Is there a grownup in the White House?

So a word on behalf of Michael McCaul, the Chairman of the House Homeland Security Committee, who has proposed convening an expert panel on technology and security in the modern era. Blue-ribbon commissions are usually a form of Beltway escapism, but in this case a detailed report and recommendations from leading minds in technology, law, computer science, police and intelligence could help shape a rough consensus -- or at least establish a common set of facts. Such a halfway house might also help calm political tempers and marginalize the absolutists.

A mature democracy -- if America still is one -- ought to be able to work out these crucial matters of national security through legislative deliberation. The public interest on encryption is best served with a rational debate, not the ad hoc nuclear legal exchange that the Administration is inviting.

Washington Post
Wrong bite of the Apple
Friday, 19 February 2016
Byline: Editorial Board

Editorial - Until Tuesday, Apple appeared to be winning its fight with law enforcement. President Obama announced last year that he would not pursue legislation forcing tech companies to give law enforcement access to users' encrypted data. But on Tuesday, the FBI persuaded a judge to order Apple to create software that would help federal investigators crack into the iPhone 5C that Syed Rizwan Farook used before he shot up a San Bernardino, Calif., banquet room in December. Apple immediately promised to fight the order.
In essence, the FBI is attempting to explore and establish the limits of its legal powers to combat terrorism - as well as more mundane domestic crimes - under existing laws, in the absence of action by Congress and the White House. We think that's the wrong call. The nation should not ask the courts to strike a balance between device security and law enforcement access. The political branches of government should do that.

The FBI relied on the two-century-old All Writs Act, a law that helps the government execute search warrants, to compel Apple to create hacking software for Farook's phone. The order was nominally tailored to Farook's specific device, but its implications are larger. To what extent is it reasonable to force companies to write code and harm their international reputations for data security - and, therefore, their business models - in order to help the U.S. government hack into suspects' phones? Should this be a routine investigative tool, or reserved for extraordinary situations, or beyond the pale? Farook's is an extreme case, but it is easy to foresee the government attempting to apply All Writs to

less important investigations. What sorts of software can the government compel tech companies to write?

The answers to these questions have major implications for online safety and security. The more government-ordered hacking techniques are developed and used, the more likely they eventually will fall into the hands of malicious actors. This risk seems small but is difficult to estimate. Even if technology companies and the government kept the techniques they developed secret, their hacking activities would still threaten the technology ecosystem. Fearful of government-mandated malware, fewer people might accept automatic updates from software companies. This would make devices more vulnerable. The anti-terrorism benefits, meanwhile, would wane over time, as high-level terrorist groups turned to software from places beyond the reach of U.S. law enforcement.

The public has reason to be frustrated that investigators cannot execute valid search warrants; this is a worrying impediment to legitimate law enforcement. We believe Apple should help search for a workable solution. If there is a Paris-style attack in the United States, decisions may be imposed on it in a far less benign atmosphere. But the decisions should be made by Congress.

Meanwhile, Apple's role as a leading exponent of data security brings special responsibilities. Whatever U.S. officials decide, the policy will be the legitimate product of a democratic government and the rule of law. That will not be true in countries such as China, where dictators would use anti- terrorism tools to crack down on dissenters. We hope that Apple will fight as hard to safeguard its users' privacy from authoritarian abuse.

Motherboard (Vice)
Police Arrest Second Alleged Member of Teen Group that Hacked CIA Director
Thursday, 18 February 2016
Byline: Lorenzo Franceschi-Bicchierai

New York - The grip seems to be tightening around the infamous group of teenage hackers that's been targeting US government agencies and high- level officials for months.
On Tuesday, police in Scotland arrested a 15- year-old boy from Glasgow, whom a source told Motherboard is one of the main members of the hacking group known as "Crackas With Attitude," or CWA. The teenager, according to the source, is the hacker known as "Cubed."

The arrest of the teenage hacker comes only a week after UK police, working with the FBI, arrested another alleged member of the group, a 16-year-old boy suspected of being Cracka, another main member of the group. Following the arrest of the boy in the UK, other members of the group, including Cubed, pledged to keep hacking and threatened the US government with more attacks.

A close friend of the arrested hacker confirmed he was the CWA member known as Cubed. The close friend spoke to Motherboard on condition of anonymity.

"I hope he's okay, he was like a brother to me," the source said.

A spokesperson from Police Scotland confirmed the arrest of a boy suspected of hacking crimes, but declined to answers questions on whether he was one of the members of the hacking group.

"Following a search of a property in the Glasgow area on Tuesday the 16th of February, a 15-year old male was arrested in connection with alleged offenses under the Computer Misuse Act 1990," the spokesperson said in a prepared statement. "He has since been released from custody and he is subject of a report to the procurator fiscal."

The arrest was first reported by the local tabloid the Daily Record on Thursday. The paper also reported that FBI agents flew to Glasgow to question the boy. Before that, on Wednesday morning (US time) another member of CWA tweeted that Cubed had been arrested.

The member, known as IncursioSubter, did not respond to a request for comment. Other members of the group declined to comment as well.

In a phone call, an FBI spokesperson didn't respond to questions regarding the arrest. And a spokesperson from the South East Regional Organised Crime Unit (SEROCU), the UK agency who arrested the teenager suspected of being Cracka, also declined to comment.

In October, Cracka and Cubed claimed to have broken into the AOL email account of John Brennan. This was just the first in a long list of attacks on high profile officials such as FBI's executive assistant Amy Hess, US spy chief James Clapper, a former senior executive at the National Geospatial-Intelligence Agency, and President Barack Obama's senior advisor on science and technology John Holdren.

More recently, the hackers were also apparently involved in a breach at the US Department of Justice, which ended up with the dump of almost 29,000 names, titles, email addresses and phone numbers from the FBI and the Department of Homeland Security.

The Daily Record (Scotland)
FBI swoop on schoolboy Scots hacker accused of breaking into their top-secret computer system
Thursday, 18 February 2016
Byline: Stephen Stewart

Glasgow - FBI agents swooped on a Scots schoolboy accused of trying to hack into their top-secret computer system.
Operatives from the US crimebusting agency travelled to Glasgow after detectives arrested the 15- year-old on Tuesday and searched his home.

It is understood the FBI agents sat in as Police Scotland officers interviewed the boy, who could face extradition and imprisonment in the United States.

A source said: "The boy is believed to have hacked into the FBI's computer systems.

"Agents then travelled to Scotland to sit in on him being questioned by detectives. He could be extradited to the US where he would face a long jail term."

Police confirmed that the boy had been arrested and later released.

A spokesman said: "Following a search of a property in the Glasgow area on Tuesday, February 16, a 15-year-old male was arrested in connection with alleged offences under the Computer Misuse Act 1990.

"He has since been released and is the subject of a report to the procurator fiscal. It would be inappropriate to comment further at this time."

A source close to the case said the boy's family were shocked at the turn of events, adding: "He comes from a respectable family."

The Glasgow operation comes just months after a Scot was dubbed the most dangerous hacker of all time by activist group Anonymous.

IT whizz Gary McKinnon, 49 - who has Asperger's syndrome - broke into 97 Pentagon and NASA computers, stealing passwords, deleting files and shutting down net-works on military bases.

He faced trial in the US and up to 70 years in jail if convicted - but Home Secretary Theresa May blocked his extradition under human rights laws.

In December, Anonymous labelled McKinnon the best-ever "black hat" hacker - the term for hackers who indulge in illegal activity.

Just days ago, police in the East Midlands arrested the alleged teenage mastermind of cyber attacks targeting US government officials

It is not known if the Glasgow teenager's case is linked to those events.

Reuters
Islamic State finds 'diminishing returns' on Twitter: report
Thursday, 18 February 2016

Washington - The Islamic State's English-language reach on Twitter has stalled in recent months amid a stepped-up crackdown against the extremist group's army of digital proselytizers, who have long relied on the site to recruit and radicalize new adherents, according to a study being released on Thursday. Suspensions of English-speaking users affiliated with Islamic State from June to October 2015 have limited the group's growth and in some cases devastated the viral reach of specific users, according to the report from George Washington University's Program on Extremism, which analyzed a list of accounts promoted by the militant group.

The report found that easily discoverable English accounts sympathetic to Islamic State was usually under 1,000, and that those users' activity was mostly insular, limited to interacting with each other. Islamic State has seized control of wide swaths of Iraq and Syria and claimed credit for attacks in Paris in November that killed 130. The U.S. and other governments consider it a terrorist organization.

Twitter Inc. has long been criticized by government officials for its relatively lax approach to policing content, even as other Silicon Valley companies like Facebook Inc. began to more actively police their platforms.

Under intensified pressure from the White House, presidential candidates and some civil society groups, Twitter announced earlier this month it had shut down more than 125,000 terrorism-related accounts since the middle of 2015, most of them linked to the Islamic State group.

In a blog post, the company said that while it only takes down accounts reported by other users it had increased the size of teams monitoring and responding to reports and has decreased its response time "significantly."

J.M. Berger, a co-author of the report, said Twitter is still less active than many of its rivals but that part of that is due to its relative youth as a company.

"Each company has been dragged into this kicking and screaming," he said in an interview.

Reporting of Twitter accounts affiliated with Islamic State is a steady, low-level activity generally, but occasionally events lead to "periodic purges," Berger said.

The study took place prior to the Paris attacks, which the researchers said likely led to a heavy wave of suspensions mostly in French and Arabic networks.

The average tweets per day measured across the lifetime of an account also declined during the monitored interval, from a peak of approximately 14.5 in June to a low of 5.5 by October, the report found. The average number of followers was measured between 300 and 400.

La Dépêche du Midi (Toulouse)

Amende pour le webmaster indélicat
Friday, 19 February 2016
Byline: J.R.

Albi, France - T.R., webmaster gaillacois de 31 ans et papa d'un enfant de 4 ans, comparaissait hier à la barre du tribunal correctionnel d'Albi présidé par la présidente Brigitte Schildknecht pour «accès frauduleux dans un système de traitement automatisé de données et collecte de données à caractère personnel par un moyen frauduleux », des faits commis courant septembre 2014 au préjudice du conseil général du Tarn puisque c'est, on s'en souvient, son site internet qui avait fait l'objet de nombreuses cyberattaques à cette époque. Une époque, rappelons-le quand même fortement marquée alors par «la bataille de Sivens entre Zadistes et pro- barrage. Le prévenu est un sympathisant zadiste et ne s'en cache pas mais réfute toute intention frauduleuse. «Je ne me suis jamais introduit sur le site du conseil général et je n'ai jamais collecté la moindre donnée».
«Pourtant, lui rétorque la présidente, les enquêteurs de la direction générale de la sécurité intérieure (DGSI) qui ont perquisitionné chez vous et avec qui vous avez passé quelques heures en garde à vue parlent de 100 000 requêtes suspectes.» «J'en ai seulement fait 150 depuis mon adresse IP (IP pour Internet Protocol), reconnaît T.R. à la barre. D'ailleurs, je ne me suis jamais caché. Je n'ai pas mis d'image et encore moins de vidéo sur ce site. J'ai juste mis un lien dans une barre d'adresse du site. Après, je n'y suis pour rien si durant cette période, les Anonymous dont je ne fais absolument pas partie, ont attaqué le site du Département. La seule chose que je n'aurais pas dû faire est de repartager des données du conseil général. Mais jamais je ne pensais qu'un simple copier/coller allait me conduire à la barre d'un tribunal.»

L'avocate du Département du Tarn s'insurgera ensuite «contre les préjudices subis avec un serveur piraté et remplacé, trente sites web affectés, des usagers pénalisés et réclamera 20 700 euros, 10 700 euros et 6 000 euros respectivement aux titres des préjudices technique, d'atteinte à l'image et opérationnel sans oublier 3 000 euros au titre de l'article 475-1.»

Selon Pascal Suhard, vice- procureur de la République, on reconnaît volontiers que vous n'appartenez pas aux Anonymous mais vous minimisez votre responsabilité en parlant d'une bêtise que vous n'auriez pas dû faire. Je requiers à votre encontre deux mois de prison avec sursis.»

Guillaume Pressec, avocat de T.R., demandera purement et simplement la relaxe de son client arguant que «les deux infractions retenues contre lui ne sont pas caractérisées. Il n'a en effet dénaturé aucun site. Il n'est par ailleurs pas poursuivi pour avoir inséré une vidéo sur ce site. Ensuite, on lui reproche du vol informatique. Or, il n'a jamais collecté frauduleusement de données. Elles étaient en vente libre sur internet. Il n'a fait qu'un copier/coller. Ce dossier est celui des fantômes, les Anonymous, condamnées pour certains par d'autres juridictions.»

Pas de prison avec sursis pour T.R. qui écope de plusieurs amendes pour un montant total de 4 000 euros.

National Post
Four charged with export of tech to China
Tuesday, 01 March 2016
Byline: Douglas Quan

Mounties have charged four men with illegally exporting restricted information from Canada to China to help develop that country's space satellites.
Investigators allege two employees of a Waterloo, Ont., technology company stole "technical data" from the company and then created a separate firm to broker contracts abroad.

The two men, along with a former employee, landed contracts with two Chinese companies, including one that was state-owned, to create microelectronics that would "enhance" China's satellite cameras, police said. The fourth man was an employee of one of the Chinese companies.

"Canada has an international responsibility to safeguard its exports which potentially may be used against Canadians and their allies," RCMP Supt. Jamie Jagoe said in a statement.

"This investigation is an example of foreign governments having an interest in Canadian-based controlled technology and it highlights the RCMP's commitment to keeping Canadian's safe from the potential misuse of that technology."

Protecting Canadian trade secrets from prying foreign eyes has become a growing priority for intelligence officials.

A briefing document prepared for Ralph Goodale, the federal public safety minister, last fall by the Canadian Security Intelligence Service said that in addition to terrorist threats, Canada continued to grapple with the targeting of classified information and advanced technology from foreign entities. "Hostile state-sponsored actors continue to target Canadian public and private resources, including computer networks, to advance their economic, military and political agendas," said the document, obtained under access- to-information laws.

Police say the investigation, dubbed Project OSensor, began in early 2014 after officials from Teledyne DALSA, the Waterloo firm, sent a written complaint to the federal government. The government then forwarded the complaint to the RCMP.

"The matter involves controlled goods and technologies being shipped between Canada and China in violation of the Canadian Controlled Goods Program and related export laws," the RCMP said in a release.

"Police allege that the four accused involved themselves in Chinese contracts for the design and development of controlled goods intended for space satellite use."

One of the contracts was with the Beijing Institute of Space Mechanics and Electricity, the Waterloo Region Record reported.

Police announced numerous theft and fraud-related charges against Arthur Xin Pang, 46, of Pierrefonds, Que., and his company, Global Precision Inc.; Binqiao Li, 59, of Waterloo; Nick Tasker, 62, of Britain, and his Montreal company 3D Microelectronics; and Hugh Ciao, 50, of California.

Pang and Li were arrested and had their first court appearance Monday. Pang remains in custody, while Li was released on conditions. Arrest warrants were issued for Tasker and Ciao.

"I can confirm that Mr. Pang and Mr. Li are no longer employees of Teledyne DALSA, and that Teledyne DALSA brought this matter to the attention of the Canadian government," company spokeswoman Geralyn Miller said Monday in an email.

"Unfortunately, we won't be commenting further on the pending criminal investigations."

Teledyne DALSA specializes in digital imaging and semi- conductor products for the industrial, defence, aerospace, medical and transport sectors, according to its website. It employs about 1,000 people.

The company has co-operated fully with the investigation, police said.

Pang's LinkedIn profile shows he worked as a sales manager until June 2014 handling "China/Taiwan key accounts of big projects (sensor and camera design)."

Li taught at Tianjin University and was an engineer at Samsung Electronics, according to an online resumé. The Canadian Space Agency, Canada Border Services Agency, Department of National Defence, Public Services and Procurement Canada, Global Affairs Canada, as well as the U.S. Department of Homeland Security, and Federal Bureau of Investigation helped in the probe.

None of the charges has been proven in court.

Canadian Press
Police charge 4 people with trading controlled satellite camera tech to China
Tuesday, 01 March 2016
Byline: Liam Casey

Four people and two Canadian companies are facing charges over their alleged roles in exporting controlled goods and technologies to China that could enhance that country's satellite cameras, RCMP said Monday.
The Mounties allege the four were involved in creating and selling microelectronics, specifically a sensor, to two Chinese companies _ one of them state-owned.

They allege the goods and technologies were being shipped from Canada to China in violation of the Canadian Controlled Goods Program and other export laws.

Two Canadians _ who worked at Waterloo, Ont.-based Teledyne DALSA Inc. _ stole technology from their employer and set up a company with a former employee in order to get a contract to make the sensor, police alleged in a statement.

Investigators say the fourth accused works with one of the Chinese companies allegedly involved.

"Project OSensor commenced in early 2014 after the RCMP was requested to conduct a criminal investigation by Public Services and Procurement Canada _ Controlled Goods Directorate and Global Affairs Canada, as a result of a written complaint ... from Teledyne DALSA," police said.

Teledyne co- operated fully with the investigation, they said.

Arthur Xin Pang, of Pierrefonds, Que., and his company Global Precision Inc., Bianqiao Li, of Waterloo, Ont., Nick Tasker of the United Kingdom and his Montreal-based company, 3D Microelectronics Inc., and Hugh Ciao, of California, face numerous offences related to the alleged incident.

Police said Pang and Li were to appear for a bail hearing in a Waterloo court on Monday, while warrants have been issued for Tasker and Ciao.

Canada has a controlled goods program designed to prevent proliferation of weapons, satellite communication equipment, military equipment and intellectual property.

"Canada has an international responsibility to safeguard its exports which potentially may be used against Canadians and their allies," said RCMP Supt. Jamie Jagoe.

"This investigation is an example of foreign governments having an interest in Canadian-based controlled technology and it highlights the RCMP's commitment to keeping Canadian's safe from the potential misuse of that technology."

The Canadian Space Agency, the Department of National Defence, Global Affairs Canada, the U.S. Department of Homeland Security, and the FBI were among the agencies involved in the investigation, police said.

Globe and Mail
Chinese censors tighten screws on freewheeling online videos
Tuesday, 01 March 2016
Byline: Nathan Vanderklippe

Section: general

China's dour censors have long maintained a lengthy naughty list, and used it to keep the country's television sets unsullied by anything deemed to "lack positive thoughts and meaning."
Now, the Chinese Communist Party under President Xi Jinping has vowed to apply the same rules online, slamming shut an era of looser rules for Internet video, amid a sweeping campaign to reassert strict new controls over the country's cultural life - a campaign motivated in part by fears that speech must be controlled lest a slowing economy sow dangerous unhappiness.

Chinese video websites such as youku.com, iqiyi.com and le.com, which blend the features of YouTube and Netflix, have flourished in recent years, attracting enormous audiences for their content, some of it bawdy and boundary-pushing.

The makers of online video had largely been allowed to self-regulate, with shows dropped only if they caused too much of a stir after people started watching.

But China now says it will extend its strict censorship rules to Internet video, under the principle that "what can't play on TV can't play online," a change that promises to end what had been an avenue for freer expression.

Authorities have already knocked at least seven popular shows offline in recent months, including Web dramas dealing with time-travel, homosexuality, journalistic ethics and elder abuse. Together, those shows had attracted billions of views, before gaining scorn from censors as being too prurient, violent or superstitious. One reappeared weeks later, with a third of its content gone. Censors have also taken a hard-line approach recently to plunging necklines in an imperial court drama.

In China, one online comment was as searing as it was succinct: "Is this North Korea?" Only two months in, 2016 has already become the year of the Chinese media crackdown, a campaign driven by parallel efforts to assert Communist Party supremacy and keep a lid on dissent that might emerge amid a slowing economy.

This weekend, Ren Zhiqiang became the highest-profile target. The bold property developer was nicknamed "the Cannon" for his willingness to challenge the party line, through sometimes scathing posts to social media.

He accumulated 38 million followers - until Sunday, when China's Internet regulator deleted his social-media accounts.

Weeks earlier, Mr. Xi visited the central organs of the state media apparatus - Xinhua, CCTV and the People's Daily - on a smilesand-handshakes tour intended to strike fear into the country's journalists.

"The media run by the party and the government are the propaganda fronts and must have the party as their family name," Mr. Xi said. Party media "must love the party, protect the party and closely align themselves with the party leadership in thought, politics and action."

That mandate has grown particularly important as China's economic growth rate slows and its stock markets fall, while the closings of factories and mines affects ever-larger numbers of people. Last summer, amid a market rout, authorities arrested hundreds for "rumour-mongering," including a journalist who reported non-public information about internal financial policy debate. In late February, the state-run China Daily explicitly tied Mr. Xi's new media mandate to the weakening prospects.

"It is necessary for the media to restore people's trust in the Party, especially as the economy has entered a new normal and suggestions that it is declining and dragging down the global economy have emerged," the paper wrote in an editorial.

The same strict mindset is being applied to cultural matters, leading to the pledge Sunday by Chinese authorities to halt the different treatment for online video, which had largely been allowed to self-regulate, with shows dropped only if they caused too much of a stir after people started watching.

Luo Jianhui, head of the online audio visual program department at the State Administration of Press, Publication, Radio, Film and Television, criticized online production for its poor writing and bad quality control, which he said yielded absurd, bizarre and vulgar content, in comments reported by Chinese media.

He pledged to "strengthen" management of online video and increase punishment for offenders.

"The government thinks online security is equivalent to national security, so it's not something that they can let slide," said Will Tao, an independent China Internet expert in Beijing.

It's a catchup game by Beijing, as its people stampede away from traditional media.

Last year, for the first time, Chinese spent more than half of their media-consumption time on the Internet, with TV coming in second at 46.3 per cent, according to estimates by Beijing-based iResearch, which conducts online audience research.

The country now counts 460 million online video viewers; in early 2014, they watched 5.7 billion hours of content a month, a figure that has since risen - in part because viewers lapped up edgier online content.

Those sites had broadcast serious work online, too, including Under The Dome, a groundbreaking environmental documentary by a Chinese journalist that racked up 200 million hits before it was taken down.

Now, viewers are bracing for a tide of boring.

David Moser, a China commentator who is academic director at CET Chinese Studies at Beijing Capital Normal, called it "a death of anything that smacks of subversion or alternative content or uncomfortable reality."

Making online video look like television "puts everything down to the lowest common denominator. It's all equally stultifying, all equally bland, all equally conservative."

Waterloo Region Record
Former employees charged in alleged plot to rip off Dalsa
Tuesday, 01 March 2016
Byline: Greg Mercer

Two former employees of Waterloo's Teledyne Dalsa have been charged with stealing sensitive satellite imaging technology and selling it to China, in violation of Canada's export laws.
The charges are the result of a two-year investigation by the RCMP's organized crime unit - dubbed Operation OSensor - which started after a complaint from the Waterloo company in early 2014.

That Kitchener-based probe crossed international borders, and involved the Canadian Space Agency, Canada Border Service Agency, Department of National Defence, Public Services and Procurement Canada, Global Affairs Canada, the U.S Department of Homeland Security and the FBI.

Two men, Arthur Pang, 46, and Binqiao Li, 59, are accused of exporting proprietary Dalsa technology to China, in violation of the Canadian Controlled Goods Program, while they worked for the Waterloo company.

Both have been arrested and face a string of charges.

The charges include theft, fraud, conspiracy to commit fraud and possession of property obtained by crime. Pang is also accused of breaking Canada's export and customs laws.

Arrest warrants have also been issued for two other men, Britain's Nick Tasker - a Dalsa employee between 2002 and 2003, according to LinkedIn - and Hugh Ciao of California, who worked for one of the Chinese firms allegedly involved in the deal. They face several charges, including fraud over $5,000.

Li and Pang are accused of stealing Dalsa technology while they worked for the company and using it to outbid their former employer for a contract with the state-owned Beijing Institute of Space Mechanics and Electricity.

After Pang - who was arrested Friday when he landed at the airport in Montreal - left Dalsa, he started his own company, Global Precision Inc. Li, meanwhile, still worked for Dalsa when the charges were laid.

The Canadian-made technology was allegedly to be used in commercial Chinese satellites, according to Lisa Mathews, the federal prosecutor who is handling both men's bail hearings.

The alleged scheme is also a matter of national security, according to the RCMP.

Canada has a Controlled Goods Program that regulates the spread of "tactical and strategic assets including weapons, satellite global positioning systems and communications equipment, military equipment and related intellectual property."

"Canada has an international responsibility to safeguard its exports which potentially may be used against Canadians and their allies," Superintendent Jamie Jagoe, southwest district commander for the RCMP in Ontario, said in a statement.

"This investigation is an example of foreign governments having an interest in Canadian-based controlled technology and it highlights the RCMP's commitment to keeping Canadians safe from the potential misuse of that technology."

It's alleged the scheme started back in June 2011 and lasted until last summer, court heard Monday.

Li, a Chinese-born Canadian citizen who lives in Waterloo, was released on $500,000 bail Monday from a Kitchener courtroom.

He wore a black winter coat, sweater and collared shirt, and relied on a Mandarin translator for the appearance. Li's wife appeared in court, and swore under oath that she'd report him if he broke any of the conditions of his bail.

His lawyer, Hal Mattson, said Li turned himself in to the RCMP in Kitchener on Monday morning. Li, who was set free after handing in his passport and given strict limits on his movements, declined to comment outside of court.

Li is a former professor of electronic and information engineering at Tianjin University, and joined Dalsa's research staff in 1998, specializing in image sensors. Prior to that, he worked for Samsung, according to his online resumé.

The investigation began after the Waterloo company tipped off the authorities two years ago, the RCMP said. A federal agency forwarded Dalsa's complaint to the police, who received the company's full help.

"The company co-operated fully with our investigation," said Sgt. Penny Hermann of the RCMP.

Li continued to be employed by Dalsa for many months after the investigation began, court heard Monday.

A spokesperson for Dalsa declined to comment.

Toronto Star
CSE chief must break her silence
Tuesday, 01 March 2016
Section: editorial

Bring our spies to heel, Editorial Feb. 25
I am happy the Star has articulated the outrage that some readers probably feel over the recent Senate testimony of the commissioner of the Communications Security Establishment.

Last Monday, Commissioner Jean-Pierre Plouffe was unable to assess for the Senate the scale of the leak of partially anonymous information on Canadians from our electronic spy agency, the Communications Security Establishment (CSE), to its foreign partners, including the U.S. National Security Agency. He has indicated, essentially, that there is no way to know how many Canadians have been affected and for how long the problem has persisted.

To me, it is inconceivable that scientists and engineers at the CSE, who are using systems with known performance characteristics, could not provide the commissioner with at least a minimum number of potential victims of the leak. I have to wonder whether all the details relevant to the problem have been made available to him.

The commissioner has the legal authority to subpoena witnesses in pursuit of an answer to the question of how many victims there may be. The Inquiries Act gives him the power to chase down evidence that people within the CSE may not want to divulge. If ever there was a time to press harder on the public's behalf using these admittedly blunt tools, this is probably it.

And what of the chief of the CSE, Greta Bossenmaier, our nation's top electronic spy who oversees the actual day-to-day operations of the agency? Not a peep. In fact, she's been peep-less without peer during this unprecedented debacle.

Now is the time for her to break with the CSE's tradition of reticence during public discussions of intelligence activities and face our legitimate concerns.

Brian Alexander, Mississauga

London Times
You won't catch terrorists by this snooper's charter
Tuesday, 01 March 2016
Byline: Bill Binney

Op-ed - When a government draws up a landmark surveillance law to "protect national security and public safety", you'd assume they'd ask: what's the most effective method of doing that -- is it bulk interception of everyone's communications, or is there a better way? The Investigatory Powers Bill will affect everyone in the UK. It will fundamentally alter the relationship between individual and state with its mass interception, mass hacking, mass acquisition of communications data, and retention of huge databases of innocent people's most sensitive information.
Three major parliamentary reports in less than ten days concluded the case hasn't been made for all of these powers. The joint committee on the draft bill made 86 major recommendations for change -- but just three weeks later the government will publish the bill today.

If ministers care about citizens' rights and national security, they must forensically examine whether bulk spying powers actually help in the fight against terror and serious crime. The answer -- as I said in my evidence to the joint committee -- is no. They hinder it.

I worked in intelligence for 36 years. I know from experience that mass surveillance inundates analysts with too much data, and that makes it harder for them to find the people intent on doing harm.

Theresa May, the home secretary, submitted anecdotal evidence to convince the committee that mass surveillance is necessary. But each example she used was of targeted surveillance. The committee's report rightly concluded the case hadn't been made to justify the bill's incredibly intrusive proposals.

GCHQ's bulk collection does not work. By scanning every single person's communications and profiling everyone's web browsing habits, GCHQ is overloaded with data and false targets. One system, for example, collects around 1,000 records for every person in the UK every day -- about 64 billion. The result is that, while details of potential attacks might be collected, people are killed before we can find them.

Intelligence gathering has to be intelligent -- it has to be targeted. Communications data should be collected on known suspects and their social networks; on visitors to websites hosting illegal or extremist content; and on certain geographical areas, like conflict zones.

This bill is a chance for the UK to shore up the safety of its people -- to think again and re-draft for the sake of our freedom and security. I hope MPs will take that chance.

Note: Bill Binney is former technical director of the US National Security Agency.

Washington Post
Apple's congressional testimony: 'Dangerous precedent' would weaken all iPhones
Monday, 29 February 2016
Byline: Andrea Peterson

Washington - Apple's general counsel plans to argue Tuesday on Capitol Hill that the FBI's request to unlock the smartphone used by one of the San Bernardino, Calif. terrorists would set "a dangerous precedent" of the federal government ordering a company to weaken the security of its own products, according to a copy of his testimony obtained by The Washington Post.
Bruce Sewell, the general counsel, plans to say that Apple has "no sympathy for terrorists." But he will argue that once the iPhone is weakened in this way, hackers and cyber criminals could wreak havoc on the personal safety and privacy of the hundreds of millions of people who own an Apple device.

"They are asking for a backdoor into the iPhone," Sewell's testimony states. "Building that software tool would not affect just one iPhone. It would weaken the security for all of them.... We can all agree this is not about access to just one iPhone."

Sewell's testimony also states that FBI Director James Comey has acknowledged that the FBI would likely use the precedent in other cases involving iPhones.

The Justice Department has argued that the request is limited in scope and is necessary because it has been unable to unlock the iPhone used by Syed Rizwan Farook, who, along with his wife, killed 14 people and injured nearly two dozen in a shooting rampage in December

"Maybe the phone holds the clue to finding more terrorists. Maybe it doesn't. But we can't look the survivors in the eye, or ourselves in the mirror, if we don't follow this lead," FBI Director James Comey, who will also testify Tuesday, said in a column on the Lawfare Blog last week. In the same column, Comey said the case San Bernardino case "isn't about trying to set a precedent or send any kind of message."

But in testimony before the House Intelligence Committee last week, Comey suggested the case "will be instructive for other courts."

Manhattan District Attorney Cyrus Vance, who will also be testifying Tuesday, previously said his office has 175 phones it is unable to unlock -- and told Charlie Rose he would "absolutely" push forward for access to them if the government prevailed in the case.

Apple formally challenged the FBI's request last week. On Tuesday, Sewell will put several questions before lawmakers at the hearing.

"Do we want to put a limit on the technology that protects our data, and therefore our privacy and our safety, in the face of increasingly sophisticated cyber attacks? Should the FBI be allowed to stop Apple, or any company, from offering the American people the safest and most secure product it can make?

"Should the FBI have the right to compel a company to produce a product it doesn't already make, to the FBI's exact specifications and for the FBI's use?"

The Guardian (London)
Home Office to publish revised draft of snooper's charter
Tuesday, 01 March 2016
Byline: Alan Travis

London - The home secretary, Theresa May, has revised some elements of her controversial "snooper's charter" legislation in an attempt to address criticism by MPs and peers of the surveillance powers it confers.
Home Office sources say the revised bill, to be published on Tuesday, will reflect a majority of the 129 recommendations made by three parliamentary committees in reports published over the last three weeks.

The committees called for a fundamental rewrite of the draft investigatory powers bill, for privacy safeguards to be made the backbone of the legislation and for safeguards to be created against new powers to track everyone's web browsing histories - known as internet connection records. The bill will not meet demands that the most intrusive snooping operations should be authorised by a judge - and not by a minister as is the case at present.

The Home Office's proposed changes include

. six codes of practice setting out how the security services will use the powers in the bill, including access to personal communications data, state computer hacking and bulk acquisition of data.

. stronger privacy safeguards including the need for a senior judge to approve security service access to a journalist's communications data. The Home Office said this was needed to ensure the willingness of sources to provide information to journalists.

. a "double-key" ministerial warrant backed by judicial approval when UK security services ask foreign intelligence agencies to undertake work on their behalf.

. a pragmatic approach to encryption that will require technology companies to remove encryption that they have themselves applied where it is practicable for them to do so.

. the period for "urgent" warrants issued for the most intrusive surveillance without judicial approval is to be reduced from five to three days.

A Home Office source said: "We have considered the committees' reports carefully and the bill we are bringing forward today reflects the majority of their recommendations. We have strengthened safeguards, enhanced privacy protections and bolstered oversight arrangements.

"This is world-leading legislation, setting out in unprecedented detail the powers available to the police and security services to gather and access communications and communications data, subject to a robust regulatory regime."

The revised bill commits to working with industry to retain internet connection records but does not provide judicial oversight of this new power.

The changes are unlikely to go far enough to satisfy political critics and privacy campaigners who have called for the 299-page "snooper's charter" to be split so that full parliamentary scrutiny can be undertaken.

The bill has been introduced after disclosure of the security services' mass surveillance capabilities by whistleblower Edward Snowden and was published in draft form before Christmas to allow for a short period of pre-legislative scrutiny.

MPs and peers were particularly critical of new powers requiring internet and phone companies to store everyone's web-browsing histories - known as internet connection records - for 12 months, saying the case for it had not been made and the cost and other practical implications had not been worked out.

The parliamentary intelligence and security committee said that privacy safeguards needed to be made the backbone of the legislation rather than treated as an "add- on".

Other criticisms of the earlier draft of the bill from the parliamentary committees included:

* the description of security service capabilities - computer hacking and collecting bulk data - was too broad and lacked clarity

* it failed to provide a comprehensive framework for surveillance powers as it did not include undercover police surveillance, nor computer hacking for attack purposes

* the independent reviewer of terrorism legislation, David Anderson QC, called for judicial authorisation of the intrusive surveillance warrants but the scrutiny committee endorsed the government's "dual key" approach with more resources for judicial commissioners.

Privacy campaigners are sceptical that the revised bill will meet their concerns: "We are gravely concerned that the significant flaws within the bill will not have been addressed," said a spokesman for the Don't Spy on Us coalition.

"We understand the government's desire to to pass the investigatory powers bill before December 2016 when the Data Retention and Investigatory Powers Act (Dripa) sunset clause expires.

New York Times
Judge Rules for Apple in New York iPhone Case
Tuesday, 01 March 2016
Byline: Katie Benner, Joseph Goldstein

New York - A federal magistrate judge on Monday denied the United States government's request that Apple extract data from an iPhone in a drug case in New York, giving the company's pro-privacy stance a boost as it battles law enforcement officials over opening up the device in other cases.
The ruling, from Judge James Orenstein in New York's Eastern District, is the first time that the government's legal argument for opening up devices like the iPhone has been put to the test. The denial could influence other cases where law enforcement officials are trying to compel Apple to help unlock iPhones, including the standoff between Apple and the F.B.I. over the iPhone used by one of the attackers in a mass shooting in San Bernardino, Calif., last year.

Judge Orenstein, in his 50-page ruling on Monday, took particular aim at a 1789 statute called the All Writs Act that underlies many government requests for extracting data from tech companies. The All Writs Act broadly says that courts can require actions to comply with their orders when not covered by existing law. Judge Orenstein said the government was inflating its authority by using the All Writs Act to force Apple to extract data from an iPhone seized in connection with a drug case.

The government's view of the All Writs Act is so expansive as to cast doubt on its constitutionality if adopted, Judge Orenstein wrote.

The All Writs Act is also being invoked in the fight over an iPhone in the San Bernardino shooting, which has publicly pitted Apple against the government. Apple's chief executive, Timothy D. Cook, has refused to comply with a federal court order to help break into the phone, saying that he needs to protect the data of all customers. That has set off a far-reaching debate over privacy and security.

Both the F.B.I. and Apple have called for Congress to step in to help settle the question of when law enforcement should get access to citizens' private data. On Tuesday, Apple's general counsel, Bruce Sewell, and James B. Comey, the F.B.I. director, will testify about balancing privacy and safety before the House Judiciary Committee.

"It's important that a judge for the first time recognizes the All Writs Act doesn't provide the lawful authority the government has been claiming in these cases," said Esha Bhandari, a lawyer with the A.C.L.U., which supports Apple's position. "It demonstrates that when the government's arguments are put to the test, a federal court has decided they were not actually right."

In a statement on Monday in response to Judge Orenstein's ruling, the Justice Department said it would ask the judge to review the decision. Apple had previously agreed to help open up the iPhone in the drug case, and has complied with past All Writs Act orders, the Justice Department said.

"This phone may contain evidence that will assist us in an active criminal investigation, and we will continue to use the judicial system in our attempt to obtain it," the Justice Department said.

An Apple senior executive said Monday's ruling makes clear that helping to open an iPhone is a constitutional issue that should be taken up by Congress.

Judge Orenstein's ruling stands out because the courts have largely been absent on the major questions of electronic surveillance and privacy of our day. While judges around the country have signed at least 70 orders at the request of the government compelling Apple to access data on phones, this was the first time that a judge and Apple have pushed back.

The legal back and forth between Judge Orenstein, the Justice Department and Apple began last October, when federal prosecutors applied for a court order to force Apple to unlock an iPhone 5s seized by the Drug Enforcement Administration in a 2014 drug case, according to court documents.

After federal prosecutors requested the order, Judge Orenstein argued in an 11-page memo last October that prosecutors were misusing the All Writs Act. The judge asked Apple to weigh in, and the company filed a brief that same month. In addition to agreeing with the judge, the company also said the request could create an undue burden and threatened to "substantially tarnish the Apple brand."

"This reputational harm could have a longer-term economic impact beyond the mere cost of performing the single extraction at issue," Apple said in a brief.

The government then called Apple's decision to side with the judge a "stunning reversal." Saritha Komatireddy, a Brooklyn federal prosecutor, said the government's application in this case "was just a simple routine request for assistance in carrying out a valid search warrant issued by a federal court, as Apple has done so many times before."

During the case, Judge Orenstein said he found it puzzling that Apple had not previously resisted the use of the All Writs Act, including in other cases where Apple had complied with the order.

"You have had apparently 70 prior instances where you have not taken the steps available to you," Judge Orenstein said to Apple's lawyers during a hearing.

Ultimately, Judge Orenstein argued that the government couldn't use the All Writs Act to ask Apple to help extract information from a device just because a different law, the Communications Assistance for Law Enforcement Act, or Calea, addresses the issue and does not include an "information services" company like Apple. Congress has been debating whether to amend Calea to include tech companies such as Apple, Facebook and Alphabet's Google.

Still, the decision is not binding for the San Bernardino case, said Eric A. Berg, a litigation lawyer and special counsel with Foley & Lardner, who is a former Justice Department lawyer.

"From a technical, legal standpoint, it doesn't really have much of an effect in the California districts," Mr. Berg said. But "if you start with public opinion, this is going to be viewed as a victory for the privacy lobby and a defeat for the government in that battle over privacy."

USA Today
Apple-FBI dispute looms large at RSA
Tuesday, 01 March 2016
Byline: Elizabeth Weise

San Francisco - The cyber security conference that comes to San Francisco every year -- might have flown past most people's radars if this was a typical year.
That changed this month when the Apple vs. FBI iPhone battle became public. While the keynotes and workshop titles aren't changing, the topics of privacy, security and government intrusion will loom over every panel.

The furor over whether Apple will be forced to aid the government in creating a program that will allow the FBI to hack into the iPhone used by San Bernardino killer Syed Rizwan Farook is hitting just as an expected 34,000 cryptographers, chief information security officers, programmers and the like gather here.

Overall, this year's conference focuses on the nuts and bolts of computer security: encryption, industrial control systems, digital identity, breaches and how to fight them.

While always important to tech companies, the Apple case is raising awareness about the technical issues that create the security and privacy, or lack thereof, in the products we use daily.

There will always be a tension between the public's expectation of protection from the government and concerns about government intrusion, Cisco CEO Carl Bass told USA TODAY last week.

"I don't think we will ever get to the point where nothing can be broken. Go back in history -- there were locks and people who picked locks. There were secret codes and code breakers. These things will always be able to be broken," he said.

The U.S. security establishment will be working to get its voice heard at the conference. Tuesday, Attorney General Loretta Lynch will deliver a keynote on cyber security and then participate in an armchair conversation on the topic. Assistant Attorney General John Carlin of the National Security Division will also talk about terrorists' use of social media and the Internet.

A topic likely to garner lots of interest is the hackability of self-driving cars. The duo who made news last year by hacking into a Jeep Cherokee, Charlie Miller and Chris Valasek, will offer a workshop titled "Intro to Car Hacking."

Both now work at Uber's Advanced Technology Center in Pittsburgh, a strategic partnership between Uber and Carnegie Mellon University.

The center focuses on research and development in areas like vehicle safety, mapping and self-driving cars.

The conference ends Friday with a question and answer session with actor Sean Penn. He'll be interviewed by RSA President Amit Yoranabout his philanthropy and public advocacy and the relationship between Hollywood stardom and privacy.

Penn most recently was in the news in January for a controversial meeting with Mexican drug lord Joaqun "El Chapo" Guzmn for Rolling Stone magazine.

The exact nature of Penn's expertise is unclear. He himself wrote in Rolling Stone in January that he is "the single most technologically illiterate man left standing. At 55 years old, I've never learned to use a laptop. Do they still make laptops? No (expletive) idea!"

Washington Free Beacon
Pentagon Wages First Cyber War on ISIS
Monday, 29 February 2016
Byline: Bill Gertz

Washington - Senior Pentagon leaders on Monday revealed the military's first use of cyber warfare operations against the Islamic State terrorist group they said are aimed at disrupting its military communications and operations.
Defense Secretary Ash Carter said the use of cyber attacks against ISIS control centers in Syria and Iraq is a new warfare capability.

The operations are being carried out to "disrupt ISIL's command and control, to cause them to lose confidence in their networks, to overload their network so that they can't function, and do all of these things that will interrupt their ability to command and control forces there, control the population and the economy," Carter told reporters at the Pentagon, using an alternative acronym for the Islamic State.

"So this is something that's new in this war, not something you would've seen back in the Gulf War," Carter added. "But it's an important new capability and it is an important use of our Cyber Command and the reason that Cyber Command was established in the first place."

Gen. Joseph Dunford, chairman of the Joint Chiefs of Staff, said cyber warfare attacks are being used as part of the overall military campaign to defeat ISIS, including cutting off the group's strongholds in Syria and Iraq, namely Raqqa and Mosul.

"I think conceptually, that's exactly the same thing we're trying to do in the cyber world," Dunford said.

"In other words, we're trying to both physically and virtually isolate ISIL, limit their ability to conduct command and control, limit their ability to communicate with each other, limit their ability to conduct operations locally and tactically."

Last week, apparently in response to the stepped-up cyber warfare attacks on ISIS, supporters of the group threatened to attack Facebook chief Mark Zuckerberg and Twitter chief Jack Dorsey. Both social media groups recently cracked down on the group's use of their platforms.

Carter and Dunford spoke to reporters at the Pentagon, outlining plans to enhance efforts against ISIS in the Middle East as well as countering its spread to North Africa and other regions.

Cyber warfare involves the use of trained computer hackers, backed by electronic and human intelligence, to break into foreign computer networks and information systems. Once inside, the attackers can implant viruses or other malware to disrupt information systems or fool them into taking action that can cause damage to their organization and its information technology.

The capability has been developed for the past several decades by the National Security Agency, which has been breaking into foreign networks for intelligence gathering since the 1980s.

The use of military cyber warfare operations is different from the covert intelligence operation, known as Olympic Games, targeting Iran's nuclear program in the late 2000s.

Carter also said cyber warfare is different from traditional electronic warfare, which has been used in previous conflicts to disrupt communications or disable radar.

"It is beyond that. We do that, too. The two enable one another and complement each other," Carter said.

Carter said the new cyber warfare capability is being distributed to all U.S. war-fighting forces through the Cyber Command.

"Cybercom itself was devised specifically to make the United States proficient and powerful in this tool of war," Carter said.

Dunford said the use of cyber attacks in Syria and Iraq will not be the same as methods used in other conflicts.

"You can't replicate what we're doing today against ISIL in Iraq and Syria elsewhere in the world," Dunford said. "What you can do is leverage the tools that have been developed for this particular operation, for other operations down the road."

Dunford declined to provide details of the operations in order to prevent the enemy learning about the activities, including the timing, location, and operational methods of the attacks.

"We don't want them to have information that will allow them to adapt over time," the four-star general said. "We want them to be surprised when we conduct cyber operations, and frankly, they're going to experience some friction that's associated with us and some friction that's just associated with the normal course of events in dealing in the information age."

The comments by Carter and Dunford are the first acknowledged use of cyber warfare in a conflict since Cyber Command, a component of the U.S. Strategic Command, was set up in 2010.

The command, co-located with the National Security Agency in Fort Meade, Md., remains one of the military's most secret organizations.

The command is still in the process of creating 133 cyber mission forces that will be deployed with the military's combatant and functional commands.

For example, the U.S. Pacific Command currently has a group known as CyberPac that supports military operations and countermeasures for that command. U.S. Forces Korea also has a cyber mission force charged with countering North Korean cyber attacks and conducting offensive operations against the North Koreans in wartime.

Carter dismissed concerns that blocking social media sites will limit intelligence gathering on the group.

Sometimes the efforts to block social media use drives terrorists to use other means of communicating, but some of those other communications are easier to intercept, he said.

The effort to use cyber attacks is a necessary part of the military campaign against ISIS, Carter said.

"We can't allow them to freely command and control forces that are enemy forces, so it's just like any other war," he said. "We have to attack their command-and-control. This is one of the ways of doing it. But it may have, actually, a beneficial effect of driving them to the kinds of communications that it's in fact easier for us to disrupt, and listen to also."

Dunford said the potential loss of intelligence as a consequence of cyber operations is examined carefully, and is "one of the variables we consider in whether or not you conduct an operation and how to conduct an operation."

The cyber and other attacks are part of the effort to put pressure on the terrorist group, which controls large swathes of territory in Iraq and Syria.

"We're trying to make life difficult for ISIL and we're trying to stay step ahead of them," Dunford said. "So we're trying to force them to make changes. We're trying to disrupt their communications, and then we can anticipate some of the adaptations they're going to make and be a step ahead of them, and that's what we're trying to do."

New York Times
National Briefing | Washington; 2002 Letter on Eavesdropping Is Made Public
Tuesday, 01 March 2016
Byline: Charlie Savage, Eric Lichtblau

Washington - The Obama administration on Monday made public a previously classified letter from 2002 about the Bush administration's secret program that allowed the National Security Agency to eavesdrop on Americans' international communications without court orders.
The release of the 22-page letter, written by John Yoo, then a top lawyer in the Justice Department's Office of Legal Counsel, adds to the historical record of one of the most controversial pieces of the Bush administration's response to the terrorist attacks of Sept. 11, 2001: The surveillance and bulk data collection program known by the code name Stellarwind.

The letter explained to Colleen Kollar-Kotelly, who at that time was the new chief judge of the Foreign Intelligence Surveillance Court, why the Justice Department considered the program lawful even though, as Mr. Yoo acknowledged, it clashed with wiretapping laws laid out in the Foreign Intelligence Surveillance Act.

The letter appeared to track a memorandum Mr. Yoo had written in Nov. 2, 2001, soon after President George W. Bush directed the N.S.A. to begin the program. A previously released inspector general report about the program included a partially redacted summary of that memo.

Among other things, Mr. Yoo claimed in the letter that the president's constitutional authority as commander-in-chief overruled statutory prohibitions and that under the circumstances the program complied with the Fourth Amendment, which bars unreasonable searches and usually requires warrants.

In the letter, Mr. Yoo wrote that, "We face a situation here where the government's interest on one side -- that of protecting the Nation from direct attack -- is the highest known to the Constitution. On the other side of the scale, the intrusion into individual privacy interests is greatly reduced due to the international nature of the communications."

In 2004, after Mr. Yoo had returned to teaching, a new leader of the Office of Legal Counsel, Jack Goldsmith, rejected parts of Mr. Yoo's legal analysis, leading to a now-famous confrontation in March of that year in the hospital room of then-Attorney General John Ashcroft and a threat by top Justice Department officials to resign.

To avert that threat, Mr. Bush then accepted some new limits on the program, which The New York Times partially disclosed 21 months later. The legal basis for the program also evolved. The spy court secretly blessed its bulk data collection components in 2004 and 2006, and Congress authorized warrantless wiretapping in a 2008 law, the Foreign Intelligence Surveillance Amendments Act.

New York Times
Last Batch of Clinton Emails Is Released
Tuesday, 01 March 2016
Byline: Steven Lee Myers, Julie Hirschfeld Davis

Washington - The State Department on Monday released the last set of emails from the 30,000 messages on Hillary Clinton's private computer server, including an email about North Korea that remains a point of dispute between the department and one of the nation's spy agencies over the secrecy of information that passed through the server.
That email -- written on July 3, 2009, after a North Korean ballistic missile test -- was one of four that prompted intensified scrutiny of the emails for classified information and a referral last year to the F.B.I. for a review of the handling of classified information by Mrs. Clinton, her aides and other State Department officials while she was secretary of state.

It was released as part of a chain of five replies and forwards on Monday with portions blocked out on the grounds that they contained information now classified "secret," though not "top secret," the higher classification that the spy agency, the National Geospatial-Intelligence Agency, had cited last summer.

"The original assessment was not correct, and the document does not contain top secret information," a State Department spokesman, John Kirby, said. He added that the department had agreed to classify

some of it "provisionally" pending further review, an indication that the dispute over the contents had not yet been resolved.

A spokesman for Mrs. Clinton's presidential campaign, Brian Fallon, said the "ongoing disagreement" about the North Korean test "means that the intelligence community's inspector general was wrong in his belief that this email was 'top secret.' "

Mrs. Clinton and her aides have said that the intelligence agencies are overzealously classifying information, and in this case the State Department agreed. The designation of "secret" nevertheless added to the list of emails that the department has released only after removing information that is now considered sensitive on national security grounds.

Among the final 1,723 emails released on Monday were 23 that the department upgraded to "secret," bringing the total classified as such to 65. Another 2,028 have had portions blocked out, or redacted, because the information is now "confidential."

Of the four emails that prompted the referral to the F.B.I., only one has now been classified as "top secret." It was among 22 emails that the State Department -- at the demand of the C.I.A. -- said it would not disclose, even in part, because they contained some of the nation's most closely guarded secrets.

In addition to the email involving North Korea's missile test, another was released last fall in full, while the third was released with portions blocked out as "confidential," the lowest level of classification. Officials have declined to specify those.

In all, less than 10 percent of the emails that passed through Mrs. Clinton's server contained confidential or secret information. That was enough to prompt reviews by the inspectors general of the State Department and the intelligence agencies, and by Congress and the F.B.I., over the mishandling of classified information.

The focus of those reviews, officials have said, has been on the advisers privy to her personal email address and on diplomats who sent messages that were forwarded by those aides, like Huma Abedin and Jake Sullivan, who served as a deputy chief of staff during Mrs. Clinton's term.

None of the emails were marked as classified at the time they were sent. And while the State Department has said that the "upgrades" do not reflect any judgment of their sensitivity at the time, the designations nonetheless suggested that at least some of the information should not have been sent over an unsecured system like hers, officials have said.

Mr. Kirby also announced that one more email between Mrs. Clinton and President Obama would not be released, adding to 18 that the State Department said in January it would not release, citing longstanding precedent that the White House controls presidential communications. Another email was

being withheld, Mr. Kirby said, at the request of a law enforcement agency, presumably because it was related to a continuing investigation.

Mr. Kirby declined to discuss either email, except to say that both were unclassified.

The end of the department's releases of the 30,068 emails, which came in 14 batches, including four in February, did not mean the end of the legal and political controversy over Mrs. Clinton's use of the private server.

In the case of the email about North Korea, the State Department also disputed the initial effort to assert that it contained classified information. The assertion came through the inspector general for the intelligence agencies, I. Charles McCullough III.

The email in question was written by a senior watch officer in the department's operations center, Shelby Smith-Wilson, and sent to Mrs. Clinton's executive staff. Although that portion was entirely redacted, one government official familiar with the contents said it described a conference call among senior officials, including Mrs. Clinton, about the ballistic missile test that North Korea conducted that day in violation of United Nations Security Council resolutions.

The email chain was forwarded with additional comments and the unofficial translation of a statement by the Japanese Foreign Ministry to Mrs. Clinton's closest aides, including Ms. Abedin, Mr. Sullivan and Cheryl D. Mills, her chief of staff.

In another email later marked as classified, Mr. Sullivan forwarded Mrs. Clinton a news article about a likely move by the Obama administration to shift some decisions on drone strikes to the White House from the Pentagon. "What Panetta is raising," Mr. Sullivan wrote in the May 2011 note, referring to Leon E. Panetta, then the head of the C.I.A.

Apple will tell Congress strong codes protect against terrorists
Monday, 29 February 2016
Byline: Aaron Pressman

New York - Apple general counsel Bruce Sewell plans to tell Congress on Tuesday that strong encryption in iPhones protects users from terrorist and hacker attacks while rejecting calls from the FBI to weaken the popular phone's security protections.
"We feel strongly that our customers, their families, their friends and their neighbors will be better protected from thieves and terrorists if we can offer the very best protections for their data," Sewell said in a copy of his opening statement released by the House Judiciary Committee on Monday. "And at the same time, the freedoms and liberties we all cherish will be more secure."

Sewell is scheduled to speak on a panel with with New York District Attorney Cyrus Vance and Worcester Polytechnic Institute professor Susan Landau before the committee at a hearing starting at 1 p.m. The three speakers will be proceeded by FBI director James Comey, who will address the committee first and by himself.

The hearing comes as Apple and law enforcement agencies remain locked in a bitter dispute over the security measures the company added to the iPhone in recent years. Two weeks ago, a U.S. magistrate judge in California ordered Apple to create new software at the behest of the the FBI to weaken the security on a phone used by deceased San Bernardino shooter Syed Rizwan Farook so the agency could try to guess Farook's passcode more easily.

The FBI says it can't get access to data on the phone, which may provide evidence of further terrorist activities, without Apple's help. Apple is appealing the order, arguing that the new software it has been ordered to create could also be used by other governments and hackers, thus weakening the security of hundreds of millions of iPhone users around the world.

Comey has defended the FBI request in testimony at other Congressional hearings last week and in a blog post. The Judiciary Committee did not provide an advance copy of Comey's expected remarks, however.

"We simply want the chance, with a search warrant, to try to guess the terrorist's passcode without the phone essentially self-destructing and without it taking a decade to guess correctly," Comey wrote in a short blog post on Feb 21. "That's it. We don't want to break anyone's encryption or set a master key loose on the land."

Vance plans to tell the committee that Apple's 2014 decision to encrypt most of the data stored on iPhones in a way that the company can't crack "severely harms" many criminal cases around the country. "Smartphone encryption has real-life consequences for public safety, for crime victims and their families," Vance's prepared remarks noted.

WPI professor Landau, an expert on cybersecurity, plans to warn the committee that the FBI's views are outdated and inconsistent with recent technological developments. "Instead of embracing the communications and device security we so badly need for securing US public and private data, law enforcement continues to press hard to undermine security in the misguided desire to preserve simple, but outdated, investigative techniques," she said in her prepared testimony.

As the security dispute moves from the courtroom to the policy arena, Apple's lawyer also plans to mention several recent government efforts backing strong encryption, including a 2013 report requested by President Obama in the wake of the Edward Snowden revelations.

That may be to counter a remark by Obama press secretary Josh Earnest on Feb. 17. "Obviously, the Department of Justice and the FBI can count on the full support of the White House as they conduct an investigation to learn as much as they possibly can about this particular incident," Earnest said when asked about the Apple-FBI legal dispute.

But, a section of the 2013 report by the Review Group on Intelligence and Communications Technologies that Sewell plans to reference, concluded that the government should make clear it will not "in any way subvert, undermine, weaken, or make vulnerable generally available commercial encryption."

BBC News
Ukraine cyber-attacks 'could happen to UK'
Tuesday, 01 March 2016
Byline: Chris Vallance

London - A recent cyber-attack on Ukraine's electricity network could be replicated in the UK, according to a member of a US investigation into the resulting blackout.
"I've been getting interest and calls from the UK, Norway, Germany and all over," said Robert Lee.

"The answer is yes [they could be vulnerable]."

Last week, the US Department of Homeland Security formally blamed hackers for December's power cuts.

It did not, however, name the suspected perpetrators.

The US government is expected to publish more details of the investigation shortly.

About 225,000 people were left without power for several hours when the Ukraine suffered what is believed to be the first successful cyber-attack on an electricity distribution network.

"The way the Ukrainians set up the grid and the type of the equipment they are using is also the way a lot of other nations do it," said Mr Lee, an infrastructure specialist at cybersecurity firm the Sans Institute.

He added the attack could have been worse, as the attackers could have shut off power to a much wider area.

"This was a shot across the bows," he told the BBC.

Individual UK power firms declined to comment on their security measures.

However, a source close to the industry - who asked to remain anonymous - confirmed that "given sufficient sophistication and funding", the UK's electricity infrastructure could be hacked.

A spokesperson for the Energy Networks Association - the body that represents the UK and Ireland's gas and electricity distributors - said cybersecurity was a top priority.

The Department for Energy and Climate Change told the BBC: "The UK has... dedicated cyber experts and teams to keep it protected."

How was the hack carried out?

In Mr Lee's view, the attack was highly likely to have originated in Russia.

But he said it was not possible to say whether it was the "Russian government or a well-funded [non-government] team".

At least six months before the power was shut off, he explained, attackers had begun sending phishing emails to Ukraine's power utility companies' offices, containing Microsoft Word documents. When opened, they installed malware.

Firewalls separated the affected computers from the power control systems.

But the malware - known as BlackEnergy 3 - allowed the hackers to gather passwords and logins, with which they were able to mount an attack.

After months of work, they gained the ability to remotely log in to vital controls, known as supervisory control and data acquisition (Scada) systems.

Finally on 23 December, Mr Lee said, the attackers "remote desk-topped" into the Scada computers and cut power at 17 substations.

At the same time, they jammed company phone lines, making it hard for engineers to determine the extent of the blackout.

How do you recover?

The power outages in Ukraine lasted for several hours. They were only reversed by switching to manual operations.

The attackers went to great lengths, according to Mr Lee, to make sure power supplies could not be turned back on automatically.

He said the hackers rewrote firmware in the electronic devices used to communicate with the substations' circuit breakers.

That meant that the power could not be turned on remotely even after engineers had regained control of the Scada computers.

In the end, the engineers had to visit the substations and operate them manually.

In the UK, this would take between one to two hours, the source close to the industry told the BBC.

Could it happen here?

UK power companies' systems are constantly under attack.

A breach "is entirely possible", said Eireann Leverett of Cambridge University's Centre for Risk Studies, but he added "there's a lot of people working very hard to stop it".

Mr Leverett is now working on a report about what the consequences might be, due to be published in April.

Glasgow University's Professor Chris Johnson has highlighted that some of the control systems used by power distribution companies can be found for sale online.

He warns that these could be used by hackers to hunt for security weaknesses.

But Mr Lee's view can be summarised as "where there's a will, there's a way".

Companies are unlikely to be able to prevent every assault on their systems, he warns. Ukraine's hackers were "inside" the electricity companies' systems for six months, he notes, highlighting the lengths they went to.

So one lesson, he says, is that power providers must ensure they can detect attacks quickly when they occur and have staff primed to respond.

That costs money, meaning more expensive bills for consumers.

In a speech to GCHQ last year, the chancellor George Osborne said an attack on the UK's electricity network could lead to "loss of life".

He announced an extra £1.9bn of taxpayer's money over five years to bolster GCHQ's cyber capabilities.

The chancellor also said countries must work together to call out those "acting outside the boundaries of acceptable behaviour".

Mr Lee has a similar view, adding that the international community must "take a stand" if responsibility for the attacks is finally determined.

How do you prevent attacks?

New York Times
Utilities Cautioned About Potential for a Cyberattack
Tuesday, 01 March 2016
Byline: David E. Sanger

Washington - The Obama administration has warned the nation's power companies, water suppliers and transportation networks that sophisticated cyberattack techniques used to bring down part of Ukraine's power grid two months ago could easily be turned on them.
After an extensive inquiry, American investigators concluded that the attack in Ukraine on Dec. 23 may well have been the first power blackout triggered by a cyberattack -- a circumstance many have long predicted. Working remotely, the attackers conducted "extensive reconnaissance" of the power system's networks, stole the credentials of system operators and learned how to switch off the breakers, plunging more than 225,000 Ukrainians into darkness.

In interviews, American officials said they have not completed their inquiry into who was responsible for the attack. But Ukrainian officials have blamed the Russians, saying it was part of the effort to intimidate the country's political leaders by showing they could switch off the lights at any time.

"They could be right," said one senior administration official. "But so far we don't have the complete evidence, and the attackers went to some lengths to hide their tracks."

Even after it has reached a conclusion, the White House might decide not to name the attackers, just as it decided not to publicly blame China for the theft of 22 million security files from the Office of Personnel Management.

But American intelligence officials have been intensely focused on the likelihood that the attack was engineered by the Russian military, or "patriotic hackers" operating on their behalf, since the first reports of the December blackout. The officials have found it intriguing that the attack did not appear designed to shut down the entire country. "This appears to be message-sending," said one senior administration official with access to the intelligence, who requested anonymity to discuss the ongoing inquiry.

Equally interesting to investigators was the technique used: The malware designed for the Ukrainian power grid was directed at "industrial control systems," systems that act as the intermediary between computers and the switches that distribute electricity and guide trains as they speed down the track, the valves that control water supplies, and the machinery that mixes chemicals at factories.

The most famous such attack was the Stuxnet worm, which destroyed the centrifuges that enriched uranium at the Natanz nuclear site in Iran. But that is not an example often cited by American officials -- largely because the attack was conducted by the United States and Israel, a fact American officials have never publicly acknowledged.

Experts in cybersecurity regard the Ukraine attack as a teaching moment, a chance to drive home to American firms the vulnerability of their own systems. "There's never been an intentional cyberattack that has taken the electric grid down before," said Robert M. Lee of the SANS Institute. Mr. Lee said that while it was still not possible to determine who conducted the attack - - what is called "attribution" in the cyber industry -- he noted that it was clearly designed to send a political message.

"It was large enough to get everyone's attention," he said, "and small enough not to prompt a major response."

The warning issued last Thursday by the Department of Homeland Security provided the first detailed account of the Ukrainian attack, based on the findings of a series of government experts who traveled to Ukraine to gather evidence.

The attack described by the Homeland Security document was highly sophisticated. The attackers gained entry, it appears, by sending a series of "spearphishing" messages that led someone in Ukraine to unintentionally give them access. Once they had that, the attackers mapped the system, much as the North Koreans mapped Sony Entertainment's computers before attacking them in the fall of 2014.

Then a series of cyberattacks were carefully coordinated to occur within 30 minutes of one another on Dec. 23. The "breakers" that disconnected power were operated "by multiple external humans" through secure communication channels. The hackers then wiped many of the systems clean using a form of malware aptly named "KillDisk" which erased files on the systems and disabled them. They wiped out the "human-machine interface" that enables operators of the electric system to run those systems -- or get them back in service -- from their computers.

For extra measure, the hackers even managed to disconnect backup power supplies, so that once the power failed, the computers could not turn them back on.

Investigators say that in the end, the Ukrainians may have been saved by the fact that their country relies on old technology and is still not as fully wired as many Western nations -- meaning they were able to restore power by manually flipping old- style circuit breakers.

"The bad news for the United States is that we can't do the same thing," said Ted Koppel, the former ABC News anchor who published a best seller last year, entitled "Lights Out," about the vulnerability of the American electric grid.

"We have 3,200 power companies, and we need a precise balance between the amount of electricity that is generated and the amount that is used," he said. "And that can only be done over a system run on the Internet. The Ukrainians were lucky to have antiquated systems."

The report from Homeland Security recommended a series of common-sense steps: Make sure that outsiders accessing power systems or other networks that operate vital infrastructure can monitor the system, but not change it; close "back doors" -- system flaws that can give an intruder unauthorized access; have a contingency plan to shut down systems that have been infected, or invaded, by outsiders.

But all those systems make it harder for legitimate operators to use the Internet to keep vast systems operating, from a smartphone or laptop if necessary.

London Daily Telegraph
Google, Apple and others not forced to break in to encryption unless 'practicable', snoopers bill to say
Tuesday, 01 March 2016
Byline: Tom Whitehead

London - Twitter, Apple, Google and other communication companies will not be forced to decrypt messages unless it is "practicable" as ministers will today admit they are powerless to stop unbreakable encryption.
Theresa May, the Home Secretary, will publish a revamped snooping bill after draft proposals on surveillance powers last year received widespread criticism.

The revised Investigatory Powers Bill will make it clear that communication providers will only be asked to remove encryption "where it is practicable for them to do so", sources said.

The move will reignite concerns that terrorists and criminals are increasingly hiding behind so-called "end-to-end encryption" in online messages, which even the provider cannot access.

It comes as figures show major communication companies are still rejecting up to half of requests for customer data from UK police and intelligence agencies.

In other measures to try and get the legislation through parliament, the Government will take the unprecedented step of publishing an "operational case" on why MI5, MI6 and GCHQ need to carry out bulk collection of data.

The document will attempt to allay fears of mass surveillance by demonstrating that even when data is scooped up, only information on suspects is targeted.

Extra safeguards for journalists and lawyers will also be included along with additional authorisation checks on UK spy agencies when they need help from foreign intelligence agencies.

Mrs May is facing a backbench revolt over the legislation amid concerns it has to be rushed in to law before the end of the year, when laws governing some existing powers fall away.

The bill will require internet and phone companies to keep a record of websites visited by every citizen for 12 months.

It also details powers for the security services to perform bulk collection of personal communications data and for the agencies and police to hack in to computers and phones.

The draft legislation, published in November, was criticised by three parliamentary committees as being "flawed" and failing to make a case for many of the controversial measures.

A source said: "We have considered the committees' reports carefully and the Bill we are bringing forward today reflects the majority of their recommendations. We have strengthened safeguards, enhanced privacy protections and bolstered oversight arrangements.

"This is world-leading legislation, setting out in unprecedented detail the powers available to the police and security services to gather and access communications and communications data, subject to a robust regulatory regime."

However, on encryption, the bill will clarify and "put beyond doubt" that companies "can only be asked to remove encryption that they themselves have applied and only where it is practicable for them to do so".

The source said that this will "make clear that the Government is not asking companies to weaken their security by undermining encryption".

Separate figures show that in the first half of 2015, Apple provide information following a UK request in 56 per cent of cases relating to a device and 63 per cent in connection with a customer account.

Google provided data in 75 per cent of requests over the same period while Facebook met 78 per cent of requests.

Twitter met 52 per cent of request in the first six months but that increased to 76 per cent in the second half of the year.

Washington Post
In New York, Apple wins a battle in its legal war with the U.S.
Tuesday, 01 March 2016
Byline: Ellen Nakashima

Washington - A federal judge in New York ruled in favor of Apple on Monday, saying that an obscure Colonial-era law did not authorize him to force the firm to lift data from an iPhone at the government's request.
The ruling is not binding in any other court, but it takes on an outsize importance as the U.S. government battles Apple in a separate case in California over whether the tech firm should help unlock a phone used by one of the shooters in the San Bernardino terrorist attack in December.

The two cases involve different versions of iPhone's operating system and vastly different requests for technical help, but they both turn on whether a law from 1789 known as the All Writs Act can be applied to cases in which the government cannot get at encrypted data stored on suspects' devices.

Magistrate Judge James Orenstein in Brooklyn, who sits in the Eastern District of New York, has become the first federal judge to rule that the act does not permit a court to order companies to pull encrypted data off a customer's phone or tablet.

In a 50-page opinion disdainful of the government's arguments, Orenstein found that the All Writs Act does not apply in instances where Congress had the opportunity but failed to create an authority for the government to get the type of help it was seeking, such as having firms ensure they have a way to obtain data from encrypted phones.

He wrote that the government's interpretation of the 200-year-old law was "absurd" in that it would authorize what they were seeking even if every member of Congress had voted against granting such authority. It would, he added, undermine "the more general protection against tyranny that the Founders believed required the careful separation of governmental powers."

He also found that ordering Apple to help the government by extracting data from the iPhone - which belonged to a drug dealer - would place an unreasonable burden on the company.

None of the factors he reviewed in the case, Orenstein said, "justifies imposing on Apple the obligation to assist the government's investigation against its will."

A Justice Department spokeswoman said the department was disappointed in the ruling and would appeal. "As our prior court filings make clear, Apple expressly agreed to assist the government in accessing the data on this iPhone - as it had many times before in similar circumstances - and only changed course when the government's application for assistance was made public by the court,"

spokeswoman Emily Pierce said in a statement. "This phone may contain evidence that will assist us in an active criminal investigation and we will continue to use the judicial system in our attempt to obtain it."

Alex Abdo, staff attorney with the American Civil Liberties Union, said Orenstein's ruling "sends a strong message that the government can't circumvent the national debate by trying to manufacture new authorities through the courts."

Following Orenstein's reasoning, Abdo said, "If the court rejects the government's request in New York, then the FBI's request in San Bernardino is necessarily illegal, too."

But other analysts say that other courts could well rule in the opposite direction. In Riverside, Calif., Magistrate Judge Sheri Pym, at the Justice Department's request, last month issued an order requiring Apple to build software to override a safety feature in a different iPhone operating system to enable the FBI to try its hand at cracking the phone's password.

The government had never before asked a firm to build software to undo a security feature that it had built in to protect a phone's encrypted data. In this case, the feature wipes data from the phone after 10 incorrect tries to guess the password. Experts said that once the feature was overridden, it should take about 20 to 30 minutes to crack a four-digit password. Apple fears that if it is forced to comply with that request, countless more will follow to help it unlock phones in even routine criminal investigations.

The prospect that the California ruling could go against Apple has tech firms rushing to file briefs in support of Apple by Thursday's filing deadline.

Because of the nature of the request, the outcome of the California case is more significant than the Brooklyn case, analysts say. "It has the potential to alter the landscape permanently," said Al Gidari, a former partner at Perkins Coie who represented tech firms and is now at Stanford University.

Four charged in Canada with selling stolen satellite equipment to China
Tuesday, 01 March 2016
Byline: Jessica Murphy

Ottawa - Canadian federal police have charged an American, a Briton and two Canadians with stealing sensitive satellite imaging technology and selling it to China in violation of export laws.
Two of them stole a sensor from their employer Teledyne Dalsa of Waterloo, Ontario, with help from a former employee, according to the Royal Canadian Mounted Police.

They sold it to two Chinese firms, one of them state-owned, in violation of the Canadian Controlled Goods Program and other laws.

The fourth accused works for one of the Chinese companies allegedly involved in the scheme.

The microelectronics were "intended for space satellite use", the RCMP said in a statement.

"This investigation is an example of foreign governments having an interest in Canadian-based controlled technology and it highlights the RCMP's commitment to keeping Canadian's safe from the potential misuse of that technology," said RCMP Superintendent Jamie Jagoe.

The two-year probe also involved the Canadian Space Agency, the military, US homeland security and the FBI.

Canadians Arthur Xin Pang, 46, and Binqiao Li, 59, were arrested and charged with more than a dozen related crimes including theft, fraud and possession, and transfer of controlled goods contrary to the Defense Production Act.

The RCMP said both were due in a Waterloo court for a bail hearing on Monday.

Arrest warrants were issued for Nick Tasker, 62, of Britain, and Hugh Ciao, 50, of California, who is currently in China.

Michel Juneau-Katsuya, former Asia-Pacific bureau chief for the Canadian Security Intelligence Service, said Canada's knowledge-based, hi- tech sectors were a prime target for corporate espionage, which he estimated cost the economy about $100bn annually.

Canadian companies, the government and national security agencies were not doing enough to tackle the problem, he said.

"We have weak laws, law enforcement is ill equipped, the government does not assume leadership and, at the end of the day, the general population and business leaders aren't aware of what's going on," he said.

Teledyne Dalsa, a tech company that specializes in digital imaging, circuit and electronic technology software, has offices in Canada, the US, Europe, and Asia.

Jason VanWees, a senior vice-president with the company, told the Guardian that "any kind of corporate espionage is a concern and that's why when we detected it, we let people know". He declined to comment further on the matter to the Guardian on Monday.

The RCMP said the company cooperated fully with the investigation, which was launched in early 2014 after Teledyne Dalsa's complaint with the force.

Canada has seen a number of high-profile corporate espionage incidents in the past.

Telecommunications giant Nortel Network's 2009 collapse and bankruptcy has been linked to its targeting for years by hackers allegedly operating out of China.

In 2014 the Canadian government pointed to a "highly sophisticated Chinese state-sponsored actor" as being responsible for hacking into computers at the National Research Council of Canada, a federal research and development body.

Canada has a domestic industrial security programme - the controlled goods programme - that aims to strengthen the country's defence trade controls and prevent the proliferation of strategic assets including satellite GPS systems and communications equipment.

En Iran, l'application Telegram connaît un succès fulgurant
Tuesday, 01 March 2016
Byline: Martin Untersinger, et Louis Imbert

Téhéran, Iran - Contrairement aux réseaux sociaux Twitter ou Facebook, le service d'échange de messages sécurisés n'est pas filtré par les autorités
En Iran, les élections législatives et de l'Assemblée des experts, se sont déroulées vendredi 26 février. Dans ce pays, l'application Telegram a pris une place considérable. Ce service d'échange de messages sécurisé à deux ou en groupe, où chacun peut ouvrir une " chaîne " de publication ouverte au public, n'est pas filtré par les autorités, contrairement à Twitter ou à Facebook. Les quelque 40 % d'Iraniens ayant accès à Internet peuvent y suivre et commenter la campagne avec une liberté inconnue des médias d'Etat, dans un mélange d'information et de rumeur difficile à démêler.

Selon une étude faite en décembre 2015 par le Centre de sondage des étudiants iraniens, environ 20 millions de personnes disposent d'un compte sur Telegram dans le pays, soit près d'un quart de la population. Tous les sites politiques, une large partie du gouvernement, comme des figures conservatrices, y ont ouvert une chaîne publique. Les candidats méconnus y trouvent un outil de campagne peu coûteux. Le bureau du Guide suprême, l'ayatollah Khamenei, y partage avec ses 225 000 abonnés de courts extraits vidéo de ses discours ou des communiqués - tout comme sur Twitter, malgré l'interdiction du réseau.

Telegram a construit son succès sur sa réputation : celle d'être un service sûr, qui permet de discuter à l'abri des oreilles indiscrètes en chiffrant les messages. Elle a pris la place, dans les téléphones des Iraniens, de l'application Viber.

Une activiste londonienne cibléeLes autorités n'ont pas tardé à réagir. Des politiques et des religieux ont critiqué l'application, l'accusant de propager des contenus " immoraux " , et menaçant de la bloquer. Une tentative lancée le 5 janvier, par la Commission de détermination des cas de contenus criminels - elle décide des sites à bloquer - a échoué, faute d'un nombre suffisant de voix. Ses membres, nommés par le gouvernement, l'autorité judiciaire et des institutions proches d'Ali Khamenei, ont l'application dans le viseur. Le 19 novembre 2015, cette commission tenait une réunion au sujet de Telegram et a décidé d'accorder un délai au ministère des télécommunications pour régler le problème des contenus " immoraux " . " Si Telegram ne prend pas, à court terme, des mesures pour appliquer nos lois, nous devrons la filtrer ", a indiqué son secrétaire, Abdul Samad Khorram Abadi.

A l'automne 2015, les Iraniens ont d'ailleurs cru que la censure avait repris ses droits. Le 20 octobre, l'application était devenue très lente. Deux jours plus tôt, le fondateur et dirigeant russe de Telegram, Pavel Durov, avait indiqué sur Twitter avoir été contacté par les autorités iraniennes, lui demandant de mettre en place des mécanismes de surveillance et de censure. Une demande qu'il a refusée tout net.

Mais une semaine plus tard, le ministre des télécommunications iranien, Mahmoud Vaezi, expliquait lors d'une conférence de presse avec son homologue russe que la " ligne rouge, c'est le respect des questions éthiques. Nous avons averti Telegram, et ils ont filtré les contenus immoraux " . M. Vaezi a attribué les lenteurs de l'application à des problèmes sur les câbles sous-marins connectant l'Iran à Internet. Le 13 janvier, il a indiqué que " Telegram avait donné son accord pour bloquer tous - les comptes publics - désignés par le ministère des communications ".

Le pouvoir iranien a-t-il réussi à mettre la main sur Telegram? Non, a assuré M. Durov. Il explique que sur Telegram, seuls les comptes publics sont soumis à un contrôle, qui ne concerne que la pornographie et le terrorisme, une thématique sensible : l'application est populaire chez les combattants de l'organisation Etat islamique. Telegram n'a que récemment pris des mesures pour perturber cette utilisation, en fermant de nombreuxcomptes appartenant au groupe djihadiste.

Surtout, M. Durov a expliqué n'avoir jamais bloqué de contenu politique ni passé d'accord avec quelque gouvernement que ce soit. Pas suffisant pour dissiper les inquiétudes sur les relations entre Telegram et les autorités. " Beaucoup s'inquiètent d'une possible collaboration entre Telegram et Téhéran pour la censure ", ditNariman Gharib, responsable de la chaîne de télévision Manoto, installée à Londres et bannie comme toute chaîne satellitaire en Iran.

Le pouvoir iranien dispose-t-il d'une porte dérobée lui permettant de pirater l'application? Peu probable : les autorités semblent recourir à d'autres techniques pour parvenir à leurs fins. Lors d'une arrestation, la police a confisqué un ordinateur portable et un téléphone sur lesquels était installé Telegram. Ils ont inspecté les contacts, repéré une activiste installée à Londres, avec laquelle ils ont conversé, se faisant passer, avec succès, pour la personne arrêtée. Pour prendre le contrôle du compte Telegram de l'activiste, les autorités ont demandé une réinitialisation de son mot de passe, la convainquant de leur fournir ce nouveau code, au prétexte de l'ajouter à une discussion de groupe. Le stratagème a

fonctionné. La police a tenté de répliquer cette méthode aux contacts de l'activiste. Mais elle a réussi à reprendre le contrôle de son compte qui aura été, pendant deux heures, aux mains des autorités. Ce scénario semble indiquer que ces dernières ne disposent pas de moyens techniques pour pénétrer à l'intérieur de l'application.

Début novembre 2015, l'agence semi-officielle Fars News, proche des gardiens de la révolution, indiquait que 170 personnes avaient déjà été arrêtées pour avoir partagé des contenus " immoraux " , notamment sur Telegram. Sur les huit derniers mois de 2015, 609 hommes et 114 femmes ont été arrêtés pour des crimes " économiques, moraux et sociaux " commis sur Internet, selon des chiffres officiels cités par l'AFP.

The Australian Financial Review
Corporate networks risk becoming terrorist tools
Tuesday, 01 March 2016
Byline: Aidan Tudehope

Catch a plane to the Middle East and so much as train with a terrorist organisation and you can expect to be sent to a dark place behind bars for a long time the moment you return to Australia.
The community would demand nothing less. But what if your fridge launches an attack on an airliner? Or your corporate network attempts to disrupt a military operation on behalf of a terrorist enemy?

Those scenarios might be extreme, but they are by no means far fetched.

The question is not if, but when, a serious security incident will be launched leveraging inadequately secured corporate networks.

Two years ago, well before the Internet of Things (IoT) had become a mainstream discussion, it was reported that a fridge, along with thousands of internet-connected TVs, had been part of a bot network that launched a distributed-denial-of-service attack.

Opportunities for connected personal and business infrastructure to be secretly "occupied" and used for nefarious purposes are expanding at an explosive rate, as devices are added to the internet at ever greater bandwidth. Inside a medium-sized business there are likely to be hundreds of devices capable of being exploited, and maybe a dozen in a small business - printers, TVs, modems and fridges just for a start.

Further, the standard defence response to an international DDOS attack - "sinking" the unwelcome traffic by diverting it into a series of dead-end destinations - is far less effective against an attack originating within Australia. There are simply fewer safe places to which the traffic can be diverted.

But even as the risk grows day by day, there is still a tendency to see cyber security as a black art. Too many senior managers do not ask the tough, penetrating questions of their technology teams they are expected to ask of experts in other fields, like finance.

If senior managers are looking for an incentive to make cyber security their business, they need only look at US retailer Target, where the loss of credit card details of 40 million customers cost the chief executive and chief information officer their jobs.

A limited subset of the business community are treating cyber security with the appropriate gravity - typically Australia's largest companies and financial institutions. The picture elsewhere is much more mixed.

Ignorance is not an excuse in the law, but there has to date been a reasonably generous attitude from lawmakers when it comes to cyber security.

The room for ignorance will be much narrower when the federal government releases its new national cyber security statement in coming weeks.

The statement is expected to highlight the importance of a few protective measures that, properly implemented, prevent the majority of common attacks and security breaches.

It is no accident that these are described as "hygiene" measures - they really should be as basic as a food service business requiring staff to wash their hands, or for a car company meeting minimum quality and safety standards.

The government's initiatives are likely to take the form of helpful advice and guidance, and some tools for businesses to lift their security stance, rather than introducing punitive measures for poor performance. It is also expected to leverage the work that the Australian Signals Directorate (ASD) and the Australian Cyber Security Centre (ACSC) has done in helping the government protect itself better from cyber attack.

Aidan Tudehope is managing director of government and hosting at Macquarie Telecom and was a member of the Prime Minister's cyber security business roundtable process.

La contre-attaque d'Apple face au FBI
Tuesday, 01 March 2016
Byline: Damien Leloup

Washington - La firme, qui s'oppose aux exigences du service fédéral, prépare une riposte juridique et technologique

Tim Cook, le PDG d'Apple, avait annoncé qu'il contesterait les demandes du FBI - le service fédéral américain de police judiciaire et de renseignement intérieur - par tous les moyens possibles, y compris en allant jusqu'à la Cour suprême des Etats-Unis. L'entreprise a rempli, jeudi 25 février, la première étape, en introduisant un recours formel contre la demande qui lui est faite de fournir au FBI un " outil de déverrouillage " qui permettrait " d'ouvrir " un iPhone chiffré ayant appartenu à l'un des terroristes ayant commis l'attentat de San Bernardino (Californie), le 2 décembre 2015. Ce jour-là, quatorze personnes ont été tuées par deux assaillants.

Dans un document communiqué à la justice vingt-quatre heures avant la fin de l'ultimatum fixé par un tribunal à Apple pour fournir ledit outil au FBI, les avocats de l'entreprise ont donné une série d'arguments, justifiant la position de la firme à la pomme. La plupart portent sur des points de jurisprudence et tentent de montrer que la demande des enquêteurs impose une contrainte déraisonnable, et que la création d'un tel outil de déverrouillage représenterait un danger pour la vie privée des utilisateurs d'iPhone. Ils relèvent, au passage, que le FBI n'a apporté aucune preuve que le téléphone pouvait contenir des éléments nécessaires à l'enquête, et que les enquêteurs ont eux-mêmes bloqué l'avancée de l'enquête en changeant - par erreur ou volontairement - le mot de passe iCloud de l'appareil, le service de sauvegarde en ligne d'Apple.

Mais les avocats de la firme de Cupertino (Californie) ont aussi mis en avant un argument massue : le code informatique, estiment-ils, est une forme d'expression écrite. En tant que tel, il est protégé par le premier amendement de la Constitution américaine qui consacre la liberté d'expression, et le FBI ne peut contraindre l'entreprise à " s'exprimer " en produisant un logiciel contre sa volonté, expliquent-ils.

Cet argument, s'il venait à être validé par les tribunaux américains, pourrait avoir de profondes répercussions sur des centaines d'autres affaires. Mais la jurisprudence actuelle ne penche pas, sur ce point, en faveur d'Apple. Dans les procédures, le géant américain pourra toutefois compter sur le soutien de plusieurs de ses rivaux. Google, Microsoft, ou Facebook ont annoncé qu'ils déposeraient, dans la première semaine de mars, une motion de soutien à la société fondée par Steve Jobs auprès du tribunal.

Fermer la " porte " d'iCloudSans attendre les résultats de son recours, Apple a lancé une autre contre-attaque, sur le plan technologique cette fois. Le groupe a commencé à travailler sur des mises à jour de sécurité qui rendraient inopérantes de futures demandes du FBI. Jusqu'à présent, l'entreprise acceptait, sur présentation d'un mandat d'un juge, de fournir aux enquêteurs américains des copies de fichiers iCloud, son système de sauvegarde de documents en ligne.

Mais selon les informations du Financial Times , Apple cherche à mettre en place un système de protection similaire à celui utilisé pour chiffrer le contenu de ses téléphones. Depuis les dernières mises à jour de son système d'exploitation iOS, le contenu chiffré n'est déverrouillable que par le propriétaire de l'appareil, qui est le seul à en connaître le mot de passe - Apple ne peut ni le communiquer à un tiers ni en décrypter le contenu.

Dans plusieurs enquêtes, les forces de l'ordre américaines ont utilisé le système de sauvegarde iCloud pour contourner ce verrouillage : quand le propriétaire laisse la synchronisation des données activées, il n'y a pas besoin de déverrouiller le téléphone, puisqu'une copie des photos et des autres documents présents sur l'appareil est transférée automatiquement sur les serveurs d'Apple. La fermeture de cette " porte " s'apparenterait à une nouvelle déclaration de guerre au FBI, et le début d'une seconde course aux armements technologique et judiciaire.

De son côté, le FBI et son patron, James Comey, ainsi que plusieurs figures politiques ont multiplié les déclarations appelant le Congrès américain à se saisir du dossier. Les demandes d'accès du service fédéral de police judiciaire sont en effet dans une zone grise juridique - aux Etats-Unis, la loi encadre les obligations des opérateurs de téléphonie et des fournisseurs d'accès à Internet, mais elle est vague en ce qui concerne les informations que les forces de l'ordre peuvent collecter auprès des constructeurs informatiques.

Engagés dans la campagne pour les primaires, les politiques n'ont pas manqué de prendre position dans la controverse qui oppose le FBI à Apple. Les principaux candidats à l'investiture républicaine ont tous, à des degrés divers, exprimé leur soutien aux enquêteurs. Côté démocrate, Hillary Clinton, qui fait la course en tête, a refusé de prendre position tandis que son rival, Bernie Sanders, a renvoyé dos à dos le " Big Brother " étatique et celui des " multinationales ". Mais la longue bataille qui s'annonce devant les tribunaux laisse présager que le futur Congrès américain devra s'emparer du sujet sous peine de blocage.

Le Temps (Suisse)
Un nouvel accord recadre l'espionnage américain
Tuesday, 01 March 2016
Byline: Ram Etwareea

Bruxelles - Protection de données
Les citoyens européens obtiennent de nombreuses garanties et diverses possibilités pour faire recours s'ils s'estiment lésés par des services de renseignement ou des entreprises américains

« Safe Harbour », le règlement transatlantique en matière de transmission et de protection des données, est mort. Vive « Privacy Shield », qui entrera en vigueur dès qu'il aura obtenu le feu vert des vingthuit Etats membres de l'Union européenne (UE) ainsi que celui du Parlement européen. En gros, les Etats-Unis promettent de moins espionner les citoyens européens. « Notre objectif est d'assurer la protection des droits fondamentaux de nos citoyens et d'apporter une sécurité juridique à nos entreprises », a expliqué lundi un haut fonctionnaire européen. Du côté des Etats-Unis, le président Barack Obama a signé la semaine dernière le Judicial Redress Act qui accorde aux Européens les mêmes droits qu'aux Américains en matière de protection des données.

Programme américain d'espionnage à grande échelle

Pour rappel, tout avait commencé en 2012 lorsque le lanceur d'alerte américain Edward Snowden avait révélé que la National Security Agency (NSA) américaine avait un programme à grande échelle dit « Prism » pour espionner les courriels des citoyens et même des dirigeants politiques européens.

Même les communications de la chancelière allemande Angela Merkel étaient interceptées par les services de renseignement, ce qui avait choqué beaucoup d'Européens. Dans un acte de contrition, le président américain avait signé en janvier 2014 un décret qui limitait la collecte d'informations sur des citoyens non-américains seulement en cas de risques liés à l'espionnage, au terrorisme, à l'usage des armes de destruction massive ou encore aux menaces contre les forces armées américaines.

Course contre la montre pour combler le vide juridique

Mais en Europe, des revendications pour une meilleure protection des données n'ont pas cessé. C'est un procès gagné par un citoyen autrichien auprès de la Cour de justice de l'UE en octobre dernier qui a conduit à l'invalidation du « Safe Harbour » . Dès lors, l'UE et les Etats-Unis se sont engagés dans une course contre la monte pour combler le vide juridique.

« Il ne sera désormais plus possible de transférer ou de stocker les données de nos citoyens et de nos entreprises de façon illégale », a poursuivi le spécialiste européen. C'est un fait que les consommateurs fournissent beaucoup d'informations personnelles lors d'une souscription, d'un achat ou encore d'une réservation en ligne d'un billet d'avion ou d'un hôtel sur des sites internet comme Hotel.com, Google, Yahoo, WhatsAppp ou Facebook. Les entreprises technologiques américaines ont montré de l'empressement pour trouver un nouvel accord. En janvier dernier, elles ont tiré la sonnette d'alarme, disant qu'un échec pourrait empêcher certaines d'entre elles de travailler en Europe.

Voies de recours

Sous « Privacy Shield », les Etats-Unis garantissent formellement que l'accès aux informations à des fins de sécurité nationale sera subordonné à des critères bien définis. Pour la première fois, les citoyens européens disposeront de voies de recours à divers niveaux. « Les Etats-Unis ne se livreront plus à des surveillances de masse à l'égard des Européens », a rassuré le haut fonctionnaire. Le nouvel instrument prévoit un ombudsman indépendant de la NSA qui recueillera les plaintes. Les plaignants obtiendront les réponses dans un délai maximal de 45 jours. En cas de non-satisfaction, ils pourront se référer à un tribunal d'arbitrage.

Lorsqu'il s'agit de plaintes visant les agissements d'entreprises, « Privacy Shield » préconise que ces dernières adoptent d'abord un code de bonnes pratiques. Ensuite, en cas de plaintes, elles doivent réagir dans un délai de 45 jours. Les Européens se sentant lésés peuvent aussi référer leur cas au Département américain du commerce qui a l'obligation d'apporter une réponse dans un délai de 90 jours. Pour les cas non résolus, l'accord prévoit également un tribunal d'arbitrage ayant le pouvoir de convoquer les entreprises.

De son côté, l'UE tiendra une consultation annuelle avec les organisations non gouvernementales actives dans ce domaine. Un rapport annuel sera également soumis au Conseil et au Parlement européens.

« Il ne sera désormais plus possible de transférer ou de stocker les données de nos citoyens et de nos entreprises de façon illégale »

The Local (Norway)
China stealing military information from Norway
Monday, 29 February 2016
Byline: Staff report

Oslo - In its annual threat assessment, the Norwegian Intelligence Service, reports The Local, said that both Russia and China present security challenges to Norway and that Beijing has most likely stolen military intelligence from Norwegian companies.
While much of the NIS report - like that of the threat assessment released by the Norwegian Police Security Service (PST) earlier this month - focused on the dangers posed by Russian spies, it also revealed that China has stolen information from Norwegian weapons companies.

"We believe that they [China, ed.] have succeeded in extracting information that they are using in their own weapons technology," NIS head Morten Haga Lunde told TV2.

The NIS report calls Russia and China "the most active players behind network-based intelligence operations aimed at Norway" and said that both nations "have high competencies and show a high degree of assertiveness in their approach to Norwegian goals".

Lunde told TV2 that China is targeting Norwegian companies as part of a global strategy to obtain valuable technological information.

"First and foremost as we say in the report, we can see that China is inside and operating within Norwegian networks to obtain information that it can use in its own technological development," he said.

Lunde stressed that Chinese espionage wasn't only aimed at Norway but is a "global challenge".

Norway's southern neighbour Denmark saw its domestic defence industry successfully hacked for years by a foreign operator, widely believed to be China. Between 2008 and 2012, an advanced cyber attack was carried out on the IT systems of at least five Danish defence companies, including it's largest weapons company.

Reuters
Major powers team up to tell China of concerns over new laws (Canada)
Tuesday, 01 March 2016

The United States, Canada, Germany, Japan and the European Union have written to China to express concern over three new or planned laws, including one on counterterrorism, in a rare joint bid to pressure Beijing into taking their objections seriously.
The U.S., Canadian, German and Japanese ambassadors signed a letter dated Jan. 27 addressed to State Councilor and Minister of Public Security Guo Shengkun, voicing unease about the new counterterrorism law, the draft cyber security law, and a draft law on management of foreign non-governmental organisations (NGOs).

In what sources said was a coordinated move, the ambassador of the European Union Delegation to China, Hans Dietmar Schweisgut, sent a letter expressing similar concerns, dated Jan. 28.

Reuters reviewed copies of both letters.

The cyber security and counterterrorism laws codify sweeping powers for the government to combat perceived threats, from widespread censorship to heightened control over certain technologies.

Critics of the counterterrorism legislation, for one, say that it could be interpreted in such a way that even non-violent dissidents could fall within its definition of terrorism.

The four ambassadors said areas of the counterterrorism law, which the National People's Congress passed in December, were vague and could create a "climate of uncertainty" among investors. They did not specify which areas.

The EU ambassador used the same phrase to describe the law's impact, and both letters expressed an interest in engaging with China as it worked out implementing regulations around the law, to try to mitigate those concerns.

Guo could not be reached for comment. China's State Council Information Office, Ministry of Public Security and Foreign Ministry did not immediately respond to requests for comment.

While countries often give feedback on proposed legislation in China, the rare joint response by several major powers, and coordination with the EU, signals an increased readiness to lend weight of numbers to their argument.

It also points to growing frustration that the low-key, individual approach taken in the past may not be working.

"While we recognize the need for each country to address its security concerns, we believe the new legislative measures have the potential to impede commerce, stifle innovation, and infringe on China's obligation to protect human rights in accordance with international law," said a strongly-worded letter co-signed by the four ambassadors.

China has defended the new and draft laws, saying such steps, including heightened censorship, were necessary to ensure stability in the country of over 1.3 billion people.

'CLIMATE OF UNCERTAINTY'

The diplomatic push comes as Beijing arguably needs cooperation from the signatories to the letters more than ever.

A slowing Chinese economy and fragile markets highlight the importance of foreign investors' confidence.

Chinese companies are increasingly looking to get approvals from foreign governments for acquisitions, and the European Union is debating whether to give China "market economy" status.

On the draft cyber security law, all five ambassadors were particularly concerned by provisions requiring companies to store data locally and to provide encryption keys, which technology firms worried may impinge on privacy and mean they would have to pass on sensitive intellectual property to the government in the name of security.

Both letters said the draft NGO management law had the potential to hinder academic exchanges and commercial activities, calling them "crucial elements" of their relationships with China.

Critics have said the draft legislation risked choking off NGOs' work by requiring them to get official sponsors and giving broad powers to police to regulate their activities.

In the letters, the ambassadors asked China to open both draft laws to another round of public consultations.

The U.S. and Canadian embassies in Beijing did not immediately respond to requests for comment for this article. A spokesman for the EU Delegation had no comment when reached by Reuters.

German embassy spokesman Nikolas Bader said: "The Embassy does not comment on the letter. But we are clearly concerned about these issues and have repeatedly raised them in the past."

The Japanese embassy said: "We pay attention to Chinese movement over relevant laws or drafts of laws."

The parties to the letters decided to express their concerns together after it became unclear to what degree China was taking their individual input on the laws on board, said a person with knowledge of the matter.

"We're trying to avoid the divide and conquer approach (by China). They like to do that on any possible occasion. We wanted to send a counter- signal that when we have shared interests, we cannot so easily be split," the person said, adding that there had been no clear response by China so far to the letters.

"We don't plan to establish a pen-pal relationship. We want something to happen."

Wall Street Journal

Apple Is Right on Encryption

Wednesday, 02 March 2016

Byline: Editorial Board

Section: editorial

Editorial - The Apple encryption conflict has turned nasty, as the Obama Administration, most Republicans and public opinion turn against the tech company. But, lo, Apple won its first court test on Monday, and its legal briefs against the court order to unlock an iPhone used by the San Bernardino jihadists show it has a better argument than the government.

The FBI is attempting to extract information on Syed Rizwan Farook's device but has been frustrated by Apple's encryption. So a California magistrate ordered the company to design a custom version of its operating software that will disable certain security features and permit the FBI to break the password. Apple has cooperated with the probe but argues that forcing it to write new code is illegal.

One confusion promoted by the FBI is that its order is merely a run-of-the-mill search warrant. This is false. The FBI is invoking the 1789 All Writs Act, an otherwise unremarkable law that grants judges the authority to enforce their orders as "necessary or appropriate." The problem is that the All Writs Act is not a catch-all license for anything judges want to do. They can only exercise powers that Congress has granted them.

Congress knows how to require private companies to serve public needs. The law obligates telecoms, for example, to assist with surveillance collection. But Congress has never said the courts can commandeer companies to provide digital forensics or devise programs it would be theoretically useful for the FBI to have -- even if they are "necessary" for a search.

Congress could instruct tech makers from now on to build "back doors" into their devices for law-enforcement use, for better or more likely worse. But this back-door debate has raged for two years. In the absence of congressional action, the courts can't now appoint themselves as a super legislature to commandeer innocent third parties ex post facto.

What makes the FBI's request so extraordinary is that the iPhone encryption and security methods were legal when they were created and still are. Apple has no more connection to the data on Farook's phone than Ford does to a bank robber who uses an F-150 as a getaway vehicle.

If the government can compel a manufacturer to invent intellectual property that does not exist in order to invade its own lawful products, then there is no limiting legal principle. Could the FBI require a tech maker, for example, to send a malware worm to a user's device in the form of a routine update?

The other myth is that Apple is merely being asked to crack "one phone in the entire world," as Marco Rubio puts it. This is also false. The Justice Department is beseeching Apple to provide software retrofits in at least a dozen public cases, and state and local prosecutors have stacks of backlogged iPhones they want unlocked too. In the New York case Apple won this week, prosecutors want Apple to unlock an iPhone even though the owner has pleaded guilty.

If Apple now writes the program the G-men desire, then the technique will be used in investigations that have nothing to do with terrorism as other prosecutors use the same argument. This is the back door by degrees that Apple CEO Tim Cook describes.

FBI director James Comey told Congress last week that the Apple case was "unlikely to be a trailblazer" and that it also would be "instructive for other courts." Well, which is it? This contradiction isn't the only reason to wonder if Mr. Comey prefers an encryption legal precedent over Farook's actual data.

One question is why the phone wasn't immediately shipped in a faraday bag to Fort Meade. The NationalSecurity Agency has a formidable decryption unit, and U.S. spooks probably have the ability to hack Farook's phone without Apple's services, especially because it is an older, less sophisticated model.

We bow to no one in defense of antiterror programs whose political popularity waxes and wanes, especially on surveillance. But this case isn't about "privacy." This is about engineering security and its implications for the security of all Americans.

Back doors are engineering vulnerabilities that make devices less secure. But terrorists and criminals will always be able to find some underground encrypted communication channel, so regulating back doors into legal devices achieves little national-security benefit. To borrow a line from James Burnham, if there's no alternative, there's no problem.

If Congress is really going to outlaw stronger encryption for law-abiding Americans, well, the political class has the right to make mistakes. But it would be a far more dangerous precedent for the courts to do so without guidance from Capitol Hill.

Mr. Comey may be leading the government to defeat, which makes the White House's incoherence -- backing this unnecessary showdown while claiming to oppose back doors -- all the stranger. If this debate really is critical to protecting public safety, then Mr. Comey should appeal to Congress to change the law, rather than insist that the courts should resolve a major policy dispute in his favor.

New York Times

Tracking Devices in Teeth, and Other Bin Laden Worries

Wednesday, 02 March 2016

Byline: Matthew Rosenberg

Section: general

Washington - American drones were devastating the upper ranks of Al Qaeda, his men were killing suspected spies, and Osama bin Laden wondered: Could an Iranian dentist have planted a tracking device in his wife's tooth?
"The size of the chip is about the length of a grain of wheat and the width of a fine piece of vermicelli," he wrote, using the nom de guerre Abu Abdallah.

A few paragraphs later, Bin Laden signed off and then added, "Please destroy this letter after reading it."

The letter was among thousands of pages of documents and other materials seized by Navy SEALs during the raid on Bin Laden's compound in Abbottabad, Pakistan, in May 2011, and it was declassified on Tuesday with 112 other pieces of writings and letters found in the Qaeda leader's hide-out.

American officials have said that the intelligence seized by the SEALs during the raid included letters, spreadsheets, books and pornography. Yet only a fraction of the materials have been made public -- Tuesday's release was the second set of documents from the raid to be declassified -- and experts have cautioned against drawing broad conclusions until there is more.

The bulk of the materials released Tuesday come from the last decade of Bin Laden's life, and include letters to lieutenants and loved ones, drafts of speeches he was preparing to release and stray bits of operational minutiae. Though there do not appear to be any major revelations, the materials provide a glimpse of Bin Laden's thinking and his struggle to keep Al Qaeda's main branch and its offshoots in line as American drones killed the group's senior leaders and demoralized its foot soldiers.

An undated will that Bin Laden is believed to have written by hand in the late 1990s was included in the documents released on Tuesday.

In it, Bin Laden reviewed his finances, saying he had received $12 million from one of his brothers and that he had $29 million in Sudan, where he lived from 1991 to 1996. If he was killed, he wrote, he hoped his family would "spend all the money that I have left in Sudan on Jihad."

A senior intelligence official, who the Central Intelligence Agency insisted speak on the condition of anonymity, said the agency did not know what became of the money, or if any of it remained at the time of Bin Laden's death. But the will, the official said, was probably important to Bin Laden, because he carried it with him for years.

The fixation on the possibility of his own premature death, and the fear of the American efforts to track him and kill him, is a theme that surfaces again and again. In one letter, Bin Laden warns that a suitcase used to deliver a ransom could contain a tracking device.

Even people presenting themselves as friends were not trusted. In another letter, which does not appear to have been written by Bin Laden, the author relates that a Qatari diplomat visited Qaeda members in Jalalabad, Afghanistan, and brought gifts, including a "huge" watch.

But after the diplomat left, a militant identified by the pseudonym Abu Umamah took the watch and "smashed it with a hammer" because he was afraid of it.

The latest documents include new details of Bin Laden's apparent struggle to impose bureaucratic uniformity across his terrorist network, including an educational syllabus for new fighters.

Titled a "Course of Islamic Study for Soldiers and Members," it includes a list of subjects and skills to be taught. (No. 1 is reading and writing.) There is also a reading list of mostly books about Islam as well as lectures ranging from the history of jihad in the Horn of Africa to "a brief word on raising children."

Bin Laden, who considered himself a student of history, tended to view events through a conspiratorial lens that often distorted his conclusions. The documents made clear, for example, that he believed the West, and the United States in particular, was controlled by a Jewish cabal.

But Bin Laden did not reject all things Western. One document released on Tuesday outlines the structure of a "chief of staff committee" replicating the structure of a military command staff that originated in 19th century France and is now used by almost all North Atlantic Treaty Organization members, including the United States.

The various branches of the staff are laid out numerically, much like the Pentagon. No. 1 is personnel, No. 2 is intelligence and No. 3 is operations. No. 4 is logistics, or what the Qaeda document calls its "provisions and supplies wing." The unidentified author added Al Qaeda's own No. 5 role, which could be translated as a morals branch.

The intelligence officials could not say whether the group ever tried to put the command staff structure into practice.

Tuesday's release was at the insistence of Congress, which in 2014 directed the Office of the Director of National Intelligence to review the material seized in the raid and make as much of it public as possible.

It has been a slow process. The review began in May 2014, and the first release, which included nearly 80 documents, books, news media clippings and other materials, did not occur until May 2015.

Most of the documents released in 2015 were notes from Bin Laden and his top deputies, and they suggested that the Qaeda leader spent his final years seeking to direct a terrorist network that appeared to have grown far beyond his control. There was talk of training recruits and of how to select the most talented to carry out major attacks in the West. There were discussions of whom to promote and how to deal with the group's franchises in the Middle East and North Africa.

In the 2015 release, the intelligence director's office also made public a list of books found in the compound. There were sober works of history and current affairs, such as "Obama's Wars," by Bob Woodward, and wild conspiracy theories, like "The Secrets of the Federal Reserve," by Eustace Mullins, a Holocaust denier.

Then there was the application for new Qaeda recruits, which was perhaps the oddest find in the first set of declassified materials. The application blended the mundanely bureaucratic with the frighteningly absurd, asking questions like "Do you wish to execute a suicide operation?" and "Who should we contact in case you become a martyr?"

Whether it was ever used is a question that American officials have not answered.

Brazilian Police Arrest a Facebook Executive in a WhatsApp Data Access Case

Wednesday, 02 March 2016

Byline: Vinod Sreeharsha, Mike Isaac

Section: general

Rio de Janeiro - Brazilian federal police arrested a Facebook executive on Tuesday after the company failed to turn over information from a WhatsApp messaging account that a judge had requested for a drug trafficking investigation.
Diego Dzodan, a Facebook vice president, was taken into custody, or what Brazilian authorities call "preventive prison," which is often less than a week but can be extended, federal police said in a statement.

The arrest was made because of Facebook "repeatedly failing to comply with judicial orders," according to the statement. "The information was required to be utilized in an investigation of organized crime and drug trafficking."

WhatsApp is owned by Facebook.

No other details were provided. The criminal case was filed in a court in the northeastern state of Sergipe.

The arrest comes as a debate over the access that law enforcement officials should get to tech companies' data has escalated. In the United States, Apple is in a fight with the government over whether to build a special tool to help law enforcement break into an iPhone used by one of the attackers in a mass shooting in San Bernardino, Calif., last year.

In Brazil, Facebook has run into other hurdles with authorities in recent months over access to its information. Tuesday's arrest comes less than three months after another judge ordered a temporary shutdown of WhatsApp in a similar case. An appeals court quickly overruled the shutdown.

The drug trafficking case that led to Tuesday's arrest is a separate case, according to a spokeswoman at the courthouse in Sergipe. The Sergipe court said in a statement that it had given Facebook three previous chances to provide the information. Yet the issue echoes past instances, with Brazilian police and authorities contending that they should be able to access information in such investigations.

Facebook's chief executive, Mark Zuckerberg, has long considered Brazil a crucial market and previously praised its Internet governance. He was one of a small group of Silicon Valley executives who met with President Dilma Rousseff of Brazil in a private meeting at Stanford University last July, according to individuals who attended.

Facebook on Tuesday said it was "disappointed with the extreme and disproportionate measure of having a Facebook executive escorted to a police station in connection with a case involving WhatsApp."

The company added, "Facebook has always been and will be available to address any questions Brazilian authorities may have."

It is unclear if the information that Brazilian authorities are seeking in the drug case in Sergipe can even be provided as WhatsApp does not store users' messages. It also increasingly has end-to-end encryption.

WhatsApp said in a statement that it disagreed with the Brazilian authorities on the case. "We are disappointed that law enforcement took this extreme step," the messaging business said. "WhatsApp cannot provide information we do not have."

USA Today

Cyber security execs firm in defense of Apple

Wednesday, 02 March 2016

Byline: Elizabeth Weise

Section: general

San Francisco - The cybersecurity industry came out swinging Tuesday in favor of Apple in its fight against the FBI's demand that it build a backdoor into an iPhone operating system.
"The path to hell starts at the backdoor, and we need to make sure that encryption technology remains strong," Microsoft President Brad Smith told a packed ballroom as the RSA computer security conference began here.

More than 40,000 people from across the globe are attending RSA this week, a record. The issue of Apple and the FBI featured in almost every speaker's remarks during the opening plenaries.

RSA President Amit Yoran began the barrage by saying that weakening encryption is solely for the ease and convenience of law enforcement for pursuing petty criminals.

"No credible terrorists or nation states would ever use technology that is knowingly weakened. However, if we weaken our encryption, you can sure bet that the bad guys will use that and exploit it against us," he said. Such policies will hurt U.S. economic interests and unconscionably undermine those working to protect the digital environment, he said.

His words were being heard not just by cryptographers, computer security companies and programmers but also by Michael Rogers, director of the NationalSecurity Agency, U.S. Secretary of Defense Ashton Carter, U.S. Attorney General Loretta Lynch, members of Congress and national cyber security czars from around the world, he told the audience. All were planning to attend the conference.

That attention wasn't license to go on the attack. "We need to be respectful, but we also must make sure that our voices are heard loud and clear," he said.

The U.S. government realizes how important the field is.

"Cyber is the new black. Everyone cares about it. Every government cares about it," U.S. State Department Coordinator for Cyber Issues Chris Painter said. He won an excellence in public policy award at RSA.

Opposing the FBI's request doesn't mean technology companies don't realize they play a crucial role in security and law enforcement work, Smith said.

After the Paris attacks in November, Microsoft received 14 requests from law enforcement seeking information about terrorist suspects at large in France and Belgium, Smith said. Once the company confirmed they were lawful, the average response time to get the information to law enforcement was 30 minutes, he said. But security doesn't mean allowing unlawful requests.

"We also need to stand up for customers," he said. In the end, "there is no such thing as national security without cyber security. We cannot keep people safe in the real world if we cannot keep people safe on the Internet," he said.

London Times

Intelligent Security

Wednesday, 02 March 2016

Byline: Editorial Board

Section: editorial

Editorial - Britain is not an oppressive nation. Our security services exist to protect citizens and the state, rather than to protect the state from citizens. Terrorism is a great and growing threat to the British people. There is a good deal of evidence that GCHQ, MI5 and MI6 work tirelessly to thwart attacks on British soil and British interests. There is scant evidence, indeed, next to none, that they have worked to the detriment of the population at large. This makes us fortunate. Too few other countries can say the same.
The Investigatory Powers Bill, tabled in parliament yesterday is at its best a forward-thinking attempt to clarify precisely what the security services can, should, and need to do to best fulfil their role. Debates about the balance between privacy and national security may never end, but in the face of terrorist aggression there are strong arguments for prioritising the latter. Electronic communications are a powerful tool in the hands of terrorists. If the security services are powerless to scrutinise them, we all suffer.

The same bill, to put it mildly, is less convincing on the subject of domestic law enforcement. In draft form, published last year, it gave police forces enhanced abilities to hack private communications and to

monitor the web history of the public when investigating "serious crimes". Since then, police lobbying of the home secretary has clearly had an effect. The actual bill provides powers far broader.

Rather than only in the context of "serious crime", hacking powers may now be used for the purpose of "mitigating any injury or damage to a person's physical or mental health". This can be authorised by a chief constable. Moreover, whereas the draft bill allowed police to see when members of the public had accessed a "red-flag" list of websites, including those providing social media, the new bill allows police to see a list of all websites visited. This is too much power, with too little scrutiny, in the hands of people with too poor a track record of trust.

Quite unlike the security services, there is a long and regrettable history of British police exploiting for other purposes powers that were designed to combat serious crime. The existing Regulation of Investigatory Powers Act (Ripa) has been used frequently to expose the sources of journalists reporting on the police themselves, most notoriously in the Metropolitan police's investigation into The Sun newspaper's reporting of the "Plebgate" scandal involving the MP Andrew Mitchell. In 2013 Cumbria police arrested whistleblowers who had leaked details of the local crime commissioner's expenses. The ability to impose police bail has been exploited to allow police to sidestep the rules about how long they can keep people in custody. Even the power of arrest itself has arguably been abused, with police keen to make a public show of activity in high-profile cases, or those involving celebrities.

Britain's security services are known to use their powers discerningly. The same cannot be said about Britain's police. The House of Commons should be wary of gifting them new powers requiring little oversight from anybody other than senior police officers. The home secretary, meanwhile, should not have jeopardised the vital preservation of national security by packaging it alongside new domestic powers that are almost certain to be abused.

Wall Street Journal

FBI: 'Mistake' Made Over iPhone

Wednesday, 02 March 2016

Byline: Devlin Barrett, Daisuke Wakabayashi

Section: general

Washington - James Comey, director of the Federal Bureau of Investigation, conceded Tuesday that a mistake was made in the early days of the investigation into the San Bernardino, Calif., terrorism attack, making it harder to get data from one of the shooters' phones.

Mr. Comey said, however, that even without that error, the government would still need Apple Inc.'s help to open the locked iPhone.

The FBI director's discussion of the San Bernardino case came during a House Judiciary Committee hearing on the issue of encryption -- the subject of a major legal battle between the FBI and Apple about the company's refusal to help investigators open a phone seized in the probe of the California shooting that left 14 dead in December.

The hearing created the unusual spectacle of Mr. Comey, one of the nation's highest-ranking law enforcement officers, squaring off against Bruce Sewell, the top lawyer for Apple, one of the world's most visible technology companies. Mr. Comey testified first, followed by Mr. Sewell.

Apple is fighting a court order to help the FBI bypass the passcode-security measures on the phone used by Syed Rizwan Farook, one of the two assailants. The FBI wants to disable a security feature that erases the phone's memory after 10 failed password attempts.

Apple has argued that if San Bernardino County officials had not reset the cloud storage account connected to that phone, the FBI might have been able to access much more of the data on the phone by connecting the device to the Wi-Fi system in Mr. Farook's apartment.

Mr. Comey conceded Tuesday that there is some truth to that argument, though he noted that even if the account hadn't been reset, the two sides would still be in court.

"There was a mistake made in that 24 hours after the attack, where the county at the FBI's request took steps that made it impossible later to cause the phone to back up to the iCloud," Mr. Comey told the congressional committee. He added, "We would still be in litigation, because there was no way we would have gotten everything off the phone from a backup."

Apple and privacy experts are likely to seize on those comments to make the case that the company shouldn't be forced to compensate for investigators' mistake.

Mr. Sewell said Apple has helped officials and wants to continue to do so, but that the company must draw a line when the government tries to force its employees to weaken the overall security of its products. He took umbrage at Mr. Comey's repeated assertion that Apple's move toward encryption is a marketing decision, rather than a question of principle or technological standards.

"Every time I hear this my blood boils," Mr. Sewell said. "This is not a marketing issue. That's a way of demeaning the other side of the argument."

Mr. Sewell said the company's increasingly tough encryption is designed to improve security against hackers and criminals. "We see ourselves as being in an arm's race" with those trying to steal customers' data, he said.

Manhattan District Attorney Cyrus Vance Jr., who has been outspoken about law enforcement's need to access encrypted devices, said: "We really need Congress to help solve this problem for us."

"Criminals understand that this new operating system provides them with a cloak of secrecy. And they are, ladies and gentlemen, quite literally laughing at us," he said.

Mr. Sewell also told the committee that Apple had not been ordered to help any other country unlock an iPhone, but if the U.S. compels the company to do this "it will be a hot minute before we get those requests from other" nations.

Separately, at a technology conference in San Francisco, Attorney General Loretta Lynch said she was "disappointed" by a federal judge's ruling on Monday in New York that the government can't compel Apple to help investigators extract data from a locked iPhone in a drug probe.

Ms. Lynch said Apple had agreed to help the government in similar instances in the past but pushed back in the New York case. She said she believes technology companies are subject to a "social compact" to comply with the law, but said law enforcement also need to be clear in what data it wants from devices.

In prepared remarks, Ms. Lynch took a conciliatory tone, saying Washington and Silicon Valley should work together. But the subsequent question-and-answer session reflected the tension between Apple and law enforcement. "Do we let one company, no matter how great the company, no matter how beautiful their devices, decide this issue for all of us?" Ms. Lynch asked.

At the congressional hearing, Mr. Comey disputed Apple's argument that forcing it to help open the San Bernardino phone would mean creating software that would weaken security for millions of other phones.

"I have a lot of faith -- maybe I don't know them well enough -- in the company's ability to secure their information," he said. "They are very, very good at protecting their information and their innovation."

Mr. Comey acknowledged that the Justice Department suffered a blow in the New York drug case on Monday, but he predicted the legal fight between the government and Apple would be "bumpy," with dueling rulings. Like Mr. Vance, Mr. Comey said lawmakers ultimately will have to address the broader questions surrounding encryption.

"This collision between public safety and privacy, the courts can't resolve that," he said.

The Justice Department's argument that law enforcement must be able to open phones when it obtains a valid court order was met by skepticism from some lawmakers.

Rep. John Conyers, (D., Mich.), the Judiciary Committee's top Democrat, said he has been reluctant to support the Justice Department and the FBI on the issue. The growth of encryption means "we will all have lockboxes in our lives that only we can open and in which we can store all that is valuable to us," he said. "There are lots of good things about this."

Others were more open to law-enforcement's viewpoint.

"The question for Americans and lawmakers is not whether or not encryption is essential, but instead, whether law enforcement should be granted access to encrypted communications when enforcing the law and pursuing their objectives to keep our citizens safe," said Rep. Robert Goodlatte, (R., Va.), the committee's chairman.

Rep. Trey Gowdy (R., S.C.) said national security concerns should trump privacy worries. "You can go into people's bodies and remove bullets, but you can't look in a dead person's phone," Mr. Gowdy said. "I just find it baffling."

The Register (UK)

NSA boss reveals top 3 security nightmares that keep him awake at night

Wednesday, 02 March 2016

Byline: Iain Thomson

Section: general

San Francisco - Admiral Michael Rogers, head of the NSA and the US Cyber Command, has told delegates during his keynote address at RSA 2016 the three things that keep him awake at night.
His first fear is an online attack against US critical infrastructure, which he said was a matter of when it will happen, not if. Citing the recent Ukrainian power grid hack as an example, Rogers said that the target was an obvious one and security systems in the US national critical infrastructure were not strong enough.

Number two on his insomnia list was data tampering. We're used to data being stolen, he said, or even deleted as in the case of Sony. But if data has been subtly altered rather than stolen, then the results could be severe.

"What happens when attacks are used to manipulate data or some of its products?" he asked the conference. "You can no longer trust the data we are seeing and we are used to just seeing and accepting it."

His third nightmare was down to the actions of non-state terrorist groups changing their use of online resources. At the moment, such groups are using the internet to recruit members, raise funds, and distribute propaganda. But if they go on the offensive against a country, the results are going to be grim.

"What happens when they use cyber for destruction?" he asked. "These groups are not interested in maintaining the status quo, but in tearing it down."

The NSA can't handle all of this itself, he said, and pleaded with the assembled security experts to bring their skills to the government in partnerships. He recognized that the current debate of encryption was harmful and the two sides aren't cooperating with each other.

Rogers, who is on the record as supporting strong crypto, said that he was worried that the encryption arguments have seen both sides of the debate talking at each other, or even not talking at all. But, he suggested, unless we hang together, we shall all hang separately.

Washington Post

Apple's strategy could be risky

Wednesday, 02 March 2016

Byline: Brian Fung

Section: general

Analysis - Apple reiterated its request Tuesday that Congress rule on whether the FBI can force the company to help authorities unlock iPhones in criminal cases.
But relying on Capitol Hill is a risky strategy for Apple. An analysis of voting patterns in major privacy and security legislation over the past two years shows that the company may be facing an uphill battle, especially in the Senate, where lawmakers have consistently voted to empower intelligence officials.

The voting record also reveals that the legislative body has not broken evenly along partisan lines. Democrats are particularly split, analysts say, between more hawkish members and those more aligned with Silicon Valley.

And although some Republicans take the libertarian view that the government should not be able to spy on Americans' technology, many others find themselves drawn toward strong national security arguments.

No-back-doors amendment

In 2014, for instance, several House members proposed an amendment to a yearly defense funding bill that aimed to limit the government's ability to circumvent encryption - the technology that protects digital data from prying eyes. The amendment ultimately was included in the defense authorization bill, which was approved by both chambers and signed into law by President Obama.

Because the defense bill is a vast, sprawling piece of legislation, it is useful to focus on the House vote on whether to include the "no back doors" amendment introduced by Reps. Zoe Lofgren (D-Calif.) and Thomas Massie (R-Ky.). That vote saw House Democrats and Republicans approve the amendment in overwhelming numbers, with the measure passing 293 to 123.

Those who opposed the amendment included the chairman of the House Judiciary Committee, Rep. Bob Goodlatte (R-Va.). Joining him were top GOP members such as then-Majority Leader Eric Cantor (R-Va.) and the top Democrat on the House Intelligence Committee, Rep. C.A. Dutch Ruppersberger (Md.). The Democrat who succeeded Ruppersberger on the committee, Rep. Adam B. Schiff (D-Calif.), also voted no.

The split shows that a vote on the Apple-FBI matter may not come down along party lines. Indeed, some top Democrats are likely to side with the FBI because they have voted with national security interests in the past, said a left-leaning lobbyist who spoke on the condition of anonymity in order to talk more freely.

"It'll be interesting to see what Democrats do," said the lobbyist. "[The Apple-FBI fight] splits us a little bit."

USA Freedom Act

The USA Freedom Act was approved by both the House and Senate last summer. Although it proposed to end the NationalSecurity Agency's practice of collecting millions of Americans' phone records in bulk, it also gave intelligence officials the opportunity to resurrect the program in a different form with greater restrictions.

In the end, the bill passed the Senate by a vote of 67 to 32. The USA Freedom Act is one of the few bills in the recent debate over security and civil liberties that received votes in both chambers, contained comparable language in both and had a recorded vote tally. But its compromise nature makes it hard to draw clear conclusions about why lawmakers voted the way they did.

Looking ahead, expect various House committees to come up with "dueling legislation" on the Apple-FBI battle, said one Republican congressional staffer, who spoke on the condition of anonymity because the discussions are private. The different flavors of these bills could spark a divide among conservatives.

CISA

The Cybersecurity Information Sharing Act is one of the clearest examples of a bill that divided lawmakers on the question of privacy. Widely panned by privacy advocates, CISA drove Sens. Patrick J. Leahy (D-Vt.), Ron Wyden (D- Ore.), Christopher A. Coons (D-Del.), Al Franken (D-Minn.) and Dean Heller (R-Nev.) each to offer changes that were shot down by proponents of the bill, such as Sens. Dianne Feinstein (D-Calif.) and Richard Burr (R- N.C.).

Apple made clear in this case that it disagreed with the legislation. The company told The Washington Post that it did not support CISA days before the Senate approved the bill 67 to 32.

Although the House did not take a recorded vote on CISA - the measure later wound up in a giant budget bill passed by both chambers and signed by Obama - the Senate's decision to overwhelmingly approve a bill that Apple criticized reflects how little its voice shifted the balance.

There are "very few members that you can say are supportive of Apple" specifically, said a former congressional staffer, who spoke on the condition of anonymity in order to talk more freely.

London Times

Bill stretches far and wide

Wednesday, 02 March 2016

Byline: Fiona Hamilton

Section: general

Analysis - This complex bill sets out the powers available to the security services and police to gather and access communications data.
It is an ambitious aim to outline all powers provided to the services in a single piece of legislation.

The government has been accused of disregarding campaigners' concerns over privacy and rushing the Investigatory Powers Bill through, but ministers are hoping that it can grapple with the changing nature of technology, which has meant that many aspects of current legislation are not considered fit for purpose.

Many of these powers have been used for years but were not explicit in law. They include the ability of the security services to harvest private data, known as bulk collection, and hack into phones and computers, known as equipment interference.

The government has insisted that agencies have "never collected data indiscriminately" but the revelation that private data had been harvested for years brought concerns. Campaigners say that their issues have not been addressed.

Encryption, or securing data, is the elephant in the room.

Communications companies will remain obliged to decrypt messages only "so far as is practicable" because the government is powerless to go further.

There is no point in writing a law that it cannot enforce and that cannot compel MAJOR technology companies based in America.

New York Times

Obama Administration Officials Soften Approach at Tech Symposium

Wednesday, 02 March 2016

Byline: Nicole Perlroth

Section: general

San Francisco - Attorney General Loretta E. Lynch joined a parade of Obama administration officials to tech's home turf on Tuesday. Their message: National security depends on the industry's cooperation. The heavyweights from Washington arrived against the backdrop of Apple's fight with the Federal Bureau of Investigation over access to an iPhone and a growing fissure between Washington and Silicon Valley.

The F.B.I. is trying to force Apple to write software to help it break into the phone of one of the gunmen in December's mass shooting in San Bernardino, Calif. The phone is protected by a security scheme that would wipe its data after a series of incorrect password attempts. Apple has so far refused to cooperate, and the company is fighting a court order requiring it to aid investigators.

In a speech Tuesday at the RSA Conference, arguably the world's largest gathering of computer security experts, Ms. Lynch avoided directly addressing the fight with Apple, and emphasized the need to find middle ground.

"I know that neither our technology companies nor their leaders have any sympathy for terrorists or criminals who target Americans," Ms. Lynch told an audience at the city's Moscone Center. "And the Department of Justice will never sacrifice the safety of the American people or the ideals we all cherish."

But in a stage interview with a Bloomberg journalist, Emily Chang, after her speech, Ms. Lynch was asked what the middle ground would be between the F.B.I. and Apple.

"For me, the middle ground" is to do "what the law requires," Ms. Lynch responded, which drew a smattering of laughter and hisses from the audience. She said law enforcement has for years had Apple's help getting access to iPhones without controversy, and that "having the inability to obtain evidence that could save lives is a real risk."

Though it is focused on a tough password mechanism, the Apple controversy is an extension of a decades-long fight between the tech industry and the federal government over the use of encryption technology. Once considered a carefully regulated munition, not unlike a tank, encryption came into wide use with the advent of the commercial Internet and was the key to modern e-commerce.

The encryption fight was considered by many in Silicon Valley to have been settled in the 1990s, but the widespread government monitoring of Internet traffic revealed in documents released by Edward J. Snowden, the former government contractor, in 2013 led to the renewal of industry efforts to toughen security.

Apple's fight with the F.B.I. has added to that tension, and a number of other tech companies are expected in the coming days to file court briefs in support of Apple. Among their fears is that creating the software to break into the iPhone could create a backdoor that could be used repeatedly by law enforcement or the spy agencies of other countries.

The director of the NationalSecurity Agency, Admiral Michael S. Rogers, also attempted a conciliatory tone at the RSA event. Admiral Rogers did not speak to the Apple case, or even mention the word encryption, but repeatedly emphasized the need for partnership and dialogue to fight cyberthreats. "I implore all of us to be part of that constructive dialogue," he said. "It's time to stop talking past each other."

In a speech made nearby at San Francisco's Commonwealth Club, Defense Secretary Ashton B. Carter acknowledged that encryption had been a "hot topic here in the Bay Area," but said he could not address the Apple case because of the ongoing litigation. Instead, he noted that the Pentagon had a vested interest in strong encryption and that the Defense Department is "the largest user of encryption in the world."

Security experts in the tech industry may not be so quick to embrace conciliation. "You're opening a can of worms," Ron Rivest, a cryptographer and professor at the Massachusetts Institute of Technology, told a separate RSA audience.

"The systems we have are so fragile that trying to have extra keys, or extra ways in, or ways to take them apart is asking for all kinds of trouble," Mr. Rivest said. "The good of the country depends on having strong security."

Other cryptographers on the panel with Mr. Rivest agreed, with one notable exception: Adi Shamir, an Israeli cryptographer and co-inventor, with Mr. Rivest and Len Adleman, of the RSA encryption algorithm that became the namesake of the annual security conference.

Mr. Shamir argued that Apple had "goofed" by not complying in the San Bernardino case and for not anticipating that the F.B.I. would ask for help to crack the shooter's iPhone password.

"Even though Apple helped in countless numbers of previous cases, they decided not to comply this time," Mr. Shamir said. "My advice would have been, comply this time, and wait for a better test case when the case is not so clearly in favor of the F.B.I."

Wall Street Journal

Apple Fight Pushes Judges Into New Role --- Magistrate judges are helping shape boundaries between technology and law

Wednesday, 02 March 2016

Byline: Nicole Hong

Section: general

New York - The fight over smartphone encryption is shining a spotlight on federal magistrate judges, low-level jurists who have become influential in shaping unsettled areas of privacy and surveillance law. Two weeks ago, it was a magistrate judge's order in California that ignited a national debate over the legal boundaries between law enforcement and technology.

At issue in the case: whether the government can use an 18th century law to compel Apple Inc. to help unlock a cellphone used by a shooter in the San Bernardino, Calif., attack. U.S. Magistrate Judge Sheri

Pym sided with the government, prompting strong opposition from Apple and other tech companies. The iPhone maker filed papers last week appealing the decision.

But on Monday, U.S. Magistrate Judge James Orenstein sided with Apple in a drug case in Brooklyn, N.Y., saying the 18th century All Writ's Act doesn't give the government the authority to force Apple to extract data from a locked phone.

The rulings have put the lowest level of the federal judiciary in the center of one of the most sensitive policy debates facing the U.S.: where to draw the line between privacy and national security. The discussion is likely to reach the highest courts and lawmakers.

Magistrate judges are generally responsible for pretrial matters such as initial court appearances for criminal defendants and government applications for search warrants.

But magistrate judges are at the forefront of interpreting an area of law with little precedent, especially as it relates to the use of new technologies and investigative tools by the government. Magistrate judges have been the first to reason through the legality of computer- hacking by the government, as well as the use of stingrays, a cellphone- tracking tool often used without a search warrant. Routine surveillance requests from the government increasingly carry constitutional implications around privacy, former government officials say.

The situation "is very unusual," said Michael Vatis, a former official at the Justice Department and Federal Bureau of Investigation, now a partner at Steptoe & Johnson LLP. Magistrate judges are "not generally trying to set important precedents."

The magistrate position was created by Congress in 1968 to relieve the congestion on federal court dockets. The nation's 500 or so full-time magistrate judges serve eight-year terms that can be renewed.

Aspiring magistrate judges, who are often former federal prosecutors, must apply for the position and are chosen by a selection committee in each district court. The current annual salary is $186,852.

Data on magistrates' decisions are hard to come by. Most aren't public; government applications for search warrants or surveillance are almost always under seal so the target isn't tipped off. Former government officials say magistrate judges historically have granted the bulk of applications by the government. Such applications are typically unopposed, and the government often presents magistrates with enough evidence for "probable cause," the legal standard needed to grant the request. Magistrate judges also may fear running afoul of the government that would be nominating them for a promotion, say legal experts.

However, in 2005, U.S. Magistrate Judge Stephen Smith in Texas denied a government request to track a cellphone's location without a search warrant. The ruling paved the way for denials by other magistrates

and set off what has been dubbed the "magistrates' revolt," involving a handful of judges, including Judge Orenstein, who have been vocal in questioning the constitutionality of government applications.

"Magistrate judges are uniquely positioned to see this increasing use of technology by law enforcement," said Andrew Crocker, a staff attorney at the Electronic Frontier Foundation, a nonprofit privacy organization. "They're on the front lines, and they're asking questions."

Legal experts say because the rulings are usually secret, it is difficult to know whether the revolt is gathering or losing steam. Aside from Judge Pym's ruling, U.S. Magistrate Judge Gabriel Gorenstein in Manhattan, N.Y., granted the government's request in 2014 to compel an unnamed phone maker to unlock a cellphone during a credit-card fraud investigation.

Because of the renewed attention to these types of government requests, experts say magistrates are likely to give more scrutiny to routine applications -- and reach out for help among colleagues.

Jenny Durkan, a former Seattle U.S. attorney who is a partner at Quinn Emanuel Urquhart & Sullivan LLP, said while magistrate judges may be shaping the debate in the short term, the ultimate arbiter of these issues may be the Supreme Court or Congress.

In his order on Monday, Judge Orenstein said the debate "must take place among legislators who are equipped to consider the technological and cultural realities of a world their predecessors could not begin to conceive."

New York Times

F.B.I. Error Led to Loss of Data in Rampage

Wednesday, 02 March 2016

Byline: Ceciilia Kang, Eric Lichtblau

Section: general

Washington - The head of the F.B.I. acknowledged on Tuesday that his agency lost a chance to capture data from the iPhone used by one of the San Bernardino attackers when it ordered that his password to the online storage service iCloud be reset shortly after the rampage.
"There was a mistake made in the 24 hours after the attack," James B. Comey Jr., the director of the F.B.I., told lawmakers at a hearing on the government's attempt to force Apple to help "unlock" the iPhone.

F.B.I. personnel apparently believed that by resetting the iCloud password, they could get access to information stored on the iPhone. Instead, the change had the opposite effect -- locking them out and eliminating other means of getting in.

The iPhone used by Syed Rizwan Farook, one of the assailants in the Dec. 2 attack in which 14 people were killed, is at the center of a fierce legal and political fight over the balance between national security and consumer privacy. Many lawmakers at Tuesday's hearing of the House Judiciary Committee seemed torn over where to draw the line.

"The big question for our country is how much privacy are we going to give up in the name of security," Representative Jason Chaffetz, a Utah Republican, told Mr. Comey. "And there's no easy answer to that."

While some lawmakers voiced support for Apple's privacy concerns, others attacked the company's position, saying it threatened to deprive the authorities of evidence in critical cases involving newer iPhones.

"We're going to create evidence-free zones?" asked Representative Trey Gowdy, a South Carolina Republican who once served as a federal prosecutor. "Am I missing something?"

"How the hell you can't access a phone, I just find baffling," he said.

Bruce Sewell, Apple's general counsel, told committee members that the F.B.I.'s demand for technical help to unlock Mr. Farook's iPhone 5c "would set a dangerous precedent for government intrusion on the privacy and safety of its citizens." Apple has said that in many cases investigators have other means to gain access to crucial information, and in some instances it has turned over data stored in iCloud.

Mr. Sewell reacted angrily to the Justice Department's suggestion that Apple's branding and marketing strategy was driving its resistance to helping the F.B.I., an assertion that he said made his "blood boil."

"We don't put up billboards that market our security," he said. "We do this because we think protecting security and privacy of hundreds of millions of iPhones is the right thing to do."

F.B.I. officials say that encrypted data in Mr. Farook's phone and its GPS system may hold vital clues about where he and his wife, Tashfeen Malik, traveled in the 18 minutes after the shootings, and about whom they might have contacted beforehand. While investigators believe that the couple was "inspired" by the Islamic State, they have not found evidence that they had contact with any extremists overseas.

A judge last month ordered Apple to develop software that would disable security mechanisms on Mr. Farook's phone so that the F.B.I. could try multiple passwords to unlock the phone through a "brute

force" attack, without destroying any data. Once the systems were disabled, it would take only about 26 minutes to find the correct password, Mr. Comey said.

He rejected an idea expressed by several lawmakers that the F.B.I. was trying to force Apple to build a "back door" to decrypt its own security features. He used a different analogy to explain the government's demands.

"There's already a door on that iPhone," Mr. Comey said. "Essentially, we're saying to Apple 'take the vicious guard dog away and let us pick the lock.' "

But the F.B.I. did not help its case with lawmakers when Mr. Comey acknowledged the mistake of changing the iCloud password.

When the dispute over Mr. Farook's iPhone erupted two weeks ago, the Justice Department blamed technicians at San Bernardino County, which employed Mr. Farook as an environmental health specialist and which owned the phone he used. But county officials said their technicians had changed the password only "at the F.B.I.'s request."

Mr. Comey acknowledged at the hearing that the F.B.I. had directed the county to change the password.

Mr. Sewell, the Apple lawyer, explained to the committee that before F.B.I. officials ordered the password reset, Apple first wanted them to try to connect the phone to a "known" Wi-Fi connection that Mr. Farook had used. Doing so might have recovered information saved to the phone since October, when it was last connected to iCloud.

"The very information that the F.B.I. is seeking would have been available, and we could have pulled it down from the cloud," he said.

The F.B.I.'s handling of the password change drew criticism from both Democrats and Republicans at the hearing.

"If the F.B.I. hadn't instructed San Bernardino County to change the password to the iCloud account, all this would have been unnecessary, and you would have had that information," said Representative Jerrold Nadler, Democrat of New York.

Mr. Gowdy leveled a similar criticism during the more than two and a half hours of testimony from Mr. Comey.

"With all due respect to the F.B.I., they didn't do what Apple had suggested they do in order to retrieve the data, correct?" Mr. Gowdy asked the director. "I mean, when they went to change the password, that kind of screwed things up, did it not?"

But Mr. Comey said that even if the F.B.I. had not mishandled the password, he did not think the bureau could have gotten everything it wanted from the phone and would still have needed Apple to help disable the security features in the phone.

"We would still be in litigation," he said, "because the experts tell me there's no way we would have gotten everything off the phone from a backup."

Mr. Comey stressed that the fight with Apple was about trying to get as much information as possible about the San Bernardino attack -- not about gaining a powerful law enforcement tool elsewhere.

But when he was asked whether the F.B.I. would seek to unlock other encrypted phones if it prevailed in the San Bernardino case, he responded, "Of course."

In the audience were relatives of a Louisiana woman, Brittney Mills, who was shot to death at her doorstep last year when she was about eight months pregnant.

Mr. Comey said the data in her phone could help investigators determine whether she was shot by someone she knew, but they had been unable to break the passcode.

New York Times

U.S. Captures ISIS Operative, Ushering In Tricky Phase

Wednesday, 02 March 2016

Byline: Multiple reporters

Section: general

Washington - An elite American Special Operations force has captured a significant Islamic State operative in Iraq and is expected to apprehend and interrogate a number of others in coming months, ushering in a new and potentially fraught phase in the fight against the extremist Sunni militant group. American defense officials described the capture as a crucial development in battling the Islamic State but said it also raised questions about handling what is likely to be a growing group of detainees.

Although American commandos have captured a handful of Islamic State fighters in Iraq and Syria in discrete operations in recent years, the Pentagon is now faced with the prospect of detaining a larger group of captives and potentially reprising some of the darkest images of the war in Iraq, particularly the abuses at Abu Ghraib prison.

The American military has largely fought the Islamic State, also known as ISIS or ISIL, from the sky, and large numbers of Islamic State fighters have been killed in Iraq and Syria by American airstrikes. The 200-member Special Operations team, made up of many Delta Force commandos, arrived in Iraq in recent weeks and is the first major American combat force on the ground there since the United States pulled out of the country at the end of 2011.

Defense officials said the team had set up safe houses and worked with Iraqi and Kurdish forces to establish informant networks and conduct raids on Islamic State leaders and other important militants.

Officials said the detainee, whom they declined to identify, was being interrogated by American officials at a temporary detention facility in the city of Erbil in northern Iraq. They said the plan was to eventually turn him over to Iraqi or Kurdish officials.

Several Defense Department officials declined to say how much information or cooperation they have received from the detainee. They said it could take weeks or months to finish questioning the operative.

As is protocol, Defense Department officials notified the International Committee of the Red Cross, which monitors the treatment of detainees, that they were holding an Islamic State fighter. A Red Cross spokesman, Trevor Keck, declined to comment on the matter, including on whether Red Cross personnel were observing the detainee's treatment at the facility in Erbil.

Defense Department officials said that the United States had no plans to hold the detainee or others indefinitely, and that they would be handed over to Iraqi or Kurdish authorities after they have been interviewed. The officials said they did not intend to establish a long-term American facility to hold Islamic State detainees, and Obama administration officials ruled out sending any to the United States military prison at Guantánamo Bay, Cuba.

One of President Obama's major objectives before he leaves office is to close Guantánamo.

Captain Jeff A. Davis, a Pentagon spokesman, reiterated Tuesday that there were no plans to detain Islamic State captives long term. "Any detention would be short term and coordinated with Iraqi authorities," he said.

Defense Department officials say the commandos, referred to at the Pentagon as a "specialized expeditionary targeting force," will almost certainly increase the intelligence on the Islamic State available to the United States, including information about current operations extracted from laptops and cellphones.

Josh Earnest, the White House press secretary, has said the commandos are to "go and scoop up paperwork and hard drives and other information that can be critical to our ongoing efforts as a central part of this strategy."

Defense Secretary Ashton B. Carter told reporters Monday that the commando force was going strong. "It's a tool that we introduced as part of the accelerated operations to conduct raids of various kinds, seizing places and people, freeing hostages and prisoners of ISIL, and making it such that ISIL has to fear that anywhere, anytime, it may be struck," Mr. Carter said.

Senior Defense Department officials said the model for handling detainees seized by the new commando unit was a Delta Force raid in May, when two dozen American commandos from Iraq entered Syria aboard Black Hawk helicopters and V-22 Ospreys and killed Abu Sayyaf, described by American officials as the Islamic State's emir for oil and gas. Abu Sayyaf's wife, Umm Sayyaf, was captured and taken to a screening facility in Iraq, where she was questioned and detained. American forces seized laptop computers, cellphones and other materials from the site.

Umm Sayyaf was kept for three months by the American authorities and provided them information, officials said. Last August, she was transferred to Kurdish custody, and last month, the Justice Department filed an arrest warrant charging her with conspiring to provide material support to the Islamic State in an offense that officials said resulted in the death of Kayla Mueller, the American aid worker who was killed in Syria in February 2014.

Defense officials said only that the commando operation that led to the capture of the Islamic State militant was conducted in recent weeks in Iraq.

Washington Post

Privacy is part of wiretap talks

Wednesday, 02 March 2016

Byline: Ellen Nakashima

Section: general

Washington - Attorney General Loretta E. Lynch said Tuesday that recently launched transatlantic talks to enable British access to wiretap data from U.S. firms would protect privacy and human rights.
In remarks at a major cybersecurity conference in San Francisco, Lynch said that under any agreement, the British government would have to accept provisions designed to safeguard such rights.

The negotiations are aimed at establishing a framework that would permit British authorities to serve orders directly on U.S. companies for live intercepts and stored data in cases in which the investigation targets accounts not used by Americans or people in the United States.

"It would help one of our oldest and closest allies perform high- priority criminal investigations that keep its citizens safe," said Lynch, speaking at the RSA Conference.

The talks are the latest instance of an effort to reconcile the borderless nature of the Internet with sometimes conflicting laws created by sovereign states.

The talks, which were first reported by The Washington Post, are also aimed at easing the plight of U.S. companies, which are increasingly under pressure from foreign governments such as Britain's to comply with their orders for data in criminal and terrorism investigations. Such data might include online chats, for instance.

Congress, however, has barred U.S. firms from providing intercepts to anyone except the U.S. government after law enforcement has obtained a court order. This clash of laws has put U.S. companies in a difficult position, Lynch said. "Either they comply with a foreign order, and risk a violation of American law - or they refuse to comply, and risk a violation of foreign law," she said.

To obtain stored emails from U.S. companies, a foreign government must rely on a mutual legal assistance treaty by which the country makes a formal diplomatic request for the data, and the Justice Department then seeks a court order on its behalf - a process that can take many months.

Officials at U.S. technology firms have voiced concerns that if no resolution is reached, foreign governments, including Britain's, will force them to host their data in those countries. They also fear passage of laws requiring foreign firms to comply with surveillance orders. Britain has passed such a law, although it has not tried to enforce it against a U.S. firm.

Privacy advocates, however, are worried that the agreement will fail to adequately protect British users' privacy and human rights and permit U.S. firms to conduct wiretaps for foreign governments without the same legal standards based on probable cause that exist in the United States.

In Britain, rather than a judge approving search and wiretap warrants, the home secretary, who oversees police and internal affairs, issues the warrant if that cabinet member finds that it is "necessary" for national security or to prevent serious crime and that it is "proportionate" to the intrusion.

Lynch noted that the agreement would require action from Congress. That probably would mean amendments to laws such as the Wiretap Act. The pact is intended to be reciprocal, which, Lynch said, could help U.S. investigations in the future.

If the agreement proves successful, she said, it might be replicated with other countries "if - and only if - their laws adequately protect privacy and civil liberties."

The negotiations are expected to take months. The White House in January gave the Justice and State departments the go-ahead to begin the talks.

London Times

Terror plots thwarted by bulk data

Wednesday, 02 March 2016

Byline: Fiona Hamilton

Section: general

London - Spies' ability to carry out bulk interception and bulk hacking is one of the most controversial aspects of the Investigatory Powers Bill. The government insists that powers to hoover up vast amounts of data is "integral to the work of the security and intelligence agencies".
Yesterday it set out a detailed case for the bulk collection of data and gave examples of where it thwarted terrorist attacks and helped investigations. The Home Office document cited the plan to bring down aircraft using homemade bombs in 2006 and the 2010 plot to bomb symbolic locations such as the London Stock Exchange. Both investigations required complex analysis of large volumes of data to identify the attackers and understand the links between them.

In another case, the name of an individual reported to be storing a weapon used in a terrorist attack was identified. Spies used bulk datasets of private information to identify the suspect from hundreds of candidates.

The collection of bulk data has also helped to identify people going to Join Islamic State in Syria.

Bulk capabilities played a part in every MAJOR counterterrorism investigation in the past decade, including seven attack plots disrupted since November 2014, it said, and were essential in identifying 95 per cent of cyberattacks on people and businesses in the UK in the past six months.

Washington Post

What's on that iPhone? Fight goes to Congress

Wednesday, 02 March 2016

Byline: Mark Berman, Ellen Nakashima

Section: general

Washington - Lawmakers on Tuesday pressed FBI Director James B. Comey about the bureau's demands that Apple help it unlock an iPhone used by one of the San Bernardino attackers.
The Justice Department and FBI have tried to cast the issue as narrowly focused on one iPhone, but Comey acknowledged that if the government succeeds in this case it could set a precedent for others.

He also said he believed that soon, all conversations and personal documents would be hidden behind encryption "that nobody else can get into." This, he said, would challenge law enforcement efforts that depend on officers obtaining warrants to access personal conversations or materials.

"Our job is simply to tell people there is a problem," Comey said. "Everybody should care about it. Everybody should want to understand. If there are warrant-proof spaces in American life, what does that mean and what are the costs of that?"

The hearing before the House Judiciary Committee came a day after a federal judge in New York ruled in favor of Apple in a separate case that also focuses on whether the government can force the tech giant to help it access locked devices. That case, however, involves a different operating system from than the one in the San Bernardino phone, and a much less burdensome request for assistance.

But both cases turn on a 220-year-old law, the All Writs Act, and whether it provides authority for a court to force the firm to provide the technical assistance the government seeks.

Comey acknowledged that if the federal government prevails in the California case, agents could seek assistance in unlocking other devices in the future. He said other judges and lawyers could look to the case for guidance. But he also said he thought there were "limits" to how useful the precedent would be, given what he described as its narrow application to an older model phone.

Bruce Sewell, Apple's general counsel, asserted that Apple's defiance of the government's court order in the San Bernardino case was not motivated by financial concerns.

"This is not a marketing issue," he said, rejecting suggestions by the Justice Department, which he said "diminishes" the serious issues being debated.

"We're doing this because we think that protecting the security and the privacy of hundreds of millions of iPhone users is the right thing to do," he said.

Sewell said Apple's move toward strong encryption in recent years arose out of a concern about customer security. "Some of you might have an iPhone in your pocket right now, and if you think about it, there's probably more information stored on that iPhone than a thief could steal by breaking into your house," Sewell said.

He said the company was "in an arms race with criminals, cyberterrorists [and] hackers."

The debate between Apple and the government has played out in recent weeks across court filings, public statements, open letters and television interviews, with both sides seeking to stake out the higher ground in a conflict centered on one iPhone but with far-reaching implications in an era where personal information is increasingly stored on digital devices and platforms.

Comey told lawmakers that the iPhone recovered after the San Bernardino attack - one of three phones that were found, though the other two were smashed - could provide information about other terrorists. The FBI, he said, was seeking to answer lingering questions: "Is there somebody else? And are there clues to what else might have gone on here?" Comey said, adding that answering those questions "is our job."

He said the NationalSecurity Agency, the world's most sophisticated electronic spy agency, had been consulted for help with the phone. Asked who the FBI had turned to, he said: "All elements of the U.S. government have focused on the problem."

Later in the hearing, when asked specifically if the FBI had talked to other government agencies, including the NSA, he replied: "Yes is the answer. We've talked to anybody who will talk to us about it."

The NSA did not immediately respond to a request for comment Tuesday.

Comey also admitted that the FBI made a "mistake" when it asked San Bernardino County technicians to reset the iCloud password for the phone, which forestalled the possibility of trying to back it up again after that occurred. But he said even if that had not occurred, the FBI and Apple might have wound up in the same situation, since some data on the phone may not have been backed up.

Sewell, though, disputed that notion, saying that if the password was not changed, the court fight might have been averted.

"The very information that the FBI is seeking would have been available and we could have pulled it down from the cloud," he said. "By changing the [iCloud] password . . . it was no longer possible."

The government is seeking to unlock an iPhone 5c used by Syed Rizwan Farook, one of two shooters in the attack that killed 14 people. Last month, a magistrate judge in California issued an order directing Apple to write software that would disable a feature that deletes the data on the phone after 10 incorrect tries at entering a password. The bureau wants to try to crack the password without risking data deletion.

The Guardian (London)

Technology firms' hopes dashed by 'cosmetic tweaks' to snooper's charter

Tuesday, 01 March 2016

Byline: Alex Hern

Section: general

Analysis - Here comes the new snooper's charter, same as the old snooper's charter.
Many in the technology sector had been hoping that the final version of the investigatory powers bill, released on Tuesday, would backtrack on some of the more controversial aspects of October's draft bill. But the final version, which will now be presented to parliament, contains only the mildest of tweaks, and even doubles-down on some areas.

A fierce lobbying effort over the winter, from firms including Apple, Facebook, Microsoft and Twitter, had focused on three specific parts of the legislation where the Home Office bill looked set to do real damage to the technology industry.

The draft bill had concerned the major US technology companies for a number of reasons.

* There was a claim of "extraterritorial jurisdiction" that would allow warrants for bulk surveillance to be served to companies even if they weren't headquartered in the UK.

* There was a requirement for firms to provide assistance with "computer network exploitation", which they worried could lead to the UK mandating their aid in hacking their own customers - a fear which has taken on a less hypothetical sheen with the revelation that the US government is currently taking Apple to court demanding the company do just that.

* There was language suggesting that tech firms could be forced to break the encryption on messages sent using their technology - a requirement which could force companies like Apple and Facebook,

which offer encrypted messaging apps, to choose between operating in Britain or breaking their own messaging apps on an international scale.

The new version of the bill does soften that last requirement, just. It offers a "pragmatic approach" on the part of the government, and makes clear that no company will be required to remove encryption of their own services if it is not technically feasible. The definition of what, exactly, constitutes technical feasibility is, however, left as an exercise for the reader - and for a lot of lawyers in the future.

But on the other areas, no changes were made.

In its response to the bill committee's recommendations, the government said that concerns over extraterritoriality were already dealt with. "The government is engaging in preliminary discussions with international partners on how a new international framework for access to data across jurisdictions might operate in principle. This would be based on strong, human rights-compliant domestic regulatory oversight," it said.

And the bill actually extended the proposed powers for the state to hack computers. Previously, the draft bill had only allowed the security services to carry out computer hacking (enshrining into law an ability believed to already be widely used). But the new version of the bill also allows the police to start hacking when they are dealing with a "threat to life" or missing persons, as well as the security services.

The Open Rights Group's executive director Jim Killock concluded that "the revised bill barely pays lip service to the concerns raised by the committees that scrutinised the draft bill.

"If passed, it would mean that the UK has one of the most draconian surveillance laws of any democracy with mass surveillance powers to monitor every citizen's browsing history."

Eric King, the director of the Don't Spy on Us coalition, warned that "Rather than a full redraft, we've been given cosmetic tweaks to a heavily criticised, deeply intrusive bill."

King added: "There simply isn't time for proper scrutiny of all these powers in the timeframe proposed." On that, he was backed up by the Web Foundation, founded by the inventor of the world wide web, Tim Berners-Lee, which called the final bill "a slap in the face for British democracy".

The time-frame is, according to the Foundation, "not only unrealistic, but dangerous."

One major US technology firm told the Guardian that it was "hugely disappointing that the government hasn't moved on any of the core issues, despite a wealth of evidence". As the bill moves through parliament, that opposition is likely to intensify.

London Daily Telegraph

Snoopers' charter: Police have powers to hack into phones and computers for 'routine investigations'

Tuesday, 01 March 2016

Byline: Tom Whitehead

Section: general

London - Police have sweeping powers to hack in to phones and computers and access web browsing histories for routine investigations, under laws unveiled on Tuesday.
Measures in the Investigatory Powers Bill allow officers to break in to electronic devices to investigate or prevent "serious crime".

But they can also covertly glean personal data for purposes of "preventing death or injury or damage to a person's physical or mental health".

It raises the prospect that police can access devices or communications data for common investigations such as assaults, missing persons or suicide risks.

So-called "equipment interference" can include remotely hacking in to phones or computers, which is restricted to a small number of police forces or law enforcement agencies, or by-passing security and passwords on seized equipment.

Officials stressed warrants to carry out such interference have to be signed off by a designated officer and a judge in a "double lock" safeguard.

The tactic was included in a revised version of the surveillance legislation, which had to be reviewed after the draft bill published last year was criticised by three parliamentary committees.

The final bill also includes an extension to the type of web histories officers can ask for.

Police access to internet connection records was to be limited to communications sites, identifying who sent a message and where it was suspected an individual was accessing illegal material.

But the bill has been amended to allow access to any web use if it is "necessary and proportionate for a specific investigation".

It was included after police chiefs warned their powers were too limited.

Access is restricted to the details of the main website visited and not individual pages or content within that.

The bill will require internet companies to store their customers' web records for up to a year.

The Government also made a raft of changes to the surveillance legislation, which aims to bring all existing powers under one bill, after accusations it was flawed and failed to make its case.

It earlier emerged that Twitter, Apple, Google and other communication companies will not be forced to decrypt messages unless it is "practicable" as ministers admitted they are powerless to stop unbreakable encryption.

The move will reignite concerns that terrorists and criminals are increasingly hiding behind so-called "end-to-end encryption" in online messages, which even the provider cannot access.

It comes as figures show major communication companies are still rejecting up to half of requests for customer data from UK police and intelligence agencies.

In other measures to try and get the legislation through parliament, the Government will take the unprecedented step of publishing an "operational case" on why MI5, MI6 and GCHQ need to carry out bulk collection of data.

The document attempts to allay fears of mass surveillance by demonstrating that even when data is scooped up, only information on suspects is targeted.

Extra safeguards for journalists and lawyers will also be included along with additional authorisation checks on UK spy agencies when they need help from foreign intelligence agencies.

Mrs May is facing a backbench revolt over the legislation amid concerns it has to be rushed in to law before the end of the year, when laws governing some existing powers fall away.

Theresa May, the Home Secretary, said: "This is vital legislation and we are determined to get it right."

But Shami Chakrabarti, director of human rights group Liberty, said: "Minor botox has not fixed this Bill."

Kate Allen, of Amnesty International, said it "beggars belief that the Government is blundering on with its snooping power-grab".

The draft legislation, published in November, was criticised by three parliamentary committees as being "flawed" and failing to make a case for many of the controversial measures.

A source said: "We have considered the committees' reports carefully and the Bill we are bringing forward today reflects the majority of their recommendations. We have strengthened safeguards, enhanced privacy protections and bolstered oversight arrangements.

"This is world-leading legislation, setting out in unprecedented detail the powers available to the police and security services to gather and access communications and communications data, subject to a robust regulatory regime."

However, on encryption, the bill will clarify and "put beyond doubt" that companies "can only be asked to remove encryption that they themselves have applied and only where it is practicable for them to do so".

The source said that this will "make clear that the Government is not asking companies to weaken their security by undermining encryption".

Separate figures show that in the first half of 2015, Apple provide information following a UK request in 56 per cent of cases relating to a device and 63 per cent in connection with a customer account.

Google provided data in 75 per cent of requests over the same period while Facebook met 78 per cent of requests.

Twitter met 52 per cent of request in the first six months but that increased to 76 per cent in the second half of the year.

The Guardian (London)

Snooper's charter: wider police powers to hack phones and access web history

Tuesday, 01 March 2016

Byline: Alan Travis

Section: general

London - Powers for the police to access everyone's web browsing histories and to hack into phones are to be expanded under the latest version of the snooper's charter legislation.
The extension of police powers contained in the investigatory powers bill published on Tuesday indicates the determination of the home secretary, Theresa May, to get her legislation on to the statute

book by the end of this year despite sweeping criticism by three separate parliamentary committees in the past month.

The bill is designed to provide the first comprehensive legal framework for state surveillance powers anywhere in the world. It has been developed in response to the disclosure of state mass surveillance programmes by the whistleblower Edward Snowden. The government hopes it will win the backing of MPs by the summer and by the House of Lords this autumn.

May said the latest version reflected the majority of the 122 recommendations made by MPs and peers, including strengthening safeguards, enhancing privacy protections and bolstering oversight arrangements.

She has, in particular, made changes to meet concerns within the technology industry that the surveillance law would undermine encryption. The latest draft makes clear that the government will take a pragmatic approach, and no company will be required to remove encryption of their own services if it is not technically feasible. The likely costs involved will also be taken into account.

But the publication of the detailed bill has also revealed that, far from climbing down over her proposals, May intends to expand the scope of its most controversial new powers - the collection and storage for 12 months of everyone's web browsing history, known as internet connection records - and state powers to hack into computers and smartphones.

The bill will now allow police to access all web browsing records in specific crime investigations, beyond the illegal websites and communications services specified in the original draft bill.

It will extend the use of state remote computer hacking from the security services to the police in cases involving a "threat to life" or missing persons. This can include cases involving "damage to somebody's mental health", but will be restricted to use by the National Crime Agency and a small number of major police forces.

Four hours after the bill's publication the Home Office issued a highly unusual 'clarification' claiming that its official response published on Tuesday listing the powers to allow the police to use computer and phone hacking as a "key change" was because they had been missed out from the draft bill.

"Documents published alongside the bill today describe the position as having changed as it was not referenced in the draft bill. However it reflects current police practice. The fact that it was not included in the draft bill was an omission that is being corrected in the final bill."

The Home Office said the hacking powers dated from the 1997 Police Act and would most likely only be used in "exceptional circumstances" such as finding missing people. They would require a "double-lock" warrant with ministerial authorisation and judicial approval.

However evidence given to the scrutiny committee by the head of the Metropolitan police technical unit, Det Supt Paul Hudson, said such hacking powers were used "in the majority of serious crime cases" but refused to give further details in a public forum.

He described it as a "covert activity so nothing that we do under equipment interference would cause any damage or leave any trace, otherwise it would not remain covert for very long". His colleague said they could provide MPs and peers with data on its use but it was "very confidential" and would have to remain unpublished.

Hudson acknowledged that the technology has long moved on since 1997. Legalised hacking now allows a third party to even take remote control of a phone's camera or microphone to record video and conversations taking place.

The Home Office claims that the legalised hacking powers had been missed out of the original draft bill and so escaped the process of pre-legislative scrutiny was greeted with scepticism by at least one member of the scrutiny committee.

The expansion of police powers to access web browsing history as part of their investigations follows pressure from the police, and the use of these powers does not need the "double-lock" ministerial authorisation.

The home secretary told MPs she had rejected the committees' recommendations to exclude the use of state surveillance powers for the "economic wellbeing" of the UK. She also resisted their demand to scrap warrants allowing GCHQ to undertake bulk computer hacking, describing them as a "key operational requirement".

May also underlined the "vital part" played by the security agencies' "bulk powers" - the mass collection and storage of everyone's communications data in Britain and the bulk interception of the content of communications of those based overseas to acquire intelligence.

The Home Office has made detailed tweaks to the original draft of the bill, including stronger protections for journalists and lawyers, six codes of practice setting out how the powers will be used, and the use of a "double-lock" authorisation of the most intrusive surveillance methods by a minister backed by the approval of a judicial commissioner.

The Home Office has acknowledged that the initial costing of the bill, at around £247m, is not set, and a final figure will be published after detailed consultations with industry.

May said: "This is vital legislation and we are determined to get it right. The revised bill we introduced today reflects the majority of the committees' recommendations - we have strengthened safeguards, enhanced privacy protections and bolstered oversight arrangements - and will now be examined by parliament before passing into law by the end of 2016.

"Terrorists and criminals are operating online and we need to ensure the police and security services can keep pace with the modern world and continue to protect the British public from the many serious threats we face."

As part of the pre-legislative process, the bill was examined by a draft scrutiny committee, the intelligence and security committee and the science and technology committee.

The MPs and peers called for a fundamental rewrite of the draft bill, with the ISC calling for privacy safeguards to be made the backbone of the legislation and the draft scrutiny committee saying the case had not yet been made for the introduction of new powers to store and access everyone's web browsing history.

Eric King, director of the Don't Spy On Us coalition, which includes Liberty, Privacy International and other privacy and digital rights groups, called for a rethink of the bill.

"Rather than a full redraft, we've been given cosmetic tweaks to a heavily criticised, deeply intrusive bill," he said. "Reshuffling safeguards without meaningfully improving protections, authorisations or oversight does nothing to address widespread concerns about mass surveillance. The unsettling absence of a robust, technical, detailed evaluation of those bulk powers means the case still hasn't been made, and parliament won't have the information it needs to do its job.

"There simply isn't time for proper scrutiny of all these powers in the timeframe proposed. More than 100 experts called on the Home Office to put on the brakes. The government must think again."

Shami Chakrabarti, director of Liberty, said: "Less than three weeks ago MPs advised 123 changes to the majorly flawed draft bill. The powers were too broad, safeguards too few and crucial investigatory powers entirely missing.

"Minor Botox has not fixed this bill. Government must return to the drawing board and give this vital, complex task appropriate time. Anything else would show dangerous contempt for parliament, democracy and our country's security."

Lord Strasburger, a Liberal Democrat member of the scrutiny committee on the draft bill, said nothing had changed since they published their report three weeks ago: "The Home Office just doesn't do privacy. It does security and ever more intrusive powers they claim will make us safer, but not privacy. The fact that they see simply changing the name of one section to include the word 'privacy' as addressing the fundamental concerns about privacy protections in this bill is breath- taking," he said.

"The speed with which the home secretary is trying to force this bill through parliament shows no respect to the joint committee and ISC who worked so hard to give them workable solutions to problems in the draft bill, to parliament, or to the British people."

Vie privée - Le précédent Apple

Wednesday, 02 March 2016

Byline: Brian Myles

Section: editorial

Editorial - Le bras de fer entre Apple et le FBI sur le décryptage du iPhone marquera un tournant dans l'évolution du droit à la vie privée. Un droit en érosion constante à l'ère de la surveillance de masse. Ils ont tous les deux raison. Apple veut protéger la crédibilité de sa marque et la vie privée des utilisateurs du iPhone en refusant de répondre aux demandes d'assistance du FBI dans l'enquête sur l'attentat terroriste de San Bernardino. Et la police fédérale souhaite explorer toutes les avenues possibles afin de débusquer des complices potentiels de l'auteur du massacre qui a fait 14 morts, Syed Rizwan Farook. Rien n'est simple quand le droit à la vie privée est mis en opposition à la sécurité nationale. Jusqu'à tout récemment, Apple prêtait assistance aux policiers, notamment pour déverrouiller des iPhone, pour autant que les enquêteurs obtiennent une autorisation judiciaire.

À la suite de la tuerie de San Bernardino, Apple a même partagé sans broncher les données du cellulaire de Farook déjà stockées sur son compte iCloud. Le problème ? La dernière sauvegarde du téléphone de Farook remonte à environ un mois avant son passage à l'acte. Le FBI s'en voudrait de ne pas " retourner toutes les pierres " et de laisser filer de présumés complices de l'auteur du pire attentat terroriste en sol américain depuis le 11 septembre 2001.

Le poids des symboles est lourd, mais il ne saurait occulter la gravité des exigences formulées par le FBI, avec l'assentiment du gouvernement Obama. Le FBI demande à Apple de créer un logiciel sur mesure afin de passer outre le système de cryptage de la nouvelle génération d'appareils mobiles.

À la suite des révélations d'Edward Snowden sur la surveillance de masse, Apple a considérablement renforcé la technologie de cryptage de ses appareils. Au-delà de dix tentatives erronées d'entrer le mot de passe, la mémoire du iPhone s'efface. Le FBI a besoin de l'aide d'Apple pour créer l'équivalent d'une " porte arrière " lui permettant de faire intrusion dans l'appareil sans risquer de compromettre les données.

L'avancement de l'enquête sur la tragédie de San Bernardino est le moindre des soucis dans cette affaire. À preuve, quelque 175 enquêtes, entre autres pour trafic de drogue et homicide, sont

présentement dans un cul-de-sac aux États-Unis parce que les policiers sont incapables d'accéder aux appareils iPhone des suspects ou des victimes.

Si les tribunaux devaient donner gain de cause au FBI, le pouvoir d'intrusion des forces de l'ordre dans la vie privée des citoyens serait encore plus grand. Cette " porte arrière " pourrait être utilisée par des organisations criminelles, des pirates informatiques ou des agences de surveillance domestiques et étrangères. Il s'agirait d'un pas important vers la banalisation de la sursurveillance dans les nouvelles sociétés du numérique.

Le problème déborde largement les frontières américaines, puisque les précédents en matière d'enquête policière et d'entrave aux libertés civiles ont tendance à trouver un écho législatif au Canada, surtout lorsqu'il s'agit de lutter contre le terrorisme.

Lundi à New York, un juge a donné raison à Apple, qui refusait cette fois d'aider les policiers à accéder au cellulaire d'un présumé vendeur de drogue. Dans cette cause comme celle de San Bernardino, le débat juridique est centré sur une loi vieille de 1789, réinterprétée en 1977 par les tribunaux. Elle force les compagnies privées à prêter assistance aux policiers et à leur fournir des données (tel un registre des appels), sur autorisation judiciaire.

Le Congrès américain a entendu le FBI et Apple à ce sujet mardi. Il lui faudra prendre un virage vers la modernité sans compromettre les libertés civiles, le tout dans un climat de polarisation exacerbée de la politique américaine.

La justice freinée par le « Web profond »

Wednesday, 02 March 2016

Byline: Louis-Denis Ebacher

Section: general

Québec - Alertes à la bombe dans les écoles du Québec et de l'Ontario
Le Web profond (Dark Web) est la partie cachée d'Internet, innavigable par les moyens conventionnels.

La Sûreté du Québec (SQ) semble avoir de la difficulté à percer les profondeurs du Web pour cerner le ou les auteurs d'alertes à la bombe ayant visé plusieurs établissements scolaires du Québec et de l'Ontario, l'automne dernier.

-- FRANCOIS GERVAIS, ARCHIVES LE NOUVELLISTE

Les quatre jeunes de la région étaient accusés d'avoir lancé des alertes à la bombe dans plus de 70 écoles du Québec, le 3 novembre dernier.

Le Directeur des poursuites criminelles et pénales (DPCP) a arrêté les procédures judiciaires entamées contre eux.

La Couronne en a fait la demande au tribunal de la Jeunesse, vendredi dernier. L'arrêt des procédures a pris effet le même jour, ce qui veut dire que les chefs d'accusation sont en quelque sorte sur la glace pour une période d'un an.

Les quatre jeunes de 16 et 17 ans, des résidents de l'Outaouais, étaient accusés d'avoir lancé des alertes à la bombe dans plus de 70 écoles du Québec, le 3 novembre dernier. On leur reprochait aussi d'avoir envoyé des messages menaçants à des écoles d'Ottawa, et d'avoir répété l'envoi de courriels inquiétants au Cégep Héritage de Gatineau pendant plusieurs jours.

La défense reprochait à la Couronne de manquer de preuves.

« L'arrêt des procédures nous permet de reprendre le dossier au courant de la prochaine année, a précisé le porte- parole du DPCP, Me René Verret. L'enquête continue, et nous prenons cette affaire très au sérieux. »

Les conditions imposées aux adolescents visés sont aussi suspendues. Lors de leur mise en accusation, la cour leur avait entre autres interdit de communiquer entre eux et d'accéder à Internet. L'avocat de la défense, Me Michel Swanston, n'a pas commenté le dossier mardi.

DOSSIER DÉLICAT

Selon nos informations, le Cégep Héritage a reçu d'autres messages menaçants ces derniers jours.

L'enquête policière serait rendue difficile par l'utilisation du Web profond (Dark Web) par les auteurs de ce qui est, pour l'instant, une série de canulars. Le « Dark

Web » est la partie cachée d'Internet, introuvable par les moteurs de recherche conventionnels comme Google ou Yahoo.

Ce modus operandi pourrait en partie expliquer pourquoi il est si difficile pour les autorités de relier les messages à leurs auteurs.

Les jeunes ont été arrêtés par les autorités cet automne, après qu'un groupe autobaptisé « Sceptre rouge » ait fait des menaces auprès d'institutions d'Ottawa, de Gatineau, puis de la province de Québec. Les enquêteurs de la SQ les avaient longuement interrogé.

Non identifié - Les cybercriminels peuvent geler vos données et vous rançonner pour les libérer
La menace est invisible, mais les dirigeants d'entreprise et les chefs d'État provenant des quatre coins de la planète savent qu'elle est bien réelle. La cybercriminalité est en " forte croissance " et ne cesse de se raffiner, causant bien des sueurs froides. En ce début du Mois de la prévention de la fraude, les analyses démontrent l'ampleur du défi auquel font face les organisations en tous genres.

La firme KPMG donne le ton dans son Rapport de cyberveille, diffusé mardi, en rapportant une augmentation du nombre de tentatives d'extorsion par l'entremise des systèmes informatiques. Les cybercriminels infiltrent par exemple le système d'une entreprise, cryptent les données et réclament une rançon pour les rendre à nouveau accessibles. En cas de refus, ils volent les fichiers.

" Il y a lieu de croire que ces pratiques vont augmenter au Canada, particulièrement dans les organisations du secteur public, et dans les sociétés des secteurs juridiques et financiers, en raison de la nature privée et sensible des renseignements qu'elles détiennent ", souligne KPMG.

Il ne s'agit-là que d'un des types d'attaques perpétrées chaque jour par les cybercriminels, dans le but d'extorquer des informations ou de l'argent. Selon un sondage dévoilé la semaine dernière par PwC, 59 % des répondants canadiens jugeaient en 2015 que la cybercriminalité gagne du terrain, comparativement à 47 % en 2014.

" Ce qu'on voit, c'est une nette progression [des attaques], confirme Francis Beaudoin, leader Cybersécurité chez KPMG. Dans mon équipe, je vous dirais que nous sommes débordés de travail. De plus en plus d'organisations font appel à nous parce qu'il y a de plus en plus de cas. Et ce n'est pas seulement vrai à Montréal, c'est vrai partout au Canada et ailleurs dans le monde. "

Dans le plus récent rapport sur les risques mondiaux du Forum économique mondial (FEM) dévoilé en janvier, les résultats d'un sondage mené auprès de dirigeants d'entreprises ont confirmé cette tendance. Les répondants américains et canadiens, tout comme ceux provenant de l'Allemagne, du Japon, de la Suisse ou des Pays-Bas estiment que les cyberattaques figurent parmi les menaces les plus susceptibles de nuire à la conduite des affaires.

" Les récentes avancées technologiques ont été bénéfiques à plusieurs égards, mais elles ont aussi ouvert la porte à une vague grandissante de cyberattaques [...] qui ciblent de plus en plus les entreprises ", fait remarquer le FEM dans son rapport.

Le document rappelle par ailleurs que la cybercriminalité coûte près de 445 milliards $US par année à l'économie mondiale, selon les données compilées en 2014 par le Center for Strategic and International Studies.

Motivation différente

À l'origine, les cybercriminels voulaient essentiellement nuire aux entreprises qu'ils attaquaient, constate Francis Beaudoin, de KPMG. Mais depuis quatre ou cinq ans, la motivation est différente. " On voit l'infiltration du crime organisé dans des groupes de hackers,et le but est de faire des gains financiers. "

M. Beaudoin admet qu'il est difficile de mesurer l'ampleur des crimes économiques commis par l'entremise du cyberespace, notamment parce que les délits ne sont pas tous déclarés. Certaines entreprises gardent le secret sur les dommages qu'elles ont subis pour éviter d'entacher leur réputation, alors que d'autres ne croient pas que les autorités policières pourront leur venir en aide.

Les plus récentes données annuelles fournies par le Centre antifraude du Canada, qui travaille en partenariat avec la Gendarmerie royale du Canada et le Bureau de la concurrence, indiquent qu'en 2014, les entreprises canadiennes ont signalé des pertes financières totalisant plus de 26 millions de dollars.

Ces sommes perdues, sans doute sous-évaluées, sont généralement le résultat d'une protection inadéquate. Le rapport du FEM soulignait à ce titre que les dirigeants d'entreprise sont préoccupés par la montée de la cybercriminalité, mais que plusieurs d'entre eux ne savent pas comment y répondre. Dans certaines organisations, le manque de clarté dans la définition des rôles nuit également à la prévention des risques.

Même si de plus en plus d'entreprises canadiennes se préparent au pire, elles ne sont pas complètement immunisées pour autant, concède Francis Beaudoin.

" C'est comme avec le virus de la grippe. Le vaccin annuel nous protège contre les souches de l'année dernière, mais pas nécessairement contre toutes les souches, illustre-t-il. Donc, oui, nous sommes souvent quelques pas derrière le hacker. "

Huit ans requis en appel à Paris pour un "cyberjihadiste" tunisien arrêté à Toulon

Wednesday, 02 March 2016

Byline: Journaliste maison

Section: general

Paris - Il se présentait comme l'administrateur du "plus grand forum jihadiste du monde", lié à Al-Qaïda: huit ans de prison ont été requis en appel lundi à Paris à l'encontre d'un "cyberjihadiste" tunisien. Nabil Amdouni avait été arrêté à son domicile en 2012 à Toulon. AR avec AFP
Dans son réquisitoire, l'avocat général a également assorti sa demande d'une peine de sûreté des deux tiers. "M. Nabil Amdouni nous dit que du musulman radical qu'il était, il est devenu un musulman tolérant avec une toute nouvelle vision de sa religion", a ironisé le représentant du ministère public. "Mais ces propos ne doivent pas nous faire oublier ce qu'il a fait."

En première instance, le procureur avait déjà requis en sus une interdiction définitive du territoire français contre celui qu'il avait qualifié "d'un des maîtres du jeu d'un autre jihad, le jihad médiatique".

L'un des administrateur du "plus grand forum jihadiste du monde"Nabil Amdouni, 37 ans, avait été arrêté en juillet 2012 à Toulon, où il vivait avec son épouse et leurs deux enfants. Les services de renseignement l'avaient identifié depuis environ un an comme administrateur du site "Choumoukh al-islam", "le plus grand forum jihadiste du monde", selon les propres mots de M. Amdouni.

Il avait créé ce site hébergé sur un serveur en Malaisie, en juin 2007, après avoir gravi les échelons (simple membre, modérateur puis administrateur) d'un autre site web jihadiste. "Choumoukh al-islam" (fierté de l'islam) avait reçu l'agrément d'Al-Fajr, la branche médiatique d'Al-Qaïda.

Nombre des messages dans la partie privée des forums étaient cryptés et Choumoukh, en lien régulier avec Al-Qaïda dans la péninsule arabique et Al-Qaïda au Maghreb islamique.

Ont ainsi été transmis des détails sur des personnalités cibles potentielles, la fabrication d'explosifs, ou encore des revendications d'enlèvement. Des filières de recrutement ou de financement étaient également promues, mais M. Amdouni a affirmé avoir aidé "seulement deux" candidats jihadistes à partir au Yémen.

"Je me condamne moi-même""Je me condamne moi-même. J'ai fait des choses immorales. Je le sais maintenant", a reconnu lundi Nabil Amdouni, qui n'a jamais nié les faits au cours de ses deux procès.

"Il y a autre chose à faire que la prison pour mon client", a plaidé son avocat Me Éric Bourlion, brandissant un rapport de la maison d'arrêt d'Osny (Val d'Oise) qui démontre que "(s)on client a changé".

Pour l'avocat, expulser son client "vers la Tunisie est contre notre intérêt car après quatre années de déradicalisation en maison d'arrêt, on pourrait espérer un retour sur investissement".

La cour d'appel de Paris rendra sa décision le 5 avril.

Big Brother, Big Data, Big Problem Il était une fois

Wednesday, 02 March 2016

Byline: Joëlle Kuntz

Section: oped

Opinion - Les personnages: - Olibrius Connecticus, habitant ordinaire de la planète numérique. Il a adhéré à la religion des codes de sécurité qui lui promet l'épanouissement de son moi sous la protection de ses mots de passe confidentiels. Il vénère saint Assange et saint Snowden, qui ont risqué leur vie pour démontrer combien sa liberté est menacée: Big Brother voit tout, écoute tout, contrôle tout. Big Brother, c'est tantôt la NSA qui enregistre Angela Merkel même quand elle dort, tantôt Google et ses caméras du coin de la rue. Olibrius se couche le soir avec l'impression contradictoire que ses codes sont sûrs mais qu'ils ne servent à rien contre Big Brother. Il s'arrange comme il peut de cette bizarrerie.
- Foreign Bureau of Investigation, FBI. Superpuissance policière prise en flagrant délit d'incompétence en matière électronique: après une fausse manoeuvre sur un iPhone abandonné par un terroriste sur la scène du massacre de San Bernadino, en Californie, le FBI a perdu tout moyen d'entrer dans la mémoire de l'appareil. Il somme Apple de lui en fournir un. Il y va de la sécurité des citoyens des Etats-Unis. L'Etat ne peut assumer la tâche de protection que ceux-ci lui délèguent démocratiquement que si chacun consent à sacrifier sa part de souveraineté.

- Apple, entreprise admirée dans la vente de connectivité confidentielle. Elle compte parmi les plus grandes capitalisations boursières de tous les temps. Elle résiste aux demandes gouvernementales. Produirait-elle une entrée - une seule - dans un téléphone vendu comme sécurisé qu'elle perdrait toute

la confiance placée en elle (exprimée en monnaie). Ce n'est pas la première fois qu'on la cherche, sous des prétextes bons ou moins bons et presque à chaque fois elle dit non.

- Silicon Valley, chef-lieu de l'utopie technologique, équivalent américain d'un Arc-et-Senans qui aurait réussi avec l'idéologie libertaire ce qui a échoué avec le communisme primitif. Là s'élaborent les conditions matérielles de l'Homme augmenté, maître de l'Information. Big Data étant aussi Big Money, Silicon Valley est unie derrière Apple contre FBI. Il y va des milliards investis dans la promesse d'une libération par les machines. Dans ce milieu de chercheurs et de marionnettistes qui inventent les moyens de tout savoir sur tout le monde règne le culte de la vie privée, du secret et de la protection des données.

- Daech, nom générique pour terrorisme, emprunté à la faction criminelle irako-syrienne qui sème la terreur et la mort un peu partout dans le monde. C'est le mal. Syed Rizwan Farook et sa femme Tashfeen Malik, les deux auteurs présumés de la tuerie de San Bernardino (14 morts, 21 blessés, le 2 décembre 2015) auraient agi au nom de Daech dont, aux dires des enquêteurs, ce serait la première attaque sur sol américain. Comme il se doit, le mal est le déclencheur de la contradiction dramatique. Par le scandale du crime, il expose la vraie situation des protagonistes.

La scène: Olibrius est la figure tragique. Doté des deux pouvoirs qui comptent, le pouvoir d'achat et le pouvoir politique, il est impuissant à déterminer lequel est pour son bien ou comment combiner les deux, si même ils se combinent. Le consommateur de machines, en lui, dispute la prérogative au citoyen électeur. Où sa liberté est-elle la mieux placée? Dans la défense de sa vie privée vendue par Apple? Dans la défense de la loi proclamée par le FBI? Seul devant son écran, Olibrius, qui n'est pas un mauvais bougre, soupèse les enjeux. Big Brother, Big Data, Big Problem. Dans quel monde est-il? Il écoute plein tube les choeurs de Silicon Valley qui accablent l'Etat fouineur. Musique agréable aux fidèles interconnectés des Nouveaux Territoires de l'humain machinisé.

C'est alors que la bombe explose, signée Daech. Le moi blindé d'Olibrius éclate en petits morceaux. Ses mots de passe se répandent sur le parquet, des chiffres et des lettres sans plus d'utilité. Ses illusions s'écoulent, goutte à goutte, jusqu'à la dernière.

Le Figaro

Le patron du FBI demande au Congrès d'obliger Apple à collaborer

Wednesday, 02 March 2016

Byline: Pierre-Yves Dugua

Section: general

Washington - En plein bras de fer judiciaire et technique avec la firme à la pomme, il veut la contraindre à ouvrir l'iPhone d'un des terroristes impliqué dans l'attaque de San Bernardino.
Apple a crée depuis 2014 une génération de smartphones inviolables et les polices américaines en sont outrées. Elles veulent renouer avec la situation qui prévalait avant septembre 2014, date de la sortie du système d'exploitation «iOS 8», logiciel au coeur des iPhone, perfectionné depuis avec l'iOS 9.

Devant la Commission judiciaire de la Chambre des représentants, mardi à Washington, le patron du FBI et le procureur de l'État de New-York ont plaidé leur cause, dans le contexte de la controverse suscitée par le refus d'Apple d'aider les autorités fédérales à accéder aux données de l'iPhone d'un des terroristes de l'attaque de San Bernardino le 2 décembre dernier.

Au même moment, à San Francisco, la Secrétaire à la Justice, Loretta Lynch, a prôné un dialogue entre le gouvernement et toute l'industrie de la haute- technologie, en déclarant qu'on ne pouvait «laisser une seule société trancher à elle-seule le débat sur l'encryptage».

«En mai 2012, Apple expliquait que son iOS 7 offrait «une protection solide contre les virus, le malware et les autres méthodes qui compromettent la sécurité d'autres plateformes». Et pourtant avec iOS 7, Apple conservait sa capacité à aider - pour reprendre leurs mots de l'époque - «la police à enquêter sur les vols et autres délits, à rechercher les enfants disparus, à localiser un patient souffrant d'Alzheimer ou à prévenir un suicide». Apple elle-même démontrait alors qu'un cryptage fort et qu'un respect des décisions de justice n'étaient pas incompatibles» a rappellé mardi Cyrius Vance Jr., procureur élu du comté de New-York.

«Nous voulons que les fabricants de smartphones offrent le même type d'encryption qu'Apple employait avant l'iOS 8» a résumé ce démocrate. Il s'exprimait aussi au nom de ses collègues d'autres États, de l'Illinois et du Texas par exemple. Son laboratoire se trouve aujourd'hui incapable de déchiffrer les données présentes dans 175 iPhone et iPad.

Un iPhone sur deux saisis par la police de New York ne peut être exploité

Désormais un de ces appareils sur deux saisis par la police de New York ne peut être exploité. Or «dossier après dossier, nous avons vu des homocides aux kidnappings, des trafics de drogue à la fraude financière et à l'exploitation des enfants, que les preuves décisives venaient des smartphones, des ordinateurs et des communications sur internet» a renchéri James Comey, le Directeur du FBI.

Les procureurs et policiers ne demandent pas de pouvoirs nouveaux. Ils souhaitent simplement le retour à la situation passée: celle antérieure au traumatisme de la Silicon Valley par l'affaire Snowden. À cette époque les géants de la technologie acceptaient les protections mises en place par la constitution américaine. Au terme de son 4ième amendement, les perquisitions et fouilles sont possibles, à condition qu'elles soient autorisées par un juge indépendant sur la base de présomptions sérieuses. «Les iPhones

sont maintenant les premiers produits de consommation de l'histoire américaine à se trouver hors de portée des mandats de perquisition prévus par le 4ième amendement» résume Cyrius Vance Jr..

Forcer Apple à changer de politique et de technologie

Sa démarche, tout comme celle du FBI, vise donc explicitement à créer un précédent, contrairement à ce que James Comey avait dit la semaine passée. En profitant du traumatisme de l'attaque terroriste de San Bernardino le 2 décembre 2015, ils tentent de forcer Apple à changer de politique et de technologie. Ils ne veulent pas simplement qu'on les laisse décrypter l'iPhone d'un terroriste islamique, assassin de 14 personnes. Ils veulent un nouveau régime législatif encadrant et garantissant ce privilège à l'avenir.

Apple, représenté mardi à Washington, par son Directeur juridique, Bruce Sewell, réplique que le FBI et les procureurs étatiques demandent de dégrader la sécurité de tous ses nouveaux iPhone. Créer un outil pour dévérrouiller ses smartphones est inacceptable aux yeux d'Apple: cela reviendrait à ouvrir une brèche dans laquelle potentiellement des criminels pourraient s'engouffrer pour violer les secrets de millions de personnes.

Asharq Al-Awsat

Facebook Executive Jailed in Brazil

Wednesday, 02 March 2016

Byline: Staff Report

Section: general

Sao Paulo - Court officials in Sergipe state confirmed that a judge had ordered the jailing of Facebook Vice President for Latin America Diego Dzodan. Thus the Brazilian police arrested the senior Facebook executive on Tuesday as a dispute accelerated over a court's demand that the company provide data from its WhatsApp messaging service to help in a private drug- trafficking investigation.
However the federal police in Sao Paulo state said he was being held there for questioning. To avoid compromising the ongoing criminal investigation, the law enforcement officials withheld further information about the nature of their request to the messaging service that Facebook Inc acquired in 2014.

The arrest came as social media and Internet companies face mounting pressure from governments around the world to help them spy on users and filter content. Such arrests of officials from social media companies are very rare, though not exceptional, since the companies typically comply with local court

orders, especially from countries where they have branch offices. However Facebook called this arrest as an "extreme and disproportionate measure".

Marcia Hoffmann, Internet law attorney, said that WhatsApp is a company that was launched very focused on U.S. laws, however now that it's owned by a company with people and resources in other countries, there is more leverage for those governments to put pressure in new and in different ways. Consequently arresting executives is one of them.

Internet freedom activist, Rebecca MacKinnon stated that "Precisely because these large global Internet companies have staff in many countries who are vulnerable to legal action including arrest and criminal charges, they generally do comply with legally binding requests from authorities for user data or to remove or block content in those countries where they have 'boots on the ground".

Because it did not have staffs scattered around the globe; unlike and previous to its acquisition by Facebook, California-based WhatsApp had less skin in the game in disputes with governments outside the United States.

Meanwhile details of the case remain foggy; court officials said the judge in Brazil resorted to the arrest after issuing a fine of 1 million reais ($250,000) to compel Facebook to assist investigators to access WhatsApp messages that are relevant to their drug-trafficking investigation.

Which is probably impossible since WhatsApp began using end-to-end encryption technology in 2014 that prevents the company from monitoring messages that travel across its network, said Christopher Soghoian, principal technologist with the American Civil Liberties Union.

Soghoian said that the arrest raised as Apple Inc finds itself at odds with the United States government on parallel grounds. "They are on use of technology in an attempt to take themselves out of the surveillance business,".

Apple has refused the U.S. prosecutors' request of the company to build a software tool that helps investigators unlock the iPhone used by one of the shooters in the San Bernardino, California, attacks. The refuse came as with Apple stating that this would set a dangerous precedent that would make its customers vulnerable to spying.

Although the confrontations hardly rise to the prominence of Apple's current standoff with the U.S. authorities, yet privacy concerns have previously put Facebook at odds with Brazilian law enforcement seeking evidence in criminal cases.

In December, a judge suspended Facebook's popular WhatsApp phone-messaging service in Brazil for about 12 hours after it failed to fulfill both of the court orders when demanded to share information in a criminal case.

According to legal expert Ronaldo Lemos, a chief architect of that 2014 law, Brazil passed an Internet law two years ago intended at streamlining thorny legal issues, but lower courts still have vast discretionary powers.

Lemos stated that the "The court of appeals tends to be more sensitive in these cases, but the lower courts are still tough, as today's decision shows".

S.Korean PM warns of cyber attacks from DPRK

Wednesday, 02 March 2016

Section: general

South Korean Prime Minister Hwang Kyo-Ahn on Wednesday warned of possible cyber attacks from the Democratic People's Republic of Korea (DPRK), instructing officials to block such attacks in advance. Hwang visited a center in Seoul for countermeasures to Internet infringement, saying that a close cooperation system should be built between the military, the government and the civilian sector to blockade the DPRK's possible attacks in cyberspace in advance.

The prime minister said that top DPRK leader Kim Jong Un had ordered officials to muster up capability for anti- South Korea terrorist attacks, which raised possibility for the DPRK's cyber provocations.

South Korea's spy agency reportedly made mention of Kim's such order without elaborating on where the agency got the information.

Hwang said the DPRK had staged massive cyber attacks against South Korea after conducting nuclear tests, instructing officials to detect such attacks at a right time and recover attacked networks successfully.

He also urged people to update security vaccines on their PCs and smartphones and to refrain from opening suspicious emails or text messages in order to minimize possible cyber attacks from Pyongyang.

His comments came amid rising concerns about DPRK's terror attacks following its fourth nuclear test on Jan. 6 when the DPRK tested what it claimed was its first hydrogen bomb. On Feb. 7, Pyongyang launch a long-range rocket, which was condemned by outsiders as a test of banned missile technology.

En 2012, le Service canadien du renseignement de sécurité (SCRS) a cherché à savoir
Wednesday, 02 March 2016
Byline: Vincent Destouches

Ottawa - En 2012, le Service canadien du renseignement de sécurité (SCRS) a cherché à savoir si Anonymous avait réellement l'intention de s'en prendre au réseau électrique.
Wikimedia

Le 21 février 2012, le Wall Street Journal a révélé l'inquiétude dont avait fait part le général Keith Alexander, alors directeur de la National Security Agency (NSA), à de hauts fonctionnaires de la Maison-Blanche. Il craignait que le groupe «hacktiviste» Anonymous «puisse avoir la capacité, d'ici un an ou deux, de provoquer une panne de courant limitée».

Ces allégations, qui seraient plus tard qualifiées d'alarmistes, ont eu des répercussions jusqu'au Canada. Au printemps de la même année, la spécialiste en piratage informatique Gabriella Coleman s'est rendue dans la banlieue d'Ottawa sur invitation du Service canadien du renseignement de sécurité (SCRS). Pour l'agence, Gabriella Coleman représentait un atout unique, puisqu'elle avait passé «plus de temps devant [son] écran d'ordinateur à "chatter" avec des membres d'Anonymous que toute autre personne étrangère au collectif, à part peut- être les informateurs», selon les propres mots de l'intéressée.

Paralysée d'appréhension, et encore plus anxieuse de dévoiler des détails qu'elle aurait préféré taire, Gabriella Coleman s'est vite rendu compte que la quarantaine d'espions canadiens venus à sa rencontre avaient un but autre que celui d'écouter son exposé: le SCRS souhaitait savoir si, à la lumière des propos tenus par la NSA, Anonymous pouvait réellement avoir l'intention de s'en prendre au réseau électrique. «J'imagine que le Canada a été amené à s'intéresser de plus près à ce groupe énigmatique sous la pression de son voisin du Sud», a écrit Coleman -- qui est aujourd'hui à la tête de la Chaire Wolfe en littératie scientifique et technologique de l'Université McGill -- dans son journal d'enquête anthropologique Anonymous: Hacker, activiste, faussaire, mouchard, lanceur d'alerte (récemment publié en français).

Même si elle ne pouvait scruter tous les salons de discussion - - d'autant qu'Anonymous ressemble à un labyrinthe générateur d'autres labyrinthes --, Coleman leur a alors répondu qu'aucun indice ne permettait de l'envisager. Anonymous, qui ne défend ni philosophie ni programme politique clair, n'avait même jamais appelé à perpétrer ce genre d'attaques. «D'ailleurs, le moindre projet d'action radicale, y compris la divulgation de données privées touchant des policiers hostiles, suscite de houleux débats moraux.»

À ses interlocuteurs de l'agence du renseignement, elle a résumé l'état d'esprit d'Anonymous, à cheval entre l'humour noir (le lulz, terme dérivé de lol) et l'irrévérence, par un trait d'esprit qu'un Anon (membre du collectif) avait partagé dans la foulée des accusations de la NSA.

«C'est vrai. Nous allons bel et bien foutre en l'air le réseau électrique. Nous saurons que nous avons réussi quand tout l'équipement dont nous avons eu besoin pour organiser la campagne sera devenu complètement inutilisable.»

Et Coleman de décrire le soulagement des agents du renseignement:

«Les postures se décontractent aussitôt. Le rire se fait de nouveau entendre chez les espions canadiens. J'ai vraiment l'impression que mon témoignage les a soulagés. Ils peuvent maintenant retourner à des affaires plus pressantes.»

Au coeur d'Anonymous se trouvent le maintien de l'anonymat, la libre circulation de l'information et la défense de la liberté d'expression - rien de plus normal pour un groupe né sur Internet. Mais ses préoccupations ne se limitent pas aux libertés civiles. Les membres ont participé à diverses campagnes au cours des dernières années, de la dénonciation de viols (notamment à Halifax) au soutien actif des militants du Printemps arabe, en 2011. Bref, l'eau a coulé sous les ponts depuis l'époque antérieure à 2008, où le nom d'Anonymous servait «presque exclusivement à ce qu'un Anon a qualifié de "salopage sur Internet" (Internet motherfuckery)».

«Il est pratiquement impossible de connaître à l'avance le moment et les motifs de la prochaine action d'Anonymous, pas plus qu'on ne peut prédire l'apparition d'un nouveau noeud, le succès d'une campagne et un changement d'orientation ou de stratégie en cours d'opération. C'est sans doute en raison de son comportement imprévisible qu'Anonymous fait si peur aux gouvernements et aux entreprises du monde entier», écrit Coleman dans son livre.

Son caractère imprévisible est également lié à la diversité des sensibilités qui coexistent au sein du dédale infini qu'est Anonymous. Le groupe repose sur le principe selon lequel n'importe qui peut revendiquer le nom d'Anonymous en toute légitimité, ce qui lui a permis de se répandre aux quatre coins du monde, devenant le visage populaire de l'agitation. La diversité de formes par lesquelles Anonymous se manifeste donne ainsi lieu à des guerres intestines, tant les réseaux et les sous-groupes sont nombreux et parfois en désaccord.

«La plupart d'entre nous sommes motivés par l'humour. C'est pourquoi il ne faut pas s'étonner de nos disputes fréquentes avec des groupes qui, tout en se réclamant d'Anonymous, n'ont plus nos bonnes grâces, comme [...] les nouveaux Anons strictement militants d'Occupy Wall Street, les adeptes des théories du complot ou d'autres entités beaucoup trop sérieuses qui se parent de ce nom», a expliqué un conférencier d'Anonymous à une classe d'étudiants de Coleman.

L'auteure a fourni un exemple de ces désaccords: une campagne de protestation contre l'Accord commercial anticontrefaçon (ACTA), qui visait «la mise en place d'une réglementation d'envergure qui criminaliserait toute violation du droit d'auteur et inciterait les fournisseurs d'accès Internet à pister et à surveiller leurs clients en vue d'établir leur profil». La discussion entourant l'ACTA sur un canal IRC (Internet Relay Chat) a montré l'étendue des visions qui s'affrontent, d'autant qu'il y a au sein

d'Anonymous un débat virulent sur la dimension éthique de l'attaque informatique par saturation. (La distributed denial-of- service (DDoS) est une tactique visant à bloquer l'accès à des serveurs Web en les submergeant de requêtes.) La question est de savoir si elle est un «acte de liberté d'expression ou un acte visant à priver autrui de ladite liberté». L'échange a aussi permis de mettre en valeur le processus peu commun par lequel un projet peut être décrété officiel: il suffit que quelqu'un le déclare comme tel et qu'assez de monde y soit favorable.

«Fin août 2010, un Anon s'exprimant sous le nom de golum (qui n'est pas son pseudo habituel) se connecte au forum et y annonce hardiment son intention de faire avancer le dossier en menant une attaque par saturation contre le site du bureau du représentant au commerce des États-Unis, ustr.gov, le 19 septembre à 21 heures HNE. [...] L'annonce de golum suscite des questionnements chez beaucoup de participants.

[...] pourquoi si vite?

Parce que c'est un dimanche et que tout le monde aime les dimanches

mais encore... pourquoi si vite?

Parce que j'ai lancé un dé

Et qu'il est tombé sur 19

Je prédis que le 19 septembre les gens auront une prise de conscience

Fais-moi confiance. Le 19 septembre.

fais-moi confiance à propos d'une date choisie sur un coup de dé

Même si tous les participants à la discussion rejettent violemment sa proposition, golum reste inflexible:

Peu importe. Écoutez, j'ai entendu tous vos arguments contre une attaque par saturation. Mais le fait est que nous devons les réveiller.

[...]

Je sais bien qu'une attaque par saturation pourrait nuire à notre cause.

Mais je crois que le jeu en vaut la chandelle.

en ce qui me concerne, n'étant pas d'accord, je ne participerai pas à une attaque par saturation

Nous devons attirer l'attention

<+void> OMG C'EST ANONYMOUS, TOUT CE QU'ILS FONT C'EST DES ATTAQUES PAR SATURATION, OMGOMGOMGOMGOMG [...]

Non.

matty, comment ça s'est passé ta prise de contact avec les politiciens?

Ouais, j'ai toujours haï les attaques par saturation

Écoutez. J'ai saisi tous les arguments, je voulais juste dire qu'on devrait le faire.

Nous ne sommes PAS en train de mener une attaque par saturation. C'est seulement dans 20 jours.

20 jours, c'est long.

Quelques Anons énumèrent alors les risques juridiques d'une telle opération en soulignant le fait que le gouvernement des États-Unis n'est pas une cible comme les autres, puis jugent la discussion terminée. (Notons que leur évaluation des risques d'arrestation s'avérera juste: au moins 27 individus seront mis en accusation pour la série d'attaques par saturation qui suivra; d'autant qu'aux États-Unis, s'en prendre à quiconque un tant soit peu célèbre peut attirer de graves ennuis.)

c'est pas justin beiber, c'est le gouv américain bordel [...]

SVP, tous, écoutez-moi quand je parle

Je vais bien me marrer quand tu iras en prison

je suis pas là pour le foutu lulz

C'est officiel. Commencez à vous préparer. »

Use of metadata crucial, CSE insists
Thursday, 03 March 2016
Byline: Greta Bossenmaier

Bring our spies to heel, Editorial Feb. 25
In response to your editorial related to the Communications Security Establishment (CSE), I would like to provide a few clarifying facts.

First, CSE's authority to acquire and use metadata is founded in the National Defence Act.

Secondly, CSE discovered the issue on its own, proactively disclosed it and took steps to address it.

Thirdly, the potential privacy impact to Canadians has been assessed as low because the metadata that was shared did not contain enough information on its own or contextual details to identify individuals associated with it. Additionally, other important safeguards and privacy protection measures are in place, and applied, as confirmed by the CSE commissioner, by both CSE and its Five Eyes partners.

CSE's work is critical to the national security of Canada and Canadians. Our work directly helps protect the lives of deployed Canadian Armed Forces and coalition members (most recently in support of Canada's Operation Impact), we detect foreign-based extremist plots against Canada and our allies, we identify hostile intelligence agencies' activities against Canada and against our national interests and we detect and thwart over 100 million malicious cyber attempts against government of Canada networks every day.

None of this is possible without the use of metadata. Metadata is critical to understanding the communications environments in which CSE operates and the behaviours of our foreign intelligence targets. It is the context but not the content of a communication. Context, not content.

CSE is committed to continuous improvement, to protecting the privacy of Canadians and to contributing to Canada's national security.

Greta Bossenmaier, chief, Communications Security Establishment, Ottawa

ABC (Australia)
Former Anonymous member Adam John Bennett given suspended sentence for website hacking
Thursday, 03 March 2016
Byline: Staff reporter

A Perth judge has given a former member of online activism group Anonymous a suspended sentence for helping hack into websites in 2012.
Adam John Bennett, 42, pleaded guilty to six charges including aiding another person to cause the unauthorised impairment of electronic communications.

Five of the offences occurred in November 2012, when members of the group Anonymous hacked into websites around the world.

Bennett used the pseudonym 'Lorax' for his online activities, and had an online radio show, as well as thousands of followers.

The court was told when Bennett's Scarborough home was searched in 2014, a Guy Fawkes mask was found, along with audio streaming and studio equipment.

It was alleged there were plans for a "mass defacement" of sites planned to mark Guy Fawkes' Day in 2012.

The court was told Bennett helped a juvenile in NSW dubbed 'Juzzy' to hack into a variety of sites, including those operated by the Australian Agency for Education and Training, the Australian Film Institute, Anchor Foods, and the Food Industries Association of Queensland.

When the public tried to access a hacked site, they found a message from the group in red text on a black background.

Prosecutor Patricia Aloi told the court "the plan was to get a much larger number of sites".

She said the "impact could be described as a nuisance, could be described as lost productivity", and such offending could escalate.

Ms Aloi said the Commonwealth believed a custodial sentence was appropriate.

Lawyer argues rant was one of 'political ideology'

Acting on behalf of Bennett, Darren Renton told the court the hacked web pages were accessible, and only the front page had the Anonymous "rant".

He agreed with Justice Phillip McCann's description of the offences as being "like barricading the front door and not the side door".

Mr Renton said the Anonymous rant was one of "political ideology" and there was no suggestion of financial or monetary gain, or sensitive information being accessed.

While the result was something akin to "digital graffiti", he said his client accepted he was breaking the law, and it was an illegal way to put forward a political view.

A sixth offence involved the website of Bennett's employer Cancer Support WA and that of HotCopper.

Bennett tested the sites for vulnerability to the Heartbleed security bug, and tried to access confidential information.

Mr Renton spoke of other communications Bennett had with various companies, and the Supreme Court of Tasmania, and Senator Nick Xenophon, in which he highlighted how they were vulnerable to hacking.

Bennett used the Anonymous Australia Twitter account, and Mr Renton said his client was being "altruistic".

But Justice McCann said the actions were more like bullying and intimidation, including when Velocity Internet was told "you have been warned".

'Immature rants of the schoolyard'

Justice McCann was highly critical of Bennett, who he referred to as a "creepy pest" and an "immature creep who doesn't mind his own business".

He said "as a private citizen he has no business pestering people like Nick Xenophon".

Justice McCann said there was a "high level conspiracy to commit anarchist acts".

He highlighted part of the rant which said information about corporation and governments should be publicly available, and called it "a recipe for anarchy".

Justice McCann said it was not a political ideology, more like "immature rants of the schoolyard".

He said Bennett, who was in his late thirties when the offences occurred, was "grossly immature" with an "unjustified sense of self worth".

But he said to jail Bennett, who had "basically never grown up", would make him a martyr, and he should instead be given the "21st century equivalent" of being in the stocks.

Justice McCann said while there was "insufficient evidence of damage" by the hacking in 2012, there was malice.

He said the use of the internet was a privilege and not a right.

Bennett was given a sentence of two years' imprisonment, suspended for two years, as well as 200 hours of community service and an intensive supervision order.

Bennett, a long-time lifesaver at Scarborough Beach, first entered guilty pleas in October 2015, and the fact he had shown remorse was taken into account.

Un « bouclier » de papier mâché
Thursday, 03 March 2016
Byline: Alain Jennotte

Bruxelles - Technologies Les critiques se multiplient contre le traité Privacy shield
Le traité entre l'Europe et les Etats-Unis pour la protection des données risque d'être l'objet de recours. Son contenu ne répond guère aux standards européens en matière de protection de la vie privée.

A peine dévoilé par la Commission européenne, le nouvel accord Privacy shield, conclu entre l'Europe et les Etats-Unis sur la protection des données personnelles, reçoit déjà une volée de bois vert. Ce « bouclier de confidentialité », dont les détails ont été publiés lundi, est le futur cadre juridique énumérant les garanties pour la protection des données personnelles des Européens, lorsqu'elles sont transférées aux Etats-Unis par des entreprises américaines, comme Google ou Facebook.

Privacy shield a été négocié pour remplacer l'accord précédent, Safe Harbor, conclu en 2000. Celui-ci avait été sèchement dégommé par la Cour européenne de justice, dans un arrêt très ferme rendu en octobre dernier. La Cour estimait notamment qu'en raison de la surveillance massive des données par ses agences gouvernementales, les Etats-Unis n'offraient plus un niveau suffisant de protection pour les données.

Le nouveau texte est loin de faire l'unanimité. « La Commission a fait fi de l'arrêt de la Cour de justice , note Emmanuel Foulon, porte-parole du député européen Marc Tarabella (PS). Le texte précise que les Américains auront le droit d'épier toutes les données qu'ils voudront, dès qu'ils estimeront avoir un motif pour le faire et cela sans avoir à donner la moindre justification » .

Le nouveau traité va mettre en oeuvre de nouveaux mécanismes de supervision afin de s'assurer que les entreprises américaines qui stockent des données européennes respectent toutes leurs obligations, sous peine de sanctions. Un ombudsman indépendant sera mis en place, permettant aux citoyens qui le souhaitent de vérifier que l'intégrité de leurs données a bien été respectée. Mais il sera également possible pour les citoyens et les entreprises de s'adresser à leur autorité nationale de protection des données pour porter plainte.

Pour la première fois, se félicite la Commission européenne, les Etats-Unis se sont engagés par écrit à s'abstenir d'un accès généralisé aux données européennes stockées chez eux. Mais tout aussitôt, l'engagement américain s'est vu assorti d'une série de conditions tellement large qu'il ne signifie plus grand-chose. Ainsi, dans les courriers officiels annexés au traité, les Etats-Unis précisent qu'ils pourront procéder à de la collecte massive de données dans six cas spécifiques. Parmi ceux-ci, la cybersécurité, la lutte contre le terrorisme, les menaces criminelles transnationales ou la détection de certaines activités menées par des pays étrangers. Les exceptions ratissent très large.

Pour l'Autrichien Max Schrems, dont le recours avait été à l'origine de l'arrêt de la Cour européenne de Justice, ces licences que s'accordent les Etats-Unis montrent que, malgré des améliorations sur des points périphériques, le nouveau texte ne répond en rien aux exigences de la Cour européenne de Justice. Un échec qui s'explique par les profondes différences entre la législation américaine sur la protection des données et la nôtre.

« Les négociations se sont enlisées parce que les Etats-Unis ont refusé jusqu'au bout de lâcher du lest et ont joué la montre , estime Joe McNamee, le directeur exécutif d'Edri, une plateforme d'associations pour la défense des droits civils numériques. Et pour tenir le calendrier qui leur avait été imposé par le groupe européen des régulateurs des données personnelles, la Commission a fait une chose étonnante, début février : elle a affirmé qu'il y avait un accord. Mais son contenu n'existait pas vraiment. Ce n'est que cette semaine que les textes ont été rendus publics. La Commission s'est donc piégée elle-même et les négociateurs américains n'ont plus eu besoin de rien négocier du tout » .

Ils sont écrits dans les astres si le contenu du traité n'est pas modifié. En avril, les régulateurs européens des données doivent rendre un avis sur le texte. Il n'est pas contraignant mais pourrait peser politiquement. Cependant, ces régulateurs vont être mis sous haute pression. Un membre officiel de la Commission, cité par la newsletter spécialisée Euractiv , estime qu'il ne serait « pas sage »de la part des régulateurs européens de faire traîner le texte jusqu'à l'année prochaine et une nouvelle présidence aux Etats-Unis. Tous les ingrédients semblent déjà réunis pour que la Cour de Luxembourg soit de nouveau saisie du dossier.

The Australian Financial Review
Cyber threat is rising
Thursday, 03 March 2016
Byline: Tony Boyd

An Australian chief executive involved in a potential M&A transaction recently received a phone call telling him his computer systems had been hacked by a state-owned enterprise believed to be in China. He was shocked and immediately asked how the caller, Richard Bergman from PwC, knew what was happening when his own chief information officer had said nothing.

Bergman told Chanticleer his team at PwC had been monitoring activity on the "dark web" and picked up a significant increase in traffic between known offshore hacker-owned computers and the company in question.

PwC was subsequently called in to clean up the company's entire IT environment. The CEO's decision to make a large investment in his IT systems is in keeping with the findings of a survey into cyber security released this week by Cisco Systems.

Cisco said in its annual security report that security breaches forced companies to rethink their investment in protection.

When the security breaches are public the incentive to act is even greater.

Bergman is not a scare monger when it comes to cyber security. He uses examples from recent contractual arrangements to make rational statements about the readiness of Australian companies for cyber attacks.

His worrying conclusion is that apart from the big four banks and Telstra, there are very few companies that have made the necessary investments in cyber security.

The lack of preparedness for cyber attacks can partly be explained by the fact that companies are not matching their security measures with the way business is done.

The proliferation of joint ventures, minority investments in other companies, collaboration with third parties and the use of outsourcing have created a raft of opportunities for those seeking to break into computer systems.

A survey by PwC released in October last year found Australia had the highest number of cyber security incidents in the previous 12 months.

The total number of incidents was 9434, more than double the previous year. The growth in the rest of the world was about 38 per cent.

Bergman's dire analysis of the readiness of companies to deal with cyber security threats is timely.

Submissions close this Friday for the federal government's mandatory data breach notification discussion paper. PwC's draft submission to that process highlights the need for many amendments to clarify the obligations of companies.

The bigger picture in relation to cyber security policy in Australia is in a state of flux.

Lynwen Connick, first assistant secretary cyber policy and intelligence in the Department of Prime Minister and Cabinet, is leading a review of cyber security.

This has involved wide consultation and includes advice from an expert panel that includes Telstra's chief information security officer Mike Burgess and Business Council of Australia CEO Jennifer Westacott.

The review has already identified that the single biggest weakness in Australia's approach to cyber security is the lack of co- ordination between all those involved in protecting information, intellectual property, intelligence and privacy.

As Bergman says, the sovereign states and organised criminals are sharing information about how to attack companies and identify their weaknesses and it would be crazy for the defenders against cyber security not to do the same.

ANZ fluffs it

ANZ Banking Group's 60-year flirtation with wealth management has ended in ignominy.

The bank set up ANZ Funds Management in 1957. The bank started to take the business seriously in the late 1980s and early 1990s.

By that time the bank had expanded into a range of different wealth management product lines including life insurance, trustee services, unit trusts and funds management. But this hotch-potch of entities were never properly consolidated or given a common purpose.

The bank's wealth management division never actually figured out the answer to one simple question: Why do we exist?

The result was that the bank stumbled from one failed strategy to another. This was compounded by failures in execution.

If there is a pecking order of notable mistakes made by ANZ in wealth management the one involving Frank Russell would have to at the top.

The bank set up a partnership with the American firm, which is famous for its indices, to offer ANZ clients a range of multi-manager investment products.

This partnership exhibited confusion about where the value resided in the wealth management chain. ANZ appeared to put growth in total funds under management ahead of profit margins.

It paid Frank Russell about 60 basis points for the privilege of having its relatively vanilla funds management products. It would have been smarter for ANZ to have its own actively managed funds earning 100 basis points.

By the time ANZ moved to a new business model in 2002 it had about $2.3 billion in the Russell multi-manager products.

The next iteration of the strategy ranks second in the list of notable mistakes. This was the 50-50 joint venture with ING in the platform space. ANZ kept 100 per cent of the distribution and handed all asset management to ING.

This mistake was compounded by the fact that ANZ never addressed the problem of how to unwind the joint venture should that be necessary.

It did become necessary and the result was a mess. The global financial crisis meant ING was distressed and it was willing to change the arrangements.

The latter years of the wealth management business caused much frustration for former CEO Mike Smith, who never really got his head around why it was a failure.

The departure of Joyce Phillips spells the death knell of the wealth management experiment.

For some reason, a succession of chief executives and talented wealth management executives never figured out how to sell quality retail financial services products through the branch network.

It sounds simple but other three major banks have also struggled to achieve this marriage of banking and wealth.

National Australia Bank bought one of the best wealth management companies in Australia, MLC in 2000 and then spent the next 15 years taking the business nowhere.

It is being dismembered to ease the capital burdens within the group.

Commonwealth Bank of Australia's purchase of Colonial should have provided the perfect foundation for building the country's premier bancassurance business.

But the combination of the wrong remuneration incentives and slack oversight of the financial planning division was incredibly destructive.

It severely damaged the CBA financial planning brands. Just as important was the damage done to the reputation of the bank's financial planners within the CBA retail network.

The referral of highly prospective clients from the branch network to quality financial planners only works if there is a strong foundation of trust. It will take time to rebuild that at CBA.

Westpac Banking Corp stands out as the only one of the big four banks to have shown considerable success in using its powerful distribution network to sell wealth products.

Duopoly stigma

The High Court decision in relation to the non-renewal of the gaming licences in Victoria for Tatts and Tabcorp contains some damming comments about duopolies.

It is clear from the fact that these cases went all the way to the High Court that the duopolists had inflated ideas about their own importance.

The five learned High Court judges have made the not so startling comment that Tatts and Tabcorp could not see what any reasonable business person should have seen - the government power to end a duopoly.

Le Monde
Apple contre FBI, les dessous d'une polémique
Thursday, 03 March 2016
Byline: Ted Goranson

Chronique - Le refus d'Apple de déverrouiller l'iPhone de l'un des auteurs de l'attentat de San Bernardino, en Californie, le 2 décembre 2015, a déclenché une polémique publique qui va bien au-delà d'un simple conflit entre sécurité publique et droit individuel à la vie privée.
J'ai fait partie, pendant une longue période, de la communauté du renseignement des Etats-Unis. Ainsi, je pense que le FBI a déjà accès à l'iPhone en question : c'est un ancien modèle, qui utilise une technologie déjà mise en défaut dans d'autres contextes.

La demande du FBI à Apple a d'ailleurs un autre aspect étrange : pour quelle raison le gouvernement a-t-il ouvert un débat public sur cette question? Le FBI est la plus puissante organisation policière du pays, et Apple sera, en fin de compte, obligé d'obtempérer.

Pour mieux comprendre, il faut examiner la dernière gamme de téléphones d'Apple, qui diffère, sur un point crucial, de celle de l'iPhone incriminé : ils contiennent une nouvelle puce conçue en utilisant une technique développée par l'Agence nationale de la sécurité (NSA) américaine, et qui a ensuite été partagée avec les Israéliens. On retrouve à présent cette technologie dans les produits Apple, par l'intermédiaire de l'entreprise israélienne qui a mis au point cette puce.

Chacune de ces nouvelles puces possède une signature unique utilisée pour le chiffrement, associée à l'empreinte digitale de son utilisateur. Sans cette signature, il est impossible de décrypter un téléphone Apple sans accès physique aux éléments internes de sa puce, qui est elle-même impénétrable. Ce cryptage s'applique également à toute information communiquée par le téléphone à un service apparié, comme le système de messagerie du géant américain.

Dans le passé, l'accès immédiat aux périphériques de téléphonie n'était pas pertinent pour le FBI, parce que les autorités disposaient d'un libre accès aux communications entrantes et sortantes de tout

téléphone. Mais, avec ses nouvelles améliorations de sécurité, Apple vient de fermer cet accès. L'entreprise ne refuse pas simplement un nouvel accès : elle retirera bientôt celui qui existe. Bien sûr, cela dérange le FBI.

Il est intéressant de noter que la NSA a pris une position différente. Les " portes dérobées " (backdoors) ont été reconnues comme dangereuses par le directeur de la NSA, l'amiral Mike Rogers, qui estime que " le cryptage est fondamental pour l'avenir. " Si l'accès aux communications privées est possible, n'importe qui peut l'utiliser dans n'importe quel but. Si un téléphone a une porte dérobée, il peut être ouvert par toutes les personnes qui ont une motivation suffisante : criminels, extrémistes ou gouvernements. Les autorités chinoises, par exemple, seraient ravies si Apple devait se conformer aux demandes du FBI...

Equilibre remis en question Cela fait des années que le FBI demande une porte dérobée à Apple. Alors qu'il effectue, en général, ces demandes en secret, il a fait le choix inhabituel de la rendre publique : l'objectif est, en prononçant le mot-clé " terrorisme ", d'inciter les médias et le législateur à répondre à l'indignation du public.

La plupart des arguments juridiques contre le " déverrouillage " de ce téléphone particulier font référence au droit à la liberté d'expression, protégé par la Constitution. Mais un meilleur parallèle est celui du droit de détention d'armes aux Etats-Unis.

A la fin du XVIIIe siècle, aucune autre technologie que celle des armes à feu n'était aussi avancée. La Constitution américaine a donc précisé que ces dernières ne pouvaient servir à limiter la liberté d'expression (premier amendement), que leur détention ne pouvait être refusée aux citoyens (deuxième amendement) et que les soldats armés ne pouvaient pas être cantonnés chez les citoyens (troisième amendement). Les neuvième et dixième amendements interdisent l'utilisation d'armes à feu dans le but de compromettre d'autres droits implicites le cas échéant.

Les technologies les plus puissantes à l'heure actuelle concernent l'information relative à nos pensées, à nos comportements et à notre santé. Si les rédacteurs de la Constitution américaine étaient vivants aujourd'hui, et aussi éclairés qu'ils l'étaient à cette période, le Bill of Rights se concentrerait probablement sur l'équilibre de l'accès à cette information, afin de s'assurer que le gouvernement n'outrepasse pas les limites de son pouvoir.

Avec cette demande publique du FBI, l'équilibre entre les citoyens et le maintien de l'ordre est remis en question. Nous devons nous demander s'il est pertinent, légalement ou d'un point de vue politique, que tout le monde (forces de l'ordre, pirates informatiques et terroristes) soit en mesure de posséder ou d'accéder à l'information.

L'affaire d'Apple penche déjà en la défaveur des citoyens. Une réponse plus réfléchie que l'envoi hystérique de tweets sera nécessaire de la part des femmes et hommes politiques américains. Compte

tenu du pouvoir actuel de l'information, ils doivent réfléchir aux conséquences juridiques de la demande du FBI.

Los Angeles Times
Phones lose place as hack target
Thursday, 03 March 2016
Byline: Paresh Dave

Los Angeles - Computer hacker Will Strafach had no trouble seizing control of the original iPhone. Same went for later generations over the next five years.
But by now, Apple Inc. has introduced so many layers of protection inside its flagship device that Strafach and others have moved on. As the frenzied hacking has subsided, publicly shared solutions to crack iPhone security are becoming harder to come by.

The frustration he and other hackers felt has hit law enforcement too. That's why agencies around the country say Apple is its last hope to unlock hundreds of smartphones important to investigations, and why the FBI is so forcefully going after Apple in its effort to get into the work iPhone of San Bernardino terrorist Syed Rizwan Farook.

Whereas a generation of hackers grew up tinkering with iPhones and Androids for fun, today's up-and-comers -- thwarted by the near- ironclad security of smartphones -- are shifting their focus to virtual reality headsets, self-driving cars, the cloud, mobile apps and other emerging online systems with less-tested locks.

Hackers like Strafach are instrumental in rooting out vulnerabilities in software and hardware. Their findings are used by specialty technology companies to design tools that extract and analyze data from devices, which are in turn used by law enforcement, technical consultants for attorneys and repair shops.

Nowadays, the more difficult task of smartphone hacking is falling to large, more well-financed teams at cybersecurity firms and secretive government departments, all of which are prone to closely guarding those vulnerabilities for national security reasons rather than sharing them with police.

"The better technology gets, the more rarefied and the smaller pool of true old-school hackers you'll have," said Greg Buckles, co-founder and principal analyst of forensics industry research firm EDJ Group.

IPhone software developer Ryan Petrich said he expects hobbyists to be outgunned within the next two years.

"It will be infeasible to develop an exploit outside a large team with very experienced security researchers," he said. "They will do things like attack specific parts of the system, but you aren't going to see ... full system access."

Strafach was a big part of the iPhone jailbreaking community, which finds holes in the iPhone operating system that can unleash unauthorized privileges.

For example, Apple allows installation of only apps it approves. A jailbroken phone eliminates the restriction.

The downside is that jailbreaking risks corrupting the phone permanently if the technical process goes awry. And demand for jailbreaking tools relaxed as iPhones began to include some of the functionality once available only on jailbroken devices.

As a teenager, Strafach would trade jailbreaking tips with about 10 buddies -- the Chronic Dev team -- in a private online chat room. They'd share their findings for others to use.

Jailbreaking tools have been "bit-for-bit critical" for forensics software makers to provide easy ways to read the contacts, messages, app data and other information on smartphones, he said.

Getting into the first- generation iPhone, released in 2007, was easy -- Strafach compares it with finding a loose brick in a wall.

But the time he and his collaborators spent looking for loose bricks increased with each new iPhone and iPhone operating system -- and there were additional hurdles.

It was as if the prize they were after was now also protected by cannons, a moat filled with alligators and a chain-link fence. To make matters worse, software updates would change the order and strength of obstacles.

By iOS 7 in 2013, the multilayered defense was overwhelming. Apple went "wild," over-securing systems "that didn't need more security," Strafach said.

He went on to start Groton, Conn.-based Sudo Security Group Inc., which is developing software for businesses to control which apps employees may download onto their mobile devices.

Nowadays, hackers can generally get only a piecemeal view into the iPhone. There is scanning software as well as passcode- guessing gadgets that can get some data from newer iPhones that are locked and running iOS 8 or iOS 9.

But no publicly known process can extract their entire contents the way they could on earlier operating systems.

One upside, Strafach said, is that the dried-up market "makes me feel safe to have an iPhone."

Strengthened mobile device security has been a major force holding back growth of the forensics-tools industry.

Other jailbreakers left for technology companies as they aged, typically driven off like Strafach by a variety of reasons -- stronger security among them. Others like George Hotz, who's developing a self-driving car, are getting ahead of tech's next big trends.

Jailbreaking remains big in China, where technology giants and advertisers sponsor efforts, labor costs are lower than those in the U.S. and demand for the pirated content available through unauthorized apps is incredible.

But security concerns and language barriers make their tools less viable outside of China.

Others haven't given up. Irvine-based Susteen Inc. dedicated several employees to uncovering vulnerabilities in iOS 9, spokesman Jeremy Kirby said.

And the company is actively looking to pay outside researchers for ideas.

British tools shop Fonefun has turned to makeshift solutions, like taping down the power button on iPhones, tearing open the device and soldering in new wiring to overcome restrictions on passcode-guessing.

"It's all about persevering until you find something that works," said Fonefun's Mark Strachan. "And hopefully we can get something positive out of that before Apple releases a new iOS and closes it."

Since iOS 9 debuted in September, Apple already has addressed more than 70 security issues through updates, according to mobile security provider NowSecure. Such figures give experts confidence that there always will be a way in.

But they acknowledge the only surefire way to penetrate Apple's top security measures is to get a hold of the company's digital stamp, which is what the FBI is seeking in the San Bernardino terrorism investigation.

Otherwise, "law enforcement is kind of in a pickle," Petrich said.

Wall Street Journal
Beijing Looms Large in iPhone Battle
Thursday, 03 March 2016

Byline: Li Yuan

Beijing - Apple's refusal of the Federal Bureau of Investigation's request to help unlock a shooter's iPhone has been a hot topic not only in its home country but in its biggest foreign market: China. Some Chinese have questioned whether the move is a marketing stunt, but others have supported Apple for standing up to the government -- something unimaginable for Chinese companies. Some also have asked: What if the Chinese government asked Apple to do the same thing? Could Apple say no?
That question points to a significant issue for the company in the current standoff: Complying with the FBI in the San Bernardino, Calif., iPhone case could make it much harder for Apple to rebuff the demands of repressive governments in China and elsewhere abroad for access to the phones of, say, dissidents. It's an important concern for Apple, which gets most of its revenue from outside the U.S. The company derives roughly 25% of its revenue from the greater China region, which includes the mainland, Hong Kong, Macau and Taiwan.

Apple hasalluded to this issue, without naming China. In its filing to a federal court in California last week, Apple warned about the dangers of building a backdoor into the iPhone. "Once developed for our government, it is only a matter of time before foreign governments demand the same tool," the filing says.

Benjamin Qiu, a partner in law firm Loeb & Loeb's Beijing office, says if Apple were to lose the battle with the FBI, China's government would have every reason to make similar requests.

"Compared to the Chinese government, FBI is a pushover," he says.

China's State Internet Information Office, which regulates the Internet, didn't respond to requests for comment.

On its privacy Web page, Apple says it "has never worked with any government agency from any country to create a 'backdoor' in any of our products or services."

Chinese technology companies are used to accommodating their government's demands. Executives say they have to surrender whatever user information the government requests, and abide by frequent updates on content to be censored.

Says an executive at one Chinese Internet company, "When government says, 'Jump,' we're expected to ask, 'How high?' "

Increasingly, Beijing is trying to regulate Western tech companies in a similar fashion.

A new Internet regulation, effective next week, bars foreign companies from publishing online content in China without prior approval. A draft Cyber Security Law, under review, would require Internet network operators to provide authorities with technological support for national security and criminal

investigations -- which Amnesty International, a rights group, says could make it easier to involve companies incensorship and surveillance.

"Since China emphasizes national security more than personal-data protection, tech companies may well be required to follow the authorities' orders," says Yun Zhao, a law professor at the University of Hong Kong.

Edward Snowden's revelations that the U.S. government tapped into electronics gear overseas to spy on other governments have fed fears about foreign technology in China. As a result, many U.S. tech companies have lost market share in a critical market.

Apple's business has been a rare bright spot among multinational tech companies in China. In fiscal 2015, its revenue in China soared 84% to $58.7 billion. In the rest of the world, it grew 16%.

But Apple, like others, faces increasing scrutiny from China's government and state-run media. In 2014, after state television called the iPhone a "national security risk," Apple moved Chinese customers' data from overseas into a domestic facility operated by state-run China Telecom. Some critics said the move could make Apple products less secure.

At the time, Apple said the move would improve performance for its Chinese customers, adding that the data are encrypted and not accessible by China Telecom.

Jonathan Zdziarski, who researches Apple's software security, posted on Twitter that Apple stores iCloud data on China Telecom with the encryption keys outside the country. "This makes sense and reduces risk of data breach," he wrote.

Still, Chinese authorities have appeared eager to make Apple seem cooperative.

In an English poston its Twitter account in January 2015, People's Daily, the Communist Party newspaper, wrote "#Apple has agreed to accept China's security checks, 1st foreign firm to agree to rules of Cyberspace Admin of China." The post was accompanied by a photo of Apple Chief Executive Tim Cook shaking hands with Lu Wei, head of the State Internet Information Office.

All telecommunications manufacturers need to submit their products for government security testing in China, as in other countries, says a person close to Apple.

New York Times
Defense Secretary Says He's Not in Favor of a Data 'Back Door'
Thursday, 03 March 2016
Byline: Nicole Perlroth

San Francisco - Defense Secretary Ashton B. Carter assured an audience of computer security experts Wednesday that he was not in favor of a "back door" that would give the government access to data that is protected by encryption.
Speaking at the annual RSA Conference, Secretary Carter sought common ground with companies worried by Apple's fight with the Federal Bureau of Investigation over access to an iPhone.

"Just to cut to the chase, I'm not a believer in back doors or a single technical approach," Secretary Carter said to loud applause during a panel discussion at the conference. "I don't think it's realistic. I don't think that's technically accurate."

Apple is resisting a court order that would require it to create software to break the password mechanism in an iPhone used by one of the assailants in the December mass shooting in San Bernardino, Calif.

The F.B.I. argues that it is not asking for any sort of permanent back door and is merely asking for help in circumventing a single phone's password protection. People in the tech industry worry, however, that the request for help in the San Bernardino case is merely a prelude and point to a number of other pending cases in which law enforcement authorities would like Apple's assistance.

The software Apple is being asked to create could be considered a back door because it could provide special access to information that would otherwise be inaccessible thanks to passwords or encryption.

Secretary Carter's comments, though short on specifics, highlight the challenges various government agencies will face as they seek cooperation from Silicon Valley as the court fight between Apple and F.B.I. continues.

Also on Wednesday, Secretary Carter said Alphabet's executive chairman, Eric Schmidt, would head a new Defense Innovation Board to help connect tech companies and entrepreneurs with various Pentagon initiatives. And he announced a Hack the Pentagon initiative, which would reward hackers who find and turn over vulnerabilities in the Pentagon's computer systems.

"I don't think we ought to let one case drive a single solution," Secretary Carter said, referring to the F.B.I.-Apple dispute. "We have to innovate our way to a sensible result. And we need to do that because you can easily think of alternatives. One is a law written by people who don't have the technical expertise, one written in anger or grief, and that's not likely to work."

Many at the conference have compared the F.B.I's software request -- some are even calling it "GovtOS," short for government operating system -- to asking journalists to write a false article, or turn over a source, on national security grounds.

Dan Kaminsky, a well-known security researcher, likened the government's approach to persecuting firefighters during a firestorm. The point being, he wrote in an article on Wired.com, that at a time when data breaches happen regularly, the F.B.I. is trying to force Apple to weaken the security of its phones instead of advocating stronger security.

Secretary Carter echoed the need for stronger security but avoided taking a side in the F.B.I.-Apple dispute. "The problems of data security are many," he said. "There isn't going to be one answer. There are lots of different parts to this."

If Silicon Valley and Washington cannot find some alternative solution through innovation, Secretary Carter added, the most likely result would be a poorly written law, "or a solution written by China or Russia."

"And you know what their view of data access and security is," he said.

The Guardian (London)
US defense chief tells Silicon Valley: 'encryption is essential'
Thursday, 03 March 2016
Byline: Spencer Ackerman, Danny Yadron

San Francisco - The escalating encryption fight between Apple and the FBI has a prominent dissenter inside the government: US defense secretary Ashton Carter.
The powerful Pentagon chief has not publicly undercut the FBI's demands for Apple to write software undermining security features on its iPhone, which the bureau says is necessary to investigate the San Bernardino terrorist attack.

Yet Carter, according to people familiar with his thinking, has grown concerned that the increasingly bitter showdown between Apple and the bureau is jeopardizing his own efforts to forge closer ties with Silicon Valley - a major priority of his tenure at the Pentagon. As Comey fights encryption, Carter is bear-hugging it.

His current trip to the west coast, only the latest in a series of California jaunts, is devoted primarily to appealing for help with securing US defense networks - embracing the robust encryption that the FBI warns will lock law enforcement out of judicially-authorized criminal and national security investigations.

"I'm just speaking for the [Defense Department] - data security, including encryption, is absolutely essential to us," Carter said on stage at the RSA security conference in San Francisco on Wednesday.

Defense Department top brass, including some leaders at the National Security Agency, also have a different set of interests in the encryption debate compared to law enforcement. The military has more

of an interest in iron-clad data security as it traffics in highly classified secrets. Meanwhile, the NSA tends to have more hacker tricks up its sleeve to get around intelligence targets' security measures, including encryption, compared to the typical FBI agent or local police investigator.

Carter said, for instance, that he would be opposed to building a function into commercial encryption that would give the government access to data. "I'm not a believer in backdoors or a single technical approach. I don't think that's realistic," he said.

Congress may end up drafting legislation 'in anger and grief'

Carter declined to comment specifically on the Apple case other than to say one incident shouldn't determine the final outcome of the privacy fight. But he is understood to think the FBI is not unreasonable in its demand in the Apple case. The defense chief is concerned that the fight is leaving the tech industry confused about how the government views encryption, and the acrimony surrounding it is deepening the post-Edward Snowden rift between the government and Silicon Valley.

Still, the defense secretary in conversation with the venture capitalist Ted Schlein, who is himself close to Washington, urged technology companies to look for ways to compromise with the government. If they don't, the pair warned, both the industry and the government will have to deal with legislation written by Congress "who don't have the technical knowledge", Carter said. "It may be written in an atmosphere of anger and grief."

Pentagon wants to attract 'vetted hackers'

In 2015, Carter became the first defense secretary to travel to the Bay Area in 20 years, signaling his concern that the US military is losing the technological advantages it has had for a generation.

Carter wants to attract what the Pentagon called "vetted hackers" for Hack the Pentagon, a hackathon to test the tensile strength of US military cybersecurity, officials said on 3 March. The Pentagon will invite hackers to search for vulnerabilities on its public webpages that hackers might exploit - a task familiar to Silicon Valley but not the the Pentagon. It is expressly aimed at the very coders who might feel alienated by the Apple-FBI clash. The one requirement is that hackers be US citizens, Carter said.

"Bringing in the best talent, technology and processes from the private sector not only helps us deliver comprehensive, more secure solutions to the DoD, but it also helps us better protect our country," said Chris Lynch, the director of the Defense Digital Service, another Carter initiative to bolster the department's digital defense.

As Comey was defending to Congress his pursuit of unlocking an iPhone 5C used by a terrorist in December's San Bernardino attacks, Carter explicitly called Apple a "partner" during a speech at the Commonwealth Club on 1 March.

Carter waxed lyrical about the "garages and dorm rooms and home offices and research laboratories" of tech-sector giants and pledged to "preserve access to a free, open and secure internet" that technologists say the FBI will undermine by compelling Apple to write software that rolls back the company's user-security features.

Even as Carter delicately tiptoed around the Apple-FBI clash, he urged continued "partnership" with Silicon Valley and warned against China's "intent to require backdoors to all new technologies" - a point Apple has made to underscore the unintended consequences of the FBI's push.

Carter, more so than any other Washington official these days, appears to have had some success befriending Silicon Valley even as it wages a war of words with other parts of the Obama administration.

On Wednesday he announced a new defense innovation board that will try to use the valley's smarts to solve major defense problems, to be led by Alphabet executive Eric Schmidt.

Google, Facebook and Microsoft all expected to file supporting briefs

Despite Carter's plea for partnership, the battle lines between law enforcement and Silicon Valley are hardening.

Major tech companies including Microsoft, Google and Facebook are expected to file a legal brief supporting Apple by 3 March.

On 2 March Apple filed its formal objection to the federal judge's order to help the FBI unlock an iPhone used by one of the San Bernardino attackers.

The digital-rights groups AccessNow and the Wickr Foundation, as well as the American Civil Liberties Union, on 2 March filed briefs strongly backing Apple, warning that the "far-reaching consequences" of the FBI's position include "deliberately compromised digital security [that] would undermine human rights groups around the globe".

The ACLU argued that the FBI has exceeded the bounds of both the almost 230-year-old law enabling judges to enforce warrants and the Constitution by effectively "enlist[ing] private parties as its investigative agents to seek out information they do not possess or control".

Washington Post
Hacked U.S. companies have more options, departing cybersecurity official says
Thursday, 03 March 2016
Byline: Ellen Nakashima

Washington - The Obama administration's power to impose economic sanctions in response to malicious cyberspace acts gives companies that have been hacked by foreign governments a new way to deter adversaries and prevent them from reaping the rewards of their intrusions, a former senior U.S. official said.
The sanctions tool, which was authorized by an executive order last April 1, has not been used yet. But it is one of the cutting-edge initiatives that Luke Dembosky, until this week the top cybersecurity official in the Justice Department's national security division, was involved in during his 14 years at the department.

It is important that the sanctions tool "be used soon so that those who carry out significant cyberattacks on U.S. interests know that we mean business," said Dembosky, who will soon join the law firm of Debevoise & Plimpton.

At the Justice Department, Dembosky was involved in many of the most significant cybersecurity cases, including North Korea's hack of Sony Pictures; the intrusions into the Office of Personnel Management, widely attributed to China; the breaches of Target, Home Depot and Anthem; and the takedowns of the GameOver Zeus botnet and the illicit Silk Road online bazaar.

Dembosky has also taken part in other leading-edge efforts. In 2009, he won the conviction of Max Ray Vision, who was at the time the most notorious hacker in U.S. history. Iceman, as he called himself, had stolen and sold nearly 2 million credit card numbers and caused losses of $86 million. He got 13 years behind bars, what was then a record sentence in a cybercrime case.

Dembosky, 47, also was part of a small team of administration officials who last fall negotiated a historic cybersecurity accord with Beijing that led to President Xi Jinping's announcement in September that China would not engage in economic cyberespionage. Until that point, China had never acknowledged that cybertheft of intellectual property for a country's commercial advantage violated international norms.

"It was, in my mind, a breakthrough on behalf of businesses to protect their valuable intellectual property," Dembosky said.

But it remains to be seen whether China will uphold its pledge, he acknowledged.

Dembosky, who will help lead Debevoise's global cybersecurity practice, noted that most companies traditionally have been wary of cooperating with government investigations into breaches. They fear that disclosing sensitive company materials will expose them to regulatory actions, privacy suits or other civil litigation.

But recent moves by the administration have the potential to change the calculus, he said. Faced with the rapid rise of national-security cyberthreats, he said, the government has expanded its arsenal of

weapons to use against cyber adversaries. Besides criminal prosecutions, there are export license restrictions, trade and diplomatic actions, and now sanctions.

"More tools give a savvy victim company a broader range of choices in working with the government," he said.

That is, if a company decides to let federal investigators examine the forensic evidence left by the intruders, the government may be able to build a case against individuals who conducted or directed the hack or who, such as officials in a rival overseas company, stood to benefit from it.

In cases where the perpetrators are overseas and are unlikely to be extradited if indicted, it may be that through sanctions their assets can be frozen and banks can be barred from doing business with them. The same penalties can apply to a sanctioned company.

But having the United States impose sanctions on, say, a Chinese or Russian company may not always be the best move for the victim company, Dembosky noted. Some may make the calculation that such a move may result in retaliation against them and that the risk is not worth it.

The point is, he said, there are more powers the government is able and willing to use to hold adversaries accountable and thus more reasons for companies to work with the government in cybersecurity investigations.

But firms also fear regulators' whips. Last year, the Federal Trade Commission settled a high-profile lawsuit with Wyndham Hotels and Resorts over a series of data breaches that exposed the credit card information of hundreds of thousands of customers. The settlement required Wyndham to set up a program to protect cardholder data as well as conduct annual information security audits, among other steps.

The Securities and Exchange Commission has begun to fine and hold accountable investment adviser firms for data breaches, and the New York State Department of Financial Services has alerted federal agencies that it is considering imposing cyberspace regulations on financial institutions in the state.

"So for companies, there is risk and opportunity in cooperating with government," Dembosky said.

Judith Germano, a former federal prosecutor who is now a senior fellow at New York University Law School's Center on Law and Security and a cybersecurity consultant, noted that the FTC has said it will take into account a firm's cooperation with law enforcement in a breach investigation in evaluating whether the firm has done all it can to reduce the harm from the breach.

She also said that the sanctions tool may be useful but that it is too soon to tell, given it has not been deployed yet.

Dembosky began his cybersecurity career 14 years ago prosecuting Eastern European criminals stealing credit card data to sell on online black markets. In 2010, he moved to Moscow as the Justice Department's attache, helping establish a cybersecurity "hotline" and other measures with Russia aimed at defusing tensions in cyberspace. In 2013, he came to Washington to oversee litigation in the department's computer crime and intellectual-property section. And in 2014, he moved to the national security division.

His national security experience is in demand now, said Bruce Yannett, Debevoise deputy presiding partner. "It is clear that the greatest cyberthreats that companies face are state actors and quasi-state actors" who have the resources and skill to cause the most harm, he said. "If you're shut down, the way Sony Pictures was, or if your deepest, darkest trade secrets are stolen, that can pose an existential threat to any company."

Le Figaro
Europe et États-Unis s'accordent sur les données
Thursday, 03 March 2016
Byline: Lucie Ronfaut

Bruxelles - Le « Privacy Shield » doit apporter stabilité et sécurité aux entreprises et internautes. Internet L'accord Privacy Shield, ou « bouclier de confidentialité » , se dévoile mais doit encore convaincre. Après plusieurs mois de négociations, les autorités américaines et l'Union européenne ont publié les principales mesures du nouvel accord régissant les échanges de données entre les deux puissances.

Il est très attendu à la fois par les entreprises américaines (comme Facebook ou Google) et les sociétés européennes hébergeant une partie ou la totalité des données de leurs utilisateurs aux États-Unis.

Signé au mois de février, le Privacy Shield a désormais la lourde tâche de faire oublier son prédécesseur, le Safe Harbor. Cet accord vieux d'une quinzaine d'années a été invalidé fin 2015 par la Cour européenne de justice. D'après cette dernière, il ne garantissait pas suffisamment la sécurité des données personnelles des Européens, notamment au regard des révélations d'Edward Snowden sur la surveillance exercée par la NSA sur les géants du Web américains.

Des mesures cosmétiques

Le Privacy Shield répond à ces inquiétudes par plusieurs mesures. Il crée un nouveau poste de médiateur aux États-Unis chargé de recueillir les plaintes des citoyens européens inquiets de l'exploitation de leurs données par les services de renseignements américains. Les entreprises faisant l'objet d'une plainte de la part des citoyens européens auront 45 jours maximum pour répondre. La Commission européenne assure également que « tout accès à des données par les autorités publiques pour des raisons de sécurité nationales fera l'objet de limitations claires et de mécanismes de contrôle, afin d'empêcher la

surveillance généralisée » . Le nouvel accord prévoit la publication d'un rapport annuel pour contrôler la bonne application de ces mesures. Il doit désormais être examiné par le groupe des autorités européennes de protection des données (le G29) avant d'être définitivement voté.

Le Privacy Shield, tout juste présenté, compte déjà de nombreux opposants, qui estiment que rien ou presque n'a changé depuis le Safe Harbor . Max Schrems, l'étudiant autrichien à l'origine de la procédure judiciaire qui a mis fin à l'accord, a dénoncé « un cochon à qui on aurait mis dix couches de rouge à lèvres. Ce n'est pas pour autant qu'on a envie de lui faire un câlin ! » . Il pointe notamment un document envoyé au département du Commerce américain, en charge des négociations, par Robert Litt, directeur juridique du renseignement national.

Cette lettre, récupérée par l'agence Reuters, prévoit six « cas spécifiques » où la surveillance généralisée des données restera autorisée. Ce qui va à l'encontre de la décision de la Cour européenne de justice, qui dénonçait justement le manque de contrôle du renseignement américain. « Malheureusement, cette décision de la Commission devrait vite retourner devant la justice, prédit Max Schrems. Il est regrettable qu'elle n'ait pas profité de cette situation pour fournir une solution stable à la fois pour les internautes et les entreprises . »

London Daily Telegraph
Two thirds of cyber-attack businesses keep silent
Thursday, 03 March 2016
Byline: Kate Palmer

London - Two thirds of cyber-attacked companies have kept silent about the breach rather than report it to the police, a poll of British businesses suggests, ahead of plans to force all companies to notify the authorities. One-in-10 British businesses suffered financial loss from cybercrime in the past year, according to a poll of 1,000 Institute of Directors members. Yet of these companies, just 28pc said they reported the attack to the police, citing fear of reputational damage.
Companies that have publicly fallen victim to a security breach have seen their share price suffer and lost customers as a result.

TalkTalk is still recovering from last year's hack, when stock fell by almost 20pc in the weeks following the breach. The full scale of the attack, which cost TalkTalk £60m in lost revenues and costs, was revealed last month in the company's full-year trading update that also showed 101,000 customers had left in the aftermath of the hack.

Currently only telecoms companies are legally required to report cyber breaches, which they must do within 24 hours or a face a £1,000 fine.

However, European Parliament is currently planning minimum cyber security standards that mean companies in key sectors - such as banks, energy and water companies - would be forced to report such incidents too.

London Daily Telegraph
Isil making £14m a month playing currency markets with looted bank cash
Thursday, 03 March 2016
Byline: Colin Freeman

London - ISIL is making millions of dollars for its war chest by playing foreign currency markets under the noses of bank chiefs, it was revealed yesterday.
The terrorist group is earning up to $20 million (£14 million) a month by funnelling dollars looted from banks during its takeover of the Iraqi city of Mosul into legitimate currency markets in the Middle East.

It then makes huge returns on currency speculation, which are wired back via unsuspecting financial authorities in Iraq and Jordan, a parliamentary committee was told.

Islamic State of Iraq and the Levant's (Isil) white collar crime is now a major source of income, along with oil smuggling and extortion from people living in Isil-controlled areas.

Details of the scam emerged during a hearing of a specially convened foreign affairs subcommittee set up to examine Britain's role in Isil financing.

The hearing was told that Isil finance chiefs would play the international stock markets using cash looted during their 2014 takeover of Mosul, in which the group got its hands on an estimated $429 million from the city's central bank.

They also used money "siphoned off " from pension payments that are still being made by the Iraqi government to civil servants living in the city. The details were revealed to the hearing by John Baron, the subcommittee's chair, who demanded to know whether the British government - which has pledged to help cut off Isil's finance networks - was taking proper action against it.

"The cash that Isil has looted, along with siphoned off pension payments, is routed into Jordanian banks and brought back into the system via Baghdad," he said. "That allows the system to be exploited by Isil, in that they take a turn [profit] on the foreign currency actions and siphon that cash back."

The profits were channelled back into Isil coffers by "hawala" transfers, an unregulated system of money transfer whereby cash payments are made via agents in one country after a similar amount is presented as collateral in another.

Tobias Ellwood, a junior Foreign Of-fice minister, admitted to the committee that there was a "porousness" in the financial system but said that work was now under way to shut it down. It had been done without the active connivance of bank staff, he added.

In December, the central bank of Iraq named 142 currency-exchange houses in Iraq that the US suspected of moving funds for Isil. It banned them from its twice-monthly dollar auctions.

But Mr Ellwood conceded: "Iraq could have moved faster on this".

Breakthrough seizure US captures Isil commander in Iraq

An American Special Operations force has captured an Isil commander in northern Iraq in what the Pentagon said may be a crucial development.

The unnamed operative was being questioned at a detention facility in Erbil, the capital of Iraq's Kurdistan region. US officials said the interrogation could take weeks or months, and that the man would then be turned over to Kurdish authorities.

A 200-strong unit, the expeditionary targeting force has been arriving in the area in recent weeks, ready to expand operations as part of the first major American combat presence in the country since US forces withdrew in 2011. The team is working with Iraqi and Kurdish forces to establish informant networks and to conduct further raids on Isil safehouses and compounds.

The possibility of future raids now raises questions about what will happen to the detainee and others like him, given that President Barack Obama has ruled out sending any more suspects to Guantánamo Bay and that the US does not want to create a holding centre for Isil captives in Iraq.

York Times
Silicon Valley Rallies to Apple's Defense, but Not Without Some Hand-Wringing
Thursday, 03 March 2016
Byline: Nick Wingfield, Mike Isaac

New York - It is a remarkable moment for the technology industry, with many different companies and organizations rallying around a single company -- Apple -- in a major legal case against the United States government over privacy and security.
Yet behind the scenes, it took time for some of the tech companies to make the decision to support Apple. Several feared the showdown with the government was too risky and could have far-reaching implications for the tech industry if Apple lost.

Those misgivings ultimately did not win the day. About 40 companies and organizations are expected to file court briefs on Thursday backing Apple as it fights a judge's order to help law enforcement break into an iPhone used by a gunman in the San Bernardino, Calif., terrorist attack last year.

Dropbox, Facebook, Google, Microsoft, Snapchat and Yahoo are among the tech companies expected to sign on to briefs in the case, according to people with knowledge of the plans who spoke on the condition of anonymity. More than 40 individuals, including prominent security experts and academics, are also planning to sign briefs, which will focus on themes like free speech, the importance of encryption and concerns about government overreach.

The show of support -- including briefs filed on Wednesday by groups like the American Civil Liberties Union and Access Now -- is unusual in its breadth, showing that many in Silicon Valley believe that it could have profound implications on the trustworthiness of their products.

"Given the years of companies' reluctance to be at the barricades around intelligence discussions, this is significant," said Jules Polonetsky, chief executive of the Future of Privacy Forum, an industry-financed think tank in Washington.

Still, several executives at tech companies supporting Apple said they were worried that Apple had picked a fight that could end up backfiring on the rest of the industry. In the days since a magistrate judge in California ordered Apple to bypass security measures on the iPhone, lawyers in some of the companies debated these issues with one another and peers at other firms.

All of the executives asked to remain anonymous because their deliberations were private, but their views are shared among others in Silicon Valley.

Keith Rabois, a venture capitalist with the firm Khosla Ventures, said he was a strong believer in privacy and encryption -- "all the normal Silicon Valley views," he said -- but worried that Apple could lose the case, setting a legal precedent that could force other companies to compromise the security of their products for law enforcement.

"In my view, this is the wrong case to fight," Mr. Rabois said. "There are plenty of other cases with a lot less sympathetic case for the government."

For Mr. Rabois and others, the circumstances working against Apple include the iPhone's connection to a terrorist attack that left 14 people dead, rather than to a less highly charged crime. Furthermore, the iPhone was owned by the employer of the gunman, Syed Rizwan Farook, which consented to a search of the device.

Apple's defenders said the company did not pick this fight -- the government did. Critics of Apple's approach believe that the company could have quietly complied with the government's request to help

break into the iPhone and then taken a public stand in a more favorable case. But Apple has said that once a tool exists for extracting data from the phone, that tool cannot be made to disappear.

Yet whatever doubts Apple's allies voiced privately, they were in the end insufficient to keep a large number of big companies from signing on to the cause.

Dropbox's general counsel, Ramsey Homsany, said in a statement, "We stand against the use of broad authorities to undermine the security of a company's products."

Bruce Sewell, Apple's general counsel, said in a statement, "We are humbled by the outpouring of support we've received from our customers, our colleagues in business, nonprofit organizations, the security community and many others." He added, "The groups filing briefs with the court understand, as more and more people have come to realize, that this case is not about one phone -- it is about the future and how we protect our safety and our privacy."

On Tuesday, Apple filed its formal objection to the government order to open up the iPhone, citing the reasons set forth in a previously filed motion.

For many tech companies that were initially concerned by Apple's opposition to opening up the iPhone in the San Bernardino case, the worries centered not only on whether this was the right case for challenging the government but also on how public perceptions of the fight might reflect on the rest of the industry, according to tech executives involved in the discussions, who spoke on the condition of anonymity.

A report by Pew Research Center last week said 51 percent of Americans believed that Apple should unlock the iPhone to assist the Federal Bureau of Investigation in the case, while only 38 percent found Apple in the right.

Some of the companies were also concerned that the relationships they had forged with the government might degrade because of Apple's battle, according to the people involved in the tech industry discussions. In the years since the disclosures by Edward J. Snowden, the former intelligence contractor who released a trove of details on United States government surveillance tactics, some tech companies have been trying to educate members of Congress about online privacy practices.

Others were also anxious that Apple's defiance of the government could lead to congressional efforts to reshape, in ways unfavorable to the tech industry, the Electronic Communications Privacy Act, which privacy advocates and tech companies have long claimed needs an overhaul.

And these companies are watching what effect the fight could have on a proposal to establish a national commission that would explore ways to obtain encrypted data from consumers while working to safeguard users' privacy. The proposed commission, the bill for which was introduced on Monday,

would be led by the House Homeland Security Committee chairman Michael McCaul, Republican of Texas, and Senator Mark Warner, Democrat of Virginia.

On Monday, Apple got good news that could help soothe lingering tech industry doubts about its defense in the San Bernardino case. A federal magistrate judge in a separate drug case in New York ruled against a government request to extract data from an iPhone, a decision that could influence the San Bernardino case.

Silicon Valley's arc in supporting Apple -- an initial flurry of concerns followed by an eventual coming around to the idea -- is epitomized by Max Levchin, the co-founder of PayPal and chief executive of Affirm, an online financial services firm. Last week in an interview on CBS, Mr. Levchin said his views on the case over the previous several days had shifted from a "clear-cut, black-and-white" stance of helping the F.B.I. He has since sided with Apple.

Asharq Al-Awsat
U.S. Military Invites Experts to "Hack the Pentagon"
Thursday, 03 March 2016
Byline: Staff Report

San Francisco - As a very novel program to ever be offered by the federal government, the Pentagon declared on Wednesday that it planned to invite vetted outside hackers to detect and examine the cybersecurity of some public U.S. Defense Department websites as part of a pilot project next month. Seeking to discover gaps in the security of their networks, competitions known as "bug bounties" are conducted by big U.S companies, including United Continental Holdings Inc. and by the same token "Hack the Pentagon" is modeled after the aforementioned competitions to inspect its cybersecurity. It's worth noting that similar programs permit cyber experts to find and identify problems before malicious hackers can exploit them. This saves both money and time in the event of damaging network breaches.

Defense Secretary Ash Carter said in a statement unveiling the pilot program "I am confident that this innovative initiative will strengthen our digital defenses and ultimately enhance our national security".

Thousands of qualified participants were expected to join the initiative, as said by one senior defense official. Further on this subject the Pentagon stated that more details and rules are still being worked out but the competition could involve monetary awards. It's worth noting that the Pentagon has long tested its own networks using internal so-called "red teams," but this initiative would open at least some of the department's vast network of computer systems to cyber challenges from across industry and academia.

Before being turned loose on a predetermined public-facing computer system all participants aught to be U.S. citizens and will have to register and submit to a background check, stated the Pentagon. It said other more sensitive networks or key weapons programs would not be included, at least initially. "The

goal is not to comprise any aspect of our critical systems, but to still challenge our cybersecurity in a new and innovative way," said the official.

The Pentagon's Defense Digital Service (DDS) is leading the initiative which was set up last November to bring experts from the U.S. technology industry into the military for short stints.

Chris Lynch, a former Microsoft executive and technology entrepreneur who heads DDS stated that bringing in the greatest talent along with technology and processes from the private sector will aid in delivering comprehensive, and more secure solutions to the DOD.

Carter introduced Lynch during a speech to the Commonwealth Club on Tuesday and said he had already recruited coders from companies like Google and Shopify for a Pentagon "tour of duty."

Christian Science Monitor
State Department reverses course on cybersecurity exports
Wednesday, 02 March 2016
Byline: Joe Uchill

Washington - After nearly 10 months of intense pressure from cybersecurity experts, the Obama administration will send the State Department to renegotiate a controversial arms control agreement meant to limit surveillance software exports.
The decision represents a turnabout for the State Department, which had resisted reopening talks with the 41 nations that are signatories of the Wassenaar Arrangement. But after widespread criticism that the trade pact would hamper the trade of legitimate security software, the US is aiming to return to the negotiating table.

"There is simply no way to interpret the plain language of the text in a way that does not sweep up a multitude of important security products," said Rep. Jim Langevin (D) of Rhode Island in a statement. "The Administration is staking out a clear position that the underlying text must be changed."

Representative Langevin says National Security Advisor Rice also became a strong factor in swaying Foggy Bottom to renegotiate the deal. Obama administration officials unanimously called for a new agreement at a meeting last week.

The controversy around Wassenaar began heating up last May when the Department of Commerce released proposed export regulations based on the pact's terms. Experts feared the broad language in the proposed rules would even ban some cybersecurity researchers in the US from jointly conducting security work abroad.

In addition to cybersecurity experts, US lawmakers and Department of Homeland Security officials also worried that Wassenaar's language could limit threat information-sharing initiatives and damage domestic security.

At a congressional hearing in January, the State Department publicly opposed renegotiating Wassenaar - citing the difficulty of signing another deal with the 31 countries that had already adopted the terms. Instead, the agency had hoped to satisfy critics by creating exemptions in the trade restrictions.

But those claims were met with Congressional skepticism. Soon after the hearing, however, State Department officials reached out to industry experts to work on a new proposal.

"The [House Oversight] hearing hammered home the national security implications of the Wassenaar language," said Katie Moussouris, the chief policy officer of the bug bounty firm HackerOne.

A vocal critic of the regulations, Ms. Moussouris was one of the industry experts called in to work on the new proposal. She says the new draft language shifts the focus of the Wassenaar guidelines with a narrower focus on surveillance software itself.

Moussouris cautions that the State Department's evolving position on cybersecurity exports does not mean the issue is closed. Other nations will still have to agree to change.

"We'll consider the issue settled when we see it settled," she said.

The Hill
Cyber experts invited to 'Hack the Pentagon'
Wednesday, 02 March 2016
Byline: Kristina Wong, Cory Bennett

Washington - The Defense Department is inviting "vetted hackers" to test its cybersecurity in a new pilot program called "Hack the Pentagon."
"This innovative project is a demonstration of [Secretary of Defense Ashton] Carter's continued commitment to drive the Pentagon to identify new ways to improve the department's security measures as our interests in cyberspace evolve," the Pentagon said in a statement Wednesday announcing the initiative.

It's the first "cyber bug bounty program in the history of the federal government" and is modeled after similar competitions held by the nation's biggest companies, the Pentagon said.

Hackers are required to register and submit to a background check to participate in the program. Hackers must be U.S. citizens, according to Reuters.

Qualified participants will then try to identify vulnerabilities in Pentagon applications, websites and networks. They could be eligible for monetary awards and other recognition. The program launches in April.

"I am always challenging our people to think outside the five-sided box that is the Pentagon," said Carter in a statement.

"Inviting responsible hackers to test our cybersecurity certainly meets that test. I am confident this innovative initiative will strengthen our digital defenses and ultimately enhance our national security."

"Critical, mission-facing systems" will not be part of the program, the Pentagon said.

The initiative is being led by the Defense Digital Service (DDS), a small team of engineers and data experts launched by Carter in November, as part of the White House's U.S. Digital Service.

"Bringing in the best talent, technology and processes from the private sector not only helps us deliver comprehensive, more secure solutions to the DOD, but it also helps us better protect our country," said DDS Director and technology entrepreneur Chris Lynch.

The Pentagon announced the program as Carter and other top officials are on a swing through Silicon Valley to meet with tech executives.

Carter said the trip is part of the military's efforts to "rebuild bridges between the Department of Defense and some of our nation's most innovative industries."

The two sides have been at odds since former National Security Agency contractor Edward Snowden in 2013 revealed through a series of leaks the extent of the government's secret surveillance efforts.

But the Defense Department has its sights set on Silicon Valley as a major talent pool for developing its cyber team. The Pentagon is in the midst of building out the half-staffed U.S. Cyber Command. The cyber division is expected to reach 6,200 personnel across 133 teams by 2018.

London Daily Telegraph

Tech companies must unite, says GCHQ chief in privacy row

Wednesday, 09 March 2016

Byline: Martin Evans

Section: general

London - An offer by the head of GCHQ to build bridges with technology companies over the ongoing encryption row has been cautiously welcomed by the industry.
Robert Hannigan, who is in charge of the intelligence agency, said it was time for the security services and large tech companies, such as Google and Apple, to put differences aside and find ways of collaborating in order to stop criminals and terrorists from using the internet to further their aims.

Both the British and American authorities have been at loggerheads with some of the major companies over the need to access information which is protected by complex encryption.

But Mr Hannigan, who had previously accused tech companies of being the "command and control networks of choice" for terrorists, struck a more conciliatory tone earlier this week and called for all sides to tackle the problem together and in a "less highly charged atmosphere".

In a speech at the Massachusetts Institute of Technology on Monday, Mr Hannigan said a "new forum" was needed to hold a "frank dialogue". He also suggested that the conflict between the two sides risked deflecting focus from combating terrorism.

"Of course some people will find new places to hide unlawful activities, and new channels of communication, but our agencies were created to tackle those hiding places," he said. "We should apply our collective goodwill and technical brilliance to meeting the hardest threats to society."

His comments have been welcomed by representatives from the tech industry who believe solutions can only be found through greater collaboration.

Antony Walker, deputy chief executive of techUK, the trade body which represents the industry, said: "We welcome Robert Hannigan's commitment to constructive dialogue with the tech industry. The solutions lie in government, academia and industry working together."

The controversy over encryption and privacy has come to a head in a bitter legal case between Apple and the FBI over attempts to access data on the iPhone of Syed Rizwan Farook, the extremist who, along with his wife, shot 14 people dead in San Bernardino, California, in December.

The FBI won a court order requiring Apple to help it get around encryption and passwords on the device but the company is challenging it.

Apple chief executive Tim Cook has described the case as "dangerous, chilling and unprecedented".

Ralph Goodale says Ukraine cyberattack caused 'international anxiety'

Wednesday, 09 March 2016

Byline: Susan Lunn

Section: general

Ottawa - Prime Minister Justin Trudeau has asked his public safety minister to review all government operations to see if Canada is well protected against a possible cyberattack.
This review comes on the heels of the cyberattack on Ukraine's power grid last December that caused a blackout for hundreds of thousands of people.

Conservative MP Cheryl Gallant raised the incident in Ukraine with Ralph Goodale at a parliamentary committee today.

"The concern is that this type of sophisticated, planned, synchronized attack could occur in North America," Gallant told the committee.

"What measures are in place to make sure that just such a coordinated attack or perhaps a more sophisticated one does not impede our electricity system and all the items attached to the grid that we depend on?" she added.

Goodale says what happened in Ukraine came up at a recent meeting in Washington with Canada's closest security partners. The "Five Eyes" group includes the United States, United Kingdom, Australia and New Zealand.

"It's a matter of international anxiety," Goodale said.

To that end, Goodale said he has been asked by the prime minister to do a government-wide review of the state of cyber security operations "to make sure that we are on top of this kind of operation and the problem that hit Ukraine will be properly defended against in Canada."

"We think that is the case today, but the review will ask that critical question: Are we sure? And we want to be sure," he added.

Canada not immune

An attack on the computers at the National Research Council in July 2014 was eventually blamed on the Chinese.

That same year, the Canada Revenue Agency had to shut down its website for a few days after the Heartbleed Internet bug breached the computer system. About 900 social security numbers were stolen.

The deputy minister at public safety, François Guimont, told the committee he believes the critical response team set up to deal with cyberattacks does a good job.

"They keep literally a laboratory of viruses that they study, understand, and they're very quick at disseminating this information to other constituents in Canada for them to take action to protect themselves," Guimont said.

"So progress has been made, but I will tell members of the committee, the cyber file, unlike other files if you wish, is always evolving."

The public safety department isn't alone is dealing with cybercrime.

The RCMP has received an extra $110 million in recent supplementary spending estimates. Part of that money is earmarked for cyberterrorism.

Guimont says the government-wide review of the cyberstrategy is timely.

"The strategy is not that old. But the file is moving so quickly it's time to step back, see where we are and carry out actions where we think we may have weaknesses," Guimont told the committee.

As he was wrapping up his testimony, Goodale asked the committee members if they had changed their passwords today, reminding them to do that frequently.

Armed drones: Should the Canadian military use the controversial weapons?

Wednesday, 09 March 2016

Byline: Laura Wright

Section: general

Ottawa - Canada's chief of defence staff announced this week that the Canadian military needs new drones and he wants those drones to be armed -- an upgrade that doesn't come without its share of controversy.
Gen. Jonathan Vance's comments came on the heels of a U.S. air strike in Somalia over the weekend that killed 150 militants linked to al-Shabaab. The strike was partly carried out by unmanned drones.

But military use of armed drones is fraught with controversies, from the perceived ease at which drone operators pull the trigger, to the number of civilian deaths associated with drone strikes.

The benefits of using drones, however, are difficult to ignore -- namely the fact drone operators don't run the risk of dying in a strike, as fighter-pilots do.

"It's high time that Canada bought that kind of a drone," says Elinor Sloan, an international relations professor at Carleton University. "Arming them simply provides options in a war zone."

As Canada gets set for a possible debate on the topic, here's a look at some of the pros and cons of using armed drones.

The use of armed drones is just the next step in the increasing "stand-off character" of warfare, Sloan argues. Humans used to fight hand-to-hand and developed tools to get further and further away from close-up combat.

"Drones just put that effort still further away from direct human contact," she says. "But a human is still in charge and directly tethered to that platform."

Drones are safer for those operating them since pilots can be thousands of kilometres away from their targets, with no risk of physical injury.

And they're relatively cheap, says Stephanie Carvin, an assistant professor of international affairs, also at Carleton University. "There are multiple different uses for them -- not just killing machines."

Drones can be better for warfare because of their precision; their surveillance capabilities allow them to follow a target for hours or days before deciding whether to strike.

This allows for what Jesse Kirkpatrick calls "tactical patience."

"It allows individuals to be operating in a cool remove that will allow them to maybe not engage in atrocities that some do after the stress of battle takes its toll on them," says Kirkpatrick, the assistant director of the Institute for Philosophy and Public Policy at Virginia's George Mason University.

Sloan and Carvin both say drone pilots often don't act alone -- up to 25 people can be involved in a mission, including the U.S. president.

Despite drones' ability to be more effective, Kirkpatrick says that "cool remove" can be unsettling.

"You have someone who seems to be hunting individuals from 3,000 miles away and can patiently wait for them," he says. "I think that image bothers people."

Civilian casualties

Despite the benefits, some say there is a high civilian death toll associated with drone strikes. The problem is those numbers are incredibly difficult to verify.

"We just don't have good data," says Carvin. "Those reports are based on the U.S. program, and are based on reports from far-off areas that we don't have access to."

She adds that some of the reports only looked at a small number of drone strikes, which can skew the data. "They're deeply methodologically flawed."

Drone pilots are sometimes disparagingly called "chair pilots," as there is a perception that their distance from the scene of a strike allows them to more easily pull the trigger.

But Kirkpatrick says he found drone pilots suffer psychological trauma at a comparable rate to fighter pilots.

"That can lead us to speculatively conclude that it's not like playing a video game -- the killing and the harm feels very real," he says.

Secrecy, myths

The public perception of the U.S. drone program in particular has not been helped by the fact it is shrouded in secrecy.

"One of the main issues is its lack of transparency, and there are significant issues for democratic oversight, participation and civilian control of the military," says Kirkpatrick. He adds this secrecy makes it very difficult to determine how many civilians are being harmed.

The U.S. government claims no civilians have been killed, but that's debatable based on who they define as a combatant.

"Observers say the only reason you can claim this is that the definition of what it means to be a combatant is way too broad," says Sarah Kreps, an associate professor of governance and law at Cornell University who has written two books about drones.

Whether the Canadian military eventually moves to using armed drones may be a debate that's missing the point; Carvin says it doesn't make a difference if the military kills people with F-18 fighter jets or with armed drones.

"[Drones] are a shiny object and we all get distracted because it's a new technology and that's understandable," she says. "But what we need to be asking is: 'What is the actual policy that we're using this for?'"

Canada should consider buying drones, she says, if they can potentially contribute to the country's future military missions -- not just because everyone else has them.

Toronto Star

In terror fight, 'drones are not a silver bullet'

Wednesday, 09 March 2016

Byline: Olivia Ward

Section: Analysis

Analysis: Defence chief Gen. Jonathan Vance this week came out in favour of modernizing Canada's armed forces with drones, including ones capable of striking at enemies abroad. The unmanned vehicles have been used increasingly by the U.S. as a way of limiting military and civilian casualties.
But critics say that such a move needs a down-to-earth assessment.

"First you need an ethically defined foreign policy. Then you have to know what kind of interventions you expect that you can realistically make," says Prof. Derek Gregory of the University of British Columbia, an expert in aerial warfare. "If you're going to join the big boys, you have to know why."

There are also doubts about the value of drones against terrorism. "All the evidence we've gathered is that they killed large numbers, and the remaining population is terrorized and traumatized," says Kat Craig, legal director for the counterterrorism team at the London-based charity Reprieve.

"Drones are not a silver bullet."

Some factors for Ottawa to consider:

Loss of control

It's unlikely Canada will decide on its own drone targets as Ottawa has always worked closely with NATO and the U.S. in "coalitions of the willing." But taking the initiative from the U.S. in a program of deadly force could have unintended consequences.

For one thing, U.S. President Barack Obama, who has expanded the drone program, will be out of office soon. A new president, warn Jameel Jaffer and Brett Max Kaufman, of the ACLU, in the New York Times, "will inherit a sweeping power to use lethal force against suspected terrorists and militants, including Americans." And, possibly, Canadians. It could also lead to wider "collateral damage" to civilians.

Targeting

If Canada adopts U.S.-designated targets it will be in murky territory. The CIA maintains a covert program that only came to light through leaks and freedom-of-information requests. But strikes are also carried out by the military under the similarly secretive Joint Special Operations Command. Nor is it clear who is being targeted - only terrorist kingpins, or fellow travellers? In Somalia this week, rank-and-file fighters from the terror group Al Shabab were also killed in larger numbers than ever before. If Canada goes it alone, it would have to sort out the same issues of who should be targeted and by what lines of command.

Intelligence

Drone targeting relies heavily on intelligence from the ground. In countries such as Iraq, Libya, Somalia, Yemen, Afghanistan and Pakistan, that means developing trusted sources of information whose reliability is difficult to test. Spotters may be subject to local pressures or executed if they are discovered. They may also be acting on information based on local resentments. Although satellite surveillance of suspects can be highly accurate, without deep knowledge of the region, it may be impossible for command and control personnel to be sure they are aiming only at "high- value" targets.

Civilian casualties

The debate between the ethics and effectiveness of aerial bombing from warplanes, versus drone strikes has taken off since the beginning of the drone program in the early 2000s. Obama chose drones as a way of limiting civilian casualties and sparing U.S. military personnel. But monitors of drone deaths have noted hundreds of dead civilians, although counts are notoriously difficult as the U.S. has classified drone casualties as militants. The numbers may or may not be clearer soon when the U.S. tables promised figures for those killed in strikes, including civilians.

Blowback

"Civilians have died, but in my firm opinion the death toll from terrorist attacks would have been much higher if we had not taken action," said former CIA director Michael Hayden in the New York Times. But for people living under the threat of drones, witnesses say there's more grief than gratitude. People arrested for foiled terrorist attacks have cited drone warfare as a motive. "In my overwhelming experience in countries where there is a secret drone war, there's little benefit and a huge amount of destruction, despair and death," says Craig of Reprieve.

Recruiting and training

Canada would need to hire "pilots," who are likely to be young recruits familiar with the technical side of targeting and carrying out strikes, but unprepared for the stresses of a job that involves the life and death of strangers. In spite of their safe distance from the battlefield, pilots are under psychological pressure from isolation, secrecy, guilt and the boredom of long hours of surveillance. They will need psychological support and monitoring to prevent leaks of classified information.

Liability and rule of law

In the U.S., Obama has used constitutional responsibility to protect Americans from terrorism and the national right to self-defence as legal justifications. That still leaves vexed legal questions - such as the option to capture and try suspects instead of killing them without recourse to due process. It could also leave Ottawa open to prosecution, such as a case against CIA officials for wrongful civilian deaths in Pakistan in 2009. And it would make Canadian leaders responsible for individual life-and-death decisions.

Cost

Drone warfare is far from cheap, including repairs and maintenance. Experts say they're more expensive than manned F-16 fighter jets to maintain, and take up to 170 personnel to keep one combat mission in the sky at a time. "You can't just buy one," says UBC's Gregory. "Combat air patrol is four drones because they have a short range. They're also susceptible to weather, even clouds. Confusing a military drone with a hobby drone is a mistake. This is big kit."

Times of Israel

US giant Lockheed-Martin releases Israeli-based cyber-security system

Wednesday, 09 March 2016

Byline: David Shamah

Section: general

Jerusalem - After more than a year of working with Israeli cyber- security start-up Cybereason, US aerospace and data protection firm Lockheed Martin officially released a cyber-security solution based on the Israeli firm's technology.
"We often look to our partners to help shape and create best practices and products," said Angie Heise, vice president, Lockheed Martin Commercial Cyber. "We have been working with Cybereason to do just that. Cybereason's market-leading endpoint threat detection and response capabilities complement our cyber security offerings, providing customers a solution that is driven by our unique threat feed intelligence and enhanced by our powerful 'analyst on demand' program."

Although known mostly for its defense and weapons work, Lockheed-Martin has a large information technology division - and in fact, the company is the number one IT solutions provider to the U.S. federal government. According to the company, its does nearly $9 billion in cyber-security business annually with clients in the private sector, government, and defense arena.

In 2013, Lockheed Martin, EMC Israel, and Ben Gurion University signed a deal in which the three organizations committed to work together to ferret out promising Israeli cyber-security start-ups, and help them develop their technology into commercial products. One company they came up with was Cybereason, which takes a different approach to cyber-security.

"Most people think of cyber-security as an IT issue, and that if a computer 'appears' clean and acts normally, it is," said Lior Div, CEO of Cybereason. "That isn't usually the case, though, as hackers can act in a very stealthy manner without the victim of an attack even realizing what is going on."

Cybereason uses what Div calls silent sensors to discover attacks. "We use a big data approach, checking every piece of data going into or out of a machine," said Div. "We collect and analyze the information and present customers with a full snapshot of what is going on at any particular time, and alert them not just to specific anomalies that they need to follow up on, but whether they are actually under the attack."

Two principles guide Cybereason, said Div; one is that "the system has to be simple enough for all customers, enabling them to understand what is happening and what needs to be done even if they are not experts in security. The second is that "hackers are probably already in your system; there is no way to keep them out, so we don't even try. The key is to eliminate the attack as soon as it is discovered, and that is what we concentrate on, very successfully."

The sensor system was one thing Lockheed-Martin liked about Cybereason, and after collaborating together for more than a year, the companies developed and released at last week's RSA security conference in San Francisco the Lockheed Martin Threat intelligence with Cybereason's Endpoint Detection and Response (EDR) Platform.

The system place software sensors on all end points within an enterprise, continuously collecting and transparently communicating to the Cybereason Malop Hunting Engine, a big data, behavioral analytics platform designed to reveal malicious operations, otherwise known as Malops.

Customers see the Malops on the system's Incident and Response Console, so customers know exactly what is happening, and where on the network it is taking place. Lockheed Martin takes this capability to its next logical step, enhancing the Malops Hunting Engine's data analytics capability with threat feed intelligence from the Lockheed Martin-Computer Incidence Response Team (LM-CIRT) and providing assistance to the end user with help from its "Analyst on Demand" program.

Thus, customers can mitigate cyber-attacks at their root, and better understand the nature of the breach that allowed hackers in, so that they it can be repaired, the companies said.

"The combination of Lockheed Martin's Threat Intelligence, the Cybereason Detection and Response Platform and Lockheed Martin's leading Analyst services is a winning trifecta for enterprises combating advance persistent threats targeting their organizations," said Div,. "Launching Wisdom EDR, powered by Cybereason, is proof positive that market leaders like Lockheed Martin believe in the merits of our enterprise EDR platform to detect and mitigate advanced attacks."

National Post

Canada's drones above

Wednesday, 09 March 2016

Byline: Lauren Heuser

Section: oped

OpEd: The Canadian government is shopping for military drones. Although a National Defence spokesperson has said they would be used "primarily" for surveillance purposes, Canada's air force has indicated it hopes they will be capable of "carrying and employing precision-guided munitions." Canada should learn from the United States, and not try to bring this important technology in through the back door.

The Obama administration - which has used drones to kill an estimated 3,300 individuals - has faced mounting criticism of its secretive drone program. It's not difficult to see why. It only formally acknowledged that drone strikes were being used against suspected terrorists in 2012, years after they'd become a fixture of its counter-terrorism strategy. Presidential assistant John Brennan justified them on grounds that the U.S. was in "an armed conflict with al-Qaida, the Taliban, and associated forces, in response to the 9/11 attacks."

In 2014, the administration released a memorandum justifying its attack on an American-born terrorist, but only after being compelled to do so by a court. It has resisted disclosure of other documents. Groups such as Human Rights Watch and the American Civil Liberties Association have called on the government to adopt a more "transparent and accountable approach" to its operations.

There are lessons here for Canada. The government should be transparent about drones' benefits and risks, and should set clear rules of engagement and accountability to govern their use. Drones' benefits are considerable. Industry experts say they're already being used for activities that would be far riskier and less effective if carried out by humans. Search and rescue operations and forest fire monitoring are but two examples of ways in which they're used.

Drones also present risks, although it's important to be clear about what those are. The fact they may be capable of killing is not, of itself, cause for concern. Military planes, after all, have been armed for decades. If one accepts that lethal force is necessary in warfare, there is no moral or legal distinction between using drones (where the operator is miles away) or a bomber (where the pilot is in the cockpit) to strike a target. Indeed, of the two, drones would seem the more favourable choice, as their greater precision reduces the likelihood of collateral damage.

The risk "killer" drones present, then, relates less to their lethal capabilities, and more to what they have made possible: executing targeted individuals. International and domestic law affords all people basic rights, like the right to life, a fair trial and due process. How can rights-respecting nations disregard these when it comes to people suspected of bad things?

In short, because international law relaxes the standards to which states are held during times of war. Under the laws of armed conflict, states are permitted to kill combatants outside of the judicial process - not because they are guilty (although they may be) - but because the combatants are enemy agents. The state is not recognized as pursuing a law enforcement agenda against individuals in this circumstance.

Targeted killings hinge, then, on a country being at war. The controversy over the U.S.'s drone strikes relates in part to experts being divided over whether the government can legitimately consider itself to be at war, when the "war on terror" has spanned so many years, different territories and different terrorist organizations. If it no longer is, the continuation of its targeted killings is unlawful.

A second concern about drones relates to their surveillance capabilities, which enable them to gather far more information on individuals than was previously possible. While some would argue this is an advantage to be exploited, others would say it risks abusing individuals' privacy rights.

Both sides have a point, which is why a full airing of the security and civil liberties issues is so important. Should judicial authorization be required to conduct surveillance on individuals? Should targeted killings be permitted in certain circumstances? If so, when and what level of intelligence on a person must first be obtained? These are just a few

of the questions we need to address.

While international law provides the minimum rules to which we must adhere, Canada could choose to hold itself to a higher standard. The important thing is that it develops rules ahead of any attacks, not on an ad hoc or after-the-fact basis.

In addition to setting rules of engagement, Canada should establish a politically accountable body to oversee drone activities. Following the template of the U.S.'s security committee, which includes Congressional and Senate representatives, Canada could establish a parliamentary committee that reviews droneobtained intelligence and investigates alleged abuses of the rules.

Like any new technology, drones present opportunities but also risks. Canada should manage the introduction of this technology with a view to ensuring that, in both appearance and fact, it not only operates on the right side of the law, but also does right by its citizens and the world.

One News Now New Zealand

Spy review suggests allowing GCSB to watch New Zealanders

Wednesday, 09 March 2016

Byline: Andrea Vance

Section: general

Wellington - A review into the security services has just been published - with 107 recommendations that include expanded powers and greater oversight.
It proposes the GCSB - long-seen as the foreign spy agency - be allowed to carry out surveillance on Kiwis.

The powers of the Bureau came under intense public scrutiny after it was found to be illegally spying on more than 80 New Zealanders.

New laws were rushed through Parliament in 2014 that would allow GCSB to carry out surveillance on behalf of the Security Intelligence Service, police and the Defence Force.

But the review authors say those laws are still unclear - and GCSB is now refusing to do that work.

Former deputy prime minister Michael Cullen, one of the authors, said: "They can't use the GCSB capacity ... if you look at section 8C [of the 2014 GCSB Act] it looks as if they will be able to ...but the view taken by GCBS is that they can't... they have felt that the legislation is insufficiently clear ...because of some mistakes that have been made over recent years...the GCSB has inevitably become extremely risk adverse around interpretation of its act...that's why I think it is wrong to say it is a widening of powers - I think it is actually clarifying what ought to be able to be done."

Cullen claims the GCSB couldn't intercept the communications of a Kiwi who is in trouble, or kidnapped overseas.

The review also recommends more powers for the SIS and GCSB to carry out visual surveillance.

Under emergency foreign fighters legislation passed in 2014, this could be carried out for 24 hours without a warrant.

A period of 48 hours was initially propsed but rejected by Parliament.

The review suggests it should also be broadened for other cases, not just counter terrorism - but with stronger oversight.

The passport of suspected jihadis travelling overseas would also be cancelled for a maximum three years - up from the current 12 month limit.

Another proposal would see the agencies also be able to access and retain electronic records from other government departments.

This would include customs information, immigration databases, police info, and births, deaths, marriages and relationship registers and citizen registers. This would be through a joint agreement between ministers.

Other personal information - tax info, driver license photos, and National Student Identification Numbers would also be able to be accessed on a case-by-case basis, with authorisation.

As well as broader powers, Cullen and fellow reviewer Dame Patsy Reddy have also suggested a stronger authorisation regime which has three tiers.

The first - and strictest stage - would require a warrant from the Attorney-General and a judicial commissioner. This would be required for spying on Kiwis. There would be a panel of three judicial commissioners, with one available at all times.

In "situations of urgency and emergency" the agencies could start surveillance without this "tier one" authorisation - and the Chief Commissioner of Warrants can order it be stopped.

The agencies must provide an explanation and get proper authorisation within 48 hours.

This "'tier one'" sign-off could also be used for surveillance done for training employees.

"Tier two" would see just the Attorney-General approve a warrant for non-Kiwis.

The lowest level of authorisation would be a "policy statement" from the Security Services Minister and would cover the collection of surveillance from public places or other publicly available info.

Cullen said the terms of reference for the review meant his report could not recommend the GCSB and the SIS be merged. But the agencies will be covered by one piece of legislation.

Security analyst says rise in number of financial transactions linked to terrorism a worry

Wednesday, 09 March 2016

Byline: Staff Writer

Section: general

Wellington - A security analyst says a massive number of transactions possibly linked to terrorism can get through New Zealand's financial systems without being picked up.
Figures released to RNZ News by the police's Financial Intelligence Unit show the number of financial transactions suspected of being linked to terrorism almost doubled from 21 in 2014 to 40 in 2015.

Paul Buchanan says some people are using New Zealand's financial systems to make transactions linked to terrorism.

Paul Buchanan says New Zealand is seen as a soft target due to its loose financial regulations.

DHS: No evidence of Ukraine power grid hack in US

Wednesday, 09 March 2016

Byline: Cory Bennett

Section: general

Washington - The Department of Homeland Security said the U.S. power grid is not under threat from the historic cyberattack that recently took out a portion of Ukraine's power grid.
The December digital assault, widely believed to be the first example of hackers causing a widespread power outage, put energy companies around the world on edge as U.S. officials flew in to assist with the investigation.

The attack "should be, and must be, a wake-up call for those who haven't already been awakened by this problem and this risk," Homeland Security Secretary Jeh Johnson said Tuesday at a Senate hearing about his agency's budget.

The DHS concluded the malicious software that downed the grid in Ukraine has not extended to the U.S. for the time being.

In a blog post, the agency said it was planning an "expanded outreach campaign" to discuss the Ukraine incident with all critical infrastructure industries.

"We are working with critical infrastructure all the time," Johnson said on Tuesday. "I've spoken to CEOs and utilities about this problem."

"There's certainly more to do," he added.

The Ukraine outage caused roughly 200,000 households to lose power for up to six hours. Researchers and Ukranian authorities have blamed Russia for the digital assault, but the DHS has not publicly named a suspect.

Senate Homeland Security Committee Chairman Ron Johnson (R-Wis.), who was overseeing the hearing, suggested he would explore legislative options to help bolster U.S. grid security.

"I want to work very closely with you over the next few months to do whatever we can legislatively in working with your department," he told the Homeland Security head.

In the last few years, policymakers have been searching for ways to secure the nation's power grid from a major cyberattack as security experts repeatedly warn the industry's digital defenses are dangerously lagging and underfunded.

National Security Agency Director Adm. Michael Rogers has told lawmakers that China and likely "one or two" other countries are currently sitting on the grid, with the ability to literally turn out the lights if they wanted to.

Johnson pressed the DHS chief about what steps the agency has taken to thwart this scenario.

"Where are we on that?" he asked.

"Better than we were, but there's more to do," Johnson replied, citing better partnerships with the private sector and a freer flow of data between government and industry.

"We're in a better place than we were," he said.

Federal News Radio

DHS chief: Agency 'not where we should be' for hiring cyber talent

Wednesday, 09 March 2016

Byline: Merideth Sommers

Section: general

Washington - Homeland Security Secretary Jeh Johnson defended his department's fiscal 2017 budget on Capitol Hill, telling the Senate Homeland Security Committee that increasing the agency's cyber workforce and capabilities is important to strengthening national security.
Johnson testified before the committee on March 8. He explained to lawmakers that the agency needs to build up its workforce in order to meet growing threats in cyberspace and compete with the private sector, which is where many qualified candidates end up working.

"We are competing in a tough marketplace against the private sector, that is in a position to offer a lot more money," Johnson said. "[Homeland Security undersecretary for the National Protection and Programs Directorate] Susan Spaulding and her people are making very aggressive efforts to A) Implement the 2014 legislation you passed and B) in the interim do a lot of things in terms of recruitment; expediting the hiring process and so forth. We need more cyber talent without a doubt in DHS, in the federal government, and we are not where we should be right now, that is without a doubt."

DHS requested $40.6 billion in appropriated funding, with an increase in total spending to $66.8 billion.

According to Johnson's submitted testimony, the fiscal 2017 DHS budget proposes:

* An increase in total workforce from 226,157 to 229,626

* A 1.6 percent pay raise

* $274.8 million for the Continuous Diagnostic Mitigation program, which provides hardware, software and services designed to support activities that strengthen the operational security of federal ".gov" networks

* $47.1 million to sustain the EINSTEIN program

* Expanding DHS' 10 cyber response teams to 48

A 'sense of patriotism'

While committee members had questions and concerns about how the budget would address certain issues related to national security -- including resources for northern border security, drug smuggling and aviation security -- some lawmakers pledged their support to the secretary for building up the agency's cyber workforce.

"I have stated repeatedly, I'm very impressed with... the quality of the federal workforce; these people are patriots, they take their mission seriously about keeping the nation safe," said Committee Chairman Ron Johnson (R-Wis.). "But I also understand the constraints. I know what the private sector will pay for talent and you're constrained there. So we're going to have to put our heads together and figure out what do we need to do so that your department is staffed with the best and the brightest. There are

plenty of patriots in America that will do it and will do it at a really great financial sacrifice. Let's try and break down barriers we create bureaucratically, to resource you."

Sen. Tom Carper (D-Del.) suggested the agency stress the importance of serving one's country in its message to potential hires.

Carper pointed out that Phyllis Schneck, the deputy undersecretary of cybersecurity in the National Protection and Programs Directorate at DHS, told him she felt an obligation and desire to give back to her country, which is why she left the private sector to work for the federal government.

"It's all well and good cyber warriors work for other companies and businesses and so forth, but in this case, there's something to be said for appealing to people's sense of patriotism," Carper said. "I think that's what one of the things that draws her. That's a calling card if you will, that we can use and I'm sure that we do."

Secretary Johnson said he agreed with the senator, suggesting the agency "ought to appeal to people's sense of patriotism."

Secretary Johnson said in his testimony that among some of the other human capital goals for DHS this fiscal year is improving employee morale.

"We've been on an aggressive campaign to improve morale over the last two years," he said. "It takes time to turn a 22-component workforce of 240,000 people in a different direction. Though the overall results last year were still disappointing, we see signs of improvement. This year we will see an overall improvement in employee satisfaction across DHS."

The Secretary also said DHS will be working to develop a Cybersecurity Assurance Program "to test and certify networked devices within the 'Internet of Things.'"

Johnson said in his testimony that the agency was asking Congress to officially authorize the Joint Task Forces that were stood up to help with southern border security. The Task Forces creation is part of the Unity of Effort initiative.

Johnson also highlighted that DHS is looking to reform its human resources process.

"We are making our hiring process faster and more efficient," he said ."We are using all the tools we have to recruit, retain and reward personnel."

CBP incentive, hazardous duty pay

Sen. John McCain (R-Ariz.) voiced his concern about filling vacancies and offering incentives to customs and border protection officers in high- traffic areas, adding that he was introducing legislation to address this potential pay increase.

"I am of the view that we need to have some kind of incentive pay or hazardous duty pay at ports of entry that experience high- traffic flows," McCain said. "It's a very tough environment... I can understand how tough a duty it is. I think just as we in the military, we provide incentive pay for hardship positions, I hope that you would look at that and I'll be introducing legislation on it, because it's just not sufficient as you know. We're well over 100 customs agents short, it's either there's something with the level of staffing required or something wrong with the level of personnel."

Secretary Johnson said he would be happy to look at the proposed legislation and similar to the cyber workforce, "we're not where we need to be, no argument from me there."

"CBP needs to and is making aggressive efforts to hire, to bring on people faster, get them through the polygraph exams," Secretary Johnson said. "I fully support the hiring of veterans and making it easier to hire veterans."

Scoop News New Zealand

Spy report a dream come true for Five Eyes

Wednesday, 09 March 2016

Byline: Valerie Morse

Section: general

Opinion: The release of the Independent review of intelligence and security recommends a range of changes that are dangerous to ordinary people, both within NZ and elsewhere, and represents a massive concentration of state power.
The major recommendation is the consolidation of the two acts governing the GCSB and the SIS into a single law. As Radio NZ reported, "A single piece of legislation would mean both agencies operated under the same objectives, functions and powers and warrant authorisation framework." This is deeply problematic.

It must be understood at the outset that both GCSB and the SIS are essentially political police: they exist to identify threats to the New Zealand state, essentially "national security." These agencies do not exist to root out criminal activity, that is the job of the Police. And, although in 2013, the GCSB was given the

power to assist police with any matter, it is not an objective of that organisation (or the SIS) to prevent, detect or prosecute criminal offending. While the definition of criminal offences are spelled out quite clearly in law with identifiable components and evidentiary thresholds, threats to "national security" are at best vague and difficult to define. Even the Law Commission, an eminent body of NZ legal practitioners, struggled to explain what the national security is, noting "While the New Zealand courts have not yet been called upon to define national security, we expect that they will also face difficulties in pinning down the concept although there are varying definitions in use." (National Security Information in Proceedings, p.14).

Historically, the GCSB and the SIS have been organisations with quite different functions within the ambit of political policing. The SIS has been responsible for internal security, monitoring Maori, political dissidents, refugee and migrant populations, and extremist groups. The GCSB, on the other hand, is entirely a child of the US National Security Agency, is New Zealand's contribution to the Five Eyes Network, and until relatively recently, worked on external signals intelligence (satellite, radio and internet).

Now, however, the argument goes, because of the global reach of the internet, the lines that existed between internal and external no longer matter. Thus, rationalising the two agencies into one makes sense. This reasoning dovetails nicely into the review's recommendation that the current restriction on the GCSB to intercept the private communications of New Zealanders for its intelligence function be removed. The enormous powers of the GCSB can then be unleashed to capture all electronic communications freed of the restrictions on nationality, legalising all of the programmes that Edward Snowden told us were happening (XKeyscore, Prism, etc), but which the government has consistently denied for the past three years. These capabilities can be coupled with that of the SIS who can now install a video camera in your home for up to 24 hours with no warrant to provide "total information awareness".

Michael Cullen's ridiculous argument that the GCSB needs to spy on New Zealanders to protect them, providing the example of how hamstrung the GCSB would be should someone be lost at sea ignores the fact that the GCSB can already provide any assistance to the Police (with no thresholds whatsoever about what the Police are doing). And it is most likely that the Police would be the agency leading any missing person investigation. Cullen's example demonstrates either a stunning lack of knowledge of the GCSB's current powers or a desire to promulgate false examples of how such additional powers would be used. In either case, this person should not be leading a so-called "Independent review."

After all, we should ask, just exactly how many New Zealanders lives have been protected by the GCSB/SIS ability to spy on them already? We have no evidence of any people being brought to justice for attempts to undermine national security - and surely if there was evidence of such offences, they would be followed up by both police and the courts. One New Zealander whose life was most definitely not protected by the GCSB's ability to spy on him was Daryl Jones, a NZ citizen killed in a US drone attack in Yemen. He was subject to an intelligence warrant (we must assume a GCSB interception warrant as it is the agency with such capability) that provided the NSA with at least some data about him. Whatever

your view about Daryl Jones, he was not an existential threat to New Zealand (or the US for that matter) nor did he received any due process of law (e.g. he was never brought before any court or accused of any crime). So the evidence we actually do have is of these agencies violating the rights of New Zealanders, not protecting them. There is a list of other violations of rights regarding both agencies that have been well canvassed in the media.

The recommendation that existing laws were "inconsistent, and a lack of clarity meant both the agencies and their oversight bodies were at times uncertain about what the law does or does not permit, which makes it difficult to ensure compliance" also beggar's belief. The GCSB law was totally overhauled in 2013, the SIS Act has been amended a half a dozen times since 2007 - and somehow at none of these points were the "inconsistencies and lack of clarity" identified and cleared up? In fact, clarity was a major issue in the GCSB Act of 2013 debate: people could see that the law allowed the agency to spy on them in a way that had previously been unlawful. The idea that the GCSB interpretation of its law makes it "risk-averse" as the review notes, (in other words, unwilling to spy on people they aren't sure they are allowed to) is a GOOD thing that should be applauded not something that needs to be amended to widen its scope even further.

Curiously, the government is hot-footing it to change the law to eliminate this "lack of clarity" but no such urgency has been extended to the Solicitor-General's 2007 view that the Terrorism Suppression Act was "unnecessarily complex, incoherent...and almost impossible to apply to a domestic situation'" Rather it seems the government wants clarity to spy but not clarity on the reasons for its spying.

One final note is the commentary about the need for "bipartisan" support for intelligence law changes, such support ostensibly giving legitimacy to, and public confidence in, these agencies. But from their start, these agencies have been shrouded in secrecy and half-truths (if not outright lies). The public is hardly able to make an "informed decision" under these circumstances. What the public does know, however, has given rise to significant public unease - and that unease is not something new. In 1977, tens of thousands marched against the expansion of the SIS. In 2013, such demonstrations were repeated. These agencies act in the shadows and as such, most New Zealanders are unaware of what they are doing. It is not that they are unconcerned, but rather that other things are more obviously of urgent pressing concern: health, education, welfare and work. But when the realities of these agencies are exposed, it takes little for the public opposition to be mobilised. It is unlikely that this would ever be a make or break election issue, but that doesn't mean that people in New Zealand consent to these agencies or to these powers, or that cross-party support gives them any legitimacy with ordinary people.

The Hill

Snowden: FBI's stance in Apple case is 'horses---'

Wednesday, 09 March 2016

Byline: Julian Hattem

Section: general

Washington - National Security Agency leaker Edward Snowden on Tuesday had harsh words regarding the FBI's claim that only Apple can break into the iPhone used by one of the San Bernardino, Calif., terrorists.
"Respectfully, that's horses---," the former government contractor said during a conference hosted by liberal advocacy group Common Cause.

The FBI has been aware of hardware attacks "since the '90s" that could gain access to otherwise locked information on Syed Rizwan Farook's phone, Snowden said via a Google hangout from Russia, where he has been living to evade federal charges for leaking government secrets.

He later added in a post on Twitter that the "global technological consensus is against the FBI."

As one example, Snowden linked to an American Civil Liberties Union (ACLU) blog post alleging that the FBI can "easily work around" a security mechanism on the iPhone.

"The FBI wants us to think that this case is about a single phone, used by a terrorist," ACLU technology fellow Daniel Kahn Gillmor wrote in the post. "But it's a power grab."

Justice Department lawyers have refuted the point in legal filings, and FBI Director James Comey has backed up the claim on Capitol Hill.

"If we could have done this quietly and privately, we would have done it," he testified on Capitol Hill earlier this month.

Snowden, a frequent antagonist of U.S. intelligence and law enforcement agencies, has previously defended Apple in its opposition to the FBI request.

On Tuesday, he claimed that the company's insistence on strong digital protections was "a good example" of technology's ability to flip the script on government officials.

"The FBI would not be as pissed off as they are if it was not effective," he said.

The Guardian (London)

FBI quietly changes its privacy rules for accessing NSA data on Americans

Wednesday, 09 March 2016

Byline: Spencer Ackerman

Section: general

New York - The FBI has quietly revised its privacy rules for searching data involving Americans' international communications that was collected by the National Security Agency, US officials have confirmed to the Guardian.
The classified revisions were accepted by the secret US court that governs surveillance, during its annual recertification of the agencies' broad surveillance powers. The new rules affect a set of powers colloquially known as Section 702, the portion of the law that authorizes the NSA's sweeping "Prism" program to collect internet data. Section 702 falls under the Foreign Intelligence Surveillance Act (Fisa), and is a provision set to expire later this year.

A government civil liberties watchdog, the Privacy and Civil Liberties Oversight Group (PCLOB), alluded to the change in its recent overview of ongoing surveillance practices.

The watchdog confirmed in a 2014 report that the FBI is allowed direct access to the NSA's massive collections of international emails, texts and phone calls - which often include Americans on one end of the conversation. The activists also expressed concern that the FBI's "minimization" rules, for removing or limiting sensitive data that could identify Americans, did not reflect the bureau's easy access to the NSA's collected international communications.

FBI officials can search through the data, using Americans' identifying information, for what PCLOB called "routine" queries unrelated to national security. The oversight group recommended more safeguards around "the FBI's use and dissemination of Section 702 data in connection with non- foreign intelligence criminal matters".

As of 2014, the FBI was not even required to make note of when it searched the metadata, which includes the "to" or "from" lines of an email. Nor does it record how many of its data searches involve Americans' identifying details - a practice that apparently continued through 2015, based on documents released last February. The PCLOB called such searches "substantial", since the FBI keeps NSA-collected data with the information it acquires through more traditional means, such as individualized warrants.

But the PCLOB's new compliance report, released on Saturday, found that the administration has submitted "revised FBI minimization procedures" that address at least some of the group's concerns about "many" FBI agents who use NSA-gathered data.

"Changes have been implemented based on PCLOB recommendations, but we cannot comment further due to classification," said Christopher Allen, a spokesman for the FBI.

Sharon Bradford Franklin, a spokesperson for the PCLOB, said the classification prevented her from describing the rule changes in detail, but she said they move to enhance privacy. She could not say when the rules actually changed - that, too, is classified.

"They do apply additional limits" to the FBI, Franklin said.

Timothy Barrett, a spokesman for the office of the director of national intelligence, also confirmed the change to FBI minimization rules.

Barrett also suggested that the changes may not be hidden from public view permanently.

"As we have done with the 2014 702 minimization procedures, we are considering releasing the 2015 procedures. Due to other ongoing reviews, we do not have a set date that review will be completed," he said.

Until that hypothetical release, it remains unknown whether the FBI will now make note of when and what it queries in the NSA data. The PCLOB did not recommend greater record-keeping.

Last February, a compliance audit alluded to imminent changes to the FBI's freedom to search the data for Americans' identifying information.

"FBI's minimization procedures will be updated to more clearly reflect the FBI's standard for conducting US person queries and to require additional supervisory approval to access query results in certain circumstances," the review stated.

The reference to "supervisory approval" suggests the FBI may not require court approval for their searches - unlike the new system Congress enacted last year for NSA or FBI acquisition of US phone metadata in terrorism or espionage cases.

Privacy advocates say that this leeway for searches that NSA and FBI officials enjoy is a "backdoor" around warrants that the law should require. In 2013, documents leaked to the Guardian by Edward Snowden revealed an internal NSA rule that Senator Ron Wyden has called the "backdoor search provision", for instance.

While the NSA performs warrantless collection, internal rules permit the FBI to nominate surveillance targets. Those targets are supposed to be non-Americans abroad, but Americans' data is often swept up in the surveillance.

The legal underpinnings for the dragnet, a 2008 amendment to the Foreign Intelligence Surveillance Act, are set to expire this year. A scheduled expiration of the Patriot Act last year gave critical leverage to legislators who wanted to rein in the bulk collection of domestic phone records, and intelligence officials last month implored Congress to reauthorize the measure wholesale.

"Reasonable people could and did argue about how important the telephone metadata collection was," FBI director James Comey told the House intelligence committee last month. "This is not even a close call. This is - if we lost this tool, it would be a very bad thing for us."

Several civil- libertarian legislators have vowed to push for an expiration of Section 702, arguing that it represents a growing surveillance authority that has moved beyond terrorism and espionage, and into the hunt for general weaknesses in the internet. The chief lawyer for the intelligence community, Robert Litt, said in 2014 that the law provides surveillance authorities the powers are "not only about terrorism, but about a wide variety of threats to our nation".

A representative for the Fisa court deferred comment to the administration.

The Intercept

The FBI vs. Apple Debate Just Got Less White

Tuesday, 08 March 2016

Byline: Jenna McLaughlin

Section: column

Column - The court fight between Apple and the FBI prompted a slew of letters and legal briefs last week from outside parties, including many tech companies and privacy groups. But a particularly powerful letter came from a collection of racial justice activists, including Black Lives Matter.
The letter focused on potential civil rights abuses, should the FBI gain the power to conscript a technology company into undermining its own users' security.

"One need only look to the days of J. Edgar Hoover and wiretapping of Rev. Martin Luther King, Jr. to recognize the FBI has not always respected the right to privacy for groups it did not agree with," wrote the signatories, including arts and music nonprofit Beats, Rhymes & Relief, the Center for Media Justice, the Gathering for Justice, Justice League NYC, activist and writer Shaun King, and Black Lives Matter co-founder and Black Alliance for Just Immigration executive director Opal Tometi.

Those tactics haven't ended, they argue. "Many of us, as civil rights advocates, have become targets of government surveillance for no reason beyond our advocacy or provision of social services for the underrepresented."

In Washington and Silicon Valley, the debate over unbreakable encryption has an aura of elite, educated, mostly male whiteness -- from the government representatives who condemn it to the experts who explain why it's necessary.

But the main targets of law enforcement surveillance have historically been African-American and Muslim communities.

Malkia Cyril, co-founder of the Center for Media Justice, one of the letter's signatories, gave a speech at one of several nationwide protests outside Apple stores two weeks ago, supporting the tech giant and pointing out the FBI's history of surveilling black activists. "In the context of white supremacy and police violence, Black people need encryption," she wrote in a tweet.

Others representing Black Lives Matter attended protests across the country, including in front of the FBI headquarters itself -- the J. Edgar Hoover building -- in downtown Washington, D.C.

"I've been reviewing the Apple vs. FBI lawsuit and now realize how important it is that that Apple wins the lawsuit. #DontHackApple," DeRay Mckesson, Baltimore mayoral candidate and prominent Black Lives Matter organizer, tweeted on February 22. "When I was arrested in protest, my iPhones were in police custody. They were secure. The police couldn't access my info," he added. "If Apple has to create an insecure iPhone iOS app, all of the private data that we store on our phones is at risk."

The letter to California federal Magistrate Judge Sheri Pym, who will hear arguments March 22 on the case, is the start of more to come.

"I think racial justice organizations have a clear stake in the fight for encryption," the Center for Media Justice's Cyril said. "It was really important to me that our voices were raised here ... because they wouldn't be [represented] by others."

Cyril, a poet and grassroots organizer born to an editor of the Black Panther newspaper, wants the average person to understand how surveillance impacts low-income communities of color -- where she argues that government spying was born.

"The mundane surveillance of people of color is what gives rise to bulk surveillance at a federal level ... not the other way around," she said. "Whatever has been considered normal at a local level" -- including systems of suspicious activity reports, predictive policing, and other tactics -- "has now been considered normal at the federal level."

Tometi, another signatory, wrote in an email to The Intercept that "one of the most alarming parts of that history has been the ways that surveillance has been misused against Black people who have been advocating for their justice. It's been used to discredit, abuse, and incarcerate them. It's important we speak out now before it's too late."

King said the Apple fight, and the phone security at risk if Apple loses, is "out of sight, out of mind for a lot of people." But it ties into a greater problem, he said: the continuous monitoring that racial justice activists experience.

He said he is "concerned about how the government may abuse its opportunity to call us threats when we're not," and then use that assumption as justification for hacking into their cellphones or using other invasive spying techniques.

Over the summer, a cybersecurity firm, described Black Lives Matter organizers Mckesson and Johnetta Elzie as "threat actors" who needed "continuous monitoring" to maintain public safety. The company, ZeroFox, briefed members of an FBI intelligence partnership program in Maryland on its analysis of the Freddie Gray protests -- which it later delivered to Baltimore City officials.

"It's only a matter of time until someone says, 'We really need to access Shaun's King's cell phone,'" King said. "We're not that many steps away from that."

"I have deep concerns about how various methods of surveillance are already being used against social justice and human rights defenders in the Black Lives Matter movement," Tometi wrote.

"Basically, what people need to understand is that to protect your First and Fourth Amendment rights in the digital age, we need to update the law to the digital age," Cyril said. "Everything we do is online ... encryption is necessary for a democracy."

Cyril calls for a public debate, so that people can understand the real stakes. "Let's be clear. Everybody has everything to hide. I want to hide my banking info from thieves -- everything that is mine. I think the public needs to understand that."

Bill Gates: Apple Could Propose a Balance in FBI Dispute

Tuesday, 08 March 2016

Byline: Matthew Deluca

Section: general

New York - Bill Gates answered some questions about Apple's ongoing dispute with the FBI during a Reddit "Ask Me Anything" on Tuesday -- and stuck solidly to the same neutral position he's maintained in earlier comments.
"I think there needs to be a discussion about when the government should be able to gather information," Gates said in response to one Redditor's question.

"What if we had never had wiretapping? Also the government needs to talk openly about safeguards."

Gates first gave his thoughts on the matter -- in which Apple is refusing a court order to help the FBI unlock an iPhone used by one of the shooters in San Bernardino -- in a Feb. 23 interview with the Financial Times.

The Microsoft co-founder later said that he felt those quotes, which were widely characterized as putting him in the FBI's camp, did not accurately represent his full opinion on the case.

But Gates' answers on Tuesday, much like those he gave in another interview with Bloomberg TV, also didn't do much to clear up where the tech pioneer personally stands on the contentious case. Asked what he would do if he were in Apple's position, Gates said the company could offer a Plan B.

"Maybe they could propose an overall plan for striking the balance between government being able to know things in some cases and having safeguards to make sure those powers are confined to appropriate cases," Gates said. "There is no avoiding this debate and they could contribute to how the balance should be struck."

Gates is no longer involved in the day-to-day operations of Microsoft, which along with nearly every other major tech company has filed a "friend of the court" brief supporting Apple in the California case.

Nigeria's Buhari says MTN fuelled Boko Haram insurgency

Tuesday, 08 March 2016

Byline: Staff report

Section: general

London - Mobile phone giant MTN fuelled the Islamist-led insurgency in Nigeria by failing to disconnect unregistered sim cards, the Nigerian president has said.
Muhammadu Buhari made the comment during a visit to Nigeria by his South African counterpart Jacob Zuma.

Last year, Nigeria fined the South African-owned firm $3.4bn (£2.7bn) for missing a deadline to disconnect cards.

Nigeria believes Boko Haram militants use unregistered sim cards to co-ordinate attacks.

BBC Nigeria reporter Martin Patience says fine has overshadowed talks in the capital, Abuja, between the leaders of Africa's two largest economies.

"You know how the unregistered [sim cards] are being used by terrorists and between 2009 and today, at least 10,000 Nigerians were killed by Boko Haram," President Buhari said at a joint press conference with Mr Zuma.

Other mobile phone operators complied with a mid- 2015 deadline to register all sim cards, but "unfortunately, MTN was very very slow and contributed to the casualties", Mr Buhari added, in his first comments on the issue.

Nigeria initially imposed a $5.2bn fine on MTN in October, but brought it down to $3.4bn.

Mr Buhari said MTN, which was in talks with Nigeria to reduce the fine further, could make gradual payments, Reuters news agency reports.

Last month, MTN said it had dropped court action to challenge the fine, and had paid $250m as part of efforts to reach an "amicable settlement".

MTN has 231 million subscribers in 22 countries across Africa, Asia and the Middle East. However, Nigeria is its biggest market.

In September, the company was named as most-admired brand in Africa in the Brand Africa 100 awards, beating Samsung, while it was also awarded the continent's most valuable brand, worth $4.6bn.

MTN was South Africa's second mobile operator when it was set up in 1994 after the end of apartheid.

It began its expansion across Africa four years later with operations in Rwanda, Uganda and Swaziland.

The six-year insurgency in north-eastern Nigeria has killed some 17,000 people and forced more than 2.6 million from their homes.

Mr Buhari said in December that Boko Haram was "technically" defeated but attacks have continued.

The National (UAE)

Cyber experts needed to stay ahead of developing threats

Wednesday, 09 March 2016

Byline: Caline Malek

Section: general

Abu Dhabi - Training the region's next generation of cyber experts will be vital in fighting evolving military threats in the future, according to defence experts at the Global Aerospace Summit.
They said the threat is especially felt in the Middle East where there is a shortfall in manpower and human capital development.

As terrorist groups become more technologically-savvy, governments and the defence industry will have to stay ahead of the curve and design weapons in such a way to keep their enemies at bay.

"The future is uncertain," said Robert Harward, retired vice admiral US Navy Seal and chief executive of UAE Lockheed Martin. "We know these existential threats in the region like Iran and you look at newer existential threats that we had missed like radical jihadists gaining capabilities. I think all these are indicative of the threats we'll have to deal with."

He said the defence industry was bringing technology to stay ahead of some of these curves. "The UAE is the perfect example of this," he said. "In partnership with the US, the UAE was able to bring top line capabilities, enabling them to defend themselves against imminent threats. We're going to need to work with the services and our allies to stay ahead of the threats and I think a big issue for all of us is do we collectively with our allies and the defence industry have the capacity to stay ahead of the threats?"

A US study by global information company IHS found that the UAE and Saudi Arabia were named the region's top importers of defence systems in 2014, most of which were advanced military aircraft and missiles.

The Emirates was ranked seventh in defence spending and fastest growing budgets the previous year, with 14.6 per cent. "It is important for us to maintain this technology lead," said Dr Theodore Karasik, senior adviser at Gulf State Analytics. "The reason why I argue this is because the 'bad guys' are getting very smart about the use of technology, even if you look at Isis, they're actually quite smart at trying to experiment with UAVs, which can be weaponised, and there has been evidence of some of them doing

that. These ideas are still continuing to percolate and it challenges us to be ahead of that curve to make sure we're ready for that kind of event. These are some of the trendlines that go about how we design weapons and working on a concept of operations that are needed to keep enemies at bay."

But the country's growing defence sector puts into question its security and opens a potential window to cyber attacks. A US report compiled by Going Global Defence Intitiative of the Virginia Economic Development Partnership two years ago found that UAE Government websites were vulnerable to cyber attacks which sought to exploit defence and security flaws. It said the country's integrated missile defence system would require comprehensive protection from cyber threats.

"The question that gets a lot of thought these days is where do cyber attacks fit in the next generation of military threats, whether it's directly on the battlefield or not," said Christopher Davis, country leader and president of UAE Raytheon. "Cyber attacks are going to be a fact of life. It's a big issue for us with our future warfare and I think a real question for us all is how do we train and retain the human capital who are the cyber experts for the next generation. Regionally, it's a real issue especially in the Middle East where manpower and human capital development is a real priority and where there is a shortfall."

The impetus is on the defence industry and regional defence forces, according to Simon Carroll, president and general manager of Saab Middle East, to find a way to work together more regularly to develop the technology needed to defeat the threat. "I think in this region in particular, we need to find a balance because not all the organisations that the battle is against at the moment are [able] to use their technical capability," he said. "We need to use our cyber asymmetry to our advantage and work more closely with defence partners and forces to be that one step ahead so we can avoid these tragedies that lead into a next generation of technology development."

Ottawa Citizen
Canada needs to educate more tech grads: Report
Thursday, 10 March 2016
Byline: Vito Pilieci

Ottawa - There will be as many as 182,000 high-paying technology jobs up for grabs in Canada by 2019, but the country's school systems aren't producing enough high technology expertise to fill those positions, according to a new research paper.
The solution? Putting computer science courses on par with literacy and arithmetic, and teaching those courses beginning in kindergarten.

Teaming with Microsoft Corp. and dozens of other corporations and public institutions, including the Ottawa Catholic School Board, the Information and Communications

Technology Council (ICTC) - a technology trend researcher - released a 51-page paper Wednesday called Digital Talent: Road to 2020. It calls on the federal government to oversee the creation and implementation of a nationwide Digital Talent Strategy aimed at encouraging more Canadian youth to pursue studies in information and communications technologies.

ICTC, founded in 1992 to research issues and lobby on behalf of Canada's technology industry, released the research paper at a formal event at the Canadian Museum of Nature in downtown Ottawa.

The research paper said there will be at least 182,000 information and communications technology jobs on offer by 2019, and at least another 32,000 will be available in 2020.

Those numbers could increase, depending on how quickly emerging areas such as virtual reality, robotics, cyber- security and advanced manufacturing (including 3D printing technologies) expand.

There are 877,470 people working in information and communications technology jobs in Canada, the research showed, and more than 43 per cent of all technology workers are employed in the professional and technical services industry. But they also have a significant showing in health care, the public sector and in manufacturing.

These are high-paying and stable jobs, according to ICTC. But despite the potential for a highpaying career, not enough Canadians are pursuing education in technology-related fields.

Of the 2.21 million Canadians enrolled in post-secondary institutions, only six per cent, or 126,000 students, are enrolled in programs that will help them land a job in the technology sector, the report said. In 2015, 12,800 students graduated from Canadian universities with degrees in information and communications technology-related studies.

The research paper came out just two days after the Entertainment Software Association of Canada's (ESAC) released its own report calling on the federal government to take a leadership role in creating a national plan to better prepare Canada's students for careers in the burgeoning technology sector.

ESAC, a lobby group for Canada's booming video game industry, said 1,400 video game-related jobs will be available over the next 12 to 24 months and the industry cannot find Canadian talent to fill those high- paying positions.

In 2015, the average salary of a worker in Canada's video game industry was $71,300.

The ICTC argues far more needs to be done to encourage youth to pursue careers in information technology-related fields, including exposing more minorities, disabled people and females to studies involving information and communications technologies and introducing children to computer science and coding as early as the age of five.

ICTC is calling on the federal government to make computer science mandatory for children, beginning in kindergarten. Recent studies suggest students are less likely to continue in computer and science courses as they age, so introducing them to these courses earlier and continuing them throughout elementary and secondary schools as part of a regular curriculum could help maintain interest in more students.

The idea isn't radical. In September 2014, the United Kingdom introduced changes to its national education curriculum to incorporate computer science into all education programs for children, starting with students as young as five years old.

In subsequent polls to monitor the initiative, more than 85 per cent of teachers have reported students have responded positively and are showing more interest in subjects that include coding and information technologies.

Wall Street Journal
Internet Providers Face Privacy Fight
Thursday, 10 March 2016
Byline: John D. McKinnon

Washington - Federal Communications Commission officials soon will seek to impose new customer-privacy rules on Internet access providers, a move expected to fuel an already fierce conflict with the industry.
The new rules, which could be brought up at an FCC meeting as soon as this month are intended to help shield tens of millions of consumers from potentially unwanted use of their Internet data by the providers, many of whom are looking to boost profits by using customer data to sell more targeted advertising online.

The Internet access companies -- which include cable and wireless firms -- are digging in for a regulatory fight, arguing that tough new FCC rules could put them at a disadvantage, particularly against Internet-services firms such as Alphabet Inc.'s Google unit or Facebook Inc. that wouldn't be covered by the new FCC rules.

Until recently, online privacy has largely been the domain of the Federal Trade Commission, another independent regulatory agency which has a long track record in privacy enforcement but which some privacy advocates believe is hamstrung by limited legal authority.

Google and Facebook -- which also use customer data -- are regulated by the FTC.

The fast-growing digital advertising market is worth tens of billions of dollars each year, and the ability to use customers' data can give telecommunications firms an important edge. That makes the FCC's effort to impose new restrictions on data a potentially high-stakes battle for Internet service providers.

It is also fueling a long-running conflict between FCC Chairman Tom Wheeler and the providers, who have sparred recently over net-neutrality rules as well as the agency's efforts to open up the market for pay-TV set-top boxes.

Mr. Wheeler is hoping to put the new privacy rules up for a preliminary vote at this month's commission meeting. He is expected to announce his plans as soon as Thursday.

On one level the new rules likely will be mundane stuff. They are expected to require the companies to explain more clearly to customers how their data would be handled.

The rules are likely to give customers more ability to opt-in or opt-out of various data uses, depending on the specific types of data involved. And they will lay down new standards for keeping data secure from breaches.

Still, they are expected to spark a contentious industry battle. Some advocates worry the FCC move could open the door to more onerous regulation of telecommunications firms' practices than they have previously experienced under the FTC.

"Despite objections and concerns I have about the FTC, which are significant, it's still a far saner regime" than the new FCC system is likely to be, said Berin Szoka, president of TechFreedom, a market-oriented think tank. That is partly because of the FCC's sweeping powers to classify practices as improper under the law.

But many privacy advocates believe FCC regulation would be an improvement. They regard the FTC as somewhat hamstrung when it comes to protecting privacy, for example because of its limited ability to impose fines on offending companies.

Privacy advocates also say telecommunications firms have access to so much data -- even more than Google or Facebook -- that they ought to be regulated differently.

"The larger and deeper the data set, the more able I am to target you personally," said Harold Feld, a senior vice president at Public Knowledge, a consumer group.

Reuters
Senators close to finishing encryption penalties legislation: sources
Thursday, 10 March 2016

Washington - Technology companies could face civil penalties for refusing to comply with court orders to help investigators access encrypted data under draft legislation nearing completion in the U.S. Senate, sources familiar with continuing discussions told Reuters on Wednesday.
The long- awaited legislation from Senators Richard Burr and Dianne Feinstein, the top Republican and Democrat on the Senate Intelligence Committee, may be introduced as soon as next week, one of the sources said.

It would expose companies like Apple Inc, which is fighting a magistrate judge's order to unlock an iPhone connected to the mass-shooting in San Bernardino, California, to contempt of court proceedings and related penalties, the source said.

Senators are expected to circulate the draft bill among interested parties next week and hope to introduce it soon after, though a timetable is not final, the source said.

The Senators' proposal would not seek criminal penalties, as some media reports have stated, the sources said.

The controversial proposal faces an uphill climb in a gridlocked Congress during an election year and would likely be opposed by Silicon Valley.

Tech companies have largely supported Apple in its legal fight against the Justice Department, which is seeking access to a phone used by Rizwan Farook, one of two shooters in the San Bernardino attack last December in which 14 were killed and 22 wounded.

It is particularly unlikely the proposal will gain traction in the U.S. House of Representatives, which staked out positions strongly supporting digital privacy in the wake of revelations about government-sanctioned surveillance of communications by former National Security Agency contractor Edward Snowden.

Last year, amid stiff private sector opposition, the White House backed away from pushing for legislation to require U.S. technology firms to provide investigators with mechanisms to overcome encryption protections.

But the issue found renewed life after the shootings in San Bernardino and Paris. An August email from Robert Litt, the top U.S. intelligence community lawyer, obtained by the Washington Post, noted that momentum on the issue "could turn in the event of a terrorist attack or criminal event where strong encryption can be shown to have hindered law enforcement."

Separately, Democratic Senator Mark Warner and Republican Representative Michael McCaul last week introduced legislation to create a national commission to further explore solutions to the so-called "going dark" problem, where strong encryption has made it more difficult for law enforcement to access communications belonging to criminal suspects.

Sputnik (Russia)
Russia Main Threat to EU, NATO Cyber Security - Estonian Intelligence
Wednesday, 09 March 2016

Tallinn - Russia poses a major cyber security threat to the European Union and NATO, a report by the Estonian Information Board, released on Wednesday, said.
"In cyberspace, Russia is the source of the greatest threat to Estonia, the European Union and NATO. Estonia is a target of hostile cyber acts both as an individual country, and as a member of the EU and NATO. Russia is actively adding to its cyber-attack capacity and has a wide range of tools and resources necessary for carrying out attacks," the report, titled "International Security and Estonia," said.

The Information Board, which is Estonia's foreign security service and intelligence agency, alleged that Russia employs attacks involving denial-of-service, malware and security vulnerabilities to wage an information war against the European Union and NATO. Russia employs hackers and cyber activists to manipulate social media, the press and thus public opinion to enforce its geopolitical power, the report said.

The report also alleged Russian to be waging a "hybrid war" in Ukraine, disrupting information and other infrastructure to ferment dissatisfaction with the government and legitimize anti-government militia groups.

The report comes just a day after a meeting between US Secretary of State John Kerry and Estonian Foreign Minister Marina Kaljurand. The meeting focused on the situation in Ukraine and current European security issues, as well as the upcoming NATO summit in Warsaw, the situation in Syria, energy and cyber security, according to Kaljurand.

Since 2014, NATO has been building up its military presence in Europe, particularly in eastern European countries bordering Russia, including Estonia, using Moscow's alleged interference in Ukraine as a pretext for the move.

Russia has repeatedly expressed concerns over NATO's military buildup along its western borders, warning that the alliance's expansion undermines regional and global security.

Ottawa Citizen
Computer virus strikes hospital
Monday, 14 March 2016
Byline: Vito Pilieci

The Ottawa Hospital has confirmed that four computers in its network of 9,800 were hit with ransomware last week, encrypting the information on those machines and making it inaccessible to hospital administrators. "No patient information was affected. The malware locked down the files and the hospital responded by wiping the drives," said Kate Eggins, a spokeswoman for the hospital. "We are confident we have appropriate safeguards in place to protect patient information and continue to look for ways to increase security. We would like to reiterate that no patient information was obtained through the attempt."
The hospital wouldn't divulge what was on the machines that were infected. However, Eggins said the computers were wiped clean of the infection and the information on the computers was restored through the use of backup copies of the data.

The infection on hospital systems comes at a time when ransomware is surging to a fever pitch, attacking personal home computers and businesses alike. Ransomware, which is a virus and not an attempt to hack a computer system, starts by tricking a computer user to install malicious software on a personal or work computer.

The dangerous software usually comes in the form of a spam email, which is being sent in the form of an invoice, a website or video.

When the computer user opens the attachment, the software then gets to work encrypting all the data on the user's computer. By encrypting the data, it locks out the user, making the data inaccessible to the computer user. To regain access to the files on the computer, the user is told to pay a ransom. The ransom is usually requested in Bitcoin, which cannot be traced. However, there is no guarantee that paying the ransom will see the machine unlocked.

The Ottawa Hospital is the second hospital to report being hit by ransomware in recent weeks. Last month, Hollywood Presbyterian Medical Centre in Los Angeles was hit by a widespread infection of ransomware that locked down a vast majority of computers and computer systems in the hospital, significantly impacting its ability to operate. The hospital was forced to pay a ransom of US$17,000 in Bitcoin.

Computer security researcher McAfee has named ransomware as one of the biggest security threats of 2016. It's one that will affect consumers and businesses equally, as the criminals behind the malicious software don't care who the virus infects as long as people are paying ransoms. According to the researcher, more than four million samples of ransomware were floating around on the Internet last year, and more than 1.2 million of those samples were new.

It should be mentioned that with last week's discovery of ransomware targeting people running Apple computers, criminals have spread their nets as wide as possible in a bid to catch as many people as possible.

In recent days, a new version of ransomware, named "Locky" by researchers, has hit a fever pitch online. According to security researcher Trustwave, as many as four million spam emails containing Locky ransomware have been detected in the past seven days alone. The researcher said the emails containing Locky just started to be sent in the past month, and that last week as many as 200,000 per hour were being detected by Trustwave's Spam Research Database.

Eggins could not confirm it was Locky that hit The Ottawa Hospital's computers.

Mark Nunnikhoven, vice-president of cloud research at computer security firm Trend Micro, said ransomware is a serious threat of which consumers and businesses need to be aware.

"It's quickly becoming the 'goto' move for cyber-criminals. The reason why ransomware is increasingly in prevalence is because it's extremely profitable for the criminals. This is a low-effort, highreturn campaign."

Nunnikoven said Locky is something that people need to be concerned about. He said he received three emails on Sunday alone that were attempting to get him to install Locky on his home computer. By locking down a person's home computer using ransomware, any photos, videos, contact information or important financial documents that may be saved to that hard drive could be lost forever.

Consumers and businesses are being reminded by computer security professionals to avoid opening any email attachments that are unsolicited. If an unexpected email does arrive with an attachment, contact the sender to verify that they actually intended to send the message. Back up all important data to an external hard drive or online cloud computing service, and ensure that anti- virus programs are kept up to date.

Globe and Mail
RCMP fight to keep lid on high-tech investigation tool
Monday, 14 March 2016

Police in Canada are fighting to keep secret the specifics of advanced technology they've used to spy on mobile phones in a criminal investigation into organized crime.
Court documents filed in the Quebec Court of Appeal show government lawyers have acknowledged that the RCMP used an extraordinary communications-interception technique involving "mobile device identifier" equipment.

But the Crown will be fighting to keep details of the operation under wraps during a court hearing scheduled for March 30 in Montreal.

Chris Parsons, a researcher with the Citizen Lab at the University of Toronto's Munk School, said this case "wouldn't be the first time [these devices] have been used - but it would be the first time [authorities] have been caught out in court."

The public is bound to want to know more, Mr. Parsons said. "These are fundamentally devices of mass surveillance," he said.

"Authorities using them will also be collecting information about law-abiding Canadians."

Between 2010 and 2012, detectives in RCMP "Project Clemenza" used a high-tech device to eavesdrop on a group of reputed mafia members who were sending each other encrypted messages on BlackBerry phones. Police believed the suspects were out to settle scores during the power vacuum that had emerged after the jailing of mob boss Vito Rizzuto.

On Nov. 24, 2011, a New Yorker named Salvatore (Sal the Ironworker) Montagna was shot dead on the outskirts of Montreal. Fearing more bloodletting was imminent, an RCMP-led team divulged its ongoing operation to local police, so they could make arrests in that gangland slaying.

Defence lawyers suggest the machinery the RCMP used in the case works by mimicking a cellphone tower and can trick all mobile phones within a specific radius into giving up data to police.

That would make this equipment similar to dragnet devices - known as "Stingrays," "cell-site simulators" or "IMSI catchers"- that have become ubiquitous and controversial in the United States. The New York Police Department, for example, was recently forced to release documents showing it had secretly used similar tracking technology more than 1,000 times since 2008.

The Mounties will not comment about their investigative techniques. "Seeing that this matter is still before the courts, it would be inappropriate for the RCMP to comment," said Sergeant Harold Pfleiderer.

The Mounties' use of the equipment is documented - in broad strokes - in a Crown brief sent to the appeal court in December, as part of the organized-crime case.

Nearly five years after the murder, most of the seven accused conspirators in the murder still await trial, as lawyers and prosecutors argue how much of the RCMP's techniques should be disclosed to the defence.

Last November, Quebec Superior Court Judge Michael Stober ordered the Crown to acknowledge its use of RCMP "mobile device identifier" (MDI) technology, and added that the accused are entitled to know details about it.

Crown lawyers immediately appealed. "The information sought would tend to identify the RCMP's methods and give a way to circumvent them," says the Dec. 14 appeal brief. Arguing that the technology is shielded by "police investigative techniques privilege," the brief says any disclosure will "hinder the RCMP's capabilities to lead criminal investigations."

The filing shows the Crown is resisting the defence's bid for the "manufacturer, make, model" of the device in question, as well as its "practical range." The defence wants "confirmation the device is a cell-site simulator" and, also, to know whether federal authorities have studied the privacy, safety and technical impact of such surveillance.

The filings do not make clear how powerful the RCMP equipment was.

Some such devices can intercept voice conversations or text messages. Others merely collect what is known as "metadata" - or information relating to phone numbers, SIM cards, or handset identifiers - on all phones that show up in a given radius.

The Crown brief suggests the RCMP used the technique to lay the legal groundwork for warrants that could facilitate lawful eavesdropping against suspects who were proving hard to track.

The crux of the alleged murder-conspiracy centres on a circle of eight suspected mobsters, one of whom is now dead. Some were known to police at the time only by the aliases they used on their phones, such as "Gateau," "Aaaaaaacounts," "Shadow," and "JJ."

The brief says the Mounties used their device as a targeting method to figure out which specific BlackBerrys to target. "The fruits of the MDI were sometimes used as grounds to connect [BlackBerry] PIN numbers pursuant to ... wiretap authorizations," the filing says.

There is no mention of verbal or typed conversations being collected by this equipment. The prosecution "will not use the MDI in its case," the brief says.

RCMP Project Clemenza has made headlines before, after the Mounties revealed they had figured out how to snoop on BlackBerry's supposedly secure messaging system. In 2014, the police force issued a press release claiming it had intercepted and read more than a million such messages as part of the wider investigation.

Now, defence lawyers are asking for details as to how exactly the Waterloo-based company may have helped police do that. Or, failing that, "how the RCMP came into possession of the BlackBerry global encryption key."

But this disclosure, too, has been resisted by the Crown.

Le Devoir
Éradiquer Facebook pour sauver la démocratie
Monday, 14 March 2016
Byline: Fabien Deglise

Québec - Richard Stallman, le père des logiciels libres, appelle les citoyens à reprendre le contrôle de leur vie
Pour le fondateur du mouvement du logiciel libre, Richard Stallman, impossible de vivre libre dans des environnements où la socialisation et où l'informatique sont assujetties à des entreprises privées qui balisent les activités humaines avec des logiciels privateurs ou avec des services dont les codes et leurs intentions sont gardés secrets.

L'homme, de passage au Québec cette semaine, où il a été invité par l'Université Laval et par le Collège Dawson à parler de liberté numérique et de logiciel libre, demande d'ailleurs aux gouvernements et aux citoyens de prendre conscience des injustices qui accompagnent ces nombreuses soumissions et appelle même au démantèlement du réseau Facebook, pour sauver la démocratie.

" Il faut éliminer Facebook pour protéger la vie privée", a lancé en entrevue au Devoir le célèbre programmeur américain, président-fondateur de la Free Software Foundation et militant de longue date pour une informatique libre et ouverte. L'homme est, par exemple à l'origine du système d'exploitation GNU/Linux qui, depuis des années, fait la nique aux systèmes informatiques privateurs développés par Apple ou Microsoft. Sans cette vie privée, sans la possibilité de communiquer et d'échanger sans être surveillé, la démocratie ne peut plus perdurer. " Pour M. Stallman, dans un monde où les communications sont surveillées, les possibilités de dénoncer les abus, de savoir ce que l'État fait diminuent forcément, avec à la clé une perte de contrôle du citoyen sur ce même État.

Utiliser ou se faire utiliser ?

Le réseau social numérique de Mark Zuckerberg " utilise bien plus ses usagers que ses usagers ne l'utilisent ", dit-il en boutade. " C'est un service parfaitement calculé pour extraire et pour amasser beaucoup de données sur la vie des gens. C'est un espace de contraintes qui profile et fiche les individus, qui entrave leur liberté, qui induit forcément une perte de contrôle sur les aspects de la vie quotidienne que l'on exprime à cet endroit. " Et selon lui, même si le plaisir d'utilisation accentue une certaine dépendance chez plusieurs utilisateurs, les conséquences sociales et politiques ne peuvent être que délétères à moyen ou long terme, surtout si le pouvoir de ce réseau se voit renforcé au fil du temps par les abonnés qui se multiplient en son sein.

" On le voit avec l'informatique privative [celle portée par les Apple et Microsoft de ce monde] qui, depuis des années, ne laisse aucune place à l'alternative de l'informatique libre, résume M. Stallman. Les entreprises qui soumettent les gens avec ces produits gagnent beaucoup d'argent, argent qu'elles utilisent pour amplifier l'inertie sociale qui bloque toutes les portes de sortie. "

Liberté sous surveillance

Et pourtant, une telle domination est néfaste pour les gouvernements assure-t-il. En laissant leurs administrations publiques se placer sous le joug d'entreprises, ils perdent de leur pouvoir tout en ne servant pas très bien les citoyens qu'ils représentent. " Une informatique publique dans l'intérêt du peuple n'est pas une informatique dont le contrôle est dans les mains d'entreprises privées qui cultivent le secret sur leurs codes informatiques, dit cet ancien du Massachusetts Institute of Technology (MIT) qui pourfend les brevets logiciels et la gestion des droits numériques. Le logiciel privateur surveille ses utilisateurs, décide de ce qu'il est possible de faire avec ou pas, contient des portes dérobées universelles qui permettent des changements à distance par le propriétaire, impose de la censure. Lorsqu'on l'utilise, on se place forcément sous l'emprise de la compagnie qui le vend. Avec ce pouvoir, le propriétaire est tenté d'imposer des fonctionnalités pour profiter des utilisateurs. On ne peut décider librement du code que l'on installe ou pas. On est donc forcément soumis et moins libre. "

À Québec mercredi, lors d'une conférence organisée par l'Institut Technologies de l'information et Sociétés (ITIS) de l'Université Laval, puis à Montréal jeudi, au Collège Dawson, l'homme va d'ailleurs réitérer les appels qu'il lance désormais aux quatre coins du globe à se défaire de ces chaînes numériques pour retrouver la liberté de créer, de partager, de construire des données, loin des contraintes imposées par les géants du numérique. " Les gouvernements ont un rôle important à jouer pour combattre ces injustices en s'échappant des cadres privateurs dans lesquels ils se sont placés, dit-il. Le système scolaire, aussi, doit apporter sa contribution en n'imposant plus la dépendance des élèves à des entités informatiques privées. Il ne devrait enseigner que le logiciel libre. C'est la seule façon de regagner collectivement la liberté perdue et de reprendre le contrôle sur des activités qui nous ont d'ores et déjà échappé ", conclut-il.

Toronto Star
Canada's master of messaging
Saturday, 12 March 2016
Byline: Patty Winsa

Ottawa - Ted Livingston, CEO of the billion-dollar tech company Kik, is sitting at a glass conference table in his Waterloo offices.
He's wearing the same thing he wears most days: a purple T-shirt that clashes with his strawberry blond hair, under a black hoodie.

And he's adamant about not posing for the camera, which has resulted in an online trail of unflattering photographs, many with his mouth open, taken while he's being interviewed.

But those quirks, which make it difficult to lay out a splashy magazine spread, may be the least interesting parts of Livingston.

The life of the Toronto native, only 28, has been entwined with some of the events that have defined the early 21st century - the rise and fall of Research In Motion, the release of the iPhone and the global banking crisis.

In that riptide Livingston managed to create Kik, a cross-platform messaging app originally for BlackBerry - where he once worked - that would connect BlackBerry users to iPhones and vice versa. The app exploded in popularity until the phone maker kicked it off its platform in 2010 and effectively shut it down.

(BlackBerry, which changed its name from Research In Motion in 2013, declined to comment for this story.)

"They disabled it," Livingston says matter-of-factly. "They completely destroyed it on BlackBerry even if you had already downloaded it.

"It was mean, not just to us, but to all those people. They all got this fastest-growing thing in human history," he says of the app, downloaded a million times in its first 15 days, "and then they took it away."

Kik "was written off for a year or two," says Blair Livingston, Ted's younger brother. Meanwhile, Ted remained in Waterloo, where he was a university student, and "formulated a plan to retake over the world."

"There are lots of examples in human history of a company or group of people who lose the battle but win the war," says Blair, the founder of a financial tech service.

Last year, Kik Interactive Inc. was valued at $1 billion (U.S.) after Tencent, the Chinese developer of messaging app WeChat, invested $50 million in return for a 5-per-cent stake, although that value is mostly on paper.

"We are making money now," says Ted Livingston. "For a long time we weren't. It was all focused on growing the user base." That base has reached 275 million, according to the Kik website.

The company says it's used by 40 per cent of teens and young adults in the U.S. Livingston speculates it caught on because it could be used on Wi-Fi with no phone number, appealing to kids with an iPod Touch or a parent's old iPhone. But that feature is being criticized for allowing people to sign up and connect to friends and strangers with a user name and personal information that may not be real.

Last month, two suspects, freshmen at Virginia Tech, were charged in the murder of Nicole Lovell, a 13-year-old cancer survivor who told friends she met the male suspect on Kik.

There have been a number of other high-profile cases, including one in November, when a 15-year-old girl from Cleveland was abducted and raped by a man she met on Kik, police allege. Police found her only after the 41-year- old man posed as the teen on Facebook.

Spokesman Rod McLeod says the company helped police identify the suspects in the Virginia case and that it shuts down accounts that are misused. He doesn't believe Kik "is used for nefarious purposes more or less than similar communications services."

"Kik co-operates with law enforcement to combat child predators anywhere in the world, either upon provision of a court order, or in emergency situations such as this one," wrote McLeod in an email.

Whether Kik and other social media sites are putting kids at risk is hard to quantify, says David Finkelhor, director of the Crimes Against Children Research Center in the U.S.

Police may report that more crimes are occurring because of a certain social media platform, he says - but does that mean the platform itself is riskier or just that it's a new medium where more people are interacting with each other?

"The argument from law enforcement has been that the anonymity that is particular to the Kik type of approach is more facilitative for these kinds of crimes. That may or may not be the case," says Finkelhor, noting that kids face much higher risk of sexual assault from people they know.

Meanwhile, messaging apps continue to grow in popularity. By 2018, it's expected nearly 80 per cent of smartphone owners - about two billion people - will have used one, according to online site eMarketer.

One of the most advanced is China's WeChat. People can chat with friends or computerized "chatbots" that can be used to market companies' products.

The race is on in the West to create a similar mobile messaging platform, where users don't have to leave the app to say, order a cab, send money to a friend or buy a shirt. There are rumours Facebook's Messenger app could introduce the technology in April.

Kik is an early adopter: users can connect to clothing lines and movie tickets, as well as their friends.

"I have a Kik user name," says Livingston. "I just ask you, 'What's your Kik?' That's what all these teenagers are doing."

Living in our smartphone world

before anybody else

When Livingston was young, all he wanted to do was build robots.

As a child in North York, he had a passion for building, anything from Lego to K'NEX, or battling with automated machines called Sumobots in his basement. He started making robots in high school.

Livingston lived with his three brothers and his parents - Bob Livingston, a financial adviser on Bay Street, and Laurel Hobbs, who met her husband while at York's MBA program, worked in advertising and later stayed home with the kids.

His older brother, Michael, 31, is a doctor. Blair, 26, runs Street Contxt, a cloud-based financial information service. Michael, Ted and Blair were educated at Toronto's prestigious private school Crescent. His youngest brother, Jack, born with severe cerebral palsy, died three years ago at 19.

The siblings' privileged upbringing - weekends skiing at a private club in Collingwood, summers at a cottage in Muskoka - never gave the older kids a sense of entitlement.

"There's an idea that people play out their lives. And if you worked hard, you're successful. You deserved that," says Livingston. "But for my brothers and I, we look at Jack and we're like, 'Well, he worked hard and he deserved it. But he didn't get anything.' It's hard for us to reconcile those two things."

After high school, Livingston pursued his dream of building robots and enrolled at the University of Waterloo in mechatronics, a co-op program that teaches students how to build computer-controlled electromechanical systems.

"The funny thing is I get to Waterloo in 2005 and I never get to build robots," says Livingston, who almost dropped out. "The big scam of engineering is you never get to build things. You just do a lot of math."

He alternated four months of school with four months of co-op work, first at Honda and then with the city of Toronto, where he painstakingly measured thousands of feet of sod and curb to determine what to pay contractors. He tried to introduce some time-saving changes.

"Eventually my boss pulled me aside," Livingston recalls. "He said, 'Ted, the government is like a train. It's on its set of rails. And unless it's going to crash, it's just going to keep going that way.'"

After that, the Waterloo student was determined to get a better placement and landed at BlackBerry.

"I felt like we were going to change the world. It was amazing to be there," he says. "It was a huge source of inspiration, even to this day, that something that big was built right here."

He lived in a social circle of interns who were connected day and night because they all had free BlackBerrys and full data plans at a time when Livingston says only bankers on Wall Street could afford them.

"That to me is a huge opportunity BlackBerry gave to me," he says, "letting me live in this world before anybody else."

But he turned down a full-time job after a couple of co-op terms and went back to school at Velocity, Waterloo's incubator program for entrepreneurs. He started building the app with a group of students including co-founder Chris Best, who is now Kik's chief technology officer.

When the next co-op term came up, what Livingston wanted most was a job with a global consulting firm, but two of the three biggest cancelled their programs in the wake of the global financial crisis.

With only one firm hiring in Canada, Livingston didn't make the cut.

"And because I didn't get that, I thought, 'Oh, I might as well keep working on this Kik thing.'"

Not ready to cash in on 'the gold rush'

Ted Livingston started the company with a $25,000 inheritance from his grandfather and money he saved from co-op jobs.

"There were no salaries," says Livingston. "Of course we're not going to pay each other," he says of his partner, Chris Best.

"This is basically a school project. Money went to pay for computers, a server, all the operational costs of things we couldn't afford.

"We'd go out to celebrate things when we launched them and pay for the pizza and beer."

The first private investors were a group of Toronto doctors and lawyers who planned to give a total of $50,000, but threw in three times that after meeting Livingston. When investments reached $1 million, the company started hiring people in Waterloo and paying them salaries.

"The way these companies work is you take a bunch of money, you burn it and you hope the ashes are worth something," says Livingston.

"That's the name of the game and why Canada is not good at consumer startups - because it's high, high risk. It's why Silicon Valley is very good at it. You have to be a little bit irrational to get into it."

High-risk or not, Kik has now been bankrolled for $120 million (U.S.). And many of those private investors must be eagerly anticipating the takeover bid or the IPO that could make them all rich, or richer.

One of them is legendary U.S. venture capitalist Fred Wilson, who went from broke to multimillionaire in one week after his investment in GeoCities paid off with a sale to Yahoo in 1999.

Wilson lost it all when the dot-com boom went bust soon after, but his company - Union Square Ventures - has since rolled the dice on startups like Tumblr, which was founded in 2007 and sold to Yahoo for $1.1 billion in 2013, as well as Twitter, Kickstarter and Foursquare, to name just a few.

This time it could be a long wait.

"If you're a minority shareholder in a company that is controlled by a founder with a long-term vision," says Wilson of Kik, "you might be in it for 20 years."

Livingston confirmed last year that his company had hired a San Francisco investment bank to explore options to partner or sell. But Kik remained independent and instead took a $50-million investment from Tencent, aligning itself with a Chinese company that has pioneered the chat platform.

"If it was up to me, we would never sell the company," says Livingston, although he is keenly aware his employees, all part-owners, could pay off mortgages with the profits. (To that end, the company let employees sell 5 per cent of their shares to a private investor a year and a half ago.)

Livingston, who is married to Christine Thayer, a product manager at Kik, would rather build the company into something "huge."

He says Kik is at the frontier of a technology that could be the biggest thing since the invention of the smartphone - building an app into a platform as powerful as Tencent's WeChat.

WeChat, which has been around for six years, has 650 million monthly active users.

The messaging app also has five million automated bots, pieces of software that users can "chat with like a friend to do things that deliver value," says Livingston. Scan one of Tencent's proprietary codes - similar to QR codes - and you can have a chat with a vending machine that will give you a Coke. Start a conversation with another bot and buy a shirt.

"Everybody realizes this ability for chat apps to be a new platform with bots," says Livingston.

In the West, competition is heating up. WhatsApp messenger, which Facebook purchased in 2014 for $19 billion in cash and stock, according to Forbes, reportedly hit a billion users in February, surpassing Facebook's own Messenger app.

"Messaging is the primary way people use their phones," says Wilson. "If they can, from that same text input line, order lunch or get a car to take them to the airport or do a search query or find out when the movie they want to go see is playing and get tickets, people are going to do that."

Livingston sees it as the next "gold rush in technology." But he's not ready to cash in just yet. He's turned down purchase offers, and when he did have a million dollars - he sold some of his own shares to give an investor a bigger cut - he gave it away.

"We just got kicked off BlackBerry," recalls Livingston. "Growth is back down to zero. Everybody's demoralized. And here's Ted with a million-dollar golden parachute. So I took the parachute and threw it out the window."

Livingston, who was 23 at the time, donated the money to Velocity, the Waterloo incubator, to fund two $25,000 startups a year.

That same reasoning and desire for modesty make it easy for him to say no to a couple of portrait photographs, which he believes would set him apart.

"He appreciates the fact that it's not just him building Kik," says Blair. "It takes a team to build a product.

"And I think this superhero CEO thing is a little bit overplayed."

Toronto Star
Lift the veil of secrecy
Saturday, 12 March 2016

Agency who have died in custody since 2000.
It's a disturbing total, and it's made worse by the fact that their names, the circumstances of their deaths and why they were being detained are kept secret by the agency. It's as if they didn't exist.

This should not be allowed in a supposedly open, accountable, caring democracy.

So it's no surprise that the announcement of the most recent death has led to yet another round of calls by human rights advocates for more transparency within the agency, the creation of an oversight body to hold it to account and the establishment of an outside body to investigate deaths in custody.

That's the least the federal government should do.

Human rights organizations are also urging the government not to hold immigration detainees in maximum security prisons, but in immigration holding cells, and for an end to indefinite detention.

And as the Star has previously argued, the agency should act on recommendations from a study it commissioned and release some detainees into the community, where they can be monitored electronically.

The five human rights organizations, including the B.C. Civil Liberties Association and Amnesty International, are not alone in their call for more openness and accountability. Last year, a report issued by the Senate national security committee called for establishment of a civilian watchdog over the agency to ensure transparency and avoid any abuse of power.

But still the agency operates in secrecy. All it said in a March 7 announcement about the most recent death was that it had been notified by the Ontario Ministry of Community Safety and Correctional Services that an individual under immigration detention at the Toronto East Detention Centre had passed away. It did not release his name or the cause of death.

It took an investigation by the Star's Debra Black to find out that the man who died was Melkioro Gahungu, who hanged himself as he awaited deportation to Burundi. He had been in prison after killing his wife in 2009.

Gahungu's death brings to mind that of Lucia Vega Jimenez. When the 41-year-old Mexican migrant hanged herself from a shower stall in an immigration holding centre at Vancouver airport in 2013, the agency did not initially even issue a bulletin of any kind.

Border agency officials hide behind the federal Privacy Act when pressed for details. But correctional officials can make public the names of people who die in their care and the details of their deaths. The Privacy Act should also be lifted for immigration detainees.

And immigration and refugee detainees should not be held at maximum security jails, where nearly one-third languish behind razor-wire fences with the worst offenders because immigration detention centres are already full.

We are not talking about a handful of people. At any given time about 600 immigrants and refugees are in detention, with some 10 per cent held for more than a year. Indeed, in 2014, five detainees had been held for five years or more.

As Star columnist Desmond Cole noted this week, the United Nations has said Canada's practice of indefinite detention amounts to cruel and unusual punishment of migrants.

But the bottom line, as Mitch Goldberg, of the Canadian Association of Refugee Lawyers, notes, is this: "Nobody should die while they are in the custody of the CBSA."

He is right. The Trudeau government should act on these sensible recommendations, starting with independent oversight of the agency, before yet another detainee dies.

New York Times
Obama Calls for Law Enforcement Access in Encryption Fight
Saturday, 12 March 2016
Byline: Michael D Shear

Astin, Tex - President Obama said Friday that law enforcement must be legally able to collect information from smartphones and other electronic devices, making clear, despite disagreement within his administration, that he opposes the stance on encryption taken by technology companies like Apple. Speaking to an audience of about 2,100 technology executives and enthusiasts at the South by Southwest festival here, Mr. Obama delivered his most extensive comments on an issue that has split the technology community and pitted law enforcement against other national security agencies. Mr. Obama declined to comment specifically on the efforts by the F.B.I. to require Apple's help in gaining data from an iPhone used by one of the terrorists in the December attack in San Bernardino, Calif.

But the president warned that America had already accepted that law enforcement can "rifle through your underwear" in searches for those suspected of preying on children, and he said there was no reason that a person's digital information should be treated differently.

"If, technologically, it is possible to make an impenetrable device or system, where the encryption is so strong that there is no key, there is no door at all, then how do we apprehend the child pornographer?" Mr. Obama said. "How do we disrupt a terrorist plot?"

If the government has no way into a smartphone, he added, "then everyone is walking around with a Swiss bank account in your pocket."

Mr. Obama's decision to embrace the law enforcement position on encryption represents a fundamental break with a tech community that has strongly supported his political career. For years, the president nurtured close ties to Silicon Valley, tapping the youthful talent there to help him reshape the federal government's aging technology infrastructure and seeking out leading executives for private advice and millions in campaign cash.

That partnership was in part a result of a philosophical affinity between Mr. Obama and technology executives that included broad agreement about gay rights, immigration, civil liberties and health care. Mr. Obama has repeatedly said he remains a fierce defender of civil liberties, including the right to privacy.

Within the administration, there is a division over encryption between the F.B.I., along with other law enforcement agencies, which says it must have a way of breaking into encrypted devices, and the intelligence community, which worries that the same techniques could be used against the American government. In his comments, which were greeted with polite silence, Mr. Obama said he, too, supported the development of strong encryption to make sure that the government can protect banks and critical infrastructure. And he said he wanted proper oversight of law enforcement. But, he said, technology executives who are "absolutist" on the issue are just wrong.

"This notion that somehow our data is different and can be walled off from those other trade-offs we make, I believe, is incorrect," he said.

Mr. Obama spoke broadly at the music, film and technology festival about the need for technology to be used to support civic life and the functioning of democracy.

He became the first sitting president to visit the festival, which in the past three decades has become a mecca for the high-tech, social-media set. He made his comments during an hourlong conversation with Evan Smith, the editor in chief of The Texas Tribune.

At the festival, the president sought to make the case that the technologies behind today's entertainment and communication apps should also be directed at solving the problems of voter turnout, access to information and civic engagement. "We want to create a pipeline where there is a continuous flow of talent that is helping to shape the government," he told the audience.

Mr. Obama is something of a technology geek, so his presence at the festival does not come as much of a surprise. He enjoys dinners with technology moguls and has tapped the wealth of Silicon Valley for his two presidential campaigns.

He has talked to his closest advisers about creating a high-tech presidential center when he leaves office, in part to help visitors engage with his legacy and in part to encourage better use of technology in society.

He has also sought to lure more tech executives and engineers to government to make federal agencies more responsive to their customers. Mr. Obama created the United States Digital Service as a kind of troubleshooting team to upgrade the technology associated with government services, and he has filled its staff largely with veterans of Google, Microsoft and other such companies.

"The work they're doing is impactful -- and it's hard to see how they don't become a permanent feature of our government," Jason Goldman, the chief digital officer for the White House, said in an article posted on the Medium website on Thursday. "Indeed, this might be President Obama's most important accomplishment as the First Tech President: establishing a lasting legacy of service that will carry on long after he leaves office."

Still, questions about how to harness the power of Twitter, Facebook and Snapchat to help government are not always clear, especially when the companies involved are, above all, designed to make money for their shareholders.

This spring, the White House will host what it is calling a summit meeting on civic engagement, and aides said the president would use it to continue the conversation about the role that technology could play.

China concludes 6,221 criminal cases involving cyber
Sunday, 13 March 2016

Beijing - China in 2015 concluded 6,221 criminal cases using cyber for fraud, crimes of provoking troubles or other crimes, a work report of the Supreme People's Court (SPC) said Sunday.
In the work report to be delivered by Chief Justice Zhou Qiang to the annual session of the national legislature, the SPC said it cracked down upon cyber crimes such as rumormongering, gambling and disseminating pornography in a bid to clean up the online environment.

It also fought in accordance with law against online crimes involving leaking private information and illegally trading information, for better safeguarding information security of individuals.

A work report of the Supreme People's Procuratorate (SPP), which was also released Sunday and to be delivered by Procurator-General Cao Jianming to the national legislature, said it actively took part in fighting new-type crimes involving telecommunications and the Internet, especially fraud through telephone, text message and the Internet.

Haaretz
Israeli Businesses Learning to Insure Themselves Against Cyber Attacks
Monday, 14 March 2016
Byline: Assa Sasson

Jerusalem - When Bank of Jerusalem discovered its database of securities accounts had been hacked, the task of investigating what happened and assessing the damage wasn't just a job for the bank and law enforcement authorities. Bank of Jerusalem's insurance company, AIG Israel, took an active part, too.

Policies against cyber attacks are an up-and-coming business in the insurance industry in Israel and worldwide, where high- profile hacking attacks heightened awareness of the problem both by businesses and their customers. Premiums for cyber coverage run about $2.5 billion to $3 billion a year but by 2020 they could reach as much as $10 billion, according to one estimate, with the market growing by 32% a year.

"The moment a business keeps personal data on its customers, like credit card numbers or their identity numbers, it's at risk of a cyber attack," said Elad Shelef, deputy CEO of Menorah Insurance. "One of the things we've seen is that hackers don't attack credit card companies directly. It's more complicated and very troublesome. They prefer to attack weaker links in the chain, which is to say businesses that keep customer records, so they are more exposed than they think."

In Israel, the market is just getting started. AIG worldwide is one of the biggest underwriters of cyber insurance and its Israeli unit has been active for some time. Menora began offering cyber protection in 2014 as an add-on to its business policies and today counts 1,000 policyholders, most of them small and medium-sized businesses.

Unlike most insurance, cyber policies involve the insurance company long before the first attack occurs. Insuring against cyber damage is complicated and involves assessing a lot more than the direct and immediate damage from an attack.

At the underwriting stage, an insurer will examine the client's risk for an attack, what defenses it has already set up and policies for things like changing passwords. Insurers know they can't prevent an attack, but they will do what they can to reduce the risk.

The most critical stage is immediately after an attack has been detected, said Shai Feldman, CEO of AIG Israel.

"When an attack occurrs the first 24-72 hours afterwards are the most important. It's an emergency in which many specialists have to be brought in to understand what happened and to undertake operative decisions," he said.

On the technology side, the company that's been attacked must be able to restore operations as quickly as possible, Feldman said. On the legal side, it has to report to law enforcement authorities and regulators. And then there is the marketing aspect. "For instance, what do you say to the media, how to do you tell customers ... It's like operating a war room," he said.

Finally, the insurer has to assess the damage, which is complicated by the fact that the damage can often go beyond lost work days or downed production lines, both of which can be sized up relatively easily. Damage to a company's reputation can be harder to quantify.

In the case of Bank of Jerusalem, the bank was relatively lucky. The hackers, who were apparently affiliated with the global hacking group Anonymous, stole information but weren't able to manipulate accounts by making trades or altering information. Only 6,000 of the 38,000 accounts were current clients of the bank.

Banks, in fact, are the biggest customers of cyber insurance, in large part due to regulatory requirements. Cyber insurance is less prevalent among other businesses. "It's a complicated risk for a business. For example, something like fire insurance is clear. Everyone understands how it works. By contrast, cyber insurance is more amorphous, so a business [owner] tends to think, 'it won't happen to me,'" said Shelef.

Gulf Daily News
Bahrain facing cyber threats warns expert
Monday, 14 March 2016
Byline: Sandeep Singh Grewal

Manama - It is just a matter of time before Bahrain is the target of a major cyber attack, a leading security expert has warned.
Computer hackers from Iran and China have been targeting several organisations and government entities in the region for years, said independent consultant Tom Lockhart.

"Bahrain has not faced any major cyber attack such as the one in 2012 on Saudi Aramco but eventually it will happen," Mr Lockhart told the GDN.

In a matter of hours 35,000 computers at Aramco were partially wiped or totally destroyed, in a cyber attack dubbed "the world's biggest hack in history".

Bahrain, along with Kuwait and Saudi Arabia, are prime targets for Iranian hackers seeking to disrupt business and steal classified data, said Mr Lockhart, who provides consultancy to independent British specialist security and risk management firm Le Beck International in Bahrain.

The hackers are targeting websites on a daily basis in order to infiltrate servers to get hold of valuable data. Investment in new technologies is needed to combat emerging new threats, said Mr Lockhart.

"Hackers from Iran and China have targeted several organisations and government departments in the region and internationally for different reasons and these hackers are both skilled and capable of achieving their goal.

"Bahrain, Kuwait and Saudi Arabia are the big targets for Iranian hackers and based on the patterns we have seen this is not something that will change in the near future.

"They are using multiple intrusion methods to discredit firms, disrupt systems and business activities which can have serious financial and strategic impact."

Cyber criminals with links to Iran were said to be responsible for hacking the Housing Ministry in 2011 and the GDN website.

Mr Lockhart said Bahrain is presently a relatively small target compared to Dubai, Abu Dhabi, Kuwait and Saudi Arabia, which are bigger financial hubs, but this did not mean that it is not under threat.

"The more businesses rely on technology to run their day-to-day activities, the more exposed and vulnerable they are to cyber attacks.

"Financial organisations, the stock exchange, energy sector and government systems, such as immigration and the Labour Market Regulatory Authority will be considered high-profile targets as they will have a significant impact on other sectors and thereby making the attack much more effective."

Mr Lockhart said if there is anything big happening in the country, then the chances of cyber attacks are high.

"We have the new UK naval base coming up and the annual Formula One race which all generates interest among cyber criminals who could target the logistics and organisational services."

Mr Lockhart, who works with several regional and international companies, urged IT professionals and security specialists in Bahrain to invest in new technologies to protect against cyber attacks.

More importantly, he stressed that these systems need continued and timely upgrading in order to address new threats before they can cause damage. "We have to be a step ahead of them, to identify vulnerabilities and prevent security breaches."

He was speaking to the GDN on the sidelines of an event organised by the Rotary Club of Adliya at the Diplomat Radisson Blu Hotel, Residence and Spa, where he gave a presentation on corporate and personal espionage. Terror groups such as the Islamic State are specialised in online warfare, he added.

The Central Informatics Organisation (CIO) officials have previously said that they have been capable of confronting any cyber attacks because of advanced training of its staff and the use of high-tech security programmes.

Officials in Bahrain said they found over one million malicious programmes and viruses that targeted government institutions in 2014 and hackers also targeted 10 government websites.

A government-wide Internet Security Study conducted for the CIO by Fresh Insight Associates last year showed that of the 83 million e-mails sent to the organisations, 75 per cent were spam and 0.09pc

contained viruses. It surveyed more than 20,000 people working in government ministries and authorities.

Data shows that 44pc of those surveyed opened attachments without knowing the sender and 5pc felt there was nothing wrong with opening such e-mails. The study also showed that 20pc of government staff shared their office passwords with one or more people, posing a major threat to security.

New York Times
China's Censors Denounced in Online Attack
Saturday, 12 March 2016
Byline: Chris Buckley

Beijing - China's formidable propaganda apparatus came under renewed attack on Friday, when a denunciation spread online in the name of an employee of Xinhua, the main state-run news agency. The letter accused censors of using tactics reminiscent of Maoist times to silence and smear critics.
The letter reflected a growing discontent among journalists, academics and even party insiders about the tighter censorship and about the giddy exultation of President Xi Jinping in state-run media.

"Under the crude rule of the Internet control authorities, online expression has been massively suppressed, and the public's freedom of expression has been violated to an extreme degree," said the letter, which spread quickly online in China and was taken down just as swiftly.

The letter was issued in the name of Zhou Fang, who gave his work address as Xinhua News Agency headquarters in Beijing, and included his cellphone number and identity card number. A man who answered the phone at that number said that he was Mr. Zhou, an employee of Xinhua, and that he had written the letter.

"I don't deny that," he said. He said that he had been an editor at the news agency and that he now held an administrative job. "I can't say anything more, because you're foreign media," he said.

The letter appeared after an uproar over Ren Zhiqiang, a blunt-speaking businessman, who was bitterly denounced by state-run media in recent weeks after he chided comments by Mr. Xi, who also serves as the Communist Party.

This week, Caixin, a prominent business magazine, issued an unusually candid denunciation of censorship, after one of its articles -- touching on censorship -- was taken down.

The new letter criticized the denunciations of Mr. Ren on party-run websites, which called him a traitor and a subversive for taking issue with Mr. Xi's demand that state-run media unfailingly obey the party.

"The recent Internet security incident of 'surrounding and attacking Ren Zhiqiang' in a kind of Cultural Revolution-style mass criticism brought the delinquency of responsibilities and abuses of power by the Internet authorities to an extreme," said the letter, which was dated Monday but spread widely only on Friday.

"This has triggered tremendous fear and outrage among the public," the letter said. People, it said, have begun to "worry about another Cultural Revolution."

An administrator at Xinhua said it did have an employee named Zhou Fang. But the administrator said she had not heard of the letter and declined to check the personal details in it.

Zhu Xiaoding, a Chinese lawyer who issued the letter via Weibo, a microblog service similar to Twitter, said he had done so at the behest of a friend and was sure it was from Mr. Zhou of Xinhua.

Mr. Xi visited Xinhua and other major state-media news outlets last month, and emphasized that they must unswervingly serve the party.

The suggestion that Mr. Xi could take China back to the turmoil of the Mao era appeared likely to irritate the authorities, who describe Mr. Xi as a bulwark of unflappable order.

This year is the 50th anniversary of the start of the Cultural Revolution in 1966, when Mao Zedong brought his methods of mass denunciation and vilification of foes to an extreme.

Some people fear that Mr. Xi is too willing to use harsh tactics that echo that time, said Zhang Lifan, a businessman and historian in Beijing whose father was persecuted under Mao.

"This era is different from the Cultural Revolution, when we were completely closed off," Mr. Zhang said. "Some of the mentality and methods from that time might persist. But people inside the system wouldn't like to see that happen again."

Adam Wu contributed research.

NewsTalk ZB (New Zealand)
Spy agencies may have been breaking the law
Saturday, 12 March 2016

Wellington - An intelligence expert is suggesting the country's spies may have been breaking the law.
It comes after recommendations in a review of intelligence laws that recommend GCSB and SIS staff be immune from criminal liability for actions undertaken in obtaining and operating under warrants.

Counter intelligence expert Dr Paul Buchanan said it's remarkable there's been no legal cover to the undercover agents of the SIS.

"And because there has been no legal cover then what they do to begin with, and assuming a false identity, is illegal".

Felix Marwick: Should the GCSB and SIS be immune from prosecution?

Dr Buchanan said the language around the immunity clauses needs to be tightened.

He said it's not good enough to say "act in good faith" or, "within the intentions of the Act".

Dr Buchanan said they'll have to specify more closely what is, and what is not, acceptable behaviour for undercover agents.

Labour leader Andrew Little said some scope has to be allowed for the fact intelligence agencies deal with people that act on the edge, if not the other side, of the law.

"In the end it comes down to making sure that there isn't some sort of carte blanche license to wholesale break the law and do whatever they like," he said.

"There's no security agency that could possibly be tolerated or justified that works in that sort of way."

Last year the High Court ruled evidence for the bulk of charges laid by Nelson police against members of the Red Devils gang was improperly obtained because a fake warrant was used to arrest an undercover officer.

Dr Buchanan said he has a strong feeling this was the precipitating event for immunity protections now being recommended for intelligence officers employed by the SIS and GCSB.

He said it must have been a red flag to the SIS in particular because it's very likely they do similar things in pursuit of their duties

SIS and GCSB Minister Chris Finlayson is still considering the review's recommendations and was unavailable to be interviewed on the matter.

The Intercept
Obama Wants Nonexistent Middle Ground on Encryption, Warns Against "Fetishizing Our Phones"
Saturday, 12 March 2016
Byline: Jenna McLaughlin

Washington - President Barack Obama says he wants strong encryption, but not so strong that the government can't get in.
"The question we now have to ask technologically is if it is possible to make an impenetrable device or system where the encryption is so strong that there is no key, there is no door at all?" he asked, speaking at the South By Southwest (SXSW) festival in Austin on Friday.

"Then how do we apprehend the child pornographer? How do we solve or disrupt a terrorist plot? What mechanisms do we have available to do even simple things like tax enforcement? If in fact you can't crack that all, if the government can't get in, then everybody is walking around with a Swiss bank account in their pocket. There has to be some concession to the need to be able to get into that information somehow."

It was Obama's first extended disquisition on the contentious issue of encryption. There have been many reports about a rift in his administration between those who recognize that unbreakable encryption is inevitable, and those who think there must be an alternative. But Obama appears to be hearing only one side.

Obama insisted that there is a middle ground. "My conclusion so far is that you cannot take an absolutist view on this," he said. "If your argument is strong encryption no matter what, and we can and should create black boxes, that I think does not strike the kind of balance we have lived with for 200, 300 years, and it's fetishizing our phones above every other value. And that can't be the right answer."

But the problem is that you can't have strong encryption without it being unbreakable.

Being absolutist about encryption is "the only way [it] works" tweeted Jake Laperruque, privacy fellow for the Constitution Project and the Open Technology Institute.

"It's not like no one has thought about this problem before. It's a fundamentally difficult problem, and it won't be solved anytime soon," wrote Matt Blaze, a computer science researcher and professor at the University of Pennsylvania.

Trying to come up with some solution that satisfies the desire for easy, ubiquitous law enforcement access while simultaneously upholding device security is what scientists call a "magic pony." Any hole for the government is a hole criminals and foreign adversaries could exploit, too.

And although Obama accused encryption supporters of being absolutist, he echoed the absolutist view that the widespread use encryption was tantamount to law enforcement "going dark". It's not.

The technology isn't universally marketable and there are plenty of other ways to amass evidence in criminal investigations, argued a group of scientists, privacy advocates, and members of the intelligence community in a Harvard Berkman Center report published in February. And the Internet of Things offers

many new ways to spy on us-- something the Director of National Intelligence James Clapper has mentioned himself.

Obama said he's "way on the civil liberties side of this thing," but civil liberties advocates didn't seem to agree.

"Why isn't 'government must always have the ability to access plaintext' the more 'absolutist' view?" asked Julian Sanchez, privacy and technology senior fellow at the Cato Institute in a tweet. "'Swallow arsenic.' No. 'Ok, a little hemlock then.' No. 'Well, c'mon, you can't be an ABSOLUTIST about this,'" he joked.

Kevin Bankston, the Director of the Open Technology Institute tweeted that he was "disappointed" Obama resorted to fear mongering. "Opens w/child kidnapping & terror, closes w/child porn & terror, vague talk of balance," he wrote.

Vancouver Sun
For drones, the sky's the limit in B.C.
Saturday, 12 March 2016
Byline: Derrick Penner

Vancouver - West Vancouver's Lofty Media uses drones like this Freefly Alta model to shoot aerial video for real estate companies. Marketing director Andrew Fyfe says the company intends to move into bigger film productions and is preparing to shoot crop surveying video for farmers.
It used to be to figure out what was going on in B.C.'s forests, foresters had the choice of walking into them and looking up from the ground, or hopping into a helicopter or airplane and looking down from high in the air.

Enter unmanned aerial vehicles, commonly called drones. Now foresters can get a view right at treetop level.

"You're not very high but close to the canopy, so you get much more detail about the forest," said Nicholas Coops, a forest researcher at the University of B.C. "Individual trees, gaps between trees, nests of birds, very, very detailed information about the understorey -- things you wouldn't get if you were in a plane."

The immediate payoff is that drone-captured images can give quick bird's-eye assessments of whether logging in a particular block has gone well or whether replanting after harvesting has gone as planned.

Researchers believe the longer-term benefit will come from marrying these drone-captured images with powerful computer processing to generate high-definition two-dimensional and three-dimensional maps of forests.

It is difficult to estimate the number of drones in commercial use. But over the past three years, the number of applications to Transport Canada for special flight operations certificates more than doubled to 2,300 in 2015 from 949 in 2013.

The certificates are Transport Canada's method of regulating professional uses, ensuring operators fly drones in compliance with regulations and while avoiding other aircraft.

Drones more typically make the news for the trouble that unregulated amateur operators cause, such as the unauthorized quadcopter spotted inside airspace over a forest fire near Oliver last August that forced the grounding of firefighting aircraft for several hours.

However, drones are increasingly being put to work in commerce and research, capturing stunning aerial shots for promotional videos and film, observing wildlife for biologists, helping police take overhead pictures for accident reconstructions, aiding transportation planners and more. They've also been put to use for inspection work, such as checking stability of cliffs after rock slides onto highways and checking power lines for BC Hydro.

In the evolution of drone technology in forestry, B.C. researchers and companies are on the leading edge of turning drone- captured imagery into high-value data for forest management.

"It's also the timeliness aspect, flying them when we want to, how we want to," said Coops, the associate dean for research and innovation in UBC's faculty of forestry, and a Canada research chair in remote sensing.

So far, Coops said, the key use of drones in B.C. forests has been in evaluating the regeneration of recently replanted forests.

"There is a lot of interest in using drones for that, because (they) work to the advantage of observing small things, and to the advantage of (being able to) go and fly every six months," he said.

He also sees them as an excellent tool for companies to do more detailed inventories of standing timber more cheaply, or to plan logging to avoid poor ground conditions after rainfall or spring run-off.

The convergence of computers, smaller high-quality cameras and improved drones to carry them is opening up this sector of the industry, said Patrick Crawford, co-founder of Vancouver-based Spire Aerobotics.

He started exploring the potential for drones while studying engineering at UBC. He put school on hold about 18 months ago to pursue a business opportunity with partner Mike Willcocks.

Crawford, who originally comes from Kamloops, came by his interest in drones naturally through a long-term passion for flight (he once held a glider pilot's licence and started work on his qualification for powered flight) and an interest in developing technology.

"I'd argue we're still in the infancy of drone technology in many ways," Crawford said.

Spire found its initial niche in using drones to scan wood chip piles at pulp mills, lumber yards, sawmills and wood-pellet plants and provide volume estimates for their inventory work.

Crawford said that is work that is traditionally done using manned aircraft and light sensors. Using drones, however, they can do the flights more cheaply and more frequently. They've also applied their data-processing techniques for researchers such as Coops.

Crawford said they've developed most of their company's intellectual property in the forestry sector, refining their capability to fly over forests and collect a great deal of two- and three-dimensional data, and turning that into maps.

"That next level of processing, you have that data -- what can you tell a business about it that can benefit them?" Crawford said. "That's where we want to focus our energy, and it's an application for business, for government or for any organization trying to sustainably manage the land base."

It might take more time to develop and incorporate some of the more "analytical" mapping applications, said Denis Cormier, a senior manager at FP Innovations, a key R&D organization in the Canadian forest industry.

First, there's the matter of making sure provincial forestry regulators accept that the level of detail provided by drone- generated aerial maps meets their standards for reporting.

Cormier said FP Innovations is comparing some of its B.C. drone-mapping results against ground-based surveys, and so far the province is on board with the new technology, "if it can meet their standards."

"It's not something you can easily do within a season. It's something that's evolving." he said. "At the research level, it's a pace that we're used to, (but) if you're a service provider that just bought a (drone) that cost you $50,000, you feel like things aren't moving fast enough."

Cormier added that while drones can be used more flexibly than manned aircraft, they are so new to the industry that existing work patterns are too set to fit them in.

For instance, forest companies that are used to hiring a helicopter or plane to conduct aerial surveys over a wide area once a year might not see the need to replace that effort with drones, which are limited to flying smaller areas, even if they are capturing more detailed visual information, he said.

For the time being, Cormier said, high-quality drone imagery is also an expensive proposition for forest companies because it costs of about $15 to $25 a hectare to turn drone-captured images into 3D maps.

As operators refine the computing process, "what we're hoping is that eventually we'll be able to meet a $5-a-hectare target," he said.A bigger limitation, however, is Transport Canada's regulation that operators don't let drones out of their sight.

"Trees are always going to be in your line of sight," Cormier said. That makes it hard for drones to cover wide areas of forest, unless operators can get a high viewpoint.

"Until we're solving the line-of-sight issue, it's going to be quite difficult to develop (drone operations) on a larger scale," he said.

But drone operators are confident that permission to fly beyond line of sight is only a matter of time, said David Bird, editor of the Journal of Unmanned Vehicle Systems, a publication of the national association Unmanned Systems Canada.

Bird, a wildlife biologist and professor emeritus at McGill University, said researchers like him are anxious to use drones for covering large areas of landscape using drones. Meanwhile, companies that want to use drones for inspecting transmission lines or large-scale survey work are also pressuring to change the rules.

Unmanned Systems Canada is preparing a position paper for Transport Canada on crafting regulations for beyond-visual-line-of-sight flight.

"It's going to come," Bird said.

Transport Canada is planning more formal regulation for drone operations, including clear rules for allowing unlicensed recreational use of drones and a drone licensing and registration system for operators in specified commercial and other drone uses, said Aaron McCrorie, director general of civil aviation.

The growth of the industry means existing regulations "are no longer adequate and we need more prescriptive regulations," McCrorie said.

Transport Canada proposed new regulations in 2015 and has held meetings across the country to gather comment. McCrorie said his department is reviewing that public comment and refining a set of regulations for Transport Minister Marc Garneau's consideration.

However, those regulations will be based on line-of-sight operations.

"A number of years down the road, we will look at regulations for beyond visual line of sight," McCrorie said. "But there's a lot more work to be done."

In the meantime, drone use continues to soar.

The B.C. Ministry of Transportation bought two drones last year for a pilot project to get aerial photos for planning work, but they've also proved useful in helping geotechnical engineers assess cliff safety after rock slides, said Mike Lorimer, the department's regional director for the southern Interior.

Lorimer said they typically hire helicopters to do that -- at a cost of $1,200 to $1,300 an hour. Replace them with drones a couple of times and "they pay for themselves," he said.

"It's helping us with design (work)," Lorimer added. "We're sort of on the verge of everyone figuring out how to use these things better, and we'd like to be at the front edge of that."

And despite their bad experience with drones grounding firefighting aircraft near Oliver last summer, the B.C. Wildfire Service tested drones during the Elaho and Boulder Creek fires near Pemberton by flying them near nightfall to look for hot spots with thermal-imaging cameras.

"It was very much a trial over a couple of days," chief fire information officer Kevin Skrepnek said.

West Vancouver-based Lofty Media started out shooting aerial video for promotional real-estate videos, but is angling to get into bigger film productions and is preparing to try crop surveying for farmers, said Andrew Fyfe, the company's marketing director.

"We haven't done any of those (crop-survey) jobs yet, but I definitely see that as a part of it as we grow," Fyfe said. "With thermal-imaging cameras, you can fly down a row of fruit trees and the camera will pick up how many fruit are on the trees, which will give the farmer a pretty accurate yield of what their crop is going to be, and it's pretty valuable information."

New York Times
In the Apple Case, a Debate Over Data Hits Home
Monday, 14 March 2016
Byline: Multiple reporters

Washington - Three years ago, reeling from Edward J. Snowden's disclosure of the government's vast surveillance programs and uncertain how to respond, President Obama said he welcomed a vigorous public debate about the wrenching trade-offs between safeguarding personal privacy and tracking down potential terrorists.
"It's healthy for our democracy," he told reporters at the time. "I think it's a sign of maturity."

But the national debate touched off this winter by the confrontation between the Justice Department and Apple over smartphone security is not exactly the one Mr. Obama had in mind.

Mr. Snowden's revelations produced modest changes and a heightened suspicion of the government's activities in cyberspace. Because the issue now centers on a device most Americans carry in their pockets, it is concrete and personal in a way that surveillance by the National Security Agency never was.

The trade-offs seem particularly stark because they have been framed around a simple question: Should Apple help the F.B.I. hack into an iPhone used by a gunman in the massacre last December in San Bernardino, Calif.?

Law enforcement officials have been adamant they must be able to monitor the communications of criminals. They received a vote of confidence from Mr. Obama on Friday, when he said the "absolutist" position taken by companies like Apple is wrong. But the pushback has been enormous.

In the month since a judge ordered Apple to comply with the F.B.I., the debate has jumped from the tech blogs to the front pages of daily newspapers and nightly newscasts. Supporters of the company's position have held rallies nationwide. Late-night comedians have lampooned government snoopers. Timothy D. Cook, the usually publicity-shy Apple chief executive, pleaded his case on "60 Minutes" last December. On Twitter, "#encryption" fills the screen with impassioned debate on both sides.

"Discussing the case with my friends has become a touchy subject," said Matthew Montoya, 19, a computer science major at the University of Texas, El Paso. "We're a political bunch with views from all across the spectrum."

Like many of her friends, Emi Kane, a community organizer in Oakland, Calif., recently found herself arguing via Facebook with a family friend about the case. Ms. Kane thought Apple was right to refuse to hack the phone; her friend, a waitress in Delaware, said she was disgusted by Apple's lack of patriotism.

After exchanging several terse messages, they agreed to disagree. "It was a hard conversation," Ms. Kane said.

The novelist Russell Banks, who signed a letter to Attorney General Loretta Lynch on behalf of Apple, said he had spoken with more than a dozen people about the case just in the last week.

"It's not just people in the tech industry talking about this," Mr. Banks, the author of "Affliction" and "The Sweet Hereafter," said. "It's citizens like myself."

That may be because the Apple case involves a device whose least interesting feature is the phone itself. It is a minicomputer stuffed with every detail of a person's life: photos of children, credit card purchases, texts with spouses (and nonspouses), and records of physical movements.

Mr. Obama warned Friday against "fetishizing our phones above every other value." After avoiding taking a position for months, he finally came down on the side of law enforcement, saying that using technology to prevent legal searches of smartphones was the equivalent of preventing the police from searching a house for evidence of child pornography.

"That can't be the right answer," he said at the South by Southwest festival in Texas, even as he professed deep appreciation for civil liberties and predicted both sides would find a way to cooperate. "I'm confident this is something that we can solve."

But polls suggest the public is nowhere near as certain as Mr. Obama. In surveys, Americans are deeply divided about the legal struggle between the government and one of the nation's most iconic companies. The polls show that Americans remain anxious about both the threat of terrorist attacks and the possible theft of personal digital information.

A Wall Street Journal/NBC News survey released last week found that 42 percent of Americans believed Apple should cooperate with law enforcement officials to help them gain access to the locked phone, while 47 percent said Apple should not cooperate. Asked to weigh the need to monitor terrorists against the threat of violating privacy rights, the country was almost equally split, the survey found.

That finding may have seemed unlikely in the wake of terrorist attacks last year in Paris and San Bernardino. In December, eight in 10 people said in a New York Times/CBS News survey that it was somewhat or very likely that there would be a terrorist attack in the United States in the coming months. A CNN poll the same month found that 45 percent of Americans were somewhat or very worried that they or someone in their family would become a victim of terrorism.

But despite the fears about terrorism, the public's concern about digital privacy is nearly universal. A Pew Research poll in 2014 found more than 90 percent of those surveyed felt that consumers had lost control over how their personal information was collected and used by companies.

The Apple case already seems to have garnered more public attention than the Snowden revelations about "metadata collection" and programs with code names like Prism and XKeyscore. The comedian John Oliver once mocked average Americans for failing to know whether Mr. Snowden was the WikiLeaks guy or the former N.S.A. contractor (he was the latter).

Now, people are beginning to understand that their smartphones are just the beginning. Smart televisions, Google cars, Nest thermostats and web-enabled Barbie dolls are next. The resolution of the legal fight between Apple and the government may help decide whether the information in those devices is really private, or whether the F.B.I. and the N.S.A. are entering a golden age of surveillance in which they have far more data available than they could have imagined 20 years ago.

"It's an in-your-face proposition for lots more Americans than the Snowden revelation was," said Lee Rainie, director of Internet, science and technology research at Pew Research Center.

Cindy Cohn, executive director of the Electronic Frontier Foundation, said: "Everyone gets at a really visceral level that you have a lot of really personal stuff on this device and if it gets stolen it's really bad. They know that the same forces that work at trying to get access to sensitive stuff in the cloud are also at work attacking the phones."

For the F.B.I. and local law enforcement agencies, the fight has become a high-stakes struggle to prevent what James B. Comey, the bureau's director, calls "warrant-free zones" where criminals can hide evidence out of reach of the authorities.

Officials had hoped the Apple case involving a terrorist's iPhone would rally the public behind what they see as the need to have some access to information on smartphones. But many in the administration have begun to suspect that the F.B.I. and the Justice Department may have made a major strategic error by pushing the case into the public consciousness.

Many senior officials say an open conflict between Silicon Valley and Washington is exactly what they have been trying to avoid, especially when the Pentagon and intelligence agencies are trying to woo technology companies to come back into the government's fold, and join the fight against the Islamic State. But it appears it is too late to confine the discussion to the back rooms in Washington or Silicon Valley.

The fact that Apple is a major consumer company "takes the debate out of a very narrow environment -- the universe of technologists and policy wonks -- into the realm of consumers where barriers like the specific language of Washington or the technology industry begins to fall away," said Malkia Cyril, the executive director of the Center for Media Justice, a grass-roots activist network.

That organization and other activist groups like Black Lives Matter have seized on the issue as important for their members. In February the civil liberties group Fight for the Future organized the day of protest against the government order that resulted in rallies in cities nationwide.

"When we heard the news and made a call for nationwide rallies, one happened in San Francisco that same day," said Tiffiniy Cheng, co-founder of Fight for the Future. "Things like that almost never happen."

Ms. Cyril says the public angst about the iPhone case feels more urgent than did the discussion about government surveillance three years ago.

"This is one of those moments that defines what's next," she said. "Will technology companies protect the privacy of their users or will they do work for the U.S. government? You can't do both."

Le Monde
Pour vivre heureux, vivons cryptés
Monday, 14 March 2016
Byline: Yves Eudes

Non identifié - Les moindres détails de notre existence sont enregistrés dans nos smartphones. Et nous sommes tous susceptibles d'être espionnés. Pas par la NSA une femme jalouse ou un patron trop curieux suffira. Face à ces risques, il faut verrouiller sa vie privée. Pas si simple.
Dans l'un de ses sketchs, le jeune humoriste Norman raconte que, depuis qu'il vit en couple, il ne peut plus jamais se séparer de son smartphone. Si par malheur il le laissait traîner dans l'appartement, sa copine pourrait s'en emparer, consulter l'historique de ses appels, lire ses courriels, ses SMS, ses messageries, ses comptes sur les réseaux sociaux, et découvrir qu'il est en contact avec d'autres femmes, dont certaines sont peut-être ses amantes.

Résultat, même quand il va prendre une douche, Norman emporte son téléphone avec lui - ce qui, bien sûr, suffit à éveiller les soupçons... La vidéo a bien marché sur YouTube, car, dans la vraie vie, ces accidents téléphoniques provoquent tous les jours d'innombrables scènes de ménage, ruptures et actes de vengeance.

Si votre conjoint veut aller jusqu'au divorce, il pourra utiliser les traces d'adultère trouvées dans votre téléphone. Article 1316-1 du code civil : " L'écrit sous forme électronique est admis en preuve au même titre que l'écrit sur support papier, sous réserve que puisse être dûment identifiée la personne dont il émane (...). " Pire : vous ne pourrez pas invoquer la violation du secret des correspondances pour refuser ce moyen de preuve, sauf s'il a été obtenu par la violence.

Le danger ne vient pas seulement de votre amant(e). Méfiez-vous de l'ado qui chope votre portable pour envoyer un SMS urgentissime, de la bonne copine qui vous soupçonne de coucher avec son mari, des parents qui se font du souci pour votre avenir, et des collègues malintentionnés - sans parler des inconnus qui trouvent le téléphone que vous avez oublié au restaurant et qui vont vous pourrir la vie, juste pour le plaisir.

Bien entendu, vous pouvez verrouiller votre appareil avec un code ou un schéma à points. Mais le plus souvent, le verrouillage se déclenche après plusieurs minutes - un délai suffisant pour un espion déterminé. Par ailleurs, si votre code est votre date d'anniversaire, si c'est le même que celui de la porte de votre immeuble, ou si c'est l'année où la France a gagné la coupe du monde de foot, vous êtes vulnérable. Le schéma à points a aussi ses faiblesses : si vous ne nettoyez pas votre écran, votre doigt laisse une trace grasse reproduisant le tracé, qui sera visible grâce à une lumière rasante.

Se méfier aussi des services multi- plates-formes, si pratiques pour glisser en douceur de votre PC vers votre smartphone. Un exemple pour les possesseurs d'un téléphone Android enregistré chez Google via une adresse Gmail : si vous laissez votre compte Google ouvert en quittant votre ordinateur, un proche

ou un collègue pourra, en trois clics, aller sur votre page personnelle " Google Device Manager ". De là, il pourra localiser votre téléphone et le pister en temps réel, le faire sonner, effacer sa mémoire et même changer le mot de passe. De même, si vous avez sauvegardé vos données dans le cloud, un espion domestique pourra aussi s'attaquer à vos comptes en ligne, souvent mal protégés.

Si les choses vont très mal, votre mari jaloux pourra subtiliser votre appareil et le porter chez un réparateur pour le faire déverrouiller. Ces artisans de quartier possèdent souvent le matériel nécessaire pour casser les codes des téléphones bas de gamme ou un peu anciens, qui restent très répandus. Ils se laisseront parfois convaincre, pour 100 à 200 euros - la vérité, ça n'a pas de prix. Un réparateur du 12e arrondissement de Paris explique que, parfois, des policiers viennent le voir discrètement pour qu'il déverrouille un téléphone. Sa méthode prend plusieurs jours, mais, chez lui, on gagne du temps sur la procédure.

Dans l'univers professionnel, les risques sont décuplés. Le plus souvent, les téléphones distribués aux employés par les entreprises contiennent des logiciels permettant de prendre la main sur les appareils, et donc de savoir en détail comment ils sont utilisés. Les marchands d'équipements d'extraction de données annoncent sur Internet qu'ils les vendent " aux services de police, aux militaires, aux professionnels du renseignement ", mais aussi aux " professionnels de la sécurité en entreprise " et aux " industries de -l'e-discovery " - une catégorie mystérieuse qui englobe différentes sortes d'enquêteurs privés. Certains groupes possèdent des appareils illicites permettant de - géolocaliser les téléphones des équipes commerciales de leurs concurrents.

Mesures, contre-mesures... la surenchère semble sans fin. Les nouveaux smartphones haut de gamme chiffrent les données automatiquement, et permettent de choisir un verrou très résistant (code à six chiffres, empreinte digitale, phrase de passe...). Ils proposent aussi une fonction spéciale, qui efface toutes les données si on tape un mauvais code dix fois de suite - imparable, mais les données sont perdues à tout jamais, y compris pour vous. Déjà, les polices et les services secrets du monde entier cherchent à casser ces nouvelles protections ou à les faire interdire - sans parler des hackeurs. Des sociétés basées en Israël et en Europe de l'Est affirment qu'elles sont capables de déverrouiller presque tous les smartphones grand public actuellement en vente dans le commerce.

Bannir Angry BirdsLa solution la plus radicale consiste donc à s'offrir un téléphone ultrasécurisé, qui chiffrera à la fois les communications et les données stockées en mémoire. Il résistera aux interceptions à distance comme aux intrusions physiques, et sera paramétré dès l'origine pour offrir les protections maximales. Attention, les appels et les SMS ne seront cryptés que si votre correspondant possède aussi un téléphone sécurisé. Par ailleurs, vous ne pourrez pas télécharger les applis de votre choix : les petits jeux apparemment anodins comme Angry Birds, qui vous géolocalisent à votre insu, seront bannis. En France, un simple particulier ne peut pas acheter ce type de téléphone, en vertu d'un décret officiel - car c'est bien connu, les honnêtes gens n'ont rien à cacher. Pour s'en procurer, il faut être patron ou cadre supérieur, et passer commande au nom de son entreprise.

Pour ceux qui ne sont pas PDG, heureusement, il existe des solutions. Vous pouvez conserver votre vieux téléphone et télécharger une application qui cryptera vos communications via Internet, pourvu que votre correspondant possède la même. Si un intrus parvient à s'emparer de votre appareil et à l'ouvrir, vos conversations seront protégées par un deuxième mot de passe. Selon les cas, ces pare-feu ont été créés par des militants de l'Internet libre ou par des start-up commerciales installées dans des pays comme la Suisse ou la Suède, où les lois sont très protectrices.

Si vous vous contentez de demi-mesures, sachez qu'Apple, Google et WhatsApp ont aussi renforcé la protection de leurs messageries. Ainsi sur iPhone, un iMessage (en bleu, envoyé à un autre iPhone) sera plus difficile à intercepter qu'un SMS ordinaire (en vert). Il n'est jamais trop tard pour agir, mais le temps presse, car Internet n'oublie rien : même si vous vous êtes racheté une conduite depuis des années, les traces numériques de vos infidélités passées pourront être retrouvées jusqu'à la fin des temps.

The Guardian (London)
Snooper's charter: Labour threatens to hold up bill over privacy fears
Monday, 14 March 2016
Byline: Rowena Mason

London - Labour is threatening to hold up the government's new investigatory powers bill that extends the internet surveillance powers of the state unless ministers address concerns about privacy.
Andy Burnham, the shadow home secretary, said there would be "no blank cheque" of Labour support for the bill when it comes to the House of Commons for its next stage on Tuesday.

Labour supports the aims of the bill, which gives the state powers to force communications firms to store individuals' internet connection records - the addresses of websites visited - for 12 months.

But Burnham said the party was prepared to delay the legislation until concerns were allayed that it intrudes too far into people's lives.

"Britain needs a new legal framework in this crucial area that is fit for the digital age, balancing powers with proper safeguards. So Labour will put party politics aside and work constructively with the government to that end," he said. "But there will be no blank cheque."

Burnham said the home secretary, Theresa May, needed to make substantial changes before the bill would be acceptable.

He added: "While I share her wish to see a comprehensive bill on the statute book by the end of this year, we can't let the timetable dictate the quality. On Tuesday, I will make clear to the home secretary that, if she fails to listen to our concerns, Labour will be prepared to delay this legislation so that we get it right.

"We believe the bill must start with a presumption of privacy, as

recommended by the intelligence and security committee, include a clearer definition of the information that can be held in an internet connection record and set a higher threshold to justify access to them. There also needs to be a higher degree of protection for journalists and their sources.

"On the left of politics, there are deeply held concerns that, in our country's past, investigatory powers have been misused against trades unionists and ordinary people who are campaigning for justice. This is why the government will have to work hard to earn our support."

The government argues the bill is needed to address a gap in police and intelligence powers that means some communication cannot be tracked.

It revives some of the aims of a previous surveillance bill, which

became dubbed the snooper's charter in the last parliament and was eventually blocked by the Liberal Democrats.

Over the weekend, the US president, Barack Obama, questioned the way tech companies were making smartphones so strongly encrypted that they could not be broken into by law enforcement agencies.

Obama told a technology festival in Texas: "The question we now have to ask is, if technologically it is possible to make an impenetrable device or system, where the encryption is so strong there's no key, there's no door at all, then how do we apprehend the child pornographer? How do we solve or disrupt a terrorist plot?"

It comes after the FBI took Apple to court in an attempt to force it to break into a smartphone owned by one of the shooters in the San Bernadino massacre.

The Independent (UK)
Snooper's Charter: Tech companies will have to give police 'back- door' access to customers' data
Monday, 14 March 2016
Byline: Matt Broomfield

London - Internet service providers and technology companies will be forced to install "back-door" flaws into their products, so British police and security services can access them on demand.
The move was announced in draft documents published in support of Theresa May's controversial Investigatory Powers Bill, announced in November 2015.

Companies will also be banned from revealing whether they had been made to install "back-door" access routes, leaving customers unable to know whether their messages and search history are truly secure.

And if the draft documents are approved and the Bill known as the "Snoopers' Charter" is passed in Parliament, the controversial measures will be partially paid for by British taxpayers.

The move, intended to prevent criminals and terrorists from networking and organising illegal activities online, follows a legal dispute between the FBI and technology company Apple over a similar issue.

An American court ruled that Apple had to help the FBI bypass encryption on an iPhone belonging to Syed Farook, one of the San Bernadino killers. Farook and his wife killed 14 people in a mass shooting in December 2015.

But Apple launched a highly-publicised appeal, arguing that while they could unlock the phone, it would set a dangerous precedent and compromise their customers' privacy and security.

When announced, the Investigatory Powers Bill also sparked an immediate backlash from privacy campaigners. It requires internet and phone companies to store the search history of web users for a year and hand this information over to the police upon request, and made explicit for the first time the power of the police to hack phones and computers.

The new documents, expanding on Theresa May's initial proposal, indicate how companies will be forced to help the police hack into their own customers' data.

Any firm with more than 10,000 customers providing a "telecommunications service" to UK citizens could be subject to the legislation, forcing them to provide the "technical capability" for "interception" of personal data. Apple, Google, Facebook and a number of broadband companies are among the organisations affected by the measures.

They would also be bound by an effective gagging order, "under a duty not to disclose the existence and contents" of the order to hand over personal data.

An independent "investigatory powers commissioner" would be available to assess cases where companies felt their rights were being infringed, while the orders would have to be reviewed every two years regardless of circumstance.

However, there is no apparent way for private citizens to find out if their personal data is being scrutinised by the police, let alone appeal against this process.

60 Minutes
The Encryption debate
Sunday, 13 March 2016
Byline: Lesley Stahl

The argument over encryption between Apple and the FBI reminds us that the world is facing a far more tech-savvy terror threat. While not that long ago al Qaeda often handled its communications by going back to the Stone Age relying on mules and couriers, the Islamic State, or ISIS, proved it can be done with just a push of a button using everyday tools of 21st century teenagers: the latest smartphones and messaging apps.
The encryption debate centers around an iPhone found in San Bernardino, where 14 men and women were killed in a terror attack last December. But before that, there was the massacre in Paris. We went there to meet the city's chief prosecutor who is confronting some of the same issues.

Francois Molins: The terrorists are able to communicate with total impunity.

Voiceover: Francois Molins is the head prosecutor of Paris -- he's investigated all the big acts of terrorism here, including Charlie Hebdo, the kosher supermarket, and now the November 13 attacks where 130 people were killed, more than 350 wounded.

Lesley Stahl: Do you have phones in terrorist attacks that you have not been able to get into because of encryption?

Francois Molins: Oui oui. With all these encryption software programs, we can't penetrate into certain conversations and we're dealing with this gigantic black hole, a dark zone where there are just so many dangerous things going on.

Voiceover: It's not just phones. One of the things he's looking into is a texting app favored by ISIS called Telegram which, like the new Apple iPhone -- offers advanced encryption.

Lesley Stahl: How often have you run in, in all your investigations, into Telegram?

Francois Molins: Yes, very often. Telegram, we can't penetrate, we can't get into it.

Voiceover: Pavel Durov is the inventor of Telegram. He's a young man without a country. He's Russian born but wanders the world now, in exile. He created Telegram so he could communicate in complete secrecy. It has taken off, used by over 100 million people.

Lesley Stahl: But it's also used by terrorists now. Is this a concern for you?

Pavel Durov: Oh definitely. And in our 100 million users, probably this illegal activity we're discussing are only a fraction of a fraction of a fraction of the potential usage. And still we're trying to, you know, prevent it.

Voiceover: Telegram has become a go-to site for ISIS. They use it to widely disseminate propaganda like this video of the Paris attackers training in Syria. But ISIS fighters can also use Telegram to send private messages to each other to covertly plan and coordinate attacks.

Lesley Stahl: Is there something on your site on Telegram that allows any messages, emails, to just disappear, vanish?

Pavel Durov: Yes. So in private messages we have this secret chat feature which provides you with a self-destruct timer.

Lesley Stahl: Self-destruct timer.

Pavel Durov: You could set a specific amount of time, like a few seconds, or a minute or a week, after which the message would disappear.

Voiceover: Durov's obsession with secrecy and security stems from his own personal history. Long before Telegram he was known as the Mark Zuckerberg of Russia because he built a popular equivalent of Facebook. But in 2011, when anti- Putin marchers filled Moscow's streets, the Kremlin demanded he take down the organizers' sites.

Pavel Durov: And I refused to do that publicly. And the next day I had armed policemen at my doorstep...

Lesley Stahl: Wonder why.

Pavel Durov: ...and tried to break into my apartment.

Voiceover: There was continual pressure on him to hand over users' personal data culminating in 2014 when, under Kremlin duress, Durov was ousted from his own company.

Lesley Stahl: How long did you stay in Russia after that?

Pavel Durov: Not a single day.

Lesley Stahl: Oh, then you fled.

Pavel Durov: I certainly feel that I am not welcome at that country anymore.

Voiceover: That's when he created Telegram and encrypted it, he says, so activists could be assured that no government could ever access their personal data. He managed to leave Russia with a reported $300 million which he uses to singled-handedly fund Telegram, costing him, he says, over a million dollars a month.

Lesley Stahl: This was something that you created to allow democracy to flourish, to allow dissidents in Russia and in other countries to communicate with each other. And then all of a sudden you find out that this terrorist group uses your site for completely different reasons.

Voiceover: Pavel Durov: Yeah, we were horrified.

Lesley Stahl: There's an irony there.

Pavel Durov: There is. But you know there's little you can do because if you allow this tool to be used for good, there will always be some people who would misuse it.

Voiceover: Just hours after the terrorists hit Paris on the night of November 13, ISIS used Telegram to take credit for the attacks. It was a wake-up call for European authorities.

Rob Wainwright: It's the first time ever in Europe that we had terrorists rampaging through our streets. First time we had terrorists wearing suicide belts in heavily populated, public areas.

Voiceover: As head of Europol, Rob Wainwright gathers and analyzes information from over 600 law enforcement agencies. He has set up a new counter terrorism center to better coordinate all the intelligence.

Lesley Stahl: How much is encryption a problem generally in these investigations?

Rob Wainwright: In most of them. I mean, across the tens of thousands of investigations that Europol is supporting every year on terrorism and serious crime, at least three quarters of them have encryption at the heart of the challenge that law enforcement face.

Lesley Stahl: Now, what about the November 13th attack specifically?

Rob Wainwright: From what we see, encryption also played a role in that part and that's something that we we're digging into much deeper at the moment.

Lesley Stahl: Why is it still a mystery?

Rob Wainwright: It's not-- not so much of a mystery. It's not that I can share all the details about a very sensitive investigation in public.

Voiceover: We know that the ringleader of the attack, 28-year-old Abdelhamid Abaaoud, was a wanted fugitive who goaded authorities by bragging in this online ISIS magazine how easily he eluded them shuttling between Europe and Syria. He liked taking selfies of his exploits, often posting them online. In this gruesome video, he and his friends tie bodies to the back of a truck, Abaaoud in the driver's seat:

[Abdelhamid Abaaoud (translator): We used to tow jet skis - now we tow the infidels fighting us.]

Lesley Stahl: What is astonishing is that you knew who he was. He was on everybody's radar screen.

Francois Molins (translator): You're right. Abaaoud-- he has been one of the major targets for France and Belgium counterterrorism for many months.

Voiceover: Before Paris, Abaaoud was suspected of guiding European jihadis in attacks in France and Belgium, but the attempts were all foiled. In one of them an iPhone belonging to one of the jihadis was confiscated but it was not useful in finding Abaaoud, because it was encrypted.

Lesley Stahl: We've been told, and I want to confirm it, that the encrypted phone may have prevented you from getting information about the Paris attacks.

Francois Molins (translator): That's a theory that really needs to be looked into, but to do so, we really need to be able to get into that phone. You know, I say, all these smart phones make justice blind because they deprive us of a lot of information that could contribute to our investigations.

Voiceover: Abaaoud was on site in Paris on the night of November 13, coordinating three different teams over his phone: one group, at a soccer stadium, exploded their suicide vests outside. Abaaoud and two others went on a killing spree at bars and cafes... while a third team stormed a rock-concert at the Bataclan theater and started shooting.

Francois Molins (translator): I said to myself: "The thing that we'd been fearing was coming for months, was now happening."

Voiceover: The prosecutor rushed to the scene - first to the cafes where Abaaoud had already sprayed the sites with an assault rifle.

Francois Molins (translator): We know that he participated in the commando attacks at the cafes. Afterwards we see him in a video in the Paris subway. And we do believe that he went maybe just in front of the Bataclan.

Voiceover: The prosecutor also went from the cafes to the Bataclan. What he didn't know was that Abaaoud was outside the theater at the same time, amid throngs of police, standing there in his orange sneakers - apparently talking on the phone to the shooters inside. While police didn't spot him there, he was tracked down to an apartment in a Paris suburb five days later, and killed in a hail of gunfire and

explosions. In a stroke of luck police found a Samsung phone one of the attackers had tossed into a garbage can in front of the Bataclan, and it posed no encryption problems.

Francois Molins (translator): We were able to get information from phone communications that enabled us to retrace the terrorists movements: where they were, where they stayed, their itineraries.

Standard text messages were found on the phone including a final one saying, "Here we go. We're starting!" Also found, the app Telegram. It had been downloaded the day of the attack.

Lesley Stahl: But you personally don't know if the attackers actually communicated via Telegram to plot these coordinated attacks, or even if they used it during the attacks?

Pavel Durov: No, we have no information to prove that.

Lesley Stahl: Is there anything in your mind that says, "Gee, we have to have - to allow law enforcement to get in because what's going on is just unacceptable.

Pavel Durov: You know the interesting thing about encryption is that it cannot be secure just for some people.

Lesley Stahl: ISIS and other terrorist groups, they just push a button on an application like yours, specifically yours, an application... and it's gone around the world, like that.

Pavel Durov: Well again, this is the world of technology and it's impossible to stop them at this point. ISIS could come up with their own messaging solution within a month or so, if they wanted to because the--

Lesley Stahl: You mean create their own Telegram?

Pavel Durov: Exactly.

Voiceover: Since Paris, Durov has been purging ISIS propaganda from Telegram but says, if asked to unlock any private messages, he would tell the authorities that the encryption code makes it mathematically impossible, using a similar argument as Apple.

Lesley Stahl: So you're basically saying that even if you wanted to, your hands are tied.

Pavel Durov: Yes.

Lesley Stahl: You can't do it.

Pavel Durov: We cannot.

Lesley Stahl: So this is one of the great debates of our time. Which is more important? Is it more important to shut down this kind of terrorism or preserve privacy?

Pavel Durov: I'm personally for the privacy side. But one thing that should be clear is that you cannot make just one exception for law enforcement without endangering private communications of hundreds of millions of people because encryption is either secure or not.

Lesley Stahl: The founder of Telegram has told us, he thinks privacy is more important than security issues, and he wouldn't open it up even if you did ask him.

Francois Molins (translator): Fine, that's his personal choice. But I consider that there are limits in all societies. There are limits to freedom and privacy. Freedom doesn't mean you can just do anything and everything you want. And there's a duty of institutions -- police and judicial -- to ensure security. You can't have freedom without security.

N.Korea 'Using Honeytraps to Steal Cyber Secrets'
Monday, 14 March 2016

North Korea is using honeytraps to steal clandestine information from gullible male South Korean officials on the Internet, the National Intelligence Service said Friday.
The NIS told the National Assembly that the North has set up fake Facebook accounts with pictures of pretty women to hook up with scores of former and incumbent South Korean officials and get hold of classified information.

The NIS said the North is also spreading false rumors about the South Korean government online. "If a beautiful stranger wants to become your friend on Facebook, you should turn them down," an NIS official warned lawmakers.

The NIS said the North Korea succeeded in hacking into the e-mail accounts of 40 South Korean government officials and military officers by sending them e-mails purporting to come from Cheong Wa Dae or other government agencies.

Lee Cheol-woo of the ruling Saenuri Party said after the closed-door session that North Korea is conducting cyber terror aimed at jamming GPS navigation systems. "Terror attacks targeting GPS systems are very dangerous since they can cause aircraft to fly in the wrong direction," he added.

Washington Post
Black Lives Matter group wary of FBI in Apple fight

Saturday, 12 March 2016
Byline: Andrea Peterson

Washington - Black Lives Matter activists are siding with Apple in the company's legal showdown with the FBI over a phone used by one of the San Bernardino, Calif., shooters.
"We urge you to consider the dire implications for free speech and civil liberties if the FBI is permitted to force Apple to create technology to serve its investigatory purposes," a coalition of activists and civil rights organizations wrote in a letter to a California court this week in support of the tech company. "The FBI's historically questionable surveillance procedures do not bode well for setting a precedent that allows the agency universal access to private smartphone data."

Privacy - especially from the spying eyes of the government - is personal for the civil rights community, at least in part because of the movement's history with the FBI.

In the 1950s, the bureau ran an initiative called COINTELPRO. At first, it was aimed at disrupting communist activities, but the program was later expanded to target other domestic groups including the Black Panther Party and the Rev. Martin Luther King Jr.

The FBI started spying directly on the civil rights leader in 1963, not long after the March on Washington, according to historian Beverly Gage. It placed wiretaps on the phones in his home and offices, as well as bugging devices in his hotel rooms, she said, uncovering evidence of King's extramarital affairs, which the bureau unsuccessfully pitched to the news media.

Perhaps frustrated by the lack of interest by the media, FBI Director J. Edgar Hoover in November 1964 denounced King during a news conference as "the most notorious liar in the country." A few days later, one of Hoover's subordinates sent King a disturbing letter, designed to look as if it was from a disenchanted supporter. It referenced audio recordings as evidence of King's infidelity and urged the civil rights leader to kill himself.

The FBI acknowledges the violations of COINTELPRO, noting on its website that the program was "later rightfully criticized by Congress and the American people for abridging first amendment rights and for other reasons."

FBI Director James B. Comey keeps a copy of the letter approving the King wiretap on his desk - and requires all new agents and analysts to study how the FBI treated the civil rights leader. "The reason I do those things is to ensure that we remember our mistakes and that we learn from them," he said in a speech at Georgetown University last year.

But the communities targeted by COINTELPRO remember the FBI's mistakes, too.

That's why the Black Lives Matter activists cited that shameful part of the bureau's history in their letter supporting Apple's challenge of the court order that would force Apple to help investigators access

information on an iPhone belonging to one of the San Bernardino attackers. The iPhone was recovered after the Dec. 2 attack that killed 14 people and injured 22 others. It was given to one of the attackers in his job as a county health inspector, and although the FBI has obtained backups taken from the phone, it has not been able to access the data stored on the device.

"[O]ne need only look to the days of J. Edgar Hoover and wiretapping of Rev. Martin Luther King, Jr. to recognize the FBI has not always respected the right to privacy for groups it did not agree with," the letter said. The activists added, "And many of us, as civil rights advocates, have become targets of government surveillance for no reason beyond our advocacy or provision of social services for the underrepresented."

New York Times
Protecting the Privacy of Internet Users
Saturday, 12 March 2016

Editorial: The chairman of the Federal Communications Commission proposed common-sense privacy rules this week that would limit what broadband companies are allowed to do with the Internet browsing history and other personal information of consumers.
Companies like Comcast and AT&T, which operate wired and wireless networks, know a lot about what Americans do online, like the websites they visit and how long they stay on them. But there are no F.C.C. rules that bar those companies from selling that information to advertisers. The commission can, however, take action against the companies for deceptive and unfair practices.

Under the proposal by the chairman, Tom Wheeler, cable and phone companies would be allowed to use personal data for things like billing and pitching more expensive versions of services that customers are already using. Customers could opt out of marketing for other services provided by their broadband companies. And the companies would have to get permission from their customers before they could do more with the data, like selling it to advertisers. Another rule would require companies to protect the data and notify customers, the commission and law enforcement agencies if the information was stolen.

These are similar to the protections the commission has long imposed on phone companies. Those rules have worked so well that most Americans do not worry that Verizon or T-Mobile is listening to their conversations or using call records to market products and services. People should have similar privacy protections when they use cable or phone lines to get on the Internet.

Companies like AT&T, however, argue that new rules are not needed because a lot of Internet traffic is encrypted and phone and cable companies cannot decipher the data. But even when data is encrypted, companies can still tell what websites people are visiting. And many websites still do not use encryption.

Another criticism is that these rules treat broadband providers differently than Internet businesses like Google and Facebook, which collect huge amounts of personal data about users. But the commission

has no authority to regulate those websites. And it is far easier for consumers to avoid those sites than to avoid their Internet service providers, especially since in many parts of the country people have only one or two choices for broadband.

Mr. Wheeler is able to make this proposal because the commission wisely decided in February 2015 to treat broadband as a telecommunications service rather than as a lightly regulated information service. That decision also made it possible for the commission to forbid cable and phone companies to create fast and slow lanes on the Internet.

The commission will vote on March 31 to open Mr. Wheeler's proposal to public comments before it can be finalized, probably before the end of the year. Cable and phone companies and their Republican supporters in Congress will undoubtedly oppose this regulation. But these rules are necessary because consumers need to have control over their personal information.

Sunday Times (UK)
Police to get phone hacking powers
Sunday, 13 March 2016
Byline: Mark Hookham

London - Police and intelligence agencies will be able to hack into people's mobile phones, tablets and computers using "backdoor" technology, which the government will force firms to install under proposed laws.
According to documents published in the past two weeks, internet service providers and technology giants would be obliged to build secret security flaws into their technology to allow them to be accessed by police and the security services on demand.

This would enable the authorities in Britain to do what the FBI has been unable to do in the US in its attempts to force Apple to give it access to the iPhone of the terrorist Syed Farook, who, with his wife, killed 14 people in California in December.

The FBI won a court order requiring Apple to help it bypass encryption and passcodes on the device but the company is challenging it.

The move threatens to provoke a huge row with the world's biggest tech firms. An executive at one leading company said this weekend: "People shouldn't be in any doubt, the government is pushing for some of the most invasive surveillance legislation out there today.

"The government wants to force companies to build in weaknesses and back doors into security systems when we're seeing the threat of hacking and cyber-crime getting worse.

"Given how much of our personal information is stored online or on phones, people should be worried about it."

The draft code of practice published alongside the government's Investigatory Powers Bill would also gag technology giants such as Apple and Google and broadband providers by banning them from revealing if they had been asked to install the back-door technology.

Ministers are even offering to use taxpayers' cash to help firms such as Apple, Facebook and Google pay for the extra costs of building a back door into messaging systems such as WhatsApp, FaceTime, iMessage or Google Hangouts.

Eric King, the director of Don't Spy On Us, a coalition of human rights groups, said this weekend the scale of the Home Office's proposals were "staggering" and would give security agencies access to "hugely intrusive capabilities".

Details of the measures are outlined in the 83-page draft code that accompanies the government's controversial Investigatory Powers Bill.

The code of practice states that the home secretary will have the power to impose a "technical capability notice" on "communication service providers".

This would force firms to provide the "technical capability" to allow the security services to access communication data as well as to undertake "interception" and "equipment interference".

The bill allows the home secretary to order the removal of "electronic protection", which technology companies claim means encryption.

The notices could be served on any firm with more than 10,000 users that provides a "telecommunication service" to UK customers, which includes phone and internet providers and technology giants that provide messaging services.

In addition, in a power similar to a legal superinjunction, companies served with notices are "under a duty not to disclose the existence and contents of that notice to any person" without the permission of the home secretary.

Failing to comply with a "technical capability notice" would be a breach of civil law.

A judge is not required to serve a technical capability notice, although a firm could force the home secretary to consult the "investigatory powers commissioner" if they oppose the notice. Once imposed, a notice must be reviewed at least once every two years.

The Home Office said the new bill "does not change the current position that companies above a certain size can be required to maintain a permanent interception capability".

Times of India
Pak hacker defaces Raipur AIIMS site, says all Indian governement sites on target
Monday, 14 March 2016
Byline: Rashmi Drolia

Raipur - Pakistani hackers on Saturday defaced the official website of AIIMS Raipur. While AIIMS administration wasn't aware about this till late in the evening, the site was patched till Sunday morning. The homepage of www.aiimsraipur.nic.in was hacked and displayed "Website stamped by Kashmiri Cheeta, Team: Pak Cyber Attackers. We are unbeatable. Mess with the Best, Die like the Rest."

Posting the mirror link on his Facebook wall, the hacker whose handle name is Amir Muzaffar virtually known as 'Kashmiri Cheetah', confirmed that he had hacked the website.

In an exclusive talk with TOI, the Pak hacker warned that "all government sites are on our target and we search sites with '.nic or .gov.in' keywords, and once we find a security lapse, you know what happens. Administrators of government websites are sloppy and rely blindly on white hat hackers whose job is to simply alert them about where the bugs are. They should not forget that there are black hat hackers too who also know where the bugs are and how to spread them to shut the sites down."

The black hat hacker Amir Muzaffar added that if Pak hackers want, they can destroy important files, but that's not in their ethics as of now.

Claiming to have hacked another Indian government's site parallel while talking to TOI he said, "I spotted many vulnerable sites including AIIMS Raipur and defaced it. Though the institute might claim to have recovered it but they have actually redirected it to AIIMS.edu but haven't patched the bugs. It would take five minutes for me to deface it again." he said.

Member of infamous Pak Cyber Attackers group, Amir says he hails from "Kashmir, Pakistan" and does hacking for alerting government about how vulnerable they are to us, if it's 'pk' or India (Pakistani site or Indian) doesn't matter.

Though he doesn't do it for fun he said, "it's for fake fame and a fake Cyber name, otherwise I love India." TOI in its reports had alerted and quoted Pak hacker Faisal Afzal that Pak hackers had launched cyber war against Indian sites. Amir has tagged Afzal in most of his posts on FB.

Earlier, calling it a cyber war against India and mocking at Prime Minister Narendra Modi's newly launched Digital India week, Pak hackers in 2015 had hacked 24 government websites at one go and twice the sites of NIT and PTRSU. Many websites of Kerala government and Gujarat were also hacked by same groups.

Indian hackers in retaliation had hacked around 250 important websites of Pakistan government including Pak telecom authority and others. AIIMS authority has been alerted and they said that the site was now safe.

Hactivist (white hat hacker) Mohit Sahu said that "AIIMS has a clone site to which they have redirected but yes, it's still vulnerable. For PCA boys it's like a game. Amir's Facebook wall shows that he has hacked many Indian sites even emails of government officials whose password he had revealed on the page. They keep challenging each other to hack more."

"Government or any agency before launching unique online schemes/services needs to be alert and 100 percent secure, else future of cyber world could be defeating," Mohit added.

Le Devoir
Un policier de Laval accusé d'utilisation frauduleuse d'une banque de données
Monday, 14 March 2016
Byline: Marie-Michèle Sioui

Montréal - Un nouveau procès concernant le recours frauduleux à une banque de données utilisée par les forces policières s'ouvre ce lundi au palais de justice de Laval et cette fois, c'est l'ex-policier de Laval Yves Smagghe qui est soupçonné d'avoir recherché des informations sur des citoyens pour servir ses fins personnelles.
Le policier de 46 ans, dont le départ a été confirmé le 18 novembre 2015, est of ficiellement accusé d' « utilisation non autorisée d'un ordinateur » , un acte criminel passible d'un emprisonnement maximal de dix ans. On reproche à Yves Smagghe d'avoir consulté le Centre de renseignements policiers du Québec (CRPQ), notamment pour obtenir des informations sur des locataires potentiels, selon ce qu'a appris Le Devoir.

Données confidentielles

Le Directeur des poursuites criminelles et pénales n'a pu donner de détails sur la nature des faits reprochés à l'ex-policier. Mais il a confirmé qu'une utilisation abusive du CRPQ constitue une infraction à l'arti-

cle 342.1 du Code criminel, article qui concerne l' « utilisation non autorisée d'un ordinateur » .

Le CRPQ est une banque de données confidentielles qui regroupe l'ensemble des renseignements informatisés -- à caractère criminel et non criminel -- que les policiers peuvent utiliser dans le cadre de leurs fonctions. Il contiendrait quelques millions de dossiers et sa consultation est strictement limitée au travail policier.

Selon nos sources, Yves

Smagghe en aurait fait une utilisation abusive, et ce, entre novembre 2007 et septembre 2012. Son procès doit commencer ce lundi au palais de justice de Laval et il devrait permettre d'en apprendre davantage sur les motivations de l'ex-policier, qui gère aujourd'hui Oasis Montebello, une vaste propriété située sur le golf du Château Montebello et pouvant être louée par le public.

Exemples récents d'utilisation frauduleuse

Décembre 2015 Le policier de Québec Jean-Bernard Lajoie est mis en accusation pour trafic de cocaïne et, entre autres infractions, pour avoir accédé de manière non autorisée au CRPQ.

Novembre 2015 Philippe Bonenfant, du SPVM, est accusé de trafic de stupéfiants et d'utilisation frauduleuse d'un ordinateur, encore pour consulter le CRPQ.

Novembre 2015 La policière de la Sûreté du Québec MariePierre Tremblay plaide coupable d'abus de confiance, d'entrave à la justice, de possession et de trafic de drogue. Elle aurait consulté le CRPQ pour transmettre des informations à son conjoint, le trafiquant de drogue Keven Harvey-Maltais.

2000 L'inspecteur-chef responsable des enquêtes criminelles à la police de Laval, Ronald Montpetit, quitte ses fonctions après avoir mené illégalement des vérifications dans le CRPQ à propos de personnes ayant postulé pour travailler au complexe Tops, qui appartenait à Tony Accurso.

New York Times
WhatsApp Encryption Said to Stymie Wiretap Order
Sunday, March 13, 2016
Byline: Matt Apuzzo

Washington - While the Justice Department wages a public fight with Apple over access to a locked iPhone, government officials are privately debating how to resolve a prolonged standoff with another technology company, WhatsApp, over access to its popular instant messaging application, officials and others involved in the case said.
No decision has been made, but a court fight with WhatsApp, the world's largest mobile messaging service, would open a new front in the Obama administration's dispute with Silicon Valley over encryption, security and privacy.

WhatsApp, which is owned by Facebook, allows customers to send messages and make phone calls over the Internet. In the last year, the company has been adding encryption to those conversations, making it impossible for the Justice Department to read or eavesdrop, even with a judge's wiretap order.

As recently as this past week, officials said, the Justice Department was discussing how to proceed in a continuing criminal investigation in which a federal judge had approved a wiretap, but investigators were stymied by WhatsApp's encryption.

The Justice Department and WhatsApp declined to comment. The government officials and others who discussed the dispute did so on condition of anonymity because the wiretap order and all the information associated with it were under seal. The nature of the case was not clear, except that officials said it was not a terrorism investigation. The location of the investigation was also unclear.

To understand the battle lines, consider this imperfect analogy from the predigital world: If the Apple dispute is akin to whether the F.B.I. can unlock your front door and search your house, the issue with WhatsApp is whether it can listen to your phone calls. In the era of encryption, neither question has a clear answer.

Some investigators view the WhatsApp issue as even more significant than the one over locked phones because it goes to the heart of the future of wiretapping. They say the Justice Department should ask a judge to force WhatsApp to help the government get information that has been encrypted. Others are reluctant to escalate the dispute, particularly with senators saying they will soon introduce legislation to help the government get data in a format it can read.

Whether the WhatsApp dispute ends in a court fight that sets precedents, many law enforcement officials and security experts say that such a case may be inevitable because the nation's wiretapping laws were last updated a generation ago, when people communicated by landline telephones that were easy to tap.

"The F.B.I. and the Justice Department are just choosing the exact circumstance to pick the fight that looks the best for them," said Peter Eckersley, the chief computer scientist at the Electronic Frontier Foundation, a nonprofit group that focuses on digital rights. "They're waiting for the case that makes the demand look reasonable."

A senior law enforcement official disputed the notion that the government was angling for the perfect case and that a court fight was inevitable.

This is not the first time that the government's wiretaps have been thwarted by encryption. And WhatsApp is not the only company to clash with the government over the issue. But with a billion users and a particularly strong international customer base, it is by far the largest.

Last year, a dispute with Apple over encrypted iMessages in an investigation of guns and drugs, for instance, nearly led to a court showdown in Maryland. In that case, as in others, the company helped the government where it was able to, and the Justice Department backed down.

Jan Koum, WhatsApp's founder, who was born in Ukraine, has talked about his family members' fears that the government was eavesdropping on their phone calls. In the company's early years, WhatsApp had the ability to read messages as they passed through its servers. That meant it could comply with government wiretap orders.

But in late 2014, the company said that it would begin adding sophisticated encoding, known as end-to-end encryption, to its systems. Only the intended recipients would be able to read the messages.

"WhatsApp cannot provide information we do not have," the company said this month when Brazilian police arrested a Facebook executive after the company failed to turn over information about a customer who was the subject of a drug trafficking investigation.

The iPhone case, which revolves around whether Apple can be forced to help the F.B.I. unlock a phone used by one of the killers in last year's San Bernardino, Calif., massacre, has received worldwide attention for the precedent it might set. But to many in law enforcement, disputes like the one with WhatsApp are of far greater concern.

For more than a half-century, the Justice Department has relied on wiretaps as a fundamental crime-fighting tool. To some in law enforcement, if companies like WhatsApp, Signal and Telegram can design unbreakable encryption, then the future of wiretapping is in doubt.

"You're getting useless data," said Joseph DeMarco, a former federal prosecutor who now represents law enforcement agencies that filed briefs supporting the Justice Department in its fight with Apple. "The only way to make this not gibberish is if the company helps."

"As we know from intercepted prisoner wiretaps," he added, "criminals think that advanced encryption is great."

Businesses, customers and the United States government also rely on strong encryption to help protect information from hackers, identity thieves and foreign cyberattacks. That is why, in 2013, a White House report said the government should "not in any way subvert, undermine, weaken, or make vulnerable generally available commercial encryption."

In a twist, the government helped develop the technology behind WhatsApp's encryption. To promote civil rights in countries with repressive governments, the Open Technology Fund, which promotes open societies by supporting technology that allows people to communicate without the fear of surveillance, provided $2.2 million to help develop Open Whisper Systems, the encryption backbone behind WhatsApp.

Because of such support for encryption, Obama administration officials disagree over how far they should push companies to accommodate the requests of law enforcement. Senior leaders at the Justice Department and the F.B.I. have held out hope that Congress will settle the matter by updating the wiretap laws to address new technology. But the White House has declined to push for such legislation. Josh Earnest, the White House spokesman, said on Friday that he was skeptical "of Congress's ability to handle such a complicated policy area."

James B. Comey, the F.B.I. director, told Congress this month that strong encryption was "vital" and acknowledged that "there are undoubtedly international implications" for the United States to try to break encryption, especially for wiretaps, as in the WhatsApp case. But he has called for technology companies and the government to find a middle ground that allows for strong encryption but accommodates law enforcement efforts. President Obama echoed those remarks on Friday, saying technology executives who were "absolutist" on the issue were wrong.

Those who support digital privacy fear that if the Justice Department succeeds in forcing Apple to help break into the iPhone in the San Bernardino case, the government's next move will be to force companies like WhatsApp to rewrite their software to remove encryption from the accounts of certain customers. "That would be like going to nuclear war with Silicon Valley," said Chris Soghoian, a technology analyst with the American Civil Liberties Union.

That view is one reason government officials have been hesitant to rush to court in the WhatsApp case and others like it. The legal and policy implications are great. While no immediate resolution is in sight, more and more companies offer encryption. And technology analysts say that WhatsApp's yearlong effort to add encryption to all one billion of its customer accounts is nearly complete.

Foreign Ministry instructs overseas missions to strengthen cybersecurity

Tuesday, 15 March 2016

Byline: Staff reporter

Section: general

Seoul - South Korea's Foreign Ministry has instructed its overseas missions to strengthen their cybersecurity amid growing threats of online attacks from North Korea, officials said Tuesday. The move came as the South Korean military and government agencies have striven to counter the North's potential attacks in cyberspace by strengthening its readiness posture and interagency cooperation.

"After a cyber crisis alert was issued last month, we have instructed all our missions abroad to enhance their cybersecurity," a ministry official said, declining to be named.

The North recently attempted to hack the smartphones of South Korean military commanders and top government officials responsible for national security, according to the South's National Intelligence Service.

To better cope with the growing threats, the government raised its five-stage cyber alert level to the third highest level of "caution" last month.

On Tuesday, the ministry held a meeting on cybersecurity with its subordinate organizations such as the Korea National Diplomatic Academy, the Korea Foundation and the Korea International Cooperation Agency.

At the meeting, presided over by Kim Hyoung-zhin, the ministry's deputy minister for political affairs, officials discussed joint responses to the threats, the ministry explained.

Toronto Star

Ottawa in Internet dark ages

Tuesday, 15 March 2016

Byline: Alex Boutilier

Section: general

OTTAWA -- The federal government is lagging behind both private sector offerings and Canadians' expectations in online services, internal documents warn.
A full 77 per cent of federal services still cannot be completed over the Internet, documents prepared for Treasury Board President Scott Brison show.

"Government is not doing a good enough job of meeting the needs and expectations of citizens for quality, accessible services," the documents, obtained by the Star under Access to Information law, read.

"Fifteen years ago, Canada placed first worldwide in e-government services; today the UN e-government survey ranks Canada as 11th."

Services such as passport applications, requesting access to government information, or obtaining proof of citizenship all require in-person treks to Service Canada locations or mailed application forms.

A minority of services, like filing taxes or updating pension information, can be done online through government websites.

Canadians grumbling about the provision of government services is, of course, not a new development in the Internet age. However, the documents state that the private sector's online offerings have increased Canadians' expectations on the speed and ease of obtaining services.

In addition to raised expectations, the documents note that it takes a long time for the sprawling federal bureaucracy to implement changes in how it delivers services.

The average time between implementing a budget decision, for instance, is 15 months between the announcement and the execution.

These factors have resulted in a situation where the federal government is failing to "keep pace" with technological developments.

"The private sector is moving toward a digital experience, even within bricks- and-mortar establishments," the documents read.

"(But) the 2013 (auditor general) audit on access to online services found that the (government) had not significantly expanded its online services offerings since 2005."

In an interview Friday, Brison acknowledged that "enterprisewide" tech solutions are difficult - whether for large companies or for governments. But he said the government must get better at offering services online.

"We need to move forward and modernize our services to Canadians, and be able to offer better services in real-time at better value for taxpayers," Brison said in an interview with the Star.

Since assuming his post as Treasury Board president, and responsibility for the federal government's overall service standards and policies, Brison has talked about the need for a culture change in the public service to be more nimble, free with information, and modern.

Brison also recently told the Ottawa Citizen that the federal public service needs an infusion of young blood - more digital-savvy, innovative generation of bureaucrats with fresh ideas.

"It's much easier to build a modern, digital government if you engage the modern, digital generation," Brison said. "This is the generation that has grown up digital. And we are never going to be able to render government digital without their engagement."

But if it were easy to bring the federal government completely online, it probably would have been done already. Brison's briefing materials detail a number of barriers to making more federal services onto the Internet. "Legislative and technological barriers inhibit sharing of information for service innovation ... (and the) potential for dynamic (government-wide) service delivery is unrealized due to untapped business intelligence," the documents read.

Still, some federal agencies have had success moving traditional pen-and-paper services online - for instance, the Canada Revenue Agency's push to get more people filing their taxes online.

The new Liberal government will have to figure out a way to bring about more widespread changes, however, if they plan to make good on their campaign pledge to create a one-stop Internet portal for federal services.

External Pressures on Government 2.0

Disruption: According to Brison's briefing notes, part of the problem is that the way information is transmitted is changing - and old institutions like newspapers, network television and professional experts are being challenged by social media, Netflix, and Google.

Speed: With those changes, information is moving at a much quicker speed - you don't have to wait for the evening news or for expert opinion to form an opinion. "A superabundance of information has led to a scarcity of attention," Brison's briefing notes read.

Authority: The transformation of those traditional pillars, however, brings with it a crisis of authority. Treasury Board notes that citizens are increasingly skeptical - or at least less deferential - to "experts" or those perceived to be "in charge."

Communication: This presents its own challenges for governments to get their message across or market their services. Information, in real-time, is often unfiltered.

The Guardian (London)

Investigatory powers bill not fit for purpose, say 200 senior lawyers

Tuesday, 15 March 2016

Byline: Owen Bowcott

Section: general

London - The investigatory powers bill, which goes before MPs on Tuesday, is not fit for purpose and breaches international standards on surveillance, according to a letter signed by more than 200 senior lawyers.
The legislation acknowledges for the first time the extent of bulk interception and hacking carried out by the government's monitoring agency, GCHQ, and sets out a legal framework with safeguards.

In a letter to the Guardian, however, the complex and controversial bill is condemned by former judges, QCs, law professors and senior lawyers as being fundamentally flawed because it destroys privacy.

Among those who have signed are the chair of the Bar Human Rights Committee Kirsty Brimelow QC, Tom de la Mare QC, who has been a special advocate in security cases, Sir Stephen Sedley, who is a former court of appeal judge, Prof Sir Geoffrey Bindman QC, Hugh Southey QC, Michael Mansfield QC and Philippe Sands QC. Among academic lawyers, there are representatives of nearly 40 law schools in the UK.

One of the key differences between the government and its critics is whether bulk interception of emails and digital records constitutes mass surveillance and breach of privacy.

GCHQ argues that it only carries out targeted searches of data under legal warrants in pursuit of terrorist or criminal activity and that bulk interception is necessary as a first step in that process; other intercepted material, it insists, is never read.

But the United Nations special rapporteur on privacy, Joseph Cannataci, last week criticised the investigatory powers bill saying that authorising bulk interception would legitimise mass surveillance.

The letter coincides with the second reading of the bill. "A law that gives public authorities generalised access to electronic communications contents compromises the essence of the fundamental right to privacy and may be illegal," it declares.

"The investigatory powers bill does this with its 'bulk interception warrants' and 'bulk equipment interference warrants'." The bill also permits "targeted interception warrants" to apply to groups, persons organisations or premises, the letter notes.

The bill also fails to mention "reasonable suspicion" - or even suspects - and there is no need to demonstrate criminal involvement or a threat to national security, the letters adds.

"These are international standards found in the recent opinion of the UN special rapporteur for the right to privacy, and in judgments of the EU court of justice and the European court of human rights," it continues. "At present, the bill fails to meet these standards - the law is unfit for purpose."

James Blessing, chair of the UK Internet Service Providers' Association, said: "[We] support reform of investigatory powers through a new bill, but we are a long way from having a bill that is clear and workable.

"Government needs to address concerns around its intentions, definitions and costs to enable industry to make a proper assessment of the bill and help arliament scrutinise the complex proposals. Getting this right is essential for the UK digital economy and user trust in services."

Eric King, director of Don't Spy On Us, said: "The government's approach to this important reform has been wrong from the very beginning: they've sought to make bad habits lawful, rather that chart a new and legitimate course for the future.

"The fact so many of the bill's key provisions fall short of international standards cannot simply be pushed aside. A full redraft of this flawed bill is needed for it to stand the test of time. Anything less is simply a waste of parliament's time."

Labour has said it will abstain in Tuesday's vote, but the Liberal Democrats and the SNP will oppose the government's bill.

Reuters

Chinese hackers behind U.S. ransomware attacks - security firms

Tuesday, 15 March 2016

Byline: Joseph Menn

Section: general

San Francisco - Hackers using tactics and tools previously associated with Chinese government-supported computer network intrusions have joined the booming cyber crime industry of ransomware, four security firms that investigated attacks on U.S. companies said.
Ransomware, which involves encrypting a target's computer files and then demanding payment to unlock them, has generally been considered the domain of run-of-the-mill cyber criminals.

But executives of the security firms have seen a level of sophistication in at least a half dozen cases over the last three months akin to those used in state-sponsored attacks, including techniques to gain entry and move around the networks, as well as the software used to manage intrusions.

"It is obviously a group of skilled of operators that have some amount of experience conducting intrusions," said Phil Burdette, who heads an incident response team at Dell SecureWorks.

Burdette said his team was called in on three cases in as many months where hackers spread ransomware after exploiting known vulnerabilities in application servers. From there, the hackers tricked more than 100 computers in each of the companies into installing the malicious programs.

The victims included a transportation company and a technology firm that had 30 percent of its machines captured.

Security firms Attack Research, InGuardians and G-C Partners, said they had separately investigated three other similar ransomware attacks since December.

Although they cannot be positive, the companies concluded that all were the work of a known advanced threat group from China, Attack Research Chief Executive Val Smith told Reuters.

The ransomware attacks have not previously been reported. None of the companies that were victims of the hackers agreed to be identified publicly.

The security companies investigating the advanced ransomware intrusions have various theories about what is behind them, but they do not have proof and they have not come to any firm conclusions.

Most of the theories flow from the possibility that the Chinese government has reduced its support for economic espionage, which it pledged to oppose in an agreement with the United States late last year. Some U.S. companies have reported a decline in Chinese hacking since the agreement.

Smith said some government hackers or contractors could be out of work or with reduced work and looking to supplement their income via ransomware.

It is also possible, Burdette said, that companies which had been penetrated for trade secrets or other reasons in the past were now being abandoned as China backs away, and that spies or their associates were taking as much as they could on the way out. In one of Dell's cases, the means of access by the team spreading ransomware was established in 2013.

The cyber security experts could not completely rule out more prosaic explanations, such as the possibility that ordinary criminals had improved their skills and bought tools previously used only by governments.

Dell said that some of the malicious software had been associated by other security firms with a group dubbed Codoso, which has a record of years of attacks of interest to the Chinese government, including those on U.S. defense companies and sites that draw Chinese minorities.

PAYMENT IN BITCOIN

Ransomware has been around for years, spread by some of the same people that previously installed fake antivirus programs on home computers and badgered the victims into paying to remove imaginary threats.

In the past two years, better encryption techniques have often made it impossible for victims to regain access to their files without cooperation from the hackers. Many ransomware payments are made in the virtual currency Bitcoin and remain secret, but institutions including a Los Angeles hospital have gone public about ransomware attacks.

Ransomware operators generally set modest prices that many victims are willing to pay, and they usually do decrypt the files, which ensures that victims will post positively online about the transaction, making the next victims who research their predicament more willing to pay.

Security software companies have warned that because the aggregate payoffs for ransomware gangs are increasing, more criminals will shift to it from credit card theft and other complicated scams.

The involvement of more sophisticated hackers also promises to intensify the threat.

InGuardians CEO Jimmy Alderson said one of the cases his company investigated appeared to have been launched with online credentials stolen six months earlier in a suspected espionage hack of the sort typically called an Advanced Persistent Threat, or APT.

"The tactics of getting access to these networks are APT tactics, but instead of going further in to sit and listen stealthily, they are used for smash-and-grab," Alderson said.

Reuters

Apple fight could escalate with demand for 'source code'

Tuesday, 15 March 2016

Byline: Staff report

Section: general

San Francisco - The latest filing in the legal war between the planet's most powerful government and its most valuable company gave one indication of how the high-stakes confrontation could escalate even further.
In what observers of the case called a carefully calibrated threat, the U.S. Justice Department last week suggested that it would be willing to demand that Apple turn over the "source code" that underlies its products as well as the so-called "signing key" that validates software as coming from Apple.

Together, those two things would give the government the power to develop its own spying software and trick any iPhone into installing it. Eventually, anyone using an Apple device would be unable to tell whether they were using the real thing or a version that had been altered by officials to be used as a spy tool.

Technology and security experts said that if the U.S. government was able to obtain Apple's source code with a conventional court order, other governments would demand equal rights to do the same thing.

"We think that would be pretty terrible," said Joseph Lorenzo Hall, chief technologist at the nonprofit Center for Democracy & Technology.

The battle between Apple and the U.S Justice Department has been raging since the government in February obtained a court order demanding that Apple write new software to help law enforcement officials unlock an iPhone associated with one of the shooters in the December attack in San Bernardino, California that killed 14 people.

Apple is fighting the order, arguing that complying with the request would weaken the security of all iPhones and create an open-ended precedent for judges to make demands of private companies.

The Justice Department's comments about source code and signing keys came in a footnote to a filing last week in which it rejected Apple's arguments. Apple's response to the DOJ brief is expected on Tuesday.

Justice Department lawyers said in the brief that they had refrained from pursuing the iOS source code and signing key because they thought "such a request would be less palatable to Apple. If Apple would prefer that course, however, that may provide an alternative that requires less labor by Apple."

The footnote evoked what some lawyers familiar with the case call a "nuclear option," seeking the power to demand and use the most prized assets of lucrative technology companies.

A person close to the government's side told Reuters that the Justice Department does not intend to press the argument that it could seize the company's code, and someone on Apple's side said the company isn't worried enough to counter the veiled threat in its brief due Tuesday.

But many people expect the iPhone matter to reach the U.S. Supreme Court, and thus even fallback legal strategies are drawing close scrutiny.

ODDS OF SUCCESS UNCLEAR

There is little clarity on whether a government demand for source code would succeed.

Perhaps the closest parallel was in a case filed by federal prosecutors against Lavabit LLC, a privacy-oriented email service used by Edward Snowden. In trying to recover Snowden's unencrypted mail from the company, which did not keep Snowden's cryptographic key, the Justice Department got a court order forcing the company to turn over another key instead, one that would allow officials to impersonate the company's website and intercept all interactions with its users.

"Lavabit must provide any and all information necessary to decrypt the content, including, but not limited to public and private keys and algorithms," the lower court ruled.

Lavabit shut down rather than comply. But company lawyer Jesse Binnall said the Fourth Circuit Court of Appeals, which upheld the lower ruling, did so on procedural grounds, so that the Justice Department's win would not influence much elsewhere.

In any case, full source code would be even more valuable than the traffic key in the Lavabit case, and the industry would go to extreme lengths to fight for it, Binnall said.

"That really is the keys to the kingdom," Binnall said.

Source code is sometimes inspected during lawsuits over intellectual property, and the Justice Department noted that Apple won permission to review some of rival Samsung's (005930.KS) code in one such case. In that case and similar battles, the code is produced with strict rules to prevent copying.

No cases brought by the government have led to that sort of code production, or at least none that have come to light.

But intelligence agencies operate under different rules and have wide latitude overseas. Some advanced espionage programs attributed to the United States used digital certificates that were stolen from Taiwanese companies, though not full programs.

U.S. software code may have been sought in other cases, such as investigations relying on the Patriot Act or the Foreign Intelligence Surveillance Act (FISA), which applies within American borders.

Several people who have argued before the special FISA court or are familiar with some of its cases say they know of no time that the government has sought source code.

Wall Street Journal

Google Faces Challenges in Encrypting Android Phones

Tuesday, 15 March 2016

Byline: Jack Nicas

Section: general

New York - Had San Bernardino shooter Syed Rizwan Farook used an Android phone, investigators would have had a better chance at accessing the data. The reason? Few Android phones are encrypted. Google, Android's maker, doesn't want it that way. The Alphabet Inc. unit has pushed encryption for Android phones and automatically encrypts its own line of Nexus devices.

But other handset makers have resisted because they are concerned that encryption -- scrambling data such as contacts, photos and videos -- hurts a phone's performance. And Google hasn't insisted for fear of driving device makers away from the official Android model, where it makes the most money.

The result: Experts estimate fewer than 10% of the world's 1.4 billion Android phones are encrypted, compared with 95% of Apple Inc.'s iPhones. That includes Mr. Farook's iPhone, now the center of a high-stakes clash between Apple and the U.S. government that raises questions about privacy and security in the digital age.

The disparity between the two dominant mobile-operating systems underscores Google's challenge in corralling the sprawling Android network of more than 400 manufacturers and 4,000 devices.

Google gives away its Android software to attract more users to its services. Google requires device makers to comply with certain requirements to use the Android brand and key Google services such as search and maps. Ultimately, though, device makers are free to use the software as they wish.

Apple, by contrast, controls both the hardware and software on iPhones. It prods users to adopt the latest version of its iOS software, fueling the spread of encryption.

"There is a push and pull with what Google wants to mandate and what the [manufacturers] are going to do," said Andrew Blaich, lead security analyst at Bluebox Security Inc., which helps secure mobile apps. In some ways, Google is "at the mercy of the larger (manufacturers) like Samsung and LG that are driving the ecosystem."

When phones aren't encrypted, law enforcement can more easily view their contents. Authorities use specialized software to crack passcodes on locked -- but unencrypted -- Android devices in about an hour, said an investigator for France's Gendarmerie Nationale. The Manhattan district attorney said in November that investigators can bypass passcodes on some older Android devices, while Google can remotely reset passcodes on others.

Google is pushing harder on device makers. Its latest version of Android -- dubbed 6.0, or Marshmallow -- requires device makers to encrypt phones that contain high-powered processors. As a result, higher-end Android phones released this year and beyond will come encrypted.

Still just 2.3% of Android devices now run Marshmallow, which was released in October. By contrast, 79% of iPhones run Apple's iOS 9, which was released in September, according to company statistics.

Ken Hong, a spokesman for LG Electronics Inc., one of the largest makers of Android phones, said many devices aren't updated to new versions of Android because manufacturers must tweak the software for each phone model, and each wireless carrier. Manufacturers typically update only their more-expensive models.

LG and HTC Corp. said many of their 2016 phones will be encrypted. A spokesman for Samsung Electronics Co., the world's leading maker of Android phones, said its new Galaxy S7 phone is encrypted but declined to comment on other devices.

"If there was encryption that didn't affect usability and performance, then I can't imagine anyone not wanting to include that feature," said Mr. Hong.

Google accelerated its encryption push in September 2014, saying it would require a new phone running the then-latest version of Android, dubbed Lollipop, to be encrypted "from the first time you turn it on." The announcement came days after Apple said it would begin encrypting iPhones.

Before making its pledge, Google said it tested several encrypted phones, and found little impact on performance. But device-makers' tests showed encryption caused seconds-long delays when launching apps on some low-end devices, Google said. In response, Google halted the encryption mandate.

Android security chief Adrian Ludwig said the company aims to eventually mandate encryption on all Android devices as components get less expensive.

Google's ability to push security on handset makers is complicated because it gives Android away free. Some device makers have created their own versions of Android, which don't use Google services such as search, that generate most of the company's revenue. Google doesn't want to drive away other device makers.

For instance, Mr. Ludwig said that when Google announced its plan to require encryption in late 2014, device makers already were manufacturing low-end devices that perform slowly when encrypted. Companies likely would have shifted those devices away from the official version of Android if Google had kept the requirement, he noted.

The Register (UK)

Only 12% of UK thinks Snoopers' Charter is 'adequately explained'

Monday, 14 March 2016

Byline: Alexander J. Martin

Section: general

London - Only 12 per cent of the British public believe the Home Secretary has "adequately explained the impact of the Investigatory Powers Bill to the UK public and presented a balanced argument for its introduction".
A survey on data privacy issues conducted by Open-Xchange has found that the "internet-savvy" public in the UK, Germany and the US are increasingly interested in policies affecting the online realm.

As Rafael Laguna, CEO at Open-Xchange, which conducted the Consumer Openness Index, told The Register: "We see there's an increased sensitivity towards data privacy and data topics, although of course different countries have different hot topics."

Debates regarding the UK's Investigatory Powers Bill, and the conflict between the FBI and Apple in the US, "have influenced people quite a bit, and they have developed stronger opinions."

Forty-six per cent of those surveyed in the UK said they paid somewhat close attention or more to the debate over balancing government surveillance with data privacy. This compares with 56 per cent in the US, and 75 per cent in Germany.

Historical national differences are lessening, however. While Germans were typically the most concerned about privacy issues, considering the partitioning of the country and the legacy of the Nazis and the Stasi, overall public opinion is becoming more similar, suggested Laguna.

In some respects, however, the UK remains more conservative than its left-and-right hand kin, with 33 per cent thinking national security was more important for the government to protect than the right to personal privacy at 11 per cent.

Only 12 per cent of the British public, however, believed the Home Secretary, Theresa May, "has adequately explained the impact of the Investigatory Powers Bill to the UK public and presented a balanced argument for its introduction".

Fifty-three per cent said they did not believe this, while 35 per cent were unsure.

The public is becoming more opinionated and more aware, said Laguna, who said Open-Xchange was hoping to raise that awareness and receive tangible statement from the government.

Fifty per cent of the British public believed that "making personal data easier for government officials to access will also make it easier for criminals to access that data as well", while only six per cent disagreed.

Laguna, who was raised in East Germany under the watch of the Stasi, said: "Everybody in the IT industry understands that there is no such thing as 'weakened encryption', there is either encryption or no encryption. I would wish the government would accept the statements of the experts and say 'We won't try to weaken encryption' and 'Of course, you can't outlaw maths, so we're not trying to do that either'."

Half of respondents said they thought the Investigatory Powers Bill's provisions regarding encryption infringed on the British public's right to privacy. Only 10 per cent thought it would not make investment in the UK less attractive to foreign companies.

"These discussions are raising awareness, and that's always the start of changing opinions," said Laguna.

Le Devoir

Données à la frontière - Plus qu'un enjeu de sécurité

Tuesday, 15 March 2016

Byline: Manon Cornellier

Section: editorial

Editorial - Depuis au moins quatre ans, Ottawa et Washington s'affairent à établir un programme d'échanges de données sur les entrées et sorties de voyageurs. La mise en oeuvre au Canada a pris du retard, mais Ottawa s'est engagé la semaine dernière à terminer le travail dès que possible. Comme toujours, on avance l'argument de la sécurité pour justifier cette coopération, mais les données servent à d'autres fins et les échanges soulèvent des questions en matière de protection de la vie privée.
Les attentats du 11 septembre 2001 ont profondément changé la nature de la relation entre le Canada et les États-Unis. La sécurité est devenue un sujet incontournable, et l'idée d'un périmètre englobant les deux pays s'est imposée. En 2011, les deux pays ont publié une vision commune à ce sujet. Parmi les engagements du plan d'action qui en a découlé en décembre 2011 est apparue une initiative sur les entrées et les sorties des voyageurs.

L'idée est simple. Les deux pays échangent des données sur l'entrée des voyageurs sur leur territoire à la frontière terrestre, ce qui permet à chacun de savoir qui sort du sien. La première étape a permis d'expérimenter le système à quelques points d'entrée terrestres en ne ciblant que les voyageurs n'étant pas citoyens de l'un ou l'autre pays.

La deuxième phase, en vigueur depuis 2013, a étendu l'expérience à tous les points d'entrée terrestres automatisés sans viser les citoyens canadiens ni américains. Ces derniers devaient être ajoutés lors de la troisième phase qui tarde à entrer en vigueur. Quant à la quatrième phase, elle devait étendre les échanges à tous les voyageurs quittant le pays en avion. Les États-Unis récoltent déjà cette information, mais ce n'est toujours pas le cas au Canada.

Ce sont ces deux dernières étapes que le Canada s'engage maintenant à mettre en oeuvre. Ce qui exigera des modifications à des lois et à des règlements. Heureusement, car cela garantira au moins la tenue d'un débat plus que nécessaire au Parlement.

Ces échanges de données soulèvent des inquiétudes depuis le début. Pour s'y opposer, certains évoquent le cas de Maher Arar, bien que ce dernier ait été expulsé en Syrie sur la base d'informations fausses fournies par la GRC. D'autres craignent qu'on fouille dans le passé des gens pour leur interdire l'entrée.

Tel qu'il existe, le programme de suivi des entrées et sorties ne le permettrait pas. La liste des données partagées est limitée : nom, date de naissance, nationalité ou citoyenneté, sexe, information sur le document de voyage (numéro, type et pays de délivrance) et enfin la date, l'heure et le point d'entrée.

Mais que la liste soit courte ou non, des questions persistent au sujet de la protection de la vie privée, de l'échange avec des pays tiers et de l'utilisation des données à d'autres fins que la sécurité. Les gouvernements ne cherchent pas qu'à conjurer une menace terroriste ou à aider les services frontaliers à confirmer le départ de personnes faisant l'objet d'un ordre d'expulsion.

Le gouvernement fédéral envisage d'utiliser ces données pour assurer le respect de certaines lois, comme celles sur la citoyenneté et l'assurance- emploi ou pour vérifier l'admissibilité à certaines prestations. Le hic est qu'à la fin d'avril dernier, les ministères et agences qui prévoient utiliser ces données -- l'Agence des services frontaliers du Canada, l'Agence du revenu, le Service canadien du renseignement de sécurité (SCRS), Citoyenneté et Immigration, Emploi et Développement social et la Gendarmerie royale du Canada -- n'avaient toujours pas remis la nécessaire Évaluation des facteurs relatifs à la vie privée, indique le dernier rapport annuel du Commissaire à la vie privée déposé en décembre.

Le communiqué canadien publié après la visite officielle du premier ministre Justin Trudeau à Washington, la semaine dernière, se limite à dire que la poursuite de cette initiative se fera " en respectant nos cadres constitutionnels et juridiques respectifs et en protégeant le droit des citoyens à la vie privée ". Le communiqué américain ne souffle mot de cette préoccupation.

Un autre problème dont on parle peu est l'échange de données avec des pays tiers. Le Canada ne peut actuellement empêcher les États-Unis de partager celles qu'il leur fournit, même si les autorités américaines sont obligées de l'aviser d'un tel transfert.

Avant d'aller de l'avant, le gouvernement canadien doit mettre cartes sur table au sujet du transfert possible de données à un pays tiers, clarifier la véritable utilisation qu'il compte faire des données et exiger de tous les ministères qu'ils fassent leurs devoirs en matière de protection de la vie privée.

La Tribune (France)

Les élites politiques seraient-elles dépassées par le numérique?

Tuesday, 15 March 2016

Byline: Sylvain Rolland

Section: general

Non identifié - La révolution numérique, caractérisée par l'essor des nouvelles technologies et par la collecte et le traitement des données à grande échelle, bouleverse tous les secteurs. Dans un contexte de chômage de masse, elle pose des défis d'une ampleur inédite au personnel politique. Cette numérisation de la société et de l'économie laisse de côté une élite politique globalement dépassée. Sortis de leur zone de confort, les élus peinent toujours à comprendre et à penser les enjeux de transformation, ils apparaissent en décalage avec les entreprises et les citoyens. Qui s'impatientent. Attention, vous risquez d'y perdre votre latin. « L'algoriSme, c'est un ciblage, mais pas sur des individus : sur des modes de communication »... Mardi 12 mai 2015, palais du Luxembourg. Jean-Yves Le Drian disserte au Sénat sur la très technique loi Renseignement, qui sera adoptée deux mois plus tard. Mais le ministre de la Défense s'emmêle sérieusement les pinceaux. Non seulement l'élu socialiste peine à prononcer correctement le mot « algorithme », mais il patine aussi sur son sens. Car le mot, apparu dès le XIIIe siècle, désigne simplement une méthode de calcul par une suite d'opérations... Évidemment, la bourde ne passe pas inaperçue. Les geeks, les opposants à la loi Renseignement et autres spécialistes des nouvelles technologies se moquent copieusement sur les réseaux sociaux du ministre. Mais ils rient jaune. « Ce lapsus est inquiétant, car il symbolise le déficit de culture numérique d'une grande partie de la classe politique française », déplore un député... de la majorité, qui fait partie de « la trentaine » d'élus nationaux (gouvernement, députés et sénateurs de gauche et de droite) réputés pour leur maîtrise des enjeux numériques.

Depuis l'incident, le mot-dièse #algorisme est devenu une tendance sur Twitter. Il réapparaît à chaque itération d'inculture numérique de la part des élites. Rien n'aurait donc changé depuis 1996? À l'époque, le président Jacques Chirac demandait à quoi servait le « mulot » en désignant une souris d'ordinateur. Fin 2009, le député-maire de Maisons-Laffitte, Jacques Myard (LR), voulait très sérieusement « nationaliser Internet pour mieux le maîtriser » car il serait « pourri par les chevaux de Troie ».

Fort heureusement, la société a fait du chemin. Les politiques aussi. Désormais, beaucoup d'élus pianotent sur leur smartphone et utilisent Facebook et Twitter. En revanche, dès que les sujets se font plus techniques ou nécessitent une maîtrise plus poussée des enjeux, « il n'y a plus grand- monde », déplore Luc Bretones. « Le problème des politiques, c'est qu'ils sont très en retard par rapport aux citoyens et aux entreprises », ajoute le vice-président de l'institut G9+, un cercle de réflexion apolitique consacré à la transformation digitale. Il synthétise le sentiment ambiant : « Comment la France pourrait-elle tirer profit de la révolution numérique quand certains concepts de base, sans même parler de leurs enjeux énormes de transformation, ne sont toujours pas compris par nos responsables politiques? »

« Cette complexité, inédite, paralyse les politiques »

Ce cri du coeur est partagé par tous les experts du numérique, qu'ils soient citoyens, entrepreneurs, intellectuels, et même par les rares élus « éclairés ». Cette frustration se comprend, car le numérique a complètement envahi nos vies, à la fois dans la sphère privée et professionnelle.

Les nouvelles technologies, la collecte et l'analyse de données à grande échelle (le fameux big data), l'informatique en nuages (le cloud) et la généralisation d'Internet pour acheter, vendre et communiquer, transforment profondément la société et l'économie. Si bien que tous les secteurs sont touchés ou vont l'être. De la banque à la santé, en passant par le commerce, l'éducation, les médias, l'administration, la sécurité ou encore les transports, le numérique réinvente les métiers, en crée de nouveaux et impose une réorganisation profonde du travail, de la protection sociale et de la création de valeur. Ces chamboulements se traduisent par un besoin de réformes politiques majeures. De fait, les élus doivent à la fois encadrer cette nouvelle économie et adapter l'ancienne. Favoriser le développement des entreprises numériques tout en protégeant les citoyens, les travailleurs et les consommateurs. Un véritable casse-tête, comme le montre le tollé autour de la loi sur le travail de Myriam El Khomri, ou encore les tensions extrêmes entre Uber et les taxis, symbole de l'impact brutal du numérique sur les secteurs dits « traditionnels ».

Cette urgence de réformer apparaît d'autant plus cruciale dans un contexte de chômage de masse. De la capacité de la France et de l'Europe à saisir la révolution numérique dépendront leur souveraineté économique et politique, et leur croissance dans la décennie à venir, indique un rapport de 2014 des députées Corinne Erhel (PS) et Laure de La Raudière (LR).

« Le numérique est une révolution au sens historique du terme », résume Benoît Thieulin, patron de la société de communication digitale La Netscouade et ancien président du Conseil national du numérique (CNNum).

« Il ne peut plus se penser comme une thématique isolée et secondaire car il irrigue l'ensemble du champ de l'action publique. Cette complexité, inédite, paralyse les politiques, qui sont comme des poissons hors de l'eau », ajoute-t-il. »

Un handicap en partie générationnel

Selon lui, les élus n'ont pas encore pris conscience que désormais, toutes les décisions de politique publique intègrent un volet technologique. Réformer la retraite à points, par exemple, n'implique-t-il pas une question de capacité logicielle pour créer un système d'information capable de gérer le compte personnel d'activité?

On peut en partie expliquer ce décalage entre les élus et la société, théorisé par la journaliste Laure Belot dans son livre La Déconnexion des élites (Les Arènes, 2015) par la sociologie du personnel politique. L'âge moyen des parlementaires frôle les 60 ans.

Seuls 22 députés (sur 577) ont moins de 40 ans. En revanche, 266 dépassent la soixantaine... Une situation beaucoup plus marquée qu'en Allemagne, au Royaume-Uni ou aux États-Unis. S'il n'est pas indispensable d'être jeune pour comprendre le numérique, le manque de renouvellement ralentit la montée en compétence globale sur le sujet.

« Comme ils sont là depuis longtemps, beaucoup de politiques ont bâti leur notoriété et leur légitimité sur d'autres sujets. Ils tendent donc à traiter le numérique à la marge plutôt que de le placer au coeur de la problématique centrale de l'emploi, ce qui est une erreur », analyse Luc Bretones. »

L'homogénéité des profils des élus pose aussi problème. « La classe politique représente très mal la société française. Elle est plus vieille, plus masculine, plus blanche, plus fonctionnaire, peu au contact du monde de l'entreprise et des évolutions sociétales », note Benoît Thieulin. Conséquence : la culture numérique, de plus en plus marquée en entreprise et quasiment instinctive chez les Millennials (ceux qui sont nés entre 1980 et 2000), peine à se diffuser dans les rangs de l'Assemblée, du Sénat et du gouvernement.

« La dernière roue du carrosse gouvernemental »

Pour Élisabeth Grosdhomme-Lulin, inspectrice des finances et directrice générale de la société d'études et de conseil Paradigme et cætera, ce manque de littératie numérique, c'est-à-dire de culture du digital au sens large, est plus grave que l'absence criante d'élus spécialisés. « Dans une démocratie, ce ne sont pas les médecins qui font la politique de santé, ni les agriculteurs qui font la politique agricole, relève-t-elle. Le plus important, c'est que les représentants du peuple soient capables de prendre de la hauteur, ce qui n'est, globalement, pas encore le cas sur le numérique. »

Les élus eux-mêmes partagent ce diagnostic. « On est toujours dans le syndrome Hadopi », déplore la députée Laure de La Raudière (LR), en référence à la loi sur le téléchargement illégal, votée en 2009 et réputée pour son inefficacité. L'élue d'Eure-et-Loir remarque que ses congénères peinent à se départir de leurs « réflexes du XXe siècle ».

« On construit des digues de sable pour protéger l'Ancien Monde en espérant que ça marche, mais ça ne marche jamais », tacle-t-elle. »

L'essor de la French Tech depuis 2013, les moyens importants alloués au financement de l'innovation (création de Bpifrance, essor de Business France et du slogan Creative France...) montrent pourtant que le gouvernement s'applique à développer l'économie numérique. Mais son approche défensive vis-à-vis des nouveaux usages collaboratifs ainsi que sa volonté paradoxale de ne pas froisser les lobbies (taxis, hôtellerie, industrie musicale...) donnent le sentiment d'une politique incohérente et déconnectée des enjeux. Le grand écart entre un axe sécuritaire d'un côté (la loi Renseignement), libéral de l'autre (la promotion de l'entrepreneuriat, les lois Macron et El Khomri), et une approche protectionniste et sociale (la loi Lemaire) brouille le message. Enfin, le statut d'Axelle Lemaire, la secrétaire d'État au numérique, apparaît en décalage avec l'importance de son maroquin. Depuis le remaniement de février

dernier, l'élue des Français d'Amérique du Nord se classe à la 37e place sur 39 dans l'ordre protocolaire. « Le numérique est clairement la dernière roue du carrosse gouvernemental, déplore le directeur général d'une fédération professionnelle d'entreprises du digital. Il faudrait un ministre du Numérique doté d'un vrai poids politique, sous l'autorité directe du Premier ministre, avec un accès à l'Élysée et les moyens de gagner des arbitrages. Axelle Lemaire est extrêmement compétente, mais c'est un poids plume », poursuit-il.

La cocréation de la loi, une méthode plébiscitée

Bonne nouvelle : de plus en plus d'élus prennent conscience de la nécessité de monter en compétence sur ces sujets. À ce titre, la Loi pour une République numérique d'Axelle Lemaire, adoptée en première lecture par l'Assemblée nationale fin janvier, est très révélatrice des progrès effectués depuis quelques années, mais aussi du chemin qu'il reste à parcourir. « Même si elle aurait pu être plus ambitieuse, cette loi est globalement positive sur le fond et une réussite sur la forme », se réjouit Luc Bretones, du cercle de réflexion G9+.

Sur le fond, le texte étend l'ouverture des données publiques à la société civile (l'open data) pour créer une « économie de la donnée ». Elle affirme aussi une série de nouveaux droits pour protéger la vie privée des citoyens/consommateurs (droit à l'oubli, portabilité des données, « mort » numérique...) et développe l'accessibilité au numérique pour les populations les plus fragiles.

« La partie sur l'open data est majeure, car même si de nombreux élus locaux ne s'en rendent pas compte, l'ouverture des données publiques aux citoyens et aux entreprises va profondément toucher leur collectivité », souligne Élisabeth Grosdhomme-Lulin. »

Sur la forme, la loi Lemaire peut être considérée comme le premier texte conçu « dans l'esprit » de la révolution numérique. Sa première version a été rédigée sur la base d'un document de synthèse réalisé par le Conseil national du numérique, à partir des observations de tous les experts du secteur. Puis le texte a été soumis pendant trois semaines à une consultation publique sur Internet. Avec succès : 21.330 contributeurs ont voté plus de 150.000 fois et déposé plus de 8.500 arguments, amendements et propositions de nouveaux articles. Le gouvernement a ensuite revu sa copie pour ajouter cinq nouveaux articles, à l'image de la création d'un cadre légal pour le sport électronique, et effectuer une soixantaine de modifications.

« Cette méthode de cocréation inédite a été longue et éreintante, tout le monde ne peut pas en sortir entièrement satisfait en raison des nécessaires arbitrages, mais elle a créé un dynamisme incroyable », indiquait Axelle Lemaire fin décembre. »

Saluée par la majorité comme par l'opposition, cette méthode devrait être reprise pour de futurs projets de loi, comme celle sur le sport.

Fort de cette légitimité citoyenne, le texte a échappé aux grandes polémiques et aux petites phrases. Davantage de députés ont participé aux débats. Mieux, tous les observateurs ont été « agréablement surpris » par la qualité des interventions parlementaires.

« Malgré quelques propositions incongrues, comme l'interdiction des liens hypertextes [un amendement des députées socialistes Karine Berger et Valérie Rabault, NDLR], le débat a été constructif et salutaire », se réjouit Luc Belot, le rapporteur (PS) du projet de loi. Le député Patrice Martin-Lalande (LR) relativise. « Nous n'étions qu'une quinzaine de parlementaires vraiment investis, mais c'est un indéniable progrès, y compris par rapport à la loi Renseignement ». »

Des sujets cruciaux, jusqu'alors mis sous le tapis, ont enfin été abordés. La question du chiffrement des données, par exemple. L'amendement - rejeté - de Nathalie Kosciusko-Morizet (LR), visant à obliger les constructeurs de matériel informatique à créer des « portes dérobées » pour que les autorités puissent accéder à du contenu chiffré dans le cadre de leurs enquêtes, a forcé le gouvernement à clarifier sa position. À savoir que le chiffrement, garant de la sécurité des données, doit être protégé. Les experts du numérique se réjouissent aussi du débat sur la création d'un « OS souverain » pour concurrencer les géants américains comme Microsoft, Apple et Google. Même s'il a été tourné en ridicule sur Twitter.

« Créer un OS franco- français n'est pas une bonne réponse, car c'est irréalisable, mais il était nécessaire de réfléchir sur la souveraineté numérique de la France », explique Benoît Thieulin, qui y voit le signe d'un « début de prise de conscience ». »

Vers la politisation du numérique ?

En définitive, la loi Lemaire a été adoptée très largement : 356 voix pour, un vote contre. Les députés Les Républicains se sont majoritairement abstenus. Une tactique pour prendre leurs distances avec le gouvernement sans gêner le texte. Certains, à l'image de Patrice Martin-Lalande, ont tout de même apporté leur voix à la majorité. Est-ce à dire que le numérique abolit le clivage gauche/droite traditionnel? « C'est le cas aujourd'hui, et cela révèle le manque de maturité global », estime Laure de La Raudière. Effectivement, on assiste plutôt à une lutte entre les anciens et les modernes, au sein même de chaque parti, plutôt qu'à une bataille idéologique entre la gauche et la droite. Pour beaucoup, le défi des années à venir consiste justement à « politiser le numérique ».

« Il faut qu'on comprenne mieux quel dessein politique se joue derrière des choix d'apparence technologique », précise Benoît Thieulin. »

Veut-on utiliser les outils numériques pour simplifier l'administration et faire des économies d'échelle, ou investir pour mener une révolution de progrès social, d'« empouvoirement » des individus et de solidarité? Souhaite-t-on une société de surveillance grâce aux mégadonnées ou choisit-on de protéger à tout prix la vie privée? À quel échelon - national, franco-allemand, européen - faut-il agir pour faire émerger de nouveaux champions dans les secteurs d'avenir comme l'Internet des objets? Autant de choix stratégiques dotés d'une forte dimension idéologique.

« On aimerait entendre Hollande, Valls et les leaders de l'opposition proposer une trajectoire, des valeurs, et parler de l'avenir comme le fait Obama dans ses discours », résume un entrepreneur de la French Tech. »

En attendant, que faire? La société civile, elle, s'impatiente.

« Quatre-vingt-dix-neuf pour cent des entreprises savent qu'elles auront de gros problèmes dans la décennie à venir si elles ne s'adaptent pas fondamentalement au numérique. Elles ont besoin d'outils », pointe Luc Bretones. »

À l'approche de l'élection présidentielle de 2017, l'institut G9+ s'apprête à dévoiler « 100 idées pour une France numérique ». Il s'agit d'une compilation de propositions par une quarantaine d'experts, issus de toutes les sensibilités politiques et de tous les secteurs. L'objectif : positionner le numérique au coeur de la prochaine campagne électorale en nourrissant la réflexion des futurs candidats.

Au menu : des mesures « concrètes » comme le développement des Moocs dans la formation professionnelle, la création d'un nuage informatique communautaire pour l'administration, d'un carnet de santé en ligne, d'un syndicat national des travailleurs de l'économie collaborative ou d'une fiche de paie dématérialisée.

Le cercle de réflexion espère que les futurs candidats se saisiront de ces propositions ou qu'elles inspireront le gouvernement et les parlementaires.

« Toutes les intelligences sont là, poursuit Luc Bretones. Il y a énormément d'entrepreneurs, d'ingénieurs, d'universitaires, d'experts sur les enjeux actuels qui sont force de proposition et qui aimeraient que les choses bougent. Qu'attendent les politiques pour les écouter et s'emparer de leurs idées? »

Quand le Pentagone recrute le directeur de Google et s'offre les services de hackers

Tuesday, 15 March 2016

Byline: Fabrice Epelboin

Section: general

Washington - Quand le Pentagone recrute le directeur de Google et s'offre les services de hackers pour pirater son propre réseau
Au début du mois de mars, le Pentagone annonçait le recrutement d'un des dirigeants historiques de Google, ainsi que le lancement d'un Bug Bounty. Deux annonces qui témoignent de la rapide accélération de l'innovation au niveau de l'armée américaine et des enjeux de sécurité criminalité auxquels les gouvernements sont confrontés.

Atlantico : Le Pentagone a annoncé au début du mois l'organisation d'un concours de piratage de ses réseaux ouvert à des hackers. Pourquoi une telle initiative ? Qu'est-ce qui la justifie?

Fabrice Epelboin : Le Pentagone organise ce que l'on appelle un " Bug Bounty ": cela consiste à inviter des hackers à identifier des failles de sécurité dans ses technologies, et à les récompenser quand ils en découvrent. Plus la faille trouvée est critique, plus la récompense est élevée. C'est une pratique assez courante chez les géants des technologies aux Etats-Unis , initiée par Netscape dès 1995. Aujourd'hui, la plupart des grands de la Silicon Valley pratiquent le Bug Bounty afin de sécuriser leurs technologies : Yahoo, Microsoft, Google, Facebook, Paypal, IBM, eBay... Mais des entreprises hors du cadre strict des technologies s'y mettent également, tel United Airlines ou General Motors.

Cette approche de la détection de faille de sécurité connait un boom aux Etats-Unis depuis quelques années, car elle se révèle être un complément indispensable à l'approche traditionnelle, le pentesting, qui consiste à mobiliser un ou deux experts durant quelques semaines en leur confiant la mission de découvrir ces même failles. Avec un Bug Bounty, on peut attirer bien plus de monde, et par là même des compétences et des approches bien plus variées , reflétant la diversité que l'on peut trouver du coté des attaquants. Qui plus est, un Bug Bounty peut être ouvert de façon indéfinie, offrant une attention permanente, là où elle n'était que ponctuelle auparavant avec la précédente approche, le pentesting. Enfin, c'est une approche bien plus rationnelle en termes de ROI : plutôt que d'acheter du temps de recherche d'un ou deux experts, on achète directement auprès des experts le résultat de cette recherche.

Le fait que le Pentagone organise son propre Bug Bounty est en quelque sorte la validation ultime de cette approche de la sécurité informatique, qui fait appel à la foule sur le mode du crowdsourcing et de "l'économie collaborative" .

Aux Etats-Unis, c'est une pratique courante, et l'arrivée du Pentagone n'est que l'aboutissement d'un mouvement entammé depuis des années par tous les géants des technologies, alors qu' en Europe, cette approche de la sécurité informatique est apparue plus récemment. Deux plateformes de Bug Bounty on été lancées cette année en France : Yogosha et BountyFactory.

Le fait de faire appel à des hackers, même si une vérification de sécurité aura lieu, ne présente-t-il pas un risque de sécurité précisément ?

Que ce soit pour le Pentagone ou pour une entreprise, c'est une crainte tout à fait légitime, mais si on l'analyse de près, on s'aperçoit vite qu'il n'y a pas lieu d'appréhender ainsi le Bug Bounty. Les hackers ayant des intentions malveillantes attaquent le Pentagone, qu'il y ait ou non un Bug Bounty en cours, et la situation est la même pour n'importe quelle entreprise qui organise un Bug Bounty. L'idée qu'un Bug Bounty attire des hackers mal intentionnés est fantasque : ces hackers "blackhat" sont déjà en train de scruter les technologies des entreprises qu'elles cherchent à attaquer, ils ne vont pas attendre qu'on leur en donne l'autorisation.

Une autre crainte, qui peut sembler fondée, consiste à imaginer qu'un hacker qui découvre une faille sur une technologie soit tenté de la vendre au plus offrant, et donc pas forcément au propriétaire de la technologie qui a mis en place un Bug Bounty. C'est une crainte plus rationnelle, mais qui ne résiste pas à la réalité du "marché" qu'établit une entreprise ou une institution en mettant en place un Bug Bounty : si vous trouvez un "bug" (une faille de sécurité), vous avez en réalité assez peu de temps devant vous pour le vendre à l'organisateur du Bug Bounty et recevoir une récompense, car d'autres "chasseurs de bug" sont également à l'oeuvre, et chaque faille n'est payée qu'une seule fois, au premier hacker qui la rapporte. Tenter de vendre ailleurs une faille de sécurité, c'est à coup sûr essayer de vendre quelque chose qui n'aura plus la moindre valeur le temps de trouver un acheteur. Entre temps, les chances sont grandes qu'un autre hacker ait rapporté cette même faille au propriétaire de la technologie à travers son programme de Bug Bounty. Ce dernier l'aura corrigé avant que quiconque ne puisse l'exploiter. Ce constat est d'autant plus implacable que les attaques sophistiquées que redoutent les entreprises, comme les institutions, s'appuient la plupart du temps sur l'exploitation d'une série de failles. Il suffit souvent que l'une d'entre elles soit corrigée pour mettre en échec une attaque en cours.

Pour y voir clair, il faut appréhender un Bug Bounty pour ce qu'il est : la mise à prix par une entreprise des failles de sécurité présentes sur ses technologies. Ces failles ont un prix dans l'absolu, en dehors de tout Bug Bounty, du moins aux yeux de ceux qui savent les utiliser pour mettre au point une attaque malveillante. Le but, dans la mise en place d'un Bug Bounty, est d'impacter ce "marché", qui existe, quoi qu'il arrive.

Un Bug Bounty peut impacter ce marché de deux façons. D'une part, en mettant un prix élevé pour les failles les plus critiques, susceptibles de causer des dommages conséquents à l'entreprise qui organise son Bug Bounty : c'est ce que font Facebook ou Google, dont les récompenses pour une faille critique découverte sur leurs technologies peuvent être très élevées , et c'est ce que devrait faire toute entreprise dont le risque en termes d'image ou d'espionnage économique est élevé. D'autre part, le Bug Bounty est un marché ouvert, transparent et rapide, contrairement aux circuits de vente de failles de sécurité du coté de la cybercriminalité. La rapidité de la transaction, conjuguée à des mises à prix suceptibles d'attirer un grand nombre de hackers sur un Bug Bounty, fait que le marché des failles de sécurité au sein de la cybercriminalité est court-circuité. Il faut ajuster les prix de façon à attirer une foule en mesure de noyer le camp adverse, dont les moyens, quels qu'ils soient, ne peuvent se comparer

avec les communautés de hackers réunies autour des différentes plateformes de Bug Bounty, qui se comptent en milliers, voire en dizaine de milliers.

On voit là toute la subtilité dans la façon de mettre en place un Bug Bounty, et surtout dans le choix des mise à prix, car c'est bien l'entreprise qui décide du prix de ses failles de sécurité. Les prix des failles peuvent, par ailleurs, évoluer avec le temps, de façon à attirer des foules différentes, adaptées aux différentes phases d'un processus de sécurisation. La plupart des plateformes de Bug Bounty emploient des experts aguerris qui maitrisent parfaitement ce sujet, et accompagnent les grands comptes dans la mise en place de leurs Bug Bounties. Mais il faut absolument réfléchir en termes de marché, non pas un marché que l'on crée, mais un marché préexistant, sur lequel on cherche à avoir un effet disruptif, et concevoir un Bug Bounty en ayant cet objectif en tête. Il s'agit bel et bien de disrupter le marché de la cybercriminalité en s'appuyant sur de vastes communauté de "hackers éthiques" qui, Dieu merci, sont en bien plus grand nombre que les cybercriminels.

Peut-on envisager la mise en place d'un tel concours en France par le ministère de la Défense ? À quelles conditions et pour quels résultats ?

Traditionnellement, la France a un temps de retard en ce qui concerne l'innovation, et comme le Pentagone vient de s'y mettre... Ceci dit, c'est tout à fait envisageable, et la France est plutôt bien placée pour faire partie des premières nations européennes à mettre ses institutions au Bug Bounty, du fait que les premières plateformes de Bug Bounty européennes ont été créées en France.

Les conditions seraient très certainement similaires au Bug Bounty organisé par le Pentagone : un périmètre limité dans un premier temps, afin de tester le dispositif, et une sélection de hackers préalablement validés par le ministère de la Défense. On peut tout à fait imaginer étendre par la suite de tels Bug Bounty à d'autres institutions, à commencer par les ministères et les administrations, ainsi qu'aux opérateurs d'importance vitale.

Quant aux résultats, ils seraient sans doute similaires à ceux de n'importe quel Bug Bounty : une liste de failles de sécurité à corriger au plus vite - du moins pour les plus critiques. Pour le moment, le ministère de la Défense, comme les autres ministères et administrations françaises, fait appel à des SSII, qui proposent des campagnes de pentesting pour identifier de telles failles de sécurité, mais l'explosion de la cybercriminalité, sans parler de l'espionnage, montre bien que cette approche n'est pas suffisante, et qu'il devient urgent de la compléter par d'autres. Le Bug Bounty est un complément évident.

Dans le même temps, le Pentagone annonçait au début du mois le recrutement du président d'Alphabet (Google) en tant que conseiller en matière d'innovation. Qu'est-ce que cela révèle des liens entre gouvernement et acteurs du numérique (qui plus est dans le contexte actuel tendu entre Apple et le FBI) ? Quel gain pour le Pentagone ?

La porosité entre les GAFAM avec les services de renseignement n'est pas une nouveauté : c'était tout l'objet de l'affaire Prism, le premier volet des révélations d'Edward Snowden. Mais ces derniers temps,

on observe des éléments visibles de première importance. Au moment où Apple occupe le devant de l'actualité avec son bras de fer qui l'oppose au gouvernement américain, Google semble effectuer la démarche inverse, celle de la coopération.

Google possède non seulement un outil de surveillance des populations que le Pentagone et la NSA ne peuvent qu'envier, mais ils sont, qui plus est, la clé de l'accès aux savoirs et à l'information un peu partout dans le monde. En Europe, 95% des recherches sur Internet sont faite à travers Google, ce qui leur donne la possibilité non seulement de contrôler ce à quoi les Européens ont accès en termes d'information, mais également de savoir ce qu'ils cherchent à tout moment.

Si Google venait à être instrumentalisé à des fins politique ou militaires, cela serait un outil d'influence incroyable, et un outil de surveillance omniscient. Il est assez naturel que le Pentagone s'y intéresse, et pas si surprenant que Google réponde à sa demande - après tout, la firme de Mountain View a abandonné récemment son slogan "Don't be Evil". Mais pour le moment, la collaboration de Google avec le Pentagone ne concerne que la gestion de l'innovation, du moins officiellement.

Le Pentagone a tout à gagner à une telle collaboration. Il est évident qu'une personnalité comme Eric Smith a beaucoup à apporter à des militaires en termes de gestion de l'innovation, même si pour ce qui est d'innover, le Pentagone n'est pas en reste.

L'arrivée concomitante de l'un des dirigeants historique de Google au Pentagone et du lancement par ce dernier d'un Bug Bounty montre de façon indiscutable une brusque accélération de l'innovation du coté des institutions américaines, en particulier au sein de l'armée.

D'une manière générale, comment interpréter ces ouvertures de La Défense vers l'extérieur ? Cela ne traduit-il pas un certain aveu de faiblesse ?

Avec une augmentation de +30% au niveau mondial et +50% en France, il est difficile de ne pas dresser un constat d'échec face à l'insécurité sur Internet. D'ailleurs, le CGHQ, l'équivalent anglais de la NSA, a récemment fait des déclarations en ce sens. La cybercriminalité augmente de façon considérable, et ni la NSA, ni le Pentagone ou qui que ce soit, n'ont pu enrayer le phénomène. Il faut dire qu'ils en sont en partie responsables.

La surveillance de masse initiée par les Etats-Unis dès le lendemain du 11 septembre 2001 repose en large partie sur l'introduction volontaire par la NSA et ses alliés, de multiples failles de sécurité dans les technologies utilisées partout dans le monde par les Etats, les entreprises et les particuliers. Cela a créé un territoire d'opportunités pour une multitude d'organisations cyber-criminelles, dont les gains sont désormais comparables, si ce n'est supérieurs, à ceux des trafiquants de drogue. Car le temps où les entreprises et les Etats faisaient face à un hacker "blackhat" isolé est derrière nous. Aujourd'hui, la menace est tout autre: il s'agit de véritables groupes mafieux, très bien organisés, avec de larges équipes aux talents multiples, disposant de beaucoup de temps et de financements.

Ces mafias agissent pour leur propre compte et détroussent les entreprises, ou les espionnent pour le compte de leurs concurrents. Face à une telle menace, le Bug Bounty est une réponse appropriée : faire appel à une foule de hackers éthiques ayant les mêmes compétences que les cyber- mafias, mais à même d'aider les organisateurs de Bug Bounty. Bon nombre d'entreprises l'ont bien compris.

China's Xi Says Military Must Develop Cutting Edge Technology

Tuesday, 15 March 2016

Section: general

China's military must pour efforts into developing cutting edge defense technology, which has strategic significance, China's President Xi Jinping said on Sunday (13/03), according to state media reports.
Xi also stressed professionalizing the country's military brass, the official China Daily reported on Monday. The armed forces have long been plagued with corruption, which senior officers have cautioned threatens combat capabilities.

Xi, who also chairs the elite Central Military Commission, has targeted corrupt military officials as part of a sprawling campaign against graft that has felled many political foes.

The capability to innovate will determine the future of the Chinese armed forces, he said, briefing lawmakers from the military.

China has poured funds in recent years into developing a high-tech weapons manufacturing industry. It has found buyers among cost-conscious countries that are unable to buy arms from the United States and its allies.

China's military rise has unnerved Asian countries, including Japan, Vietnam and the Philippines, with which Beijing has maritime territorial disputes.

Xi is seeking to drag the People's Liberation Army, the world's largest armed forces, into the modern age, cutting 300,000 jobs and revamping its Cold War-era command structure.

China said earlier this month it would hike military spending by 7.6 percent this year, the lowest increase in six years, amid a slowing economy.

China, the world's second-largest economy, is increasingly exposed to international crises like the Middle East but has little experience at dealing with them, unlike established powers like the United States and Russia.

Publicité ciblée sur le web et les réseaux sociaux Mise en garde pour les consommateurs
Wednesday, 16 March 2016
Byline: Lia Lévesque

Montréal - Le groupe Option consommateurs demande aux entreprises comme Google, Facebook, Microsoft et Yahoo de recueillir moins de renseignements personnels sur les utilisateurs. Et il invite ces derniers à mieux utiliser les outils à leur disposition pour ne pas divulguer ces précieux renseignements. Option consommateurs a dévoilé, mardi, une recherche sur ces entreprises qui offrent des services gratuits aux consommateurs, mais qui, en retour, se servent des renseignements ainsi obtenus pour les pister, connaître leurs goûts, leurs habitudes, et les soumettre à de la publicité ciblée. Or, ces techniques peuvent aller très loin, a affirmé l'auteur de la recherche, Me Alexandre Plourde, au cours d'une rencontre avec la presse. À l'aide d'algorithmes automatisés, elles peuvent même identifier certains mots glissés dans la correspondance des consommateurs, affirme-t-il.

Après avoir fait ces constatations, Option consommateurs ne va pas jusqu'à demander l'adoption de lois et règles plus sévères. L'organisme demande néanmoins que les règles actuelles soient mieux connues des consommateurs et appliquées.

Il faudrait que les agences qui en surveillent le respect, comme le Commissariat à la protection de la vie privée du Canada ou la Commission d'accès à l'information, disposent de plus de moyens, a plaidé Me Plourde. Mais les consommateurs aussi doivent faire une prise de conscience.

« Les consommateurs ont du pouvoir là-dedans. On a déjà vu beaucoup de réseaux sociaux ou des entreprises technologiques qui sont passées, du jour au lendemain, d'être très populaires à perdre presque tous leurs utilisateurs et à disparaître très rapidement du paysage. Nous, ce sur quoi on mise essentiellement, c'est sur l'action des consommateurs. On croit que si les consommateurs savaient ce qu'ils révèlent sur leur vie privée, ils insisteraient davantage sur le respect de leur vie privée », a affirmé Me Plourde.

Il suggère quelques outils, comme le recours au mécanisme « Do not track », qui est censé être inclus dans la plupart des navigateurs.

L'avocat spécialisé en droit de la consommation indique aussi que le consommateur peut aller sur le site de Google pour voir les étiquettes qui lui ont été accolées - comme « aime le jogging » ou « aime le rock » - et retirer les étiquettes qu'il n'aime pas. De même, Me Plourde informe les consommateurs du fait qu'il existe un moteur de recherche appelé duckduckgo, « et c'est justement ça, son avantage comparatif : ne pas recueillir de renseignements personnels sur les consommateurs ».

Me Plourde rappelle qu'ultimement, les consommateurs peuvent aussi se plaindre, d'abord auprès des entreprises visées, ensuite auprès du Commissariat à la protection de la vie privée du Canada et de la Commission d'accès à l'information.

Carleton professor fights cyberattacks from Orléans
Wednesday, 16 March 2016
Byline: Kate Porter

Behind locked doors at a municipal building in the Ottawa suburb of Orléans, Tony Bailetti is quietly working on a plan to turn Canada into a global powerhouse for fighting cyberattacks.
The professor is known for nurturing more than 200 companies in his job straddling Carleton University's business and engineering departments.

These days, he jokes that he practically sleeps at VENUS Cybersecurity, a non-profit hub he created in a former town council office.

Bailetti is preoccupied by much more than malicious software nabbing credit card data from retailers like Target.

His eye is on big intrusions -- the idea that cyberattackers could take down power grids and water systems, or remotely take over control of cars from their drivers.

And his goal is to have Canada "playing with the bigger boys and girls" to tacke the global problem of cybersecurity in fewer than five years.

"The people who have investments in critical infrastructure -- we will be the go-to guys," Bailetti said.

'Bell-Northern Research of cybersecurity'

VENUS Cybersecurity was announced to great fanfare at a press conference at Ottawa's City Hall in November 2013.

Politicians boasted that VENUS would create much needed jobs in the eastern suburb -- and Bailetti has done that, though these are no run-of- the-mill jobs.

He has assembled some two dozen bright minds, many who have PhDs or are graduates of Carleton's technology innovation management program. Some do research and development. Others conduct tests offsite.

They're funded partly by grants, and increasingly by contracts they do for companies, government departments and universities.

"I describe VENUS as being the Bell Northern Research of cyber security," Bailetti said, likening thithe venture to the cutting-edge research labs at Nortel Networks' predecessor, almost fabled among Ottawa engineers, where he once worked.

The key for Bailetti, and something he champions in his teaching at Carleton, is that the technology must be practical and solve real problems.

Finding attack brings 'rush'

Alongside a research team, Bailetti gives entrepreneurs space to toil away on cybersecurity startups.

Bailetti may talk about global domination one moment, but the next he's self- deprecating and then directs your attention to entrepreneurs he thinks are doing great things.

Take Sherif Koussa, whose company Software Secured is busy hacking into applications to spot weak computer codes for small businesses.

"When I find an attack and notify a client, I get a kind of rush that I prevented something," Koussa said.

Then, there's Arthur Low, who once designed microchips for Nortel and IBM, and holds patents in cryptography.

Low now thinks he's hit on a way to help computers from being contaminated, especially for companies with employees who travel or work on outside computers.

Low's technology doesn't involve scanning for viruses. Instead, he's created an operating system that he likens to a disposable cup that can be thrown away to prevent the spread of germs.

Low thinks for Canada to become the cybersecurity powerhouse Bailetti predicts, Canada needs more visionaries who will spend money on technology and products like his. And, Low is not banking on government.

"In the end, this has to connect with people with a profit agenda. And the only way that's to happen is you have to help them make money, so our goal is to help other people make money with these solutions,"said Low, who is about to start field trials with an early adopter.

"You just need to have one initial success to prove it works -- and then it's going to catch on like fire."

CBC News
Government tech support putting RCMP, public safety at risk, documents reveal
Wednesday, 16 March 2016

Byline: Alison Crawford

Internal RCMP reports and emails obtained by CBC News show that Shared Services Canada's takeover of the Mounties' tech support has been a costly disaster that has jeopardized court cases and investigations while putting the safety of officers and members of the public at risk.
The documents received through access to information include correspondence from RCMP Commissioner Bob Paulson in which he refused to give SSC any more control over the Mounties' information technologies.

SSC is the federal department created in 2012 to take over the delivery of email, data centre and network services for 43 government agencies, including the RCMP.

By all internal accounts, its work on behalf of the RCMP has been a fiasco.

At a Sept. 25, 2015 meeting between Paulson and SSC president Liseanne Forand, the commissioner highlighted a number of examples where the department's mistakes and oversights have affected policing operations, including:

-On October 22, 2014 while the terrorist attack on Parliament Hill was taking place -- without consulting the RCMP or understanding the risks involved -- SSC increased bandwidth to receive evidence gathered by the public by shutting down the Disaster Recovery site

-Mission B.C.'s phone system is in need of replacement. The concern was originally raised with SSC in January 2015, with no progress to date. The situation has come to the point that there is a public safety risk because the phone line service is unstable, affecting 911 calls and dispatch

-On September 18, 2014 a server failed in a Dorchester, Que. data centre, resulted in some corruption of data needed for an investigative disclosure package. SSC had been advised on Nov. 7, 2012, and through several follow-up inquiries, that the equipment was past the end of its life but did not replace it

-SSC has lapsed contracts concerning security protection of networks and servers

Overall, the documents raise serious concerns about three major areas -- safety and security, loss of service or information, and cost to taxpayers.

Unit compromised

A January 2014 memo to Paulson from the RCMP's civilian IT employees highlighted dozens of concerns.

In December 2013, Mounties reported having to spend almost $1 million to sustain systems critical to two special units, including one that investigates online child sex assaults, because SSC "is neither willing nor able to purchase" the equipment required.

"There is simply no appetite to fix any systems until they have failed. When this happens, it will be too late. RCMP will lose court cases," the group of employees told Paulson.

Another system failure occurred when SSC could not renew Hewlett Packard warranties

"It cost approximately $20,000 to have HP come in to attempt repairs and system recovery ... RCMP was left with a broken system to fix and major data loss which may impact court cases."

Risk to front-line officers

Even more money was wasted when SSC had to pay $10,000 in interest after it didn't pay Northwestel -- the force's phone and internet provider in the territories and northern B.C. -- for months on end.

"Shared Services has not been paying their bills. Vendors have threatened and have cut-off service to various units such as Shaw Cable, disrupting operations to the RCMP. There is risk to the front line," the employees warned Paulson.

Several more egregious examples of ineptitude include how SSC couldn't get the newly opened Berens River RCMP detachment any kind of telecommunications service for two years.

"In desperation a regular member in Berens River ordered satellite service so he could do his work ... and paid for it out of his own pocket on his personal credit card. Shared Services then declined to pay for his out-of-pocket expense," RCMP supervisor Rick Lippens told senior management in an email.

Members of the RCMP repeatedly expressed frustration that SSC treats the Mounties as though they work at a regular government department working 9 a.m. to 5 p.m. in downtown Ottawa.

"They've extended our evergreening cycle from three years to six. That's just asking for trouble. It's one thing if a router goes down in Ottawa and they can walk over and replace it but we need to deal with very remote locations that could be down for days until we can get in there by plane, boat or ice road to deal with a failure," a group of employees wrote in frustration to Paulson.

No one from the RCMP or Shared Services Canada responded to our requests for comment on the documents.

However, in Paulson's Nov. 25, 2014 letter to Forand, the commissioner wrote that the department's proposal to manage even more of the RCMP's information technologies "pose unacceptable risks to public safety, protection of RCMP members and policing across Canada."

Paulson went on to explain how he is compelled to exercise his authority to refuse the Mounties' participation in the next phase of Shared Services Canada.

Toronto Star
Brison envisions one federal online site
Wednesday, 16 March 2016
Byline: Alex Boutilier

OTTAWA -- Treasury Board President Scott Brison says he can see a future where all levels of government provide services to Canadians through a single online portal.
Granted, Brison says, he's thinking in the very long term. But with most Canadians not thinking long and hard about the division of responsibilities between different levels of government, why not give them one-stop shopping?

"When Canadians have an issue with government, they're not necessarily aware of whether the issue is related to federal or provincial government, (or) in some cases municipal," Brison told the Star in an interview last week.

"Long term, we should be thinking not just to work such that all the departments and agencies of the federal government are accessible through a single portal approach . . . but, in time, once we get that right, I think there will be opportunities to work with other levels of government as well."

The new Liberal government has promised to put in place a single point of online access for all federal government services, as well as to create a website where Canadians can securely access all personal information the government has on them.

Brison, who is responsible making those commitments a reality, acknowledged there's work to be done. The Star reported on Tuesday that 77 per cent of all federal government services still require pen and paper forms filled out in person or via snail mail.

But even after getting the federal government fully online, Carleton professor Amanda Clarke said there would be serious barriers to bringing the provinces, territories, and municipalities under one system.

"That would be the dream, for sure. I appreciate his ambition," said Clarke, who studies digital government and public administration.

"(But) how would you brand that website? . . . Every jurisdiction now has created, with higher or lower levels of sophistication, some kind of colour scheme and organization and logos that they use. And these (choices) are also politically powerful, as well."

Clarke said there would be definite advantages to consolidating the services of multiple governments under one roof - such as being able to pool investment in web design and functionality, or scaling responses to policy issues.

The data harvested on such a site would be invaluable, as well. Looking at who is requesting what services in different regions would be a government data geek's dream, and could inform policy responses from all levels of government.

But Clarke said as governments are increasingly "becoming their websites" - that is, moving to a point where the website will be the primary interaction between citizens and government - all the traditional arguments over jurisdiction and responsibility apply.

"All the challenges that are always at play when you talk about cross-jurisdictional collaboration or co-ordination in Canada would come in play when you were dealing with websites," Clarke said.

Despite the challenges, Clarke said Canada is actually starting from a pretty good position.

The federal government's web presence was largely centralized under the previous Conservative government, avoiding the balkanized situation giving countries like the U.K. trouble.

To build from that starting point, Clarke suggested the government could create a team loosely based on the model of large U.S. tech companies to provide a more agile approach to web development.

Wall Street Journal
Apple's Encryption Puzzle
Wednesday, 16 March 2016
Byline: Daisuke Wakabayashi

New York - Apple Inc. has refused federal requests to help unlock the phone of San Bernardino gunman Syed Rizwan Farook. But it turned over data from his phone that Mr. Farook had backed up on the company's iCloud service.
Soon, that might not be so simple. Apple is working to bolster its encryption so that it won't be able to decode user information stored in iCloud, according to people familiar with the matter.

But Apple executives are wrestling with how to strengthen iCloud encryption without inconveniencing users. Apple prides itself on creating intuitive, easy-to- use software, and some in the company worry about adding complexity. If an iCloud user forgets a password, for example, and Apple doesn't have the keys, the user might lose access to photos and other important data.

If Apple keeps a copy of the key, the copy be "can be compromised or the service can be compelled to turn it over," said Window Snyder, a former Apple security and privacy manager who is now chief security officer at Fastly, a content-delivery network.

The issue is similar in the physical world: tighter security means more hurdles, such as more locks or codes for a home alarm system.

As a result, the timing of any move to strengthen encryption is uncertain. The Financial Times earlier reported on Apple's plans to encrypt iCloud backups.

Separately, in a new court filing Tuesday in its iPhone standoff with the government, Apple said it "has never built a backdoor" or "made data stored on the iPhone or iCloud more technically accessible to any country's government."

Apple's iCloud is a set of Internet services that allow users to store and sync data across their devices. A photo taken on an iPhone, for example, can appear automatically on a Mac or iPad with the same iCloud account.

When connected to Wi-Fi, iCloud's backup service automatically takes a daily snapshot of a phone's contents. Customers can use backups to transfer photos, iMessages, health data, and other information from an old iPhone when they buy a new one.

Apple already stores some data that it can't access or read, in a feature called iCloud Keychain, where a user can store passwords and credit- card information.

Another device associated with the same iCloud account can give permission to a new phone to access Keychain. But not everyone has more than one Apple device. A user also could create a security code to regain access, but if the user enters an incorrect code 10 times, Apple removes the Keychain account from its servers.

An Apple spokeswoman pointed to comments by Craig Federighi, the company's senior vice president of software engineering, in a March 6 opinion piece in the Washington Post. "Security is an endless race -- one that you can lead but never decisively win," Mr. Federighi wrote. "Yesterday's best defenses cannot fend off the attacks of today or tomorrow."

To get a sense of the challenge, consider software maker Box Inc., which provides a way for businesses to store data on remote computers in the "cloud." It took Box three years to design a system to encrypt corporate information so that it couldn't access the data, without hindering popular features such as document preview, or forcing users to download additional apps.

Box Keysafe works much like a bank safe- deposit box, with one key held by the owner and one key held by Box. Without both keys, the data can't be decrypted so Box alone can't access the information. Box Chief Executive Aaron Levie said he can foresee consumers seeking similar protection. "The cloud is going more and more in this direction," he said.

Any steps Apple takes to close off access to iCloud backups are likely to further antagonize law-enforcement authorities, for which the backups can be a trove of useful data.

"No doubt it will," said Robert Cattanach, a partner at law firm Dorsey & Whitney LLP and a former Justice Department attorney. "It could present a fairly significant burden to law enforcement."

Apple has fought the Federal Bureau of Investigation's requests to help unlock Mr. Farook's iPhone, which was last backed up on Oct. 19, about six weeks before he and his wife killed 14 people in a Dec. 2 terrorist attack. Apple says the device is encrypted in a way that leaves Apple itself without access to the data, the result of a change it made in its iPhone software in 2014.

In court documents, the FBI has said that the iCloud files revealed that Mr. Farook communicated with some people killed in the attack. In a declaration filed in the case, Christopher Pluhar, an FBI supervisory special agent in the San Bernardino investigation, said iCloud backups could provide "valuable evidence," but offered no specifics of what investigators learned from Mr. Farook's data.

The phone could contain information about Mr. Farook's movements and communications after its last backup.

Washington Free Beacon
China, Russia Planning Space Attacks on U.S. Satellites
Wednesday, 16 March 2016
Byline: Bill Gertz

Washington - China and Russia are preparing to attack and disrupt critical U.S. military and intelligence satellites in a future conflict with crippling space missile, maneuvering satellite, and laser attacks, senior Pentagon and intelligence officials told Congress on Tuesday.
Air Force Gen. John Hyten, commander of the Air Force Space Command, said the threat to U.S. space systems has reached a new tipping point, and after years of post-Cold War stagnation foreign states are focused on curbing U.S. space systems.

"Adversaries are developing kinetic, directed-energy, and cyber tools to deny, degrade, and destroy our space capabilities," Hyten said in a prepared statement for a hearing of the House Armed Service strategic forces subcommittee.

"They understand our reliance on space, and they understand the competitive advantage we derive from space. The need for vigilance has never been greater," the four-star general said.

Hyten said U.S. Global Positioning System satellites remain vulnerable to attack or jamming. The satellites' extremely accurate time-keeping feature is even more critical to U.S. guided weapons than their ability to provide navigation guidance, he said.

Disrupting the satellites time capabilities would degrade the military's ability to conduct precision strike operations used in most weapons systems today.

Hyten said a new joint military-intelligence command center is helping to monitor space threats, such as anti-satellite missile launches, covert killer robot satellites, and ground-fired lasers that can blind or disrupt satellites. The unit is called the Joint Interagency Combined Space Operations Center, located at Schriever Air Force Base, Colorado.

The Space Command also is creating 39 cyber mission teams that will be used for defensive and offensive cyber operations involving space systems.

Lt. Gen. David Buck, commander of Joint Functional Component for Space, a U.S. Strategic Command unit, testified along with Hyten that China and Russia pose the most serious threats to space systems.

"Simply stated, there isn't a single aspect of our space architecture, to include the ground architecture, that isn't at risk," Buck said.

"Russia views U.S. dependency on space as an exploitable vulnerability and they are taking deliberate actions to strengthen their counter-space capabilities," he said.

China in December created its first dedicated space warfare and cyber warfare unit, called the Strategic Support Forces, for concentrating their "space, electronic, and network warfare capabilities," Buck said.

"China is developing, and has demonstrated, a wide range of counter-space technologies to include direct-ascent, kinetic-kill vehicles, co-orbital technologies that can disable or destroy a satellite, terrestrially-based communications jammers, and lasers that can blind or disable satellites," Buck said.

"Moreover, they continue to modernize their space programs to support near-real-time tracking of objects, command and control of deployed forces, and long-range precision strikes capabilities," the three-star general said.

Douglas Loverro, deputy assistant defense secretary for space policy, also warned about growing threats to satellites and outlined U.S. plans to deter future attacks.

Loverro said the United States does not want a war in space. "But let me be clear about our intent--we will be ready," he said.

None of the five Pentagon and intelligence officials who took part in the budget hearing for military space efforts mentioned any U.S. plans or programs to develop anti-satellite missiles and other space weapons for use against Chinese or Russian space systems. The subcommittee, however, held a closed-door session after the public hearing.

A modified U.S. missile defense interceptor, the SM-3, was used in 2008 to shoot down a falling U.S. satellites in a demonstration of the country's undeclared anti-satellite warfare capability.

Loverro suggested U.S. defense and deterrence of space attacks could involve counter attacks, possibly on the ground or in cyber space. But he provided no specifics.

"Today our adversaries perceive that space is a weak-link in our deterrence calculus," Loverro said. "Our strategy is to strengthen that link, to assure it never breaks, and to disabuse our adversaries of the idea that our space capabilities make tempting targets."

Many of the most important navigation, communications, and intelligence satellites were designed during the Cold War for use in nuclear war and thus incorporate hardening against electronic attacks, Loverro said.

For conventional military conflict, however, adversaries today view attacks on U.S. satellites as a way to blunt a conventional military response what Loverro called the "chink in the conventional armor of the United States."

"In this topsy-turvy state, attacks on space forces may even become the opening gambit of an anti-access/area-denial strategy in a regional conflict wherein an adversary seeks to forestall or preclude a U.S. military response," he said. "Chinese military strategists began writing about the targeting of space assets as a 'tempting and most irresistible choice' in the late 1990s, and the People's Liberation Army has been pursuing the necessary capabilities ever since," he said.

Rather than threatening foreign states' satellites, Loverro said deterrence against foreign nations' space attacks is based on defending against missile strikes or other attacks and making sure satellite operations will not be disrupted in war.

That would be carried out through partnering with the growing commercial space sector that is expected to deploy hundreds of new satellites in the coming years that could be used as back up systems for the Pentagon in a conflict.

Deterrence also will be based on increasing foreign partnerships with allied nations in gathering intelligence on space threats and other cooperation.

A space defense "offset" strategy will seek to reduce the advantage of using relatively low cost of missiles, small satellites, or cyber forces to attack U.S. satellites, Loverro said.

"An advanced U.S. satellite might cost upwards of $1 billion; missiles that could destroy such a satellite cost a few percent of that sum; co-orbital microsatellites cost even less; and lasers that might blind or damage satellites have an unlimited magazine with almost zero cost per shot," Loverro said.

Deploying large numbers of low-cost satellites will not offset those advantages, he said.

Instead, Loverro offered vague plans for countering the threat. "A space offset strategy must employ a diverse set of resilience measures that complicate the technical, political, and force structure calculus of our adversaries, by arraying a complex set of responses, with few overlapping vulnerabilities and a combination of known and ambiguous elements," he said.

Frank Calvelli, deputy director of the National Reconnaissance Office, the spy agency that builds and operates strategic intelligence and reconnaissance satellites, said a resurgent Russia and aggressive China are among several current national security threats.

Calvelli revealed that the agency in October launched a new satellite that carried 13 smaller "CubeSats."

"The NRO sponsored nine of the CubeSats while the National Aeronautics and Space Administration sponsored the remaining four," Calvelli said.

Among the missions of the CubeSats are software-defined radios "to provide beyond-line-of-sight communication for disadvantaged users in remote locations, and technology pathfinders to demonstrate tracking technologies, optical communications, and laser communication," he said.

Four advanced intelligence-gathering satellites will be launched this year to support military operations and intelligence analysis and decision-making.

Calvelli also said space threats are prompting the Reconnaissance Office to develop "better and faster" systems in space and on the ground, along with better overall "resiliency"-- a term used by the military to signify an ability to operate during high- intensity warfare.

The agency is investing substantial sums in bolstering defenses for space and ground systems to make them more survivable during space war.

"We are more focused on survivability and resiliency from an enterprise perspective than we have ever been and we have made significant investments to that end," he said.

The agency also is "improving the persistence of our space-based systems, providing greater 'time on target' to observe and characterize activities, and the potential relationship between activities, and to hold even small, mobile targets at risk," Calvelli said.

It also is upgrading its ground stations, which are used to control and communicate with orbiting satellites, including an artificial intelligence system called "Sentient."

"Sentient--a 'thinking' system that allows automated, multi-intelligence tipping and cueing at machine speeds-- is just one of those capabilities," Calvelli said.

New ground stations also are being deployed that will empower "users of all types with the capabilities to receive, process, and generate tailored, timely, highly- assured, and actionable intelligence," he said.

The comments were a rare public discussion of the activities of one of the most secret U.S. intelligence agencies.

Dyke D. Weatherington, director of unmanned warfare and intelligence, surveillance, and reconnaissance at the Pentagon, said eight national security satellites were launched in 2015, including tactical and strategic communications, and navigation, position, and timing satellites.

Weatherington said the United States maintains a strategy advantage in space system but warned that is changing. "The rapid evolution and expansion of threats to our space capabilities in every orbit regime has highlighted the converse: an asymmetric disadvantage due to the inherent susceptibilities and increasing vulnerabilities of these systems," he said.

While space threats are increasing, "our abilities have lagged to protect our own use of space and operate through the effects of adversary threats," Weatherington said.

The Pentagon currently has 19 military- capable GPS satellites on orbit and a new generation of GPS satellites is being developed that will be produce signals three times stronger than current system to be able to overcome electronic jamming, he said.

The officials at the hearing also discussed plans to transition from the sole reliance on the use of Russian-made RD-180 rocket engines to launch national security satellites.

A new U.S. made engine, however, will not be fully developed until 2022 or 2023.

The Hill
DHS cyber threat sharing program review shows privacy risks
Tuesday, 15 March 2016
Byline: Katie Bo Williams

Washington - A Department of Homeland Security review of a cyberthreat information-sharing program has revealed some inadequacies in how the system protects privacy.
Despite safeguards to prevent personally- identifiable information from being transmitted, "residual privacy risk that these processes may not always identify and remove unrelated [personal information], thereby disseminating more [information] than is directly related to the cybersecurity threat," the report reads.

The automated system, required under a major cybersecurity bill signed into law in December, is intended to allow private companies to share threat indicators with the federal government without impacting privacy by stripping personal information out of the shared data.

The so-called Cybersecurity Information Sharing Act placed the system under the umbrella of the Department of Homeland Security, widely seen as the agency with the best privacy protections in the federal government.

The bill requires any personally- identifiable information that is shared through the program -- which is voluntary -- to be directly related to a cybersecurity threat.

But whether the government can be trusted to adequately protect the information it receives and shares was a major sticking point in the passage of the bill.

Some privacy advocates argued vehemently that breaches like the one discovered last summer at the Office of Personnel Management -- which exposed over 20 million people -- demonstrate the risks of providing such information to a federal agency.

The system, known as the Automated Indicator Sharing initiative, is ultimately intended to be fully automated, although right now some data still requires human attention.

If a field contains information that the system doesn't recognize, it will flag it for a human analyst who can determine whether it contains personal information before it is shared.

New York Times
Justice Dept. and Apple Trade Barbs Over Law
Wednesday, 16 March 2016
Byline: Katie Benner, Eric Lichtblau

San Francisco - Apple on Tuesday emphasized its opposition to a court order requiring it to help unlock an iPhone for law enforcement purposes, saying in a new legal brief that the government's "methods for achieving its objectives are contrary to the rule of law, the democratic process and the rights of the American people."
The company's argument quickly drew a response from the Justice Department, which upbraided Apple for trying to stand above the law. "The Constitution and the three branches of the federal government should be entrusted to strike the balance between each citizen's right to privacy," a Justice Department spokeswoman, Emily Pierce, said in a statement. "The Constitution and the laws of the United States do not vest that power in a single corporation."

The latest volleys between Apple and the Justice Department represent a final cementing of positions in a case that has pitted the world's largest company against the government, which wants to extract data

from an iPhone used by a gunman in the San Bernardino, Calif., terrorist attack last December. Apple has refused to comply with the order and its filing on Tuesday was the last before a crucial hearing in the case, which is scheduled for March 22 before Magistrate Judge Sheri Pym of the Federal District Court for the Central District of California.

The case has set off a fierce debate over privacy and security, with heated arguments between Apple and the government. Apple has contended that the court order could have grave consequences for digital security and privacy. The Justice Department has said Apple's inability to get into its smartphones has created a system tailor-made for criminals.

For the last few weeks, the two sides have stumped for their positions before Congress and in the court of public opinion. Each side has asked Congress to decide under what circumstances the government may see private customer data. President Obama said last week that law enforcement authorities must be legally able to collect information from smartphones and other electronic devices.

In its legal filing Tuesday, Apple tried to move the debate from an intense and personal tone and refocus attention on what it said it sees as the matter at hand, a fight over civil liberties and data privacy. The issue cannot be weighed without taking into account the larger national debate over data privacy concerns, Apple said.

"The Justice Department and F.B.I. argue that this court must decide this issue in a vacuum," the company said in its brief. "The court not only can consider this broader context, it must do so."

Apple's filing on Tuesday also reiterated points the company made last month when it asked the court to drop its order, contending that the request would "inflict significant harm -- to civil liberties, society and national security -- and would pre-empt decisions that should be left to the will of the people through laws passed by Congress and signed by the president."

The filing emphasized the constitutional arguments that Apple has made, specifically that the court order violates the company's constitutional right to free speech and subjects it to "arbitrary deprivation" of its liberty by the government.

Apple also repeated its argument that the government was overstepping its bounds by seeking to force the company to break into the iPhone using a statute called the All Writs Act, which dates to 1789. Apple has said the government is interpreting the law too broadly, and re- emphasized that point on Tuesday.

"The All Writs Act cannot be stretched to fit this case," Apple said.

The filing was less fiery than the brief filed in the case last Thursday by the Justice Department, which suggested Apple was refusing to comply with the government while secretly conducting a different,

special relationship with China. Apple's general counsel, Bruce Sewell, has said that the accusations were baseless and cited unnamed sources.

Apple's brief on Tuesday, while less angry in tone, did seek to put to rest what its lawyers called the government's most inflammatory claims about the company's relationship with China and its use of privacy as a marketing tool. To buttress its defense, Apple cited declarations from Craig Federighi, its senior vice president for software engineering, and Robert Ferrini, its senior director for worldwide advertising and planning.

"Apple uses the same security protocols everywhere in the world," Mr. Federighi said in his declaration filed Tuesday. "Apple has never made user data, whether stored on the iPhone or in iCloud, more technologically accessible to any country's government. We believe any such access is too dangerous to allow."

Mr. Ferrini also disputed the government's contention that Apple was using privacy as a marketing tool. Of Apple's approximately 1,793 advertisements worldwide, he said, "not a single one has ever advertised or promoted the ability of Apple's software to block law enforcement requests for access to the contents of Apple devices."

Any decision by Judge Pym is likely to be appealed and could reach the Supreme Court, which has issued a mixed set of rulings in recent years on the scope of the government's powers to collect evidence.

"We look forward to responding to Apple's arguments before the court next week," said Ms. Pierce of the Justice Department.

Washington Post
Conservative group plans to depose seven over Clinton emails
Wednesday, 16 March 2016
Byline: Spencer S. Hsu

Washington - A conservative legal advocacy group submitted plans Tuesday to question under oath seven current and former top State Department officials and aides to Democratic presidential contender Hillary Clinton - but not Clinton herself at this point - about her use of a private email server when she was secretary of state.
Judicial Watch said its deposition plan includes Cheryl D. Mills, who was Clinton's chief of staff at State; Huma Abedin, a top aide who served as Mills's deputy and who now is vice chairman of Clinton's presidential campaign; and Bryan Pagliano, a Clinton staff member during her 2008 presidential campaign who helped set up the private server.

U.S. District Judge Emmet G. Sullivan of Washington granted a request on Feb. 23 for legal discovery by Judicial Watch, which seeks to determine whether Clinton's email arrangement thwarted federal open-

records laws. After his order, Sullivan directed Judicial Watch to file a detailed plan about how it intended to proceed.

The submitted plan can be contested by lawyers from the Justice and State departments and is subject to approval by Sullivan.

Sullivan set an April 12 deadline for filings by the two sides, meaning that questioning of key Clinton aides could take place as she tries to secure the Democratic nomination and turn to the November general election.

"Based on information learned during discovery, the deposition of Mrs. Clinton may be necessary," wrote Michael Bekesha, counsel for Judicial Watch. "If Plaintiff believes Mrs. Clinton's testimony is required, it will request permission from the Court at the appropriate time."

Judicial Watch also said it wants to question Undersecretary for Management Patrick F. Kennedy; Stephen D. Mull, executive secretary from June 2009 to October 2012; Lewis A. Lukens, executive director of the executive secretariat from 2008 to 2011; and Donald R. Reid, senior coordinator for security infrastructure in the bureau of diplomatic security.

A Justice Department spokesman declined to comment.

Clinton campaign spokesman Brian Fallon said, "This is the same right-wing organization that has been repeatedly attacking the Clintons without success since the 1990s, and they are clearly going to pull out all the stops to try to hurt the secretary's presidential campaign."

The Judicial Watch lawsuit came over a May 2013 request for information about Abedin's employment arrangement. For six months in 2012, Abedin was employed simultaneously by the State Department, the Clinton Foundation, Clinton's personal office and a private consulting firm connected to the Clintons.

In his February ruling, Sullivan criticized the government for what he called "a constant drip" of piecemeal disclosures and a "staggering" amount of resources devoted to a situation in which private counsel for former federal employees - Clinton and Abedin - decided what government records to disclose.

Sullivan said there was sufficient basis to show that senior department officials knew of Clinton's server arrangement from the time she took over at State in January 2009, citing an email chain among Kennedy, Lukens, Mills and others regarding setting up a computer in Clinton's office so that she could check her "off network" email.

Sullivan also noted email traffic among Abedin, Mull, Mills, Kennedy and others discussing communication problems, in which Mull suggested that Clinton be issued a State Department BlackBerry that would protect her identity but be subject to public-records requests.

"How on earth can the Court conclude that there's not, at a minimum, a reasonable suspicion of bad faith regarding the State Department's response to this FOIA request?" Sullivan said.

Judicial Watch said it intended to seek answers about department officials' creation, maintenance, support or awareness of Clinton's email system; any instructions given to department workers about communicating by email with Clinton and Abedin; and any inquiries into or discussions about disclosing Clinton's use of the system.

The group also said it would ask the department to identify who handled requests for email records from the secretary's office, inventoried Clinton's and Abedin's information, or used an account on Clinton's email server for official business.

Millions menaced as ransomware-smuggling ads pollute top websites
Wednesday, 16 March 2016
Byline: John Leyden

London - Top-flight US online publishers are serving up adverts that attempt to install ransomware and other malware on victims' PCs.
Websites visited by millions of people daily - msn.com, nytimes.com, aol.com, nfl.com, theweathernetwork.com, thehill.com, zerohedge.com and more - are accidentally pushing out booby-trapped adverts via ad networks, warn infosec researchers.

The adverts are built from exploit kits, which as the name suggests, are toolkits of code that exploit security vulnerabilities in browsers and plugins to gain control of computers.

Jérôme Segura, a senior security researcher at Malwarebytes, said that the malvertising campaign began slowly before ratcheting up into top gear on Sunday.

"The first couple of days before this campaign went big, we observed a few hits on smaller publishers that were pushing the RIG exploit kit," Segura blogged. "On Sunday, when the attack really expanded, the Angler exploit kit was then used."

The Angler EK exploits a recently patched Silverlight vulnerability as well as more standard Flash and JavaScript vulnerabilities in order to push malware onto the Windows PCs of surfers served with tainted ads.

Trend Micro reported on the same attack on Monday. The exploit kit downloads a variant of the Bedep backdoor which, in turn, drops a trojan, according to Trend Micro, which reckons "tens of thousands of users" have been affected by the attack.

"It's important to note that while these popular sites are involved in the infection process they are, much like infected clients, victim of malvertising," blogged Trustwave's SpiderLabs Research. "The only 'crime' here is being popular and having high volumes of traffic going through their sites daily."

SpiderLabs has de-obfuscated the malware's code, and found that it checks to see if any antivirus and security products are installed, and if not: it pulls in Angler using a HTML iframe.

Patching regularly, uninstalling Silverlight or setting plugins such as Flash to click-to-play, will defend against attacks from dodgy banner adverts.

London Daily Telegraph
Telecoms bosses falling behind on cyber security, economists say
Tuesday, 15 March 2016
Byline: Kate Palmer

London - Telecoms companies are the most vulnerable businesses in Britain to cyber attacks, yet spend the least on defending themselves against hackers, according to an industry-wide survey.
Mobile and broadband providers were found to be most at risk of being attacked by hackers because they hold highly-prized customer information, according to the study from the Centre for Economic and Business Research (CEBR).

Economists at the CEBR modelled how a real cyber attack would affect a cross-section of the British economy, including the telecoms, utilities, retail, banking and insurance sectors. They found that telecoms companies were the most vulnerable due to the nature of sensitive information stored, the value of this data and low levels of investment in cyber security.

More than half of telecoms bosses who took part in the survey believed their company would experience a "significant breach" within a year's time.

"Britain's boardrooms are struggling to get a handle on cyber security issues," said Andrew Rogoyski, head of cyber security at the CGI, who warned there would be more breaches unless investment increased.

"Bosses know it is a risk but are uncertain in their approach, often failing to prioritise spending on cyber security."

However, three-quarters of telecoms boards said they now planned to increase spending on cyber security experts, compared with just 7pc of boards in the lower-risk retail sector.

And high-profile hacks, including the TalkTalk breach last year, have prompted some 80pc of all businesses surveyed to step up their cyber security, although just half of had crisis management plans in place in the event of a data breach, the report found.

British companies typically hold £52.5m worth of sensitive information, including customers' financial details and commercially- sensitive intellectual property. Banks hold the most valuable details, roughly £65m per financial institution, according to the CEBR.

Economists at the CEBR estimate that the total cost of a serious data breach to a business over one year is £1.2m on average. That figure is roughly in line with recent Government estimates that security breaches would cost companies £1.46m, revised up from £600,000 in 2014.

Vodafone, one of the world's biggest telecoms firms, has set up its own security arm. From today, the UK- based company will begin selling cyber technology developed with BAE systems to business customers, including 80pc of FTSE 100-listed companies.

Vodafone's head of enterprise, Nick Jeffery, said: "Our customers know they face a wide range of cyber threats, many of which could materially impact their operations and brand."

The Guardian (London)
'Snooper's charter': Theresa May faces calls to improve bill to protect privacy
Wednesday, 16 March 2016
Byline: Multiple reporters

London - Theresa May is facing calls from senior Tories and the opposition to improve the investigatory powers bill to allay concerns about privacy.
In a debate for the second reading of the bill, Ken Clarke, the Conservative former home secretary, and Dominic Grieve, the Tory former attorney general, suggested there could be improvements to the new laws that overhaul the state's surveillance powers.

The bill passed easily with 281 for and just 15 against, mostly comprising Liberal Democrats, while Labour and the SNP abstained. However, almost 50 Conservatives were absent, suggesting many may not be happy with the legislation as it currently stands. If the SNP and Labour had voted with the Lib Dems, it would have been comprehensively defeated.

Labour and the SNP abstained as they remain unconvinced about whether privacy is adequately protected, while the Liberal Democrats are going one step further and voting against the bill, which has been nicknamed "snooper's charter".

It will hand law enforcement agencies more access to people's internet connection records but also make sure judges oversee the granting of warrants for interception.

The home secretary said privacy was "hard-wired" into new controversial surveillance powers and they would not give security services generalised access to people's web browsing histories.

But Andy Burnham, the shadow home secretary, said he wanted to see a general presumption in favour of privacy along with at least six other improvements before the party could be persuaded to back the bill.

Clarke twice pressed May on whether judges should be given stronger powers to oversee interception of communications warrants.

As the bill is currently drafted, judges will be able to disagree with the home secretary's granting of a warrant on matters of process but not substance. "Questions of judgment and proportionality are the most important of all, that worry me most," Clarke said.

He said it was necessary to be "vigilant against some future administration abusing" the powers and pointed out that "all kinds of curious public bodies" would be able to get access to huge amounts of extra information. "I doubt the wisdom of that," he added.

Clarke said he was troubled that use of the powers could be justified on the wide-ranging grounds of "economic wellbeing" and "national security".

Grieve said he supported the bill as it was necessary but hoped ministers would accept it was "capable of further improvement" and he trusted that "during its passage, it performs the equally important role of being seen as an upholder of freedom and liberty".

Another to raise concerns was Stella Creasy, the Labour MP for Walthamstow, who said there was a "challenge in separating out contact and content" when people's internet connection records were tracked. "It's not the same as a phone record when you look at somebody's internet correspondence," she said.

However, May insisted there would be no access to people's web browsing histories and the bill would only allow tracing of their connections to the internet.

"It is absolutely possible, and we've been talking at length with the companies, to be able to separate in internet connection records (ICRs) for example, the device or website that a particular device has accessed and not then go into the content of whatever it is that has been looked at in relation to that," she said.

"It's very important that I make that clear because when it comes on to ICRs, we are not talking about looking at people's web browsing history, we are simply looking at that initial point of contact."

Before the debate,concerns about the legislation were raised by a number of groups including the internet provider industry body and a group of 200 lawyers.

The Internet Services Providers' Association said: Our members have significant concerns about the ambitious timetable of the bill. The prime minister himself argued at prime minister's questions that the investigatory powers bill is one of the most important bills this House will discuss.

"We recognise that three parliamentary committees have investigated the bill and made 123 recommendations. However, even our members are not yet fully clear about what the bill will mean for them. It is vital that parliament is provided with a sufficient amount of time to scrutinise the bill."

Renate Samson, chief executive of the civil liberties group Big Brother Watch, has said the drive to get the bill on the statute books by the end of the year was "too fast".

Senior lawyers raised concerns in a letter to the Guardian, saying it was fundamentally flawed because it destroyed privacy.

Among those who have signed the letter are the chair of the Bar Human Rights Committee, Kirsty Brimelow QC, Tom de la Mare QC, who has been a special advocate in security cases, Sir Stephen Sedley, who is a former court of appeal judge, Prof Sir Geoffrey Bindman QC, Hugh Southey QC, Michael Mansfield QC and Philippe Sands QC. Among academic lawyers, there are representatives of nearly 40 law schools in the UK.

Earlier, the Lib Dems called on Labour to do more to kill off the new surveillance laws, calling the decision to abstain from voting on the bill "gutless".

Burnham made it clear that Labour was prepared to vote down the legislation at a later stage and force the government to extend its transitional arrangements unless there were a string of changes.

But he said he was persuaded that the police and security services were losing the ability to catch criminals because of advances in technology and that the law needed to be updated to give a "clear legal framework" for access to some internet records.

The changes suggested by Labour include:

* A guarantee that the political activities of campaigners for justice, trade unionists and bereaved families will not be spied on using the new legislation.

* A clear definition of protecting "national security" and "economic wellbeing", which are the current conditions that justify the use of the new powers.

* A proportionate list of crimes that would justify allowing police and security services to access someone's internet connection record.

* Restrictions on the number of law enforcement agencies that would be allowed to use the legislation.

* Better protections for the confidential communications of "sensitive professions", such as MPs with constituents, lawyers with clients and journalists with sources.

* Approval for interception to be granted by judges on the basis of the evidence rather than merely whether the right process has been followed.

Burnham said: "The bill cannot be supported in its current form, but nor should we just oppose it because there is a deadline where the country needs new legislation.

"What I am saying very clearly to Theresa May is: here are very specific concerns that we have and unless you meet them we will not cooperate with getting this bill on the statute book by the end of the year. That is quite a significant statement."

The Daily Beast
Anti-ISIS-Propaganda Czar's Ninja War Plan: We Were Never Here
Tuesday, 15 March 2016
Byline: Kimberly Dozier

Washington - The Obama administration is launching a stealth anti- Islamic State messaging campaign, delivered by proxies and targeted to individual would-be extremists, the same way Amazon or Google sends you shopping suggestions based on your online browsing history.
At least that's the plan, revealed Monday, of new anti-ISIS message czar Michael Lumpkin, now that the White House has put the ink to the final legal measures establishing the Center for Global Engagement, which replaces previous less- than-successful efforts. The new executive order expands what Lumpkin can spend, who he can hire, and which parts of the U.S. government he can pull into the new campaign.

"I intend to do what we have done in special operations" to hunt ISIS terrorists, Lumpkin told The Daily Beast. "You need a network to defeat a network, so we're going to take a network approach to our messaging."

Those messages won't say "made in the U.S.A."

The new center "is not going to be focused on U.S. messages with a government stamp on them, but rather amplifying moderate credible voices in the region and throughout civil society," said Lisa Monaco, speaking at the Council on Foreign Relations last week. "Recognizing who is going to have the most legitimate voice and doing everything we can to lift that up and not have it be a U.S. message."

The idea is to give local nonprofits, regional leaders, or activists invisible financial support and technical expertise to make their videos or websites or radio programs look and sound professional--and let them own and distribute the message.

The center will also employ data analysts who will work with private industry partners to sift through the public information any user leaves on social media, to determine who might be leaning toward radicalism and message them directly--though how isn't clear yet.

"This is uncharted territory," Lumpkin said. "The U.S. government has not done this type of discrete scalpel-like messaging before."

Lumpkin is a former Navy SEAL who has political capital to spend after running special operations at the Pentagon since December 2013 and managing successful Joint Special Operations Command raids and the occasional drone strike in Syria and Libya, among other tasks.

He has been blunt in his critique of the previous messaging efforts by the much-maligned and now defunct Center for Strategic Counterterrorism Communications.

"Our response to their propaganda has been under-resourced, too slow, and too cautious," Lumpkin said in comments before the Global Special Operations Forces Symposium last month in Palm Harbor, Florida. "In the face of a nimble, adaptive opponent unconstrained by truth or ethics, our people are left swimming in bureaucracy, using outdated technology," he told the audience of current and former special operators.

Lumpkin has fought to double the center's budget from $10 million last year to more than $20 million requested for next year, and he says he'll ask for more after that.

The new center will work a bit like a Hollywood talent agent--finding other, more legitimate voices and making them the star. It will rely on embassies worldwide to reach out to local leaders, media professionals, and others to join the messaging network. The State Department will also help them develop the material.

Frustratingly for journalists and other advocates of government transparency, the center will seldom reveal who it is supporting, just as special operators don't reveal the forces they are training unless that nation chooses to reveal it.

"I don't want to burn our partners," Lumpkin said, while acknowledging that his office is already working with a handful of non-governmental agencies, some of which approached his office for help.

"We're helping guide them, hiring out content to be developed, giving them the contact," Lumpkin said. "They will put their own logos on it and call it their own, which I am very happy with, and then we can

help amplify it and hand it to other people to repurpose it, but they're kind of on their own once they've got it."

The Daily Beast tracked down two of the regional experts working with the State Department, who agreed to describe their cooperation on condition that they were not identified. They said they had approached the State Department for funding, and got a small grant, with the only stipulation being that they make whatever they produced available to the public.

That means these U.S.- funded programs will produce material that may travel the Web and be seen by American citizens--an issue Lumpkin acknowledges.

"Clearly at the State Department, we don't message U.S. citizens," Lumpkin said. That would be done by the new Homeland Security office to counter violent extremism, which is in a similarly embryonic stage.

But if a U.S. citizen comes across the material, it's the same as choosing to follow the State Department's anti- ISIS Twitter account, he added.

Then there's the delivery of the content. That's where the big data analysts come in. Lumpkin will be contracting private companies that crunch the public trail of information Internet users leave behind, just like they do for large retailers looking for new buyers.

His team has also met with social media companies to explore the parameters of their privacy agreements and hear how they police their sites for violent extremism.

It's a touchy subject at social media companies, in an era when so many firms were burned by the revelations of cooperation in the Edward Snowden documents.

Facebook spokesman Jodi Seth said they'd shared research with Lumpkin and other administration officials showing "factors that help make counter-speech more successful," including the format of the content (i.e., generally it is better to share photos and video instead of text) and tone of the content (the most successful forms of counter-speech were constructive, and satire and humor worked better than attacks).

She added that the research shows the speaker is very important and should be directly related to the targeted audience, sometimes a celebrity, sometimes a former extremist or community leader--all advice Lumpkin has obviously incorporated into the new program.

"Twitter is largely a public service and the U.S. government may review public accounts on its own. Government requests for non-public information are reviewed pursuant to our privacy policy and law enforcement guidelines, and disclosed in our transparency report," he wrote.

"They clearly have business equities... and they have privacy arrangements with their customers and we don't want to infringe on that," Lumpkin said. There's plenty that can be learned from "open source" information, i.e., information that anyone with a laptop can find on the Web.

"The big data is there. You just have to figure out how to use it," he said.

When he took charge, he put a stop to tweeting at terrorists--engaging in open rhetorical battles with hardcore ISIS followers on public social media platforms, as previous iterations of the new Global Engagement Center had done. Previous leaders had stopped the tweet battle in English, but continued it in Arabic and other regional languages.

"Those are hardcore followers, so we decided it's not worth our energy to focus on them," one official involved in the program explained.

Lumpkin wants to focus on those who are vulnerable to ISIS's message and emulate how ISIS goes after its followers.

"Usually it starts on Twitter, then it goes to Facebook, then it goes to Instagram, and ultimately, it goes to Telegram or some other encrypted, point-to-point discussion," he said. "They are doing what Amazon does. They are targeting selected information to an individual based on their receptivity. We need to do the same thing."

The office has flip-flopped through different leaders and strategies, with uneven-to-little success. The State Department's Twitter handle Think Again, Turn Away has only 26,000 followers, and much of the anti-ISIS propaganda videos it has released on a dedicated YouTube channel has been widely panned as "gruesome."

Back in 2014, senior State Department officials touted their success in stemming the flow of ISIS recruits. But the numbers released by the U.S. intelligence community soon overturned that assessment, rising from an estimated 7,000 foreign fighters in Syria and Iraq in 2014 to just above 38,000 foreign fighters now, with many of them counted in the ranks of ISIS as well as al Nusra and other rebel groups.

Estimates of the size of ISIS tracked that rise, going from a few thousand to a high of 30,000 last year. An all-source intelligence estimate has since downgraded ISIS's size, to a range of 19,000-25,000 fighters in Iraq and Syria, though a U.S. intelligence official said that was due to "the combined effects of battlefield deaths, desertions, internal disciplinary actions, recruiting shortfalls, and difficulties that foreign fighters face traveling to Syria."

Lumpkin said he'll use sophisticated computer analytic programs to measure if the new messages being sent are resonating with the target population, but the only real measure is if the numbers of ISIS recruits goes down.

"The goal is that you have to stop the recruiting," he said. "You do that through those who are likely to be radicalized and catch them early... to make sure that the true nature of these violent extremist groups is well known so they don't end up joining. It's not what they think it is.

Epoch Times
Michael Chan's Libel Suit: Globe and Mail Files Statement of Defence
Thursday, 17 March 2016
Byline: Omid Ghoreishi

The Globe and Mail's recently filed defence statement in a close to $5 million lawsuit by Ontario Immigration Minister Michael Chan says the paper was acting in the public good by exposing the minister's questionable dealings with China and the concerns they sparked at CSIS.
The Globe's argument centres on the relevance of its reporting on Chan as a public figure, information that the paper made public for the first time regarding interaction between the Canadian Security Intelligence Service and the Ontario government on Chan, and the "very thin investigation" on Chan's conduct by the provincial government.

The Globe reported that Ontario Premier Kathleen Wynne was unaware of CSIS's concerns regarding Chan's relationship with Chinese officials before her decision to promote Chan to the immigration and international trade file.

Chan's statement of claim describes the Globe's stories as old, "ludicrous" allegations and an attempt to boost circulation. The Globe counters that Chan is a public figure who has been placed in a sensitive post even after CSIS took the extraordinary step of approaching the province to have him investigated.

Globe Reports on Chan

Last year, the Globe and Mail published a series of stories about Chan revealing that he was one of the two provincial ministers that then-CSIS director Richard Fadden said in 2010 were feared to be under foreign influence.

Chan has fiercely denied any wrongdoing, calling the Globe stories a "re-hash of ludicrous allegations." He is defended by Wynne.

But the Globe's editor-in-chief David Walmsley, one of the defendants, has said the paper stands by its articles.

The Lawsuit

Filed last August in Ontario's Superior Court of Justice, Chan's lawsuit names Walmsley, the paper's publisher Phillip Crawley, and Craig Offman, the main reporter and author of the articles, as defendants. Offman spent 10 months investigating Chan. Also named is Charles Burton, an associate professor at Brock University who wrote an editorial on the topic in the Globe.

Chan's statement of claim says the Globe's coverage didn't offer anything new, and that the paper published the articles to attract "reader (and paid subscriber) attention and leading to greater revenues" after what it describes as the paper's loss of readership in recent years.

"[The Globe and Mail] had been perceived as not having strength in investigative journalism, and most particularly as having fallen behind the Toronto Star in that area," the statement reads.

It adds that Offman didn't provide Chan with adequate opportunity to comment on the claims in the articles, and that from a "thin and fragile thread," Offman and the Globe proceeded to "weave together a story that would portray for readers the picture that there was a reasonable basis for readers to doubt Michael Chan's loyalty to Canada or for an investigation of that issue."

The Globe's statement says Offman gave opportunities to Chan to respond to issues raised in the articles, including a face-to-face interview and follow-up questions, calling it "disingenuous to suggest that Chan did not have an adequate opportunity to address the concerns of CSIS with Offman."

The Globe's statement also says the story has far from run its course, since "Chan remains a publicly accountable elected representative and cabinet minister in Ontario government."

CSIS's Concerns

In interviews with the CBC in 2010, Fadden, who at the time was the director of CSIS, expressed concerns that two Canadian provincial cabinet ministers are being influenced by foreign governments, without naming any names.

According to the Globe, Fadden had sent a top-secret memo to the federal minister of public safety identifying Chan as one of those cabinet ministers. Following this, the government of Ontario conducted what the Globe describes as "a very thin investigation" of the issue, consisting of a few phone calls.

Concerned by the lack of adequate response by the Ontario government, "CSIS undertook the extraordinary step" of sending a high-level official to ask the provincial government to revisit the issue, the Globe's statement says. Offman's articles were the first to expose those discussions.

Seven issues were raised by CSIS, the Globe says, but the articles only reported on the three that the paper could confirm--two of which centred on Chan's close ties with the Chinese consul-general in Toronto. The third was Chan's possible ownership of two properties in China, which were undisclosed.

Following the CSIS official's visit, the Ontario government engaged the province's integrity commissioner to interview Chan, according to the statement. The matter was disposed of by the commissioner in one to one-and-a-half days, and in October 2014, then-Premier Dalton McGuinty told the public that the matter was closed.

The Globe argues that the integrity commissioner lacks expertise in matters relating to foreign influence.

After Wynne became premier, Chan's cabinet post was changed from minister of tourism and culture to minister of citizenship, immigration, and international trade.

"This elevation in Chan's portfolio placed him in a pivotal position vis-a-vis relations with China, Ontario's second largest trading partner," reads the Globe's statement, adding that Wynne said she had "no information from CSIS, the federal government, or anyone on the matter."

"It is a matter of immense public interest that deserves serious scrutiny," reads the Globe's defence.

Deserving of Consideration'

According to the Globe's statement, Chan's actions while in office are "deserving of consideration."

Chan lobbied to bring the Confucius Institute--controversial Beijing-run institutes intelligence agencies describe as a tool to extend China's soft power--to the Toronto District School Board, even though the institute is not in his riding and education is not within his portfolio.

Among those considerations are: Chan's lobbying efforts to bring the controversial Confucius Institute to the Toronto District School Board; his hiring of Michael Huang, who has a history of taking pro-Beijing causes, as a constituency assistant, as well as Wilson Chan, a former editor with a Toronto Chinese-language newspaper who was fired for censoring anti-Beijing coverage and is now working for Wynne's office in charge of the ethnic media portfolio; and his statements publicly downplaying the importance of Hong Kong's Umbrella Movement.

"Such a stance by Chan flies in the face of Canadian values regarding the proper role of democracy in society," says the Globe's statement, referring to the latter consideration.

The statement also cites an interview, first reported by the Epoch Times, given by Chan to the Chinese state-run Xinhua news agency related to his personal trip to China in 2009 where he attended the 60th anniversary of the founding of the Chinese Communist Party. In the interview, Chan said: "Great is my motherland. Great are the people of my motherland. ... Today seeing the [People's Liberation] army on parade with such precision and the high spirits of the people, I am moved even more by the strength and power of my motherland."

"The Globe and Mail defendants plead that the reporting in the articles was in the public interest in that it provided a detailed examination of the CSIS concerns and the Ontario government's unilateral and opaque decision to declare the matter closed," the Globe's statement says.

Paul Gaboury
Fonction publique fédérale Les critiques sur les réseaux sociaux interdites
Thursday, 17 March 2016
Byline: Paul Gaboury

Ottawa - Les employés fédéraux ne peuvent se servir des médias sociaux pour critiquer les décisions prises par leur employeur.
C'est l'avertissement qu'a lancé le ministère des Services publics et de l'Approvisionnement aux employés fédéraux qui utiliseraient ces jours-ci les médias sociaux pour faire part de leur mécontentement, notamment sur la situation au Bureau de la traduction.

Sous le couvert de l'anonymat, un employé se disant « désespéré » a indiqué au Droit, mardi, qu'une « chasse aux délinquants » était lancée pour trouver les employés qui utilisent les médias sociaux pour commenter les décisions prises par la direction du Bureau de la traduction, notamment sur l'outil de traduction automatique qui est au coeur d'une controverse et de récents débats à la Chambre des communes.

Invité à réagir, le ministère des Services publics et de l'Approvisionnement, responsable du Bureau de la traduction, n'a pas voulu confirmer au Droit si des employés ont été sanctionnés jusqu'à maintenant pour des commentaires émis sur les réseaux sociaux.

Toutefois, le ministère a rappelé aux fonctionnaires que les règles d'éthique en vigueur dans la fonction publique fédérale leur interdisent d'utiliser les réseaux sociaux pour émettre des critiques sur les gestionnaires.

« Le gouvernement du Canada a mis en place plusieurs mécanismes qui permettent aux employés de fournir de la rétroaction directe ou indirecte à ses cadres. L'utilisation des médias sociaux à cette fin contrevient aux règles d'éthique établies dans la fonction publique. Cette politique n'est pas en vigueur uniquement dans la fonction publique, mais aussi auprès de bien d'autres employeurs », a indiqué dans un courriel Jessica Kingsbury, porte- parole de Services publics et Approvisionnement Canada.

Avertissement des syndicats

Dans un avis sur l'utilisation des médias sociaux, en 2012, les principaux syndicats du secteur public fédéral avaient recommandé à leurs membres utilisateurs de Facebook et Twitter de se servir d'un ordinateur domestique et d'une adresse de courriel personnelle, et d'éviter de faire des commentaires visant des particuliers ou des ministères précis. On y indiquait qu'ils n'étaient pas à l'abri de la surveillance de l'employeur simplement parce que leur profil était protégé par des filtres de confidentialité.

L'avis mettait aussi en garde les employés contre les conséquences graves pour les employés qui seraient reconnus coupables de conflits d'intérêts ou de pas avoir suivi les codes et lois. Dans ces cas, l'avis rappelait que les employés risquaient des mesures disciplinaires, pouvant aller « jusqu'à la destitution », et les invitait à faire preuve « d'autant de professionnalisme » en participant à cette campagne que dans leurs fonctions pour l'employeur.

Motherboard (Vice)
'Chilling Effect' of Mass Surveillance Is Silencing Dissent Online, Study Says
Thursday, 17 March 2016
Byline: Nafeez Ahmed

New York - Thanks largely to whistleblower Edward Snowden's revelations in 2013, most Americans now realize that the intelligence community monitors and archives all sorts of online behaviors of both foreign nationals and US citizens.
But did you know that the very fact that you know this could have subliminally stopped you from speaking out online on issues you care about?

Now research suggests that widespread awareness of such mass surveillance could undermine democracy by making citizens fearful of voicing dissenting opinions in public.

A paper published last week in Journalism and Mass Communication Quarterly, the flagship peer-reviewed journal of the Association for Education in Journalism and Mass Communication (AEJMC), found that "the government's online surveillance programs may threaten the disclosure of minority views and contribute to the reinforcement of majority opinion."

The NSA's "ability to surreptitiously monitor the online activities of US citizens may make online opinion climates especially chilly" and "can contribute to the silencing of minority views that provide the bedrock of democratic discourse," the researcher found.

The paper is based on responses to an online questionnaire from a random sample of 255 people, selected to mimic basic demographic distributions across the US population.

Participants were asked to answer questions relating to media use, political attitudes, and personality traits. Different subsets of the sample were exposed to different messaging on US government surveillance to test their responses to the same fictional Facebook post about the US decision to continue airstrikes against the Islamic State of Iraq and Syria (ISIS).

They were then asked about their willingness to express their opinions about this publicly--including how they would respond on Facebook to the post; how strongly they personally supported or opposed continued airstrikes; their perceptions of the views of other Americans; and whether they supported or opposed online surveillance.

The study used a regression model--a statistical method to estimate the relationships between different variables--to test how well a person's decisions to express their opinion could be predicted based on the nature of their opinion, their perceptions of prevailing viewpoints, and their attitude to surveillance.

This sort of model doesn't produce simple percentages, but provides a statistical basis to explain variances in the factors being tested. In this case, the study found that "35% of the variance in an individuals' willingness to self-censor" could be explained by their perceptions of whether surveillance is justified.

For the majority of respondents, the study concluded, being aware of government surveillance "significantly reduced the likelihood of speaking out in hostile opinion climates."

Although more nuanced than a blanket silencing, the study still concluded that "knowing one's online activities are subject to government interception and believing these surveillance practices are necessary for national security play important roles in influencing conformist behavior."

Perhaps unsurprisingly, the most significant conformist effect was from people who supported surveillance. They turned out to be more likely to conceal other dissenting opinions, which they felt strayed from the majority view.

When such individuals "perceive they are being monitored, they readily conform their behavior--expressing opinions when they are in the majority, and suppressing them when they're not," the paper concluded. These findings suggest that a person's "fear of isolation from authority or government" adds new "chilling effects" to public discourse.

"What this research shows is that in the presence of surveillance, our country's most vulnerable voices are unwilling to express their beliefs online," said Elizabeth Stoycheff, associate professor of journalism and new media at the Department of Communication, Wayne State University, and lead author of the paper. "This finding is problematic because it may enable a domineering, majority opinion to take control of online deliberative spaces, thus negating deliberation."

But, she added, the increasing complexity of surveillance, and its use in tandem with private industry, means that more research is essential to understand how surveillance is altering the way people interact online, with content, and with one another.

The study happens to confirm recent comments by Snowden himself last Saturday, during a live video address to a gathering of whistleblowers, journalists and technologists in Berlin.

"It's the minorities who are most at risk" from the impact of mass surveillance, Snowden said. "Without privacy there is only society, only the collective, which makes them all be and think alike. You can't have anything yourself, you can't have your own opinions, unless you have a space that belongs only to you."

The Hill
NSA dismissed Clinton request for 'secure' BlackBerry
Thursday, 17 March 2016
Byline: Julian Hattem

Washington - Federal intelligence officials rebuffed an early effort by Hillary Clinton's top aides to provide her with a "secure 'BlackBerry- like'" device to use while serving as secretary of State, according to new emails released Wednesday.
Emails released as part of an open records lawsuit from conservative legal watchdog Judicial Watch show that the National Security Agency (NSA) rebuffed requests from the State Department in February of 2009 to find a replacement for Clinton's mobile device.

"[T]he current state of the art is not too user friendly, has no infrastructure at State, and is very expensive," Donald Reid, a top security official at the State Department, wrote in a Feb. 13, 2009, email.

"[E]ach time we asked the question, 'What was the solution for [the president]?' we were politely told to shut up and color," he added.

In another email, Reid described Clinton as being "hooked" on her BlackBerry following the 2008 presidential campaign. But she felt "hamstrung" when she had to lock it up before entering secure spaces at the State Department.

Clinton and her aides "are used to having the BB on their hip and staying closely in touch with developments during the day," he wrote.

It's unclear from the emails how the matter was ultimately resolved.

The NSA appears not to have shut the State Department down entirely.

The agency "opened the door for us to establish requirements and they would try to help," Reid wrote in the Feb. 13 message.

In a Feb. 18 email, Reid wrote that he and his staff would "be working with NSA on a set of possible options to meet [Clintons'] and others requirements."

In the same email, Reid noted that a briefing with officials from the NSA and Cheryl Mills, Clinton's then-chief of staff, prompted NSA staffers to raise "a host of related issues" about what Clinton and her staff "have been briefed on with respect to travel and technology vulnerabilities."

Clinton's use of a private email server throughout her tenure as secretary of State has become a nagging political problem for her presidential campaign. Critics contend that it may have skirted federal recordkeeping laws and could also have jeopardized U.S. secrets.

Reid is the security coordinator for security infrastructure in the State Department's diplomatic security bureau. Earlier this week, he and Mills was listed as two of eight people whom Judicial Watch wanted to testify about the setup of Clinton's private email server, as part of a separate case.

Rogers makes his case for a CyberCom budget boos
Thursday, 17 March 2016
Byline: Sean Lyngaas

Washington - U.S. Cyber Command Commander Adm. Michael Rogers on March 16 told appropriators that his command deserves an approximately nine percent budget hike in an increasingly contested cyber environment.
Against a backdrop of sizable nation-state and criminal threats, Cyber Command is right now engaged in a "range of both defensive and offensive real-world operations," Rogers told the House Armed Services Subcommittee on Emerging Threats and Capabilities. One of those operations is hacking the so-called Islamic State after being ordered to do so by Defense Secretary Ash Carter.

Cyber Command is asking for $506 million for fiscal 2017, Rogers advisers said after his testimony. The command's appropriated budget for fiscal 2016 is $466 million, with $207 million of that going to support the command's cyber mission forces, according to Rogers' written testimony.

Over five years since its inception, Cyber Command has reached a "tipping point" in terms of offensive and defensive capabilities, according to Rogers. "We're trying to use some of the real world insights" gleaned from the Office of Personnel Management hack and the campaign against the Islamic State to furnish combatant commands with greater cyber tools, he told lawmakers.

Cyber Command's budget is dwarfed by that of the National Security Agency, which Rogers also heads, but the command has used NSA's technical prowess to grow more adept in cyber operations.

Lawmakers were generally receptive to Rogers' funding requests. However, Rep. Mo Brooks (R- Ala.) sounded a note of caution.

"America's financial condition has taken a fairly stark turn for the worse," Brooks told Rogers.

Rogers replied that part of the reason his command is co-located with NSA is to avoid duplicative funding. Cybersecurity is a field that requires more spending, Rogers argued. "Look at the world around you," he told Brooks, referring to threats in cyberspace.

Rep. Joe Wilson (R-S.C.), the subcommittee's chairman, said the panel was ready to back Rogers' programmatic needs.

"From the intrusion on the Joint Staff networks to the compromise of personal information of millions of government personnel and their families, cyber is proving to be both a domain of warfare on its own, as well as a key enabler for all other domains of war," Wilson said in his opening statement.

The fiscal year 2016 defense policy bill that became law last November granted Cyber Command enhanced acquisition authorities, including the designation of an executive in charge of negotiating agreements with other military departments.

Rogers praised those new acquisition authorities, calling them a "significant augmentation" in the command's ability to hone its mission force.

Cyber Command has a representative at the Pentagon's Silicon Valley outpost, known as the Defense Innovation Unit Experimental, and the admiral was in Northern California earlier this month to push for expanded partnerships with the private sector. The command's next planned "point of presence" for private-sector outreach is Boston, he said at the March 16 hearing.

Baltimore Sun
Cyber Command chief: Foreign governments use criminals to hack U.S. systems
Thursday, 17 March 2016
Byline: Ian Duncan

Washington - Foreign governments are building relationships with criminals and other hackers to hide their attempts to break into American computer systems, the head of U.S. Cyber Command told members of Congress on Wednesday.
"It potentially or theoretically makes it more difficult to go country X and say we see this activity going on, you are doing it, this is unacceptable to us," Adm. Michael S. Rogers said. "And their ability to say it's not us, it's criminal groups."

Rogers, who leads both Cyber Command and the National Security Agency at Fort Meade, said criminals remain the most numerous threat to American networks and people's data, but foreign governments have the patience, skills and resources to carry out the most sophisticated attacks.

In prepared remarks, he focused on how Russia's state-backed hacking efforts sometimes overlap with the work of criminals.

"Russia has very capable cyber operators who can and do work with speed, precision and stealth," he said. "Russia is also home to a substantial segment of the world's most sophisticated cybercriminals, who have found victims all over the world."

The admiral's comments lent weight to those of analysts and lawmakers who have argued that the Russian government relies on criminal groups to carry out hacking attacks.

The U.S. government has not named Russia as the suspect in any particular attack, but the country is believed to be responsible for the breach of the email system of the Joint Chiefs of Staff last year. Officials regularly cite China, Iran and North Korea as other top hacking threats.

Rogers testified before a panel of the House Armed Services Committee on the budget for Cyber Command. The organization recently announced a campaign against the self-declared Islamic State.

It was the first time the United States has acknowledged carrying out a cyber warfare campaign. The details remain mostly secret.

"USCYBERCOM is executing orders to make it more difficult for ISIL to plan or conduct attacks against the U.S. or our allies from their bases in Iraq and Syria to keep our service men and women safer," he said.

Rogers said the command is looking to take on a greater role before conflict breaks out, using cyber power to dissuade adversaries from starting a conflict.

"We at USCYBERCOM are thinking more strategically about shifting our response planning from fighting a war to also providing decision makers with options to deter and forestall a conflict before it begins," he said.

For 2016, the command has a budget of almost $500 million and a staff of some 1,400 troops, civilians and contractors working at Fort Meade. Rogers said he expects the organization to be fully operational by fall of 2018.

Fox News
Clinton tried to change rules to use BlackBerry in secure facility for classified information
Thursday, 17 March 2016
Byline: Catherine Herridge

Washington - Less than a month after becoming secretary of state, and registering the personal email domain that she would use exclusively for government business, Hillary Clinton's team aggressively pursued changes to existing State Department security protocols so she could use her BlackBerry in

secure facilities for classified information, according to new documents released under the Freedom of Information Act.
"Anyone who has any appreciation at all of security, you don't ask a question like that," cybersecurity analyst Morgan Wright told Fox News. "It is contempt for the system, contempt for the rules that are designed to protect the exact kind of information that was exposed through this email set up. "

Current and former intelligence officials grimaced when asked by Fox News about the use of wireless communications devices, such as a BlackBerry, in a SCIF (Sensitive Compartmented Information Facility) emphasizing its use would defeat the purpose of the secure facility, and it is standard practice to leave all electronics outside.

A former State Department employee familiar with the Clinton request emphasized security personnel at the time thought the BlackBerry was only for unclassified material, adding their concerns would have been magnified if they had known Clinton's email account also held classified material.

"When you allow devices like this into a SCIF, you can allow the bad guys to listen in," Wright added.

A February 17, 2009 email marked SECRET and cleared through the NSA says, "Ms. Mills described the requirement as chiefly driven by Secretary Clinton, who does not use standard computer equipment but relies exclusively on her Blackberry for emailing and remaining in contact on her schedule etc. Ideally all members of her suite would be allowed to use Blackberries for communication in the SCIF (Sensitive Compartmented Information Facility)"

Cheryl Mills was Clinton's chief of staff from 2009-13.

The emails, obtained by Judicial Watch as part of a Freedom of Information Act lawsuit also show that a specialized NSA team was brought in to assess the vulnerabilities and feasibility of using wireless communications, including within a secure facility.

The NSA State Department liaison, whose name was withheld, told Mills in a now highly redacted email: "Sometimes the distinction between what can be done and what is, or is not, recommended to be done differ; this is one of those instances. (State Department Diplomatic Security) DS's response illustrates their level of concern based on their extensive professional expertise. "

Another memo from Mar?ch 2009, obtained by Judicial Watch through its FOIA lawsuit, from Assistant Secretary for Diplomatic Security Eric Boswell to Mills explicitly warned, "the vulnerabilities and risks associated with the use of Blackberries in Mahogany Row [seventh floor executive offices] considerably outweigh their convenience." Clinton has claimed she used the personal account and BlackBerry for convenience.

Clinton never used a State Department issued BlackBerry. It is not clear from the documents whether Clinton and her team went ahead and used their BlackBerrys in SCIFs despite the concerns, including

those of the NSA. Though a state department official said "no waiver allowing PDAs within Mahogany Row was granted.".

A February 18 2009 email from the State Department's Senior Coordinator for Security Infrastructure, Donald R. Reid, states "...once she (Clinton) got the hang of it, she was hooked, now every day, she feels hamstrung because she has to lock up her BB up. She does go out several times a day to an office they have crafted for her outside the SCIF and plays email catch-up. Cheryl Mills and others who are dedicated BB addicts are frustrated because they too are not near their desktop very often during the working day..."

The reference to a secondary office for Clinton appears to conflict with a February statement from the State Department that no stand-alone computer was set up outside Clinton's main office on the executive floor, known as Mahogany Row, to check her personal account.

On February 25, Fox News pressed the State Department spokesman about a January 2009 email, also obtained by Judicial Watch, between Under Secretary for Management Patrick Kennedy and then Clinton chief of staff Mills where Kennedy said it was a "great idea" to setup a stand-alone PC for Clinton to check her email.

The State Department said Wednesday no computer was set up but confirmed there was a space created to accommodate Clinton's personal email use. ?"There is an area dedicated to supporting the secretary outside but in the immediate vicinity of the secretary's secure office. Secretary Clinton, as with anyone, could use such non-SCIF spaces to check personal devices.," a State Department official said.

Clinton did not use a government-issued BlackBerry that was certified as secure for government use. Under Secretary for Management Patrick Kennedy recently told the Benghazi Select Committee that he knew about Clinton's personal account from the earliest days, but did not understand the extent of its use, even though he sent State Department business to Clinton via the Clintonemail account.

In January 2009, Clinton signed at least two non-disclosure agreements in which she promised to protect classified information. Since then, more than 2,100 emails containing classified information have been identified, as well as 22 Top Secret that are too damaging to national security to release.

Earlier this week, Judicial Watch presented the federal court in Washington with a list of 7 Clinton aides it wants to question under oath about Clinton's use of a private email sever when she was secretary of state.

Adelaide Advertiser
Spycatcher warns of subs leaks from 'weakest link'
Thursday, 17 March 2016
Byline: Tory Shepherd

One of the world's top spy fighters says he would be "shocked" if Chinese spies were not trying to hack our military capabilities.
Kevin Mandia, a cybersecurity guru, also said it was likely that elements of Australia's Future Submarines would leak out.

Russia "might" target Australia, but China had been "honing their skills" and were the main culprits, he said. Mr Mandia founded the first company dedicated to responding to attacks and is now the president of FireEye, a US-based cybersecurity firm. He is in Canberra this week meeting with MPs and officials.

Mr Mandia said military, defence, industrial capabilities as well as companies doing mergers and acquisitions and any experts on China who advised the Australian Government were among the likely targets.

"I'd be shocked and astonished if the Chinese aren't actively targeting any military capability here," he said.

Asked whether he thought it was possible to keep data related to the submarines safe, he said it would be difficult because of the immense complexity of the project.

"The more companies that work on things, the more suppliers involved in building something and the longer it takes to do it the more (difficult) it becomes to secure. It will become a challenge," he said. "You'll be as secure as the weakest link." The Advertiser revealed last year that France, Germany and Japan - the three countries vying to build the submarines - had all been attacked by Chinese spies.

All three recognise it was a top priority to protect top-secret information and use the best technology possible to protect themselves.

The Defence Department is aware of cyber attacks but say there is no evidence any of Australia's classified information has been compromised to date, while industry is also exposed to constant attempts.

In the recently released Defence White Paper the Government has pledged up to $400 million for cybersecurity capability development over 10 years.

Billions more will be spent on developing electronic warfare to protect Defence assets, modernised intelligence systems, enhanced surveillance and a larger workforce to tackle evolving threats.

"Australia will develop its cyber capabilities to deter and defend against the threat of cyber attack," the White Paper states.Last year a Japanese Government official told The Advertiser that there had been

Chinese cyberattacks on their classified information, while German shipbuilders TKMS said they were fending off up to 40 hacking attempts a day.

Press Trust of India
India's billion-member biometric database raises privacy fears
Thursday, 17 March 2016

New Delhi - India's parliament is set to pass legislation that gives federal agencies access to the world's biggest biometric database in the interests of national security, raising fears the privacy of a billion people could be compromised.
The move comes as the ruling Bharatiya Janata Party (BJP) cracks down on student protests and pushes a Hindu nationalist agenda in state elections, steps that some say erode India's traditions of tolerance and free speech.

It could also usher in surveillance far more intrusive than the US telephone and internet spying revealed by former National Security Agency (NSA) contractor Edward Snowden in 2013, some privacy advocates said.

The Aadhaar database scheme, started seven years ago, was set up to streamline payment of benefits and cut down on massive wastage and fraud, and already nearly a billion people have registered their finger prints and iris signatures.

Now the BJP, which inherited the scheme, wants to pass new provisions including those on national security, using a loophole to bypass the opposition in parliament.

"It has been showcased as a tool exclusively meant for disbursement of subsidies and we do not realise that it can also be used for mass surveillance," said Tathagata Satpathy, a lawmaker from the eastern state of Odisha.

"Can the government ... assure us that this Aadhaar card and the data that will be collected under it -- biometric, biological, iris scan, finger print, everything put together -- will not be misused as has been done by the NSA in the US?" Finance Minister Arun Jaitley has defended the legislation in parliament, saying Aadhaar saved the government an estimated Rs150 billion ($2.2 billion, Dh8 billion) in the 2014-15 financial year alone.

A finance ministry spokesman added that the government had taken steps to ensure citizens' privacy would be respected and the authority to access data was exercised only in rare cases.

According to another government official, the new law is in fact more limited in scope than the decades-old Indian Telegraph Act, which permits national security agencies and tax authorities to intercept telephone conversations of individuals in the interest of public safety.

Those assurances have not satisfied political opponents and people from religious minorities, including India's sizeable Muslim community, who say the database could be used as a tool to silence them. "We are midwifing a police state," said Asaduddin Owaisi, an opposition MP.

Raman Jit Singh Chima, global policy director at Access, an international digital rights organisation, said the proposed Indian law lacked the transparency and oversight safeguards found in Europe or the US, which last year reformed its bulk telephone surveillance programme.

He pointed to the US Foreign Intelligence Surveillance Court, which must approve many surveillance requests made by intelligence agencies, and European data protection authorities as oversight mechanisms not present in the Indian proposal.

The Indian government brought the Aadhaar legislation to the upper house of parliament on Wednesday in a bid to secure passage before lawmakers go into recess.

To get around its lack of a majority there, the BJP is presenting it as a financial bill, which the upper chamber cannot reject. It can return it to the lower house, where the ruling party has a majority.

In its assessment of the measure, New Delhi- based PRS Legislative Research said law enforcement agencies could use someone's Aadhaar number as a link across various data sets such as telephone and air travel records.

That would allow them to recognise patterns of behaviour and detect potential illegal activities. But it could also lead to harassment of individuals who are identified incorrectly as potential security threats, PRS said.

Sunil Abraham, executive director of the Bengaluru-based Centre for Internet and Society, said Aaadhaar created a central repository of biometrics for almost every citizen of the world's most populous democracy that could be compromised.

"Maintaining a central database is akin to getting the keys of every house in Delhi and storing them at a central police station," he said.

"It is very easy to capture iris data of any individual with the use of next generation cameras. Imagine a situation where the police is secretly capturing the iris data of protesters and then identifying them through their biometric records."

Saudi Gazette
GCC paces world in cyber-preparedness
Thursday, 17 March 2016

Abu Dhabi - GCC countries are among the global leaders in cybersecurity preparedness, with the region's network security spend tripling to $1 billion by 2018, industry experts announced Wednesday at Infosecurity Middle East, part of ISNR.
With the region's rapid economic development and connectivity in the Internet of Things era - especially in critical national infrastructure, oil and gas, and financial services - the GCC's network security spend is set to grow from $340 million in 2012 to $1 billion by 2018, according to a new Frost & Sullivan report.

At Infosecurity Middle East's 6th International Cyber Crime Conference, localized from Europe's leading cyber security exhibition, law enforcement, legal, and business and IT experts debated and discussed Smart City, Internet of Things, and financial cyber security, the UAE National Agenda for Information Security, and online safety and privacy for children.

"As cyber-threats grow in complexity and severity, GCC organizations are among the world's most advanced in deploying solutions that proactively protect devices, user information, and corporate data. Infosecurity Middle East is an ideal platform to promote the global Mobile Security Alliance and our enterprise mobility management and end user computing solutions," said Ian Evans, Vice President of End User Computing at VMware, and EMEA Managing Director at AirWatch.

VMware AirWatch joins over 100 leading international exhibiting companies at Infosecurity Middle East, including Bitdefender, Blue Coat, Cyberoam Technologies, Dionach, Elettronica, Exclusive Networks, Huawei, QinetiQ, and Winsted.

"Everyone involved in cybersecurity must always keep in mind that customers have different weak spots and different processes, with risks needing to be managed in different ways. There are exciting opportunities around those cybersecurity solutions that can take the fear factor out of unknown quantities, and make them 'known', but there continues to be significant opportunities around those protection measures that apply the universe of known cyber threat knowledge, to keep us safe every day. Infosecurity Middle East is a major event for driving new business leads for our vendors, and enhancing the region's cybersecurity preparedness," said Nathan Clements, Managing Director, Exclusive Networks Middle East.

Providing hands-on cybersecurity expertise, Infosecurity Middle East, in partnership with (ISC2), the global leader in cyber education, is hosting more than 40 free-to-attend, hands-on workshops, including in risk, governance, and cloud security.

Infosecurity Middle East joins Emergency Response and Disaster Prevention, Fire Fighting Middle East, and Occupational Safety and Health Middle East at ISNR 2016. Organized by the UAE Ministry of Interior and Reed Exhibitions Middle East, ISNR 2016 runs till today (March 17) at the Abu Dhabi National Exhibition Centre.

Naharnet Newsdesk
Illegal Networks: Violating Country's Sovereignty Unacceptable
Thursday, 17 March 2016

Beirut - Telecommunications Minister Butros Harb stated on Wednesday that violations against the country's sovereignty and its national security are unacceptable, assuring that perpetrators behind the illegal internet networks will be punished.
"We will not accept violations against our national sovereignty and security, nor will we accept infringing on the privacy rights of the Lebanese. These crimes will not go unpunished," Harb stated in a press conference.

"The networks belong to suspicious sides and we consider it a crime against our sovereignty," he pointed out, in reference to the possibility that the networks can be breached by Lebanon's long-time foe Israel or any party that wants to spy on the country.

"We are in front of an extensive system with wide expertise. Some of the perpetrators have already been implicated in the Barouk scandal," he added.

Last week and during a meeting of the parliamentary media committee it was unveiled that a "mafia" is taking advantage of internet services by installing internet stations that are not subject to the state control.

The owners of these stations are buying international internet bandwidth with nominal cost from Turkey and Cyprus which they are selling back to Lebanese subscribers at reduced prices.

Harb added: "Some sensitive state departments were victims of illegal internet providers," he said pointing out that they inadvertently subscribed to the services at a nominal cost and sometimes for free.

He stressed that the file was referred to the related judicial and security authorities.

The Minister stressed that the equipment were confiscated, he said: "Our technical teams were able to uncover unlicensed technical equipment in different locations on several mountainous terrains."

Later during the day, Head of the parliamentary media committee MP Hassan Fadlallah said after a weekly meeting of lawmakers with Speaker Nabih Berri: "The parliament will address the illegal internet network. We are faced with a system that works in parallel to that of the state and it is open to Israeli spying."

It has been reported that wireless internet towers and technical equipment were placed lawlessly in some mountainous terrains including Tannourine, al-Dinnieh, Sannine and al- Zaarour.

Smuggled internet services initiate risks namely the possibility of security breach as it lacks the basic control standards exposing Lebanon's security to third parties including Israel.

Adding to the above is the fact that smuggling online services outside legal frameworks is a waste for the state's treasury amounting to over $2 million losses on a monthly basis.

In 2009, a telecommunications station in the Barouk area of the Shouf was uncovered, triggering heated debate on the involvement of Israel in spying operations.

Globe and Mail
We need stronger limits on Apple-style court orders
Saturday, 19 March 2016
Byline: Gerald Chan & Stephen Aylward

Comment: Apple Inc. CEO Tim Cook has recently grabbed headlines for his company's strong stance on digital privacy. The U.S. Federal Bureau of Investigation obtained a court order requiring Apple to bypass the security lock features on an iPhone belonging to one of the shooters in the San Bernardino terrorist attack, and Apple is appealing the order.
Canadian iPhone users following this legal skirmish may not be aware that the same issue has already arisen on this side of the border. The scope of our privacy protections, however, remains uncertain even as police become increasingly reliant on technology companies for assistance. Canada needs clearer and stronger limits on when law enforcement can compel private companies to undermine the digital security of their users.

After rumours surfaced in 2013 of a video showing former mayor Rob Ford smoking crack cocaine, Toronto police began investigating Mr. Ford and his driver, Alexander Lisi. Police obtained a search warrant for Mr. Lisi's iPhone, which they believed would contain evidence linking Mr. Ford or Mr. Lisi to criminal activity.

When they discovered that it was locked with a passcode, they returned to court for an "assistance order" requiring Apple to provide "reasonable technical assistance" to bypass the code. An Ontario judge granted the order.

Because Apple did not contest the order, however, the judge gave no reasons explaining his decision.

Apple has now begun to push back against similar orders in the United States. The Lisi order is virtually identical to an order that Apple successfully opposed in a New York court case decided last month. The San Bernardino order is also similar, although it goes one step further - it requires Apple to create new software to bypass the passcode lock because the iPhone model has more advanced security features.

Until recently, "assistance orders" such as the one in the Lisi case, have played a minor supporting role in criminal investigations. They have been used to allow police access to a building or to make copies of documents.

In a case involving Telus last year, however, assistance orders were given more muscle.

Telus challenged an assistance order requiring it to disclose customer name and address information to police as being overly intrusive. In a setback for technology companies, an Ontario court ruled that assistance orders can go further than connecting wires and flipping switches. They can require a company to do what is necessary to help a warrant "succeed at its intended objective."

Police may also resort to the "production order" power in the Criminal Code, which allows them to require a company to produce data within its control.

This, however, may be a more challenging route. It is arguable that the data in the iPhone is not within Apple's "control" if it has to create new software in order to access it. Even if it is, a company can resist a production order on the basis that it would be "unreasonable in the circumstances" (i.e., too onerous).

Canadian companies have had some success challenging production orders. Earlier this year, Rogers and Telus successfully challenged a set of "tower dump" production orders that would have required them to produce call records of more than 40,000 customers (capturing anyone who happened to be near specified cellular towers). The court found that the requested orders went too far because they were not "minimally intrusive" of customer privacy.

Finally, if neither the "assistance order" or "production order" power suffices, police may try to obtain a "general warrant." This is the residual, catch-all power in the Criminal Code that allows police to "use any device or investigative technique or procedure or do any thing described in the warrant" that is not authorized elsewhere in the code.

Most notably, general warrants have been used to authorize police to do "sneak and peek" searches (covert entries into homes and other properties) in drug cases. Whether the "general warrant" can go so far as to require a company like Apple to create software to bypass its own security features remains to be seen.

In the digital age, the keys to our privacy are held by companies like Telus, Rogers and Apple.

We rely on these companies to protect our data, defend our privacy and guard against hackers.

But until the law catches up with technology, Canadians cannot be sure how their personal information will be protected when law enforcement comes knocking.

This situation does not serve either the privacy or the security of Canadians.

Twitter helps connect leaders with people
Monday, 21 March 2016
Byline: Janice Ponce de Leon

Dubai - From announcing new laws to restructuring the cabinet and warning people about accidents and crimes, the UAE government has strengthened its public service by connecting to people in real-time, one tweet at a time.
The micro-blogging site Twitter over its first 10 years of existence has become popular among UAE leaders and government agencies. This comes as no surprise as Twitter has become the social media of choice for world leaders, including His Highness Shaikh Mohammad Bin Rashid Al Maktoum, Vice-President and Prime Minister of the UAE and Ruler of Dubai.

Shaikh Mohammad is one of the world's top 10 most followed world leaders. He ranked fourth in the World Leaders on Twitter ranking report in December 2015, up by two spots in 2014 and with a growth in followers of almost two million. Since joining Twitter in June 2009, Shaikh Mohammad (@HHShkMohd) has garnered 5.85 million followers and made 3,824 tweets.

Shaikh Mohammad has used Twitter to announce government efforts and decisions such as the major restructuring of the federal government in February, and new policies such as mandatory military service in the UAE, among others.

"The significance of these [social media] channels lies in their ability to reach out easily to all members of the society through personal devices," Shaikh Mohammad said at the Social Media Influencer Summit in 2015.

Twiplomacy, a leading global study of world leaders on Twitter, described Shaikh Mohammad's tweets as engaging and have made him "approachable to the masses and his open engagement with audiences on all social platforms demonstrates the UAE government's efforts to be open to dialogue".

To further enhance the dialogue process, Shaikh Mohammad transformed the traditional majlis (Arabic for 'council') into a technology-based citizen engagement platform during the UAE Brainstorming Session last year, according to the Arab Social Media Report 2015.

Thousands of followers proposed more than 82,000 new ideas and innovative solutions through social media, focusing on the challenges in the public health and education sectors.

As a whole, the UAE leads the Gulf countries in terms of social media use and penetration, according to Twiplomacy. After Shaikh Mohammad, Shaikh Abdullah Bin Zayed Al Nahyan, Minister of Foreign Affairs and International Cooperation, has become the second most followed foreign minister on Twitter.

Twitter-friendliness extends to other government entities such as the Ministry of Interior (@moiuae) and Dubai Police that are actively tweeting to their audiences. Both warn people about road accidents, traffic updates, crime prevention, useful hotlines and their latest initiatives.

Dubai's Roads and Transport Authority (@RTA_Dubai) also tweets about opening new bridges and roads, road closures, traffic updates, and many more. Another source of real-time information is the

National Centre of Meteorology and Seismology's Twitter page (@NCMS_media) that contains the latest weather forecasts, live updates and warnings on rain, thunderstorms, and earthquakes.

Washington Post
FBI aids search for culprits in huge cyberheist attempt
Monday, 21 March 2016
Byline: Serajul Quadir

Dhaka, Bangladesh - Police met an FBI official here in the capital of Bangladesh on Sunday to try to track down culprits behind an attempted $951 million cyberheist from the country's central bank.
Initial investigations aim to identify the origin of a transfer order for $81 million that the Federal Reserve Bank of New York paid from Bangladesh Bank's account there to casinos in the Philippines, a senior police official told reporters.

The transfer, one of the largest cyberheists in history, was among 35 requests that unknown hackers made for payments from the bank's New York Fed account in early February.

Other requested transfers from that account, which the country uses for international settlements, apparently were blocked.

Former finance secretary Fazle Kabir took over Sunday as head of the central bank after Atiur Rahman, the former governor, resigned amid complaints from the government that it had learned of the heist only a month later from the media.

Also Sunday, the wife of a cybercrime expert reported that her husband, Tanvir Hassan Zoha, had been abducted early Thursday. He had met with police Tuesday and told the media that he knew three of the user IDs used in the heist.

Senior police official Mirza Abdullahel Baqui said after meeting the FBI official that criminals in six countries apparently were involved in the heist.

"This is the biggest transnational organized crime ever seen in Bangladesh, and so we sought both technical and human assistance" from the FBI, he said.

The officials also discussed how to proceed with their investigation, he added.

A government investigative committee led by former central bank governor Mohammad Farash Uddin began its probe Sunday. "This is a wake-up call," he said of the unprecedented breach in the bank's computer security.

A Senate hearing in the Philippines last week included testimony that $30 million of the total $81 million haul was delivered in cash to an ethnic Chinese casino junket operator in Manila. The rest was transferred to two casinos in the Philippines.

According to his wife, Kamrun Nahar Chowdhury, cybercrime expert Zoha was blindfolded by unknown plainclothes people early Thursday before being taken away in a vehicle.

Chowdhury said that police had refused to investigate her husband's disappearance and that she had appealed to the government for help. Police were unavailable for comment.

"We don't know why he was picked up," she said.

Washington Post
Johns Hopkins researchers poke a hole in Apple's encryption
Monday, 21 March 2016
Byline: Ellen Nakashima

Washington - Apple's growing arsenal of encryption techniques -- shielding data on devices as well as real-time video calls and instant messages -- has spurred the U.S. government to sound the alarm that such tools are putting the communications of terrorists and criminals out of the reach of law enforcement.
But a group of Johns Hopkins University researchers has found a bug in the company's vaunted encryption, one that would enable a skilled attacker to decrypt photos and videos sent as secure instant messages.

This specific flaw in Apple's iMessage platform likely would not have helped the FBI pull data from an iPhone recovered in December's San Bernardino, Calif., terrorist attack, but it shatters the notion that strong commercial encryption has left no opening for law enforcement and hackers, said Matthew D. Green, a computer science professor at Johns Hopkins University who led the research team.

The discovery comes as the U.S. government and Apple are locked in a widely watched legal battle in which the Justice Department is seeking to force the company to write software to help FBI agents peer into the encrypted contents of the iPhone used by Syed Rizwan Farouk, one of two attackers who were killed by police after the shooting rampage that claimed 14 lives.

Cryptographers such as Green say that asking a court to compel a tech company such as Apple to create software to undo a security feature makes no sense -- especially when there may already be bugs that can be exploited.

Apple's growing arsenal of encryption techniques -- shielding data on devices as well as real-time video calls and instant messages -- has spurred the U.S. government to sound the alarm that such tools are putting the communications of terrorists and criminals out of the reach of law enforcement.

But a group of Johns Hopkins University researchers has found a bug in the company's vaunted encryption, one that would enable a skilled attacker to decrypt photos and videos sent as secure instant messages.

This specific flaw in Apple's iMessage platform likely would not have helped the FBI pull data from an iPhone recovered in December's San Bernardino, Calif., terrorist attack, but it shatters the notion that strong commercial encryption has left no opening for law enforcement and hackers, said Matthew D. Internet Cut at Defense Ministry to Dismantle Illegal Network
Monday, 21 March 2016

Beirut - The internet connection at the Defense Ministry at Yarzeh was severed over the weekend in order to dismantle the illegal network that was recently uncovered in the country, reported the daily al-Mustaqbal on Sunday.
The development was a product of a parliamentary decision to remove illegal internet stations. The Defense Ministry has since been "returned to the fold of the state" and the legal internet network.

A decision was also taken to implement future projects aimed at developing the army's communication capabilities through a fiber-optic network that connects various military stations.

Media reports said there are four illegal "communication crossings" with a tremendous ability of 40GB per second WiFi network speed, which is equivalent to a third of the international capacities set by the Ministry of Telecommunications in service (150GB per second).

Anonymous parties described as a "mafia" are taking advantage of internet services by installing internet stations that are not subject to state control.

It has been reported that wireless internet towers and technical equipment were placed illegally in some mountainous terrains, including Tannourine, al-Dinnieh, Sannine and al- Zaarour.

Smuggled internet services could cause possible security breaches as they lack the basic control standards, exposing Lebanon to third parties, including Israel.

In addition, smuggling online services outside legal frameworks is a waste for the state's treasury amounting to over $2 million losses on a monthly basis.

Commentary: Technology is not always twinned with progress
Monday, 21 March 2016
Byline: Justin Thomas

If nations can be classed as underdeveloped, developing, and developed, can they also be considered overdeveloped? We have a fascination with technology and progress. Perhaps this is hard-wired into the human psyche? The most creative and destructive force in nature is the human mind. Our latest technological tools take the form of thinking machines, artificially intelligent devices that save us time and effort. We now have an app for almost everything. But at what cost?
Carl Jung, the Swiss psychologist, once suggested that: "Our progressiveness, though it may result in a great many delights, piles up an equally gigantic debt, which has to be paid off from time to time in the form of hideous catastrophes". Today's computers can rapidly manage large amounts of data. Most of the time they do this without a hitch. But when they do mess up, they mess up spectacularly.

Banking, for example, was an industry quick to embrace the digital revolution and here we can find examples of potentially catastrophic malfunction. In 2013, Reggie Theus, a restaurant manager from Texas, became an accidental trillionaire when a banking error left him looking at a balance of $4 trillion (Dh 14tn). In 2015, Deutsche Bank misdirected $6 billion to one of its customers. In the same year, an Indian woman became one of the richest women on earth when a banking error resulted in her account being credited with the rupee equivalent of around $1.5bn.

There are many other cases of banking mishaps, and invariably these errors are apologetically attributed to IT failures. The quoted examples are the cases that make the news. I wonder about the errors that go undetected or unreported?

It is not only in industry. Our technological advancements impact our social lives too. As the old joke goes: do you know who really loves smart phones? Divorce lawyers. A survey by the American Academy of Matrimonial Lawyers found that evidence pulled from our digital devices is increasingly featuring in divorce proceedings: from text messages to GPS data. Information technology undoubtedly helps us connect with one and other. However, the ease with which we can now connect has, some argue, made

it easier for people to be unfaithful, also ushering in new ways to cheat on each other. It would be tragically ironic if the devices that were meant to connect us, actually lead to an increase in disconnection in the form of divorce.

However, for every tragic tale that implicates technology, there are many more that point the finger at human frailty. After the German Wings disaster, when a co-pilot allegedly crashed a commercial passenger plane into a French mountainside, one of the debates that arose was: human pilot vs autopilot. Developments in artificial intelligence and sensor technology are now raising serious questions about the need for human pilots, lines of inquiry that may resurface following Saturday's FlyDubai plane crash in Russia.

Also, when there is an app that can do what you do - only faster and cheaper - how will you feel? Technology and unemployment is an old Luddite concern. However, it is becoming more relevant as the rate of our labour-saving technological progress increases in the context of a growing global population.

I'm not against technology at all, but we do need to look critically at what our technology actually helps us achieve. To paraphrase a British politician: if the cannibal now orders his meals online and eats them with titanium cutlery, rather than his hands, is that progress?

Technology is not always synonymous with progress, and progress is best when it's at the right pace and in the right direction.

For Carl Jung, and many other psychologists, the direction of progress now needs to turn inwards. We need to focus more effort on conquering cruelty, greed, despair and selfishness. We already have lots of apps for the external stuff.

Dr Justin Thomas is an associate professor of psychology at Zayed University and author of Psychological Well-Being in the Gulf States.

Swedish newspaper websites shut down in hacker attack
Sunday, 20 March 2016

Stockholm - The online editions of Sweden's main newspapers were knocked out for several hours by unidentified hackers at the weekend, police said on Sunday as they launched an investigation.
The attack was "extremely dangerous and serious," the head of the Swedish Media Publishers' Association, Jeanette Gustafsdotter, told Swedish news agency, TT.

"To threaten access to news coverage is a threat to democracy," she said.

No one has claimed responsibility for the attacks, which either partially or totally shut down the sites of Dagens Nyheter, Svenska Dagbladet, Expressen, Aftonbladet, Dagens Industri, Sydsvenskan and Helsingborgs Dagblad on Saturday evening from about 8:00 pm (1900 GMT) until about 11:00 pm (2200 GMT).

Several experts quoted in the media suggested the sites were subjected to distributed denial-of-services (DDoS) attacks, in which hackers hijack multiple computers to send a flood of data to the target, crippling its computer system.

Police said in a statement they had launched an investigation, and Swedish intelligence was also being kept abreast of developments.

An anonymous threat was issued on a Twitter account shortly before the attack. The account was attributed to J@_notJ.

Washington Post
America's cyber-insecurity
Sunday, 20 March 2016
Byline: Fred Kaplan

OpEd: When the widely respected national security mandarin Robert Gates was appointed secretary of defense in late 2006, his daily intelligence reports on the cascade of cyberattacks directed against the United States left him incredulous. As author and Slate columnist Fred Kaplan recounts, Gates was "so stunned by the volume of attempted intrusions into American military networks - his briefings listed dozens, sometimes hundreds every day - that he wrote a memo to the Pentagon's deputy general counsel. At what point, he asked, did a cyber attack constitute an act of war under international law?" When the defense secretary finally received a response - vague and evasive, in his estimation - almost two full years had passed.
The episode illustrates an enduring challenge for the United States in the digital age. While some bureaucratic actors within its government are not capable of operating at Internet speed, America's adversaries - hostile sovereign powers, transnational criminal enterprises, hacker and terrorist collectives - continue to attack with all the relentless intensity and innovation afforded by a constantly evolving arsenal of modern cyberweapons, penetration technologies and tactics.

"Dark Territory" captures the troubling but engrossing narrative of America's struggle to both exploit the opportunities and defend against the risks of a new era of global cyber- insecurity. Assiduously and industriously reported, Kaplan's history underscores a double irony in American cyber-strategy. The severity and scope of cyberthreats against the United States have been consistently predicted and demonstrated for decades and have never meaningfully abated. The most extreme threats, such as "decapitation" strikes against U.S. military networks and critical infrastructure, have been effectively countered for more than 20 years, however, while the most pervasive and common penetrations

against American business and corporate interests have been growing exponentially, with no plausible strategy in sight to engineer effective deterrence or a reliable defense.

America's vulnerabilities have been clear for decades. In 1997, a secret National Security Agency "Red Team" was instructed to test the defenses protecting the Pentagon's computer networks. The National Military Command Center was hacked in a day. The Defense Department's intelligence directorate was then penetrated with stunning simplicity: A member of the Red Team called, claiming to be from the Pentagon IT department, and explained that the directorate's password would need to be changed. "The person answering the phone gave him the existing password without hesitation," Kaplan discovered. "The Red Team broke in."

The following year, the computers at Andrews Air Force Base outside Washington were penetrated, a hack that swiftly spread to a dozen military locations. The breach, code-named Solar Sunrise, was initially traced by investigators to an Internet service provider in the United Arab Emirates, triggering speculation that the operation had originated from Iraq. Yet within days, a less dramatic explanation emerged. The culprits were a pair of 16-year-old boys in the San Francisco suburbs operating under the aliases Makaveli and Stimpy.

Kaplan recapitulates one hack after another, building a portrait of bewildering systemic insecurity in the cyber domain. Appointed director of national intelligence in 2007, Mike McConnell was by then a self-appointed proselytizer on the burgeoning cyberthreat. He lobbied the government's national security agencies - as well as the Treasury, Energy and Commerce departments - seeking to impart a greater sense of awareness and urgency. "He would bring the cabinet secretary a copy of a memo," Kaplan writes. " 'Here,' McConnell would say, handing it over. 'You wrote this memo last week. The Chinese hacked it from your computer. We hacked it back from their computer.' "

The cyberthreat posed by China is among the most acute, Kaplan observes, because it is driven by a diverse spectrum of incentives. China executed the most spectacular breach ever of U.S. government data, hacking the Office of Personnel Management (an event that followed the completion of Kaplan's manuscript). According to a Senate briefing provided by FBI Director James Comey, the personal information of up to 18 million Americans was stolen. In addition to conventional spying and penetration operations, Kaplan explains, China engages in highly organized commercial cyberespionage and intellectual property theft. In March 2013, national security adviser Tom Donilon confronted Beijing over its attacks against American corporations and the "sophisticated, targeted theft of confidential business information and proprietary technologies through cyber intrusions emanating from China on an unprecedented scale."

The principal Chinese antagonist of American business, according to Kaplan, was well known across the senior ranks of the Obama administration. It was the Second Bureau of the Third Department of the People's Liberation Army's General Staff, also known as Unit 61398, headquartered in a 12-story building outside Shanghai. It is but one cadre of a cyber-force estimated to be in the tens of thousands.

Kaplan alludes to the scope of the cybersecurity crisis for American businesses and corporations, citing a report by telecommunications giant Verizon that there were 79,790 verified security breaches in the United States in 2014, with approximately 25 percent more penetrations and 55 percent more data losses than the year before. As arresting as this statistic may be, it does not convey the ultimate economic costs at stake. According to some cybersecurity industry estimates, more than $750 billion in economic value is stolen through global cybercrime and commercial cyberespionage operations annually.

One of the deep insights of "Dark Territory" is the historical understanding by both theorists and practitioners that cybersecurity is a dynamic game of offense and defense, each function oscillating in perpetual competition. The United States, Kaplan demonstrates, has excelled in offense.

Tailored Access Operations, an elite unit within the NSA, developed an arsenal of technologies enabling penetration across the communications network. "Obscure points of entry were discovered in servers, routers, workstations, handsets, phone switches, even firewalls (which, ironically, were supposed to keep hackers out), as well as in the software that programmed, and the networks that connected, this equipment," Kaplan notes, ticking off now- ubiquitous hacking technologies. "LoudAuto activated a laptop's microphone and monitored the conversation of anyone in its vicinity. HowlerMonkey extracted and transmitted files via radio signals," even when a computer was not connected to the Internet. "MonkeyCalendar tracked a cell phone's physical location and conveyed the information through a text message. NightStand was a portable wireless system that loaded a computer with malware from several miles away."

During the Iraq War, NSA equipment and analysts were deployed on the ground in a heavily fortified concrete bunker north of Baghdad to assist with the "surge" in American operations to crush insurgent militias and terrorist groups. Captured laptops yielded e-mails, passwords, phone numbers, usernames and the identities of al-Qaeda leaders, all of which were used to launch entrapment and assassination operations that in 2007 alone resulted in the deaths of 4,000 Iraqi insurgents.

In 2009, Defense Secretary Gates created a dedicated Cyber Command. In the first three years the command's budget tripled from $2.7 billion to $7 billion, and cyberattack teams grew from 900 specialists to 4,000, with 14,000 anticipated by the end of the decade. The most ingenious and resourceful operation that has spilled into the public domain is code-named Olympic Games, a joint initiative by the NSA, the CIA and Israel's cyberwar bureau, Unit 8200, to inject the now-famous "Stuxnet" malware program into the industrial computer systems at Iran's nuclear facility in Natanz, disabling thousands of uranium centrifuges.

Today the United States - its defense complex, intelligence community, government agencies, and broad array of economic and corporate interests - is utterly engulfed in what appears to be a ceaseless cycle of offensive incursions and breached defenses. As the Defense Science Board stated in 2013 in a now grimly familiar conclusion, "The network connectivity that the United States has used to tremendous advantage, economically and militarily, over the past twenty years has made the country more

vulnerable than ever to cyber attacks." It is an unsettling thesis that "Dark Territory" indisputably substantiates.

Gordon M. Goldstein is a managing director at the global technology investment firm Silver Lake Partners and an adjunct senior fellow at the Council on Foreign Relations.

Chelsea Manning Revealed How the US 'Insider Threat' Program Tries to Catch Whistleblowers
Sunday, 20 March 2016
Byline: Tess Owen

Washington - Do you work with an egomaniac? Does your colleague seem disgruntled? Are they worried about money? Are they greedy? Or a pushover?
If so, they might be a whistleblower, according to the US government's handbook for its "Insider Threat" program. The program surveils the internal communications of the government's military and civilian contractors, combing them for evidence of particular personality traits and flagging would-be whistleblowers -- like US soldier Chelsea Manning and former NSA staffer Edward Snowden -- to prevent future intelligence leaks.

Manning, who is serving a 35-year sentence for leaking classified information to Wikileaks in 2010, obtained documents about the program after she submitted a Freedom of Information Act request from behind bars in Fort Leavenworth, Kansas. The documents show how officials used Manning to establish a prototype of a whistleblower. Her character and personality are dissected and presented as being symptomatic of the kind of person who would reveal state secrets.

The document, which was first published by the Guardian, lists broad categories at the beginning of the soldier's 31-page file. The main categories are listed as "greed or financial difficulties," "disgruntled or wants revenge," "ideology," "divided loyalties," "vulnerable to blackmail," "ego/self image," "ingratiation," and "family/personal issues."

Related: Chelsea Manning Is Suing the Government to Get Her FBI File

Manning contends that those purported "motives" are overly broad and subjective, and essentially give US officials the green light to spy on whoever they want. "The broad sweep of the program means officials have been given a blank check for surveillance," Manning said.

"This lack of focus has already led to the program becoming industrialized," Manning said, referring to a document from 2015 in which the US Department of Defense revealed the existence of "continuing evaluations" of 100,000 personnel on and off the job.

In the aftermath of the Wikileaks revelations in 2010, where Manning downloaded and distributed thousands of classified documents, the Obama administration formed the National Insider Threat Task Force. The task force was comprised of a number of government agencies, including the Office of the Director of National Intelligence and the Department of Justice. That initiative was applicable to anyone who worked for a federal agency.

Some civil rights groups have found the way Manning's gender dysphoria is cast in the document to be particularly egregious. US officials imply that Manning's gender identity had a significant part to play in her decision to leak the documents. The version of the document using Manning as a case study was drawn up in 2014, 10 days before she legally changed her gender from male to female. As a result, the document uses male pronouns to describe Manning.

"During PVT Manning's service in the US army, he struggled with his self-image as a man when he wanted to be an openly accepted female in the US army."

"The program alleges that I am 'disgruntled' based on my perceived sexual orientation and gender identity," Manning wrote in response to the documents. "It describes me as an 'advocate for homosexuals openly serving' in the military, and my concern and advocacy of queer and trans rights as being expressed 'obsessively.'"

Related: Edward Snowden Calls 'Bullshit' on FBI's Claim That It Can't Unlock iPhone

The ideology Manning espoused, according to the document, was that of a hacker who deemed "all information (government in particular) should be public knowledge."

That Manning had reportedly broken up with her boyfriend before being deployed to Iraq, that she worked the late shift, and that she researched gay rights "obsessively," were also red flags, according to the document.

There are no federal statutes that limit a private employer from surveilling their staff. However, the Federal Privacy Act does limit the amount of information a federal employer can collect on their employees. As a way of getting around those restrictions, the "Insider Threat" initiative basically provides all federal employers with a warrant.

The program also fosters a "if you see something, say something" mentality in the workplace - - effectively encouraging people to keep tabs on their co-workers. "In past espionage cases, we find people saw things that may have helped identify a spy, but never reported it," Gene Barlow, a spokesman for the Office of the National Counterintelligence Executive said in 2013. "That is why the awareness effort of the program is to teach people not only what types of activity to report, but how to report it and why it is so important to report it."

New York Times
Building a Better Anonymouse Trap
Sunday, 20 March 2016
Byline: Margaret M. Sullivan

The Times has a new way to handle information supplied by people who don't want to be identified by name -- also known as anonymous sources, or jocularly, because they are omnipresent and hard to control, as "anonymice."
After I wrote about the new guidelines last week in a blog post, many readers wrote me to share their reactions. I want to use this column to give voice to those reactions, which ranged from skepticism to gratitude, sometimes with a healthy dose of caution thrown in.

But first, some background. The new policy has been in the works ever since The Times published (and then had to recant major parts of) two articles within six months that were based on anonymous sources: One reported that the Justice Department had been asked to do a criminal investigation of Hillary Clinton's email practices; another described the supposedly out-in-the-open social media support for jihad by one of the San Bernardino killers.

After the articles were fixed, and hefty corrections or editors' notes attached, the executive editor, Dean Baquet, told me that he thought current practices needed strengthening. He assigned a team of senior newsroom managers, led by the standards editor, Philip Corbett, to work on it; and they in turn sought the opinion of some of The Times's most experienced reporters and editors.

The result is a sensible, wise and much-needed approach to a problem that readers have long complained about. It's one of the concerns I've heard the most about during my time as public editor.

Under the new guidelines, articles in which the main point hinges on an anonymous source or sources must get special scrutiny; they have to be flagged for review and approval by Mr. Baquet, or by one of two deputy executive editors, Matt Purdy and Susan Chira. Mr. Purdy, in an interview last week, described these kinds of stories to me as potential "journalistic I.E.D.s" because they may explode and do great harm to The Times's credibility.

Any other use of anonymous sources must be approved by a "desk head" -- for example, the top culture, metro or international editor -- or that person's deputy. And the guidelines reinforce a longstanding policy that an editor must know the identity of each anonymous source.

Finally, the guidelines state that the use of direct quotations from unnamed individuals should be rare. Mr. Purdy told me that too often, these quotes allow sources to express "their impression, their spin, their agenda" without accountability and without allowing readers to evaluate their motives. After all, readers don't know who's behind the quoted words.

Many readers were appreciative that The Times has taken their concerns seriously. "Outstanding!" wrote Steven Hillyard of Carmel, Calif., who said he had almost given up on this issue. He added: "Keep it up; it's important for us to get the real news, not just spin."

And Jim Poling, managing editor of The Hamilton Spectator, a daily newspaper in Ontario, Canada, praised The Times for what he called an important step and for emphasizing the importance of credibility. He distributed the guidelines to his own staff for consideration.

Still, perhaps the most common reaction was a kind of world-weary skepticism, along the lines of "I'll believe it when I see it."

Philip Kalikman of New York said that editors' assurances that the guidelines would indeed be followed, "rest on a lot of wishful thinking and good intentions." He proposed a reader-driven policing of the guidelines: "How about a requirement that whenever a reader writes to the public editor to question or object to the use of an anonymous source, and the public editor deems the objection valid, the news editors must respond to the specific incident with more information." I've passed the idea along to Mr. Corbett.

Another reaction -- less common but certainly worth thinking about -- was concern that the policy might hurt enterprise journalism. Some readers realize that sometimes anonymous sources are the only way important stories can come to light.

Steven M. Gorelick of Westfield, New Jersey wrote: "It seems I'm in the minority, but I hope The Times will do everything possible to make sure that the use of anonymous sources remains a vital, effective part of the reporter's tool kit."

Tightening the rules is fine, Mr. Gorelick said, but the paper should not go too far. "The last thing I want is a news product limited to stories provided and confirmed by named sources," he wrote. "I don't want genuinely intimidated whistle-blowers to ever be reluctant to get on the phone. I don't want powerful people who are uniquely situated to know painful truths to ever have to fear exposure if they contact a reporter."

Mr. Gorelick depends, he said, on Times journalists' "best judgment and careful scrutiny of who these sources are and the truth of what they are claiming."

His comments are astute. Whenever I've written on this subject, mostly to urge The Times to follow its own guidelines on using anonymous sources only as "a last resort," I've acknowledged that confidential sources are indispensable to a lot of great journalism.

These new guidelines certainly don't ban anonymous sources, nor should they. But they will probably make them less common and more carefully scrutinized; that was evident already in the pages of The

Times last week. The guidelines are a commendable development. It will be important to adhere to them conscientiously, not just in this initial phase but in the long run.

The opening words of Mr. Baquet's memo announcing the changes put it well: "The use of anonymous sources is sometimes crucial to our journalistic mission. But it also puts a strain on our most valuable and delicate asset: our trust with readers."

Sometimes it takes a crisis to create change. But no matter what prompted it, newsroom leadership has listened to readers' concerns and taken firm action. That's heartening -- and crucially important for the future of The Times.

A post in last week's Public Editor's Journal took up reader concerns about the post-publication editing of an article on Bernie Sanders' legislative accomplishments, which changed its tenor without notification or explanation to readers.

New York Times
ZTE Document Raises Questions About Huawei and Sanctions
Saturday, 19 March 2016
Byline: Paul Mozur

Hong Kong - When the United States government punished ZTE of China this month, saying it had done business with Iran, it released internal company documents that it said detailed how the electronic equipment maker had done it -- and that also suggested the problem might not be limited to one Chinese company.
One document described how ZTE would set up seemingly independent companies -- called "cut-off companies" -- that would sign the deals in other countries. That could enable it to continue to do business in Iran, North Korea and other countries placed under American restrictions.

In describing the effort, the document cited as a model -- and at times a cautionary tale -- a rival company it called F7. ZTE said F7 had done something similar, though its business in restricted companies ended up hurting its American ambitions.

The document does not give F7's real name. But the description offered by ZTE matches a company far larger and more politically sensitive: Huawei Technologies, its chief rival and a major force in the technology world.

The ZTE document, dated August 2011, suggests that other Chinese companies could have potential exposure to American export limits. Given the recent sanctions against ZTE, it also suggests that the issue could be a continuing one between Chinese and American government officials.

ZTE on Thursday said that it had delayed the release of its annual financial results because of the sanctions, which limit the ability of American companies to sell equipment to it.

ZTE officials declined to comment on the identity of F7, and Huawei declined to comment. ZTE has said it is cooperating with investigators and is committed to complying with the law.

The United States Commerce Department, which last week restricted sales of American telecommunications equipment to ZTE, accusing it of violating embargoes, did not respond to requests for comment.

It is rare for the Commerce Department to publicly provide evidence for an addition to its blacklist of restricted companies, especially full disclosure of internal documents.

It is not clear how accurate ZTE's version of the events might be. The document says some information about F7 was gathered by ZTE's legal department, without offering details.

F7, the document says, tried in 2010 to buy an American company called 3Leaf but met with opposition from American officials. That same year, Huawei agreed to buy major assets from 3Leaf, but it dropped the bid in February 2011 because of opposition from American officials.

F7 also has a joint venture with the American digital security company Symantec, the 2011 document says. Huawei had a joint venture with Symantec before the American company dissolved it in 2012.

Like ZTE, Huawei makes telecommunications equipment for corporate networks and for big telecommunications systems such as phone companies. American officials have long suspected it has Chinese government ties, and United States intelligence officials have tried to tap into the company's network. Both companies are effectively barred from selling equipment for American networks.

Huawei says that it is privately owned and that accusations of government ties are an excuse to hurt the company for protectionist purposes.

Huawei is much larger than ZTE. In 2014, it reported revenue of about $60 billion, about four times that of ZTE. Depending on the measure, it ranks with Sweden's Ericsson as the world's largest supplier of the base stations and other equipment that make mobile telecom networks run. Huawei equipment supports networks in countries across the world, including many European markets.

While both Huawei and ZTE are given privileged status as high-tech innovators by China's leadership, Huawei is more prominent.

Huawei has also had greater success selling its smartphones in America, and indeed across the world. The company was the third-largest smartphone vendor by units sold in the fourth quarter of 2015 according to IDC, with an 8.1 percent share of the global market, compared with the 21.4 percent share of Samsung, the company in first place.

Despite the trouble in the United States, Huawei has not shied away from potentially controversial deals. In September, Huawei signed a deal with Syria's Communications and Technology Ministry to help the country develop its communications networks.

The ZTE document details how F7 recruited compliance experts and placed them in its joint ventures as part of efforts to mitigate its risks. It says that the company recruited one "senior export control compliance specialist from Texas Instruments" and a "Chinese- American attorney who is familiar with the related laws in the U.S."

It also describes how F7 found partners that it could say were independent companies and that could work on its behalf in countries under embargo. F7, it said, found a big information technology company that was "serving as its agent to sign contracts for projects in embargoed countries."

"This cut-off company's capital credit and capability are relatively strong compared to our company; it can cut off risks more effectively," the document said.

But ZTE came to believe that F7's activities in embargoed countries hurt its American expansion efforts.

It said it believed that F7's efforts to acquire companies in the United States were in part blocked because of its "ongoing projects in embargoed countries."

Pakistan Dawn
The threat of cyberterrorism
Monday, 21 March 2016
Byline: Uzair M. Younus

Islamabad - Over three billion users access the internet today, compared to a measly 400 million in 2000. As the internet creates new opportunities for countries across the world, it also creates a whole host of challenges in the cyber realm. The anonymity offered by the internet, and its disregard for national boundaries, a revolutionary trait, is now becoming a military challenge. To ensure long-term security of its military and civilian infrastructure, Pakistan must implement a forward-looking strategy to deal with these cyber threats.
When US director of National Intelligence, James Clapper, was asked about the threats faced by the United States, he placed cyber at the top. "Cyber threats," he said, "to US national and economic security are increasing in frequency, scale, sophistication and severity of impact; [and] the ranges of

cyber threat actors, methods of attack, targeted systems and victims are also expanding." The United States is not the only country facing this challenge; all leading economies of the world are wary of the real danger they face in cyberspace.

Starting with the Stuxnet attack on Iran in January 2009, the scale and damage caused by cyberattacks has grown tremendously. Russia, China, North Korea, Iran, the United States and Israel all have robust and indigenous cyber warfare capabilities. Under the Modi government, India has also started work on developing its own cyber capabilities. Pakistan has been lagging behind and has so far failed to develop and implement any robust policy framework directed at emerging cyber challenges.

Cyberterrorism poses an immediate and short-term threat to the country's national security. This could consist of cyberattacks and the use of the internet by terrorists to plan, recruit, and communicate with other terrorists inside and outside the country. While terrorists probably do not have the sophisticated skills to target critical infrastructure, they have used the dark corners of the internet to communicate, recruit, and plan terrorist attacks. As ongoing counterterrorism operations squeeze the physical space for militants in Pakistan, they will increasingly withdraw deep into the internet to plan and communicate with each other. Unable to carry out large terrorist attacks in public, they could also begin to learn new and more dangerous cyber warfare capabilities.

The government, military and private sector must develop a framework for securing the country's critical infrastructure from cyberattacks.

A more serious and long-term threat emanates from cyber warfare carried out by other nation states, in particular India. After the Mumbai terrorist attacks of November 2008, plans to carry out quick military strikes against Pakistan were developed. Future terrorist attacks, like Mumbai, could lead to a quick military response from India and punish Pakistan for its alleged involvement in terrorist strikes on Indian soil. In response, Pakistan began developing tactical nuclear weapons at a rapid pace. These weapons have lowered the nuclear threshold and act as a deterrent against such measures.

The introduction of offensive cyber capabilities, however, would upend this strategic balance. Armed with offensive cyber weapons, and confident that Pakistan does not have similar capabilities, India could wreck Pakistan's critical military infrastructure. It could then conduct quick offensive strikes against Pakistan, or be satisfied with the damaging effect of cyberattacks. The development of such weapons would undermine the balance of power in the region and allow India to conduct punitive strikes against Pakistan with relative ease.

A three- pronged approach is needed to deal with cyber threats emanating from state and non-state actors.

Firstly, the government must pass well-articulated legislation that provides a legal framework for law enforcement and intelligence agencies to operate under. The draft cybercrime bill developed by the government has raised a number of issues. This bill needs a lot more work and must be amended before

being passed as law. Furthermore, a transparent process, with input from the private sector, needs to be developed for accessing communications data when national security is at risk. Such regulatory measures should not trample on freedom of speech and the user's right to privacy, and should have oversight measures to ensure that the powers granted to the intelligence agencies are not abused.

Secondly, Pakistan must develop a centralised command that serves as the central organisation responsible for the development of military capabilities in the cyber realm. This cyber command should be tasked with modernising Pakistan's cyber defences, both in the military and civilian domain, and for developing and demonstrating offensive cyber capabilities. The goal of the cyber command must be to ensure that Pakistan achieves and maintains a strategic cyber deterrent. China's People's Liberation Army (PLA) is beginning to develop a similar cyber command, and Pakistan can leverage its deep defensive ties with China to collaborate with the PLA in this domain.

Finally, the government, military, and the private sector must come together to develop a framework for securing the country's critical infrastructure from cyberattacks. Financial markets, the electric grid, nuclear weapons, and other physical assets must be secured in a consistent manner. Scenario planning and war games must be conducted to harden critical assets, and exercises must be carried out to simulate cyberattacks and flush out measures that must be taken during such events.

Cyber threats will continue to grow exponentially in the coming years and the costs of not investing in a full spectrum of cyber capabilities will continue to escalate. While the Senate Committee on Defence and Defence Production, along with other experts have raised this issue, no significant headway has yet been made. Emerging cyber threats can no longer be ignored, and a continued failure to plan and execute today will cause long-term damage to the security of the country.

English unsafe language to communicate crucial data
Monday, 21 March 2016

New Delhi - English language was the highest spam sending language in 2015, with 84.1 per cent of all spammers using it for cyberattacks, followed by Chinese (2.6 per cent) and German (1.7 per cent) in second and third spots, respectively, a report by Trend Micro Incorporated said.
Japan-based firm Trend Micro Incorporated released its annual security round-up report, which dissected the most significant security incidents from 2015.

It said that people need to constantly update their systems to protect against new attacks. "The first quarter of 2016 clearly showed we need to also watch out for older threats, and how no industry or system should feel exempt. After all, who would have thought that language is also something to worry about from cyber threats perspective?" the report said.

The research confirms cyber criminals are now bolder, smarter and more daring than ever before.

The Trend Micro Smart Protection Network blocked more than 52 billion threats in 2015 -- a 25 per cent decrease from 2014.

This decrease is consistent with the downward trend of system infections since 2012, caused by attackers who have become more selective of their targets as well as the shift in technologies they use.

Robin du web, un Anonymous résisterait dans le Mâconnais
Monday, 21 March 2016
Byline: Jérôme Morin

Mâcon, France - Il a 36 ans, vit dans la région mâconnaise et ferait partie du mouvement des Anonymous. Un homme, qui travaille dans le domaine paramédical, lève le voile sur ce groupe né sur internet. Pas besoin d'être hacker, assure-t-il, pour devenir un Anonymous.
Nous ne commettons ni vol de données, ni destruction. » Un homme de 36 ans, né à Mâcon et qui vit aujourd'hui dans les environs, ferait partie du mouvement des Anonymous, né sur internet, et qui fonctionne sans leader. « Je ne suis qu'un membre, pas le représentant », prévient l'activiste, qui s'est engagé il y a deux ans dans ce réseau « totalement apolitique. On voit souvent les Anonymous comme un groupe de hackers. En fait, seulement 10 % sont capables de pirater n'importe quoi. Chacun peut être Anonymous. »

Pour preuve, l'homme, performant, dit-il, en informatique, participerait également chaque mois à des maraudes à Lyon auprès de sans-abri avec d'autres Anonymous. Il aurait aussi placardé des affiches du type "Je ne veux pas que tu penses comme moi. Je veux simplement que tu penses", dans les rues du Mâconnais.

« Nous sommes pacifiques et nous le resterons. Certains mouvements d'extrême droite notamment utilisent malheureusement notre symbole » : le fameux masque blanc à moustache.

Un hacking en cours de la banque centrale des banques centrales ?

Un masque qui, selon le trentenaire, est « le symbole de ceux qui ont choisi de se battre pour la justice et la liberté. Nous protégeons l'anonymat car il ne fait pas bon de nos jours de dire la vérité. » Comme lui, des habitants de Chalon, Montceau ou encore Lyon auraient rejoint le mouvement international.Avec « ses frères et soeurs » Anonymous, il assure dénoncer.

Régulièrement les propos pédophiles tenus sur Facebook et Twitter - et « ils sont nombreux ».Après les attentats du 13 novembre, les Anonymous ont notamment bloqué des sites internet de Daesh. Actuellement, ils se concentreraient, selon le jeune homme, sur une grosse opération de hacking de la banque centrale des banques centrales, la Bank for International Settlements, basée en Suisse.

A Right to Privacy?
Wednesday, 30 March 2016
Byline: Marni Soupcoff
Section: oped

If there's one thing we know about politics, it's that you should never expect the players to be consistent. Before last fall's federal election, several prominent Liberal MPs expressed strong misgivings about Canada's agreement to turn over the personal financial information of "U.S. persons" residing in Canada to the U.S. government. It was a deal reached to comply with the U.S.'s new Foreign Account Tax Compliance Act (FATCA). At the Americans' behest, Canada began sharing tax information about Canadians, some of whom have never lived in the United States, never worked in the United States and never owed the Internal Revenue Service (IRS) a single penny.
No one was clearer about his qualms about this agreement than now- Prime Minister Justin Trudeau, who wrote in a pre-election letter, "The Government of Canada has a responsibility to stand up for its citizens when foreign governments are encroaching on their rights. We believe that the deal reached between Canada and the U.S. is insufficient to protect affected Canadians."

In 2014, MP Marc Garneau, now the transport minister, also voiced his disapproval of the agreement by pointing out that the IRS was trying to get the Canada Revenue Agency (CRA) to "do its dirty work." Yet now he says he supports the deal.

The current revenue minister, Diane Lebouthillier, has repeatedly defended the agreement and sought to reassure Canadians that it does not violate their rights. According to iPolitics reporter Elizabeth

Thompson, a request from that news outlet for an interview with Lebouthillier elicited an email reply from her office that said: "The CRA ensures that tax cooperation with its foreign partners is done in a manner fully consistent with privacy rights in Canada. It is important to note that Canada and the United States have a long history of exchanging tax information in a fair and responsible manner, going back to 1942."

It is, of course, every policymaker's prerogative to change his mind, and there's no doubt that the U.S. has made the penalties for not acceding to its demands with regard to FACTA exceptionally harsh. It is, however, still disappointing that we appear to be no further ahead in addressing the constitutional problems with the FATCA-related agreement than we were when the previous government passed it two years ago.

Indeed, the unfair ramifications of the deal remain: for Canadians, merely having dual U.S. citizenship - for example, because one's parents were Americans or one was born on U.S. soil to Canadian parents - is enough to trigger the mandatory sharing of private financial details. This is why two Ontario women launched a lawsuit against the Canadian government in August 2014 for agreeing to the information sharing.

That suit is still before the courts, but the feelings of one of the plaintiffs, Gwen Deegan, expressed around the time the constitutional challenge was launched, remain as relevant as ever: "This is an infringement on Canadians of U.S. origin by our Canadian government. It's literally a betrayal and I feel we can't just sit idly by and let it happen."

Deegan is a graphic designer from Toronto who was born in the United States, but has not lived there since she was five years old; she has never held a U.S. passport, nor has she ever worked in the United States. This tenuous connection with the United States still qualifies her as a "U.S. person" whose financial details the CRA will now be turning over to the IRS, if it hasn't already. Her fellow plaintiff, Ginny Hillis, a retired lawyer from Windsor, Ont., has also not lived in the United States since she was five years old; that's when she moved to Canada with her Canadian parents. Like Deegan, Hillis has never held a U.S. passport.

As I noted in a column in 2014, the interesting thing about Deegan and Hillis's circumstances is that both women happen to be married to Canadians with whom they hold several joint financial accounts. Why should these women's husbands - who are not "U.S. persons," even under the most expansive definition of that term - also be subject to having the details of their financial savings turned over to a foreign government? Do Canada's constitutional guarantees of liberty, security of the person and freedom from unreasonable search and seizure not apply as forcefully to these men, as well?

At the heart of this debate is the question of whether the agreement with the U.S. is in violation of the Canadian Constitution, as Deegan, Hillis and others have argued convincingly during this case.

If it is, all the American bullying in the world is not enough reason to sacrifice Canadians' rights.

Marni Soupcoff is executive director of the Canadian Constitution Foundation (theccf.ca).

Cracking the Apple case
Wednesday, 30 March 2016
Section: editorial

The stare-down between Apple Inc. and the U.S. government over the sanctity of the company's encryption techniques has ended with the Federal Bureau of Investigation hacking into an iPhone 5C on its own. But the underlying issue remains. Despite valid public concern about protection of personal privacy, the FBI was right to do so.
The key question was whether Apple was obliged to help the government break into a device suspected of containing information relevant to the investigation into the terrorist attack in San Bernardino, Calif., last year. The company declined to assist, professing a duty to protect the privacy of its customers.

It's natural to sympathize.

People don't want strangers - whether criminals, governments or the merely prurient - rummaging around in their online financial transactions, medical communications or love letters. And the Obama administration has shown a cavalier disregard for certain civil liberties, especially the Fourth Amendment guarantee against "unreasonable searches and seizures." Some of the more notorious examples that have come to light include the Department of Justice secretly obtaining journalists' phone records, the FBI and National Security Agency tapping into Internet servers and misleading Congress about their activities, and the Central Intelligence Agency hacking into Senate Intelligence Committee computers while the committee was investigating its detention and interrogation policies.

No wonder people are worried. And no wonder companies like Apple feel compelled to respond to their concerns. But the technological aspect of the San Bernardino iPhone case should not obscure the underlying issues, which are legal rather than technical.

The reason governments, in Canada as well as the U.S., can't kick down your door and strip-search you in your bedroom isn't because it doesn't know how. It's because it would need a warrant to do so. The same is true should it wish to seize your phone and rifle through your text messages.

Suppose police were aware that crucial evidence had been hidden in a safe. They can't just blow it open at will. But they can apply for a warrant and make their case to a judge. If the police then asked the manufacturer for details enabling them to open it without damaging the contents, would the company be defending liberty to refuse? Or obstructing justice?

The manufacturer would be correct to point out that aiding the police might increase their technical ability to open any such safe with or without a warrant. Yet having that knowledge would not necessarily lead to a rash of lawless break-ins. Because what stops the police from safe-cracking at random isn't lack of tools or technical knowledge. It's the absence of a warrant.

The same applies to data stored in private phones. Users have every right to protect their privacy, including through encryption, just as they have every right to lock their doors. And the state has no right to ask companies to weaken their encryption, as the U.S. government was accused of doing in asking Apple to create a modified operating system to bypass the iPhone's password security. But that does not imply absolute protection for information related to unlawful activities, or give the company the right to refuse cooperation in lawfully obtaining access.

The FBI found a way into this iPhone anyway, and hence others like it. In doing so, it may dent confidence in Apple's boasts about the quality of its encryption. Indeed, one possible side benefit of this case may to help cure people's outsized faith in the ability of technology to guard privacy, especially those curiously convinced that Apple products have flawless encryption and are immune to viruses.

The key to protection against the state breaking into your phone is the same one protecting the sanctity of your home. Without a warrant, such activity is itself criminal.

It's important that judges remain skeptical when warrants are sought for digital devices. But if appropriate conditions are met, there is no more right to refuse to unlock your phone to the police than to refuse to unlock your door. And phone companies have no more right than safe manufacturers to refuse to explain how the thing works.

Eternal vigilance is the price of freedom. Not strong encryption.

BlackBerry could stand to benefit after U.S. authorities hack iPhone
Wednesday, 30 March 2016
Byline: Jeff Lagerquist

BlackBerry Inc. could benefit from the U.S. Federal Bureau of Investigation's successful unlocking of the San Bernadino gunman's iPhone as major smartphone makers look to shore up security on their devices. But technology analyst Carmi Levy says it will mean Blackberry drawing a "line in the sand" on government access, like rival Apple Inc.
"If BlackBerry wants to maintain its brand going forward . . . it's all about security. It needs to be perceived the same way," said Levy in an interview with BNN.

Privacy software has been a key focus for BlackBerry for several years as the Waterloo, Ontario-based company shifts its focus away from building phones.

"Security is what we do. Privacy is what you get. We have the most trusted networks outside of the carriers themselves. It is what we offer, and how we think about our business," said CEO John Chen in a Feb. 11 blog post.

Both BlackBerry and Apple have denied government requests for so- called backdoor software that would allow investigators to access a phone's data without company assistance. But Chen has said that BlackBerry's privacy commitment "does not extend to criminals."

The successful hack of the iPhone 5C used by Syed Farook avoids a courtroom battle between the U.S. Justice Department and Apple Inc. that could have set a precedent on privacy issues between governments and technology companies.

Apple is now faced with selling a product that has a proven security vulnerability. The FBI and U.S. Justice Department have no obligation to reveal how the phone's security features were hacked. Speculation online points to third party assistance from the private sector - including Israeli data extraction specialists Cellebrite Mobile Synchronization Ltd.

"Apple has got a problem now. Apple is no longer the one controlling the agenda of who gets into its phones. Some third party is," said Levy. "Next time the FBI, CSIS, or any other law enforcement agency [is] not even going to bother with a warrant for Apple. They are going to go to that third party and ask for their help."

Meanwhile, BlackBerry has showcased its ability to combine its core security competencies with Google's Android platform with the release of its PRIV smartphone last year.

"This could turn out to be a potential win for BlackBerry if they are able to secure contracts with those operating software makers, that would be Google or Apple," said BNN's Amber Kanwar.

The potential boon for BlackBerry's software business comes at a time when some analysts are predicting the company will cease its hardware offerings. Daniel Chan of TD Securities said in a recent note to clients the absence of a cheap BlackBerry handset at the Mobile World Congress in Barcelona a few weeks ago was a telltale sign that the company would focus solely on software.

BlackBerry has been on a buying spree to boost its security capabilities over the last 18 months, acquiring AtHoc, Secusmart, WatchDox, and Good Technology. The company hopes to extend its security services beyond smartphones into Internet of Things-based machine-to-machine communication.

BlackBerry reports its fiscal fourth-quarter earnings on Friday.

China Daily
Manufacturing of 'spy' story to stain China's reputation
Wednesday, 30 March 2016

Chinese businessman Su Bin, according to some media reports, pleaded guilty to "cyber espionage" charges almost at the same time that China's Foreign Ministry announced President Xi Jinping's participation in the fourth Nuclear Security Summit in Washington on Thursday and Friday.
No wonder some media outlets and US officials are trying to cast a shadow over Beijing-Washington ties before Xi's meeting with US President Barack Obama on the sidelines of the nuclear summit. With vivid descriptions and seemingly "credible evidence", the reports have painted the picture of a plot in Su's case which resembles those in James Bond movies and some Hollywood blockbusters to catch eyeballs.

According to US Assistant Attorney General for National Security John Carlin, the admission of guilt by Su sends a strong signal that a heavy price has to be paid for stealing intelligence from the US and its enterprises, and Washington will - and has the capability to - capture those who do so and hold them accountable. An official from the Federal Bureau of Investigation's cyber section said the US should be on high alert against cyber threats because its adversaries are continuously raising their capabilities.

The reports also said that following Su's confession, the US is doubling its efforts to prevent "cyber espionage" by China.

That Washington chose to announce the "details" of Su's case on the very day that Beijing released the agenda for Xi's visit to the US suggests it is aimed at pressuring China into conceding some serious demands on cybersecurity. The making of "China's cyber espionage" story and its dissemination across the media and the international community are apparently aimed at spoiling China's reputation.

By doing so, the US can use the excuse of "judicial independence" to shirk its responsibility in such a case whenever China raises questions over Washington's cyberespionage activities.

The timing of the announcement is also a breach of basic international practice and diplomatic protocol, and exposes the US' hegemony mentality.

Despite appearing to be an accidental incident, the Su case shows the effects of the US' meticulous planning if seen in the context of the recent developments in Sino-US ties. Over the past year, the US' policy toward China has witnessed certain changes, making it increasingly likely that Washington would find faults with Beijing. This is not only related to the increasing anti-China rhetoric in the year of the US presidential election, but also to the growing "sense of anxiety" in the US' strategy toward China.

The intensifying strategic competition between the two sides because of China's steady rise has prompted some in the US to seek a strong response to China. It has also made them push for a "China-containment" policy by raising topics such as "cyber espionage" and "freedom of navigation" in the South China Sea to disturb the peaceful environment China needs for its development.

Considering that the expected meeting between Xi and Obama in Washington is likely to further advance Sino-US relations, Washington should reduce the media hype over the Su case and prevent it from disturbing the smooth development of bilateral ties, damaging mutual interests and endangering the US' strategic interests.

China and the US both should adhere to the agreements they reached at a high-level dialogue in December on fighting cyber crimes, for they are meant to guide them to seek common grounds, expand cooperation and avoid confrontation in the field of cybersecurity. More importantly, the US should discard its Cold War mentality and work with China to keep Sino-US ties on track in order to develop a new pattern of bilateral relations, which both have vowed to build.

The author is director of the center for crisis management studies, China Institutes of Contemporary International Relations.

Comelec seeks NBI help vs hackers
Wednesday, 30 March 2016

The Commission on Elections yesterday asked the National Bureau of Investigation (NBI) to look into the hacking of the Comelec's website last Sunday.
Comelec spokesman James Jimenez said they have referred the case to the NBI's cybercrime division as a group identifying itself as "LulzSec" has claimed uploading parts of the Comelec's database to its Facebook account.

"That matter has actually been referred to the NBI cybercrimes. So right now, the first step really is to validate whether or not the data they posted are authentic... At this point, I really don't know if it's the real deal and that's the first thing that we want to find out," Jimenez said.

The NBI, however, said it has yet to receive the request from the Comelec.

"None yet," said Victor Lorenzo, executive officer of the NBI's cybercrime division.

However, Lorenzo stressed the communication between the NBI and the Comelec should be established and secured before the hacking incident is investigated.

"We have to check if the logs on the website have been restored. Comelec may have kept some of them while restoring the website for security," Lorenzo said.

In its Facebook account, LulzSec posted "A great lol (laugh out loud) to the Commission on Elections, here's your whoooole database."

LulzSec, reportedly affiliated with hacker group Anonymous Philippines, hacked the Comelec's website, leaked the voter database and demanded that the poll body make the May 9 elections credible.

The website is still accessible but the precinct finder search engine, which publishes assigned precincts of registered voters based on their names and birthdays, is still "under maintenance."

Jimenez said the Comelec has not restored the website as it is undertaking a cleanup.

"But it's not been hacked again," Jimenez said. "I think that's the most important thing. We're just undergoing maintenance right now. It's not yet 100 percent back to normal but we're working on it."

Jimenez said the election website would be highly secured in time for the upcoming polls.

Khaleej Times
DarkMatter to boost regional cyber security solutions

Wednesday, 30 March 2016
Byline: Sandhya D'Mello

Dubai - UAE-headquartered DarkMatter -- exclusive cyber security partner to the UAE government -- an international cyber security firm, is planning to boost its cyber security solutions in UAE and in the region, said Dr Najwa Aaraj, vice-president of special projects at DarkMatter on the sidelines of the Future Technology Week which opened on Tuesday and will conclude on March 31, 2016 at Dubai World Trade Centre, or DWTC.
Dr Aaraj gave a presentation based on the theme, 'Security solutions for the mobile embedded world'. The company helps transforming the cyber security landscape by providing a complete range of state-of-the-art services and solutions to government and commercial clients.

"We have observed that UAE market is one of the biggest adapters of the smartphone embedded devices, IoT devices and embedded systems with people wanting to adopt latest technology and latest operating systems and apps are installed there. However, there is no real control and poor device management over what applications are being downloaded. Societies need to understand the mobile and cyber threats are on rise with almost five billion attacks in 2015 alone were recorded on general infrastructure in addition to half a million new threats coming every year."

The first edition of Future Technology Week opened at DWTC on Tuesday, with thousands of technology industry professionals flocking to the opening salvo of the two-day Internet of Things Expo (IoTX) and the one-day Gulf Enterprise Mobility Exhibition & Conference, or Gemec.

The Gemec discussions focussed on how heightened enterprise mobility will transform companies' customer engagement strategies and how forensics, access controls and authentication can limit mobile security threats in a mobile embedded world. Ashi Sheth, manager Enterprise Platforms of Netflix, delivered the keynote address.

A new umbrella identity collecting Gulf Information Security Expo & Conference (GISEC), IoTX, The Big Data Show and GEMEC, the exhibition element of Future Technology Week collects more than 180 exhibitors displaying innovative solutions and products on the show floor.

Jerusalem Post
Knesset approves extension of biometric database pilot
Wednesday, 30 March 2016
Byline: Yonah Jeremy Bob

Jerusalem - The Knesset on Tuesday voted 41-32 in favor of a nine- month extension of the current biometric database pilot program despite signs that support for the initiative, even within the coalition, has eroded somewhat.

The vote ratified a request by Interior Minister Arye Deri on Sunday for an extension until December 31, 2016 to better learn the issues since he is relatively new in the job.

The reduced support is a result of a representative of the program admitting last week that the database is not leak-proof, an issue coalition chairman Tzachi Hanegbi (Likud) noted bothered him as well and could lead him to eventually vote down the program.

Last week, the Movement for Digital Rights slammed the admission by Naama Ben Zvi Riblis, a lawyer for the Biometric Database Authority, as proof that validated its attack on the entire new biometric database idea as exposing citizens to a new level of invasion of their privacy rights.

The NGO's lawyer, Yehonatan Kleigar, stated, "At this meeting they put the truth on the table for the first time" as the authority "said on the record that the working assumption was that the entire biometric database would be hacked... and now we are not the only ones who are saying this... so why do we need this? Why take the risk?" Asked about the admission of how easily the database could be hacked, Knesset Constitution, Law and Justice Committee chairman Nissan Slomiansky's spokesman said he did not remember the authority saying that, but, surprisingly, if they did say that, the chairman still "had no position" on whether this should impact moving forward.

Committee spokesman Shimon Malka said the authority making the admission of "no one will sign an insurance form that the database will never be hacked" was correct, while suggesting that the NGO had taken the statement a little bit further than what was said.

The initial pilot program started in June 2013 and expired in June 2015, but former interior minister Silvan Shalom had already extended the program nine months, with that extension due to expire soon.

Slomiansky summarized the views at the hearing as mostly agreeing that the biometric cards were positive developments, but with a debate about whether to continue the database.

Ben Zvi Riblis, in contrast, said the database should be continued, but that possibly it would only contain facial recognition data and not fingerprint data.

The phenomenon of forging false identity cards led the Knesset to authorize the pilot for new identity cards in 2009 and to authorize managing the database in August 2011.

Arab News
KACST chief calls for upgrade in cyber security technology
Wednesday, 30 March 2016
Byline: Mohammed Rasooldeen

Riyadh - There is a strong need to develop scientific research in the field of information security through transfer and localization of technology in the Kingdom, said Prince Turki bin Saud bin Mohammed, president of the King Abdulaziz City for Science and Technology (KACST), here on Tuesday.
He was speaking during the inauguration of the third Saudi international conference on information technology entitled "Cyber Security" at the KACST headquarters.

Organized by KACST under the patronage of Custodian of the Two Holy Mosques King Salman, the event was attended by Communications and IT Minister Mohammed Al-Suwaiyel.

The theme of the two-day conference was "Information security and protection to ensure a secure electronic culture."

Prince Turki said the annual losses accruing from cybertattacks are estimated at $445 billion globally, and the volume of damage of such attacks is expected to rise in the future as a result of the expansion of electronic services and the entry of new technology concepts. "We have to build our own national capabilities through innovation to protect data."

Moreover, he said, the KACST has been working in cooperation with the relevant authorities on the transfer and localization of latest technologies in the Kingdom through the establishment of a sophisticated infrastructure and national capability building in many scientific fields. "They include the transfer of information technology in general and cyber security technology in particular, in accordance with the vision of the leadership to pave the way for scientific research and technical development in various fields for sustainability."

International experts are discussing cutting-edge technology on cyber security at the event. Also, the conference is addressing a number of key themes, notably: "The next ten years of the Internet: Threats and opportunities;" "Bridging the cyber security skills gap: UK experience;" "Malware Download Path Forensics and Mitigation" and "Toward Deployment of a Next-generation Secure Internet Architecture."

The conference has targeted staff and students from higher education institutions, and encourages attendance of managers and officials of public and private sectors within and outside the Kingdom who are interested in electronic security management, the authors of the regulations and policies for information security and its innovation within and outside the Kingdom besides local and international experts and researchers in the field of information security technology.

The event will feature 11 lecturers who are specialized in the field of information security, such as Professor Taher Elgamal, Professor Radha Poovendran, Professor Mustaque Ahamad and Professor Bart Preneel.

The winners of the cyber security competition entitled "Capture the Flag Competition" were also honored on the occasion, with Dia Mohammed Diab, from the Dia to Diab Team, winning the first prize carrying a cash award of SR25,000.

Le Monde
Le FBI abandonne ses poursuites contre Apple
Wednesday, 30 March 2016
Byline: Zeliha Chaffin

San Bernardino, Californie - L'agence annonce avoir déverrouillé l'iPhone de l'un des terroristes de San Bernardino
C'est un coup dur pour la firme à la pomme. Le FBI a annoncé, lundi 28 mars, avoir réussi à débloquer l'iPhone d'un des auteurs de l'attentat de San Bernardino (Californie), sans avoir eu recours à l'aide d'Apple. Dans un document transmis à la justice par les autorités américaines, le FBI précise avoir " accédé avec succès aux données stockées sur l'iPhone de - Syed - Farook et n'a donc plus besoin de l'assistance d'Apple ". Cet épilogue met fin au feuilleton qui oppose la firme à la pomme au gouvernement américain depuis le 16 février.

Conséquence de ce rebondissement : l'injonction judiciaire à l'encontre d'Apple est annulée. " Notre décision de mettre fin à la procédure est basée seulement sur le fait qu'avec l'assistance récente d'un tiers nous sommes maintenant capables de débloquer cet iPhone sans compromettre les informations dans le téléphone ", a précisé la procureure fédérale du centre de la Californie, Eileen Decker, dans un communiqué.

Depuis mi-février, la marque à la pomme était au coeur d'une violente polémique, car elle refusait de se plier aux injonctions du FBI. L'agence fédérale américaine l'exhortait à lui fournir un logiciel permettant de contourner les protections dont sont dotés les iPhone pour déverrouiller un téléphone chiffré ayant appartenu à l'un des terroristes présumés de l'attentat de San Bernardino, qui avait fait 14 morts le 2 décembre 2015.

La firme de Cupertino se refusait à satisfaire cette demande, arguant que celle-ci allait " au-delà de l'affaire concernée " et risquait de créer un précédent dangereux pour garantir la sécurité des données privées de ses clients. Le PDG d'Apple, Tim Cook, s'était même autorisé à commenter ce duel judiciaire, lundi 21 mars, lors de la keynote de présentation du nouvel iPhone SE. " L'iPhone est un objet extrêmement personnel. C'est une extension de nous-mêmes. Nous avons une responsabilité envers nos utilisateurs et envers notre pays. Nous ne la fuirons pas ", avait-il précisé. Apple avait notamment reçu le soutien d'autres géants du secteur, à l'instar de Google ou Facebook.

Un débat ouvert en FranceLe FBI se sera finalement passé de son aide. " Dès le début, nous nous sommes opposés à la demande du FBI (...) parce que nous pensions que c'était mal et que cela aurait constitué un dangereux précédent. Ce procès n'aurait jamais dû être intenté ", a déclaré Apple dans un

communiqué lundi soir. Si le déblocage de l'iPhone, qui met en avant une faille, pourrait lui nuire, Apple garde la satisfaction d'être resté ferme sur ses positions.

Le mystère qui entoure le déblocage du smartphone par le FBI reste, lui, entier. Le 21 mars, l'agence fédérale américaine avait indiqué qu'une " tierce partie " avait fait aux enquêteurs la démonstration d'une " autre méthode pour déverrouiller l'iPhone ". Le nom d'une entreprise israélienne, Cellebrite, spécialisée dans l'extraction de données sur mobiles, comme possible partenaire du FBI pour hacker l'iPhone, avait été évoqué par la presse, sans qu'il y ait confirmation.

En France, le débat sur la protection des données privées est également ouvert. Dans le cadre du projet de loi contre le crime organisé et le terrorisme, l'Assemblée nationale a adopté en mars un amendement du député Philippe Goujon (LR) contraignant les fabricants de téléphone à déchiffrer leurs appareils sur demande de la justice et punissant de cinq ans de prison et 350 000 euros d'amende ceux qui s'y refuseraient. Le Sénat devrait l'examiner cette semaine.

Los Angeles Times
Apple seeks FBI hacking method
Wednesday, 30 March 2016
Byline: Paresh Dave

Los Angeles - Apple Inc. refused to give the FBI software the agency desperately wanted. Now Apple is the one that needs the FBI's assistance.
The FBI announced Monday that it managed to unlock an iPhone 5c belonging to one of the San Bernardino shooters without the help of Apple. And the agency has shown no interest in telling Apple how it skirted the phone's security features, leaving the tech giant guessing about a vulnerability that could compromise millions of devices.

"One way or another, Apple needs to figure out the details," said Justin Olsson, product counsel at security software maker AVG Technologies. "The responsible thing for the government to do is privately disclose the vulnerability to Apple so they can continue hardening security on their devices."

But that's not how it's playing out so far. The situation illuminates a process that usually takes place in secret: Governments regularly develop or purchase hacking techniques for law enforcement and counterterrorism efforts, and put them to use without telling affected companies.

What's different in this case is that the world has been watching from the start. After Syed Rizwan Farook and his wife killed 14 people in December, the government publicly sought a court order to compel Apple to unlock Farook's work phone. Apple opposed that order, heightening long-standing tensions between Silicon Valley and law enforcement.

Now that the FBI has dropped its case against Apple, there's a new ethical dilemma: Should tech companies be made aware of flaws in their products, or should law enforcement be able to deploy those bugs as crime-fighting tools?

It's unclear whether the FBI's hacking technique will work on other versions of the iPhone, though a law enforcement official who spoke on the condition of anonymity said its applications were limited.

Some news outlets citing anonymous sources have identified Israeli police technology maker Cellebrite as the undisclosed third party helping the government, but neither the company nor the FBI has confirmed those reports.

A source who is unauthorized to discuss the case told The Times that the FBI was provided with the ability to incorrectly guess more than 10 passwords without permanently rendering the phone's data inaccessible. That allowed the agency to use software to run through potential pass codes until it landed on the correct one. It is not clear what info, if any, was gleaned from the phone.

Attorneys for Apple are researching legal tactics to compel the government to turn over the specifics, but the company had no update on its progress Tuesday.

The FBI could argue that the most crucial information is part of a nondisclosure agreement, solely in the hands of the outside party that assisted the agency, or cannot be released until the investigation is complete.

Many experts agree that the government faces no obvious legal obligation to provide information to Apple. But authorities, like professional security researchers, have recognized that a world in which computers are crucial in commerce and communications shouldn't be riddled with security flaws.

Even the White House's cybersecurity coordinator has acknowledged there are times when more people could be harmed by an unfixed security issue than helped by the government covertly using the loophole as part of an investigation.

A secretive White House-led procedure governs whether companies get notified of potential flaws.

Officials involved in the multi-agency deliberations -- called the Vulnerabilities Equities Process -- consider the risks and rewards of keeping flaws secret, according to federal records. They weigh whether the government could get the information in some other way and how likely it is someone else will discover the same vulnerability.

Federal officials have maintained that they lean toward private disclosure of a newly discovered vulnerability in most cases. But in some cases, federal agents have apparently benefited from previously unknown technical slip-ups by software developers.

The National Security Agency, though it denies the claim, reportedly took advantage of a flaw in the way websites transmit sensitive data for two years before private researchers uncovered the issue in 2014. Attorneys in two other cases have accused the FBI of using bugs in the Tor Internet browser to identify suspected criminals.

Apple's anxiety is understandable. No tech company wants a major security gap in its products - - and most are given months of warning to fix issues before they are made public by the researchers who discover them.

That's why Apple sees the government holding a moral obligation to disclose details of its hacking technique.

"Apple's best chance is to make a compelling case that the disclosure of this exploit is in the interest of national security, as in, if it remains undisclosed and undiscovered, it potentially puts innocent users at risk of data breach," AVG's Olsson said.

Apple stated in court filings that part of the reason its executives feared developing software to circumvent iPhone security features was that once created, it could end up in the wrong hands. That same argument could come into play with the disclosure issue if Apple makes a public plea that the government and the outside group can't properly safeguard the technique. Last year, an Italian company that bought and sold bugs saw its entire database leaked onto the Internet. The security issue could explain why the FBI and the outside party are being so secretive about the process.

There's also the concern that now that an iPhone can be hacked, others will try. The iPhone has been seen as "a tiny little Fort Knox that from the outside has shown very hard to get into," said Kevin Bocek, vice president of security strategy and threat intelligence at Venafi.

The San Bernardino situation changes the dynamics, providing a reason for "cybercriminals and amateur hackers to come out of the woodwork," said Peter Tran, a general manager at RSA's advanced cyber defense group.

Although someone helped the FBI crack the iPhone, probably in exchange for money, other people who stumble upon the same hacking technique could choose to sell to cyberthieves or other governments. An extensive underground online network, concentrated in Eastern Europe, does just that every day, Bocek said.

Apple generally doesn't reward bug-finders with cash. But given the publicity in this instance, experts said Apple could turn to the black market too.

"It proves once again that what you don't know, you can buy," said Nikias Bassen, principal mobile security researcher at Zimperium.

Wall Street Journal
Broader Fight Is Brewing Over Tech Privacy
Wednesday, 30 March 2016
Byline: Daisuke Wakabayashi, Devlin Barrett

New York - The sudden halt in the legal battle over a dead terrorist's phone may only intensify the broader fight about privacy and encryption, as tech companies race to better secure their hardware and software, while law-enforcement authorities fight to maintain access.
The Justice Department decided Monday to drop its lawsuit against Apple Inc., saying that the Federal Bureau of Investigation, aided by a third party, had unlocked the iPhone belonging to Syed Rizwan Farook, one of two gunmen in the San Bernardino, Calif., attack, and no longer needed the company's help.

The government didn't disclose how it got into the phone, or whether that vulnerability remains open for others to exploit in the future.

It isn't clear whether the government will share the information with Apple, but officials said Tuesday that there are good reasons to keep the company in the dark -- at least for now. Chief among those, they said, was Apple's resistance to helping investigators unlock its phones.

Meanwhile, the FBI is working to determine whether the method used to crack Mr. Farook's iPhone 5C might work on other models of the phone, according to people familiar with the matter.

The Justice Department's decision to drop the case leaves both the government and the company in awkward positions. Apple avoids being compelled to build a back door into its software that it argued could be exploited by hackers, but now faces an undefined threat to iPhone security.

The government gains a tool to unlock Apple devices that it says could help fight crime and terrorism, but risks losing credibility with Silicon Valley and the public, after first saying it couldn't open the phone, and then declaring that it could but refusing to reveal how. And, if it doesn't share the information with Apple, it risks leaving criminals an opening to exploit the same weakness.

The outcome is likely to intensify the mistrust between technology companies and law-enforcement authorities. Technology firms may now feel the need to make their security as impenetrable as possible to ease the public's concerns about privacy, industry officials said.

Meanwhile, without a decisive court victory, law- enforcement agencies have more incentive to find and exploit technological vulnerabilities and keep their methods secret.

"It deepens both sides in their respective positions," said Casey Ellis, chief executive of cybersecurity firm Bugcrowd. Government agencies have kept vulnerabilities to themselves before, but the FBI doing "this publicly and in front of so many people is a new thing," he said.

The legal fight between the government and Apple was viewed as a pivotal showdown over how to balance security and privacy in the smartphone era, with both sides prepared to go to the Supreme Court. But, federal prosecutors in the case asked the judge to vacate her earlier order compelling Apple to cooperate, leaving the central issue unresolved. Late Tuesday, the judge granted the prosecutors' request.

Apple has made clear that it will keep fortifying its devices. It said Monday it would "continue to increase the security of our products as the threats and attacks on our data become more frequent and more sophisticated."

As reported, Apple is working to beef up its encryption so that it won't be able to access some user information stored by its iCloud service.

Other companies are expected to follow suit.

Mark Bartholomew, a law professor at the University of Buffalo who specializes in privacy and cybersecurity, said technology firms will now "go full-speed ahead on full encryption and fuller encryption."

Decisions on whether government computer experts should tell tech firms or the public about security flaws are handled through what White House officials call a vulnerabilities equity review process, in which intelligence and law-enforcement agencies weigh the pros and cons of revealing the glitch so it can be fixed.

The Office of the Director of National Intelligence has said it leans toward disclosing security flaws.

There are other considerations that can weigh in favor of not disclosing them, including whether criminal hackers or foreign governments are likely to exploit the vulnerability, and whether revealing itcould curtail government access to critical intelligence.

On Tuesday, prosecutors made a new court filing in another closely watched phone case in federal court in Brooklyn, N.Y., where a magistrate judge has ruled in favor of Apple, saying current law doesn't allow the Justice Department to force the company to help investigators open a locked phone in a drug case. Federal prosecutors have asked a higher judge to review that decision.

With the San Bernardino phone now accessed by investigators, the Brooklyn case could become the next big legal fight involving the issue.

USA Today
1,000 devices in limbo after FBI drops iPhone case

Wednesday, 30 March 2016
Byline: Kevin Johnson, Elizabeth Weise

Washington - The government's surprise decision to withdraw its case against Apple over the San Bernardino, Calif., killer's iPhone adds uncertainty to criminal cases in which state and local authorities are confronted with more than 1,000 locked smartphones and other devices, blocking access to potential evidence, according to a survey of more than a dozen jurisdictions.
These locked devices are separate from the most high- profile one: the iPhone used by Syed Farook, who with his wife, Tashfeen Malik, carried out the shooting in San Bernardino that left 14 dead in December. In mid-February, a California court ordered Apple to aid the FBI in unlocking that iPhone.

On Monday, the FBI said it had been able to unlock the phone without Apple's aid. Left unanswered is what the Justice Department's abandoned legal action means for other law enforcement agencies seeking help from manufacturers in unlocking devices.

"We were hoping this decision, which could have gone to the Supreme Court, would have been a road map, and now it's not," said Stewart Baker of Steptoe & Johnson. State and local investigators have been blocked from accessing contents of more than 1,000 devices because of their inability to bypass security functions similar to those encountered by the FBI in the San Bernardino case.

"The overwhelming majority of criminal investigations stalled by default device encryption will remain so until Congress intervenes," Manhattan District Attorney Cyrus Vance said in a statement Tuesday.

According to some attorneys, the government's actions have weakened its credibility if it tries to argue for compelling companies to help it in future cases. Justice spent a month saying Apple's assistance was the only way it could get into the phone, then suddenly said it wasn't, said Scott Vernick, head of data security at Fox Rothschild in Philadelphia.

"Now any other court is going to ask, 'Really? Are you sure you need their help? That's what you asked for last time, and apparently you didn't,'" Vernick said.

Washington Post
FBI, Apple in 'arms race,' experts say
Wednesday, 30 March 2016
Byline: Matt Zapotosky, Elizabeth Dwoskin

Washington - The U.S. government's revelation that it had accessed the San Bernardino shooter's iPhone without the help from Apple that it had so desperately sought indicates that the FBI was either disguising its technical capabilities or its agents and employees remain outmatched by tech workers in the private sector, according to current and former bureau officials and legal scholars.

The bureau in recent years has launched a recruiting blitz to attract employees with cyber expertise, and the National Science Foundation has even made scholarship money available to students who study cybersecurity and later work in government. But former FBI officials said the bureau will always face an uphill battle against private firms, which can offer much more money, a less-rigorous code of conduct and more opportunities to do creative work.

Ernest Hilbert, a former FBI special agent focusing on cybercrimes, said the bureau had lost tech talent in recent years. "The most an agent can make is 180K," he said. "That's like a starting salary in the private sector. You have a big push by private industry to pull out these individuals."

That bureau officials were able to access Syed Rizwan Farook's phone allows the government to avoid - at least for now - a showdown with Apple over the extent U.S. law compels the company to help in a criminal investigation.

But the high-profile fight over the San Bernardino terrorist's phone also exposes that Apple's phone has vulnerability, further motivating it and other companies to strengthen the security of their devices and forcing the government to keep up with new security measures, technology executives and security analysts said.

"They're in an arms race," said Matthew Blaze, a cryptography researcher and professor at the University of Pennsylvania. "The FBI is trying to find new ways in, and Apple is trying to find new ways to defend against that."

In interviews, engineers across Silicon Valley said they thought the case would affect the way products are built going forward at both start-ups and large companies.

The case "will reinforce people's arguments" for tougher encryption, said Cameron Walters, an engineer who was an early engineer at payments start-up Square. "It might push them to do it - if it was a question of effort versus return."

The cloud-computing company Box, which filed a legal brief supporting Apple in the San Bernardino case, is one of the many tech firms rushing to offer new encryption-related security features. It recently launched a product, KeySafe, that allows corporate customers to hold on to their own encryption keys - a move co-founder and chief executive Aaron Levie said was as much about fighting off hackers as about fending off government surveillance. The implementation of KeySafe means the company cannot collect and hand over a customer's private information even when the authorities have a warrant.

Lawyers and people in the tech industry say that the FBI's sudden arrival at a solution - a month ago it was claiming it could not get into Farook's phone without Apple's help - raises questions about law enforcement's handling of the matter. FBI officials have offered their version of what happened in court documents and sworn affidavits, and have disputed any insinuation that they did wrong.

On this much, many agree: The case shows that the FBI is lagging behind when it comes to some technical capabilities.

"I think the bureau is absolutely in an uphill battle, desperately trying to keep up pace, and they are not," said Ronald T. Hosko, a former assistant director in charge of the FBI's criminal division who is now president of the Law Enforcement Legal Defense Fund.

The FBI devotes significant resources to cybersecurity investigations and its operational- technology division. The bureau's fiscal 2017 budget proposal asked for $85.1 million more for cybersecurity and an additional $38.3 million for an initiative meant to help investigators beat encryption when appropriate.

Farook and his wife, Tashfeen Malik, were killed in a shootout with police in December after they launched an attack that killed 14 people at the Inland Regional Center in San Bernardino, Calif.

The bid to access the phone used by Farook was meant to further the FBI's investigation. The Justice Department obtained a court order compelling Apple's assistance under the All Writs Act, a centuries-old law that gives courts the power to "issue all writs necessary or appropriate in aid of their respective jurisdictions and agreeable to the usages and principles of law."

Federal prosecutors initially said they had no way into the phone without Apple's help. Apple resisted, arguing that complying with the government's request would infringe customers' privacy.

Last week, on the eve of a hearing in the case, prosecutors for the first time suggested there might be a way in without Apple, writing in a court filing that "an outside party demonstrated to the FBI a possible method for unlocking Farook's iPhone." The method apparently worked; prosecutors wrote in another court filing Monday that they had "successfully accessed the data stored on Farook's iPhone," and a judge formally vacated an order compelling Apple's assistance Tuesday.

The FBI has not disclosed how it got in, other than to say it no longer needed Apple's help. An official familiar with the matter, while declining to discuss the San Bernardino case in particular, said, "Whether a solution comes ultimately from our own personnel, from another federal agency or other entity is less important than whether the solution addresses the requirements to investigate major crimes and terrorist attacks." The official spoke on the condition of anonymity to discuss internal bureau operations.

Alex Abdo, a staff attorney with the American Civil Liberties Union, said that "the speed with which they were able to verify this new technique is a reason to be skeptical" of officials' previous claims.

"The FBI sat on this phone for two months, then made a deliberate decision to very publicly fight with Apple over the unlocking mechanism, and then made very strong statements about their inability to get in without Apple's help. And, on a dime, that all changed," Abdo said.

FBI and Justice Department officials have bristled at the notion that they misled the public or that agents were not working hard to access the phone. Deputy Attorney General Sally Q. Yates said at a recent news conference that FBI agents had "been working hard all along" and that officials at the Justice Department were "a little surprised" to learn there might be another solution.

FBI Director James B. Comey wrote in a letter to the Wall Street Journal that he was "not embarrassed to admit that all technical creativity does not reside in government."

That the FBI got in without Apple's help leaves unresolved a critical question: Can the government use the All Writs Act to compel others to take the steps it wanted Apple to take? That matter, legal experts said, will be left for Congress or another court case.

Wall Street Journal
Hackers Breach Law Firms, Including Cravath, Weil Gotshal
Wednesday, 30 March 2016
Byline: Nicole Hong, Robin Sidel

New York - Hackers broke into the computer networks at some of the country's most prestigious law firms, and federal investigators are exploring whether they stole confidential information for the purpose of insider trading, according to people familiar with the matter.
The firms include Cravath Swaine & Moore LLP and Weil Gotshal & Manges LLP, which represent Wall Street banks and Fortune 500 companies in everything from lawsuits to multibillion-dollar merger negotiations.

Other law firms also were breached, the people said, and hackers, in postings on the Internet, are threatening to attack more.

It isn't clear what information the hackers stole, if any, but the focus of the investigation is on whether confidential data were taken for the purpose of insider trading, according to a person familiar with the matter.

The Manhattan U.S. attorney's office and Federal Bureau of Investigation are conducting the probe, which began in the past year and is in its early stages, the people said. Representatives for both declined to comment.

Cravath said the incident, which occurred last summer, involved a "limited breach" of its systems and that the firm is "not aware that any of the information that may have been accessed has been used improperly." The firm said its client confidentiality is sacrosanct and that it is working with law enforcement as well as outside consultants to assess its security.

A spokeswoman for Weil Gotshal declined to comment.

The cyberattacks show what law-enforcement officials have been warning companies about for years. As hacking tools and hackers for hire proliferate in certain corners of the Internet, it has become easier for criminals to breach computer networks as a way to further a range of crimes, from insider trading to identity theft.

In recent years, a number of major retailers have been breached, as was J.P. Morgan Chase & Co., the country's biggest bank by assets. In those cases, hackers stole data such as credit-card numbers and email addresses that they could use to make fraudulent purchases or entice customers into scams.

The attacks on law firms appear to show thieves scouring the digital landscape for more sophisticated types of information. Law firms are attractive targets because they hold trade secrets and other sensitive information about corporate clients, including details about undisclosed mergers and acquisitions that could be stolen for insider trading.

Hackers often steal large amounts of information indiscriminately and then analyze it later to see how it could be useful, making it difficult to determine early on in these types of investigations whether any information was actually used for insider trading, observers said.

The potential vulnerability of law firms is raising concerns among their clients, who are conducting their own assessments of the firms they hire, according to senior lawyers at a number of firms.

A case last year shows that hackers have gone after sensitive material to fuel illegal trading. In that case, brought by federal prosecutors in New Jersey and Brooklyn, N.Y., hackers in Ukraine allegedly breached newswires companies in the U.S. and stole news releases about corporate earnings before they became public. Stock traders then made lucrative bets based on the releases, prosecutors said. At least three of the defendants have pleaded guilty, and the case is pending.

The federal investigation into the law firms is one of several recent cyber-related incidents that have affected the legal industry.

In February, a posting appeared on an underground Russian website called DarkMoney.cc, in which the person offered to sell his phishing services to other would-be cyberthieves and identified specific law firms as potential targets. In phishing attacks, criminals send emails to employees, masked as legitimate messages, in an effort to learn sensitive information like passwords or account information.

Security firm Flashpoint issued alerts to law firms in January and February about the threats and has acquired a copy of a phishing email that is aimed at law firms, according to a person familiar with the alerts. "It has definitely picked up steam," this person said.

The FBI also issued an alert in recent weeks that warned law firms about potential attacks, according to people familiar with the alert. The FBI declined to comment.

Law firms said they have double-checked their cybersecurity defenses in response to the posting and raised more awareness about the issue internally. It isn't clear if the hacker's efforts have resulted in any breaches. A Flashpoint spokeswoman declined to comment on the alerts.

One senior partner at a top law firm said he often receives suspicious emails from people who pretend to be seeking legal representation. "Law firms are being deluged with attempts to crack their systems," he said.

Law firms last year formed an information-sharing group to disseminate information about cyberthreats and other vulnerabilities. It is modeled after a similar organization for financial institutions.

So far, 75 law firms have joined the group, said Bill Nelson, chief executive officer of the Financial Services Information Sharing and Analysis Center, which oversees the legal group and similar entities that focus on other industries, such as retail.

One of the trickiest questions for law firms is when they are required to publicly disclose a data breach. Forty-seven U.S. states have their own breach-notification laws, forcing law firms and other companies to navigate a patchwork of different rules.

New York Times
Beijing May Pull Reins Tighter on Websites in Country
Wednesday, 30 March 2016
Byline: Paul Mozur

Hong Kong - China's government said on Monday that it would take steps to more strictly manage websites in the country, its latest push to set boundaries in the wider Internet.
A draft law posted by one of China's technology regulators said that websites in the country would have to register domain names with local service providers and with the authorities.

It was not clear whether the rule would apply to all websites or only to those hosted on servers in China. Chinese laws can be haphazardly enforced and are usually vague, and because the new rule is only a draft, analysts said they expected the regulator, the Chinese Ministry of Industry and Information Technology, to specify later to whom the law would apply.

If the rule applies to all websites, it will have major implications and will effectively cut China out of the global Internet. By creating a domestic registry for websites, the rule would create a system of censorship in which only websites that have specifically registered with the Chinese government would be reachable from within the country.

Zhu Wei, deputy director of the Communications Law Research Center at the China University of Political Science and Law in Beijing, said he believed that under the current wording, the law would block foreign websites not registered with China.

"I think the draft mostly tries to address Internet security and the large amount of pornographic websites and other websites that violate Chinese laws," he said. "Most of those domains are registered abroad. It is not easy to tackle them."

Other experts, however, said the law would probably apply only to websites hosted in China.

"I think these regulations are about content hosted in China," said Rogier Creemers, a lecturer on Chinese politics at Oxford University. "It can be that they expand in the future." He pointed out that if the rules applied to all websites, they would eliminate access overnight to a huge chunk of the Internet.

If the law applies only to sites hosted in China, it would still represent a consolidation of power by Beijing. Forcing registration with Chinese entities is likely to create a new boom in domain-name service registrars. At the moment, Alibaba operates China's primary domain-name service provider, called Wan Wang.

The new rule would also enable the Chinese government to keep closer tabs on the real identities of website operators. It would also help Beijing assemble a registry of important websites if China wants to break away from the global registry that unifies the Internet, Mr. Creemers said.

The Ministry of Industry and Information Technology, which said violators of the rule would face fines of 10,000 renminbi to 30,000 renminbi, or about $1,500 to $4,500, will hear comments on the regulation until April 25.

The new rules are the latest in a string of measures taken by the Chinese government under President Xi Jinping to assert control over the Internet. This year, regulators created rules to block foreign companies from publishing online content in China without the government's consent. Regulators also shut down the social media accounts of the sharp-tongued tycoon Ren Zhiqiang.

In recent years, Mr. Xi has presided over a special committee to strengthen the government's oversight of the Internet domestically, and more broadly to influence how the Internet is governed abroad.

He has also presided over the creation of the Cyberspace Administration of China, a regulatory body that has pushed censorship and worked on an annual conference intended to trumpet China's belief that each country should be allowed to impose rules on the Internet within its borders.

Lokman Tsui, a professor at the School of Journalism and Communication at the Chinese University of Hong Kong, said the latest move was "in line with the developments that have been going on for a while

now, where the government is trying to exercise more supervision and control over the Internet, and on the domain name system in China."

Washington Post
Judge allows questioning in Clinton email case
Wednesday, 30 March 2016
Byline: Spencer S. Hsu

Washington - A second federal judge in Washington ruled Tuesday that a conservative legal watchdog group may question the State Department and potentially several top aides to Democratic presidential contender Hillary Clinton about her use of a private email server while she was secretary of state.
In a three-page order, U.S. District Senior Judge Royce C. Lamberth granted a request from Judicial Watch, which has sought public records of talking points used by Susan E. Rice, then the U.S. ambassador to the United Nations, in television appearances after the deadly Sept. 11, 2012, attacks on U.S. facilities in Benghazi, Libya.

Appearing five days later on Sunday- morning talk shows, Rice, now President Obama's national security adviser, said the assaults appeared to have stemmed from a spontaneous protest over an anti-Islam video. U.S. investigators later concluded that the attacks were carried out by terrorist groups.

"Where there is evidence of government wrong-doing and bad faith, as here, limited discovery is appropriate, even though it is exceedingly rare in FOIA [Freedom of Information Act] cases," Lamberth wrote.

His decision came about five weeks after another federal judge in Washington, U.S. District Judge Emmet G. Sullivan, ruled that current and former top State Department and Clinton aides could be questioned under oath about her email arrangement in a separate Judicial Watch FOIA case. The group has questioned whether officials intentionally thwarted federal open-records laws by using or allowing the use of a private email server during Clinton's tenure at State from 2009 to 2013.

In both cases, the judges said sufficient doubt had been raised about whether department searches of public records were adequate.

The department faced dozens of FOIA lawsuits after disclosures that Clinton exclusively used a personal server for government business while at State and that several aides also used the server or personal email addresses. Clinton and others have since returned tens of thousands of pages that they or their attorneys have designated as work-related for government FOIA review and potential release.

However, Sullivan and Lamberth criticized what Lamberth called the "constantly shifting admissions by the government and former government officials" about the arrangement. Sullivan said the server

arrangement allowed former federal employees to decide what government records to disclose, apparently without ensuring that State records were secured within the department's own systems.

Calling Clinton's personal server use "extraordinary," Lamberth wrote, "An understanding of the facts and circumstances . . . is required before the Court can determine whether the search conducted here reasonably produced all responsive documents."

Sullivan, in the earlier case, set an April 12 deadline for Judicial Watch and the government's lawyers to lay out a plan for how they want to proceed, subject to court approval.

Lamberth said in his order that after Sullivan decides how to proceed in that case, Judicial Watch should submit a proposed discovery plan within 10 days to him in the Rice matter, and the government can respond in another 10 days.

The case before Sullivan concerns public records sought by Judicial Watch about the employment arrangement of Huma Abedin, a longtime confidante who served as Clinton's deputy chief of staff.

Judicial Watch has proposed questioning seven current and former officials, including Cheryl D. Mills, who was Clinton's chief of staff at State; Abedin, who now is vice chairman of Clinton's presidential campaign; and Bryan Pagliano, a Clinton staff member during her 2008 presidential campaign who helped set up the private server.

Others designated for deposition are Undersecretary for Management Patrick F. Kennedy; Stephen D. Mull, executive secretary at State from June 2009 to October 2012; Lewis A. Lukens, executive director of the executive secretariat from 2008 to 2011; and Donald R. Reid, senior coordinator for security infrastructure in the Bureau of Diplomatic Security.

Judicial Watch said it intends to seek answers about department officials' creation, maintenance, support or awareness of Clinton's email system; any instructions given to department workers about communicating by email with Clinton and Abedin; and any inquiries into or discussions about disclosing Clinton's use of the system.

Sullivan noted in his ruling that senior department officials appeared to know about Clinton's set-up from her swearing-in at State in January 2009, citing an email chain among Kennedy, Lukens, Mills and others regarding setting up a computer in Clinton's office so she could check her "off network" email.

Sullivan also noted email traffic among Abedin, Mull, Mills, Kennedy and others discussing communication problems, in which Mull suggested that Clinton be issued a State Department BlackBerry that would protect her identity but be subject to public-records requests.

Politico

Official: FBI team on Clinton email probe not near 150
Monday, 28 March 2016
Byline: Josh Gerstein

Washington - The FBI does not have close to 150 agents working the investigation into former Secretary of State Hillary Clinton's email server, a source familiar with the matter told POLITICO Monday.
The official, who spoke on condition of anonymity, commented after the Washington Post reported that FBI Director James Comey told an unnamed member of Congress that 147 agents were working the Clinton investigation.

Asked about the Post report, the source said: "That number is greatly exaggerated."

The source and other officials declined to provide any further details about FBI staffing or the status of the inquiry.

The Post report followed similar but slightly different reports in other media outlets. In January, Fox News reported that 100 FBI agents were working regularly on the Clinton case with as many as 50 more on temporary assignment. At about the same time, the Washington Examiner reported that a former U.S. Attorney for Washington, D.C., Joseph DiGenova, indicated a similar scope to the FBI probe.

"There are now, I am told, 150 agents working on this case," DiGenova said, calling that "a very unusually high number."

Both the Fox and Washington Examiner reports focused on an expansion of the Clinton email probe to cover possible public corruption involving the Clinton Foundation. The FBI has declined to confirm that any such probe is underway, although Comey has confirmed publicly that the FBI is looking into issues involving classified material on the Clinton server.

In a court filing Friday, an FBI records official called that investigation "active" and "ongoing."

New York Times
Apple's Newest Challenge: Learning How Government Cracked Its iPhone
Wednesday, 30 March 2016
Byline: Multiple reporters

San Francisco - Now that the United States government has cracked open an iPhone that belonged to a gunman in the San Bernardino, Calif., mass shooting without Apple's help, the tech company is under pressure to find and fix the flaw.
But unlike other cases where security vulnerabilities have cropped up, Apple may face a higher set of hurdles in ferreting out and repairing the particular iPhone hole that the government hacked.

The challenges start with the lack of information about the method that the law enforcement authorities, with the aid of a third party, used to break into the iPhone of Syed Rizwan Farook, an attacker in the San Bernardino rampage last year. Federal officials have refused to identify the person, or organization, who helped crack the device, and have declined to specify the procedure used to open the iPhone. Apple also cannot obtain the device to reverse-engineer the problem, the way it would in other hacking situations.

Making matters trickier, Apple's security operation has been in flux. The operation was reorganized late last year. A manager who had been responsible for handling most of the government's data extraction requests left the team to work in a different part of the company, according to four current and former Apple employees, who spoke on the condition of anonymity because they were not authorized to speak publicly about the changes. Other employees, among them one whose tasks included trying to hack Apple's own products, left the company over the last few months, they said, while new people have joined.

The situation is in many ways a continuation of the cat-and-mouse game Apple is constantly engaged in with hackers, but the unusually prominent nature of this hacking -- and the fact that the hacker was the United States government -- creates a predicament for the company.

"Apple is a business, and it has to earn the trust of its customers," said Jay Kaplan, chief executive of the tech security company Synack and a former National Security Agency analyst. "It needs to be perceived as having something that can fix this vulnerability as soon as possible."

Apple referred to a statement it made on Monday when the government filed to drop its case demanding that the company help it open Mr. Farook's iPhone. "We will continue to increase the security of our products as the threats and attacks on our data become more frequent and more sophisticated," Apple said.

Apple has been making many long-term moves to increase the security of its devices. The company's chief executive, Timothy D. Cook, has told colleagues that he stands by Apple's road map to encrypt everything stored on its devices and services, as well as information stored in Apple's cloud service iCloud, which customers use to back up the data on their mobile devices. Apple engineers have also begun developing new security measures that would make it tougher for the government to open a locked iPhone.

For now, with the dearth of information about the flaw in Mr. Farook's iPhone 5C, which runs Apple's iOS 9 operating system, security experts could only guess at how the government broke into the smartphone.

Forensics experts said the government might have attacked Apple's system using a widely discussed method to extract information from a protected area in the phone by removing a chip and fooling a mechanism that blocks password guessing, in order to find the user's password and unlock the data.

The authorities may have used a procedure that mirrors the phone's storage chip, called a NAND chip, and then copied it onto another chip. Often referred to as "NAND-mirroring," this would allow the F.B.I. to replace the original NAND chip with one that has a copy of that content. If the F.B.I. tried 10 passcodes to unlock the phone and failed, it could then generate a new copy of the phone's content and try another password guess.

"It's like trying to play the same level on Super Mario Brothers over and over again and just restoring from your saved game every time you kill Mario," said Jonathan Zdziarski, an iOS forensics expert.

Newer iPhone models may be less susceptible to NAND-mirroring because they have an upgraded chip known as the A7, with a security processor called the Secure Enclave that has a unique numerical key not known to the company and which is essential to the securing of information stored in the phone.

Security vulnerabilities in Apple products have become increasingly prized by hackers in recent years, given the ubiquity of the company's mobile devices. Yet as interest has grown in attacking Apple's hardware and software, the company's own security teams have been in flux.

Apple previously had two main security teams -- a group called Core OS Security Engineering and a product security team. The product security team included a privacy group that examined whether data was properly encrypted and anonymized, among other functions, according to three former Apple employees. The product security team also had people who reacted to vulnerabilities found by people outside Apple, as well as a proactive team, called RedTeam, which worked to actively hack Apple products.

Last year, the product security team was broken up and the privacy group began reporting to a new manager, the former employees said. The rest of product security -- the proactive and reactive pieces -- was absorbed by the Core OS Security Engineering team, which itself experienced shifts.

The leader of the Core OS Security Engineering team, Dallas DeAtley, left the security division last year to work in a different part of Apple. Mr. DeAtley was one of the few employees who over the years had taken care of government requests to extract data from iPhones. Mr. DeAtley did not respond to requests for comment.

A few other members of the team also departed. Others joined Apple as the company acquired a handful of security outfits last year, including LegbaCore, which previously found and fixed flaws for Apple.

Some of the departures had more to do with market forces, the former Apple employees said. Security professionals are some of the most sought-after engineers in the technology sector.

Whether Apple's security operation will ever obtain information about how the government hacked into Mr. Farook's iPhone remains unclear.

It's possible that the government won't say how it opened the iPhone because the method is "proprietary to the company that helped the F.B.I.," said Stewart A. Baker, a lawyer at Steptoe & Johnson and the Department of Homeland Security's first assistant secretary for policy.

Within the security community, researchers and professionals said they were incensed that they - - and Apple -- may not find out how the F.B.I. was able to crack Mr. Farook's iPhone.

"There is very little debate that it is in everyone's best interest that Apple find out about this vulnerability and everyone should be asking why that is not the case," said Alex Rice, the chief technology officer at HackerOne, a security company in San Francisco that helps coordinate vulnerability disclosure for corporations.

The Hill
Obama extends cyber sanctions power
Wednesday, 30 March 2016
Byline: Cory Bennett

Washington - President Barack Obama on Tuesday expanded upon his statement that the rising number of cyberattacks on the U.S. constitutes a national emergency.
"These significant malicious cyber-enabled activities continue to pose an unusual and extraordinary threat to the national security, foreign policy and economy of the United States," Obama wrote in a notice.

The president initially made the declaration on April 1, 2015, as part of an executive order that empowered the Treasury Department to levy sanctions on individuals or entities behind cyberattacks and cyber espionage.

The move was an attempt to impose costs on foreign hackers who have peppered the U.S. with cyberattacks for years with few repercussions.

The sanctions would effectively freeze targets's assets when they pass through the U.S. financial system and prohibit them from transacting with American companies.

Obama said Treasury would retain these powers for at least another year, given the pervasive cyber threat that remains.

"The measures adopted on that date to deal with that emergency, must continue in effect beyond April 1, 2016," he said.

The White House has yet to exercise these powers, although some believe the administration may follow up the recent indictment of seven Iranian hackers with targeted sanctions.

Prior to the executive action, the White House did slap North Korea with a round of economic sanctions after blaming the reclusive East Asian country for orchestrating a digital assault on the movie studio Sony Pictures Entertainment.

Reuters
Spy chiefs tell U.S. lawmakers plan to share raw data protects privacy
Wednesday, 30 March 2016
Byline: Mark Hosenball

Washington - American spy chiefs have told congressmen that a plan to allow the National Security Agency (NSA) to share more raw eavesdropping reports with other agencies will not be unlawful and will protect the privacy rights of U.S. citizens.
In a letter sent on Monday to two members of Congress and reviewed by Reuters, Director of National Intelligence James Clapper said the NSA's proposal to give other spy agencies access to "unevaluated signals intelligence" will ensure data is used only for intelligence activities directed at foreigners.

Last week, U.S. Representatives Ted Lieu and Blake Farenthold of the House Oversight Committee asked the NSA to halt the sharing plan, suggesting it would be "unconstitutional and dangerous." The specifics of the proposal are still secret.

Lieu, a Democrat from California and Farenthold, a Republican from Texas, wrote in a March 21 letter to NSA Director Michael Rogers that the proposal would violate Fourth Amendment privacy protections because the collected data would not require a warrant before being searched for domestic law enforcement purposes.

Monday's reply from the intelligence chief's office said the plan would not allow the use of communications data for domestic law enforcement.

Instead, the proposed rules would limit access to raw NSA data to spy agencies, "and only for authorized foreign intelligence and counterintelligence purposes," said the letter. It said it would also not authorize any new collection of private communications.

Civil liberties advocates have interpreted the proposed change as potentially allowing NSA foreign intelligence data, which sometimes can include collection of communications to, from or about Americans, to be used for domestic policing purposes.

Under current procedures, NSA analysts are supposed to scrub or black out certain personal information, particularly related to American citizens or residents, before handing any communications data over to other agencies.

Congress last year passed a law curtailing certain aspects of the NSA's spying authority, most notably ending its bulk collection of domestic phone records exposed by former NSA contractor Edward Snowden in 2013. NSA began that program after the Sept. 11, 2001 attacks on the United States by Islamist militants.

The NSA has presented the plan to a government advisory committee, the Privacy and Civil Liberties Oversight Board, for review.

London Daily Telegraph
Trident upgraded to protect against cyber attack
Tuesday, 29 March 2016
Byline: Ben Farmer

London - Britain's Trident nuclear deterrent is to be updated to protect it from cyber attack. Software in the nuclear missile system will be upgraded as defence officials admitted there was "legitimate concern" about threats from cyber hackers.

The Trident missiles, which are shared with America, will be updated amid growing worries defence computers and systems could be vulnerable to cyber attacks from Russia, China, groups such as Islamic State or organised crime gangs.

A former Defence Secretary last year warned that the deterrent was unreliable unless the Government could ensure it was free of cyber weak spots that might be targeted.

Lord Browne of Ladyton warned: "If they are unable to do that then there is no guarantee that we will have a reliable deterrent or the Prime Minister will be able to use this system when he needs to reach for it."

The US Navy has now announced American and British Trident missiles will be upgraded as both nations pour billions into cyber security.

John Daniels, a spokesman for the US Navy's nuclear deterrent programme, told Bloomberg: "Now that cyber has become even more important in our national security, there will be even more requirements. In our modern era, cybersecurity threats are a legitimate concern."

The software security work will be carried out by BAE Systems, which carries out maintenance of the missiles. The company declined to comment on the work.

Britain's 58 missiles, which are carried by the Royal Navy's four Vanguard class nuclear submarines, are sent back to America for upgrades and maintenance. Each boat carries eight missiles, and each one can be fitted with up to 12 warheads that can strike different targets with a range of 7,500 miles.

Andrew Futter, a nuclear strategy expert at Leicester University, said until recently commanders had been "fairly complacent" about the cyber threat to the nuclear deterrent.

He said defence officials had stressed that because the UK's nuclear submarines were not connected to the Internet on secret deterrent missions they were largely protected from hackers by an "air gap" between the deterrent and the rest of the online world.

But he said there were still potential weak spots and there was a greater risk when the boats came in to port to receive upgrades and maintenance. Malicious programs to sabotage or damage the deterrent could also be secretly hidden in nuclear systems when new parts are being designed and made.

Dr Futter said a scenario where someone hacks into the deterrent to try to fire a missile or hold a country to ransom was "very, very slim".

A more likely risk would be hackers stealing design or operational secrets from the deterrent that would make it vulnerable.

He said: "It's information security that could be more important in the cyber realm."

A Ministry of Defence spokesman said: "The deterrent remains safe and secure. We take our responsibility to maintain a credible nuclear deterrent extremely seriously and continually assess the security of the whole deterrent programme and its operational effectiveness, including against threats from cyber."

London Times
Internet spy system could cost over £1bn
Wednesday, 30 March 2016
Byline: James Dean

London - The cost of creating a new surveillance system to collect the internet browsing records of British citizens has been drastically underestimated by the Home Office, MPs have been told.
The government would have to spend about £1.2 billion, more than seven times the Home Office's upper estimate, an analysis has suggested.

The authorities want internet companies to collect internet connection records (ICRs) of every British citizen and store them for up to 12 months using a new provision in the Investigatory Powers Bill. These

records, which are time-stamped histories of all the websites that people have visited, are to be used to help the police and security services with investigations.

The Danish government is attempting to put a similar record system in place but suspended its plans earlier this month after an official study found that the set-up costs would be far higher than envisioned. The Commons public bill committee on the Investigatory Powers Bill was told last week that the Danish study cast doubt on the Home Office's estimates.

The government has estimated that it would need to reimburse internet companies between £130.6 million and £164.4 million to set up computer systems that are capable of gathering and storing ICRs. Annual running costs would be a further £4.4 million to £5.6 million over ten years.

However, a study by EY, commissioned by the Danish government, found that the country's internet providers would need to spend 1 billion Danish kroner (£105 million) on computer systems capable of collecting and storing ICRs. The figure is equivalent to about £19 per person and would add up to £1.2 billion if that cost is applied to the UK's population of 64.6 million.

The IT-Political Association of Denmark, a digital rights group, said in written evidence: "Based on the new cost information from Denmark, it seems unlikely that the Home Office budget can cover a sufficiently effective ICR implementation, unless only a small part of the British population is subjected to [ICRs]."

The Home Office did not respond to requests for comment.

Globe and Mail
Six guilty pleas to murder conspiracy end risk of revealing police-surveillance secrets
Thursday, 31 March 2016
Byline: Colin Freeze

Six accused mobsters were acquitted of first-degree murder charges in Laval on Wednesday as they agreed to plead guilty to a lesser charge of murder conspiracy, scuttling a separate hearing that risked revealing sensitive information about police surveillance technology.
In the second case the same day in Montreal, Canada's national police force learned there would be no binding Quebec Court of Appeal hearing related to "mobile device identifier" technology that the RCMP had used to keep tabs on the alleged Mafia members.

These two decisions on the same landmark police- surveillance case came Wednesday morning after five years of being stuck in neutral as lawyers debated disclosure issues.

The outcome benefited both prosecution and defence, but it meant none of those convicted of murder conspiracy in the shooting death of a man in the streets of Montreal five years ago are still facing actual murder charges.

"This is a matter of prosecutorial discretion and I will not comment further," Quebec prosecutor Robert Rouleau said, after The Globe asked him why the Crown did not pursue the firstdegree murder charges.

The case appears to show just how far police and prosecutors will go to safeguard investigative techniques considered secret.

Speaking outside the appeal court Wednesday, Mr. Rouleau pointed out that the guilty pleas effectively meant there would be no more disclosure about the police devices.

"Since the case becomes moot, there's no reason to pursue a production order if there is no disclosure to be made."

The Globe first reported on filings related to the case earlier this month, revealing that Crown prosecutors had taken to publicly calling the RCMP device a "mobile device identifier" in an apparent bid to escape some of the criticisms surrounding devices more commonly known as "IMSI- catchers."

It turns out that MDI is simply an RCMP term. "The MDI is a device that may be described as and is commonly referred to as an 'IMSI catcher,' " reads one Crown exhibit in the case, viewed by The Globe and Mail on Wednesday.

The roots of the case trace back to Nov. 24, 2011, when a New Yorker named Salvatore (Sal the Ironworker) Montagna was shot dead on the outskirts of Montreal. Fearing more bloodletting was

imminent, an RCMP- led team divulged its organized-crime surveillance operation to local police so they could make arrests in that gangland slaying.

For five years, six suspects faced first-degree murder charges - a conviction would mean 25 years in prison with no chance of parole. On Wednesday, the same six pleaded guilty to the lesser charge of conspiracy to commit murder. Sentencing hasn't been settled yet, but it likely means that - at the most - they will get a few years on top of the time they've spent in jail awaiting trial.

(A seventh man also pleaded guilty Wednesday to being an accessory after the fact of a murder.)

The case amounts to the first acknowledged used by Canadian police of IMSI catchers.

The portable devices, packed by police surveillance teams, can impersonate a cellphone tower, capturing the digital signatures of all the phones within a given radius (IMSI stands for "international mobile subscriber identity"). From there, police can try to identify suspects' phones by a process of elimination and try to get wiretaps on those specific phones.

In pretrial motions police argued all this was a privileged investigative technique, while defence lawyers argued they were entitled to detailed information about the device. Toronto-based defence lawyers Frank Addario and Michael Lacy raised a litany of detailed questions - such as asking for the IMSI catcher's make and model, its range and the reliability of its evidence. A national-security specialist, Toronto lawyer Anil Kapoor, was brought in as a friend of the court to help settle some of the questions.

While prosecutors argued the defence was on a "fishing trip" that would essentially hand the police playbook to alleged mobsters, Quebec Superior Court Judge Michael Stober sided with the defence last December. "The Court concludes that the accused have a legitimate interest in receiving disclosure of information that goes to the heart of this prosecution," he ruled.

The Crown immediately appealed - setting the stage for Wednesday's appeal court hearing. Had it happened, it would have had the effect of creating a binding ruling about how police are to use and disclose such devices in Quebec.

Instead, Wednesday morning's hearing in Montreal lasted only long enough for the judges to learn that the scheduled hearing was no longer necessary, due to the guilty pleas that had just been uttered in Laval. The effect is that Justice Stober ruling is an outlier's opinion from the lone judge in Canada who got a chance to explore the legal questions raised by RCMP IMSI catchers.

"It's not going to bind any other courts," said Mr. Kapoor, who had been on hand to Montreal to make arguments at the appellate court.

Sputnik (Russia)
US 'Political Chatter' Prevents Snowden's Defense
Thursday, 31 March 2016

Moscow - Former US National Security Agency (NSA) contractor Edward Snowden accused of espionage by the United States cannot prove his innocence, as long as US authorities only make cunning statements about him and do not announce the subject of his charges, one of Snowden's lawyers said Thursday.
"From the first day Edward Snowden has been on the territory of Russia, sweeping accusations against him began to appear, without submitting any specific charges of committing any crime. A person must understand the subject of the charges to defend himself, and there is no such thing, there is a political chatter," Anatoly Kucherena told RIA Novosti.

The lawyer also called Washington's claims of providing Snowden with a fair trial in the United States "cunning."

"We are well aware that such chatter, sweeping accusations, insults, him being used for political purposes by US presidential hopefuls - leave a just, fair trial of Edward Snowden out of the question," Kucherena added.

Snowden started making revelations about widespread US global surveillance in 2013. The same year, Russia granted the whistleblower temporary asylum for one year. In August 2014, Snowden received a three-year residence permit to live in Russia.

In the United States, he faces up to 30 years in prison on charges of espionage and theft of government property.

The US Espionage Act was never intended to prosecute journalistic sources used for public good and prevents Snowden from defending himself in an open court before a jury, according to the whistleblower.

Wall Street Journal
Google Was Also Ordered To Unlock Phones
Thursday, 31 March 2016
Byline: Devlin Barrett

Washington - Alphabet Inc.'s Google has been repeatedly ordered to help federal agents open cellphones, according to court records in seven states that show Apple Inc. isn't the only company facing government demands at the center of a fierce debate over privacy and security.

The American Civil Liberties Union found 63 instances where the government sought a court order under a 1789 law called the All Writs Act to compel Apple and Google to help in accessing data on locked phones.

The outcomes aren't clear. However, federal prosecutors have said until late last year, when Apple began resisting such efforts, it was routine for judges to approve such requests. And those requests aren't new -- the cases stretch back to 2008.

Details of the cases come days after the Justice Department said it cracked into a terrorist's cellphone, ending a court battle over whether Apple can be forced by a court to help the Federal Bureau of Investigation bypass the phone's passcode security system.

The overall numbers aren't surprising, since prosecutors have previously said Apple provided assistance in such cases more than 70 times. Most, but not all, of the 63 cases identified by the ACLU involve Apple.

But the figures offer the first accounting of how the government has also sought such orders for Google to help investigators pull data off locked smartphones, typically by having the company reset the devices' passwords.

"We carefully scrutinize subpoenas and court orders to make sure they meet both the letter and spirit of the law," a Google spokesman said. "However, we've never received an All Writs Act order like the one Apple recently fought that demands we buildnew tools that actively compromise our products' security. . .We would strongly object to such an order."

The language of the All Writs Act is expansive, allowing federal courts broad authority to compel others to do what they say. But the government has most often looked to it for help in cases involving technology beyond its control.

The Justice Department has defended the practice of getting court orders to compel assistance from technology companies as a routine and necessary part of law-enforcement work when there is no other way for agents to access a suspect's phone that might hold important criminal evidence. Privacy groups argue the government is misusing an outdated law to claim authority not granted by Congress.

A court filing last month from Apple indicated there were at least a dozen active cases in which the Justice Department was pursuing similar orders involving Apple.

In one of the Google cases, a 2015 drug investigation in California, prosecutors got a court order compelling Google to provide assistance in getting data from an Alcatel cellphone and a Kyocera cellphone, both of which were using Google's Android operating system, according to court records.

The ACLU found Google was also the subject of All Writs Act cases in Alabama, New Mexico, North Carolina, North Dakota, Oregon and South Dakota.

Some records show judges signed court orders compelling Google to help investigators, though the records don't indicate whether Google complied. In one such case, a 2015 child pornography investigation in Sacramento, Calif., Google was ordered to reset the password of a Samsung telephone so investigators could search its contents. Other court dockets are unclear as to the outcome of the prosecutors' request.

The technical issues are different for Alphabet Inc.'s Google than for Apple, partly because Google makes the Android cellphone operating system, but that system runs on phones manufactured by others, while Apple makes both phones and their operating software.

The Google cases involve investigations by the FBI, Secret Service, Homeland Security Department, Drug Enforcement Administration and Bureau of Land Management.

Apple's dispute with the Justice Department in the terrorism case centered on the work phone of Syed Rizwan Farook, who along with his wife killed 14 people and injured 22 others in a Dec. 2 attack on a holiday party of San Bernardino, Calif., county employees.

Just as the two sides were due to face off in court last week, federal officials said they found a new potential technique to get data from the phone without Apple's help. On Monday, the Justice Department said the method worked and it was dropping the case against Apple.

Los Angeles Times
FBI keeping hack tools under wraps
Thursday, 31 March 2016
Byline: Paresh Dave, David Pierson

Los Angeles - Even when courts compel law enforcement agencies to reveal the ways they hack into technology products, it's criminal suspects - - not the makers of hardware or software -- who are most likely to learn the details.
As Apple Inc. considers legal tactics that could force the FBI to share how it unlocked an iPhone belonging to one of the San Bernardino shooters, a federal court case in Washington illuminates how the judicial process can leave the tech world in the dark.

The case involves the Tor browser, which is popular among activists, dissidents, journalists -- and those who want to mask their identities when surfing online. The FBI hacked the browser as part of a sweeping child pornography investigation that led to 1,300 suspects.

In one of the cases, a judge has ordered that the FBI give defense attorneys details about the software flaw that allowed the FBI to identify suspect Jay Michaud of Vancouver, Wash., whose prosecution has

been at the forefront of the investigation. But prosecutors on Tuesday opposed the ruling in a heavily redacted document.

They say the defense already has enough information to analyze the operation. And former federal prosecutors say disclosing the vulnerability takes away the ability to use the technique to nab more offenders.

But technology developers and privacy activists fear that consumers' safety could be put at risk if the Tor issue turns out to be an unpatched bug.

The tension will manifest in "much more litigation to understand the techniques used to capture individuals," said Michael Zweiback, an attorney at Alston & Bird and former chief of the Justice Department's cybercrimes section.

The issue will not go away as the FBI's growing interest in probing the Internet for criminal activity will require using "techniques that are more proactive -- that are recognized exploits -- to get access to information," Zweiback said.

In the Washington case, federal agents briefly seized control of Playpen, a secretive online forum, accessible through Tor, where more than 214,000 members traded what authorities describe as sexually explicit photos and videos, including of children. The FBI learned the Internet protocol addresses of Playpen visitors by using a software bug linked to Tor to defeat the browser's security measures.

Public defenders for Michaud, who is charged with possession of child pornography, say they can't fully vet the legality of the FBI's investigation without knowing how the agency hacked Tor. While the government has turned over details about the software that identified his address, it hasn't shared information about how that tracking tool was introduced.

Prosecutors and experts say what matters is that the hack didn't tamper with Michaud's data.

"Getting through the lock doesn't matter, as long as the information on the other side of the door isn't affected," Zweiback said, comparing digital searches with physical ones.

Colin Fieman, an attorney for Michaud, told a judge in his case last month that the government's objections to revealing the vulnerability were "puzzling." The information wasn't classified or confidential, he said, according to a court transcript.

Law enforcement generally seeks to protect its hacking methods as long as possible because the techniques' usefulness shrinks when the public or manufacturers are aware, Zweiback said.

Fieman said only his technological expert would examine the hacking tool.

"We are not looking to circulate this stuff," he told the court. "We just need to look at it."

Last month, U.S. District Judge Robert Bryan ruled in Fieman and Michaud's favor. But prosecutors this week asked Bryan to reconsider, saying that the additional information wouldn't address the defense's concerns. Justice and FBI officials didn't have immediate comment.

Fieman in an email Wednesday said he disagreed with the government's assertion that law enforcement privilege "should trump a defendant's constitutional rights to an effective defense and fair trial."

Though his team may eventually gain access to details of the FBI method, Tor has little recourse. Suing the government to get the same information is unlikely to end well, legal experts said.

Kate Krauss, director of communications and public policy for the Cambridge, Mass.-based nonprofit that develops and operates the browser, said her colleagues suspect that the issue exploited by the FBI has been fixed, but they want to confirm that.

"We're watching with interest," Krauss said over a voice call on the encrypted chat app Signal. "We're the gold standard for online anonymity software, and we're committed to keeping the security stronger."

It's a desire shared by Apple too. Attorneys for the Cupertino, Calif., company say they plan to insist that the government explain how, with the help of an undisclosed outside group, investigators bypassed an iPhone 5c's security -- the same device authorities had maintained couldn't be opened without Apple's assistance.

Krauss said Tor, just like the tech industry at large, prefers that people who find vulnerabilities in products privately report them so they can be fixed before they are turned against users. But law enforcement and counter- terrorism agencies maintain a narrow set of bugs are better left untouched for investigative purposes.

Apple and Tor may never confirm the FBI's tactics. But the publicity around the two incidents could lead judges overseeing similar cases to ask more questions, said Robert Cattanach, a former Justice Department attorney who specializes in cybersecurity for the law firm Dorsey & Whitney.

"You have skeptical judges and criminal defense lawyers using San Bernardino to exploit ways to get under the FBI's skin if nothing else," Cattanach said. "Even the most neutral federal judge is going to give pause when the FBI makes representations."

Michael Vatis, a former official with the Justice Department and FBI, now a partner at Steptoe & Johnson, said any time that the FBI uses a technical vulnerability in a case, details of it are kept under seal. But Cattanach said there were instances, though rare, when the FBI revoked cases because it was

asked to share hacking methods, even just to defendants and their attorneys. He declined to provide details.

Attorneys said the question of when authorities must bare all is set to explode in significance. The FBI and police will need to rely increasingly on taking advantage of technical flaws to ferret out cybercriminals as tech companies introduce stronger security protections.

"There's been some frustration at the FBI that they're operating with one hand tied behind their back," Cattanach said. "They've since realized that if you're going to beat the bad guys at their own game, you've got to play the game."

But in improving capabilities, the FBI has turned into yet another security research group that tech firms want to learn from.

"There is a great deal of irony ... that the FBI is being asked to reveal their work now" in the Michaud case, Vatis said.

Los Angeles Times
FBI may keep its hacking secret
Thursday, 31 March 2016
Byline: Richard Winton, James Queally

Los Angeles - The successful hack of a phone linked to the San Bernardino terror attacks is unlikely to help police win greater access to encrypted data in thousands of smartphones sitting in evidence lockers nationwide, legal experts and law enforcement officials say.
The process used to gain access to Syed Rizwan Farook's iPhone 5c might not work on other devices, according to an FBI official with knowledge of the investigation.

Though the FBI might want to use the new tool to help solve other criminal cases, doing so would also make the process subject to discovery during criminal trials and place the information in the public domain, according to the official, who was not authorized to discuss the case and spoke on the condition of anonymity.

Any application of the method used to access Farook's phone would probably be limited to investigations that are unlikely to result in criminal cases, the official said.

"A technical option developed for a particular computing device may not work on other devices," the FBI official said. "The effectiveness of these lawful methods may be limited by time and resources, and may lack the scalability to be a viable option for most investigations."

On Wednesday, an Arkansas prosecutor said the FBI has agreed to help his office gain access to an iPhone 6 and an iPod that might hold evidence in a murder trial. It was not clear if the FBI would employ the method it used to access Farook's phone.

News that the FBI found a way into Farook's phone Monday thrilled police, who have long complained that encrypted data represents a major roadblock to routine police investigations. Thousands of smartphones sit in police evidence lockers across the country. At least 400 locked devices are in the possession of the Los Angeles Police Department and the L.A. County Sheriff's Department.

But as it became clear that the FBI's success in the San Bernardino case wouldn't translate to broader access for law enforcement, officials once again called on Congress to settle the issue.

"We cannot ask crime victims across 3,000 local jurisdictions to stake their hope for justice on an unending technological arms race between the government and Apple," Manhattan Dist. Atty. Cyrus Vance Jr., one of the leading national voices decrying encryption, said in a statement issued Tuesday. "The ongoing public safety challenge posed by warrant-proof encryption demands a comprehensive, legislative solution."

Terrence Cunningham, the police chief in Wellesley, Mass., and president of the International Assn. of Chiefs of Police, said he respects the FBI's position but warned that criminals will continue to use encryption to deflect police investigations until a legislative solution is presented.

"The concern is that today's technology provides criminals with powerful new tools that keep police from protecting the public," he said. "Data that rests in emails, text messages, photos and videos stored on mobile devices can help to locate a suspect or a victim, and in some cases, save lives. Law enforcement's mission is to keep the public safe and to protect communities, and collecting digital evidence from criminals and terrorists will help us do that."

Federal investigators have offered few details about how they gained access to Farook's phone. The iPhone 5c was at the center of a court battle between the FBI and Apple, which led to a court order that Apple create software that would allow the FBI to access encrypted data on the device.

Farook disabled the phone's iCloud backup feature six weeks before the Dec. 2 attack, according to court filings. He had also enabled an auto- erase feature that would permanently destroy all data on the phone after 10 consecutive failed attempts to enter the device's password.

A third party provided the FBI with a way to disable the password entry limit, according to another law enforcement official with knowledge of the investigation who was not authorized to discuss the case and spoke on the condition of anonymity.

Internal government policy might limit what, if anything, the FBI could share about the method used to hack Farook's phone, said Andrew Crocker, a staff attorney with the Electronic Frontier Foundation, a digital rights advocacy group.

If the government exploited a flaw in Apple's security measures, it could be required to disclose that information to Apple under the Vulnerabilities Equities Process, Crocker said. The policy is weighted toward disclosure, but the government has successfully fought to keep such details secret before.

Government agencies are allowed to share information about digital security flaws with one another, he said. But if the government chose not to share that information with Apple, it could also conceivably be barred from telling police agencies about the process used to unlock Farook's phone.

"They certainly can share it within the federal government without disclosing it to Apple," Crocker said. "The way I read the policy, sharing it with local police would be a dissemination outside the government."

In the Arkansas case, Cody Hiland, prosecuting attorney for the state's 20th Judicial District, said the FBI's Little Rock field office had agreed to help prosecutors gain access to a pair of locked devices linked to suspects in the slayings of Robert and Patricia Cogdell.

Calls to the FBI's Little Rock field office were not immediately returned. An FBI spokesman in Washington, D.C., declined to comment.

Attorneys for Apple are researching legal tactics to compel the government to tell the company what, if any, flaws it exploited in gaining access to Farook's phone. But most experts believe the FBI has no obligation to comply. The FBI could also argue that the most crucial information is part of a nondisclosure agreement, solely in the hands of the outside party that assisted the agency, or cannot be released until the investigation is complete.

Though the debate over Farook's phone did not land in criminal court, the fight between law enforcement and Silicon Valley over access to encrypted data is far from over. The FBI may have claimed a victory this week, but some police leaders fear it won't take long for Apple or another company to build tougher encryption methods.

"If the FBI did in fact find some type of a flaw that they were able to exploit, clearly the industry is going to say, 'We've got to find a way to plug that hole,'" Cunningham said.

Jerusalem Post
Twitter diplomacy conference opens in Tel Aviv
Thursday, 31 March 2016
Byline: Herb Keinon

Tel Aviv - Tweeting diplomatic messages and using Facebook as a communications tool during crisis situations are among the topics being discussed in Tel Aviv at a two-day first-of-itskind conference on digital diplomacy.
The conference, which opened Wednesday, is jointly hosted by the Foreign Ministry and the Partner Institute for Internet Studies at Tel Aviv University.

It is bringing together some 50 diplomats and scholars from 25 countries to look at how states are using digital platforms as a diplomatic tool.

The conference is dealing with a number of issues that are arising as a result of the use of social media by foreign ministries around the world, including the need to train diplomats in social media engagement, ways to evaluate the impact, and the intersect between digital diplomacy, public diplomacy and nation branding.

Noam Katz, head of the ministry's public diplomacy division, is scheduled to deliver a talk Thursday on how Israel engages with the Arab world through social media.

According to the ministry, governments are increasingly using social media as a diplomatic tool, with some 400 heads of states and governments active on Twitter.

Foreign Ministry spokesman Alon Lavi said that the ministry sees digital diplomacy as an important diplomatic tool, "certainly in light of the challenges we face." He said that Israel is able through social media to expose many people to its messages whom Jerusalem would otherwise be unable to reach.

Khaleej Times
'50% of GCC organisations can't predict, prevent cyber attacks'
Thursday, 31 March 2016
Byline: Sandhya D'Mello

Dubai - Gulf Business Machines, or GBM, the region's number one provider of IT solutions, has revealed that nearly 50 per cent of GCC executives lack confidence in their organisations in having the right tools to predict and prevent cyber attacks.
The statistic is part of GBM's latest security survey, which was unveiled at Gulf Information Security Expo and Conference (GISEC) 2016. The annual GBM Security Study, now in its fifth year, polled over 700 executives and IT professionals based in the UAE, Qatar, Oman, Bahrain and Kuwait.

Corporate investment in IT security is a major focus of the GBM survey, and despite internal and external threats to organisations, 71 per cent of executives confirmed that their IT security budgets will either stay the same or decrease in 2016.

In response to whether their organisations hire external consultants to help guard against cyber threats, 48 per cent of respondents said that their organisations conduct regular third-party security assessments, while 40 per cent of organisations have a dedicated IT governance, risk and compliance function.

Discussing the security survey at GISEC, Hani Nofal, Vice President of Networks, Security and Mobility said: "Security is no longer strictly an IT function but companies across the region increasingly understand that this is a boardroom and organizational conversation."

Asharq Al-Awsat
Saudi Censorship to Monitor Cyber-Attacks on Government Bodies
Thursday, 31 March 2016
Byline: Fatah Al-Rahman Youssef

Riyadh - A Saudi official has revealed that there is a continuous censorship and follow up to track any attempt for cyber attacking government and private installations, including terrorist actions and money laundering.
The official explained that there are specialized committees in the country to review these cases and protect information security in the Kingdom.

Prince Dr Turki bin Saud bin Mohammed, President of King Abdulaziz City for Science and Technology (KACST) talked during a press conference following the inauguration of the Third Saudi International Conference on Information Technology entitled "Cyber Security", which was organized by KACST at its headquarters in Riyadh, under the patronage of the Custodian of the Two Holy Mosques King Salman bin Abdulaziz Al Saud.

Dr Turki bin Saud explained that his country is fully alert to save its security information from hackers and pointed out that Saudi Arabia has assigned specialized bodies to watch suspicious activities, including terrorist acts and money laundering.

The prince called the private sector to invest in the fields of information and electronic securities, be updated, and submit challenges, problems and review solutions to solve them and contribute to developing the information security field.

Dr Turki said that the cost of losses due to cyber- attacks per year was estimated at $ 445 billion globally, and the damage bill of such attacks is expected to rise in the future as a result of the expansion of electronic services and the entry of new technology concepts.

He also reinforced the need to develop scientific research efforts in the field of information security in support of national interests through the transfer and localization of technology, building capabilities and innovation of national algorithms that can be used safely to protect data.

Moreover, the KACST President said that the City has worked and is still working in cooperation with the relevant authorities on the transfer and localization of the latest technologies of the Kingdom through the establishment of a sophisticated infrastructure and national capability-building in many scientific fields.

These fields include the transfer of those related to information technology in general and cyber security technology in particular, emanating from the leadership's interest in scientific research and technical development in various fields for their important role in development and its sustainability.

Moreover, Dr Turki pointed out that KACST has built a supportive integrated environment for the transfer and development of technologies related to information security through the establishment of the National Center for Information Security Technology and implementation of applied research in the field of information security in partnership with a number of distinguished universities and research centers around the world, as well as the preparation of qualified and national capabilities on research and development in this area.

The conference targeted staff and students from higher education institutions and encouraged attendance of managers and officials of public and private sectors within and outside the Kingdom, who are interested in electronic security management, the authors of the regulations and policies for information security and its innovation, besides local and international experts and researchers in the field of information security technology.

Online 'activists' a threat to Middle East security
Thursday, 31 March 2016
Byline: Caline Malek

Dubai - The most prevalent cyber criminals in the Middle East are not online thieves out to pilfer your bank account, but "activists", according to a new report by a UK-based defence, security and aerospace company.
These individuals and groups take their political, religious or social causes to the internet, setting out to harm reputations, steal data or target infrastructure, said Dr Adrian Nish, head of threat intelligence at BAE Systems Applied Intelligence.

"There are many tensions in the Middle East, many communities who are very active, scoring political blows against each other," he said.

"And to some extent, it does not seem like such a significant threat but then you do get nation state-backed actors using those personas to steal information and maybe publish it, and pretend to be an activist. "We've seen many cases of this happening in the Middle East."

While these crimes, he said, were much more at the nation-state angle than corporate, there were also cyber criminals targeting Middle Eastern businesses, "trying to defraud people out of large sums of money as well", Dr Nish said during a meeting on demystifying cybercriminals at the Fairmont Hotel in Dubai on Wednesday. Cyber crime is a massive industry with so many ways for criminals to cause havoc, he said.

There are those who run phone support scams, those who write software for other cyber criminals or launder the ill-gotten gains or help prop up the cybercrime supply chain in other ways. There are also non-state actors who work for governments to steal valuable data or intelligence to create international incidents.

Cyber crime was the second most-reported economic crime, and one that affected 30 per cent of organisations, in the Middle East, the report said.

"Threats are evolving, and governments and businesses have an urgent requirement to comply with increasing regulation," said Bulent Teksoz, global cyber security strategist at BAE Systems Applied Intelligence. Warfare, he said, does not look like it used to.

"Battles would take place in the air, on land or in the sea but the battlefield has now extended to cyber space," he said. "Borders mean nothing.

"This interconnected world leaves organisations vulnerable to threats. "You have to know your enemy to defend yourself."

He said that Middle East governments did recognise the scale of the threat and were taking precautions to defend their countries. "Governments are doing well on educating end-users," he said.

Matthew Cochran, chairman of the Defence Services Marketing Council in Abu Dhabi, said 'hacktivism' was dangerous if not controlled and approved by the government.

"If a 'hacktivist' is not appropriately audited by cyber security supervisors and cleared by the respective government cyber command authorities then a slippery slope of private individuals with an enormous amount of sensitive documents and data can endanger both the public and government alike globally," he said.

Reuters
FBI's secret method of unlocking iPhone may never reach Apple
Thursday, 31 March 2016
Byline: Staff report

Washington - The FBI may be allowed to withhold information about how it broke into an iPhone belonging to a gunman in the December San Bernardino shootings, despite a U.S. government policy of disclosing technology security flaws discovered by federal agencies.
Under the U.S. vulnerabilities equities process, the government is supposed to err in favor of disclosing security issues so companies can devise fixes to protect data. The policy has exceptions for law enforcement, and there are no hard rules about when and how it must be applied.

Apple Inc has said it would like the government to share how it cracked the iPhone security protections. But the Federal Bureau of Investigation, which has been frustrated by its inability to access data on encrypted phones belonging to criminal suspects, might prefer to keep secret the technique it used to gain access to gunman Syed Farook's phone.

The referee is likely to be a White House group formed during the Obama administration to review computer security flaws discovered by federal agencies and decide whether they should be disclosed.

Experts said government policy on such reviews was not clear-cut, so it was hard to predict whether a review would be required. "There are no hard and fast rules," said White House cybersecurity coordinator Michael Daniel, in a 2014 blog post about the process.

If a review is conducted, many security researchers expect that the White House group will not require the FBI to disclose the vulnerability it exploited.

Some experts said the FBI might be able to avoid a review entirely if, for instance, it got past the phone's encryption using a contractor's proprietary technology.

Explaining the policy in 2014, the Office of the Director of National Security said the government should disclose vulnerabilities "unless there is a clear national security or law enforcement need."

The interagency review process also considers whether others are likely to find the vulnerability. It tends to focus on flaws in major networks and software, rather than individual devices.

During a press call, a senior Justice Department official declined to disclose whether the method used on Farook's phone would work on other phones or would be shared with state and local law enforcement.

Apple declined to comment beyond saying it would like the government to provide information about the technique used.

PROTECTING "CRUCIAL INTELLIGENCE"

The government reorganized the review process roughly two years ago and has not disclosed which agencies regularly participate other than the Department of Homeland Security and at least one

intelligence agency. A National Security Council spokesman did not respond to a request for comment about agency participation.

In his April 2014 blog post, White House cybersecurity coordinator Daniel, who chairs the review group, said secrecy was sometimes justified.

"Disclosing a vulnerability can mean that we forego an opportunity to collect crucial intelligence that could thwart a terrorist attack stop the theft of our nation's intellectual property," Daniel wrote.

On Tuesday, a senior administration official said the vulnerability review process generally applies to flaws detected by any federal agency.

Paul Rosenzweig, a former deputy assistant secretary at the Department of Homeland Security, said he would be "shocked" if the Apple vulnerability is not considered by the group.

"I can't imagine that on one of this significance that the FBI, even if it tried to, would succeed in avoiding the review process," said Rosenzweig, founder of Red Branch Consulting, a homeland security consulting firm.

He predicted the FBI would not be forced to disclose the vulnerability because it appears to require physical possession of a targeted phone and therefore poses minimal threat to Internet security more broadly.

Many security researchers have suggested that the phone's content was probably retrieved after mirroring the device's storage chip to allow data duplication onto other chips, effectively bypassing limitations on the number of passcode guesses.

Kevin Bankston, director of the think tank Open Technology Institute, said there is no public documentation of how the review process has worked in recent years. He said Congress should consider legislation to codify and clarify the rules.

Stewart Baker, former general counsel of the NSA and now a lawyer with Steptoe & Johnson, said the review process could be complicated if the cracking method is considered proprietary by the third party that assisted the FBI.

Several security researchers have pointed to the Israel-based mobile forensics firm Cellebrite as the likely third party that helped the FBI. That company has repeatedly declined comment.

If the FBI is not required to disclose information about the vulnerability, Apple might still have a way to pursue details about the iPhone hack.

The Justice Department has asked a New York court to force Apple to unlock an iPhone related to a drug investigation. If the government continues to pursue that case, the technology company could potentially use legal discovery to force the FBI to reveal what technique it used, a source familiar with the situation told Reuters.

At least one expert thinks a government review could require disclosure. Peter Swire, a professor of law at the Georgia Institute of Technology who served on the presidential intelligence review group that recommended the administration disclose most flaws, said there is "a strong case" for informing Apple about the vulnerability under the announced guidelines.

"The process emphasizes the importance of defense for widely used, commercial software," he said.

The Register (UK)
Former FBI spy hunter: Don't trust China on 'no hack' pact
Wednesday, 30 March 2016
Byline: John Leyden

London - A former FBI investigator who helped expose Soviet double agent Robert Hanssen warns that enterprises should give up worrying about hackers, "who are now the good guys", and be more worried about spies.
Veteran spy hunter turned infosec exec Eric O'Neill said that espionage has evolved and become increasingly digital as hackers have become key in exposing security bugs through bug bounties and the like. The evolution of the threat landscape has happened without corporate security mindsets catching up, he says.

Too many enterprises continue to think that they aren't important enough to become a target for cyber-espionage from so- called APT groups but this mindset is wrong and needs to change, according to O'Neill, who argues that reconnaissance followed by spear-phishing or other social engineering attacks has become the go-to spying method of the 21st century. Much of this is targeted towards industrial espionage with China and (to a much smaller extent) Russia primarily to blame, he says.

O'Neill, the national security strategist for endpoint security firm Carbon Black, described last year's China-US "no hack pact" as a "joke".

"I don't believe there's anyone in the US government [who] thought China would stop spying," O'Neill said.

"Chinese firms don't invest in research and development. They're not interested in innovation themselves," he claimed.

O'Neill claims China is playing the long game with hacks against American health insurer Anthem and the US government's Office of Personnel Management last year. China has said the attacks were carried out by China- based criminals rather than state-sponsored hackers. But O'Neill insists that both breaches were about long-term intelligence gathering and perhaps ultimately aimed towards cultivating insiders as assets rather than the theft of trade secrets. Real world examples of the latter are not hard to find.

O'Neill cited the case of a Chinese spy convicted of stealing trade secrets from Motorola as well as the recent case of a Chinese man convicted of stealing military aircraft secrets from Boeing.

The attack against US retailer Target, which relied on breaching its systems and stealing credit card data after first hacking into its heating and ventilation contractor, is also more a case of espionage rather than a "conventional" hack, according to O'Neill.

"You need the right mindset and extraordinary efforts to prevent loss," O'Neill said. "Attackers are spending more time and energy on more sophisticated attacks."

The bad guys are not playing by the rules. This is a particular problem because security as a whole is too reactive and slow to adapt. "We need to do a better job at protecting ourselves," O'Neil concluded.

O'Neil served five years in the FBI prior to leaving just before 9/11 ("I'd probably still be at the agency if I hadn't left beforehand," he said) to work as a lawyer before moving to a security consultancy. In his new role at Carbon Black, O'Neil will be focusing on raising awareness of cybersecurity within governments, helping to shape policies around national security.

Yonhap News Agency
S. Korea restarts project to launch 5 military satellites
Thursday, 31 March 2016

South Korea plans to kick start a program to send five satellites into orbit by 2022 which will allow the military to keep close tabs on North Korea, defense officials said Thursday.
The project, dubbed "425 project," has been stalled for a year amid budget limitations, with the National Assembly allocating only 2 billion won (US$1.7 million) in the 2016 budget out of 64.3 billion won requested by the defense ministry.

"The ministry has set its sights on reaching a contract within the latter half of this year," a defense official said. "The timing of the project's kickoff has been delayed by one year ... but we will follow through with the goal to complete the project within the target date," he noted.

Under the project, the military plans to launch five reconnaissance satellites by 2022 that have onboard cameras capable of taking clear images of an object on the Earth's surface with a diameter of 0.3-0.5 meters.

Four of satellites will also be equipped with all-weather synthetic aperture radar, while one will carry electronic optics and infrared surveillance equipment.

With the new satellites, South Korea would be able to detect all launch preparations or other military activities by North Korea, including those involving mobile transport erector launchers, within two to three hours.

Globe and Mail
Ottawa's big IT project still struggling
Monday, 04 April 2016
Byline: Barrie Mckenna

It was a seductively simple idea.
Take the maze of federal government databases, e-mail systems and computer networks, and put them under one departmental roof. More than 60 e-mail systems would become one, 500plus databases would be merged into seven, and thousands of tech workers from dozens of departments would go to work for a single agency, Shared Services Canada.

The two Conservative ministers in charge at the time - former public works minister Rona Ambrose (now interim Conservative leader) and treasury board president Tony Clement - were bursting with optimism when they announced the project five years ago. They promised the consolidation would save piles of money (up to $400-million a year), wipe out duplication and enhance cybersecurity.

"This is a whole new way of doing business for the government," Mr. Clement vowed.

Not so much. It's turned into an old and very familiar story of how Ottawa works. Years and billions of dollars later, virtually none of the wondrous benefits have come to pass.

And in last week's budget, the new Liberal government quietly gave Shared Services a $384-million infusion over two years to its roughly $1.9-billion annual budget - apparently, to keep creaky old government computer systems from crashing. The agency will get another $75-million to strengthen security.

But this isn't just an inside-Ottawa tale of serial bungling. There are disturbing real-world consequences of the government's failure to fix chronic information technology (IT) problems. Websites periodically crash and go offline, sometimes for days, because of continuing database problems.

A 2014 cyberattack by Chinese hackers on the National Research Council's network paralyzed much of its research work for nearly a year. Also in 2014, emergency workers in Saskatchewan lost voice communications for nearly an hour owing to a mix-up between Shared Services and the RCMP.

Not only is Ottawa not saving money, it's spending more and getting less than it needs in the way of IT. Much of the promised consolidation remains a work in progress, with no clear end-date in sight.

The merging of e-mail systems, outsourced to Bell Canada and CGI Group, is already more than a year behind schedule. Fewer than one in five government workers is using new Canada.ca addresses.

Efforts to move more than 15,000 computer applications onto three new centralized databases in Gatineau, Que., Barrie, Ont., and at Canadian Forces Base Borden, north of Toronto, are running late.

Fewer than 10 per cent of government apps have been shifted over to Shared Services. And an $18-million project aimed at making it easier for users to sort through Statistics Canada data is also badly behind schedule.

Auditor-General Michael Ferguson issued a scathing report in February, outlining Shared Services' mounting problems and its inability to deliver results. "They have big problems ahead of themselves," Mr. Ferguson told reporters bluntly.

The view of the new Liberal government is that Shared Services was set up to fail by the Conservatives. The agency was hit with severe budget cuts soon after its creation, leaving it starved of the resources it needed.

The question now is can the new government make it right? A key issue is sorting out what information technology the government should develop in-house, and what it should buy off the shelf. In a postbudget brief, Canadian Advanced Technology Alliance president John Reid lamented that "despite longstanding good intentions, the [government's] procurement model has not modernized to keep up with industry changes and standards. It is not fully aligned with the digital era."

It's a missed opportunity to spur innovation, according to CATA. Too often, Ottawa winds up overpaying for inferior IT, while crowding out the private sector by building custom systems rather than buying commercial offerings and spurring the emergence of promising technology exports.

The government "has no export sales. ... No intellectual property gets created that is patentable," the group laments.

Of course, CATA, which speaks for Canadian tech companies, has an interest in seeing some of that business flow to its members.

But given recent experience, it's hard to imagine Ottawa could do worse. Surely there is a better way for Ottawa to acquire the technology it needs to do its work.

La Presse
La surveillance demasse menacerait la diversité d'opinions
Saturday, 02 April 2016
Byline: Marc Thibodeau

La surveillance de masse des communications en ligne pousse nombre d'internautes à s'autocensurer, y compris ceux qui affirment «n'avoir rien à cacher», et limite la diversité d'opinions à un degré préoccupant.

Le constat figure dans une nouvelle étude parue dans la revue Journalism & Mass Communication Quartely qui sonne l'alarme quant à l'impact potentiellement néfaste sur la liberté d'expression de pratiques mises en lumière aux États- Unis par Edward Snowden.

L'ancien consultant de la National Security Agency (NSA) avait notamment affirmé en 2013, documents à l'appui, que l'influent service de renseignements était en mesure d'accéder au contenu des serveurs de géants de la Silicon Valley comme Google, Facebook et Yahoo!.

Les firmes désignées ont démenti toute collaboration sans pour autant convaincre la population américaine, qui demeure très partagée quant à l'utilisation de programmes de surveillance à grande échelle par le gouvernement pour lutter contre le terrorisme.

Étude

Pour évaluer leur impact sur le comportement des internautes, une chercheuse de la Wayne State University, au Michigan, a demandé à un groupe de 250 personnes de réagir à une nouvelle fictive portant sur l'engagement des États-Unis contre le groupe armé État islamique.

Les répondants devaient préciser à quel point ils étaient à l'aise avec l'idée de commenter publiquement la nouvelle sur Facebook, dire ce qu'ils estiment être la position de la majorité des Américains à ce sujet et donner leur appréciation des programmes de surveillance de masse.

La moitié des personnes recrutées pour l'exercice se voyaient rappeler qu'il était important de garder en tête que la NSA «surveille les activités en ligne de citoyens».

Dans la vaste majorité des cas, écrit la chercheuse responsable, Elizabeth Stoycheff, les participants ayant été sensibilisés par le message sur la NSA se montraient beaucoup moins disposés à exprimer leur opinion s'ils avaient l'impression qu'elle n'était pas conforme à celle de la majorité.

Ceux qui étaient les plus susceptibles d'adopter un comportement conformiste sont ceux qui soutenaient le plus les programmes de surveillance.

«Ces individus prétendent que la surveillance est nécessaire pour assurer la sécurité nationale et qu'ils n'ont rien à cacher. Toutefois, quand ces individus ont l'impression qu'ils sont surveillés, ils modifient volontairement leur comportement - exprimant leurs opinions quand ils sont en phase avec la majorité et les taisant dans le cas contraire», relève l'auteur.

Seules les personnes qui étaient très critiques à l'endroit des programmes de surveillance semblaient disposées à exprimer leur opinion sans réserve, qu'ils soient ou non en phase avec la majorité.

Des études antérieures ont démontré que les usagers des réseaux sociaux sont moins susceptibles de s'exprimer librement sur un sujet s'ils ont l'impression d'être minoritaires, en partie de crainte de se retrouver isolés.

L'effet «modérateur» découlant de la crainte d'un programme de surveillance constitue un autre facteur que les autorités devraient examiner attentivement alors qu'ils statuent sur l'utilité et la légitimité de programmes de surveillance de masse, souligne Mme Stoycheff.

Programme révisé

La polémique suscitée par les révélations d'Edward Snowden a notamment poussé le Congrès américain à réviser un programme de collecte de métadonnées qui permettait à la NSA d'accumuler des renseignements sur l'ensemble des clients de Verizon.

Les élus ont cependant «traîné les pieds» avant d'interrompre cette pratique et tardent à adopter les réformes requises pour protéger adéquatement les données des internautes contre des intrusions abusives, juge l'Electronic Frontier Foundation (EFF) dans un récent rapport.

L'organisation de défense des droits des internautes salue parallèlement les efforts des géants de l'internet, relevant qu'ils ont, dans la majorité des cas, adopté des politiques beaucoup plus restrictives à ce sujet au cours des dernières années.

Les normes de l'industrie en la matière ont sensiblement évolué, mais il reste encore beaucoup à faire, prévient l'EFF.

Washington Post
Hackers find soft spot in hospitals
Sunday, 03 April 2016
Byline: Carolyn Y. Johnson and Matt Zapotosky

The cyberattack on MedStar Health - one of the biggest health-care systems in the Washington region - is a foreboding sign that an industry racing to digitize patient records and services faces a new kind of security threat that it is ill-prepared to handle, security experts and hospital officials say.
For years, hospitals and the health-care industry have focused on keeping patient data from falling into the wrong hands. But the recent attacks on MedStar's network and other hospitals across the country highlight an even more frightening downside of security breaches: As hospitals have become dependent on electronic systems to coordinate care, communicate critical health data and avoid medication errors, patients' well-being may also be at stake when hackers strike.

Hospitals are used to chasing the latest medical innovations, but they are rapidly learning that caring for sick people also means protecting medical records and technology systems from hackers. An industry

that has traditionally spent a small fraction of its budget on cyberdefense is finding that it also must teach doctors and nurses not to click on suspicious online links and shore up its technical systems against hackers armed with an ever-evolving set of tools.

In some ways, health care is an easy target: Its security systems tend to be less mature than those of other industries, such as banking and tech, and its doctors and nurses depend on data to perform time-sensitive, lifesaving work. Where a financial-services firm might spend a third of its budget on information technology, hospitals spend only about 2 to 3 percent, said John Halamka, the chief information officer of Beth Israel Deaconess Medical Center in Boston.

"If you're a hacker . . . would you go to Fidelity or an underfunded hospital?" Halamka said. "You're going to go where the money is and the safe is easiest to open."

The stakes are extraordinarily high. Hospitals' electronic systems are often in place to help prevent errors. Without computer systems, pharmacists cannot easily review patients' lab results, look up what other medications the patients are on or figure out what allergies they might have before dispensing medications. And nurses administering drugs cannot scan the medicines and the patients' wristbands as a last check that they are giving the correct treatments. When lab results exist only on a piece of paper in a patient's file, it is possible they could be accidentally removed by a busy doctor or nurse - and critical information could simply disappear.

In MedStar's case, a virus early this week infiltrated its computer systems, forcing the health-care giant to shut down its entire network, turn away patients, postpone surgeries and resort to paper records.

"One thing I think is becoming clear, especially over the last few weeks or months, is that health care is rapidly becoming a target for this," said Daniel Nigrin, chief information officer of Boston Children's Hospital, whose network came under attack by the hacker collective Anonymous in April 2014. "What struck us at that point was, you know what? These attacks can do a lot more than get your data; they can really disrupt the day-to-day operations of your facilities."

Although a handful of hospitals nationwide have been victims of cyberattacks in recent weeks, the MedStar security breach shows hackers' increasing boldness and sophistication. The chain is one of biggest employers in the Baltimore-Washington region and runs 10 hospitals as well as 250 clinics and other sites. MedStar spokeswoman Ann Nickels declined to elaborate on what sort of software attack the hospital suffered, but several employees have said they saw a pop-up message suggesting that it was "ransomware" - software that can lock people out of systems until they make a bitcoin payment. According to a photo of the pop-up message provided by a MedStar Southern Maryland Hospital Center employee, the hackers were demanding 45 bitcoins - equivalent to about $19,000 - to restore access to MedStar's system.

"You just have 10 days to send us the Bitcoin," the note read. "After 10 days we will remove your private key and it's impossible to recover your files."

Nickels said MedStar saw "no indication that data has left our system" or that patient privacy had been compromised. In a statement, the health-care system said it had not paid any type of ransom. A Friday-afternoon update from the hospital said MedStar was "approaching 90 percent functionality" of its systems.

Ransomware is not new, but cybersecurity experts and FBI data say its use is on the rise. Hospitals, of course, are not the only institutions facing such attacks. In nine months in 2014, the FBI received 1,838 complaints about ransomware, and it estimates that victims lost more than $23.7 million. The next year, the bureau received 2,453 complaints, and victims lost $24.1 million. The FBI does not condone the paying of ransoms, but its agents acknowledge that businesses are often left with a tough choice.

Hospitals, in particular, are vulnerable. In the weeks before the attack on MedStar, hackers hit Hollywood Presbyterian Medical Center in Los Angeles, extorting $17,000 in bitcoins, and Kentucky-based Methodist Hospital, which declared a state of emergency after an attack. Two Southern California hospitals, part of Prime Healthcare Services, were attacked in March.

Justin Harvey, the chief security officer of Fidelis Cybersecurity, said the hackers' success is likely to make them bolder, and he worries about critical infrastructure in the United States.

"I can't comment on whether the [Federal Aviation Administration] and all the power grids are up to snuff," he said. "If they're not, it can create a big problem."

Craig Williams, security outreach manager at Talos, the cybersecurity research group of Cisco, said the use of ransomware has exploded because it yields good profit margins. He estimated that it is a $100 million-a-year business.

"The malware industry is making giant steps toward ransomware, and really, the reason behind this is ransomware's profit margin simply exceeds that of other types of criminal activity," Williams said.

The way hackers get into a system is generally through a phishing attack - persuading an unsuspecting employee to click on a link or an attachment in an email - or by finding a network vulnerability.

That leaves hospitals with two challenges: designing systems that can resist attack and training employees.

On the network side, Williams said health-care companies - or any companies - that do not have full-time security specialists may not be keeping up with the latest problems and patches. He noted that one strain of ransomware exploits a well-known vulnerability in networks, and when his team did a scan of the Internet this week, it found 2.1 million servers that would be susceptible to such an attack.

The cultural problem may be even harder to solve.

"You're as vulnerable as your most gullible employee," Halamka said.

At Beth Israel, the hospital has printed up stickers that appear on salad containers and cookie packaging in the cafeteria so that people are reminded, even when eating lunch, not to click on links in emails they did not expect to receive. The hospital also has conducted internal phishing campaigns - sending fake emails to employees to assess where risks exist and to see whether extra cybersecurity training is needed.

Experts said the recent attacks seem to be based in Eastern Europe, although it is hard to tell whether one group alone is responsible. The hacks have similarities, to be sure, but hackers trade tools and information. One concern is that as the attacks gain coverage, they will inspire more copycats who will use the same technique to target other vulnerable networks.

"This thing is an industry, the black market that does this type of activity," said Chris Ensey, chief operating officer at Dunbar Security Solutions.

The details of MedStar's particular case - including what particular version of ransomware might have been used and how it got into the system - remain murky. An FBI spokesman declined to provide any details - including on the type of possible ransomware - other than to say the bureau was "aware of the incident and is looking into the nature and scope of the matter."

Google removes Taliban propaganda app from its stores after it was used to spread hate speech
Monday, 04 April 2016
Byline: Fionn Hargreaves

AN app developed by the Taliban has been taken down from Google's Play Store for breaking the tech giant's rules on hate speech. The hate- filled app, "Pashto Afghan News - alemarah" ran news and videos from the extremist group.
Pashto is one of the two official languages of Afghanistan and Alemarah is the name of the Taliban's propaganda arm.

US group SITE Intel, who moniter jihadist activity online, discovered the app on Friday.

It was taken down on Saturday.

The app is thought to have been removed for inciting hate speech.

Google's rules state: "We don't allow apps that advocate against groups of people based on their race or ethnic origin, religion, disability, gender, age, nationality, veteran status, sexual orientation, or gender identity".

A Google spokesman said: "While we don't comment on specific apps, our policies are designed to provide a great experience for users and developers. That's why we remove apps from Google Play that violate those policies."

Why iPhone Breach Is Good for Users

Monday, 04 April 2016
Byline: Christopher Mims
Section: column

There was only one way for the court battle between the Federal Bureau of Investigation and Apple Inc. over access to the data on a killer's phone could end well for everyday Americans. Luckily, the FBI achieved it.
With the help of outside hackers, whose identity remains a mystery, the FBI successfully circumvented Apple's much-touted security. In the process, the agency did exactly what defenders of encryption and digital privacy have advocated for some time. It is called "lawful hacking," which is another way to describe law enforcement exploiting weaknesses in a security process.

Advocates say lawful hacking is an alternative to, and preferable to, creating a new "backdoor" into the system. An author of a recent paper on the subject, Columbia University professor and cybersecurity expert Steven Bellovin, says "I don't have any problem with what the FBI did. The whole premise of lawful hacking is there are vulnerabilities."

Here is why that is a good thing: It makes software more secure. Bugs are often discovered by "white hat" hackers who share them with the software's creator so they can be patched, typically before the flaw is even disclosed. This isn't a purely benevolent system; it works because these hackers, or their employers at universities or cybersecurity companies, want the money from bug "bounties," or the publicity that comes with finding an exploit, and because everyone, including hackers, is vulnerable to undisclosed exploits.

This dynamic is so well-established that it played out quietly in the background as the FBI-Apple dispute raged. Researchers at Johns Hopkins University last month revealed a flaw in Apple's iMessage texting program that could have allowed law-enforcement agents or hackers to decrypt photos or videos attached to messages as they moved over the Internet. The researchers disclosed the bug to Apple, which devised a patch.

We also saw the process at work in 2014 with a bug called Heartbleed, which jeopardized the encryption scheme used on much of the Internet. The flaw was first reported by a researcher at Google; a fix was quickly devised and deployed by those responsible for the open-source code in which it was found.

In that case, the White House made an unprecedented disclosure about how the federal government decides whether or not to share a vulnerability with the companies responsible for fixing them. The National Security Agency, for example, has said it discloses 91% of the vulnerabilities it discovers, but probably only after it has used them for its own purposes. Officials said they decide whether to disclose a flaw by weighing factors including whether the vulnerability poses a threat to national security, the likelihood that someone else has found it, the value of the intelligence that could be gathered if it is used, and whether it can be patched.

Given the publicity around the iPhone dispute, Shane McGee, chief privacy officer of cybersecurity firm FireEye Inc., says it is now open season on Apple's iOS operating system among hackers, who are often driven by ego as much as lucre.

There is a big caveat in the Apple case, however. For now, at least, the FBI won't disclose the bug to Apple, which means Apple can't fix it. That is bad for Apple's privacy-focused brand and could be bad for users, since others who learn of the flaw could exploit it for nefarious purposes. We don't know how likely that is, because we don't know how the FBI gained access to the phone; its method could require physical access to a device, plus a lot of time and money, making other exploits less likely.

The FBI and Apple declined to comment.

Whatever happens with this bug, and this phone, the struggle between breaking into software and securing software will only intensify. As FireEye's Mr. McGee points out, Apple is already working to make the next version of iOS even more impenetrable by the government and Apple itself.

The possibility that Apple could create a device that it would be unable to breach even if ordered by a court must keep those in law enforcement awake at night. And yet we seem headed to a world in which even the most draconian edict couldn't force Apple to unravel the laws of mathematics at the heart of its own encryption.

In a world of ever-multiplying threats -- including multimillion-dollar bank heists carried out from a keyboard -- increased security is an unqualified win for all Apple users.

It won't necessarily come easily, however. Absent action from Congress -- which lawmakers have said is unlikely in a polarizing election year -- the battle between Apple and the FBI seems destined to continue ad infinitum. Which, paradoxically, is evidence that the system is working.

It may be in the nature of this dispute that it can never end. And that may be the only satisfactory "resolution" we can hope for.

New York Times
Technology Upgrades Get White House Out of the 20th Century
Monday, 04 April 2016
Byline: Michael D. Shear

Can you run the country with spotty Wi-Fi, computers that power on and off randomly and desktop speakerphones from Radio Shack, circa 1985?
It turns out you can. But it is not ideal, as President Obama's staff has discovered during the past seven years. Now, as Mr. Obama prepares to leave the White House early next year, one of his legacies will be the office information technology upgrade that his staff has finally begun.

Until very recently, West Wing aides were stuck in a sad and stunning state of technological inferiority: desktop computers from the last decade, black- and-white printers that could not do double-sided copies, aging BlackBerries (no iPhones), weak wireless Internet and desktop phones so old that few staff members knew how to program the speed-dial buttons.

On Air Force One, administration officials sent emails over an air-to-ground Internet connection that was often no better than dial-up modems from the mid- 1990s.

"We can't do this," recalled Anita Decker Breckenridge, the deputy chief of staff for operations at the White House, who has since worked with the Air Force to upgrade the president's plane to broadband speeds. "This is the Oval Office in the sky. Talk about a network that didn't work."

Part of the problem? Responsibility for White House technology has long been divvied up between four agencies, each with their own chief information officer: the National Security Council, the Executive Office of the President, the Secret Service and the White House Communications Agency. That led to a series of Band-Aid solutions over the years, as one agency or another has attempted piecemeal upgrades to White House gear.

It also led to comical moments. In 2014, when White House aides accompanying Mr. Obama on his summer vacation in Martha's Vineyard struggled with balky laptops as they tried to revise a presidential statement, they could not get on-the- road tech support from the White House Communications Agency because the agency's staff members were not authorized to log in to computers issued by the Executive Office of the President.

Ms. Breckenridge was inspired by Mr. Obama's development in 2015 of the United States Digital Service and its mission to upgrade the federal government beyond the White House. She was determined after her frustrations in Martha's Vineyard to fix the mess, and by March 2015 had hired David Recordon, who designed and maintained the office technology for Mark Zuckerberg and the other employees at Facebook, as the information technology guy for the White House complex.

"It was an interesting challenge and world for me," Mr. Recordon said.

One of his first tasks was trying to map the miles of Ethernet cables and phone wires inside the walls of 1600 Pennsylvania Avenue. The team of technicians eventually discovered and removed 13,000 pounds of abandoned cables that no longer served any purpose.

"They had been installed over the decades by different organizations using different standards, different techniques, from different eras," Mr. Recordon said. "They were finding these pipes that just had bundles of cable that had been cut off over the years, no longer used. So we just started pulling it out."

With the wiring fixed, Mr. Recordon started replacing computers (the new ones have fast, solid- state drives and modern processors) and color printers. The new phone system -- the first since the Clinton years -- is all digital, with built-in speakerphones and speed-dial buttons that can be changed online. Many White House aides now carry the most recent iPhones. Mr. Obama, however, still carries a specially modified, highly secure BlackBerry.

The Wi-Fi in the Roosevelt Room is finally strong enough to live-stream an event on Facebook, like White House aides did last week when Mr. Obama surprised former federal inmates whose sentences had been commuted. Forgotten passwords are no longer an irritant now that the White House has started requiring users to log on with a chip-enabled smart card and a pin code.

Mr. Recordon's team also designed a new web-based system for admitting visitors to the West Wing that can be managed securely from any computer, including ones outside the White House complex.

To be sure, some important West Wing technology was upgraded by the George W. Bush administration, which overhauled the Situation Room for the first time since the Kennedy administration and added modern communications gear. Joe Hagin, the deputy chief of staff for Mr. Bush, recalled having to replace the phones in the presidential limousine after Mr. Bush complained that he had not been able to make a single phone call from his motorcade over an entire weekend.

"He said to me, 'What the heck would happen if there were a true national emergency?' " Mr. Hagin recalled. That fear came true months later on Sept. 11, 2001, when communications glitches plagued the government and led to new equipment in Air Force One and the first BlackBerries in the White House.

Mr. Hagin's team also upgraded the Intel 486 computers and got rid of the slow and cumbersome Lotus Notes email system. But the speed of technological advancement has once again left the current White House behind.

"I'm very sympathetic to them," said Mr. Hagin, who commiserated with Ms. Breckenridge last year about the sorry state of White House technology.

Ms. Breckenridge said the White House has not had to request any additional money for the new upgrades, which have been paid for out of the existing technology budgets for the various agencies involved. In some cases, she said, they have saved money by eliminating duplications. The four agencies no longer negotiate their own contracts with cellphone companies and no longer buy duplicate copies of software licenses.

Ms. Breckenridge said she was hopeful that Mr. Obama will leave to his successor's staff a building that is more useful in the Facebook and Twitter era, or whatever comes next.

Mr. Hagin said he wished them well, but predicted it will not be easy. He recalled once discovering a basement room in the West Wing filled with telephone switching gear that technicians said could be replaced with a unit the size of a dorm-room refrigerator. But everyone was nervous about cutting the wires because no schematics or design guides existed anymore, he said.

Replacing the equipment took a full two years.

Jerusalem Post
Wikimedia Foundation holds its 'Hackathon' in Jerusalem
Sunday, 03 April 2016

The Start-Up Nation earned yet another colorful feather in its already well-ornamented cap on Sunday, after hosting the annual Wikimedia Foundation's Hackathon in Jerusalem.
The four-day event, which brought together more than 150 computer developers from 17 countries to enhance Wikipedia's user experience and ensure reliable data, concluded at the capital's Hansen House, a former leper hospital converted into a bustling hub for artists.

There, at least 40 programmers from around the globe presented proposals to improve the highly popular online encyclopedia frequented by millions of users every day.

Quim Gil, an engineering community manager for the Wikimedia Foundation, emceed the forum's final event, where programmers presented solutions to improve the technological infrastructure of Wikipedia, particularly the MediaWiki platform on which it is based, and the Wikimedia code development.

"We celebrate this event every year," said Gil in a cavernous third-floor Jerusalem Stone-lined room in the historic former hospital, located in the Talbiyeh neighborhood, near the Jerusalem Theater.

"It's our biggest technical event of the Wikimedia movement, which is held in a different city every year."

According to Gil, Wikimedia chose Jerusalem after deeming the Wikimedia Israel chapter to be the best candidate for prospective host cities around the world.

"The Wikimedia movement has different chapters and organizations, so we opened a call for different participants, and in this case we felt that Wikimedia Israel was what we felt was the most appropriate candidate for this year," he said.

The Wikimedia Foundation, Gil explained, is the organization in charge of hosting Wikipedia, as well as the foundation's numerous other ancillary projects.

"Our mission is to bring free knowledge for all the world, for everybody, for free," he said. "And this is a gathering of developers working to improve Wikipedia system projects, and developer tools that allow us to create, promote and distribute content in a better way."

As a case in point, Gil cited one solution presented at the forum developed to assist users with poor vision.

"One of the projects we demonstrated here is a gadget that will allow people with impaired vision to be able to read pages with increased font and with higher contrast than regular Wikipedia," he said.

Another development featured an editing app for Android, which allows users to make edits and add citations from their smart phones.

"Using a tiny mobile interface to review a huge document will allow people to select a word or sentence and then be given an option just to edit that one sentence," he said. "For us this is critical, because Wikipedia wouldn't be what it is if readers didn't become editors at some point."

Indeed, Gil emphasized that ensuring that users are capable of adding and correcting content in real time, from any mobile device, is instrumental to the nonprofit company's ongoing success.

"Users are welcome to use Wikipedia, but if a percentage of those users see a typo or a missing date, them being able to fix it is what makes Wikipedia what it is," he said.

Asked about the dangers of users who post false or libelous content on the platform, Gil responded that another project developed at the conference addressed that issue by applying artificial intelligence to prevent such abuses.

And despite the event's steep competition, Gil noted that a prize is not presented to the most industrious developer.

"We had 40 projects demonstrated that didn't exist three days ago," he said. "We are not really into number ones', we are a community of collaboration and longtime relationships. This is how we work."

Yuri Astrakhan, a senior software engineer for Wikimedia Foundation, who was born and Russia and has lived in New York for 25 years, said he presented a solution for storing more data on Wikipedia.

"I worked on a way to store structured data so that when you make an interactive graph or chart or a map, you can store the data in a structured way and reuse it for multiple articles," he said.

Aaron Halfaker, a senior research scientist for the foundation, said the major attraction for participants is the concept of "open knowledge."

"This is a lot of people who are really interested in the idea of open knowledge, and the way that they can contribute to it most effectively," he said.

Gil said next year's Wikimedia Foundation's Hackathon will be hosted in Austria.

Associated Press
State Dept. delays Clinton email review amid FBI probe
Saturday, 02 April 2016
Byline: Matthew Lee

The State Department has suspended its internal review into whether former Secretary of State Hillary Clinton or her top aides mishandled emails containing information now deemed "top secret." Spokeswoman Elizabeth Trudeau said Friday the department had paused the review to avoid interfering with an ongoing FBI investigation into Clinton's use of a private server while she was America's top diplomat.

She said the decision was made after the department sought the FBI's advice on how to proceed with the review and received word that it should follow its standard practice.

Trudeau said the department's standard practice is to place internal reviews "on hold while there is an ongoing law enforcement investigation underway."

"Of course, we do not want our internal review to complicate or impede the progress of their ongoing law enforcement investigation," Trudeau said.

Trudeau said the department would "reassess next steps" in the internal review process when the FBI completes its probe.

The department began the internal review in January when it announced that it had classified 22 emails that Clinton sent or received as top secret.

None of the emails was marked classified at the time it was sent.

One aspect of the internal review, conducted by the bureaus of Diplomatic Security and Intelligence and Research, was to investigate whether any of the information in the emails was classified at the time of transmission.

The review could result in counseling, warnings or other action against employees if it finds the information was mishandled.

Wall Street Journal
FBI Offers Help to Agencies On Phones
Saturday, 02 April 2016
Byline: Devlin Barrett

WASHINGTON -- The Federal Bureau of Investigation told law enforcement agencies around the country Friday it would try to help them open locked phones or other devices as much as "legal and policy constraints" allow.
The unusual guidance from the nation's premier law- enforcement agency is in response to a surge of interest from state and local authorities in how the agency was able to open a locked iPhone seized in the probe of a terror attack in San Bernardino, Calif., in December.

The FBI advisory seems to be aimed at reassuring police and prosecutors that while they don't have much to tell them now, they hope to provide more information and possibly help in the near future.

For months, the FBI had been unable to open the phone -- a 5C model -- and was engaged in a high stakes legal battle with Apple Inc. trying to force the company to help open the device. The Justice Department ended that legal battle this week, when it announced a third party outside the U.S. government had shown them a new means of cracking the phone.

"That method for unlocking that specific iPhone proved successful," the FBI missive said, adding that the agency is aware the difficulty of accessing locked data in criminal probes "is a substantial state and local law enforcement challenge that you face daily."

The FBI is now testing to see whether the method used in the San Bernardino case may work against over types of iPhones, say people familiar with the matter.

While the government says it needs to be able to look inside such devices when it has a warrant, Apple and other tech companies argue that even with a warrant it is wrong to force them to create new weaknesses in their systems that could expose millions of customers to hacking or snooping.

The FBI letter goes on to pledge an "open dialogue" with local officials, ending: "We are in this together."

Washington Post
FBI weighs if it can share hacking tool with local law enforcement
Saturday, 02 April 2016
Byline: Ellen Nakashima and Adam Goldman

The FBI and Justice Department are debating whether the hacking tool that helped the bureau unlock the iPhone of one of the San Bernardino, Calif., terrorists can be used to help state and local law enforcement, officials said Friday.
That will be a challenge because the bureau has classified the tool, making it difficult to use in state and local criminal prosecutions requiring disclosure of evidence to defendants, officials said.

"There's a desire to be forward-leaning to help state and local law enforcement," said a senior law enforcement official, who, like others, spoke on the condition of anonymity to discuss an ongoing investigation. "But no one knows quite what the answer is."

Moreover, the tool itself likely will have a shelf life of only a few months, as tech companies may find and fix the vulnerabilities that the tool exploits, and they periodically update the under-lying software.

The firm that helped the bureau -- not the Israeli company Cellebrite, as had been widely rumored -- charged a one-time flat fee, officials said.

The bureau is not releasing the company's name and has declined to discuss details of the solution. Officials last week said the approach was aimed at dismantling security features on the iPhone 5C to permit investigators to make many attempts to crack the passcode without wiping data from the device.

Since its announcement, the bureau has been peppered with inquiries from state and local law enforcement officials seeking to know whether the solution might be useful for their cases.

Manhattan District Attorney Cyrus R. Vance Jr. was among those who called. But, he said, he recognized that the solution itself may not be applicable to the more than 200 iPhones that he has sitting in a crime lab and his technicians cannot unlock.

None is a 5C running iOS 9, which is the model and operating system of the phone used by Syed Rizwan Farook, who was killed by police in December after a shooting attack that claimed 14 lives.

"The overwhelming majority of criminal investigations stalled by default device encryption will remain so until Congress intervenes," Vance said.

One-off technical solutions will result in a "cat-and-mouse cyber arms race" between the government and industry, he said in an interview. "I don't think that's the smart way to approach public safety or privacy policy."

The classification of the method highlights a tension between criminal and national security cases in which the most sophisticated tools are not always available to law enforcement. Unlike state and local courts, federal courts have procedures to protect classified information.

"It's been a challenge for law enforcement for a while," said Austin Berglas, a former assistant special agent in charge of the FBI's New York cyber branch and now head of cyber investigations at K2 Intelligence, a consultancy firm.

Berglas has worked cases on both sides of the divide, including one federal cybercrime investigation in which he was not given permission to use a classified tool because intelligence officials feared it would be disclosed in court.

"The FBI is very prudent when deploying the technologies," Berglas said. "The question is: Is it going to help the greater good by using this? Knowing that we may never have the ability to use this capability against the adversary again, are we willing to take that risk and use it?"

To referee the issue, the government has an interagency process headed by the attorney general to decide which capabilities should be classified. This is separate from the "vulnerabilities equities process" managed by the White House, which decides which software flaws should be disclosed to the software maker.

Now that the bureau owns the solution, it could conceivably have a local agency submit a phone to be unlocked to see if the solution works on it. But there would be constraints. For instance, the FBI likely would not testify about the tool in court, and the local agency would likely have to avoid using data retrieved from the phone as evidence in a criminal prosecution.

"So it would depend on how heavily that evidence weighs in that case. If it's a small part, maybe they can build a case around it," the senior official said. If not, he said, the tool is not for them.

Peter Modafferi, chief of detectives of New York's Rockland County, said he does not fault federal authorities for keeping some of their tools on a high shelf. "That's life," he said. "The bureau goes out of its way to help us when they can, but there's a difference between national security and local law enforcement."

Sunday Times (UK)
Threats spur Djibouti to sue Facebook (Canada)
Sunday, 03 April 2016
Byline: Mark Tighe

The president of Djibouti wants an Irish High Court judge to order Facebook to delete three accounts he alleges have been used to make death threats and threats of violence against him and his family. Ismail Omar Guelleh, known as IOG in the small East African country he has led since 1999, has applied for a High Court injunction against Facebook Ireland. The case is due for mention on April 11 in the chancery list, where business disputes are decided. Maki Omar Abdoulkadar, Djibouti's director of public prosecutions, has filed an affidavit in the case in support of his president's application.

Facebook Ireland is designated as the data processor for all account holders not resident in America or Canada. Guelleh's case is the first time a foreign individual has brought a legal action in Ireland seeking to compel Facebook to take action about material hosted by the social network. The Sunday Times has established that last year Guelleh brought an action against Facebook France and Facebook Inc in Paris in a bid to have the same three accounts suspended and the individual behind them identified.

Facebook appealed against a Paris judge's finding in Guelleh's favour in the French Court of Appeal, where it lost on most grounds. The company paid a fine rather than disclose the identity of the account holder.

The accounts use variations of the username Ainan Ainan, an anti-Guelleh activist who claims to live in Brussels.

One of Ainan Ainan's posts quoted in the French judgment spoke about Guelleh "losing a leg or two" or "an eye or two".

The post described the president as a "pirate". "Soon he will be punished , even if he fled ... he will be captured or die. [in English] Dead or alive".

Another post, partly in English and French, referred to Guelleh and said: "we'll be everywhere. To kill you." The post called on people to stop their pacifism and march against Guelleh's regime.

In its appeal in the French case, Facebook argued that the French judges had exceeded their power and complained that their actions in ordering the closure of accounts was disproportionate with respect for freedom of expression.

It also argued that although the accounts were in the French language and Djibouti is a former French colony, the proper jurisdiction was in Ireland where Facebook Ireland was subject to Irish data protection laws.

Guelleh's complaint sought damages of 85,000 from Facebook including a 20,000 fine for not taking down the accounts. He said that the accounts defamed him, and threatened his life and the physical safety of his family. Despite his efforts Facebook had refused to close the "illegal" accounts, he said.

The Court of Appeal fined Facebook 5,000 and 1,000 a day for three months for failing to close the accounts.

Djibouti is strategically important because of its location on the Horn of Africa near shipping lanes and areas where Islamist terrorists are active on the Arabian peninsula.

Reporters Without Borders ranks Djibouti 170 out of 180 countries in its annual world press freedom index. Guelleh, is campaigning to be re-elected president in an election this Friday. He is expected to be returned for a fourth term.

Reporters Without Borders said that this year, Mohamed Ibrahim Waiss, who works for La Voix de Djibouti, an opposition online radio station outside the country, was beaten by police and made to surrender his Facebook usernames and passwords so his account could be used to post images insulting the opposition. A US State Department report of 2013 noted that government forces monitor social media and police visit those who post antigovernment messages.

Maydaneh Abdallah Okieh, a journalist and activist, was sentenced to 45 days in prison and fined 1,000 after he posted photographs on Facebook of police breaking up a demonstration. On appeal, the court increased his sentence to five months.

This year, a London judge ruling on a case brought by Djibouti called Guelleh's regime "capricious", "cavalier" and on occasions "reprehensible".

Reuters
FBI trick for breaking into iPhone likely to leak, limiting its use
Sunday, 03 April 2016
Byline: Staff reporter

SAN FRANCISCO - The FBI's method for breaking into a locked iPhone 5c is unlikely to stay secret for long, according to senior Apple Inc engineers and outside experts.
Once it is exposed, Apple should be able to plug the encryption hole, comforting iPhone users worried that losing physical possession of their devices will leave them vulnerable to hackers.

When Apple does fix the flaw, it is expected to announce it to customers and thereby extend the rare public battle over security holes, a debate that typically rages out of public view.

The Federal Bureau of Investigation last week dropped its courtroom quest to force Apple to hack into the iPhone of one of the San Bernardino shooters, saying an unidentified party provided a method for getting around the deceased killer's unknown passcode.

If the government pursues a similar case seeking Apple's help in New York, the court could make the FBI disclose its new trick.

But even if the government walks away from that battle, the growing number of state and local authorities seeking the FBI's help with locked phones in criminal probes increases the likelihood that the FBI will have to provide it. When that happens, defense attorneys will cross-examine the experts involved.

Although each lawyer would mainly be interested in whether evidence-tampering may have occurred, the process would likely reveal enough about the method for Apple to block it in future versions of its phones, an Apple employee said.

"The FBI would need to resign itself to the fact that such an exploit would only be viable for a few months, if released to other departments," said Jonathan Zdziarski, an independent forensics expert who has helped police get into many devices. "It would be a temporary Vegas jackpot that would quickly get squandered on the case backlog."

In a memo to police obtained by Reuters on Friday, the FBI said it would share the tool "consistent with our legal and policy constraints."

Even if the FBI hoards the information - despite a White House policy that tilts toward disclosure to manufacturers - if it is not revealed to Apple, there are other ways the method could come to light or be rendered ineffective over time, according to Zdziarski and senior Apple engineers who spoke on condition of anonymity.

The FBI may use the same method on phones in cases in which the suspects are still alive, presenting the same opportunity for defense lawyers to pry.

In addition, the contractor who sold the FBI the technique might sell it to another agency or country. The more widely it circulates, the more likely it will be leaked.

"Flaws of this nature have a pretty short life cycle," one senior Apple engineer said. "Most of these things do come to light."

The temporary nature of flaws is borne out in the pricing of tools for exploiting security holes in the government-dominated market for "zero-days," called that because the companies whose products are targets have had zero days' warning of the flaw.

Many of the attack programs that are sold to defense and intelligence contractors and then to government buyers are purchased over six months, with payments spaced apart in case the flaw is discovered or the hole is patched incidentally with an update from the manufacturer, market participants told Reuters.

Although Apple is concerned about consumer perception, employees said the company had made no major recent changes in policy. Instead, its engineers take pride in the fact that a program for breaking into an iPhone via the web was recently purchased by a defense contractor for $1 million, and that even that program is likely to be short- lived.

They said most iPhone users have more to fear from criminals than from countries, and few crooks can afford anything like what it costs to break into a fully up-to-date iPhone.

Wall Street Journal
China's ZTE to Replace Three Senior Executives
Sunday, 03 April 2016
Byline: Juro Osawa

HONG KONG--ZTE Corp.'s board will meet early next week to replace three of its most senior executives, including its chief executive, people familiar with the matter said, as the Chinese telecommunications-equipment maker tries to rebuild its reputation after being accused of violating of U.S. trade rules. Chief Executive Shi Lirong, who has been in the role since 2010, as well as executive vice presidents Tian Wenguo and Qiu Weizhao, will step down pending board approval, the people said. Chief Technology Officer Zhao Xianming is expected to assume the role of CEO and chairman, they said.

On Tuesday and Wednesday, the board plans to discuss and approve the management changes as well as ZTE's 2015 financial results, which were delayed after the U.S. Commerce Department slapped trade sanctions on the company last month, alleging it violated rules by exporting American technological goods to Iran and other nations.

As part of a recent agreement between the U.S. Commerce Department and ZTE to temporarily remove the sanctions, the Chinese company's executives who have been involved in the alleged violation must be removed from management roles, the people said.

In a 2011 ZTE internal document obtained and disclosed last month by the U.S. government, Mr. Tian and Mr. Qiu were named as executives who were in charge of ZTE's plans for allegedly circumventing U.S. export rules. The document detailed the Chinese firm's elaborate plans to set up shell companies to ship goods to Iran without getting caught by U.S. authorities.

ZTE didn't make the executives available for comment.

The shake-up in ZTE's top management comes after the U.S. Commerce Department recently agreed to lift the sanctions on a temporary basis as long as the company stays true to the commitments it has made with the U.S. government. The sanctions, which blocked ZTE's access to supplies of U.S. components and software, threw the Chinese firm's business into doubt and created a new source of tension between Washington and Beijing. China's commerce minister responded by expressing "strong dissatisfaction" with the situation.

ZTE, which has roughly 80,000 employees globally, is a major global supplier of telecom networking-equipment such as wireless base stations and antennas. Over the past few years, its smartphone business has also gained a substantial presence in the U.S., where it was ranked fourth with a 7.2%

market share last year, behind Apple Inc., Samsung Electronics Co. and LG Electronics Inc., according to research firm Canalys.

ZTE is renewing its management as it scrambles to keep its business moving. ZTE will release its full-year earnings Wednesday after postponing the announcement last month, the people said. Trading in ZTE's Hong Kong-listed shares, suspended since March 7, is expected to resume Thursday, the people said.

Some of the company's component suppliers that had temporarily halted shipments with the company last month are resuming their shipments, according to people familiar with the matter.

ZTE is also planning to release its new flagship smartphone called the Axon 2 in mid-May, after delaying its previous plans to launch the phone in April, people familiar with the matter said.

In January, ZTE said it expects to report a 44% increase in 2015 net profit to 3.78 billion yuan ($583 million) and revenue to rise 24% to 100.8 billion yuan, based on preliminary unaudited results.

Had the sanctions stayed in place longer, the impact would have been disastrous for ZTE, analysts said.

In a letter sent to ZTE employees March 8, when the U.S. sanctions took effect, Mr. Shi described the situation as a "crisis" and said the company had set up a special team of executives to handle the issue. The U.S. restrictions hindered ZTE's ability to procure not only components manufactured in the U.S., but also those manufactured overseas based on U.S. technology, according to lawyers specializing in U.S. export control laws.

RAF's new 'GCHQ in the sky' spy planes which can hack enemy emails and phone calls
Sunday, 03 April 2016
Byline: Nigel Nelson

The MoD has bought nine Boeing P-8 Poseidon aircraft to replace the Nimrod spy planes contrioversially scrapped in 2010
Air chiefs have bought nine spy planes, each one like a flying GCHQ .

The Boeing P-8 Poseidon is as effective at information -gathering as the Government's eavesdropping headquarters.

It can hack terrorists' mobile calls and emails, track and -monitor enemy movements and direct our fighter jet response.

The RAF is believed to be spending £2.6billion on buying and maintaining the P-8s, -regarded as the world's most -hi-tech spy planes.

The fleet will also guard Britain's shipping lanes, protect the Navy's aircraft carrier and nuclear submarines.

Britain has had no maritime spy plane since the controversial 2010 scrapping of the Nimrod MR4A by the Government.

Since then Russian combat jets and nuclear-powered subs have encroached into British air and waters almost weekly.

The P-8 is so advanced it can identify an enemy sub's -periscope from several thousand feet.

Read more: Tories order spy planes that don't work with RAF's in-flight refuelling system

Its sensors and radars are so precise it will detect, classify and identify ships and small -vessels. It can also track subs.

And it is sophisticated enough to direct our jets and -surveillance drones on to targets approaching the UK.

The spy-in-the-sky is also one of the most deadly planes in the air as it can carry a lethal -battery of missiles, anti-submarine -torpedoes, bombs, depth charges and mines.

The aircraft, with two pilots and seven intelligence experts, has a range of about 1,200 miles with a 500mph cruising speed. It can also hover 200ft over a target for up to four hours during -sub-hunting operations.

The P-8, already used by the Australian, US, Indian and New Zealand air forces, will be -delivered to the RAF by 2020.

Defence chiefs scrapped a new generation of Nimrods in 2010 as part of MoD cuts.

Over £3.8billion of taxpayers money had been spent on the programme, which was £789million over budget and was nine years late.

When the Nimrod costs are added to the £250million per P-8, the cost of each plane rises to over £650million.

A defence source told the Sunday People : "The cancellation of the Nimrod -programme had effectively given Russian subs and aircraft a "free pass" to enter UK waters.

"Barely a week passes without some Russian ship, aircraft or sub trying to enter British -shipping lanes or airspace."

An MoD spokesman said: "We are committed to buying P-8 aircraft, which will be based at RAF Lossiemouth.

"The full cost of programme is yet to be determined."

Weapons: Freefall bombs, Harpoon anti-ship missiles, supersonic low-altitude -missiles (SLAM), land attack missiles, depth charges, sonar buoy torpedoes.

Range: 1,200 miles

Speed: Max 564mph

Cruising: 506mph

Dimensions: Length 129ft Wingspan: 117ft Weight: 62.7tons

Crew: Pilot and co-pilot plus seven console operators

Engines: 2 x CFM56-7B -turbofans.

Radar/surveillance: Electro- optical infrared -sensor can ID, track and -engage several targets - from land vehicles, aircraft, and ships. Can hack mobiles, emails and encrypted -communications. Advanced magnetic anomaly detection system for sub tracking.

Globe and Mail
Ottawa's big IT project still struggling
Monday, 04 April 2016
Byline: Barrie Mckenna

It was a seductively simple idea.
Take the maze of federal government databases, e-mail systems and computer networks, and put them under one departmental roof. More than 60 e-mail systems would become one, 500plus databases would be merged into seven, and thousands of tech workers from dozens of departments would go to work for a single agency, Shared Services Canada.

The two Conservative ministers in charge at the time - former public works minister Rona Ambrose (now interim Conservative leader) and treasury board president Tony Clement - were bursting with optimism when they announced the project five years ago. They promised the consolidation would save piles of money (up to $400-million a year), wipe out duplication and enhance cybersecurity.

"This is a whole new way of doing business for the government," Mr. Clement vowed.

Not so much. It's turned into an old and very familiar story of how Ottawa works. Years and billions of dollars later, virtually none of the wondrous benefits have come to pass.

And in last week's budget, the new Liberal government quietly gave Shared Services a $384-million infusion over two years to its roughly $1.9-billion annual budget - apparently, to keep creaky old government computer systems from crashing. The agency will get another $75-million to strengthen security.

But this isn't just an inside-Ottawa tale of serial bungling. There are disturbing real-world consequences of the government's failure to fix chronic information technology (IT) problems. Websites periodically crash and go offline, sometimes for days, because of continuing database problems.

A 2014 cyberattack by Chinese hackers on the National Research Council's network paralyzed much of its research work for nearly a year. Also in 2014, emergency workers in Saskatchewan lost voice communications for nearly an hour owing to a mix-up between Shared Services and the RCMP.

Not only is Ottawa not saving money, it's spending more and getting less than it needs in the way of IT. Much of the promised consolidation remains a work in progress, with no clear end-date in sight.

The merging of e-mail systems, outsourced to Bell Canada and CGI Group, is already more than a year behind schedule. Fewer than one in five government workers is using new Canada.ca addresses.

Efforts to move more than 15,000 computer applications onto three new centralized databases in Gatineau, Que., Barrie, Ont., and at Canadian Forces Base Borden, north of Toronto, are running late.

Fewer than 10 per cent of government apps have been shifted over to Shared Services. And an $18-million project aimed at making it easier for users to sort through Statistics Canada data is also badly behind schedule.

Auditor-General Michael Ferguson issued a scathing report in February, outlining Shared Services' mounting problems and its inability to deliver results. "They have big problems ahead of themselves," Mr. Ferguson told reporters bluntly.

The view of the new Liberal government is that Shared Services was set up to fail by the Conservatives. The agency was hit with severe budget cuts soon after its creation, leaving it starved of the resources it needed.

The question now is can the new government make it right? A key issue is sorting out what information technology the government should develop in-house, and what it should buy off the shelf. In a postbudget brief, Canadian Advanced Technology Alliance president John Reid lamented that "despite longstanding good intentions, the [government's] procurement model has not modernized to keep up with industry changes and standards. It is not fully aligned with the digital era."

It's a missed opportunity to spur innovation, according to CATA. Too often, Ottawa winds up overpaying for inferior IT, while crowding out the private sector by building custom systems rather than buying commercial offerings and spurring the emergence of promising technology exports.

The government "has no export sales. ... No intellectual property gets created that is patentable," the group laments.

Of course, CATA, which speaks for Canadian tech companies, has an interest in seeing some of that business flow to its members.

But given recent experience, it's hard to imagine Ottawa could do worse. Surely there is a better way for Ottawa to acquire the technology it needs to do its work.

La Presse
La surveillance demasse menacerait la diversité d'opinions
Saturday, 02 April 2016
Byline: Marc Thibodeau

La surveillance de masse des communications en ligne pousse nombre d'internautes à s'autocensurer, y compris ceux qui affirment «n'avoir rien à cacher», et limite la diversité d'opinions à un degré préoccupant.

Le constat figure dans une nouvelle étude parue dans la revue Journalism & Mass Communication Quartely qui sonne l'alarme quant à l'impact potentiellement néfaste sur la liberté d'expression de pratiques mises en lumière aux États- Unis par Edward Snowden.

L'ancien consultant de la National Security Agency (NSA) avait notamment affirmé en 2013, documents à l'appui, que l'influent service de renseignements était en mesure d'accéder au contenu des serveurs de géants de la Silicon Valley comme Google, Facebook et Yahoo!.

Les firmes désignées ont démenti toute collaboration sans pour autant convaincre la population américaine, qui demeure très partagée quant à l'utilisation de programmes de surveillance à grande échelle par le gouvernement pour lutter contre le terrorisme.

Étude

Pour évaluer leur impact sur le comportement des internautes, une chercheuse de la Wayne State University, au Michigan, a demandé à un groupe de 250 personnes de réagir à une nouvelle fictive portant sur l'engagement des États-Unis contre le groupe armé État islamique.

Les répondants devaient préciser à quel point ils étaient à l'aise avec l'idée de commenter publiquement la nouvelle sur Facebook, dire ce qu'ils estiment être la position de la majorité des Américains à ce sujet et donner leur appréciation des programmes de surveillance de masse.

La moitié des personnes recrutées pour l'exercice se voyaient rappeler qu'il était important de garder en tête que la NSA «surveille les activités en ligne de citoyens».

Dans la vaste majorité des cas, écrit la chercheuse responsable, Elizabeth Stoycheff, les participants ayant été sensibilisés par le message sur la NSA se montraient beaucoup moins disposés à exprimer leur opinion s'ils avaient l'impression qu'elle n'était pas conforme à celle de la majorité.

Ceux qui étaient les plus susceptibles d'adopter un comportement conformiste sont ceux qui soutenaient le plus les programmes de surveillance.

«Ces individus prétendent que la surveillance est nécessaire pour assurer la sécurité nationale et qu'ils n'ont rien à cacher. Toutefois, quand ces individus ont l'impression qu'ils sont surveillés, ils modifient volontairement leur comportement - exprimant leurs opinions quand ils sont en phase avec la majorité et les taisant dans le cas contraire», relève l'auteur.

Seules les personnes qui étaient très critiques à l'endroit des programmes de surveillance semblaient disposées à exprimer leur opinion sans réserve, qu'ils soient ou non en phase avec la majorité.

Des études antérieures ont démontré que les usagers des réseaux sociaux sont moins susceptibles de s'exprimer librement sur un sujet s'ils ont l'impression d'être minoritaires, en partie de crainte de se retrouver isolés.

L'effet «modérateur» découlant de la crainte d'un programme de surveillance constitue un autre facteur que les autorités devraient examiner attentivement alors qu'ils statuent sur l'utilité et la légitimité de programmes de surveillance de masse, souligne Mme Stoycheff.

Programme révisé

La polémique suscitée par les révélations d'Edward Snowden a notamment poussé le Congrès américain à réviser un programme de collecte de métadonnées qui permettait à la NSA d'accumuler des renseignements sur l'ensemble des clients de Verizon.

Les élus ont cependant «traîné les pieds» avant d'interrompre cette pratique et tardent à adopter les réformes requises pour protéger adéquatement les données des internautes contre des intrusions abusives, juge l'Electronic Frontier Foundation (EFF) dans un récent rapport.

L'organisation de défense des droits des internautes salue parallèlement les efforts des géants de l'internet, relevant qu'ils ont, dans la majorité des cas, adopté des politiques beaucoup plus restrictives à ce sujet au cours des dernières années.

Les normes de l'industrie en la matière ont sensiblement évolué, mais il reste encore beaucoup à faire, prévient l'EFF.

Washington Post
Hackers find soft spot in hospitals
Sunday, 03 April 2016
Byline: Carolyn Y. Johnson and Matt Zapotosky

The cyberattack on MedStar Health - one of the biggest health-care systems in the Washington region - is a foreboding sign that an industry racing to digitize patient records and services faces a new kind of security threat that it is ill-prepared to handle, security experts and hospital officials say.
For years, hospitals and the health-care industry have focused on keeping patient data from falling into the wrong hands. But the recent attacks on MedStar's network and other hospitals across the country highlight an even more frightening downside of security breaches: As hospitals have become dependent on electronic systems to coordinate care, communicate critical health data and avoid medication errors, patients' well-being may also be at stake when hackers strike.

Hospitals are used to chasing the latest medical innovations, but they are rapidly learning that caring for sick people also means protecting medical records and technology systems from hackers. An industry

that has traditionally spent a small fraction of its budget on cyberdefense is finding that it also must teach doctors and nurses not to click on suspicious online links and shore up its technical systems against hackers armed with an ever-evolving set of tools.

In some ways, health care is an easy target: Its security systems tend to be less mature than those of other industries, such as banking and tech, and its doctors and nurses depend on data to perform time-sensitive, lifesaving work. Where a financial-services firm might spend a third of its budget on information technology, hospitals spend only about 2 to 3 percent, said John Halamka, the chief information officer of Beth Israel Deaconess Medical Center in Boston.

"If you're a hacker . . . would you go to Fidelity or an underfunded hospital?" Halamka said. "You're going to go where the money is and the safe is easiest to open."

The stakes are extraordinarily high. Hospitals' electronic systems are often in place to help prevent errors. Without computer systems, pharmacists cannot easily review patients' lab results, look up what other medications the patients are on or figure out what allergies they might have before dispensing medications. And nurses administering drugs cannot scan the medicines and the patients' wristbands as a last check that they are giving the correct treatments. When lab results exist only on a piece of paper in a patient's file, it is possible they could be accidentally removed by a busy doctor or nurse - and critical information could simply disappear.

In MedStar's case, a virus early this week infiltrated its computer systems, forcing the health-care giant to shut down its entire network, turn away patients, postpone surgeries and resort to paper records.

"One thing I think is becoming clear, especially over the last few weeks or months, is that health care is rapidly becoming a target for this," said Daniel Nigrin, chief information officer of Boston Children's Hospital, whose network came under attack by the hacker collective Anonymous in April 2014. "What struck us at that point was, you know what? These attacks can do a lot more than get your data; they can really disrupt the day-to-day operations of your facilities."

Although a handful of hospitals nationwide have been victims of cyberattacks in recent weeks, the MedStar security breach shows hackers' increasing boldness and sophistication. The chain is one of biggest employers in the Baltimore-Washington region and runs 10 hospitals as well as 250 clinics and other sites. MedStar spokeswoman Ann Nickels declined to elaborate on what sort of software attack the hospital suffered, but several employees have said they saw a pop-up message suggesting that it was "ransomware" - software that can lock people out of systems until they make a bitcoin payment. According to a photo of the pop-up message provided by a MedStar Southern Maryland Hospital Center employee, the hackers were demanding 45 bitcoins - equivalent to about $19,000 - to restore access to MedStar's system.

"You just have 10 days to send us the Bitcoin," the note read. "After 10 days we will remove your private key and it's impossible to recover your files."

Nickels said MedStar saw "no indication that data has left our system" or that patient privacy had been compromised. In a statement, the health-care system said it had not paid any type of ransom. A Friday-afternoon update from the hospital said MedStar was "approaching 90 percent functionality" of its systems.

Ransomware is not new, but cybersecurity experts and FBI data say its use is on the rise. Hospitals, of course, are not the only institutions facing such attacks. In nine months in 2014, the FBI received 1,838 complaints about ransomware, and it estimates that victims lost more than $23.7 million. The next year, the bureau received 2,453 complaints, and victims lost $24.1 million. The FBI does not condone the paying of ransoms, but its agents acknowledge that businesses are often left with a tough choice.

Hospitals, in particular, are vulnerable. In the weeks before the attack on MedStar, hackers hit Hollywood Presbyterian Medical Center in Los Angeles, extorting $17,000 in bitcoins, and Kentucky-based Methodist Hospital, which declared a state of emergency after an attack. Two Southern California hospitals, part of Prime Healthcare Services, were attacked in March.

Justin Harvey, the chief security officer of Fidelis Cybersecurity, said the hackers' success is likely to make them bolder, and he worries about critical infrastructure in the United States.

"I can't comment on whether the [Federal Aviation Administration] and all the power grids are up to snuff," he said. "If they're not, it can create a big problem."

Craig Williams, security outreach manager at Talos, the cybersecurity research group of Cisco, said the use of ransomware has exploded because it yields good profit margins. He estimated that it is a $100 million-a-year business.

"The malware industry is making giant steps toward ransomware, and really, the reason behind this is ransomware's profit margin simply exceeds that of other types of criminal activity," Williams said.

The way hackers get into a system is generally through a phishing attack - persuading an unsuspecting employee to click on a link or an attachment in an email - or by finding a network vulnerability.

That leaves hospitals with two challenges: designing systems that can resist attack and training employees.

On the network side, Williams said health-care companies - or any companies - that do not have full-time security specialists may not be keeping up with the latest problems and patches. He noted that one strain of ransomware exploits a well-known vulnerability in networks, and when his team did a scan of the Internet this week, it found 2.1 million servers that would be susceptible to such an attack.

The cultural problem may be even harder to solve.

"You're as vulnerable as your most gullible employee," Halamka said.

At Beth Israel, the hospital has printed up stickers that appear on salad containers and cookie packaging in the cafeteria so that people are reminded, even when eating lunch, not to click on links in emails they did not expect to receive. The hospital also has conducted internal phishing campaigns - sending fake emails to employees to assess where risks exist and to see whether extra cybersecurity training is needed.

Experts said the recent attacks seem to be based in Eastern Europe, although it is hard to tell whether one group alone is responsible. The hacks have similarities, to be sure, but hackers trade tools and information. One concern is that as the attacks gain coverage, they will inspire more copycats who will use the same technique to target other vulnerable networks.

"This thing is an industry, the black market that does this type of activity," said Chris Ensey, chief operating officer at Dunbar Security Solutions.

The details of MedStar's particular case - including what particular version of ransomware might have been used and how it got into the system - remain murky. An FBI spokesman declined to provide any details - including on the type of possible ransomware - other than to say the bureau was "aware of the incident and is looking into the nature and scope of the matter."

The Sun (UK)
Google removes Taliban propaganda app from its stores after it was used to spread hate speech
Monday, 04 April 2016
Byline: Fionn Hargreaves

AN app developed by the Taliban has been taken down from Google's Play Store for breaking the tech giant's rules on hate speech. The hate- filled app, "Pashto Afghan News - alemarah" ran news and videos from the extremist group.
Pashto is one of the two official languages of Afghanistan and Alemarah is the name of the Taliban's propaganda arm.

US group SITE Intel, who moniter jihadist activity online, discovered the app on Friday.

It was taken down on Saturday.

The app is thought to have been removed for inciting hate speech.

Google's rules state: "We don't allow apps that advocate against groups of people based on their race or ethnic origin, religion, disability, gender, age, nationality, veteran status, sexual orientation, or gender identity".

A Google spokesman said: "While we don't comment on specific apps, our policies are designed to provide a great experience for users and developers. That's why we remove apps from Google Play that violate those policies."

NHS nurse blackmailed female colleague in sick revenge porn plot after she dumped him

The terrorist group aim to reconquer Afghanistan after being removed from power in 2001.

They want to bring back Sharia law, a conservative Islamic law, to the country.

Taliban spokesman Zabihullah Mujahed told Boomberg the app "is part of our advanced technological efforts to make more global audience"

But Mr Mujahed said that they were having technical difficulty with the app.

This is just one of many ways in which extremist groups are using the internet to spread their messages of hate.

The Taliban already run a website in five different languages as well as maintaining a Facebook and Twitter account.

Twitter are trying to fight ISIS's large presence on their social media site as staff have been suspending extremists' accounts.

It was estimated in 2015 that ISIS are running more than 46,000 Twitter accounts.

Wall Street Journal
Why iPhone Breach Is Good for Users

Monday, 04 April 2016
Byline: Christopher Mims
Section: column

There was only one way for the court battle between the Federal Bureau of Investigation and Apple Inc. over access to the data on a killer's phone could end well for everyday Americans. Luckily, the FBI achieved it.
With the help of outside hackers, whose identity remains a mystery, the FBI successfully circumvented Apple's much-touted security. In the process, the agency did exactly what defenders of encryption and digital privacy have advocated for some time. It is called "lawful hacking," which is another way to describe law enforcement exploiting weaknesses in a security process.

Advocates say lawful hacking is an alternative to, and preferable to, creating a new "backdoor" into the system. An author of a recent paper on the subject, Columbia University professor and cybersecurity expert Steven Bellovin, says "I don't have any problem with what the FBI did. The whole premise of lawful hacking is there are vulnerabilities."

Here is why that is a good thing: It makes software more secure. Bugs are often discovered by "white hat" hackers who share them with the software's creator so they can be patched, typically before the flaw is even disclosed. This isn't a purely benevolent system; it works because these hackers, or their employers at universities or cybersecurity companies, want the money from bug "bounties," or the publicity that comes with finding an exploit, and because everyone, including hackers, is vulnerable to undisclosed exploits.

This dynamic is so well-established that it played out quietly in the background as the FBI-Apple dispute raged. Researchers at Johns Hopkins University last month revealed a flaw in Apple's iMessage texting program that could have allowed law-enforcement agents or hackers to decrypt photos or videos attached to messages as they moved over the Internet. The researchers disclosed the bug to Apple, which devised a patch.

We also saw the process at work in 2014 with a bug called Heartbleed, which jeopardized the encryption scheme used on much of the Internet. The flaw was first reported by a researcher at Google; a fix was quickly devised and deployed by those responsible for the open-source code in which it was found.

In that case, the White House made an unprecedented disclosure about how the federal government decides whether or not to share a vulnerability with the companies responsible for fixing them. The National Security Agency, for example, has said it discloses 91% of the vulnerabilities it discovers, but probably only after it has used them for its own purposes. Officials said they decide whether to disclose a flaw by weighing factors including whether the vulnerability poses a threat to national security, the likelihood that someone else has found it, the value of the intelligence that could be gathered if it is used, and whether it can be patched.

Given the publicity around the iPhone dispute, Shane McGee, chief privacy officer of cybersecurity firm FireEye Inc., says it is now open season on Apple's iOS operating system among hackers, who are often driven by ego as much as lucre.

There is a big caveat in the Apple case, however. For now, at least, the FBI won't disclose the bug to Apple, which means Apple can't fix it. That is bad for Apple's privacy-focused brand and could be bad for users, since others who learn of the flaw could exploit it for nefarious purposes. We don't know how likely that is, because we don't know how the FBI gained access to the phone; its method could require physical access to a device, plus a lot of time and money, making other exploits less likely.

The FBI and Apple declined to comment.

Whatever happens with this bug, and this phone, the struggle between breaking into software and securing software will only intensify. As FireEye's Mr. McGee points out, Apple is already working to make the next version of iOS even more impenetrable by the government and Apple itself.

The possibility that Apple could create a device that it would be unable to breach even if ordered by a court must keep those in law enforcement awake at night. And yet we seem headed to a world in which even the most draconian edict couldn't force Apple to unravel the laws of mathematics at the heart of its own encryption.

In a world of ever-multiplying threats -- including multimillion-dollar bank heists carried out from a keyboard -- increased security is an unqualified win for all Apple users.

It won't necessarily come easily, however. Absent action from Congress -- which lawmakers have said is unlikely in a polarizing election year -- the battle between Apple and the FBI seems destined to continue ad infinitum. Which, paradoxically, is evidence that the system is working.

It may be in the nature of this dispute that it can never end. And that may be the only satisfactory "resolution" we can hope for.

New York Times
Technology Upgrades Get White House Out of the 20th Century
Monday, 04 April 2016
Byline: Michael D. Shear

Can you run the country with spotty Wi-Fi, computers that power on and off randomly and desktop speakerphones from Radio Shack, circa 1985?
It turns out you can. But it is not ideal, as President Obama's staff has discovered during the past seven years. Now, as Mr. Obama prepares to leave the White House early next year, one of his legacies will be the office information technology upgrade that his staff has finally begun.

Until very recently, West Wing aides were stuck in a sad and stunning state of technological inferiority: desktop computers from the last decade, black- and-white printers that could not do double-sided copies, aging BlackBerries (no iPhones), weak wireless Internet and desktop phones so old that few staff members knew how to program the speed-dial buttons.

On Air Force One, administration officials sent emails over an air-to-ground Internet connection that was often no better than dial-up modems from the mid- 1990s.

"We can't do this," recalled Anita Decker Breckenridge, the deputy chief of staff for operations at the White House, who has since worked with the Air Force to upgrade the president's plane to broadband speeds. "This is the Oval Office in the sky. Talk about a network that didn't work."

Part of the problem? Responsibility for White House technology has long been divvied up between four agencies, each with their own chief information officer: the National Security Council, the Executive Office of the President, the Secret Service and the White House Communications Agency. That led to a series of Band-Aid solutions over the years, as one agency or another has attempted piecemeal upgrades to White House gear.

It also led to comical moments. In 2014, when White House aides accompanying Mr. Obama on his summer vacation in Martha's Vineyard struggled with balky laptops as they tried to revise a presidential statement, they could not get on-the- road tech support from the White House Communications Agency because the agency's staff members were not authorized to log in to computers issued by the Executive Office of the President.

Ms. Breckenridge was inspired by Mr. Obama's development in 2015 of the United States Digital Service and its mission to upgrade the federal government beyond the White House. She was determined after her frustrations in Martha's Vineyard to fix the mess, and by March 2015 had hired David Recordon, who designed and maintained the office technology for Mark Zuckerberg and the other employees at Facebook, as the information technology guy for the White House complex.

"It was an interesting challenge and world for me," Mr. Recordon said.

One of his first tasks was trying to map the miles of Ethernet cables and phone wires inside the walls of 1600 Pennsylvania Avenue. The team of technicians eventually discovered and removed 13,000 pounds of abandoned cables that no longer served any purpose.

"They had been installed over the decades by different organizations using different standards, different techniques, from different eras," Mr. Recordon said. "They were finding these pipes that just had bundles of cable that had been cut off over the years, no longer used. So we just started pulling it out."

With the wiring fixed, Mr. Recordon started replacing computers (the new ones have fast, solid- state drives and modern processors) and color printers. The new phone system -- the first since the Clinton years -- is all digital, with built-in speakerphones and speed-dial buttons that can be changed online. Many White House aides now carry the most recent iPhones. Mr. Obama, however, still carries a specially modified, highly secure BlackBerry.

The Wi-Fi in the Roosevelt Room is finally strong enough to live-stream an event on Facebook, like White House aides did last week when Mr. Obama surprised former federal inmates whose sentences had been commuted. Forgotten passwords are no longer an irritant now that the White House has started requiring users to log on with a chip-enabled smart card and a pin code.

Mr. Recordon's team also designed a new web-based system for admitting visitors to the West Wing that can be managed securely from any computer, including ones outside the White House complex.

To be sure, some important West Wing technology was upgraded by the George W. Bush administration, which overhauled the Situation Room for the first time since the Kennedy administration and added modern communications gear. Joe Hagin, the deputy chief of staff for Mr. Bush, recalled having to replace the phones in the presidential limousine after Mr. Bush complained that he had not been able to make a single phone call from his motorcade over an entire weekend.

"He said to me, 'What the heck would happen if there were a true national emergency?' " Mr. Hagin recalled. That fear came true months later on Sept. 11, 2001, when communications glitches plagued the government and led to new equipment in Air Force One and the first BlackBerries in the White House.

Mr. Hagin's team also upgraded the Intel 486 computers and got rid of the slow and cumbersome Lotus Notes email system. But the speed of technological advancement has once again left the current White House behind.

"I'm very sympathetic to them," said Mr. Hagin, who commiserated with Ms. Breckenridge last year about the sorry state of White House technology.

Ms. Breckenridge said the White House has not had to request any additional money for the new upgrades, which have been paid for out of the existing technology budgets for the various agencies involved. In some cases, she said, they have saved money by eliminating duplications. The four agencies no longer negotiate their own contracts with cellphone companies and no longer buy duplicate copies of software licenses.

Ms. Breckenridge said she was hopeful that Mr. Obama will leave to his successor's staff a building that is more useful in the Facebook and Twitter era, or whatever comes next.

Mr. Hagin said he wished them well, but predicted it will not be easy. He recalled once discovering a basement room in the West Wing filled with telephone switching gear that technicians said could be replaced with a unit the size of a dorm-room refrigerator. But everyone was nervous about cutting the wires because no schematics or design guides existed anymore, he said.

Replacing the equipment took a full two years.

Jerusalem Post
Wikimedia Foundation holds its 'Hackathon' in Jerusalem
Sunday, 03 April 2016

The Start-Up Nation earned yet another colorful feather in its already well-ornamented cap on Sunday, after hosting the annual Wikimedia Foundation's Hackathon in Jerusalem.
The four-day event, which brought together more than 150 computer developers from 17 countries to enhance Wikipedia's user experience and ensure reliable data, concluded at the capital's Hansen House, a former leper hospital converted into a bustling hub for artists.

There, at least 40 programmers from around the globe presented proposals to improve the highly popular online encyclopedia frequented by millions of users every day.

Quim Gil, an engineering community manager for the Wikimedia Foundation, emceed the forum's final event, where programmers presented solutions to improve the technological infrastructure of Wikipedia, particularly the MediaWiki platform on which it is based, and the Wikimedia code development.

"We celebrate this event every year," said Gil in a cavernous third-floor Jerusalem Stone-lined room in the historic former hospital, located in the Talbiyeh neighborhood, near the Jerusalem Theater.

"It's our biggest technical event of the Wikimedia movement, which is held in a different city every year."

According to Gil, Wikimedia chose Jerusalem after deeming the Wikimedia Israel chapter to be the best candidate for prospective host cities around the world.

"The Wikimedia movement has different chapters and organizations, so we opened a call for different participants, and in this case we felt that Wikimedia Israel was what we felt was the most appropriate candidate for this year," he said.

The Wikimedia Foundation, Gil explained, is the organization in charge of hosting Wikipedia, as well as the foundation's numerous other ancillary projects.

"Our mission is to bring free knowledge for all the world, for everybody, for free," he said. "And this is a gathering of developers working to improve Wikipedia system projects, and developer tools that allow us to create, promote and distribute content in a better way."

As a case in point, Gil cited one solution presented at the forum developed to assist users with poor vision.

"One of the projects we demonstrated here is a gadget that will allow people with impaired vision to be able to read pages with increased font and with higher contrast than regular Wikipedia," he said.

Another development featured an editing app for Android, which allows users to make edits and add citations from their smart phones.

"Using a tiny mobile interface to review a huge document will allow people to select a word or sentence and then be given an option just to edit that one sentence," he said. "For us this is critical, because Wikipedia wouldn't be what it is if readers didn't become editors at some point."

Indeed, Gil emphasized that ensuring that users are capable of adding and correcting content in real time, from any mobile device, is instrumental to the nonprofit company's ongoing success.

"Users are welcome to use Wikipedia, but if a percentage of those users see a typo or a missing date, them being able to fix it is what makes Wikipedia what it is," he said.

Asked about the dangers of users who post false or libelous content on the platform, Gil responded that another project developed at the conference addressed that issue by applying artificial intelligence to prevent such abuses.

And despite the event's steep competition, Gil noted that a prize is not presented to the most industrious developer.

"We had 40 projects demonstrated that didn't exist three days ago," he said. "We are not really into number ones', we are a community of collaboration and longtime relationships. This is how we work."

Yuri Astrakhan, a senior software engineer for Wikimedia Foundation, who was born and Russia and has lived in New York for 25 years, said he presented a solution for storing more data on Wikipedia.

"I worked on a way to store structured data so that when you make an interactive graph or chart or a map, you can store the data in a structured way and reuse it for multiple articles," he said.

Aaron Halfaker, a senior research scientist for the foundation, said the major attraction for participants is the concept of "open knowledge."

"This is a lot of people who are really interested in the idea of open knowledge, and the way that they can contribute to it most effectively," he said.

Gil said next year's Wikimedia Foundation's Hackathon will be hosted in Austria.

State Dept. delays Clinton email review amid FBI probe
Saturday, 02 April 2016
Byline: Matthew Lee

The State Department has suspended its internal review into whether former Secretary of State Hillary Clinton or her top aides mishandled emails containing information now deemed "top secret." Spokeswoman Elizabeth Trudeau said Friday the department had paused the review to avoid interfering with an ongoing FBI investigation into Clinton's use of a private server while she was America's top diplomat.

She said the decision was made after the department sought the FBI's advice on how to proceed with the review and received word that it should follow its standard practice.

Trudeau said the department's standard practice is to place internal reviews "on hold while there is an ongoing law enforcement investigation underway."

"Of course, we do not want our internal review to complicate or impede the progress of their ongoing law enforcement investigation," Trudeau said.

Trudeau said the department would "reassess next steps" in the internal review process when the FBI completes its probe.

The department began the internal review in January when it announced that it had classified 22 emails that Clinton sent or received as top secret.

None of the emails was marked classified at the time it was sent.

One aspect of the internal review, conducted by the bureaus of Diplomatic Security and Intelligence and Research, was to investigate whether any of the information in the emails was classified at the time of transmission.

The review could result in counseling, warnings or other action against employees if it finds the information was mishandled.

Wall Street Journal
FBI Offers Help to Agencies On Phones
Saturday, 02 April 2016
Byline: Devlin Barrett

WASHINGTON -- The Federal Bureau of Investigation told law enforcement agencies around the country Friday it would try to help them open locked phones or other devices as much as "legal and policy constraints" allow.
The unusual guidance from the nation's premier law- enforcement agency is in response to a surge of interest from state and local authorities in how the agency was able to open a locked iPhone seized in the probe of a terror attack in San Bernardino, Calif., in December.

The FBI advisory seems to be aimed at reassuring police and prosecutors that while they don't have much to tell them now, they hope to provide more information and possibly help in the near future.

For months, the FBI had been unable to open the phone -- a 5C model -- and was engaged in a high stakes legal battle with Apple Inc. trying to force the company to help open the device. The Justice Department ended that legal battle this week, when it announced a third party outside the U.S. government had shown them a new means of cracking the phone.

"That method for unlocking that specific iPhone proved successful," the FBI missive said, adding that the agency is aware the difficulty of accessing locked data in criminal probes "is a substantial state and local law enforcement challenge that you face daily."

The FBI is now testing to see whether the method used in the San Bernardino case may work against over types of iPhones, say people familiar with the matter.

While the government says it needs to be able to look inside such devices when it has a warrant, Apple and other tech companies argue that even with a warrant it is wrong to force them to create new weaknesses in their systems that could expose millions of customers to hacking or snooping.

The FBI letter goes on to pledge an "open dialogue" with local officials, ending: "We are in this together."

Washington Post
FBI weighs if it can share hacking tool with local law enforcement
Saturday, 02 April 2016
Byline: Ellen Nakashima and Adam Goldman

The FBI and Justice Department are debating whether the hacking tool that helped the bureau unlock the iPhone of one of the San Bernardino, Calif., terrorists can be used to help state and local law enforcement, officials said Friday.
That will be a challenge because the bureau has classified the tool, making it difficult to use in state and local criminal prosecutions requiring disclosure of evidence to defendants, officials said.

"There's a desire to be forward-leaning to help state and local law enforcement," said a senior law enforcement official, who, like others, spoke on the condition of anonymity to discuss an ongoing investigation. "But no one knows quite what the answer is."

Moreover, the tool itself likely will have a shelf life of only a few months, as tech companies may find and fix the vulnerabilities that the tool exploits, and they periodically update the under-lying software.

The firm that helped the bureau -- not the Israeli company Cellebrite, as had been widely rumored -- charged a one-time flat fee, officials said.

The bureau is not releasing the company's name and has declined to discuss details of the solution. Officials last week said the approach was aimed at dismantling security features on the iPhone 5C to permit investigators to make many attempts to crack the passcode without wiping data from the device.

Since its announcement, the bureau has been peppered with inquiries from state and local law enforcement officials seeking to know whether the solution might be useful for their cases.

Manhattan District Attorney Cyrus R. Vance Jr. was among those who called. But, he said, he recognized that the solution itself may not be applicable to the more than 200 iPhones that he has sitting in a crime lab and his technicians cannot unlock.

None is a 5C running iOS 9, which is the model and operating system of the phone used by Syed Rizwan Farook, who was killed by police in December after a shooting attack that claimed 14 lives.

"The overwhelming majority of criminal investigations stalled by default device encryption will remain so until Congress intervenes," Vance said.

One-off technical solutions will result in a "cat-and-mouse cyber arms race" between the government and industry, he said in an interview. "I don't think that's the smart way to approach public safety or privacy policy."

The classification of the method highlights a tension between criminal and national security cases in which the most sophisticated tools are not always available to law enforcement. Unlike state and local courts, federal courts have procedures to protect classified information.

"It's been a challenge for law enforcement for a while," said Austin Berglas, a former assistant special agent in charge of the FBI's New York cyber branch and now head of cyber investigations at K2 Intelligence, a consultancy firm.

Berglas has worked cases on both sides of the divide, including one federal cybercrime investigation in which he was not given permission to use a classified tool because intelligence officials feared it would be disclosed in court.

"The FBI is very prudent when deploying the technologies," Berglas said. "The question is: Is it going to help the greater good by using this? Knowing that we may never have the ability to use this capability against the adversary again, are we willing to take that risk and use it?"

To referee the issue, the government has an interagency process headed by the attorney general to decide which capabilities should be classified. This is separate from the "vulnerabilities equities process" managed by the White House, which decides which software flaws should be disclosed to the software maker.

Now that the bureau owns the solution, it could conceivably have a local agency submit a phone to be unlocked to see if the solution works on it. But there would be constraints. For instance, the FBI likely would not testify about the tool in court, and the local agency would likely have to avoid using data retrieved from the phone as evidence in a criminal prosecution.

"So it would depend on how heavily that evidence weighs in that case. If it's a small part, maybe they can build a case around it," the senior official said. If not, he said, the tool is not for them.

Peter Modafferi, chief of detectives of New York's Rockland County, said he does not fault federal authorities for keeping some of their tools on a high shelf. "That's life," he said. "The bureau goes out of its way to help us when they can, but there's a difference between national security and local law enforcement."

Sunday Times (UK)
Threats spur Djibouti to sue Facebook (Canada)
Sunday, 03 April 2016
Byline: Mark Tighe

The president of Djibouti wants an Irish High Court judge to order Facebook to delete three accounts he alleges have been used to make death threats and threats of violence against him and his family. Ismail Omar Guelleh, known as IOG in the small East African country he has led since 1999, has applied for a High Court injunction against Facebook Ireland. The case is due for mention on April 11 in the chancery list, where business disputes are decided. Maki Omar Abdoulkadar, Djibouti's director of public prosecutions, has filed an affidavit in the case in support of his president's application.

Facebook Ireland is designated as the data processor for all account holders not resident in America or Canada. Guelleh's case is the first time a foreign individual has brought a legal action in Ireland seeking to compel Facebook to take action about material hosted by the social network. The Sunday Times has established that last year Guelleh brought an action against Facebook France and Facebook Inc in Paris in a bid to have the same three accounts suspended and the individual behind them identified.

Facebook appealed against a Paris judge's finding in Guelleh's favour in the French Court of Appeal, where it lost on most grounds. The company paid a fine rather than disclose the identity of the account holder.

The accounts use variations of the username Ainan Ainan, an anti-Guelleh activist who claims to live in Brussels.

One of Ainan Ainan's posts quoted in the French judgment spoke about Guelleh "losing a leg or two" or "an eye or two".

The post described the president as a "pirate". "Soon he will be punished , even if he fled ... he will be captured or die. [in English] Dead or alive".

Another post, partly in English and French, referred to Guelleh and said: "we'll be everywhere. To kill you." The post called on people to stop their pacifism and march against Guelleh's regime.

In its appeal in the French case, Facebook argued that the French judges had exceeded their power and complained that their actions in ordering the closure of accounts was disproportionate with respect for freedom of expression.

It also argued that although the accounts were in the French language and Djibouti is a former French colony, the proper jurisdiction was in Ireland where Facebook Ireland was subject to Irish data protection laws.

Guelleh's complaint sought damages of 85,000 from Facebook including a 20,000 fine for not taking down the accounts. He said that the accounts defamed him, and threatened his life and the physical safety of his family. Despite his efforts Facebook had refused to close the "illegal" accounts, he said.

The Court of Appeal fined Facebook 5,000 and 1,000 a day for three months for failing to close the accounts.

Djibouti is strategically important because of its location on the Horn of Africa near shipping lanes and areas where Islamist terrorists are active on the Arabian peninsula.

Reporters Without Borders ranks Djibouti 170 out of 180 countries in its annual world press freedom index. Guelleh, is campaigning to be re-elected president in an election this Friday. He is expected to be returned for a fourth term.

Reporters Without Borders said that this year, Mohamed Ibrahim Waiss, who works for La Voix de Djibouti, an opposition online radio station outside the country, was beaten by police and made to surrender his Facebook usernames and passwords so his account could be used to post images insulting the opposition. A US State Department report of 2013 noted that government forces monitor social media and police visit those who post antigovernment messages.

Maydaneh Abdallah Okieh, a journalist and activist, was sentenced to 45 days in prison and fined 1,000 after he posted photographs on Facebook of police breaking up a demonstration. On appeal, the court increased his sentence to five months.

This year, a London judge ruling on a case brought by Djibouti called Guelleh's regime "capricious", "cavalier" and on occasions "reprehensible".

Reuters
FBI trick for breaking into iPhone likely to leak, limiting its use
Sunday, 03 April 2016
Byline: Staff reporter

SAN FRANCISCO - The FBI's method for breaking into a locked iPhone 5c is unlikely to stay secret for long, according to senior Apple Inc engineers and outside experts.
Once it is exposed, Apple should be able to plug the encryption hole, comforting iPhone users worried that losing physical possession of their devices will leave them vulnerable to hackers.

When Apple does fix the flaw, it is expected to announce it to customers and thereby extend the rare public battle over security holes, a debate that typically rages out of public view.

The Federal Bureau of Investigation last week dropped its courtroom quest to force Apple to hack into the iPhone of one of the San Bernardino shooters, saying an unidentified party provided a method for getting around the deceased killer's unknown passcode.

If the government pursues a similar case seeking Apple's help in New York, the court could make the FBI disclose its new trick.

But even if the government walks away from that battle, the growing number of state and local authorities seeking the FBI's help with locked phones in criminal probes increases the likelihood that the FBI will have to provide it. When that happens, defense attorneys will cross-examine the experts involved.

Although each lawyer would mainly be interested in whether evidence-tampering may have occurred, the process would likely reveal enough about the method for Apple to block it in future versions of its phones, an Apple employee said.

"The FBI would need to resign itself to the fact that such an exploit would only be viable for a few months, if released to other departments," said Jonathan Zdziarski, an independent forensics expert who has helped police get into many devices. "It would be a temporary Vegas jackpot that would quickly get squandered on the case backlog."

In a memo to police obtained by Reuters on Friday, the FBI said it would share the tool "consistent with our legal and policy constraints."

Even if the FBI hoards the information - despite a White House policy that tilts toward disclosure to manufacturers - if it is not revealed to Apple, there are other ways the method could come to light or be rendered ineffective over time, according to Zdziarski and senior Apple engineers who spoke on condition of anonymity.

The FBI may use the same method on phones in cases in which the suspects are still alive, presenting the same opportunity for defense lawyers to pry.

In addition, the contractor who sold the FBI the technique might sell it to another agency or country. The more widely it circulates, the more likely it will be leaked.

"Flaws of this nature have a pretty short life cycle," one senior Apple engineer said. "Most of these things do come to light."

The temporary nature of flaws is borne out in the pricing of tools for exploiting security holes in the government-dominated market for "zero-days," called that because the companies whose products are targets have had zero days' warning of the flaw.

Many of the attack programs that are sold to defense and intelligence contractors and then to government buyers are purchased over six months, with payments spaced apart in case the flaw is discovered or the hole is patched incidentally with an update from the manufacturer, market participants told Reuters.

Although Apple is concerned about consumer perception, employees said the company had made no major recent changes in policy. Instead, its engineers take pride in the fact that a program for breaking into an iPhone via the web was recently purchased by a defense contractor for $1 million, and that even that program is likely to be short- lived.

They said most iPhone users have more to fear from criminals than from countries, and few crooks can afford anything like what it costs to break into a fully up-to-date iPhone.

Wall Street Journal
China's ZTE to Replace Three Senior Executives
Sunday, 03 April 2016
Byline: Juro Osawa

HONG KONG--ZTE Corp.'s board will meet early next week to replace three of its most senior executives, including its chief executive, people familiar with the matter said, as the Chinese telecommunications-equipment maker tries to rebuild its reputation after being accused of violating of U.S. trade rules. Chief Executive Shi Lirong, who has been in the role since 2010, as well as executive vice presidents Tian Wenguo and Qiu Weizhao, will step down pending board approval, the people said. Chief Technology Officer Zhao Xianming is expected to assume the role of CEO and chairman, they said.

On Tuesday and Wednesday, the board plans to discuss and approve the management changes as well as ZTE's 2015 financial results, which were delayed after the U.S. Commerce Department slapped trade sanctions on the company last month, alleging it violated rules by exporting American technological goods to Iran and other nations.

As part of a recent agreement between the U.S. Commerce Department and ZTE to temporarily remove the sanctions, the Chinese company's executives who have been involved in the alleged violation must be removed from management roles, the people said.

In a 2011 ZTE internal document obtained and disclosed last month by the U.S. government, Mr. Tian and Mr. Qiu were named as executives who were in charge of ZTE's plans for allegedly circumventing U.S. export rules. The document detailed the Chinese firm's elaborate plans to set up shell companies to ship goods to Iran without getting caught by U.S. authorities.

ZTE didn't make the executives available for comment.

The shake-up in ZTE's top management comes after the U.S. Commerce Department recently agreed to lift the sanctions on a temporary basis as long as the company stays true to the commitments it has made with the U.S. government. The sanctions, which blocked ZTE's access to supplies of U.S. components and software, threw the Chinese firm's business into doubt and created a new source of tension between Washington and Beijing. China's commerce minister responded by expressing "strong dissatisfaction" with the situation.

ZTE, which has roughly 80,000 employees globally, is a major global supplier of telecom networking-equipment such as wireless base stations and antennas. Over the past few years, its smartphone business has also gained a substantial presence in the U.S., where it was ranked fourth with a 7.2%

market share last year, behind Apple Inc., Samsung Electronics Co. and LG Electronics Inc., according to research firm Canalys.

ZTE is renewing its management as it scrambles to keep its business moving. ZTE will release its full-year earnings Wednesday after postponing the announcement last month, the people said. Trading in ZTE's Hong Kong-listed shares, suspended since March 7, is expected to resume Thursday, the people said.

Some of the company's component suppliers that had temporarily halted shipments with the company last month are resuming their shipments, according to people familiar with the matter.

ZTE is also planning to release its new flagship smartphone called the Axon 2 in mid-May, after delaying its previous plans to launch the phone in April, people familiar with the matter said.

In January, ZTE said it expects to report a 44% increase in 2015 net profit to 3.78 billion yuan ($583 million) and revenue to rise 24% to 100.8 billion yuan, based on preliminary unaudited results.

Had the sanctions stayed in place longer, the impact would have been disastrous for ZTE, analysts said.

In a letter sent to ZTE employees March 8, when the U.S. sanctions took effect, Mr. Shi described the situation as a "crisis" and said the company had set up a special team of executives to handle the issue. The U.S. restrictions hindered ZTE's ability to procure not only components manufactured in the U.S., but also those manufactured overseas based on U.S. technology, according to lawyers specializing in U.S. export control laws.

The Mirror
RAF's new 'GCHQ in the sky' spy planes which can hack enemy emails and phone calls
Sunday, 03 April 2016
Byline: Nigel Nelson

The MoD has bought nine Boeing P-8 Poseidon aircraft to replace the Nimrod spy planes contrioversially scrapped in 2010
Air chiefs have bought nine spy planes, each one like a flying GCHQ .

The Boeing P-8 Poseidon is as effective at information -gathering as the Government's eavesdropping headquarters.

It can hack terrorists' mobile calls and emails, track and -monitor enemy movements and direct our fighter jet response.

The RAF is believed to be spending £2.6billion on buying and maintaining the P-8s, -regarded as the world's most -hi-tech spy planes.

The fleet will also guard Britain's shipping lanes, protect the Navy's aircraft carrier and nuclear submarines.

Britain has had no maritime spy plane since the controversial 2010 scrapping of the Nimrod MR4A by the Government.

Since then Russian combat jets and nuclear-powered subs have encroached into British air and waters almost weekly.

The P-8 is so advanced it can identify an enemy sub's -periscope from several thousand feet.

Read more: Tories order spy planes that don't work with RAF's in-flight refuelling system

Its sensors and radars are so precise it will detect, classify and identify ships and small -vessels. It can also track subs.

And it is sophisticated enough to direct our jets and -surveillance drones on to targets approaching the UK.

The spy-in-the-sky is also one of the most deadly planes in the air as it can carry a lethal -battery of missiles, anti-submarine -torpedoes, bombs, depth charges and mines.

The aircraft, with two pilots and seven intelligence experts, has a range of about 1,200 miles with a 500mph cruising speed. It can also hover 200ft over a target for up to four hours during -sub-hunting operations.

The P-8, already used by the Australian, US, Indian and New Zealand air forces, will be -delivered to the RAF by 2020.

Defence chiefs scrapped a new generation of Nimrods in 2010 as part of MoD cuts.

Over £3.8billion of taxpayers money had been spent on the programme, which was £789million over budget and was nine years late.

When the Nimrod costs are added to the £250million per P-8, the cost of each plane rises to over £650million.

A defence source told the Sunday People : "The cancellation of the Nimrod -programme had effectively given Russian subs and aircraft a "free pass" to enter UK waters.

"Barely a week passes without some Russian ship, aircraft or sub trying to enter British -shipping lanes or airspace."

An MoD spokesman said: "We are committed to buying P-8 aircraft, which will be based at RAF Lossiemouth.

"The full cost of programme is yet to be determined."

Weapons: Freefall bombs, Harpoon anti-ship missiles, supersonic low-altitude -missiles (SLAM), land attack missiles, depth charges, sonar buoy torpedoes.

Range: 1,200 miles

Speed: Max 564mph

Cruising: 506mph

Dimensions: Length 129ft Wingspan: 117ft Weight: 62.7tons

Crew: Pilot and co-pilot plus seven console operators

Engines: 2 x CFM56-7B -turbofans.

Radar/surveillance: Electro- optical infrared -sensor can ID, track and -engage several targets - from land vehicles, aircraft, and ships. Can hack mobiles, emails and encrypted -communications. Advanced magnetic anomaly detection system for sub tracking.

USA Today
Pentagon to Panama Papers, a history of leaked data
Tuesday, 05 April 2016
Byline: Elizabeth Weise

The 11.5 million leaked documents from the Panamanian law firm Mossack Fonseca are providing a treasure trove of data on a hidden world of offshore accounts and murky dealings.
Expect more such leaks in the future.

"It's becoming much easier than it used to be to store and move very large amounts of data. I would expect this to continue," said John King, a professor of information at the University of Michigan in Ann Arbor.

The history of such leaks shows a steady increase in their depth and breadth, as information technology has become more sophisticated and allowed more data to be captured and revealed by leakers.

In 1948, spy Whittaker Chambers famously hid two rolls of microfilm in a hollowed-out pumpkin in a pumpkin patch. The film contained just 58 images of State and Navy Department documents.

By 1969, anti-war activist Daniel Ellsberg spent multiple nights laboriously making photocopies of the so-called Pentagon Papers, a 700-page report by the Department of Defense covering U.S. decision- making in Vietnam. Excerpts were eventually published in The New York Times and the Washington Post.

WikiLeaks has published nearly 500,000 documents leaked by hackers who attacked Sony Pictures Entertainment on Thanksgiving of 2014.

In 2013 Edward Snowden leaked more than 1.5 million documents from the National Security Agency to the press. What are being called "the Panama Papers" contain 10 times that amount.

The documents are estimated to contain about 2.6 terabytes of data, according to the Suddeutsche Zeitung, the German newspaper that first obtained them. It's not that much data. Ten terabytes would be about 260 HD movies. Today, big-box stores routinely sell solid-state drives that hold 3 terabytes of data and are just a little thicker than a smartphone.

Moving that much data surreptitiously out of a network also isn't that hard. "If you have the time, you can remove an enormous amount of data in not very much elapsed time because you can take it in chunks," King said.

According to a report by cyber security firm Mandiant, the median number of days hackers spend inside a system before they're discovered was 205 in 2015. Of course, that depends on the network, whether the people who own it are watching and what kinds of movement they are used to seeing.

"Transferring 11 terabytes of data wouldn't even be noticed on the Netflix or Amazon networks, but would stand out pretty quickly most other places," said Jonathan Sander, vice president of Lieberman Software, a cyber security firm based in Los Angeles.

The Intercept
A Key Similarity Between Snowden Leak and Panama Papers: Scandal Is What's Been Legalized
Tuesday, 05 April 2016
Byline: Glenn Greenwald
Section: column

FROM THE START of the reporting based on Edward Snowden's leaked document archive, government defenders insisted that no illegal behavior was revealed. That was always false: Multiple courts have now found the domestic metadata spying program in violation of the Constitution and relevant statutes and have issued similar rulings for other mass surveillance programs; numerous articles on NSA and GCHQ documented the targeting of people and groups for blatantly political or legally impermissible purposes; and the leak revealed that President Obama's top national security official (still), James Clapper, blatantly lied when testifying before Congress about the NSA's activities -- a felony.
But illegality was never the crux of the scandal triggered by those NSA revelations. Instead, what was most shocking was what had been legalized: the secret construction of the largest system of suspicionless spying in human history. What was scandalous was not that most of this spying was against the law, but rather that the law -- at least as applied and interpreted by the Justice Department and secret, one-sided FISA "courts" -- now permitted the U.S. government and its partners to engage in mass surveillance of entire populations, including their own. As the ACLU's Jameel Jaffer put it after the Washington Post's publication of documents showing NSA analysts engaged in illegal spying: "The 'non-compliance' angle is important, but don't get carried away. The deeper scandal is what's legal, not what's not."

Yesterday, dozens of newspapers around the world reported on what they are calling the Panama Papers: a gargantuan leak of documents from a Panama-based law firm that specializes in creating offshore shell companies. The documents reveal billions of dollars being funneled to offshore tax havens by leading governmental and corporate officials in numerous countries (the U.S. was oddly missing from the initial reporting, though journalists vow that will change shortly).

Some of these documents undoubtedly reveal criminality: either monies that were illegally obtained (and are being hidden for that reason) or assets being concealed in order to criminally evade tax debts. But the crux of this activity -- placing assets offshore in order to avoid incurring tax liability -- has been legalized. That's because Western democracies, along with overt tyrannies, are typically controlled by societies' wealthiest, and laws are enacted to serve their interests. Vox's Matt Yglesias this morning published a very good explainer of various aspects of this leak and he makes that point clear:

Even as the world's wealthiest and most powerful nations have engaged in increasingly complex and intensive efforts at international cooperation to smooth the wheels of global commerce, they have willfully chosen to allow the wealthiest members of Western society to shield their financial assets from taxation (and in many cases divorce or bankruptcy settlement) by taking advantage of shell companies and tax havens.

If Panama or the Cayman Islands were acting to undermine the integrity of the global pharmaceutical patent system, the United States would stop them. But the political elite of powerful Western nations have not acted to stop relatively puny Caribbean nations from undermining the integrity of the global tax system -- largely because Western economic elites don't want them to. ...

... But even though various criminal money-laundering schemes are the sexiest possible use of shell companies, the day-to-day tax dodging is what really pays the bills. As a manager of offshore bank accounts told me years ago, "People think of banking secrecy as all about terrorists and drug smugglers, but the truth is there are a lot of rich people who don't want to pay taxes." And the system persists because there are a lot of politicians in the West who don't particularly want to make them. ...

... Incorporating your hedge fund in a country with no corporate income tax even though all your fund's employees and investors live in the United States is perfectly legal. So is, in most cases, setting up a Panamanian shell company to own and manage most of your family's fortune.

Tax avoidance is an inevitable feature of any tax system, but the reason this particular form of avoidance grows and grows without bounds is that powerful politicians in powerful countries have chosen to let it happen. As the global economy has become more and more deeply integrated, powerful countries have created economic "rules of the road" that foreign countries and multinational corporations must follow in order to gain lucrative market access.

Proving that certain behavior is "legal" does not prove that it is ethical or just. That's because corrupted political systems, by definition, often protect and legalize exactly the behavior that is most unjust. Vital journalism does not only expose law breaking. It also highlights how corrupted political and legal systems can be co-opted by the most powerful in order to legally sanction atrocious and destructive behavior that serves their interests, typically with little or no public awareness that it's been done.

In such cases, as Jaffer put it, "The deeper scandal is what's legal, not what's not." The key revelation is not the illegality of the specific behavior in question but rather the light shined on how our political systems function and for whose benefit they work. That was true of the Snowden leak, and it's true of the Panama Papers as well.

Le Figaro
La sécurité aérienne à l'épreuve de la technologie
Tuesday, 05 April 2016

Byline: Véronique Guillermard

Quinze ans après sa création, l'Agence européenne de la sécurité aérienne (EASA) veut élargir son champ d'intervention. Elle a déposé une demande en ce sens auprès de sa tutelle, l'Union européenne. « Le monde a beaucoup changé depuis 2002, les technologies évoluent très vite et de nouveaux sujets de sécurité et de sûreté aériennes sont apparus. Nos missions doivent évoluer » , a expliqué Patrick Ky, directeur exécutif de l'EASA, lors d'un débat organisé par le magazine Air & Cosmos .
Drones, big data, cybersécurité... sont quelques-uns des nouveaux domaines dans lesquels l'EASA aura des responsabilités à partir de 2017. Elles s'ajouteront à ses missions historiques de certification des appareils européens, d'écriture du règlement européen de sécurité aérienne et au contrôle de son application.

Des avions « hackés »

Bruxelles a demandé à l'agence de travailler sur les drones civils. L'EASA a été chargée d'écrire « une opinion technique » qui doit servir de base à un futur règlement européen. Les incidents entre drones et avions de ligne se multiplient, comme l'a démontré la collision évitée de justesse entre un drone et un Airbus A 320 à l'approche de Roissy début mars. Aux États-Unis, les incidents sont quasi quotidiens. Le 19 mars, un drone a frôlé un A 380 de la Lufthansa à l'aéroport de Los Angeles. « Pour le moment, la compétence de l'EASA est circonscrite aux drones de plus de 150 kg mais elle sera étendue en 2017. À côté de la mise en place de règles communes en Europe, nous discutons avec les avionneurs et les motoristes. Nous pourrions demander des tests d'ingestion de drone par un avion de ligne et des mesures d'impact de drone sur la verrière d'un cockpit par exemple » , développe Patrick Ky.

Autre chantier auquel s'est attelé l'EASA, la construction « d'une compétence big data » . L'idée est de réunir toutes les données des vols européens, recensant notamment les incidents, et de les analyser afin de modéliser les zones à risque pour les avions commerciaux. Ils sont de plus en plus nombreux - comme le vol MH17 détruit par un missile au-dessus de l'Ukraine en juillet 2014 - à survoler des régions en crise (guerre, terrorisme...). L'EASA doit rattraper son retard sur la FAA, son homologue américaine, qui s'est dotée d'un système de big data, baptisé « Asias » . « Les Américains nous ont proposé de gérer et traiter nos données dans leur centre. Mais comme Asias dépend du ministère de la Défense américain, nous avons décliné. Il est stratégique pour l'Europe de construire son propre système de big data » , insiste le directeur exécutif. Pourtant, la Commission n'est pas disposée à débloquer les 50 millions d'euros nécessaires. Du coup, Patrick Ky envisage de faire appel à l'industrie dans le cadre d'un partenariat public-privé.

L'EASA avance aussi en matière de cybersécurité. Elle a mené « des études de vulnérabilité » édifiantes. Elles démontrent que les avions peuvent être piratés au sol ou en vol. Un expert de l'agence doué en informatique et titulaire d'une licence de pilote est parvenu à pénétrer, en quelques minutes, dans le système de messagerie (Acars) d'un avion. Et il ne lui a fallu que deux ou trois jours pour entrer dans son système de contrôle au sol.

Yonhap News Agency
N. Korea's GPS jamming targeted at aircraft navigation system: official
Tuesday, 05 April 2016

Seoul - North Korea's continuing attempts to jam South Korea' Global Positioning System (GPS) may be aimed at disrupting the navigation systems of aircraft, government officials said as the communist country continued to send jamming signals on Tuesday.
In a provocative operation that started in late March, North Korea has been sending GPS-jamming signals across the border. The signals began last Thursday and continued on and off into Tuesday, according to military and information and communication technology (ICT) sector officials.

"An assessment showed that North Korea's near daily GPS-jamming activity seems to be targeting aircraft's navigation equipment," an intelligence source said, asking not to be named.

But the North Korean operation has not yet resulted in any trouble with South Korea's aircraft because they use both GPS and an inertial navigation system that is immune to jamming attacks, the official said.

In the GPS disruption campaign so far, the North has sent jamming signals on a total of 100 occasions and their maximum output reached more than 45 decibels, the official said.

The strength of the signals are constantly lessening or increasing in what appears to be a new type of assault operation, according to the official.

The country's ICT ministry said the jamming attack has not led to any major GPS disruption locally as of Tuesday, although a total of 962 airplanes have been exposed to the malicious signals.

Nearly 700 fishing ships have been subject to the signals as well, while a total of 1,786 mobile telecommunication base stations have been exposed.

Officials said North Korea had previously launched similar jamming assaults three times between 2010 and 2012, which partly disrupted the GPS-guided navigation of some 1,000 passenger jets as well as of the military's unmanned aerial vehicles.

New dilemma on digital privacy
Tuesday, 05 April 2016
Byline: Lee Jae-min
Section: oped

We all know how devastating it is to lose a cellphone or tablet PC, as our daily life is entirely disrupted.

With so much personal information digitized and stored in one single device, the handheld gadget means the entire world for the owner. So, from the perspective of users, nothing would be more sensitive to their privacy than the information contained in this device.

On the contrary, for the law enforcement agencies a cell phone is an information bonanza. Make-or-break materials are stored on the device. Naturally, nothing provides sharper confrontation between national security and privacy than digital devices and cloud technologies. The digitalization cuts both ways.

As one of the most wired countries in the world, this issue is not new to Korea either. For almost two years now, law enforcement agencies and KakaoTalk, a South Korean messaging app, have been wrangling over the agencies' access to some of the tech company's messaging data. Knowing that almost 90 percent of South Koreans use the app for daily communication, the agencies have come to appreciate the value of digital information to be mined. In the company's eyes, however, such cooperation runs the risk of compromising consumers' privacy and causing a major dent to its business image.

When the FBI retrieved an iPhone used by a terrorist in San Bernardino last December, the agency knew that the smartphone would yield critical information about the events leading to the attack. But the device was encrypted and protected by a password and someone needed to break the code to get to the information inside.

The problem was, 10 incorrect password entries would cause the phone to destroy all the information stored on it. A strong safety feature indeed.

In order to retrieve the information safely, the agency asked Apple to decrypt the iPhone, but the company refused to cooperate, citing the risk of such technologies leading to the invasion of privacy of its consumers. Apple's continued rejection led to a seminal legal battle over national security versus privacy in the digital age. The legal confrontation has just ended, for better or worse, as the FBI succeeded in breaking the code with the help of hired experts.

These recent examples tell us that the cat-and-mouse games between law enforcement agencies and digital companies will continue, as new technologies will immediately emerge to deal with new vulnerabilities. Companies will continue to develop and apply stronger protection systems for the information of their consumers. With that, the demand from law enforcement agencies for help and cooperation to break down security walls will equally escalate. So this issue stands to intensify over time.

Yet, reliable guidelines are yet to come that balance the state's interest for national security and individuals' interest for privacy in the new landscape of the digital age.

What applies now in this field is simply the rules developed from the days of papers and documents collected and stored by corporations, or the days of getting cooperation from phone companies for wiretapping. These conventional rules do not necessarily fit with cyber networks and devices connecting people participating in the networks. Rapid advances in technology are raising new issues in this field as well.

When confronted with this issue, people tend to have a mixed feeling. On the one hand, they release a sigh of relief because the key information has been retrieved to preserve national security. On the other, they raise their eyebrows as their messages and conversations deep inside the smartphones can be broken into and retrieved by outsiders.

We are playing both sides of this fence. Notably, to deal with this new dilemma some countries have initiated a constructive discussion between law enforcement agencies and tech companies in order to explore a new legislation. This is a new development that we need to pay attention to.

Data of nearly 50 million Turks allegedly leaked online
Tuesday, 05 April 2016

Hackers have posted a database online that seems to contain the personal information of nearly 50 million Turkish citizens in what is one of the largest public leaks of its kind.
The leaked database contains 49,611,709 entries and divulged considerable private information, putting people at risk of identity theft and fraud. Entries include data such as national ID numbers, addresses, birthdates and parents' names.

The hackers spotlighted the information for Turkish President Recep Tayyip Erdogan, his predecessor Abdullah Gül, and Prime Minister Ahmet Davuto?lu.

The leak came with the message: "Who would have imagined that backwards ideologies, cronyism and rising religious extremism in Turkey would lead to a crumbling and vulnerable technical infrastructure?"

In a message on the lessons to be learned by Turkey, the hackers said, "Bit shifting isn't encryption."

The hackers also dedicated their stunt to the U.S,. saying: "We really shouldn't elect [Donald] Trump, that guy sounds like he knows even less about running a country than Erdo?an does."

The site appears to be hosted by an Icelandic group that specializes in divulging leaks, using servers in Romania.

The Associated Press on April 4 was able to partially verify the authenticity of the leak by running 10 non-public Turkish ID numbers against names contained in the dump. Eight were a match.

In an era where hackers frequently gain access to sensitive information, the Turkish government is not alone in facing a major breach.

Among the most serious recent incidents, the U.S. government's Office of Personnel Management revealed in April 2015 that hackers gained access to the personal information of more than 22 million U.S. federal employees, retirees, contractors and others, and millions of sensitive and classified documents.

U.S. officials believe a Chinese espionage operation infiltrated OPM's records.

This Day
ICAO Moves to Avert Attacks in Nigeria, Cameroun, Egypt, Others (Canada)
Tuesday, 05 April 2016
Byline: Dele Ogbodo

Abuja - The President in Council of the International Civil Aviation Organisation (ICAO), Mr. Bernard Olumuyiwa Aliyu, has said the body is strategising with the Ministers of Aviation of Nigeria, Cameroun, Niger, Somali, Egypt and countries within the continent to stem any terrorist attack on their airports. One of the strategies, Aliyu said, would be the adoption of biometric passport or the e-passport to monitor closely the movement of passengers within and outside the region.

He admitted that ICAO had been having very close relationship with the Ministers of Aviation on aviation security challenges in Mali, Somali, Egypt and Nigeria, adding that aviation security was a very sensitive issue which ICAO cannot put in public domain.

The ICAO boss, who is seeking re-election bid for a second term, made the disclosure at a get-together dinner organised Sunday night in Abuja for him by the Minister of State for Aviation, Mr. Hadi Sirika.

He stated that ICAO was working hard to make the airports safe across Africa, adding that "bombing at airports is one of the critical issues that we are discussing at the moment," as he said ICAO and Nigeria would have to collaborate very closely on the matter.

He said: "Few months ago, I sent ICAO team to Nigeria and the neighbouring countries of Chad, Niger and Cameroun to do an assessment, and arising from that, we will strategies on new measures that we are going to implement.

"As I leave Nigeria, I will be going for aviation security and facilitation on Africa where they will all gather together at a meeting with ICAO and the African Civil Aviation Commission (ACAC) to chart the way forward.

"We shall raise the level of aviation security on the continent as well as the issues of facilitation and biometrics passport which we call the e-passport in order to monitor closely the movement of people and passengers in the region."

Aliyu alleged that corruption had impacted on the national economy and retarded the growth of the civil aviation, adding however that there was light at the end of the tunnel because of the present posture of President Muhammadu Buhari and his current fight against corruption.

"I'm hopeful for our country because of the posture and the determination of Buhari regarding his fight against corruption. This is the bane of our society that has impacted all aspects of the national economy including the civil aviation.

"I'm very hopeful now with the determination of the minister and the support that he is receiving from government, when he visited me in Montreal, Canada, I told him that we cannot afford to miss this opportunity.

"With me being at ICAO and he being the minister for aviation, we will put ICAO resources at the disposal of Nigeria in all its efforts to move the sector forward."

In his remark, Sirika, said government is committed to making sure that Aliu is re-elected as president of the council before the end of the year based on his experience and achievements that he has recorded in his first term.

He said: "We began his campaign for a second term and it was huge success and welcomed by every country and nation so far. When I spoke to the delegates of the United States and Canada about the representation of Aliu they told me that you cannot do any better."

Panama Papers leaks show change doesn't happen by itself, says Edward Snowden
Wednesday, 06 April 2016
Byline: Tamsyn Burgmann

VANCOUVER _ A trove of leaked data about offshore tax havens in Panama highlights more than ever the vital role of the whistleblower in a free society, says one of the tech era's most prominent figures to expose state secrets, Edward Snowden.
The former U.S. intelligence contractor said Tuesday that the so-called Panama Papers, which were given to journalists by an anonymous source, demonstrate that "change doesn't happen by itself."

"The media cannot operate in a vacuum and ... the participation of the public is absolutely necessary to achieving change," the ex-National Security Agency analyst said during a video conference from Moscow.

Snowden was speaking from exile on a panel organized by Simon Fraser University examining the opportunities and dangers of online data gathering.

The 32- year-old remains wanted by the U.S. government on charges of espionage after leaking classified documents in 2013 as evidence that government spy agencies were monitoring citizens' telecommunication.

The 11.5 million documents taken from the Panamanian law firm Mossack Fonseca reportedly reveal the offshore dealings of more than 100 politicians and public figures from multiple countries.

Snowden told more than 2,700 people at the Vancouver event that the 2.6 terabytes of data contained in the papers demonstrate the most privileged and powerful people in the world are operating by a different set of rules.

"It happens without our knowledge, without our awareness, without our consent," he said. "They don't even pay the same taxes as we do."

Reporters for a German newspaper obtained the volumes of data after they were approached by an unnamed individual about one year ago. The team sought help from the International Consortium of Investigative Journalists in Washington, D.C., which assembled 400 reporters in 80 countries to decipher the contents. The first reports were published on Sunday.

The moderator of the event asked Snowden whether the confidential source had reached out to him asking for advice on how to conduct the leak.

"If they had, I could not say one way or another, because that would be inappropriate," he replied, before adding with a laugh: "But, for they record, no, they have not."

Snowden joked throughout the one-and- a-half hour session, speaking in an animated style and often adjusting his glasses. He told the crowd it was 5 a.m. for him and he hadn't actually slept.

Within days of the Panama Papers' publication, Iceland's Prime Minister resigned. Sigmundur Gunnlaugsson stepped down earlier Tuesday following mass protests over revelations he had owned an offshore company with his wife.

Snowden lauded the "fruits of the investigation" but emphasized that global reform won't come in one night or as a result of a single protest.

"By developing a culture of transparency and accountability where we not only know what government is doing, but recognize that we have not just the right but the responsibility to actually act in changing the nature of government ... directly holds these individuals to account," he said.

"We can achieve change. And ultimately whether we do or not is a decision that falls to us."

Snowden has been livestreamed into Canada before. He made a surprise appearance at the 2014 TED Conference in Vancouver and spoke to high school students at Upper Canada College in Toronto in February 2015.

Globe and Mail
Snowden says Panama Papers show whistleblowers 'vital' to society
Wednesday, 06 April 2016
Byline: Sunny Dhillon

Vancouver - Edward Snowden, the former U.S. National Security Agency contractor responsible for the release of thousands of classified documents detailing the American government's use of mass surveillance, says the Panama Papers show the role of the whistleblower in a free society has become "vital."
Mr. Snowden, who is living in Russia under political asylum, made the comments via video link during a sold-out event hosted by Simon Fraser University on Tuesday night.

Mr. Snowden said the Panama Papers reveal "the most privileged and the most powerful members of society are operating by a different set of rules."

"I think that this shows, more than ever, the role of the whistleblower in a free society has become not only desirable but vital," he said.

The Panama Papers are a cache of 11.5- million records leaked from Mossack Fonseca, a Panamanian law firm that has been retained by politicians and business leaders around the world to channel money beyond their countries' borders and into tax havens through the use of offshore accounts.

The Prime Minister of Iceland stepped down Tuesday after he and his wife were said to have had an offshore account.

The International Consortium of Investigative Journalists has said the records reveal the offshore holdings of 140 politicians and public officials, and more than 200,000 shell companies in all.

Simply setting up offshore entities is not illegal and companies, as well as rich individuals, often do so to take advantage of perfectly legal tax loopholes or for other legitimate purposes. But offshore entities can also be used to illegally evade taxes or to launder or hide money.

Mr. Snowden, when asked by the event moderator if he had had any contact with the person who leaked the Panama Papers, said he had not.

He accused public officials of increasingly "creating a new paradigm."

"They're increasingly guarding knowledge of their operations, of their assets, of their interests," he said. "At the same time, through programs of mass surveillance revealed in recent years, we, the private citizens, are increasingly transparent to government. The relationship between the governing and the governed has become inverted. And rather than those who represent us in our government being accountable to us, we are now accountable to them."

Mr. Snowden, when asked about Canada's new anti-terror legislation, cited its connection to the United States and the Five Eyes intelligence alliance.

"You put everything in one big, giant bucket. I would suspect this is what C-51 is really about," he said. "It's about broadening that bucket and making sure we put more Canadian information in that sharing bucket, so that it's more easily shared. Now I don't want to say that it's absolutely what's happening, but ... this is how it works, this is what we do for every other country."

Mr. Snowden received a standing ovation at the end of the 90-minute event.

Tuesday's event, held at the Queen Elizabeth Theatre, was part of the SFU President's Dream Colloquium, which brings leading thinkers to the university. The event was also live-streamed online.

This was not the first time Mr. Snowden directly addressed a Canadian audience. He also spoke via web link to a crowd of more than 1,000 students at Toronto's Upper Canada College in February of last year.

Washington Times
ISIS Internet operation impossible to stop: U.S. commander
Wednesday, 06 April 2016
Byline: Rowan Scarborough

The nation's top military officer in charge of cyber warfare said on Tuesday that the U.S. is powerless to shut down the vast information network operated on the Internet by the Islamic State terror army. Like no other terrorist group, the Islamic State has embraced cyber space, and its associated messaging apps and platforms, to spread propaganda, recruit foreign killers and plan massacres, such as the March 22 attacks in Brussels.

At a Senate Armed Services Committee hearing, Sen. Joe Manchin asked Navy Adm. Michael S. Rogers, chief of U.S. Cyber Command, "why can't be shut down the part of the Internet. Why can't we interrupt ISIS's ability to go on social media and attract? Why aren't we able to infiltrate that more?"

"The idea you are going to shut down the Internet, given its construction and complexity, is just not [doable]," answered Adm. Rogers, who also directs the National Security Agency, which works to intercept ISIL's communications.

"I've had people ask me can't you just stop it in that area of the world where all the problems are coming from?" Mr. Manchin, West Virginia Democrat, asked, referring to ISIL's home turf of Iraq and Syria.

"It's just not that simple," Adm. Rogers said. "I wish I could say there is a part of the Internet that is only used by a specific set of users."

Adm. Rogers' public answer does not mean his agencies are not attacking ISIL in cyber space.

Defense Secretary Ashton Carter said in February that the U.S. is targeting various ISIL networks to disrupt activities. He said one tactic is to overload a network to force a crash, in what is Cyber Command's first publicly acknowledged war.

"We're trying to both physically and virtually isolate ISIL, limit their ability to conduct command and control, limit their ability to communicate with each other, limit their ability to conduct operations locally and tactically," said Mr. Carter.

The U.S., in an operation never publicly disclosed, developed malware that caused damage to Iran's nuclear weapons program.

ISIL uses not only the seeable public Internet, but also encrypted apps readily downloadable on the commercial market to link up with killers and potential recruits.

Adm. Rogers said the Internet is clearly a boon to ISIL.

"They've harnessed the power of the information arena to promulgate their ideology on a global basis to recruit on a global basis, to generate revenue, and to move money as well as to coordinate some level of activity on a larger dispersed basis," he testified.

"The challenge I look for, what concerns me when I look at the future, what happens if a non-state actor, ISIL being one example, starts to use cyber as a weapons system? That would really be a troubling development," the admiral said.

Washington Post
World's top messaging app now fully encrypted
Wednesday, 06 April 2016
Byline: Ellen Nakashima

WhatsApp, the world's most popular instant-message app with more than 1 billion users, is now fully encrypted on all platforms: Android, iPhone, BlackBerry and others.
That's good news for users who care about security and privacy, including journalists and dissidents. At the same time, it represents the intensification of a trend toward ubiquitous encryption that has posed challenges for law enforcement in the United States and around the world.

"The idea is simple: when you send a message, the only person who can read it is the person or group chat that you send that message to. No one can see inside that message. Not cybercriminals. Not hackers. Not oppressive regimes. Not even us," WhatsApp co-founders Jan Koum and Brian Acton wrote in a blog post Tuesday.

Such encryption, in which only the sender and receiver can decrypt messages, makes it virtually impossible for foreign governments and U.S. agencies to intercept instant messages and voice calls, even with a warrant.

WhatsApp, which is owned by Facebook, has frustrated federal investigators in criminal investigations, but the Justice Department has not taken the matter to court publicly in the way it did recently with Apple.

The Apple case involved data stored on an iPhone used by one of the terrorists in San Bernardino, Calif. By contrast, WhatsApp provides chat, group chat and voice call services to users - or "data in motion."

WhatsApp and Facebook are "great American companies," FBI General Counsel James A. Baker said Tuesday in a moderated discussion at a conference of the International Association of Privacy Professionals. But "this presents us with a significant problem."

If the trend continues, he said, "encryption like that will continue to roll out in a variety of different ways across the technological landscape," adding that the "genie's out of the bottle."

Some of it is good, Baker said, noting that his own data has been stolen by hackers a number of times and he wished that the data had been encrypted. "But the key thing is that it has costs."

His boss, FBI Director James B. Comey, has often said that the Islamic State is using encrypted apps to direct people to kill "innocent people" in the United States. And it is hindering investigations of murder, child pornography, organized crime and a range of other crimes, law enforcement officials said.

Still, Comey said at a congressional hearing last month: "It is not our job to tell the American people how to resolve that problem. . . . Our job is simply to tell people there is a problem."

But for WhatsApp and Open Whisper Systems, a group of software developers that has helped the company integrate the "end-to-end" encryption into its platform, the issues are security and privacy. "What we're doing is trying to make private communications simple," not thwart criminal investigations, said Moxie Marlinspike, founder of Open Whisper Systems.

Criminals and terrorists will use encryption regardless of what commercial firms do, he said. Some al-Qaeda-linked groups have released their own encryption platforms.

Koum and Acton said in their blog post: "While we recognize the important work of law enforcement in keeping people safe, efforts to weaken encryption risk exposing people's information to abuse from cybercriminals, hackers, and rogue states."

Koum, who is WhatsApp chief executive, said he has a personal stake in privacy. "I grew up in the USSR during communist rule and the fact that people couldn't speak freely is one of the reasons my family moved to the United States."

Open Whisper Systems developed the encryption protocol for WhatsApp - the same protocol used for an Open Whisper messaging app called Signal, which has millions of users. Over the next year, Open Whisper Systems will continue to work with additional messaging platforms to incorporate strong encryption, the group said.

Wall Street Journal
Facebook's WhatsApp Bolsters Encryption
Wednesday, 06 April 2016
Byline: Robert McMillan

Facebook Inc.'s WhatsApp texting service said it had strengthened its encryption so that only the sender and receiver are able to read the contents of messages.
WhatsApp has been working for more than a year to ensure the encryption works on different phone platforms and for different types of messages. On Tuesday, a spokesman said the more secure encryption is now available for all of the service's one billion users.

Facebook's move comes as the nation debates the uses and limits of encryption technology. Over the past month, Apple Inc. and the Federal Bureau of Investigation have been locked in a bitter struggle over the FBI's demands that Apple help unlock its mobile phones.

The FBI argues that it will be less effective without ways to tap into the communications of terrorists and criminals. Apple and other technology companies argue that encryption is essential to protecting consumer privacy.

The Justice Department suspended one case against Apple after saying it found another way to extract data from the phone of San Bernardino shooter Syed Rizwan Farook.

But roughly a dozen other cases are pending in federal court, and local prosecutors say they have hundreds of encrypted phones that are stymying investigations.

"We're sympathetic with Apple," Facebook Chief Executive Mark Zuckerberg said during a technology conference in February. "I don't think requiring back doors into encryption is either going to be an effective way to increase security or is really the right thing to do."

WhatsApp has been working on the project since late 2014, using encryption software built by Open Whisper Systems, a not-for-profit security-development group. In 2014, text messages were encrypted, but WhatsApp group messages and messages containing media, such as photos or videos, weren't encrypted.

Many Internet companies encrypt messages before they are stored on their servers, but they are typically able to decrypt them when necessary -- for example, in the case of a court order. With Open Whisper's technology, WhatsApp won't be able to read its customers' messages under any circumstances, a feature known as "end-to-end" encryption.

That will make it much harder for anyone -- including criminals, intelligence agencies and law enforcement -- to read WhatsApp messages without permission, said Moxie Marlinspike, founder of Open Whisper Systems.

USA Today
Chinese censors curb Panama Papers coverage
Wednesday, 06 April 2016

Byline: Roger Yu

China moved swiftly in reacting to reports and online chats about the Panama Papers leak, largely banning the topic and related search terms at news organizations and social media channels in the country.
A group of over 100 news organizations worldwide -- coordinated by the International Consortium of Investigative Journalists -- published stories Sunday about the inner workings of Panamanian law firm Mossack Fonseca, which helps politicians, businessmen, athletes and celebrities create offshore accounts for untraceable funds.

The political fallout from the consortium's investigative stories, based on 11.5million documents that were leaked anonymously, continued this week as Iceland's Prime Minister Sigmundur David Gunnlaugsson stepped aside Tuesday amid pressure.

Several prominent Chinese names appear in the documents, according to the ICIJ's report.

"The files reveal offshore companies linked to the family of China's top leader, Xi Jinping," the report said. "Family members of at least eight current or former members of China's Politburo Standing Committee, the country's main ruling body, have offshore companies arranged though Mossack Fonseca. They include President Xi's brother-in-law, who set up two British Virgin Islands companies in 2009."

The revelation will not be easy to find online for Chinese readers, though. Internet censors also blocked the stories by the ICIJ's and several of its publishing partners, including Spain's El Pas, France's Le Monde, Sddeutsche Zeitung in Germany, the Canadian Broadcasting Corp., and the United Kingdom and U.S. editions of The Guardian, according to ICIJ, citing reports from news organizations and analytics by GreatFire.org, which monitors Web censorship in China.

The People's Daily, an official daily newspaper of the Chinese Communist Party, and state broadcaster China Central Television have not reported on the affair, according to The Wall Street Journal.

A search for "Panama" on the website of the China Daily, an English daily in China, renders one wire story -- written by Agence France-Presse -- related to the investigation. Five stories related to the Panama Papers appeared on Xinhua's English website, but they referred to the scandals in Iceland, Spain and New Zealand.

Mossack says it "does not foster or promote illegal acts."

Washington Post
Spy probe morphed into child porn case

Wednesday, 06 April 2016
Byline: Ellen Nakashima

FBI agents entered Keith Gartenlaub's home in Southern California while he and his wife were visiting her relatives in Shanghai. Agents wearing gloves went through boxes, snapped pictures of documents and made copies of three computer hard drives before leaving as quietly as they had entered. The bureau suspected that Gartenlaub was a spy for China.

The FBI had obtained a secret search warrant to enter the house, citing national security grounds. The agents were searching for evidence that Gartenlaub, an information technology manager at Boeing, had leaked computer information about the defense contractor's C-17 military transport plane to people acting on behalf of China.

But since the search in January 2014, no spy or hacking charges have been brought against him.

Instead, seven months later, he was charged with the possession and receipt of child pornography. He has denied the charges, but a jury convicted him in December.

Gartenlaub's case highlights how exceptional powers given to the government in recent years to gather information about suspected terrorist or espionage threats without some of the traditional safeguards for a defendant's rights are now leading to charges in more routine criminal cases.

Over the past 15 years or so, the wall between U.S. intelligence officials and criminal prosecutors has fallen, making it easier for them to share information, especially to fight terrorism. And under the Foreign Intelligence Surveillance Act (FISA), defendants are generally unable to effectively challenge the warrants that authorized the search or surveillance because they are not permitted to see them or the underlying application on national security grounds.

Gartenlaub's attorneys are troubled that what began as an espionage case - one that resulted two weeks ago in a guilty plea by a Chinese businessman with no connection to their client - morphed into a child pornography prosecution.

In Gartenlaub's case, the government made sealed filings, so neither the defense nor the public was able to see them. Based on the secret filings, the judge held that the government had shown probable cause that the house to be searched belonged to "an agent of a foreign power" or a spy.

"There has, over the last decade-plus, been an erosion of the formerly bright line between foreign intelligence surveillance and investigation for criminal prosecution," said Jennifer Daskal, a former official in the Justice Department's national security division who teaches law at American University.

In criminal cases, by contrast, a defendant and his attorneys are generally entitled to see an affidavit for a warrant and challenge the grounds for its issuance before a judge. Gartenlaub wants to see the warrant in his case so he can challenge it as based on false information and therefore invalid.

"The government is increasingly using national security tools to investigate domestic criminal cases, bypassing key constitutional protections," said Patrick Toomey, a staff lawyer with the American Civil Liberties Union. "This problem is only compounded in the digital age, where the FBI is collecting vast amounts of our data for intelligence purposes but then goes sifting through all that information in unrelated criminal investigations."

In a case in Philadelphia last year, for instance, the government used a FISA order to obtain evidence on a Temple University professor who they apparently suspected was sharing technology with China, but they indicted him on garden-variety wire fraud charges before eventually dropping the case. In an Iowa case, the government used a FISA order to gather information about a Chinese businessman suspected of stealing patented corn seeds from farm fields. In 2013, he was indicted on charges of theft of trade secrets. He pleaded guilty this year to one count of conspiracy to steal trade secrets.

Federal prosecutors in Gartenlaub's case insist that they followed the law.

"The issue of the FISA warrant was the subject of an extensive pretrial briefing and an order from the judge finding that the orders were lawfully issued and did not violate the defendant's due process rights," said Thom Mrozek, a spokesman for the U.S. attorney's office in Los Angeles.

The judge specifically found that the pornography material "obtained pursuant to FISA was lawfully acquired" and did not violate the defendant's Fourth Amendment rights, he said. The court also found that "there is no indication of any false statements having been included in the FISA materials."

Mrozek said the fact that the child pornography case began as a national security investigation does not lessen its severity.

"When law enforcement lawfully obtains evidence of a serious crime, in this case a crime against children, we will pursue further investigation of that crime," he said.

Justice Department officials added that Congress has always intended that information obtained through intelligence authorities could be used in criminal prosecutions. "It would be irresponsible for the government to ignore evidence of criminal wrongdoing when such evidence is lawfully collected," said Justice Department spokesman Marc Raimondi.

In Gartenlaub's case, the defense unsuccessfully argued that he could not be linked to identical copies of child pornography videos found on four hard drives in his house. Two of the hard drives had been in a computer that was kept at a beach house where numerous people had access to it, Gartenlaub said.

"They claim I'm a spy and a pervert, and I'm neither one," Gartenlaub said in an interview from his home in Riverside County, a house he may not leave without permission while awaiting sentencing.

Jeff Fischbach, a forensic technologist for the defense, said there is no evidence that the child pornography was ever seen by anyone who used the computer, much less Gartenlaub.

The government's own forensic expert, Bruce W. Pixley, said he could not find any evidence of the material being downloaded onto any of the computers, the defense noted. That means it had to have been copied onto the computer - but by whom is unknown.

Prosecutors are seeking a 10-year prison term for Gartenlaub, who has asked Judge Christina A. Snyder of the U.S. District Court for the Central District of California to overturn the verdict or order a new trial. A hearing is scheduled for this month.

Gartenlaub, 47, was fired in August 2014 and has been unemployed since. His attorney said his defense was hampered by an inability to obtain basic information about how the evidence was obtained and on what specific grounds the warrant was issued.

"We've always cherished the right to confront and cross-examine our accusers and examine the evidence that's used as the basis for a search of our homes," said Mark J. Werksman, Gartenlaub's attorney. "And to be told, 'We went in. We had good reasons. We're not going to tell you why. Trust us,' is alarming. Especially when the case becomes a run-of-the-mill criminal case."

In February 2013, the FBI emailed Gartenlaub that it was investigating a data breach and wanted to talk to him. Over two days at Boeing's facility in Long Beach, Calif., and a third day at its Huntington Beach facility, agents interviewed Gartenlaub about the C-17 program; his team of engineers was also questioned. Two agents showed him a copy of an intercepted email. The communication described information on the C-17 that was apparently being sought by the Chinese.

Gartenlaub told them that he had no idea who wrote it or why.

The next time he heard about the C-17 was more than a year later, in June 2014, when he saw the news about the arrest of the Chinese businessman, Su Bin. When he reviewed Su's arrest warrant, he realized that the email excerpt he had been shown 16 months earlier had been sent by Su.

Still, Gartenlaub had no sense that he was a target. "Why would I think I would be under suspicion?" he said.

The only thing he could think was that his wife, who was born in China and became a U.S. citizen and was a member of an Orange County Chinese business association, somehow made the FBI suspicious.

In an affidavit for a warrant for the couple's emails, separate from the national security warrant, agent Wesley Harris stated that Gartenlaub was the "nationwide Unix military administrator for Boeing," suggesting that that position would allow him to log into C-17 data, Gartenlaub said.

According to two Boeing colleagues, who spoke on the condition of anonymity because they were not authorized to talk to the media, there is no such job at the company. And Gartenlaub was, in any case, an IT manager. Moreover, they said, the breached files were accessible through servers in the field, such as at Air Force bases. These were not servers that Gartenlaub or his team of engineers who supported the plane's designers had access to, they said.

Then on a Monday in late August, two FBI agents came to speak to Gartenlaub at the Huntington Beach facility. They showed him pictures of himself and his wife with some of her acquaintances whom Gartenlaub couldn't remember.

Two days later, the agents returned. This time they handcuffed him.

During his initial appearance in a federal courthouse in Santa Ana, Calif., the prosecutors indicated a willingness to reduce or drop the child pornography charges if he would tell them about the C-17, said Sara Naheedy, Gartenlaub's attorney at the time.

"They said what they really wanted was information about the C-17 Chinese hacking situation," Naheedy recalled.

All along, Werksman said, the government suspected Gartenlaub was working with Su. "They triangulated Keith as the guy at Boeing who would have been Su Bin's inside source," he said.

That suspicion is "ridiculous," Gartenlaub said.

"I've been a good Boeing employee for years. Just because I married somebody from China doesn't mean I'm going to betray my country," he said. "If they think I'm a spy, then charge me with it."

Russia, China are greatest cyberthreats, but Iran is growing
Wednesday, 06 April 2016
Byline: Lolita C. Baldor

Russia and China present the greatest cyber security threat to the U.S., but Iran is trying to increase and spend more on its capabilities, the Navy admiral in charge of the military's Cyber Command told Congress Tuesday.
Adm. Michael Rogers told the Senate Armed Services Committee that while the U.S. has more overall military power than the three countries, the gaps are narrower when it comes to cyber warfare.

He said U.S. Cyber Command is making progress building cyber mission teams, and will have 133 fully operational by September 2018. He said that nearly 100 teams are already conducting cyberspace operations.

Defence Secretary Ash Carter has beefed up the use of offensive cyber warfare in Iraq and Syria and made increasing the department's cyber capabilities a key goal.

As part of that, he is considering elevating Cyber Command to a full, independent military command. Currently U.S. Cyber Command is a sub-unit of the military's Strategic Command.

During testimony on Tuesday, Rogers told senators that being designated a full command would allow his units to "be faster, which would generate better mission outcomes."

He added that it also would give him more input into the budget process and how to prioritize spending.

A senior U.S. official said Tuesday that Carter believes that making Cyber Command a full command would be worthwhile. The official said that while discussions with the White House are ongoing, Carter has not yet sent his final recommendation to the president. Congress would also need to approve such a change.

The official was not authorized to discuss the matter publicly and spoke on condition of anonymity.

During the hearing, Rogers said that his major cybersecurity concerns include attacks against critical infrastructure in the U.S. and the possibility that cyber hackers may begin breaching networks and changing data, rather than just reading it or stealing it. As a result, he said, officials would no longer be able to "believe what we're seeing," including in data that the military needs for critical operations.

In addition, he said that there are increasing worries that extremist groups and others may begin to view cyber as a weapons system and "want to use it as a vehicle to inflict pain against the United States and others."

New York Times
China Censors Mentions of 'Panama Papers' Leaks
Wednesday, 06 April 2016
Byline: Michael Forsythe and Austin Ramzy

The release of the "Panama Papers" is setting off a political firestorm the world over, prompting protests calling for the resignation of Iceland's prime minister and drawing stern replies from the Kremlin.

But in China, where the names of relatives of several top leaders have been found in the leak of millions of pages of documents from a Panamanian law firm that expose the murky world of offshore companies, most citizens will never hear of the news, which the International Consortium of Investigative Journalists released on Sunday.

Censors have been working hard to ensure that news of the leaks does not penetrate China's "Great Firewall" of Internet controls. Searches using the Chinese characters for "Panama" early on Tuesday on Weibo, China's equivalent to Twitter, turned up information on regulations for importing fruit, including some from Panama. But by the afternoon in Beijing, queries resulted in the following terse message: "Sorry, searches for 'Panama' came up with no relevant results."

A censorship notice sent by a Chinese provincial Internet office told editors to delete reports on the leaks, according to China Digital Times, a website affiliated with the University of California, Berkeley, that monitors the Chinese Internet.

"If material from foreign media attacking China is found on any website, it will be dealt with severely," the notice said. China Digital Times said it did not name the body issuing the notice to protect its source.

The top censored phrases monitored on Monday on Weibo by the University of Hong Kong's Weiboscope all appeared to be related to the Panama Papers: tax evasion, file, leaked, Putin and company.

The leaks, from the Panamanian law firm Mossack Fonseca, show that relatives or business partners of several current and former members of China's ruling Politburo were tied to offshore companies that had the effect of obscuring their ownership interests.

Surely the most politically sensitive leak, for China's censors, was the revelation that Deng Jiagui, the brother-in-law of President Xi Jinping, had set up two British Virgin Islands-registered companies through Mossack Fonseca in 2009, when Mr. Xi was vice president but already marked as the heir apparent for the country's top position.

The consortium did not find what the two companies -- Best Effect Enterprises and Wealth Ming International -- were used for, and by the time Mr. Xi became China's top leader in late 2012, the companies were dormant, reported the group, based in Washington.

The new revelations add to previous exposés of Mr. Deng, who is married to Mr. Xi's older sister, Qi Qiaoqiao. In 2012, Bloomberg News reported on the vast business empire built by Mr. Deng and Ms. Qi both inside China and through offshore companies that amounted to hundreds of millions of dollars. In early 2014, the consortium's first report from leaked offshore accounts also turned up information on an offshore company where Mr. Deng was an owner.

Another politically powerful Chinese couple that had been the subject of previous revelations by the consortium was Li Xiaolin, the daughter of the former premier Li Peng, and Ms. Li's husband, Liu Zhiyuan. The Panama Papers leaks showed that Ms. Li and Mr. Liu were the owners of a foundation based in Liechtenstein that in turn owned a company in the British Virgin Islands, Cofic Investments. A lawyer for Cofic told Mossack Fonseca that the company's profits came from helping the law firm's other clients export heavy machinery from Europe to China, the consortium reported.

Ms. Li's name has turned up in each of the three exposés by the consortium on leaked offshore accounts and Swiss bank accounts that have been published in the past two years. Last year, she and Mr. Liu were listed as the owners of a Swiss bank account that held as much as $2.5 million.

Another relative of a top leader revealed to have offshore accounts is Jasmine Li Zidan, the granddaughter of Jia Qinglin, a former member of the Politburo Standing Committee. Ms. Li's father, Li Botan, was a central figure in a report last year by The New York Times on the political ties of the Dalian Wanda Group chairman, Wang Jianlin. Companies linked to Mr. Li made hundreds of millions of dollars in capital gains from their holdings in Wanda property and entertainment enterprises.

One of the few mainland news outlets to mention the Panama Papers was Global Times, a newspaper run by the Chinese Communist Party.

In a commentary published on Tuesday, the newspaper questioned the lack of a named source for the documents, and the Chinese version of the article suggested that Western intelligence agencies could easily slip fake information into such a large trove of records.

The article accused the Western news media of using the leaks for ideological purposes by attacking President Vladimir V. Putin of Russia. It said that Iceland's prime minister, who is under fire after the leaks disclosed that he and the woman who is now his wife set up a British Virgin Islands company in 2007, was an insignificant figure by comparison.

"The Western media has taken control of the interpretation each time there has been such a document dump, and Washington has demonstrated particular influence in it," Global Times wrote. "Information that is negative to the U.S. can always be minimized, while exposure of non- Western leaders, such as Putin, can get extra spin."

The Global Times article omitted any information about the leaks pertaining to Chinese leaders.

WhatsApp Encryption Now Covers All Messages
Wednesday, 06 April 2016
Byline: Mike Issac

WhatsApp, the messaging app owned by Facebook and used by more than one billion people, on Tuesday introduced full encryption for its service, a way to ensure that only the sender and recipient can read messages sent using the app.
Known as "end-to-end encryption," it will be applied to photos, videos and group text messages sent among people in more than 50 languages across the world, including India, Brazil and Europe. Previously, only one-to-one text messages were fully encrypted.

"Every day we see stories about sensitive records being improperly accessed or stolen," WhatsApp said in a blog post. "And if nothing is done, more of people's digital information and communication will be vulnerable to attack in the years to come."

"Fortunately, end-to-end encryption protects us from these vulnerabilities," the company said.

The move thrusts WhatsApp further into a standoff between tech companies and law enforcement officials over access to digital data, one that pits Silicon Valley's civil libertarian ideals against the federal government's concerns over national security. Increased encryption will make it more difficult, if not impossible, for the authorities to intercept WhatsApp communications for investigations.

The government has faced similar issues with companies like Telegram, Signal and Wickr Me, messaging services that also offer encrypted communications.

The debate over access to digital data erupted in February when a federal court in California ordered Apple to help crack open an iPhone used by a gunman in the San Bernardino, Calif., rampage last year. Apple's chief executive, Timothy D. Cook, resisted the order, saying that the company needed to protect individuals' privacy. Law enforcement officials, including the F.B.I. director, James B. Comey, have criticized encryption as a hindrance to investigations, including in terrorism cases.

Last month, President Obama said in a speech that he opposed the stance on encryption taken by technology companies. The Justice Department later dropped its demand that Apple help open the iPhone of the San Bernardino killer after saying that it had found another, undisclosed, way into the device.

End-to-end encryption for WhatsApp is of particular concern to the F.B.I., considering the service's huge subscriber base and large international footprint. With increasing amounts of communications now sent across messaging services, encrypted texts, video, photos and the like may end up being more problematic for law enforcement than locked devices. The encryption on WhatsApp will be turned on by default, so users will not be required to enable it themselves.

WhatsApp has previously clashed with law enforcement over its digital data. Last month, the federal police in Brazil arrested a Facebook executive for not turning over information from a WhatsApp account in a drug trafficking case. The executive was released.

In the United States, the Justice Department has been discussing how to proceed in a continuing criminal investigation in which a federal judge approved a wiretap, but investigators were stymied by WhatsApp's encryption.

London Times
WhatsApp locks out terror police
Wednesday, 06 April 2016
Byline: James Dean

Terrorism investigators are to be completely locked out of WhatsApp after the company re-engineered its systems to make it powerless to comply with warrants to hand over suspicious communications. A security upgrade to the world's most popular messaging service means that its engineers can no longer unscramble encrypted communications sent by its one billion users.

WhatsApp's decision will further antagonise GCHQ, MI5 and MI6, which believe that American technology companies fail to provide adequate assistance to terrorism investigations. The companies argue that strong encryption is essential as more private communications take place through digital channels.

French officials investigating the Paris attacks last November named WhatsApp as being among several messaging services allegedly used by Isis to plot the massacres.

WhatsApp said yesterday that it had switched on "end-to-end" encryption by default for text, video, picture and audio messages and voice calls transmitted over its network. It therefore no longer holds the digital "keys" needed to unscramble encrypted communications. The company previously had enabled such encryption for some users and some communications.

WhatsApp's move comes shortly after a spat over encryption between Apple and the FBI. The FBI wanted to force Apple to break into an encrypted iPhone used by a suspected terrorist in the San Bernardino massacre in California last year, but dropped its case last week.

Underground Hacker Market is Booming, Says New Report
Wednesday, 06 April 2016
Byline: Nicole Hong

Intelligence analysts found that business is booming in underground markets for Russian and other hackers, according to a report released Tuesday by security firm Dell SecureWorks Inc.

Malware, which includes viruses and other software intended to disrupt computer users, is becoming "much cheaper and continues to offer a low barrier to entry for cybercriminals looking to steal information," wrote the analysts, who scoured dozens of websites on the dark web over the past eight months.

Among the findings: Hackers are offering to steal personal emails from Gmail or Yahoo accounts for $129. The report, which didn't detail the extent to which the online hackers delivered on their promises, said one illicit service boasted that emails could be snatched without the victim noticing any suspicious activity.

Offers to hack into corporate email accounts cost more: $500 per mailbox, the security firm said.

The findings come amid growing concerns among law-enforcement officials about the burgeoning hacker-for-hire market, which allows anyone with Internet access and a bit of money to potentially wreak havoc on computer networks. Hacking has become a way to facilitate all sorts of crimes, from illegal gambling to insider trading.

Tutorials for new hackers, such as how to send phishing emails, can be purchased online for $20 to $40, the report said. Remote access "trojans, " which allow cybercriminals to secretly control other people's computers from a distance, can go for as little as $5 to $10.

The report suggests that hackers are operating more like regular businesses, with many Russian hackers touting 24/7 customer service. Analysts found hackers hawking their goods like a typical startup company. One ad offered "free-trial attacks" and "huge abilities."

Standard goods for identity theft like credit card numbers, bank account credentials and passports are still popular on the dark web. Dell SecureWorks also found that hackers are now selling frequent flyer accounts and hotel points accounts, a trend previously reported by The Wall Street Journal. These points can be exchanged on legitimate websites for gift cards.

Russian Hackers Extend Working Hours to Please Customers
Wednesday, 06 April 2016

Underground hackers throughout the world, particularly in Russia, have started to expand working hours and offer transaction guarantees in order to provide excellent service to customers, Dell's SecureWorks said in a report.
"That trend [of improving services] has not died out, but rather increased, especially on the Russian Underground forums, where we saw many of the hackers expand their working hours to include weekends and even promising to be available 24/7," the report stated on Tuesday.

Dell's SecureWorks, which provides intelligence-driven security solutions to counter cyberattacks, noted that "like any other market in a capitalist system, the business of cybercrime is guided by the supply and demand for various goods and services waxes and wanes."

The company added that many hackers are now providing customers with the ability to work through so- called "guarantors."

"A guarantor for a legitimate transaction typically ensures that the exchange of data and payment takes place fairly by holding money and the product before distributing it to both parties involved in the transaction," the report explained.

The services offered by hackers include accessing Gmail and Yahoo accounts, and hacking into popular Russian and Ukrainian email providers such as Mail.Ru, Yandex, Rambler and Ukr.net.

An email hack costs anywhere from $65 to $129, according to the report.

The hackers also offer to access US and Russian socials media accounts, corporate emails and sell credit card credentials from around the world. Providing DDoS, or distributed denial-of-service attacks, is another popular service hackers offer.

In addition, Russian hackers are ready to provide full business dossiers on Russian companies.

"The hackers are selling information and documents from Russian organizations, including all of the credentials associated with a company's various bank accounts (account numbers, logins, passwords, tokens)," the report pointed out.

Yet another hackers' service includes selling identities, passports, social security cards and other documents.

"The price for an actual US passport ranges from $3,000 to as high as $10,000," the report said. "Templates for US passports sell anywhere from $100 to $300, and the buyer must find their own printer."

Dell SecureWorks urged individuals and companies to implement protective measures to address the threat of potential cyberattack. The company advised building strong technology defenses, using encrypted email and employing vulnerability scanning, among other measures to guard against hacks.

Daily Sabah
Turkish hacker group's attacks shut down Armenian government websites
Wednesday, 06 April 2016

Amid renewed fighting between Armenia and Azerbaijan since the weekend, a Turkish hacker group launched attacks on Armenian government websites on Tuesday, causing long shutdowns.
The attacks by the hacker team named "Aslan Neferler Tim" (which can roughly be translated as Lion Privates Team) caused blackouts on government websites including defense, energy, agriculture ministries' sites, in addition to various other government agencies.

In a Facebook post, the group claimed that their attacks will increase.

The group had earlier claimed responsibility for the attacks on the websites of Belgian government agencies, Dutch right-wing politician Geert Wilders, the Armenian Central Bank, and the main webpage of renowned hacker movement Anonymous.

N.K. cyber capabilities pose serious challenges to U.S.: cyber command chief
Wednesday, 06 April 2016
Byline: Staff reporter

Washington - North Korea's cyber capabilities pose serious challenges to the United States, the U.S. cyber commander said Tuesday, emphasizing the communist nation has steadily been bolstering its capabilities and has been "quite active" in the cyber domain.
Adm. Michael S. Rogers made the assessment in a statement submitted for a Senate Armed Services Committee hearing, saying the North is one of the countries that his command is watching "most closely," along with Russia, China and Iran.

"Iran and North Korea represent lesser but still serious challenges to U.S. interests. Although both states have been more restrained in this last year in terms of cyber activity directed against us, they remain quite active and are steadily improving their capabilities," Rogers said. "Both of these nations have encouraged malicious cyber activity against the United States and their neighbors, but they currently devote the bulk of their resources and effort to working against their neighbors."

The North's cyber capabilities have been a greater focus of attention since a massive hacking attack on Sony Pictures in late 2014, which Pyongyang is believed to have carried out in retaliation for Sony's release of a comedy film ridiculing North Korean leader Kim Jong-un.

"A year ago I mentioned North Korea's brazen cyber operations to impair and intimidate Sony Pictures Entertainment. We have seen no repetition of such destructive assaults against targets in the United States," Rogers said.

The Intercept
Documents reveal secretive UK surveillance policies
Thursday, 21 April 2016
Byline: Ryan Gallagher

Washington - Newly disclosed documents offer a rare insight into the secretive legal regime underpinning the British government's controversial mass surveillance programs.
London-based group Privacy International obtained the previously confidential files as part of an ongoing legal case challenging the scope of British spies' covert collection of huge troves of private data.

Millie Graham Wood, Legal Officer at Privacy International, said in a statement Wednesday that the documents show "the staggering extent to which the intelligence agencies hoover up our data. This can be anything from your private medical records, your correspondence with your doctor or lawyer, even what petitions you have signed, your financial data, and commercial activities."

She added: "The agencies themselves admit that the majority of data collected relates to individuals who are not a threat to national security or suspected of a crime. This highly sensitive information about us is vulnerable to attack from hackers, foreign governments, and criminals."

The documents, published online Wednesday, primarily relate to the opaque rules regulating British spy agencies' use of so-called bulk personal datasets, which are obtained without any judicial authorization and contain "personal data about a wide range of individuals, the majority of whom are not of direct intelligence interest," according to the agencies' own definition of them.

The datasets could cover a wide variety of information, the documents suggest, potentially revealing details deemed particularly "sensitive," such as people's political opinions, religious beliefs, union affiliation, physical or mental health status, sexual preferences, biometric data, and financial records. They may also contain data revealing legally privileged information, journalists' confidential sources, and "details about individuals who are dead," one document says.

The documents include internal guidance codes for spies who have access to the surveillance systems. One memo, dated June 2014, warns employees of MI6, the U.K.'s equivalent of the CIA, against performing a "self-search" for data on themselves, offering a bizarre example that serves to illustrate the scope of what some of the repositories contain.

"An example of an inappropriate 'self search' would be to use the database to remind yourself where you have travelled so you can update your records," the memo says. "This is not a proportionate use of the system, as you could find this information by another means (i.e. check the stamps in your passport or keep a running record of your travel) that would avoid collateral intrusion into other people's data."

Another document warns MI6's employees that they must not trawl the surveillance databases "for information about other members of staff, neighbors, friends, acquaintances, family members and

public figures." That is, it adds, "unless it is necessary to do so as part of your official duties." The agency says that it has monitoring systems in place to catch any abuses, but it is unclear whether the checks that are in place are sufficient. One 2010 policy paper from MI6 states there is "no external oversight" of it or its partners' "bulk data operations," though adds that this was subject to review.

Elsewhere in the documents, eavesdropping agency Government Communications Headquarters (GCHQ) and domestic intelligence agency MI5 admit that they have obtained the bulk datasets on several occasions dating back more than a decade - GCHQ beginning in 1998, and MI5 in 2005 - under Section 94 of the 1984 Telecommunications Act. The agencies argue that the data has thwarted terror plots and is needed "to identify subjects of interest, or unknown individuals who surface in the course of investigations; to establish links between individuals and groups, or otherwise improve understanding of a target's behavior and connections; to validate intelligence obtained through other sources; or to ensure the security of operations or staff."

Last year, The Intercept exposed how GCHQ has in recent years attempted to create what it described as the world's largest surveillance system, covertly harvesting in excess of 50 billion records every day about people's emails, phone calls, and Web browsing habits. In one program code-named KARMA POLICE, the agency said it was seeking to obtain "a web browsing profile for every visible user on the internet."

The Guardian (London)
UK spy agencies have collected bulk personal data since 1990s, files show (Canada)
Thursday, 21 April 2016
Byline: Owen Bowcott, Richard Norton-Taylor

London - Britain's intelligence agencies have been secretly collecting bulk personal data since the late 1990s and privately admit they have gathered information on people who are "unlikely to be of intelligence or security interest".
Disclosure of internal MI5, MI6 and GCHQ documents reveals the agencies' growing reliance on amassing data as a prime source of intelligence even as they concede that such "intrusive" practices can invade the privacy of individuals.

A cache of more than 100 memorandums, forms and policy papers, obtained by Privacy International during a legal challenge over the lawfulness of surveillance, demonstrates that collection of bulk data has been going on for longer than previously disclosed while public knowledge of the process was suppressed for more than 15 years.

The files show that GCHQ, the government's electronic eavesdropping centre based in Cheltenham, was collecting and developing bulk data sets as early as 1998 under powers granted by section 94 of the 1984 Telecommunications Act.

The documents offer a unique insight into the way MI5, MI6, and GCHQ go about collecting and storing bulk data on individuals, as well as authorising discovery of journalists' sources.

Bulk personal data includes information extracted from passports, travel records, financial data, telephone calls, emails and many other open or covert sources. Often they are "fused" together to help pinpoint suspects.

The frequency of warnings to intelligence agency staff about the dangers of trespassing on private records is at odds with ministers' repeated public reassurances that only terrorists and serious criminals are having their personal details compromised.

For example, a newsletter circulated in September 2011 by the Secret Intelligence Agency (SIS), better known as MI6, cautioned against staff misuse. "We've seen a few instances recently of individuals crossing the line with their database use ... looking up addresses in order to send birthday cards, checking passport details to organise personal travel, checking details of family members for personal convenience," it says.

"Another area of concern is the use of the database as a 'convenient way' to check the personal details of colleagues when filling out service forms on their behalf. Please remember that every search has the potential to invade the privacy of individuals, including individuals who are not the main subject of your search, so please make sure you always have a business need to conduct that search and that the search is proportionate to the level of intrusion involved." Better where possible to use "less intrusive" means, it adds.

There has been disciplinary action. Between 2014 and 2016, two MI5 and three MI6 officers were disciplined for mishandling bulk personal data. Last year, it was reported that a member of GCHQ's staff had been sacked for making unauthorised searches.

The papers show that data handling errors remain a problem. Government lawyers have admitted in responses to Privacy International that between 1 June 2014 and 9 February this year, "47 instances of non-compliance either with the MI5 closed section 94 handling arrangements or internal guidance or the communications data code of practice were detected." Four errors involved "necessity and proportionality" issues; 43 related to mistransposed digits, material that did not relate to the subject of investigation or duplicated requests.

Another MI5 file notes that datasets "contain personal data about individuals, the majority of whom are unlikely to be of intelligence or security interest".

The documents have been disclosed before a trial due later this summer at the investigatory powers tribunal, which hears complaints about state-authorised surveillance and the intelligence agencies. IPT sessions hear secret evidence behind closed doors.

Release of these internal records follows admissions by David Cameron and by parliament's intelligence and security committee (ISC) last year in the wake of revelations by the US whistleblower Edward Snowden.

The most recent documents refer to a "more onerous authorisation process" after the prime minister's avowal of the "use of bulk personal data". They provide fresh detail of what is happening in the intelligence agencies.

Web and phone companies are required to retain data for official access for 12 months, but the intelligence agency documents make clear that acquired bulk data sets can be held far longer.

An MI5 memorandum says retention of "low intrusion" material needs to be reviewed only every two years. Some key words are missing from the memo, but it adds: "In MI5, a maximum retention period [redaction] is applied to [bulk personal data]. This can be increased in exceptional circumstances via a policy waiver. This waiver must be authorised by a senior MI5 official and agreed by the BPDRP [bulk data retention review panel] but shall be subject to a detailed review."

Bulk personal data is exchanged with "foreign agencies", presumably mainly those from other countries in the UK's traditional "Five Eyes" alliance - the USA, Canada, Australia and New Zealand.

The documents do not specify every type of information exploited but give examples and broad categories: population data and passports, travel records, financial data and communications information. "Some of this data is publicly available, some of it is purchased and some of it is acquired covertly in accordance with SIS statutory functions," according to an MI6 note.

Monetary information is held. "The fact that [MI5] holds bulk financial, albeit anonymised data is assessed to be a high corporate risk since there is no public expectation that the service will hold or have access to this data in bulk. Were it to become widely known that the service held this data, the media response would most likely be unfavourable and probably inaccurate.

"In some cases, it may be necessary for the relevant team to approach the data provider to examine whether any unnecessary/extraneous parts of the dataset can be removed prior to acquisition. Such extraneous data might include large numbers of minors, details of earnings or medical information."

Death provides no escape. "Policy and processes in relation to bulk personal data is the same for both the living and the dead," a combined agencies memo records.

Each intelligence service has its own database, it appears from the documents. For MI5, storage of bulk data is at their London HQ, Thames House. "In order to ensure the security and integrity of the datasets that the service relies upon for its enhanced analytical capabilities and to reassure data providers that their data will be handled securely, it is essential that the necessary physical controls are in place to

mitigate unauthorised access to, or loss of, this information during transportation to and subsequent storage in Thames House."

The justification for assembling such sophisticated databases, according to an MI5 document, is that it speeds up the process of detecting suspects. "By integrating bulk data [redaction] with information about individual subjects of interest from other sources of intelligence (liaison relationships, agent reporting, intercept, eavesdropping, surveillance) and from 'fusing' different data- sets in order to identify common links, we can better understand target networks, locations and behaviours, enabling a greater depth and breadth of target coverage.

"The fragmentary nature of many intelligence leads and the magnitude of the threat all mean that there is currently no effective method of resolving identities in a timely fashion without using bulk data."

The standard MI5 form for acquisition of bulk data requires agency staff to a tick box if it holds sensitive personal data such as "biometric, financial, medical, racial or ethnic origin, religious, journalistic, political, legal, sexual or criminal activity" and membership of a trade union. MI5 officers also need to explain why acquisition is "necessary and proportionate".

The documents show how alert the agencies are to their legal obligations. They refer to the agencies' "ethics team", the need for "proportionality" and "necessity". One note stresses that GCHQ employees' conditions of employment state that "unauthorised entry to computer records may constitute gross misconduct".

But the papers also reveal how much latitude the law - notably Ripa, the Telecommunications Act, and the Data Protection Act - in practice gives them.

The documents include for the first time certificates under section 28 of the Data Protection Act - signed by David Blunkett and Jack Straw in 2001 when they were home and foreign secretary respectively - which provided secrecy about authorised bulk data interceptions under section 94 of the Telecommunications Act. The existence of such directions were not disclosed until last year.

The quantity of information the agencies have been forced to release suggests their long-established position of "neither confirming nor denying" any operational details may be crumbling at the edges.

In parliamentary debate over the investigatory powers bill, the government has argued that the security services only conduct targeted searches of data under legal warrants in pursuit of terrorist or criminal activity and that bulk interception is necessary as a first step in that process.

Millie Graham Wood, a legal officer at Privacy International, said: "The information revealed by this disclosure shows the staggering extent to which the intelligence agencies hoover up our data.

"This highly sensitive information about us is vulnerable to attack from hackers, foreign governments and criminals. The agencies have been doing this for 15 years in secret and are now quietly trying to put these powers on the statute book for the first time in the investigatory powers bill, which is currently being debated in parliament. These documents reveal a lack of openness and transparency with the public about these staggering powers and a failure to subject them to effective parliamentary scrutiny."

A Home Office spokesman said: "Bulk powers have been essential to the security and intelligence agencies over the last decade and will be increasingly important in the future.

"The acquisition and use of bulk provides vital and unique intelligence that the security and intelligence agencies cannot obtain by any other means. The security and intelligence agencies use the same techniques that modern businesses increasingly rely on to analyse data in order to overcome the most significant national security challenges."

BBC News
Spies' 'staggering' data requests revealed
Thursday, 21 April 2016
Byline: Chris Vallance

London - Since 2005 successive Home Secretaries have authorised the collection of vast amounts of telecommunications data, documents reveal.
The documents also show that MI5 secretly collected large amounts of "anonymised" financial data.

Campaign group Privacy International said the documents show "the staggering extent of UK government surveillance".

The Home Office said the data acquisition had "been essential to the security and intelligence agencies".

It added that the data had provided "vital and unique intelligence".

The disclosure of the documents was made to Privacy International as it prepares for an Investigatory Powers Tribunal hearing in July.

The tribunal handles complaints against UK intelligence agencies MI5, MI6 and GCHQ.

The campaign group is challenging the agencies use and acquisition of "bulk personal datasets" - very large amounts of personal data collected from public and private organisations.

The Home Office has repeatedly refused to list the datasets the agencies hold, but the documents show the agencies could request a range of sensitive information, including medical information, financial information, and information about telephone and internet communications.

The documents reveal that among other things this data is vital in identifying "foreign fighters", possibly a reference to jihadists involved in the conflict in Syria and Iraq.

Privacy International said: "The intelligence agencies have secretly given themselves access to potentially any and all recorded information about us".

But the Home Office told the BBC: "The acquisition and use of bulk [data] provides vital and unique intelligence", adding: "The security and intelligence agencies use the same techniques that modern businesses increasingly rely on to analyse data in order to overcome the most significant national security challenges".

Bad press

In several documents the risk that the public might become aware of the powers is discussed.

An MI5 policy issued in 2010 says the agency's access to "anonymised" financial data would be against "public expectations".

It says that if the data is revealed the media response could be "unfavourable and probably inaccurate".

David Davis MP, a former Conservative Shadow Home Secretary, told the BBC: "It's clear the agencies and the government have been keeping information secret about what they've been doing not just for security reasons, as is normally claimed, but to avoid both embarrassment and public opposition."

Every six months since 21 July 2005, Home Secretaries have authorised MI5 to collect in a database, information from communication network providers, the documents reveal.

This could include telephone data and internet data. It does not include the content of communications.

The documents say the data is anonymous as it does not contain "subscriber information", but privacy campaigners argue it would be possible work out the identity of an individual from the data.

MI5 says the data is deleted every 12 months. In the documents the data is said to be of "significant security value."

The data is obtained under Section 94 of the Telecommunications Act 1984. The government's independent reviewer of terrorism legislation, David Anderson QC, has previously told the BBC the legislation was "so vague that anything could be done under it".

But requests to use the database, the documents say, require a separate authorisation under the Regulation of Investigatory Powers Act.

Misuse detailed

The documents set out detailed procedures required to authorise the collection and use of the data.

But they reveal that misuse has occurred.

One document produced by MI6 gives examples of "individual users crossing the line" for example, "looking up addresses in order to send birthday cards" and "checking details of family members for personal reasons"

The revelations will add to the controversy surrounding the Investigatory Powers Bill currently working its way through parliament.

Millie Graham Wood of Privacy International said: "The agencies have been doing this for 15 years in secret and are now quietly trying to put these powers on the statute book for the first time."

But the Home Office said the new law is necessary and will strengthen safeguards, telling the BBC that the Bill "will also establish the Investigatory Powers Commissioner who will keep under review the use of bulk personal datasets by the intelligence agencies."

That is currently done by the Intelligence Services Commissioner, who confirmed in his 2014 report that "the case for holding BPD has been established in each service" and "agencies all have strict procedures in place in relation to handling, retention and deletion."

New York Times
Chinese Maker of Drones Says It May Share Data
Thursday, 21 April 2016
Byline: Paul Mozur

Shenzhen - DJI is the Chinese company that took drone technology -- long the purview of major military forces -- and made it cheap and accessible enough for ordinary people.
But as the technology is put into the hands of consumers, it raises new questions for DJI and others in the industry: What should be done with the information those drones gather? The little pilotless flying machines typically carry cameras, GPS sensors and other devices that can tell interested parties where they have been and what they have seen. How much of that information should be shared with local governments?

That question is especially important in China, where regulators have looked askance at drones while tightening their hold over civil society.

In a briefing for Chinese and foreign journalists at DJI's headquarters in Shenzhen on Wednesday, Zhang Fanxi, a spokesman for the company, said it was still working out how to deal with the data it collects in China. But for now, he said, DJI is complying with requests from the Chinese government to hand over data.

Adam Najberg, another DJI spokesman, said DJI evaluated each request and complied if it decided that request was legitimate.

DJI could also give the government data from flights in Hong Kong, Mr. Zhang said. That could raise eyebrows among drone users in the city, a semiautonomous Chinese territory with its own laws that guarantee freedom of expression and its own independent judicial system. Protests in Hong Kong that shut down parts of the city in late 2014 were prompted in part by concerns that Beijing was interfering in local affairs.

For the moment, Mr. Zhang said, DJI was uncertain what the industry would decide to do with the data. "This data, exactly how we use it, when we use it and which government departments we give it to" is a continuing discussion, he said.

DJI also sells drones in the United States. Mr. Najberg said DJI did not have a way to see video or images from drones beyond those that users upload themselves via a company social-media app. He also said that the company's phone app uploads flight data to its servers, though consumers can use third-party apps that do not.

DJI is not alone in cooperating with Chinese authorities when they request data, which is required of all companies doing business there. In its most recent report on government requests for information, Apple said it received about 1,000 requests for data in the second half of last year from Chinese authorities and supplied data about two-thirds of the time. Apple said this week that it had never handed encryption keys over to the Chinese authorities, which would give Beijing direct and broad access to communications on Apple's products.

(Over the same period, Apple received about 4,000 requests from the United States authorities and handed over data four-fifths of the time, according to its report. Access to encrypted communications on Apple devices has become the subject of a fierce American political debate.)

But China has been seeking more ways to tap into electronic communications. Two years ago, it proposed a law that would require foreign companies to turn over encryption keys for security reasons, though the final version dropped that language. Officials have cited rising online crime in China, worries about terrorist attacks and disclosures by Edward J. Snowden, the former United States government contractor who revealed that American intelligence agencies sometimes used American technology products to gather information.

Mr. Zhang said DJI did not give Chinese authorities direct access to drones unless requested. "If the government says it wants this data, we will tell the user," he said. "We communicate all of this."

Still, China has not formalized rules over drones, so the industry's obligations are unclear.

Already, DJI's user agreement flags the possibility that whoever flies a drone may not be flying it alone. It reads: "Please note that if you conduct your flight in certain countries, your flight data might be monitored and provided to the government authorities according to local regulatory laws."

In other areas, relations with Beijing remain untested. The company has had numerous requests from local governments in China to work with and train the military police and other security forces to use its drones for surveillance and to track criminals, Mr. Zhang said.

Still, drones face a skeptical audience here. In 2013, Chinese forces shot down a drone over a Beijing suburb. Several months later, a foreigner who took breathtaking shots of central Beijing with a DJI drone earned a brief detention and a stern talking-to.

Drones have raised security concerns in the United States as well, after one crashed on the White House lawn last year. At the briefing, DJI said that it continued to expand a system that ensured the drones could not fly in sensitive areas, an arrangement known as geofencing.

Sydney Morning Herald
Australia ready to hit back at foreign attackers
Thursday, 21 April 2016
Byline: Heath Aston

Sydney - Australia has acknowledged for the first time that it is prepared to strike back against foreign cyber attacks and take "offensive" action to protect the nation's interests.
The message that the government is ready to "deter and respond to malicious cyber activities", comes before a $230 million cyber security strategy to be announced by Prime Minister Malcolm Turnbull on Thursday.

The first update to the nation's cyber attack plan since 2009 will largely involve recruiting 100 more police and cyber specialists to boost the fight against "foreign adversaries", both state- sponsored and those linked to organised crime, and also widen information sharing between business and government.

China, Russia, North Korea and Iran are among the nations suspected to be the most active in launching daily "cyber crime intrusions" against government, business and people in Australia.

In the past six months, systems at the Bureau of Meteorology experienced a "massive breach", believed to have originated in China, and it was reported 97 federal agencies were told to encrypt more data amid "hundreds" of attempted intrusions a month.

The extra resources come on top of $400 million over a decade in the Defence white paper to pay for cyber defence, including experts with hacking experience working for the Australian Signals Directorate whose motto is "Reveal their secrets, protect our own".

Mr Turnbull will characterise the security strategy as a way to protect and enshrine the personal freedoms associated with the online world rather than the creeping reach of Big Brother.

"The maintenance of our security online and the protection of freedom online are not only compatible but reinforce each other," he said. "Australia and Australians are targets for malicious actors - including serious and organised criminal syndicates and foreign adversaries - who are all using cyberspace to further their aims and attack our interests.

"The scale and reach of malicious cyber activity affecting Australian public and private sector organisations and individuals is unprecedented."

Mr Turnbull will appoint a new minister assisting the prime minister on cyber security and a new special adviser on cyber security in his department. Foreign Minister Julie Bishop will appoint Australia's first cyber ambassador.

The Australian Cyber Security Centre, housed inside the headquarters of the Australian Security Intelligence Organisation in Canberra, will be moved to encourage more interaction with business.

A "joint threat-sharing centre" will be established in a capital city, with plans for one in each state capital over time.

The strategy document confirms resources have already gone into "offensive cyber capabilities".

The United States has long used offensive cyber powers. In 2010 its "Stuxnet" worm reportedly infected control systems and disabled Iranian nuclear centrifuges.

China Daily
Nation's drones are in demand
Thursday, 21 April 2016
Byline: Zhao Lei

Beijing - Foreign countries seek 'powerful, affordable' CH military series for reconnaissance, combat, anti-terrorist uses

A number of foreign nations are awaiting delivery of China's CH series military drones, one of the country's most popular products on the international arms market.

The drone family, bearing the name Cai Hong, which means rainbow in Chinese, is considered by experts to be among the most lethal drones on the planet. The newest and largest capacity combat drone in the series, the CH-5, is awaiting government approval for export.

"The total value of contracts we signed in 2015 could definitely be one of the highest in terms of armed drone deals made last year on the international market," Shi Wen, chief drone designer at the China Academy of Aerospace Aerodynamics in Beijing, told China Daily in an exclusive interview. He did not provide a figure.

The academy, part of China Aerospace Science and Technology Corp, is one of China's largest military drone developers. Its CH series drones have been sold to 20 military users from more than 10 foreign countries and are the largest military drone family that China has exported, Shi said.

The early models, CH-1 and CH-2, are small, unarmed reconnaissance craft that have a proven record in locating and monitoring targets. The larger ones - the CH-3 midrange combat and reconnaissance drone and CH-4 mid-altitude, high-endurance armed drone - immediately attracted buyers seeking a powerful, affordable unmanned combat aircraft.

"Our best-selling type so far is the CH-3, while the CH-4 has also received many orders," Shi said, adding that many more countries have expressed a "strong desire" to buy CH drones, but have yet to do so because of their sluggish economies.

The Australian
Firepower boosted to battle cyber hits
Thursday, 21 April 2016
Byline: Brendan Nicholson

Sydney - The government will spend -another $230 million to fight the more than 1000 major cyber -attacks in Australia each year.
The new strategy does not identify nations or criminal gangs responsible for hits on Australia's computer systems but it says they are sophisticated enough to find and target the weakest link in -robust defences.

"Cyber adversaries are aggressive and persistent in their efforts to compromise Australian networks and information," says the cyber security strategy to be -released by Malcolm Turnbull today.

"They are constantly improving their methods in an attempt to defeat our network defences and exploit new technologies." China has been blamed for cyber intrusions around the world and one of its agencies is believed to have penetrated the computer system of Australia's Bureau of Meteorology.

That was of particular concern because of fears it could have provided the intruders with a back door into many more sensitive public service areas, including -Defence's Canberra headquarters.

China strongly denied any involvement in the breach.

Plugging the gap in the public service system and upgrading -security is believed to have cost Australia millions of dollars.

The report concludes that the way the internet is governed, with the private sector and the community as equal partners with governments, is the most effective model to ensure it is open, free and secure.

The new money, to be spent over four years, will cover the cost of additional infrastructure and pay for an additional 101 cyber -security specialists. The Australian Signals Directorate will assess the vulnerability of government agencies and advise them how to deal with emerging technology and threats.

A cyber ambassador will be -appointed to liaise with other -nations on cyber threats.

The Australian Cyber Security Centre will be pulled out of the high-security ASIO building to make it more accessible to Aus-tralian businesses and institutions.

The fresh resources complement a massive investment in cyber activity announced in the defence white paper, with an -additional 900 uniformed ADF personnel and 800 Defence civilians to work in the intelligence processing and broader cyber protection areas.

The Turnbull government says Australia is ahead of most countries in the cyber security area.

The Australian Signals Directorate has the ability to defend the nation against a major cyber -attack or to launch an attack of its own on a -nation or criminal gang penetrating Australia's computer systems.

The strategy says it is important to track down those responsible for malicious cyber activity and bring them to justice.

"Due to the global nature of malicious online activities, tackling cyber crime will involve both increasing the numbers and improving the criminal intelligence capacity and skill sets of law -enforcement officers at home as well as partnering with law enforcement and other agencies abroad," the strategy says."Any measure used by Aus-tralia in deterring and responding to malicious cyber activities would be consistent with our support for the international rules-based order and our obligations under international law."

Australian Associated Press
Govt gears up for cyberattack combat
Thursday, 21 April 2016
Byline: Elise Scott

Canberra - Prime Minister Malcolm Turnbull has declared war on cyberinvasion, confirming the government could launch offensive attacks to deter foreign online espionage.
He did so in unveiling Australia's $230 million cybersecurity strategy, which focuses on closer collaboration with business.

The move comes as the government confirmed reports the Bureau of Meteorology and Department of Parliamentary Services have been targets of malicious cyberattacks in recent years.

Foreign Minister Julie Bishop told reporters on the NSW South Coast the BOM attack was under investigation.

Mr Turnbull said an offensive cybercapability provided an option for the government to respond, but would be subject to "stringent" legal oversight.

"Some intrusions are the work of foreign adversaries, others involve malicious software," he said at the strategy launch in Sydney on Thursday.

"The scale and rate of compromise is increasing."

The government would work with other nations to shut down safe havens for criminal and terrorist organisations.

Unexplained cyberattacks could escalate into war between countries, Mr Turnbull said.

The Australian Crime Commission estimated the cost to the economy of cybercrime was about $1 billion each year, while other assessments put it closer to $17 billion.

Many people would have no idea they'd been targeted by cybercriminals.

"Now as your prime minister, my highest duty and that of my government is to keep Australians safe," Mr Turnbull said.

"It is no different in cyberspace."

The strategy's centrepiece involves sharing threat information between business and government, using the existing Australian Cyber Security Centre and new portals in capital cities.

The centre will be relocated from Australia's spy building in Canberra to a more accessible venue.

The prime minister will convene annual meetings with business leaders.

The strategy, the first since 2009, took 18 months to develop and will create about 100 jobs - most of which will be highly specialised.

Mr Turnbull announced the new role of cyberambassador and will appoint a minister assisting him on cybersecurity.

The strategy sits alongside $400 million outlined in the Defence blueprint for cyberactivities.

While agencies don't believe there's yet been a serious cyberattack - which is defined as compromising national security - there are thousands of intrusions every year.

They range from theft of intellectual property to illegally modifying data to seeking ransom to unlock a computer affected by malicious software.

"We must safeguard against criminality, espionage, sabotage and unfair competition online," Mr Turnbull said.

About $190 million allocated to the strategy was new money, with the remaining funds coming from the Innovation and Science Agenda.

It included an education program to raise awareness of cyberintrusions.

Associated Press
Forum to focus on cybersecurity needs in US and Canada
Thursday, 21 April 2016
Byline: Staff report

Boston - Cybersecurity experts are planning to hold a forum on ways the United States and Canada can toughen their online defenses.
The discussion will focus on the growing number of lone wolf and foreign government-sponsored cyber-attacks that harm national security and commerce in both countries.

Thursday's event is sponsored by The New England-Canada Business Council and will include a discussion of strategies needed to stem the tide of cyber-attacks -- particularly those by crime syndicates, rogue nations, terrorist groups and individual hackers.

Organizers of the forum say the attacks disrupt the free exchange of information on the Internet and undermine business transactions.

One of the biggest cyber thefts on record was by an Eastern European crime organization that investigators say raked in $300 million from stolen credit card numbers.

Le Figaro avec l'Agence France-Presse
L'Australie confirme avoir essuyé une cyberattaque en 2015
Thursday, 21 April 2016
Byline: Journaliste maison

Canberra - L'Australie a reconnu aujourd'hui qu'une de ses administrations sensibles avait été la cible en 2015 d'un piratage informatique d'envergure, et débloqué des centaines de millions de dollars australiens pour lutter contre la cybercriminalité.
Le premier ministre australien Malcolm Turnbull s'est refusé à accuser la Chine de cette attaque, concédant seulement que "des efforts étaient fournis par des acteurs étrangers, gouvernementaux ou non, pour pénétrer" dans les systèmes informatiques des agences gouvernementales australiennes. "Je suis en mesure de confirmer que le Bureau de météorologie a été victime d'une intrusion informatique d'envergure qui a été découverte au début de l'année dernière, et le département des services parlementaires a été la victime d'une intrusion similaire ces dernières années", a déclaré le premier ministre lors d'une conférence de presse à Sydney.

"Je n'ai rien à ajouter", a-t-il balayé devant les journalistes qui l'interrogeaient sur l'éventuelle origine chinoise de l'attaque contre le Bureau de météorologie (BOM). En décembre, l'Australian Broadcasting Corporation l'avait imputée à Pékin en s'appuyant sur les déclarations d'un responsable non identifié.

Le BOM, qui a des liens avec le ministère de la Défense, est doté d'un des plus puissants superordinateurs du pays. M. Turnbull a annoncé une enveloppe de 230 millions de dollars australiens (159 millions d'euros) pour lutter contre la cybercriminalité. Celle-ci vient s'ajouter à l'allocation de 400 millions prévue dans ce domaine pour les 10 ans qui viennent.

Les autorités estiment le coût annuel direct des cyberattaques en Australie à un milliard de dollars australiens, selon M. Turnbull. "Mais certaines estimations en chiffrent le coup réel à 1% du PIB, soit 17 milliards de dollars australiens", a ajouté le Premier ministre. Des médias avaient déjà attribué en 2013 à des pirates informatiques chinois le vol des plans secrets du nouveau siège des renseignements australiens. En 2011, les ordinateurs des premier ministre, ministres des Affaires étrangères et de la

Défense avaient été piratés. La presse affirmait que les agences du renseignement chinois étaient soupçonnées, une information que Canberra n'avait là encore pas voulu commenter.

Globe and Mail
Disclosure issues linger over police surveillance techniques
Tuesday, 26 April 2016
Byline: Colin Freeze

Canadian detectives cannot keep secret their advanced spying devices or their relationships with telecommunications corporations because claims of police privilege carry little or no weight in criminal courts.
So ruled Quebec Superior Court Justice Michael Stober as he ordered several modern police surveillance techniques disclosed to lawyers representing six accused mobsters in Montreal.

Finding that police arguments for secrecy rely at times upon "selfserving and weak" legal logic, his decisions have laid bare RCMP tactics.

From the Stober disclosure rulings flowed the recent revelation that the Mounties use a device that mimics a cellphone tower.

The fact that Canadian federal agents also have access to a version of a virtual skeleton key, one that can crack coded BlackBerry communications, has also been exposed.

Police had fought for years to protect such methods from becoming broadly known, until a cat-and-mouse criminal case pitting the RCMP against the Montreal six forced Justice Stober to consider 21st-century techniques.

A publication ban was imposed on his rulings about pretrial disclosure when they were issued last fall, but redacted versions were filed in a higher court this spring. On March 30, the Quebec Court of Appeal in Montreal was to revisit the Stober decisions.

But on the morning that matter was to be heard, the Crown lawyers who appealed the rulings walked away from the underlying first- degree-murder case.

Across town in Laval, the six people arrested in 2011 were acquitted of that charge and pleaded guilty to the lesser charge of conspiracy to murder.

That outcome freed the Crown of its obligation to make increasingly uncomfortable amounts of disclosure and left the appellate judges with no case to consider.

Court decision or no court decision, however, important disclosure issues remain for police, lawyers and judges across Canada.

Here's the question: If police want to borrow from the playbooks of modern spies and advance their investigations with secret surveillance techniques or the help of telecommunications corporations, can they prevent those methods from being revealed during prosecutions?

The court of Justice Stober, which has had a unique exposure to those issues, ruled that the answer is a resounding no. "The interests of the accused in having a fair trial where the accused is able to make full answer and defence outweighs the public interest in protecting police-investigative techniques," he ruled.

The case was extraordinary in several ways. The judge heard police pleas for secrecy in several closed pretrial proceedings from which the accused and their defence lawyers were barred. To balance the scales, the court took the extraordinary step of allowing Toronto lawyer Anil Kapoor, who has national-security clearance, to make arguments on the defence's behalf.

What emerged as a result of these hearings is that, while police in Canada may have plenty of protections to keep human informants anonymous, they have no analogous legal safeguards for surveillance technology or corporate relationships.

Yet, federal agents remain loath to reveal their techniques because they feel they are in an arms race with savvy adversaries.

In the Montreal case, each suspect had multiple unregistered BlackBerrys, and they talked to each other through the company's proprietary encoded "PINto-PIN" texts. Detectives within the RCMP's technological units saw a murder conspiracy take shape in those messages, but it came into focus only through painstaking work.

First, the Mounties had to use a portable cellphone-tower simulator (often known as a "IMSI catcher") to draw data that revealed which handsets in a certain area were controlled by the suspects.

Then, police served assistance orders on BlackBerry directing the Waterloo company to help facilitate interception of the suspects' messages - which were cracked with a version of the company's "global encryption key" that RCMP had somehow acquired.

In more mundane crimes, defence lawyers challenge the accuracy of police breathalyzers and radar guns. In the case at hand, lawyers Frank Addario and Mike Lacy pushed for increasing amounts of detail about police techniques. At one point, they even persuaded Justice Stober to order police to hand over their version of the BlackBerry key so that the defence lawyers for the accused could test it.

Prosecutors and police pushed back hard on that front, saying that would be like letting go of a skeleton key that could open tens of millions of houses. A BlackBerry executive swore a last-minute affidavit saying such a move could undermine customers' trust. In the end, Justice Stober withheld the key, even as he ordered other surveillance techniques disclosed.

At one point, an RCMP inspector testified that a degree of secrecy is needed because being seen to help police is "not good marketing" for tech companies. But Justice Stober characterized such arguments as "weak and self-serving." As a Canadian judge, he said, he had no legal basis to consider any "adverse impact on [Blackberry's] business interests."

The bottom line for the Crown was that Justice Stober's disclosure orders could yield "a new and thorough body of information that would educate the criminal element," or even provide it with "a user guide on how to circumvent a level of secrecy the State is entitled to protect." This, at least, is what the Crown appeal had put forward, until the surprise plea arrangement between the Crown and defence scuttled the hearing.

The Australian
Cybersphere globe's new battlefront
Tuesday, 26 April 2016
Byline: Alan Dupont
Section: oped

If the ambitious goals of Malcolm Turnbull's just released cyber security strategy are achieved, the document could turn out to be the most important and innovative government strategy yet written. Its great strength is that it provides a clear plan for harnessing Australia's transitioning economy to the enabling technology of the internet, while recognising that a secure cyber space is critical to exploiting the benefits of the digital age and to protecting our interests online.

Turnbull's aim is to make Australia a cyber smart nation. This is a formidable undertaking requiring sustained investment in cyber architecture and intellectual capital, major cultural change and a genuine cyber partnership between government, business and the wider community that has yet to materialise.

His starting point is that the internet is the most transformational technological development in human history and therefore central to Australia's future prosperity and security. It's hard to argue with this proposition. Australia is already a wired economy. Nearly 90 per cent of Australians are online, including 84 per cent of small and medium businesses. The internet-based economy contributed $79 billion, or 5.1 per cent of GDP, in 2014 which could grow to $139bn, or 7.3 per cent of GDP, by 2020. By 2019, the average Australian household will have 24 devices connected online.

But it's not just humans who are connecting to the internet. Machines are, too, in ever increasing numbers. Cars, fridges, power plants -- just about every device we use has the capacity to communicate autonomously with other machines. By 2020, the government estimates there may be 50 billion devices connected to the internet globally. Cybersecurity pioneer John McAfee believes the figure is likely to be 212 billion. The Internet of Things is increasingly the Internet of Everything.

Australia has been slow off the mark to understand and capitalise on the enormous economic -potential of this cyber revolution. We have too few cyber entrepreneurs; business still regards cyber security as a technological, rather than a strategic issue; and there is an educational and vocational mismatch between what the digital economy needs and what our schools and universities provide. We are a long way from being a cyber smart nation.

By contrast, a small country like Israel has embraced the cyber revolution, attracting 20 per cent of global private sector investment in the burgeoning cyber security industry and joining the US, Russia, China and Britain as an emerging cyber power. Israel is nurturing a new generation of cyber-literate young people in its universities and schools, right down to primary school level.

The good news is that the cyber security strategy puts Australia on a path to addressing our digital deficiencies by fostering a new network of cyber research and innovation.

At its hub will be a cyber security growth centre that will define and prioritise cyber challenges. Cyber security centres of excellence in universities will be established to help address the serious shortage of cyber security professionals. They will be linked to previous STEM initiatives designed to boost our dwindling stocks of scientists, technologists, engineers and mathematicians.

However, these commendable steps and the accompanying four-year commitment of $230 million are insufficient to realise Turnbull's vision, which requires nothing less than a cradle-to-grave investment of a kind rarely seen in Australia, starting with primary school education. Cyber literacy has to become an intuitive and foundational skill for all Australians.

A second impediment to realising the full potential of the internet is malicious cyber attacks, which have grown exponentially in number and sophistication over the past decade.

An estimated one million Australians were victims of online identity fraud in 2014 and cyber crime may be costing the economy as much as $17bn annually. One in three Australian businesses have experienced some form of cyber crime.

Professional services firm Deloitte ranks Australia as one of the five most vulnerable economies to cyber attacks in the Asia Pacific region.

The loss of intellectual property and state secrets in electronic smash and grab burglaries is an even more serious issue, because they are the crown jewels that determine a country's competitive position and capacity to defend -itself. Malicious actors inhabit the cyber world's dark side and include criminals, terrorists, spies and hostile states. They undermine trust in the reliability and security of the internet. So improving our cyber defences and sensitising Australians to the risk is central to the strategy's success.

The core problem is finding the right balance between protecting users through better security and regulation, and maintaining an open and free system. In Turnbull's words, "we must ensure that the

administration of the internet continues to be governed by those who use it -- not dominated by governments. Equally, cyberspace cannot be allowed to become a lawless domain".

Unfortunately, there are daily reminders that the bad guys are winning. These headlines, taken from a representative selection of international news stories, give a sense of what a lawless internet could mean. "Two teenage hackers crack Brinks smart safe in less than 30 minutes"; "Pirates hack into shipping company servers to identify booty"; "Islamic State brainwashes youth online"; "Electricity grid at risk, says spy boss".

Despite the increasing coverage of dark side stories, most Australians do not see cyber threats as first order security issues because of the reluctance of governments, and business, to openly discuss the challenge.

Governments worry about revealing sensitive intelligence methods. Companies fear a loss of reputation, or business to competitors in publicly revealing the loss of IP, personal data or money, from a successful hack.

Another reason, according to Alastair MacGibbon, Turnbull's new special adviser on cyber security, is that "we seem to think that cyber attacks have no offline or kinetic effects", unlike a highly visible and obviously destructive terrorist bomb, conventional war or natural disaster. Not being able to see the perpetrator, or vicariously share the anguish of victims, diminishes the emotional impact of a cyber attack.

Regrettably, cyber wars with real kinetic effects are already a reality since it is possible to destroy a power generator with only 21 lines of malicious code, as Russian hackers demonstrated in December, last year, with a devastating attack on Ukraine that left 230,000 Ukrainians in the dark and was the first confirmed hack to take down a power grid.

In championing the virtues of an open, free but secure internet network the national security strategy has struck the right balance between advancing and protecting our economic and security interests in the digital age. But the jury is still out on the ultimate measure of success -- the creation of a dynamic digital economy supported by a resilient cyber network.

Alan Dupont is adjunct professor of international security at the University of NSW and a non-resident fellow at the Lowy Institute.

Tech City News (UK)
Tech: A double-edged sword for national security
Tuesday, 26 April 2016
Byline: Emily Spavin

London - "I remember my first day at Mi6. I thought it was probably going to be nothing like the James Bond books and films. 'It'll just be a desk job', I told myself. I was wrong."
Matthew Dunn now lives in Gloucestershire and writes spy novels for a living - an interesting enough way to earn a crust, but his previous career is much more fascinating.

He served as a British intelligence officer and Mi6 field officer, taking part in around 70 missions that saw him travel the world, moving undercover from one hostile environment to another.

"I was tasked with targeting senior echelons, people who had access to secrets in rogue states that offered significant threats in terms of things like regional conflicts, nuclear conflicts and hostile threats against the West in the guise of intelligence attacks or military attacks," Dunn explained.

He used his training in all aspects of intelligence collection and direct action, including explosives, military unarmed combat, surveillance, advanced driving, infiltration techniques and covert communications, with one particular mission earning him a rare personal commendation from the Secretary of State for Foreign and Commonwealth Affairs.

Gadgetry

As for the role technology played in Dunn's Mi6 career, he explained James Bond-esque gadgetry did exist to some capacity, but not quite to the extent it plays in the Hollywood films.

"Mi6 does have a whole department totally devoted to creating weird and wacky gadgets and other technical equipment. It is actually called the Q department, but I still don't know whether Q in James Bond or Q in Mi6 came first."

Dunn said he was provided with technology such as recording briefcases, surveillance equipment and special weaponry, but explained it was something of a running joke due to its temperamental nature: "The gadgets all worked absolutely perfectly when tested in the head office, but it was often a different story when you tried to use them overseas."

"I'm sure things have come a long way since then, though," he conceded.

The internet has dramatically changed the way the Secret Intelligence Service operates and

the threats faced by the service have certainly developed and mutated, meaning nerds at laptops now often do work previously carried out by men with guns and sharp suits.

In the words of Q in the James Bond epic SkyFall: "I'll hazard I can do more damage on my laptop sitting in my pyjamas before my first cup of Earl Grey than you can do in a year in the field."

Internet

Technology is becoming ever more vital in the protection of national security, particularly within the sphere of counter terrorism. Tech enabled the government to prevent at least seven potentially deadly attacks in the UK last year, however, much more needs to be done to limit the freedom terrorists have in using these same tools to further their plights, promote propaganda and recruit new members.

This January, Baroness Shields, the Minister for Internet Safety, delivered a speech on challenging online extremism. She said the internet is becoming an "echo chamber of hate, fear mongering and intolerance", with terrorist groups like Isis/Daesh being quick to realise and exploit the power of the web. They are running modern and effective global brand marketing campaigns thanks to the borderless and boundary-free nature of social platforms.

"Unlike in the physical world where national governments can take clear and firm actions to keep people safe; there are no such obvious solutions available in the virtual world," she said.

In 2015, the UK's Counter Terrorism Internet Referral unit worked with industry players to remove over 55,000 pieces of terrorist and extremist content. Also last year, YouTube removed 14 million videos in just one instance and, since the middle of 2015, Twitter suspended over 125,000 accounts for threatening or promoting terrorist acts, primarily related to Daesh.

While this is all very positive, it's worth bearing in mind an average of 200,000 Daesh-supporting messages are posted every day on Twitter alone.

Communication

Social media aside, the way in which terrorists communicate has changed significantly, particularly over the past three years. In June 2014, NSA director US Navy Admiral Michael S Rogers said whistleblower Edward Snowden's revelation of government surveillance techniques had lead to some terrorist groups altering their methods of communication.

Among Snowden's revelations was information that the NSA was secretly tapping into Yahoo and Google data centers to collect data from hundreds of millions of account holders across the globe. He also revealed the UK's Government Communications Headquarters (GCHQ) had spied on users of Second Life, Xbox Live and World of Warcraft, and planned to infect millions of computers with malware using a program called Turbine.

While some lauded Snowden a hero, others labelled him a traitor and said revealing government collections partners tipped off terrorists and enabled them to drop those carriers and email addresses. Many have since switched to alternative platforms with encryption.

Last September, head of MI5 Andrew Parker explained that developments in encryption are making Mi5's job harder. Parker told the BBC that encrypted communication services are outpacing the laws required to govern access to data: "Shifts in technology, particularly internet technology, and the use of encryption and so on are creating a situation where law enforcement agencies and security agencies can no longer obtain, under proper legal warrant, the content of communications between people they have reason to believe are terrorists."

Privacy vs protection

Tech giants now, more than ever, have governments knocking on their doors, demanding access to records of users' communications. Thus these companies face, on a daily basis, the struggle of creating a suitable balance between privacy and protection.

In the first six months of 2010, Google received almost 15,000 government requests for user data. By 2014, that number had risen to just under 35,000. The tech giant provided information in over 65% of these cases, but is adamant it will not give in to all government demands.

"The solution, we believe, lies in a principled yet practical approach: one that restricts indiscriminate surveillance and supports valid law enforcement efforts while also protecting people's privacy and security," said Rachel Whetstone, former senior vice president of communications and public policy at Google.

In the UK specifically, parliament is scrutinising the Draft Investigatory Powers Bill - the largest overhaul for 15 years of laws surrounding surveillance. It wants to provide new powers to security services, enabling them to collect tens of thousands of personal records online without ministerial authorisation or oversight.

The Intelligence and Security Committee recently published a report labelling parts of the Bill "inconsistent and largely incomprehensible" and said it lacks clarity on fundamental issues, such as encryption and equipment interference.

Counter-extremism

Whatever the eventual reach of the Bill, is severe surveillance really the answer? Perhaps what is required to boost national security is a bigger drive to turn potential terrorist converts away from the darkened path they're being led down.

Jonathan Russell is head of policy at counter-extremism think tank Quilliam and his organisation focuses on spreading a counter narrative to that proffered by terrorists.

"Counter-extremism has existed for about a decade offline, but in the last three or four years, we have had to shift our focus online," he explained.

Russell said Quilliam's research into how extremists exploit people online has found they "create echo chambers for themselves". They use platforms like Facebook and Twitter, firstly because of the sheer volume of people using those services, but also because the algorithms in use mean they can focus their message without being interrupted by counter-arguments.

"YouTube is the clearest example of that," he said. Watch a Miley Cyrus video, then you'll be presented with related content - another Miley Cyrus video or something similar.

"Exactly the same is true for extremists, except that's worrying because you can just get pushed further and further down a rabbit hole and turn around after an hour or two and have only heard one point of view," explained Russell.

The extremists don't necessarily say anything on social media platforms that promotes violence, because they know that would be taken down, instead they stoke the victimhood narrative, driving opposition to the establishment and painting an overarching picture that the West is at war with Islam.

Most of the messages they produce are about utopia, not brutality, as brutality turns many people off, said Russell.

"They're essentially selling a dream," he added, "and it's up to us to come up with alternative messages and sell a different dream."

Russell stressed that, while Daesh may look like a "medieval death cult", they're using 21st century tools in their plight, so the response needs to be in line with this - they need to be dealt with as if they're a modern brand - a corporation.

"The tools we have available to us with which to respond are not national security tools, they're not related to surveillance, most of them are from the strategic communications and marketing worlds."

Russell said the social media giants have been very good at working with Quilliam and other groups to set up networks and give people in communities the skills to spread counter-extremism messages themselves.

What he'd really like to see, though, is the government doing more to support this kind of approach and for private companies to see this work as part of their corporate and social responsibilities.

"This is the answer, not surveillance. We need to win the war of words and work together to fight the great evil of our time," he concluded.

Vital role

Whatever the specifics, tech has undoubtedly played a vital role in national security over, at least, the past 70 years, and as technology develops, the more integral it becomes.

On a daily basis, it helps the government intercept threats and protect its citizens, but conversely, it enables terrorists to communicate, enemies to intercept confidential information and extremists to recruit.

The war on terror is nowhere near over and both threats and counterterrorism practices will continue to evolve. We now have to rely on the masses, the smartest and the most talented to join the right side of the battle.

NBC News
Ransomware Hackers Blackmail U.S. Police Departments
Tuesday, 26 April 2016
Byline: Chris Francescani

New York - Cyber criminals who have forced U.S. hospitals, schools and cities to pay hundreds of millions in blackmail or see their computer files destroyed are now targeting the unlikeliest group of victims -- local police departments.
Eastern European hackers are hitting law enforcement agencies nationwide with so-called "ransomware" viruses that seize control of a computer system's files and encrypt them. The hackers then hold the files hostage if the victims don't pay a ransom online with untraceable digital currency known as Bitcoins. They try to maximize panic with the elements of a real-life hostage crisis, including ransom notes and countdown clocks.

If a ransom is paid, the victim gets an emailed "decryption key" that unlocks the system. If the victim won't pay, the hackers threaten to delete the files, which they did last year to departments in Alabama and New Hampshire. That means evidence from open cases could be lost or altered, and violent criminals could go free.

Since 2013, hackers have hit departments in at least seven states. Last year, five police and sheriff's departments in Maine were locked out of their records management systems by hackers demanding ransoms.

Ransomware crimes on all U.S. targets are soaring. In just the first three months of 2016, attacks increased tenfold over the total entire previous year, costing victims more than $200 million. Authorities stress that this number only represents known attacks. One federal law enforcement official told NBC News that the "large majority" of attacks go unreported.

The viruses - most of which come from Russia and Eastern Europe -- are typically so impenetrable that even FBI agents have at times advised victims to just pay up and get their data back.

Police computers, however, are especially vulnerable to ransomware, because many small departments have ancient systems.

One chief acknowledged to NBC News that when his department's computers were attacked last year, they were running on DOS, an outdated disc-operating system that dates back to the early 1980s.

"Think about it," said Robert Siciliano, an online safety expert for Intel Security. "You have local law enforcement [which is] provided grants for all kinds of advanced technologies that often revolve around weaponry, but then when it comes to upgrading their desktops laptops -- they may not be up to speed."

Said Siciliano, "It's not unheard of to see a Windows XP or Vista still in action in a law enforcement environment."

'We Are Cops. We Generally Don't Pay Ransoms'

An attack commonly begins when a person opens a piece of malware disguised as a recognizable, sometime personalized e-mail attachment. Once opened, it freezes data block by block until everything is locked.

Then, a ticking countdown clock will often appear on a victim's screen, experts said, with a ransom demand and deadline. Hackers nearly always demand Bitcoins.

Some digital ransom notes include user-friendly instructions on how to buy Bitcoins online, and direct targets to websites that broker anonymous, peer- to-peer financial exchanges.

The attacks are increasingly forcing police chiefs into frustrated deliberations over whether or not -- against all their training and instincts -- to reward extortionists whose identity they may never know.

"My initial reaction was 'No way!" said Sheriff Todd Brackett of Lincoln County, Maine, whose system was frozen last spring. After "48 long hours," Brackett reluctantly paid.

"We are cops," he said with a sigh. "We generally don't pay ransoms."

Last year, the police chief in Durham, New Hampshire, refused to pay, and his files were deleted. He was able to recover most of them from a backup system.

When the Collinsville, Alabama, police department was hit in 2014, the chief refused to pay. He never saw the files again.

What makes the ransoms so maddeningly tempting for cops to pay is that most attacks that have disabled police department computers have sought just a few hundred dollars.

"It's much easier to ask for smaller amounts that you are actually going to get," said Alabama criminal justice professor Diana Dolliver.

Local law enforcement agencies' computer systems can contain plenty of vital -- sometimes even deeply personal -- information, ranging from rape and other violent crime reports to 911 call records, case files of ongoing investigations, personnel records and access to law enforcement databases like the National Crime Information Center (NCIC), which contains criminal case information on federal, state and local investigations.

While authorities say they are not aware of attacks on local law enforcement networks that have resulted in compromised evidence, they believe it is only a matter of time.

Business Is Booming

The attacks on U.S. police are an improbable part of what experts describe as a ransomware epidemic. One new study warns that 2016 "is the year ransomware will wreak havoc on America's critical infrastructure community ...'To Pay or Not to Pay,' will be the question fueling heated debate in boardrooms across the nation."

The business of high-tech extortion is growing exponentially. Last year, the FBI received nearly 2,500 ransomware attack complaints that cost victims $24 million. In the first three months of 2016, ransomware attacks cost Americans another $209 million.

Yet security experts and law enforcement officials agree that the actual figures are likely much, much higher.

"There are a lot of other law enforcement agencies out there that have been affected by this...that don't want their names out there," said Jeff McCliss, a Dickson County, Tennessee- -based detective whose department paid a $622 ransom in Bitcoins.

Many known intrusions have focused on health care facilities, school systems and even small cities -- targets with critical infrastructure, limited security and a constant need for access to their records.

In February, California's Hollywood Presbyterian Medical Center paid a ransom of about $17,000 in Bitcoins, one of at least six major health care systems victimized so far this year. Last month, the city of Plainfield, New Jersey, faced a demand for about $700 in Bitcoins to unfreeze their municipal servers.

Federal investigators say that a majority of the attacks are launched by Eastern European cyber gangs, but there have been few high-profile arrests to date because it's so hard to identify and locate the culprits.

And while early versions of ransomware had to be executed individually, by a human, experts said that today's viruses are fully automated. They are commonly disbursed like spam by the thousands, allowing hackers to execute hundreds of shakedowns simultaneously.

Vulnerabilities 'So Easy to Mitigate'

Ransomware viruses have put federal law enforcement officials in a nearly impossible position. In most cases they can't thwart the attack, apprehend the culprit or retrieve the locked data -- and they know from experience that most victims who pay get their files back.

Yet they're all- too-aware that each payout encourages more extortion.

For several years, multiple federal agencies have issued warning after warning to the public and private sectors urging proper "cyber-hygiene" and stressing the simplicity of the fix -- keep your software up to date and your system regularly backed up.

"This is so easy to mitigate," the federal official said.

While the FBI now explicitly advises against paying ransoms, individual agents have been known to nudge victims in that direction.

"To be honest, we often advise people to just pay the ransom," Joseph Bonavolonta, a Boston FBI cyber and counterintelligence specialist, told a security conference last fall. "The ransomware is that good."

Those comments drew headlines in the tech industry press, and prompted a clarifying statement from the FBI.

"The FBI doesn't make recommendations to companies," the agency told Naked Security last October. "[I]nstead the Bureau explains what the options are ... and how it's up to individual companies to decide for themselves the best way to proceed ... either revert to back up systems, contact a security professional, or pay."

Earlier this month, an FBI spokeswoman issued a statement to NBC News which said, in part, that "The FBI does not condone payment of ransom, as payment of extortion monies may encourage continued criminal activity, lead to other victimizations, or be used to facilitate serious crimes."

Bonavolonta could not immediately be reached for comment.

The Department of Homeland Security offers cyber-safety training to state and local governments and conducts "red team" tests on municipal systems to determine how secure they are. The FBI offers similar training in the private sector.

"It's really important for people to know [that] we can help," said Dr. Andy Ozmant, DHS assistant secretary for cybersecurity and communications. "We have a lot of resources available."

Compromised Evidence?

Experts said that ransomware attacks can have a potentially devastating impact on a municipality's criminal justice system.

"A good defense attorney is going to raise a question about whether or not evidence had been tampered with," said Dolliver. "That's the part I've actually been really watching for, but have not seen it come up in court cases."

Lincoln County law enforcement officials brought the same concerns to their local prosecutors, who concluded that none of the recovered data was ever actually breached.

So far at least, legal experts said, most ransomware cases have not necessarily tainted evidence.

"If the computer is simply held hostage but there is no evidence that any files have been altered, there will be no problem," said Steven Saltzburg, a George Washington University law professor who co-authored the 2013 Federal Criminal Procedures Litigation Manual. "If there is evidence that files have been altered, that is a problem."

'Last Laugh'

The ransomware attacks on U.S. police have left more than a few chiefs privately fuming, including Sheriff Brackett.

In a last-ditch bid to strike at least a tiny blow on behalf of U.S. law enforcement against ransomware extortionists, Brackett and his IT team paid the Bitcoin ransom, received the decryption key, cancelled the payment, and unlocked their system.

"We got the last laugh," Brackett thought to himself at the time.

Two days after his bait-and-switch scheme, hackers struck again.

This time the ransom was about $500.

This time Brackett paid and walked away.

The Register (UK)

Hackers so far ahead of defenders it's not even a game
Tuesday, 26 April 2016
Byline: John Leyden

London - Cybercriminals are way ahead of the game against defenders without having to try anything new, according to the latest edition of Verizon's benchmark survey of security breaches.
The study shows that miscreants have no need to switch up, because the same old tactics are still working fine. Security defenders are still performing poorly in their attempts to defend against hacking or malware-based attacks. This isn't for a lack of trying or skills on their part, but almost completely down to the fact that the game is rigged against them.

Verizon's ninth annual Data Breach Investigations Report (DBIR) provides an analysis of over 100,000 security incidents and 3,141 confirmed data breaches last year, drawing on real-world data breach caseloads handled by either Verizon or around 50 other contributing organisations.

Those involved include the US Secret Service, the European Cyber Crime Center (EC3), UK CERT and the Irish Reporting and Information Security Service (IRISS CERT), amongst others.

Hackers are getting faster whilst defenders are treading water. Over 99 per cent of attacks compromise systems within days (four out of five do it within minutes), and two-thirds of those siphon off data within days (a fifth do it in minutes). Whilst there was an improvement in the number of breaches detected in 'days or less' noted in the last DBIR, that turned out to be a temporary blip. This year, less than a quarter of breaches were detected within the same timeframe - meaning attackers have almost always gotten away with the goods before anyone notices.

Worse yet, it's usually not the victim that notices the breach, but a third party (normally either a security researcher or law enforcement).

Nearly two-thirds of all breaches are still traced back to weak or stolen passwords - a basic security failure.

"People are not sitting in front of consoles, looking for SQL Injections before running a manual attack," Dave Ostertag, global investigation manager at Verizon told El Reg. "They are stealing credentials, planting malware, pivoting and exfiltrating data."

Hackers have begun using multiple exfiltration points to avoid detection, Ostertag added.

Phishing lures

Phishing (which "is efficient and works really well," according to Ostertag) remains a huge problem and a major factor in most breaches. The DBIR found that nearly a third of phishing emails get opened, and more than one in ten recipients open the attachments, a significant rise from last year. The main

perpetrators of these attacks are organised crime syndicates, but nearly one in ten can be attributed to a state-affiliated actor. China accounts for more than half of all cyber- espionage attacks by volume last year, according to Ostertag, who nonetheless welcomed the recent US/China no hack pact as a positive development.

Public sector, manufacturing and professional services firms top the hit list of targets for cyber-espionage. Attackers are using phishing scams and pilfered passwords to open up a backdoor onto enterprise networks. This foothold is used to smuggle malware into targeted networks. Corporate networks would be far harder to attack - even with access credentials - in cases where enterprises had applied two-factor authentication. However, failure in this area was yet another security shortcoming identified during Verizon's study.

"Many victims have single- factor access into parts of their network even if they think otherwise," according to Ostertag.

On the cybercrime-for-profit front, ransomware is a problem across the board in manufacturing, the public sector and healthcare, Verizon reports. Cybercrooks, like cyber-spies, often rely on phishing.

"Hackers do their homework using social media like LinkedIn and other sources to know who to target, and what sort of content is likely to be opened," Ostertag explained.

"Cybercrooks are going after people who initiate or manage financial transactions."

Older threats such as phishing, malware and weak passwords predominate in breaches. By contrast, the much- discussed security risks from the Internet of Things and mobile phones barely register in Verizon's breach study.

Wall Street Journal
The Encryption Farce
Tuesday, 26 April 2016
Byline: Editorial Board

Editorial - If history repeats itself first as tragedy and then as farce, what does the FBI have in store next for its encryption war with Apple? After withdrawing its demands in San Bernardino and then reopening hostilities with a drug prosecution in Brooklyn, the G-men abruptly dumped the second case over the weekend too. Is anyone in charge at the Justice Department, or are junior prosecutors running the joint? The FBI claimed for weeks in a California court that it couldn't unlock the iPhone of terrorist Syed Farook unless Apple was compelled to create a new operating system, but then reported at the 11th hour that an unspecified outside party had engineered a solution that didn't require Apple's help. Justice lawyers also insisted the purpose of the litigation wasn't to create a legal precedent, but that such extraordinary commandeering was an exception for "one phone" related to terrorism.

This claim never stood up to scrutiny, given the nationwide profusion of such cases. But the Brooklyn flame-out is especially instructive about the FBI-Justice method without the crutch of invoking the fast-moving terror exigencies or uncovering potential domestic cells.

The iPhone in question was seized when the feds arrested a methamphetamine dealer called Jun Feng in 2014. Feng isn't dead, like Farook; he merely said he couldn't remember his password. Justice waited more than a year to try to force Apple to break the device, and shortly after these proceedings were initiated Feng and his codefendants copped guilty pleas.

Justice said the case wasn't moot because the device's data could yield evidence of other drug trafficking. FBI Director James Comey has suggested that the San Bernardino software exploit is no use on other iPhone models.

Yet while Justice argued in Brooklyn that Apple's help was essential, it also argued the FBI had no obligation to pursue a non-Apple work-around. The remarkable claim was that prosecutors need not exhaust all possible alternatives before conscripting a private company, such as consulting with other U.S. agencies, hiring an outside digital forensics outfit or even interrogating Feng again.

Such assertions were as false in Brooklyn as in San Bernardino. Two hours and a half before a deadline on Friday night, the government withdrew the case after "an individual provided the passcode to the iPhone," according to legal filings. This second immaculate conception in as many months further undermines the FBI's credibility about its technological capabilities. Judges ought to exercise far more scrutiny in future decryption cases even as Mr. Comey continues to pose as helpless.

The FBI Director recently said at Kenyon College that the end of the San Bernardino affair was "a very good thing," because "litigation is a terrible place to have any discussion about a complicated policy issue, especially one that touches on our values, on the things we care about most, on technology, on trade-offs, and balance." He added that "it will be bad thing if the conversation ended."

Yet forgive us if this "conversation" now seems more like a Jim Comey monologue. The debate might start to be productive if the FBI Director would stop trying to use the courts as an ad hoc policy tool and promised not to bring any more cases like the one in Brooklyn.

Meanwhile, the White House has taken the profile- in-courage stand of refusing to endorse or oppose any encryption bill that Congress may propose. If the Obama team won't start adjusting to the technological realities of strong and legal encryption, they could at least exercise some adult supervision at Main Justice.

New York Times
Obama Stresses Data in Terrorism Fight

Tuesday, 26 April 2016
Byline: Mark Scott

Berlin - The trans-Atlantic debate over digital privacy rights versus the surveillance needs of intelligence agencies was put under a spotlight on Monday, as President Obama called for continued access by law enforcement officials to thwart terrorism, while some European privacy advocates urged greater restraint.
"I want to say this to young people who value their privacy and spend a lot of time on their phones: The threat of terrorism is real," Mr. Obama said, speaking at a trade show in Hanover, Germany.

"I've worked to reform our surveillance programs to ensure that they're consistent with the rule of law and upholding our values, like privacy -- and, by the way, we include the privacy of people outside of the United States," he added.

Mr. Obama's message comes at a sensitive time, as cities like Brussels and Paris are still recovering from recent terrorist attacks. But his words are unlikely to slow down European efforts to expand people's control over their digital lives.

Europe is at the heart of a global debate over the way companies like Google and Facebook, as well as national intelligence agencies, handle people's digital data. Some regulators in the 28-member bloc have called on companies and governments, particularly that of the United States, to comply with the region's tough privacy regulations.

"Those who want to play in our backyard must play by our rules," Viviane Reding, a member of the European Parliament from Luxembourg and a former top European Union official, said on Monday at a privacy conference in Berlin. "Protection of our personal data shouldn't have a national barrier."

Ms. Reding is an author of a European Union privacy law that will go into force in 2018. It will be able to impose fines of up to 4 percent of a company's global revenue for the most serious breaches of European data protection rules. Those penalties would apply to any company -- even if it has no physical presence in Europe -- that has customers within the European Union.

At issue are communications via cellphones, as well as data generated in social media, online searches and e-commerce purchases.

The protections pursued in the European Union include the so-called right to be forgotten, detailed by the bloc's highest court, which requires search giants like Google to remove links to online information in some cases.

And Europe's national privacy regulators have vowed to take a tough line against a new pact between the United States and the European Union that is intended to ensure the relatively unimpeded flow of

personal data across the Atlantic. The national regulators are wary of the ability of American law enforcement and intelligence agencies to monitor data to fight crime or terrorism.

But American agencies, including the Commerce Department and the Federal Trade Commission, argue that they actively monitor companies' access to individuals' digital data. They say that American privacy safeguards -- including the United States Constitution -- often provide better protection than the rules in other jurisdictions, including those in Europe.

"We care about Europeans' privacy," Mr. Obama said in Hanover, "not just Americans' privacy."

Many European officials acknowledge that the region's privacy laws share many similarities with those in the United States. But they also highlight important differences, including the lack of overarching federal privacy legislation. The differences, they say, must be bridged if Europe and the United States are to effectively supervise the way companies like Facebook and Google gain access to data worldwide.

"The digital world is globalized," Giovanni Buttarelli, the European Union's data protection supervisor, said at the Berlin conference on Monday. "So data protection should also be globalized."

The Intercept
Spy Chief Complains That Edward Snowden Sped Up Spread of Encryption by 7 Years
Monday, 25 April 2016
Byline: Jenna McLaughlin

Washington - The Director of National Intelligence on Monday blamed NSA whistleblower Edward Snowden for advancing the development of user- friendly, widely available strong encryption.
"As a result of the Snowden revelations, the onset of commercial encryption has accelerated by seven years," James Clapper said during a breakfast for journalists hosted by the Christian Science Monitor.

The shortened timeline has had "a profound effect on our ability to collect, particularly against terrorists," he said.

When pressed by The Intercept to explain his figure, Clapper said it came from the National Security Agency. "The projected growth maturation and installation of commercially available encryption -- what they had forecasted for seven years ahead, three years ago, was accelerated to now, because of the revelation of the leaks."

Asked if that was a good thing, leading to better protection for American consumers from the arms race of hackers constantly trying to penetrate software worldwide, Clapper answered no.

"From our standpoint, it's not ... it's not a good thing," he said.

Technologists have been tirelessly working to strengthen encryption for decades, not just the past few years. But Snowden's revelations about the pervasiveness of mass surveillance clearly accelerated its more widespread availability.

And technologists say the threat of law enforcement "going dark" has been overhyped. For instance, there are almost always ways to hack around encryption, even if you can't break it.

Clapper acknowledged that there is no such thing as unbreakable encryption from his perspective. "In the history of mankind, since we've been doing signals intelligence, there's really no such thing, given proper time, and proper application of technology."

Christian Science Monitor
Encryption hindering efforts to stop Islamic State, intelligence director says
Monday, 25 April 2016
Byline: Anna Mulrine

Washington - The Edward Snowden leaks have accelerated the sophistication of encryption technologies by "about seven years," Director of National Intelligence James Clapper told reporters this morning. And that is not a development to be celebrated, he added in remarks at a breakfast hosted by The Christian Science Monitor.

"From our standpoint, it's not a good thing."

New, commercially available encryption software "had and is having major, profound effects on our ability" to collect intelligence, "particularly against terrorists," he warned.

That's in large part because the Islamic State is "the most sophisticated user by far of the Internet." They privately purchase software that "to ensure end-to-end encryption" of their communications.

"And so that is a major inhibitor to discerning plotting, principally by ISIL and others," Mr. Clapper said, using one acronym for the Islamic State.

The seven year estimation comes from the National Security Agency, he said.

It raises the issue of the tension between the need for security against cyber attacks - which as recently as February Clapper cited as a greater threat than terrorism - and the opposition to law enforcement against so-called unbreakable encryption software that, they say, could hinder their search for terrorists.

Clapper for his part echoed President Obama's warning against "absolutist positions" on the topic. "Somehow, we need to find a balance here," he said. "I don't know the technicalities of how we might

arrive here, how we thread the needle" between how to "ensure privacy and security on an individual basis, as well as security in the context of what's best for the collective good."

At the moment, he added, that goal "is an elusive holy grail that we're pursuing."

That said, he warned that the development of unbreakable encryption, which he likened to the possibility that that it could, in essence, "give the terrorists a pass."

Clapper warned Monday that the group has clandestine cells that are plotting more terrorist attacks in Germany, Italy, and England.

To this end, the United States is stepping up efforts to promote more intelligence sharing. In the meantime, since the recent IS attacks on Paris and Brussels, US intelligence officials have learned some things about the terrorist group, he said.

For starters, they are "very op-sec conscious," Clapper said. A former Air Force lieutenant general, he was using military parlance for "operational security."

It is clear that IS is also taking advantage of the migrant crisis in Europe, he added.

And that poses a formidable challenge for Europe. There is a "fundamental conflict" between European Union incentives and drives to promote openness and free movement of people and goods with privacy, "which is in some ways in conflict with the responsibilities that each country has as a nation-state to protect the borders and securities of their nations and peoples," Clapper said.

Times of Israel
The programming school that keeps the IDF running
Tuesday, 26 April 2016
Byline: David Shamah

Jerusalem - You can't shake a stick in Israel's technology scene without hitting a graduate of the IDF's famous Unit 8200, which has produced CEOs and CTOs of some of the world's most successful tech and cyber-security firms. All of those soldiers passed through the IDF Computing and Cyber Defense Academy, which runs dozens of courses for the many tech needs of the modern Israeli army.
"The Israeli army faces challenges large and small, from the sakin to the gar'in" -- threats ranging from stabbing attacks to nuclear weapons, according to Major Dor Cohen, head of the programming section of the Academy.

There is today one common denominator that powers all of the army's defensive efforts, he said. "It's fair to say that technology is the basic building block of any defense effort these days, large or small," said Cohen.

"Programming, cyber-defense tactics, app development, and other technology are the backbone of all parts of the IDF today, from systems like Iron Dome and David's Sling that defend against missile attacks to programs that can quickly issue deployment orders and ensure that soldiers and reservists get where they need to be quickly to ensuring that supplies, parts, personnel, and everything else arrives where it is supposed to. I'm proud to say that the academy is ground zero for the training of the personnel needed to master the technology to do this."

Part of the C4i Computer Services Directorate, the academy hosts dozens of courses at its campus, including, for example, Shahar, the tech-oriented "little brother" of the much more well-known Nahal Hareidi program, which deploys ultra-Orthodox soldiers in the field, on patrols and in combat duty.

The Programming division teaches students basic and advanced knowledge in computer languages, app development, cyber-security, firewalls, hacking projects - anything needed to navigate the world of programming and networks, with the objective to quickly, neatly, and effectively deploy systems that help protect Israel.

Speed of response is one of the important skills taught, said Cohen. "We learned this all too well in 2014's Operation Protective Edge, when things changed minute to minute. In most organizations you have levels of administration and approval that require supervisors to sign off on projects, and the process could take weeks. Cyber-threats and other matters came up throughout the war, and we needed to respond within hours."

In addition, apps are becoming increasingly important in the IDF, said Cohen. "Everyone today carries around in their pocket a super-sophisticated computer that can be used to provide directions, information, warnings, and other vital information. There is no reason not to use these devices and their capabilities in defending Israelis. Of course, the apps and the system have to be secure."

In February, the Academy sponsored a hackathon in which hundreds of soldiers developed apps and technologies that could respond to the issues faced by soldiers in the field. "Our courses teach programmers to develop apps using secure technologies the IDF has developed," said Cohen. "There is a great demand throughout the various forces for these apps, and we get many requests for solutions using these devices."

One of the greatest challenges Cohen faces is finding the personnel to fill the growing number of programming jobs throughout the IDF. "As everyone knows, there are not enough kids studying math and science in high schools, and we are part of the effort to encourage more students to take on those subjects," said Cohen. "But we don't strictly rely on the educational system to produce the candidates

we need. We review the records of IDF recruits and check their aptitudes, and if we find a likely candidate we lobby them to join our program."

According to Cohen, his program can take recruits who know almost nothing about computers or programming and turn them into programmers with very good to excellent skills.

Of course, a lot of hard work goes into creating programmers "from scratch" - both on the part of the candidates themselves and on the part of Cohen's staff. Fortunately, they are up to the task, he said.

"Many of the teachers in the program are themselves graduates, very highly motivated - enough to remain in the army and to help develop the new generation of programmers instead of going into private enterprise."

And although many highly motivated young Israelis prefer service in combat units, there's plenty of action - and prestige - in the army's programming and cyber units, said Cohen. "Our soldiers don't fight in the field in the same way Golani and Givati unit soldiers fight, but they are engaged in extremely important defense projects.Tech is now the basis of warfare. Without our people, the army cannot move an inch."

Fox News
Did anti-Israel bias keep France from getting terror tech before Paris attacks?
Tuesday, 26 April 2016
Byline: Hollie McKay

Washington - Shortly after the Charlie Hebdo attack in Paris, and nearly a year before terrorists killed 130 in coordinated strikes that rocked the City of Light, French security officials rejected an Israeli company's offer of terrorist-tracking software that could have helped them flag the deadly terror cell, a security expert said.
The offer of data- mining technology that would allow French authorities to "connect all the dots" in the Islamist extremist community was made to the Directorate- General for Internal Security, France's main intelligence agency. It is used to analyze and match up fragmented intelligence reports from several national and international databases, giving counter-terrorism agents the most up-to-date information on potential terrorists available.

The overture was rejected.

"French authorities liked it, but the official came back and said there was a higher-level instruction not to buy Israeli technology," a well-placed Israeli counter-terror specialist familiar with the technology and the company behind it told FoxNews.com. "The discussion just stopped."

The Israeli source declined to name the company or detail the technology, which has been shared with the U.S. and other nations on good terms with Israel, other than to say it scans databases from multiple agencies and Interpol and pinpoints "high-risk" people. But he believes it could have given French authorities a chance at stopping the Nov. 13, 2015, attacks in Paris, and possibly the coordinated bombings in Brussels that killed 32 on March 22.

"Government agencies struggling to foil terror attacks need access to technologies that allow them to connect their data fragments, making it possible to handle daily data challenges," the source said. "With this system, all data can then be easily navigated, processed and represented by employing a set of powerful analytic tools and unique algorithms."

The offer followed Israeli Prime Minister Benjamin Netanyahu's pledge to work closely with Europe on enhancing security in the wake of the Brussels attacks, taken in Israel as a call for intelligence and technology sharing.

"In Paris or Brussels or San Bernardino or Tel Aviv or Jerusalem, terror must be condemned equally and it must be fought equally," Netanyahu said. "Israel stands ready to cooperate with all the nations in this great struggle."

No official reason was given for France's rejection of the offer, and the source acknowledged it could have been triggered by legitimate concerns about hacking vulnerability. Yet many suspect politics was to blame.

"The European Union has blamed Israel for everything that is happening in the Middle East and stopped cooperation in regards to military, law enforcement and intelligence training and banning university cooperation which [generates] much of the technology to fight terrorism," said Itamar Gelbman, a former IDF Special Forces and who is now a counter-terrorism consultant.

DGSI did not respond to requests for comment and a European Union official told FoxNews.com that there is no formal French, or wider EU ban, on purchasing technology products made in Israel. However, tensions between the European Union and Israel have heightened in recent years, primarily over claims the Jewish State illegally occupies Palestinian territories.

The Israeli-Palestinian conflict has long divided the international community. Human rights groups routinely condemn Israel for repressing and harshly retaliating against Palestinian aggression, while Israel remains staunch that it acts in self-defense and to protect its people.

Kamal Nawash, an American attorney and president of the Free Muslims Coalition, noted that Europe's tough stance against Israel and hesitation in making technology purchases is an "example of the global community sending a message to Israel that its treatment of the Palestinians is unacceptable."

"Israel would be wise to change its treatment of Palestinians by providing them with civil and human rights and pursuing a desegregation policy in general," Nawash said. "Otherwise, Israel may experience the same fate as South Africa during the apartheid era with all the countries of the world boycotting Israel."

The recent spate of terror attacks on European soil could bring about a resurgence in investment with Israeli tech and intelligence companies, given its undisputed status as a global leader in the field.

"Israel has been facing terror threats since its inception in 1948," said Gilles Perez, manager of HLS & Aerospace Unit at the Israel Export Institute. "In the 1970s, it was Israel's national airline that pioneered the concept of an undercover security officer on every commercial flight long before it was adopted by other countries after September 11, almost 40 years later."

Security at airports, such as Zaventem Airport in Brussels, where last month's bombing occurred, has long been an area of Israeli expertise. But intelligence, such as the system offered to French officials, could be even more crucial, said Col. Eran Lerman, former deputy chief of Israel's National Security Council and senior IDF Military Intelligence division director.

"However, the key to successful security has to be intelligence, in the broader sense of the word," Lerman told Homeland Security Today. "For too many years, for very good reasons, Europeans have neglected the need for effective intelligence measures."

Israel-based security training expert Daniel Sharon said that since the Brussels attacks last month there has been particular interest in airport and aviation security prevention concepts, interest that transcends popular protest.

"The goods are boycotted in European supermarkets," Sharon said. "But when they are in trouble they run to Israel for help."

Less than a week after the attacks in Brussels, Belgian law enforcement bought advanced surveillance and rapid view technology from Israeli company BriefCam. The technology is already in use at the Statue of Liberty and various U.S. airports, said President and CEO Dror Irani.

Israel's tech and security sector has long been an incubator for anti-terror solutions, say experts. The more France and Europe in general are threatened, the more willing they may be to work with companies based in the Jewish state.

"Israel is leading the field in counter-terrorism technology, but it's not a popular country," said Ari Zoldan, CEO of technology and e-commerce firm Quantum Network. "It is unlikely that Israel will suddenly become popular, but the need for better national security will force people to work with Israeli solutions."

Reuters

Bangladesh Bank hackers compromised SWIFT software, warning to be issued

Tuesday, 26 April 2016

Dhaka - The attackers who stole $81 million from the Bangladesh central bank probably hacked into software from the SWIFT financial platform that is at the heart of the global financial system, said security researchers at British defense contractor BAE Systems.
SWIFT, a cooperative owned by 3,000 financial institutions, confirmed to Reuters that it was aware of malware targeting its client software. Its spokeswoman Natasha Deteran said SWIFT would release on Monday a software update to thwart the malware, along with a special warning for financial institutions to scrutinize their security procedures.

The new developments now coming to light in the unprecedented cyber-heist suggest that an essential lynchpin of the global financial system could be more vulnerable than previously understood to hacking attacks, due to the vulnerabilities that enabled attackers to modify SWIFT's client software.

Deteran told Reuters on Sunday that it was issuing the software update "to assist customers in enhancing their security and to spot inconsistencies in their local database records."

The software update and warning from Brussels-based SWIFT, or the Society for Worldwide Interbank Financial Telecommunication, come after researchers at BAE, which has a large cyber-security business, told Reuters they believe they discovered malware that the Bangladesh Bank attackers used to manipulate SWIFT client software known as Alliance Access.

BAE said it plans to go public on Monday with a blog post about its findings concerning the malware, which the thieves used to cover their tracks and delay discovery of the heist.

The cyber criminals tried to make fraudulent transfers totaling $951 million from the Bangladesh central bank's account at the Federal Reserve Bank of New York in February.

Most of the payments were blocked, but $81 million was routed to accounts in the Philippines and diverted to casinos there. Most of those funds remain missing.

Investigators probing the heist had previously said the still-unidentified hackers had broken into Bangladesh Bank computers and taken control of credentials that were used to log into the SWIFT system. But the BAE research shows that the SWIFT software on the bank computers was probably compromised in order to erase records of illicit transfers.

Deteran reiterated on Sunday that "the malware has no impact on SWIFT's network or core messaging services."

The SWIFT messaging platform is used by 11,000 banks and other institutions around the world, though only some use the Alliance Access software, Deteran said.

SWIFT may release additional updates as it learns more about the attack in Bangladesh and other potential threats, Deteran said. SWIFT is also reiterating a warning to banks that they should review internal security.

"Whilst we keep all our interface products under continual review and recommend that other vendors do the same, the key defense against such attack scenarios is that users implement appropriate security measures in their local environments to safeguard their systems," Deteran said.

Adrian Nish, BAE's head of threat intelligence, said he had never seen such an elaborate scheme from criminal hackers.

"I can't think of a case where we have seen a criminal go to the level of effort to customize it for the environment they were operating in," he said. "I guess it was the realization that the potential payoff made that effort worthwhile."

A Bangladesh Bank spokesman declined comment on BAE's findings. A senior official with the Bangladesh Police's Criminal Investigation Department said that investigators had not found the specific malware described by BAE, but that forensics experts had not finished their probe.

Bangladesh police investigators said last week that the bank's computer security measures were seriously deficient, lacking even basic precautions like firewalls and relying on used, $10 switches in its local networks.

Still, police investigators told Reuters in an interview that both the bank and SWIFT should take the blame for the problems.

"It was their responsibility to point it out but we haven't found any evidence that they advised before the heist," said Mohammad Shah Alam, head of the Forensic Training Institute of the Bangladesh police's criminal investigation department, referring to SWIFT.

The BAE alert to be published on Monday includes some technical indicators that the firm said it hopes banks could use to thwart similar attacks. Those indicators include the IP address of a server in Egypt the attackers used to monitor use of the SWIFT system by Bangladesh Bank staff.

The malware, named evtdiag.exe, was designed to hide the hacker's tracks by changing information on a SWIFT database at Bangladesh Bank that tracks information about transfer requests, according to BAE.

BAE said that evtdiag.exe was likely part of a broader attack toolkit that was installed after the attackers obtained administrator credentials. It is still not clear exactly how the hackers ordered the money transfers.

Nish said that BAE found evtdiag.exe on a malware repository and had not directly analyzed the infected servers. Such repositories collect millions of new samples a day from researchers, businesses, government agencies and members of the public who upload files to see if they are recognized as malicious and help thwart future attacks.

Nish said he was highly confident the malware was used in the attack because it was compiled close to the date of the heist, contained detailed information about the bank's operations and was uploaded from Bangladesh.

While that malware was specifically written to attack Bangladesh Bank, "the general tools, techniques and procedures used in the attack may allow the gang to strike again," according to a draft of the warning that BAE shared with Reuters.

The malware was designed to make a slight change to code of the Access Alliance software installed at Bangladesh Bank, giving attackers the ability to modify a database that logged the bank's activity over the SWIFT network, Nish said.

Once it had established a foothold, the malware could delete records of outgoing transfer requests altogether from the database and also intercept incoming messages confirming transfers ordered by the hackers, Nish said.

It was able to then manipulate account balances on logs to prevent the heist from being discovered until after the funds had been laundered.

It also manipulated a printer that produced hard copies of transfer requests so that the bank would not identify the attack through those printouts, he said.

Globe and Mail
Disclosure issues linger over police surveillance techniques
Tuesday, 26 April 2016
Byline: Colin Freeze

Canadian detectives cannot keep secret their advanced spying devices or their relationships with telecommunications corporations because claims of police privilege carry little or no weight in criminal courts.
So ruled Quebec Superior Court Justice Michael Stober as he ordered several modern police surveillance techniques disclosed to lawyers representing six accused mobsters in Montreal.

Finding that police arguments for secrecy rely at times upon "selfserving and weak" legal logic, his decisions have laid bare RCMP tactics.

From the Stober disclosure rulings flowed the recent revelation that the Mounties use a device that mimics a cellphone tower.

The fact that Canadian federal agents also have access to a version of a virtual skeleton key, one that can crack coded BlackBerry communications, has also been exposed.

Police had fought for years to protect such methods from becoming broadly known, until a cat-and-mouse criminal case pitting the RCMP against the Montreal six forced Justice Stober to consider 21st-century techniques.

A publication ban was imposed on his rulings about pretrial disclosure when they were issued last fall, but redacted versions were filed in a higher court this spring. On March 30, the Quebec Court of Appeal in Montreal was to revisit the Stober decisions.

But on the morning that matter was to be heard, the Crown lawyers who appealed the rulings walked away from the underlying first- degree-murder case.

Across town in Laval, the six people arrested in 2011 were acquitted of that charge and pleaded guilty to the lesser charge of conspiracy to murder.

That outcome freed the Crown of its obligation to make increasingly uncomfortable amounts of disclosure and left the appellate judges with no case to consider.

Court decision or no court decision, however, important disclosure issues remain for police, lawyers and judges across Canada.

Here's the question: If police want to borrow from the playbooks of modern spies and advance their investigations with secret surveillance techniques or the help of telecommunications corporations, can they prevent those methods from being revealed during prosecutions?

The court of Justice Stober, which has had a unique exposure to those issues, ruled that the answer is a resounding no. "The interests of the accused in having a fair trial where the accused is able to make full answer and defence outweighs the public interest in protecting police-investigative techniques," he ruled.

The case was extraordinary in several ways. The judge heard police pleas for secrecy in several closed pretrial proceedings from which the accused and their defence lawyers were barred. To balance the scales, the court took the extraordinary step of allowing Toronto lawyer Anil Kapoor, who has national-security clearance, to make arguments on the defence's behalf.

What emerged as a result of these hearings is that, while police in Canada may have plenty of protections to keep human informants anonymous, they have no analogous legal safeguards for surveillance technology or corporate relationships.

Yet, federal agents remain loath to reveal their techniques because they feel they are in an arms race with savvy adversaries.

In the Montreal case, each suspect had multiple unregistered BlackBerrys, and they talked to each other through the company's proprietary encoded "PINto-PIN" texts. Detectives within the RCMP's technological units saw a murder conspiracy take shape in those messages, but it came into focus only through painstaking work.

First, the Mounties had to use a portable cellphone-tower simulator (often known as a "IMSI catcher") to draw data that revealed which handsets in a certain area were controlled by the suspects.

Then, police served assistance orders on BlackBerry directing the Waterloo company to help facilitate interception of the suspects' messages - which were cracked with a version of the company's "global encryption key" that RCMP had somehow acquired.

In more mundane crimes, defence lawyers challenge the accuracy of police breathalyzers and radar guns. In the case at hand, lawyers Frank Addario and Mike Lacy pushed for increasing amounts of detail about police techniques. At one point, they even persuaded Justice Stober to order police to hand over their version of the BlackBerry key so that the defence lawyers for the accused could test it.

Prosecutors and police pushed back hard on that front, saying that would be like letting go of a skeleton key that could open tens of millions of houses. A BlackBerry executive swore a last-minute affidavit saying such a move could undermine customers' trust. In the end, Justice Stober withheld the key, even as he ordered other surveillance techniques disclosed.

At one point, an RCMP inspector testified that a degree of secrecy is needed because being seen to help police is "not good marketing" for tech companies. But Justice Stober characterized such arguments as "weak and self-serving." As a Canadian judge, he said, he had no legal basis to consider any "adverse impact on [Blackberry's] business interests."

The bottom line for the Crown was that Justice Stober's disclosure orders could yield "a new and thorough body of information that would educate the criminal element," or even provide it with "a user guide on how to circumvent a level of secrecy the State is entitled to protect." This, at least, is what the Crown appeal had put forward, until the surprise plea arrangement between the Crown and defence scuttled the hearing.

The Australian
Cybersphere globe's new battlefront
Tuesday, 26 April 2016
Byline: Alan Dupont
Section: oped

If the ambitious goals of Malcolm Turnbull's just released cyber security strategy are achieved, the document could turn out to be the most important and innovative government strategy yet written. Its great strength is that it provides a clear plan for harnessing Australia's transitioning economy to the enabling technology of the internet, while recognising that a secure cyber space is critical to exploiting the benefits of the digital age and to protecting our interests online.

Turnbull's aim is to make Australia a cyber smart nation. This is a formidable undertaking requiring sustained investment in cyber architecture and intellectual capital, major cultural change and a genuine cyber partnership between government, business and the wider community that has yet to materialise.

His starting point is that the internet is the most transformational technological development in human history and therefore central to Australia's future prosperity and security. It's hard to argue with this proposition. Australia is already a wired economy. Nearly 90 per cent of Australians are online, including 84 per cent of small and medium businesses. The internet-based economy contributed $79 billion, or 5.1 per cent of GDP, in 2014 which could grow to $139bn, or 7.3 per cent of GDP, by 2020. By 2019, the average Australian household will have 24 devices connected online.

But it's not just humans who are connecting to the internet. Machines are, too, in ever increasing numbers. Cars, fridges, power plants -- just about every device we use has the capacity to communicate autonomously with other machines. By 2020, the government estimates there may be 50 billion devices connected to the internet globally. Cybersecurity pioneer John McAfee believes the figure is likely to be 212 billion. The Internet of Things is increasingly the Internet of Everything.

Australia has been slow off the mark to understand and capitalise on the enormous economic -potential of this cyber revolution. We have too few cyber entrepreneurs; business still regards cyber security as a technological, rather than a strategic issue; and there is an educational and vocational mismatch between what the digital economy needs and what our schools and universities provide. We are a long way from being a cyber smart nation.

By contrast, a small country like Israel has embraced the cyber revolution, attracting 20 per cent of global private sector investment in the burgeoning cyber security industry and joining the US, Russia, China and Britain as an emerging cyber power. Israel is nurturing a new generation of cyber-literate young people in its universities and schools, right down to primary school level.

The good news is that the cyber security strategy puts Australia on a path to addressing our digital deficiencies by fostering a new network of cyber research and innovation.

At its hub will be a cyber security growth centre that will define and prioritise cyber challenges. Cyber security centres of excellence in universities will be established to help address the serious shortage of cyber security professionals. They will be linked to previous STEM initiatives designed to boost our dwindling stocks of scientists, technologists, engineers and mathematicians.

However, these commendable steps and the accompanying four-year commitment of $230 million are insufficient to realise Turnbull's vision, which requires nothing less than a cradle-to-grave investment of a kind rarely seen in Australia, starting with primary school education. Cyber literacy has to become an intuitive and foundational skill for all Australians.

A second impediment to realising the full potential of the internet is malicious cyber attacks, which have grown exponentially in number and sophistication over the past decade.

An estimated one million Australians were victims of online identity fraud in 2014 and cyber crime may be costing the economy as much as $17bn annually. One in three Australian businesses have experienced some form of cyber crime.

Professional services firm Deloitte ranks Australia as one of the five most vulnerable economies to cyber attacks in the Asia Pacific region.

The loss of intellectual property and state secrets in electronic smash and grab burglaries is an even more serious issue, because they are the crown jewels that determine a country's competitive position and capacity to defend -itself. Malicious actors inhabit the cyber world's dark side and include criminals, terrorists, spies and hostile states. They undermine trust in the reliability and security of the internet. So improving our cyber defences and sensitising Australians to the risk is central to the strategy's success.

The core problem is finding the right balance between protecting users through better security and regulation, and maintaining an open and free system. In Turnbull's words, "we must ensure that the

administration of the internet continues to be governed by those who use it -- not dominated by governments. Equally, cyberspace cannot be allowed to become a lawless domain".

Unfortunately, there are daily reminders that the bad guys are winning. These headlines, taken from a representative selection of international news stories, give a sense of what a lawless internet could mean. "Two teenage hackers crack Brinks smart safe in less than 30 minutes"; "Pirates hack into shipping company servers to identify booty"; "Islamic State brainwashes youth online"; "Electricity grid at risk, says spy boss".

Despite the increasing coverage of dark side stories, most Australians do not see cyber threats as first order security issues because of the reluctance of governments, and business, to openly discuss the challenge.

Governments worry about revealing sensitive intelligence methods. Companies fear a loss of reputation, or business to competitors in publicly revealing the loss of IP, personal data or money, from a successful hack.

Another reason, according to Alastair MacGibbon, Turnbull's new special adviser on cyber security, is that "we seem to think that cyber attacks have no offline or kinetic effects", unlike a highly visible and obviously destructive terrorist bomb, conventional war or natural disaster. Not being able to see the perpetrator, or vicariously share the anguish of victims, diminishes the emotional impact of a cyber attack.

Regrettably, cyber wars with real kinetic effects are already a reality since it is possible to destroy a power generator with only 21 lines of malicious code, as Russian hackers demonstrated in December, last year, with a devastating attack on Ukraine that left 230,000 Ukrainians in the dark and was the first confirmed hack to take down a power grid.

In championing the virtues of an open, free but secure internet network the national security strategy has struck the right balance between advancing and protecting our economic and security interests in the digital age. But the jury is still out on the ultimate measure of success -- the creation of a dynamic digital economy supported by a resilient cyber network.

Alan Dupont is adjunct professor of international security at the University of NSW and a non-resident fellow at the Lowy Institute.

Tech City News (UK)
Tech: A double-edged sword for national security
Tuesday, 26 April 2016
Byline: Emily Spavin

London - "I remember my first day at Mi6. I thought it was probably going to be nothing like the James Bond books and films. 'It'll just be a desk job', I told myself. I was wrong."
Matthew Dunn now lives in Gloucestershire and writes spy novels for a living - an interesting enough way to earn a crust, but his previous career is much more fascinating.

He served as a British intelligence officer and Mi6 field officer, taking part in around 70 missions that saw him travel the world, moving undercover from one hostile environment to another.

"I was tasked with targeting senior echelons, people who had access to secrets in rogue states that offered significant threats in terms of things like regional conflicts, nuclear conflicts and hostile threats against the West in the guise of intelligence attacks or military attacks," Dunn explained.

He used his training in all aspects of intelligence collection and direct action, including explosives, military unarmed combat, surveillance, advanced driving, infiltration techniques and covert communications, with one particular mission earning him a rare personal commendation from the Secretary of State for Foreign and Commonwealth Affairs.

Gadgetry

As for the role technology played in Dunn's Mi6 career, he explained James Bond-esque gadgetry did exist to some capacity, but not quite to the extent it plays in the Hollywood films.

"Mi6 does have a whole department totally devoted to creating weird and wacky gadgets and other technical equipment. It is actually called the Q department, but I still don't know whether Q in James Bond or Q in Mi6 came first."

Dunn said he was provided with technology such as recording briefcases, surveillance equipment and special weaponry, but explained it was something of a running joke due to its temperamental nature: "The gadgets all worked absolutely perfectly when tested in the head office, but it was often a different story when you tried to use them overseas."

"I'm sure things have come a long way since then, though," he conceded.

The internet has dramatically changed the way the Secret Intelligence Service operates and

the threats faced by the service have certainly developed and mutated, meaning nerds at laptops now often do work previously carried out by men with guns and sharp suits.

In the words of Q in the James Bond epic SkyFall: "I'll hazard I can do more damage on my laptop sitting in my pyjamas before my first cup of Earl Grey than you can do in a year in the field."

Internet

Technology is becoming ever more vital in the protection of national security, particularly within the sphere of counter terrorism. Tech enabled the government to prevent at least seven potentially deadly attacks in the UK last year, however, much more needs to be done to limit the freedom terrorists have in using these same tools to further their plights, promote propaganda and recruit new members.

This January, Baroness Shields, the Minister for Internet Safety, delivered a speech on challenging online extremism. She said the internet is becoming an "echo chamber of hate, fear mongering and intolerance", with terrorist groups like Isis/Daesh being quick to realise and exploit the power of the web. They are running modern and effective global brand marketing campaigns thanks to the borderless and boundary-free nature of social platforms.

"Unlike in the physical world where national governments can take clear and firm actions to keep people safe; there are no such obvious solutions available in the virtual world," she said.

In 2015, the UK's Counter Terrorism Internet Referral unit worked with industry players to remove over 55,000 pieces of terrorist and extremist content. Also last year, YouTube removed 14 million videos in just one instance and, since the middle of 2015, Twitter suspended over 125,000 accounts for threatening or promoting terrorist acts, primarily related to Daesh.

While this is all very positive, it's worth bearing in mind an average of 200,000 Daesh-supporting messages are posted every day on Twitter alone.

Communication

Social media aside, the way in which terrorists communicate has changed significantly, particularly over the past three years. In June 2014, NSA director US Navy Admiral Michael S Rogers said whistleblower Edward Snowden's revelation of government surveillance techniques had lead to some terrorist groups altering their methods of communication.

Among Snowden's revelations was information that the NSA was secretly tapping into Yahoo and Google data centers to collect data from hundreds of millions of account holders across the globe. He also revealed the UK's Government Communications Headquarters (GCHQ) had spied on users of Second Life, Xbox Live and World of Warcraft, and planned to infect millions of computers with malware using a program called Turbine.

While some lauded Snowden a hero, others labelled him a traitor and said revealing government collections partners tipped off terrorists and enabled them to drop those carriers and email addresses. Many have since switched to alternative platforms with encryption.

Last September, head of MI5 Andrew Parker explained that developments in encryption are making Mi5's job harder. Parker told the BBC that encrypted communication services are outpacing the laws required to govern access to data: "Shifts in technology, particularly internet technology, and the use of encryption and so on are creating a situation where law enforcement agencies and security agencies can no longer obtain, under proper legal warrant, the content of communications between people they have reason to believe are terrorists."

Privacy vs protection

Tech giants now, more than ever, have governments knocking on their doors, demanding access to records of users' communications. Thus these companies face, on a daily basis, the struggle of creating a suitable balance between privacy and protection.

In the first six months of 2010, Google received almost 15,000 government requests for user data. By 2014, that number had risen to just under 35,000. The tech giant provided information in over 65% of these cases, but is adamant it will not give in to all government demands.

"The solution, we believe, lies in a principled yet practical approach: one that restricts indiscriminate surveillance and supports valid law enforcement efforts while also protecting people's privacy and security," said Rachel Whetstone, former senior vice president of communications and public policy at Google.

In the UK specifically, parliament is scrutinising the Draft Investigatory Powers Bill - the largest overhaul for 15 years of laws surrounding surveillance. It wants to provide new powers to security services, enabling them to collect tens of thousands of personal records online without ministerial authorisation or oversight.

The Intelligence and Security Committee recently published a report labelling parts of the Bill "inconsistent and largely incomprehensible" and said it lacks clarity on fundamental issues, such as encryption and equipment interference.

Counter-extremism

Whatever the eventual reach of the Bill, is severe surveillance really the answer? Perhaps what is required to boost national security is a bigger drive to turn potential terrorist converts away from the darkened path they're being led down.

Jonathan Russell is head of policy at counter-extremism think tank Quilliam and his organisation focuses on spreading a counter narrative to that proffered by terrorists.

"Counter-extremism has existed for about a decade offline, but in the last three or four years, we have had to shift our focus online," he explained.

Russell said Quilliam's research into how extremists exploit people online has found they "create echo chambers for themselves". They use platforms like Facebook and Twitter, firstly because of the sheer volume of people using those services, but also because the algorithms in use mean they can focus their message without being interrupted by counter-arguments.

"YouTube is the clearest example of that," he said. Watch a Miley Cyrus video, then you'll be presented with related content - another Miley Cyrus video or something similar.

"Exactly the same is true for extremists, except that's worrying because you can just get pushed further and further down a rabbit hole and turn around after an hour or two and have only heard one point of view," explained Russell.

The extremists don't necessarily say anything on social media platforms that promotes violence, because they know that would be taken down, instead they stoke the victimhood narrative, driving opposition to the establishment and painting an overarching picture that the West is at war with Islam.

Most of the messages they produce are about utopia, not brutality, as brutality turns many people off, said Russell.

"They're essentially selling a dream," he added, "and it's up to us to come up with alternative messages and sell a different dream."

Russell stressed that, while Daesh may look like a "medieval death cult", they're using 21st century tools in their plight, so the response needs to be in line with this - they need to be dealt with as if they're a modern brand - a corporation.

"The tools we have available to us with which to respond are not national security tools, they're not related to surveillance, most of them are from the strategic communications and marketing worlds."

Russell said the social media giants have been very good at working with Quilliam and other groups to set up networks and give people in communities the skills to spread counter-extremism messages themselves.

What he'd really like to see, though, is the government doing more to support this kind of approach and for private companies to see this work as part of their corporate and social responsibilities.

"This is the answer, not surveillance. We need to win the war of words and work together to fight the great evil of our time," he concluded.

Vital role

Whatever the specifics, tech has undoubtedly played a vital role in national security over, at least, the past 70 years, and as technology develops, the more integral it becomes.

On a daily basis, it helps the government intercept threats and protect its citizens, but conversely, it enables terrorists to communicate, enemies to intercept confidential information and extremists to recruit.

The war on terror is nowhere near over and both threats and counterterrorism practices will continue to evolve. We now have to rely on the masses, the smartest and the most talented to join the right side of the battle.

NBC News
Ransomware Hackers Blackmail U.S. Police Departments
Tuesday, 26 April 2016
Byline: Chris Francescani

New York - Cyber criminals who have forced U.S. hospitals, schools and cities to pay hundreds of millions in blackmail or see their computer files destroyed are now targeting the unlikeliest group of victims -- local police departments.
Eastern European hackers are hitting law enforcement agencies nationwide with so-called "ransomware" viruses that seize control of a computer system's files and encrypt them. The hackers then hold the files hostage if the victims don't pay a ransom online with untraceable digital currency known as Bitcoins. They try to maximize panic with the elements of a real-life hostage crisis, including ransom notes and countdown clocks.

If a ransom is paid, the victim gets an emailed "decryption key" that unlocks the system. If the victim won't pay, the hackers threaten to delete the files, which they did last year to departments in Alabama and New Hampshire. That means evidence from open cases could be lost or altered, and violent criminals could go free.

Since 2013, hackers have hit departments in at least seven states. Last year, five police and sheriff's departments in Maine were locked out of their records management systems by hackers demanding ransoms.

Ransomware crimes on all U.S. targets are soaring. In just the first three months of 2016, attacks increased tenfold over the total entire previous year, costing victims more than $200 million. Authorities stress that this number only represents known attacks. One federal law enforcement official told NBC News that the "large majority" of attacks go unreported.

The viruses - most of which come from Russia and Eastern Europe -- are typically so impenetrable that even FBI agents have at times advised victims to just pay up and get their data back.

Police computers, however, are especially vulnerable to ransomware, because many small departments have ancient systems.

One chief acknowledged to NBC News that when his department's computers were attacked last year, they were running on DOS, an outdated disc-operating system that dates back to the early 1980s.

"Think about it," said Robert Siciliano, an online safety expert for Intel Security. "You have local law enforcement [which is] provided grants for all kinds of advanced technologies that often revolve around weaponry, but then when it comes to upgrading their desktops laptops -- they may not be up to speed."

Said Siciliano, "It's not unheard of to see a Windows XP or Vista still in action in a law enforcement environment."

'We Are Cops. We Generally Don't Pay Ransoms'

An attack commonly begins when a person opens a piece of malware disguised as a recognizable, sometime personalized e-mail attachment. Once opened, it freezes data block by block until everything is locked.

Then, a ticking countdown clock will often appear on a victim's screen, experts said, with a ransom demand and deadline. Hackers nearly always demand Bitcoins.

Some digital ransom notes include user-friendly instructions on how to buy Bitcoins online, and direct targets to websites that broker anonymous, peer- to-peer financial exchanges.

The attacks are increasingly forcing police chiefs into frustrated deliberations over whether or not -- against all their training and instincts -- to reward extortionists whose identity they may never know.

"My initial reaction was 'No way!" said Sheriff Todd Brackett of Lincoln County, Maine, whose system was frozen last spring. After "48 long hours," Brackett reluctantly paid.

"We are cops," he said with a sigh. "We generally don't pay ransoms."

Last year, the police chief in Durham, New Hampshire, refused to pay, and his files were deleted. He was able to recover most of them from a backup system.

When the Collinsville, Alabama, police department was hit in 2014, the chief refused to pay. He never saw the files again.

What makes the ransoms so maddeningly tempting for cops to pay is that most attacks that have disabled police department computers have sought just a few hundred dollars.

"It's much easier to ask for smaller amounts that you are actually going to get," said Alabama criminal justice professor Diana Dolliver.

Local law enforcement agencies' computer systems can contain plenty of vital -- sometimes even deeply personal -- information, ranging from rape and other violent crime reports to 911 call records, case files of ongoing investigations, personnel records and access to law enforcement databases like the National Crime Information Center (NCIC), which contains criminal case information on federal, state and local investigations.

While authorities say they are not aware of attacks on local law enforcement networks that have resulted in compromised evidence, they believe it is only a matter of time.

Business Is Booming

The attacks on U.S. police are an improbable part of what experts describe as a ransomware epidemic. One new study warns that 2016 "is the year ransomware will wreak havoc on America's critical infrastructure community ...'To Pay or Not to Pay,' will be the question fueling heated debate in boardrooms across the nation."

The business of high-tech extortion is growing exponentially. Last year, the FBI received nearly 2,500 ransomware attack complaints that cost victims $24 million. In the first three months of 2016, ransomware attacks cost Americans another $209 million.

Yet security experts and law enforcement officials agree that the actual figures are likely much, much higher.

"There are a lot of other law enforcement agencies out there that have been affected by this...that don't want their names out there," said Jeff McCliss, a Dickson County, Tennessee- -based detective whose department paid a $622 ransom in Bitcoins.

Many known intrusions have focused on health care facilities, school systems and even small cities -- targets with critical infrastructure, limited security and a constant need for access to their records.

In February, California's Hollywood Presbyterian Medical Center paid a ransom of about $17,000 in Bitcoins, one of at least six major health care systems victimized so far this year. Last month, the city of Plainfield, New Jersey, faced a demand for about $700 in Bitcoins to unfreeze their municipal servers.

Federal investigators say that a majority of the attacks are launched by Eastern European cyber gangs, but there have been few high-profile arrests to date because it's so hard to identify and locate the culprits.

And while early versions of ransomware had to be executed individually, by a human, experts said that today's viruses are fully automated. They are commonly disbursed like spam by the thousands, allowing hackers to execute hundreds of shakedowns simultaneously.

Vulnerabilities 'So Easy to Mitigate'

Ransomware viruses have put federal law enforcement officials in a nearly impossible position. In most cases they can't thwart the attack, apprehend the culprit or retrieve the locked data -- and they know from experience that most victims who pay get their files back.

Yet they're all- too-aware that each payout encourages more extortion.

For several years, multiple federal agencies have issued warning after warning to the public and private sectors urging proper "cyber-hygiene" and stressing the simplicity of the fix -- keep your software up to date and your system regularly backed up.

"This is so easy to mitigate," the federal official said.

While the FBI now explicitly advises against paying ransoms, individual agents have been known to nudge victims in that direction.

"To be honest, we often advise people to just pay the ransom," Joseph Bonavolonta, a Boston FBI cyber and counterintelligence specialist, told a security conference last fall. "The ransomware is that good."

Those comments drew headlines in the tech industry press, and prompted a clarifying statement from the FBI.

"The FBI doesn't make recommendations to companies," the agency told Naked Security last October. "[I]nstead the Bureau explains what the options are ... and how it's up to individual companies to decide for themselves the best way to proceed ... either revert to back up systems, contact a security professional, or pay."

Earlier this month, an FBI spokeswoman issued a statement to NBC News which said, in part, that "The FBI does not condone payment of ransom, as payment of extortion monies may encourage continued criminal activity, lead to other victimizations, or be used to facilitate serious crimes."

Bonavolonta could not immediately be reached for comment.

The Department of Homeland Security offers cyber-safety training to state and local governments and conducts "red team" tests on municipal systems to determine how secure they are. The FBI offers similar training in the private sector.

"It's really important for people to know [that] we can help," said Dr. Andy Ozmant, DHS assistant secretary for cybersecurity and communications. "We have a lot of resources available."

Compromised Evidence?

Experts said that ransomware attacks can have a potentially devastating impact on a municipality's criminal justice system.

"A good defense attorney is going to raise a question about whether or not evidence had been tampered with," said Dolliver. "That's the part I've actually been really watching for, but have not seen it come up in court cases."

Lincoln County law enforcement officials brought the same concerns to their local prosecutors, who concluded that none of the recovered data was ever actually breached.

So far at least, legal experts said, most ransomware cases have not necessarily tainted evidence.

"If the computer is simply held hostage but there is no evidence that any files have been altered, there will be no problem," said Steven Saltzburg, a George Washington University law professor who co-authored the 2013 Federal Criminal Procedures Litigation Manual. "If there is evidence that files have been altered, that is a problem."

'Last Laugh'

The ransomware attacks on U.S. police have left more than a few chiefs privately fuming, including Sheriff Brackett.

In a last-ditch bid to strike at least a tiny blow on behalf of U.S. law enforcement against ransomware extortionists, Brackett and his IT team paid the Bitcoin ransom, received the decryption key, cancelled the payment, and unlocked their system.

"We got the last laugh," Brackett thought to himself at the time.

Two days after his bait-and-switch scheme, hackers struck again.

This time the ransom was about $500.

This time Brackett paid and walked away.

The Register (UK)

Hackers so far ahead of defenders it's not even a game
Tuesday, 26 April 2016
Byline: John Leyden

London - Cybercriminals are way ahead of the game against defenders without having to try anything new, according to the latest edition of Verizon's benchmark survey of security breaches.
The study shows that miscreants have no need to switch up, because the same old tactics are still working fine. Security defenders are still performing poorly in their attempts to defend against hacking or malware-based attacks. This isn't for a lack of trying or skills on their part, but almost completely down to the fact that the game is rigged against them.

Verizon's ninth annual Data Breach Investigations Report (DBIR) provides an analysis of over 100,000 security incidents and 3,141 confirmed data breaches last year, drawing on real-world data breach caseloads handled by either Verizon or around 50 other contributing organisations.

Those involved include the US Secret Service, the European Cyber Crime Center (EC3), UK CERT and the Irish Reporting and Information Security Service (IRISS CERT), amongst others.

Hackers are getting faster whilst defenders are treading water. Over 99 per cent of attacks compromise systems within days (four out of five do it within minutes), and two-thirds of those siphon off data within days (a fifth do it in minutes). Whilst there was an improvement in the number of breaches detected in 'days or less' noted in the last DBIR, that turned out to be a temporary blip. This year, less than a quarter of breaches were detected within the same timeframe - meaning attackers have almost always gotten away with the goods before anyone notices.

Worse yet, it's usually not the victim that notices the breach, but a third party (normally either a security researcher or law enforcement).

Nearly two-thirds of all breaches are still traced back to weak or stolen passwords - a basic security failure.

"People are not sitting in front of consoles, looking for SQL Injections before running a manual attack," Dave Ostertag, global investigation manager at Verizon told El Reg. "They are stealing credentials, planting malware, pivoting and exfiltrating data."

Hackers have begun using multiple exfiltration points to avoid detection, Ostertag added.

Phishing lures

Phishing (which "is efficient and works really well," according to Ostertag) remains a huge problem and a major factor in most breaches. The DBIR found that nearly a third of phishing emails get opened, and more than one in ten recipients open the attachments, a significant rise from last year. The main

perpetrators of these attacks are organised crime syndicates, but nearly one in ten can be attributed to a state-affiliated actor. China accounts for more than half of all cyber- espionage attacks by volume last year, according to Ostertag, who nonetheless welcomed the recent US/China no hack pact as a positive development.

Public sector, manufacturing and professional services firms top the hit list of targets for cyber-espionage. Attackers are using phishing scams and pilfered passwords to open up a backdoor onto enterprise networks. This foothold is used to smuggle malware into targeted networks. Corporate networks would be far harder to attack - even with access credentials - in cases where enterprises had applied two-factor authentication. However, failure in this area was yet another security shortcoming identified during Verizon's study.

"Many victims have single- factor access into parts of their network even if they think otherwise," according to Ostertag.

On the cybercrime-for-profit front, ransomware is a problem across the board in manufacturing, the public sector and healthcare, Verizon reports. Cybercrooks, like cyber-spies, often rely on phishing.

"Hackers do their homework using social media like LinkedIn and other sources to know who to target, and what sort of content is likely to be opened," Ostertag explained.

"Cybercrooks are going after people who initiate or manage financial transactions."

Older threats such as phishing, malware and weak passwords predominate in breaches. By contrast, the much- discussed security risks from the Internet of Things and mobile phones barely register in Verizon's breach study.

Wall Street Journal
The Encryption Farce
Tuesday, 26 April 2016
Byline: Editorial Board

Editorial - If history repeats itself first as tragedy and then as farce, what does the FBI have in store next for its encryption war with Apple? After withdrawing its demands in San Bernardino and then reopening hostilities with a drug prosecution in Brooklyn, the G-men abruptly dumped the second case over the weekend too. Is anyone in charge at the Justice Department, or are junior prosecutors running the joint? The FBI claimed for weeks in a California court that it couldn't unlock the iPhone of terrorist Syed Farook unless Apple was compelled to create a new operating system, but then reported at the 11th hour that an unspecified outside party had engineered a solution that didn't require Apple's help. Justice lawyers also insisted the purpose of the litigation wasn't to create a legal precedent, but that such extraordinary commandeering was an exception for "one phone" related to terrorism.

This claim never stood up to scrutiny, given the nationwide profusion of such cases. But the Brooklyn flame-out is especially instructive about the FBI-Justice method without the crutch of invoking the fast-moving terror exigencies or uncovering potential domestic cells.

The iPhone in question was seized when the feds arrested a methamphetamine dealer called Jun Feng in 2014. Feng isn't dead, like Farook; he merely said he couldn't remember his password. Justice waited more than a year to try to force Apple to break the device, and shortly after these proceedings were initiated Feng and his codefendants copped guilty pleas.

Justice said the case wasn't moot because the device's data could yield evidence of other drug trafficking. FBI Director James Comey has suggested that the San Bernardino software exploit is no use on other iPhone models.

Yet while Justice argued in Brooklyn that Apple's help was essential, it also argued the FBI had no obligation to pursue a non-Apple work-around. The remarkable claim was that prosecutors need not exhaust all possible alternatives before conscripting a private company, such as consulting with other U.S. agencies, hiring an outside digital forensics outfit or even interrogating Feng again.

Such assertions were as false in Brooklyn as in San Bernardino. Two hours and a half before a deadline on Friday night, the government withdrew the case after "an individual provided the passcode to the iPhone," according to legal filings. This second immaculate conception in as many months further undermines the FBI's credibility about its technological capabilities. Judges ought to exercise far more scrutiny in future decryption cases even as Mr. Comey continues to pose as helpless.

The FBI Director recently said at Kenyon College that the end of the San Bernardino affair was "a very good thing," because "litigation is a terrible place to have any discussion about a complicated policy issue, especially one that touches on our values, on the things we care about most, on technology, on trade-offs, and balance." He added that "it will be bad thing if the conversation ended."

Yet forgive us if this "conversation" now seems more like a Jim Comey monologue. The debate might start to be productive if the FBI Director would stop trying to use the courts as an ad hoc policy tool and promised not to bring any more cases like the one in Brooklyn.

Meanwhile, the White House has taken the profile- in-courage stand of refusing to endorse or oppose any encryption bill that Congress may propose. If the Obama team won't start adjusting to the technological realities of strong and legal encryption, they could at least exercise some adult supervision at Main Justice.

New York Times
Obama Stresses Data in Terrorism Fight

Tuesday, 26 April 2016
Byline: Mark Scott

Berlin - The trans-Atlantic debate over digital privacy rights versus the surveillance needs of intelligence agencies was put under a spotlight on Monday, as President Obama called for continued access by law enforcement officials to thwart terrorism, while some European privacy advocates urged greater restraint.
"I want to say this to young people who value their privacy and spend a lot of time on their phones: The threat of terrorism is real," Mr. Obama said, speaking at a trade show in Hanover, Germany.

"I've worked to reform our surveillance programs to ensure that they're consistent with the rule of law and upholding our values, like privacy -- and, by the way, we include the privacy of people outside of the United States," he added.

Mr. Obama's message comes at a sensitive time, as cities like Brussels and Paris are still recovering from recent terrorist attacks. But his words are unlikely to slow down European efforts to expand people's control over their digital lives.

Europe is at the heart of a global debate over the way companies like Google and Facebook, as well as national intelligence agencies, handle people's digital data. Some regulators in the 28-member bloc have called on companies and governments, particularly that of the United States, to comply with the region's tough privacy regulations.

"Those who want to play in our backyard must play by our rules," Viviane Reding, a member of the European Parliament from Luxembourg and a former top European Union official, said on Monday at a privacy conference in Berlin. "Protection of our personal data shouldn't have a national barrier."

Ms. Reding is an author of a European Union privacy law that will go into force in 2018. It will be able to impose fines of up to 4 percent of a company's global revenue for the most serious breaches of European data protection rules. Those penalties would apply to any company -- even if it has no physical presence in Europe -- that has customers within the European Union.

At issue are communications via cellphones, as well as data generated in social media, online searches and e-commerce purchases.

The protections pursued in the European Union include the so-called right to be forgotten, detailed by the bloc's highest court, which requires search giants like Google to remove links to online information in some cases.

And Europe's national privacy regulators have vowed to take a tough line against a new pact between the United States and the European Union that is intended to ensure the relatively unimpeded flow of

personal data across the Atlantic. The national regulators are wary of the ability of American law enforcement and intelligence agencies to monitor data to fight crime or terrorism.

But American agencies, including the Commerce Department and the Federal Trade Commission, argue that they actively monitor companies' access to individuals' digital data. They say that American privacy safeguards -- including the United States Constitution -- often provide better protection than the rules in other jurisdictions, including those in Europe.

"We care about Europeans' privacy," Mr. Obama said in Hanover, "not just Americans' privacy."

Many European officials acknowledge that the region's privacy laws share many similarities with those in the United States. But they also highlight important differences, including the lack of overarching federal privacy legislation. The differences, they say, must be bridged if Europe and the United States are to effectively supervise the way companies like Facebook and Google gain access to data worldwide.

"The digital world is globalized," Giovanni Buttarelli, the European Union's data protection supervisor, said at the Berlin conference on Monday. "So data protection should also be globalized."

The Intercept
Spy Chief Complains That Edward Snowden Sped Up Spread of Encryption by 7 Years
Monday, 25 April 2016
Byline: Jenna McLaughlin

Washington - The Director of National Intelligence on Monday blamed NSA whistleblower Edward Snowden for advancing the development of user- friendly, widely available strong encryption.
"As a result of the Snowden revelations, the onset of commercial encryption has accelerated by seven years," James Clapper said during a breakfast for journalists hosted by the Christian Science Monitor.

The shortened timeline has had "a profound effect on our ability to collect, particularly against terrorists," he said.

When pressed by The Intercept to explain his figure, Clapper said it came from the National Security Agency. "The projected growth maturation and installation of commercially available encryption -- what they had forecasted for seven years ahead, three years ago, was accelerated to now, because of the revelation of the leaks."

Asked if that was a good thing, leading to better protection for American consumers from the arms race of hackers constantly trying to penetrate software worldwide, Clapper answered no.

"From our standpoint, it's not ... it's not a good thing," he said.

Technologists have been tirelessly working to strengthen encryption for decades, not just the past few years. But Snowden's revelations about the pervasiveness of mass surveillance clearly accelerated its more widespread availability.

And technologists say the threat of law enforcement "going dark" has been overhyped. For instance, there are almost always ways to hack around encryption, even if you can't break it.

Clapper acknowledged that there is no such thing as unbreakable encryption from his perspective. "In the history of mankind, since we've been doing signals intelligence, there's really no such thing, given proper time, and proper application of technology."

Christian Science Monitor
Encryption hindering efforts to stop Islamic State, intelligence director says
Monday, 25 April 2016
Byline: Anna Mulrine

Washington - The Edward Snowden leaks have accelerated the sophistication of encryption technologies by "about seven years," Director of National Intelligence James Clapper told reporters this morning. And that is not a development to be celebrated, he added in remarks at a breakfast hosted by The Christian Science Monitor.

"From our standpoint, it's not a good thing."

New, commercially available encryption software "had and is having major, profound effects on our ability" to collect intelligence, "particularly against terrorists," he warned.

That's in large part because the Islamic State is "the most sophisticated user by far of the Internet." They privately purchase software that "to ensure end-to-end encryption" of their communications.

"And so that is a major inhibitor to discerning plotting, principally by ISIL and others," Mr. Clapper said, using one acronym for the Islamic State.

The seven year estimation comes from the National Security Agency, he said.

It raises the issue of the tension between the need for security against cyber attacks - which as recently as February Clapper cited as a greater threat than terrorism - and the opposition to law enforcement against so-called unbreakable encryption software that, they say, could hinder their search for terrorists.

Clapper for his part echoed President Obama's warning against "absolutist positions" on the topic. "Somehow, we need to find a balance here," he said. "I don't know the technicalities of how we might

arrive here, how we thread the needle" between how to "ensure privacy and security on an individual basis, as well as security in the context of what's best for the collective good."

At the moment, he added, that goal "is an elusive holy grail that we're pursuing."

That said, he warned that the development of unbreakable encryption, which he likened to the possibility that that it could, in essence, "give the terrorists a pass."

Clapper warned Monday that the group has clandestine cells that are plotting more terrorist attacks in Germany, Italy, and England.

To this end, the United States is stepping up efforts to promote more intelligence sharing. In the meantime, since the recent IS attacks on Paris and Brussels, US intelligence officials have learned some things about the terrorist group, he said.

For starters, they are "very op-sec conscious," Clapper said. A former Air Force lieutenant general, he was using military parlance for "operational security."

It is clear that IS is also taking advantage of the migrant crisis in Europe, he added.

And that poses a formidable challenge for Europe. There is a "fundamental conflict" between European Union incentives and drives to promote openness and free movement of people and goods with privacy, "which is in some ways in conflict with the responsibilities that each country has as a nation-state to protect the borders and securities of their nations and peoples," Clapper said.

Times of Israel
The programming school that keeps the IDF running
Tuesday, 26 April 2016
Byline: David Shamah

Jerusalem - You can't shake a stick in Israel's technology scene without hitting a graduate of the IDF's famous Unit 8200, which has produced CEOs and CTOs of some of the world's most successful tech and cyber-security firms. All of those soldiers passed through the IDF Computing and Cyber Defense Academy, which runs dozens of courses for the many tech needs of the modern Israeli army.
"The Israeli army faces challenges large and small, from the sakin to the gar'in" -- threats ranging from stabbing attacks to nuclear weapons, according to Major Dor Cohen, head of the programming section of the Academy.

There is today one common denominator that powers all of the army's defensive efforts, he said. "It's fair to say that technology is the basic building block of any defense effort these days, large or small," said Cohen.

"Programming, cyber-defense tactics, app development, and other technology are the backbone of all parts of the IDF today, from systems like Iron Dome and David's Sling that defend against missile attacks to programs that can quickly issue deployment orders and ensure that soldiers and reservists get where they need to be quickly to ensuring that supplies, parts, personnel, and everything else arrives where it is supposed to. I'm proud to say that the academy is ground zero for the training of the personnel needed to master the technology to do this."

Part of the C4i Computer Services Directorate, the academy hosts dozens of courses at its campus, including, for example, Shahar, the tech-oriented "little brother" of the much more well-known Nahal Hareidi program, which deploys ultra-Orthodox soldiers in the field, on patrols and in combat duty.

The Programming division teaches students basic and advanced knowledge in computer languages, app development, cyber-security, firewalls, hacking projects - anything needed to navigate the world of programming and networks, with the objective to quickly, neatly, and effectively deploy systems that help protect Israel.

Speed of response is one of the important skills taught, said Cohen. "We learned this all too well in 2014's Operation Protective Edge, when things changed minute to minute. In most organizations you have levels of administration and approval that require supervisors to sign off on projects, and the process could take weeks. Cyber-threats and other matters came up throughout the war, and we needed to respond within hours."

In addition, apps are becoming increasingly important in the IDF, said Cohen. "Everyone today carries around in their pocket a super-sophisticated computer that can be used to provide directions, information, warnings, and other vital information. There is no reason not to use these devices and their capabilities in defending Israelis. Of course, the apps and the system have to be secure."

In February, the Academy sponsored a hackathon in which hundreds of soldiers developed apps and technologies that could respond to the issues faced by soldiers in the field. "Our courses teach programmers to develop apps using secure technologies the IDF has developed," said Cohen. "There is a great demand throughout the various forces for these apps, and we get many requests for solutions using these devices."

One of the greatest challenges Cohen faces is finding the personnel to fill the growing number of programming jobs throughout the IDF. "As everyone knows, there are not enough kids studying math and science in high schools, and we are part of the effort to encourage more students to take on those subjects," said Cohen. "But we don't strictly rely on the educational system to produce the candidates

we need. We review the records of IDF recruits and check their aptitudes, and if we find a likely candidate we lobby them to join our program."

According to Cohen, his program can take recruits who know almost nothing about computers or programming and turn them into programmers with very good to excellent skills.

Of course, a lot of hard work goes into creating programmers "from scratch" - both on the part of the candidates themselves and on the part of Cohen's staff. Fortunately, they are up to the task, he said.

"Many of the teachers in the program are themselves graduates, very highly motivated - enough to remain in the army and to help develop the new generation of programmers instead of going into private enterprise."

And although many highly motivated young Israelis prefer service in combat units, there's plenty of action - and prestige - in the army's programming and cyber units, said Cohen. "Our soldiers don't fight in the field in the same way Golani and Givati unit soldiers fight, but they are engaged in extremely important defense projects.Tech is now the basis of warfare. Without our people, the army cannot move an inch."

Fox News
Did anti-Israel bias keep France from getting terror tech before Paris attacks?
Tuesday, 26 April 2016
Byline: Hollie McKay

Washington - Shortly after the Charlie Hebdo attack in Paris, and nearly a year before terrorists killed 130 in coordinated strikes that rocked the City of Light, French security officials rejected an Israeli company's offer of terrorist-tracking software that could have helped them flag the deadly terror cell, a security expert said.
The offer of data- mining technology that would allow French authorities to "connect all the dots" in the Islamist extremist community was made to the Directorate- General for Internal Security, France's main intelligence agency. It is used to analyze and match up fragmented intelligence reports from several national and international databases, giving counter-terrorism agents the most up-to-date information on potential terrorists available.

The overture was rejected.

"French authorities liked it, but the official came back and said there was a higher-level instruction not to buy Israeli technology," a well-placed Israeli counter-terror specialist familiar with the technology and the company behind it told FoxNews.com. "The discussion just stopped."

The Israeli source declined to name the company or detail the technology, which has been shared with the U.S. and other nations on good terms with Israel, other than to say it scans databases from multiple agencies and Interpol and pinpoints "high-risk" people. But he believes it could have given French authorities a chance at stopping the Nov. 13, 2015, attacks in Paris, and possibly the coordinated bombings in Brussels that killed 32 on March 22.

"Government agencies struggling to foil terror attacks need access to technologies that allow them to connect their data fragments, making it possible to handle daily data challenges," the source said. "With this system, all data can then be easily navigated, processed and represented by employing a set of powerful analytic tools and unique algorithms."

The offer followed Israeli Prime Minister Benjamin Netanyahu's pledge to work closely with Europe on enhancing security in the wake of the Brussels attacks, taken in Israel as a call for intelligence and technology sharing.

"In Paris or Brussels or San Bernardino or Tel Aviv or Jerusalem, terror must be condemned equally and it must be fought equally," Netanyahu said. "Israel stands ready to cooperate with all the nations in this great struggle."

No official reason was given for France's rejection of the offer, and the source acknowledged it could have been triggered by legitimate concerns about hacking vulnerability. Yet many suspect politics was to blame.

"The European Union has blamed Israel for everything that is happening in the Middle East and stopped cooperation in regards to military, law enforcement and intelligence training and banning university cooperation which [generates] much of the technology to fight terrorism," said Itamar Gelbman, a former IDF Special Forces and who is now a counter-terrorism consultant.

DGSI did not respond to requests for comment and a European Union official told FoxNews.com that there is no formal French, or wider EU ban, on purchasing technology products made in Israel. However, tensions between the European Union and Israel have heightened in recent years, primarily over claims the Jewish State illegally occupies Palestinian territories.

The Israeli-Palestinian conflict has long divided the international community. Human rights groups routinely condemn Israel for repressing and harshly retaliating against Palestinian aggression, while Israel remains staunch that it acts in self-defense and to protect its people.

Kamal Nawash, an American attorney and president of the Free Muslims Coalition, noted that Europe's tough stance against Israel and hesitation in making technology purchases is an "example of the global community sending a message to Israel that its treatment of the Palestinians is unacceptable."

"Israel would be wise to change its treatment of Palestinians by providing them with civil and human rights and pursuing a desegregation policy in general," Nawash said. "Otherwise, Israel may experience the same fate as South Africa during the apartheid era with all the countries of the world boycotting Israel."

The recent spate of terror attacks on European soil could bring about a resurgence in investment with Israeli tech and intelligence companies, given its undisputed status as a global leader in the field.

"Israel has been facing terror threats since its inception in 1948," said Gilles Perez, manager of HLS & Aerospace Unit at the Israel Export Institute. "In the 1970s, it was Israel's national airline that pioneered the concept of an undercover security officer on every commercial flight long before it was adopted by other countries after September 11, almost 40 years later."

Security at airports, such as Zaventem Airport in Brussels, where last month's bombing occurred, has long been an area of Israeli expertise. But intelligence, such as the system offered to French officials, could be even more crucial, said Col. Eran Lerman, former deputy chief of Israel's National Security Council and senior IDF Military Intelligence division director.

"However, the key to successful security has to be intelligence, in the broader sense of the word," Lerman told Homeland Security Today. "For too many years, for very good reasons, Europeans have neglected the need for effective intelligence measures."

Israel-based security training expert Daniel Sharon said that since the Brussels attacks last month there has been particular interest in airport and aviation security prevention concepts, interest that transcends popular protest.

"The goods are boycotted in European supermarkets," Sharon said. "But when they are in trouble they run to Israel for help."

Less than a week after the attacks in Brussels, Belgian law enforcement bought advanced surveillance and rapid view technology from Israeli company BriefCam. The technology is already in use at the Statue of Liberty and various U.S. airports, said President and CEO Dror Irani.

Israel's tech and security sector has long been an incubator for anti-terror solutions, say experts. The more France and Europe in general are threatened, the more willing they may be to work with companies based in the Jewish state.

"Israel is leading the field in counter-terrorism technology, but it's not a popular country," said Ari Zoldan, CEO of technology and e-commerce firm Quantum Network. "It is unlikely that Israel will suddenly become popular, but the need for better national security will force people to work with Israeli solutions."

Reuters

Bangladesh Bank hackers compromised SWIFT software, warning to be issued

Tuesday, 26 April 2016

Dhaka - The attackers who stole $81 million from the Bangladesh central bank probably hacked into software from the SWIFT financial platform that is at the heart of the global financial system, said security researchers at British defense contractor BAE Systems.
SWIFT, a cooperative owned by 3,000 financial institutions, confirmed to Reuters that it was aware of malware targeting its client software. Its spokeswoman Natasha Deteran said SWIFT would release on Monday a software update to thwart the malware, along with a special warning for financial institutions to scrutinize their security procedures.

The new developments now coming to light in the unprecedented cyber-heist suggest that an essential lynchpin of the global financial system could be more vulnerable than previously understood to hacking attacks, due to the vulnerabilities that enabled attackers to modify SWIFT's client software.

Deteran told Reuters on Sunday that it was issuing the software update "to assist customers in enhancing their security and to spot inconsistencies in their local database records."

The software update and warning from Brussels-based SWIFT, or the Society for Worldwide Interbank Financial Telecommunication, come after researchers at BAE, which has a large cyber-security business, told Reuters they believe they discovered malware that the Bangladesh Bank attackers used to manipulate SWIFT client software known as Alliance Access.

BAE said it plans to go public on Monday with a blog post about its findings concerning the malware, which the thieves used to cover their tracks and delay discovery of the heist.

The cyber criminals tried to make fraudulent transfers totaling $951 million from the Bangladesh central bank's account at the Federal Reserve Bank of New York in February.

Most of the payments were blocked, but $81 million was routed to accounts in the Philippines and diverted to casinos there. Most of those funds remain missing.

Investigators probing the heist had previously said the still-unidentified hackers had broken into Bangladesh Bank computers and taken control of credentials that were used to log into the SWIFT system. But the BAE research shows that the SWIFT software on the bank computers was probably compromised in order to erase records of illicit transfers.

Deteran reiterated on Sunday that "the malware has no impact on SWIFT's network or core messaging services."

The SWIFT messaging platform is used by 11,000 banks and other institutions around the world, though only some use the Alliance Access software, Deteran said.

SWIFT may release additional updates as it learns more about the attack in Bangladesh and other potential threats, Deteran said. SWIFT is also reiterating a warning to banks that they should review internal security.

"Whilst we keep all our interface products under continual review and recommend that other vendors do the same, the key defense against such attack scenarios is that users implement appropriate security measures in their local environments to safeguard their systems," Deteran said.

Adrian Nish, BAE's head of threat intelligence, said he had never seen such an elaborate scheme from criminal hackers.

"I can't think of a case where we have seen a criminal go to the level of effort to customize it for the environment they were operating in," he said. "I guess it was the realization that the potential payoff made that effort worthwhile."

A Bangladesh Bank spokesman declined comment on BAE's findings. A senior official with the Bangladesh Police's Criminal Investigation Department said that investigators had not found the specific malware described by BAE, but that forensics experts had not finished their probe.

Bangladesh police investigators said last week that the bank's computer security measures were seriously deficient, lacking even basic precautions like firewalls and relying on used, $10 switches in its local networks.

Still, police investigators told Reuters in an interview that both the bank and SWIFT should take the blame for the problems.

"It was their responsibility to point it out but we haven't found any evidence that they advised before the heist," said Mohammad Shah Alam, head of the Forensic Training Institute of the Bangladesh police's criminal investigation department, referring to SWIFT.

The BAE alert to be published on Monday includes some technical indicators that the firm said it hopes banks could use to thwart similar attacks. Those indicators include the IP address of a server in Egypt the attackers used to monitor use of the SWIFT system by Bangladesh Bank staff.

The malware, named evtdiag.exe, was designed to hide the hacker's tracks by changing information on a SWIFT database at Bangladesh Bank that tracks information about transfer requests, according to BAE.

BAE said that evtdiag.exe was likely part of a broader attack toolkit that was installed after the attackers obtained administrator credentials. It is still not clear exactly how the hackers ordered the money transfers.

Nish said that BAE found evtdiag.exe on a malware repository and had not directly analyzed the infected servers. Such repositories collect millions of new samples a day from researchers, businesses, government agencies and members of the public who upload files to see if they are recognized as malicious and help thwart future attacks.

Nish said he was highly confident the malware was used in the attack because it was compiled close to the date of the heist, contained detailed information about the bank's operations and was uploaded from Bangladesh.

While that malware was specifically written to attack Bangladesh Bank, "the general tools, techniques and procedures used in the attack may allow the gang to strike again," according to a draft of the warning that BAE shared with Reuters.

The malware was designed to make a slight change to code of the Access Alliance software installed at Bangladesh Bank, giving attackers the ability to modify a database that logged the bank's activity over the SWIFT network, Nish said.

Once it had established a foothold, the malware could delete records of outgoing transfer requests altogether from the database and also intercept incoming messages confirming transfers ordered by the hackers, Nish said.

It was able to then manipulate account balances on logs to prevent the heist from being discovered until after the funds had been laundered.

It also manipulated a printer that produced hard copies of transfer requests so that the bank would not identify the attack through those printouts, he said.

Canada Is Considering Spying on Kids to Stop Cyberbullying

Wednesday, 27 April 2016

Byline: Jordan Pearson

Section: general

Toronto - Cyberbullying is simply awful, and its consequences can be utterly horrific. Canadians have known this all too well since 17-year-old Rehtaeh Parsons' suicide in 2013, after photos of her alleged rape circulated online.
It's only human to want to put a stop to it. But is it worth spying on kids?

To wit, the Canadian government is looking for a person or organization to "conduct an evaluation of an innovative cyberbullying prevention or intervention initiative" in a "sample of school- aged children and youth," according to a tender notice published by Public Safety Canada last week.

Although nothing has been finalized, the government will consider letting the organization spy on kids' digital communications to do it, Barry McKenna, the Public Safety procurement consultant in charge of the tender, told me.

"The tender doesn't preclude or necessarily require digital monitoring," said McKenna. "But there are certainly products on the market that do that, and I would guess that that kind of intervention would be one of interest."

The school board overseeing the school used in the study would have to sign off on digital surveillance of kids, McKenna said, and so would Public Safety. McKenna would not disclose whether any person or organization has responded to the tender yet. The government has budgeted $60,000 for the program, the notice states.

"Cyberbullying isn't a technological problem"

"Any use by government of technology to scan the internet and read somebody's communications obviously raises privacy issues," said David Fraser, a Canadian privacy lawyer consulting on a new cyberbullying law for Nova Scotia. "Fewer privacy issues if it's following an intervention and it's targeted," he continued, "way more if they're trying to single out kids in Canada and assess what they're saying."

"What we've seen come out of Public Safety and most law enforcement agencies is a pretty un-nuanced, heavy- handed, over the top model," Fraser added. Nova Scotia's previous cyberbullying law, passed in the wake of Parsons' suicide, was ruled unconstitutional and struck down for being too broad and infringing on people's civil rights.

If the Public Safety study ends up taking a more blanket approach to monitoring kids instead of targeting surveillance after an incident, it could also risk undermining communication between kids and their teachers or parents, according to US Cyberbullying Research Center co- director Sameer Hinduja.

"Installing tracking apps undermines any sort of open-minded communication [that] youth-serving adults might have with these kids, because you're tracking them surreptitiously," said Hinduja. "Kids, as they get older, want more privacy and freedom. It's natural--you want it, and I want it."

This isn't the first time somebody has considered surveillance as a solution to the complex social issue of kids being absolutely horrific to each other, and it likely won't be the last. In 2013, The LA Times noted that the Glendale Unified School District in Southern California reportedly paid a firm $40,000 to monitor kids' social media accounts to combat bullying. The move raised the ire of privacy advocates in the US then, too.

The point, according to Hinduja, is that bullying isn't a uniquely digital problem. You don't solve bullying forever by putting a teacher in every hallway, and you don't fix crime by putting a cop on every corner.

"Cyberbullying isn't a technological problem," said Hinduja. "You can't blame the apps, the smartphones, or the internet. Instead, cyberbullying is rooted in other issues that everyone has been dealing with since the beginning of time: adolescent development, kids learning to manage their problems, and dealing with stress."

Needs to Revive the Encryption Debate It Had in the 1990s

Wednesday, 27 April 2016

Byline: Matthew Braga

Section: Comment

Comment: In the wake of a court battle between Apple and the FBI, American lawmakers have been considering a new policy on encryption, on the basis that strong technological protections are making it difficult for law enforcement and intelligence agencies to solve crime.
Such a policy, which would mandate a so-called backdoor in encryption software, would inevitably compromise the security of all communications, privacy advocates have argued. And yet, given the gravity of the situation, in Canada there has been no similar debate. At least, not recently.

Though largely forgotten today, the Canadian federal government actually did have an encryption debate of its own in the late 1990s. It brought law enforcement together with experts to discuss encryption's role in a then-early internet, and the potential impacts on national security and public safety that might arise from encryption's use.

What's most fascinating is how closely the arguments from two decades prior mirror those that are being made today. Though technology has come a long way since then, looking back at Canada's own debate shows that some of the arguments being made today by politicians and law enforcement in the US are still stuck in the past.

"We all came to the conclusion that [legislation] would be the death-knell for [...] secure communications online," said Ann Cavoukian, who served as the Information and Privacy Commissioner of Ontario from 1997 to 2014. "We thought it had died, and here it is again."

18 law enforcement agencies, including the RCMP and CSIS, even called for "mandatory access" to encryption keys

US lawmakers and experts previously engaged in a pair of fierce cryptographic fights that came to a head in 1994: the first, over the passing of the Communications Assistance for Law Enforcement Act, or CALEA, an American wiretapping law that dictates when and how telecommunications companies have to assist law enforcement and intelligence agencies engage in electronic surveillance; and the second, over a US-government backed encryption scheme called Clipper, a special computer chip that, when installed in a phone, would give the National Security Agency backdoor access to otherwise encrypted communications.

Ultimately, CALEA passed--with compromises--and the Clipper chip was scrapped. It was in this context, the aftermath of the Crypto Wars to the south, that the Canadian government decided to have its own debate.

In January 1999, a Senate Special Committee on Terrorism and Public Safety released a report on threats to public safety and national security, and listed encryption as an emerging issue. Based on interviews with law enforcement, academics, telecommunications companies and members of the financial community, the committee reiterated many of the same arguments that can still be heard today: that encryption is making law enforcement's job harder; that backdoors built into encryption mechanisms for

government use could just as easily be used by criminals; and that undermining encryption would compromise the security of financial systems too.

18 law enforcement agencies, including the RCMP and CSIS, even called for "mandatory access" to encryption keys used to protect stored data and data in transit. In what has become an oft-used turn-of-phrase, police argued that "they do not seek increased investigative capabilities through mandatory key access or otherwise, but instead seek only to restore and maintain their existing investigative capabilities."

In the end, no cryptography policy was proposed, and the committee recommended law enforcement and intelligence agencies seek other methods to overcome the obstacle of encryption. However, the committee did recommend amending the Criminal Code "to provide lawful access to encryption keys by law enforcement and security intelligence organizations and to criminalize encryption when used in the commission of a crime."

These recommendations were never adopted. It's not clear why, but it's likely that the government chose to follow the lead of countries such as the US, which had backed down from similar schemes.

As the RCMP previously told Motherboard, there is no power in the Criminal Code specific to encryption. According to Scott Bardsley, press secretary for Public Safety Minister Ralph Goodale's office, police can either compel a third party to decrypt data with judicial authorization, or they may attempt to decrypt the data themselves.

When asked if the Canadian government was planning on revisiting the encryption debate, Barsdley would only tell Motherboard that "broad public consultations on national security issues" are planned in the "medium term." But Cavoukian would be happy if there was no debate at all.

"I would prefer no discussion, because if there's no discussion, you're not resurrecting the discussion of the 90s," she said. "To me, we put the issue to bed."

Globe and Mail

Ransomware poses complex legal and reputational risks

Wednesday, 27 April 2016

Byline: Brent Arnold & Christopher Oates

Section: Comment

Comment: As businesses and public institutions increasingly become the targets of ransomware - malware that blocks access to computer systems or the information they contain until the user performs actions demanded by hackers - legal risks surrounding such headlinemaking attacks have come to the fore in Canadian corporate consciousness.
A January report by the Online Trust Alliance reveals that ransomware attacks aimed at companies are not only growing more prevalent, but they are also becoming more sophisticated. Today's hackers can custom tailor their demands according to the size and market value of their corporate mark. Making matters worse, last month Apple's iOS operating system was infected with ransomware for the first time.

Ransomware typically gains access to a computer system when a user clicks on unfamiliar links or strange attachments (although a growing number of programs are infecting computers via the download of ostensibly legitimate applications).

In its most benign form, an infection could force employees to complete a survey; at its most malignant, it has strongarmed companies into paying actual ransoms (typically in the nationless and virtually untraceable currency of bitcoin).

Businesses that fail to comply face the destruction of client and proprietary data, and intellectual property - not to mention sustaining significant reputational damage and exposure to third-party lawsuits from clients and consumers (and there is never any guarantee that meeting hackers' demands will result in computers or data being unlocked).

Despite this growing threat, legal recourses for ransomware victims are slim. The activity is, of course, illegal and should be immediately reported to police (the RCMP also suggest reporting to the Canadian Anti-Fraud Centre). But despite the fact that such attacks have been reported for more than a decade, there are no documented cases of ransomware perpetrators ever having been prosecuted in Canada.

Given the often remote nature of the crime (the few attacks that have been successfully traced typically come from foreign countries), criminal and civil remedies may be unlikely to succeed.

In the rare event a cybercriminal is identified, civil proceedings against foreign nationals are most likely to result in default judgments that are difficult if not impossible to collect on.

While cybercriminals frequently avoid prosecution, their corporate victims may find themselves in the legal spotlight. Recent amendments to the Personal Information Protection and Electronic Documents Act (PIPEDA) will soon require companies subject to PIPEDA to alert the federal privacy commissioner, affected individuals and relevant organizations or government institutions following a breach of security safeguards that "creates a real risk of significant harm to the individual."

This can include risk of economic loss by the person whose personal information is subject to the breach, as well as potential reputational harms.

While reporting obligations provide an important consumer protection and will be a legal necessity in certain cases (companies that fail to report where required by PIPEDA may be subject to fines of up to $100,000), they are nonetheless problematic for businesses - particularly those for whom data security is a critical component of their brand identity. Recent hacks have shaken consumer and shareholder confidence and resulted in both significant disruption for targeted businesses and resignations by top executives.

All indicators suggest ransomware will only become more vicious and prevalent in the foreseeable future. With added reporting pressure looming on the horizon, companies that fall prey may soon find themselves facing complex legal and reputational risks.

Brent Arnold and Christopher Oates are lawyers at Gowling WLG, whose practices focus heavily on technology- and privacy-related matters.

Washington Post

FBI says it can't explain how iPhone was hacked

Wednesday, 27 April 2016

Byline: Ellen Nakashima

Section: general

Washington - The FBI intends to tell the White House this week that its understanding of how a third party hacked the iPhone of a shooter in San Bernardino, Calif., is so limited that there's no point in undertaking a government review of whether the tool should be shared with Apple, officials said. The decision, said officials familiar with the discussion who spoke on the condition of anonymity, ends several weeks of internal debate by bureau lawyers and technical experts about the FBI's obligation to disclose the method.

Last month, the FBI paid more than $1 million for a tool to crack an iPhone used by one of the shooters in California. But the contract did not include rights to the software flaws that went into the tool, officials said.

As a result, the bureau has a limited technical understanding of how the method worked, officials said.

On Tuesday, FBI Director James B. Comey acknowledged the internal debate.

"The threshold is: Are we aware of the vulnerability, or did we just buy a tool and don't have sufficient knowledge of the vulnerability that would implicate the process?" he said at a cyber conference at Georgetown University.

Comey was referring to a process, led by the White House, in which agencies such as the FBI, National Security Agency (NSA) and Homeland Security Department debate whether to disclose a computer software flaw discovered by the government to the software maker so the company can fix it.

Most flaws are disclosed, the White House has said. But some are kept secret so that the law enforcement or intelligence agency can use them in intelligence- gathering or criminal investigations.

The FBI's decision to not submit to a review of the method used in the San Bernardino case was first reported by the Wall Street Journal.

Some security experts said the bureau or the NSA could reverse-engineer the tool to gain information about the flaws. But the bureau was not likely to do so, several officials said.

"If what we have bought is a tool, and we've said that we won't reverse-engineer the tool such that you can figure out what vulnerability is used to make the tool work, then even if we wanted to disclose something, there's nothing we can disclose," one senior administration official said.

The FBI recovered the iPhone of Syed Rizwan Farook, one of the shooters in the December terrorist attack in San Bernardino, but could not access the data on it because it did not know Farook's passcode. In February, the Justice Department obtained a court order to force Apple to write software that would disable several phone security features so the FBI could try to crack the code.

Apple challenged the order, arguing that the court had no basis to issue it and that it would set a dangerous precedent. In late March, the FBI disclosed that a third party had come forward with a tool to help it gain access to the phone and so it no longer needed the court order to force Apple's assistance.

Security and privacy advocates then began to push the bureau to disclose to Apple the flaws on which the tool was based so the tech giant could repair them.

Last month, professional hackers or vulnerabilities researchers brought flaws they had found to a company whose name the FBI has not disclosed.

Apple has said it will not press for the vulnerabilities to be disclosed.

"We're confident that the vulnerability the government alleges to have found will have a short shelf life," a lawyer for Apple told reporters earlier this month. "In our normal process . . . we'll continue to improve the phones and at some point this fix will get implemented."

Times of Israel

Operational Cyber Intelligence

Wednesday, 27 April 2016

Section: general

Jerusalem - Visitors to the CyberTech 2016 exhibition had the impression that every single exhibitor boasted a cyber intelligence capability. Indeed, cyber intelligence (or threat intelligence) has evolved into one of the hottest trends of the cyber technology industry in the last few years. Even the relatively small Israeli market generates massive demand for intelligence services and some ten product and service companies are involved in this activity, competing one another.
The regulator has not remained idle either. According to Directive #361 of the Banking Supervisor at the Bank of Israel, financial institutions must use intelligence in addition to the other security mechanisms they employ. So, apparently everyone is talking about cyber intelligence and many people would like to know how to consume it, but what, in fact, is cyber intelligence and how does it help users to defend themselves against threats?

Cyber intelligence produces operational insights by looking outside the organization and issuing alerts of imminent and future threats to the organization. The type of intelligence may be categorized according to the manner in which the information is collected and analyzed and the manner in which the final product is used. Roughly, the world of cyber intelligence is divided into three categories: technical intelligence, tactical intelligence and operational intelligence.

Technical Intelligence Technical intelligence constitutes the overwhelming majority of intelligence sold around the world. This intelligence category is based on a method adopted from military intelligence, known as Signals Intelligence (SigInt), which consists of the interception of electronic signals and deriving information from those signals. In the Internet world, this refers to the characteristics of web traffic (IP address, server locations and so forth), as well as to malware indicators. Combining these data makes it possible to identify suspicious traffic to and from the organization, and to block it.

Organizations and suppliers that collect intelligence of this category deploy networks of sensors to identify suspicious traffic and IP addresses suspected of disseminating malware and junk mail. This information is delivered in a digital format directly to the security systems (Firewalls, Anti-Virus

software) and enables them to block undesirable elements. The primary disadvantage of this intelligence category is the fact that it is essentially responsive, namely - it identifies and handles attacks that have already taken place somewhere in the digital space. It cannot effectively identify new attacks that have not been documented, analyzed and translated into 'signatures'.

The various approaches that attempt to solve this problem through mathematical/statistical analysis of behavior patterns are plagued by a high percentage of false positive 'noise' messages. Additionally, these technical intelligence models do not normally produce insights regarding potential attacks, and no conclusions may be derived from them for the purpose of making tactical or strategic security decisions. Additionally, the widespread use of robotic networks (botnets) for offensive purposes makes spotting and prevention extremely difficult.

Tactical Intelligence The second intelligence category is tactical intelligence. This category is about spotting and identifying preparations for an attack, identifying information that leaked from the organization and analyzing the technological capabilities and motivation of the attackers, as well as their development methods and attack vectors, with the intention of providing early warning prior to the attack. This intelligence category relies on Human Intelligence (HumInt) or the translation thereof to the web world - WebInt - plus complementary technical intelligence.

This intelligence activity is similar to the ages-old methodology of operating agents who collect information directly and pass it on to their operators for analysis, processing and subsequent action, combined with field intelligence specialists who analyze the 'combat doctrines' of the various opponents, their possible attack objectives, methods for extensive cyber warfare operations and so forth.

HumInt in the cyber world includes the creation of virtual personae, or 'Avatars', planting them in attacker groups or in organized crime forums, passively 'monitoring' their discussions and reporting the information to the operator. The product of this intelligence- gathering effort is normally a report that concludes the activity and offers recommended courses of action, or in more uncommon cases - a concrete early warning of an intended attack.

This intelligence category suffers from a dual disadvantage - as it involves entities operated by humans, the coverage span of the intelligence being collected is limited. A good cyber analyst can operate 2-5 entities simultaneously, but there are dozens of forums in which he should operate. After the intelligence has been produced, it is submitted to the end user as a report that he should read, analyze and then make decisions regarding possible courses of action. Naturally, this burdens the end user (normally the Chief Information Security Officer - CISO) who suffers from substantial manpower gaps to begin with.

"Most of the Intelligence being produced is not utilized" The objective of intelligence is to support the security layout. Without such a layout, intelligence is of no significance. For this reason, only mature organizations seek intelligence after they had already deployed the standard solutions and as they now

wish to enhance their security. For these organizations, the intelligence should provide a sort of early warning against attacks. In reality, however, technical intelligence does not produce such alerts and tactical intelligence produces generalized alerts.

This is the reason why most of the intelligence being produced for cyberspace is not utilized - it does not pertain to the organization directly. Clients who gain experience using cyber intelligence services stop consuming those services after a while, as they find no direct value in them and as they do not have available, skilled personnel for assimilating and implementing the intelligence they are provided with. Consequently, the world is becoming disillusioned with cyber intelligence as a sub-activity of the cyber technology world. In a very short period of time, numerous companies were acquired or stricken off the market (Sight Partners and IID were acquired by FireEye and Norse has ceased to operate recently). Apparently, the market is maturing and now seeks tactical solutions with a high degree of automation.

Operational Intelligence The third category of cyber intelligence, which begins to stand out as a separate activity, is operational intelligence. It derives from the change in the security concept. Instead of securing the peripheral boundaries of the organization, which means primarily deploying security assets for the purpose of identifying and stopping the attack or the attacker - developing prompt capabilities for identifying an attack and neutralizing the damage it attempts to inflict. This approach is an adaptation to the cyber threats of the active routine security concept used in the field of national security.

One of the companies that offers an operational intelligence solution is the Sixgill Company of Yokne'am, Israel. This company develops a platform capable of producing intelligence effectively as it allows a small number of analysts to 'dominate' an extensive pool of sources in the Darknet - forums, 'stores' that sell credit cards and 'Dumps' (websites that publish large amounts of data stolen from various elements).

As the system produces alerts automatically, it directs the analysts to analyze the information and derive operational insights. The CEO of Sixgill, Avi Kashtan, told us that the system was developed in cooperation with one of the world's leading banks that uses it daily to spot preparations for attacks, employee and customer data that leaked or was stolen and more general information about future trends.

The operational intelligence approach calls for information that consists primarily of methods, processes and combat and active defense doctrines. It empowers the doctrinal and technical elements cyber intelligence can extract from the space where the opponents organize and conduct their administrative activities. Instead of searching for information regarding a specific attack against the organization, operational cyber intelligence focuses on analyzing the opponents' combat doctrines, weapon systems and attack and operational scenarios. This approach shifts the center of gravity from advance identification and blocking - which were proven to be ineffective, to the ability to respond and block the outcome of the attack within the organizational environment or in its immediate vicinity.

Reuters

FBI decides provisionally not to share iPhone unlock: sources

Wednesday, 27 April 2016

Byline: Mark Hosenball, Dustin Volz

Section: general

Washington - The FBI has provisionally decided not to share an iPhone unlocking mechanism used by a contractor to open the phone of one of the San Bernardino shooters because the agency does not own the mechanism, two U.S. government sources said on Tuesday.
The FBI is expected within days to write to the White House explaining why the agency cannot share the unlocking mechanism with other government agencies, Apple or other third parties, said the sources, who asked to remain anonymous.

Several U.S. government sources said the FBI contractor that unlocked the shooter's phone was a foreign entity and did not give U.S. authorities details of the mechanism. Without that, the FBI could not share it even if it wanted to, sources said.

Reuters reported on April 13 that the unnamed contractor had sole ownership of the method it used, making it unlikely that the government could share it.

A day later, the FBI warned Apple of a separate flaw in its iPhone and Mac software, the company told Reuters on Tuesday.

It was the first time the government had alerted Apple to a vulnerability under a White House interagency procedure, known as the Vulnerabilities Equities Process, for reviewing technology security flaws and deciding which ones should be made public, the company said.

The FBI's provisional decision means that the unlocking mechanism used on the San Bernardino iPhone will not be referred to the interagency procedure for review.

Earlier on Tuesday, FBI Director James Comey said his agency was assessing whether the mechanism would go through the review.

"We are in the midst of trying to sort that out," Comey said.

Officials have said that the interagency review process leans toward disclosure of technological flaws. But it is not set up to handle or reveal flaws which are discovered and owned by private companies, sources have told Reuters.

Comey's comments appeared to confirm the FBI did not own the method used to crack the county-owned work phone belonging to Syed Farook, who with his wife opened fire in December on a San Bernardino, Calif., holiday party, killing 14 and wounding 22.

The method instead belongs to a still-unidentified third party that the FBI said came forward due to the attention received from its public pursuit of a court order to compel Apple's assistance in unlocking the phone.

Apple's refusal to comply prompted a high-profile standoff and fueled a long-simmering debate over security, privacy and law enforcement access to encrypted technology.

The government withdrew its case after it said the hacking method worked. Comey has said the method works on a "narrow slice" of iPhone 5c devices running iOS 9.

An Apple senior executive told reporters earlier this month that it was confident the flaw used by the third party would have a "short shelf life" and be patched through the firm's ongoing efforts to improve the security of its devices.

Reuters

After the Snowden NSA leaks, fewer people are searching for info on terror groups online (Canada)

Wednesday, 27 April 2016

Byline: Joseph Menn

Section: general

San Francisco - nternet traffic to Wikipedia pages summarizing knowledge about terror groups and their tools plunged nearly 30 percent after revelations of widespread Web monitoring by the U.S. National Security Agency, suggesting that concerns about government snooping are hurting the ordinary pursuit of information.
A forthcoming paper in the Berkeley Technology Law Journal analyzes the fall in traffic, arguing that it provides the most direct evidence to date of a so-called "chilling effect," or negative impact on legal conduct, from the intelligence practices disclosed by fugitive former NSA contractor Edward Snowden.

Author Jonathon Penney, a fellow at the University of Toronto's interdisciplinary Citizen Lab, examined monthly views of Wikipedia articles on 48 topics identified by the U.S. Department of Homeland Security as subjects that they track on social media, including Al Qaeda, dirty bombs and jihad.

In the 16 months prior to the first major Snowden stories in June 2013, the articles drew a variable but an increasing audience, with a low point of about 2.2 million per month rising to 3.0 million just before disclosures of the NSA's Internet spying programs. Views of the sensitive pages rapidly fell back to 2.2 million a month in the next two months and later dipped under 2.0 million before stabilizing below 2.5 million 14 months later, Penney found.

The traffic dropped even more to topics that survey respondents deemed especially privacy-sensitive. Viewership of a presumably "safer" group of articles about U.S. government security forces decreased much less in the same period.

Penney's results, subjected to peer-review, offer a deeper dive into an issue investigated by previous researchers, including some who found a 5.0 percent drop in Google searches for sensitive terms immediately after June 2013. Other surveys have found sharply increased use of privacy-protecting Web browsers and communications tools.

Penney's work may provide fodder for technology companies and others arguing for greater restraint and disclosure about intelligence-gathering. Chilling effects are notoriously difficult to document and so have limited impact on laws and court rulings.

More immediately, the research could aid a lawsuit filed by the American Civil Liberties Union on behalf of Wikipedia's nonprofit parent organization and other groups against the NSA and the Justice Department.

The year-old suit argues that intelligence collection from backbone Internet traffic carriers violated the Fourth Amendment ban on unreasonable searches.

Pentagon Won't Give Islamic State Clues on Cyber Strategy

Wednesday, 27 April 2016

Byline: Damian Paletta

Section: general

Washington - The Pentagon is being careful not to reveal the precise ways it is targeting Islamic State through the use of expanded cyber weaponry, concerned that any clues could help the terror network avoid future attacks.
Adm. Mike Rogers, head of U.S. Cyber Command and the National Security Agency, said Tuesday that the Pentagon's use of computer tactics to confront Islamic State is part of its broader campaign to defeat the group. Speaking at Georgetown University, however, he wouldn't say what those tactics are or what the impact has been.

"I'm not going to go into specifics of what we're doing," Adm. Rogers said. "We are working against an adaptive, agile opponent. I'm not interested in giving them any advantage."

In February, the White House and Pentagon began speaking more openly about the government's use of cyberweapons to confront Islamic State, saying it was meant to complement military strikes that have killed a number of the terror network's senior officials in recent months. The public mentions of these computer tools marked a first for the Pentagon, which is usually much more secretive about its use of cyberattacks against foreign groups.

Officials have said the tactics include actions like disrupting Islamic State's ability to communicate, sowing confusion among its members, and steering militants toward certain tools that are easier for the U.S. government to intercept or track.

The true impact of these cyberattacks, however, is unclear. Some people who follow Islamic State's use of social media, for example, say they have seen some change in how militants communicate, but that the group hasn't abandoned traditional methods altogether.

The government's use of these tactics has fed a long-standing tension between intelligence agencies and the military. Intelligence agencies generally want to use any access to an adversary's computer networks to monitor information, while military leaders often see benefit in destroying those networks.

Military and intelligence officials have had numerous discussions about the best way to address this dilemma when confronting Islamic State, people familiar with the matter said. Those discussions are expected to continue.

Presidential front-runners Hillary Clinton and Donald Trump have both expressed frustration that Islamic State continues to use computers and software encryption tools to communicate, recruit and plan attacks. They have proposed taking steps that limit or eliminate Islamic State's access to computers in places like Raqqa, Syria, and Mosul, Iraq.

As recently as several months ago, there were four active Internet cafes in Raqqa, people familiar with the matter said, and Islamic State was careful about monitoring who logged onto Internet devices there and how those devices were used.

Intelligence officials have known about these Internet cafes for months, and it is unclear if the new tactics by Cyber Command are aimed at targeting such locations or pursuing militants and leaders on the battlefield.

The U.S. government has launched a separate effort to work with tech companies including Facebook Inc. and Twitter Inc., hoping to make it harder for violent extremists to use those social media tools.

Iran opens a new front in cyber warfare

Tuesday, 26 April 2016

Byline: Sam Jones

Section: general

London - The first neighbourhood they unplugged was Olaya, Riyadh's wealthiest and gaudiest central district. By the time they had finished their rampage through the computer systems behind the power grid, the infiltrators believed they had left millions without electricity, crippling hospitals and military facilities.
What the hackers, whose use of Farsi and bespoke malware gave away their Iranian origins, did not realise was that the critical computer networks they had compromised were fake.

The network, complete with Arabic scripting and precise names of individual substations and pylons, was the work of MalCrawler, a cyber security group specialising in protecting industrial computer systems. It was just one of a set of intricate digital honeytraps designed to gauge the intentions of the attackers who routinely tried to crack into the systems owned by MalCrawler's clients. Equally intricate models were made of European, American and Israeli power systems.

The evidence from the models aligned. The Chinese hungrily scooped up anything that looked like novel technical information. The Russians permeated deep into systems, mapping them and implanting hard-to-find backdoor access for potential future use. But neither dared do damage -- unlike Iran.

Among the world's big five cyber superpowers -- the US, UK, Israel, Russia and China -- MalCrawler concluded there was a digital equilibrium in military cyber offence based on assumptions over deterrence and reprisal.

"But in the Middle East, that's not the case at all," says Dewan Chowdhury, MalCrawler's chief executive. "The mindset just seemed completely different -- it wasn't espionage or some kind of targeted operation necessarily, it was just to do as much damage as possible."

The model MalCrawler designed to replicate the Israeli power grid was hit just as hard as the Saudi one. The hackers, again displaying tell-tale signs of Iranian origin, fatally compromised the safety systems of what they thought was one of Israel's nuclear power stations.

Iran is rapidly emerging as the sixth member of the cyber superpower club. Denuded of its nuclear ambitions by the landmark deal struck last year to limit uranium and plutonium enrichment, some fear Tehran will wield its cyber arsenal as an equally long-range weapon with which to menace its adversaries.

"Before the [nuclear] deal, cyber was just one option they used for leverage, but now, post deal, it is even more central to their toolkit," says one senior Middle Eastern intelligence official. "Iran is poised to do something in cyber that will change the way the world looks at it?...?the US knows this. [The US] saw what they [Iran] did during the agreement and they know what they are doing after it."

Industrial sabotage

While high-tech espionage is rife -- for strategic state advantage and commercial and criminal gain -- destructive acts of cyber attack remain rare.

Iran is the only country that has both been on the receiving end of a major act of physical cyber-sabotage and the perpetrator of such an attack. In 2008, the Stuxnet computer worm, created by the US and Israel was unleashed on Iran's nuclear programme.

In 2012, Iranian hackers struck Saudi Arabia's national oil company, Saudi Aramco, nearly obliterating its corporate IT infrastructure, and bringing the company close to collapse.

Aramco was a wake-up call for Iran's adversaries. Nearly four years on, just how strong are Iran's cyber capabilities and what, if anything, will Tehran seek to do with them?

"Their abilities are growing fast and they are diversifying. They're getting harder and harder to track," says one senior intelligence official from within the five-eyes alliance -- the digital intelligence-sharing group comprising Australia, Canada, New Zealand, the UK and US. "There is certainly a big move towards having more destructive capability. They want to be able to do more Aramcos. Right now they are researching, practising." Tehran says it spends $1bn a year on cyber programmes.

While its industrial oil production systems were unaffected, Aramco was nearly fatally compromised because so much of its corporate infrastructure was destroyed. Company officials had to use typewriters and faxes to try and keep billions of dollars of oil trades from falling through. Domestically, the company gave oil away for several days following the attack because it could not process transactions.

Christina Kubecka, a cyber security expert who worked for the oil company, told CNN last year that company officials flew to Southeast Asia to acquire as many computer hard drives as they could straight off factory floors.

But the Aramco incident was also a relatively unsophisticated hack. One senior security consultant who worked for the Saudi government in 2012 told the Financial Times that during the very early stages of the operation, the Iranian infiltrators -- who dubbed themselves the Cutting Sword of Justice - - stumbled on a Word document saved on an IT department hard drive, entitled: "Administrator passwords".

Iran's other big cyber operation at that time was Operation Ababil, attributed to a hacking group known as the Cyber Fighters of Izz ad-Din al-Qassam. It launched crude, but sustained attacks to try to overwhelm the websites of some of the US's largest banks. The group claimed no allegiance, but two senior western intelligence officials and other independent cyber security experts say it was an Iranian proxy.

In March this year, the US justice department brought charges against seven Iranians who it said were responsible for the attacks. All worked for Iranian companies -- fronts, said prosecutors, for Tehran's Islamic Revolutionary Guards Corps.

The attacks were "the first shot across the bow", says John Hultquist, director of cyber espionage analysis at iSight. "Since Aramco [and Ababil], we have seen significant development from Iran in terms of their operations and capabilities. I wouldn't call them top tier in sophistication yet, but if I were to list off the most important threats globally -- I would put them [in] there. The [importance] of what they are going after, and their sheer aggression, that's the issue."

Lethal kittens and cleavers

Two hacking groups in particular highlight the development of Iran's cyber capabilities. The first, known as Rocket Kitten, has been closely tracked by many in the cyber security industry since 2014.

FireEye, a US digital security company, first identified it as "Ajax security team", noting its use of a spear-phishing campaign -- the use of legitimate-looking emails to snare targeted victims into opening malicious attachments or following links -- to target Iranian dissidents and Israeli organisations. By 2015, however, other cyber security groups realised that Rocket Kitten, as it was rechristened, was using its own customised malware, not just off-the-shelf code, and was broadening its reach.

Last November, lapses in the Rocket Kitten security procedures allowed the US firm Check Point to access the hackers' own software platform, called "Oyun". Check Point discovered a sophisticated user-friendly application and within it a list of more than 1,842 "projects" -- individuals targeted by hackers. When they ran through the list, they came up with a comprehensive breakdown of Rocket Kitten's targets: 18 per cent were Saudi, 17 per cent from the US, 16 per cent Iranian and 5 per cent Israeli. They ranged from defence officials and contractors, to dissidents, journalists and politicians.

Two intelligence officials, one from Europe and the other from the Middle East, separately told the FT that Rocket Kitten was linked to the IRGC, which, they both added, dominates Tehran's cyber warfare agenda.

It is a second IRGC-backed group, however, that is of even more interest to western defence and security experts.

In December 2014, Cylance, a US cyber security firm, informed its clients of the activities of Iranian hackers engaged in a project it called Operation Cleaver. Based on a forensic analysis of the hackers' activities, Cylance pointed to a group that dubbed itself "Tarh Andishan" -- "the thinkers" in Farsi -- as being behind the action. The research pointed to government- backed organisations as being ultimately responsible.

Cylance declared Iran "the new China" for its aggressive actions in cyber space. Its report detailed a sophisticated online campaign, tracked over two years, that was using custom-built malware to deliberately infect and gain access to sensitive industrial control systems and critical infrastructure in companies across the globe.

The hackers behind Cleaver successfully infected the computers of hundreds of companies and sensitive organisations, from military systems, to oil and gas production controls, to airport and airline security databases. The countries hit hardest were not just the regional and traditional foes of Iran. They included places such as South Korea and Canada.

"What Cleaver really brought to the surface was that these guys were aggressive, compromising critical infrastructure in missions that did not have any classic espionage outcome?...?the Iranians aren't getting into airports and oil and gas companies for intelligence collection?...?these are systems to compromise in order to do harm," says Mr Hultquist. "What was really eye-opening is that they were doing it globally."

Complex picture

Knowing what Iran is technically capable of is only part of the picture. Since 2012, when Ayatollah Ali Khamenei, the Islamic republic's supreme leader, established the supreme cyber council, it has been hardliners that have dominated control of it.

"[Cyber] is folded into the larger context of political and military relationships that the [Iranian] leadership has to sit down and calculate, 'When do I want to do this?'," says Jim Lewis, director of technology and public policy at the Washington-based Center for Strategic and International Studies.

Much of Iran's capability in cyber space stems from its efforts to control dissent and monitor émigrés in the wake of protests triggered by the flawed 2009 election and emergence of the Green movement. The Basij militias -- the paramilitary, pro-regime forces under the direction of the IRGC -- that were crucial in suppressing those protests are now a critical part of Iran's cyber force.

A second, more sophisticated and highly trained group within the guards is responsible for activities such as those seen in operation Cleaver, says one senior British security official.

Iran's proxy cyber forces form a third component with Tehran accused of being one of the world's most active cyber "proliferators", providing damaging malware to groups such as Hizbollah, the Lebanese Shia militants. Such arrangements do raise questions over command and control -- and just what is being done in Iran's name without explicit sanction from Tehran.

In the months since the nuclear deal, MalCrawler, whose digital honeytraps are still in use, collecting data, has noticed a tail-off in Iranian activity. "We're in a period of reorganisation in cyber space," says Mr Chowdhury.

But few expect that to remain the case. "In the short term, as sanctions come off, they want stability," says one Israeli official, "so they are rethinking their attacks. But people need to understand that they are developing capabilities for use years from now."

Cyber, he says, is as core to Iran's strategy as its ballistic missile programme.

"Before cyber they were powerless," says CSIS's Mr Lewis. "They had to sit there and take it. We had sanctions, we had aircraft carriers off their coast. Now with cyber they can strike back."

La Tribune (France)

Sous-marins : les cinq clés du succès de DCNS en Australie

Wednesday, 27 April 2016

Byline: Michel Cabirol

Section: general

Paris - Le succès de DCNS en Australie est à la fois surprenant et logique. Surprenant parce que gagner chez les Wallabies pour un groupe français de défense est une véritable gageure tant ce pays partage des intérêts stratégiques intimes avec les États-Unis, puis dans un second temps avec les pays du Pacifique comme le Japon. Logique également car l'offre de DCNS était imbattable sur le plan technologique et industrielle. N'en déplaise à tous les adeptes du french-bashing, le groupe naval avait le meilleur sous-marin de la compétition en Australie, loin devant le sous- marin japonais et celui proposé sur le papier par l'allemand ThyssenKrupp Marine Systems (TKMS).
Encore fallait-il en convaincre les Australiens ainsi que les Américains, qui n'étaient pas franchement pro-DCNS selon les médias australiens, et, surtout, être capable de le démontrer au sein d'une équipe de France soudée. Sur ce dernier point, ce ne fût pas toujours le cas en coulisse... mais le succès effacera tout. En dépit de ces parasites, la France a toutefois montré officiellement à l'Australie une équipe oeuvrant sur la même longueur d'ondes. Comme savent le faire les Allemands à chaque compétition.

Le réalisme à la française a donc payé dans une compétition qui était imperdable sur le plan technique pour DCNS mais que le groupe naval aurait pu perdre. Car l'histoire des négociations de très grands contrats d'armement montre que très souvent la balance a penché plus sur des critères politiques qu'opérationnels. C'est donc tout à l'honneur de l'Australie, qui s'engage pour 50 ans avec DCNS, d'avoir choisi le meilleur sous-marin pour ces marins dans le cadre d'une consultation qui a été "menée de façon très rigoureuse" , indique-t-on dans l'entourage du ministre de la Défense, Jean-Yves Le Drian.

"L'offre française présentait les meilleures capacités pour répondre aux besoins uniques de l'Australie", a assuré le Premier ministre australien Malcolm Turnbull à Adélaïde, où les sous-marins seront construits. Les 12 sous-marins, a-t-il expliqué, seront "les vaisseaux les plus sophistiqués construits dans le monde".

1/ Le Shortfin Barracuda, le nec plus ultra de la compétition

Face à ses deux rivaux japonais et allemand, DCNS a mis en compétition un sous-marin océanique de plus de 95 mètres de long pour plus de 4.000 tonnes de déplacement en plongée, un navire dérivé du sous-marin nucléaire d'attaque (SNA) Barracuda, le Shortfin Barracuda Block 1A qui dispose d'une propulsion hybride (diesel et électrique). Dans sa version nucléarisée, le Barracuda existe bel et bien. Les premiers essais à la mer sont d'ailleurs programmés en 2017. C'est la première fois que DCNS proposait de partager avec un pays étranger les technologies mises au point pour le Barracuda, qualifiées de joyaux de la couronne par la direction générale de l'armement (DGA).

Selon le gouvernement australien, le sous-marin proposé par DCNS offre "des performances supérieures en matière de senseurs et de furtivité, ainsi que des capacités de projection et d'endurance similaires à celles des sous- marins de la classe Collins", les sous-marins actuellement en service dans la marine australienne.

Le bâtiment est doté d'un système de propulsion avec des pompes-hélices plutôt que d'hélices classiques afin de réduire son empreinte sonore. En outre, selon la directrice générale en charge du développement de DCNS, Marie-Pierre de Bailliencourt, le Shortfin Barracuda offre les "meilleures capacités opérationnelles" en termes d'architecture et de technologies. Notamment il offre une "supériorité acoustique, la meilleure discrétion et va garantir aux Australiens la meilleure autonomie et la meilleure endurance à la mer, c'est-à-dire sa capacité à mener de longues patrouilles" , a-t-elle précisé.

Du côté de ses rivaux, TKMS n'avait aucun sous-marin à proposer de la taille des 4.000 tonnes, le plus gros qu'il ait construit étant le sous-marin d'attaque de 2.200 tonnes, le Dolphins II en service en Israël. Dans ce cadre, TKMS, qui a par ailleurs déjà deux ans de retard dans le programme de sous-marins singapouriens, proposait pour satisfaire au cahier des charges du programme "SEA 1000" le programme Type 216, un bâtiment basé sur les sous-marins 212/214. Avec l'AIP, il aurait eu un rayon d'action de 4.815 km (2.600 nautiques). Mais ce n'était encore qu'un projet contrairement au Shortfin Barracuda. "TKMS a promis la lune en sur-vendant leurs technologies et ont été très bruyants surt la partie industrielle" , analyse une source proche du dossier.

Le consortium, composé de l'État, de Mitsubishi Heavy Industries et de Kawasaki Heavy Industries proposait quant à lui à la marine australienne le sous- marins de type Soryu, long de 84 mètres et déplaçant 4.200 tonnes en plongée. Toutefois, il était moins performant en plongée en eau très profonde, le Barracuda allant beaucoup plus profondément. Le Soryu avait également des problèmes techniques sur la double-coque. Enfin, les industriels japonais, qui sont engagés dans un important programme de renouvellement des sous-marins de la marine japonaise, n'avaient pas non plus les forces nécessaires pour réaliser les bâtiments australiens.

2/ Une équipe de France soudée officiellement

En dépit des sourires qui illuminent aujourd'hui le visage des industriels et des étatiques français, cela n'a pas été facile de mener une équipe de France soudée au succès en Australie. Très clairement, de nombreuses questions se sont posées dans le milieu de la défense sur la façon dont DCNS menait les discussions avec l'Australie. Ces critiques sont restées dans "la famille" de la défense ou presque...Le dossier français a été amélioré au fur et à mesure des discussions qu'a eu le groupe naval avec les Australiens dans le cadre du dialogue compétitif. Notamment le volet industriel a bien été renforcé de façon à réduire l'écart avec les Allemands dont ce volet était le point fort.

Pour autant, le PDG de DCNS, Hervé Guillou, avec sa foi de charbonnier, a cru très tôt à un possible succès dès son arrivée à l'été 2014 à la barre du groupe naval. A l'issue de sa visite le 1er novembre 2014 à Albany en Australie pour le centenaire en hommage des soldats australiens et néo-zélandais (ANZAC) morts en Europe au cours de la Première Guerre Mondiale, Jean-Yves Le Drian y croit aussi. Tant mieux. Car personne n'imagine alors un succès de DCNS en Australie tant les Japonais sont archi- favoris. Ils sont déjà quasi-choisis par le gouvernement précédent.

Pour Jean-Yves Le Drian, DCNS doit arriver au moins en deuxième position derrière les Japonais, qui, juge-t-on en France, ont fait une offre incertaine. Ce qui a été in fine le cas. Canberra a estimé selon la presse que l'offre japonaise posait "un risque considérable" compte tenu du manque d'expérience de Tokyo dans la construction navale à l'étranger. Le ministère de la Défense se met alors en ordre de marche de la même manière que pour les campagnes Rafale. Tous les quinze jours, il organise dès la fin de l'année 2014 une réunion de suivi très détaillée de la campagne en présence d'Hervé Guillou, de responsables de Thales, de la DGA, de l'état-major des armées et du chef d'état-major de la marine ainsi que d'un représentant du ministère des Affaires étrangères. "Il y a eu une très forte intégration des équipes étatiques et industrielles autour de Jean-Yves Le Drian" , assure-t-on dans l'entourage du ministre.

Des entreprises telles que Total, Schneider Electric, Vivendi, Technip et même Airbus... donnent de temps en temps des coups de main à l'équipe France. Bref, la fibre patriotique française joue à fonds. En tant que représentant spécial pour les relations avec l'Australie, le franco-australien Ross McInness, président du conseil d'administration de Safran, a également oeuvré pour le dossier français. Parallèlement, des délégations australiennes viennent à plusieurs reprises à Cherbourg en toute discrétion pour mieux comprendre l'offre française. "Il a fallu leur expliquer comment nous avions construit le coût du programme, quel était le niveau de risques, comment nous comptions gérer les approvisionnements... , précise-t-on à la Tribune. Il a également fallu leur expliquer les écarts de prix selon le lieu de fabrication des sous-marins : en France, en Australie ou un mixte" .

Jean-Yves Le Drian continue de son côté à se démener discrètement pour DCNS. Lors d'un voyage à Washington le 6 juillet, il interroge le ministre de la Défense Ashton Carter, sur la position des États-Unis sur ce dossier. On lui assure alors la neutralité des Américains. En février 2016, le ministre de la Défense retourne en Australie à Sydney, Canberra et Adélaïde, où seront fabriqués les sous-marins australiens dans le chantier navals publics australiens ASC. Il présente à nouveau au Premier ministre australien les arguments de l'offre française. Courant avril, la France apprend que le dossier s'accélère. La semaine dernière, François Hollande écrit à Malcolm Turnbull pour lui rappeler la volonté de la France d'entretenir une coopération stratégique sur le long terme avec l'Australie.

3/ Une relation stratégique de haut niveau

"Nous n'avons pas fait une offre sur un produit mais une offre sur un partenariat sur 50 ans avec l'Australie" , explique-t-on chez DCNS à La Tribune. Car au vu du fiasco de la coopération sur les Collins entre le chantier naval suédois Kockums et l'Australie, qui a traumatisé Canberra, les Australiens ne souhaitaient pas se tromper une nouvelle fois. "Ils cherchaient un allié fiable" , explique- t-on chez DCNS. Ainsi, l'accord de gouvernement à gouvernement (G to G) a fait partie intégrante des 21 points de l'offre française. L'Australie a pu être rassurée également par la capacité de la France à garder une industrie sous-marinière sur une très longue durée pour fournir à la Marine nationale - notamment des sous-marins nucléaires lanceurs d'engins (SNLE) jusqu'en 2085 - et à accompagner et qualifier des programmes complexes grâce à la DGA. "Il ont été rassurés par la stabilité et la pérennité du partenariat qu'on leur proposai t", affirme-t-on dans l'entourage du ministre.

"Notre capacité opérationnelle est sans comparaison avec les deux autres pays , assure-t-on en outre dans l'entourage du ministre. A l'image de l'Australie, nous avons une marine océanique capable de mener des missions de longue durée à travers tous les océans" . Ce qui n'est pas le cas de l'Allemagne, qui reste essentiellement en mer Baltique et en Mer du Nord, et du Japon, dont la zone de navigation est également restreinte que celle de la France. "Les Australiens ont beaucoup insisté sur ce volet" , précise-t-on au ministère. C'est dans ce cadre que la marine française a apporté son soutien au projet de DCNS. Le groupe aéronaval (GAN) français parti en fin d'année dernière dans le golfe persique pour lutter contre Daech a accueilli dans son escorte la frégate australienne HMAS Melbourne.

Au-delà du soutien de Canberra à la France dans le cadre de la lutte contre le djihadisme international (escorte du porte-avions Charles-de-Gaulle et ravitaillement des avions de combat français par des tankers australiens dans le cadre de l'opération Chammal en Irak), la France et l'Australie partagent "une grande proximité d'analyse" dans leurs réflexions stratégiques au regard de leur livre blanc sur la défense, observe-t-on dans l'entourage du ministre. Tout comme la France, l'Australie a identifié trois grandes menaces : un pays qui menace la souveraineté (Chine), la menace du terrorisme transnational (combattants australiens au sein de Daech) et, enfin, le risque de déstabilisation d'une région par des Etats faillis comme les Fidji après le putsch de décembre 2006 .

Par ailleurs, la non-livraison des Mistral à la Russie en 2014 a permis à la France de présenter une offre, assure-t-on dans l'entourage du ministre. L'Australie a été l'un des pays qui a le plus interrogé la France sur le dossier des Mistral. Enfin, Paris aurait continué son partenariat stratégique avec Canberra même en cas d'échec.

4/ Une proposition industrielle attractive

Face à la soi-disant " Deutsche Qualität" de l'Allemagne, la France a mis les bouchées doubles pour présenter une offre industrielle attractive et séduisante pour l'Australie. La France a très vite compris qu'elle devait aider Canberra à développer des capacités industrielles de souveraineté nationale pour compenser une dépense de plus de 34 milliards d'euros. Les transferts de technologies (ToT) étaient donc l'une des clés majeures de la compétition. D'autant plus que les Australiens, très déçus par les faibles retours industriels du programme Collins, ont toute la capacité à absorber les ToT.

DCNS possède une longue expérience de coopération au niveau international avec les succès du Scorpène au Brésil, en Malaisie et en Inde où à chaque fois le groupe naval a transféré de la technologie. En revanche, TKMS voulait industrialiser l'Australie en emmenant dans ses bagages sa supply chain et les Japonais n'avaient aucune expérience en ToT pour un programme de cette envergure. Contrairement à DCNS et ses partenaires, qui ont préféré s'appuyer sur l'industrie australienne pour développer cette fameuse industrie de souveraineté nationale. DCNS a signé des accords d'exclusivité avec les huit principales universités australiennes, dont l'hydrodynamisme (dynamisme des fluides), les matériaux composites, les fluides anti-corrosion... En outre, DCNS a audité 250 entreprises australiennes pour expertiser leur solidité sur le long terme.

Thales, un atout pour DCNS en Australie

"Thales est un industriel de confiance en Australie , a résumé le PDG de Thales, Patrice Caine. Cela a aidé DCNS a faire le break face aux Allemands" . En tant que sous-systémier du groupe américain qui sera retenu pour le cerveau des sous- marins (CMS ou systèmes de gestion de combat) -Lockheed Martin ou Raytheon - , le groupe d'électronique vise "potentiellement" 1 milliard de prises de commandes comme la fourniture de sonars et d'équipements de communications, de guerre électronique et d'optronique pour les sous-marins que doit fournir DCNS à l'Australie. Thales, qui emploie quelque 3.200 personnes en Australie, a déjà fourni au pays les sonars et des équipements d'optronique et de communications pour ses sous-marins, a-t-il rappelé.

Straits Times

Don't be a victim of cyber attacks

Wednesday, 27 April 2016

Section: general

Singapore - It all started with my business card. It was all the hacker needed to start a chain of events that ended with me clicking on a dubious link on a website.
Earlier this month, I had approached security firm Trend Micro to conduct an experiment: they would attempt to hack me and my colleague, Lisabel Ting.

Cybercrime is on the rise; the number of such incidents almost doubled in 2015 from the previous year, according to crime statistics released by the Singapore Police Force in February.

Earlier this month, the Government announced in Parliament that a new cyber security Bill will be introduced in 2017 to strengthen measures against online crime.

The purpose of the Trend Micro experiment was to find out how easy - or difficult - it is for cyber attacks to succeed. Trend Micro's senior research manager Ryan Flores crafted a spear-phishing e-mail that impersonated my former boss, someone I know and trust. For Lisabel, Mr Flores had created a fake Facebook profile of her friend in order to get close to her.

Spear-phishing starts with the cyber criminal researching the target to create e-mails that appear to come from trusted sources. They could be a colleague or business partner. These e-mails may include content relevant to the target's interests or industry. Because these e-mails appear authentic, the target is more likely to download an attachment or open a link in them, which are openings for malware to be installed on your device.

For instance, cyber criminals could install a keylogger that records your key strokes to find out your passwords.

Ransomware is another form of malware used in cyber scams. "The hacker would lock the user out of his device and demand a ransom to unlock it. Personal information could also be used to blackmail the user," explained Mr Flores.

Spear-phishing is not new, but it is increasingly easy to use because of the vast amount of personal information available on social media such as Facebook and LinkedIn. These days, anything from a person's movie preferences to the home address can be found in an online search. Photos can reveal a person's social circles and travel information will show a person's location, said Intel Security's vice-president David Freer.

In fact, Singapore was ranked third globally in terms of spear-phishing attacks, according to Symantec's annual Internet Security Threats 2015 report.

The high number of spear-phishing attempts in Singapore could be because of its status as a regional financial hub, with many potential targets for cyber criminals, said Symantec's senior director Peter Sparkes.

In other words, these cyber hits could be targeted at employees in order to compromise their organisations. A high-profile example is a 2011 incident that occurred at RSA, the American security firm known for its two-factor authentication product. An RSA employee fell victim to a spear-phishing e-mail that contained malware giving the criminals remote access to his computer and company network. As a result, sensitive company data was stolen.

To prevent yourself from becoming a victim of cyber attacks, here are five tips compiled from security experts at Symantec, Intel Security and Trend Micro:

Keep your browser, operating system and security software updated to prevent malware from affecting your computer, in the event that you open a malicious attachment or link. But note that there are often new vulnerabilities that may not have been patched in time.

Be cautious about sharing the details of your life on social media. Personal information, such as the name of your primary school or pet nickname may be used in security questions asked by online accounts to verify users during password recovery.

If an online deal sounds too good to be true, it probably is. Avoid clicking on such links. Hover the mouse over the link to check if it leads to a reputable website.

Vary the names of your e-mail accounts - do not use the same alias for multiple accounts. Each account should have its own unique and strong password (mix of alpha-numeric characters).

Use the incognito or private browsing modes offered by browsers, especially when accessing the Internet at a public location.

Iran Daily

US, Canada to join Iranian crude customers

Wednesday, 27 April 2016

Section: general

Tehran - Iran has begun negotiations with American and Canadian oil companies on petrochemical sales, technology purchase as well as investment in the country's oil and gas projects.
Following the removal of nuclear- related sanctions, new oil agreements were to be inked with major European firms like Shell, BP, Eni, Total and Repsol though North American companies seem to have overtaken them in launching oil talks with Iran, Mehr News Agency reported.

Accordingly, over the past few months several American and Canadian companies have initiated talks on implementing projects in upstream and midstream sections of Iranian oil, gas and petrochemical industries aiming to make investments, sell goods and equipment, offer drilling services as well as to purchase oil products of Iran.

Iran's Minister of Oil Bijan Zanganeh had previously pointed to negotiations with several American companies like General Electric, stressing "the talks have been constructive."

In addition, Managing Director of National Iranian Oil Company Rokneddin Javadi has rejected the existence of legal restrictions or prohibitions on making oil deals or joint investments with North American companies especially American ones; "Iran is ready to sell oil to all world countries except for the Zionist regime."

In time with the return of General Electric to the negotiations table, Halliburton Company of the US has also conducted talks with the National Iranian Drilling Company on offering certain technical services as

the likelihood of signing oil agreements with the American firm has increased for launching new drilling projects with Iranian private and state companies.

Managing Director of the National Petrochemical Company (NPC) Marzieh Shah-Daei touched upon certain talks with a number of American companies on running new cooperation in petrochemical industries maintaining "no direct talks has been conducted with American oil giants"

Shah-Daei said the axis of talks with the American-European company has been purchase of technical knowledge asserting "direct investment in Iranian petrochemical industries on the part of American companies is not currently at stake."

Meanwhile, some managers of Iranian petrochemical firms have reported on receiving proposals from American companies on exports of certain petrochemical and polymer products like different grades of PVC powder.

Also, Head of Technology and Research at Iranian Offshore Oil Company (IOOC) Javad Rostami had noted "the project to examine economic justification and feasibility of Binaloud oilfield has been handed over to a Canadian company; "currently, we are looking forward to receiving the final report by the company," he had asserted.

Head of Oil Industry Equipment Producing Association Reza Khiamian also reported on talks with Canadian oil equipment producers adding "in addition to the North American country, some negotiations have been held with European countries like France and Germany."

Khiamian further enumerated main axes of talks between Iranian and Canadian companies including "knowledge and technology transfer, establishment of a production line for manufacturing advanced industrial equipment as well as investment attraction."

On Monday, Director of DMC Process Project at Research Institute of Petroleum Industry (RIPI) Mansur Bazmi also reported on collaborations with a Canadian company on construction of an oil desalination plant; "Iran and Canada will both participate in the construction the facilities."

Is your fleet hacker-proof?

Wednesday, 27 April 2016

Byline: Stephen Brennan

Section: general

Dubai - Traffic accidents killed 675 people in the UAE last year and injured a further 6,863. The advent of driverless cars holds the promise to cut this to a fraction.
The full societal potential of the technology goes far further -- from providing a lifeline to the old, to cutting down on traffic congestion and freeing up family time.

What's vital is that government and motor industry executives take the necessary steps to ensure that driverless cars are protected from malicious hackers, learning from other industries research and experience, so that the public can profit from this transformative technology.

It's important to get things into perspective before indulging in science fiction fantasies of runaway cars causing havoc on our roads. Much of the technology already exists. For example, autopilot controls most of the routine portion of aircraft flights.

Airlines increasingly mandate computer control for extreme weather conditions, where computers can react swiftly, predictably and without panic.

Nonetheless, the autonomy and connectivity of driverless cars does leave them open to attacks from malicious cybercriminals or terrorists. The principal threats are three-fold:

First, hackers could gain control of an individual car, either to cause mischief, or at the extreme end turn it into a missile.

Second, they could use the car's systems to intrude on the privacy of individuals, by tracking their movements and access personal or otherwise sensitive data (although considering most of us carry around a smartphone this is hardly a unique threat).

Third, and potentially most damaging, hackers could use the inherent connectivity of driverless vehicles to disrupt an entire city. It's not hard to imagine thousands of cars parked motionless on Shaikh Zayed road.

It happens most rush hours, but if these fleets were being controlled to produce maximum disruption over days, this would have serious implications for emergency services and the economy of Dubai.

There are clear steps that carmakers, and their governmental regulators, can take to ensure that any risk from cyberattack is minimised. The airline industry has already led the way with its focus and enhancements on deterministic ethernet.

Carmakers need to ensure that control systems are managed in an organised and systematic manner rather than simply bolted on to the general internet connectivity of the vehicle.

It's vital to look after three 'A's of computer security: authentication, authorisation and accounting. Authentication provides a way of identifying a user with advanced cryptography. This ensures that the car's central processing unit knows exactly who or what it's receiving information from and giving commands to at all times.

Authorisation ensures that each part of the system gives appropriate commands; it's perfectly acceptable for the neighbouring car to be providing its positional data to avoid a crash; it's not for the car to cause your engine to stop.

Third, all the information needs to be accounted for. It's inevitable some accidents will happen, and it's vital that a record is kept of all events for subsequent analysis just like a plane's black box.

Cybersecurity concerns should not stop a revolution, which according to tech entrepreneur Elon Musk may be only a few years away, but security does need to be built in at a foundational level to ensure the world gains the benefits and minimises the risks.

International Bank Transfer System Hacked

Wednesday, 27 April 2016

Section: general

Tehran - Swift, the global financial network that banks use to transfer billions of dollars every day, has warned its customers it is aware of "a number of recent cyber incidents" where attackers had sent fraudulent messages over its system.
The disclosure came as law enforcement authorities in Bangladesh and elsewhere investigated the cyber theft of US$81m (£55.9m) from the Bangladesh central bank account at the New York Federal Reserve. Swift has acknowledged the scheme involved altering Swift software on Bangladesh Bank's computers to hide evidence of fraudulent transfers, Guardian reported.

Monday's statement from Swift marked the first acknowledgement that the Bangladesh Bank attack was not an isolated incident but one of several recent criminal schemes that aimed to take advantage of the global messaging platform used by some 11,000 financial institutions.

"Swift is aware of a number of recent cyber incidents in which malicious insiders or external attackers have managed to submit Swift messages from financial institutions' back offices, PCs or workstations connected to their local interface to the Swift network," the group warned customers.

The warning, which Swift issued in a confidential alert sent over its network, did not name any victims or disclose the value of any losses from the previously undisclosed attacks. Swift confirmed to Reuters the authenticity of the notice.

Swift, or the Society for Worldwide Interbank Financial Telecommunication, is a cooperative owned by 3,000 financial institutions.

Also on Monday, Swift released a security update to the software that banks use to access its network to thwart malware that security researchers with British defence contractor BAE Systems said was probably used by hackers in the Bangladesh Bank heist.

BAE's evidence suggested that hackers manipulated Swift's Alliance Access server software, which banks use to interface with Swift's messaging platform, to cover their tracks. BAE said it could not explain how the fraudulent orders were created and pushed through the system.

But Swift provided some evidence about how that happened in its note to customers, saying that in most cases the attackers obtained valid credentials for operators authorised to create and approve Swift messages, then submitted fraudulent messages by impersonating those people.

Cyber security experts said more attacks could surface as Swift banking clients look to see if their access had been compromised.

Shane Shook, a banking security consultant, said hackers were turning to Swift and other private financial messaging platforms because they could steal larger amounts. "These hacks specifically target financial institutions because smaller efforts result in much larger thefts," he said. "It's much more efficient than stealing from consumers."

Justin Harvey, chief security officer with Fidelis Cybersecurity, said hackers followed the money and would be drawn into such schemes in hopes of emulating a big heist like the one on Bangladesh Bank. "After the Bangladesh Bank heist became public, every other attacker out there is looking to see if they can do the same," he said.

Swift spokeswoman Natasha Deteran told Reuters that the commonality in these cases was that internal or external attackers compromised the banks' own environments to obtain valid operator credentials. "Customers should do their utmost to protect against this," she said in an email to Reuters.

Swift told customers that the security update must be installed by 12 May. "We have made the Alliance interface software update mandatory as it is designed to help banks identify situations in which

attackers have attempted to hide their traces - whether these actions have been executed manually or through malware," she said.

Canada Is Considering Spying on Kids to Stop Cyberbullying

Wednesday, 27 April 2016

Byline: Jordan Pearson

Section: general

Toronto - Cyberbullying is simply awful, and its consequences can be utterly horrific. Canadians have known this all too well since 17-year-old Rehtaeh Parsons' suicide in 2013, after photos of her alleged rape circulated online.
It's only human to want to put a stop to it. But is it worth spying on kids?

To wit, the Canadian government is looking for a person or organization to "conduct an evaluation of an innovative cyberbullying prevention or intervention initiative" in a "sample of school- aged children and youth," according to a tender notice published by Public Safety Canada last week.

Although nothing has been finalized, the government will consider letting the organization spy on kids' digital communications to do it, Barry McKenna, the Public Safety procurement consultant in charge of the tender, told me.

"The tender doesn't preclude or necessarily require digital monitoring," said McKenna. "But there are certainly products on the market that do that, and I would guess that that kind of intervention would be one of interest."

The school board overseeing the school used in the study would have to sign off on digital surveillance of kids, McKenna said, and so would Public Safety. McKenna would not disclose whether any person or organization has responded to the tender yet. The government has budgeted $60,000 for the program, the notice states.

"Cyberbullying isn't a technological problem"

"Any use by government of technology to scan the internet and read somebody's communications obviously raises privacy issues," said David Fraser, a Canadian privacy lawyer consulting on a new cyberbullying law for Nova Scotia. "Fewer privacy issues if it's following an intervention and it's targeted," he continued, "way more if they're trying to single out kids in Canada and assess what they're saying."

"What we've seen come out of Public Safety and most law enforcement agencies is a pretty un-nuanced, heavy- handed, over the top model," Fraser added. Nova Scotia's previous cyberbullying law, passed in the wake of Parsons' suicide, was ruled unconstitutional and struck down for being too broad and infringing on people's civil rights.

If the Public Safety study ends up taking a more blanket approach to monitoring kids instead of targeting surveillance after an incident, it could also risk undermining communication between kids and their teachers or parents, according to US Cyberbullying Research Center co- director Sameer Hinduja.

"Installing tracking apps undermines any sort of open-minded communication [that] youth-serving adults might have with these kids, because you're tracking them surreptitiously," said Hinduja. "Kids, as they get older, want more privacy and freedom. It's natural--you want it, and I want it."

This isn't the first time somebody has considered surveillance as a solution to the complex social issue of kids being absolutely horrific to each other, and it likely won't be the last. In 2013, The LA Times noted that the Glendale Unified School District in Southern California reportedly paid a firm $40,000 to monitor kids' social media accounts to combat bullying. The move raised the ire of privacy advocates in the US then, too.

The point, according to Hinduja, is that bullying isn't a uniquely digital problem. You don't solve bullying forever by putting a teacher in every hallway, and you don't fix crime by putting a cop on every corner.

"Cyberbullying isn't a technological problem," said Hinduja. "You can't blame the apps, the smartphones, or the internet. Instead, cyberbullying is rooted in other issues that everyone has been dealing with since the beginning of time: adolescent development, kids learning to manage their problems, and dealing with stress."

Needs to Revive the Encryption Debate It Had in the 1990s

Wednesday, 27 April 2016

Byline: Matthew Braga

Section: Comment

Comment: In the wake of a court battle between Apple and the FBI, American lawmakers have been considering a new policy on encryption, on the basis that strong technological protections are making it difficult for law enforcement and intelligence agencies to solve crime.
Such a policy, which would mandate a so-called backdoor in encryption software, would inevitably compromise the security of all communications, privacy advocates have argued. And yet, given the gravity of the situation, in Canada there has been no similar debate. At least, not recently.

Though largely forgotten today, the Canadian federal government actually did have an encryption debate of its own in the late 1990s. It brought law enforcement together with experts to discuss encryption's role in a then-early internet, and the potential impacts on national security and public safety that might arise from encryption's use.

What's most fascinating is how closely the arguments from two decades prior mirror those that are being made today. Though technology has come a long way since then, looking back at Canada's own debate shows that some of the arguments being made today by politicians and law enforcement in the US are still stuck in the past.

"We all came to the conclusion that [legislation] would be the death-knell for [...] secure communications online," said Ann Cavoukian, who served as the Information and Privacy Commissioner of Ontario from 1997 to 2014. "We thought it had died, and here it is again."

18 law enforcement agencies, including the RCMP and CSIS, even called for "mandatory access" to encryption keys

US lawmakers and experts previously engaged in a pair of fierce cryptographic fights that came to a head in 1994: the first, over the passing of the Communications Assistance for Law Enforcement Act, or CALEA, an American wiretapping law that dictates when and how telecommunications companies have to assist law enforcement and intelligence agencies engage in electronic surveillance; and the second, over a US-government backed encryption scheme called Clipper, a special computer chip that, when installed in a phone, would give the National Security Agency backdoor access to otherwise encrypted communications.

Ultimately, CALEA passed--with compromises--and the Clipper chip was scrapped. It was in this context, the aftermath of the Crypto Wars to the south, that the Canadian government decided to have its own debate.

In January 1999, a Senate Special Committee on Terrorism and Public Safety released a report on threats to public safety and national security, and listed encryption as an emerging issue. Based on interviews with law enforcement, academics, telecommunications companies and members of the financial community, the committee reiterated many of the same arguments that can still be heard today: that encryption is making law enforcement's job harder; that backdoors built into encryption mechanisms for

government use could just as easily be used by criminals; and that undermining encryption would compromise the security of financial systems too.

18 law enforcement agencies, including the RCMP and CSIS, even called for "mandatory access" to encryption keys used to protect stored data and data in transit. In what has become an oft-used turn-of-phrase, police argued that "they do not seek increased investigative capabilities through mandatory key access or otherwise, but instead seek only to restore and maintain their existing investigative capabilities."

In the end, no cryptography policy was proposed, and the committee recommended law enforcement and intelligence agencies seek other methods to overcome the obstacle of encryption. However, the committee did recommend amending the Criminal Code "to provide lawful access to encryption keys by law enforcement and security intelligence organizations and to criminalize encryption when used in the commission of a crime."

These recommendations were never adopted. It's not clear why, but it's likely that the government chose to follow the lead of countries such as the US, which had backed down from similar schemes.

As the RCMP previously told Motherboard, there is no power in the Criminal Code specific to encryption. According to Scott Bardsley, press secretary for Public Safety Minister Ralph Goodale's office, police can either compel a third party to decrypt data with judicial authorization, or they may attempt to decrypt the data themselves.

When asked if the Canadian government was planning on revisiting the encryption debate, Barsdley would only tell Motherboard that "broad public consultations on national security issues" are planned in the "medium term." But Cavoukian would be happy if there was no debate at all.

"I would prefer no discussion, because if there's no discussion, you're not resurrecting the discussion of the 90s," she said. "To me, we put the issue to bed."

Globe and Mail

Ransomware poses complex legal and reputational risks

Wednesday, 27 April 2016

Byline: Brent Arnold & Christopher Oates

Section: Comment

Comment: As businesses and public institutions increasingly become the targets of ransomware - malware that blocks access to computer systems or the information they contain until the user performs actions demanded by hackers - legal risks surrounding such headlinemaking attacks have come to the fore in Canadian corporate consciousness.
A January report by the Online Trust Alliance reveals that ransomware attacks aimed at companies are not only growing more prevalent, but they are also becoming more sophisticated. Today's hackers can custom tailor their demands according to the size and market value of their corporate mark. Making matters worse, last month Apple's iOS operating system was infected with ransomware for the first time.

Ransomware typically gains access to a computer system when a user clicks on unfamiliar links or strange attachments (although a growing number of programs are infecting computers via the download of ostensibly legitimate applications).

In its most benign form, an infection could force employees to complete a survey; at its most malignant, it has strongarmed companies into paying actual ransoms (typically in the nationless and virtually untraceable currency of bitcoin).

Businesses that fail to comply face the destruction of client and proprietary data, and intellectual property - not to mention sustaining significant reputational damage and exposure to third-party lawsuits from clients and consumers (and there is never any guarantee that meeting hackers' demands will result in computers or data being unlocked).

Despite this growing threat, legal recourses for ransomware victims are slim. The activity is, of course, illegal and should be immediately reported to police (the RCMP also suggest reporting to the Canadian Anti-Fraud Centre). But despite the fact that such attacks have been reported for more than a decade, there are no documented cases of ransomware perpetrators ever having been prosecuted in Canada.

Given the often remote nature of the crime (the few attacks that have been successfully traced typically come from foreign countries), criminal and civil remedies may be unlikely to succeed.

In the rare event a cybercriminal is identified, civil proceedings against foreign nationals are most likely to result in default judgments that are difficult if not impossible to collect on.

While cybercriminals frequently avoid prosecution, their corporate victims may find themselves in the legal spotlight. Recent amendments to the Personal Information Protection and Electronic Documents Act (PIPEDA) will soon require companies subject to PIPEDA to alert the federal privacy commissioner, affected individuals and relevant organizations or government institutions following a breach of security safeguards that "creates a real risk of significant harm to the individual."

This can include risk of economic loss by the person whose personal information is subject to the breach, as well as potential reputational harms.

While reporting obligations provide an important consumer protection and will be a legal necessity in certain cases (companies that fail to report where required by PIPEDA may be subject to fines of up to $100,000), they are nonetheless problematic for businesses - particularly those for whom data security is a critical component of their brand identity. Recent hacks have shaken consumer and shareholder confidence and resulted in both significant disruption for targeted businesses and resignations by top executives.

All indicators suggest ransomware will only become more vicious and prevalent in the foreseeable future. With added reporting pressure looming on the horizon, companies that fall prey may soon find themselves facing complex legal and reputational risks.

Brent Arnold and Christopher Oates are lawyers at Gowling WLG, whose practices focus heavily on technology- and privacy-related matters.

Washington Post

FBI says it can't explain how iPhone was hacked

Wednesday, 27 April 2016

Byline: Ellen Nakashima

Section: general

Washington - The FBI intends to tell the White House this week that its understanding of how a third party hacked the iPhone of a shooter in San Bernardino, Calif., is so limited that there's no point in undertaking a government review of whether the tool should be shared with Apple, officials said. The decision, said officials familiar with the discussion who spoke on the condition of anonymity, ends several weeks of internal debate by bureau lawyers and technical experts about the FBI's obligation to disclose the method.

Last month, the FBI paid more than $1 million for a tool to crack an iPhone used by one of the shooters in California. But the contract did not include rights to the software flaws that went into the tool, officials said.

As a result, the bureau has a limited technical understanding of how the method worked, officials said.

On Tuesday, FBI Director James B. Comey acknowledged the internal debate.

"The threshold is: Are we aware of the vulnerability, or did we just buy a tool and don't have sufficient knowledge of the vulnerability that would implicate the process?" he said at a cyber conference at Georgetown University.

Comey was referring to a process, led by the White House, in which agencies such as the FBI, National Security Agency (NSA) and Homeland Security Department debate whether to disclose a computer software flaw discovered by the government to the software maker so the company can fix it.

Most flaws are disclosed, the White House has said. But some are kept secret so that the law enforcement or intelligence agency can use them in intelligence- gathering or criminal investigations.

The FBI's decision to not submit to a review of the method used in the San Bernardino case was first reported by the Wall Street Journal.

Some security experts said the bureau or the NSA could reverse-engineer the tool to gain information about the flaws. But the bureau was not likely to do so, several officials said.

"If what we have bought is a tool, and we've said that we won't reverse-engineer the tool such that you can figure out what vulnerability is used to make the tool work, then even if we wanted to disclose something, there's nothing we can disclose," one senior administration official said.

The FBI recovered the iPhone of Syed Rizwan Farook, one of the shooters in the December terrorist attack in San Bernardino, but could not access the data on it because it did not know Farook's passcode. In February, the Justice Department obtained a court order to force Apple to write software that would disable several phone security features so the FBI could try to crack the code.

Apple challenged the order, arguing that the court had no basis to issue it and that it would set a dangerous precedent. In late March, the FBI disclosed that a third party had come forward with a tool to help it gain access to the phone and so it no longer needed the court order to force Apple's assistance.

Security and privacy advocates then began to push the bureau to disclose to Apple the flaws on which the tool was based so the tech giant could repair them.

Last month, professional hackers or vulnerabilities researchers brought flaws they had found to a company whose name the FBI has not disclosed.

Apple has said it will not press for the vulnerabilities to be disclosed.

"We're confident that the vulnerability the government alleges to have found will have a short shelf life," a lawyer for Apple told reporters earlier this month. "In our normal process . . . we'll continue to improve the phones and at some point this fix will get implemented."

Times of Israel

Operational Cyber Intelligence

Wednesday, 27 April 2016

Section: general

Jerusalem - Visitors to the CyberTech 2016 exhibition had the impression that every single exhibitor boasted a cyber intelligence capability. Indeed, cyber intelligence (or threat intelligence) has evolved into one of the hottest trends of the cyber technology industry in the last few years. Even the relatively small Israeli market generates massive demand for intelligence services and some ten product and service companies are involved in this activity, competing one another.
The regulator has not remained idle either. According to Directive #361 of the Banking Supervisor at the Bank of Israel, financial institutions must use intelligence in addition to the other security mechanisms they employ. So, apparently everyone is talking about cyber intelligence and many people would like to know how to consume it, but what, in fact, is cyber intelligence and how does it help users to defend themselves against threats?

Cyber intelligence produces operational insights by looking outside the organization and issuing alerts of imminent and future threats to the organization. The type of intelligence may be categorized according to the manner in which the information is collected and analyzed and the manner in which the final product is used. Roughly, the world of cyber intelligence is divided into three categories: technical intelligence, tactical intelligence and operational intelligence.

Technical Intelligence Technical intelligence constitutes the overwhelming majority of intelligence sold around the world. This intelligence category is based on a method adopted from military intelligence, known as Signals Intelligence (SigInt), which consists of the interception of electronic signals and deriving information from those signals. In the Internet world, this refers to the characteristics of web traffic (IP address, server locations and so forth), as well as to malware indicators. Combining these data makes it possible to identify suspicious traffic to and from the organization, and to block it.

Organizations and suppliers that collect intelligence of this category deploy networks of sensors to identify suspicious traffic and IP addresses suspected of disseminating malware and junk mail. This information is delivered in a digital format directly to the security systems (Firewalls, Anti-Virus

software) and enables them to block undesirable elements. The primary disadvantage of this intelligence category is the fact that it is essentially responsive, namely - it identifies and handles attacks that have already taken place somewhere in the digital space. It cannot effectively identify new attacks that have not been documented, analyzed and translated into 'signatures'.

The various approaches that attempt to solve this problem through mathematical/statistical analysis of behavior patterns are plagued by a high percentage of false positive 'noise' messages. Additionally, these technical intelligence models do not normally produce insights regarding potential attacks, and no conclusions may be derived from them for the purpose of making tactical or strategic security decisions. Additionally, the widespread use of robotic networks (botnets) for offensive purposes makes spotting and prevention extremely difficult.

Tactical Intelligence The second intelligence category is tactical intelligence. This category is about spotting and identifying preparations for an attack, identifying information that leaked from the organization and analyzing the technological capabilities and motivation of the attackers, as well as their development methods and attack vectors, with the intention of providing early warning prior to the attack. This intelligence category relies on Human Intelligence (HumInt) or the translation thereof to the web world - WebInt - plus complementary technical intelligence.

This intelligence activity is similar to the ages-old methodology of operating agents who collect information directly and pass it on to their operators for analysis, processing and subsequent action, combined with field intelligence specialists who analyze the 'combat doctrines' of the various opponents, their possible attack objectives, methods for extensive cyber warfare operations and so forth.

HumInt in the cyber world includes the creation of virtual personae, or 'Avatars', planting them in attacker groups or in organized crime forums, passively 'monitoring' their discussions and reporting the information to the operator. The product of this intelligence- gathering effort is normally a report that concludes the activity and offers recommended courses of action, or in more uncommon cases - a concrete early warning of an intended attack.

This intelligence category suffers from a dual disadvantage - as it involves entities operated by humans, the coverage span of the intelligence being collected is limited. A good cyber analyst can operate 2-5 entities simultaneously, but there are dozens of forums in which he should operate. After the intelligence has been produced, it is submitted to the end user as a report that he should read, analyze and then make decisions regarding possible courses of action. Naturally, this burdens the end user (normally the Chief Information Security Officer - CISO) who suffers from substantial manpower gaps to begin with.

"Most of the Intelligence being produced is not utilized" The objective of intelligence is to support the security layout. Without such a layout, intelligence is of no significance. For this reason, only mature organizations seek intelligence after they had already deployed the standard solutions and as they now

wish to enhance their security. For these organizations, the intelligence should provide a sort of early warning against attacks. In reality, however, technical intelligence does not produce such alerts and tactical intelligence produces generalized alerts.

This is the reason why most of the intelligence being produced for cyberspace is not utilized - it does not pertain to the organization directly. Clients who gain experience using cyber intelligence services stop consuming those services after a while, as they find no direct value in them and as they do not have available, skilled personnel for assimilating and implementing the intelligence they are provided with. Consequently, the world is becoming disillusioned with cyber intelligence as a sub-activity of the cyber technology world. In a very short period of time, numerous companies were acquired or stricken off the market (Sight Partners and IID were acquired by FireEye and Norse has ceased to operate recently). Apparently, the market is maturing and now seeks tactical solutions with a high degree of automation.

Operational Intelligence The third category of cyber intelligence, which begins to stand out as a separate activity, is operational intelligence. It derives from the change in the security concept. Instead of securing the peripheral boundaries of the organization, which means primarily deploying security assets for the purpose of identifying and stopping the attack or the attacker - developing prompt capabilities for identifying an attack and neutralizing the damage it attempts to inflict. This approach is an adaptation to the cyber threats of the active routine security concept used in the field of national security.

One of the companies that offers an operational intelligence solution is the Sixgill Company of Yokne'am, Israel. This company develops a platform capable of producing intelligence effectively as it allows a small number of analysts to 'dominate' an extensive pool of sources in the Darknet - forums, 'stores' that sell credit cards and 'Dumps' (websites that publish large amounts of data stolen from various elements).

As the system produces alerts automatically, it directs the analysts to analyze the information and derive operational insights. The CEO of Sixgill, Avi Kashtan, told us that the system was developed in cooperation with one of the world's leading banks that uses it daily to spot preparations for attacks, employee and customer data that leaked or was stolen and more general information about future trends.

The operational intelligence approach calls for information that consists primarily of methods, processes and combat and active defense doctrines. It empowers the doctrinal and technical elements cyber intelligence can extract from the space where the opponents organize and conduct their administrative activities. Instead of searching for information regarding a specific attack against the organization, operational cyber intelligence focuses on analyzing the opponents' combat doctrines, weapon systems and attack and operational scenarios. This approach shifts the center of gravity from advance identification and blocking - which were proven to be ineffective, to the ability to respond and block the outcome of the attack within the organizational environment or in its immediate vicinity.

Reuters

FBI decides provisionally not to share iPhone unlock: sources

Wednesday, 27 April 2016

Byline: Mark Hosenball, Dustin Volz

Section: general

Washington - The FBI has provisionally decided not to share an iPhone unlocking mechanism used by a contractor to open the phone of one of the San Bernardino shooters because the agency does not own the mechanism, two U.S. government sources said on Tuesday.
The FBI is expected within days to write to the White House explaining why the agency cannot share the unlocking mechanism with other government agencies, Apple or other third parties, said the sources, who asked to remain anonymous.

Several U.S. government sources said the FBI contractor that unlocked the shooter's phone was a foreign entity and did not give U.S. authorities details of the mechanism. Without that, the FBI could not share it even if it wanted to, sources said.

Reuters reported on April 13 that the unnamed contractor had sole ownership of the method it used, making it unlikely that the government could share it.

A day later, the FBI warned Apple of a separate flaw in its iPhone and Mac software, the company told Reuters on Tuesday.

It was the first time the government had alerted Apple to a vulnerability under a White House interagency procedure, known as the Vulnerabilities Equities Process, for reviewing technology security flaws and deciding which ones should be made public, the company said.

The FBI's provisional decision means that the unlocking mechanism used on the San Bernardino iPhone will not be referred to the interagency procedure for review.

Earlier on Tuesday, FBI Director James Comey said his agency was assessing whether the mechanism would go through the review.

"We are in the midst of trying to sort that out," Comey said.

Officials have said that the interagency review process leans toward disclosure of technological flaws. But it is not set up to handle or reveal flaws which are discovered and owned by private companies, sources have told Reuters.

Comey's comments appeared to confirm the FBI did not own the method used to crack the county-owned work phone belonging to Syed Farook, who with his wife opened fire in December on a San Bernardino, Calif., holiday party, killing 14 and wounding 22.

The method instead belongs to a still-unidentified third party that the FBI said came forward due to the attention received from its public pursuit of a court order to compel Apple's assistance in unlocking the phone.

Apple's refusal to comply prompted a high-profile standoff and fueled a long-simmering debate over security, privacy and law enforcement access to encrypted technology.

The government withdrew its case after it said the hacking method worked. Comey has said the method works on a "narrow slice" of iPhone 5c devices running iOS 9.

An Apple senior executive told reporters earlier this month that it was confident the flaw used by the third party would have a "short shelf life" and be patched through the firm's ongoing efforts to improve the security of its devices.

Reuters

After the Snowden NSA leaks, fewer people are searching for info on terror groups online (Canada)

Wednesday, 27 April 2016

Byline: Joseph Menn

Section: general

San Francisco - nternet traffic to Wikipedia pages summarizing knowledge about terror groups and their tools plunged nearly 30 percent after revelations of widespread Web monitoring by the U.S. National Security Agency, suggesting that concerns about government snooping are hurting the ordinary pursuit of information.
A forthcoming paper in the Berkeley Technology Law Journal analyzes the fall in traffic, arguing that it provides the most direct evidence to date of a so-called "chilling effect," or negative impact on legal conduct, from the intelligence practices disclosed by fugitive former NSA contractor Edward Snowden.

Author Jonathon Penney, a fellow at the University of Toronto's interdisciplinary Citizen Lab, examined monthly views of Wikipedia articles on 48 topics identified by the U.S. Department of Homeland Security as subjects that they track on social media, including Al Qaeda, dirty bombs and jihad.

In the 16 months prior to the first major Snowden stories in June 2013, the articles drew a variable but an increasing audience, with a low point of about 2.2 million per month rising to 3.0 million just before disclosures of the NSA's Internet spying programs. Views of the sensitive pages rapidly fell back to 2.2 million a month in the next two months and later dipped under 2.0 million before stabilizing below 2.5 million 14 months later, Penney found.

The traffic dropped even more to topics that survey respondents deemed especially privacy-sensitive. Viewership of a presumably "safer" group of articles about U.S. government security forces decreased much less in the same period.

Penney's results, subjected to peer-review, offer a deeper dive into an issue investigated by previous researchers, including some who found a 5.0 percent drop in Google searches for sensitive terms immediately after June 2013. Other surveys have found sharply increased use of privacy-protecting Web browsers and communications tools.

Penney's work may provide fodder for technology companies and others arguing for greater restraint and disclosure about intelligence-gathering. Chilling effects are notoriously difficult to document and so have limited impact on laws and court rulings.

More immediately, the research could aid a lawsuit filed by the American Civil Liberties Union on behalf of Wikipedia's nonprofit parent organization and other groups against the NSA and the Justice Department.

The year-old suit argues that intelligence collection from backbone Internet traffic carriers violated the Fourth Amendment ban on unreasonable searches.

Wall Street Journal

Pentagon Won't Give Islamic State Clues on Cyber Strategy

Wednesday, 27 April 2016

Byline: Damian Paletta

Section: general

Washington - The Pentagon is being careful not to reveal the precise ways it is targeting Islamic State through the use of expanded cyber weaponry, concerned that any clues could help the terror network avoid future attacks.
Adm. Mike Rogers, head of U.S. Cyber Command and the National Security Agency, said Tuesday that the Pentagon's use of computer tactics to confront Islamic State is part of its broader campaign to defeat the group. Speaking at Georgetown University, however, he wouldn't say what those tactics are or what the impact has been.

"I'm not going to go into specifics of what we're doing," Adm. Rogers said. "We are working against an adaptive, agile opponent. I'm not interested in giving them any advantage."

In February, the White House and Pentagon began speaking more openly about the government's use of cyberweapons to confront Islamic State, saying it was meant to complement military strikes that have killed a number of the terror network's senior officials in recent months. The public mentions of these computer tools marked a first for the Pentagon, which is usually much more secretive about its use of cyberattacks against foreign groups.

Officials have said the tactics include actions like disrupting Islamic State's ability to communicate, sowing confusion among its members, and steering militants toward certain tools that are easier for the U.S. government to intercept or track.

The true impact of these cyberattacks, however, is unclear. Some people who follow Islamic State's use of social media, for example, say they have seen some change in how militants communicate, but that the group hasn't abandoned traditional methods altogether.

The government's use of these tactics has fed a long-standing tension between intelligence agencies and the military. Intelligence agencies generally want to use any access to an adversary's computer networks to monitor information, while military leaders often see benefit in destroying those networks.

Military and intelligence officials have had numerous discussions about the best way to address this dilemma when confronting Islamic State, people familiar with the matter said. Those discussions are expected to continue.

Presidential front-runners Hillary Clinton and Donald Trump have both expressed frustration that Islamic State continues to use computers and software encryption tools to communicate, recruit and plan attacks. They have proposed taking steps that limit or eliminate Islamic State's access to computers in places like Raqqa, Syria, and Mosul, Iraq.

As recently as several months ago, there were four active Internet cafes in Raqqa, people familiar with the matter said, and Islamic State was careful about monitoring who logged onto Internet devices there and how those devices were used.

Intelligence officials have known about these Internet cafes for months, and it is unclear if the new tactics by Cyber Command are aimed at targeting such locations or pursuing militants and leaders on the battlefield.

The U.S. government has launched a separate effort to work with tech companies including Facebook Inc. and Twitter Inc., hoping to make it harder for violent extremists to use those social media tools.

Iran opens a new front in cyber warfare

Tuesday, 26 April 2016

Byline: Sam Jones

Section: general

London - The first neighbourhood they unplugged was Olaya, Riyadh's wealthiest and gaudiest central district. By the time they had finished their rampage through the computer systems behind the power grid, the infiltrators believed they had left millions without electricity, crippling hospitals and military facilities.
What the hackers, whose use of Farsi and bespoke malware gave away their Iranian origins, did not realise was that the critical computer networks they had compromised were fake.

The network, complete with Arabic scripting and precise names of individual substations and pylons, was the work of MalCrawler, a cyber security group specialising in protecting industrial computer systems. It was just one of a set of intricate digital honeytraps designed to gauge the intentions of the attackers who routinely tried to crack into the systems owned by MalCrawler's clients. Equally intricate models were made of European, American and Israeli power systems.

The evidence from the models aligned. The Chinese hungrily scooped up anything that looked like novel technical information. The Russians permeated deep into systems, mapping them and implanting hard-to-find backdoor access for potential future use. But neither dared do damage -- unlike Iran.

Among the world's big five cyber superpowers -- the US, UK, Israel, Russia and China -- MalCrawler concluded there was a digital equilibrium in military cyber offence based on assumptions over deterrence and reprisal.

"But in the Middle East, that's not the case at all," says Dewan Chowdhury, MalCrawler's chief executive. "The mindset just seemed completely different -- it wasn't espionage or some kind of targeted operation necessarily, it was just to do as much damage as possible."

The model MalCrawler designed to replicate the Israeli power grid was hit just as hard as the Saudi one. The hackers, again displaying tell-tale signs of Iranian origin, fatally compromised the safety systems of what they thought was one of Israel's nuclear power stations.

Iran is rapidly emerging as the sixth member of the cyber superpower club. Denuded of its nuclear ambitions by the landmark deal struck last year to limit uranium and plutonium enrichment, some fear Tehran will wield its cyber arsenal as an equally long-range weapon with which to menace its adversaries.

"Before the [nuclear] deal, cyber was just one option they used for leverage, but now, post deal, it is even more central to their toolkit," says one senior Middle Eastern intelligence official. "Iran is poised to do something in cyber that will change the way the world looks at it?...?the US knows this. [The US] saw what they [Iran] did during the agreement and they know what they are doing after it."

Industrial sabotage

While high-tech espionage is rife -- for strategic state advantage and commercial and criminal gain -- destructive acts of cyber attack remain rare.

Iran is the only country that has both been on the receiving end of a major act of physical cyber-sabotage and the perpetrator of such an attack. In 2008, the Stuxnet computer worm, created by the US and Israel was unleashed on Iran's nuclear programme.

In 2012, Iranian hackers struck Saudi Arabia's national oil company, Saudi Aramco, nearly obliterating its corporate IT infrastructure, and bringing the company close to collapse.

Aramco was a wake-up call for Iran's adversaries. Nearly four years on, just how strong are Iran's cyber capabilities and what, if anything, will Tehran seek to do with them?

"Their abilities are growing fast and they are diversifying. They're getting harder and harder to track," says one senior intelligence official from within the five-eyes alliance -- the digital intelligence-sharing group comprising Australia, Canada, New Zealand, the UK and US. "There is certainly a big move towards having more destructive capability. They want to be able to do more Aramcos. Right now they are researching, practising." Tehran says it spends $1bn a year on cyber programmes.

While its industrial oil production systems were unaffected, Aramco was nearly fatally compromised because so much of its corporate infrastructure was destroyed. Company officials had to use typewriters and faxes to try and keep billions of dollars of oil trades from falling through. Domestically, the company gave oil away for several days following the attack because it could not process transactions.

Christina Kubecka, a cyber security expert who worked for the oil company, told CNN last year that company officials flew to Southeast Asia to acquire as many computer hard drives as they could straight off factory floors.

But the Aramco incident was also a relatively unsophisticated hack. One senior security consultant who worked for the Saudi government in 2012 told the Financial Times that during the very early stages of the operation, the Iranian infiltrators -- who dubbed themselves the Cutting Sword of Justice - - stumbled on a Word document saved on an IT department hard drive, entitled: "Administrator passwords".

Iran's other big cyber operation at that time was Operation Ababil, attributed to a hacking group known as the Cyber Fighters of Izz ad-Din al-Qassam. It launched crude, but sustained attacks to try to overwhelm the websites of some of the US's largest banks. The group claimed no allegiance, but two senior western intelligence officials and other independent cyber security experts say it was an Iranian proxy.

In March this year, the US justice department brought charges against seven Iranians who it said were responsible for the attacks. All worked for Iranian companies -- fronts, said prosecutors, for Tehran's Islamic Revolutionary Guards Corps.

The attacks were "the first shot across the bow", says John Hultquist, director of cyber espionage analysis at iSight. "Since Aramco [and Ababil], we have seen significant development from Iran in terms of their operations and capabilities. I wouldn't call them top tier in sophistication yet, but if I were to list off the most important threats globally -- I would put them [in] there. The [importance] of what they are going after, and their sheer aggression, that's the issue."

Lethal kittens and cleavers

Two hacking groups in particular highlight the development of Iran's cyber capabilities. The first, known as Rocket Kitten, has been closely tracked by many in the cyber security industry since 2014.

FireEye, a US digital security company, first identified it as "Ajax security team", noting its use of a spear-phishing campaign -- the use of legitimate-looking emails to snare targeted victims into opening malicious attachments or following links -- to target Iranian dissidents and Israeli organisations. By 2015, however, other cyber security groups realised that Rocket Kitten, as it was rechristened, was using its own customised malware, not just off-the-shelf code, and was broadening its reach.

Last November, lapses in the Rocket Kitten security procedures allowed the US firm Check Point to access the hackers' own software platform, called "Oyun". Check Point discovered a sophisticated user-friendly application and within it a list of more than 1,842 "projects" -- individuals targeted by hackers. When they ran through the list, they came up with a comprehensive breakdown of Rocket Kitten's targets: 18 per cent were Saudi, 17 per cent from the US, 16 per cent Iranian and 5 per cent Israeli. They ranged from defence officials and contractors, to dissidents, journalists and politicians.

Two intelligence officials, one from Europe and the other from the Middle East, separately told the FT that Rocket Kitten was linked to the IRGC, which, they both added, dominates Tehran's cyber warfare agenda.

It is a second IRGC-backed group, however, that is of even more interest to western defence and security experts.

In December 2014, Cylance, a US cyber security firm, informed its clients of the activities of Iranian hackers engaged in a project it called Operation Cleaver. Based on a forensic analysis of the hackers' activities, Cylance pointed to a group that dubbed itself "Tarh Andishan" -- "the thinkers" in Farsi -- as being behind the action. The research pointed to government- backed organisations as being ultimately responsible.

Cylance declared Iran "the new China" for its aggressive actions in cyber space. Its report detailed a sophisticated online campaign, tracked over two years, that was using custom-built malware to deliberately infect and gain access to sensitive industrial control systems and critical infrastructure in companies across the globe.

The hackers behind Cleaver successfully infected the computers of hundreds of companies and sensitive organisations, from military systems, to oil and gas production controls, to airport and airline security databases. The countries hit hardest were not just the regional and traditional foes of Iran. They included places such as South Korea and Canada.

"What Cleaver really brought to the surface was that these guys were aggressive, compromising critical infrastructure in missions that did not have any classic espionage outcome?...?the Iranians aren't getting into airports and oil and gas companies for intelligence collection?...?these are systems to compromise in order to do harm," says Mr Hultquist. "What was really eye-opening is that they were doing it globally."

Complex picture

Knowing what Iran is technically capable of is only part of the picture. Since 2012, when Ayatollah Ali Khamenei, the Islamic republic's supreme leader, established the supreme cyber council, it has been hardliners that have dominated control of it.

"[Cyber] is folded into the larger context of political and military relationships that the [Iranian] leadership has to sit down and calculate, 'When do I want to do this?'," says Jim Lewis, director of technology and public policy at the Washington-based Center for Strategic and International Studies.

Much of Iran's capability in cyber space stems from its efforts to control dissent and monitor émigrés in the wake of protests triggered by the flawed 2009 election and emergence of the Green movement. The Basij militias -- the paramilitary, pro-regime forces under the direction of the IRGC -- that were crucial in suppressing those protests are now a critical part of Iran's cyber force.

A second, more sophisticated and highly trained group within the guards is responsible for activities such as those seen in operation Cleaver, says one senior British security official.

Iran's proxy cyber forces form a third component with Tehran accused of being one of the world's most active cyber "proliferators", providing damaging malware to groups such as Hizbollah, the Lebanese Shia militants. Such arrangements do raise questions over command and control -- and just what is being done in Iran's name without explicit sanction from Tehran.

In the months since the nuclear deal, MalCrawler, whose digital honeytraps are still in use, collecting data, has noticed a tail-off in Iranian activity. "We're in a period of reorganisation in cyber space," says Mr Chowdhury.

But few expect that to remain the case. "In the short term, as sanctions come off, they want stability," says one Israeli official, "so they are rethinking their attacks. But people need to understand that they are developing capabilities for use years from now."

Cyber, he says, is as core to Iran's strategy as its ballistic missile programme.

"Before cyber they were powerless," says CSIS's Mr Lewis. "They had to sit there and take it. We had sanctions, we had aircraft carriers off their coast. Now with cyber they can strike back."

La Tribune (France)

Sous-marins : les cinq clés du succès de DCNS en Australie

Wednesday, 27 April 2016

Byline: Michel Cabirol

Section: general

Paris - Le succès de DCNS en Australie est à la fois surprenant et logique. Surprenant parce que gagner chez les Wallabies pour un groupe français de défense est une véritable gageure tant ce pays partage des intérêts stratégiques intimes avec les États-Unis, puis dans un second temps avec les pays du Pacifique comme le Japon. Logique également car l'offre de DCNS était imbattable sur le plan technologique et industrielle. N'en déplaise à tous les adeptes du french-bashing, le groupe naval avait le meilleur sous-marin de la compétition en Australie, loin devant le sous- marin japonais et celui proposé sur le papier par l'allemand ThyssenKrupp Marine Systems (TKMS).
Encore fallait-il en convaincre les Australiens ainsi que les Américains, qui n'étaient pas franchement pro-DCNS selon les médias australiens, et, surtout, être capable de le démontrer au sein d'une équipe de France soudée. Sur ce dernier point, ce ne fût pas toujours le cas en coulisse... mais le succès effacera tout. En dépit de ces parasites, la France a toutefois montré officiellement à l'Australie une équipe oeuvrant sur la même longueur d'ondes. Comme savent le faire les Allemands à chaque compétition.

Le réalisme à la française a donc payé dans une compétition qui était imperdable sur le plan technique pour DCNS mais que le groupe naval aurait pu perdre. Car l'histoire des négociations de très grands contrats d'armement montre que très souvent la balance a penché plus sur des critères politiques qu'opérationnels. C'est donc tout à l'honneur de l'Australie, qui s'engage pour 50 ans avec DCNS, d'avoir choisi le meilleur sous-marin pour ces marins dans le cadre d'une consultation qui a été "menée de façon très rigoureuse" , indique-t-on dans l'entourage du ministre de la Défense, Jean-Yves Le Drian.

"L'offre française présentait les meilleures capacités pour répondre aux besoins uniques de l'Australie", a assuré le Premier ministre australien Malcolm Turnbull à Adélaïde, où les sous-marins seront construits. Les 12 sous-marins, a-t-il expliqué, seront "les vaisseaux les plus sophistiqués construits dans le monde".

1/ Le Shortfin Barracuda, le nec plus ultra de la compétition

Face à ses deux rivaux japonais et allemand, DCNS a mis en compétition un sous-marin océanique de plus de 95 mètres de long pour plus de 4.000 tonnes de déplacement en plongée, un navire dérivé du sous-marin nucléaire d'attaque (SNA) Barracuda, le Shortfin Barracuda Block 1A qui dispose d'une propulsion hybride (diesel et électrique). Dans sa version nucléarisée, le Barracuda existe bel et bien. Les premiers essais à la mer sont d'ailleurs programmés en 2017. C'est la première fois que DCNS proposait de partager avec un pays étranger les technologies mises au point pour le Barracuda, qualifiées de joyaux de la couronne par la direction générale de l'armement (DGA).

Selon le gouvernement australien, le sous-marin proposé par DCNS offre "des performances supérieures en matière de senseurs et de furtivité, ainsi que des capacités de projection et d'endurance similaires à celles des sous- marins de la classe Collins", les sous-marins actuellement en service dans la marine australienne.

Le bâtiment est doté d'un système de propulsion avec des pompes-hélices plutôt que d'hélices classiques afin de réduire son empreinte sonore. En outre, selon la directrice générale en charge du développement de DCNS, Marie-Pierre de Bailliencourt, le Shortfin Barracuda offre les "meilleures capacités opérationnelles" en termes d'architecture et de technologies. Notamment il offre une "supériorité acoustique, la meilleure discrétion et va garantir aux Australiens la meilleure autonomie et la meilleure endurance à la mer, c'est-à-dire sa capacité à mener de longues patrouilles" , a-t-elle précisé.

Du côté de ses rivaux, TKMS n'avait aucun sous-marin à proposer de la taille des 4.000 tonnes, le plus gros qu'il ait construit étant le sous-marin d'attaque de 2.200 tonnes, le Dolphins II en service en Israël. Dans ce cadre, TKMS, qui a par ailleurs déjà deux ans de retard dans le programme de sous-marins singapouriens, proposait pour satisfaire au cahier des charges du programme "SEA 1000" le programme Type 216, un bâtiment basé sur les sous-marins 212/214. Avec l'AIP, il aurait eu un rayon d'action de 4.815 km (2.600 nautiques). Mais ce n'était encore qu'un projet contrairement au Shortfin Barracuda. "TKMS a promis la lune en sur-vendant leurs technologies et ont été très bruyants surt la partie industrielle" , analyse une source proche du dossier.

Le consortium, composé de l'État, de Mitsubishi Heavy Industries et de Kawasaki Heavy Industries proposait quant à lui à la marine australienne le sous- marins de type Soryu, long de 84 mètres et déplaçant 4.200 tonnes en plongée. Toutefois, il était moins performant en plongée en eau très profonde, le Barracuda allant beaucoup plus profondément. Le Soryu avait également des problèmes techniques sur la double-coque. Enfin, les industriels japonais, qui sont engagés dans un important programme de renouvellement des sous-marins de la marine japonaise, n'avaient pas non plus les forces nécessaires pour réaliser les bâtiments australiens.

2/ Une équipe de France soudée officiellement

En dépit des sourires qui illuminent aujourd'hui le visage des industriels et des étatiques français, cela n'a pas été facile de mener une équipe de France soudée au succès en Australie. Très clairement, de nombreuses questions se sont posées dans le milieu de la défense sur la façon dont DCNS menait les discussions avec l'Australie. Ces critiques sont restées dans "la famille" de la défense ou presque...Le dossier français a été amélioré au fur et à mesure des discussions qu'a eu le groupe naval avec les Australiens dans le cadre du dialogue compétitif. Notamment le volet industriel a bien été renforcé de façon à réduire l'écart avec les Allemands dont ce volet était le point fort.

Pour autant, le PDG de DCNS, Hervé Guillou, avec sa foi de charbonnier, a cru très tôt à un possible succès dès son arrivée à l'été 2014 à la barre du groupe naval. A l'issue de sa visite le 1er novembre 2014 à Albany en Australie pour le centenaire en hommage des soldats australiens et néo-zélandais (ANZAC) morts en Europe au cours de la Première Guerre Mondiale, Jean-Yves Le Drian y croit aussi. Tant mieux. Car personne n'imagine alors un succès de DCNS en Australie tant les Japonais sont archi- favoris. Ils sont déjà quasi-choisis par le gouvernement précédent.

Pour Jean-Yves Le Drian, DCNS doit arriver au moins en deuxième position derrière les Japonais, qui, juge-t-on en France, ont fait une offre incertaine. Ce qui a été in fine le cas. Canberra a estimé selon la presse que l'offre japonaise posait "un risque considérable" compte tenu du manque d'expérience de Tokyo dans la construction navale à l'étranger. Le ministère de la Défense se met alors en ordre de marche de la même manière que pour les campagnes Rafale. Tous les quinze jours, il organise dès la fin de l'année 2014 une réunion de suivi très détaillée de la campagne en présence d'Hervé Guillou, de responsables de Thales, de la DGA, de l'état-major des armées et du chef d'état-major de la marine ainsi que d'un représentant du ministère des Affaires étrangères. "Il y a eu une très forte intégration des équipes étatiques et industrielles autour de Jean-Yves Le Drian" , assure-t-on dans l'entourage du ministre.

Des entreprises telles que Total, Schneider Electric, Vivendi, Technip et même Airbus... donnent de temps en temps des coups de main à l'équipe France. Bref, la fibre patriotique française joue à fonds. En tant que représentant spécial pour les relations avec l'Australie, le franco-australien Ross McInness, président du conseil d'administration de Safran, a également oeuvré pour le dossier français. Parallèlement, des délégations australiennes viennent à plusieurs reprises à Cherbourg en toute discrétion pour mieux comprendre l'offre française. "Il a fallu leur expliquer comment nous avions construit le coût du programme, quel était le niveau de risques, comment nous comptions gérer les approvisionnements... , précise-t-on à la Tribune. Il a également fallu leur expliquer les écarts de prix selon le lieu de fabrication des sous-marins : en France, en Australie ou un mixte" .

Jean-Yves Le Drian continue de son côté à se démener discrètement pour DCNS. Lors d'un voyage à Washington le 6 juillet, il interroge le ministre de la Défense Ashton Carter, sur la position des États-Unis sur ce dossier. On lui assure alors la neutralité des Américains. En février 2016, le ministre de la Défense retourne en Australie à Sydney, Canberra et Adélaïde, où seront fabriqués les sous-marins australiens dans le chantier navals publics australiens ASC. Il présente à nouveau au Premier ministre australien les arguments de l'offre française. Courant avril, la France apprend que le dossier s'accélère. La semaine dernière, François Hollande écrit à Malcolm Turnbull pour lui rappeler la volonté de la France d'entretenir une coopération stratégique sur le long terme avec l'Australie.

3/ Une relation stratégique de haut niveau

"Nous n'avons pas fait une offre sur un produit mais une offre sur un partenariat sur 50 ans avec l'Australie" , explique-t-on chez DCNS à La Tribune. Car au vu du fiasco de la coopération sur les Collins entre le chantier naval suédois Kockums et l'Australie, qui a traumatisé Canberra, les Australiens ne souhaitaient pas se tromper une nouvelle fois. "Ils cherchaient un allié fiable" , explique- t-on chez DCNS. Ainsi, l'accord de gouvernement à gouvernement (G to G) a fait partie intégrante des 21 points de l'offre française. L'Australie a pu être rassurée également par la capacité de la France à garder une industrie sous-marinière sur une très longue durée pour fournir à la Marine nationale - notamment des sous-marins nucléaires lanceurs d'engins (SNLE) jusqu'en 2085 - et à accompagner et qualifier des programmes complexes grâce à la DGA. "Il ont été rassurés par la stabilité et la pérennité du partenariat qu'on leur proposai t", affirme-t-on dans l'entourage du ministre.

"Notre capacité opérationnelle est sans comparaison avec les deux autres pays , assure-t-on en outre dans l'entourage du ministre. A l'image de l'Australie, nous avons une marine océanique capable de mener des missions de longue durée à travers tous les océans" . Ce qui n'est pas le cas de l'Allemagne, qui reste essentiellement en mer Baltique et en Mer du Nord, et du Japon, dont la zone de navigation est également restreinte que celle de la France. "Les Australiens ont beaucoup insisté sur ce volet" , précise-t-on au ministère. C'est dans ce cadre que la marine française a apporté son soutien au projet de DCNS. Le groupe aéronaval (GAN) français parti en fin d'année dernière dans le golfe persique pour lutter contre Daech a accueilli dans son escorte la frégate australienne HMAS Melbourne.

Au-delà du soutien de Canberra à la France dans le cadre de la lutte contre le djihadisme international (escorte du porte-avions Charles-de-Gaulle et ravitaillement des avions de combat français par des tankers australiens dans le cadre de l'opération Chammal en Irak), la France et l'Australie partagent "une grande proximité d'analyse" dans leurs réflexions stratégiques au regard de leur livre blanc sur la défense, observe-t-on dans l'entourage du ministre. Tout comme la France, l'Australie a identifié trois grandes menaces : un pays qui menace la souveraineté (Chine), la menace du terrorisme transnational (combattants australiens au sein de Daech) et, enfin, le risque de déstabilisation d'une région par des Etats faillis comme les Fidji après le putsch de décembre 2006 .

Par ailleurs, la non-livraison des Mistral à la Russie en 2014 a permis à la France de présenter une offre, assure-t-on dans l'entourage du ministre. L'Australie a été l'un des pays qui a le plus interrogé la France sur le dossier des Mistral. Enfin, Paris aurait continué son partenariat stratégique avec Canberra même en cas d'échec.

4/ Une proposition industrielle attractive

Face à la soi-disant " Deutsche Qualität" de l'Allemagne, la France a mis les bouchées doubles pour présenter une offre industrielle attractive et séduisante pour l'Australie. La France a très vite compris qu'elle devait aider Canberra à développer des capacités industrielles de souveraineté nationale pour compenser une dépense de plus de 34 milliards d'euros. Les transferts de technologies (ToT) étaient donc l'une des clés majeures de la compétition. D'autant plus que les Australiens, très déçus par les faibles retours industriels du programme Collins, ont toute la capacité à absorber les ToT.

DCNS possède une longue expérience de coopération au niveau international avec les succès du Scorpène au Brésil, en Malaisie et en Inde où à chaque fois le groupe naval a transféré de la technologie. En revanche, TKMS voulait industrialiser l'Australie en emmenant dans ses bagages sa supply chain et les Japonais n'avaient aucune expérience en ToT pour un programme de cette envergure. Contrairement à DCNS et ses partenaires, qui ont préféré s'appuyer sur l'industrie australienne pour développer cette fameuse industrie de souveraineté nationale. DCNS a signé des accords d'exclusivité avec les huit principales universités australiennes, dont l'hydrodynamisme (dynamisme des fluides), les matériaux composites, les fluides anti-corrosion... En outre, DCNS a audité 250 entreprises australiennes pour expertiser leur solidité sur le long terme.

Thales, un atout pour DCNS en Australie

"Thales est un industriel de confiance en Australie , a résumé le PDG de Thales, Patrice Caine. Cela a aidé DCNS a faire le break face aux Allemands" . En tant que sous-systémier du groupe américain qui sera retenu pour le cerveau des sous- marins (CMS ou systèmes de gestion de combat) -Lockheed Martin ou Raytheon - , le groupe d'électronique vise "potentiellement" 1 milliard de prises de commandes comme la fourniture de sonars et d'équipements de communications, de guerre électronique et d'optronique pour les sous-marins que doit fournir DCNS à l'Australie. Thales, qui emploie quelque 3.200 personnes en Australie, a déjà fourni au pays les sonars et des équipements d'optronique et de communications pour ses sous-marins, a-t-il rappelé.

Straits Times

Don't be a victim of cyber attacks

Wednesday, 27 April 2016

Section: general

Singapore - It all started with my business card. It was all the hacker needed to start a chain of events that ended with me clicking on a dubious link on a website.
Earlier this month, I had approached security firm Trend Micro to conduct an experiment: they would attempt to hack me and my colleague, Lisabel Ting.

Cybercrime is on the rise; the number of such incidents almost doubled in 2015 from the previous year, according to crime statistics released by the Singapore Police Force in February.

Earlier this month, the Government announced in Parliament that a new cyber security Bill will be introduced in 2017 to strengthen measures against online crime.

The purpose of the Trend Micro experiment was to find out how easy - or difficult - it is for cyber attacks to succeed. Trend Micro's senior research manager Ryan Flores crafted a spear-phishing e-mail that impersonated my former boss, someone I know and trust. For Lisabel, Mr Flores had created a fake Facebook profile of her friend in order to get close to her.

Spear-phishing starts with the cyber criminal researching the target to create e-mails that appear to come from trusted sources. They could be a colleague or business partner. These e-mails may include content relevant to the target's interests or industry. Because these e-mails appear authentic, the target is more likely to download an attachment or open a link in them, which are openings for malware to be installed on your device.

For instance, cyber criminals could install a keylogger that records your key strokes to find out your passwords.

Ransomware is another form of malware used in cyber scams. "The hacker would lock the user out of his device and demand a ransom to unlock it. Personal information could also be used to blackmail the user," explained Mr Flores.

Spear-phishing is not new, but it is increasingly easy to use because of the vast amount of personal information available on social media such as Facebook and LinkedIn. These days, anything from a person's movie preferences to the home address can be found in an online search. Photos can reveal a person's social circles and travel information will show a person's location, said Intel Security's vice-president David Freer.

In fact, Singapore was ranked third globally in terms of spear-phishing attacks, according to Symantec's annual Internet Security Threats 2015 report.

The high number of spear-phishing attempts in Singapore could be because of its status as a regional financial hub, with many potential targets for cyber criminals, said Symantec's senior director Peter Sparkes.

In other words, these cyber hits could be targeted at employees in order to compromise their organisations. A high-profile example is a 2011 incident that occurred at RSA, the American security firm known for its two-factor authentication product. An RSA employee fell victim to a spear-phishing e-mail that contained malware giving the criminals remote access to his computer and company network. As a result, sensitive company data was stolen.

To prevent yourself from becoming a victim of cyber attacks, here are five tips compiled from security experts at Symantec, Intel Security and Trend Micro:

Keep your browser, operating system and security software updated to prevent malware from affecting your computer, in the event that you open a malicious attachment or link. But note that there are often new vulnerabilities that may not have been patched in time.

Be cautious about sharing the details of your life on social media. Personal information, such as the name of your primary school or pet nickname may be used in security questions asked by online accounts to verify users during password recovery.

If an online deal sounds too good to be true, it probably is. Avoid clicking on such links. Hover the mouse over the link to check if it leads to a reputable website.

Vary the names of your e-mail accounts - do not use the same alias for multiple accounts. Each account should have its own unique and strong password (mix of alpha-numeric characters).

Use the incognito or private browsing modes offered by browsers, especially when accessing the Internet at a public location.

Iran Daily

US, Canada to join Iranian crude customers

Wednesday, 27 April 2016

Section: general

Tehran - Iran has begun negotiations with American and Canadian oil companies on petrochemical sales, technology purchase as well as investment in the country's oil and gas projects.
Following the removal of nuclear- related sanctions, new oil agreements were to be inked with major European firms like Shell, BP, Eni, Total and Repsol though North American companies seem to have overtaken them in launching oil talks with Iran, Mehr News Agency reported.

Accordingly, over the past few months several American and Canadian companies have initiated talks on implementing projects in upstream and midstream sections of Iranian oil, gas and petrochemical industries aiming to make investments, sell goods and equipment, offer drilling services as well as to purchase oil products of Iran.

Iran's Minister of Oil Bijan Zanganeh had previously pointed to negotiations with several American companies like General Electric, stressing "the talks have been constructive."

In addition, Managing Director of National Iranian Oil Company Rokneddin Javadi has rejected the existence of legal restrictions or prohibitions on making oil deals or joint investments with North American companies especially American ones; "Iran is ready to sell oil to all world countries except for the Zionist regime."

In time with the return of General Electric to the negotiations table, Halliburton Company of the US has also conducted talks with the National Iranian Drilling Company on offering certain technical services as

the likelihood of signing oil agreements with the American firm has increased for launching new drilling projects with Iranian private and state companies.

Managing Director of the National Petrochemical Company (NPC) Marzieh Shah-Daei touched upon certain talks with a number of American companies on running new cooperation in petrochemical industries maintaining "no direct talks has been conducted with American oil giants"

Shah-Daei said the axis of talks with the American-European company has been purchase of technical knowledge asserting "direct investment in Iranian petrochemical industries on the part of American companies is not currently at stake."

Meanwhile, some managers of Iranian petrochemical firms have reported on receiving proposals from American companies on exports of certain petrochemical and polymer products like different grades of PVC powder.

Also, Head of Technology and Research at Iranian Offshore Oil Company (IOOC) Javad Rostami had noted "the project to examine economic justification and feasibility of Binaloud oilfield has been handed over to a Canadian company; "currently, we are looking forward to receiving the final report by the company," he had asserted.

Head of Oil Industry Equipment Producing Association Reza Khiamian also reported on talks with Canadian oil equipment producers adding "in addition to the North American country, some negotiations have been held with European countries like France and Germany."

Khiamian further enumerated main axes of talks between Iranian and Canadian companies including "knowledge and technology transfer, establishment of a production line for manufacturing advanced industrial equipment as well as investment attraction."

On Monday, Director of DMC Process Project at Research Institute of Petroleum Industry (RIPI) Mansur Bazmi also reported on collaborations with a Canadian company on construction of an oil desalination plant; "Iran and Canada will both participate in the construction the facilities."

Is your fleet hacker-proof?

Wednesday, 27 April 2016

Byline: Stephen Brennan

Section: general

Dubai - Traffic accidents killed 675 people in the UAE last year and injured a further 6,863. The advent of driverless cars holds the promise to cut this to a fraction.
The full societal potential of the technology goes far further -- from providing a lifeline to the old, to cutting down on traffic congestion and freeing up family time.

What's vital is that government and motor industry executives take the necessary steps to ensure that driverless cars are protected from malicious hackers, learning from other industries research and experience, so that the public can profit from this transformative technology.

It's important to get things into perspective before indulging in science fiction fantasies of runaway cars causing havoc on our roads. Much of the technology already exists. For example, autopilot controls most of the routine portion of aircraft flights.

Airlines increasingly mandate computer control for extreme weather conditions, where computers can react swiftly, predictably and without panic.

Nonetheless, the autonomy and connectivity of driverless cars does leave them open to attacks from malicious cybercriminals or terrorists. The principal threats are three-fold:

First, hackers could gain control of an individual car, either to cause mischief, or at the extreme end turn it into a missile.

Second, they could use the car's systems to intrude on the privacy of individuals, by tracking their movements and access personal or otherwise sensitive data (although considering most of us carry around a smartphone this is hardly a unique threat).

Third, and potentially most damaging, hackers could use the inherent connectivity of driverless vehicles to disrupt an entire city. It's not hard to imagine thousands of cars parked motionless on Shaikh Zayed road.

It happens most rush hours, but if these fleets were being controlled to produce maximum disruption over days, this would have serious implications for emergency services and the economy of Dubai.

There are clear steps that carmakers, and their governmental regulators, can take to ensure that any risk from cyberattack is minimised. The airline industry has already led the way with its focus and enhancements on deterministic ethernet.

Carmakers need to ensure that control systems are managed in an organised and systematic manner rather than simply bolted on to the general internet connectivity of the vehicle.

It's vital to look after three 'A's of computer security: authentication, authorisation and accounting. Authentication provides a way of identifying a user with advanced cryptography. This ensures that the car's central processing unit knows exactly who or what it's receiving information from and giving commands to at all times.

Authorisation ensures that each part of the system gives appropriate commands; it's perfectly acceptable for the neighbouring car to be providing its positional data to avoid a crash; it's not for the car to cause your engine to stop.

Third, all the information needs to be accounted for. It's inevitable some accidents will happen, and it's vital that a record is kept of all events for subsequent analysis just like a plane's black box.

Cybersecurity concerns should not stop a revolution, which according to tech entrepreneur Elon Musk may be only a few years away, but security does need to be built in at a foundational level to ensure the world gains the benefits and minimises the risks.

International Bank Transfer System Hacked

Wednesday, 27 April 2016

Section: general

Tehran - Swift, the global financial network that banks use to transfer billions of dollars every day, has warned its customers it is aware of "a number of recent cyber incidents" where attackers had sent fraudulent messages over its system.
The disclosure came as law enforcement authorities in Bangladesh and elsewhere investigated the cyber theft of US$81m (£55.9m) from the Bangladesh central bank account at the New York Federal Reserve. Swift has acknowledged the scheme involved altering Swift software on Bangladesh Bank's computers to hide evidence of fraudulent transfers, Guardian reported.

Monday's statement from Swift marked the first acknowledgement that the Bangladesh Bank attack was not an isolated incident but one of several recent criminal schemes that aimed to take advantage of the global messaging platform used by some 11,000 financial institutions.

"Swift is aware of a number of recent cyber incidents in which malicious insiders or external attackers have managed to submit Swift messages from financial institutions' back offices, PCs or workstations connected to their local interface to the Swift network," the group warned customers.

The warning, which Swift issued in a confidential alert sent over its network, did not name any victims or disclose the value of any losses from the previously undisclosed attacks. Swift confirmed to Reuters the authenticity of the notice.

Swift, or the Society for Worldwide Interbank Financial Telecommunication, is a cooperative owned by 3,000 financial institutions.

Also on Monday, Swift released a security update to the software that banks use to access its network to thwart malware that security researchers with British defence contractor BAE Systems said was probably used by hackers in the Bangladesh Bank heist.

BAE's evidence suggested that hackers manipulated Swift's Alliance Access server software, which banks use to interface with Swift's messaging platform, to cover their tracks. BAE said it could not explain how the fraudulent orders were created and pushed through the system.

But Swift provided some evidence about how that happened in its note to customers, saying that in most cases the attackers obtained valid credentials for operators authorised to create and approve Swift messages, then submitted fraudulent messages by impersonating those people.

Cyber security experts said more attacks could surface as Swift banking clients look to see if their access had been compromised.

Shane Shook, a banking security consultant, said hackers were turning to Swift and other private financial messaging platforms because they could steal larger amounts. "These hacks specifically target financial institutions because smaller efforts result in much larger thefts," he said. "It's much more efficient than stealing from consumers."

Justin Harvey, chief security officer with Fidelis Cybersecurity, said hackers followed the money and would be drawn into such schemes in hopes of emulating a big heist like the one on Bangladesh Bank. "After the Bangladesh Bank heist became public, every other attacker out there is looking to see if they can do the same," he said.

Swift spokeswoman Natasha Deteran told Reuters that the commonality in these cases was that internal or external attackers compromised the banks' own environments to obtain valid operator credentials. "Customers should do their utmost to protect against this," she said in an email to Reuters.

Swift told customers that the security update must be installed by 12 May. "We have made the Alliance interface software update mandatory as it is designed to help banks identify situations in which

attackers have attempted to hide their traces - whether these actions have been executed manually or through malware," she said.

New York Times
F.B.I. Opts Not to Share iPhone-Unlocking Method
Thursday, 28 April 2016
Byline: Eric Lichtblau, Katie Benner

Washington - The F.B.I. closed the door Wednesday to the possibility of giving Apple the technical solution that the government bought to unlock the iPhone used by one of the attackers in the mass shooting in San Bernardino, Calif.
The decision leaves Apple in the dark about the technical details of how the F.B.I. -- with help from an unknown outside group that was apparently paid at least $1.3 million -- managed to bypass the company's vaunted encryption.

After two months of tense sparring over the San Bernardino iPhone, the government's decision was a clear rebuke to Apple. Its chief executive, Timothy D. Cook, has declared publicly that the company should not have to develop new software so the F.B.I. can unlock its phones. The F.B.I. on Wednesday appeared eager to return the favor by refusing to divulge how it finally broke in.

The decision upset some technology industry executives, who said it appeared to run counter to the Obama administration's promises to promote security and transparency in the nation's technology operations.

Apple declined to comment on Wednesday.

F.B.I. officials maintained that what they bought from the outside company amounted only to a tool for getting into the phone, and not a blueprint exposing the actual security flaws in the device.

As a result, F.B.I. officials decided not to send the issue on to a special White House panel that reviews the question of whether software vulnerabilities discovered by American intelligence officials should be shared with the software designer to enhance security.

That review panel could have determined that the technical fix bought by the F.B.I. should be shared with Apple.

"The F.B.I. purchased the method from an outside party so that we could unlock the San Bernardino device," said Amy S. Hess, executive assistant director for science and technology.

"We did not, however, purchase the rights to technical details about how the method functions, or the nature and extent of any vulnerability upon which the method may rely in order to operate. As a result, currently we do not have enough technical information about any vulnerability that would permit any meaningful review" by the White House examiners, she said.

Soon after the government said that a third party had successfully gotten data from the phone, after giving the F.B.I. a demonstration of its method in February, many security professionals were hopeful that the method would be made public.

"It's the position of Obama administration that security flaws should be disclosed to the parties that can fix them," said Denelle Dixon-Thayer, chief legal and business officer at Mozilla. She added that the fact that the F.B.I. did not take the necessary steps to understand how the outside group opened the phone shows that the review process over all needs to be more transparent.

The government's decision simply to hire the locksmith and ignore how that lock was opened "creates a gap in the review process" that is "not transparent and has not been set in legislation," she said.

The F.B.I.'s carefully worded statement reveals that law enforcement authorities have found a loophole in the vulnerability review process created by the administration-- hire the hacker to extract the data, but be careful to not know how he got the job done.

"The F.B.I. is intentionally exploiting a known vulnerability and enabling people to profit off of it," said Alex Rice, the chief technology officer at HackerOne, a security company in San Francisco that helps coordinate vulnerability disclosure for corporations. "The collateral damage done by this lack of transparency and the possible ongoing existence of the flaw is serious."

The government's claim that it does not have enough details to provide any information to the review process is not unusual. "Over the last 10 years as cellphones became more important to criminal investigations, law enforcement would hire digital forensics teams, would extract data for investigators without necessarily buying the capability to do it themselves," said Ben Johnson, the co- founder of the security start-up Carbon Black.

The F.B.I. decided not to send the issue to the White House to review under a classified and little- known system known as the Vulnerabilities Equities Process.

There are often "legitimate pros and cons" in deciding whether a flaw should be disclosed to the designer, a senior official said in a 2014 White House blog post -- one of the few times the review process has been publicly discussed.

Because the government relies on Internet security, wrote Michael Daniel, special assistant to the president on cybersecurity, "disclosing vulnerabilities usually makes sense. We need these systems to be secure as much as, if not more so, than anyone else."

But Mr. Daniel acknowledged that the United States government could sometimes exploit the security flaws itself if it does not disclose them.

"Disclosing a vulnerability can mean that we forgo an opportunity to collect crucial intelligence that could thwart a terrorist attack, stop the theft of our nation's intellectual property, or even discover more dangerous vulnerabilities that are being used by hackers or other adversaries to exploit our networks," he said.

Wall Street Journal
Encryption Without Tears
Thursday, 28 April 2016
Byline: Senators Richard Burr and Dianne Feinstein

Op-ed - In an increasingly digital world, strong encryption of devices is needed to prevent criminal misuse of data. But technological innovation must not mean placing individuals or companies above the law.
Over the past year the two of us have explored the challenges associated with criminal and terrorist use of encrypted communications. Two examples illustrate why the status quo is unacceptable.

The first is the Islamic State-inspired terrorist attack last year in Garland, Texas. FBI Director Jim Comey said the attackers "exchanged 109 messages with an overseas terrorist" the morning of the shooting, but the FBI cannot access those messages to determine the exact role of Islamic State in the shooting and how to help prevent future attacks.

Another case involves the murder of Brittney Mills, eight months pregnant when she was shot to death last year on her front porch in Baton Rouge, La. Her unborn son was delivered at the hospital but died a week later.

Even though police found Brittney's smartphone next to her body, the murder remains unsolved and law enforcement cannot access any information on her encrypted phone, including an electronic diary Brittney kept.

These are two of the many cases where law enforcement is unable to fully investigate terrorism or criminal activities. In fact, today the FBI is unable to gain access to data on many of the mobile devices they obtain that are password protected.

In response to these cases, we are circulating a proposal in the Senate to ensure that technology does not undermine the justice system.

The draft proposal requires a person or a company -- when served with a court order -- to provide law enforcement with information (in readable form) or appropriate technical assistance that is responsive to the judicial request. This will enable law enforcement to conduct investigations using the communications involved in criminal and terrorist activities.

Our draft bill wouldn't impose a one-size-fits-all solution on all covered entities, which include device manufacturers, software developers and electronic-communications services. The proposal doesn't define the technological solutions or tell businesses how to solve the problem. It provides compensation for reasonable costs that businesses may incur when complying with a court order.

We want to provide businesses with full discretion to decide how best to design and build systems that maintain data security while at the same time complying with court orders.

Critics in the industry suggest that providing access to encrypted data will weaken their systems. But these same companies, for business purposes, already maintain and have access to vast amounts of encrypted personal information, such as credit-card numbers, bank-account information and purchase histories.

We are not asking companies to provide law enforcement with unfettered access to encrypted data. We aren't even asking companies to tell the government how they gain access to this encrypted data. All we are doing is asking companies to find a way to keep their data secure while also cooperating with law enforcement in terrorism and criminal investigations.

President Obama said earlier this year, "You cannot take an absolutist view on this." We agree -- and believe that strong data security and compliance with the justice system don't have to be mutually exclusive. American technology companies have done some amazing things that are the envy of the world. We think that finding a way to achieve both goals simultaneously is not beyond their capabilities.

Note: Sen. Burr (R., N.C.) is the chairman, and Sen. Feinstein (D., Calif.) the vice chairman, of the Senate Select Committee on Intelligence.

Washington Post
Three TSA managers say 'bullies' punish whistleblowers
Thursday, 28 April 2016
Byline: Ashley Halsey III

Washington - The Transportation Security Administration on Wednesday was caught in a crossfire by three of its executives who said the agency's managers punish employees when they point out security lapses at the nation's airports.
"These leaders are some of the biggest bullies in government," Jay Brainard, a TSA security director in Kansas, told the House Committee on Oversight and Government Reform. "While the new administrator of TSA has made security a much-needed priority once again, make no mistake about it, we remain an agency in crisis."

As airports anticipate what may be a record crush of passengers this summer, the three men testified that morale was near rock bottom among TSA security workers.

"Many airports are complaining that TSA is getting worse, not better," said Oversight Committee Chairman Jason Chaffetz (R-Utah). He said that 103 of the TSA's 48,000 airport screeners quit each week.

"They really don't like working there," Chaffetz said. "That's a management problem there."

Chaffetz set the stage for Wednesday's hearing in a series of letters sent in February and March to TSA Administrator Peter V. Neffenger. They demanded to know all disciplinary actions taken against TSA employees, bonus payments made to TSA staff and an explanation for a policy under which workers can be forced to relocate.

Since his Senate confirmation in June 2015, Neffenger has centralized training of TSA employees in Georgia, restricted executive bonuses, ended forced relocations and taken steps to increase airport security.

Brainard told the committee that Neffenger had "done his best to get his arms around the situation, but he hasn't resolved it." He said a group of about 20 senior supervisors whom he blames for the TSA's mismanagement were "waiting [Neffenger] out."

"The refusal to address or to hold senior leaders accountable is paralyzing this agency," Mark Livingston, a program manager in the TSA's Office of the Chief Risk Officer, testified. "TSA employees are less likely to report operational security or threat- relevant issues out of fear of retaliation from supervisors who fear further retaliation from their chain of command. No one who reports issues is safe at TSA."

When he raised concerns, Livingston said, his supervisors ignored them and punished him instead.

"They reduced me two pay grades," he said. "This action was intended to publicly humiliate me. They sought to make an example of me."

The men have run afoul with their supervisors. Livingston has filed a discrimination lawsuit against the agency. Brainard and Andrew Rhoades, an assistant director in the Office of Security Operations, reportedly are under internal review by the TSA.

Rhoades said he was asked to run the names of Somali Americans with whom he met in Minneapolis through a terrorist database, a directive he considered to be racial profiling.

"The Transportation Security Administration takes seriously all allegations of inappropriate behavior by its employees at all levels and does not tolerate illegal, unethical or immoral conduct," the TSA said in a statement after the hearing. "Due to ongoing litigation and open investigations, we are unable to comment on many of the specific allegations brought up during today's hearing."

The hearing came 10 months after an inspector general's report that said his undercover operatives were able to slip through airport security with weapons and phony bombs more than 95 percent of the time. They were able to carry weapons or bomb-like material through airport-security checkpoints in 67 of 70 attempts last year.

Then- acting TSA administrator Melvin Carraway was forced from the job in June 2015 after reports of the airport-security issues became public.

"I appreciate that the TSA has taken steps to address the inspector general's concerns," Chaffetz said.

Rhoades's trouble with the TSA dates to autumn 2014, when a local TV news station began reporting on security lapses at the Minneapolis-St. Paul International Airport.

Rhoades already was on record with his supervisors for objecting to the way TSA screeners were handling confiscated weapons and a failure to put stickers on some checked bags that had been cleared by the agency. He said he played no role in the leaks.

In the aftermath of the news reports, one of Rhoades's supervisors set out to determine whether TSA employees provided information to reporters, according to an investigation by the U.S. Office of Special Counsel (OSC). Early last year, the OSC said, the same supervisor issued Rhoades a forced transfer to Florida.

The OSC stepped in to investigate whether it was a retaliatory move against a whistleblower, and the TSA later rescinded the transfer.

CBS News
Ransomware's next target: Anything that's connected
Thursday, 28 April 2016
Byline: Anne Picci

New York - "Ransomware" has turned into a lucrative business for scammers, but it could jump from a troubling annoyance to life-threatening attacks.
The hack is typically targeted at computers, with scammers encrypting files on unwitting victims' machines. They then demand a ransom - - typically about $500, payable in untraceable Bitcoin -- in exchange for a key that will decrypt the files. One new type of scam convinces consumers to download the malicious encryption software with the message "Your package has been delivered."

Already this year, the pace of ransomware attacks has quickened. Security firm Endgame noted that a dozen new variations have been identified so far, compared with about 10 for all of 2015. Security experts say the frequency and type of ransomware attacks are only going to pick up, given that hackers are profiting from it.

One think tank is predicting that the types of attacks will eventually expand to the "Internet of things," or Internet-connected devices such as cars and medical devices like pacemakers.

"Everything is connected now. It's the Internet of everything," said James Scott, senior fellow at the Institute for Critical Infrastructure Technology, which published the report on connected devices. "There are so many vulnerabilities that you can exploit."

While most people think of ransomware as targeting their computers, it has already spread to mobile phones. Last year, a version emerged called "Porn Droid" that changes an Android phone's PIN and then flashes a warning to the user that appears to come from the FBI. The warning tells the user that the phone has been locked because "suspicious files have been found" including pornography. The fee to get out of the "charges"? $500.

If a mobile phone is infected with ransomware, it's best to restore it to its factory settings, Scott noted.

When it comes to other Internet-connected devices, many "lack any form of security," according to the report.

"How much do you predict someone would pay to remove ransomware from a pacemaker?" the report asked. "The scenario is not too far-fetched; in fact, it is much more deadly. Many medical devices, such as pacemakers, insulin pumps, and other medication dispersion systems are Internet or Bluetooth enabled."

Still, the scammers face drawbacks in that it's tougher to deliver a message demanding a ransom through a pacemaker, for instance. In that case, it's likely the scammer would still use email or texting to communicate with the victim.

Scott said consumers should take several steps to avoid a ransomware or malware attack. First, back up your computer to an external hard drive, and make sure to unplug the hard drive between backups. The latter step will keep the it clear of malware or ransomware in case of an attack on the computer.

Second, maximize your privacy settings on your social media accounts, which will stop scammers (as well as anyone you don't know) from sending you texts or messages with malicious links or programs. Third, limit the personal information you disclose on sites such as Facebook (FB) or LinkedIn (LNKD).

"Guys put where they went to high school, their hobbies," Scott said. "I'm a social engineer. So, LinkedIn was the always the first place I would look when a company wanted us to penetrate their network."

Hackers can use that personal information to engineer an email campaign that looks as if it's from a company's CEO or another executive.

Browser add-ons such as self-destructing cookies and HTTPS Everywhere can help protect consumers, Scott noted. If your ISP offers antivirus or antispam services, sign up. It's also important to understand how hackers target consumers, such as through "spearphishing," which is when criminals create emails that are designed to look as though they come from a trusted source.

Consumers should also "stop filling out every form they see on the Internet," Scott added. "You don't have to put your real name in if you want to download an e-book."

London Daily Telegraph
Revealed: Britain's borders left exposed as screening system crashed twice in 48 hours
Thursday, 28 April 2016
Byline: Ben Riley Smith

London - Britain's borders were left exposed to terrorists last year after a Home Office computer system which screens passengers crashed twice in 48 hours, The Telegraph can reveal.
The eBorders system, which was put in place after the 9/11 terror attacks to protect the country from jihadists, ground to a halt in June last year.

The incident, which this newspaper has seen details of, was deemed so serious that Theresa May, the Home Secretary, was alerted by officials close to midnight.

The Home Office refused to reveal how often the system has crashed or whether there have been any outages since the incident.

Technicians worked through the night to fix the system amid fears from border officials that hundreds of extremists, convicts and illegal immigrants were arriving in the UK undetected.

The disclosure that a vital part of Britain's border security stopped working during a time of "severe" threat from terrorism will raise serious questions about whether it is fit for purpose.

Mrs May is likely to come under pressure to explain why the public were kept in the dark despite tens of thousands of people likely to be traveling into the UK at the time.

Flights were not grounded despite the system being down and border officials unable to check in advance passenger details against terrorism watch lists.

Sources familiar with the situation told the Daily Telegraph that they would normally expect to see the names of hundreds of potential suspect passengers being 'flagged' each day.

During the outages just one individual was 'flagged' suggesting others could have gone under the radar.

A Home Office spokesman said that all passengers would still have had to cross passport control after arriving in the UK.

Officials at the border have access to lists of "dangerous" people, which the Home Office insists would have been cross-checked to ensure there was no breach.

However the warnings index - which dates back to 1995 - was deemed inadequate on its own after the 9/11 attacks and was recently found to be breaking down twice a week.

But terrorists or criminals could still have boarded aircraft without being detected by British security services.

The Telegraph has launched a new Border Security campaign, which has seen former counter terrorism figures call for a review in the wake of terror attacks on the Continent.

At the heart of Britain's ability to stop dangerous people entering the country is Semaphore, a system which checks passenger data against watch lists of suspect individuals.

Every day Semaphore scans information on passengers traveling to and from Britain on planes, trains and ferries against lists of those flagged up by government agencies.

The system - unlike its predecessor - helps alert the border agencies to suspect passengers bound for the UK before they board planes.

Matches are passed to the National Border Targeting Centre (NBTC) which decides whether to stop the passenger from boarding, intercept them at passport control or let them enter the UK.

This newspaper has learnt that on Sunday, June 14, and Monday, June 15, the Sempahore system suffered two national outages after being overwhelmed by requests.

The first crash happened when a fault saw tens of thousands or error messages flood the system which froze under the pressure.

Both Mrs May and James Brokenshire, the immigration minister, were alerted shortly before midnight as technicians worked through the night, updating the government every hour.

The system appeared to stabilise before another malfunction saw hundreds of thousands of passenger details flood the system and trigger another outage on Monday night. Mrs May was notified again.

Officers at the NBTC warned that instead of seeing hundreds of matches they had received just one - meaning potential criminals and jihadists heading to Britain were not being flagged up.

Specialists worked through the night again trying to locate the source of the problem before finally stabilising the system on Wednesday.

They occurred just months after the Charlie Hebdo shooting that saw jihadists kill 11 people in Paris and while Britain's threat level was set at "severe", meaning a terrorist attack is "highly likely".

The Age
Cyber security check-up
Thursday, 28 April 2016
Byline: Georgia Wilkins

Canberra - The federal government will foot the bill for cyber security "health checks" at some of Australia's biggest companies.
The top 100 ASX-listed companies will be have the chance to get their voluntary check under the government's new $230 million cyber security package.

The government has declined to say how much it will spend on the scheme but said it hoped to eventually roll out the service to all public and private companies. It would not say whether the checks would be done by a government regulator or private consultants.

Industry experts said on Monday that large companies should have to shoulder the burden of data protection themselves.

"If the ASX100 are not competent enough to govern their own cyber security issues, those boards are not doing their jobs," said Dr Robert Merkel, a lecturer in software engineering at Monash University.

Prime Minister Malcolm Turnbull last week announced the government's cyber security strategy, which will focus on closer collaboration of government and business.

It is the result of a year-long review of the industry. The strategy will see the Australian Cyber Security Centre moved away from the Australian Security Intelligence Organisation in Canberra to allow for greater ties with business.

The government said cyber security health checks would "enable boards and senior management to better understand their cyber security status".

Ty Miller, director of security firm Threat Intelligence, said health checks were becoming popular in the industry.

"There's an increasing amount of cyber insurance being purchased, because there are so many more breaches happening these days," he said.

"When you sign up to a cyber insurance policy, you have to have a certain level of security in the organisation, and you can check that through a health check."

Associated Press
Police in dark over Haider Facebook posts
Thursday, 28 April 2016
Byline: Numan Haider

Canberra - Police say they might not have met a radicalised Melbourne teen who was shot dead after stabbing two officers if they been aware of ASIO'S concerns about his escalating Facebook posts. Numan Haider, 18, was shot in the head outside the Endeavour Hills police station after he stabbed a Victoria Police officer and an Australian Federal Police officer attached to the Joint Counter Terror Team on September 23, 2014.

Officers from ASIO, AFP and Victoria Police had met before then to share information on Haider.

Two ASIO officers told an inquest into Haider's death on Thursday that at a meeting on September 19, Haider's escalating online activity - including Facebook posts - was discussed.

They said "erratic" behaviour by Haider at Dandenong Plaza on September 18 - where the teen unfurled a flag linked to Islamic State - was also discussed.

However, three Victoria Police also giving evidence on Thursday had no memory of ASIO sharing Facebook posts with them.

They said they would have reconsidered meeting the teen had they seen the posts, which included a picture of Haider wearing a balaclava and holding the Shahada flag, with derogatory comments about ASIO and the AFP.

The first Victoria Police officer also contradicted the ASIO witnesses' recollection that the interagency meeting knew about the incident at Dandenong Plaza.

He said he had returned from leave on September 22 when he saw the report on Haider at Dandenong Plaza, and then passed it on to another Victoria Police officer to inform ASIO and AFP.

Another police officer told the inquest that during the September 19 meeting all the agencies agreed Haider was not an immediate threat and police would make contact with him.

Earlier this week a senior ASIO officer gave evidence that in the weeks before he was killed, Numan Haider had conducted internet searches for information on Tony Abbott's upcoming visits to Victoria, a military base and AFL football.

She said she would not allow ASIO officers to interview Haider again because she believed he had at least one knife.

The inquest continues before Coroner John Olle.

Xinhua News Agency
New Zealand government seeking business help in cybercrime fight
Thursday, 28 April 2016
Byline: John Macdonald

Wellington - Leading international cyber security specialists will discuss how New Zealand businesses can help fight cybercrime at the first government-backed Cyber Security Summit in Auckland next week, Communications Minister Amy Adams said Thursday.
"Cyber-attacks can and do damage our economy. Businesses are acutely aware of the 257 million NZ dollars (178.2 million U.S. dollars) lost to cybercrime last year," Adams said in a statement.

"The challenge cyber security presents can't be met by the public sector alone. What's clear is that we need a joined up response -- the private and public sectors working together to share information and expertise," she said.

"The summit is an opportunity for chairs and chief executives from across New Zealand to continue the conversation around how as a country we tackle the threat of cybercrime, and improve our resilience and security in this increasingly digital age."

International keynote speakers at the May 5 summit would include Jim Lewis from the U.S. Center for Strategic and International Studies in Washington, and Matt Thomlinson, vice president of security of Microsoft.

Times of Israel
Security breach in Israeli-made Waze lets hackers stalk users
Thursday, 28 April 2016
Byline: Stuart Winer

Jerusalem - Computer researchers in the US have demonstrated a way of breaching the globally popular Waze road navigation application that allows hackers to track users' movements or even create fake traffic jams.

Ben Zhao, professor of computer science at University of California-Santa Barbara, was along with his research team able to use the method to create thousands of "ghost cars" in Waze's system, which could then be used to monitor genuine users, the Fusion website reported Tuesday. "Anyone could be doing this [tracking of Waze users] right now," Zhao said. "It's really hard to detect."

Created in Israel in 2008 and sold to Google in 2013 for $1.1 billion, Waze provides navigation instructions to drivers that include traffic conditions and road hazards, and has an estimated 50 million users around the world.

The researchers began their hack by intercepting the transmission that Waze servers use to communicate with users. The Waze servers employ an SSL encryption to communicate with cellphones -- a security precaution intended to verify that the servers are communicating with a real phone. By diverting a cellphone running Waze and making it communicate directly with their own computers, researchers were able to reverse-engineer the coding Waze uses to communicate with users' phones.

Armed with the code, Zhao and his team wrote software that could send instructions to the Waze servers filling the system with virtual "ghost cars" which could be used to create a fake traffic jam -- or monitor real drivers located around the virtual vehicles.

As a social networking app, Waze relies on users sharing information such as location and username with other drivers to build up a picture of traffic conditions. The ghost cars were used to gather data from real users enabling tracking of their movements.

Researchers demonstrated the tracking method on one of their own team as well as on a Fusion reporter. They also created a fake traffic jam on a quiet Texas back road in the dead of night, to prove that it could be done but without interfering with users.

"You could scale up to real- time tracking of millions of users with just a handful of servers," Zhao noted. "If I wanted to, I could easily crawl all of the US in real time. I have 50-100 servers, and could get more from [Amazon Web Services] and then I could track all of the drivers."

The team, which began testing their theory in the spring of 2014, warned Waze later that year and published their findings in 2015. In January, Waze issued an update of the application which included new cloaking measures but the researchers found they were still able to track users. Nonetheless, Waze users who choose the option of going "invisible" are not vulnerable to the hack. "It's such a massive privacy problem," Zhao said.

The hack is similar to one carried out by a pair of Israeli students two years ago when they managed to create fake traffic jams, but gave researchers much more powerful options for manipulating the Waze system.

Fusion speculated that hackers could use the breach to download the activity of drivers who use the app and then make the information public, revealing who had been where and when. "We needed to get this information out there," Zhao said. "Sitting around and not telling the public and the users isn't an option. They could be tracked right now and never know it."

Zhao warned that the same method could also be used on other social networking apps, and expressed the opinion that plugging the breach would not be a simple task. "Not being able to separate a real device from a [hacking] program is a larger problem," said Zhao. "It's not cheap and it's not easy to solve."

A Waze spokesperson told Fusion that, "The company is examining the new issue raised by the researchers and will continue to take the necessary steps to protect the privacy of our users." The company is "examining the new issue raised by the researchers and will continue to take the necessary steps to protect the privacy of our users," the spokesperson added.

In 2014 Israeli students Shir Yadid and Meital Ben-Sinai from the Technion, Israel's Institute of Technology, demonstrated a method of hacking into Waze and tricking the system to show fake traffic jams. The Israeli researchers also notified Waze of the method at the time.

Lebanon's security agencies to get telecoms data
Thursday, 28 April 2016

Beirut - The cabinet held a regular session on Wednesday to address various issues and approved providing the telecommunications data to all security apparatuses while leaving the decision of giving it to the State Security in the hands of PM Tammam Salam.
"We have requested that all security apparatuses have access to the data including the State Security and Salam has assured us that this will be the case," said Education Minister Elias Bou Saab after the cabinet session.

On the H5N1 bird flu virus that was detected in poultry farms in Baalbek last week, Information Minister Ramzi Jreij said: "The government gave an initial approval to compensate the farmers whose poultry was affected by the virus."

As for the waste management file, Jreij said: "The cabinet approved the formation of a committee, chaired by the Premier, to address waste incinerators."

Ahead the meeting, Environment Minister Mohammed al-Mashnouq replied to complaints about the waste odor filling the air saying: "The odor is the result of the removal of 550 tons of accumulated trash."

The session that kicked off at the Grand Serail in a bid to tackle several pressing issues excluded the thorny file of the State Security which officials said is being followed up by Salam.

Before the session convened, Tourism Minister Michel Pharaon emphasized that "the solution for the State Security file is an administrative one."

The National (UAE)
UAE aims to be world hub for technology
Thursday, 28 April 2016

Dubai - The UAE on Wednesday launched the latest component of its strategy to become an ideas hothouse and a world-leading hub for technology.
Sheikh Mohammed bin Rashid, the Vice President and Prime Minister and Ruler of Dubai, announced ambitious plans to develop and exploit 3-D printing, a process that the consultants McKinsey estimate will have a $550 billion impact on the global economy in the next 10 years.

The new plans follow a target set this week for a quarter of journeys in Dubai to be driverless by 2030. Like 3-D printing, autonomous transport is viewed as a "disruptive" technology with worldwide implications. Companies as diverse as Google, Mercedez-Benz, Audi and the German industrial comglomerate Bosch are investing heavily in its future.

Sheikh Mohammed made it clear on Wednesday that the UAE would continue its quest to achieve global leadership in driving innovation that had benefits for all mankind.

"Our vision for development is driven by a deep understanding of future needs, and built on proactive ideas because we want to be in first place globally," he said.

"Our methodology for development is based on initiatives that can be applied anywhere in the world, creating a model not only for our economy but also for the global economy.

"The future does not wait for those who hesitate and slow down. The next stage requires us to act fast and utilise the opportunities. A few days ago we launched the Dubai Future Agenda and we have started to implement it in a way that adds value to humanity and our national economy.

"The UAE is presenting to the world today the first integrated and comprehensive strategy to exploit 3-D technology to serve humanity."

Sheikh Mohammed said the first impact of 3-D technology would be on the construction industry, and he set a target of 25 per cent of buildings in Dubai to be constructed using 3-D printing by 2030.

The technology would transform the industry by saving time, cutting construction waste and reducing the need for unskilled labour, with an estimated economic benefit of Dh3bn by 2025, Sheikh Mohammed said.

He expects the use of 3-D in construction to increase by about 2 per cent a year from 2019, depending on how the technology and its reliability develop.

Sheikh Mohammed also targeted medical and consumer products for manufacture using 3-D printing.

In the medical products sector, the focus will be on 3-D printed teeth, bones, artificial organs, medical and surgical devices and hearing aids, with a projected value of Dh1.7bn by 2025.

Consumer products made using using 3-D printing will include household items, optics, fashion jewellery, children's games and fast food, with an estimated value of Dh2.8bn by 2025.

Sheikh Mohammed has directed organisations including Dubai Municipality, Dubai Holding and Dubai Health Authority, under the umbrella of the Dubai Future Foundation, to implement the overall strategy.

They will set up the infrastructure to develop 3-D printing technology, propose a legislative framework to regulate it, find sources of funding, recruit the necessary scientific talent and determine market demand.

There will also be an international forum in Dubai for 3-D printing designers, manufacturers and developers, to discuss developments in the technology.

"The future will depend on 3-D printing technologies in all aspects of our life, starting from the houses we live in, the streets we use, the cars we drive, the clothes we wear and the food we eat," Sheikh Mohammed said,

"This technology will create added economic value and benefits worth billions of dollars. We should have a share in this growing global market."

Pour la création d'une association algérienne de cryptographie
Wednesday, 27 April 2016
Byline: Journaliste maison

Oran, Algérie - La création d'une société savante dédiée à la cryptographie figure parmi les ambitions affichées mardi à Oran par des participants à un un premier workshop international consacré à cette spécialité scientifique portant sur le développement des techniques de protection des données informatiques.

"La réflexion est engagée en vue de la création d'une association algérienne de cryptographie", a indiqué Pr Adda Ali Pacha, président de la rencontre réunissant deux jours durant une cinquantaine de participants algériens et étrangers à l'Université des sciences et de la technologie Mohamed Boudiaf (USTO-MB).

Le regroupement de compétences nationales au sein d'une société savante a pour objectif de "répondre avec efficience aux attentes du secteur économique et industriel", a expliqué Pr Pacha, également directeur du Laboratoire de codage et de la sécurité de l'information (Lacosi).

Illustrant la contribution de la communauté universitaire en la matière, ce responsable a fait savoir que cinq projets de recherche sont actuellement menés par les équipes de son laboratoire relevant de l'USTO-MB.

Le workshop s'est ouvert en présence de la rectrice, Nacéra Benharrat qui s'est félicitée de la tenue de cet événement dans la mesure où "il met en lumière les capacités des chercheurs nationaux à apporter des solutions technologiques à même de protéger les intérêts de l'industrie et des institutions du pays".

La responsable de l'USTO-MB a en outre insisté sur la feuille de route mise en oeuvre au sein de son établissement, axée essentiellement sur "l'enrichissement des cursus pédagogiques au profit des étudiants, la diversification des parcours de formation et le développement de la recherche scientifique".

La conférence plénière de ce workshop a été donnée par le Pr René Lozi de l'Université de Nice "Sophia Antipolis" (France) qui a évoqué les étapes historiques du développement de la cryptographie avant de mettre en relief son importance aujourd'hui dans nombre de domaines comme la lutte contre le terrorisme et la lutte contre l'espionnage industriel.

La rencontre est mise à profit par les participants algériens, issus de différentes universités du pays, pour présenter les résultats de leurs travaux de recherche portant notamment sur la création de nouveaux algorithmes utiles pour le chiffrage des données.

Ce workshop est organisé avec le soutien d'organismes partenaires, à l'instar de la Direction générale de la recherche scientifique et du développement technologique (DG-RSDT) et de l'Autorité de régulation de la poste et des télécommunications (ARPT).

Sécurité informatique 5 millions pour une solution signée Immunio
Wednesday, 27 April 2016
Byline: Jean-François Codère

Montréal - Automatiser la sécurité des applications web, c'est le défi que s'est donné la jeune entreprise montréalaise Immunio, qui vient de conclure un nouveau cycle de financement de 5 millions US mené par White Star Capital, un fonds d'origine québécoise.
White Star rejoint le fonds britannique Hoxton Ventures, la BDC et Real Ventures au sein du capital d'Immunio, qui avait déjà fait l'objet d'un placement de 3,3 millions US depuis sa fondation, en 2013.

Immunio a été cofondée par Zaid Al Hamami et Mike Milner, qui se sont rencontrés à Montréal alors qu'ils travaillaient pour Canonical. Le premier terminait une maîtrise en administration des affaires du MIT, le deuxième avait bossé pendant une dizaine d'années pour le Centre de la sécurité des télécommunications (CST) au Canada et chez son équivalent britannique.

Les deux hommes cherchaient une façon de se lancer dans le domaine de la cybersécurité.

« C'est un marché qui a toujours été très axé sur les grandes entreprises, observe M. Al Hamami. En 2000, la seule demande venait des banques, alors les entreprises technologiques ont produit des solutions très complexes, dispendieuses, qui nécessitent des consultants. Moi, je me demandais qui étaient les entreprises qui faisaient des choses cool, qui s'adressaient vraiment aux ingénieurs parce que, ultimement, c'est eux qui décident ce qui marche ou non, et la réponse était : personne. Alors nous nous sommes lancés. »

Après deux ans de développement, Immunio a lancé sa solution récemment. Il s'agit d'un module qui s'intègre aux applications web et surveille leur sécurité en temps réel.

« On surveille constamment pour déterminer ce qui constitue une activité normale pour cette application et nous détectons ce qui n'est pas normal », résume M. Al Hamami.

L'accès à des fichiers inhabituels, un utilisateur qui se branche à partir d'une région inattendue ou une ligne de code qui envoie de drôles de requêtes à la base de données sont autant d'éléments qu'Immunio peut d'abord détecter, puis bloquer.

« On peut pointer à notre client la ligne de code exacte que les pirates ont ciblée et leur indiquer comment ils s'en servent. »

Selon Jean-François Marcoux, cofondateur de White Star Capital, Immunio dispose d'une technologie « très unique, qui rend accessible la sécurité des applications à tous les développeurs ». Son cycle de vente assez court, comparativement à des solutions plus complexes et conçues sur mesure, est aussi cité comme un avantage qui pourrait lui permettre de croître rapidement.

Immunio compte actuellement 22 employés, dont la moitié à Montréal, où elle compte embaucher « agressivement » au cours de la prochaine année.

International Business Times (UK)
Qatar National Bank: Database leak gives data on al-Jazeera journalists and British 'spies'
Thursday, 28 April 2016
Byline: Jason Murdock

London - A 1.4GB trove of internal documents, files and sensitive financial data purporting to be from the Qatar National Bank (QNB) has been leaked online.
The massive data dump appears to contain hundreds of thousands of records including customer transaction logs, personal identification numbers and credit card data. Additionally, dozens of separate folders consist of information on everything from Al Jazeera journalists to what appears to be the Al-Thani Qatar Royal Family.

However, it is a folder listed as "SPY, Intelligence" that quickly catches the eye. Upon analysis, it contains a slew of records listed as Ministry of Defence, MI6 (the UK foreign intelligence service) and Qatar's State Security Bureau, also known as "Mukhabarat".

The MI6 file, which sits alongside similar documents reportedly holding information on Polish and French intelligence, opens up an in-depth report on an alleged agent. This includes names of close relations, phone numbers, social media accounts and credit card data. Furthermore, in one instance, a file marked "wife", opens a photo showing a woman and two children.

There are roughly a dozen of these intelligence dossiers included in the Qatar data dump. However, this data is not likely to have been collated by the bank and remains unverified by IBTimes UK.

The alleged banking leak also openly lists a folder marked "Al Jazeera" that stores nearly 30 separate profiles alongside a Microsoft Excel file that holds more than 1,200 records - including national ID numbers, telephone numbers and home addresses. Much like the intelligence files, the Al Jazeera disclosure contains a number of entries labelled "SPY" and also includes images of the person alongside social accounts, banking data and passwords.

When contacted, multiple sources confirmed to IBTimes UK the data is legitimate.

On the customer-facing side, the data dump contains a number of folders that are likely to concern users. Some of the listed database spreadsheets are labelled: "Account Master", "User Profile" and "Transactions" however, much like the rest of the contents, IBTimes UK is still in the process of verifying the entire leak. It remains unknown how current the data is - and how or when it made its way into the public domain.

The massive leak was initially uploaded at Global-Files.net however was quickly removed without explanation. Then, a separate well-known whistle-blowing website mirrored the entire data dump in an easily- accessible format.

In response to questions from IBTimes UK, Maha Mubarak, QNB media relations officer said: "It is QNB Group policy not to comment on reports circulated via social media. QNB would like to take this opportunity to assure all concerned that there is no financial impact on our clients or the bank. QNB Group places the highest priority on data security and deploying the strongest measures possible to ensure the integrity of our customers' information. QNB is further investigating this matter in coordination with all concerned parties."

The same statement has since been posted online.

After analysing the data Simon Edwards, cybersecurity expert with Trend Micro, said: "The breach seems to be a classic attack on a bank, with the majority of data leaked online exposing customers' bank account details, such as account numbers, credit cards and addresses.

"There's also a lot of information on banking transactions, suggesting that the perpetrators were trying to expose specific transactions. This theory can be further strengthened by the hacker's attempts to profile the bank's customers into different categories, mostly focusing on Qatar's TV network along with other foreign agencies, some of which are categorised as 'spies'."

He added: "Interestingly, there is also additional data about mainly foreign bank account holders, which includes information such as their Facebook and LinkedIn profiles, along with 'friends' associated through those social networks. This data doesn't appear to have come directly from the bank itself, rather the perpetrator used the data held by the bank to then build up profiles of further targets."

Reuters
German nuclear plant infected with computer viruses, operator says
Thursday, 28 April 2016
Byline: Staff report

Frankfurt - A nuclear power plant in Germany has been found to be infected with computer viruses, but they appear not to have posed a threat to the facility's operations because it is isolated from the Internet, the station's operator said on Tuesday.
The Gundremmingen plant, located about 120 km (75 miles) northwest of Munich, is run by the German utility RWE.

The viruses, which include "W32.Ramnit" and "Conficker", were discovered at Gundremmingen's B unit in a computer system retrofitted in 2008 with data visualization software associated with equipment for moving nuclear fuel rods, RWE said.

Malware was also found on 18 removable data drives, mainly USB sticks, in office computers maintained separately from the plant's operating systems. RWE said it had increased cyber-security measures as a result.

W32.Ramnit is designed to steal files from infected computers and targets Microsoft Windows software, according to the security firm Symantec. First discovered in 2010, it is distributed through data sticks, among other methods, and is intended to give an attacker remote control over a system when it is connected to the Internet.

Conficker has infected millions of Windows computers worldwide since it first came to light in 2008. It is able to spread through networks and by copying itself onto removable data drives, Symantec said.

RWE has informed Germany's Federal Office for Information Security (BSI), which is working with IT specialists at the group to look into the incident.

The BSI was not immediately available for comment.

Mikko Hypponen, chief research officer for Finland-based F-Secure, said that infections of critical infrastructure were surprisingly common, but that they were generally not dangerous unless the plant had been targeted specifically.

The most common viruses spread without much awareness of where they are, he said.

As an example, Hypponen said he had recently spoken to a European aircraft maker that said it cleans the cockpits of its planes every week of malware designed for Android phones. The malware spread to the planes only because factory employees were charging their phones with the USB port in the cockpit.

Because the plane runs a different operating system, nothing would befall it. But it would pass the virus on to other devices that plugged into the charger.

In 2013, a computer virus attacked a turbine control system at a U.S. power company after a technician inserted an infected USB computer drive into the network, keeping a plant off line for three weeks.

After Japan's Fukushima nuclear disaster five years ago, concern in Germany over the safety of nuclear power triggered a decision by the government to speed up the shutdown of nuclear plants. Tuesday was the 30th anniversary of the Chernobyl nuclear disaster.

Financial Times
Germany replaces head of external intelligence agency
Thursday, 28 April 2016
Byline: : Stefan Wagstyl

Berlin - The German government replaced the head of the country's external intelligence service on Wednesday after a barrage of criticism over the part it played in helping the US spy on European targets.

The Bundesnachrichtendienst (BND) has been in the public spotlight since 2013 leaks by Edward Snowden, a former US government contractor, that alleged that the US had tapped.the telephone of Angela Merkel, Germany's chancellor, for more than a decade.

Last year, German media reported that the BND had assisted the US National Security Agency to spy on European targets such as the French presidency, the European Commission and Airbus, the aerospace group.

The government's decision to replace 63-year-old Gerhard Schindler, who is retiring early as head of the BND on July 1, is an apparent attempt to draw a line under the affair.

But Ms Merkel's critics warned that the BND's conservative new chief -- Bruno Kahl, a 53-year-old official with close ties to Wolfgang Schäuble, Germany's finance minister -- might be more inclined to protect the service from outside scrutiny than to improve external political oversight.

Hans-Christian Ströbele, security spokesman for the opposition Green party, said that the nomination of a Schäuble confidant meant that "the hardliners" had won and opponents of intelligence service reform could succeed in blocking real change.

But Patrick Sensburg, a spokesman for Ms Merkel's ruling CDU, said the BND needed "a new start", depicting Mr Kahl as somebody who could see the agency's looming "reform process ... through to the end".

Mr Schindler, BND boss since 2012, had taken office promising "more fun, more risk" -- meaning that the agency had to engage more in security hotspots such as the Middle East.

In the event, his time was dominated by the revelations of Mr Snowden who disclosed widespread global electronic surveillance by the NSA, sometimes with the co- operation of its allies, notably the UK and, at times, Germany.

Germany is particularly sensitive to state-sponsored spying, due to its Nazi and communist East German past.

According to Spiegel magazine, the NSA provided the BND with information -- such as email addresses -- for tracking. Spiegel said that in 2013 the BND deleted 12,000 such pieces of information -- including some email addresses with the domain suffix .de, suggesting they were German-based.

The issue is highly sensitive since the BND is banned from operating within Germany -- the job of the Bundesamt für Verfassungsschutz (BfV), the country's domestic intelligence agency, which works under tighter laws.

Intelligence co-operation between Germany and the US, including information exchange, was intensified under a 2002 pact, forged amid growing concerns over Islamist terrorism.

However, the suggestion that targets unconnected with suspected terrorism had been spied on prompted an outcry, with opposition Green politicians leading the charge.

Ms Merkel's chancellery responded by saying it had asked the BND for explanations and "identified technical and organisational deficiencies in the BND".

Ms Merkel resisted opposition pressure for detailed clarifications, for stronger parliamentary supervision of the service, and for resignations, including Mr Schindler's.

The government instead tightened the chancellery's control of the service, instituted reforms in the BND, and prepared a new law, due to be presented to the Bundestag later this year, on clarifying the BND's legal responsibilities.

Mr Kahl comes to the BND with long government and political experience, much of it gained with Mr Schäuble.

Mr Schäuble specialised in security issues before he was finance minister and served as interior minister in 2005-9, when he recruited Mr Kahl for a succession of senior posts, including running his office.

The Intercept
Snowden Debates CNN's Fareed Zakaria on Encryption
Tuesday, 26 April 2016
Byline: Jenna McLaughlin

Washington - NSA whistleblower and privacy advocate Edward Snowden took part in his first public debate on encryption on Tuesday night, facing off against CNN's Fareed Zakaria, a journalist and author known for his coverage of international affairs.
Zakaria, in New York, defended the government's right to access any and all encrypted messages and devices as long as there's court approval. Snowden, speaking over a live video-link from Moscow, argued the security of the Internet is more important than the convenience of law enforcement. The debate was organized by NYU's Wagner School of Public Service and the Century Foundation.

Though Zakaria started off firm in his conviction that law enforcement should be able to get hold of all digital messages with court approval, he gradually conceded that it may not be that simple. Zakaria said he himself doesn't actively encrypt any of his communications, assuming everything will be fine -- though Snowden pointed out that, since he has an iPhone, some of his data and communications are encrypted by default.

Zakaria opened the debate by posing a hypothetical: Bank of America creates an "iVault" allowing anyone to store all their financial data totally encrypted. An embezzler could take advantage of that service to hide the evidence of their misdeeds, foiling investigators. "I understand within a democracy, you have to sacrifice liberty for democracy at some point. You cannot have an absolute zone of privacy," he said.

Snowden agreed with Zakaria that absolute zones of privacy don't exist, and that encryption does pose real problems for law enforcement. But he disagreed that universal access is the best way to solve the problem. "For the government to unlock everything there has to be a key to everything. Every other person in the world can find that key and use it too," he said. "It's a fundamental problem of science."

Instead, he suggested, police should take advantage of the many other options available to them. He cited the investigation into the founder of Silk Road, an anonymous, encrypted platform for black market drug sales. In that case, a team of investigators caught the mastermind at the library after he typed in his password.

"Encryption is not an unbreakable wall," Snowden said. "Or if it is, it is one we can get around, if we are patient, if we are careful, if we think and plan how to go about our investigations."

By the end of the debate, Zakaria said he did not support the legislation proposed by Sens. Richard Burr, R-N.C., and Dianne Feinstein, D-Calif., which would mandate companies to immediately decrypt all communications when asked by a court. The bill has been heavily criticized by technologists.

And Zakaria acknowledged that if it was genuinely impossible for a company to decrypt communications, then the court should accept that -- though it would be a "hard case."

"If WhatsApp says we literally do not know how to write this code -- WhatsApp could demonstrate to a court that they don't have to do it," Zakaria said.

He concluded by encouraging greater clarity about what kind of communications the government can and cannot access -- before the next disastrous terrorist attack. "We do face real threats out there. There are people out there trying to do bad things. Once they happen, the government will be given carte blanche," he said.

Snowden noted that former security officials now proclaiming the value of unbreakable encryption -- including former NSA Director Michael Hayden -- had considered those questions carefully and had fallen on the side of computer security.

Jerusalem Post
Are US, Israel winning or losing newest cyber battles
Thursday, 28 April 2016

Byline: Yonah Jeremy Bob

Jerusalem - Keeping track of the cyber battles between the US and Israel and their cyber adversaries is dizzying and constantly changing.
The US is certainly upgrading its cyber capabilities to undermine groups such as ISIS. The New York Times reported on Sunday that the US Department of Defense's Cyber Command unit is mounting an offensive against ISIS to block it from spreading its message, recruiting members, paying fighters and from exercising command and control functions such as issuing instructions online.

As part of its "cyber bomb," the US has placed implants within ISIS's networks so it can mimic their behaviors and orders, and make slight changes to redirect ISIS fighters in a way that leaves them exposed to ground or drone assaults.

These are the practical measures the US has shied away from using until now because of legal issues and the possibility of a boomerang effect. For example, there are also reports that the US came close to paralyzing Syria's air force a few years ago to hamper its barrel bombing of civilian populations, but held off because it could cause diplomatic complications with third countries.

Yet ISIS is adversary unlike any seen before; its ruthlessness has invited innovative ideas about how it can be defeated. In mid-April, Pentagon officials told the US Congress that it is developing cyber and other electronic weapons to attack enemy missile systems prior to launch. Such weapons act as a counterpunch to adversaries trying to overwhelm US defense systems with a volley of missiles.

The potential of these cyber offensive actions is awesome in their breadth, but they are really part of a defensive strategy. They have evolved to counter the possibility of a missile defense system being overwhelmed by sheer volume. Attack rockets cost less than defensive missiles, but only if the US can produce them en masse to avoid a costly arms race.

But on the flip side, the US, after sufferings years of cyber attacks from Chinese hackers (despite a pledge by President Xi Jinping to stamp out such activity) has not found any solutions. US President Barack Obama appears willing to keep his head down on the issue as he nears the end of his term.

The bilateral pledge between the US and China, agreed to in September, calls for an end to cyber hacking, especially commercial hacking. Obama pushed for the initiative since 2013.

Despite the pledge, V.-Adm. James D. Syring, chief of the US Missile Defense Agency, last week reiterated that China is still trying to hack into US missile defenses, even after the US has flagged this and other violations of the deal. Besides negotiations, the US embarrassed Beijing by indicting five senior Chinese officials for cyber spying in the summer of 2014 and considered offensive cyber retaliation by counter-hacking and publicly revealing Chinese secrets. Hacking could go as far as breaking down China's great firewall for censorship, opening China's citizenry to unguarded and unmonitored Internet access, along with spilling Chinese state secrets.

But Obama's truce, despite past Chinese transgressions as well as US weakness in the face of current breaches, shows that the US president believes avoiding conflict is more important than the payoff of enforcing the pact. Like the US, Israel has some impressive offensive cyber weapons. The Jerusalem Post reported in June 2015 that IDF Brig.-Gen. (res.) Pinchas Barel Buchris, a former head of Unit 8200, said that it has the ability to hack into Hezbollah's highly advanced computerized rockets to prevent their launch. This capability could save Israel from an arms race involving iron dome missiles versus rockets from Hezbollah and Hamas, much like the case with the US.

On March 31 the Institute for National Security Studies published a 81-page report with recommendations for Israeli cyber policy. In terms of using cyber offensives, the report recommended a multi-pronged approach, including integrating them with attacks by conventional armed forces, disrupting the enemy's communications system, using private sector proxies (as Israeli adversaries do), and utilizing restrained attacks to send deterrent messages.

Last week, the Post's Yaakov Lappin reported that the IDF's unit for information technology security held its first-ever cyber war drill. The drill was based on accumulated experience about what to expect from recent cyber attacks on the IDF's systems. But with all of these offensive and defensive innovations, Israel has recently admitted that a number of cyber hacks have been embarrassingly successful in targeting the country's most sensitive systems.

The first hack carried less severe operational consequences. In January, The Intercept magazine revealed that between 2008 and 2012, the US and British intelligence services hacked into Israeli drones and aircraft such as the F-16 fighter, in order to monitor their activity under a classified program code-named "Anarchist."

It was revealed that the UK's intelligence services, known as the Governments Communication Headquarters, which works in conjunction with the US National Security Agency, systematically surveyed Israeli drones from Cyprus.

The purpose was to collect information on military operations in Gaza, especially during 2008-9's Operation Cast Lead, monitor the possibility of Israeli strikes on Iran and tap into drone technology the Jewish state was exporting globally.

The UK and US intelligence services collected snapshot images from the Israeli drones, as well as data that mapped the paths taken by the unmanned aircraft.

Israel's arch enemies carried out the second hack, making it far more serious. On March 23, Islamic Jihad master hacker Maagad Ben Juwad Oydeh was indicted in the Beersheba District Court for grave cyber hacking crimes against Israel from 2011 to 2014. The announcement shockingly revealed that the Palestinian had hacked repeatedly into the IDF's drones hovering over Gaza enabling him to view the drones' video feed.

An indictment filed by the Southern District Attorney's Office also charged Oydeh with hacking into the police, transportation authority and Ben-Gurion Airport's video cameras, enabling the terrorist group to study the location of civilians and IDF personnel in real-time as fired rockets during past conflicts.

Also, in mid-March, former New York mayor and current cyber security guru Rudolph Giuliani told the Post that there are many cutting-edge cyber defense technologies that governments are not using and he is not sure why - although he did not list them, for security reasons.

Public relations for Israel's cyber strength could stress that the breaches were from 2014 or earlier and that Giuliani's criticism was vague.

And none of the defensive vulnerabilities detract from the US and Israel's cyber offensive prowess.

If anything, the latest developments simply stress that whoever is on the cyber offensive almost always has a serious advantage and that all sides of a cyber conflict are unlikely to avoid getting cyber-bloodied.

Toronto Star
Canada's spies in spat over privacy breach reporting
Sunday, 01 May 2016
Byline: Alex Boutilier

Ottawa - Canada's electronic spies are concerned reporting too many details about serious privacy breaches could reveal too much about the agency's highly secretive surveillance and cyber-defence activities, the Star has learned.
The Communications Security Establishment has been in a yearlong spat with privacy commissioner Daniel Therrien's office over reporting "material" privacy breaches.

The spy agency's reluctance comes despite government-wide regulations requiring all serious privacy breaches - - those that potentially could cause serious harm to an individual, or involving a large number of Canadians -- to be disclosed to the independent watchdog.

"As with all (government) departments and agencies, CSE is required to report material privacy breaches to the Office of the Privacy Commissioner," CSE spokesman Ryan Foreman wrote in a statement.

"However, we do continue to discuss the most effective manner to report material privacy breaches when they occur in the operational space, in a matter that safeguards the sensitive nature of information related to CSE's mandated activities."

Documents obtained by the Star show that "discussion" has been going on since at least January of last year.

In a letter sent to a senior Treasury Board employee, released under access to information law, Therrien took aim at a proposal to provide only limited information to his office about privacy violations at CSE.

"A report that does not state the number of breaches does not give the Office of the Privacy Commissioner enough information to have a clear discussion with the institution in question," Therrien wrote. "The expertise of the Office of the Privacy Commissioner can not, therefore, be put to use."

A change in Treasury Board policy under the previous Conservative government requires all federal departments and agencies to report "material" privacy breaches to the commissioner and the Treasury Board.

As the single largest repository of Canada's top secret information, CSE certainly handles sensitive information. The agency is a member of the Five Eyes alliance, a group of closely aligned security and intelligence agencies in the U.K., U.S., Australia and New Zealand.

The alliance was shaken by revelations from whistleblower Edward Snowden in 2013, who pulled back the curtain on those countries' mass surveillance capabilities and tools. In the wake of those disclosures,

the normally press-adverse CSE has been more open about its mandate and the steps it takes to protect Canadians' privacy.

Since 2007, CSE has kept a single database for all privacy violations, from the mundane to the serious. Every year, a small team at the CSE commissioner's office, an arm's-length review body, reviews privacy violations self-reported by the agency.

William Galbraith, a spokesman for CSE commissioner Jean-Pierre Plouffe, said that his office has been in discussions with Treasury Board and Therrien about CSE's privacy breach reporting.

Galbraith said the 12-person office already examines privacy infractions, and it's important to avoid "duplication" in reviewing CSE's activities.

"The CSE commissioner has spoken with the privacy commissioner on this issue, recognizing that (Therrien's) mandate covers all government departments and receives reports for breaches, and also noting that (Plouffe's) mandate is specific to CSE and includes examination of compliance with the law including the Charter and the Privacy Act," Galbraith wrote in a statement.

But Therrien's letter noted that while the CSE commissioner reviews the legality of CSE's actions, the expertise to investigate privacy breaches is housed in the privacy commissioner's office. Therrien is not an outsider on these questions, having served as a senior Department of Justice lawyer responsible for intelligence and law enforcement agencies.

Plouffe reported earlier this year that CSE illegally, if inadvertently, transmitted Canadian metadata to a Five Eyes partner. The mistake, which CSE says did not identify any specific Canadians, was reported by the agency to the commissioner, not uncovered by Plouffe's team themselves.

Documents tabled in Parliament earlier this month show that reporting serious privacy breaches has varied widely between government departments.

Treasury Board President Scott Brison, who is responsible for enforcing the government-wide reporting, vowed in an interview with iPolitics that Ottawa will do better on reporting the infractions.

"It's an area that we will work with the (privacy commissioner's) office and with departments and agencies to understand fully what we can do to improve results and we're seized with (the issue)," Brison told the outlet.

The details about what each side is proposing in the debate between CSE and Therrien's office remain secret. Details only emerged through multiple documents, obtained by the Star over the course of several months, from Treasury Board, CSE and the privacy commissioner's office.

In statements to the Star, all three organizations said they continue to discuss the matter and hope for a resolution in the near future.

Secret service can hack innocent people to reach target: Volkskrant
Saturday, 30 April 2016

Amsterdam - The new law giving greater powers to the secret service to intercept internet traffic will allow officials to hack innocent people despite protests by privacy groups, the Volkskrant said on Friday. The paper bases its claim on the new draft legislation, which has not yet been officially published.

The new powers mean that people who share the same server as suspects could be hacked by the spy service to get access to their targets.

Ministers say this is crucial because suspects are often well protected against hacking. The new powers will apply only to the security service, not the police, the Volkskrant said. Privacy groups have already warned that this will create 'unacceptable risks to privacy'.

'Someone who is completely innocent can suddenly find the secret service accessing their data,' Ton Siedsma of Bits of Freedom told the Volkskrant. This could include their phones, tablets, smart watches, fridges and even cars, the paper said. Ministers say that the security services will have to have permission from a special commission before they can access non-suspects internet traffic.

Hackers' $81 Million Sneak Attack on World Banking
Sunday, 01 May 2016
Byline: Michael Corkery

Washington - Tens of millions of dollars siphoned from the Federal Reserve Bank of New York. A shadowy set of casinos in the Philippines. A large bank in Bangladesh with creaky technology. An unknown -- and perhaps uncatchable -- group of anonymous thieves with sophisticated hacking skills. What unites this curious cast of characters and enabled one of the most brazen digital bank heists ever is a ubiquitous and highly trusted international bank messaging system called Swift.

Swift -- the Society for Worldwide Interbank Financial Telecommunication -- is billed as a supersecure system that banks use to authorize payments from one account to another. "The Rolls-Royce of payments networks," one financial analyst said.

But last week, for the first time since hackers captured $81 million from Bangladesh's central bank in February, Swift acknowledged that the thieves have tried to carry out similar heists at other banks on its network by sneaking into the beating heart of the global banking system.

"There are many banks out there right now saying, 'There but for the grace of God go us,'" said Gareth Lodge, a payments analyst at Celent, a financial consulting firm.

The admission that the attack was not a one-time event in a developing country but perhaps part of a broader threat has thrust Swift into a spotlight, raising questions about how securely money is being moved around the world. Some financial security experts point out the Swift system is only as safe as its weakest link.

The attack also reflects a growing sophistication among digital criminals, who for years have been breaching personal bank accounts and stealing credit card credentials. The thieves in Bangladesh may have spent months lurking inside the central bank's computers, studying how to steal the necessary credentials to gain access to Swift.

It is the digital version of the heist depicted in the movie "Ocean's Eleven," said Adrian Nish, head of the cyberthreat intelligence team at BAE Systems, a defense and security company.

"The trend is moving from opportunistic crime to Hollywood-scale attacks," said Mr. Nish, whose firm has analyzed the malware believed to have been used in the Bangladesh breach.

In the United States, most banks take special precautions with their Swift computers, building multiple firewalls to isolate the system from the bank's other networks and keeping the machines physically isolated in a separate locked room.

But elsewhere, some banks take far fewer precautions. And security experts who have analyzed the Swift breach said they had concluded that the Bangladesh bank may have been particularly vulnerable to an attack.

"Swift is a great organization," said Chris Larsen, the founder of Ripple, a financial technology company that aims to speed up global money transmissions. "But the system is fractured and antiquated. The way it is set up, you cannot totally isolate problems in a place like Bangladesh from the whole network."

In some ways, Swift is a testament to how technology has helped all countries -- including poorer ones -- gain access to the financial system. But that broader access has a downside.

The central bank in Bangladesh, by some accounts, employed fewer protections against cyberattacks than many other large banks. The bank, for example, used $10 routers and no firewalls, according to news reports.

The server software that the Bangladesh bank employed was a Swift product called Alliance Access, which connects banks to the central messaging system. In a sign of how seriously Swift regards the breach of Alliance Access, the group issued a "mandatory software update" last week to help its members identify possible irregularities.

"These hackers figured out this was a weak point on the periphery, and they went for it," said Jeffrey Kutler, editor in chief at the Global Association of Risk Professionals, a trade group. "But they were not able to compromise the core."

Swift's core is built on technology that has been evolving for decades. What began in 1973 as a relatively small network of 240 banks in Europe and North America is now a sprawling network of 11,000 users that includes both banks and large corporations. At first, Swift could be used to authorize payments across national borders. But it is now also used to transmit messages related to domestic payments, securities settlements and other transactions.

Swift's growth in recent years -- it set a record for messages in March -- reflects the increasingly global and interconnected nature of finance. But it also shows the risk of so many financial instructions running through a single system made up of a patchwork of banks and companies with varying levels of online protection.

Each bank on the Swift network is identified by a set of codes. And it was the codes assigned to the Bank of Bangladesh that were recognized -- correctly -- by the Federal Reserve Bank of New York when it transferred $81 million of the Bangladesh bank's money to the Philippines, not knowing that someone, somewhere, had stolen the credentials of the Bangladesh bank and installed malware to cover his or her tracks.

Initially, the thieves requested the transfer of $951 million into a handful of bank accounts in Sri Lanka and the Philippines -- a number that prompted the New York Fed to ask the Bangladesh bank to reconfirm that it indeed wanted to move the money.

In the end, the Fed processed only five of the 35 fraudulent payment requests, after it could not reconfirm with officials in Bangladesh.

The hackers seemed to time the attack perfectly: When officials from the Fed tried to reach out to Bangladesh, it was a weekend there and no one was working. By the time central bankers in Bangladesh discovered the fraud, it was the weekend in New York and the Fed offices were closed.

To conceal the crime, the malware disabled a printer in the Bangladesh bank to prevent officials from reviewing a log of the fraudulent transfers.

The money was transferred to accounts in the Philippines and then into the Philippine casino system, which is exempt from many of the country's anti-money-laundering requirements.

The New York Fed has been criticized for letting the $81 million slip out. Representative Carolyn B. Maloney, a New York Democrat and member of the Financial Services Committee, has called for an investigation, warning that the breach "threatens to undermine the confidence that foreign central banks have in the Federal Reserve, and in the safety and soundness of international monetary transactions."

The New York Fed said in a statement that "there is no evidence that any Fed systems were compromised" and that the transfer of the money had been "fully authenticated" by Swift.

Swift, which prides itself on its secrecy and low public profile, also put out a statement about the attacks. But its executives declined to speak on the record about the episodes, which are still under investigation. The group's chairman, Yawar Shah, who is a senior executive at Citigroup, also declined to comment.

In its statement, Swift emphasized that the hackers had been able to breach only some of the banks that communicate over Swift, not the network itself.

"The commonality in what we have seen is that (internal or external) attackers have successfully compromised banks' own environments," Swift said.

Even if officials at the Bangladesh bank had employed the highest of security measures, the thieves displayed a level of skill, cunning and determination that may have been able to penetrate a far more secure system.

"If you have an attacker who really wants to get in and knows there is a big prize," Mr. Nish said, "keeping them out over the long term is really difficult."

The Mirror UK
ISIS hackers threaten to leak 'British secret intelligence' obtained from Ministry of Defence
Sunday, 01 May 2016
Byline: Jonathan Sharman

London - The hacking group made the claim in a hit-list document listing the identities of US Predator and Reaper drone operators, sparking fears of a version featuring UK personnel.
Islamic State hackers have threatened to leak "secret intelligence" they claim to have obtained from a mole at the Ministry of Defence, and say they are slowly "infiltrating" the UK and America.

A group calling itself the Islamic State Hacking Division made the claim in an anti-drone warfare document that purported to make public the identities, addresses and other details of US Predator and Reaper drone operators.

The terrorists used the hit-list document to suborn the murder of drone teams it dubbed "cowards".

But the the details of US military personnel appeared to have been scraped from publicly-accessible sources like Facebook, rather than obtained through a hack or leak, the Sunday Times reported.

Several British ISIS terrorists, including the murderer Mohammed Emwazi, known as Jihadi John, have been killed in drone strikes.

The hacker group said in the hit-list it circulated on Twitter: "In our next leak we may even disclose secret intelligence the Islamic State has just received from a source the brothers in the UK have spent some time acquiring from the Ministry of Defence in London as we slowly and secretly infiltrate England and the USA online and off."

The Ministry of Defence said: "We do not comment on alleged leaked documents."

It comes just days after a splinter group of the ISHD, the Caliphate Cyber Army, published a hit list including the names and home addresses of 3,000 ordinary New Yorkers and encouraged others to target them.

RAF air strikes have killed nearly 1,000 ISIS terrorists in Iraq and Syria since September 2014, the MoD said this week.

The campaign has intensified in recent months, with Typhoon and Tornado fighter jets attacking infrastructure targets such as oilfields and bomb factories as well as mortar and sniper positions.

Nuclear-powered subs a 'no-brainer'
Sunday, 01 May 2016
Byline: Daniel Wills

Canberra - Australia's future submarine fleet could be transitioned to include a potent mix of both intelligence gathering diesel boats and rapid, fast-moving nuclear-powered vessels once the state develops a sophisticated atomic industry based around storage, Business SA says.
The Federal Government is facing calls from across the strategic policy and business communities, as well as from an outspoken SA Senator, to strongly consider the nuclear option.

SA rejoiced this week in the expectation of thousands of new jobs as the Federal Government selected French naval giant DCNS to build 12 new conventional diesel-powered subs in Port Adelaide, which are charged with defending the nation's waters for a generation.

Premier Jay Weatherill visited DCNS's Cherbourg shipyard on Friday Adelaide time, just hours after SA was chosen as the likely site of a low-level nuclear waste dump, and as former governor Kevin Scare puts the finishing touches on a Royal Commission due for release within days.

Business SA chief executive Nigel McBride, who joined the Cherbourg tour to observe the construction of a nuclear Barracuda sub that will become the template for Australia's diesel fleet, said there was strong national defence reasons for having a mix of the two. Diesel subs are prized for their ability to become completely silent when powered down, while nuclear vessels are much faster and do not need to resurface for fuel and battery charging.

Australian Strategic Policy institute senior analyst Mark Thomson said it was a "no-brainer" to go with nuclear subs if politics allowed it, and Family First Senator Bob Day claimed national security will be put at risk if the state fails to go for a more potent and tested design.

Mr McBride said storage was a "starting point" in a discussion about other applications. The first future sub is set to hit the water in the early 2030s, about the time when the state could have a storage industry up and running if it moved to do so immediately.

"We walked around a facility today which had a significant nuclear threat," Mr McBride said.

"Nobody even blinked. We walked around and took it for granted that it would be professionally contained.

"A lot will change over the next decade or so. I think right now that is a conversation that is very difficult to have or even raise. But, yes, logically given that investment you would think it would be valuable to have half conventional submarines and then half nuclear submarines." Senator Day said there was "no escaping" the strategic need for nuclear subs. "Australia's defence needs are best served by six conventional diesel-powered subs and six nuclear-powered, but not nuclear armed, subs," he said.

"The winning DCNS bid links SA with a French nation with nuclear subs and nuclear power. This opens up great opportunities for SA to learn how to embrace all facets of the nuclear fuel cycle." Australian law currently bars the use of nuclear subs.

Speaking in Cherbourg, Mr Weatherill said defence use of nuclear technology was not under consideration by the Royal Commission and "not something we are contemplating at the moment".

"We have a Nuclear Fuel Cycle Royal Commission which is considering elements of the fuel cycle, but that doesn't extent into defence." He has previously said it would take about two decades to build up such a technical capacity, which would require community backing and significant technical investment.

New York Times
The House Votes Unanimously to Strengthen Email Privacy
Saturday, 30 April 2016

Editorial: In a rare and remarkable display of bipartisanship, the House voted unanimously this week to strengthen a 30-year-old privacy law that governs how and when law enforcement agencies can obtain access to emails, photographs and other documents that people store online. If enacted, the changes will ensure that the law protects digital information as well as it does physical documents.
The bill will require law enforcement agencies to obtain search warrants from judges to gain access to personal messages and files stored on the servers of companies like Google, Yahoo and Dropbox. The legislation would substantially revise a 1986 law, the Electronic Communications Privacy Act, that allows agencies to get emails older than 180 days and other digital files by issuing subpoenas to technology companies without going to a judge.

This sensible update reflects how people store information today. And some courts have already recognized the principle that emails and files kept in the cloud should receive the same protection under the law as documents left in filing cabinets and closets. In 2010, the United States Court of Appeals for the Sixth Circuit ruled that the government must obtain warrants before searching emails stored online. But that ruling was not appealed to the Supreme Court, so it did not establish national precedent.

The bill is not perfect. When it was introduced, it required law enforcement agencies to notify people that their digital data had been obtained through a warrant. That provision was removed before the House voted on the bill because of law enforcement opposition. Technology companies, however, will be allowed to notify their customers about warrants.

Law enforcement agencies will be able to ask judges to temporarily forbid such notification if it would hurt investigations or cause other problems, but they will not be able to prevent disclosure indefinitely, as under current law. Microsoft filed a lawsuit earlier this month against the Justice Department arguing that the existing nondisclosure provision violates the Constitution.

The Obama administration has not taken a position on the House bill but has previously said it supports updating the 1986 law. In the Senate, Mike Lee, Republican of Utah, and Patrick Leahy, Democrat of Vermont, have sponsored a similar bill and won bipartisan support from 24 other senators.

But the proposals for reform could face opposition from key senators. The chairman of the Judiciary Committee, Chuck Grassley, Republican of Iowa, has not said whether he will schedule a vote. He seems concerned that changing current law could hurt the government's ability to get data it needs for criminal and civil investigations.

His fears are misplaced. Judges rarely turn down governmental requests for warrants. And civil enforcement agencies that cannot seek warrants, like the Securities and Exchange Commission, can still issue subpoenas directly to the people and businesses they are investigating.

Senator Mitch McConnell, the majority leader, ought to heed the resounding vote in the House and bring the legislation up for a vote.

Motherboard Blog
GCHQ Has Disclosed Over 20 Vulnerabilities This Year, Including Ones in iOS
Saturday, 30 April 2016
Byline: Joseph Cox
Section: Analysis

Analysis: Earlier this week, it emerged that a section of Government Communications Headquarters (GCHQ), the UK's signal intelligence agency, had disclosed a serious vulnerability in Firefox to Mozilla. Now, GCHQ has said it helped fix nearly two dozen individual vulnerabilities in the past few months, including in highly popular pieces of software like iOS.
"So far in 2016 GCHQ/CESG has disclosed more than 20 vulnerabilities across a number of software products," a GCHQ spokesperson told Motherboard in an email. CESG, or the National Technical Authority for Information Assurance, is the information security wing of GCHQ.

Those issues include a kernel vulnerability in OS X El Captain v10.11.4, the latest version, that would allow arbitrary code execution, and two in iOS 9.3, one of which would have done largely the same thing, and the other could have let an application launch a denial of service attack.

The spokesperson also pointed to two vulnerabilities in Squid, a caching proxy which can improve web response times. Recently, GCHQ intervened in the rollout of smart gas and electricity metres, which were planned to use a signal encryption key.

"We are not always credited by vendors for bugs that we disclose. We ask companies for credit in bulletins that they may publish, but recognise that this is not always possible," a GCHQ spokesperson said.

In a speech last year, the Director of GCHQ Robert Hannigan said: "GCHQ has disclosed vulnerabilities in every major mobile and desktop platform, including the big names that underpin British business."

However, governments sometimes withhold details of vulnerabilities from affected companies because the security holes can be used for hacking operations instead. Motherboard's question of whether the recent selection of vulnerabilities were only disclosed after they had already been exploited by the offensive arm of GCHQ went unanswered.

Sunday Times (UK)
Isis hackers publish hitlist of drone pilots

Sunday, 01 May 2016
Byline: Dipesh Gadher

London - ISIS hackers with links to Britain have published a "hitlist" of dozens of American military personnel purportedly involved in drone strikes against terrorists in Syria and Iraq.
A group calling itself the "Islamic State Hacking Division" yesterday circulated online the names, home addresses and photographs of more than 70 US staff, including women. It urged supporters: "Kill them wherever they are, knock on their doors and behead them, stab them, shoot them in the face or bomb them."

The group also claimed that it might have a mole in Britain's Ministry of Defence and threatened to publish "secret intelligence" in the future that could identify RAF drone operators. The claim could not be verified.

The Isis hacking division was previously led by Junaid Hussain, a former computer hacker from Birmingham who was killed by a US drone strike in Syria last August after he was discovered to be orchestrating attacks against the West. His wife, Sally Jones, a Muslim convert from Kent, is still believed to be involved in the organisation, which in the past has urged "lone wolf" attacks against RAF bases in the UK.

Inquiries made by The Sunday Times yesterday suggested that the names on the American hitlist are genuine.

However, the information published by Isis does not appear to be the result of a leak or genuine hack. Instead, the group seems to have painstakingly gleaned the names of Reaper and Predator drone operators from news articles and military newsletters, before matching them to addresses, photos and other personal details from publicly available sources on the internet.

Some of the information appears to have been taken from social media sites, including Facebook and LinkedIn.

Among those named on the list are Lieutenant-General Sean MacFarland, the US commander leading the coalition against Isis in Syria and Iraq.

His identity and role are already in the public domain.

Coalition drone strikes have been highly effective in killing senior figures within Isis in recent months and putting the terrorist group on the back foot in its self-declared "caliphate" in the Middle East.

At least five British Isis fighters, including Hussain, 21, and Mohammed Emwazi, 27, the murderer from London known as Jihadi John, have been killed by such strikes.

The US drone programme is mainly run from bases in Nevada and New Mexico.

The new hitlist features the Isis flag above the heading: "Target -- United States Military". The document, circulated via Twitter and posted on the JustPaste website, states: "You crusaders that can only attack the soldiers of the Islamic State with joysticks and consoles, die in your rage!

"Your military has no courage, neither has your president as he still refuses to send troops. So instead you press buttons thousands of miles away in your feeble attempt to fight us. A nation of cowards that holds no bravery as you resort to sending your remotecontrolled unmanned Reaper and Predator drones to attack us from the skies. So this is for you, America."

The group claimed that it had "acquired" information "to expose the location of your drone personnel".

It continued: "These 75 crusaders are posted as targets for our brothers and sisters in America and worldwide to hunt down and kill."

The group also warned: "In our next leak we may even disclose secret intelligence the Islamic State has just received from a source the brothers in the UK have spent some time acquiring from the Ministry of Defence in London as we slowly and secretly infiltrate England and the USA online and off."

After mini-biographies of each of the targeted US personnel, an apparent disclaimer states: "A few of the addresses may not be current due to the databases being outdated."

At the bottom of the Isis document is an image of the Statue of Liberty with its head cut off.

Jones, 46, a former member of a female punk rock band who now calls herself Umm Hussain, has used the same image for her Twitter profile picture.

Jones followed Hussain to Syria in 2013 after meeting him online. She travelled with Jojo, her 10-year-old son from a previous relationship.

Last October the American government listed Jones as a "specially designated global terrorist" after she urged an undercover reporter to plot an attack on the Queen at VJ-Day commemorations in London.

Using an alternative name for Isis, Major Adrian Rankine- Galloway, a Pentagon spokesman, said: "We are aware that Isil and other terrorist organisations have periodically purported to release personal information on US service members and military members of our coalition partners involved in operations against Isil.

"We take proactive measures to protect our service members and their families and keep them apprised of changes to the security situation," he added. "We will not comment on the authenticity of the information in question, and this will have no effect on operations against Isil."

The MoD said: "We do not comment on alleged leaked documents."

Toronto Star
Public still in the dark after tax deadline error
Saturday, 30 April 2016
Byline: Vanessa Lu

Toronto - The Canada Revenue Agency (CRA) gave us an extra five days to file our returns last year, but it is keeping details about the reason under wraps. Last year, on April 24 the CRA told tax preparers the deadline was May 5. Then it told us to ignore the message, insisting the deadline would remain April 30, the usual filing date.
Then the CRA reversed course, giving Canadians until May 5, promising no extra interest or penalties.

It blamed the goof on "human error," without further explanation. "The CRA takes full responsibility for the error and our first priority is to ensure that no Canadian is negatively affected," the agency said at the time. Immediately after the deadline was extended, the Star filed two separate requests for information under the Access to Information Act.

One asked for details of the mistake, how it was made and discovered. The other asked for financial implications of lost revenue related to the extension.

Now nearly a year later, the information hasn't been released - even though the agency indicated it would need up to a 90-day extension beyond the 30-day statutory limit, back in June 2015.

When contacted about the delay last week, an official in the access to information division said the agency was close to completing the request on lost revenues, likely within two weeks, but that the other one would take longer.

When pushed to explain why almost a year has passed on this request, Dianne Piercey said: "It's not unusual for a file to be so late."

Sue Brennan, also of the access to information division, followed up with another phone call, apologizing for the delay. She said the Star's request is not unique. Other files that are even older are still waiting for response.

CRA spokeswoman Jelica Zdero said in an email that timely information disclosure is in the public interest and a priority for the CRA, but it also must protect privacy and confidential information of taxpayers.

"The CRA received over 6,000 access to information and privacy requests last year and processes approximately two million responsive pages annually, the second highest volume across the Government of Canada," she said.

"Many of these requests involve documents containing personal or third-party information," Zdero said.

"The people or organizations to whom this information pertains must be consulted on whether the information requires protection from disclosure according to the exemptions under the Access to Information Act. "

Last year's deadline extension was the second time in a row that taxpayers got five extra days to fill out their returns.

In 2014, the CRA had to shut down its website to all electronic filing for five days, after determining someone had hacked into the service and accessed social insurance numbers.

This was at the time news broke that the Heartbleed Bug, a flaw in widely used encryption software, could leave online password and sensitive personal information exposed.

Online giants such as Google, Facebook and Yahoo had to scramble to deal with the threat.

A London, Ont., man has been charged in the case. Stephen Arthuro Solis-Reyes, 21, faces numerous charges including unauthorized use of a computer and mischief in relation to data.

The RCMP later laid new charges against Solis-Reyes related to other hacking including computers at Western University, the London District Catholic School Board and an email service Jersey Mail.

A spokeswoman for the Ontario Superior Court in Ottawa said a pretrial hearing in the Solis-Reyes case was scheduled for Friday.

London Times
Queen bans drones over estate amid terror fears
Monday, 02 May 2016
Byline: Staff report

London - The Queen has banned drones from being flown without permission over her Sandringham estate in an apparent move to prevent terrorist attacks and protect the privacy of the royal family. The ban covers all 20,000 acres of the estate in north Norfolk, making it potentially the largest single area in the UK to ban unmanned aircraft.

It comes amid fears that remotecontrolled drones could carry a bomb or chemical weapon. The ban will also help to foil paparazzi using drones to take aerial photographs.

Last December the Department for Transport made it a criminal offence for low-flying aircraft, including drones, to be flown within 1.5 miles of the Duke and Duchess of Cambridge's home at Anmer Hall on the estate. A similar ban is in place within 1.5 miles of Sandringham House from every December to the end of February when the Queen and other members of the royal family are often in residence.

The restrictions are similar to the drone bans around military bases, nuclear power stations and airports. Anyone breaking the restrictions faces a fine of up to £5,000.

A spokesman for the Civil Aviation Authority said that it was unclear how the ban could be enforced over the entire estate, because landowners did not automatically control the airspace over their land.

The spokesman said: "Nobody owns the air under UK law."

A Buckingham Palace spokeswoman refused to comment.

Wall Street Journal
Social Sites Slow Terror Fight
Monday, 02 May 2016
Byline: Multiple reporters

Washington - European counterterrorism officials say American laws and corporate policies are hampering their efforts to prevent a next attack, because legal procedures for getting international evidence from U.S.-based social-media firms are dangerously outdated.
European police officials who face a lengthy process to get communications data from companies such as Facebook, Twitter, YouTube and WhatsApp want to make American technology firms more responsive to overseas requests.

Even emergency requests for basic customer data -- which often don't require a legal and diplomatic review -- can cause friction between social media firms and European investigators, officials on both sides of the Atlantic say.

An online posting days after the Paris attacks in November made clear how acute those tensions are. In it, a suspected Islamic State supporter boasted that a similar attack would occur the following Sunday in Brussels, people familiar with the incident said.

When Belgian police sought to find out who was behind the account, the unidentified U.S. company in question decided it would provide the subscriber data only if the company could notify the suspect of the search and give him the contact information of the police official involved.

Belgian officials resisted that demand, fearing it could compromise the investigation and potentially endanger the police official, according to officials familiar with the discussions. The fight became tense enough that the U.S. Justice Department had to weigh in. That led to what one official called "a long discussion" that ultimately persuaded the company to give the Belgians the information.

On Nov. 21, just over a week after the Paris killings, Belgium raised its security alert to the highest level and warned of an imminent threat, closing the subway system and schools and canceling events. Belgian officials wouldn't say whether the online posting influenced the four-day lockdown.

With domestic investigations, American companies are required to cooperate with U.S. court orders to comply with such requests. But in many cases, U.S. law forbids companies to provide intercepted communications to foreign officials, unless it is through a diplomatic review process. People on all sides agree any real change for European access would have to come by changing U.S. law.

In the wake of the Paris and Brussels attacks, "people are pretty quick to point to the intelligence failures between France and Belgium, but in fact there's a very good chance there was information they couldn't get," said Terry Cunningham, president of the International Association of Chiefs of Police, which has pressed Congress on the issue. Other officials say leads in European terror cases can languish for as much as a year.

Even when European police believe suspects are plotting an attack on European soil, they can't get access to the suspects' real-time Internet conversations on American-owned social-media sites. Under U.S. law, authorities can't conduct a legally valid intercept of communications if the suspected activity doesn't involve American interests.

In other words, if a terror plot doesn't potentially threaten Americans in some way, European officials can't get legal authority to monitor the suspects' communications on an American social-media site.

Some industry executives worry that privacy would be eroded if technology firms had to start recognizing the authority of foreign courts and judges making cross-border demands for data. Microsoft's top lawyer, Brad Smith, has long argued firms should follow the legal process of the country in which the data is stored -- in the case of many American social-media firms, the U. S. -- not the legal process of whatever country is demanding data.

Still, many U.S. Internet companies agree there is a problem. They say their options are limited under current law.

A spokeswoman for Facebook, which also owns WhatsApp, said the legal process for international evidence requests can be "slow and cumbersome," adding that the firm is "actively pushing the U.S. and other governments for reforms."

Meanwhile, she said Facebook has "well-developed processes" for responding to international law-enforcement requests, including those that don't require a monthslong diplomatic review process. Emergency requests get priority, she added, and the company is often able to respond within hours or, if necessary, even minutes.

"Our legal and safety teams worked around the clock to respond to law-enforcement requests following the recent terrorist attacks," she said.

A spokeswoman for Google, which owns YouTube, said it responds to valid legal requests for user data from abroad "when they are consistent with the laws of the requesting country and the U.S., our policies, and international norms," a position echoed by Twitter.

Beyond legal restrictions, officials at social-media companies say other factors can complicate such requests. Some foreign requests may fall short of generally accepted legal practices in the U.S., they say, and sometimes foreign investigators and the officials at the firms don't have much of an everyday working relationship to smooth the process. But European officials say American Internet companies could be doing more, such as providing basic customer details in emergency situations.

Koen Geens, Belgium's justice minister, said the problem needs to be urgently addressed. "The level of cooperation strongly differs from provider to provider, but generally it is largely unsatisfactory and it endangers investigations and, by consequence, people's security," he said.

Many complaints focus on a diplomatic tool called Mutual Legal Assistance Treaties, which guide the exchange of evidence in criminal matters between the U.S. and other countries. Because of legal and bureaucratic steps, it can take nearly a year to obtain evidence through the process. By the time the search is approved, officials said, the key data has often been deleted because many U.S. companies retain it for a limited period.

American police agencies are engaged in their own struggle with Silicon Valley over issues of privacy and security, but the hurdles are higher for Europeans, officials said. The use of encryption, for example, increasingly means that an in-country wiretap may be useless because the only unencrypted version of a conversation between European suspects may reside in a computer server on U.S. soil.

Even with a law change, though, agreements would likely have to be negotiated with numerous countries. The Justice Department recently struck a deal to speed up the process for the U.K., but that change still requires congressional approval.

BBC News
Craig Wright revealed as Bitcoin creator Satoshi Nakamoto
Monday, 02 May 2016
Byline: Staff report

London - Australian entrepreneur Craig Wright has publicly identified himself as Bitcoin creator Satoshi Nakamoto.
His admission ends years of speculation about who came up with the original ideas underlying the digital cash system.

Mr Wright has provided technical proof to back up his claim using coins known to be owned by Bitcoin's creator.

Prominent members of the Bitcoin community and its core development team have also confirmed Mr Wright's claim.

Mr Wright has revealed his identity to three media organisations - the BBC, the Economist and GQ.

At the meeting with the BBC, Mr Wright digitally signed messages using cryptographic keys created during the early days of Bitcoin's development. The keys are inextricably linked to blocks of bitcoins known to have been created or "mined" by Satoshi Nakamoto.

"These are the blocks used to send 10 bitcoins to Hal Finney in January [2009] as the first bitcoin transaction," said Mr Wright during his demonstration.

Renowned cryptographer Hal Finney was one of the engineers who helped turn Mr Wright's ideas into the Bitcoin protocol, he said.

"I was the main part of it, but other people helped me," he said.

Mr Wright said he planned to release information that would allow others to cryptographically verify that he is Satoshi Nakamoto.

Soon after Mr Wright went public, Gavin Andresen, chief scientist at the Bitcoin Foundation, published a blog backing his claim.

"I believe Craig Steven Wright is the person who invented Bitcoin," he wrote.

Jon Matonis, an economist and one of the founding directors of the Bitcoin Foundation, said he was convinced that Mr Wright was who he claimed to be.

"During the London proof sessions, I had the opportunity to review the relevant data along three distinct lines: cryptographic, social, and technical," he said.

"It is my firm belief that Craig Wright satisfies all three categories."

Not everyone has been convinced by Mr Wright's claims and technical proofs. In its article about Mr Wright, The Economist said "important questions remain" about whether he was Satoshi Nakamoto.

In addition, many people involved in bitcoin have taken to social media to express their doubts and have called for further proof.

How Bitcoin works

Bitcoin is often referred to as a new kind of currency.

But it may be best to think of its units being virtual tokens rather than physical coins or notes.

However, like all currencies its value is determined by how much people are willing to exchange it for.

To process Bitcoin transactions, a procedure called "mining" must take place, which involves a computer solving a difficult mathematical problem with a 64-digit solution.

For each problem solved, one block of Bitcoins is processed. In addition the miner is rewarded with new Bitcoins.

This provides an incentive for people to provide computer processing power to solve the problems.

To compensate for the growing power of computer chips, the difficulty of the puzzles is adjusted to ensure a steady stream of new Bitcoins are produced each day.

There are currently about 15 million Bitcoins in existence.

To receive a Bitcoin, a user must have a Bitcoin address - a string of 27-34 letters and numbers - which acts as a kind of virtual post-box to and from which the Bitcoins are sent.

Since there is no registry of these addresses, people can use them to protect their anonymity when making a transaction.

These addresses are in turn stored in Bitcoin wallets, which are used to manage savings.

They operate like privately run bank accounts - with the proviso that if the data is lost, so are the Bitcoins owned.

The Hill
Snowden: Without encryption, everything stops
Monday, 02 May 2016

Byline: Rebecca Savransky

Washington - Edward Snowden defended the importance of encryption, calling it the "backbone of computer security."
"Encryption saves lives. Encryption protects property," the former National Security Agency (NSA) contractor said during a debate with CNN's Fareed Zakaria that aired Sunday.

"Without it, our economy stops. Our government stops. Everything stops."

Snowden, who previously leaked documents revealing the extent of the NSA's surveillance program, said we are in the midst of the "greatest crisis in computer security in history."

He said computer security bumped terrorism out of the top spot on our list of national security threats.

"Our intelligence agencies say computer security is a bigger problem than terrorism, than crime, than anything else," he said.

He called encryption a "field of mathematics."

"No matter how much we might hope otherwise, math is math. It works the same for Mother Teresa as it does for Osama bin Laden," he said.

"Lawful access to any device or communication cannot be provided to anybody without fatally compromising the security of everybody."

He also added that for the government to unlock everything, there has to be a key to everything.

"We can pass a law to require a key under every doormat in order to make things easier for police, but the problem is that every other person in the world can find that key, too, and they can use it," he said.

Former NSA Director Michael Hayden said America is more secure and safer with "unbreakable end to end encryption," Snowden said.

I can promise you ... one thing: If I am standing shoulder to shoulder with the director of the National Security Agency on something," Snowden said, "there's a damn good reason for that."

Saudi Gazette
60 million cyber-attacks against Saudi public sector annually
Monday, 02 May 2016
Byline: Maryam Al-Sughayar

Riyadh - Security expert and information security researcher Muhammad Amin revealed the number of cyber-attacks targeting the Kingdom last year was 60 million, a figure that made Saudi Arabia the most attacked country in the Middle East.
He attributed the high number of cyber- attacks to the Kingdom's status and distinct role in the region in the political, financial and security arenas.

"It is a country that is rich in oil and gas and it has potentials that criminals and other countries seek to take advantage of. All these factors make the Kingdom a target of these attacks, which is deemed the most prominent contemporary security problem," he said.

Amin added that the government sectors recorded the most number of hacking attempts with oil, gas, financial and telecommunications sectors ranking among the most affected.

Among the most vulnerable industries, Amin said the Saline Water Conversion Corporation (SWCC) and oil and gas installations are most likely to be targeted by hackers as they use industrial equipment that is remotely managed by the Internet. Of the most prominent hacking attacks in the world were those against Saudi Aramco.

He further said with all equipment being connected to the Internet, especially smart cities, there is a dire need to focus on how to protect them from being hijacked by hackers.

As for the hacking of banks, he said most hackers target customers' bank accounts but some also target automated teller machines (ATMs) and point of sales machines. More serious attacks against financial institutions, like the hacking of over 100 banks worldwide, cause the greatest financial losses. Such attacks are complicated and are carried out by criminal groups that use sophisticated methods, like transferring money from banks and changing the names of account owners.

Amin stressed the importance of protecting the Kingdom's institutions from cyber attacks and said a clear strategy that utilizes the latest technology is needed.

"Awareness is necessary for the user so they can ensure the safety of devices connected to the Internet. One should be aware about such crimes especially since terrorists benefit from illicit money stolen in cyber attacks," he added.

Pakistan Dawn
Govt requests to Facebook for user data rise sharply
Monday, 02 May 2016
Byline: Tauseef Razi Mallick

Karachi - The government made 471 requests to Facebook for data related to 706 accounts/users in the latter half of last year, marking a two-fold increase in the number of requests made to the social networking site during the first six months of 2015.
The details were given in a bi- annual transparency report, "Global Government Requests Report", issued by Facebook recently.

Between January and June of 2015, 192 such requests were made for data related to 275 users/ accounts, meaning that there was a 145 per cent jump in the number of requests made by the government to the social media giant during the second half of the year.

The website said: "Based on legal requests from the Pakistan Telecom Authority, Facebook restricted access to six items that were alleged to violate local laws prohibiting blasphemy."

Of the 471 requests made between July and December 2015, Facebook cooperated and provided information in 66.45pc of the cases.

Speaking to Dawn, founder and director of Digital Rights Foundation Nighat Daad said: "Not only is there an alarming increase in the number of data requests made by the Pakistan government, but the instances when Facebook obliged the requests are also increasing."

Ms Daad, however, questioned the legal process adopted by both parties in the transfer of private data. "All this is happening without any judicial oversight," she said.

She went on to say that Facebook still held the right to accept or deny any request for data, but once the proposed Cyber Crime Bill was passed, the website would be bound by law to provide data on each request made to it.

"The rise in complaints also shows how rigorously the government wants to control the internet," she pointed out.

The sole responsibility of data privacy didn't lie with the government but also with the international companies which otherwise preached freedom of expression, she said.

According to Facebook, the recently released report provided information about the number of government requests it received for data, and the number of items restricted for violating local laws.

The Facebook administration mentioned an overall global increase in government requests for user data and content restrictions pursuant to local law.

"Government requests for account data rose by 13pc, from 41,214 requests to 46,763. The number of items restricted for violating local law increased over the first half of 2015, to 55,827 items, up from 20,568," said the report.

Facebook said it only "responds to valid requests relating to criminal cases".

The social network added that each request received from a government was checked for legal sufficiency and was rejected unless it required greater specificity on requests which were overly broad or vague.

Jakarta Post
15,000 radical sites created to recruit new followers: BNPT
Monday, 02 May 2016
Byline: Suherdjoko

Jakarta - The National Counterterrorism Agency (BNPT) has warned of the growing efforts by radical movements to spread their views through social media.
The agency's deputy director for terrorism prevention, protection and deradicalization Maj. Gen. Abdul Rahman Kadir said the number of radical sites amounted to around 15,000.

"One of the radical groups whose existence has become more alarming is the Islamic State [IS]. As a new global terrorist power, the IS is striving to recruit young people as its members," said Rahman.

Several recent terrorism cases showed that the terror perpetrators were aged between 20 and 30 years, he added.

Rahman said recent terrorist incidents included those in Paris, Brussels, Lahore and the bomb and gun attack on Jl.Thamrin, Central Jakarta, in January.

The Thamrin attack was perpetrated by young people and it was terrorist propaganda spread by radical groups via the cyber world that had influenced those young people to commit the crimes.

"Many radical sites have used Islam to mask their crimes as their content contradicts Islamic values. The radical movements now have a new pattern; they are getting smarter to benefit from information technology," said Rahman.

The counterterrorism official was speaking at the opening of a dialogue entitled "Preventing the spread of radical and terrorist views and IS influence" held at the Military Area Command (Kodam) IV/Diponegoro in Semarang, Central Java, recently.

The BNPT's terrorism prevention director Brig. Gen. Hamidin said the radical sites had created terrorists who were radicalized via the internet. "They can learn how to create a home-made bomb or other terrorist actions on the internet," he said.

Hamidin further explained that the internet had revealed new groups other than the 21 radical groups known to have affiliated with IS.

Ansor Youth Movement (GP Ansor), the youth wing of Indonesia's biggest Islamic organization Nahdlatul Ulama (NU), says it has built up the Ansor Cyber Army (ACA) to fight against radicalism and terrorism in the cyber world.

"We are preparing ACA to attack the campaigns of radical groups in social media," GP Ansor chairman Yaqut Cholil Qoumas said.

He said cyber technology allowed all issues to develop on social media. Unfortunately, radical groups such as IS often used this technology as a propaganda and campaign tool.

That was why GP Ansor had instructed all elements of Ansor and Barisan Ansor Serbaguna (Banser), the NU youth wing, to fight against the radical groups' propaganda, which threatened the unity of the Republic of Indonesia, via the cyber world, Qoumas said.

"We, the Ansor members, have always been willing to fight against radical groups both in the written and cyber world," he asserted.

Qoumas explained the radical groups had continued to boost their campaigns. Citing an example, the Ansor leader mentioned the installing of banners and other attributes emblazoned with messages that called for the establishment of the Khilafah Islamiyah (Islamic Empire), which occurred in areas of NU support. "They're conducting a huge campaign; thus, we have to fight it on an equally big scale," said Qoumas.

Gulf News
Qatar National Bank says client accounts safe despite breach
Monday, 02 May 2016
Byline: Staff Report

Doha - Qatar National Bank, the Middle East's largest lender by assets, said it had taken immediate steps to ensure customers would not suffer any financial loss after a security breach last week exposed personal data of thousands of clients.
"We are taking every measure to protect the privacy of our customers and have engaged an external third party expert to review all our systems to ensure no vulnerabilities exist," the bank said in a statement on Sunday.

"All our customers' accounts are secure," it added, although it was not clear how the bank planned to protect accounts whose details, including customer names and passwords, have already been published.

The 1.5GB trove of leaked documents posted online last week included the bank details, telephone numbers and dates of birth of several journalists for satellite broadcaster Al-Jazeera, supposed members of the ruling al-Thani family and government and defence officials.

Some files had pictures of account holders from Facebook and LinkedIn, a potentially sensitive issue in a conservative country where privacy is valued.

The bank said the breach was an attack on its reputation, rather than specifically targeted at the customers, and only involved a portion of Qatar based customers. The statement did not mention the identity of the hackers.

QNB said some of the data released may be accurate but much of it was constructed and "contains a mixture of information from the attack as well as other non-QNB sources, such as personal data from social media channels." A copy of the leaked content seen by Reuters contained transaction data of QNB customers that showed overseas remittance data from as recently as September 2015.

One file had information on what appeared to be 465,437 QNB accounts, although only a fraction of these accounts had anything resembling full account details.

Several known Qatari figures in the government and media whose names appeared on the list confirmed to Reuters that their account details were accurate.

Middle Eastern banks are attractive targets for cyber criminals because of the high levels of wealth in the oil-rich region. Qatar is the wealthiest country in the world on a per capita basis, according to the World Bank.

Cyber warriors needed to protect online security in UAE
Monday, 02 May 2016
Byline: Samihah Zaman

Abu Dhabi - Although the UAE's online security frameworks are very robust, the threat of hacking cannot be ignored as the country strives to become a leading knowledge economy, a top information technology official said in the capital on Sunday.
"The UAE is working to implement smart government portals for the benefit of its residents, and introduce more and more services online. But these portals and their connected networks must be kept safe and reliable from the attacks of ever smarter hackers and online thieves," said Abdul Aziz Al Madhloum, head of training at federal cyber security regulator, the National Electronic Security Authority (Nesa).

"We need a generation of cyber warriors who can stay a step ahead of online criminals, and this is why we need to interest and inform our youth of cybersecurity measures," he added.

To ensure this, the Nesa organised in the capital its annual three-day cybersecurity competition, Cyber Quest, which pits teams of ethical hackers against one another. Through this, participants are taught about the importance of ethical hacking, and how it can help reveal the vulnerabilities of online and computer systems so that they can be resolved.

A total of 60 schoolchildren from public and private institutions across the UAE participated in this third edition of Cyber Quest. The youngest of them was a Grade 7 student. The participants worked in teams of two to crack up to 40 challenges using their knowledge of forensics, programming and scripts in order to hack into networks and servers.

As reported by Gulf News last November (2015), more than two million residents were victims of cybercrime in 2014-2015, losing Dh4.9 billion between them.

"Despite the threats posed by online criminals, every passing year, we note that children are becoming even more knowledgeable about the security threats facing us online. And we want to hone that knowledge and help these cyber enthusiasts develop into savvy online security experts," Al Madhloum said.

"I believe people are still careless about their online security and don't take simple measures. For myself, I use a 25-character long password. And I hope to one day become a cyber security expert," said Yousuf Awad, a Canadian participant from Dubai's Greenwood International School. Awad won the first prize at Cyber Quest along with his Emirati classmate, Mohammad Hamad.

"The best thing is that we were taught how to think like online attackers. So we can use this knowledge to defend ourselves," Hamad, who also wants to pursue a career in cybersecurity, added.

Over the next two days, the Nesa will continue to organise trial competitions for interested pupils, and also offer training activities focussing on automobile cyber-attacks, counterfeit detection, forensics and cryptography.

Fars News Agency
Rouhani Lauds Iran's Development of Advanced Technologies
Monday, 02 May 2016

Tehran - Iranian President Hassan Rouhani thanked experts and scientists for developing hi-tech in the country, and urged that Iran should become a knowledge-based economy.

"Some time in the past, we received advanced technologies from other countries, but today we enjoy hi-tech and can interact with other countries to further enhance these technologies," Rouhani said, addressing a ceremony on the occasion of the International Labors Day in Tehran on Sunday.

Voicing pleasure that the Iranian economic enterprises are now competing with their rivals at the international level, he said, "If we want to increase our income and wealth and improve the workers' situations, we should move towards a knowledge- based economy."

Iran is among the few world countries such as the US, Japan and Germany that have access to a number of hi-tech, including in nuclear, stem cell and aerospace technologies.

The country has taken wide strides in science and technology, particularly in medical and medicinal fields, in recent years.

In relevant remarks last year, Iran's Vice- President for Science and Technology Sorena Sattari underscored the necessity for paying special attention to the development of knowledge-based economy in Iran.

"Today we should move toward changing the old approach towards research, a kind of approach which has been created based on reliance on oil revenues and has influenced research environment of the country," Sattari said.

Changing the old habits needs firm determination for moving toward innovation by Iranian enterprises because reliance on mere oil revenues in research and technology has led to creation of luxury but inefficient infrastructures in the country and that is why we should leave behind a kind of culture which is based on dependence on oil economy, the official added.

He said expertise and skilled human resources make up the back bone of knowledge-based economy, adding today the country faces a big and exceptional opportunity to move toward materialization of knowledge- based economy and distance itself from oil-dependent economy.

Globe and Mail
Brazilian judge orders WhatsApp shutdown
Tuesday, 03 May 2016
Byline: Stephanie Nolen

A Brazilian judge has once again ordered the shutdown of the mobile messaging service WhatsApp, which is wildly popular in the country and used by more than 100 million people.
The order to the country's five telecommunications companies to suspend WhatsApp for 72 hours was issued by a lower court judge in Sergipe state in the northeast. The judge wants the company to share messages related to a case against drug traffickers with the federal police, something the company says it cannot do.

The telecom operators took the service offline; they faced a fine equivalent to $180,000 a day if they failed to comply, according to the newspaper Folha de Sao Paulo.

The suspension is an inconvenience for Brazilians, who rely on the service to share information between families, from schools and with their doctors; WhatsApp is the most-used app in the country. The court order is also symbolic of the immense power of even lower court judges in Brazil, a feature of the legal system, which has had considerable political importance in recent months.

Judge Marcel Montalvao had Diego Dzodan, Facebook's vicepresident for Latin America, arrested in March over failure to comply with a subpoena apparently related to the same case. Mr. Dzodan was held in custody for 24 hours until the arrest order was overturned in an appeals court.

Last December, WhatsApp was ordered offline for 48 hours by a lower court judge in Sao Paulo state, who wanted to compel the company to share information relevant to an unrelated criminal case. The service was restored after 13 hours.

The Sergipe case appears to hinge on the issue of end-to- end encryption, which WhatsApp recently began to offer - a security feature that means, the company says, that only the person who sends and the person who receives have access to what is in the text, audio, picture or video images transmitted through the service. So, says Facebook, which owns WhatsApp, it can't give the court the information the police want - it doesn't have access to it.

In February, yet another judge tried to suspend the service to compel the company to co-operate in a separate case, but that decision was appealed and struck down before the suspension took effect.

Judges have immense power in Brazil. This has been brought into vivid relief in the political upheaval that has gripped the country in recent months. In March, Sergio Moro, a federal court judge, released audio recordings of the current and former presidents' phone calls as part of a corruption investigation.

That same week, President Dilma Rousseff appointed the former president, Luiz Inacio Lula da Silva, to her cabinet, but he hasn't been able to take up the job because a series of lower courts issued injunctions to stop him.

Many Brazilians disgusted by the corruption scandal engulfing the political class have celebrated the actions of the judiciary, but the WhatsApp shutdowns illustrate how the broad scope of legal purview means a single judge can dramatically influence the course of national events.

An estimated 91 per cent of Brazilian mobile users countrywide use WhatsApp, and the shutdown order presents a conundrum for the telecom companies, who have made clear they don't like the service. The company has headquarters in California and doesn't pay taxes here, but it's sucking away the data and calling traffic that generates revenue for the mobile operators.

Bare-bones WhatsApp consumes minimal data, which makes it extremely popular with Brazilians, who face some of the highest mobile package tariffs in the world. The main competitor messaging service, Telegram, reported that it signed up more than a million new users in the hours after the suspension was announced - but while 5.7 million signed up during the December shutdown, very few stuck with the service, migrating en masse back to the familiar interface of WhatsApp as soon as the ban was lifted.

Motherboard
What Happens When Canadian Cops Find a Software Security Flaw?
Tuesday, 03 May 2016
Byline: Matthew Braga

When law enforcement and intelligence agencies in Canada discover flaws in computer software--say, a bug that could help hackers steal messages from a smartphone, or spy on unsuspecting victims via internet- connected webcams--do they disclose those holes to the software's creator so they can be plugged?
Or do they keep such flaws secret for their own use in future investigations, with the hope that no one else will find and use them maliciously first?

These types of weak spots, if left unpatched, can pose a very real security risk to users. But unlike counterparts in the US, the Canadian government has never gone on the record about how it handles the disclosure of newly discovered software bugs.

Often referred to as zero day vulnerabilities, such flaws are valuable to spies and police because their existence is not widely known, not even to the companies themselves. Thus, they can be used to gain access to computer networks, smartphones, or other electronic devices again and again, until the vulnerability is discovered, or disclosed and patched.

By keeping knowledge of such bugs secret--not only to consumers, but to the software's creator--critics have argued that the government is compromising the privacy and security of users so that it can build an arsenal of secret bugs for use in future digital attacks. The longer zero-day bugs remain unpatched, the more likely it is that criminals or other governments can discover and exploit them. Some zero day exploits, such as the ones used in the Stuxnet attack on a uranium enrichment facility in Iran, can go undetected for years.

In the United States, there is a policy called the Vulnerabilities Equities Process, or VEP. First introduced in 2010, it determines how and when the US government discloses information about flaws it discovers--or purchases--to the industry at large.

The VEP is supposed to weigh this trade-off between national security and user security by evaluating the implications of whether a bug is disclosed. In Canada, however, there is no publicly available documentation that suggests whether or not a similar process exists.

"I'm not aware of one," said Imran Ahmad, a lawyer at Cassels Brock in Toronto who works with clients on issues related to cybersecurity, privacy and data breaches. "To my knowledge, there's no formal process by which law enforcement regularly communicates with software manufacturers to flag vulnerabilities that they've come across in their own testing, to the extent that there's testing going on."

In an email, the RCMP would not answer questions related to its policy for disclosing software vulnerabilities, nor whether police purchase, discover or use software exploits as part of its investigations. "We generally do not comment on specific investigative methods, tools and techniques outside of court," wrote Sgt. Julie Gagnon.

Ryan Foreman, spokesperson for the Canadian government's cyberspy agency Communications Security Establishment (CSE), wrote in an email that CSE shares "cyber threat information" with government stakeholders that "may originate from CSE's own analysis," but did not not specifically address software exploits, nor whether a policy comparable to the VEP exists.

The VEP isn't perfect. In 2014, The The New York Times reported that the NSA typically reports bugs to software companies--unless those bugs can be used for "a clear national security or law enforcement need." Then, last November, the NSA wrote on its website that it had released "more than 91 percent of vulnerabilities discovered in products" but did not specify when the disclosures were made, nor how long those vulnerabilities had been exploited before being disclosed, if they were exploited at all.

Recent court battles, such as the fight between Apple and the FBI for access to a locked iPhone, and the FBI's mass-hacking of a child predator ring operating on the dark web, demonstrate the extent to which US police have relied on such bugs in their investigations. But as Electronic Frontier Foundation staff attorney Andrew Crocker recently told Motherboard's Joseph Cox, because the VEP is a closely held secret, "no one really knows if it's followed in any cases."

Apple, for example, told Reuters earlier this week that the first time the FBI had ever disclosed flaws in Apple software was April 14. Though an annual report on the VEP's implementation is required, none of these reports have ever been made public.

Toronto Star
Spy agency cagey on privacy breaches
Tuesday, 03 May 2016
Byline: Alex Boutilier

OTTAWA -- The Communications Security Establishment is refusing to release the number of privacy breaches the agency has logged since 2007.
Documents obtained by the Star state the intelligence and cyber defence agency has maintained a central database for certain privacy violations since 2007. These breaches are categorized as minor "procedural errors" or more serious "privacy incidents," and reviewed by the CSE Commissioner's office every year.

"In these files, CSE records any incidents it identifies that put at risk the privacy of a Canadian in a manner that runs counter to (or is not provided in) its operational policies," says a September 2014 letter from former CSE chief John Forster to a senior Treasury Board official.

The Star requested just the number of breaches - no details about what actually transpired or the Canadian personal information involved - but was told the agency could not comply due to "operational security concerns."

"Releasing the number of (breaches) would provide insight into CSE's capacity to conduct operations, the extent of its capabilities, the degree to which partner organizations benefit from sharing and the reach of the programs," wrote spokesperson Ryan Foreman in an email last week.

CSE is one of Canada's most technologically sophisticated agencies, responsible for collecting foreign intelligence and protecting Canadian networks from cyber attacks. It is forbidden to use its surveillance tactics against Canadian citizens, except under specific circumstances.

But disclosures from U.S. whistleblower Edward Snowden have aroused suspicion about CSE's tools and tactics as part of the Five Eyes alliance that also includes the U.S., U.K., Australia and New Zealand.

Documents tabled in Parliament last month show CSE logged 13 privacy and information breaches in 2015, affecting at least 630 individuals. The agency did not report any of the privacy breaches to the federal privacy commissioner, as CSE determined that there was "no significant risk" to the individuals involved.

CSE further refused to report the activities that led to the breaches.

The Star reported Sunday that the agency has been in a year-long debate with the Privacy Commissioner Daniel Therrien's office over how much information CSE is required to report about privacy breaches. A government-wide regulation requires all serious breaches to be reported to the privacy watchdog, but a "discussion" about how best to do that has been dragging on since at least January 2015.

On Monday, NDP foreign affairs critic Hélène Laverdière asked Defence Minister Harjit Sajjan to explain why CSE is resisting turning information over to Therrien's office.

"CSE has proactively worked with the commissioner on all aspects, and they do have a good working relationship," said Sajjan, who is responsible for the intelligence agency. "CSE abides by Canadian law, including the Privacy Act."

Wesley Wark, a professor at the University of Ottawa specializing in security and intelligence matters, said reviewing CSE's privacy breaches has typically fallen to the CSE commissioner, rather than the privacy watchdog.

"Really, the protection of privacy role, in terms of external review, has de facto been given to the CSE commissioner," Wark said in an interview last week.

The 12-person team at CSE Commissioner Jean-Pierre Plouffe's office is mandated to ensure that CSE complies with Canadian law.

Globe and Mail
Canadian arrested in Nepal over tweets
Tuesday, 03 May 2016
Byline: Tu Thanh Ha

A Canadian expatriate working in Kathmandu has been arrested and threatened with expulsion from Nepal because of his socialmedia posts criticizing the country's human-rights situation.
Robert Penner, a software developer living in Lalitpur, a district south of Kathmandu, had been writing about issues such as the problems of the Madhesi minority, the arrest of prominent journalist Kanak Mani Dixit and the local reaction to a recent report by Human Rights Watch on Nepal.

Mr. Penner said the local police came to his office on Monday afternoon.

"I repeatedly asked Nepal Police to tell me under what charges they're taking me but they won't say," he tweeted just before his arrest.

Mr. Penner was being held overnight on immigration charges that his Twitter posts were harming "security and mutual harmony in Nepal," his lawyer, Dipendra Jha, told The Globe and Mail.

"They're saying they plan to deport him back because they can cancel his visa."

Rishi Ram Sharma, chief district officer of Lalitpur, confirmed to The Globe that local police took Mr. Penner into custody at the request of immigration officials.

"Immigration asked us to hand [him] over," he said when reached by phone.

Kedar Neupane, director-general of the Department of Immigration, declined to comment when contacted by The Globe, saying he was busy with a meeting.

Mr. Neupane, however, told the Nepalese newspaper Republica that his department wants to expel Mr. Penner back to Canada.

"He obtained a visa for working at an IT company but he was found engaged in making provocative statements that may jeopardize national integrity," Mr. Neupane was quoted as saying.

"Foreigners are not allowed to engage in such activities."

"We are investigating into the matter, and will deport him if charges against him are proven true," The New York Times reported Mr. Neupane as saying.

Madhesi activist Puru Shah said Mr. Penner had riled up many Nepalese nationalists by questioning how their country was handling human-rights concerns.

"He's a very logical guy. He sees something that is not logical, he will call it out," Mr. Shah said in an interview.

The arrest puts a spotlight on the country's controversial new constitution, which has upset minorities such as the Madhesi, who say they will be marginalized under its citizenship rules.

Under the new constitution, children of Nepali women who marry foreigners won't have fullfledged citizenship rights, an issue for the Madhesis, who live near India and have a tradition of cross-border marriages, Mr. Shah said.

He said Mr. Penner had written two articles for a pro-Madhesi website. "He made a lot of people upset."

According to his social-media posts, Mr. Penner is a former resident of Kelowna, B.C., who first visited Nepal a decade ago and has been living in the Kathmandu area for the past four years, working for a technology outsourcing company, CloudFactory.

"My Twitter timeline is a war zone these days," Mr. Penner told a friend on Facebook last December.

He shared screen captures of people on Twitter accusing him of having a hidden agenda and using human-rights discussions as a cover to promote "the secessionist movement."

Some made threats. Others called on the Nepalese government to expel Mr. Penner.

Mr. Shah said he saw a tweet written in Nepali earlier this month that alerted an official government account about Mr. Penner's writings. The government account then replied, asking for more details, Mr. Shah said.

Under the new constitution, the right to freedom of expression is only guaranteed to Nepalese citizens, not foreign residents, human-rights lawyer Santosh Sigdel told The Globe.

Mr. Sigdel also noted that another Nepalese law makes it illegal to publish material in the electronic media that "may jeopardize the harmonious relations subsisting among the peoples of various castes, tribes and communities."

New Zealand Herald
Trust a vital asset as NZ faces future
Tuesday, 03 May 2016
Byline: Gehan Gunasekara
Section: oped

With the recent announcements of manufacturing closures in New Zealand, such as Fisher & Paykel's Auckland plant, it is important to develop new knowledge-based jobs here. Twenty-first century business is increasingly data-driven by analytics and Big Data. Personal information is becoming the new oil and companies here must be able to tap into it.
A good example of information-based business is cloud providers. Currently, the United States is the dominant player. New Zealand has never competed on scale; instead its strength has been the quality of its products and the reputation of its brands. With cloud services reputation and trust is everything.

Legal safeguards for personal information and restraining unimpeded surveillance are crucial to allow businesses to make the most of this trust.

The recent Independent Review of Intelligence and Security by the Hon Sir Michael Cullen and Dame Patsy Reddy has produced remarkably detailed recommendations for revamped laws surrounding the activities of our spy agencies. If they are implemented in their entirety we will have some of the toughest controls on such agencies in the western world.

If instead the Government cherry-picks aspects of the Cullen-Reddy report then the gaps would quickly be exploited by the agencies concerned and we may as well not have bothered with any reform.

To give just one example, one of the currently neglected areas is "incidentally gathered information". Electronic surveillance tends to "vacuum up" vast amounts of information. Most is undoubtedly discarded by the likes of the GCSB but currently it can be sent to its partners in the Five-Eyes network who can do what they want with it.

The report recommends plugging this gap by requiring the New Zealand agency to decide which part of the data it wants to keep or share and to go through procedures (such as an obtaining an interception warrant). This would mean all surveillance is targeted and mass surveillance such as that exposed by Edward Snowden could not occur.

Into this heady mix must be factored the restrictions imposed on New Zealand by the TPP. Although this free-trade agreement requires its parties to adopt or maintain a legal framework providing for the protection of personal information, the requirement is weakly defined. It can be satisfied by laws providing for enforcing voluntary undertakings by enterprises relating to privacy. This is essentially the American approach and has not prevented frequent privacy invasions by the likes of Facebook and Google, for instance.

The TPP's article 14.11.2 mandates that cross-border data flows of personal information not be restricted, and article 14.13 prohibits laws that require data to be held in New Zealand and not, for example, elsewhere such as Australia.

Exceptions are subject to a complex four-step test with the onus being on the country imposing restrictions to show why they are essential for its public policies, and that they are non-discriminatory and proportionate.

Finally, there are the investor-state dispute settlement provisions prohibiting direct or indirect expropriation of overseas investors targeting New Zealand.

Should the Government follow recommendations for strengthening the Privacy Act by imposing strict liability on local agencies that outsource information or use cloud providers, it is likely that the agencies would seek to obtain indemnities from the overseas providers involved. This may lead to the latter refusing to provide the services.

Where existing facilities (say data storage) have already been built with a view to serving customers here, this may amount to indirect expropriation and lead to our government being sued by investors under investor-state provisions in the TPP. This may not be far-fetched and illustrates why delaying much-overdue reform of the Privacy Act has weakened our ability to project a privacy-friendly image.

Note: Gehan Gunasekara is an associate professor in commercial law at the University of Auckland Business School and advised the Law Commission on reform of the Privacy Act 1993.

South China Morning Post
Government 'powerless' against deep web threat
Tuesday, 03 May 2016
Byline: Allen Au-yeung

Hong Kong authorities are powerless to police clandestine activities flourishing in the "deep web" - the unseen portion of the internet that makes up 96 per cent of online content - because there is no legal basis to do so, according to local cybersecurity experts.
Duncan Wong, director of security and data sciences at the Hong Kong Applied Science and Technology Research Institute, told the Post that only 4 per cent of the web can be accessed by conventional search engines.

The rest, called the deep web, is unsearchable and password-protected. Inside the deep web, there is also an area known as the "dark web", which can only be accessed using identity- hiding encryption technology.

"The dark web is a collection of websites. This collection can be accessed anonymously," said Wong, who frequently surfs it to gather intelligence on the latest hacking trends. "A part of the dark web is pretty dark. People use it to exchange malicious software, like recently popular ransomware.

"On the dark web, people are also selling drugs and some websites are related to pornography."

Ransomware is malware that encrypts files in victims' computers, rendering them unrecoverable. Victims are then told to pay a ransom in bitcoin to unlock them.

As of mid- March, the Hong Kong Computer Emergency Response Team Coordination Centre had received 18 reports about the use of ransomware. Victims included small businesses and non-governmental organisations, and the team believed there were many more unreported cases.

While the latest attacks' origin was unclear, Wong said the type of malware involved was known to not infect computer systems operating in Russian.

Information technology lawmaker Charles Mok said he believed it was impossible for law enforcers by themselves to regulate the dark web as the bulk of its activities took place abroad.

"It's something that exists, unless you completely cut yourself off from the internet. It's impossible to shut it down," said Mok.

He said the government had been passive in helping the public protect themselves.

"The government has always been late in understanding the problems," Mok said.

Wong said the best way for businesses to protect themselves was to regularly back up files on a computer not always hooked up to the internet.

But he said people should not fear the dark web, which also serves as a channel for whistle-blowers who want to share sensitive information anonymously.

"I don't think there is anything to worry about," Wong said. "There is no way to stop the dark web, and it has its value for different people. It will be there forever. You can shut down some of the drug dealing sites like Silk Road and then Silk Road 2.0 is out."

Reuters
Canadian held for second day after social media criticism of Nepal government
Tuesday, 03 May 2016

Kathmandu - A Canadian computer programmer who has been vocally critical of the government of Nepal on social media has been held for a second day of questioning, a Nepali official said on Tuesday. Robert Penner was taken to the Department of Immigration for questioning on Monday by police who arrested him at his office in southern Kathmandu, said Lalitpur Senior Superintendent of Police Pitambar Adhikari. Penner lives in Kathmandu and works for Sound Cloud, an outsourcing company.

He criticized the Nepal government on social media during unrest that followed the passing of Nepal's constitution last year and he denounced the recent arrest and detention of Kanak Mani Dixit, a prominent journalist and civil rights activist.

"Yesterday we requested the police to bring him to the Department of Immigration for questioning," Prakash Neupane, director of immigration told Reuters.

"Penner is still under the process of investigation. We are investigating whether he has contravened the terms of his working visa, which state he can be punished if he engages in activities outside the terms of his working visa."

Lawyer Dipendra Jha, who is representing Penner, said he had been informed that the Canadian would be released on Tuesday, and his visa revoked. Officials at the Department of Immigration declined to confirm this.

The Canadian consulate in Kathmandu could not be reached for comment. The Canadian High Commission in the Indian capital New Delhi declined to comment.

Press Trust of India
Canadian arrested in Nepal for posting provocative tweets
Tuesday, 03 May 2016

Kathmandu - A Canadian national, who backed the Madhes movement, was today arrested by Nepal Police for allegedly posting provocative and anti- national comments on social media and visa violations. Robert Penner was arrested from Lalitpur on a request from the Department of Immigration (DoI), Nepalease media reported.

DoI Director-General Kedar Neupane said Penner was arrested to probe his posts on social media which are "liable to incite" social disharmony in the nation.

Penner had obtained working visa for a sprout technology company, which was already dissolved in 2012, but worked for Cloud Factory, a foreign outsourcing company, according to the DoI.

Penner is also accused of holding multiple visas and overstaying. "He obtained visa for working at an IT company but he was found engaged in making provocative statements that may jeopardise national integrity," said Neupane, adding, "foreigners are not allowed to engage in such activities."

The report said immigration laws bar any foreign national from expressing public comments on internal politics of the host nation.

A source at the DoI told MyRepublica that they received complaints that Penner had been engaging in activities that could harm Nepal's national integrity. "We had to arrest him due to his suspicious activities and for misusing his visa," said the source.

Penner has previously tweeted in favour of the Madhes movement. He had also written controversial tweets about the arrest of journalist Kanak Mani Dixit, MyRepublica reported.

Madhesis, mostly of Indian origin, have been demanding that Nepal's Constitution be amended to include their concerns over inadequate political representation and redrawing of federal boundaries.

They had enforced months-long blockade of Nepal's all trading points with India, creating huge shortage of essential commodities in the country.

The Intercept
WhatsApp, Used by 100 Million Brazilians, Was Shut Down Nationwide Today by a Single Judge
Tuesday, 03 May 2016
Byline: Glenn Greenwald, Adam Fishman

Washington - A BRAZILIAN STATE JUDGE ordered mobile phone operators to block nationwide the extremely popular WhatsApp chat service for 72 hours, a move that will have widespread international reverberations for the increasingly contentious debate over encryption and online privacy. The ruling, issued on April 26, became public today when it was served on mobile service providers. It took effect at 2 p.m. local time (1 p.m. ET); as of that time, people in Brazil who tried to use the service could not connect, nor could they send or receive any messages. Failure to comply will subject the service providers to a fine of 500,000 reals per day ($142,000 per day).
WhatsApp is the most-used app in Brazil, a country of 200 million people (it is now owned by Facebook, the country's second-most used app). An estimated 91 percent of Brazilian mobile users nationwide -- more than 100 million individuals -- use WhatsApp to communicate with one another for free (it has 900 million active daily users around the world). Brazilians spent this morning, in the hours before the block took effect, frantically sending each other messages on WhatsApp warning that the service was going down for three days.

This ruling comes from the same judge, Marcel Maia Montalvão, of a small town in Sergipe state, who two months ago ordered Facebook's vice president for Latin America, Diego Dzodan, to be detained over WhatsApp's failure to cooperate with a subpoena issued as part of a criminal investigation. The judge said the arrest was justified by Facebook's "repeatedly failing to comply with judicial orders" in a drug-trafficking case. Pursuant to that order, Dzodan was arrested by federal police and held in custody for a full day, until an appellate court overturned the order.

Afterward, the Facebook executive insisted that "the way that information is encrypted from one cellphone to another, there is no information stored that could be handed over to authorities." WhatsApp similarly said: "WhatsApp cannot provide information we do not have." According to Folha de São Paulo, Brazil's largest newspaper, today's ruling ordering the shutdown of WhatsApp stems from the same case.

The extraordinary orders reflect what is becoming a global controversy over the fight of technology companies to offer their users "end-to-end" encryption. That service, which has become quite in demand in the wake of reporting from the archive provided by Edward Snowden, ensures that only the users -- but not the company itself -- can access the content they are sharing. The post- Snowden fixation of tech companies to demonstrate a genuine commitment to protect the privacy of their users (motivated by business self-interest) has driven a wedge between the once-fully collaborative Silicon Valley and U.S. government surveillance state partners, creating a protracted and bitter public PR war that culminated last month in the Apple/FBI fight over access to iPhones.

As a result of its encryption protections, the position of WhatsApp in response to subpoenas has been that it is incapable of turning over users' communications because the encryption not only keeps governments and non-state actors out but also the company itself. Over the past several years, numerous countries have begun enacting laws to bar companies from using any encryption that they cannot circumvent, and the Obama administration has been debating whether to support legislation that would allow only the use of encryption to which government agencies have backdoor access (in the

1990s, the Clinton administration used the Oklahoma City bombing to argue for a similar law, but it was blocked by a coalition of privacy advocates from both parties in Congress).

THIS IS NOT the first time WhatsApp service has been interrupted in Brazil. Last December, in a separate case, a lower court judge in São Paulo state ordered service providers to block the app for 48 hours as retribution for its failure to cooperate in a criminal investigation. An appeals court overturned the ruling but only after hours of service outage, invoking "constitutional principles" to say that "it does not seem reasonable that millions of users are affected because of the inertia of a company."

In many ways, Brazil -- with huge numbers of internet users and a growing online population of young people -- is a key battleground for the global struggle for internet freedom. The Wall Street Journal called Brazil "the social media capital of the universe." In January, after the last WhatsApp shutdown, two analysts from the Brazil-based Igarapé Institute, Robert Muggah and Nathan Thompson, wrote in the New York Times, "The country has one of the fastest growing populations of internet users in the world. Online tools like Facebook, Twitter and WhatsApp are used not only to express opinions; they are an affordable alternative to exorbitantly priced Brazilian telecom providers."

In a country with turbulent political conflicts and a highly engaged online population, the debate over internet freedom has become very prominent. Along with Germany, the Brazilian government, in the wake of the Snowden revelations, was the most vocal in denouncing the U.S. for excessive NSA surveillance (Brazil was a key target for such spying). In 2014, the government enacted what it claimed was a law to protect internet freedom, "Marco Civil da Internet," that did provide some privacy protections but also granted new surveillance powers to the government. Just last month, the government demanded, and received, a new draconian anti-terrorism law that provided it with extreme new law enforcement powers (causing ex-President Lula da Silva to break with his party, which controls the government, by telling The Intercept in an interview that he opposes the new law).

And now, as The Intercept reported last week, a new cybercrime bill on the verge of being enacted could codify internet-shutdown powers of the type the state judge today imposed. In a Facebook post, Ronaldo Lemos, founding director of the Institute of Technology and Society of Rio de Janeiro and an architect of Brazil's landmark 2014 Marco Civil internet legislation, wrote: "Tomorrow, the Cybercrime CPI will vote on a proposal to make this type of block lawful. If the CPI proposal goes forward, this will be the new normal in the country. Every week we would have news of sites and services that are blocked, as it is in Saudi Arabia and North Korea."

It is stunning to watch a single judge instantly shut down a primary means of online communication for the world's fifth-largest country. The two security experts in the NYT wrote of the first WhatsApp shutdown: "The judge's action was reckless and represents a potentially longer-term threat to the freedoms of Brazilians." But there is no question that is just a sign of what is to come for countries far from Brazil: There will undoubtedly be similar battles in numerous countries around the world over what rights companies have to offer privacy protections to their users.

The Intercept
Inside the Assassination Complex
Tuesday, 03 May 2016
Byline: Edward Snowden

Comment - "I've been waiting 40 years for someone like you." Those were the first words Daniel Ellsberg spoke to me when we met last year. Dan and I felt an immediate kinship; we both knew what it meant to risk so much -- and to be irrevocably changed -- by revealing secret truths.
One of the challenges of being a whistleblower is living with the knowledge that people continue to sit, just as you did, at those desks, in that unit, throughout the agency, who see what you saw and comply in silence, without resistance or complaint. They learn to live not just with untruths but with unnecessary untruths, dangerous untruths, corrosive untruths. It is a double tragedy: What begins as a survival strategy ends with the compromise of the human being it sought to preserve and the diminishing of the democracy meant to justify the sacrifice.

But unlike Dan Ellsberg, I didn't have to wait 40 years to witness other citizens breaking that silence with documents. Ellsberg gave the Pentagon Papers to the New York Times and other newspapers in 1971; Chelsea Manning provided the Iraq and Afghan War logs and the Cablegate materials to WikiLeaks in 2010. I came forward in 2013. Now here we are in 2016, and another person of courage and conscience has made available the set of extraordinary documents that are published in The Assassination Complex, the new book out today by Jeremy Scahill and the staff of The Intercept. (The documents were originally published last October 15 in The Drone Papers.)

We are witnessing a compression of the working period in which bad policy shelters in the shadows, the time frame in which unconstitutional activities can continue before they are exposed by acts of conscience. And this temporal compression has a significance beyond the immediate headlines; it permits the people of this country to learn about critical government actions, not as part of the historical record but in a way that allows direct action through voting -- in other words, in a way that empowers an informed citizenry to defend the democracy that "state secrets" are nominally intended to support. When I see individuals who are able to bring information forward, it gives me hope that we won't always be required to curtail the illegal activities of our government as if it were a constant task, to uproot official lawbreaking as routinely as we mow the grass. (Interestingly enough, that is how some have begun to describe remote killing operations, as "cutting the grass.")

A single act of whistleblowing doesn't change the reality that there are significant portions of the government that operate below the waterline, beneath the visibility of the public. Those secret activities will continue, despite reforms. But those who perform these actions now have to live with the fear that if they engage in activities contrary to the spirit of society -- if even a single citizen is catalyzed to halt the machinery of that injustice -- they might still be held to account. The thread by which good governance hangs is this equality before the law, for the only fear of the man who turns the gears is that he may find himself upon them.

Hope lies beyond, when we move from extraordinary acts of revelation to a collective culture of accountability within the intelligence community. Here we will have taken a meaningful step toward solving a problem that has existed for as long as our government.

Not all leaks are alike, nor are their makers. Gen. David Petraeus, for instance, provided his illicit lover and favorable biographer information so secret it defied classification, including the names of covert operatives and the president's private thoughts on matters of strategic concern. Petraeus was not charged with a felony, as the Justice Department had initially recommended, but was instead permitted to plead guilty to a misdemeanor. Had an enlisted soldier of modest rank pulled out a stack of highly classified notebooks and handed them to his girlfriend to secure so much as a smile, he'd be looking at many decades in prison, not a pile of character references from a Who's Who of the Deep State.

There are authorized leaks and also permitted disclosures. It is rare for senior administration officials to explicitly ask a subordinate to leak a CIA officer's name to retaliate against her husband, as appears to have been the case with Valerie Plame. It is equally rare for a month to go by in which some senior official does not disclose some protected information that is beneficial to the political efforts of the parties but clearly "damaging to national security" under the definitions of our law.

This dynamic can be seen quite clearly in the al Qaeda "conference call of doom" story, in which intelligence officials, likely seeking to inflate the threat of terrorism and deflect criticism of mass surveillance, revealed to a neoconservative website extraordinarily detailed accounts of specific communications they had intercepted, including locations of the participating parties and the precise contents of the discussions. If the officials' claims were to be believed, they irrevocably burned an extraordinary means of learning the precise plans and intentions of terrorist leadership for the sake of a short-lived political advantage in a news cycle. Not a single person seems to have been so much as disciplined as a result of the story that cost us the ability to listen to the alleged al Qaeda hotline.

If harmfulness and authorization make no difference, what explains the distinction between the permissible and the impermissible disclosure?

The answer is control. A leak is acceptable if it's not seen as a threat, as a challenge to the prerogatives of the institution. But if all of the disparate components of the institution -- not just its head but its hands and feet, every part of its body -- must be assumed to have the same power to discuss matters of concern, that is an existential threat to the modern political monopoly of information control, particularly if we're talking about disclosures of serious wrongdoing, fraudulent activity, unlawful activities. If you can't guarantee that you alone can exploit the flow of controlled information, then the aggregation of all the world's unmentionables -- including your own -- begins to look more like a liability than an asset.

Truly unauthorized disclosures are necessarily an act of resistance -- that is, if they're not done simply for press consumption, to fluff up the public appearance or reputation of an institution. However, that

doesn't mean they all come from the lowest working level. Sometimes the individuals who step forward happen to be near the pinnacle of power. Ellsberg was in the top tier; he was briefing the secretary of defense. You can't get much higher, unless you are the secretary of defense, and the incentives simply aren't there for such a high-ranking official to be involved in public interest disclosures because that person already wields the influence to change the policy directly.

At the other end of the spectrum is Manning, a junior enlisted soldier, who was much nearer to the bottom of the hierarchy. I was midway in the professional career path. I sat down at the table with the chief information officer of the CIA, and I was briefing him and his chief technology officer when they were publicly making statements like "We try to collect everything and hang on to it forever," and everybody still thought that was a cute business slogan. Meanwhile I was designing the systems they would use to do precisely that. I wasn't briefing the policy side, the secretary of defense, but I was briefing the operations side, the National Security Agency's director of technology. Official wrongdoing can catalyze all levels of insiders to reveal information, even at great risk to themselves, so long as they can be convinced that it is necessary to do so.

Reaching those individuals, helping them realize that their first allegiance as a public servant is to the public rather than to the government, is the challenge. That's a significant shift in cultural thinking for a government worker today.

I've argued that whistleblowers are elected by circumstance. It's not a virtue of who you are or your background. It's a question of what you are exposed to, what you witness. At that point the question becomes Do you honestly believe that you have the capability to remediate the problem, to influence policy? I would not encourage individuals to reveal information, even about wrongdoing, if they do not believe they can be effective in doing so, because the right moment can be as rare as the will to act.

This is simply a pragmatic, strategic consideration. Whistleblowers are outliers of probability, and if they are to be effective as a political force, it's critical that they maximize the amount of public good produced from scarce seed. When I was making my decision, I came to understand how one strategic consideration, such as waiting until the month before a domestic election, could become overwhelmed by another, such as the moral imperative to provide an opportunity to arrest a global trend that had already gone too far. I was focused on what I saw and on my sense of overwhelming disenfranchisement that the government, in which I had believed for my entire life, was engaged in such an extraordinary act of deception.

At the heart of this evolution is that whistleblowing is a radicalizing event -- and by "radical" I don't mean "extreme"; I mean it in the traditional sense of radix, the root of the issue. At some point you recognize that you can't just move a few letters around on a page and hope for the best. You can't simply report this problem to your supervisor, as I tried to do, because inevitably supervisors get nervous. They think about the structural risk to their career. They're concerned about rocking the boat and "getting a reputation." The incentives aren't there to produce meaningful reform. Fundamentally, in an open society, change has to flow from the bottom to the top.

As someone who works in the intelligence community, you've given up a lot to do this work. You've happily committed yourself to tyrannical restrictions. You voluntarily undergo polygraphs; you tell the government everything about your life. You waive a lot of rights because you believe the fundamental goodness of your mission justifies the sacrifice of even the sacred. It's a just cause.

And when you're confronted with evidence -- not in an edge case, not in a peculiarity, but as a core consequence of the program -- that the government is subverting the Constitution and violating the ideals you so fervently believe in, you have to make a decision. When you see that the program or policy is inconsistent with the oaths and obligations that you've sworn to your society and yourself, then that oath and that obligation cannot be reconciled with the program. To which do you owe a greater loyalty?

One of the extraordinary things about the revelations of the past several years, and their accelerating pace, is that they have occurred in the context of the United States as the "uncontested hyperpower." We now have the largest unchallenged military machine in the history of the world, and it's backed by a political system that is increasingly willing to authorize any use of force in response to practically any justification. In today's context that justification is terrorism, but not necessarily because our leaders are particularly concerned about terrorism in itself or because they think it's an existential threat to society. They recognize that even if we had a 9/11 attack every year, we would still be losing more people to car accidents and heart disease, and we don't see the same expenditure of resources to respond to those more significant threats.

What it really comes down to is the political reality that we have a political class that feels it must inoculate itself against allegations of weakness. Our politicians are more fearful of the politics of terrorism -- of the charge that they do not take terrorism seriously -- than they are of the crime itself.

As a result we have arrived at this unmatched capability, unrestrained by policy. We have become reliant upon what was intended to be the limitation of last resort: the courts. Judges, realizing that their decisions are suddenly charged with much greater political importance and impact than was originally intended, have gone to great lengths in the post- 9/11 period to avoid reviewing the laws or the operations of the executive in the national security context and setting restrictive precedents that, even if entirely proper, would impose limits on government for decades or more. That means the most powerful institution that humanity has ever witnessed has also become the least restrained. Yet that same institution was never designed to operate in such a manner, having instead been explicitly founded on the principle of checks and balances. Our founding impulse was to say, "Though we are mighty, we are voluntarily restrained."

When you first go on duty at CIA headquarters, you raise your hand and swear an oath -- not to government, not to the agency, not to secrecy. You swear an oath to the Constitution. So there's this friction, this emerging contest between the obligations and values that the government asks you to uphold, and the actual activities that you're asked to participate in.

These disclosures about the Obama administration's killing program reveal that there's a part of the American character that is deeply concerned with the unrestrained, unchecked exercise of power. And there is no greater or clearer manifestation of unchecked power than assuming for oneself the authority to execute an individual outside of a battlefield context and without the involvement of any sort of judicial process.

Traditionally, in the context of military affairs, we've always understood that lethal force in battle could not be subjected to ex ante judicial constraints. When armies are shooting at each other, there's no room for a judge on that battlefield. But now the government has decided -- without the public's participation, without our knowledge and consent -- that the battlefield is everywhere. Individuals who don't represent an imminent threat in any meaningful sense of those words are redefined, through the subversion of language, to meet that definition.

Inevitably that conceptual subversion finds its way home, along with the technology that enables officials to promote comfortable illusions about surgical killing and nonintrusive surveillance. Take, for instance, the Holy Grail of drone persistence, a capability that the United States has been pursuing forever. The goal is to deploy solar-powered drones that can loiter in the air for weeks without coming down. Once you can do that, and you put any typical signals collection device on the bottom of it to monitor, unblinkingly, the emanations of, for example, the different network addresses of every laptop, smartphone, and iPod, you know not just where a particular device is in what city, but you know what apartment each device lives in, where it goes at any particular time, and by what route. Once you know the devices, you know their owners. When you start doing this over several cities, you're tracking the movements not just of individuals but of whole populations.

By preying on the modern necessity to stay connected, governments can reduce our dignity to something like that of tagged animals, the primary difference being that we paid for the tags and they're in our pockets. It sounds like fantasist paranoia, but on the technical level it's so trivial to implement that I cannot imagine a future in which it won't be attempted. It will be limited to the war zones at first, in accordance with our customs, but surveillance technology has a tendency to follow us home.

Here we see the double edge of our uniquely American brand of nationalism. We are raised to be exceptionalists, to think we are the better nation with the manifest destiny to rule. The danger is that some people will actually believe this claim, and some of those will expect the manifestation of our national identity, that is, our government, to comport itself accordingly.

Unrestrained power may be many things, but it's not American. It is in this sense that the act of whistleblowing increasingly has become an act of political resistance. The whistleblower raises the alarm and lifts the lamp, inheriting the legacy of a line of Americans that begins with Paul Revere.

The individuals who make these disclosures feel so strongly about what they have seen that they're willing to risk their lives and their freedom. They know that we, the people, are ultimately the strongest and most reliable check on the power of government. The insiders at the highest levels of government

have extraordinary capability, extraordinary resources, tremendous access to influence, and a monopoly on violence, but in the final calculus there is but one figure that matters: the individual citizen.

And there are more of us than there are of them.

Note: From The Assassination Complex: Inside the Government's Secret Drone Warfare Program by Jeremy Scahill and the staff of The Intercept, with a foreword by Edward Snowden and afterword by Glenn Greenwald, published by Simon & Schuster.

New York Times
Canadian Held Over Twitter Post
Tuesday, 03 May 2016
Byline: Bhadra Sharma

Kathmandu - A Canadian man in Nepal who writes frequently about political issues on social media was arrested on Monday afternoon after "posting a provocative message on Twitter aimed at spreading social discord," according a Nepalese immigration official.
The man, Robert Penner, has been living in Nepal for at least two years. He was arrested at his office in the Lalitpur district by a team of police officers on the instructions of the Department of Immigration, according to Pitambar Adhikari, the district police chief. Mr. Penner was turned over to the immigration authorities, who have held him since then.

Mr. Penner has been prolific online, often weighing in on political controversies. After Nepal passed a new Constitution last year, he questioned a citizenship provision that was seen as discriminatory against women. In November, he responded to critics of a Human Rights Watch report about violations in southern Nepal.

More recently, he criticized the detention of Kanak Mani Dixit, a journalist who was arrested last month on suspicion of abusing his position as the chairman of a transportation cooperative.

According to his Twitter profile, Mr. Penner works as a scientist at Cloud Factory, a technology company with an office in Lalitpur. An official at the Department of Immigration said Mr. Penner had a valid work visa.

The immigration official, Kedar Neupane, said Mr. Penner had been arrested because he had was "spreading unnecessary messages about Nepal" on social media, but did not say who had made the complaint.

Manila Bulletin
Anonymous PH declares ceasefire from hacking gov't sites

Tuesday, 03 May 2016
Byline: Argyll Cyrus B. Geducos

Manila - A ceasefire from hacking government websites until a new president is elected was declared yesterday by members of Anonymous Philippines, a group of hackers who had claimed responsibility for defacing the website of the Commission on Elections (Comelec).
Around 30 members of the group trooped to the Department of Justice (DOJ) on Padre Faura Street in Manila yesterday and demanded that the government hire the arrested hackers instead. The group also called for the release of two arrested hackers.

The National Privacy Commission (NPC) had explained that it is difficult to hire the arrested hackers - Paul Biteng and Joenel de Asis - as this may imply to the jobless technology experts that there are jobs waiting for them.

Wearing their signature masks similar to the mask in the movie "V for Vendetta," the members endured the morning heat to insist that defacing the poll body's website only showed that their system was indeed weak.

"Ito po ay pagpapatibay lamang din na ang gobyerno ay naging pabaya sa seguridad ng data ng bawat Pilipino (This is just proof that the government has been careless in securing the data of everybody)," they said.

They also reiterated that Biteng only defaced the Comelec website and was not responsible of leaking the data, a statement already confirmed by De Asis, the hacker arrested by the National Bureau of Investigation (NBI) last Thursday.

De Asis earlier said that their group, LulzSec Philippines, had leaked the 340-gigabyte data online through a fake Facebook account. However, they claimed that the hacker website "WeHaveYourData.com" which contained the sensitive data was put up by somebody else.

Anonymous Philippines also revealed that they have forewarned Comelec officials back in 2013 about the many vulnerabilities in their website. "Ibinunyag na namin noong 2013 na mahina ang inyong sistema ngunit ano ang nangyari? Hindi ba't kapabayaan ito? (We have already revealed in 2013 that their system is weak but this still happened. Isn't this negligence on their part?)" The group also said that they had been watching the Comelec's system since 2010.

Meanwhile, the National Bureau of Investigation (NBI) warned those who have downloaded and seeded the leaked data from the Comelec website that the Bureau will soon be hunting them down.

This came after the arrest of De Asis, the second hacker, on Thursday afternoon for reportedly leaking the 340-gigabyte data after it was hacked by Biteng on March 22.

NBI-Cybercrime Division (CCD) Chief Ronald Aguto Jr. said that the next step is to hunt down and file cases against individuals who downloaded and used the said data.

Bangkok Post
Regime goes after ringleaders
Tuesday, 03 May 2016
Byline: Wassana Nanuam

Bangkok - Tougher steps are likely to deal with anti-coup elements, the army chief says, as the regime looks for evidence to pursue ringleaders including red-shirt leader Jatuporn Prompan and persistent critic Sombat Boon-ngamanong.
The coup critics are bent on causing public unrest, he added. Teerachai Nakwanich's comment followed the arrests last week of eight Facebook users for online messages allegedly criticising the prime minister and the regime.

The suspects have been charged with inciting public unrest under the Criminal Code's Section 116 and breaching the Computer Crime Act for Facebook posts that can be used to instigate chaos.

As police held a press briefing last Thursday, they revealed an "anti-coup" chart showing the connections between the suspects and their alleged links to Mr Jatuporn and Sombat. Police are also gathering evidence to seek warrants for the arrest of the pair.

Gen Teerachai said the anti-coup chart was based on the suspects' statements given to police. He also warned various protest groups opposing the draft constitution, saying these groups are made up of "the same old faces".

The army chief said he will not let them do anything to stir up trouble. Asked if he will adopt harsh measures to deal with protesters, Gen Teerachai said: "Wait and see. But we will no longer use 'attitude adjustment' because it's hard to talk to them now."

Based on the investigation findings, one of the eight suspects, Natthika Worathaiyawich, was hired to operate websites for Mr Jatuporn and Mr Sombat, police said.

According to police, Ms Natthika was the administrator of several sites that were highly critical of the government and military regime, including "We Love Prayuth", "UDD Thailand" and "Red Intelligence". She had received 110,000 baht monthly from another suspect, Harit Mahaton, since March 2014 and split the money with five other suspects, who are team members, police said.

Police said Ms Natthika also worked for the "Jatuporn Prompan" and "Peace TV" sites and was paid 20,000 baht per month. She was also allegedly paid 992,500 baht by Mr Sombat to operate sites criticising the People's Democratic Reform Committee from December 2013 to March 2014, police said.

Mr Harit was identified as a content adviser for "We Love Prayuth" and "UDD Thailand" and paid 28,000 baht for his services. His contact was allegedly Chaitat Rattanajan, a ninth suspect who is currently overseas and is believed to have received instructions from another unidentified person.

The rest of the eight suspects in custody are Noppakao Kongsuwan, Worawit Saksamutnan, Yothin Mangkhangsanga, Thanawat Buranasiri, Supachai Saibut, and Kannasit Tangboonthina.

Gen Teerachai says attempts to incite unrest are the jobs of the 'Facebook 8' arrested last week, red-shirt icon Jatuporn Prompan and regime critic Sombat Boon- ngamanong (insets).

Ten people were rounded up by the military last Wednesday, but two were released shortly after being cleared of any involvement. Deputy police spokesman Krissana Pattanacharoen talked Monday about a report that Panthongtae Shinawatra, the son of former prime minister Thaksin Shinawatra, was linked to the eight suspects.

A police source said when the police investigator submitted a request seeking the Military Court's permission to detain eight suspects, they also named Mr Panthongtae as a supporter of the suspects in the detention request.

Pol Col Krissana said investigators needed to gather clear evidence before issuing warrants for anyone. If evidence points to Mr Panthongtae, he will be summoned for questioning, Pol Col Krissana said.

Mr Jatuporn on Monday led a group of United Front for Democracy against Dictatorship members including Nattawut Saikuar, Weng Tojirakarn and Tida Tawornseth to the Bangkok Remand Prison to visit the eight detainees. The Military Court has denied the detainees bail as their charges carry a heavy penalty.

Speaking after the meeting, Mr Jatuporn said the charges levelled against the suspects for inciting unrest under Section 116 were unwarranted. The eight were only involved in making web pages with "political mockery" content, he said.

Mr Jatuporn also called on Prime Minister Prayut Chan-o-cha to be open to criticism as suggested by ex-premier Yingluck Shinawatra.

The prime minister is a public figure and should not be easily offended by criticism or mockery, Mr Jatuporn said. He also dismissed claims of Mr Panthongtae's links to the eight suspects as groundless.

Coup critic Mr Sombat said Monday he did not think pages mocking the prime minister would have an impact on national security. He denied any links to the so-called anti-coup chart.

Also on Monday, the Military Court approved a request from the Crime Suppression Division to further detain Pheu Thai Party key member Watana Muangsook.

Gulf News
QNB hackers to leak more data of another big bank soon
Tuesday, 03 May 2016
Byline: Naushad K. Cherrayil

Dubai - The hackers who attacked Qatar National Bank last week have attacked a second bank and are set to leak more data, a security expert told Gulf News on Monday.
"They have announced that they are going to release data from another big bank dating back to 2001. This data could be used for ransomware. They have said they are going to make it public, either today or tomorrow. We are monitoring it," said Mohammad Amin Hasbini, senior security researcher, global research and analysis team at Kaspersky Lab Middle East, Turkey and Africa. He said that the hackers have Turkish roots and are known as Bozkurtlar.

The hackers, which has uploaded a video online, have claimed responsibility for the bank breach. Al Habsini said could be linked to Syrian conflict.

Hasbini said that the hackers have not asked for any money yet, but have only leaked the data online. It [QNB breach] could be a political motive but "we are not sure yet. It is strange, normally hackers do hack for a goal."

Global losses from hacking and undesired spamming exceed $100 billion a year, according to Kaspersky Lab. Hackers stole $101 million from Bangladesh's central bank in February, and at least 40 million credit cards were compromised in a data breach at Target Corp in 2013.

News of the breach comes just weeks after Bangladesh's central bank announced that cybercriminals managed to steal over $100 million from one of its accounts at the Federal Reserve Bank of New York. The bank managed to recover some of the money, but $81 million that were transferred to the Philippines are still missing.

"Going by the motivation of financial gains, GCC region and the regional financial institutions could be more vulnerable because of the high concentration of wealthy individuals in the region. In the light of the increasing attacks it is important for regional institutions to take additional steps to protect their key data," said Stephen Bailey, who leads the cyber security team in PA Consulting's technical security practice in the Middle East and North Africa region.

"The motive of the QNB hacking can't be pinpointed at this stage. Although the bank has claimed it is an attack on its reputation, there could be a "financial angle" as these professional hackers are hired by someone with a motive, which could be from tarnishing someone's reputation to making financial gains

from personal data of customers. But at this stage, it is difficult to believe anyone hacking into a bank's data system just for defaming the institution.

"The strangest part of the QNB incident is that the hackers reportedly had access to the bank's data systems for a fairly long period -- by some accounts about 200 days -- and the bank's security system could not detect it until they made off with 1.4GB of data, and worse, the bank came to know of it when some of the data was published," he said.

Hasbini said the hackers have used an 'SQL injection" method to bypass the security of the bank and leak the data.

SQL injection is an open source tool that is used to attack data-driven programs. It must exploit security vulnerability in software, and is the most common method for attacking websites. It allows the hackers to complete disclosure of all data on the system, spoof identity (gaining an illegitimate advantage into the network by falsifying data), destroy the data or tamper with the existing data.

Most of the time vulnerabilities in security systems occur when modifications are done to existing websites and applications. Institutions must get their basics right in securing their critical data, Bailey said.

"There needs to be more care taken when modifications or new modules to the existing data system is introduced. There needs to be classification of data at various levels, the storing and securing should be done according to the importance of these data," he said.

Symantec figures show the total number of breaches has risen slightly by two per cent in 2015. The year also saw nine mega-breaches, surpassing 2013's record of eight breaches containing more than 10 million identities each.

Hassam Sidani, regional manager for Symantec Gulf, said over half a billion personal records were stolen or lost in 2015 globally. Data breaches continue to impact the enterprise.

In fact, he said that large businesses that are targeted for attack will on average be targeted three more times within the year. Additionally, the largest data breach ever publicly reported occurred last year with 191 million registered US voters' records compromised in a single incident. There were also a record-setting total of nine reported mega-breaches. While 429 million identities were exposed, the number of companies that chose not to report the number of records lost jumped by 85 per cent.

He said that businesses in the UAE were a victim of 2.7 per cent of global targeted attacks, with an organisation facing an average of 2.2 attacks through the year.

"Organisations in the finance, insurance and real estate sectors were the most affected by targeted attacks in the UAE in 2015, with 31.5 per cent of overall attacks being directed towards them. Small

organisations (1-250 employees), were the target of the most number of (64.2 per cent) spear-phishing attacks in the country," he said.

These organisations may be targeted as they have "less robust security" parameters, and can be used to gain access to its partner ecosystem, which may comprise larger and more lucrative companies.

Hasbini said banks will need to protect them from SQL injection attacks and they need to fine-tune and well protect its products and customers.

Feds have found 'unbelievable' amounts of child porn on National Security computers. Is this the answer?
Tuesday, 03 May 2016
Byline: Staff report

Washington - A top National Security Agency official wants to keep tabs on national security personnel off-the-clock, in part by tracking their online habits at home. The aim is to spot behavior that might not be in America's best interests.
Historically, some illicit activity, like downloading child pornography, has occurred on government computers and been prosecuted.

But today, the digital lives of employees cleared to access classified information extend beyond the office.

About 80 percent of the National Security Agency workforce has retired since Sept. 11, 2001, says Kemp Ensor, NSA director of security. When the millennial and Gen Y staff that now populate the spy agency get home, they go online.

"That is where were we need to be, that's where we need to mine," Ensor said.

Currently, managers only look for aberrant computer behavior on internal, agency-owned IT systems - it's a practice known as "continuous monitoring."

But the military and intelligence communities are beginning to broaden checks on cleared personnel in the physical and digital worlds. It used to be that national security workers were re-investigated only every five or 10 years.

Under the evolving "continuous evaluation" model, the government will periodically search for signs of problems through, for example, court records, financial transactions, and -- if authorized -- social media posts.

Ensor and other federal officials spoke April 28 about new trends in personnel security at an Intelligence and National Security Alliance symposium in Chantilly, Virginia.

On government devices, "the amount of child porn I see is just unbelievable," said Daniel Payne, director of the Pentagon's Defense Security Service. The point being, there's a need to routinely scan agency network activity and criminal records to gauge an individual's suitability to handle classified information.

Payne, whose 34 years of counterintelligence experience have spanned the military, CIA and National Counterintelligence and Security Center, was not referring to any specific agency or any specific timeframe, his current employer told Nextgov.

Payne just returned to the Defense Security Service in February, after starting his career there.

"Director Payne provided this example to demonstrate the range of issues identified during the personnel security process, and the range and value of different data sources that have a bearing on an individual's ability to access sensitive information," the Defense Security Service said in an emailed statement.

Ensor echoed his colleague's concerns, noting he sees child pornography on NSA IT systems. In the national security space, "what people do is amazing," he said. Ensor's guess about the presence of explicit material is that there are many "introverts staring at computer screens" day in and day out. This is why it is so important to look at individuals holistically when determining who might be a so-called insider threat, Ensor said.

In the past, military and intelligence personnel have exploited minors online, without notice, for years or even an entire career.

The Boston Globe broke a story in 2010 that a significant number of federal employees and contractors with high- level security clearances downloaded child pornography -- sometimes on government computers -- at NSA and the National Reconnaissance Office, among other defense agencies.

At least one NSA contractor holding a top secret clearance told investigators in 2007 he had been spending $50 to $60 monthly fees on various sexually explicit websites for the past three years, according to a Defense inspector general report on the matter. After each session on the porn sites, he would wipe the browsing history of that system. The Pentagon investigation did not state who owned the computer.

More recently, a military official pleaded guilty to pedophile crimes and accessing child pornography through the Internet -- but at home.

On April 15, a U.S. district judge sentenced former Army Corps of Engineers official Michael Beeman, of Virginia, to 30 years in prison for molesting minors, beginning in the 1980s while working in public affairs

at Patrick Air Force Base. He later downloaded child pornography to personal devices, court records show.

Case files state the illegal online activity occurred between 2010 and 2014, which according to LinkedIn, was when Beeman served as an Army Corps of Engineers public affairs regional chief.

New York Times
Judge Shuts Down WhatsApp in Brazil
Tuesday, 03 May 2016
Byline: Vinod Sreeharsha

Rio de Janeiro - WhatsApp, a messaging service owned by Facebook, was shut down in Brazil on Monday after a court order from a judge who is seeking user data from the service for a criminal investigation. Judge Marcel Maia Montalvão ordered telecom companies operating in Brazil to suspend WhatsApp nationwide for 72 hours. As of just after midday Monday, Brazilians said they could not use the popular messaging service.

The shutdown is the latest twist in a case that has embroiled WhatsApp in legal trouble. The case, which is under seal, involves an organized crime and drug trafficking investigation in the court in Lagarto, in the northeastern state of Sergipe. The court has been seeking data from WhatsApp to aid in the investigation. Diego Dzodan, a Facebook executive, was briefly taken into custody in March for refusing to comply with orders to turn over WhatsApp information in the case.

The judge who ordered WhatsApp's shutdown on Monday is the same one who ordered Mr. Dzodan's arrest. Mr. Dzodan was released after one night when a higher court judge said the arrest was "an extreme measure."

"This decision punishes more than 100 million Brazilians who rely on our services," a WhatsApp spokesman said of the shutdown, adding that the company had cooperated to the "full extent of our ability with local courts."

The shutdown is the second time a Brazilian judge has ordered a nationwide ban of WhatsApp in the last few months. In December, a judge in São Paulo ordered telecommunications carriers to block WhatsApp for 48 hours because it had not complied with police eavesdropping requests in a separate criminal drug case.

An appeals court overturned the ban the same day it took effect, saying that "it was not reasonable" to suspend a service used by so many people simply because the company had not provided information sought by the courts.

A debate over law enforcement access to tech companies' data has been raging. In the United States, Apple recently grappled with a court order asking it to help unlock an iPhone used by a terrorist. Apple refused, leading to a standoff with the United States government that was tabled when the F.B.I. found an alternate way into the device.

American tech companies and law enforcement are now sparring over access to digital data in other venues, including Washington, where many are lobbying over a new draft encryption bill released last month by Senator Richard Burr, a North Carolina Republican and chairman of the Senate Intelligence Committee, and Senator Dianne Feinstein of California, the ranking Democrat on the committee.

Concern is growing in Brazil that its Congress may pass laws that would weaken digital privacy. One measure calls for Internet companies to remove content deemed critical of politicians within 48 hours, while another calls for imprisonment for violating an Internet's site's terms of use. The proposals worry many Internet privacy advocates, including the authors of Brazil's widely respected Internet bill of rights or Marco Civil.

The full Congress is considering several of these proposals and could vote on them this week.

On Monday, Brazilians took to Twitter to lament the loss of WhatsApp, which is used there as much by professionals as by students. But some appreciated the respite. @IZATLEITE, a Twitter user, wrote, "now without WhatsApp, I'll finally be able to read without being disturbed or interrupted."

Toronto Star
To Serve, Protect, Watch and Predict
Saturday, 07 May 2016
Byline: Alex Ballingall

Analysis: Try to imagine what policing will look like in the future. Microwave heat cannons and sound bazookas dispersing rowdy crowds? Robocops patrolling the streets while whirring drones keep watch from the sky?
Or maybe we'll arrive at a world where all crime is wiped away, where people peacefully coexist in sleeper pods while life is played out through virtual reality helmets.

Maybe.

The more realistic picture, according to police technology experts, is that surveillance and the collection and analysis of information will play a central role in solving and preventing crime.

The public safety regime of tomorrow, in other words, is all about data. "This is the future of policing," says Christopher Schneider, an associate professor of sociology at Brandon University in Manitoba.

Cops in the coming decades will gather information online, interact with the public through social media and even use data gleaned from the Internet and past crimes to predict and prevent future law-breaking, Schneider says. This is already happening, to varying degrees, in American cities and places such as Vancouver and Toronto, where police used a program to comb through Twitter to gather evidence for a recent online harassment trial.

"Policing as an apparatus is going to be much more mediated, and it's going to be much more community-oriented than it currently is, through the Internet, through social media," Schneider says.

"This is going to expand the gaze, as it were, toward crime and deviance."

The nexus between police and the public they serve has already expanded beyond the traditional 911 call (if you're even more of a troglodyte, just yell: "Help! Police!"). Ritesh Kotak, a police consultant for agencies in Canada and overseas, said tools like social media have created space for the "co-creating of public safety," with new and convenient avenues to report crimes and follow police data shared over the Internet.

"That's where it's headed with 'next generation 911.' That's where it's headed with the ability to see something and communicate right through our smartphones with police," Kotak said. "Data is the currency of the future."

With an open data mentality and deeper engagement through social media, Kotak added, police forces can repair and engender trust with the citizenry. "People feel like they're part of something," he said.

But data collection can also be used for more futuristic means. Ryan Prox, a special constable with the Vancouver Police Department, is one of the pre-eminent experts in the emerging field of "predictive policing." Prox prefers to call it crime "forecasting," in which police forces use complex computer programs that churn through mountains of data to try and predict when and where future crimes will occur.

This has yet to catch on in full force in Canada, but police in cities such as Los Angeles and Miami have signed on to "predictive" programs designed by companies such as PredPol, Prox explains. PredPol uses three data points -- time, place and type of crime -- to draw up boundaries in which crimes are most likely to occur, then local police patrol these areas in the hopes of catching the bad guys.

Prox cautions, however, that little independent scientific research has been done on these programs in the U.S. and suggests they may not be as accurate as their makers claim.

That's why he's spearheading a six-month predictive-policing pilot project in Vancouver, which began Feb. 1, that uses an intricate software program that has been designed by a team of mathematicians and geospatial engineers. The program sifts through crime data as far back as March 2001, including the time, place and nature of an offence, Prox says. But it also considers 60 "non-crime" factors, such as neighbourhood income, area traffic density, locations of illicit graffiti and even wind speed, to forecast the probability of a future crime being committed in the coming hours within a 100-metre radius of a given location.

Plainclothes cops will be dispatched to monitor these areas, with uniformed officers on standby to make an arrest in the event that a crime is witnessed, Prox says.

Tests have already shown a 60 to 70 per cent accuracy rate for some property crimes such as break and enters, which are easiest to predict because they're high frequency and often involve repeat offenders, Prox says. The more police use the program, the more data they have and the more accurate officials hope it can become.

"It sounds really sci-fi goofy," he laughs, "but they basically call it an 'artificial learning neural network.' That's the mathematical model."

The endgame of such programs, Prox says, is maximum police efficiency. In an era of ballooning police budgets -- now more than $1 billion a year in Toronto, for example -- that could be a welcome prospect.

But critics point to controversial information-gathering programs such as "carding" in Toronto, which many argue disproportionately target visible minorities.

To rely on such practices to fuel computer software programs that dictate how cops are deployed, could entrench existing police biases, Schneider says.

"Are we going to then be criminalizing certain people, certain segments of the population? Who are the police going to be looking at?" he asks.

Prox acknowledges this is a legitimate concern, but says the Vancouver police program only considers data from crime reports and other objective factors. It's generated by the public rather than fuelled by the cops themselves.

Others have brought forward concerns about how predictive policing will affect individual rights. Brenda McPhail, director of the Canadian Civil Liberties Association's Privacy, Technology and Surveillance Project, says the main worry is that the types of data currently used to forecast crime will expand to include more personal information -- social media posts, online purchase histories, travel bookings or location data from public Wi-Fi use.

This could not only invade individual privacy, it could erode the presumption of innocence, McPhail adds, citing court decisions in Canada and the U.S. that have suggested it is disproportionate to comb through data of many individuals to find a single criminal.

"The concern is that it is the thin edge of a wedge," she says. "Before any such programs are implemented, we as a society need to compare the benefits with the costs, particularly the costs to our rights and civil liberties. We need to consider the risks."

Such worries go beyond crime-forecasting programs.

Some point to privacy issues in the face of intensifying means of surveillance, such as the extensive camera networks that are used by police in Fresno, Calif., where police can monitor live feeds throughout the community through their Real Time Crime Center.

David Lyon, a Queen's University sociologist and head of the school's Surveillance Studies Centre, has argued that people's lives are being watched to the point that it already makes sense to label many western countries "surveillance societies." Lyon is co-author of a 2014 book on the subject, in which he and his colleagues argue we're at a "historic turning point" for the expansion of surveillance measures, developments with obvious consequences for privacy and state power.

Much of this can be viewed as part of a social shift toward a so-called "safety state," where more and more government policies - - and police actions -- are justified through fear of danger, says Charles Raab, a political science professor at the University of Edinburgh.

"As long as there are some plausible reasons to think we live in exceptionally dangerous times" -- such as terrorist attacks in big cities -- "there will be public fears and demands for more security and safety," says Raab. "Other values, such as equality, fairness and the exercise of rights and liberties, are constrained by the imperative to make everything safe and secure."

This isn't inevitable, Raab says. But with terrorism and climate change dominating the media and politicians routinely emphasizing this danger in their quests for votes, safety will continue to be a top social priority.

And that probably means the police of tomorrow will find ways to use our data and train cameras on us in an effort to keep us safe.

Mail on Sunday
Now Experts Say Don't Change Your Password
Sunday, 08 May 2016
Byline: Martin Beckford

London - It is one of the banes of modern life - you finally come up with a memorable yet secure password for your office computer, only to be told just a few months later that it has expired and you have to find a new one.
But now Britain's security services themselves have decreed that workers may be safer from hackers if they do not have to keep changing passwords. In a new briefing to Whitehall, power stations, banks and the public sector, cyber experts at CESG - the information security arm of intelligence agency GCHQ - concluded: 'It's one of those counter-intuitive security scenarios; the more often users are forced to change passwords, the greater the overall vulnerability to attack.'

The advice continues: 'Most password policies insist that we have to keep changing them. And when forced to change one, the chances are that the new password will be similar to the old one. Attackers can exploit this... New passwords are also more likely to be forgotten, and this carries the productivity costs of users being locked out... CESG now recommends organisations do not force regular password expiry.'

The advice comes as Ministers urge greater protection against cyber crime, after a survey found two-thirds of large businesses suffered an attack or security breach in the past year.

Fox News
Romanian hacker who claims he breached Clinton server says he spoke with FBI at length
Saturday, 07 May 2016
Byline: Catherine Herridge

Washington - The Romanian hacker who says he easily breached Hillary Clinton's personal email server also claimed, in a series of interviews with Fox News, that he spoke with the FBI at length on the plane when extradited from Romania to Virginia last month.

"They came after me, a guy from the FBI, from the State Department," 44-year-old Marcel Lehel Lazar, who goes by the moniker "Guccifer," told Fox News during a jailhouse phone interview. He said the conversation was "80 minutes ... recorded," and he took his own notes.

A government source confirmed that the hacker had a lot to say on the plane but provided no other details. Lazar was flown to the U.S. to face separate cyber-crime charges.

In addition to the apparent conversation with the FBI on the plane, Fox News has learned a meeting was expected as early as this week at the Alexandria, Va., detention center where he's being held involving Guccifer, the FBI, the U.S. attorney and the defendant's court- appointed lawyer.

These officials have not commented on his clams or detention.

An intelligence source close to the investigation, speaking with Fox News last month, questioned the timing of Lazar's extradition to the U.S., coming amid the Clinton email probe. As for what was discussed on that plane, Lazar said he told a State Department representative on the plane about "hot" data, some of which was hidden in Google drives, and other data that was too sensitive and deleted. The hacker, who offered no proof for his claims, said cryptically that he could not say more.

"I can't tell [you] now. I can't tell because I want to talk to the FBI. It is a matter of national security. Yeah," he said. Pressed by Fox News, Lazar seemed to indicate the data was not connected to the ongoing FBI criminal probe of Clinton's server.

Fox News recently met with Lazar in the secure visitor center in Alexandria, then followed up with a series of phone calls which he gave permission to be recorded. Separated by reinforced glass, Lazar was polite and methodical as he explained how he allegedly accessed the Clinton server in early 2013, by using her longtime confidant Sidney Blumenthal's AOL account as a stepping stone.

Fox News was first to report the hacker's claims of accessing the Clinton server, which he said "was easy."

Lazar said he got into the Blumenthal account by correctly guessing his security question, after doing extensive research on the web. He said his hacking always followed a "four step process": identify the target, do extensive web research on the target, access the target's account to harvest data, and send it out to the media.

Lazar said he was puzzled by the American media. He said he sent the Blumenthal emails, which is how the Clintonemail.com account first came to light, to many large news organizations in 2013, and it was The Smoking Gun that picked it up. Lazar said he started his "Guccifer archive," releasing materials in October and November 2012, and it ended "like August 2013."

Three cybersecurity experts said they found Lazar's explanation for accessing the Clinton server plausible but had questions.

Cybersecurity expert Morgan Wright explained how the FBI could marry up available evidence, including forensics or the configuration of the server and its folders, to assess his claims. "So we're going to map these things together, and if those things match up together, they're going to say 'yes, this was compromised,' then it means it was open to other people to compromise as well," he said.

Since Fox News reported on Guccifer's claims Wednesday, anonymous sources have reported that a review of the Clinton hard drives does not appear to indicate a breach. However, Wright and other experts warned that Clinton IT specialist Bryan Pagliano was the server's administrator and not principally a cybersecurity specialist - and may not have installed an adequate detection system for a Cabinet secretary's email.

"If you have a bank and you have one video camera when you need 20, then you missed it," Wright said. "If they weren't capturing all the activity, their security logs may say they didn't see anything."

Asked about Lazar's claims at Thursday's press briefing, State Department spokesman Mark Toner also said he's not aware of such an incident.

"We don't have any reason to believe that it might be true," he said.

At the same time, Toner repeatedly stressed he did not want to comment on the security of the server, citing ongoing investigations. Asked if he's in a position to even know whether Lazar's claims are true, Toner again said he did not want to comment. The Clinton campaign has rejected Lazar's claims, calling them "baseless" and emphasizing he is a convicted hacker.

Other cyber specialists like Bob Gourley with Cognitio warned there will "always be uncertainty and ambiguity" with hackers like Guccifer. But he said: "One thing I would say with certainty however -- if this computer were in a well- managed facility, where everything was being monitored and watched, we would have more information and ground truth."

Canada Revenue Agency hacker pleads guilty, says he's sorry
Saturday, 07 May 2016
Byline: Jane Sims

London - Stephen Solis-Reyes is one of those brainiac computer whiz kids who, it seems, was a little too smart for his own good.
Two years ago, when the London, Ont. man was just 19, and with what he maintains were the best of intentions, he was able to steal 900 social insurance numbers from the files of the Canada Revenue Agency. He says he wanted to demonstrate its online vulnerability to the Heartbleed computer bug.

The result was a sudden, panicked shutdown of the agency's website for four days that sent techno-fear shivers about online security across Canada and prompted the CRA to extend Canadians' tax-filing deadline by a week.

On Friday, now a top- notch computer science student at Western University, the 21-year-old pleaded guilty in an Ottawa courtroom to four charges.

Two were for mischief -- one for the Canada Revenue breach, another for exposing security breaches in JerseyMail, the now-defunct online arm of the postal service in Jersey, one of the Channel Islands off the coast of Great Britain.

The two other guilty pleas were to one count each of unauthorized use of a computer and obstructing a police officer by swiping information off a computer at his arrest.

"I want to express to Your Honour my most sincere regret and remorse for the wide-reaching effects of damage and harm my actions have caused to many different people and organizations," he wrote in a letter to the court.

"I truly understand the severity and gravity of the situation. I want to say that I never had any malicious intent and I never intended to cause harm or damage to anyone in any way."

The Crown dropped 13 other charges that, had be been convicted, could have sent him to prison for as long as 10 years.

For all of the national hubbub surrounding his activities in April 2014, Solis-Reyes was sentenced to an 18-month conditional sentence -- the first four months under house arrest, the rest under supervision.

The defence gave the judge more than 20 reference letters from professors, teachers, friends and family who spoke of Solis-Reyes' intellect and quiet, sensitive and respectful nature.

He's carrying a 98.6 per cent grade average in his fourth year and has already been named to the dean's honour list three times.

Assistant Crown attorney James Cavanaugh read an agreed statement that outlined how Solis-Reyes was able to breach the computer systems from his laptop computer.

Defence lawyer Faisal Joseph told the judge Solis-Reyes was able to get into the CRA system in "six seconds."

Central to the case, was Solis-Reyes' intentions. Joseph told the judge it would have been easy for Solis-Reyes to sell the information or make money off it. None of that happened.

"He did it because he could, because he was capable of breaking into these national security places," Joseph said, and that Solis-Reyes "has done the country a service" by exposing the flaws in the system.

One professor referred to him as "not only one of the smartest students around, but he is also one of the nicest, friendliest and most honest."

"His code is a thing of beauty," another wrote.

His father, Roberto Solis-Oba, the graduate chairman of Western's computer science department, wrote it was his son's "insatiable curiosity that led him to perform the actions that got him in trouble with the law.

The defence was harshly critical of what he alleges were the interrogation methods the RCMP put Solis-Reyes through after his arrest at his London home.

He said his client was questioned for six hours without a lawyer present. He was accused of being a terrorist and was asked "what would Jesus think" about his activities, Joseph said.

Joseph pointed out an RCMP corporal suggested Solis-Reyes's father's job could be in jeopardy and how, in France, it's not illegal to tie somebody up in a hot water tank until he speaks.

"In over 30 years of practising law as a prosecutor and a defence lawyer I have never met a better family or a more respectful, loving, intelligent boy as my client," Joseph said. "Murderers and rapists haven't expereince what my 19-year old client received at the hands of the RCMP's investigating officer for hours on end."

Reached for comment late Friday, the RCMP had not yet responded to the lawyer's characterization.

Solis-Reyes must serve two years of probation, with 200 hours of community service ordered.

He said in his letter he "will never again be in trouble with the law."

"This situation has taught me the importance of thinking before acting and I know every action I take has consequences."

Calgary Herald
Police trying to stay ahead of technology
Saturday, 07 May 2016
Byline: Kim Bolan

Calgary - Mounties were trying to investigate a threat to national security. But because they couldn't get critical information from a telecommunications company, they hit a roadblock.
Despite pursuing other investigative avenues, the case went nowhere, Chief Supt. Jeff Adam, director-general of the RCMP's technical investigation services, said in an interview.

"We spent roughly six months trying to design and implement a partial solution in order to get some of that data. But the gaps remained. And despite the judicial authorization, we've been unable to collect the evidence." The national security case is just one example of the obstacles police face as criminals and terrorists use cutting-edge technology to cover their tracks, Adam said. In another case, the RCMP got a court order "to intercept email messages between suspected criminals - high-level drug traffickers in Canada - and we could intercept, but we could not read the email traffic that they were sending," Adam said. "It was encrypted and this particular investigation involved some of our international law enforcement partners and we were unable to assist ourselves or them in getting the evidence."

Adam said the inability to decipher encrypted messages even when police get warrants is a challenge in many investigations - particularly those involving national security, organized crime and child exploitation.

Another issue, he said, is "lack of requirements for data retention by our telecommunications service providers."

Say police get a court order to obtain the text messages of a suspect in a case of threatening. But the company then tells investigators that it "doesn't keep anything more than 24 hours, so that evidence is therefore expunged from the system," Adam said.

On a recent trip to B.C., RCMP Commissioner Bob Paulson warned that while emerging technology has many benefits, "it's also changing criminality and it is putting us at risk and maybe you have to think that through more."

He cited the recent U.S. case where the FBI took Apple to court to get the iPhone of one of the San Bernardino terrorists unlocked. Apple refused. The FBI finally found a third party who could crack the password.

"It's just a taste of what's before us in terms of how we are going to go down this road," Paulson said. "It shouldn't be up to the police to say how we are going to roll. I think the community needs to engage because the threat is manifest."

Ann Cavoukian, executive director of Ryerson's Privacy and Big Data Institute, thinks police exaggerate the technological obstacles they face. And she said they rarely "point out the advantages they have from technology."

"It is deceptive because while it's true that occasionally they won't have access to one or two communications that have been encrypted, largely speaking they have more access now to a wide variety, a wide swath of information that they never had access to before," said Cavoukian, Ontario's former privacy commissioner.

"They're only pointing you to the small tiny percentage of cases where they might not be able to decrypt a phone because it has got end-to-end encryption. But that happens rarely."

The law-abiding public relies on encryption to protect sensitive personal information - often including health and banking records - that they now store on their phones.

"All of this information is accessed through your iPhone and you want people to be able to encrypt that safely to protect it from all the cyber attacks that are taking place," she said.

Cavoukian said there are huge privacy concerns with some of the technology police use in their investigations.

Media reports from a Montreal Mafia trial recently revealed that the RCMP had used a device known as a Stingray to intercept suspects' calls.

The device is controversial because it mimics a cellphone tower, allowing police to collect information from their targets' phones, but also from anyone else in the vicinity.

Last month, the office of the federal privacy commission confirmed it was investigating complaints about the RCMP's refusal to discuss its use of the Stingray device.

Cavoukian said the lack of transparency by police just increases the public's skepticism and distrust.

She said she has no problem with police getting proper warrants and getting the specific information they need for criminal investigations. But the fear is that law enforcement agencies have the ability to cast a wider net that unfairly ensnares lawabiding citizens, she said. She also acknowledged that the public puts its own privacy at risk with by using wireless devices and fitness trackers that can send personal information to "dozens of parties unbeknownst to the individual and the information can be used against them."

In a recent Pennsylvania case, a woman's claim to police that she'd been raped was disproven by her Fitbit data.

Le Journal De Montreal
Recrutés sur Instagram
Saturday, 07 May 2016
Byline: Hugo Jocas

Montréal - «Quelqu'un» a utilisé le réseau social Instagram pour tenter de recruter les jeunes arrêtés en mai 2015, selon la déclaration de la GRC à la Cour du Québec.
Un adolescent de Saint-Léonard «se sentait comme hypnotisé par le discours du suspect», selon son père, qui a appelé la police fédérale pour le dénoncer.

Son fils utilisait son téléphone iPhone pour naviguer sur Instagram et échanger avec le recruteur.

«L'homme lui a dit que vivre au Canada était péché, car ce n'est pas un pays musulman», mentionne la dénonciation de la police fédérale.

Le recruteur allégué utilisait toujours un profil différent sur Instagram pour communiquer, mais il commençait toujours par le même nom, caviardé dans le document de l'Équipe intégrée de sécurité nationale.

FAUX VOYAGE

L'adolescent avait fait croire à sa famille qu'il partait pour un voyage en Grèce avec son école.

Son père a interrogé la direction: aucun voyage n'était organisé. Il a alors confronté son fils, qui a éclaté en sanglots.

Contrairement aux autres, le jeune a été arrêté chez lui et non à l'aéroport.

Un autre des 10jeunes s'était rendu avec lui dans une agence de voyages pour s'informer sur le prix de billets pour Rome, avec escale à Istanbul, selon nos informations. Il avait acheté un billet, mais lui aussi a abandonné le projet.

Toronto Star
Reveal high-tech privacy violations: Editorial
Sunday, 08 May 2016

Editorial: We know Ottawa's electronic spy agency has violated the privacy of Canadians on multiple occasions. Indeed, the highly secretive Communications Security Establishment maintains a central database of such transgressions dating back to 2007.
What we don't know is how many such breaches have occurred. As reported by the Star's Alex Boutilier, the organization refuses to reveal this number, citing "operational security concerns." The CSE is evidently worried that disclosing the total might give Canada's enemies insight into its "capacity to conduct operations" and "the extent of its capabilities."

It's far more likely that what actually troubles this agency is having Canadians see its capacity for misconduct and the extent of its abuses.

To assure people that the principle of public accountability is being respected it's important for the CSE to level with Canadians and reveal how often it has violated their privacy.

There's no doubt wrongdoing has taken place. That was revealed earlier this year when Parliament was told the electronic eavesdropping agency had inadvertently shared Canadians' "metadata" with foreign allies.

This class of information can include the destination and duration of phone calls, emails, and text messages. To protect privacy, such material was supposed to be scrubbed of key details before being passed along to other members of the "Five Eyes" alliance -- the United States, United Kingdom, Australia and New Zealand. But the CSE learned, in 2013, that a technical glitch had resulted in a leak of confidential data.

It informed government officials but kept the mistake hidden from the Canadian public for two years. This gives rise to an obvious question: how many other privacy violations might this agency be keeping secret?

As reported by Boutilier, documents tabled in Parliament last month show the CSE admitting to 13 privacy and information breaches in 2015, affecting at least 630 people. None of these cases were reported to Canada's privacy commissioner on grounds that they posed "no significant risk" to anyone.

It's hard to see how presenting a similar tally, dating back to 2007, would pose a serious security threat. It would, however, give Canadians some insight into how well their rights are being protected.

The Liberal government came to office promising a new level of openness and accountability. Responsibility for fulfilling that pledge now rests with Treasury Board President Scott Brison. And a good place for him to start would be to let Canadians know how often their privacy has been violated by a shadowy agency that refuses to fully answer even to this country's information and privacy commissioner.

Technicians from SWIFT left Bangladesh Bank exposed to hackers
Monday, 09 May 2016

Dhaka - The technicians introduced the vulnerabilities when they connected SWIFT to Bangladesh's first real-time gross settlement (RTGS) system, said Mohammad Shah Alam, the head of the criminal investigation department of the Bangladesh police who is leading the probe into one of the biggest cyber-heists in the world.
"We found a lot of loopholes," Alam said in an interview in Dhaka. "The changes caused much more risk for Bangladesh Bank."

He and a senior central bank official said the SWIFT employees made missteps in connecting the RTGS to the central bank's messaging platform.

The technicians did not appear to have followed their own procedures to ensure the system was secure, according to the Bangladesh Bank official, who said he was not authorised to publicly comment because of the ongoing investigation.

Because of this, SWIFT messaging at the central bank was widely accessible, including remote access with only a simple password, police said. It had no firewalls and only a rudimentary switch. "It was the responsibility of SWIFT to check for weaknesses once they had set up the system. But it does not appear to have been done," said the bank official.

SWIFT's chief spokeswoman Natasha de Teran said she had no comment on the allegations by authorities in Bangladesh. She also declined comment on any aspect of the Bangladesh project, including whether the firm had deployed any employees or outside contractors to Bangladesh Bank.

Reuters was not able to independently verify the allegations by Bangladeshi officials about the SWIFT technicians. If they are validated, however, that could undermine confidence in the cooperative that is the backbone of global financial transactions.

The officials in Dhaka discussed their findings with Reuters ahead of a meeting this week in Basel, Switzerland where Bangladesh Bank officials have said their governor and a lawyer appointed by the bank will discuss recovery of about $81 million stolen by the hackers with the head of the Federal Reserve Bank of New York and a senior executive from SWIFT.

Bangladesh Bank officials have said they believed SWIFT, and the New York Fed, bear some responsibility for the February cyber heist. SWIFT has declined comment on that claim.

The RTGS, which enables domestic banks and the central bank to settle large transfers between themselves, was installed at Bangladesh Bank in October last year and then connected to SWIFT. In

February, hackers sent fraudulent messages, ostensibly from the central bank in Dhaka, on the SWIFT system to the New York Fed seeking to transfer nearly $1 billion from Bangladesh Bank's account there.

Most of the transfers were blocked but about $81 million was sent to a bank in the Philippines and much of that money remains missing.

A spokesman for Bangladesh Bank declined comment on the investigation into the heist. He said, however, that RTGS continued to work well, noting that a large number of countries use SWIFT messaging for similar systems. "There is no inherent risk in this," he said.

According to the Bangladeshi police, the technicians linked the RTGS to SWIFT computers on the same network as about 5,000 central bank computers that are accessible from the open Internet.

Instead, they should have set up a separate local area network, or LAN, that could not connect to the rest of the bank or the Internet, police said.

The technicians also failed to install a firewall between the RTGS and the SWIFT room so that the bank could block malicious traffic from coming into the facility.

When they installed a networking switch to control access to SWIFT, they chose to use a rudimentary old one they had found unused in the bank, rather than a more sophisticated, managed switch that gave the bank the ability to control access to the network, police said.

During the job, the technicians set up a wireless connection so they could access computers in the locked SWIFT room from other offices inside the bank. When they finished, they failed to disconnect the remote access, which was only secured with a simple password, police and the bank official said.

They also failed to disable a USB port on the computer attached to the SWIFT system, as is usual for critical networks to prevent malicious software from being installed through a tainted thumb drive, police said. Police did not provide any evidence for any of the assertions.

But another central bank official familiar with the SWIFT room operations confirmed that the port was "active" until the heist came to light. He had no explanation. The hackers used malicious software to modify the SWIFT messaging software to help hide their tracks.

Bangladeshi police said they have asked SWIFT to facilitate interviews with the SWIFT technicians. "Whether it is intentional or negligence, we are trying to find out," said Alam.

SWIFT, or the Society for Worldwide Interbank Financial Telecommunication, is used by about 8,000 banks around the world to order funds transfers and other communications. It is connected to RTGS systems installed at scores of banks worldwide, and there have been no reports of problems elsewhere

with connections between those two systems. The US FBI, which is leading investigations into the case, has made no comment so far.

New York Fed executive Richard Dzina said at a conference last week that bank workers "acted properly" in releasing the funds. The system was penetrated, he said, because the hackers had acquired valid credentials to order the transfers

Former central bank governor Mohammed Farashuddin, who is heading an internal probe by Bangladesh Bank into the heist, said SWIFT needed to review its technology in the wake of the heist.

"It seems to be a case of extreme carelessness," he told Reuters. He declined to provide more details saying a final report was due in the next few weeks.

Agence France-Presse
Indonesia's Muslim cyber warriors take on IS
Monday, 09 May 2016

Jakarta - A group of Indonesian "cyber warriors" sit glued to screens, as they send out messages promoting a moderate form of Islam in the world's most populous Muslim-majority country.
Armed with laptops and smartphones, some 500 members of the Nahdlatul Ulama (NU) -- one of the world's biggest Muslim organizations -- are seeking to counter the Islamic State group's extremist messages.

"We'll never let Islam be hijacked by fools who embrace hate in their heart," tweeted Syafi' Ali, a prominent member of the NU's online army, a typical message to his tens of thousands of followers.

They are trying to hit back at IS's sophisticated Internet operations, which have been credited with attracting huge numbers from around the world to their cause.

Internet propaganda is believed to have played a key role in drawing some 500 Indonesians to the Middle East to join IS, particularly among those living in cities where it is easier to get online.

The dangers of the growing IS influence in Indonesia were starkly illustrated in January when militants linked to the jihadists launched a gun and suicide bombing attack in Jakarta, leaving four assailants and four civilians dead.

It was the first major attack in Indonesia for seven years, following a string of Islamic militant bombings in the early 2000s that killed hundreds.

As well as firing off tweets, the NU members have sought to dominate cyberspace by establishing websites promoting the group's moderate views, an Android app and web-based TV channels, whose broadcasts include sermons by moderate preachers.

The initiative has been building momentum for a while but started to pick up pace a few months ago. A handful of cyber warriors operate from a small office in Jakarta, while the rest work remotely, and the group mostly communicate with one another over the web.

But it will be an uphill battle and the NU, which has been promoting moderate Islam for decades, conceded they have previously struggled to take on IS's hate-filled messages.

"NU has for a while wrestled with this radical propaganda," said Yahya Cholil Staquf, secretary general of the NU, which claims at least 40 million followers. "Every time we defeated them, it didn't take long for them to regain their strength."

The online drive comes as the NU is set to take its campaign to promote their tolerant form of Islam onto the international stage this week, with a two-day meeting from Monday of moderate religious leaders from around the world.

They aim to showcase their particular brand of the Muslim faith, known as "Islam Nusantara", to counter the IS jihadists' radical interpretation of Islam.

Meaning "Islam of the Archipelago" -- Indonesia is the world's biggest archipelago, comprising over 17,000 islands -- it is accepting of diversity and stresses non-violence.

It grew up organically in Indonesia, as the religion entered the country gradually and had to mix with existing traditional beliefs such as praying at tombs, making it a naturally tolerant form of Islam.

Nowadays, most of the approximately 225 million Muslims in Indonesia practice a moderate form of Islam.

The NU wants to persuade Muslims from around the world to look for inspiration to Indonesia, where religious minorities and a multitude of ethnic groups mostly coexist harmoniously, rather than to harsher forms of Islam from the Middle East.

The group nevertheless has a long way to go to fight the rising tide of IS propaganda. Despite their good intentions, the NU cyber warriors appear amateur next to IS's well-funded set-up.

The jihadists, who control huge swathes of territory in Iraq and Syria, have a sophisticated online operation, using social media, apps and slickly produced videos.

They send about 200,000 tweets a day into the United States alone, according to US officials. It even has its own news agency, Amaq, which is often the first to report that IS is claiming responsibility for attacks.

In Indonesia, there are two main ways that IS propaganda spreads -- by supporters posting on websites and apps such as Whatsapp, Facebook, Twitter and Line, and through returnees from the Middle East preaching the group's radical ideology.

Most of the NU's online army are volunteers, often reaching into their own pockets to cover costs.

"ISIS has oil, while the only oil we have is for hair," Ali said, explaining the project's start was delayed for more than a year due to funding problems. Oil smuggling has been a key revenue source for IS.

Robi Sugara, a terrorism expert from NGO the Indonesian Muslim Crisis Center, welcomed the NU's online approach. "It's a good strategy to make Google searches fill up with moderate Islamic content," he told AFP.

"The battleground for Islamic ideology has moved to the Internet, and by producing as many moderate websites as they can, they can keep more minds healthy."

Haaretz
Classified Documents Stolen From Israel Police Cybersecurity Expert
Monday, 09 May 2016
Byline: Yaniv Kubovich

Jerusalem - Thief presumably used a grabber tool to filch the folder from a table through an open window, together with the officer's house and car keys. A file folder containing classified documents was stolen on Thursday from the central-Israel home of a police expert in computer security.
The Walla Hebrew-language news site reported that the deputy head of the cyber security division of the Israel Police left the folder on a table after returning home. The assumption is that the unknown thief used a long-handled rake or other instrument to grab the folder, as well as the officer's key ring, through a window. The thief then apparently entered the house using the keys and stole a wallet before fleeing.

The police are investigating and have notified security agencies that could potentially be affected by the theft of critical information. The fact that neither valuables nor the officer's unmarked car were stolen suggest that the motive may have gone behind simple financial gain.

The official was not identified -- the Israel Police said this was in order to protect the official's privacy, but it is known that he was recruited into the police from the army's signal intelligence unit 8200.

All possible motives for the theft are being explored, however, including simple theft.

Haaretz recently reported on the disappearance of 27 files from the police station in the Tel Aviv suburb of Givatayim under unclear circumstances.

About a month ago, police officers from the station went on vacation to Eilat. On their return, one investigator noted the disappearance of the files, which had been either awaiting investigation or were to be transferred to other offices. This case too involved sensitive files that appeared to be left unprotected.

Khaleej Times
The future of media? It's digitization
Monday, 09 May 2016
Byline: Bernd Debusmann Jr.

Dubai - Digitisation is setting the future of the media industry in the Middle East and North Africa as increased broadband usage leads to soaring use of portable devices, according to the newly-released fifth edition of the Arab Media Outlook.
The report, which was released on Sunday, highlights the current media landscape of 14 Arab countries, and identifies future trends that will shape the industry between 2016 and 2018.

In 2015, according to the report, the digital sector accounted for 15 per cent of the Mena's media industry, which was valued at over $11.36 billion. In 2020, that number is expected to rise to 27 per cent. In that same time, the total size of the Mena media industry is expected to rise by 3.7 per cent to over $13.63 billion.

Mona Ghanim Al Marri, president of the Dubai Press Club, said that the findings brought into stark focus the need to find solutions that allow for "effective competition" between media outlets, and ways in which to couple digital media platforms and traditional media outlets, as well as using these platforms to maintain the position of media and develop content.

Print media - which in 2015 represented 45 per cent of the region's media industry - is expected to decline to 31 per cent. In the Mena region, a total of 41 per cent of the average time spent on media in 2015 - 11 hours - is done online, compared to 49 per cent in the UK and 47 per cent in Australia.

Al Marri also noted the noticeable growth of the paid media sector compared to advertising sector, where spending on advertising is set to increase by 2.5 per cent annually between 2016-18, while spending on paid media is set to grow by 3.7 per cent.

Paid media, the report notes, will largely by backed by the growth of video games, which will account for over $1.14 billion in revenue in 2018, 62 per cent of which will be driven by social gaming, compared to

52 per cent in 2015. Paid TV revenue, for its part, is expected to grow 10 per cent in the same timeframe, to over $1.53 billion.

"While paid media is a synonym of 'excellent content', we should stop at this noticeable progress and think about what our local and Arab media should do in terms of development steps, to keep pace with the rapid changes," Al Marri said.

Notably, digital video is expected to form 30 per cent of the media industry by 2018. Already in 2015, video accounted for an average of 71 minutes of daily time spent by 15-to-24-year-olds, compared to 51 minutes on social networks, 29 minutes on search engines and business sites, and only 14 minutes on news websites.

Dr Amina Al Rustamani, group chief executive officer of Tecom Group - of which Dubai Media City is part - noted that a careful study of the findings will be crucial in forming future media and communications strategies.

"The dynamics and trends of the media industry have always provided valuable insight into consumer behaviour and have helped shape the thinking of government and business as to what are the most effective means of communication with their citizens and customers," she said. "Launching the Arab Media Outlook Report 2016-2018 is especially timely and relevant, against a backdrop of a paradigm shift in the media industry, and unprecedented change and innovation. This report enables us to guide our partners in forming their own strategies for growth."

A print version of the executive summary of the report will be available during the 15th edition of the Arab Media Forum, to be held on Tuesday and Wednesday at the Dubai World Trade Centre.

Albert Oil
How To Do Business in Brazil
Monday, 09 May 2016
Byline: Staff reporter

After raising the hopes of foreign investors in Brazil and opening up its vast reserves to overseas drillers, the country's political system has lurched into instability recently with millions of people taking to the streets demanding the president's head over a vast corruption scandal at state-owned Petrobras, which operates globally.
Niko Resources of Alberta has offshore exploration assets in Brazil, as does Brasoil.

Opportunities

In 2014, Brazil produced 2.95 million b/d of oil-- up 9.5 percent from 2013--making it the world's ninth-largest producer. The U.S. Energy Information Administration (EIA) estimates that in 2015, Brazil had 15

billion barrels of proved oil reserves, second only on the continent to Venezuela. More than 94 percent of Brazil's reserves are located offshore. About a quarter of its output comes from the deep water presalt layer, where production hit a record 865,000 b/d in 2015 as new wells came on stream in the Santos basin.

Brazil opened up to private and foreign investment in 1997. Canadian companies brought their offshore Atlantic experience to the table. Some service firms went inland. Weatherhaven, on the heels of the visit of former prime minister Stephen Harper to Brazil, closed a deal to build exploration camps for production in the Amazon. Gran Tierra Energy entered onshore Brazil in 2009, following Encana, and later entered the offshore in 2011 with Statoil and Petrobras in the Camamu-Almada basin. Canadian firms operate some of those blocks, including Brasoil, and Calgary's Tuscany International Drilling. Tuscany went there looking for year-round work, instead of the seasonal cash flows of Alberta, although the company has since gone bankrupt.

Risks

In 2013, Brazilian President Dilma Rousseff accused the Communications Security Establishment Canada (CSEC) of spying on Brazil's Ministry of Mines and Energy. She based her intelligence on documents leaked to Brazilian media by Edward Snowden. Snowden worked for the U.S. National Security Agency--the counterpart of Canada's CSEC. It's alleged that the Harper government spied to provide Canadian energy firms with intelligence to give them the edge over rivals when bidding for concessions. Today, Rousseff is fighting for her political survival as she faces impeachment for allegedly cooking the books to hide a budget deficit, and millions of people have taken to the streets as a massive corruption scandal at state-owned oil giant Petrobras threatens to bring down the government.

Police picked up former president Luiz Inacio Lula da Silva, Rousseff's mentor, for questioning in a federal investigation, dubbed "Operation Carwash," into a corruption scheme that apparently turned Petrobras into a giant slush fund for the ruling Workers' Party. The former president was questioned about allegedly receiving illicit kickbacks from Petrobras in the form of cash payments and luxury real estate. Rousseff quickly made da Silva a member of her cabinet to protect him from prosecution. Many of Brazil's top figures in business and politics have been implicated in deepening the worst recession in decades in South America's biggest economy.

As well as navigating Brazil's muddy political torrents, Canadian firms have to deal with blowback from neighboring nations. Amazon tribespeople from Peru and Brazil have joined forces to stop Toronto's Pacific Rubiales from allegedly destroying land and putting at risk the lives of uncontacted tribes. Pacific Rubiales is exploring in Block 135 in Peru, which is an area proposed as a reserve for uncontacted tribes

Gulf Daily News
Security technologies 'crucial for aviation industry'

Monday, 09 May 2016

Manama - Security technologies like encryption, intrusion protection, firewalls and right technical design and architecture are critical to ensure sustainable growth of the aviation industry, a leading expert has said.
According to Gulf Air's director of information technology (IT) Dr Jassim Haji, the incidence of cyber attacks against airlines around the world has been rising as has the damage and loss they have caused.

Addressing leading IT industry experts at global market intelligence and advisory provider International Data Corporation's Security Roadshow in Bahrain, Dr Haji said a diverse digital ecosystem had brought security to the forefront as it underpinned every operation, process and service within the industry.

Explaining how latest technologies and phenomena like mobile, social, cloud and Big Data had brought benefits to the industry, he said there had also been an increase in risks as well as actual and potential threats. "Airlines hold private and confidential information about their passengers and it is critical that this information was protected and kept safe from unauthorised access or manipulation," he said.

This, he added, assumes greater significance in the case of governments and border controls which are custodians of sensitive information about passengers with possible national security implications.

Talking about new generation of aircraft, Dr Haji said every equipment and part has become a piece of electronics thus becoming susceptible to external manipulation and control. He said all airlines needed to have a cutting-edge risk management framework that would be used to efficiently identify potential risks, their impact, likelihood of occurring, mitigation plans and regular assessments of such risks.

Referring to drones as one of the new and obvious risks, Dr Haji said they were increasingly becoming uncontrolled and unmanaged, citing a recent incident at an airport in London where an aircraft was hit by a drone as an example of the damage that can occur from this unmanaged state.

He also emphasised that initiatives based around becoming "smart," were bringing about a need for secure, open platforms. "The culture of security has to be instilled in every single employee so they protect their own company and act vigilantly." Dr Haji also serves on the SITA Council and sits on the board of directors of a leading hospitality and tourism technology provider in the Middle East.

Through his myriad initiatives, he has managed to achieve 26 top Middle-Eastern technology awards for Gulf Air, including best project implementations for cloud computing, virtualisation, Big Data, mobility applications and IT security. Held at the Diplomat Radisson Blu Hotel, Residence and Spa, the event saw participation from more than 100 professionals and executives.

Sky News (UK)
Small Firms 'Underinvesting' In Cyber Security

Monday, 09 May 2016

London - Half of small manufacturers in the UK have failed to increase cyber security investment in the past two years, according to a survey.
Research by manufacturers' organisation EEF found that 56% of businesses have not increased their spending.

A fifth fail to make employees aware of cyber risks, while only 56% say cyber security is given serious attention by their board.

Just over a third, or 36% of manufacturers, have an incident response plan in place, and only 24% monitor cyber threats.

EEF Chief Economist Lee Hopley, is urging manufacturers to step up their planning to counter the increasing number of cyber threats.

"As technology and data start to play increasingly critical roles in manufacturing, companies will inevitably find themselves more vulnerable to cyber breaches," said Mr Hopley.

"Our survey highlights that investment in new technology isn't being matched by investment in managing risks, especially among smaller firms.

"It is important that manufacturers are able to identify, understand and put the correct strategies in place to keep their businesses safe and cyber secure."

The Government has also called for industries to act to protect themselves while announcing it will launch a National Cyber Security Centre this autumn and spend £1.9m over the next five years.

Its research revealed that 90% of large businesses and 74% of small businesses reported cyber security breaches last year. Average breaches cost up to to £3.14m for large firms and up to £311,000 for small businesses.

A quarter of large firms come under attack at least once a month, according to the Department for Culture, Media and Sport.

The research shows the most common attacks detected involved viruses, spyware or malware and could have been prevented using the Government's Cyber Essentials scheme.

A TalkTalk cyber attack last year cost the telecoms group up to £45m and triggered a sharp drop in customers.

Washington Free Beacon
Obama Policies Toward Hackers From China, Iran, Syria Produce Few Results
Monday, 09 May 2016
Byline: Bill Gertz

Column - Recent federal indictments of Iranians and Syrians for cyber attacks on U.S. networks further highlight the failure of President Obama and his administration to counter the growing threat of foreign hacker strikes on American networks.
In March, the Justice Department indicted two groups of hackers, one from Iran linked to cyber intrusions of an industrial control system operating a New York dam, and a second from Syria engaged in illegal activities that included causing damage to computers and extortion.

The indictments are largely symbolic, since none of the Iranians or Syrians are within reach of U.S. law enforcement and the chances the hackers will ever face justice in a courtroom are slim.

Like many of President Obama's foreign policies, the indictments appear designed to provide the president and his administration with political cover by adopting seemingly proactive measures, but without having much impact.

The approach to cyber threats coincides with the president's generally pacifistic approach to foreign affairs, which he is reported to have summed up as "don't do stupid shit." In practice, this approach often amounts to doing as little as possible, and doing nothing that might require the use of military force.

The policy was captured in a New York Times profile last week of Ben Rhodes, the White House deputy national security adviser for communications who was described as "The Boy Wonder" of the White House.

Leon Panetta, who served as CIA director and defense secretary under Obama, explained that the president's approach to foreign affairs has been dominated by the desire to avoid possible conflicts.

"I think the whole legacy that he was working on was, 'I'm the guy who's going to bring these wars to an end, and the last goddamn thing I need is to start another war,'" Panetta said of Obama's approach to Iran and the nuclear deal. The former defense secretary said the president believes that "if you ratchet up sanctions, it could cause a war. If you start opposing their interests in Syria, well, that could start a war, too."

On cyber security, the president and his advisers have rejected policy options from military and civilian national security experts since at least 2011 for a show of force in cyberspace against China or other states and groups engaged in widespread cyber attacks, according to officials familiar with internal discussions.

Private industry, which is barred by federal statute from conducting its own cyber counterattacks, has pressed the White House and the U.S. intelligence community to do more against the onslaught of hacks. So far the response has been a firm "no" from the president.

Symbolic indictments or other diplomatic measures have not worked to deter cyber attacks. The FBI announced in July it was revamping its cyber counter- espionage unit after logging a 53 percent increase in its caseload.

A State Department security report published on March 30 noted that in the indictments of the Iranian Syrian hackers, U.S. private sector institutions were the main victims.

"These cyber attacks resulted in disrupted customer communications, data infringement, and significant financial losses," the report said, adding, "the hackers will likely not face prosecution in the U.S. for their actions ... [h]owever, some analysts believe the U.S. government will continue publicly blaming foreign hackers in an effort to deter future attacks."

The indictments followed a similar May 2014 action by the Justice Department against five Chinese military hackers who also remain out of reach of law enforcement and who likely will never be brought to trial.

The indictment was a response to Chinese government denials to the Justice Department about its cyber activities and a demand to produce legal evidence implicating China's cyber warfare troops in what the United States has charged is widespread theft of corporate and government secrets.

John Carlin, the Justice Department's national security chief, explained that the indictment was simply following through on Beijing's dare.

"We heard directly from the Chinese who said, 'If you have evidence, hard evidence, that we're committing this type of activity that you can prove in court, show us.' So we did," Carlin told a security conference months after the indictment.

A short time after the indictment, the Chinese military was linked to the theft of 80 million records from Anthem, the American health care provider. Then came the pillaging, also by Chinese military hackers, of Office of Personnel Management networks. The hack resulted in the loss of another 22 million records, including sensitive data from background investigations for security clearances.

Obama came close to imposing sanctions on the Chinese for the large-scale data hacking but backed off in September during the visit to Washington by Chinese President Xi Jinping, who promised to halt Chinese economic espionage in cyberspace. U.S. intelligence officials recently told Congress they were unable to verify that the Chinese ended the cyber attacks, a clear indication they have continued.

The State Department report, produced for a public-private partnership called the Overseas Security Advisory Council, or OSAC, said the indictment of Chinese military hackers was an "an unprecedented announcement, publicly blaming the Chinese government for espionage against the U.S. private sector."

"The five indicted Chinese military officers have also not yet been brought to court in the U.S.," the report said. "However, this case was among the first to highlight the threat of intellectual property theft from a nation-state, which remains a concern among many OSAC constituent organizations operating overseas."

The report said the indictments of the Iranians and Syrians highlighted the "blended threat" posed by foreign government and non-government hackers. It also showed that cyber attacks were behind the economic espionage confirmed in the PLA case, including cyber denial-of-service, intimidation, and extortion activities.

"The threat to the private sector is heightened as hackers look to carry out these various operations for both professional and personal gain," the report said.

"The traditional categories of threat actors-- nation-state, criminal, politically-motivated--no longer define all of the malicious network activity affecting U.S. private sector organizations," it added. "The 'blended threat' of hackers who are willing to work as proxies for governments or other organizations can hinder detection and prosecution in multiple ways."

The use of non-state hackers for foreign government cyber attacks makes it more difficult for authorities to identify the attackers, and allows nation-states or terrorist groups to benefit from the technical expertise of private sector hackers.

Additionally, proxies give foreign governments what spy agencies call plausible deniability--a key information warfare tactic allowing governments to avoid being linked to cyber attacks, the report said.

The report concluded that the recent indictments of Chinese, Iranian, and Syrian hackers "are unlikely to deter malicious cyber actors from exploiting this blended threat to target the U.S. private sector."

As Obama winds down his final term as president, it appears one of his legacies will be an unwillingness to take effective steps to counter cyber attacks against the United States that have caused serious damage to U.S. security.

As former NSA Director Keith Alexander has said, China is stealing everything it can to boost its economy. "It's intellectual property, it's our future. I think it's the greatest transfer of wealth in history," Alexander said.

IRD team to sift through papers on foreign-owned trusts
Sunday, 08 May 2016
Byline: Nicholas Jones

Canberra - The IRD has set up a team to sift through documents about foreign-owned trusts from the Panama Papers.
A cache of material from the leak of documents from the Panamanian law firm Mossack Fonseca is due to be released today. Prime Minister John Key said the information could lead to law changes.

"It is quite useful that the Panama Papers get released," Mr Key said, "if that helps assist the New Zealand Government in making improvements to any of the laws that we have, or the partners that we work with like the OECD."

He said he did not condone the hacking of private information, but now that information would be released "there might be some benefits to gain from that".

Any New Zealanders found to be avoiding tax could expect a "knock at the door", he said, and if there was evidence of trusts being used improperly by foreigners the rules could be tightened.

Labour leader Andrew Little said the Prime Minister's tone had changed.

"There may well be now a rapidly changing position, which is because they discovered that, actually, most New Zealanders don't like this, and don't like us to be party to this."

Talk of the IRD investigating Kiwis was something of a distraction, he said, when the real issue was the use of the trusts by foreigners to avoid tax.

Labour wants the foreign trust industry shut down, but Mr Key called that a "knee-jerk" reaction.

Following the first release of details from the papers last month, the Government began a review of the disclosure rules for NZ's foreign trusts. Opposition parties have criticised the review's narrow focus.

An article in the Australian Financial Review on Friday shed new light on the number of foreign investors who had moved their cash and assets into tax-free New Zealand-based trusts, and the way these investors were able to minimise their tax.

It also said Auckland-based lawyer Ken Whitney, whose clients include Mr Key, had written a reference for Auckland law firm Cone Marshall to get accreditation with Mossack Fonseca in 2009.

After the release of the papers, Mr Key said Mr Whitney had assured him he had not had any dealings with Mossack Fonseca.

Yesterday the Prime Minister said the reference did not contradict that: "People give references all of the time."

Wall Street Journal
Twitter Bars Intelligence Agencies From Using Analytics Service
Monday, 09 May 2016
Byline: Christopher S. Stewart, Mark Maremont

New York - Twitter Inc. cut off U.S. intelligence agencies from access to a service that sifts through the entire output of its social-media postings, the latest example of tension between Silicon Valley and the federal government over terrorism and privacy.
The move, which hasn't been publicly announced, was confirmed by a senior U.S. intelligence official and other people familiar with the matter. The service--which sends out alerts of unfolding terror attacks, political unrest and other potentially important events--isn't directly provided by Twitter, but instead by Dataminr Inc., a private company that mines public Twitter feeds for clients.

Twitter owns about a 5% stake in Dataminr, the only company it authorizes both to access its entire real-time stream of public tweets and sell it to clients.

Dataminr executives recently told intelligence agencies that Twitter didn't want the company to continue providing the service to them, according to a person familiar with the matter. The senior intelligence official said Twitter appeared to be worried about the "optics" of seeming too close to American intelligence services.

Twitter said it has a long-standing policy barring third parties, including Dataminr, from selling its data to a government agency for surveillance purposes. The company wouldn't comment on how Dataminr--a close business partner--was able to provide its service to the government for two years, or why that arrangement came to an end.

In a statement, Twitter said its "data is largely public and the U.S. government may review public accounts on its own, like any user could."

The move doesn't affect Dataminr's service to financial industry, news media or other clients outside the intelligence community. The Wall Street Journal is involved in a trial of Dataminr's news product.

Dataminr's software detects patterns in hundreds of millions of daily tweets, traffic data, news wires and other sources. It matches the data with market information and geographic data, among other things, to determine what information is credible or potentially actionable.

For instance, Dataminr gave the U.S. intelligence community an alert about the Paris terror attacks shortly after they began to unfold last November. That type of information makes it "an extremely valuable tool" to detect events in real time, the intelligence official said.

In March, the company says it first notified clients about the Brussels attacks 10 minutes ahead of news media, and has provided alerts on ISIS attacks on the Libya oil sector, the Brazilian political crisis, and other sudden upheaval in the world.

U.S. government agencies that used the Dataminr service are unhappy about the decision and are hoping the companies will reconsider, according to the intelligence official.

"If Twitter continues to sell this [data] to the private sector, but denies the government, that's hypocritical," said John C. Inglis, a former deputy director of the National Security Agency who left in 2014. "I think it's a bad sign of a lack of appropriate cooperation between a private-sector organization and the government."

Analysis of Twitter and other social-media services has become increasingly important to intelligence and law-enforcement agencies tracking terror groups. Islamic State posts everything from battlefield positions to propaganda and threats over Twitter. San Francisco-based Twitter deletes thousands of accounts a month for violating its antiterror policies, but Islamic State supporters create new accounts almost as quickly.

"The volume of the group's activity on Twitter yields a vast amount of data that is a crucial tool for counterterrorism practitioners working to manage threats," said Michael S. Smith II, chief operating officer of the security consulting firm Kronos Advisory. "Twitter's decision could have grave consequences."

In a speech last September, David S. Cohen, a deputy director of the Central Intelligence Agency, discussed the importance of "open source" social-media data gathered by the CIA, saying Islamic State's "tweets and other social- media messages publicizing their activities often produce information that, especially in the aggregate, provides real intelligence value."

Silicon Valley and the U.S. government have been locked in intensifying conflicts over cooperation since the revelations by former National Security contractor Edward Snowden about government surveillance of electronic communication.

Most recently, Apple Inc. and the Justice Department were embroiled in a legal showdown over demands by the Federal Bureau of Investigation to unlock an iPhone used by one of the killers in the San Bernardino, Calif., attack in December. That fight--which unlike the Dataminr product involved the release of private data--ended in March when the FBI found another way to access the phone.

In-Q-Tel, a venture-capital arm of the U.S. intelligence community, has been investing in data-mining companies to beef up the government's ability to sort through massive amounts of information. In-Q-Tel, for example, has invested in data-mining firms Palantir Technologies Inc. and Recorded Future Inc.

U.S. intelligence agencies gained access to Dataminr's service after an In-Q-Tel investment in the firm, according to a person familiar with the matter.

When a pilot program arranged by In-Q-Tel ended recently, Twitter told Dataminr it didn't want to continue the relationship with intelligence agencies, this person said.

"Post-Snowden, American-based information technology companies don't want to be seen as an arm of the U.S. intelligence community," said Peter Swire, a Georgia Institute of Technology law professor and expert on data privacy.

Dataminr, based in New York, was launched seven years ago by three former Yale University roommates. A financing round early last year valued it at $700 million, according to Dow Jones VentureSource.

Its product goes beyond what a typical Twitter user could find in the jumble of daily tweets, employing sophisticated algorithms and geolocation tools to unearth relevant patterns.

Dataminr has a separate, $255,000 contract to provide its breaking news-alert service to the Department of Homeland Security, which is still in force.

Associated Press
Lawmakers, advocates push to reveal extent of surveillance
Monday, 09 May 2016

Washington - Even though the bulk collection of Americans' telephone records has ended, calls and emails are still being swept up by U.S. surveillance work targeting foreigners. Congress is making a renewed push to find out how many.
Six Republicans and eight Democrats on the House Judiciary Committee have asked the nation's top intelligence official for the number of Americans' emails and phone calls collected under programs authorized by Section 702 of the Foreign Intelligence Surveillance Act.

The programs target foreigners, but domestic communications sometimes are vacuumed up as well. They were first revealed to the public by Edward Snowden, who leaked files from the National Security Agency.

"Surely the American public is entitled to some idea of how many of our communications are swept up by these programs," the committee members wrote in their April 22 letter to Director of National Intelligence James Clapper.

They weren't the first to request the information.

In the past five years, Democratic Sens. Ron Wyden of Oregon and Tom Udall of New Mexico have asked repeatedly. Last October, a coalition of more than 30 civil liberties groups wrote Clapper seeking the information. Unsatisfied with the answer they received, they wrote him again in January.

Intelligence officials have tried to assuage concerns of Congress and others by saying that any domestic communications collected are "incidental" to the targeting of foreigners. They say Section 702 allows the government to target only non-U.S. persons reasonably believed to be located outside the United States. They say the law explicitly bars the government from targeting a foreigner to acquire the communications of an American or someone in the U.S. But they say intelligence agencies are authorized under Section 702 to query communications made with U.S. persons under certain cases with certain approvals.

Late last month, Clapper said intelligence agencies are looking into several options for providing an estimate and will do their best to come up with a number.

"This tool is a terrific producer of critical intelligence for this country and our allies," Clapper said recently about continued need for Section 702 programs.

He did not say how soon an estimate could be released and cautioned that "any methodology we come up with will not be completely satisfactory to all parties."

Even Congress acknowledges that producing an estimate could require reviewing actual emails, for instance, those acquired under Section 702, which itself could raise privacy concerns. But lawmakers say they are only advocating a "one- time, limited sampling" of communications.

Intelligence officials held briefings last week for congressional aides to explain ways an estimate could be provided. That is something Congress wants to get before it starts debating whether to reauthorize Section 702, which is set to expire at the end of next year. The Senate Judiciary Committee plans a hearing Tuesday on the issue.

Intelligence officials also briefed privacy advocates in March and are expected to hold another this month on the best way to estimate the extent to which domestic communications are ensnared in the quest for foreign intelligence. Among the problems is determining the citizenship of a caller or emailer, or whether the person is inside or outside the United States.

"We can't go into what I hope will be an extensive public debate without this basic information," said Elizabeth Goitein, co-director of the Brennan Center for Justice's program on liberty and national security.

In a recent article, Goitein wrote: "The National Security Agency acquires more than 250 million Internet communications each year under this program. Given the ubiquity of international communication, this number is virtually certain to include tens of millions of exchanges that involve Americans, but there is no official public data on how many Americans' communications are swept up."

Congress and privacy advocates got a glimpse into Section 702 surveillance from a congressionally mandated report that Clapper's office released this past week. The report said Section 702 surveillance targeted 94,368 foreign persons, groups or entities outside the U.S. last year, up slightly from 92,707 in 2014.

While the year-to-year increase is small, Jameel Jaffer, deputy legal director at the American Civil Liberties Union, notes that the number of targets has risen to more than 94,000 since the surveillance became legal in 2008.

The report also said that 23,800 queries concerning U.S. persons were conducted on the database, although the report notes that one of the intelligence agencies involved in the queries, which was not identified, did not provide this information.

The report also said 4,672 search terms concerning U.S. persons were used to retrieve information from Section 702 data, but privacy experts point out that the number excludes queries conducted by the FBI.

"It's true that the targets are foreigners, but in the course of targeting those 94,000 people, the government collects the communications of many, many - we don't know the number - Americans," Jaffer said. "That number is missing."

New York Times
Police and Tech Giants Wrangle Over Encryption on Capitol Hill
Monday, 09 May 2016
Byline: Cecilia Kang

Washington - Cyrus R. Vance Jr., the district attorney of Manhattan, visited Washington late last month to argue his case on a pressing issue: encryption.
In a string of meetings with members of Congress, Mr. Vance told central lawmakers that encryption needed to be diminished during criminal investigations. During a 45-minute session with Senator Angus King, an independent from Maine who is on the Senate Intelligence Committee, Mr. Vance said his office had 230 iPhones that might contain crucial information for cases but were useless because Apple refused to help the police break the encryption on the devices.

"I wanted to express a sense of urgency around resolution of this issue," Mr. Vance said in an interview about his Washington visit.

A day after Mr. Vance was on Capitol Hill, tech executives including Kent Walker, the general counsel of Google, and Brad Smith, president of Microsoft, also met with lawmakers -- but with a very different message on encryption. Tech executives at the meetings said they were concerned about any laws that would force companies to weaken the security of their technology, according to news officials representing these companies.

This kind of behind-the-scenes lobbying has become de rigueur in Washington as the battle over encryption shifts to Capitol Hill. It is the next phase of a bitter divide that spilled into public view this year when Apple refused to comply with a court order to help bypass security functions on an encrypted iPhone used by an attacker in the San Bernardino, Calif., mass shooting last year. Doing so would have let the F.B.I. gain access to the phone. That case ended after the F.B.I. found an alternative way into the device.

Yet the standoff between the United States government and Silicon Valley tech companies continues -- and the flurry of activity around the issue is broadening. Last month, a Senate draft encryption bill, written by Richard M. Burr, Republican of North Carolina, and Dianne Feinstein, Democrat of California, rallied the attention of both sides. The bill would require tech companies to give access to encrypted data with court orders.

Law enforcement officials immediately announced their support of the bill and began to push lawmakers to back it. Trade groups representing tech companies like Apple and Facebook have flooded into congressional offices, sent letters expressing concerns that the bill weakens consumer privacy and security, and delivered scorching speeches about the proposals.

"This is an escalating fight," said Robert D. Atkinson, president of the Information Technology and Innovation Foundation, a research firm based in Washington that is funded by tech companies including Google and Microsoft. "It's become the focus now in Washington, with hearings and legislative activity."

Law enforcement officials blame tech companies for creating the impasse.

"There's no question our relationship with the tech industry has gotten worse, and now it seems like the tech industry is taking every opportunity they have to put up obstacles in our way, including trying to derail legislative efforts that would give law enforcement what they need to keep people safe," said Terrence Cunningham, president of the International Association of Chiefs of Police.

Facebook, Google and Microsoft declined to comment on their lobbying activity. An Apple spokesman said the company has met regularly with members of Congress on encryption and other issues.

The amount of lobbying on the encryption bill is unusual at this early stage of a bill's life, showing the stakes involved. Tech companies are reluctant to give access to encrypted information from their users, for privacy reasons and because it may affect their businesses. Law enforcement officials say their efforts to prevent and solve crime are hampered if they cannot see digital data on phones, messaging services and other technology services.

"Today, terrorists and criminals are increasingly using encryption to foil law enforcement efforts, even in the face of a court order," Senator Feinstein said in a statement about the draft bill. "We need strong encryption to protect personal data, but we also need to know when terrorists are plotting to kill Americans."

The rhetoric in Washington around encryption has grown increasingly sharp. Last month, when the contents of the draft encryption bill were leaked, the president of the Consumer Technology Association, a trade group that counts Apple, Google, Facebook and Amazon among its 4,000 members, spoke to an audience filled with government officials at a lunch hosted by the Media Institute.

The bill is "dangerously overreaching and technically unsophisticated," said Gary Shapiro, president of the association. "This bill would essentially make effective cybersecurity illegal in the United States, pushing companies that take cybersecurity seriously offshore."

Other tech trade groups, including Reform Government Surveillance and the Business Software Alliance, have also waded into the fray, sending critical letters and meeting with senators to warn of the dangers of the bill. And Silicon Valley executives have, in increasing numbers, made the trek to Washington to make their cases directly.

Bob Lord, chief information security officer at Yahoo, visited several members of Congress in late April to talk about the technology behind encryption and to warn of the "unintended consequences" of legislation that could weaken security. While he did not specifically mention the Burr-Feinstein bill, he emphasized how consumers and human rights activists worldwide depend on encrypted technology for their safety and privacy.

"The notion that we would weaken encryption or provide back doors, those suggestions will have unintended consequences," Mr. Lord said.

Law enforcement officials, in turn, have frequently met with the same lawmakers in the Senate and House intelligence, judiciary and commerce committees who are being targeted by the tech companies, according to congressional staff members. Chief Cunningham and other members of the police chiefs' group have talked with Mr. Burr and Ms. Feinstein, given opinions during the drafting of the legislation and hosted panels on encryption for House and Senate lawmakers.

Tech companies have turned to certain politicians to champion their cause, such as Senator Ron Wyden, a Democrat from Oregon. On the day the draft encryption bill was introduced, Mr. Wyden, who voted

against the 2012 copyright bills known as the Stop Online Piracy Act and the Protect Intellectual Property Act, which were also opposed by the tech industry, said he had been flooded with calls from tech companies wanting to know what he would do.

Mr. Wyden said he intended to filibuster the proposal. He has since met with Intelligence Committee members to persuade them to kill the bill.

"I have not filibustered many issues, but I think the stakes are enormous," Mr. Wyden said in an interview. "The bill as written is a lose- lose, because it will create less security, American families will be less safe, and your liberty and privacy will be damaged."

For all the lobbying, few lawmakers have expressed their views on the encryption bill.

"I'm reserving judgment," said Senator King, who met with Mr. Vance last month. "The issues are so complex, it's like trying to nail Jell-O to the wall."

Toronto Star
To Serve, Protect, Watch and Predict
Saturday, 07 May 2016
Byline: Alex Ballingall

Analysis: Try to imagine what policing will look like in the future. Microwave heat cannons and sound bazookas dispersing rowdy crowds? Robocops patrolling the streets while whirring drones keep watch from the sky?
Or maybe we'll arrive at a world where all crime is wiped away, where people peacefully coexist in sleeper pods while life is played out through virtual reality helmets.

Maybe.

The more realistic picture, according to police technology experts, is that surveillance and the collection and analysis of information will play a central role in solving and preventing crime.

The public safety regime of tomorrow, in other words, is all about data. "This is the future of policing," says Christopher Schneider, an associate professor of sociology at Brandon University in Manitoba.

Cops in the coming decades will gather information online, interact with the public through social media and even use data gleaned from the Internet and past crimes to predict and prevent future law-breaking, Schneider says. This is already happening, to varying degrees, in American cities and places such as Vancouver and Toronto, where police used a program to comb through Twitter to gather evidence for a recent online harassment trial.

"Policing as an apparatus is going to be much more mediated, and it's going to be much more community-oriented than it currently is, through the Internet, through social media," Schneider says.

"This is going to expand the gaze, as it were, toward crime and deviance."

The nexus between police and the public they serve has already expanded beyond the traditional 911 call (if you're even more of a troglodyte, just yell: "Help! Police!"). Ritesh Kotak, a police consultant for agencies in Canada and overseas, said tools like social media have created space for the "co-creating of public safety," with new and convenient avenues to report crimes and follow police data shared over the Internet.

"That's where it's headed with 'next generation 911.' That's where it's headed with the ability to see something and communicate right through our smartphones with police," Kotak said. "Data is the currency of the future."

With an open data mentality and deeper engagement through social media, Kotak added, police forces can repair and engender trust with the citizenry. "People feel like they're part of something," he said.

But data collection can also be used for more futuristic means. Ryan Prox, a special constable with the Vancouver Police Department, is one of the pre-eminent experts in the emerging field of "predictive policing." Prox prefers to call it crime "forecasting," in which police forces use complex computer programs that churn through mountains of data to try and predict when and where future crimes will occur.

This has yet to catch on in full force in Canada, but police in cities such as Los Angeles and Miami have signed on to "predictive" programs designed by companies such as PredPol, Prox explains. PredPol uses three data points -- time, place and type of crime -- to draw up boundaries in which crimes are most likely to occur, then local police patrol these areas in the hopes of catching the bad guys.

Prox cautions, however, that little independent scientific research has been done on these programs in the U.S. and suggests they may not be as accurate as their makers claim.

That's why he's spearheading a six-month predictive-policing pilot project in Vancouver, which began Feb. 1, that uses an intricate software program that has been designed by a team of mathematicians and geospatial engineers. The program sifts through crime data as far back as March 2001, including the time, place and nature of an offence, Prox says. But it also considers 60 "non-crime" factors, such as neighbourhood income, area traffic density, locations of illicit graffiti and even wind speed, to forecast the probability of a future crime being committed in the coming hours within a 100-metre radius of a given location.

Plainclothes cops will be dispatched to monitor these areas, with uniformed officers on standby to make an arrest in the event that a crime is witnessed, Prox says.

Tests have already shown a 60 to 70 per cent accuracy rate for some property crimes such as break and enters, which are easiest to predict because they're high frequency and often involve repeat offenders, Prox says. The more police use the program, the more data they have and the more accurate officials hope it can become.

"It sounds really sci-fi goofy," he laughs, "but they basically call it an 'artificial learning neural network.' That's the mathematical model."

The endgame of such programs, Prox says, is maximum police efficiency. In an era of ballooning police budgets -- now more than $1 billion a year in Toronto, for example -- that could be a welcome prospect.

But critics point to controversial information-gathering programs such as "carding" in Toronto, which many argue disproportionately target visible minorities.

To rely on such practices to fuel computer software programs that dictate how cops are deployed, could entrench existing police biases, Schneider says.

"Are we going to then be criminalizing certain people, certain segments of the population? Who are the police going to be looking at?" he asks.

Prox acknowledges this is a legitimate concern, but says the Vancouver police program only considers data from crime reports and other objective factors. It's generated by the public rather than fuelled by the cops themselves.

Others have brought forward concerns about how predictive policing will affect individual rights. Brenda McPhail, director of the Canadian Civil Liberties Association's Privacy, Technology and Surveillance Project, says the main worry is that the types of data currently used to forecast crime will expand to include more personal information -- social media posts, online purchase histories, travel bookings or location data from public Wi-Fi use.

This could not only invade individual privacy, it could erode the presumption of innocence, McPhail adds, citing court decisions in Canada and the U.S. that have suggested it is disproportionate to comb through data of many individuals to find a single criminal.

"The concern is that it is the thin edge of a wedge," she says. "Before any such programs are implemented, we as a society need to compare the benefits with the costs, particularly the costs to our rights and civil liberties. We need to consider the risks."

Such worries go beyond crime-forecasting programs.

Some point to privacy issues in the face of intensifying means of surveillance, such as the extensive camera networks that are used by police in Fresno, Calif., where police can monitor live feeds throughout the community through their Real Time Crime Center.

David Lyon, a Queen's University sociologist and head of the school's Surveillance Studies Centre, has argued that people's lives are being watched to the point that it already makes sense to label many western countries "surveillance societies." Lyon is co-author of a 2014 book on the subject, in which he and his colleagues argue we're at a "historic turning point" for the expansion of surveillance measures, developments with obvious consequences for privacy and state power.

Much of this can be viewed as part of a social shift toward a so-called "safety state," where more and more government policies - - and police actions -- are justified through fear of danger, says Charles Raab, a political science professor at the University of Edinburgh.

"As long as there are some plausible reasons to think we live in exceptionally dangerous times" -- such as terrorist attacks in big cities -- "there will be public fears and demands for more security and safety," says Raab. "Other values, such as equality, fairness and the exercise of rights and liberties, are constrained by the imperative to make everything safe and secure."

This isn't inevitable, Raab says. But with terrorism and climate change dominating the media and politicians routinely emphasizing this danger in their quests for votes, safety will continue to be a top social priority.

And that probably means the police of tomorrow will find ways to use our data and train cameras on us in an effort to keep us safe.

Now Experts Say Don't Change Your Password
Sunday, 08 May 2016
Byline: Martin Beckford

London - It is one of the banes of modern life - you finally come up with a memorable yet secure password for your office computer, only to be told just a few months later that it has expired and you have to find a new one.
But now Britain's security services themselves have decreed that workers may be safer from hackers if they do not have to keep changing passwords. In a new briefing to Whitehall, power stations, banks and the public sector, cyber experts at CESG - the information security arm of intelligence agency GCHQ - concluded: 'It's one of those counter-intuitive security scenarios; the more often users are forced to change passwords, the greater the overall vulnerability to attack.'

The advice continues: 'Most password policies insist that we have to keep changing them. And when forced to change one, the chances are that the new password will be similar to the old one. Attackers can exploit this... New passwords are also more likely to be forgotten, and this carries the productivity costs of users being locked out... CESG now recommends organisations do not force regular password expiry.'

The advice comes as Ministers urge greater protection against cyber crime, after a survey found two-thirds of large businesses suffered an attack or security breach in the past year.

Fox News
Romanian hacker who claims he breached Clinton server says he spoke with FBI at length
Saturday, 07 May 2016
Byline: Catherine Herridge

Washington - The Romanian hacker who says he easily breached Hillary Clinton's personal email server also claimed, in a series of interviews with Fox News, that he spoke with the FBI at length on the plane when extradited from Romania to Virginia last month.

"They came after me, a guy from the FBI, from the State Department," 44-year-old Marcel Lehel Lazar, who goes by the moniker "Guccifer," told Fox News during a jailhouse phone interview. He said the conversation was "80 minutes ... recorded," and he took his own notes.

A government source confirmed that the hacker had a lot to say on the plane but provided no other details. Lazar was flown to the U.S. to face separate cyber-crime charges.

In addition to the apparent conversation with the FBI on the plane, Fox News has learned a meeting was expected as early as this week at the Alexandria, Va., detention center where he's being held involving Guccifer, the FBI, the U.S. attorney and the defendant's court- appointed lawyer.

These officials have not commented on his clams or detention.

An intelligence source close to the investigation, speaking with Fox News last month, questioned the timing of Lazar's extradition to the U.S., coming amid the Clinton email probe. As for what was discussed on that plane, Lazar said he told a State Department representative on the plane about "hot" data, some of which was hidden in Google drives, and other data that was too sensitive and deleted. The hacker, who offered no proof for his claims, said cryptically that he could not say more.

"I can't tell [you] now. I can't tell because I want to talk to the FBI. It is a matter of national security. Yeah," he said. Pressed by Fox News, Lazar seemed to indicate the data was not connected to the ongoing FBI criminal probe of Clinton's server.

Fox News recently met with Lazar in the secure visitor center in Alexandria, then followed up with a series of phone calls which he gave permission to be recorded. Separated by reinforced glass, Lazar was polite and methodical as he explained how he allegedly accessed the Clinton server in early 2013, by using her longtime confidant Sidney Blumenthal's AOL account as a stepping stone.

Fox News was first to report the hacker's claims of accessing the Clinton server, which he said "was easy."

Lazar said he got into the Blumenthal account by correctly guessing his security question, after doing extensive research on the web. He said his hacking always followed a "four step process": identify the target, do extensive web research on the target, access the target's account to harvest data, and send it out to the media.

Lazar said he was puzzled by the American media. He said he sent the Blumenthal emails, which is how the Clintonemail.com account first came to light, to many large news organizations in 2013, and it was The Smoking Gun that picked it up. Lazar said he started his "Guccifer archive," releasing materials in October and November 2012, and it ended "like August 2013."

Three cybersecurity experts said they found Lazar's explanation for accessing the Clinton server plausible but had questions.

Cybersecurity expert Morgan Wright explained how the FBI could marry up available evidence, including forensics or the configuration of the server and its folders, to assess his claims. "So we're going to map these things together, and if those things match up together, they're going to say 'yes, this was compromised,' then it means it was open to other people to compromise as well," he said.

Since Fox News reported on Guccifer's claims Wednesday, anonymous sources have reported that a review of the Clinton hard drives does not appear to indicate a breach. However, Wright and other experts warned that Clinton IT specialist Bryan Pagliano was the server's administrator and not principally a cybersecurity specialist - and may not have installed an adequate detection system for a Cabinet secretary's email.

"If you have a bank and you have one video camera when you need 20, then you missed it," Wright said. "If they weren't capturing all the activity, their security logs may say they didn't see anything."

Asked about Lazar's claims at Thursday's press briefing, State Department spokesman Mark Toner also said he's not aware of such an incident.

"We don't have any reason to believe that it might be true," he said.

At the same time, Toner repeatedly stressed he did not want to comment on the security of the server, citing ongoing investigations. Asked if he's in a position to even know whether Lazar's claims are true, Toner again said he did not want to comment. The Clinton campaign has rejected Lazar's claims, calling them "baseless" and emphasizing he is a convicted hacker.

Other cyber specialists like Bob Gourley with Cognitio warned there will "always be uncertainty and ambiguity" with hackers like Guccifer. But he said: "One thing I would say with certainty however -- if this computer were in a well- managed facility, where everything was being monitored and watched, we would have more information and ground truth."

Canada Revenue Agency hacker pleads guilty, says he's sorry
Saturday, 07 May 2016
Byline: Jane Sims

London - Stephen Solis-Reyes is one of those brainiac computer whiz kids who, it seems, was a little too smart for his own good.
Two years ago, when the London, Ont. man was just 19, and with what he maintains were the best of intentions, he was able to steal 900 social insurance numbers from the files of the Canada Revenue Agency. He says he wanted to demonstrate its online vulnerability to the Heartbleed computer bug.

The result was a sudden, panicked shutdown of the agency's website for four days that sent techno-fear shivers about online security across Canada and prompted the CRA to extend Canadians' tax-filing deadline by a week.

On Friday, now a top- notch computer science student at Western University, the 21-year-old pleaded guilty in an Ottawa courtroom to four charges.

Two were for mischief -- one for the Canada Revenue breach, another for exposing security breaches in JerseyMail, the now-defunct online arm of the postal service in Jersey, one of the Channel Islands off the coast of Great Britain.

The two other guilty pleas were to one count each of unauthorized use of a computer and obstructing a police officer by swiping information off a computer at his arrest.

"I want to express to Your Honour my most sincere regret and remorse for the wide-reaching effects of damage and harm my actions have caused to many different people and organizations," he wrote in a letter to the court.

"I truly understand the severity and gravity of the situation. I want to say that I never had any malicious intent and I never intended to cause harm or damage to anyone in any way."

The Crown dropped 13 other charges that, had be been convicted, could have sent him to prison for as long as 10 years.

For all of the national hubbub surrounding his activities in April 2014, Solis-Reyes was sentenced to an 18-month conditional sentence -- the first four months under house arrest, the rest under supervision.

The defence gave the judge more than 20 reference letters from professors, teachers, friends and family who spoke of Solis-Reyes' intellect and quiet, sensitive and respectful nature.

He's carrying a 98.6 per cent grade average in his fourth year and has already been named to the dean's honour list three times.

Assistant Crown attorney James Cavanaugh read an agreed statement that outlined how Solis-Reyes was able to breach the computer systems from his laptop computer.

Defence lawyer Faisal Joseph told the judge Solis-Reyes was able to get into the CRA system in "six seconds."

Central to the case, was Solis-Reyes' intentions. Joseph told the judge it would have been easy for Solis-Reyes to sell the information or make money off it. None of that happened.

"He did it because he could, because he was capable of breaking into these national security places," Joseph said, and that Solis-Reyes "has done the country a service" by exposing the flaws in the system.

One professor referred to him as "not only one of the smartest students around, but he is also one of the nicest, friendliest and most honest."

"His code is a thing of beauty," another wrote.

His father, Roberto Solis-Oba, the graduate chairman of Western's computer science department, wrote it was his son's "insatiable curiosity that led him to perform the actions that got him in trouble with the law.

The defence was harshly critical of what he alleges were the interrogation methods the RCMP put Solis-Reyes through after his arrest at his London home.

He said his client was questioned for six hours without a lawyer present. He was accused of being a terrorist and was asked "what would Jesus think" about his activities, Joseph said.

Joseph pointed out an RCMP corporal suggested Solis-Reyes's father's job could be in jeopardy and how, in France, it's not illegal to tie somebody up in a hot water tank until he speaks.

"In over 30 years of practising law as a prosecutor and a defence lawyer I have never met a better family or a more respectful, loving, intelligent boy as my client," Joseph said. "Murderers and rapists haven't expereince what my 19-year old client received at the hands of the RCMP's investigating officer for hours on end."

Reached for comment late Friday, the RCMP had not yet responded to the lawyer's characterization.

Solis-Reyes must serve two years of probation, with 200 hours of community service ordered.

He said in his letter he "will never again be in trouble with the law."

"This situation has taught me the importance of thinking before acting and I know every action I take has consequences."

Calgary Herald
Police trying to stay ahead of technology
Saturday, 07 May 2016
Byline: Kim Bolan

Calgary - Mounties were trying to investigate a threat to national security. But because they couldn't get critical information from a telecommunications company, they hit a roadblock.
Despite pursuing other investigative avenues, the case went nowhere, Chief Supt. Jeff Adam, director-general of the RCMP's technical investigation services, said in an interview.

"We spent roughly six months trying to design and implement a partial solution in order to get some of that data. But the gaps remained. And despite the judicial authorization, we've been unable to collect the evidence." The national security case is just one example of the obstacles police face as criminals and terrorists use cutting-edge technology to cover their tracks, Adam said. In another case, the RCMP got a court order "to intercept email messages between suspected criminals - high-level drug traffickers in Canada - and we could intercept, but we could not read the email traffic that they were sending," Adam said. "It was encrypted and this particular investigation involved some of our international law enforcement partners and we were unable to assist ourselves or them in getting the evidence."

Adam said the inability to decipher encrypted messages even when police get warrants is a challenge in many investigations - particularly those involving national security, organized crime and child exploitation.

Another issue, he said, is "lack of requirements for data retention by our telecommunications service providers."

Say police get a court order to obtain the text messages of a suspect in a case of threatening. But the company then tells investigators that it "doesn't keep anything more than 24 hours, so that evidence is therefore expunged from the system," Adam said.

On a recent trip to B.C., RCMP Commissioner Bob Paulson warned that while emerging technology has many benefits, "it's also changing criminality and it is putting us at risk and maybe you have to think that through more."

He cited the recent U.S. case where the FBI took Apple to court to get the iPhone of one of the San Bernardino terrorists unlocked. Apple refused. The FBI finally found a third party who could crack the password.

"It's just a taste of what's before us in terms of how we are going to go down this road," Paulson said. "It shouldn't be up to the police to say how we are going to roll. I think the community needs to engage because the threat is manifest."

Ann Cavoukian, executive director of Ryerson's Privacy and Big Data Institute, thinks police exaggerate the technological obstacles they face. And she said they rarely "point out the advantages they have from technology."

"It is deceptive because while it's true that occasionally they won't have access to one or two communications that have been encrypted, largely speaking they have more access now to a wide variety, a wide swath of information that they never had access to before," said Cavoukian, Ontario's former privacy commissioner.

"They're only pointing you to the small tiny percentage of cases where they might not be able to decrypt a phone because it has got end-to-end encryption. But that happens rarely."

The law-abiding public relies on encryption to protect sensitive personal information - often including health and banking records - that they now store on their phones.

"All of this information is accessed through your iPhone and you want people to be able to encrypt that safely to protect it from all the cyber attacks that are taking place," she said.

Cavoukian said there are huge privacy concerns with some of the technology police use in their investigations.

Media reports from a Montreal Mafia trial recently revealed that the RCMP had used a device known as a Stingray to intercept suspects' calls.

The device is controversial because it mimics a cellphone tower, allowing police to collect information from their targets' phones, but also from anyone else in the vicinity.

Last month, the office of the federal privacy commission confirmed it was investigating complaints about the RCMP's refusal to discuss its use of the Stingray device.

Cavoukian said the lack of transparency by police just increases the public's skepticism and distrust.

She said she has no problem with police getting proper warrants and getting the specific information they need for criminal investigations. But the fear is that law enforcement agencies have the ability to cast a wider net that unfairly ensnares lawabiding citizens, she said. She also acknowledged that the public puts its own privacy at risk with by using wireless devices and fitness trackers that can send personal information to "dozens of parties unbeknownst to the individual and the information can be used against them."

In a recent Pennsylvania case, a woman's claim to police that she'd been raped was disproven by her Fitbit data.

Le Journal De Montreal
Recrutés sur Instagram
Saturday, 07 May 2016
Byline: Hugo Jocas

Montréal - «Quelqu'un» a utilisé le réseau social Instagram pour tenter de recruter les jeunes arrêtés en mai 2015, selon la déclaration de la GRC à la Cour du Québec.
Un adolescent de Saint-Léonard «se sentait comme hypnotisé par le discours du suspect», selon son père, qui a appelé la police fédérale pour le dénoncer.

Son fils utilisait son téléphone iPhone pour naviguer sur Instagram et échanger avec le recruteur.

«L'homme lui a dit que vivre au Canada était péché, car ce n'est pas un pays musulman», mentionne la dénonciation de la police fédérale.

Le recruteur allégué utilisait toujours un profil différent sur Instagram pour communiquer, mais il commençait toujours par le même nom, caviardé dans le document de l'Équipe intégrée de sécurité nationale.

FAUX VOYAGE

L'adolescent avait fait croire à sa famille qu'il partait pour un voyage en Grèce avec son école.

Son père a interrogé la direction: aucun voyage n'était organisé. Il a alors confronté son fils, qui a éclaté en sanglots.

Contrairement aux autres, le jeune a été arrêté chez lui et non à l'aéroport.

Un autre des 10jeunes s'était rendu avec lui dans une agence de voyages pour s'informer sur le prix de billets pour Rome, avec escale à Istanbul, selon nos informations. Il avait acheté un billet, mais lui aussi a abandonné le projet.

Toronto Star
Reveal high-tech privacy violations: Editorial
Sunday, 08 May 2016

Editorial: We know Ottawa's electronic spy agency has violated the privacy of Canadians on multiple occasions. Indeed, the highly secretive Communications Security Establishment maintains a central database of such transgressions dating back to 2007.
What we don't know is how many such breaches have occurred. As reported by the Star's Alex Boutilier, the organization refuses to reveal this number, citing "operational security concerns." The CSE is evidently worried that disclosing the total might give Canada's enemies insight into its "capacity to conduct operations" and "the extent of its capabilities."

It's far more likely that what actually troubles this agency is having Canadians see its capacity for misconduct and the extent of its abuses.

To assure people that the principle of public accountability is being respected it's important for the CSE to level with Canadians and reveal how often it has violated their privacy.

There's no doubt wrongdoing has taken place. That was revealed earlier this year when Parliament was told the electronic eavesdropping agency had inadvertently shared Canadians' "metadata" with foreign allies.

This class of information can include the destination and duration of phone calls, emails, and text messages. To protect privacy, such material was supposed to be scrubbed of key details before being passed along to other members of the "Five Eyes" alliance -- the United States, United Kingdom, Australia and New Zealand. But the CSE learned, in 2013, that a technical glitch had resulted in a leak of confidential data.

It informed government officials but kept the mistake hidden from the Canadian public for two years. This gives rise to an obvious question: how many other privacy violations might this agency be keeping secret?

As reported by Boutilier, documents tabled in Parliament last month show the CSE admitting to 13 privacy and information breaches in 2015, affecting at least 630 people. None of these cases were reported to Canada's privacy commissioner on grounds that they posed "no significant risk" to anyone.

It's hard to see how presenting a similar tally, dating back to 2007, would pose a serious security threat. It would, however, give Canadians some insight into how well their rights are being protected.

The Liberal government came to office promising a new level of openness and accountability. Responsibility for fulfilling that pledge now rests with Treasury Board President Scott Brison. And a good place for him to start would be to let Canadians know how often their privacy has been violated by a shadowy agency that refuses to fully answer even to this country's information and privacy commissioner.

BDNews24
Technicians from SWIFT left Bangladesh Bank exposed to hackers
Monday, 09 May 2016

Dhaka - The technicians introduced the vulnerabilities when they connected SWIFT to Bangladesh's first real-time gross settlement (RTGS) system, said Mohammad Shah Alam, the head of the criminal investigation department of the Bangladesh police who is leading the probe into one of the biggest cyber-heists in the world.
"We found a lot of loopholes," Alam said in an interview in Dhaka. "The changes caused much more risk for Bangladesh Bank."

He and a senior central bank official said the SWIFT employees made missteps in connecting the RTGS to the central bank's messaging platform.

The technicians did not appear to have followed their own procedures to ensure the system was secure, according to the Bangladesh Bank official, who said he was not authorised to publicly comment because of the ongoing investigation.

Because of this, SWIFT messaging at the central bank was widely accessible, including remote access with only a simple password, police said. It had no firewalls and only a rudimentary switch. "It was the responsibility of SWIFT to check for weaknesses once they had set up the system. But it does not appear to have been done," said the bank official.

SWIFT's chief spokeswoman Natasha de Teran said she had no comment on the allegations by authorities in Bangladesh. She also declined comment on any aspect of the Bangladesh project, including whether the firm had deployed any employees or outside contractors to Bangladesh Bank.

Reuters was not able to independently verify the allegations by Bangladeshi officials about the SWIFT technicians. If they are validated, however, that could undermine confidence in the cooperative that is the backbone of global financial transactions.

The officials in Dhaka discussed their findings with Reuters ahead of a meeting this week in Basel, Switzerland where Bangladesh Bank officials have said their governor and a lawyer appointed by the bank will discuss recovery of about $81 million stolen by the hackers with the head of the Federal Reserve Bank of New York and a senior executive from SWIFT.

Bangladesh Bank officials have said they believed SWIFT, and the New York Fed, bear some responsibility for the February cyber heist. SWIFT has declined comment on that claim.

The RTGS, which enables domestic banks and the central bank to settle large transfers between themselves, was installed at Bangladesh Bank in October last year and then connected to SWIFT. In

February, hackers sent fraudulent messages, ostensibly from the central bank in Dhaka, on the SWIFT system to the New York Fed seeking to transfer nearly $1 billion from Bangladesh Bank's account there.

Most of the transfers were blocked but about $81 million was sent to a bank in the Philippines and much of that money remains missing.

A spokesman for Bangladesh Bank declined comment on the investigation into the heist. He said, however, that RTGS continued to work well, noting that a large number of countries use SWIFT messaging for similar systems. "There is no inherent risk in this," he said.

According to the Bangladeshi police, the technicians linked the RTGS to SWIFT computers on the same network as about 5,000 central bank computers that are accessible from the open Internet.

Instead, they should have set up a separate local area network, or LAN, that could not connect to the rest of the bank or the Internet, police said.

The technicians also failed to install a firewall between the RTGS and the SWIFT room so that the bank could block malicious traffic from coming into the facility.

When they installed a networking switch to control access to SWIFT, they chose to use a rudimentary old one they had found unused in the bank, rather than a more sophisticated, managed switch that gave the bank the ability to control access to the network, police said.

During the job, the technicians set up a wireless connection so they could access computers in the locked SWIFT room from other offices inside the bank. When they finished, they failed to disconnect the remote access, which was only secured with a simple password, police and the bank official said.

They also failed to disable a USB port on the computer attached to the SWIFT system, as is usual for critical networks to prevent malicious software from being installed through a tainted thumb drive, police said. Police did not provide any evidence for any of the assertions.

But another central bank official familiar with the SWIFT room operations confirmed that the port was "active" until the heist came to light. He had no explanation. The hackers used malicious software to modify the SWIFT messaging software to help hide their tracks.

Bangladeshi police said they have asked SWIFT to facilitate interviews with the SWIFT technicians. "Whether it is intentional or negligence, we are trying to find out," said Alam.

SWIFT, or the Society for Worldwide Interbank Financial Telecommunication, is used by about 8,000 banks around the world to order funds transfers and other communications. It is connected to RTGS systems installed at scores of banks worldwide, and there have been no reports of problems elsewhere

with connections between those two systems. The US FBI, which is leading investigations into the case, has made no comment so far.

New York Fed executive Richard Dzina said at a conference last week that bank workers "acted properly" in releasing the funds. The system was penetrated, he said, because the hackers had acquired valid credentials to order the transfers

Former central bank governor Mohammed Farashuddin, who is heading an internal probe by Bangladesh Bank into the heist, said SWIFT needed to review its technology in the wake of the heist.

"It seems to be a case of extreme carelessness," he told Reuters. He declined to provide more details saying a final report was due in the next few weeks.

Agence France-Presse
Indonesia's Muslim cyber warriors take on IS
Monday, 09 May 2016

Jakarta - A group of Indonesian "cyber warriors" sit glued to screens, as they send out messages promoting a moderate form of Islam in the world's most populous Muslim-majority country.
Armed with laptops and smartphones, some 500 members of the Nahdlatul Ulama (NU) -- one of the world's biggest Muslim organizations -- are seeking to counter the Islamic State group's extremist messages.

"We'll never let Islam be hijacked by fools who embrace hate in their heart," tweeted Syafi' Ali, a prominent member of the NU's online army, a typical message to his tens of thousands of followers.

They are trying to hit back at IS's sophisticated Internet operations, which have been credited with attracting huge numbers from around the world to their cause.

Internet propaganda is believed to have played a key role in drawing some 500 Indonesians to the Middle East to join IS, particularly among those living in cities where it is easier to get online.

The dangers of the growing IS influence in Indonesia were starkly illustrated in January when militants linked to the jihadists launched a gun and suicide bombing attack in Jakarta, leaving four assailants and four civilians dead.

It was the first major attack in Indonesia for seven years, following a string of Islamic militant bombings in the early 2000s that killed hundreds.

As well as firing off tweets, the NU members have sought to dominate cyberspace by establishing websites promoting the group's moderate views, an Android app and web-based TV channels, whose broadcasts include sermons by moderate preachers.

The initiative has been building momentum for a while but started to pick up pace a few months ago. A handful of cyber warriors operate from a small office in Jakarta, while the rest work remotely, and the group mostly communicate with one another over the web.

But it will be an uphill battle and the NU, which has been promoting moderate Islam for decades, conceded they have previously struggled to take on IS's hate-filled messages.

"NU has for a while wrestled with this radical propaganda," said Yahya Cholil Staquf, secretary general of the NU, which claims at least 40 million followers. "Every time we defeated them, it didn't take long for them to regain their strength."

The online drive comes as the NU is set to take its campaign to promote their tolerant form of Islam onto the international stage this week, with a two-day meeting from Monday of moderate religious leaders from around the world.

They aim to showcase their particular brand of the Muslim faith, known as "Islam Nusantara", to counter the IS jihadists' radical interpretation of Islam.

Meaning "Islam of the Archipelago" -- Indonesia is the world's biggest archipelago, comprising over 17,000 islands -- it is accepting of diversity and stresses non-violence.

It grew up organically in Indonesia, as the religion entered the country gradually and had to mix with existing traditional beliefs such as praying at tombs, making it a naturally tolerant form of Islam.

Nowadays, most of the approximately 225 million Muslims in Indonesia practice a moderate form of Islam.

The NU wants to persuade Muslims from around the world to look for inspiration to Indonesia, where religious minorities and a multitude of ethnic groups mostly coexist harmoniously, rather than to harsher forms of Islam from the Middle East.

The group nevertheless has a long way to go to fight the rising tide of IS propaganda. Despite their good intentions, the NU cyber warriors appear amateur next to IS's well-funded set-up.

The jihadists, who control huge swathes of territory in Iraq and Syria, have a sophisticated online operation, using social media, apps and slickly produced videos.

They send about 200,000 tweets a day into the United States alone, according to US officials. It even has its own news agency, Amaq, which is often the first to report that IS is claiming responsibility for attacks.

In Indonesia, there are two main ways that IS propaganda spreads -- by supporters posting on websites and apps such as Whatsapp, Facebook, Twitter and Line, and through returnees from the Middle East preaching the group's radical ideology.

Most of the NU's online army are volunteers, often reaching into their own pockets to cover costs.

"ISIS has oil, while the only oil we have is for hair," Ali said, explaining the project's start was delayed for more than a year due to funding problems. Oil smuggling has been a key revenue source for IS.

Robi Sugara, a terrorism expert from NGO the Indonesian Muslim Crisis Center, welcomed the NU's online approach. "It's a good strategy to make Google searches fill up with moderate Islamic content," he told AFP.

"The battleground for Islamic ideology has moved to the Internet, and by producing as many moderate websites as they can, they can keep more minds healthy."

Haaretz
Classified Documents Stolen From Israel Police Cybersecurity Expert
Monday, 09 May 2016
Byline: Yaniv Kubovich

Jerusalem - Thief presumably used a grabber tool to filch the folder from a table through an open window, together with the officer's house and car keys. A file folder containing classified documents was stolen on Thursday from the central-Israel home of a police expert in computer security.
The Walla Hebrew-language news site reported that the deputy head of the cyber security division of the Israel Police left the folder on a table after returning home. The assumption is that the unknown thief used a long-handled rake or other instrument to grab the folder, as well as the officer's key ring, through a window. The thief then apparently entered the house using the keys and stole a wallet before fleeing.

The police are investigating and have notified security agencies that could potentially be affected by the theft of critical information. The fact that neither valuables nor the officer's unmarked car were stolen suggest that the motive may have gone behind simple financial gain.

The official was not identified -- the Israel Police said this was in order to protect the official's privacy, but it is known that he was recruited into the police from the army's signal intelligence unit 8200.

All possible motives for the theft are being explored, however, including simple theft.

Haaretz recently reported on the disappearance of 27 files from the police station in the Tel Aviv suburb of Givatayim under unclear circumstances.

About a month ago, police officers from the station went on vacation to Eilat. On their return, one investigator noted the disappearance of the files, which had been either awaiting investigation or were to be transferred to other offices. This case too involved sensitive files that appeared to be left unprotected.

Khaleej Times
The future of media? It's digitization
Monday, 09 May 2016
Byline: Bernd Debusmann Jr.

Dubai - Digitisation is setting the future of the media industry in the Middle East and North Africa as increased broadband usage leads to soaring use of portable devices, according to the newly-released fifth edition of the Arab Media Outlook.
The report, which was released on Sunday, highlights the current media landscape of 14 Arab countries, and identifies future trends that will shape the industry between 2016 and 2018.

In 2015, according to the report, the digital sector accounted for 15 per cent of the Mena's media industry, which was valued at over $11.36 billion. In 2020, that number is expected to rise to 27 per cent. In that same time, the total size of the Mena media industry is expected to rise by 3.7 per cent to over $13.63 billion.

Mona Ghanim Al Marri, president of the Dubai Press Club, said that the findings brought into stark focus the need to find solutions that allow for "effective competition" between media outlets, and ways in which to couple digital media platforms and traditional media outlets, as well as using these platforms to maintain the position of media and develop content.

Print media - which in 2015 represented 45 per cent of the region's media industry - is expected to decline to 31 per cent. In the Mena region, a total of 41 per cent of the average time spent on media in 2015 - 11 hours - is done online, compared to 49 per cent in the UK and 47 per cent in Australia.

Al Marri also noted the noticeable growth of the paid media sector compared to advertising sector, where spending on advertising is set to increase by 2.5 per cent annually between 2016-18, while spending on paid media is set to grow by 3.7 per cent.

Paid media, the report notes, will largely by backed by the growth of video games, which will account for over $1.14 billion in revenue in 2018, 62 per cent of which will be driven by social gaming, compared to

52 per cent in 2015. Paid TV revenue, for its part, is expected to grow 10 per cent in the same timeframe, to over $1.53 billion.

"While paid media is a synonym of 'excellent content', we should stop at this noticeable progress and think about what our local and Arab media should do in terms of development steps, to keep pace with the rapid changes," Al Marri said.

Notably, digital video is expected to form 30 per cent of the media industry by 2018. Already in 2015, video accounted for an average of 71 minutes of daily time spent by 15-to-24-year-olds, compared to 51 minutes on social networks, 29 minutes on search engines and business sites, and only 14 minutes on news websites.

Dr Amina Al Rustamani, group chief executive officer of Tecom Group - of which Dubai Media City is part - noted that a careful study of the findings will be crucial in forming future media and communications strategies.

"The dynamics and trends of the media industry have always provided valuable insight into consumer behaviour and have helped shape the thinking of government and business as to what are the most effective means of communication with their citizens and customers," she said. "Launching the Arab Media Outlook Report 2016-2018 is especially timely and relevant, against a backdrop of a paradigm shift in the media industry, and unprecedented change and innovation. This report enables us to guide our partners in forming their own strategies for growth."

A print version of the executive summary of the report will be available during the 15th edition of the Arab Media Forum, to be held on Tuesday and Wednesday at the Dubai World Trade Centre.

Albert Oil
How To Do Business in Brazil
Monday, 09 May 2016
Byline: Staff reporter

After raising the hopes of foreign investors in Brazil and opening up its vast reserves to overseas drillers, the country's political system has lurched into instability recently with millions of people taking to the streets demanding the president's head over a vast corruption scandal at state-owned Petrobras, which operates globally.
Niko Resources of Alberta has offshore exploration assets in Brazil, as does Brasoil.

Opportunities

In 2014, Brazil produced 2.95 million b/d of oil-- up 9.5 percent from 2013--making it the world's ninth-largest producer. The U.S. Energy Information Administration (EIA) estimates that in 2015, Brazil had 15

billion barrels of proved oil reserves, second only on the continent to Venezuela. More than 94 percent of Brazil's reserves are located offshore. About a quarter of its output comes from the deep water presalt layer, where production hit a record 865,000 b/d in 2015 as new wells came on stream in the Santos basin.

Brazil opened up to private and foreign investment in 1997. Canadian companies brought their offshore Atlantic experience to the table. Some service firms went inland. Weatherhaven, on the heels of the visit of former prime minister Stephen Harper to Brazil, closed a deal to build exploration camps for production in the Amazon. Gran Tierra Energy entered onshore Brazil in 2009, following Encana, and later entered the offshore in 2011 with Statoil and Petrobras in the Camamu-Almada basin. Canadian firms operate some of those blocks, including Brasoil, and Calgary's Tuscany International Drilling. Tuscany went there looking for year-round work, instead of the seasonal cash flows of Alberta, although the company has since gone bankrupt.

Risks

In 2013, Brazilian President Dilma Rousseff accused the Communications Security Establishment Canada (CSEC) of spying on Brazil's Ministry of Mines and Energy. She based her intelligence on documents leaked to Brazilian media by Edward Snowden. Snowden worked for the U.S. National Security Agency--the counterpart of Canada's CSEC. It's alleged that the Harper government spied to provide Canadian energy firms with intelligence to give them the edge over rivals when bidding for concessions. Today, Rousseff is fighting for her political survival as she faces impeachment for allegedly cooking the books to hide a budget deficit, and millions of people have taken to the streets as a massive corruption scandal at state-owned oil giant Petrobras threatens to bring down the government.

Police picked up former president Luiz Inacio Lula da Silva, Rousseff's mentor, for questioning in a federal investigation, dubbed "Operation Carwash," into a corruption scheme that apparently turned Petrobras into a giant slush fund for the ruling Workers' Party. The former president was questioned about allegedly receiving illicit kickbacks from Petrobras in the form of cash payments and luxury real estate. Rousseff quickly made da Silva a member of her cabinet to protect him from prosecution. Many of Brazil's top figures in business and politics have been implicated in deepening the worst recession in decades in South America's biggest economy.

As well as navigating Brazil's muddy political torrents, Canadian firms have to deal with blowback from neighboring nations. Amazon tribespeople from Peru and Brazil have joined forces to stop Toronto's Pacific Rubiales from allegedly destroying land and putting at risk the lives of uncontacted tribes. Pacific Rubiales is exploring in Block 135 in Peru, which is an area proposed as a reserve for uncontacted tribes

Gulf Daily News
Security technologies 'crucial for aviation industry'

Monday, 09 May 2016

Manama - Security technologies like encryption, intrusion protection, firewalls and right technical design and architecture are critical to ensure sustainable growth of the aviation industry, a leading expert has said.
According to Gulf Air's director of information technology (IT) Dr Jassim Haji, the incidence of cyber attacks against airlines around the world has been rising as has the damage and loss they have caused.

Addressing leading IT industry experts at global market intelligence and advisory provider International Data Corporation's Security Roadshow in Bahrain, Dr Haji said a diverse digital ecosystem had brought security to the forefront as it underpinned every operation, process and service within the industry.

Explaining how latest technologies and phenomena like mobile, social, cloud and Big Data had brought benefits to the industry, he said there had also been an increase in risks as well as actual and potential threats. "Airlines hold private and confidential information about their passengers and it is critical that this information was protected and kept safe from unauthorised access or manipulation," he said.

This, he added, assumes greater significance in the case of governments and border controls which are custodians of sensitive information about passengers with possible national security implications.

Talking about new generation of aircraft, Dr Haji said every equipment and part has become a piece of electronics thus becoming susceptible to external manipulation and control. He said all airlines needed to have a cutting-edge risk management framework that would be used to efficiently identify potential risks, their impact, likelihood of occurring, mitigation plans and regular assessments of such risks.

Referring to drones as one of the new and obvious risks, Dr Haji said they were increasingly becoming uncontrolled and unmanaged, citing a recent incident at an airport in London where an aircraft was hit by a drone as an example of the damage that can occur from this unmanaged state.

He also emphasised that initiatives based around becoming "smart," were bringing about a need for secure, open platforms. "The culture of security has to be instilled in every single employee so they protect their own company and act vigilantly." Dr Haji also serves on the SITA Council and sits on the board of directors of a leading hospitality and tourism technology provider in the Middle East.

Through his myriad initiatives, he has managed to achieve 26 top Middle-Eastern technology awards for Gulf Air, including best project implementations for cloud computing, virtualisation, Big Data, mobility applications and IT security. Held at the Diplomat Radisson Blu Hotel, Residence and Spa, the event saw participation from more than 100 professionals and executives.

Sky News (UK)
Small Firms 'Underinvesting' In Cyber Security

Monday, 09 May 2016

London - Half of small manufacturers in the UK have failed to increase cyber security investment in the past two years, according to a survey.
Research by manufacturers' organisation EEF found that 56% of businesses have not increased their spending.

A fifth fail to make employees aware of cyber risks, while only 56% say cyber security is given serious attention by their board.

Just over a third, or 36% of manufacturers, have an incident response plan in place, and only 24% monitor cyber threats.

EEF Chief Economist Lee Hopley, is urging manufacturers to step up their planning to counter the increasing number of cyber threats.

"As technology and data start to play increasingly critical roles in manufacturing, companies will inevitably find themselves more vulnerable to cyber breaches," said Mr Hopley.

"Our survey highlights that investment in new technology isn't being matched by investment in managing risks, especially among smaller firms.

"It is important that manufacturers are able to identify, understand and put the correct strategies in place to keep their businesses safe and cyber secure."

The Government has also called for industries to act to protect themselves while announcing it will launch a National Cyber Security Centre this autumn and spend £1.9m over the next five years.

Its research revealed that 90% of large businesses and 74% of small businesses reported cyber security breaches last year. Average breaches cost up to to £3.14m for large firms and up to £311,000 for small businesses.

A quarter of large firms come under attack at least once a month, according to the Department for Culture, Media and Sport.

The research shows the most common attacks detected involved viruses, spyware or malware and could have been prevented using the Government's Cyber Essentials scheme.

A TalkTalk cyber attack last year cost the telecoms group up to £45m and triggered a sharp drop in customers.

Washington Free Beacon
Obama Policies Toward Hackers From China, Iran, Syria Produce Few Results
Monday, 09 May 2016
Byline: Bill Gertz

Column - Recent federal indictments of Iranians and Syrians for cyber attacks on U.S. networks further highlight the failure of President Obama and his administration to counter the growing threat of foreign hacker strikes on American networks.
In March, the Justice Department indicted two groups of hackers, one from Iran linked to cyber intrusions of an industrial control system operating a New York dam, and a second from Syria engaged in illegal activities that included causing damage to computers and extortion.

The indictments are largely symbolic, since none of the Iranians or Syrians are within reach of U.S. law enforcement and the chances the hackers will ever face justice in a courtroom are slim.

Like many of President Obama's foreign policies, the indictments appear designed to provide the president and his administration with political cover by adopting seemingly proactive measures, but without having much impact.

The approach to cyber threats coincides with the president's generally pacifistic approach to foreign affairs, which he is reported to have summed up as "don't do stupid shit." In practice, this approach often amounts to doing as little as possible, and doing nothing that might require the use of military force.

The policy was captured in a New York Times profile last week of Ben Rhodes, the White House deputy national security adviser for communications who was described as "The Boy Wonder" of the White House.

Leon Panetta, who served as CIA director and defense secretary under Obama, explained that the president's approach to foreign affairs has been dominated by the desire to avoid possible conflicts.

"I think the whole legacy that he was working on was, 'I'm the guy who's going to bring these wars to an end, and the last goddamn thing I need is to start another war,'" Panetta said of Obama's approach to Iran and the nuclear deal. The former defense secretary said the president believes that "if you ratchet up sanctions, it could cause a war. If you start opposing their interests in Syria, well, that could start a war, too."

On cyber security, the president and his advisers have rejected policy options from military and civilian national security experts since at least 2011 for a show of force in cyberspace against China or other states and groups engaged in widespread cyber attacks, according to officials familiar with internal discussions.

Private industry, which is barred by federal statute from conducting its own cyber counterattacks, has pressed the White House and the U.S. intelligence community to do more against the onslaught of hacks. So far the response has been a firm "no" from the president.

Symbolic indictments or other diplomatic measures have not worked to deter cyber attacks. The FBI announced in July it was revamping its cyber counter- espionage unit after logging a 53 percent increase in its caseload.

A State Department security report published on March 30 noted that in the indictments of the Iranian Syrian hackers, U.S. private sector institutions were the main victims.

"These cyber attacks resulted in disrupted customer communications, data infringement, and significant financial losses," the report said, adding, "the hackers will likely not face prosecution in the U.S. for their actions ... [h]owever, some analysts believe the U.S. government will continue publicly blaming foreign hackers in an effort to deter future attacks."

The indictments followed a similar May 2014 action by the Justice Department against five Chinese military hackers who also remain out of reach of law enforcement and who likely will never be brought to trial.

The indictment was a response to Chinese government denials to the Justice Department about its cyber activities and a demand to produce legal evidence implicating China's cyber warfare troops in what the United States has charged is widespread theft of corporate and government secrets.

John Carlin, the Justice Department's national security chief, explained that the indictment was simply following through on Beijing's dare.

"We heard directly from the Chinese who said, 'If you have evidence, hard evidence, that we're committing this type of activity that you can prove in court, show us.' So we did," Carlin told a security conference months after the indictment.

A short time after the indictment, the Chinese military was linked to the theft of 80 million records from Anthem, the American health care provider. Then came the pillaging, also by Chinese military hackers, of Office of Personnel Management networks. The hack resulted in the loss of another 22 million records, including sensitive data from background investigations for security clearances.

Obama came close to imposing sanctions on the Chinese for the large-scale data hacking but backed off in September during the visit to Washington by Chinese President Xi Jinping, who promised to halt Chinese economic espionage in cyberspace. U.S. intelligence officials recently told Congress they were unable to verify that the Chinese ended the cyber attacks, a clear indication they have continued.

The State Department report, produced for a public-private partnership called the Overseas Security Advisory Council, or OSAC, said the indictment of Chinese military hackers was an "an unprecedented announcement, publicly blaming the Chinese government for espionage against the U.S. private sector."

"The five indicted Chinese military officers have also not yet been brought to court in the U.S.," the report said. "However, this case was among the first to highlight the threat of intellectual property theft from a nation-state, which remains a concern among many OSAC constituent organizations operating overseas."

The report said the indictments of the Iranians and Syrians highlighted the "blended threat" posed by foreign government and non-government hackers. It also showed that cyber attacks were behind the economic espionage confirmed in the PLA case, including cyber denial-of-service, intimidation, and extortion activities.

"The threat to the private sector is heightened as hackers look to carry out these various operations for both professional and personal gain," the report said.

"The traditional categories of threat actors-- nation-state, criminal, politically-motivated--no longer define all of the malicious network activity affecting U.S. private sector organizations," it added. "The 'blended threat' of hackers who are willing to work as proxies for governments or other organizations can hinder detection and prosecution in multiple ways."

The use of non-state hackers for foreign government cyber attacks makes it more difficult for authorities to identify the attackers, and allows nation-states or terrorist groups to benefit from the technical expertise of private sector hackers.

Additionally, proxies give foreign governments what spy agencies call plausible deniability--a key information warfare tactic allowing governments to avoid being linked to cyber attacks, the report said.

The report concluded that the recent indictments of Chinese, Iranian, and Syrian hackers "are unlikely to deter malicious cyber actors from exploiting this blended threat to target the U.S. private sector."

As Obama winds down his final term as president, it appears one of his legacies will be an unwillingness to take effective steps to counter cyber attacks against the United States that have caused serious damage to U.S. security.

As former NSA Director Keith Alexander has said, China is stealing everything it can to boost its economy. "It's intellectual property, it's our future. I think it's the greatest transfer of wealth in history," Alexander said.

IRD team to sift through papers on foreign-owned trusts
Sunday, 08 May 2016
Byline: Nicholas Jones

Canberra - The IRD has set up a team to sift through documents about foreign-owned trusts from the Panama Papers.
A cache of material from the leak of documents from the Panamanian law firm Mossack Fonseca is due to be released today. Prime Minister John Key said the information could lead to law changes.

"It is quite useful that the Panama Papers get released," Mr Key said, "if that helps assist the New Zealand Government in making improvements to any of the laws that we have, or the partners that we work with like the OECD."

He said he did not condone the hacking of private information, but now that information would be released "there might be some benefits to gain from that".

Any New Zealanders found to be avoiding tax could expect a "knock at the door", he said, and if there was evidence of trusts being used improperly by foreigners the rules could be tightened.

Labour leader Andrew Little said the Prime Minister's tone had changed.

"There may well be now a rapidly changing position, which is because they discovered that, actually, most New Zealanders don't like this, and don't like us to be party to this."

Talk of the IRD investigating Kiwis was something of a distraction, he said, when the real issue was the use of the trusts by foreigners to avoid tax.

Labour wants the foreign trust industry shut down, but Mr Key called that a "knee-jerk" reaction.

Following the first release of details from the papers last month, the Government began a review of the disclosure rules for NZ's foreign trusts. Opposition parties have criticised the review's narrow focus.

An article in the Australian Financial Review on Friday shed new light on the number of foreign investors who had moved their cash and assets into tax-free New Zealand-based trusts, and the way these investors were able to minimise their tax.

It also said Auckland-based lawyer Ken Whitney, whose clients include Mr Key, had written a reference for Auckland law firm Cone Marshall to get accreditation with Mossack Fonseca in 2009.

After the release of the papers, Mr Key said Mr Whitney had assured him he had not had any dealings with Mossack Fonseca.

Yesterday the Prime Minister said the reference did not contradict that: "People give references all of the time."

Wall Street Journal
Twitter Bars Intelligence Agencies From Using Analytics Service
Monday, 09 May 2016
Byline: Christopher S. Stewart, Mark Maremont

New York - Twitter Inc. cut off U.S. intelligence agencies from access to a service that sifts through the entire output of its social-media postings, the latest example of tension between Silicon Valley and the federal government over terrorism and privacy.
The move, which hasn't been publicly announced, was confirmed by a senior U.S. intelligence official and other people familiar with the matter. The service--which sends out alerts of unfolding terror attacks, political unrest and other potentially important events--isn't directly provided by Twitter, but instead by Dataminr Inc., a private company that mines public Twitter feeds for clients.

Twitter owns about a 5% stake in Dataminr, the only company it authorizes both to access its entire real-time stream of public tweets and sell it to clients.

Dataminr executives recently told intelligence agencies that Twitter didn't want the company to continue providing the service to them, according to a person familiar with the matter. The senior intelligence official said Twitter appeared to be worried about the "optics" of seeming too close to American intelligence services.

Twitter said it has a long-standing policy barring third parties, including Dataminr, from selling its data to a government agency for surveillance purposes. The company wouldn't comment on how Dataminr--a close business partner--was able to provide its service to the government for two years, or why that arrangement came to an end.

In a statement, Twitter said its "data is largely public and the U.S. government may review public accounts on its own, like any user could."

The move doesn't affect Dataminr's service to financial industry, news media or other clients outside the intelligence community. The Wall Street Journal is involved in a trial of Dataminr's news product.

Dataminr's software detects patterns in hundreds of millions of daily tweets, traffic data, news wires and other sources. It matches the data with market information and geographic data, among other things, to determine what information is credible or potentially actionable.

For instance, Dataminr gave the U.S. intelligence community an alert about the Paris terror attacks shortly after they began to unfold last November. That type of information makes it "an extremely valuable tool" to detect events in real time, the intelligence official said.

In March, the company says it first notified clients about the Brussels attacks 10 minutes ahead of news media, and has provided alerts on ISIS attacks on the Libya oil sector, the Brazilian political crisis, and other sudden upheaval in the world.

U.S. government agencies that used the Dataminr service are unhappy about the decision and are hoping the companies will reconsider, according to the intelligence official.

"If Twitter continues to sell this [data] to the private sector, but denies the government, that's hypocritical," said John C. Inglis, a former deputy director of the National Security Agency who left in 2014. "I think it's a bad sign of a lack of appropriate cooperation between a private-sector organization and the government."

Analysis of Twitter and other social-media services has become increasingly important to intelligence and law-enforcement agencies tracking terror groups. Islamic State posts everything from battlefield positions to propaganda and threats over Twitter. San Francisco-based Twitter deletes thousands of accounts a month for violating its antiterror policies, but Islamic State supporters create new accounts almost as quickly.

"The volume of the group's activity on Twitter yields a vast amount of data that is a crucial tool for counterterrorism practitioners working to manage threats," said Michael S. Smith II, chief operating officer of the security consulting firm Kronos Advisory. "Twitter's decision could have grave consequences."

In a speech last September, David S. Cohen, a deputy director of the Central Intelligence Agency, discussed the importance of "open source" social-media data gathered by the CIA, saying Islamic State's "tweets and other social- media messages publicizing their activities often produce information that, especially in the aggregate, provides real intelligence value."

Silicon Valley and the U.S. government have been locked in intensifying conflicts over cooperation since the revelations by former National Security contractor Edward Snowden about government surveillance of electronic communication.

Most recently, Apple Inc. and the Justice Department were embroiled in a legal showdown over demands by the Federal Bureau of Investigation to unlock an iPhone used by one of the killers in the San Bernardino, Calif., attack in December. That fight--which unlike the Dataminr product involved the release of private data--ended in March when the FBI found another way to access the phone.

In-Q-Tel, a venture-capital arm of the U.S. intelligence community, has been investing in data-mining companies to beef up the government's ability to sort through massive amounts of information. In-Q-Tel, for example, has invested in data-mining firms Palantir Technologies Inc. and Recorded Future Inc.

U.S. intelligence agencies gained access to Dataminr's service after an In-Q-Tel investment in the firm, according to a person familiar with the matter.

When a pilot program arranged by In-Q-Tel ended recently, Twitter told Dataminr it didn't want to continue the relationship with intelligence agencies, this person said.

"Post-Snowden, American-based information technology companies don't want to be seen as an arm of the U.S. intelligence community," said Peter Swire, a Georgia Institute of Technology law professor and expert on data privacy.

Dataminr, based in New York, was launched seven years ago by three former Yale University roommates. A financing round early last year valued it at $700 million, according to Dow Jones VentureSource.

Its product goes beyond what a typical Twitter user could find in the jumble of daily tweets, employing sophisticated algorithms and geolocation tools to unearth relevant patterns.

Dataminr has a separate, $255,000 contract to provide its breaking news-alert service to the Department of Homeland Security, which is still in force.

Associated Press
Lawmakers, advocates push to reveal extent of surveillance
Monday, 09 May 2016

Washington - Even though the bulk collection of Americans' telephone records has ended, calls and emails are still being swept up by U.S. surveillance work targeting foreigners. Congress is making a renewed push to find out how many.
Six Republicans and eight Democrats on the House Judiciary Committee have asked the nation's top intelligence official for the number of Americans' emails and phone calls collected under programs authorized by Section 702 of the Foreign Intelligence Surveillance Act.

The programs target foreigners, but domestic communications sometimes are vacuumed up as well. They were first revealed to the public by Edward Snowden, who leaked files from the National Security Agency.

"Surely the American public is entitled to some idea of how many of our communications are swept up by these programs," the committee members wrote in their April 22 letter to Director of National Intelligence James Clapper.

They weren't the first to request the information.

In the past five years, Democratic Sens. Ron Wyden of Oregon and Tom Udall of New Mexico have asked repeatedly. Last October, a coalition of more than 30 civil liberties groups wrote Clapper seeking the information. Unsatisfied with the answer they received, they wrote him again in January.

Intelligence officials have tried to assuage concerns of Congress and others by saying that any domestic communications collected are "incidental" to the targeting of foreigners. They say Section 702 allows the government to target only non-U.S. persons reasonably believed to be located outside the United States. They say the law explicitly bars the government from targeting a foreigner to acquire the communications of an American or someone in the U.S. But they say intelligence agencies are authorized under Section 702 to query communications made with U.S. persons under certain cases with certain approvals.

Late last month, Clapper said intelligence agencies are looking into several options for providing an estimate and will do their best to come up with a number.

"This tool is a terrific producer of critical intelligence for this country and our allies," Clapper said recently about continued need for Section 702 programs.

He did not say how soon an estimate could be released and cautioned that "any methodology we come up with will not be completely satisfactory to all parties."

Even Congress acknowledges that producing an estimate could require reviewing actual emails, for instance, those acquired under Section 702, which itself could raise privacy concerns. But lawmakers say they are only advocating a "one- time, limited sampling" of communications.

Intelligence officials held briefings last week for congressional aides to explain ways an estimate could be provided. That is something Congress wants to get before it starts debating whether to reauthorize Section 702, which is set to expire at the end of next year. The Senate Judiciary Committee plans a hearing Tuesday on the issue.

Intelligence officials also briefed privacy advocates in March and are expected to hold another this month on the best way to estimate the extent to which domestic communications are ensnared in the quest for foreign intelligence. Among the problems is determining the citizenship of a caller or emailer, or whether the person is inside or outside the United States.

"We can't go into what I hope will be an extensive public debate without this basic information," said Elizabeth Goitein, co-director of the Brennan Center for Justice's program on liberty and national security.

In a recent article, Goitein wrote: "The National Security Agency acquires more than 250 million Internet communications each year under this program. Given the ubiquity of international communication, this number is virtually certain to include tens of millions of exchanges that involve Americans, but there is no official public data on how many Americans' communications are swept up."

Congress and privacy advocates got a glimpse into Section 702 surveillance from a congressionally mandated report that Clapper's office released this past week. The report said Section 702 surveillance targeted 94,368 foreign persons, groups or entities outside the U.S. last year, up slightly from 92,707 in 2014.

While the year-to-year increase is small, Jameel Jaffer, deputy legal director at the American Civil Liberties Union, notes that the number of targets has risen to more than 94,000 since the surveillance became legal in 2008.

The report also said that 23,800 queries concerning U.S. persons were conducted on the database, although the report notes that one of the intelligence agencies involved in the queries, which was not identified, did not provide this information.

The report also said 4,672 search terms concerning U.S. persons were used to retrieve information from Section 702 data, but privacy experts point out that the number excludes queries conducted by the FBI.

"It's true that the targets are foreigners, but in the course of targeting those 94,000 people, the government collects the communications of many, many - we don't know the number - Americans," Jaffer said. "That number is missing."

New York Times
Police and Tech Giants Wrangle Over Encryption on Capitol Hill
Monday, 09 May 2016
Byline: Cecilia Kang

Washington - Cyrus R. Vance Jr., the district attorney of Manhattan, visited Washington late last month to argue his case on a pressing issue: encryption.
In a string of meetings with members of Congress, Mr. Vance told central lawmakers that encryption needed to be diminished during criminal investigations. During a 45-minute session with Senator Angus King, an independent from Maine who is on the Senate Intelligence Committee, Mr. Vance said his office had 230 iPhones that might contain crucial information for cases but were useless because Apple refused to help the police break the encryption on the devices.

"I wanted to express a sense of urgency around resolution of this issue," Mr. Vance said in an interview about his Washington visit.

A day after Mr. Vance was on Capitol Hill, tech executives including Kent Walker, the general counsel of Google, and Brad Smith, president of Microsoft, also met with lawmakers -- but with a very different message on encryption. Tech executives at the meetings said they were concerned about any laws that would force companies to weaken the security of their technology, according to news officials representing these companies.

This kind of behind-the-scenes lobbying has become de rigueur in Washington as the battle over encryption shifts to Capitol Hill. It is the next phase of a bitter divide that spilled into public view this year when Apple refused to comply with a court order to help bypass security functions on an encrypted iPhone used by an attacker in the San Bernardino, Calif., mass shooting last year. Doing so would have let the F.B.I. gain access to the phone. That case ended after the F.B.I. found an alternative way into the device.

Yet the standoff between the United States government and Silicon Valley tech companies continues -- and the flurry of activity around the issue is broadening. Last month, a Senate draft encryption bill, written by Richard M. Burr, Republican of North Carolina, and Dianne Feinstein, Democrat of California, rallied the attention of both sides. The bill would require tech companies to give access to encrypted data with court orders.

Law enforcement officials immediately announced their support of the bill and began to push lawmakers to back it. Trade groups representing tech companies like Apple and Facebook have flooded into congressional offices, sent letters expressing concerns that the bill weakens consumer privacy and security, and delivered scorching speeches about the proposals.

"This is an escalating fight," said Robert D. Atkinson, president of the Information Technology and Innovation Foundation, a research firm based in Washington that is funded by tech companies including Google and Microsoft. "It's become the focus now in Washington, with hearings and legislative activity."

Law enforcement officials blame tech companies for creating the impasse.

"There's no question our relationship with the tech industry has gotten worse, and now it seems like the tech industry is taking every opportunity they have to put up obstacles in our way, including trying to derail legislative efforts that would give law enforcement what they need to keep people safe," said Terrence Cunningham, president of the International Association of Chiefs of Police.

Facebook, Google and Microsoft declined to comment on their lobbying activity. An Apple spokesman said the company has met regularly with members of Congress on encryption and other issues.

The amount of lobbying on the encryption bill is unusual at this early stage of a bill's life, showing the stakes involved. Tech companies are reluctant to give access to encrypted information from their users, for privacy reasons and because it may affect their businesses. Law enforcement officials say their efforts to prevent and solve crime are hampered if they cannot see digital data on phones, messaging services and other technology services.

"Today, terrorists and criminals are increasingly using encryption to foil law enforcement efforts, even in the face of a court order," Senator Feinstein said in a statement about the draft bill. "We need strong encryption to protect personal data, but we also need to know when terrorists are plotting to kill Americans."

The rhetoric in Washington around encryption has grown increasingly sharp. Last month, when the contents of the draft encryption bill were leaked, the president of the Consumer Technology Association, a trade group that counts Apple, Google, Facebook and Amazon among its 4,000 members, spoke to an audience filled with government officials at a lunch hosted by the Media Institute.

The bill is "dangerously overreaching and technically unsophisticated," said Gary Shapiro, president of the association. "This bill would essentially make effective cybersecurity illegal in the United States, pushing companies that take cybersecurity seriously offshore."

Other tech trade groups, including Reform Government Surveillance and the Business Software Alliance, have also waded into the fray, sending critical letters and meeting with senators to warn of the dangers of the bill. And Silicon Valley executives have, in increasing numbers, made the trek to Washington to make their cases directly.

Bob Lord, chief information security officer at Yahoo, visited several members of Congress in late April to talk about the technology behind encryption and to warn of the "unintended consequences" of legislation that could weaken security. While he did not specifically mention the Burr-Feinstein bill, he emphasized how consumers and human rights activists worldwide depend on encrypted technology for their safety and privacy.

"The notion that we would weaken encryption or provide back doors, those suggestions will have unintended consequences," Mr. Lord said.

Law enforcement officials, in turn, have frequently met with the same lawmakers in the Senate and House intelligence, judiciary and commerce committees who are being targeted by the tech companies, according to congressional staff members. Chief Cunningham and other members of the police chiefs' group have talked with Mr. Burr and Ms. Feinstein, given opinions during the drafting of the legislation and hosted panels on encryption for House and Senate lawmakers.

Tech companies have turned to certain politicians to champion their cause, such as Senator Ron Wyden, a Democrat from Oregon. On the day the draft encryption bill was introduced, Mr. Wyden, who voted

against the 2012 copyright bills known as the Stop Online Piracy Act and the Protect Intellectual Property Act, which were also opposed by the tech industry, said he had been flooded with calls from tech companies wanting to know what he would do.

Mr. Wyden said he intended to filibuster the proposal. He has since met with Intelligence Committee members to persuade them to kill the bill.

"I have not filibustered many issues, but I think the stakes are enormous," Mr. Wyden said in an interview. "The bill as written is a lose- lose, because it will create less security, American families will be less safe, and your liberty and privacy will be damaged."

For all the lobbying, few lawmakers have expressed their views on the encryption bill.

"I'm reserving judgment," said Senator King, who met with Mr. Vance last month. "The issues are so complex, it's like trying to nail Jell-O to the wall."

Canadian Press
IBM and universities join forces in battle against cybercrime
Wednesday, 11 May 2016

Ottawa - IBM wants its Watson computer system to learn how to fight cybercrime and it's asking eight leading universities, including three in Canada, for help. Watson - IBM's question answering computer system - was originally designed to compete (and win) on the television quiz show Jeopardy, but the technology has since been used on other problem-solving projects.
Now IBM is launching Watson for Cyber-security - a cloud-based version of their cognitive technology - that will be trained over the next year to examine threats of cybercrime.

Caleb Barlow, vice-president of IBM Security, said it is becoming increasingly difficult for security staffto deal with the growing number of cyber threats.

"Your average enterprise is dealing with 200,000 incidents a day that they've got to dig through. Human beings simply cannot look at all of that data," he said.

"Combine that with the fact we have a major skill shortage in the security industry - around 1.5 million jobs by 2020 - and even if we could fill all those jobs we still can't get through the data as it continues to grow."

Barlow said experts are doing a good job to examine cyber threats, but their work often ends up in various forms such as reports, blogs and presentations and in numbers too large for others to read and remember.

That's where Watson comes in.

Students at the eight universities, including the University of New Brunswick, University of Ottawa and the University of Waterloo, will put the information in a form the computer can understand and help train the system to use that information to examine cyber threats.

"The more information that Watson has, the better reasoning it can provide and therefore in some cases the better prediction it can provide," said Ali Ghorbani, dean of the faculty of computer science at the University of New Brunswick in Fredericton.

The students will input about 15,000 security documents per month during the year-long project, starting this fall.

"Our students are getting involved in a real-world cyber-security project with a global company. Not only will they increase their knowledge, but also create a relationship with IBM for future collaborations - either jobs for our students or more research and development projects with IBM," Ghorbani said.

He said IBM is hoping that not only will Watson be able to provide early warnings of potential attacks, it will also do it fast.

Barlow said IBM opened its entire threat intelligence database to the world a year ago, and invited people to develop applications to work with their QRadar software.

That software was developed by Q1 Labs, developed in turn at the University of New Brunswick, and purchased more than four years ago by IBM.

He said by getting information out to security staffaround the world, cybercrime may become less lucrative for organized crime.

"We start changing the dynamic for the bad guys because it's not worth investing $100,000 or more in that new attack you've got if it's only going to be viable for a few minutes before we find it and tell the rest of the world," Barlow said.

Air Canada employees told to seek extra ID from kids even after feds' screening directive
Wednesday, 11 May 2016
Byline: Shanifa Nasser

Ottawa - A passport, a school ID card or even an Aeroplan number are among the pieces of identification Air Canada employees were instructed to obtain from children, even as the federal public safety minister said additional security screening was not required for people under 18.
Screenshots of documents taken by an Air Canada employee in January, sent to CBC News show the airline carrier issued a directive to employees stating children are not subject to extra screening measures, but goes on to list numerous such steps to clear what is known as the "deemed high profile" or DHP list. CBC News agreed to protect the employee's identity because of concerns of job termination.

"Children are not subject to extra screening under the Transport Canada Secure Air Travel Act (SATA) and Passenger Protect Program; however, until a passenger has been seen by an Airport agent, we cannot confirm their identity and date of birth," the screenshot says.

The revelations come just after the Minister Goodale announced that Canada and the U.S. set up a working group to help prevent false-positives for children matching names on no-fly lists.

The no-fly list is generated by the government, but "piggybacked onto the computer systems of the airlines. It's not an interactive system," he said Tuesday, admitting changes to the problem of false security-list matches won't be quick or easy.

By contrast, the American system is entirely government run and is entirely interactive, Goodale said.

"You've got to change the entire database."

In a statement, Air Canada representative Peter Fitzpatrick told CBC News it is a legal requirement that all passengers be vetted against watch lists, adding that children whose names are similar to a flagged name are "uniquely identified and cleared."

Employees are "instructed to use an Aeroplan number because it is a unique identifier (unlike a birthday because people share birth dates and the information can sometimes be entered incorrectly,)" Fitzpatrick said.

But to Toronto-area Khadija Cajee, whose six-year-old son, Adam Ahmed, nearly missed an Air Canada flight to Boston last year because his name showed up on the DHP list, an Aeroplan number makes little sense.

"I can log on as Bugs Bunny and get an Aeroplan number. It's not a foolproof government identification. It's a loyalty program," Cajee said.

Since Ahmed's case made headlines, more than 40 other parents have come forward through social media and other means, with the same complaint.

Cajee, meanwhile, has found herself the unwitting liaison for the group #NoFlyListKids and the government.

One of those mothers, based in Kamloops, said on Tuesday that Air Canada employees have recommended she change her baby's name to bypass the delays.

"I wasn't happy with that," Faaria Siddiqui told CBC News. "How do we know if we change his name it won't be on the list or the name we choose won't be on list?"

Reuters
SWIFT rejects Bangladeshi claims over $81 million cyber heist
Wednesday, 11 May 2016

Dhaka - SWIFT has rejected allegations by officials in Bangladesh that technicians with the global messaging system made the nation's central bank more vulnerable to hacking before an $81 million cyber heist in February.
The comments were in response to a Reuters story that cited Bangladeshi police and a central bank official as saying that SWIFT technicians introduced security holes into the bank's network while connecting SWIFT to Bangladesh's first real-time gross settlement (RTGS) system.

"SWIFT was not responsible for any of the issues cited by the officials, or party to the related decisions," the Brussels-based bank-owned cooperative said in a statement posted on its website on Monday.

"As a SWIFT user like any other, Bangladesh Bank is responsible for the security of its own systems interfacing with the SWIFT network and their related environment - starting with basic password protection practices - in much the same way as they are responsible for their other internal security considerations," the statement said.

But Bangladesh's main police investigator maintained there were loopholes in the way SWIFT carried out the integration of its network with the RTGS platform that left the central bank's computer systems vulnerable to hackers.

Mohammad Shah Alam, the head of the Criminal Investigation Department of the Bangladesh Police, said the probe had identified specific deviations from set procedures that compromised Bangladesh Bank's security. "We stand by our investigation," he said in response to the comments by SWIFT.

But he added he did not want to engage in a debate and urged greater international cooperation to identify the culprits behind one of the world's biggest cyber thefts.

Reuters has not been able to independently verify the allegations by Bangladeshi officials about the SWIFT technicians.

US investigators suspect the involvement of employees of the Bangladesh Bank in helping the hackers breach the systems, the Wall Street Journal said, quoting people familiar with the matter.

It said the Federal Bureau of Investigation had found evidence that at least one bank employee acted as an accomplice but there could be more who assisted the hackers in navigating around Bangladesh Bank's computer systems.

Bangladesh Police said they have been looking for inside involvement in the heist from the beginning of the probe, but no evidence has turned up against anyone.

Investigators say they think there was some level of local facilitation in the attack on the central bank's computers but haven't identified it as yet. "If the FBI has uncovered evidence, they should share with us," a police officer said.

The revelations came ahead of a meeting on Tuesday in Basel, Switzerland, where Bangladesh Bank officials have said their governor and a lawyer appointed by the bank would discuss recovery of about $81 million stolen by hackers with the head of the Federal Reserve Bank of New York and a senior executive from SWIFT.

The money was stolen from Bangladesh Bank's account at the New York Fed through fraudulent transfer orders sent on the SWIFT system.

SWIFT's statement said it "looks forward to the meeting with Bangladesh Bank and New York Federal Reserve Bank officials in Basel on 10th May, when the bank's security issues and these baseless allegations will be discussed."

Bangladesh Bank officials have said they believed SWIFT, and the New York Fed, bear some responsibility for the February cyber heist.

Banks to face growing challenge on data security
Wednesday, 11 May 2016
Byline: Babu Das Augustine

Dubai - In the context of rising cases of data breaches across regional financial institutions, KPMG expects the UAE based banks to face growing challenges from hackers and other malicious actors. "In November 2015, we surveyed a broad range of KPMG clients in the UAE to better understand their cyber security arrangements and their level of preparedness to respond to a cyber-attack. What we learned clearly showed that many organizations in the UAE -- including financial institutions -- continue to struggle in a number of different areas," said Cristian Carstoiu, Director, Management Consulting.

The survey showed that many UAE organisations find it difficult to develop an adequate investment case to recruit the right level of expertise and to implement appropriate security technologies, even against a backdrop of increasing concern over cyber security attacks in the region.

"We believe many organisations in the UAE need to improve their emergency response and contingency plans in order to appropriately respond to, and recover from, a cyber breach. Organisations in the UAE also need to better understand their threat profile: who, when and why they are likely to be targeted," said Carstoiu.

The study also said that many boards in the UAE -- where the ultimate responsibility for cyber security lies -- do not have a comprehensive or accurate view of their cyber risks, often because threat intelligence and cyber monitoring have been inconsistently implemented.

Global Times
Activist's cyber hunt violates moral codes
Wednesday, 11 May 2016
Section: editorial

Internet activist Wen Yunchao on Sunday launched a cyber manhunt on Twitter aimed at five experts and technical personnel who helped improve China's Great Firewall. Wen encouraged Net users to find out whether the five, four of whom are professors and postgraduate students from a university in Nanjing, have any personal issues or are engaged in academic corruption.
Wen is a radical political dissident, who was disciplined many times at his Chinese university for various reasons. After he began his studies in the US in 2009, he gradually became a democracy activist against the Chinese political system.

Wen often voices aggressive opinions over freedom of speech and judicial justice. But the manhunt he initiated is a far cry from his philosophy.

These cyber manhunts go severely against cyber ethics, and for a number of reasons are violations of the law. However, it is unfortunate that Twitter has done nothing about it after the case was reported by some Western media. Imagine if Edward Snowden called for a cyber manhunt against all the designers of the US surveillance program PRISM on social networks, would Twitter still be so indifferent?

Certain dissidents have totally lost their moral bottom line nowadays. They flatter themselves that they stand on the moral high ground. Assuming that they did everything for a just cause, they think they can thus trample on ordinary people's codes of conduct.

Every country is responsible for its own cyber management. Technical inventions by a few researchers do not have any political nature.

Yet Wen attacked those technical workers online because of objections to the Chinese firewall. Such paranoia is familiar to us.

No matter how many grudges one has over social governance, he cannot publicly infringe on the rights of others like Wen has done. Otherwise, the entire society will fall into chaos.

After some dissidents fled to the US and other Western countries, they have not only had "more freedom" to express their political views, but also showed the dark side in their humanity. They seem to be so anxious to witness great disorder in China in no time. There is no telling whether their behavior stems from their own issues or the influence of the anti-China forces in the US.

That these malcontented dissidents living abroad, who are losers in life, are washed out by China's reform and opening-up is amusing and thought-provoking.

Smart tech set to revolutionize airports
Wednesday, 11 May 2016
Byline: Staff Report

Dubai - The 16th edition of the Airport Show, currently under way at the Dubai International Convention and Exhibition Centre with over 300 exhibitors from 55 countries, has been utilised as a platform to showcase technologies and innovative solutions by multi-national and regional companies.
Some of the prominent technology devices that are being showcased include the Intelligent Trolley and Trolley Security Scanner by Denmark-based Exruptive, an associate company of Dubai-based emaratech, airport runway cleaning systems by US-based Cyclone Technology, Smart Tray cargo and baggage handling systems by Siemens, driverless shuttle by Navya ARMA and the latest face recognition technology by Rockwell Collins.

The Intelligent Trolley will act as a passenger's personal guide through the airport. It can be used to power personal devices, act as a real-time way finding device in the airport via an interactive 3D-map. For flight and gate information, the device updates information on a real-time basis and keeps the passenger updated.

"We are extremely pleased with the response from trade visitors. There have been invitations to visit many airports," said Morten Pankoke, chief operating officer of Exruptive.

Rockwell Collins'face recognition technology captures a traveller's identity using biometrics and matches it with the passenger's passport and boarding pass information.

Dr Ian Bache PMP, technical pre-sales director, Arinc Airports Information Management Services, Rockwell Collins, said: "Airports are always looking to automate passenger processing while maintaining the highest security levels. We offer tailor-made solutions which can be configured with airport identity management solutions. Many airports in this region are showing interest in these technologies." US-based Cyclone Technology has displayed an ultra high water pressure system, The Cyclone 4006, which cleans airport runways and apron surfaces more effectively and in less time than other methods. The patented cleaning and recovery head cleans and removes rubber and paint build-up without damage to the surface.

Siemens is showcasing its latest baggage handling systems, prominent among them is 'smart tray' or SmartTilter, Siemens' solution for the dynamic tilting of tray conveyors, which help get baggage to its destination as quickly as possible.

Navya ARMA introduced a 100 per cent electric and intelligent driverless shuttle which can transport up to 15 passengers and safely drive up to 45 km/h. Navya, the French company which has conceptualised and manufactured the vehicle, is keen on introducing the shuttle at airports across the Middle East region.

The National (UAE)
Beijing postpones implementing new e-commerce regulations

Wednesday, 11 May 2016
Byline: Saibal Dasgupta

Beijing - In a rare move, China today held back implementation of new regulations that were passed last month on goods imported from overseas markets using e-commerce platforms. The government said it will now make adjustments to the rules before they are brought in.
The decision indicated that Beijing is going through a process of rethinking over the use of the internet for a variety of business and security-related functions.

On Monday, the government ordered Beijing's Baidu, one of the world's largest search engines, to revamp its vast business spanning several countries. The cyber administration of China asked the Nasdaq-listed Baidu to formulate a new and more credible algorithm and restrict the amount of promotional content by May 31.

These developments have taken place against the backdrop of the government drafting and finalising three different laws on cybersecurity and new counter terrorism laws. Foreign companies and industry lobby groups are worried that the proposed regulations may impinge on their privacy and force them to share "sensitive intellectual property" with the government in the name of "national security".

"Foreign companies feel they are vulnerable towards potential scrutiny and even attacks by Chinese authorities," Yun Sun, a senior associate with the East Asia programme at the Washington think tank Stimson Center, told The National today.

She said the new laws make foreign companies vulnerable towards potential scrutiny or even potential investigation by Chinese authorities. "This reduces the security level for these companies and their products, and also threatens the credibility for their operations in the global market," she said.

Beijing says the new laws have mainly been brought to deal with the threat of terrorism from militants involved in the East Turkmenistan movement in western China's Xinjiang province, and the enhanced global fears after the recent terrorist attacks in parts of Europe and Egypt. The Xinjiang-based militants have attacked targets in Beijing and Kunming cities besides carrying out bomb attacks in the western province in recent years.

"The government's main objective is to fight terrorist using the cyber space to further their activities. But it also wants to control data flow. It is this aspect that would hurt businesses," Ada Wang, a legal counsel and compliance officer with TUVRheinland, said yesterday.

"The new laws will not just affect foreign companies. It would also hamper Chinese companies operating overseas because the government does not want sensitive date to leave the country," she said. Indeed, the rules make it obligatory for companies to use specified infrastructure, and ensure that their websites are hosted in satellites hovering over China, and not in foreign locations.

Other Chinese experts and businessmen see it differently. "There will be a new phase for internet development in China," said Xiong Huang, a researcher at Communication University of China, said listening to the Chinese president Xi Jinping talk about the importance of internet security at a conference in Beijing last month.

Following the event, Jack Ma, the founder and chairman of China's giant e-commerce company Alibaba Group, said: "This is the first high-profile meeting in the internet field for our country. Not only does the meeting show how much China values the internet as a national strategy, but the country has a quite high level in both practice and theory on the development of the internet. I'm firm about the internet development in China after the speech."

What the regulations might do is force more foreign companies to enter into joint ventures with local enterprises to make sure they do not cross the line and attract the wrath of the authorities empowered with the new legislation.

The laws cover all businesses engaged in transmission of data via cyber space. The regulations state that companies are expected to: assist authorities in unravelling complicated data whenever required; use data infrastructure that is based in China; use encryption technology before transmitting data outside China; never generate or use data in any manner that would affect the country's national security; disallow any person, groups or organisation to use their internet platforms to disseminate propaganda against Chinese political systems, or instigate the local population against government authorities.

One of the implications of the new law is that it will involve additional costs to build secure internet infrastructure and hire legal services to deal with compliance issue. This is partly because the new law is vague about compliance requirements, and not specifically pinpointed, an analysts said.

Companies based in Hong Kong will now be treated as offshore enterprises, and treated as foreign firms under these laws. This can be a bothersome to foreign companies because many of them are registered in Hong Kong, and not in mainland China.

One analyst, who declined to be named, said that the rules are not meant to target foreign companies. "They have merely come in the way of these laws because they impose a wide range of restrictions on the use of internet, and flow of data," he said.

New York Times
Sensitive Email Routinely Sent as Unclassified
Wednesday, 11 May 2016
Byline: Steven Lee Myers

Washington - On the morning of March 13, 2011, the assistant secretary of state for Near Eastern affairs, Jeffrey D. Feltman, wrote an urgent email to more than two dozen colleagues informing them

that Saudi Arabia and the United Arab Emirates were sending troops into Bahrain to put down antigovernment protests there.
Mr. Feltman's email prompted a string of 10 replies and forwards over the next 24 hours, including to Secretary of State Hillary Clinton, as the Obama administration debated what was happening and how to respond.

The chain contained information now declared classified, including portions of messages written by Mr. Feltman; the former ambassador in Kuwait, Deborah K. Jones; and the current director of the Central Intelligence Agency, John O. Brennan.

The top administration officials discussed the Bahrain situation on unclassified government computer networks, except for Mrs. Clinton, who used a private email server while serving as secretary of state.

Her server is now the subject of an F.B.I. investigation, which is likely to conclude in the next month, about whether classified information was mishandled.

Whatever the disposition of the investigation, the discussion of troops to Bahrain reveals how routinely sensitive information is emailed on unclassified government servers, reflecting what many officials describe as diplomacy in the age of the Internet, especially in urgent, fast-developing situations.

A review of the 30,322 emails from Mrs. Clinton's private server that the State Department has made public under the Freedom of Information Act provide an extensive record of how such sensitive information often looped throughout President Obama's foreign policy apparatus on unclassified systems, from embassies to the United Nations to the White House.

The senders included Denis R. McDonough, currently the White House chief of staff and previously the deputy national security adviser, and Susan E. Rice, the former American representative at the United Nations who is now Mr. Obama's national security adviser.

Many of the emails were sent over the State Department's unclassified system, state.gov, which is considered secure but not at the level of the State Department's system for emailing classified information.

At the State Department, the Pentagon and the White House, among other agencies, officials have two systems for email, one for classified messages and one for more routine business. They are nicknamed the "high side" and the "low side."

Mrs. Clinton's private server -- set up in her home in Westchester County, N.Y. -- was assumed to be even less secure than the State Department's "low side," although the unclassified servers at some government agencies have been hacked in recent years.

One result of Mrs. Clinton's decision to maintain a private server is that it has put State Department officials on the defensive about their use of state.gov for some business that might be considered classified.

Of the 30,322 emails made public, 2,028 have had portions redacted and are now classified at the lowest level of classification, "confidential."

Nearly three-quarters of those emails were classified because they contained what is called "foreign government information" -- a vast category of information, gathered through conversations and meetings with foreign counterparts that are the fundamentals of diplomacy, but which had to be protected when the emails were released.

Last week, in an apparent attempt to dispel criticism that many of the emails were improperly sent, a top State Department official argued in a letter to three Senate Democrats that the nation's diplomats and officials were in fact allowed to send "foreign government information" through the government's unclassified computer systems.

"Department officials of necessity routinely receive such information through unclassified channels," said the letter, dated May 2 and written by the assistant secretary of state for legislative affairs, Julia Frifield.

"For example, diplomats engage in meetings with counterparts in open settings, have phone calls with foreign contacts over unsecure lines, and email with and about foreign counterparts via unclassified systems."

The letter went on to say that using "foreign government information" in unclassified emails "does not amount to mishandling the information."

The State Department, unlike some other federal agencies, does not have the authority to redact that category of information even if it is required to release documents under the Freedom of Information Act.

Thus, the only way the State Department could withhold "foreign government information" in the emails being released under court order was to classify it, according to the letter.

The letter was a reply to one sent in March to Senators Patrick J. Leahy of Vermont, Thomas R. Carper of Delaware and Dianne Feinstein of California. A copy was given to The New York Times by a government official who believed the classification of the emails was unfairly implicating diplomats and other officials conducting diplomacy in the modern era.

Of the 30,322 emails, the F.B.I.'s investigation has focused on a smaller number, including 22 that the C.I.A. insisted contained information classified "top secret."

Those emails have not been released, even with redactions, because they include material classified at the highest levels, known as "top secret/SAP," according to a letter from the inspector general of the nation's intelligence agencies, I. Charles McCullough III.

That designation refers to "special access programs," which are among the nation's most guarded secrets. The emails are said to include references to, among other things, the C.I.A.'s program to hunt and kill suspected terrorists with armed drones in Pakistan.

An additional 65 emails, which have been released, have had portions redacted because they included information classified at the level of "secret."
