"To do it over again, I would have made the argument that training be mandatory for all users," she testified. "I can't mandate training, but it's the one thing, if I could do over, I would do."

The problems with the Phoenix pay system are at the centre of a labour tribunal hearing into whether the federal government is breaking the law by not paying thousands of public servants properly and on time.

As departments drilled down into the issues, Di Paola said, they found two "root causes" - the information public servants were plugging into the system was wrong or untimely, and the processing times of transactions at the Miramichi, N.B., pay centre were slower than expected.

There are "pieces" of pay administration that are not working, she said, but Phoenix "as a technology is working."

Di Paola said the 80,000 people backlogged awaiting extra pay are not considered Phoenix problems.

They ended up not getting paid what they are owed because information was not put into the system properly.

Her comments, however, have sparked a backlash from federal employees.

Chris Aylward, president of the Public Service Alliance of Canada, said Di Paola was trying to shift blame to the workers.

"We're talking 80,000 people who didn't input their information properly?" Aylward asked after her testimony. "I find that hard to believe. And there is no system problem or problem with the pay system? I find that extremely hard to believe.

"It's embarrassing when we have a manager responsible for the implementation of a new pay system who blames everyone else but the pay system itself ... and (she's saying) 'It's either your HR people or employees themselves who are not inputting data properly', " Aylward added.

DND employees who provided the Citizen with the internal message about Phoenix training echoed Aylward's criticism.

Military managers of the department's civilian employees do not currently have access to the Phoenix pay system, a situation that has also created problems in the department.

But they are still expected to complete what is called the "Phoenix Self-Service for Military Managers" course, the internal message noted.

Phoenix was designed to integrate payroll and human resources systems.

The government bought off-theshelf software and "reconfigured" and "customized" it to handle the 80,000 pay rules and rates of pay for public servants.

Canada's CIA Had No Policy for Collecting and Using Massive Amounts of Data
Saturday, 01 October 2016
Byline: Jordan Pearson

Ottawa- The Canadian Security Intelligence Service (CSIS), the country's CIA equivalent, used large datasets to track and identify persons of interest without a policy to guide their collection, retention, or use, according to a new report from Canada's intelligence watchdog.
CSIS is tasked with tracking terror suspects within and outside of Canada, and the investigation was undertaken in the context of new, and incredibly broad, powers bestowed upon the spy agency by the controversial Bill C-51.

Canada has recently ramped up its efforts to identify people connected to pro- terror ideologies. In August, the Royal Canadian Mounted Police (RCMP) arrested 24-year-old Ottawa man Tevis Gonyou-McLean who was later released on a peace bond that restricts his movement, communication, and online activities. The RCMP's national security unit frequently receives intelligence from CSIS.

A report published on Thursday by the civilian Security Intelligence Review Committee (SIRC) notes that CSIS uses large databases to find out more information about suspects, develop leads, and even to "identify previously unknown individuals of interest by linking together types of information which have mirrored threat behaviour."

According the SIRC report, CSIS had "no comprehensive governance framework guiding the collection, retention and use of bulk datasets." The investigation, which began last year, recommended that CSIS have a policy in place by February of 2016, and CSIS suspended bulk data collection upon SIRC's recommendation until a policy could be implemented.

The Communications Security Establishment, CSIS' sister organization and Canada's answer to the NSA in the US, stopped sharing metadata with foreign spying partners under similar circumstances last year when an internal review concluded that the agency had handled data improperly.

The new report also suggests that CSIS employed overly generous interpretations of the law in order to collect more data than it was supposed to.

So-called "referential" datasets--defined by CSIS as already being publicly available, such as a phone book--are not considered to be "collected" by the agency under the CSIS Act, and thus do not need to meet the legal threshold of being "strictly necessary" for a particular investigation.

However, the watchdog "found instances where [it] felt the criteria for inclusion in the 'referential' category--data that is publicly available and openly sourced--were not met." Indeed, SIRC "found no evidence to indicate that CSIS had appropriately considered the threshold."

In other words, CSIS collected large datasets that the watchdog considered to be more invasive than, say, a phone book or a map, but was miscategorizing them and in the process bypassed legal safeguards governing sensitive data.

CSIS has not responded to Motherboard's request asking for clarification on what types of datasets would be considered referential and non-referential.

As a remedy, SIRC recommended that before engaging in bulk data collection, "a clear connection to a threat to the security of Canada" must be established, alternatives to bulk data collection must be considered, and an assessment of how likely the bulk data collection is to produce intelligence of value must be undertaken.

Overall, however, the watchdog was bullish on CSIS' use of its new powers despite these failures on the part of the spy agency.

Canada plays catchup as wireless providers create emergency alerts for cellphones
Monday, 03 October 2016
Byline: Staff reporter

A new emergency alert system that transmits messages directly to cellphones, whether people want the alerts or not, is in the works for Canada.
The alerts would be transmitted to cellphone users regardless of their wireless providers. A similar system has been in place in the United States for years.

Once a message is sent out, it would be received by every cellphone in a geographic area, said Marc Choma, spokesman for the Canadian Wireless Telecommunications Association.

The association represents wireless service providers and businesses that develop products for the wireless industry.

The emergency messages would be used to alert Canadians to serious concerns like dangerous storms and possible terror threats.

System tested in Ontario

The system could use an emergency radio channel that is picked up by cellphones, and enables the system to reach people even if the servers that handle cellphone calls and text messages are overwhelmed.

"If there is going to be an emergency, the best way to reach people is with something that almost everybody has in their pocket right now, and that would be their cellphone," said Choma.

He said the alerts can also contain pictures and text.

This "cell broadcast system" has already been tested in the Durham Region of Ontario, according to Choma.

Public Safety Canada is working with the wireless industry to test the system. It's the federal department's mandate to keep Canadians safe from a long list of potential dangers, like crime, natural disasters and terrorism.

System could cost $25M

The Department of Public Safety said the wireless alert system pilot project will be completed in 2017. Choma said setting up the system could cost wireless providers about $25 million. Despite the cost, he said, wireless carriers support adopting the system.

The Canadian Radio-television and Telecommunications Commission (CRTC) launched a full public consultation on the emergency alerts in March.

The CRTC refused to comment on the system. However, the comments Canadians made about the proposed system have been made public. Those comments are mixed, but some people don't like the idea of being automatically included in the program.

"Only implement such a system if it can be disabled by the end user so that it is not forced upon them," wrote David Cole from Toronto. "That way, if it is poorly implemented, it can be turned off. Enough intrusion already."

"No, unless the CRTC prevents the wireless service providers from charging a fee to provide the service," wrote Ernest Price from St. Catharines, Ont.

'Take it to a higher level'

In Nova Scotia, the emergency management office supports the system. Paul Mason, director of emergency services, said the province currently uses TV and radio alerts to let the public know about emergencies.

"People spend a lot of time on their cellphones, and the alerts that would go out would have a loud noise that would get their attention ... I think bringing cellphones in would take it to a higher level."

Mason expects the CRTC will make a ruling on the system by December. If the alerts get the go ahead, he expects it to take at least a year or two before the system is brought online.

Public Safety Canada said it will work with all levels of government to make sure the alerting system is successfully implemented across the country.

Cell emergency alerts already in U.S.

A similar federal cellphone alert system already exists in the United States. It can only send a 90-character text message that can't contain any pictures or videos.

Ben Krakauer, director of watch command with New York City's Office of Emergency Management, said people cannot opt out of the program. "A national program that works regardless of whether you live in the city, whether you have a New York City phone number or if you're visiting us from across the country or around the world, is fantastic," he said.

In total, Krakauer said, they've only used the federal emergency alert system eight times. He believes it has saved lives.

Most recently, his office sent out a text message informing people of the search for Ahmad Khan Rahami, he Afghan-born U.S. citizen charged in last month's explosives incidents in New York City and New Jersey.

China flag ceremony at Vancouver City Hall raises red flags for some
Monday, 03 October 2016
Byline: David P. Ball

Local politicians touted a Chinese independence anniversary event in Vancouver this weekend as a way to celebrate Canada's relationship to the People's Republic of China.
But the celebration -- at which City Coun. Kerry Jang raised the Chinese flag on a City Hall flagpole alongside Richmond East MP Joe Peschisolido, both wearing red scarves -- isn't being celebrated by everyone in the Chinese-Canadian community.

"I myself and my family lived through the (Chinese) Cultural Revolution," said Meena Wong, former mayoral candidate for the Coalition of Progressive Electors. "The flag and red scarf represent oppression to me.

"My family was raided by the Red Guards wearing those red scarves. I'm very disgusted and disappointed."

The ceremony also sparked an online petition by a group of Chinese-Canadians who have protested outside pro-Communist Party of China events, including this summer in Richmond at a birthday party for late dictator Mao Zedong, infamous for overseeing the killings of at last 60 million people.

"We know how (Chinese authorities) treat people and how they use their influence to brainwash people," said Louis Huang, chair of the Alliance of the Guard of Canadian Values.

"We wanted to live a better life there and to change our country, but the (1989) Tiananman Square massacre completely destroyed everything of our dreams ... that's one reason I left China."

Huang added that it's not just human rights in the dictatorship which he finds worrying, but also concerns about allegations that Chinese officials are attempting to influence affairs in Canada. Those concerns have even been raised by the Canadian Security and Intelligence Service (CSIS), our spy service.

"The Chinese government is extending its influence into our society and into Canadian governments -- municipal, MLAs and MPs," Huang alleged. "Lots of people are worried about this ... We worry about our economy, our society, and our national security."

But Jang, who attended the event as the city's Acting Mayor, lashed out at critics -- asking why no one protested City Hall's recent Mexican or Slovenian flag- raising events.

"To me, this is just racism pure and simple," he told Metro. "Why pick on the Chinese?

"I'm getting tired of putting up with this bulls---, these types of comments, my whole life. I'm 64, I figured we should have come somewhere by now as Canadians."

Asked what he'd say to Chinese-Canadians criticizing the event, Jang said, "Leave the war at home."

"We have raised our concerns about human rights and the death penalty and we're affecting change in China," he said. "We don't get that change by just yelling or being mean. They're changing."

Peschisolido concurred, arguing that "engaging" with the Chinese government was the best way to achieve democratic reform.

He told Metro that his speech at City Hall, and other recent independence events, "talked about the importance of human rights, freedom of speech, of religion freedoms and freedom of the press."

Friends of Hong Kong organizer Fenella Sung told Metro she "was totally shocked" to see photos from the event, arguing that "even Hong Kong under the sovereignty of China would not do a flag-raising with Communist Party of China" representatives in attendance.

The red scarves especially caught her eye, because they're "the uniform of one of the Communist Party's hierarchies ... Do they really know what it means to wear that?"

Jang replied that the scarf has been a Chinese cultural symbol "since time immemorial" and predated the current regime. But Sung was unsatisfied with the explanation, nor claims it would help push China towards reform.

"How could they think that by raising the flag of Communist China, Canada would help anything to do with human rights in China?" she asked.

"Would prisoners being tortured be able to get freedom because we raised the flag on our City Hall? Would prisoners of conscience have their prison terms shortened?"

Washington Post
Freer rein for law enforcement hackers
Saturday, 01 October 2016
Byline: Ellen Nakashima & Rachel Weiner

Washington - When the FBI searched Andrew Workman's computer, they say they found pornographic videos of girls as young as 3 years old. A federal judge in Colorado ruled in September that the computer hack that helped the bureau uncover the videos should never have been allowed.
Why? The search warrant permitting the hack was issued by a magistrate judge in Virginia - outside the judicial district in which Workman lived - and in an apparent violation of federal criminal rules.

But a shift in federal rules set to go into effect in December says that a judge in one district can approve a warrant to hack computers outside that district in cases in which the computers' locations are shielded.

The change would aid the government in its sweeping national investigation into child pornography on the "dark Web," a universe of sites that are off Google's radar, where pedophiles using special technology can operate in anonymity.

The government contends that the change - which was approved by the Supreme Court in April and will go forward unless Congress opposes it - is necessary to clear up a loophole created by technology. Because investigators cannot know in advance where a target computer is physically located if a suspect

is using tools to mask his or her location, it is impossible to seek a search warrant in the district in which the target is located, officials say. They add that the change does not create any new authority and would still require a showing of probable cause before a warrant is issued.

"It really just gives us the ability to go in front of a [single] judge and get a warrant to do a search," Assistant Attorney General Leslie Caldwell said. "Otherwise we could find ourselves in a situation where we knew child-exploitation activity was happening in a lot of different places, but we wouldn't know exactly where the computers were located and we wouldn't have a judge to go to."

But privacy advocates and some lawmakers contend that the amendment to Rule 41 of the Federal Rules of Criminal Procedure would legally sanction mass hacking, in which federal law enforcement, with one warrant, can hack thousands of computers whose locations are unknown. And they argue that the rule change would allow prosecutors to seek out judges they feel would be more sympathetic to their warrant application.

If the rule change goes through, and if the government can show probable cause, "the FBI gets the authority to hack anywhere in the world," said Christopher Soghoian, principal technologist for the American Civil Liberties Union. "We desperately need to have congressional hearings and investigations into the use of this technology before it becomes the tool of choice of law enforcement."

Google, PayPal and several other technology companies have also lobbied against the change to the rule, calling it "dangerously broad."

In the case that ensnared Workman, the FBI took over a child- pornography site called PlayPen and surreptitiously installed software on it that enabled investigators to identify computers of users who went to the site. Since then, the government has obtained Internet protocol addresses of at least 1,300 computers in the United States, identified at least 38 children subject to sexual abuse, and brought about 200 cases.

Critics say that allowing the government to use such hacking software potentially endangers the computers of law-abiding citizens who have nothing to do with pedophiles.

"A bungled government hack could damage systems at hospitals, on the power grid, in transportation or other critical infrastructure," said Sen. Ron Wyden (D-Ore.), who is part of a bipartisan, bicameral group of lawmakers seeking to block the Rule 41 change.

Caldwell dismissed such assertions, saying that investigators work closely with private-sector computer security experts. "We do a lot of testing to make sure that the software we're using is not going to have harmful, unintended consequences," she said.

She also noted that the proposed rule change is the result of three years of extensive review and public testimony involving two committees consisting of academics, judges and defense attorneys.

The change to Rule 41, the government says, will help settle what has become a confusing area for judges and prosecutors.

Since the warrant used to hack Workman's computer was issued in February 2015, there have been 24 challenges to it. Nineteen judges who reviewed the warrant concluded it was not properly issued on venue grounds. Of those, four, including the judge in Colorado, threw out the evidence as a result. The other 15 ruled that the violation was not serious enough to suppress the evidence. And the remaining five found the warrant was properly issued.

Any change to Rule 41 would not automatically apply to the pending cases. But the Justice Department could request that each individual court apply the new rules.

Even if the change goes through, defense lawyers say they will continue to challenge the hacking warrants on other grounds. For instance, they have argued that the hacking constitutes a violation of the Fourth Amendment.

Judge R. Brooke Jackson, who decided to suppress the evidence in Workman's case, said he was aware that his ruling might free a guilty man.

"This is particularly difficult to stomach where the crime at issue is something as reprehensible as the possession of child pornography," he wrote in his decision. "On the other hand, this ruling might serve as a reminder to ... be attentive to 'something as basic as who can issue a warrant.'"

Kashmir Observer
Over 70% terrorists using cyber space: PMO Cyber Coordinator
Saturday, 01 October 2016

New Delhi - Over 70 percent of terrorists and terror groups across the globe are using various cyber medium tools to spread the evil of terrorism and further their goals, Gulshan Rai, the National Cyber Security Coordinator in the Prime Ministers Office (PMO) has said.
Speaking at the India Conference on Cyber Security & Internet Governance organised by Observer Research Foundation in New Delhi, Rai said 70-75 percent of terrorists are using tools like voice over internet telecom, social media and even encryption to spread the menace of terrorism and further their goals.

He said that post the controversy surrounding whistle-blower Edward Snowden, users and nations have become worried about the security of their data and are now using various encryption techniques and policies that has led to interruptions in seamless flow of data and information.

Former Central Intelligence Agency (CIA) employee Snowden copied and leaked classified information from the National Security Agency (NSA) in 2013 without prior authorisation.

Stressing on the need for finding a fine balance between the security and seamless flow of data, Rai said India is coming out with the national encryption policy with the focus on multi-stake holder model.

Based on public private partnership, the model, will have the government, industry, academia and the civil society working together to ensure a perfect balance between security and smooth flow of data.

The three-day international conference that began on September 28, was inaugurated by Union Minister for Information Technology & Law and Justice, Ravi Shankar Prasad.

New York Times
Hate Speech Bounded by Character Limit Alone
Monday, 03 October 2016
Byline: Jim Rutenberg

Column - If you go by what some Twitter users have to say, it's a wonder I can string together a sentence. I don't know how I ever manage to get myself to the office given what a "dumb ass" I am -- a Jew, no less, and someone who soils his pants out of fear of a Trump presidency. And if you don't believe that last bit, someone using a pseudonymous Twitter account was kind enough to provide a graphic photograph of the supposed soiling, but not his or her actual name, because it's just so much easier to hurl bile while cowering behind anonymity.
Then again, I don't know what it's like to be really savaged by Twitter. No one has threatened to rape me or kill me (unless being advised to kill myself counts). No one has relegated me to a gas chamber. And no one has hit me with anything like the sustained racist and sexist barrage that forced the "Saturday Night Live" and "Ghostbusters" star Leslie Jones to temporarily leave Twitter in disgust.

Now that Twitter is contemplating putting itself up for sale, we can only wonder what lucky suitor is going to walk away with such a charming catch.

Twitter is seeking a buyer at a time of slowing subscriber growth (it hovers above the 300 million mark) and "decreasing user engagement," as Jason Helfstein, the head of internet research at Oppenheimer & Company, put it when he downgraded the stock in a report last week.

There's a host of possible reasons for this, including new competition, failure to adapt to fast-changing media habits and an "open mike" quality that some potential users may find intimidating.

But you have to wonder whether the cap on Twitter's growth is tied more to that most basic -- and base -- of human emotions: hatred.

It courses through Twitter at an alarming rate, turbocharged by this year's political campaigns and the rise of anti- immigration movements that dabble in racist, sexist and anti-Semitic tropes across the globe. And this is to say nothing of its use by terrorist recruiters.

It's a lamentable turn that Twitter says it is urgently working to address.

Soon after Twitter took its place in the tech-driven media revolution a decade ago, it proved to be a forceful amplifier of ideas and personalities, one that could be a political game changer. Its role in enabling the Arab Spring movements remains inspirational. It helped foster bottom-up movements like the Tea Party and Black Lives Matter here in the United States. And, of course, it helped make possible the outsider candidacy of Donald J. Trump, who continues to use it, er, aggressively.

The back-and-forth over his candidacy, and the news media's coverage of it, have added a new cache of material to the uglier side of Twitter's oeuvre.

More often than not, the venom comes from pseudonymous accounts -- the white hoods of our time.

Just take a gander at @Bridget62945958, who published a series of anti-Semitic posts against my colleague Binyamin Appelbaum. One message showed a series of lampshades. Its caption read: "This is your family when Trump wins. Get your Israeli passport ready."

Twitter suspended the account after Mr. Appelbaum brought it to the attention of Twitter's co-founder and chief executive, Jack Dorsey, by way of his own Twitter feed. A new account sprang right up to continue the vitriol, prompting Jeffrey Goldberg, a national correspondent for The Atlantic, to write a post asking Mr. Dorsey, "How does it feel to watch Twitter turning into an anti-Semitic cesspool?"

Mr. Goldberg says he is torn about what Twitter should do, given that its cause -- openness and free speech -- is a reason he and so many other journalists are drawn to the service. "That's the fundamental problem," he told me. "At a certain point I'd rather take myself off the platform where the speech has become so offensive than advocate for the suppression of that speech."

Twitter clearly wrestles with the same fundamental problem. It warns users they may not "threaten other people on the basis of race, ethnicity, national origin, sexual orientation, gender" and various other traits. Yet it often fumbles the enforcement. Charlie Warzel of BuzzFeed News unearthed a doozy last week.

After a user who identified herself as Kathleen posted a tweet criticizing the Trump campaign, a Twitter member going by Adorable Deplorable directed a message back at her featuring a photograph of a beheaded man -- apparently an ISIS victim -- and the words, "Your [sic] heading for a deep hole."

Twitter forced the photo's removal after BuzzFeed's inquiries, but it initially told Kathleen that the post did not violate its policies. This is apparently common. In a BuzzFeed survey of Twitter users, about 90 percent of those who said they had reported abuse said their complaints went unheeded.

So-called trolls are a problem for all social media -- even Facebook, which keeps a tidier, more contained system. (To wit, the Facebook message a local New Jersey politician wrote to the Daily Beast writer Olivia Nuzzi after she posted something about Mr. Trump that he did not like: "Hope. You. Get. Raped. By. A. Syrian. Refugee.")

But the openness of Twitter, and the sheer speed and volume of information that moves through it, present a particularly hard challenge that executives there say they are rushing to meet.

"Everyone on Twitter should feel safe expressing diverse opinions and beliefs," the company said in a statement it sent me on Saturday. "But behavior that harasses, intimidates or uses fear to silence another person's voice should have no place on our platform."

In a letter to shareholders, Mr. Dorsey said the company was putting in place technology enabling it to more readily detect abusive accounts, make it easier for users to report them and even prevent them in the first place.

It's all a bit tricky for a company founded with an absolutist ethos, once calling itself "the free speech wing of the free speech party."

Some of its moves to curtail abuse have drawn accusations that it is applying a double standard aimed at conservatives. After Twitter placed the Breitbart News editor Milo Yiannopoulos on permanent suspension for his role in the Twitter campaign against Ms. Jones, he accused it of declaring "war on free speech," specifically against "libertarians, conservatives and anyone who loves mischief."

Another banned Twitter provocateur, Charles C. Johnson -- whom my predecessor David Carr once called a "troll on steroids" -- says he is planning a lawsuit to fight his suspension.

In an interview, Mr. Johnson said he respected Twitter's right to ban patently offensive speech but argued that it needed to set a consistent, uniformly applied standard. Still, he said, "the problem of trolls" might be unsolvable.

"It might just be a human nature problem," he said. "Maybe we don't like each other that much -- and that's what Twitter has revealed."

We didn't need Twitter to reveal that. And in the previous two media revolutions -- radio and television -- the country managed to strike some sort of accommodation between the right to free speech and the greater civic good.

That happened because there was an immediate national recognition that these media could have tremendous power to shape culture, politics and government for good and for ill.

As Herbert Hoover moved to establish basic standards for radio, he acknowledged that it had "great possibilities of future influence" but was also of "potential public concern."

He declared radio should be developed with public interest in mind, an idea that carried over to television. What followed were standards that forced broadcasters to devote at least some of their hours to civic affairs while avoiding obscene and "grossly offensive" content. At times, the efforts have wandered dangerously into censorship. But at least there was a big national discussion about what should beam into American living rooms.

There was no similarly robust discussion at the start of this, the latest media revolution, and we can only hope that the political mistrust isn't so great that we can't have a constructive one now.

Each new media development has served as a mirror for the society that spawned it. It sure seems time for a good, hard look.

But what does this dumb, pants-soiling Jew know?

London Times
Google diverts would-be jihadists away from radical websites
Monday, 03 October 2016
Byline: Anthony Cornish

London - Hundreds of thousands of people seeking information about Islamic State on Google have been diverted to anti-extremism search results, as part of a drive to stop Muslims becoming radicalised online.
The pioneering project directed people searching for particular Isis-related terms to YouTube videos that confront jihadist propaganda.

The under-the- radar scheme, which has been praised by government ministers, made use of Google's AdWords service, which allows organisations to pay to have their results at the top of searches.
Keywords targeted included the Isis slogan baqiya wa tatamaddad (remaining and expanding), the deferential term al dawla al islamiya (supporters of Islamic State), and the organisation's media sources Al-Furqan, Al-I'tisam, Al-Hayat, Amaq news agency and Ajnad.

Names of buildings in Isis-controlled areas known to host recruits, such as the Ninawa International Hotel in Mosul, in northern Iraq, were included.

The project, known as Redirect Method, was launched in a pilot scheme by Jigsaw, a technology incubator formerly known as Google Ideas. It was operated by the London-based tech business Moonshot CVE (Countering Violent Extremism).

The initiative comes amid growing criticism of the failure of technology giants to prevent online radicalisation.

The scheme has escaped the hostility aimed at the British government's Channel and Prevent anti-radicalisation strategies, which go further in identifying and challenging potential jihadi youngsters but have been attacked by some groups for perceived stigmatisation of Muslims.

Redirect Method's first task was to work out which words might interest a potential fighter. Former extremists, researchers and online advertising specialists helped to choose terms which could identify searchers at risk of radicalisation.

"Amaq News" was added in March when Isis used the outlet to claim responsibility for the Brussels bombings which killed 32 people.

Moonshot did the English-language version of the scheme while Quantum Communications, with offices in Lebanon and Washington, produced an equivalent in Arabic.

Users were invited on their screens to watch specially created YouTube channels with playlists of anti-Isis videos. The clips chosen were available online.

The videos included real footage from the self-styled caliphate's de facto capital in the Syrian city of Raqqa, first-hand accounts of what life is like under Isis, and imams challenging the group's interpretation of Islam.

In English, there were 30 campaigns covering more than 1,000 keywords. The Arabic campaign was more extensive. The Redirect Method's pilot claimed to reach 320,000 online users in eight weeks. Engagement was quantified in terms of "click-through rate" and effectiveness was judged by how long users spent watching the content.

Baroness Shields, minister for internet safety and security and a former managing director at Facebook, said: "Global technology companies play a vital role in addressing this challenge posed by terrorists and extremists using their platforms to radicalise, recruit and inspire."

Analysis: Search engine could class anyone as extreme

The Redirect Method may threaten anti-establishment groups and could damage trust in the Google search engine, according to Arun Kundnani, former researcher at the Institute of Race Relations.

He says that it sets a dangerous precedent for the future of ideas online.

"Once we have accepted this for people we call jihadis, it will be easier to accept it for all sorts of other radicals. There is a danger that Jigsaw will end up identifying individuals who express dissenting or unpopular opinions, classify them as extremists, and then opaquely engineer their information environment -- what we would normally call propaganda.

"There will be growing distrust of [Google's] search algorithm and people will choose to rely on other information sources that more closely match their world view."

Ian Pearson, a futurologist, said: "Superficially it looks like a good thing. If someone's in the early stages of radicalisation then redirecting them along a safer path and stopping them from being radicalised would seem to be a good idea.

"On the other hand, you do wonder why Google is this great moral arbiter of our time -- where does that mandate come from? Why do they think that they're the people who should be making such decisions? Surely we have governments that do that."

Financial Times
Lauri Love on US extradition and how hackers can help companies
Monday, 03 October 2016
Byline: Maija Palmer

London - If businesses are serious about reducing the risk of cyber attacks, they must work closely with hackers, says Lauri Love, the UK computer security expert who is facing extradition to the US, accused of computer crimes.
Mr Love, who lost his appeal against extradition in September, says more should be done to ensure young people with computer skills learn to use their talents in a positive way working for companies, rather than engaging in crime. The transition to cyber vandalism and worse often starts when a bright but socially awkward teenager is drawn into the wrong circles, he says.

"A lot of the mental make-up that can make you quite good at analysing computers and information systems tends to manifest with problems of social adaptiveness. People can find that they have trouble concentrating at school or problems with behaviour and authority," Mr Love adds. "They don't have the availability and means of getting into doing cyber security and developing their skills in the appropriate safe environment in a constructive way.

"The underworld doesn't care how well- dressed you are or whether you can maintain eye contact. They just care if you have the skills. There is a perverse sense in which the criminal underworld is more meritocratic than society. Sadly, their agenda is different."

Until last month, Mr Love was part of a social enterprise, Hacker House, which aims to give young computer enthusiasts a place to practise their hacking skills without causing damage -- and to put them to use helping, rather than harming, businesses.

"We want to provide a place where people who have started down the path to being a little bit naughty can come. We can say, 'OK, we will teach you how to hack, you can have all the fun, but you won't be interfering with someone's business and you won't find yourself on the end of a difficult conversation with people with badges,'" he adds.

Companies could learn a lot from hackers, Mr Love says. Most businesses severely underestimate their risk from cyber crime. Hackers often penetrate their defences in very basic ways.

"There is a lot of code running on computers -- some of it is kept up to date and patched against security vulnerabilities, some of it is not," Mr Love says. "Hacking is mostly a case of persistence; it is not always a case of spectacular ability -- just determination to keep looking until you find the one thing that wasn't up to scratch."

He compares looking at the back end of corporate systems to looking back in time. "Sometimes you end up going back to the 1990s and finding levels of security that we ought to have moved past," he says. "You see the same mistakes over and over again."

There is a tradition of ex-hackers going to work in corporate security. Kevin Mitnick, who was imprisoned in the US in the 1990s for hacking, runs his own corporate security consultancy. George Hotz, a hacker who faced litigation by Sony in 2011 for hacking the PlayStation 3 games console, has since worked for Facebook and Google.

Companies can also tap into the hacker community more broadly by setting up so-called "bug bounty" programmes, where hackers are rewarded if they discover and report serious security flaws.

"We can shape the rules of the game so people who find these things out have a way to come to the [company] and say, 'I have found out this is insecure,' without being afraid of being prosecuted or sued," Mr Love says. "We can create an incentive structure to bring people onside. These are bug bounty programmes and people are just learning to do them."

With a mischievous smile, Mr Love, who is accused of breaking into US military computers, adds: "In fact the Pentagon just ran its first bug bounty system. And so whereas some people in the world are in trouble for allegedly hacking the Pentagon, now the Pentagon is asking sometimes the same people to come and hack it."

The FBI and US Department of Justice allege Mr Love stole thousands of files from the Pentagon and Nasa, as well as from other bodies, including the Federal Reserve and Environmental Protection Agency.

Mr Love's lawyers have argued that he should face legal proceedings in the UK rather than the US, where they say his health could be affected by a lengthy jail term. Mr Love has Asperger syndrome, which his lawyers say could deteriorate and lead to a mental breakdown or even suicide.

In any case, Mr Love feels the current approach by the police and criminal justice system is not deterring hackers.

"The issue is that there are 7bn people connected to the internet and not all of them are in legal jurisdictions where computer crimes will be prosecuted. Even if you can scare all the people in the UK into not testing your security, that doesn't affect the people that live somewhere where you don't have extradition arrangements," he says.

He is not arguing that computer breaches should be decriminalised, but he says there should be more differentiation between cases where hackers are going in to steal money or information, and cases where people are merely testing the system's defences.

"When you damage a system, when you trespass, when you interfere with business operations -- that is a crime and should remain defined as a crime. But the priority of the state shouldn't be to try to frighten people into not testing security, we need security to be tested," he says.

"I don't think we should be heavy-handed with people, not when they haven't adopted a criminal mindset. I'm hoping law enforcement can start taking more of a harm-reduction approach rather than this kind of traditional drugs-war approach of being very hard on it and trying to scare the kids straight -- because the kids aren't being scared straight."

Mr Love's case is due to considered by Amber Rudd, the UK's home secretary, in mid-November. If she decides to authorise the US's extradition request, Mr Love will have 14 days to appeal against the ruling.

SC Magazine (UK)
National Cyber Security Centre HQ operational
Monday, 03 October 2016

London - The UK's new National Cyber Security Centre (NCSC) officially opens for business today as a public-facing part of GCHQ that acts as a focal point for the government to deliver authoritative advice on tackling cyber-security issues. It will be based in the Nova office and shopping complex near Victoria Station in London, not in Cheltenham at GCHQ, as originally announced last year, though it will also have offices there..
While this operational centre will focus on defensive work, it will be able to call on offensive capabilities developed by GCHQ and the Ministry of Defence.

According to Evening Standard reports, the NCSC will have a staff of 700, more than half of whom will be based in the new HQ, moving in to the building later this year and in early 2017. It will have specialist teams for the City, Whitehall, intelligence and security services, energy, telecoms and other parts of the critical national infrastructure.

It is led by CEO Ciaran Martin who was director general cyber at GCHQ, with Dr Ian Levy, former technical director of cyber-security at GCHQ, becoming technical director at the NCSC. The NCSC's website is scheduled to go live tomorrow (4 October).

The launch of the organisation was announced by the former Chancellor George Osborne last year then confirmed by Matt Hancock, minister for the Cabinet Office and Paymaster General. Its remit is to ensure the online safety of the general public, both public and private sector organisations as well as the UK's critical national infrastructure. Objectives include raising awareness of government intent; undertake genuine dialogue that shapes service delivery; demonstrate serious commitment to listen; and develop sustainable engagement channels to provide structured consultation with the private sector.

One of its first tasks is to work with the Bank of England to produce advice for the financial sector to manage cyber-security effectively.

Minister for the Cabinet Office and Paymaster General, Matthew Hancock commented: "In establishing the National Cyber Security Centre we are creating a body devoted to cyber-security and this will transform the UK's approach to an issue that affects us all.

"This important work with the Bank of England is paramount to ensuring that businesses of all shapes and sizes understand the threats and what they can do to mitigate them.

"We'll do this by informing the entire business community and public sector about emerging threats, providing support when attacks happen and educating everyone on how best to stay safe online."

In an official statement Robert Hannigan, director GCHQ said: "Given the industrial-scale theft of intellectual property from our companies and universities, as well as the numerous phishing and malware scams that waste time and money, the National Cyber Security Centre shows that the UK is focusing its efforts to combat the threats that exist online.

"Ciaran will be an excellent Chief Executive who will ensure that the NCSC will continue the outstanding work done by all of the existing organisations to protect national security and our economic success."

Ciaran Martin stated: "I'm very pleased to have the privilege of leading a world class team to get ahead of one of the most important threats of our time." Echoing Osborne's comments last year, he told ES, "Our role is helping t make the UK the safest place to live and do business online," noting that this would range from tackling hostile states, criminal gangs, to smaller scale attacks.

In an email to SCMagazineUK.com, David Damato chief security officer, Tanium

Offered his advice for the new NCSC: "The new National Cyber Security Centre will provide an important bridge between business and government, but it cannot succeed if it does not urgently address the accountability gap that sees board members and executives too often without the information and tools they need to take responsibility for cyber security.

"Discussions on cyber-security rarely reach corporate boardrooms, leaving many of the UK's biggest businesses dangerously exposed. Only a third of the leaders of UK's top 350 companies say they understand the threat of a cyber-attack and even fewer are regularly updated about security threats.

"If the UK wants to stem the tide of cyber-crime, the National Cyber Security Centre must make closing the corporate accountability gap its first order of business."

According to its prospectus, The National Cyber Security Centre will have four key objectives:

. To understand the cyber security environment, share knowledge, and use that expertise to identify and address systemic vulnerabilities. The NCSC will be the centre of government expertise on what is happening in cyberspace, combining the knowledge gathered from incidents and intelligence with that shared through the close relationships with industry, academia and international partners. That knowledge will be used to provide best practice advice and guidance, and to tackle systemic vulnerabilities to enhance cyber security for all.

. To reduce risks to the UK by working with public and private sector organisations to improve their cyber security. The NCSC will support the most critical organisations in the UK across government and the private sector to secure and defend their networks. It is planned that this will include the provision of bespoke advice and guidance, help to design and test networks, and exercise response arrangements.

. To respond to cyber- security incidents to reduce the harm they cause to the UK. It is recognised that despite all the efforts made to reduce the risks and enhance security, incidents will still happen. When a serious cyber incident occurs, the NCSC will work with victims to minimise the damage, to help with recovery, and to learn lessons to reduce the chance of recurrence and minimise future impact. Often this will entail helping by connecting victims with commercial companies known to be excellent at cyber incident response. At the same time the NCSC will ensure that the wider response of government and law enforcement is well co-ordinated. And in the case of very serious incidents this might mean communicating publicly about consequences and the steps people and businesses should take to protect themselves.

. To nurture and grow our national cyber security capability, and provide leadership on critical national cyber security issues. Cyber security and information technology continues to develop and evolve at a rapid pace. As the Centre within government for cyber-knowledge, the NCSC will have the best possible

visibility of what is happening today - in terms of threats, vulnerabilities and technology trends. This means cutting edge technical research teams, combining the best of government, industry and academic expertise, scanning the horizon and helping plan for what could challenge us tomorrow. The NCSC will lead the UK's thinking across the range of initiatives and developments, ensuring that the UK Government, organisations and the public can harness the advantages that new technologies bring in a safe and secure manner.

Boston Globe
Hackers now have wider choice of weapons
Monday, 03 October 2016
Byline: Hiawatha Bray

Boston - Over the past two weeks, hackers launched two of the biggest digital attacks in Internet history, targeting a French Internet provider and one of the foremost computer-security journalists in the United States.
What's perhaps more unusual is not the size of the attacks, but their source: Internet-connected cameras and digital video recorders like those in home and office security systems.

Cyber-criminals hacked into thousands of these devices around the world and used them to bombard analyst Brian Krebs and the French company OVH with trillions of bits of meaningless data. The attack was severe enough to temporarily shut down Krebs's website.

The attacks raise questions about the security of the much-vaunted Internet of Things (IoT), in which everyday objects from home appliances to door locks, cars, and digital video recorders are connected over a network and can be controlled remotely. The research firm Gartner Inc. estimates there are about 6.4 billion IoT devices in the world, with many many more on the way--20.8 billion by 2020. Internet security analysts say that many of these devices are just as hackable as our home computers, but much harder to protect from attack.

"It's already a nightmare," Krebs said of the state of cyber-security for these Internet-connected devices. "They just keep shipping devices that are insecure by default, and it's been going on for a long time."

Most IoT devices offer some measure of security, but usually not enough. For example, many devices require a password to change software settings, but don't force the user to create one of his own. So many users stick with the default password installed at the factory. They might as well use none at all. The default passwords for hundreds of popular products are published online; hackers can just look them up on Google.

Once in control of the device, the hackers can install malware to steal data from other devices, pump out spam e-mails, or, as in Krebs's case, crush an Internet site under an avalanche of data.

Last year, Burlington-based data security company Veracode tested 10 such devices. Testers found that eight of the 10 devices had serious security flaws that could allow intruders to seize control.

Consumers are famously ill-equipped to protect their personal computers from malware attacks. But most people know enough to install antivirus software and download the latest security patches. Bruce Schneier, a fellow at the Berkman Klein Center for Internet & Society at Harvard University, said many IoT devices don't provide a way to update their software, and most people wouldn't know how anyway.

"We're moving down the chain to lower-cost embedded devices without upgrade paths, without patch systems, without security teams," said Schneier, who is also chief technology officer of Resilient, a data security company owned by IBM Corp. "There's going to be no way to fix this," said Schneier. "None."

The Xively business unit of Boston's LogMeIn Inc. makes software that helps manage the data generated by IoT devices. Ryan Lester, Xively's director of IoT strategy, said that most IoT device makers put good security features into their products.

But he acknowledged, "for many organizations the race to get an IoT product to market is a fast and furious one and it can be tempting to cut corners - especially in areas that can be complex and time consuming like security."

Lester said that his company has a set of security standards that all clients must meet. "We have turned a few prospective customers away that did not," he said.

But Roland Dobbins, principal engineer at computer security company Arbor Networks Inc. of Burlington, said that it's not enough to rely on the security policies of individual companies. He called for IoT companies to band together and set industrywide policies, to make their products harder to hack.

"Vendors who write code for these devices must be given very, very specific guidance on security standards," he said. But up to now, the industry's efforts in this area have mostly been "lip service," he said.

Even if such standards are drawn up, Dobbins said it might be necessary for the federal government to ensure compliance. "Something's going to have to change," Dobbins said, "and it's just a question of whether industry is going to get its act together or government is going to have to intervene."

WhatsApp case reveals India's need for law to protect data privacy
Monday, 03 October 2016
Byline: Rebecca Bundhun

New Delhi - India needs new data privacy laws, experts say, as a court case with WhatsApp has brought the issue into sharp focus.
WhatsApp last month revised its privacy policy to allow the Facebook-owned messaging app to share data with Facebook and permit targeted adverts.

Two students filed a public litigation in the Delhi High Court to try to get the policy reversed. The court ruled that because the policy would only come into effect on September 25, all data before that should be deleted. It also resulted in the court asking India's telecom regulator, Trai, to look at bringing WhatsApp and other messaging services under the statutory regulatory framework. But the students did not succeed in winning the case to get the WhatsApp policy reversed.

"In addition to laws for data privacy and security, what is required to be done on priority is to educate the end user of the implication of such usage," said Srividya Kannan, the founder and director at Avaali Solutions, based in Bangalore.

India is a key market for Facebook and WhatsApp given the rapid growth of smartphone and internet use. WhatsApp in its defence has said that users are under no obligation to use the app.

The number of internet users in India is estimated to have reached 402 million by the end of last year, meaning that India has passed the United States with the second-largest number of internet users in the world. Only China is ahead, according to the Internet and Mobile Association of India and the research group IMRB International.

"Data privacy is an intrinsic risk to the usage of any of the social media applications," says Ms Kannan. "User data including perhaps the phone number could be compromised for commercial marketing, advertising. For enterprises, while social media is a great means of customer service, this is a double-edged sword and must be designed to prevent leakage of business sensitive information."

Bloomberg
U.S. spies finally embracing iPhones, wireless connections
Sunday, 02 October 2016
Byline: Nafeesa Syeed

Washington - U.S. spies are catching up to the masses in their gradual embrace of 21st-century technology, from installing wireless connections in secure facilities to wielding iPhones and tablets, according to an official with the U.S. National Geospatial-Intelligence Agency.
"We'd be cutting off our noses to spite our faces by denying us those kinds of tools," Matt Conner, deputy chief information security officer of the agency, said in an interview.

The NGA provides intelligence to other parts of the government from battlefield maps to satellite imagery of national disasters. It's among agencies that are working with the Director of National

Intelligence to study how to maximize the use of secure wireless networks and devices, while still maintaining the cover that spies need.

Already, NGA has secure wireless for its senior leaders in its mammoth headquarters in Springfield, Virginia, outside of Washington, Conner said. Protective equipment needed to make a wireless system secure can be costly and "there are people who are skeptical that there's value there," he said.

Conner, 41, a former information security officer with General Dynamics Corp., and others at the NGA migrated last year from BlackBerry devices to iPhones, although they aren't allowed to use them in the agency's building. The agency is also "moving swiftly" toward cloud services with Amazon Web Services on both its encrypted classified network and its unclassified network, as well as working with Microsoft on other cloud-based resources, he said.

In addition, it has developed internal mobile apps for workers as well as a few that are available to the public in Apple's App Store and on Google Play. Its Mobile Awareness GEOINT Environment app helps first responders in natural disasters by letting them geotag field reports and to record photos, videos and audio to share with others.

The agency also has opened an outpost in Silicon Valley. Its staff is trying to learn from startups and tech companies, which are making sophisticated yet widely available commercial geospatial tools, such as Google Earth.

NGA, which operates under the Defense Department, built the model of al-Qaida leader Osama bin Laden's compound in Pakistan that the military used for training before the 2011 raid that killed him. This year, NGA provided intelligence to authorities during the Olympics in Rio.

Conner oversees the cybersecurity of vast digital archives and the transmission of intelligence data. NGA uses encryption for long-haul communication between agencies as well as for the images and products resting in its libraries, he said. His team of a few hundred civilian employees and contractors also has to "sanitize" data that teams collect from social media and other open-source streams, screening for malware.

As with other military agencies, NGA's computer networks are targeted by other nations, according to Conner, who wouldn't name countries but said "they're probably the ones you think they are." The FBI has high confidence recent hacking attacks on U.S. political groups and election systems were orchestrated by Russia, according to a person familiar with the agency's probe. President Vladimir Putin has rejected the accusations.

The high-profile reports of hacking have "absolutely raised the visibility" of his work, Conner said. "I've joked often that it's a good problem to have -- we have more senior-level attention on our cybersecurity program that I'm aware of," he said.

The agency also takes threats from within seriously after the leaks by Edward Snowden, who worked for a National Security Agency contractor.

"We're conscious of the insider," Conner said. "We have a very robust program to manage our insider threat, at least bolstered by the Snowden disclosures three years ago, and that is across the federal agency space."

Daily Telegraph
Cyber crime unit opens amid surge in online attacks
Saturday, 01 October 2016

London - Britain's first national centre for combating cyber criminals will open next week, amid rapid growth in the number of online attacks.
Terrorists, hackers and online gangs will be targeted by intelligence experts at the new National Cyber Security Centre in Victoria, central London. A team of around 700 people will help to advance the Government's war against cyber crime.

The threat is growing, with 200 major incidents a month, double the rate last year.

The centre will be led by Ciaran Martin, formerly the director general for cyber security at GCHQ.

At a cyber security conference in Washington DC earlier this month, Mr Martin outlined plans to create a firewall that could protect government agencies and internet users against cyber attacks. He said Britain was facing twice as many "national security level cyber incidents" as this time last year.

Mr Martin said that the centre would help make the UK "the safest place to live and do business online".

"We'll tackle the major threats from hostile states and criminal gangs. But we'll also work tirelessly to protect people automatically from those smaller scale and deeply damaging attacks." The creation of the agency was announced by George Osborne, the former chancellor, in November last year. GCHQ has said one of the centre's first tasks will be to work with the Bank of England to provide advice to the financial sector.

Shadow Brokers' Whine That Nobody Is Buying Their Hacked NSA Files
Sunday, 02 October 2016
Byline: Joshua Kopstein

Washington - The hacking group responsible for stealing a large cache of National Security Agency hacking tools is very upset that no one seems to be bidding on their pilfered files.

Early Saturday morning, the person or group which calls itself "TheShadowBrokers" authored another bizarre rant, expressing their annoyance at the seeming lack of interest in ponying up bitcoins to release the full set of stolen files.

"Peoples is having interest in free files ... But people is no interest in #EQGRP_Auction," the mysterious hacker group complained in a ranting post on Medium, which seems to be purposely written in Borat-style broken English. "TheShadowBrokers is thinking this is information communication problem."

The message also blindly lashes out at hackers, foreign intelligence services, and basically anyone else who hasn't bid on the files.

"TheShadowBrokers ... is thinking peoples is having more balls, is taking bigger risks for to make advantage over adversaries," the group adds. "Equation Group is pwning you everyday, because you are giant fucking pussies."

So Shadow Brokers are implicitly criticising me for not buying their zero days, or what? Mustafa Al-Bassam October 1, 2016

TheShadowBrokers originally made headlines after posting a sample of the cache, which contained exploit code matching the names and functionality of several previously-revealed NSA hacking tools. The contents and organization of the files led experts to conclude that they were accidentally left behind on a compromised server once used as a staging area by an NSA-linked hacking entity called Equation Group.

That theory was reinforced last week, when Reuters reported that "four people with direct knowledge" of an FBI investigation into the leak had stated that the files were found by Russian hackers after NSA operatives "mistakenly" abandoned them on a remote server. There is still no conclusive evidence that TheShadowBrokers is associated with Russian intelligence services, however.

Motherboard reached out to the hackers and will post an update if we receive a response. However, the group stated in their Medium post that they would only agree to interviews if offered money.

Of course, it's not exactly surprising that no one is rushing to bid on the group's stolen files. While the tools are likely legit, the high profile of the leak makes it insanely risky, and the suspected age of the exploit code makes it unclear whether the hacks are even still effective.

At the time of this writing, TheShadowBrokers have only received bids for a total of 1.76 bitcoins--or about $1,082--far below the group's asking price of $1 million.

Hackers targeted voter registration systems in 20 states
Saturday, 01 October 2016

Washington - With the US presidential election just over a month away, a Homeland Security official says voter registration systems in 20 states were the targets of hackers. The Associated Press reports that an official from the department confirmed the activity over the the last few months and explained that it hasn't been determined if the threats were domestic or foreign. ABC News reported this week that Russian hackers targeted the systems of 20 states and successfully infiltrated four.
This news follows an FBI warning in August that hackers outside of the US took aim at systems in Illinois and Arizona. While it's important to note that these attacks are on the voter registration systems and not the actual voting systems themselves, it's still a major concern heading into the election. There are already concerns that foreign hackers may try to influence the results of the process and the FBI has said it's looking into Russian hackers that may try to do so.

As the AP notes, government officials say that accessing the polling systems to sway an election would be "nearly impossible" because they are decentralized and not connected to the internet in most cases. However, Engadget security columnist Violet Blue argues there's reason to be concerned about the issue for a number of reasons, including aging voting machines. Homeland Security Secretary Jeh Johnson told state election officials last month to take technical precautions and make sure that machines aren't connected to the internet for added security.

Associated Press
Iran says new attack drone modeled on captured US aircraft
Saturday, 01 October 2016

Tehran - Iran's Revolutionary Guard has built a new attack drone which is similar to a U.S. unmanned aerial vehicle captured five years ago, Iranian media reported Saturday.
The semi-official Tasnim news agency says the "Saegheh" (Thunderbolt) drone is similar to the RQ-170 Sentinel spy drone. Iran's state-run Press TV says the long-range drone can carry four precision-guided bombs. Neither report gave figures for the drone's range.

Iran claimed to have shot down an RQ-170 drone used by the Central Intelligence Agency in December 2011 and broadcast footage of the recovered aircraft. It also claims to have captured three American ScanEagle drones.

Iran said last year that it had successfully tested its replica of the RQ-170.

Also on Saturday, Tasnim published photos of what it said was a U.S.-made MQ-1C drone captured recently by the Guard. It did not say when or how the drone was captured.

Fox News
FBI files reveal how Clinton server was created in K Street lab
Saturday, 01 October 2016
Byline: Catherine Herridge & Pamela K. Browne

Washington - If Hillary Clinton's 'homebrew' server ever got the Mary Shelley treatment, IT specialist Bryan Pagliano would make a fine Dr. Frankenstein - FBI documents reveal new details about how he painstakingly created the machine over a series of months while working in a room along Washington's storied K Street.
According to files released last Friday evening, Pagliano worked to design and build the now-infamous server inside a room once used as part of Clinton's campaign headquarters. On the street known as Washington's power corridor, Pagliano even used computer remnants from Clinton's failed 2008 presidential bid, where he had worked as an IT specialist.

The story of how the server came into existence became clearer thanks to witness interviews known as 302s. Though they were highly redacted, the bureau files include new details Pagliano revealed in a June 24 interview with the FBI.

In that interview, Pagliano said it was longtime Clinton Foundation aide Justin Cooper who asked him to build the server "in the fall of 2008" and that Pagliano completed the work in early 2009. (Pages 155, 163)

After the server's completion in the makeshift lab on K Street, Pagliano stated that he "rented a minivan and drove to Chappaqua New York to install the email server in the Clinton residence."

Pagliano and Cooper were separately interviewed by the FBI five times during the bureau's investigation into Clinton's use of private server and private email for government business while secretary of state. According to the reviewed documents, Pagliano was interviewed first on Dec. 22, 2015 and again six months later on June 21, 2016.

Cooper was interviewed three times -- once in 2015 and twice in 2016 -- and appeared before Congress. Pagliano was one of five people who received limited immunity from the Justice Department, has taken the Fifth and refused to testify before Congress.

In his interviews with the FBI, Pagliano said that "he could not recall any existing computer systems at the Chappaqua residence other than the Apple server described previously to the FBI."

Widely published reports including one in the New York Times indicated that Clinton was informally announced as Obama's choice of secretary of state on Nov. 22, 2008, with her formal nomination on Dec. 1. After working in her 2008 presidential campaign, Pagliano joined Clinton in the State Department as an employee and IT specialist, but he also continued to work on the homebrew server he built.

Pagliano, though, insisted to the FBI that he "believed the email server he was building would be used for private email exchange with Bill Clinton aides."

In addition, it was during his second interview with the FBI in June, that Pagliano suddenly "recalled being given a list of user names and passwords that Cooper asked to be transferred from Cooper's Apple server to Pagliano's system." (Page 164)

The 302 continued, "Pagliano did not recall transferring an account for Hillary Clinton and does not know how her account was installed on the server he built."

Justin Cooper did not work for the State Department but stated in his March 2016 interview that he registered the domain, clintonemail.com, because he handled financial issues for the Clintons. Cooper continues to works for Clinton Foundation entities which include Teneo.

Despite handing out limited immunity deals to five people including Pagliano, FBI Director James Comey has stated that Clinton's actions with her email practices were "extremely careless" -- but not criminal. As a presidential candidate once again, Hillary Clinton continues to refer to the server and her use of private email as "a mistake."

Strikingly, Cooper also said in his March interview that Hillary Clinton "had Sensitive Compartmented Information Facilities (SCIF's) in both her New York residence as well as her residence in the District of Columbia (DC)."

In his last interview with the FBI in June, Cooper suddenly remembered there were also two identical iMac computers inside what were supposed to be tightly secured rooms used to review classified materials. The interview states, "Cooper recalled a personally-owned iMac computer in the Sensitive Compartmented Information Facility (SCIF) of both the Washington, DC and Chappaqua, NY residences of Hillary Clinton."

Cooper added he did not have the combination to open the SCIF and admitted: "The SCIF doors at both residences were not always secured." This on its face is a direct violation of security protocol.

Cooper added further insight into close aide Huma Abedin's access to the SCIFs by stating "Abedin was frequently there but did not know if Abedin could access the SCIF when it was secured."

Catherine Herridge is an award-winning Chief Intelligence correspondent for FOX News Channel (FNC) based in Washington, D.C. She covers intelligence, the Justice Department and the Department of Homeland Security. Herridge joined FNC in 1996 as a London-based correspondent.

Pamela K. Browne is Senior Executive Producer at the FOX News Channel (FNC) and is Director of Long-Form Series and Specials. Her journalism has been recognized with several awards. Browne first joined FOX in 1997 to launch the news magazine "Fox Files" and later, "War Stories."

Mail on Sunday
Inside China's Bif Brother HQ
Sunday, 02 October 2016
Byline: George Knowles

about their daily lives in airports, government buildings, sports stadiums, high streets and stations. Hikvision, a company controlled by the Chinese government, was recently revealed to be Britain's biggest supplier of CCTV equipment, raising fears its internet-linked cameras could be hacked from Beijing at the touch of a button.

Last week, undercover Mail on Sunday reporters posed as businessmen to infiltrate its headquarters in the 'surveillance city' of Hangzhou in eastern China, to investigate its activities.

What they found will raise fresh cause for concern about a company whose growing influence in the UK has already been questioned by former MI6 officers and Security Ministers. Far from being the independently run business it claims to be in its customer-friendly marketing, Hikvision is controlled by China's ruling Communist Party.

Hikvision is central to the government's Orwellian programme to spy on its 1.3 billion citizens, and is inextricably linked to the totalitarian crackdown on those considered 'enemies of the state'.

More worryingly, Hikvision vice-president Pu Shiliang, 38, is also technical leader of a key laboratory at the Ministry of Public Security, the feared body that has been accused of the extrajudicial arrest and detention of thousands of lawyers, activists and perceived government opponents within China every year.

Hikvision's high- tech CCTV systems can 'see in the dark', track vehicles, and count the number of people entering and leaving a building, as well as boasting unparalleled 'face-tracking' technology.

They are even able identify a person by their gait.

These capacities enable the Chinese authorities to track dissidents, activists and human-rights campaigners, who are routinely rounded up and detained.

Last night, Lord West of Spithead, a Security Minister under Labour, said: 'We know very well that the Chinese hack Western systems on a massive scale to get intellectual property, but this is even more

worrying. If these cameras were in an office, they could see all the paperwork and get names of employees.

'What I've been pushing for is for the Government to set up a group that looks at the implications of all these decisions, and that should include the security agencies.

'The Chinese are hacking on a massive scale and if people do that, it's only right that we look at the implications.

'Yes, we want to trade with them, but people have to play by certain rules.'

Hikvision has been bankrolled to the tune of billions of pounds from Beijing, using the funding to sell CCTV systems at what critics claim are below market prices, and enabling it to become the world's biggest video surveillance system company in under a decade.

But until now, no one has seen behind the darkened glass windows of its headquarters in Hangzhou.

The Mail on Sunday was shown surveillance systems capable of singling out 'targets' in crowds within seconds by studying their faces and gait. Officials candidly told us their cameras in cities across China are controlled by the government which used them to track wanted people on a vast database of 'bad guys'.

They also told us government officials used the G20 summit in Hangzhou last month, attended by Barack Obama, Angela Merkel and Theresa May, to test the system's latest people-watching capabilities.

The China-wide project using products made by Hikvision and other smaller technology companies is called Skynet - the same name as the malignant Artificial Intelligence system bent on destroying humanity in the Terminator films.

And while Hikvision tells customers Skynet is an anti-crime initiative, government policy documents declare that its primary aim is to prevent public protests and 'find and control hostile forces' threatening China's repressive one-party state.

The revelations raise uncomfortable questions over whether Hikvision - now the biggest security camera provider in Britain with 20 per cent of the market - should be allowed unfettered access to the UK, and why it has never been subjected to security checks.

Experts fear Hikvision's internet-linked surveillance systems could potentially be remotely hacked from China through so-called 'back door' loopholes and used to track dissidents and human rights campaigners seeking refuge in the UK.

Nigel Inkster, a former deputy chief of MI6, said: 'There's probably a good case for a government look at this - who controls or has access to significant amounts of our national infrastructure.'

The firm's systems are in use on the London Underground network and in city centre surveillance in Salford, Manchester, and Hammersmith and Fulham in London, including at Chelsea Football Club.

Managers at Hikvision agreed to give us a tour of the research and development facilities, apparently keen to drum up more orders from overseas clients. In a suite of showrooms, we were shown surveillance cameras capable of seeing through fog and dark, and systems that can read vehicle number plates. The systems' advanced technology can also give accurate estimates of a target's age, sex and height.

'We have many customers in Britain now,' a company official told us. 'It is one of our biggest overseas markets after the US.'

Hikvision, which has 17,000 employees, says its urban surveillance systems target criminals and terrorists. 'We call it our safe city project,' the official said. 'Our cameras help to make a better world, a better city. If someone has committed a crime and walks across this camera area they will be identified from the database and the information will be instantly sent to the police.'

But a government document on Skynet issued in 2005 stated that its main aim was not to prevent normal crime but to maintain 'social stability... find out and control hostile forces' and to 'prevent mass disturbances in public areas'.

In an attempt to address privacy concerns, the official added: 'We just provide the cameras. We do not use the database ourselves, so people's privacy is protected. It is the government that controls the cameras and the database.'

China's leader Xi Jinping - who has led a ruthless crackdown on dissidents since his appointment in 2013 - visited Hikvision's HQ last year, praising its work and applauding the company for having a workforce with an average age of just 28.

Despite claiming on its website to be 'an independent and publicly traded corporation', Hikvision is in fact owned by Chinese Electronic Technology Corporation, a government body tasked with developing electronic systems for military and civilian use, including developing software to collate data on the jobs, hobbies, consumption habits and other behaviour of citizens to identify 'terrorists'.

As it rapidly expands its global presence, Hikvision has been generously bankrolled by Chinese state banks, which critics say give it an unfair commercial edge. It received £2.4 billion from China Development Bank in December and a further £2.3 billion loan from the Export-Import Bank of China in August, both of which are controlled by the government.

Weeks before our visit, Hangzhou hosted the G20 summit and tens of thousands of Hikvision surveillance cameras were put in place on key road junctions and buildings. Every taxi and bus also had

miniature security cameras installed. Today, there are an estimated 600,000 CCTV cameras in Hangzhou - one for every ten residents - making it one of the world's most watched cities along with the capital Beijing, which state media boasts is now '100 per cent covered' by surveillance cameras.

'You can be watched anywhere you go in Hangzhou,' the company official told us, adding that the G20 was used to test the efficiency of the latest Skynet systems. 'It was like an experiment,' he said.

The Chinese government's bid to expand Skynet reflects its paranoid determination to wipe out any opposition to the Communist Party as its economy stutters.

In the north-eastern city of Changchun, there was an outcry in 2013 when hundreds of thousands of surveillance cameras failed to find any trace of a car stolen from outside a supermarket with a sleeping two-year-old baby boy in the back. The boy was later found murdered.

'Skynet is useless. It isn't for public protection - it is just for following dissidents,' one furious resident said on an online forum.

Last night, Sir Malcolm Rifkind, former chairman of Parliament's Intelligence and Security Committee, said: 'There's clearly going to be a series of these Chinese-related projects and some may or may not have national security implications. There's going to be a need for a more joined-up strategy.

'You can't automatically say all business with China is dangerous but the security agencies can give expert judgment on the technical possibilities of another government accessing systems.'

John Honovich, head of the surveillance industry monitor IPVM, said the systems developed by Hikvision gave the Chinese government 'a powerful means to monitor and suppress any opposition to the party'.

He said that Hikvision was being heavily funded by China's state banks in a push to give it global dominance, allowing it to undercut rivals and sell systems overseas at relatively low prices.

'The overall strategic goal is to maximise market share, even at the expense of losses,' he added.

Mr Honovich advised local and national governments not to use Hikvision products at all, arguing: 'The risks of using products manufactured by the Chinese government are simply too high.'

WE CAN SEE YOU...

Workers inspect a bank of monitors at Hikvision's headquarters in Hangzhou, the surveillance capital of the world with 600,000 cameras such as the one above. Its software - shown in action, right - can identify faces and even a person's gait. The Chinese authorities have used this technology to identify dissidents at a glance and place them in long-term detention.

How Ottawa revived Canada's most controversial privacy issue
Wednesday, 05 October 2016
Byline: Michael Geist
Section: oped

The controversial issue of lawful access rules, which address questions of police access to Internet subscriber information and the interception capabilities at Canadian telecommunications companies, has long been played down by Canadian governments.
When the policy proposals first emerged in the early 2000s, the Liberal government focused on the anti-terrorism and anti-spam benefits. Subsequent Conservative proposals promoted the ability to combat child pornography and, most recently, cyberbullying.

Yet when the Conservatives passed lawful access legislation in late 2014, it seemed that more than a decade of debate had delivered a typical Canadian compromise.

The new legislation eliminated liability concerns for Internet service providers that voluntarily disclose basic subscriber information and created a series of new police powers to require access to, and preservation of, digital data.

The law faced some criticism, but more contentious proposals involving mandatory warrant-less disclosure of personal information and government-prescribed surveillance capabilities for telecom networks were not included.

Moreover, the Supreme Court of Canada ruled in the R v. Spencer case in June, 2014, that there was a reasonable expectation of privacy in subscriber information such that a warrant is required for disclosure in most circumstances.

Notwithstanding the legislative resolution and renewed legal certainty, Public Safety Minister Ralph Goodale has quietly revived the lawful access debate with a public consultation that raises the prospect of new rules that would effectively scrap the 2014 compromise.

Ironically, the focus this time is the public's demand for amendments to Bill C-51, the Conservatives' anti- terrorism law that sparked widespread criticism and calls for reform during last year's election campaign.

In other words, the balance of Canadian privacy is being put at risk by a policy initiative the purports to fix privacy.

The Public Safety consultation skips over the years of lawful access debate by putting everything back on the table, acknowledging that the law was updated less than 24 months ago but suggesting that more change may be needed.

For example, it implies that the "lack of consistent and reliable technical intercept capability on domestic telecommunications networks" presents a risk to law-enforcement investigations.

Yet left unsaid is that the prior proposed solutions in the form of government- mandated interception capabilities were rejected because of the enormous cost, inconsistent implementation and likely ineffectiveness of standards that would exempt many smaller providers.

The consultation also renews the possibility of easier access to basic subscriber information. Even after the Spencer court decision, transparency reports from many of Canada's largest telecom companies indicate that law enforcement still regularly obtains access to subscriber information.

The current approach strikes a balance that reflects the need for access for investigative purposes and the privacy protections to which all Canadians are entitled.

The consultation hints that changes to the basic subscriber information access system are coming with an emphasis on "the needs of law enforcement and national security agencies and the impact of those measures on industry" before any reference to privacy law.

In fact, Mr. Goodale places another controversial issue on the policy table, noting that encryption technologies are "vital to cybersecurity, e-commerce, data and intellectual property protection, and the commercial interests of the communications industry" but lamenting that those same technologies can also be used by criminals and terrorists.

Given its widespread use and commercial importance, few countries have imposed decryption requirements. However, this year's controversy involving access to data on an Apple iPhone owned by one of the San Bernardino, Calif., shooters revived the debate over access to encrypted communications, and the consultation asks Canadians to comment on the circumstances under which law enforcement should be permitted to compel decryption.

The consultation remains open until Dec. 1, but the message from the government is clear: The cost of changing Bill C-51 comes with a significant privacy price.

The anti-terrorism provisions that sparked concern will be examined, but so too will be lawful access rules that have enormous implications for Canadian business, law enforcement and the broader public.

Michael Geist holds the Canada Research Chair in Internet and E-commerce Law at the University of Ottawa, Faculty of Law.

Ottawa Citizen
StatCan's new head likes move to SSC

Wednesday, 05 October 2016
Byline: Tom Spears

Ottawa - Canada's new chief statistician has only good things to say about his agency's move to Shared Services Canada, almost three weeks after the former chief statistician called the situation "really damaging" and quit.
In September, Wayne R. Smith said the centralizing of computer services by SSC threatens Statistics Canada's ability to do good work.

On Tuesday, Anil Arora, the new head of StatCan, said he looks forward to improved data protection once Shared Services provides the IT infrastructure for his department.

"We have partnerships with service providers and always have had, for decades," Arora said in an interview.

"This is another partnership. It's an important partnership for us" that requires robust and secure infrastructure to handle massive amounts of data.

"Look, there are all sorts of risks that we manage on a daily basis," and StatCan is good at adapting and making contingency plans, he said.

"That (the transfer to SSC) is one additional risk that obviously we have to manage, and I have got nothing but co-operation from Shared Services Canada in understanding what our business is like and in working with us. So we are working closely with them" to look at capacity demands and ensure the infrastructure will support growing future demands with safeguards on privacy, he said.

"We have to do our share, and they have to be held accountable to do their share.

"I've got nothing but positive feedback that we are going to be able to work collaboratively."

StatCan also stands to gain from the SSC changes because there will be one central computer system to keep safe and up to date, which is "a lot better protection than if we have to worry about 40 disparate systems."

"I have the utmost respect for Wayne," he said, adding that Smith deserves credit for "successfully turning the census back to its mandatory long form" and other work. The recent census "is probably the best collection (of data) that we have seen."

"Wayne has his views, and he has made them known publicly.

"My job is to ensure that we continue to move forward, and I have my own style, my own way of doing things ... To me, it's really about the energy of the people that work here and the collaborative nature in which we are going to move forward."

Arora said StatCan has an "exciting and an ambitious agenda" and staff there "are really pumped" about the future.

Arora spent 21 years at StatCan and was assistant chief statistician when he left 6½ years ago for Natural Resources Canada and later Health Canada.

Amid Deteriorating U.S.-Russia Relations, Questions Grow About Cyberwar
Wednesday, 05 October 2016
Byline: Mary Louise Kelly

Washington - Just when you thought U.S.-Russia relations couldn't get worse, diplomatic deals on both Syria and nuclear security fell apart this week.
Moscow went first, announcing that it was pulling out of a landmark agreement on plutonium. Russia's President Vladimir Putin blamed "unfriendly actions" by the United States.

Hours later, Washington said it was breaking off talks on a ceasefire in Syria. "This is not a decision that was taken lightly," State Department spokesman John Kirby wrote in a statement. "Unfortunately, Russia failed to live up to its own commitments."

Moscow and Washington aren't cooperating on much of anything these days. And that prompts a question: What might come next, in the way of cyberattacks?

Russia is suspect-in-chief for recent attacks on targets ranging from the Democratic National Committee to a former U.S. NATO commander to former Secretary of State Colin Powell.

Rob Knake, who until last year served as director of cybersecurity policy for the National Security Council, says the toxic atmosphere might open the door to the U.S. retaliating. Until recently, Knake says, "We would say we want Russia's help on Syria. We want Russia's help on nukes. We want Russia's help on North Korea. Now, we've taken at least two of those issues off the table."

His point: if Russia and the U.S. aren't cooperating anyway, there may be less of a downside to hitting back on the cyber front. On the flip side, Knake argues, Russia may also feel less constrained.

"If they don't have an interest in cooperating with the U.S. in Syria, they may feel free to unleash the kind of attacks that they have yet kept on hold," he says. He sees a real risk of tit-for-tat retaliation spiraling out of control.

Angela Stent, who's watched Russia for many years from perches at the National Intelligence Council and now at Georgetown University, takes a different view, though she agrees this marks an exceptionally dangerous period in U.S.-Russia relations.

"This is the lowest point -- it's the worst relationship -- since, I would say, before Gorbachev came to power," she says, meaning all the way back to the 1980s, before Mikhail Gorbachev took over as the Soviet Union's head of state.

But Stent is not persuaded this low point will translate to gloves-off, bare-knuckle fighting in the cyber arena. That's because Moscow and Washington still share common interests -- including Syria, where Russia and the U.S. are still working together to coordinate counterterrorism operations.

Still, Stent says, Russia will not stop trying to provoke the U.S. with cyber intrusions.

"I think the Kremlin concluded some time ago that this was a lame-duck administration," she says. "And that this was the time to get whatever advantages they can. Because they don't know what the next president's going to do."

Meanwhile, President Obama and his advisers continue to avoid publicly naming and blaming Russia. They cite the ongoing FBI-led investigation into recent hacks.

CIA director John Brennan went about as far as any administration official has, in front of a crowd last week at the Washington Ideas Forum.

Asked whether Russia is trying to hack the U.S. election, Brennan replied: "What we do at [the] CIA is to look at a country's capabilities, look at their intent, look at things that they have done in the past, and determine whether something that certainly looks like a duck, smells like a duck and flies like a duck, whether it's a duck or not."

The question now is whether -- and how -- Washington decides to hunt.

Washington Post
Yahoo scanned all of its users' incoming emails on behalf of U.S. intelligence officials
Wednesday, 05 October 2016
Byline: Andrea Peterson

Washington - Yahoo in April of last year began secretly scanning the incoming emails of its hundreds of millions of users to comply with an order from the U.S. intelligence community, a move that prompted at least two company officials to leave, according to a former Yahoo employee familiar with the matter.

The company's decision not to fight the order from intelligence officials caused Yahoo's then-chief information security officer Alex Stamos to resign last year -- and at least one other security staffer left the company -- due to ethical concerns about the surveillance program, according to the person, who spoke on the condition of anonymity because the matter was confidential. Reuters, citing unnamed former employees, first reported the news Tuesday.

The government's demand to scan email in real time alarmed privacy advocates, as did Yahoo's compliance with such a broad order. Patrick Toomey, a staff attorney with the American Civil Liberties Union, called the order "unprecedented and unconstitutional."

"It is deeply disappointing that Yahoo declined to challenge this sweeping surveillance order, because customers are counting on technology companies to stand up to novel spying demands in court," he said in a statement.

Google, which runs Gmail, said in a statement: "We've never received such a request, but if we did, our response would be simple: 'no way'." Microsoft, another major email provider, said, "We have never engaged in the secret scanning of email traffic like what has been reported today about Yahoo." Apple, in a statement said, "We have never received a request of this type. If we were to receive one, we would oppose it in court."

It was unclear which intelligence agency directed Yahoo to scan emails, the person familiar with the matter said. It's also unknown what the government officials were looking for and what, if any, data Yahoo turned over to the government, the person said. The Office of the Director of National Intelligence did not respond to a request for comment.

"Yahoo is a law abiding company, and complies with the laws of the United States," the company said in a statement.

The company has fought a previous government request for data. In 2007, Yahoo unsuccessfully argued as unconstitutional an intelligence community demand that it hand over user communications to and from foreign targets without individual search warrants.

The challenge was heard in the secretive Foreign Intelligence Surveillance Court and some details about the case have remained under seal. But documents declassified in 2014 showed that the government threatened Yahoo with a massive $250,000 per day fine if it did not comply.

But Yahoo chief executive Marissa Mayer's decision to obey the order last year upset Stamos and some other senior executives, according to Reuters. Instead of looping in the security team, Mayer turned to the Yahoo's email engineers to develop the software, Reuters reported. That decision led to a programming error that left all Yahoo email vulnerable to hackers, the former Yahoo employee said.

When reached via Twitter direct message, Stamos, who is now Facebook's chief security officer, said, "I'm not commenting at all."

New York Times
Federal Tactics in Data Pursuit Are Excessive, Tech Firms Say
Wednesday, 05 October 2016
Byline: Nicole Perlroth, Katie Benner

San Francisco - It has been six months since the Justice Department backed off on demands that Apple help the F.B.I. break the security of a locked iPhone.
But the government has not given up the fight with the tech industry. Open Whisper Systems, a maker of a widely used encryption app called Signal, received a subpoena in the first half of the year for subscriber information and other details associated with two phone numbers that came up in a federal grand jury investigation in Virginia.

The subpoena arrived with a court order that said Open Whisper Systems was not allowed to tell anyone about the information request for one year.

Technology companies contend that court-imposed gag orders are being used too often by law enforcement and that they violate the Bill of Rights. The companies also complain that law enforcement officials are casting a wide net over online communications -- often too wide -- in their investigations.

Justice Department officials, for their part, argue that these gag orders are necessary to protect developing cases and to avoid tipping off potential targets. The officials say that they are simply following leads where they take them.

Through a spokesman, the Justice Department declined to comment on the case.

The information request made of Open Whisper Systems is particularly sensitive, since its encryption app is used around the world, and it is often recommended to journalists and human rights activists.

Microsoft sued the Justice Department over the gag order practice in April, arguing that law enforcement was relying on these orders too often. Specifically, the software giant said the gag orders violate the Fourth Amendment right of its customers to know if the government searches or seizes their property and also the company's First Amendment right to speak to its customers.

Microsoft also complained that the orders often came without time limits, unlike the Open Whisper Systems order. Dozens of other technology, media and civil liberties groups filed briefs supporting Microsoft last month, and the case is pending.

Part of the gag order on Open Whisper Systems was lifted after a court challenge by the American Civil Liberties Union, and redacted versions of documents related to the information request were made public last week. But the small San Francisco company was still not allowed to tell specific account holders about the investigation.

The documents made public show that the government asked Open Whisper Systems to turn over data associated with two telephone numbers, including web browsing histories and data stored in the tracking "cookies" of the web browsers attached to those accounts. But one of Signal's biggest draws is that it does not collect most of that information.

"The Signal service was designed to minimize the data we retain," said Moxie Marlinspike, the founder of Open Whisper Systems. Mr. Marlinspike said Signal uses a technology called end-to-end encryption that kept the service from gaining access to the contents of its users' messages. The company also does not store information on those with whom its users are communicating.

Civil liberties lawyers argue the Justice Department request fell well outside the bounds of what is typically covered by a subpoena, including basic subscriber information. Additional information, such as computer logs or content, would require a search warrant under the 1986 Electronic Communications Privacy Act.

"The Justice Department is pushing the envelope," said Jennifer Granick, director of civil liberties at the Stanford Law School Center for Internet and Society. Big companies like Apple and Microsoft have the wherewithal to push back, she said. But smaller companies may cave, rather than risk an expensive fight.

The Justice Department came to Open Whisper Systems with a menu of information needs, including subscriber details, addresses, telephone numbers, email addresses and method of payment. The request went on to demand information on internet addresses, browsers and internet providers that the account holders could have used, according to court records.

One of the phone numbers the government was investigating was not a Signal user after all. For the other phone number, Open Whisper Systems turned over the only pieces of data it could: the time the user's account had been created and the last time it had connected to the service -- far less than the government sought.

In other circumstances, the government has tried to force companies via court order to re-engineer their services to collect missing pieces of information, as it did with Apple earlier this year and in a similar case in 2013 against Lavabit, a small encrypted messaging service used by the former defense contractor Edward J. Snowden.

The government did not make that request of Open Whisper Systems. "They need to pick those cases carefully," Ms. Granick said. "They are only picking cases where they think they're going to have the people on their side."

The Justice Department and F.B.I. tried to force Apple to break its own software security in the case of an iPhone used by a gunman in last year's San Bernardino terrorist attacks, she said.

Companies are having some success in getting courts to lift gag orders. Last year, Nicholas Merrill, the owner of a now-defunct internet service provider, got a gag order lifted, though it took more than a decade. After the court decision in Mr. Merrill's case, a federal judge in the Eastern District of New York denied gag orders in more than a dozen cases related to Facebook subpoenas last May. And in June, Yahoo was successful in getting a court to lift gag orders on a number of law enforcement information requests.

"Gag orders should be used in exceptional cases," said Brett M. Kaufman, the staff attorney with the A.C.L.U. who represented Open Whisper Systems. "This one demonstrates that the exception has become the rule in routine proceedings."

London Times
Cardiff man 'hid data on cufflink for use in terrorism'
Wednesday, 05 October 2016
Byline: John Simpson

London - A suspected member of Islamic State is accused of giving terror training on encrypted technology and secreting a computer program on a removable hard drive hidden in a cufflink in pursuit of its campaign of terrorism.
Samata Ullah, 33, was charged last night with six terror offences including membership of Islamic State -- a proscribed organisation -- and downloading books on missile guidance systems for terrorist purposes.

Mr Ullah, of Cardiff, was also charged with directing "an organisation which is concerned in the commission of acts of terrorism" and in relation to giving instruction on the use of encrypted technology on a blog.

The charges include the allegation that Mr Ullah had a "USB cufflink that had an operating system loaded on to it for a purpose connected with the commission, preparation or instigation of terrorism" and the possession of "a book about guided missiles and a PDF version of a book about advanced missile guidance" for the same purpose. All the charges relate to offences allegedly committed on or before September 22. Mr Ullah is expected to appear in custody at Westminster magistrates' court today.

Mr Ullah lives in the Grangetown area of Cardiff with his family, who run the Cardiff Commercial Cleaning company. Neighbours have said that he regularly works out at a gym.

Announcing the charges, a spokesman for Scotland Yard said: "The arrest, which took place in the street in Cardiff by officers from the Counter Terrorism Command was pre-planned and as a result of a pro-active investigation by the Counter Terrorism Command supported by the Wales extremism and counterterrorism unit."

New York Times
Assange Sets New Schedule of Disclosures
Wednesday, 05 October 2016
Byline: Melissa Eddy

Berlin - Julian Assange, the founder of WikiLeaks, promised on Tuesday to release "significant material" over the next 10 weeks about arms, Google, mass surveillance, oil, the United States election and war. Speaking via a video link at a news conference in Berlin to mark a decade since the inception of WikiLeaks, Mr. Assange vowed that his organization would continue to provide a platform for the release of classified documents held by the United States and by other governments and institutions in positions of global power.

"We hope to be publishing every week for the next 10 weeks, we have on schedule, and it's a very hard schedule, all the U.S. election-related documents to come out before Nov. 8," said Mr. Assange, who made his announcement from the Ecuadorean Embassy in London, where he has been living since 2012. "Our upcoming series includes significant material on war, arms, oil, Google, the U.S. elections and myself."

WikiLeaks used the occasion of its 10th anniversary to trumpet some of its prominent releases of information, including documents about the United States detention camp at Guantánamo Bay, Cuba; files about the wars in Iraq and in Afghanistan; United States diplomatic cables; and Democratic Party emails that were made public on the eve of the party's convention in Philadelphia.

The remarks from Mr. Assange disappointed many followers of WikiLeaks in the United States, who had stayed up hoping to hear information relevant to the presidential election.

Although Mr. Assange promised to release such documents before the election on Nov. 8, he said, "If we are going to make a major publication, we don't do it at 3 a.m." in the United States.

He dismissed speculation that the documents related to the United States election would contain information intended to damage the candidacy of Hillary Clinton, the Democratic nominee. The idea that "we intend to harm Hillary Clinton, or I intend to harm Hillary Clinton, or I don't like Hillary Clinton, all those are false," Mr. Assange said.

Mr. Assange laughed when he was asked whether he felt any personal affinity for her Republican rival, Donald J. Trump, saying that he felt "personal affinity for all human beings." He explained that he felt sorry for both Mrs. Clinton and Mr. Trump, given that "these are two people who are tormented by their ambitions."

Mr. Assange had been scheduled to make the announcement from the balcony of the embassy where he has been staying since Ecuador granted him political asylum, but he changed that plan at the last minute because of security reasons. He declined to give further details about those concerns.

Mr. Assange sought refuge after Sweden said it wanted him for questioning on allegations of rape, an accusation that he has denied. He feared that if he were sent to Sweden, he would then be extradited to the United States to face espionage charges.

Times of India
7,000 Indian sites hacked, claim Pak rookies
Wednesday, 05 October 2016
Byline: Chethan Kumar

Bengaluru - A group of Pakistani hackers has said they have hacked 7,070 Indian websites and released a list of names early on Tuesday. The hackers are no experts, say cyber security specialists, but are 'script kiddies' or those who don't write their own code and use existing scripts to hack into websites.
Each of the websites has the logo of the hacking group, Pakistan Haxors Crew, and a song "Ae watan tera ishara aagaya, ar sipahi ko pukar aagaya..." (Oh nation, we've received your signal, every soldier has got his call(ing)..." begins to play with a scroll that reads, "Tum ne socha tha, hum ne kar dikhaya" (You thought, we've done it). The group has in the past hacked websites of Tata Motors, AIADMK and Taj Mahal, and on Tuesday, said, "There is more to come."

While most of them are non-government websites, experts say this indicates how vulnerable Indian websites are to such threats. According to information from the communication and information technology ministry, 1,490 government websites have been hacked between January, 2010, and December, 2015. The data for this year is yet to be compiled.

"I've seen their post. They are not even proper hackers. They are what we call script kiddies, people who use existing computer scripts to hack into computers as they lack the expertise to write their own," says Mirza Faizan Asad, legal head, Global Cyber Security Response Team. And, if people who cannot write their own code are hacking into websites, the damage by real hackers would be greater.

One of the worst instances of the hacking of a government website was in August, 2013. The Electronics Corporation of India Ltd (ECIL) website was hacked by 'PhrozenMyst', who allegedly stole sensitive data pertaining to the Indian Space Research Organisation (Isro) and Bhabha Atomic Research Centre (Barc). The hacking of government websites saw a decline from 2013. However, in 2015, the number went up.

Aravind Prakash, associate professor at Binghamton University, US, said, "There is always a school of thought that will argue, 'why can't we buy software'? But one must understand that you cannot trust these companies that we buy from to provide a vulnerability- free software or system. Intrusion or hacking happens when there are vulnerabilities."

Reuters
Yahoo secretly scanned customer emails for U.S. intelligence - sources
Tuesday, 04 October 2016
Byline: Joseph Menn

San Francisco - Yahoo Inc last year secretly built a custom software program to search all of its customers' incoming emails for specific information provided by U.S. intelligence officials, according to people familiar with the matter.
The company complied with a classified U.S. government directive, scanning hundreds of millions of Yahoo Mail accounts at the behest of the National Security Agency or FBI, said two former employees and a third person apprised of the events.

Some surveillance experts said this represents the first case to surface of a U.S. Internet company agreeing to a spy agency's demand by searching all arriving messages, as opposed to examining stored messages or scanning a small number of accounts in real time.

It is not known what information intelligence officials were looking for, only that they wanted Yahoo to search for a set of characters. That could mean a phrase in an email or an attachment, said the sources, who did not want to be identified.

Reuters was unable to determine what data Yahoo may have handed over, if any, and if intelligence officials had approached other email providers besides Yahoo with this kind of request.

According to the two former employees, Yahoo Chief Executive Marissa Mayer's decision to obey the directive roiled some senior executives and led to the June 2015 departure of Chief Information Security Officer Alex Stamos, who now holds the top security job at Facebook Inc."Yahoo is a law abiding company, and complies with the laws of the United States," the company said in a brief statement in response to Reuters questions about the demand. Yahoo declined any further comment.

Through a Facebook spokesman, Stamos declined a request for an interview.

The NSA referred questions to the Office of the Director of National Intelligence, which declined to comment.

The demand to search Yahoo Mail accounts came in the form of a classified directive sent to the company's legal team, according to the three people familiar with the matter.

U.S. phone and Internet companies are known to have handed over bulk customer data to intelligence agencies. But some former government officials and private surveillance experts said they had not previously seen either such a broad directive for real-time Web collection or one that required the creation of a new computer program.

"I've never seen that, a wiretap in real time on a 'selector,'" said Albert Gidari, a lawyer who represented phone and Internet companies on surveillance issues for 20 years before moving to Stanford University this year. A selector refers to a type of search term used to zero in on specific information.

"It would be really difficult for a provider to do that," he added.

Experts said it was likely that the NSA or FBI had approached other Internet companies with the same demand, since they evidently did not know what email accounts were being used by the target. The NSA usually makes requests for domestic surveillance through the FBI, so it is hard to know which agency is seeking the information.

Reuters was unable to confirm whether the 2015 demand went to other companies, or if any complied.

Alphabet Inc's Google and Microsoft Corp, two major U.S. email service providers, did not respond to requests for comment.

CHALLENGING THE NSA

Under laws including the 2008 amendments to the Foreign Intelligence Surveillance Act, intelligence agencies can ask U.S. phone and Internet companies to provide customer data to aid foreign intelligence-gathering efforts for a variety of reasons, including prevention of terrorist attacks.

Disclosures by former NSA contractor Edward Snowden and others have exposed the extent of electronic surveillance and led U.S. authorities to modestly scale back some of the programs, in part to protect privacy rights.

Companies including Yahoo have challenged some classified surveillance before the Foreign Intelligence Surveillance Court, a secret tribunal.

Some FISA experts said Yahoo could have tried to fight last year's directive on at least two grounds: the breadth of the demand and the necessity of writing a special program to search all customers' emails in transit.

Apple Inc made a similar argument earlier this year when it refused to create a special program to break into an encrypted iPhone used in the 2015 San Bernardino massacre. The FBI dropped the case after it unlocked the phone with the help of a third party, so no precedent was set.

Other FISA experts defended Yahoo's decision to comply, saying nothing prohibited the surveillance court from ordering a search for a specific term instead of a specific account. So-called "upstream" bulk collection from phone carriers based on content was found to be legal, they said, and the same logic could apply to Web companies' mail.

As tech companies become better at encrypting data, they are likely to face more such requests from spy agencies.

Former NSA General Counsel Stewart Baker said email providers "have the power to encrypt it all, and with that comes added responsibility to do some of the work that had been done by the intelligence agencies."

SECRET SIPHONING PROGRAM

Mayer and other executives ultimately decided to comply with the directive last year rather than fight it, in part because they thought they would lose, said the people familiar with the matter.

Yahoo in 2007 had fought a FISA demand that it conduct searches on specific email accounts without a court-approved warrant. Details of the case remain sealed, but a partially redacted published opinion showed Yahoo's challenge was unsuccessful.

Some Yahoo employees were upset about the decision not to contest the more recent directive and thought the company could have prevailed, the sources said.

They were also upset that Mayer and Yahoo General Counsel Ron Bell did not involve the company's security team in the process, instead asking Yahoo's email engineers to write a program to siphon off messages containing the character string the spies sought and store them for remote retrieval, according to the sources.

The sources said the program was discovered by Yahoo's security team in May 2015, within weeks of its installation. The security team initially thought hackers had broken in.

When Stamos found out that Mayer had authorized the program, he resigned as chief information security officer and told his subordinates that he had been left out of a decision that hurt users' security, the sources said. Due to a programming flaw, he told them hackers could have accessed the stored emails.

Stamos's announcement in June 2015 that he had joined Facebook did not mention any problems with Yahoo. (bit.ly/2dL003k)

In a separate incident, Yahoo last month said "state-sponsored" hackers had gained access to 500 million customer accounts in 2014. The revelations have brought new scrutiny to Yahoo's security practices as the company tries to complete a deal to sell its core business to Verizon Communications Inc for $4.8 billion.

Le big data au secours de la lutte antiblanchiment
Wednesday, 05 October 2016
Byline: Sandrine Cassini

Paris - La Française des jeux et IBM vont s'appuyer sur l'analyse de données pour traquer la fraude Comment lutter contre le blanchiment d'argent sale? A l'image des banques, la Française des jeux (FDJ) est tenue à une obligation de vigilance. Car son réseau, ses jeux de grattage et ses paris sportifs n'échappent pas aux opérations frauduleuses. Chaque année, elle détecte dans ses 32 000 points de vente pour 10 à 12 millions d'euros d'opérations suspectes, et remonte une centaine d'opérations à Tracfin, le service de renseignement rattaché à Bercy et chargé de la lutte contre le blanchiment de capitaux.

Pour la FDJ, qui réalise 14 milliards d'euros de chiffre d'affaires et 4 milliards de transactions annuelles, lutter contre ces fraudeurs revient à chercher une aiguille dans une botte de foin. Elle a donc donné le coup d'envoi à un partenariat avec IBM le 28 septembre. Objectif : utiliser le big data, l'analyse de données à grande échelle, pour détecter de manière plus efficace les comportements suspects.

" La plateforme brasse entre 80 et 100 critères par jour. Elle analyse des lieux, la fréquence des transactions, leur montant " , explique Xavier Etienne, directeur général adjoint chargé des technologies au sein de la FDJ. En test depuis un an, la nouvelle plateforme permet déjà d'identifier 20 % à 25 % de nouveaux schémas de fraudes. " Nous voulons passer moins de temps sur la recherche et mieux remonter les informations " , dit-il.

Rachat de tickets gagnants Globalement, les fraudeurs utilisent deux artifices pour blanchir des fonds. Le premier consiste à racheter en masse des tickets gagnants avec de l'argent sale et à les échanger dans un point de vente contre de l'argent propre. Autre subterfuge, le recours aux jeux faisant moins appel au hasard, mais plus à une certaine adresse, à l'image des paris sportifs. " Il peut y avoir des sommes très importantes misées sur une équipe gagnante, dans le seul but de blanchir de l'argent " , précise le directeur général adjoint.

La lutte contre le blanchiment n'est qu'une première étape. " Nous faisons avec la FDJ la recherche et développement commune pour explorer la mise en place de nouveaux services " , assure Marie-Noëlle

Muller, directrice des pôles publics d'IBM France. Prochaine étape, l'identification en amont des points de vente en difficulté, à partir du comportement des joueurs.

Call for rules on armed drones highlights Canadian debate over such weapons
Thursday, 06 October 2016
Byline: Lee Berthiaume

OTTAWA _ Canada has joined dozens of other countries in calling for clearer rules around the sale and use of armed drones, even as the government debates whether the military should acquire such weapons.
The U.S. State Department on Wednesday released a joint declaration, signed by Canada and 44 other countries, laying out five general principles on the export and use of armed unmanned aerial vehicles, or UAVs.

They include emphasizing the importance of international law, compliance with existing arms-control laws and transparency about the use of drones.

The declaration is expected to be a starting point for establishing clear and definitive rules and standards to govern what is an increasingly common weapon used by militaries around the world.

"Our participation in this initiative complements Canada's membership in all four of the export-control regimes and our overall efforts in the legitimate trade in military goods," Global Affairs Canada spokeswoman Jessica Seguin said in a statement.

Yet while Canada has added its name to the declaration, it remains unclear if it will actually buy armed drones. This is despite more than a decade of research and calls for such weapons from senior military commanders.

Defence Minister Harjit Sajjan's spokeswoman, Jordan Owens, said the question of whether to acquire armed drones is among the issues being considered in the government's defence policy review, the results of which aren't expected until next year.

"This is very much a decision that rests with the government of Canada, but no decision has been made at this time," Owens said by email.

"As we do with any procurement of equipment, we are doing our due diligence to ensure any decision that is made will meet Canada's defence needs, now and into the future."

The Canadian military has operated UAVs in the past. French- and Israeli-made drones were used during the war in Afghanistan and the government announced in August that it was spending $14.2 million to buy five U.S. unmanned aircraft. But those have all been unarmed and used for surveillance.

The military has been kicking the tires on larger drone systems since the early 2000s, but has yet to get government approval to move forward. In the meantime, senior commanders have made no secret of their desire to obtain armed UAVs.

Speaking to reporters in March, chief of the defence staff Gen. Jonathan Vance said surveillance is important, "but we also want to be able to contribute to the strike.

"So I think it's important for the military force to have a range of options available to it," he said. "In my view there's little point in having a UAV that can see a danger but can't strike if it needs to."

Other officers, such as retired lieutenant-general Charles Bouchard, who commanded NATO's air and sea campaign in Libya in 2011, have also highlighted the benefits of armed drones. Bouchard is now head of defence giant Lockheed Martin's Canadian office.

Earlier this year, National Defence asked interested companies to submit information about what drones they would be able to provide to Canada. Among the requirements was "a weapons carrying and delivery capability in support of (Canadian Armed Forces) operations worldwide."

But Royal Canadian Air Force spokeswoman Lt.-Col. Holly Apostoliuk said the requirement was listed as a "secondary mission," and that the focus is on surveillance and the ability to operate in different parts of Canada, including the Arctic.

An actual competition is not expected until 2019, at the earliest.

Any move to acquire armed drones for the Canadian military is likely to stir controversy. Aside from concerns about dehumanizing war, some have questioned the accuracy of drone strikes.

The White House says 116 civilians have been killed in 473 drone attacks since U.S. President Barack Obama took office in 2009. But some estimates say the number could be as high as 800. One strike alone in eastern Afghanistan last week killed 15 civilians and injured 13 more.

Owens acknowledged the legal questions associated with using armed drones, but said "any UAV system acquired by Canada would be compliant with our domestic and international legal obligations and employed in a manner that is consistent with these obligations."

Motherboard
The Canadian Government's Plan to Sell New Spying Powers to Citizens
Thursday, 06 October 2016
Byline: Jordan Pearson

Canada's government is taking a forum for citizens to sound off about its spying powers and flipping it into an opportunity to sell Canadians on new and overbroad police capabilities, according to a new watchdog report.
In September, Trudeau's Liberals made good on a promise to open a public consultation on national security and released two documents, a green paper and a background document, explaining the issues at stake to Canadians at a time when the government is ramping up its efforts to thwart domestic terrorists. These included hot topics such as the difficulties police face when dealing with encrypted devices and issues surrounding data retention.

However, according to the watchdog report, the government's framing of the issues is selling Canadians on a police power that has been shot down again and again by the courts and the public: warrantless access to subscriber information from telecom companies.

"Successive federal governments have sought to legislatively enshrine a state power to access subscriber identification data from telecommunications companies," Citizen Lab researcher Christopher Parsons and Canadian Internet Policy and Public Interest Clinic staff lawyer Tamir Israel write in their report. "Such legislative initiatives would have facilitated access to such data on an indiscriminate basis and without any judicial authorization or control."

"All of these attempts have proven controversial and each has fallen in the face of public resistance," they continue. In 2014, the Supreme Court of Canada ruled that accessing subscriber information without a warrant constitutes an illegal search.

In its green paper, the government describes subscriber information as being akin to a phone book. However, subscriber information includes IP addresses, name, home address, phone number, email address, and mobile devices' IMSI number--much more information than is contained in your average phone book.

"Our laws on how information can be properly collected and then used in court as evidence were mostly written before the rapid pace of new technology became a consideration," the government's green paper states. Now, police worry about "slow and inconsistent access to basic subscriber information to help identify who was using a particular communications service at a particular time," the report states.

The idea of giving Canada's police and spying agencies access to subscriber information without a warrant was first raised in a consultation document in 2002, and was defeated in 2012 after being included in the failed Bill C-30, also known as the "Protecting Children from Internet Predators Act."

Most recently, in 2015, the Canadian Association of Chiefs of Police passed a resolution at their annual conference to lobby for warrantless, "real time" access to subscriber information.

Now, it seems, the federal government has moved from paedophiles to terrorists in its bid to convince the public that warrantless access to subscriber information is a good idea.

New Zealand Herald
Spark seeks details on US email scans
Thursday, 06 October 2016
Byline: Nicholas Jones

Wellington - Kiwi telco Spark is seeking clarification from Yahoo as to whether any of its customers had email searched at the behest of United States intelligence agencies.
According to an investigation by Reuters, Yahoo last year used a software program to search its customers' incoming email for specific information provided by US intelligence agencies.

That happened after the Yahoo complied with a classified US government demand, it was reported.

Spark is seeking more information, including whether Spark's Xtra Mail customers could have been affected. Yahoo hosts more than 800,000 accounts on behalf of Spark.

"At this time we are still seeking clarification from Yahoo if any Spark Xtra email customers are involved," a spokeswoman told the Herald.

Privacy Commissioner John Edwards said Spark was right to be making its own inquiries. "I would be concerned if these kinds of arrangements were occurring without a clear legal authority. But we haven't seen enough in the Reuters report to know the basis of it."

Edwards said there was a big difference between an intelligence agency asking a provider to scan all email accounts, and seeking access to a particular communication when there were legitimate law enforcement reasons to do so.

"They have no reason to believe that any individual is a suspect. They are just going across everything."
Spark will soon migrate its Xtra email accounts back to New Zealand, to be hosted by cloud email provider SMX.

Edwards said the Reuters report would fuel such moves worldwide.

"It really undermines confidence in the digital economy."

Last month, Spark contacted 131,000 Xtra customers about another scare, after hackers accessed hundreds of millions of Yahoo accounts in late 2014. They were told their accounts were potentially affected and to change their password.

The Spark spokeswoman said Yahoo had since advised there was no evidence Xtra accounts had been used for malicious activity.

The Daily Beast
NSA Thief Worked With Elite Hacker Squad
Thursday, 06 October 2016
Byline: Multiple reporters

Washington - The retired Navy officer arrested for allegedly removing highly classified information from the National Security Agency worked with the organization's elite computer hackers, who specialize in using computer code to penetrate the systems of foreign nations, according to a former colleague and the man's online resume.
Harold Thomas Martin, III, who goes by Hal, was also enrolled in a PhD program at the University of Maryland Baltimore County. The university has a partnership with the NSA, in which the agency helps develop curriculum for the school and agency employees can take classes there.

Martin worked with NSA's Tailored Access Operations unit, sources with knowledge of his background told The Daily Beast. In his LinkedIn resume, Martin says he worked as a "cyber engineering advisor" supporting "various cyber related initiatives" in the Defense Department and intelligence community.

Allen was employed by NSA contractor Booz Allen Hamilton. "When Booz Allen learned of the arrest of one of its employees by the FBI, we immediately reached out to the authorities to offer our total cooperation in their investigation, and we fired the employee," Craig Veith, a vice president with the company, said in a statement. "We continue to cooperate fully with the government on its investigation into this serious matter."

Martin was charged with two counts of mishandling classified information and theft of government property. According to the New York Times, which first reported his arrest, the FBI is investigating whether Martin stole classified computer codes that the NSA uses to break into foreign networks. The FBI discovered the material at Martin's home in Maryland.

Martin's case immediately drew comparisons to that of Edward Snowden, who was also working as a contractor for Booz Allen Hamilton when he stole classified documents that he gave to journalists. The NSA put in place so-called insider-threat detection programs after Snowden's leaks to catch future unauthorized disclosures. But it wasn't immediately clear whether those systems failed to spot Martin or if he removed the classified material before they were put in place.

Martin's lawyer told the Wall Street Journal "There is no evidence that Hal Martin intended to betray his country." He has also not been charged yet with espionage or attempting to provide the classified information to a third party or a foreign government.

Former intelligence officials, who said they aren't familiar with Martin's case, suggested he may have brought the material home to use as research for his PhD studies. "It's conceivable given what he was

working on that he might have used the [classified] material for research," a former official said, speaking on condition of anonymity.

The university's director of communications, Dinah Winnick, confirmed to The Daily Beast that Martin, 51, is a PhD student in the Information Systems program but said the school had no further comment.

It's not known whether Martin's PhD work related to his work at NSA, which focused on offensive cyber operations. But his description at the school's Interactive Systems Research Center said Martin was looking at "new methods for remote analysis of heterogeneous & cloud computing architectures." He presented a paper on the topic with his dissertation committee chair at a conference in Seattle in 2014.

His dissertation, currently in its fourth draft, according to a file on his personal homepage, is not publicly available. Members of Martin's dissertation committee did not return The Daily Beast's requests for comment.

According to Navy records, Martin served for twelve years -- four of them in the active component and the rest as a reservist. The highlight of his career appears to be his service on the USS Seattle, from April 1989 to July 1992. The Seattle, a fast combat support ship, was one of the first ships to arrive after Iraqi leader Saddam Hussein's forces invaded Kuwait in 1990.

Wilbur Trafton, the commander of the Seattle during the war to liberate Kuwait, told The Daily Beast that he doesn't remember the then-Lt. Martin. A second shipmate also said he couldn't recall Martin.

Martin's title at the time, Surface Warfare Officer, is a broad job description that reveals little about his work on the ship. The Seattle was decommissioned in March 2005.

Martin's ex-wife, Marina, declined to discuss her former husband.

CNBC
NSA has lost some terrorists because of encryption, its top lawyer says
Wednesday, 05 October 2016
Byline: Harriet Taylor

Cambridge - The NSA has lost some terrorists because of their adoption of strong encryption, but the agency is supportive of the use of the technology, it's top lawyer said Wednesday.
Glenn Gerstell, general counsel of the National Security Agency, made the comments at the Cambridge Cyber Summit at MIT in Cambridge, Massachusetts.

"We are big supporters of encryption," said Gerstell. "Encryption is more of a law enforcement issue."

He said the NSA sees ISIS terrorists using end-to-end encryption, and that has prevented the agency from finding out the key information about those bad actors.

The widespread availability of encryption technology requires the government to employ additional resources to monitor terrorists, said Gerstell. He declined to elaborate on specific sources and methods.

Privacy advocate Cindy Cohn, executive director of the Electronic Frontier Foundation, listed some of the methods the government may use when encryption blocks access to information shared by suspects: They install key loggers on devices to discover passwords, stop computers on their way to being shipped and install backdoors or send fake messages masquerading as popular services like Facebook to trick suspects to divulging passwords.

"We know they purchase vulnerabilities and don't tell the companies their systems are vulnerable," she said.

About 90 percent of the vulnerabilities the government discovers are in fact disclosed, but at times they choose not to share that information for national security reasons, said Gerstell.

The NSA is in an excellent position to assess cyberthreats given its tech chops, but the anonymity enabled by end-to-end encryption -- whose adoption is growing -- allows some people to get away with "mischief" and the barriers to entry for the use of this technology are "extremely low," he said.

Cybersecurity is the biggest threat the NSA will face over the next couple of decades, and the agency is very focused on combating cybercrime. It takes a multifaceted approach -- working hand in hand with the FBI and Department of Homeland Security to share threat information, and issuing bulletins to reach the public where appropriate, Gerstell said.

The conference is sponsored by CNBC, MIT and The Aspen Institute.

South China Morning Post
Snowden biopic to illuminate situation of asylum seekers (Canada)
Thursday, 06 October 2016
Byline: Raquel Carvalho

Beijing - Oliver Stone's Snowden film, which opens in Hong Kong cinemas today, has raised some concerns about the public exposure that those who sheltered the former US intelligence contractor in Hong Kong in 2013 are facing.
"I haven't seen the portrayal ... but am aware of some of the reports of the persons sheltering Mr Snowden," human rights lawyer Mark Daly said. "I think in very general terms it may shed some light on the situation of refugees in Hong Kong but the 'light' may not be welcomed by all," he noted.

Daly said that "usually, genuine asylum seekers would not wish to reveal their identities as this could expose them, or their families, to danger if returned to their countries of origin".

But he noted: "The issues are complex and perhaps raise further questions and concerns."

It emerged last month that Edward Snowden, a former National Security Agency contractor who leaked classified documents detailing the extent of electronic spying by the United States and other governments, took shelter in asylum seekers' homes during his stay in Hong Kong in June 2013. Their identities, including names and photos, appeared in the news over the past weeks.

Justice Centre advocacy officer Victoria Wisniewski Otero said although it is hard to predict the impact on the families who sheltered Snowden, the film might highlight the broader situation.

Robert Tibbo, one of the lawyers who assisted Snowden in Hong Kong, said there was no option but to reveal the identities of those who sheltered the former US intelligence contractor. "There are exactly eight refugees identified in the media and who are portrayed in the film ... There was no choice about the fact that they existed and sheltered Snowden as it is in the film," he said.

Tibbo noted that they knew the media would try to locate the three refugee families. "We did not want my other asylum seeking clients being questioned and harassed by the media or other people or organisations ... I did not want the three families to be living in fear," the lawyer told the South China Morning Post.

Revealing their identities before the film's release also provided an opportunity for them "to have control over their story". According to the Canadian barrister, "the identification of the three refugee families ... will certainly provide greater protection to them".

Tibbo said the film will "reveal that the refugees who sheltered and cared for Snowden were ordinary people who did the extraordinary. It will also "dispel the negative opinions the Hong Kong government and officials have made" and "thus improve the -image of the refugee community", he said.

Wall Street Journal
Firms Brace for More Hacks After Code Reveal
Thursday, 06 October 2016
Byline: Robert McMillan, Drew FitzGerald

New York - Internet companies are bracing for more trouble after hackers released the code behind one of the most powerful online attacks ever, which harnessed as many as one million internet-connected devices to knock a blogger offline.
The malicious software takes advantage of weak security on video recorders, routers and other internet-connected devices, taking control of the systems and forming them into a collection of attacking

machines, called a "botnet." It can then disable a victim's internet servers by flooding them with internet traffic.

The botnet code was released Friday -- apparently after a dispute between developers -- and is now available for anyone to download, meaning more attacks are likely. By Tuesday, it had infected about 300,000 devices, along with nearly one million affected using an earlier version of the software, according to Level 3 Communications Inc. Some machines were hijacked by both strains.

That has made networking engineers around the world nervous, said Paul Vixie, chief executive of Farsight Security Inc., who has helped developed some of the internet's core protocols. "The people who keep the internet running are either at the bar with stiff drinks in their hands or they're tearing their hair out because there is nothing they can do to stop this," he said.

The botnet software remotely connects to video recorders and routers, and then tries out default usernames and passwords until it gains control of the device. With nearly one million devices, a botnet theoretically could pump out an unprecedented 4 terabits-per-second computer attack, equivalent to streaming 800,000 high-definition movies simultaneously, according Fastly Inc., a company that sells networking services.

Level 3 said last week that cameras and video recorders made by China's Dahua Technology Co. were responsible for a large portion of the previous attacks. Dahua couldn't be reached for comment Tuesday, but the company last week said the vulnerability applied to internet-connected cameras with firmware dated before January 2015. It also advised users to upgrade the software on their devices and set strong passwords.

Big software makers like Microsoft Corp. have spent billions of dollars during the past two decades securing their software from hackers. But security experts say the makers of many internet-connected devices don't have the resources to do so.

Politico
DHS official: Half of U.S. states have sought help to thwart election hackers
Thursday, 06 October 2016
Byline: Darren Samuelson

Washington - Hacking threats have prompted 25 states so far to seek out the Obama administration's help in assessing vulnerabilities and fending off attacks to their voting systems headed into Election Day, a Department of Homeland Security official told POLITICO on Wednesday.
DHS won't name the specific states that have reached out for federal aid -- that's up to each individual state to confirm, the agency said. But DHS has been providing a running total on the overall number of states. Last Friday, a department official said that 21 states had expressed an interest in its vulnerability scanning services.

"We hope to see more," DHS Secretary Jeh Johnson said in a statement on Saturday.

Concerns about a cyberattack on the nation's election system have grown in recent months, following a series of suspected Russian hacks targeting Democratic political offices, the Hillary Clinton campaign and state election networks. GOP nominee Donald Trump has also prompted concerns about the integrity of the election by repeatedly stating the outcome will be "rigged" and by calling for his supporters to volunteer in "certain areas" as poll watchers.

Federal and state election officials insist the country's balloting is secure from a widespread hacking attack -- they note the diverse nature of 50 different state jurisdictions, plus thousands more at the county and local level. In addition, voting itself doesn't involve any connections to the internet, officials insist.

But weaknesses do exist across the system, too. A DHS official last week confirmed that hackers had been detected seriously probing into state voter registration systems in more than 20 states, and they actually had varying degrees of success getting into the rolls in Arizona and Illinois.

In an interview last week, Colorado Secretary of State Wayne Williams confirmed he's met with officials from DHS, the FBI and the U.S. attorney office in Colorado and availed his state of the federal government's resources. "We do participate in that process," he said.

Georgia Secretary of State Brian Kemp also told POLITICO it was "great" that states had the opportunity to tap federal officials for help prepping for the election. But the Republican said he also wasn't bowled over by what the federal government was providing in the way of detection services.

"They're not offering anything we're not already doing in Georgia in regards to running penetration tests on our system," Kemp said.

Washington Post
NSA contractor charged with stealing top secret data
Thursday, 06 October 2016
Byline: Multiple reporters

Boston - A federal contractor suspected in the leak of powerful National Security Agency hacking tools has been arrested and charged with stealing classified information from the U.S. government, according to court records and U.S. officials familiar with the case.
Harold Thomas Martin III, 51, who did technology work for Booz Allen Hamilton, was charged with theft of government property and unauthorized removal and retention of classified materials, authorities said. According to two U.S. officials familiar with the case, he is suspected of "hoarding" classified

materials going back as far as a decade in his house and car, and the recent leak of the hacking tools tipped investigators to what he was doing.

Martin was arrested in August after investigators raided his home in Glen Burnie, Md., and found documents and digital information stored on various devices that contained highly classified information, authorities said.

The breadth of the harm Martin is alleged to have caused -- and what might have motivated it, if proven -- was not immediately clear, although officials said some of the documents he took home "could be expected to cause exceptionally grave damage to the national security of the United States."

Investigators are probing whether Martin, who had top secret clearance, was responsible for an apparent leak that led to a cache of NSA hacking tools appearing online in August, according to the officials familiar with the case, who spoke on the condition of anonymity because the investigation is ongoing.

The FBI and NSA are trying to figure out what drove Martin. The FBI's Behavioral Analysis Unit is working on a psychological assessment, officials said. "This definitely is different" from other leak cases, one U.S. official said. "That's why it's taking us awhile to figure it out."

The leaked NSA tools included "exploits" that take advantage of unknown flaws in firewalls, for instance, allowing the government to control a network. They were posted by a group calling itself the Shadow Brokers. Current and former federal officials said their disclosure could allow targets of NSA spying to determine they were hacked by the United States, and some foreign spy agencies might be able to repurpose the tools.

"This will embolden many to retaliate, likely leading to an escalation of an already costly exchange of cyberattacks between the U.S. and some of its adversaries," said Leo Taddeo, a former FBI agent and chief security officer at Cryptzone, a cybersecurity firm.

Martin's arrest, first reported by the New York Times, marks another humiliating lapse for both Booz Allen and the NSA. In 2013, contractor Edward Snowden, who also worked for Booz Allen, passed a massive trove of documents to journalists, shedding light on massive government surveillance programs that have drawn criticism since they were revealed.

Even before that, the federal government had made detecting and deterring leaks a high priority. In 2011, President Obama created the National Insider Threat Task Force to assist in that effort, and the Justice Department under his administration has prosecuted more leakers than all of its predecessors combined. And after the Snowden disclosures, the NSA doubled down, adopting new technical measures to control information.

For example, officials instituted new rules on downloading sensitive data and implemented audit trails and more frequent screenings of network access by system administrators.

Rep. Adam B. Schiff (Calif.), the ranking Democrat on the House Intelligence Committee, said in a statement that Martin's arrest made it "painfully clear that the Intelligence Community still has much to do to institutionalize reforms designed to protect in advance the nation's sources and methods from insider threats."

An NSA spokesman declined to comment on Martin's arrest. In a statement attached to an SEC filing, Booz Allen said that when it learned one of its employees was arrested, "we immediately reached out to the authorities to offer our total cooperation in their investigation, and we fired the employee. We continue to cooperate fully with the government on its investigation into this serious matter." The company said there had "been no material changes to our client engagements as a result of this matter."

White House press secretary Josh Earnest said Wednesday: "This is certainly a situation that the Department of Justice takes seriously, as evidenced by their complaint. This is also a situation that President Obama takes quite seriously. And it is a good reminder for all of us with security clearances about how important it is for us to protect sensitive national security information."

Military records and an online profile show that Martin was a former Naval officer and reservist with a broad interest in cyber issues. His attorney said he was a Navy lieutenant, and records show he served for more than a decade, spending some years on the USS Seattle before ending his military career in the inactive reserves.

According to his LinkedIn profile and school officials, Martin was in an information systems graduate program at the University of Maryland Baltimore County, and he had studied software and security engineering at George Mason University and economics at the University of Wisconsin. He wrote that his goal was "to advance state of the art in several areas of computing practices in the public/private sector."

Federal public defender Jim Wyda and first assistant federal public defender Deborah Boardman, who are representing Martin, said in a statement that the charges against Martin were "mere allegations" and that they had not yet seen prosecutors' evidence.

"There is no evidence that Hal Martin intended to betray his country. What we do know is that Hal Martin loves his family and his country," the attorneys said. "He served honorably in the United States Navy as a lieutenant and he has devoted his entire career to protecting his country. We look forward to defending Hal Martin in court."

Roy Rada, Martin's former mentor at the University of Maryland Baltimore County, said in an email that Martin was "highly motivated" and had an "intense personal and professional interest in the post-

traumatic stress disorder." Rada, who retired from the school earlier this year, said Martin believed the school had the technology to diagnose PTSD earlier and sought funding to support his research, though, at least when Rada was involved, he did not received any.

Rada said Martin eventually sought a new mentor, and the two lost touch. He said Martin was "thoughtful, sensitive, and dedicated," and the news of his arrest was unexpected.

"While he had a commanding physical presence, emotionally he suffered from the feeling that his relatively special situation was inadequately appreciated," Rada said.

When Martin was taken into custody on Aug. 27, a Saturday, neighbors could hear a boom from blocks away.

It was around 2:30 p.m., and Steve Cunningham, behind a house two doors down, was so startled that he dropped to the ground. Around the corner, Glen Bond had just cracked a Miller Lite and sat down to watch TV in his living room. He walked outside, suspicious that a neighbor had just set off a giant firework.

Federal agents dressed in tactical gear and toting drawn rifles were swarming around the small brick and vinyl-sided house. At least two federal vans and more than 20 vehicles shut down access to the area.

Murray Bennett walked out on his stoop just in time to see a dozen agents smash through Bennett's backyard fence.

"Get back in the house!" a man in an FBI jacket yelled at him.

Not long after, he saw Martin escorted outside in handcuffs.

"Next thing you know, he was gone," Bennett said.

Until well past midnight, neighbors watched as the investigators ransacked Bennett's aging purple Chevrolet Caprice -- still parked in the driveway -- and carried out black trash bags from his home. Bennett said he knew Martin as a "computer guy" who was well educated and decent.

"Unreal," said Bennett, who has known Martin for about a decade. "We passed out Halloween candy together."

Neighbors described Martin as friendly but quiet. They said they hadn't noticed any change in him leading up to the raid.

Around 3 p.m. on Tuesday, a woman who identified herself as Martin's wife pulled up in a black Nissan Rogue and unloaded her groceries.

"The only thing I can say is that it's a matter under investigation. I have no comment," she told reporters before stepping inside.

Prosecutors did not reveal in the criminal complaint how they were tipped to Martin or what precisely they recovered. The complaint alleged that Martin initially denied to investigators that he took documents home, but once confronted with specific examples, he admitted he did so and that he knew the materials were classified. The complaint alleged that Martin "stated that he knew what he had done was wrong."

If convicted, Martin would face a maximum of 11 years in prison. The U.S. attorney's office in Maryland said he appeared in court on Aug. 29 and remains detained.

New York Times
Yahoo Said to Have Aided U.S. Email Surveillance by Adapting Spam Filter
Thursday, 06 October 2016
Byline: Charlie Savage, Nicole Perlroth

Washington - A system intended to scan emails for child pornography and spam helped Yahoo satisfy a secret court order requiring it to search for messages containing a computer "signature" tied to the communications of a state-sponsored terrorist organization, several people familiar with the matter said on Wednesday.
Two government officials who spoke on the condition of anonymity said the Justice Department obtained an individualized order from a judge of the Foreign Intelligence Surveillance Court last year. Yahoo was barred from disclosing the matter.

To comply, Yahoo customized an existing scanning system for all incoming email traffic, which also looks for malware, according to one of the officials and to a third person familiar with Yahoo's response, who also spoke on the condition of anonymity.

With some modifications, the system stored and made available to the Federal Bureau of Investigation a copy of any messages it found that contained the digital signature. The collection is no longer taking place, those two people said.

The order was unusual because it involved the systematic scanning of all Yahoo users' emails rather than individual accounts; several other tech companies said they had not encountered such a demand.

News of the order has opened a new chapter in a public debate over the trade-offs between security needs and privacy rights that has cast a spotlight on the sometimes cooperative, sometimes antagonistic relationship between Silicon Valley companies and the United States government.

It comes six months after a standoff between the F.B.I. and Apple, in which the government obtained a federal magistrate's order to force the company to help it unlock an encrypted iPhone from one of the attackers in the December mass shooting in San Bernardino, Calif. The F.B.I. gave up the fight with Apple after it found a way into the iPhone without the company's help.

By contrast, Yahoo cooperated with the Foreign Intelligence Surveillance Court order, although the technical burden on the company appears to have been significantly lighter than the one the F.B.I. placed on Apple.

Details of Yahoo's cooperation with the court order come two weeks after the company reported that hackers had broken into its computer network, stealing the credentials of 500 million users. Yahoo engineers discovered the breach this summer, two years after it had occurred, and just weeks after Verizon Communications announced plans to buy the troubled internet company for $4.8 billion.

The two government officials familiar with the matter said the digital signature Yahoo was ordered to look for last year was individually approved in an order issued by a judge, who was persuaded that there was probable cause to believe that it was uniquely used by a foreign power.

Investigators had learned that agents of the foreign terrorist organization were communicating using Yahoo's email service and with a method that involved a "highly unique" identifier or signature, but the investigators did not know which specific email accounts those agents were using, the officials said.

The officials' description of the unusual surveillance operation carried out at Yahoo shed new light on a report by Reuters that has attracted widespread attention and provoked outrage among privacy and technology specialists.

The Reuters article reported that in response to a "broad demand" from the government, Yahoo had "secretly built a custom software program to search all of its customers' incoming emails for specific information provided by U.S. intelligence officials."

According to the government officials, Yahoo was served with an individualized court order to look only for code uniquely used by the foreign terrorist organization. Two sources, including one of the officials, portrayed it as adapting the scanning systems that it already had in place to comply with that order rather than building a brand-new capability. The other official did not comment on the technology. The officials did not name the terrorist organization.

Asked on Wednesday about the information obtained by The New York Times, Suzanne Philion, a Yahoo spokeswoman, said the company had nothing further to say. Earlier in the day, the company said in a statement that the Reuters article was "misleading."

"We narrowly interpret every government request for user data to minimize disclosure," the Yahoo statement said. "The mail scanning described in the article does not exist on our systems."

Richard Kolko, a spokesman for the Office of the Director of National Intelligence, declined in a statement to discuss specific foreign intelligence collection techniques, but referred to the Foreign Intelligence Surveillance Act, or FISA.

"Under FISA, activity is narrowly focused on specific foreign intelligence targets and does not involve bulk collection or use generic key words or phrases," he said. "The United States only uses signals intelligence for national security purposes, and not for the purpose of indiscriminately reviewing the emails or phone calls of ordinary people."

Technology companies like Yahoo, Google and Microsoft scan for child pornography and are required to report any discoveries to the National Center for Missing and Exploited Children. They similarly search traffic for malware and spam, which companies disclose in their terms of service.

There is no engineering limitation preventing technology companies from using their spam and child pornography filtering systems to search email traffic for other sorts of digital signatures, said Hany Farid, chairman of the computer science department at Dartmouth, who helped develop the child pornography scanning system with Microsoft.

But the use of that technology to carry out an order from the Foreign Intelligence Surveillance Court to search for a digital signature used by a foreign power is rare, and one of the officials portrayed it as innovative.

"This is another example of how the government is pushing secretly novel or innovative interpretations of surveillance law" to conduct wiretapping in broader ways than the public realizes, said Jennifer Granick, the director of civil liberties at the Stanford Law School Center for Internet and Society.

The government has not released any intelligence court opinion explaining how the judge interpreted FISA to authorize such surveillance. Although Congress in June 2015 enacted a law that required the government to make public novel and significant rulings by the court, the order to Yahoo appears to have predated that legislation, the USA Freedom Act, by several months.

Yahoo has an inconsistent record with meeting government data demands. In 2007, the company settled a lawsuit related to allegations that it helped the Chinese government crack down on journalists by passing along their Yahoo emails.

But that year, the firm fought a legal battle, then secret, before the Foreign Intelligence Surveillance Court, challenging a mandate that it turn over, without a warrant, emails from user accounts the F.B.I. and the National Security Agency said belonged to noncitizens abroad who had been targeted for surveillance.

That litigation became an important test of whether Congress could legalize the Bush administration's warrantless surveillance program through the Protect America Act and, later, the FISA Amendments Act. Ultimately, the intelligence court ruled against Yahoo, and after being threatened with a huge fine, the company cooperated.

Yahoo was not able to clarify details of the Reuters article on Tuesday because orders from the Foreign Intelligence Surveillance Court are secret by law, and an increasing number of other government requests come with gag orders that prohibit tech companies from even acknowledging they exist.

Tech companies complain that such gag orders make it impossible for them to explain to customers what sort of data they do and do not turn over. Twitter and Microsoft have separately sued the Justice Department over the gag order practice, and both cases are pending.

Dozens of other companies have filed briefs in support of Microsoft. In its brief, Apple said it had received about 590 gag orders, of unlimited or indefinite durations, in the first eight months of 2016.

Yahoo investigated by Irish watchdog over email 'scanner'
Thursday, 06 October 2016
Byline: Cara McGoogan

Dublin - Yahoo is under investigation in Europe over claims that it monitored millions of emails at the request of the US government.
The Irish privacy watchdog said it would examine whether Yahoo had broken EU data protection law as a "matter of considerable concern". It had been reported Yahoo had built a tool to scan every email sent or received for certain phrases that could signal criminal activity on behalf of the National Security Agency and FBI.

"Arising from media reports, the Office of the Data Protection Commissioner is making enquiries into this matter," said the Dublin-based watchdog. As Yahoo's European headquarters is based in Ireland, the Irish office is responsible for determining whether it complies with laws across the EU.

Yahoo last night called reports of its surveillance "misleading". A spokesman said: "The mail scanning described in the article does not exist on our systems. We narrowly interpret every government request for user data to minimise disclosure."

TalkTalk fined £400,000 for mass hacking breach
Thursday, 06 October 2016
Byline: Robin Pagnamenta

London - The information commissioner has given TalkTalk a record fine after the personal details of hundreds of thousands of customers, including addresses and bank account details, were stolen by hackers last year.
The £400,000 penalty was imposed after the commissioner's office said that TalkTalk, which supplies broadband services to four million households, had failed to take rudimentary steps to safeguard its customers' privacy and security. The regulator said that hackers had been able to access the information "with ease", leading to the theft of the details of 156,959 customers -- or 4 per cent of the total -- in October last year.

In most cases, names, addresses, dates of birth, phone numbers and email addresses were stolen. However, of these, more than 15,600 customers also had their bank account details and sort codes stolen.

Elizabeth Denham, the information commissioner, said: "Today's record fine acts as a warning to others that cybersecurity is not an IT issue, it is a boardroom issue. TalkTalk's failure to implement the most basic cybersecurity measures allowed hackers to penetrate its systems with ease. Yes, hacking is wrong, but that is not an excuse for companies to abdicate their security obligations. TalkTalk should and could have done more to safeguard its customer information."

TalkTalk, which said that the hacking incident cost about £60 million to resolve, was "disappointed" by the decision to impose the fine for breaches of Britain's Data Protection Act.

The company said it had "cooperated fully with the ICO at all times and, whilst this is clearly a disappointing decision, we continue to be respectful of the important role the ICO plays in upholding the privacy of consumers". It added: "During a year in which government data showed nine in ten large UK businesses were successfully breached, the TalkTalk attack was notable for our decision to be open and honest with our customers from the outset. This gave them the best chance of protecting themselves and we remain firm that this was the right approach for them and for our business.

"As the case remains the subject of an ongoing criminal prosecution, we cannot comment further at this time."

The ICO said that TalkTalk was to blame because the hackers used a common technique known as "SQL injection" to hack three vulnerable and out-of-date web pages. The data was contained in "inherited infrastructure" that formed part of the acquisition of Tiscali's UK operations by TalkTalk in 2009.

The watchdog said that TalkTalk should have been aware of the technique and should have had systems in place to prevent such a cyberattack.

The company had also been given two warnings that it appeared unaware of. The first was a successful cyberattack on July 17 last year that exploited the same vulnerability in webpages. A second attack was launched between September 2 and 3 last year.

A 19-year-old man and a 17- year-old youth have been charged in relation to the alleged hack.

The Aspen Institute's Walter Isaacson Interviews Admiral Michael S. Rogers from the Cambridge Cyber Summit Today
Wednesday, 05 October 2016
Byline: Walter Isaacson
Section: Interview transcript

The Following is the unofficial transcript of an EXCLUSIVE interview with Admiral Michael S. Rogers, Commander, U.S. Cyber Command; Director, National Security Agency; Chief, Central Security Service, live from the Cambridge Cyber Summit hosted by The Aspen Institute, CNBC and MIT on Wednesday, October 5th.
WALTER ISAACSON: Thank you. Thank you very much, Michael, for being with us today. The latest of these is Yahoo, in which supposedly a lot was just read because they were ordered to do so. I just got a statement from them, an email, saying, no, no it wasn't really that way. We did not open up all of the emails. It was a much narrower complying with orders. Talk to us about the type of things you need to do and have industry cooperate with you, why that's legal and where you think we have to draw the line.

ADMIRAL ROGERS: So clearly we have a legal framework in this nation that enables the government under specific -- for specific reasons, under specific conditions, to make a case before a judge in which we're able to show a judge we have reason to believe that there is threat here to the United States associated with specific individuals and a judge grants, simplistically, authority for a specific purpose for a specific period of time to access data. And the court order is then given to the private sector to execute. This is done -- phone records, bank records, this is a long- standing mechanism in our nation for how does the government access information using a lawful mechanism to do that. Cyber and intelligence, in this aspect, is no different then.

WALTER ISAACSON: Let me make sure I heard you correctly. That means you couldn't get one that would just blanket look at all emails.

ADMIRAL ROGERS: No. I was going to say, that would be illegal. We don't do that, and no court would ever grant us the authority to do that. We have to make a specific case. And what the court grants is specific authority for a specific period of time for a specific purpose. It's not a blanket, A, just everything.

WALTER ISAACSON: So we shouldn't believe the stories that we read?

ADMIRAL ROGERS: I've read this real quickly and I thought, well, this is a little speculative.

WALTER ISAACSON: Now, do you need cooperation from the big companies, in Silicon Valley, especially on encryption, and are you getting that cooperation?

ADMIRAL ROGERS: I think particularly on the defensive side, as a nation, is we're trying to figure out, so how are we going to ensure that our systems, our data, are secure. The sweet spot to me is how do we create a partnership between the private sector and the government where the best of both are brought together for a unified purpose. Because I don't think asking the private sector to do this by themselves -- I don't think it's particularly realistic and is not going to generate the outcomes we want. I would argue, as well, turning to the government and saying, "Well, you just defend the private sector on your own," I don't think that's workable. It's our ability to bring these two parties and their different perspectives together in a common framework that enables us, I think, to get to where ultimately we need to be.

WALTER ISAACSON: And you said we have for 240 years of framework, it's a pretty simple one, which is unreasonable search. I've heard you talk about that. It used to be that nothing, anything, the trunk of your car, your safe deposit box, your diary, nothing was out of the reach of law if a court said it could be searched. Why did that change recently? And is that a problem?

ADMIRAL ROGERS: I think a lot of factors are coming together. I think we have to acknowledge that right now as a society we have broad distrust, in some ways, of the mechanisms and the structures of government and governance. Those structures within our nation that we have traditionally given responsibility -- law enforcement, intelligence -- oversight that we have traditionally given responsibility to execute some of these functions. I think we have to acknowledge we're living in a world now in which some of those mechanisms are not trusted. If you go back, much of the framework, the court, FISA court, congressional oversight to HSPCI and SSCI, the two congressional committees that conduct oversight, for example, for intelligence purposes, all created in the late 1970s, in the aftermath of the Pike and the Church Committees in which they came to a couple conclusions. We need to provide a legal framework for the intelligence organizations of the U.S. government to execute their operations so they're not acting indiscriminately.

Secondly, we need to provide a level of oversight so that the citizens of the nation have some level of awareness of what they are doing, why they are doing it. But at the same time we need to do it in a way that doesn't compromise what they're doing. Thus, was born the idea of, hey, Congress is the elected representatives of our citizens. We'll execute this oversight function in the name of the citizens, and thus was born the two oversight committees.

It's 40 years later now. And what I try to tell our team is we've got to step back, you guys, and ask ourselves, so that quirk structure that we've created, how is it viewed today by the citizens of our country. We have to acknowledge it's a slightly different construct. The government makes an argument

before the FISA court, and the judge shares the argument and the judge makes the decision, do they agree? Do they disagree? Have we met the threshold of evidentiary proof? Likewise, the oversight committees, in a time in which, again, I think we have to be honest, Congress, as in many other institutions, is not quite held in the same regard as it was potentially in the aftermath of Watergate, where Congress was viewed as, hey, look, you took a proactive role, you took on the Executive Branch, and you generated insights that help our nation understand some activity that was truly of concern to us.

You fast-forward 40 years, I would argue we're in a very different place now. It's just not the broad view that most -- not all, at least many citizens take.

So I think part of our challenge going forward is how do we create oversight mechanisms that enable intelligence, law enforcement, to do their important duties in a way that both engenders confidence for the citizens we serve but at the same time acknowledges in order to do this, we can't just publicly get into the details of everything we do. Because not only are citizens with a very lawful concern paying attention, but the very targets we're trying to access, they're paying attention as well. And they want to know, How are they coming after me? What are the sources they're using to generate insights, if I'm ISIL, if I'm a foreign state, they're very much interested in? So what are the intelligence? How are they doing what they do? That's not really what we want to give up.

WALTER ISAACSON: Do you think that private companies should be allowed to create devices and services that are designed specifically to thwart the reach of the courts?

ADMIRAL ROGERS: Let's ask an easy question.

WALTER ISAACSON: And, by the way, you've talked to Tim Cook about it. Tell me what you said to him.

ADMIRAL ROGERS: I'm not going to go into specifics, but, broadly, this is what I say. We have to acknowledge it as a nation we have two incredibly important imperatives here. We must ensure the security and the safety of our citizens while at the same time doing it in a way that does not undermine their rights or our very structures as a government. Because achieving security, in the name of becoming something we're not, is a bad place for us to be as a nation.

Likewise, I would argue, ensuring the protection -- ensuring the privacy and the rights of our citizens without also providing them security, I would argue that's not a great place for us to be. So, it's how do we find this middle ground. This is a tough challenge for us, because, again, it's happening in a broader context; it's happening in a time when the mechanisms of structure just are largely distrusted.

I'm struck by the fact, for example, phone companies, on a regular basis, are given significant numbers of search warrants to comply with a Federal court that says you must provide the Federal government, under specific circumstances, access to the communications of the phonecalls of the following individuals. And yet, when we use the same process for emails, for example, we're generating a very

different reaction as a society. I'm still trying to work my way through personally, what is the difference? What is it that generates a fundamentally different approach?

To go to your initial point to me where, as a nation, we had previously accepted the fundamental premise that nothing is beyond the reach of the government with appropriate protection and appropriate use of the court, a legal framework, the legislative branch. We've generally accepted that as a fundamental premise, and yet we seem to be in a different place now where, in some areas, we're not quite as comfortable. And I'm still trying to work my way through it. So in my conversations with my private-sector teammates, I go: We've got to have this conversation. We cannot vilify each other. It isn't one side is good and one side is bad. We're trying to make sure that these two incredibly foundational imperatives for us as a country are executed in a way that the one doesn't undermine the other. And that's not an easy challenge.

I think lastly -- I apologize for going on so long for you. But we have to acknowledge we're currently in a place where technology has outstripped our legal and our policy framework. And we've got to ask ourselves: How do we address that? Are we comfortable with that? That's not something that you want guys like me deciding. That's something I think more broadly we, as a society, have to have a conversation about, what are we comfortable with here, and not just vilify each other, one side's good and other side is bad. That's just so simplistic, and it isn't going to let us get to solutions; because in the end, we have to generate solutions, I think.

WALTER ISAACSON: As part of both the NSA and especially cyber commander protecting both the defense department but in general the critical infrastructure, what authority -- if, on the day running up to election day, there were large amounts of hacking and traffic and malware and denial of service attacks coming from a country like Russia, as we've already seen them come in on places, do you have the authority right now, or what type of authority would you need to A, defend against those attacks; and B, if necessary, retaliate against the attacks, if for example, some actor decided to wipe out the voter registration rolls of Miami, Cleveland and Philadelphia?

ADMIRAL ROGERS: So, right now as the commander of the United States Cyber Command, and as the director of the National Security Agency, do I have the authority to unilaterally access U.S. systems? No, I cannot do that.

And in the scenario that you highlight, where potentially we might be looking at a penetration, major damage, we have a structure and a process within the government where, in this case, either state, local, or private would approach the government looking for a system, we -- both Cyber Command and NSA -- would be part of a broader government effort to provide that. There's no simple, single rule that fits all. So, it's a case-by-case, specifics of a case-by-case. That's one of the challenges for some people I see in cyber where they will say to me: Well, I'm a little confused why we act this way in this situation and we act a very different way in another situation. I say: That's an appropriate approach to me because it's not one size fits all.

It's no different than -- excuse me -- in the application of kinetic force, for example, as a military guy. It isn't one size fits all. We tailor our rules of engagement, we tailor the decisions we make to the specifics of a particular incident or event, and we respond in a very discreet and appropriate way. Not, hey, it's the same thing no matter what happens.

WALTER ISAACSON: Well, let me just ask a question. You say people keep asking you about a problem, which is, you acted in a very specific way -- well, not you but the government -- with the Sony hack. You named who it was, you shamed them, you put sanctions on and for all we know, you may have done other things that were covert. With the Chinese, there were some indictments against PLA members.

With the Russians, you haven't done anything that we've known. Why not? Is it because you don't know that it's the Russians doing this to our various electoral systems in Illinois or DNC?

ADMIRAL ROGERS: So, first, that's a broader policy issue. I've got to acknowledge, hey, look, I'm a military guy. But -- so I'd make a couple points, Walter, based on what you just said. First, I think it's important we made a decision on the basis of the specifics in each of those scenarios. In one case, we opted to go with a very public, both acknowledgment of the activity, naming of the actor who did it, in this case the North Koreans, as well as specific actions we're going to take in response.

With our Chinese counterparts, we've opted to engage in a long-term ongoing dialogue about what our concerns are to try to identify the behaviors we find objectionable and to try to highlight through specific legal means, in this case, highlighting and indicting five specific individuals, here are concrete examples that we believe meet a legal threshold that would highlight the sorts of activity that we believe are unacceptable.

In the case of the Russia piece, I would just argue, look, this is an ongoing issue, so I'm not going to get into specifics. Let's wait and see how this plays out a little bit and don't just assume that because you haven't seen anything broadly, that it doesn't mean that there isn't activity ongoing. And we'll just let this play out a little bit.

WALTER ISAACSON: And if at some point there is activity ongoing, is there an advantage to being public with that?

ADMIRAL ROGERS: It depends on the scenario. If you look at Sony, for example, so that's November of 2014 -- it's hard to believe we're coming up on two years since the North Korean attack against Sony. At the time, my input -- and I'm just one person in the process. I had a couple of concerns. I said, number one, this is so public that we just can't put our head in the sand and pretend it's not happening.

Secondly, if I'm in the private sector and I see this kind of activity -- because it's directed at the private sector in this case, Sony, a private company -- hey government, if you're not going to do something here, then my option as the private sector is should I draw the conclusion that that means I need to do something and that I shouldn't look to the government in this case? That was an important part for me

of the Sony piece. I thought not only did we want to send a very clear message to the North Koreans, but I thought we also wanted to send a very clear signal to our own private sector about, hey, the government would be willing to stand up under specific conditions and highlight unacceptable behavior and try to bring the capabilities of the government to bear to stop that from happening again. I think that's a positive for us as a nation. I think the approach we've taken with China has been effective to date. I'm not going to argue it's perfect, but it's enabled us to continue moving forward in a dialogue and to agree to changes in behavior. We'll see how this plays out over time. But those are all positives.

WALTER ISAACSON: Can I just drill down right there? What changes in behavior have you seen on China?

ADMIRAL ROGERS: Well, remember, the specific agreement on the 25th of September, 2015. So, again, it's hard to believe we're slightly over a year from there. Can you tell --

WALTER ISAACSON: Time flies when you're having fun.

ADMIRAL ROGERS: -- I'm a happily married guy? I love dates.

What we agreed to there with them was, look, we acknowledge that nation states use cyber as a tool to generate insights as to what others in the world around us are doing. The difference of opinion that we had with the Chinese counterparts was, look, in the U.S. structure we do not take the mechanisms of government, intelligence structures, the military, we don't use those as a vehicle to access the private sector and other companies and other countries for the express purpose of then taking that data, providing it to the private sector in the United States to gain competitive economic damage. We don't do that. In our structure there's a large firewall between what the private sector does when it competes economically and what the role of the government is in that competitive process. We draw a strong firewall there.

Our concern with the Chinese was we don't see that same differentiation in your behavior. We see you penetrating U.S. private systems and then sharing that data with your companies to give them competitive advantage. Look, that is unacceptable to us. And so both of the leaders -- as I said a year ago, in the aftermath of the visit between the two presidents in Washington, came out and said: Hey, look, this is unacceptable behavior, and both nations agree we will not engage in that behavior.

WALTER ISAACSON: Are we having those conversations with the Russians?

ADMIRAL ROGERS: Slightly different structure there, I would argue. Again, everything is a case-by-case basis. The challenge set there is a little different. It's not quite the same.

WALTER ISAACSON: Do you consider our election infrastructure part of our critical infrastructure the way the electricity grid is?

ADMIRAL ROGERS: It's interesting. I think we need to step back and redefine a little bit just what does the idea of critical infrastructure mean in the 21st century? We traditionally have tended to look at it along very industrial lines. Does the segment produce an industrial output of significance to our nation: air travel, finance, petroleum distribution?

In the world that we're living in now, I think another thing we need to think about when we're trying to define what is critical infrastructure for me is the whole idea of data. When I look at the election structure, I go, look, that is the protection of data in the form of votes in the electoral college. What are the implications for us? Because, quite frankly, I don't think any of us really put a lot of time thinking, boy, would somebody ever contest, you know, the infrastructure associated with our election process? But clearly we are moving into a world in which, seemingly -- and you can pick any media outlet any day, every day we're watching major cyber penetrations, theft, extraction of data on a global basis. And we're entering a world where literally nothing seems to be beyond the reach or intent of someone out there to try to access it and often for a variety of purposes: economic advantage, intelligence, embarrassment.

WALTER ISAACSON: Do you see those things changing? In other words, it used to be for economic benefit and now, at least what we're seeing recently, it's just to sow doubt and mess up an election system.

ADMIRAL ROGERS: I mean, there's an aspect of it there. I also remind people, look, if you look at the totality of activity out there, the criminal segment is still the greatest majority. Probably -- depending on the source you want to use, probably 65% of the total cyber activity of concern that you see out in the Worldwide Web today is largely criminal, groups, individual actors using cyber, using the web as a vehicle to gain access to data which they then turn around for economic advantage. Hey, we sold credit card numbers. We sold social security numbers. We sell identities.

WALTER ISAACSON: That 65% is stable, or has it gone up or down?

ADMIRAL ROGERS: It's been pretty -- the last thing -- because I'd be the first to admit it, it's not the biggest focus for me. It seems to be pretty stable in terms of a percentage, but I will say that the capabilities of some of the criminal actors that you see today -- I mean, this is money. So it's not surprising: Where you find money, you find people willing to make investment and willing to generate capability, and the criminal segment sadly is no different. There's a lot of money out there, and so you see a lot of groups really upping their game in terms of what they're capable of doing.

WALTER ISAACSON: If we don't either name, shame, or retaliate or do something with, say, the Russians, if they're the ones messing with our election system, do you assume they'll do it to the German elections next?

ADMIRAL ROGERS: Well, the way I phrase it is don't look for this to be isolated behavior.

WALTER ISAACSON: In other words, yes?

ADMIRAL ROGERS: Yeah. Look for this -- I won't go to the specifics of a country, but my comment would be look for this sort of behavior to continue. And I think that goes to the broad question we're all trying to grapple with. So how do we change the dynamic to get to a place where behavior like this is unacceptable or is perceived to be of such a risk that you don't want to engage in it? And clearly, we're just not there today and that's not a good thing for us.

WALTER ISAACSON: And so we're not there today because we haven't been able to name or we haven't been able to retaliate or we don't have the rules of the road? What should we be doing?

ADMIRAL ROGERS: So my first comment is there's no silver bullet here. It's going to be a combination of how do we make it much more difficult for nations, actors, individuals to be able to successfully penetrate systems. You know, one of our challenges is we are dealing with literally trillions of sunk costs in the form of investments that are out there today, and our network structures and our data flow and our infrastructure, the way it's built, the way it's designed, much of it, most of it was built in a time in which redundancy, resiliency and defensibility were just not core design characteristics. Simplistically it was about, how do you achieve maximum efficiency and effectiveness at the lowest price point?

And so we have built structures over the decades that were never built for this kind of dynamic, this kind of environment where you have a wide range of actors attempting to penetrate them for a variety of purposes. To date, those purposes have largely been the extraction of information. But what happens when it's not just about extracting data and information anymore? What happens when it's about manipulating data so that you can't trust what you're looking at? Think about how that would shape our choices, our decisions as consumers, as businesses, as military individuals. If I couldn't believe the kind of picture that I'm looking at of an environment that enables me as a military commander to start to make risk-based decisions to try to gain advantage and forestall what an opponent is doing, if I lost that ability and instead I'm looking at a picture that's totally false and, in fact, is leading me to make choices that are not helping me, they're helping the opponent, in fact, they're undermining me, that's a bad place.

What happens when we get to the point where some non-state actors, let's take ISIL as an example, decide that the Worldwide Web offers not just the opportunity to spread the ideology, to recruit, to coordinate among geographically dispersed entities, to generate revenue -- what happens when they decide, this is a weapons system, this is a vulnerability, hey, we can exploit this? My concern is this is going to happen. It's the when to me, not the if. And most -- and I apologize. I'll just finish real quick. Most nation states, while they want to gain an advantage, they are unwilling to destroy the status quo as the price of gaining the advantage. I look at a non-state actor like ISIL and I think they have no desire to preserve the status quo. They have no desire to protect the mechanisms of stability that have engendered our ability to create these amazing global inter-connectivities and this amazing structure that we have. They have no interest in preserving that. That's not their vision.

WALTER ISAACSON: So if that's the case, is it that our -- are our offensive capabilities against ISIL not as much of a deterrent as in the old days when our intermediate-range nuclear missiles were a deterrent against an invasion across Europe? In other words, what type of cyber offense comes out of Fort Mead to an ISIL?

ADMIRAL ROGERS: So, I'm not going to get into the specifics. We have publicly acknowledged as a department that cyber command, as a DOD operational entity, is employing cyber in an offensive capability in Syria and Iraq against ISIL. I'm not going to get into the specifics of the how or the what. But one of my takeaways I hope people will draw from this is we have publicly acknowledged, now that we've been doing this for months, we've been able to do this in a very targeted, very focused way, in a very proportionate way.

So you haven't heard, you know, Oh, my God, look at what they're doing against civilian infrastructure, look at what they're doing against -- that's impacting NGOs in the space. We have tried to be very precise, very measured, very discreet. Because we are aware, hey, look, there's second and third implications here that we need to be mindful of. And so, you know, that's something that I feel very good about. We've been able to show that we can execute and use these sorts of offensive capabilities. We can have impact. We can do it in a way that doesn't cause fratricide with very legitimate second and third parties that are operating in the same space.

WALTER ISAACSON: For that to happen, you need to have cyber command, which is an operational division, and you do have it, very closely linked physically, both under your hat -- because you have two hats -- with the NSA, the intelligence gathering. There are proposals to separate, compartmentalize, as opposed to integrate more, to take them apart more. I know that's a big political discussion that will be ongoing. But what cautions would you give the next administration about answering that question, should we separate cyber command from NSA?

ADMIRAL ROGERS: First, clearly an ongoing discussion. We routinely, as an organization, assess our structures the way we're organized. That's nothing new. We do this all the time much more broadly across the department. Hey, that's perfectly appropriate. You always want to ask yourself: Are the assumptions that we made in the past still valid today? Is the structure and the processes we picked that we have created to generate cyber outcomes, do they still make sense? As we're working our way through this, you know, my points have been in the long run, I acknowledge, I think this is the right thing to do as cyber command gains more capability, as cyber command gains more capacity. I believe that in the long run, we want to keep these two organizations closely aligned. But we're probably going to want to get to a position where cyber command is able to act a little bit more on its own. And, quite frankly, part of it is just the human dynamic. These are two very -- I'm the first to acknowledge, these are two demanding sets of responsibilities. But on the other hand, I've also argued you don't want to do anything so precipitously that you end up incurring risk that you don't have to. I'm getting some broader policy decision. We'll work our way through the how, the if, the when. You know, there's some smart people looking at this. This is not something that's going to be done casually.

WALTER ISAACSON: The issue of end-to-end encryption, how bad is that for you, really?

ADMIRAL ROGERS: Now, it varies. If you are a law enforcement entity, a local sheriff, the FBI, encryption puts you in a very tough spot. You do not have the technical means, and you don't have the legal means to overcome it. So you are trying to figure out, I got a device, the potential has evidence related to exploitation of youth, crime, violence, guns, weapons, terrorism. And in many cases, these days, you increasingly find yourself unable to access it.

For the National Security Agency, the intelligence structure is a little different for us. We operate in foreign space, number one. So we have some legal options that are available to us that are domestic. Law enforcement teammates do not. Secondly, we've got a set of tools that we can look at more broadly. So my input to this has been, for us, this has had impact. That impact will grow over time. It's going to get worse, not better. That while many people, for example, will talk to me about the power of metadata. I'm like, Hey, look, I spent a lot of time on the bar in metadata. I don't disagree. But another thing I try to remind people is the goal -- let's talk about terrorism, where this really is starting to come to the fore, that's the one that's really driving this in some ways right now. Because you are watching groups that we know are attempting to conduct attacks in the United States, that have done attacks in western Europe, and they are using these tools to coordinate among each other and to move people, move money, move explosives.

WALTER ISAACSON: "These tools" means like an application, encryption? And you lose them and they go dark to you and you can't follow them?

ADMIRAL ROGERS: It depends on the scenario, specifically. But they clearly are aware of the technical limitations here, and they are trying to take advantage of that.

For us, the point I'm trying to make is, our goal is not to be in a position to respond in the aftermath of an attack. Is that part of our job? Yes. But the goal we're constantly striving for is to get ahead of the problem set and stop events from happening before they even occur. To do that, in my experience, you fundamentally have to get the content. Metadata won't tell you, so who are the specific actors here that I need to roll up? How many parts of the network are truly involved in this? What exactly is the target? How are they going to do this? Is it explosives, is it weapons, is it vehicles? Where is the target? You don't get all that from metadata, for example. So increasingly the challenge for law enforcement, for us is, how do you access content in a way that both protects the rights of lawful citizens but at the same time enables us to generate the insight that those citizens are counting on to help ensure their security and their safety?

WALTER ISAACSON: And if you could pick -- this is my last question -- one thing that Congress could pass that would get that balance right on that most important issue, let's keep it focused on possible use by terrorists of communications, what would you ask for?

ADMIRAL ROGERS: I say this to my congressional counterparts when I get asked: Help to try to create an environment in which we can have a meaningful dialogue about how we're going to deal with this.

Because I am a little concerned. My argument would be, you don't want us, intelligence or law enforcement, jamming a solution down your throat. I would argue, you don't want the private sector doing this unilaterally. How can we come together and bring the best of our nation? I say this out in the valley all the time: You are about the power of potential. You are the greatest innovative engine. You represent much, much broader than just the valley. You are the visible face of one of the most powerful innovative engines on this planet and in the history of this world.

As a society, traditionally, America is all about "can do." And I hear us right now spending a lot of time about "can't do." And the frustration for me is, can't we harness the power, the insight, the knowledge, the innovative approaches of the private sector, and the knowledge and skills of the government to come together and to key up options for our citizens to decide what are they comfortable with that would enable us to address this very important and fundamental issue? It goes to this mismatch about our legal framework and the state of technology.

WALTER ISAACSON: Admiral Mike Rogers, thank you very much for being with us.

ADMIRAL ROGERS: Thank you. Thank you. Thank you very much.

Radio-Canada - Nouvelles (site web)
Un employé de la NSA arrêté pour vol de données secrètes
Thursday, 06 October 2016
Byline: Journaliste maison

Non identifié - Un employé contractuel de la NSA soupçonné d'avoir volé des données de l'agence fédérale classées « top secret » a été arrêté, à la toute fin du mois d'août, par le FBI. C'est ce qu'a révélé le New York Times dans son édition du mercredi 5 octobre.
L'homme qui répond du non d'Harold Thomas Martin III est un salarié de Booz Allen Hamilton, une société sous-traitante travaillant pour la NSA. La même qui avait engagé Snowden, l'informaticien qui avait révélé le programme de surveillance et d'espionnage américain.

Selon le quotidien new-yorkais, la perquisition effectuée dans le domicile de M. Martin révèle une importante saisie de documents et d'informations numérisées stockées sur différents appareils électroniques. Le journal ajoute que la police avait retrouvé aussi des documents confidentiels dans la voiture de l'accusé.

Motivations inconnues

Interrogé par les agents du FBI, l'homme de 51 ans a d'abord nié les faits, avant de les reconnaitre, écrit le journal.

Dans la foulée des révélations du New York Times, les avocats de M. Martin ont publié un communiqué en affirmant qu'il n'y avait pas de « preuves évidentes » contre leur client. Il aime sa famille et son pays, il ne va pas trahir les États- Unis, ont-ils écrit.

Selon le journal américain, les motivations de M. Martin restent inconnues par les agents du FBI. Mais ces derniers le soupçonnent d'avoir voulu pirater les systèmes informatiques des pays rivaux des États-Unis (Russie, Chine, Iran et Corée du Nord) avec les codes confidentiels qu'il a volés.

Pour le FBI, il est très tôt de parler espionnage. Mais les agents fédéraux disent poursuivre l'enquête pour savoir si M. Martin n'est pas le responsable d'une fuite de code de la NSA classé « confidentiel » attribué au groupe dit Courtiers Fantômes. Les enquêteurs veulent savoir aussi s'il avait joué un rôle dans une série des fuites sur les écoutes téléphoniques américaines concernant des pays comme le Japon, l'Allemagne et publiées l'année dernière par Wikileaks.

Pas d'« épidémie » Snowden

Le FBI refuse de faire une comparaison avec l'affaire Snowden. Les enquêteurs pensent que M. Martin aurait « volé » les documents avant que l'affaire M. Snowden ne soit rendue publique, indique le quotidien new- yorkais.

Bruce Schneider, un spécialiste de sécurité informatique qui suit de près les fuites de la NSA, a indiqué au New York Times qu'il n'y avait « pas une épidémie » Snowden.

Toutefois, M. Schneider a fait remarquer que l'agence fédérale a recruté ces dernières années beaucoup de jeunes programmeurs et des spécialistes dans le piratage informatique. Les officiels ont peur que ces jeunes soient inspirés par Snowden, mais le suspect actuel ne semble pas répondre à ce profil, selon lui.

Dans un document du FBI, le département de la Justice évalue à plus de 1000 $ l'équipement volé par M. Martin qui, pour le moment, est poursuivi pour détention de matériels secrets et vol au détriment du gouvernement. Il risque respectivement un an et dix ans de prison pour ces faits.

Le Temps (Suisse)
La Suisse plus restrictive
Thursday, 06 October 2016
Byline: Sylvia Revello

Berne - Expert en droit des médias et des nouvelles technologies, Nicolas Capt analyse l'affaire Yahoo! du point de vue juridique suisse

Peut-on envisager un accord similaire à celui de Yahoo! entre les autorités et des fournisseurs suisses?

Au-delà du caractère illégal, cette situation me paraît peu probable. Les prérogatives étatiques sont très différentes en Suisse. Dans l'exemple américain, on est face à une surveillance à grande échelle, une sorte de fishing expedition qui ratisse large en espérant obtenir des résultats. Le cadre helvétique est bien plus restrictif, y compris avec la nouvelle loi sur le renseignement, qui pose de nombreux garde-fous. De la part des autorités pénales comme du Service de renseignement de la Confédération (SRC), l'observation des données privées reste limitée et surtout ciblée. La vraie différence réside dans une certaine opacité de la surveillance du SRC qui officie, par principe, hors de toute procédure pénale.

La NSA avait-elle vraiment besoin que Yahoo! lui fournisse ses données, connaissant sa puissance de frappe?

Il n'est pas absolument certain que la NSA soit capable de procéder seule à une surveillance aussi large. Politiquement parlant, je relève que le scandale est moindre en négociant un accord préalable avec la société plutôt qu'en opérant une attaque informatique contre une entreprise, qui plus est américaine. Cette forme de coopération assez servile n'existe pas, à ce jour, en Suisse. Le pays a d'ailleurs une vraie carte à jouer en termes de confidentialité des données - sorte d'héritage de feu le secret bancaire - et de respect de la vie privée. De nombreux data centers voient le jour dans ce sens et une association, VigiSwiss, défend la place suisse à l'international en tant que coffre-fort numérique.

Malgré leurs déclarations, Google et Microsoft pourraient-ils imiter Yahoo!?

Difficile de le dire, à ce stade, sans sombrer dans les conjectures. Le passé récent, et notamment le programme Prism, montre toutefois que beaucoup ont accepté de collaborer. Ils pourraient en revanche, comme Apple au début de l'année, opposer une résistance pour des raisons éthiques et/ou commerciales. Cette position de principe n'a toutefois pas empêché le gouvernement de parvenir à ses fins, en faisant déverrouiller l'iPhone appartenant à un terroriste par une société tierce.

The Pioneer
Kerala ISIS in cyber overdrive
Thursday, 06 October 2016

Kochi - The Kerala unit of the Islamic State of Iraq and Syria (ISIS), Ansar-ul-Khilafa is still active in cyberspace despite the arrest of six of its top leaders by the National Investigation Agency (NIA) from Kannur district on Sunday even as the Intelligence agencies believe that there could be several young men in northern Kerala, especially in Kasaragod, Kannur and Kozhikode districts, who may have connections with the global terror group or are its sympathisers.
According to Intelligence officials, a Facebook page which was being maintained allegedly by Manseed of Kannur, arrested from Kanakamala along with five others last Sunday, under the assumed name of

Sameer Ali, is still active and is being updated frequently. They said the page was updated even on Tuesday.

The NIA had found that Manseed alias Sameer was the chief coordinator of the 12-member control group of Ansar-ul-Khilafa Kerala.

Fresh posts declaring support to the ISIS and calling for jehad had appeared on the Facebook page in the past 48 hours, say officials. The new posts indicated that the page manager had knowledge of the six arrests. The messages aimed at jehadis said activities in the path of jehad did not depend on individuals and that jehadis might get killed or jailed but the jehad would not end because of such incidents.

The new posts, which also exhorted believers to wage war against those violating the laws of Allah, said it would be difficult for Keralites who had been keeping away from the path of jehad for several decades to join the movement. Updating is said to be happening on an hourly basis in the Telegram chat group of Ansar-ul-Khilafa Kerala. The NIA has learned that there are 32 participants in this chat group.

The NIA has found the Malayalam blog of the Kerala unit of the ISIS, which was started almost a year ago and had gone out of function last July after the agency infiltrated it. The agency has also found that articles written by Sameer Ali had been posted on the blog even the day before the arrest of the six alleged operatives from Kannur.

Participants in the group had been given strict instructions to keep details of the account concealed, sources said. The NIA has received information that those writing in the group's Malayalam blog, which had articles criticising the Muslim organisations in the State, are young Keralites living abroad.

Meanwhile, some non-resident Kerala industrialists could have provided financial assistance - knowingly or unknowingly - for the activities of Ansar-ul-Khilafa Kerala, sources said, adding that an Islamic outfit with extremist leanings based in northern Kerala could have provided help for the formation of the ISIS's State unit. Investigations are progressing in these matters, they said.

According to Central Intelligence agencies, the Kerala Police had failed in taking effective action even after the Facebook group of young Keralites had appeared in cyberspace in the name of Ansar-ul-Khilafa Kerala. This lapse on the part of the police could have contributed to the expansion of the group with ISIS sympathizers in the State.

It has now become clear that huge sums of money had flowed into Kerala from abroad for the formation and functioning of Ansar-ul-Khilafa Kerala. There are indications that some of the 22 people from Kasaragod and Palakkad districts who had disappeared mysteriously and are feared to have joined the ISIS in Afghanistan had been in direct or indirect contact with the leadership of Ansar-ul-Khilafa Kerala.

Yonhap News Agency

N. Korea shows increased activity at nuclear test site: 38 North

Friday, 07 October 2016

Byline: Staff reporter

Section: general

Washington - North Korea is showing increased activity at its nuclear test site in what could be part of preparations for a new test, a U.S. website monitoring the North said Thursday, amid concern the regime could undertake provocations to mark a key anniversary next week.
Commercial satellite imagery taken on Oct. 1 of the Punggye-ri underground test site in the country's northeast "indicates continuing activity at all three tunnel complexes that could be used to conduct a nuclear test," the website 38 North said.

Activity at the North Portal, where the communist nation conducted its fifth nuclear test last month, could be for a number of purposes "including collecting post-test data, sealing the portal or preparing for another test," the report said.

Satellite imagery shows a large vehicle, possibly a truck, near the portal's entrance, while a large canopy in its parking lot, which has been present for the past two months, remains in place, the report said. No signs of new excavation were seen, but there appear to be boxes or material around the side of the main building, it said.

Increased activity was spotted at the South Portal where excavation stopped in 2012, the report said.

Two small vehicles were seen on the road as well as what appears to be a group of people standing near one of the portal entrances, indicating ongoing work or maintenance, the report said.

"The purpose of this activity is also unclear although the portal is assumed to be capable of supporting a nuclear test once a decision is made to move forward," it said.

In addition, mining carts and furrows were evident on the spoil pile at the West Portal, but it is unlikely that tunnel excavation has resumed since the pile has not grown over the past two months, the report said.

South Korean officials have said that the North appears to be ready to carry out an additional nuclear test at any time. Speculation has grown that Pyongyang could conduct one to mark the anniversary of its ruling Workers' Party that falls on Monday next week.

Reuters

Satellite images show activity at North Korea nuclear test site - report

Friday, 07 October 2016

Byline: Staff reporter

Section: general

Seoul - An increase in activity at North Korea's nuclear test site could signal preparations for a new test or a collection of data from its last one, a U.S.-based monitoring group said on Friday, citing satellite images.
The 38 North group, run by Johns Hopkins University's School of Advanced International Studies, said there was activity at all three tunnel complexes at the Punggye-ri nuclear test site involving a large vehicle and personnel.

"One possible reason for this activity is to collect data on the Sept. 9 test although other purposes cannot be ruled out, such as sealing the portal or other preparations related to a new test," the group said, referring to the last nuclear test.

The North is believed to be ready for another nuclear test at any time and there has been speculation it could mark the Oct. 10 anniversary of the founding of its Workers' Party with another underground detonation.

North Korea conducted its first nuclear test in 2006 and has since then defied U.N. sanctions and rejected international talks to press ahead with the development of the weapons and missiles to carry them, which it says it needs for its defence.

In January, it conducted its fourth nuclear test and last month its fifth and biggest, on the anniversary of the nation's founding.

The United States and South Korea are pushing for tighter sanctions against North Korea by closing loopholes left in a U.N. Security Council resolution in March.

South Korea's Unification Ministry spokesman Jeong Joon-hee told a briefing there were no particular indication of a plan for a nuclear test timed to coincide with the Oct. 10 anniversary.

South Korea's Yonhap news agency cited an unidentified government official that there was activity at the North's rocket launch station near the west coast that could be preparations for a long-range missile launch.

Last month, the North said it had successfully conducted a ground test of a new rocket engine that would be used to launch satellites. South Korea said the engine could be used for a long-range missile.

North Korea last month fired three missiles that flew about 1,000 km (600 miles). In August, it tested a submarine-launched ballistic missile that international experts said showed considerable progress.

Japan said the possibility of further "provocative action" by North Korea could not be ruled out.

"The government is taking all possible measures in gathering information, exercising vigilance and taking surveillance activities to be able to respond to any situations," Japan's Chief Cabinet Secretary Yoshihide Suga told a news conference. Wall Street Journal

Accused Contractor Was on Hacking Team

Friday, 07 October 2016

Byline: Damian Paletta, Scott Calvert

Section: general

Washington - Harold "Hal" Martin, the former National Security Agency contractor charged this week with stealing government secrets, spent parts of the past decade on a government hacking team, sought funding for research into post-traumatic stress disorder, and tried to rally internet users to wage digital warfare against computer "commandos."
Investigators are still trying to determine why Mr. Martin, a former employee of consulting firm Booz Allen Hamilton who worked on projects at the NSA and the Pentagon, took classified documents containing computer-spying tools to his home in Glen Burnie, Md. But as the probe continues, more details of his background are coming into focus.

A former academic mentor of Mr. Martin described him as focused, and burdened by a sense that his insights weren't appreciated.

Roy Rada, a professor of information systems at the University of Maryland, Baltimore County until he retired in January, said he served as a mentor to Mr. Martin several years ago, and the two worked together for a few months. Mr. Rada, in an email to The Wall Street Journal and two other news organizations, said Mr. Martin, now 51 years old, was "highly motivated" and had served in the Navy in wars in the Middle East.

Mr. Rada said Mr. Martin had an "intense personal and professional interest in the post-traumatic stress disorder" and wanted to focus his graduate research in this area.

Mr. Martin had hoped he could secure enough funding to finance his graduate work on PTSD but wasn't able to, Mr. Rada recounted. Mr. Martin then decided to work with another mentor at UMBC, and Mr. Rada said he and his former mentee lost touch.

Mr. Rada described Mr. Martin as "thoughtful, sensitive, and dedicated."

"While he had a commanding physical presence, emotionally he suffered from the feeling that his relatively special situation was inadequately appreciated," he said, without expanding on what that situation might be.

Mr. Martin's LinkedIn page says he started his Ph.D. work at UMBC in 2007 but it remained incomplete. "Trying to finish that dissertation," he wrote. His graduate work had moved in another direction from PTSD. In 2014, he published a paper at a Seattle conference on cloud computing.

Cloud computing has been a focus for U.S. military and intelligence officials, who are interested both in protecting cloud-stored data from hackers and penetrating the cloud to steal information from others.

In 2009, someone using Mr. Martin's email address highlighted the vulnerability of data moving from clouds to "server farms" and then to computers. The person warned on Seclists.org, a site used by people to discuss computer security, of potential attackers including "'commandos' and 'dirty dozen' types mounting the electronic 'castle walls.'"

"You just have to ask yourself if you are ready form [sic] digital aiki-do," the person wrote, referring to martial arts. "Or do you intend to let digital banditry win the day and plunder your lands . . ."

According to his LinkedIn page, Mr. Martin was working as a government contractor at the NSA and Pentagon while trying to obtain his doctorate from UMBC.

In his government work, Mr. Martin was assigned to a unit that looked for holes in the U.S. intelligence apparatus using a process called "red-teaming," said Rep. C.A. "Dutch" Ruppersberger (D., Md.) in an interview.

Red teams are internal hacking groups that look for flaws in networks to help make them more secure. Team members can have access to some of the government's most sophisticated hacking tools. Mr. Ruppersberger, who received a classified briefing on Mr. Martin's case, said he didn't know exactly what Mr. Martin's work involved but called him "very knowledgeable."

"He was working in a sensitive area where they trusted his expertise," he said. Mr. Martin passed at least one polygraph test, Mr. Ruppersberger added.

The NSA didn't respond to requests for comment. Mr. Martin's lawyer, Jim Wyda, also didn't respond Thursday, but said Wednesday the case amounted only to allegations.

Mr. Martin's LinkedIn page doesn't mention his affiliation with Booz Allen or the NSA, saying only that he worked "for various cyber related initiatives across DoD [the Department of Defense] and the IC," or intelligence community.

On his LinkedIn page, Mr. Martin doesn't mention the interest in PTSD cited by Mr. Rada. It says he graduated from the University of Wisconsin in 1989. His service in the Navy, confirmed by the military, began in 1988, something he described as "not just a job, but an adventure as well."

Washington Post

Arrest of NSA contractor highlights growing concern over insider threats

Friday, 07 October 2016

Byline: Christian Davenport

Section: general

Washington - The arrest of a National Security Agency contractor charged with stealing highly classified material is the latest example of a trend that officials say can be every bit as dangerous as an outside hacker: the insider threat.
The federal government has been increasingly concerned about the ability of its own employees and contractors to use their positions to walk away with troves of sensitive information. And it has tried to

implement new safeguards to not only better secure important data but also monitor the people with access to it.

Fears over insider threats intensified after the breach by former Army Pfc. Chelsea Manning and Edward Snowden, an NSA contractor working for Booz Allen Hamilton. But with the revelation that Harold Thomas Martin III was arrested in August and charged with theft of government property and unauthorized removal and retention of classified materials, there will be even greater scrutiny of how the nation protects its secrets, officials said.

The allegations against Martin, 51, of Glen Burnie, Md., suggest "that our counterintelligence abilities are still inadequate," said Steven Aftergood, the director of the Project on Government Secrecy for the Federation of American Scientists, "and that the kinds of precautions that would be necessary to prevent removal of highly classified material are not in place. ... It simply should not be possible to remove information from a classified system without supervision by somebody else. And evidently that kind of supervision was lacking here."

Martin's federal public defenders said in a statement that the charges against him were "mere allegations." "There is no evidence that Hal Martin intended to betray his country," the attorneys said.

In response to the Manning WikiLeaks leak, President Obama in 2011 issued an executive order that established a National Insider Threat Task Force and required all federal agencies that handle classified material to institute programs to seek out saboteurs and spies.

Agencies began monitoring their computer networks with renewed scrutiny and tracking employee behavior for signs of problems. Even workers with the highest clearances face additional surveillance.

The Pentagon's Defense Security Service announced this year that contractors will be required to implement programs that are designed "to detect, deter and mitigate insider threats." Contractors will be required to designate a senior insider threat official to oversee the program and provide training on how best to implement it.

While many details of the Martin case are not yet known, it is clear that it is not good for Booz Allen to have a second employee charged with stealing secrets from one of its most important customers, officials said.

"When a government employee does something like this, it is a scandal of one sort or another," said Loren Thompson, a defense industry consultant who also serves at the Lexington Institute. "But when a contractor is involved, it's potentially a business-threatening situation."

In an SEC filing, Booz Allen said that "we immediately reached out to the authorities to offer our total cooperation in their investigation, and we fired the employee. We continue to cooperate fully with the government on its investigation into this serious matter."

It added that there have "been no material changes to our client engagements as a result of this matter."

After the Snowden scandal, Booz Allen vowed to strengthen its security procedures. And critics have blasted the nation's intelligence community for loose controls, especially over contractors. But contractors remain a vital component to the United States' national security and intelligence establishments, so much so that "the system would not function without them," Aftergood said.

Chris Taylor, a longtime defense industry executive who teaches a class on the business of national security at Georgetown University, said that the threats the country faces are very complex and moving so fast that it makes sense to tap outside expertise.

"Any bureaucracy has an optimum speed at which they can operate," he said. "And if they're wise enough to realize those constraints keep them behind the power curve, they look outside for capacity to help them get ahead."

Several top defense firms have developed technologies designed to root out insider threats for government agencies and corporations. Lockheed Martin provides a service called Wisdom, which it says acts as your "eyes and ears on the Web." On its website, the company says that "insider threat losses are escalating at an alarming rate, with trade secrets and [intellectual property] theft projected to double in 2017."

Booz Allen, which came under intense scrutiny after Snowden walked off with some of the NSA's most closely guarded secrets, also helps organizations root out rogue employees. Last year, it announced a partnership with Raytheon, which offers a service that can give organizations the ability to digitally record the activity on their employees' computer screens and play it back - even in slow motion.

"Organizations are paying more attention to protecting their enterprises against the growing cyberthreats, and as a result, they are putting more personnel, IT and consulting resources toward managing this risk," Brad Medairy, a Booz Allen senior vice president, said at the time. "While managing the outside risk is critical, equally as important is the threat from within."

The detection programs use artificial intelligence and machine learning to create profiles of employees based on their activity, vacuuming up reams of data: Every time an employee swipes their badge to get into the building, every time they log on to their computer, the phone calls they make, the amount of email sent and received, the files they access, the data they upload.

"All these things generate a breadcrumb trail of your activities," said Chris Kauffman, the chief executive of Personam, a Northern Virginia company that focuses on insider threats. "Then it's up to the machine learning algorithms to sift through the data to establish patterns."

It tracks "anomalies" such as off-hour entries into the building or when large files are downloaded. Kauffman said his company's system caught rogue attorneys who were surreptitiously making electronic copies of case files.

Even so, insider threats pose a delicate and difficult challenge and can be hard to detect, especially since large amounts of data can be downloaded quickly and stored on tiny devices.

"The problem with insider threats is that they're not trying to infiltrate the place," Thompson said. "They are already there, and they know most of the procedures guarding information. When you know those procedures, you can develop better ways of working around them."

ATS looks for terror clues on social media

Friday, 07 October 2016

Byline: Ritesh Shah

Section: general

Ahmedabad - If you are active on social media, don't be in a hurry to post likes or follow any content that has anything remotely to do with terrorism, atrocities, riots, extremist propaganda, and other such topics. For, along with physical spaces, the Gujarat Anti-Terrorism Squad has increased its surveillance in cyber space too. All major social networking sites, including Facebook, WhatsApp and Twitter, are under observation. Following the Uri attack and the surgical strikes by the Indian Army, the ATS has been keeping track of content being posted on the sites.
Whenever someone posts a like or follows content related to terrorism or extremist propaganda, the person comes on the radar of ATS. The person's movements are monitored. In Gujarat, maximum likes to sensitive, or potentially volatile, content are posted from Ahmedabad, Vadodara, Bharuch, Navsari and Valsad.

ATS officials are also keeping tab on visitors of terrorism convicts lodged in jails across the state. According to authorities, their movements could help the cops find out about sleeper cells. Suspects are already under observation on social media. To bust the sleeper cells, the state agencies are working in tandem with central agencies like IB, RAW and NIA among others. The Coast Guard too has been sharing information about activities at sea and coasts.

Informer network has been strengthened. Those who have been in touch with the terrorists earlier too are being monitored.

According to ATS sources, calls made between Gujarat and Pakistan are being monitored. KK Patel, DySP-ATS, said "We are taking all fresh inputs seriously. Every input is probed thoroughly. We are monitoring activities in jails too. We are not restricting ourselves to social media users in Gujarat. Suspicious posts from outside state and country too will be scanned." "Our network is spread in Bangladesh, Pakistan and other countries. But, we cannot do anything till we get evidence," Patel added.

ABC News

NSA Contractor Who Allegedly Stole Top Secret Info 'More Weirdo Than Whistleblower,' Officials Say

Thursday, 06 October 2016

Byline: Multiple reporters

Section: general

New York - The National Security Agency contractor who federal authorities say took top secret information from the NSA is being described as "more weirdo than whistleblower," senior officials told ABC News.
Harold Martin, 51, was arrested in late August in what neighbors described as a dramatic FBI raid, but it was not until Wednesday that his curious case was revealed in a criminal complaint. In court documents, the FBI says Martin took home physical documents and information stored on digital devices, some of which was sensitive compartmented information (SCI), the highest level of classification.

It was information that the FBI said, if made public, would "reasonably be expected to to cause exceptionally grave damage to the national security of the United States." In all, the Department of Justice said investigators seized "thousands of pages of documents and dozens of computer or other digital storage devices and media" that held "many terabytes of information."

Although Martin worked at Booz Allen Hamilton, the same contractor for whom Edward Snowden worked, and was apparently able to slip through the NSA's security with highly sensitive information, as Snowden did in 2013, officials said overnight that that appears to be where the similarities between the two end.

It is unclear why Martin, a Navy veteran, allegedly removed so much sensitive information from his workplace and allegedly stored it in his home, nearby woodsheds or his vehicle, but he has not been

charged with espionage -- indicating to some former officials that this case may not be as serious as Snowden's. The Department of Justice said Tuesday that if convicted, Martin could face up to 11 years in prison - - one year for unauthorized removal of classified material and 10 years for theft of government property. Snowden, however, could face a far harsher prison sentence, should he return to the U.S. from Moscow; the U.S. government has said the death penalty will not be sought.

"It's not a repeat of Snowden, but it is another insider," Chris Inglis, a former NSA deputy director, told ABC News Wednesday. "It could be quite harmful, but [so far] it's not as malicious or nefarious."

Jim Wyda, a public defender assigned to Martin, said there is "no evidence Hal Martin intended to betray his country."

"What we do know is that Hal Martin loves his family and his country. He served our nation honorably in the United States Navy, and he has devoted his entire career to serving and protecting America. We look forward to defending Hal Martin in court," Wyda said.

Regardless of Martin's intentions, the incident is another embarrassment for the NSA, coming three years after Snowden made off with a cache of data that exposed dozens of NSA surveillance programs. It is unclear whether Martin purportedly absconded with his data before or after post-Snowden security reforms were put in place.

"When you download this kind of top secret information off the NSA network into your own computer or into a thumb drive, alarms should go off. Apparently they didn't," said former White House cybersecurity adviser and current ABC News consultant Richard Clarke.

Martin's former employer, Booz Allen, released a statement Wednesday saying the company fired one of its employees, without identifying Martin, after learning of his arrest and that the firm continues to work with law enforcement.

The federal complaint complaint says Martin was interviewed by federal agents in late August and, when "confronted with specific documents, admitted he took documents and digital files from his work assignment to his residence and vehicle that he knew were classified." He allegedly said he knew what he had done was wrong.

Boston Herald

NSA Director Denies Mass Scanning of Yahoo Emails

Friday, 07 October 2016

Byline: Jordan Graham

Section: general

Boston - Top U.S. intelligence officials denied a blockbuster Reuters report claiming Yahoo built special software to scan emails to hundreds of millions of accounts, while a subsequent New York Times report claims the snooping was limited to suspected members of a terrorist organization.
"That would be illegal. We don't do that, and no court would ever grant us the authority to do that. We have to make a specific case. And what the court grants is specific authority for a specific period of time for a specific purpose," said Adm. Michael Rogers, director of the National Security Agency, speaking at the Cyber Security Summit at Massachusetts Institute of Technology Oct. 5.

"We have a legal framework in this nation that enables the government ... for specific reasons, under specific conditions, to make a case before a judge in which we're able to show a judge we have reason to believe that there is threat here to the United States associated with specific individuals and a judge grants, simplistically, authority for a specific purpose for a specific period of time to access data."

On Tuesday, Reuters reported Yahoo had built custom software for the U.S. government that scanned incoming emails to millions of accounts.

"I've read this real quickly and I thought, well, this is a little speculative," Rogers said.

In a statement, Yahoo called the story "misleading."

After Rogers spoke yesterday, The New York Times, citing sources, reported the order from the Justice Department required Yahoo to search for a "digital signature" used by a state-sponsored terrorist organization.

The Times said Yahoo modified its existing spam, virus and child pornography filter to look for messages with the digital signature.

According to the report, the search was unusual in that every email was scanned for the specific signature, rather than searching for a specific user's account. The Justice Department was able to convince a judge that signature was unique to the terrorist group. The search is no longer ongoing, the Times said.

Associated Press

After latest NSA breach, does agency do enough to protect classified data?

Friday, 07 October 2016

Byline: Staff report

Section: general

Washington - The arrest of a National Security Agency contractor accused of stealing classified information represents the second known case of a government contractor being publicly accused of removing secret data from the intelligence agency since 2013.
The latest arrest came despite efforts to reform security after the Edward Snowden disclosures, especially in regard to insider threats.

Harold Thomas Martin III, 51, of Glen Burnie, Maryland, was arrested by the FBI in August, after federal prosecutors say he illegally removed highly classified information and stored the material in his home and car. A defense attorney said Martin did not intend to betray his country.

The arrest was not made public until Wednesday, when the Justice Department unsealed a criminal complaint that accused Martin of having been in possession of top-secret information that could cause "exceptionally grave danger" to national security if disclosed.

The fact that Snowden and now Martin -- both working for Booz Allen Hamilton as contractors for NSA -- were able to leave the NSA with highly classified documents, especially given the supposed security upgrades put into place, raises the question of whether the intelligence agency's efforts to tighten internal security afterward were effective or adequate. The NSA declined to comment.

"One key thing we don't have visibility into now is how he was caught, because that would provide some insight into whether the reforms that were put in post-Snowden were effective or not, or their relative efficacy," said Rajesh De, who was the NSA's general counsel when the Snowden story broke and remained there until last year. Snowden's 2013 theft of documents that were leaked to journalists revealed the NSA's bulk collection of millions of Americans' phone records.

Rep. Adam Schiff of California, the senior Democrat on the House Permanent Select Committee on Intelligence, said in a statement that "it is painfully clear that the intelligence community still has much to do to institutionalize reforms designed to protect (U.S. government secrets) from insider threats."

While details remain sparse, Martin's arrest also illustrates the difficulty of guarding against an insider threat given that employees that, by virtue of their clearance level and jobs, must be entrusted with the nation's secrets.

It's unlikely, given the thousands of people in the intelligence community, "you're going to be able to stop every incident of somebody taking documents if they're determined to do so. But the real question is how quickly can you detect it, how quickly can you mitigate the harm of any such incident," De said.

Adm. Mike Rogers, who heads the NSA, has repeatedly spoken since 2013 about efforts the agency has taken to ensure that such a thing doesn't happen again. He has said the agency tried to strike a balance so as to not overly upset workers, who are law-abiding citizens, with aggressive internal security mechanisms.

On Wednesday evening at a Harvard University event, Rogers declined to offer details on the ongoing investigation but officially confirmed that the contractor was employed at the NSA, which monitors and collects sensitive information and data, mostly from overseas.

Among the classified documents found with Martin, the FBI said, were six that contain sensitive intelligence -- meaning they were produced through sensitive government sources or methods that are critical to national security -- and date back to 2014. All the documents were clearly marked as classified information, according to a FBI affidavit accompanying the complaint.

The complaint does not specify which documents Martin is alleged to have taken. He was arrested around the same time U.S. officials acknowledged an investigation into a cyber leak of purported hacking tools used by the NSA. That toolkit consists of malicious software intended to tamper with firewalls, the electronic defenses protecting computer networks. Those documents were leaked by a group calling itself the "Shadow Brokers." The complaint does not reference that group or allege a link to Martin.

White House spokesman Josh Earnest said President Barack Obama takes the situation "quite seriously. And it is a good reminder for all of us with security clearances about how important it is for us to protect sensitive national security information."

The New York Times first reported the arrest of a NSA contractor who worked for Booz Allen Hamilton. Booz Allen said in a statement that after learning of the arrest of one of its employees, it contacted law enforcement authorities to offer its cooperation and fired the worker.

At Martin's home, investigators found stolen property valued at "well in excess of $1,000," the complaint said. He voluntarily agreed to an interview.

"Martin at first denied, and later when confronted with specific documents, admitted he took documents and digital files from his work assignment to his residence and vehicle that he knew were classified," the affidavit says. "Martin stated that he knew what he had done was wrong and that he should not have done it because he knew it was unauthorized."

He has been in custody since his arrest in August.

"There is no evidence that Hal Martin intended to betray his country," his public defenders, James Wyda and Deborah Boardman, said in a statement. "What we do know is that Hal Martin loves his family and his country. He served honorably as a lieutenant in the United States Navy, and he has devoted his entire career to serving his country. We look forward to defending Hal Martin in court."

The complaint charges Martin with unauthorized removal and retention of classified materials and theft of government property.

In 2013, journalists relying on classified documents stolen by Snowden revealed the NSA's bulk collection phone records and spurred a national debate on privacy and national security.

Rogers has said that since those revelations, he's repeatedly reminded the workforce of their agreement to never divulge the sensitive information they've been given access to. In prior comments, Rogers has said security isn't just about technical and insider threat preparation, but also about ensuring professional behavior.

"At times, I have some people telling me, 'Hey, what this should show you is you can't trust contractors,' " said Rogers, in a speech at Stanford University in 2014, noting that some of the biggest compromises of information came from direct U.S. employees. "This idea that you can't trust contractors, I just don't think I'm concerned about the long-term implications of that."

White House official: Cyberthreats continue to multiply

Friday, 07 October 2016

Byline: Sean D. Carberry

Section: general

Washington - A senior White House official said cyberthreats are figuring more prominently in President Barack Obama's daily briefing on intelligence and national security concerns.
"What I have found in the three-and-a-half years I have been in this position is that cyberthreats have consumed a greater and greater portion of the piece of the briefing that I do," said Lisa Monaco, assistant to the president for homeland security and counterterrorism.

Speaking at the Washington Post Cybersecurity Summit, Monaco said that almost on a daily basis now, she has to brief the president on some variety of cyberthreat.

"I've been struck by the breadth of the threats that we're facing, certainly against the U.S. government, against the private sector," she said.

Monaco added that cyberthreats are coming from an increasing range of actors --countries such as Russia, China, Iran and North Korea; criminal entities; and individual hackers.

"The other thing that is featured prominently in [the president's] briefing and in cyberthreats in general has been the range of tactics that we're seeing," she said. "Added to issues like denial-of-service attacks has been the increasing willingness of aggressive actors to use destructive attacks in the cyber realm."

In addition, the threat of data manipulation is growing. Monaco said the integrity of data is a near-, mid- and long-term concern.

In that regard, she acknowledged the recent probing of state election systems but echoed the argument of FBI Director James Comey and others that U.S. election systems are resilient and often not connected to any network, thereby protecting them from being hackers.

Intelligence officials and industry experts have attributed those probes and the hacks of Democratic National Committee servers to actors backed by the Russian government. Members of Congress have accused the Obama administration of failing to take public and assertive action against Russia, which they said is emboldened by the lack of retaliation and a clear policy of cyber deterrence.

"I disagree with the critics that we don't have a strategy or a deterrence policy," Monaco said.

She argued that Obama has worked to create an international set of norms for cyber behavior -- for example, by establishing that countries will not launch cyberattacks on one another's critical infrastructure and will not conduct cyber espionage for economic purposes.

"When countries violate those norms, there's an isolation of that country, there's an agreement that you can impose sanctions," Monaco said. "Maybe there is a consideration that there's an act of aggression if those norms are violated, so there's a framework there."

She added that the administration continues to build a response framework based on the broad question of what is in America's national security interest.

"We will respond in a time and place and manner of our choosing, and when we do so, we will consider a full range of tools -- economic, diplomatic, criminal law enforcement, military -- and some of those responses may be public and some of them may not be," she said.

The same guiding philosophy is used to respond to terrorism or any military or intelligence actions against U.S. interests, she added.

Furthermore, any public declarations or actions must not reveal the sources and methods the U.S. used to gather intelligence and attribute an attack to a particular actor, Monaco said.

She cited the U.S. decision to confront China over its cyber espionage as an example of how publicly attributing malicious cyber activity can have a deterrent effect.

"We've seen a diminishment in that behavior [by China]," Monaco said. "However, I think this is something we have to be continually vigilant on and be very clear, as we have been with the Chinese, that we expect adherence to this commitment," she added in reference to the agreement reached between China and the U.S. to fight economic cyber espionage.

In addition, the U.S. continues to face the threat of the "malicious insider," she said, and she cited the Justice Department's arrest of a Booz Allen Hamilton contractor who is alleged to have stolen National Security Agency software used to hack foreign adversaries.

"What this case and others have pointed out is we can't completely guarantee that we can eliminate the threat of a determined insider who is determined to steal information," Monaco said.

Kaspersky Lab hosts annual Cybersecurity Weekend in Bali

Friday, 07 October 2016

Byline: Desy Nurhayati

Section: general

Bali - Global cybersecurity company Kaspersky Lab is set to hold the Cybersecurity Weekend for Asia Pacific countries in Jimbaran, Bali, on Friday.
During the annual event, the company's experts and renowned leaders in cybersecurity will provide updates on the latest cybercrime trends, particularly in the financial industry. They will reveal secrets and tips for businesses to protect themselves and survive in a world of cybersecurity threats.

"Our objective for the event is to share our expertise in cybersecurity and to show the audience different perspectives of cybersecurity, focusing on the financial industry," Kaspersky Lab Asia Pacific's head of corporate communications, Jesmond Chang, said on Thursday.

Information technology for financial transactions is advancing at a tremendous pace in Asia Pacific. As a result, many organizations and users tend to forget to implement cybersecurity.

"We hope that by creating more awareness, the public will have a better understanding of cybersecurity and together we can move towards making the cyberspace a safer place," Chang said.

The Australian

'Top-Down' Grid A Gift For Savvy Cyber Attacks

Friday, 07 October 2016

Byline: Roger Bradbury

Section: Commentary

Commentary: The shutdown of South Australia last week is a near- perfect example of the impact of a cyberattack. A one-day shutdown led to hundreds of millions of dollars in losses to the economy, disruptions to citizens' lives and an unravelling of political, social and economic certainties.
Sure, South Australia has peculiarities that made it particularly susceptible to such an event. But the shutdown nevertheless shows in high relief the vulnerability of today's interconnected systems of critical infrastructure.

What we saw last week was not just a loss of the electricity network but also the shutdown of the other infrastructure networks: telecommunications, water, sewerage, transport, financial services, the internet and so on.

Advanced Western societies have spent the past 30 years refining and interconnecting their critical infrastructure, improving their efficiency but also increasing their vulnerability. We've reached the point where the interconnections are more or less complete, so every critical infra-structure -- energy, water, fin-ance, transport or cyber -- is dep-endent, to a high degree, on every other.

This interdependency means disruptions in one infrastructure quickly spread to all other interconnected systems. And because these infrastructures -- with the exceptions of cyber and transport -- are

organised in a top-down hierarchy, it means if the disruptions can spread up to the top of the tree, they can then spread down to the rest of the network.

This is what happened in South Australia. Excessively hierarchical networks in key infrastructures enabled -- one may say encouraged -- the collapse of each of those networks.

(Note: Roger Bradbury is a professor in the Australian National University's National Security College.)

'Undertaking' the mission of recalibrating cyber security

Friday, 07 October 2016

Byline: Faisal Al Bannai

Section: general

Dubai - Over the last 20 years of technological innovation, it has become increasingly apparent that successful start-ups have a much more disruptive impact on the status quo, developing radical new business models or actually creating ones that previously did not exist.
What lies at the heart of this deeply disruptive ability is twofold. The first being the fact that the very nature of modern technology today allows an instantaneous engagement with a huge number of entities and people across continents. The second is because successful start-ups are entrepreneurial; entrepreneurship being derived from the French word that means "to undertake".

Thus successful start-ups have a sense of "undertaking" in their mission; meaning they have a purpose for being and are looking to find a solution to a set of problems, or even better, create altogether new use cases that render earlier problems irrelevant.

Cyber security is in need of an entrepreneurial approach, which is to say, a requirement for new ideas, new ways of doing things, and most fundamentally, a new attitude to what protection and resiliency really mean in a digital world.

The best start- ups and entrepreneurs do not exist for existence's sake. They are constantly in motion, driven by the "undertaking" to make things quicker, easier, better, more resilient. They ground themselves in the techniques and industry norms of the day but then go on to leap towards new problem-solving ideas, which challenge the status quo and in some cases obliterate it.

The exponential growth in digital networking means that we have entered uncharted territory with respect to the way digital infrastructure is utilised and information transmitted. With the sheer volume of digital information being exchanged and the importance of such data in allowing us to live our daily lives as normal, adding immunity to this environment requires an entrepreneurial flair, an "undertaking" to protect digital infrastructure end-to-end.

Last month, the UK's security agency GCHQ announced the launch of a cyber security accelerator as part of a programme to create two "world-leading" innovation centres. The accelerator will see selected start-ups receive a grant and be able to work in the building.

Creation of the accelerator is the first part of a renewed attempt by the UK government to invest in cyber security. In November 2015, then-Chancellor George Osborne said £1.9 billion ($2.4 billion) would be made available for investing in cyber defences.

The accelerator will be the first of two innovation centres where cyber start-ups can base themselves in their crucial early months, and which can become platforms for giving those start- ups the best possible support.

As well as using the funding for developing start-ups and the UK's cyber scene, the money would also be used for launching active defence programmes against national threats.

While not exclusively focused on cyber security, in Dubai a bold accelerator programme has also been launched with the aim to utilise technology to solve national-level challenges.

The Dubai Future Accelerators is the world's largest government-supported accelerator, launched by Shaikh Hamdan Bin Mohammad Bin Rashid Al Maktoum, Crown Prince of Dubai and Chairman of the Dubai Future Foundation. The programme is in line with the directives of His Highness Shaikh Mohammad Bin Rashid Al Maktoum, Vice-President and Prime Minister of the UAE and Ruler of Dubai, and identifies ground breaking companies from around the world, offering them the opportunity to find and test new solutions to real-life challenges.

We welcome the rise of increased disruption in cyber security and believe it is a necessary development in bolstering defences for every nation, enterprise, and individual.

Le Mag (Maroc)

Presse: le 'Maroc' remplacé par 'Califat' sur une carte d'un avion d'Air France

Thursday, 06 October 2016

Byline: Adam Sfali

Section: general

Paris - Dans un avion d'Air France quelqu'un a joué avec les cartes de trajectoires de vol, vus par les passagers sur les écrans de l'avion.
Selon le site du journal britannique The Telegraph, citant des sources des services secrets français, dans le cadre d'une série de tentatives de sabotages qu'auraient subit la compagnie Air France, des membres du personnel du transporter aérien français, présumés radicalisés auraient bidouiller les cartes de trajectoires de vol sur un avion en s'attaquant à deux pays, le Maroc et Israël.

Ainsi, sur une carte affichée sur les écrans de l'avion, les passagers pouvaient lire un nom bizarre collé sur la carte du Maroc : " Califat" probablement en référence au prétendu califat autoproclamé par les terroristes de daech en Irak. Sur une autre carte, le nom d'Israël a été effacé et remplacé par Gaza.

Selon les mêmes sources, Air France serait victime d'une série de tentatives d'attentats dont les coupables ne seraient d'autres que des membres de son personnel naviguant et au sol.

L'une des plus dangereuses actions aurait été une tentative de provoquer un accident aérien en déconnectant le cockpit d'un avion des commandes de ses moteurs. Les services secrets français disent enquêter sur ces dangereuses tentatives, mais apparemment sans grands succès.

Ottawa Citizen
Eyes in sky hit operational turbulence
Tuesday, 11 October 2016
Byline: David Pugliese

Ottawa - Canada's much-vaunted surveillance planes operating over Iraq were so limited in the information they could collect and share with allies, Canadian military personnel planning CF-18 attacks had to rely on the U.S. for data, according to documents obtained by the Ottawa Citizen. The briefing, produced last year on lessons learned from operations in Iraq in 2014, also pointed out efforts to set up ball hockey facilities and a Tim Hortons for personnel at a base in Kuwait should take a back seat to getting key components of the mission in place.
Canada initially contributed special forces, Aurora surveillance aircraft, a refuelling plane and CF-18 fighter jets to the international coalition battling Islamic extremists.

The Liberal government withdrew the jets, but expanded the number of special forces and kept the refuelling planes and Auroras on scene.

Canadian officers have claimed from the beginning of the mission the upgraded CP-140 Auroras are among the most advanced surveillance aircraft in the world. But the "lessons learned" document, obtained through the Access to Information law, tells a different story.

"The CP140 deployed without the organic capability to share their data with coalition partners," it notes.

In addition, the software needed to process some CP-140 surveillance data was not available and the aircrews needed "greater experience operating over land."

The Aurora is primarily a maritime surveillance plane, but the upgrades allow it to collect data on ground targets.

The problems didn't stop with the Auroras. There were concerns about the overall lack of ability to share information Canada collected from various sources with its allies. In addition, the Canadian Forces had problems accessing coalition intelligence data without having to go through a U.S. military intermediary.

Gathering information about targets the CF-18s were to attack proved difficult. Problems with the planes' targeting pods "severely" limited some information gathering, although the details were censored.

"Poor information" was provided to those deciding on targets. There is a need to increase the capability to "contribute to target discovery," other comments in the briefing point out.

Military staff asked about the lessons learned said while ball hockey and a Tim Hortons trailer were "a nice boost," these "projects must wait well into the sustainment phase after the mission's essential components are all in place."

Other issues included: Significant delays in del ivering communications equipment and having enough trained personnel.

Military communications personnel sent back to Canada within seven days of arriving in Kuwait, and before the systems were up and running.

Some military personnel, who travelled overseas on civilian flights, had to use their own credit cards to pay up front, then had trouble getting reimbursed. In some cases, they had to spend up to $1,000 just for baggage.

Civilian contractors supporting the refuelling aircraft detachment were not properly prepared for work in Kuwait or the type of accommodation they were given.

There should be a 24/7 duty desk to deal with problems encountered by those on overseas missions. "A list of people who can actually help with problems would be nice," said one person. "Help accounts suck. They are rarely monitored. Real people with real contact lists only."

Commanders back in Canada weren't spared criticism either. Some of those serving in Kuwait questioned the abilities of the Ottawa-based Canadian Joint Operations Command, which co-ordinates military missions at home and around the world.

"Despite the best of intentions and a desire to do so, CJOC is incapable of conducting true 24/7 operations, at least as it concerns targeting," said one critic.

Canadian Forces spokesman Capt. Vincent Bouchard said in an email many of the challenges outlined in the document are common when setting up a multinational operation abroad. "The capabilities the Block III CP140s brought to theatre were new, both to the RCAF and our allies," he said. "As it was expected, it took time to learn how to make the most of these new capabilities in the context of a multinational operation."

Bouchard said the points raised in the documents were dealt with and the Aurora detachment continues to provide valuable surveillance information for the coalition.

He repeated the Canadian military's statement the Auroras are "world-class intelligence surveillance and reconnaissance aircraft." Ottawa Citizen dpugliese@postmedia.com Twitter.com/davidpugliese

Ottawa Citizen

Government ramps up Facebook advertising
Tuesday, 11 October 2016
Byline: Jason Fekete

Ottawa - Rapidly changing how it communicates with Canadians, the federal government is on pace to spend more on Facebook ads in the Liberals' first year in office than it did between 2006 and 2014 combined.
The Liberal government spent at least $3.8 million on Facebook ads between November 2015 and June 2016 targeting Canadians and foreigners of various age groups and demographics, and is on pace to spend well over $6 million during Prime Minister Justin Trudeau's first year in office, according to documents tabled in the House of Commons.

The data from dozens of departments, agencies and Crown Corporations was tabled in response to a question from Conservative MP Martin Shields.

By comparison, the federal government spent $5.8 million on Facebook ads between April 2006 and early June 2014, according to a federal government response to a similar question two years ago.

As well, the spending on Facebook ads during the Liberal tenure doesn't include that from CBC/Radio-Canada, which was one of the biggest spenders detailed in the last response. The government declined to release the information this time around, saying it's "competitive information." Government of Canada annual advertising reports show the rapidly changing trend that sees federal departments and agencies looking to contact Canadians more through the Internet.

In the 2011-12 fiscal year, just over 10 per cent of federal government media placements purchased through its agency of record were on the Internet (including search and display ads, and paid social media ads). That number more than doubled to over 25 per cent of media placements by 2014-15. (Data for the 2015-16 fiscal year won't be released until January).

Some of the biggest government spenders on Facebook ads were agencies and Crown corporations that often don't garner much attention, but turned to social media to promote various events, exhibits and government programs, as well as market Canada internationally.

The details on the spending also show how specific a targeted audience the government is going after.

Destination Canada, formerly the Canadian Tourism Commission, spent more than $1.8 million between November and July on Facebook ads, most of it going after "potential travellers to Canada" and to "raise awareness" by promoting videos and links to Internet pages.

Immigration, Refugees and Citizenship Canada coughed up $467,300 for Facebook ads, including $67,300 to "raise awareness among Canadians to get involved and support efforts in welcoming Syrian refugees."

The primary target audiences and demographics were "Canadians that may wish to donate, assist or sponsor refugees" as well as "Canadian youth." The secondary target audiences were "community stakeholders and partners," Canadian media, provincial/territorial and municipal governments, and major corporations.

The other $400,000 spent by the department targeted foreign travellers, students and temporary foreign workers age 18-65 coming to Canada, to inform them of the need to obtain an electronic travel authorization.

The Royal Canadian Mint spent more than $147,000 on Facebook ads to promote specialty coins it produced, including a "Batman vs. Superman $20 Silver coin" to English and French Canadian comic fans, a "gingerbread coin," Star Wars coins, and one promoting the 40th anniversary of the Toronto Blue Jays, among many others.

Via Rail spent more than $437,000 promoting its rail services, but didn't provide specifics on the various campaigns.

Statistics Canada spent about $228,000 on Facebook ads to promote the 2016 Census. Statistics Canada's ad campaigns were broken down into various target audiences and demographics, including the mass population, aboriginal population, "ethnic groups," the male population and the "unattached and mobile population."

Export Development Canada spent nearly $130,000 on Facebook ads targeted at small and medium Canadian companies that "export or have interest in exporting," highlighting various trade agreements, managing the risks of international trade, and several other initiatives.

Various federal museums spent tens of thousands of dollars combined targeting audiences in Canada and abroad for various exhibits.

The Canada Science and Technology Museum spent $15,000 promoting Star Trek: The Starfleet Academy Experience to adults in the Ottawa/Gatineau area, while the Canadian Museum of History spent thousands promoting exhibitions on such things as Vikings and Thomas the Train.

CBC.CA
CSIS, Bill C-51 and Canada's growing metadata collection mess
Tuesday, 11 October 2016
Byline: Steven Zhou
Section: Opinion

Opinion: Much has been made over whether the Canadian Security Intelligence Service, Canada's spy agency, should be armed with broader powers to "disrupt" what it perceives as terrorist plots. A report tabled this month by the Security Intelligence Review Committee, which watches over CSIS's work, notes that while the spy agency hasn't abused its new powers of disruption, its bulk data collection program needs to be scaled back.

It's easy to think of CSIS and other spy agencies as shadowy organizations that carry out James Bond-like "missions" involving cool gadgets and high-tech weaponry, but the Snowden leaks, among other revelations, have shown the public that metadata collection (online communications, phone logs and other electronic exchanges that can be intercepted in enormous amounts) now constitutes the state's primary instrument of control.

Privacy Commissioner Daniel Therrien recently called upon legislators (the Liberals in particular) to amend certain aspects of Canada's national security laws in order to address the issue of metadata collection.

In particular, Therrien referred to the Communications Security Establishment, which seems to get a lot less public scrutiny than CSIS. The CSE is responsible for collecting massive volumes of foreign communications through "signals-intelligence," (or "sigint"), but also tends to drag up large amounts of Canadian metadata as well, which it isn't supposed to be doing.

This is also a point that Jean-Pierre Plouffe, the commissioner who provides oversight for the work the CSE does, has consistently made. Plouffe tabled his annual report earlier in the year and revealed that the CSE illegally and inadvertently shared a large amount of metadata with Canada's "Five Eyes" intelligence allies: the U.K., U.S., New Zealand and Australia.

The shared metadata could have included the private communications information of Canadians. He noted that there's no way to tell exactly how long the CSE has been doing this, and that the agency has also been buying faulty software that should have worked to protect people's privacy.

Given the amount of work and data collection that CSIS and the CSE both do, it's hard to see how each agency's mandate should be expanded without a corresponding expansion of the powers of watchdogs who monitor their work.

Under Stephen Harper, the Security Intelligence Review Committee wasn't even fully staffed, and for all their promises to reform Canada's national security apparatus, Justin Trudeau's Liberals still haven't released any details about how they want to do that.

Meanwhile, Therrien's report also reveals that many government agencies didn't go through with the proper protocol to assess whether they have the necessary infrastructure in place to protect people's privacy, as each department is given more leeway to share this data with each other.

This is one of the main features of Bill C-51, which is the same omnibus bill that gave CSIS their new powers to "disrupt."

Therrien reported that as each government agency is given permission to share data with other agencies, the responsible thing would have been to assess how these newly acquired capabilities would impact Canadians' privacy. Rather than carry out this assessment and look out for the Canadian people, many agencies that acquired this power under C-51 simply chose not to do them.

Therrien stressed that the information-sharing regime mandated by C- 51 is "unprecedented" in its scope and that law-abiding Canadian citizens who aren't under suspicion shouldn't be caught up in it at all. Yet this country's sprawling metadata regime and national security agencies don't seem to have any powerful tools to ensure any meaningful level of privacy protection.

One can, for the moment, leave aside the issue of whether or not the collection of metadata is itself a smart and constitutional thing to do, but even if the answer is yes, there still needs to be a discussion over how to keep the scope of collection within the appropriate parameters. CSIS has since halted (for the time being) its bulk metadata collection programs, but the CSE has not.

And as threats like the Islamic State continue to exist and inspire like-minded terrorists across the world, the Canadian public seems to have put the issue of privacy on the backburner.

Bill C-51 anti-terror arrests without a crime concern legal experts

This complacency cannot continue if there's to be a meaningful check on the state's power to intrude upon the lives of its citizens.

The Hindu
Mumbai govt. law college website hacked
Tuesday, 11 October 2016
Byline: Gautam S Mengle

Mumbai - The website of the Government Law College in Mumbai could be the latest victim of the 'cyber war' supposedly being waged by Pakistani hackers on Indian websites in response to the surgical strikes in Pakistan by the Indian Army earlier this month.
Multiple sources inside the GLC confirmed to The Hindu that the Churchgate based institute's website was found to be hacked on Monday evening. The hackers left a message on the home page which claimed the hack to be the handwork of a group calling itself 'PakCyberPirates'. "To all Indians out there....surgical strike...." the message said.

Sources said that the hack was discovered by around 6:00 pm by a student of the GLC, who brought it to the notice of the some professors, after which the police were informed.

The 'cyber war' first began on October 3, when the website of the National Green Tribula based in Delhi was hacked by unknown persons who left pro-Pakistan slogans on the home page. A day later, the website of a Kerala based institute was also hacked and a similar message left by the perpetrators.

Text messages to Inspector General of Police (Cyber) Brijesh Singh, Maharashtra Police and Deputy Commissioner of Police (Cyber), Sachin Patil did not receive any response.

Times of India
Hack your targets with machetes, Islamic State tells lone wolves
Tuesday, 11 October 2016
Byline: Bharti Jain

New Delhi - Islamic State (IS) modules and 'lone wolves' in India have lately been instructed by their handlers to focus on hacking their targets, particularly foreign citizens, to death with big chopping knives or machetes.
"We have gathered that IS modules and lone wolves here are being told by their handlers not to risk gathering explosives, assembling IEDs or illegally buying automatic weapons for attacks. Instead, all they need to do is buy big chopping knives or machetes, which would neither raise suspicion nor involve a huge cost," a senior intelligence official told TOI.

The first case of IS-inspired youths plotting beheadings came to light in July when a module led by terrorist Masiuddin alias Abu Musa was busted by West Bengal CID and machetes recovered. Now, members of the Kerala-Tamil Nadu module arrested last week have revealed that they too planned to hack foreigners to death in the two southern states.

The motive behind the proposed hacking attacks in India, according to top sources in intelligence agencies, is to create maximum impact in terms of terrorising people, given the gore and horror associated with them, and grab eyeballs, including that of international audience.

Agencies believe IS-inspired youth may also be looking to record these hackings and share the photos and videos with their handlers, so that they can be uploaded on IS's online forums to promote the outfit in India.

This trend was seen in Bangladesh, with the Dhaka attackers capturing the hacking of foreigners during the July 1 hostage situation in Holey Artisan cafe with their smartphones. These photos were later uploaded by IS.

"It has been noticed that IS modules are now largely operating as small, localised groups in different states -- particularly Maharashtra, Kerala, Tamil Nadu, Telangana and Karnataka. After the NIA busted a pan-India module in January leading to two dozen arrests across northern, southern and western states, IS handlers have been encouraging Indian contacts to work in smaller groups with minimal inter-connectivity. This is to escape surveillance and minimise arrests in case a module is detected," an intelligence officer said.

In the case of the Kerala-Tamil Nadu module busted recently, those arrested are believed to have gathered for a meeting at Kanakamala hilltop in Kannur to discuss plans for acquiring machetes when an NIA team, based on a specific intelligence alert, closed in on them and arrested five people. "Though they were discussing targeting Jews the plan, as per our assessment, was to hack foreigners to death in tourist hotspots in Kerala and Tamil Nadu," an intelligence officer said.

"In the case of the West Bengal module, the accused were arrested after they bought the machetes and before they could hack the members of a family that night. But we decided against waiting for the Kerala-TN youth to acquire the knives/machetes before arresting them," the officer added.

However, the threat of hacking attacks still looms, with many radicalised Indian youths in touch with IS handlers and motivators online. "We are keeping them under surveillance and would ask the agencies concerned to arrest them as and when the threat of their planning or executing an attack becomes imminent," the officer said.

Straits Times
Asean members should cooperate to fight full spectrum of cyber threats
Tuesday, 11 October 2016
Byline: Lim Yan Liang

Singapore - The Singapore Government wants to intensify Asean-wide cooperation to build a stronger cyberspace commons in a region where governments are vulnerable to a spectrum of cyber attacks, Minister for Communications and Information Yaacob Ibrahim said on Tuesday (Oct 11).
Speaking at the first Asean ministerial conference on cyber security at the Shangri-la Hotel, Dr Yaacob, who is also Minister-in-charge of cyber security, identified three areas where the group of 10 countries should focus its efforts in order to fight the "full spectrum of cyber threats - cybercrime, espionage, and other malicious activities".

The ministerial conference took place one day after the Government launched its National Cybersecurity Strategy, a wide-ranging document that maps Singapore's efforts to secure its online space.

The first is cyber capacity building so that Asean member states can deepen its capacity to fight malicious cyber activity.

This is crucial as a joint Singtel-FireEye study found that South-east Asian governments are more likely to be targeted for attack than other organisations.

Visitors trying out virtual reality goggles at a booth at the inaugural Singapore International Cyber Week at Suntec Convention and Exhibition Centre yesterday.

"Attack targets could range from financial to data theft, reputation as damage, and also disruption to our critical information infrastructure," he said.

To this end, Dr Yaacob launched a new $10 million Asean Cyber Capacity Programme, which Singapore will channel towards honing the technical skills and incident response capabilities of fellow Asean countries.

"The money will pay for resources, expertise and training so that we will be equipped to drive and take ownership of the cyber security agenda in our respective countries," he said.

Second, Dr Yaacob urged Asean members to tap into global efforts to build a trusted cyberspace, such as through international law enforcement efforts like the Interpol Global Complex for Innovation (IGCI) that is based in Singapore. "Countries have to actively support the IGCI for its continued success and effectiveness," he said.

"We can support the IGCI by seconding more Asean law enforcement officers to the IGCI. By partnering Interpol, we can conduct more joint operations against cyber criminals and enhance the collective safety and security of Asean."

Singapore will also contribute $900,000 to the CyberGreen global initiative that provides tools for a country to measure its level of cyber health, announced Dr Yaacob.

With this sponsorship, all Asean member countries will be able to access the CyberGreen platform through Singapore for free and be able to better identify different levels of threats and ways to counter them.

Third, Asean has to start a dialogue on cyber norms, and work towards developing a set of regional cyber norms.

"Cyber capacity building, cyberspace awareness, and cyber norms: these are three suggestions to Asean for enhancing cyber security cooperation," said Dr Yaacob. "Singapore is committed to these ideas, and we are backing our words with resources and investment."

New York Times
American Cellphones Ringing in Tehran

Sunday, 09 October 2016
Byline: Thomas Erdbrink

Tehran - Rushing for a plane to Tehran because of a family emergency, the Iranian-American businessman stuffed his mobile phone into his carry-on, forgetting to turn it off.
It was useless in Iran anyway, he knew. American mobile phones never worked in the country, and even after the recent nuclear deal, many economic sanctions remain in place, frustrating foreign businesses interested in cracking the Iranian market.

So it was something of a shock when, having fallen asleep after arriving at his sick grandmother's house in Tehran, the businessman, Faryar Ghazanfari, an intellectual-property lawyer, heard a buzzing coming from the bag.

At first, he thought it was an alarm. Then he picked up. "I couldn't believe what was happening," he said. "It was San Francisco. A colleague wanted an update on a patent case."

Until recently, an American phone in Iran would not receive any signal. But that has quietly changed. This past week, a spokesman for AT&T acknowledged that the company was providing voice and data service in Iran to its customers with American phones through a partnership with a local firm, RighTel. An employee at the Iranian company, fully owned by a state entity, confirmed the partnership.

While the announcement that Airbus and Boeing will provide dozens of jetliners to Iranian carriers garnered worldwide headlines last month, the deal that AT&T clinched in March, making it the only American provider to offer phone service in Iran, flew under the radar.

The agreement is one of the few signs that the promises President Hassan Rouhani made long ago of welcoming Western businesses and ending Iran's isolation are at last beginning to be realized.

"This is a step in the right direction," Masoud Daneshmand, an official at the Iran Chamber of Commerce, said of AT&T's partnership with RighTel. "The fact that phones are working in Iran and the United States is a sign of good will on both sides."

With its oil wealth and nearly 80 million consumers, Iran has long held out the promise of a lucrative, if elusive, market for Western companies. In the immediate aftermath of the nuclear deal in January and the lifting of many economic sanctions, there were heightened expectations in both countries that the day had finally arrived.

But enough sanctions remained that Western banks refused to finance commerce with Iran without specific licenses from the United States Treasury. That seemed to choke off most business opportunities outside the oil and gas sector and the airlines. But for whatever reasons, AT&T decided to move ahead, apparently determined to shun publicity about its moves.

It remains unclear how AT&T and RighTel will settle accounts. A representative for AT&T said the company would not disclose information on financial arrangements made with the Treasury or with its Iranian partner. One possible clue: RighTel is owned by the Social Security Organization of Iran, a state entity that has large stakes in several domestic banks.

The Treasury would also not speak about the deal, saying in a statement that it "generally does not comment on specific licenses or engagement with private parties."

Nevertheless, having working American mobile phones in Iran sends a powerful message that times are changing, albeit very slowly.

"Now we are, of course, hoping that the United States lifts all trade restrictions on Iran," Mr. Daneshmand said. "In return, we will lift visa restrictions for Americans."

In the past, Iranian interest in AT&T was of a different nature. In 2011, Iranian hackers targeted the carrier along with several other companies, dozens of banks and even a small dam in a suburb of New York, the Justice Department wrote in a complaint this year. Seven Iranian computer specialists who regularly worked for the Islamic Revolutionary Guards Corps were accused of carrying out the attacks.

AT&T still faces the many hurdles that all companies have in doing business in Iran. In addition to its endemic corruption and bureaucratic inefficiency, Iran works on a calendar different from the West's, with different months and a Thursday- Friday weekend. The communication infrastructure is poor but improving, and many websites are blocked by the government.

And there is still the possibility of opposition from conservative clerics and Iran's supreme leader, Ayatollah Ali Khamenei, who could end the arrangement in a flash if he felt it was inappropriate.

For Iranian hard-liners, direct service to the United States means yet another connection to the "Great Satan," the place they wish death upon in every Friday Prayer. For many of them, simply the idea of an ever-friendlier and familiar America is a threat to the founding ideology of the Islamic republic.

For many, perhaps, but by no means all. "If we get service in return, it is not that bad," said Mohammad Javad Helali, a Shiite Muslim cleric connected to the hard-line faction. "We just hope that the services will be free from infiltration by American intelligence services."

The opening up of phone service is undoubtedly a welcome surprise to Iranians and the approximately two million Iranians living in the United States, many of whom travel frequently to their home country.

Azad Jafarian, an Iranian-American filmmaker, said his mother had just flown in from Los Angeles through a connection in the Persian Gulf state of Qatar, and he smiled when he saw her turning off the flight mode on her cellphone, bringing it back to normal operating status.

What happened next startled him. "I was driving her home, I saw her swiping her phone, and seconds later the phone started ringing," Mr. Jafarian recalled. In a light panic, he told her to turn it off. "I was like, 'This can't be real.'"

Canberra Times
IT security Watchdog warns of tougher scrutiny Super funds targets for cyber attacks
Sunday, 09 October 2016
Byline: Clancy Yeates

Canberra - Australia's $2.1 trillion pool of retirement savings is being targeted disproportionately in serious cyber attacks on the financial sector, official figures suggest. Banks, insurance companies, and wealth managers all face an increasingly elaborate array of cyber attacks, but a recent survey by the financial regulator shows the superannuation industry was attacked most frequently within the sector. While financial institutions have not yet suffered a "material" loss from these incidents, the Australian Prudential Regulation Authority plans to take a tougher line in making sure the sector can fend off cyber attacks. APRA last week released the results of survey looking into cyber security incidents at 37 financial institutions between last October and this March, and how they were managed. More than half of the businesses had been hit with an attack serious enough to warrant involvement from executive managers in the 12months before the survey. The superannuation industry was the most likely to have been hit
by such an attack, with 75 per cent of funds experiencing a cyber security "incident" that was serious enough to report to executive managers. In comparison, 44 per cent of banks and 46 per cent of insurers suffered incidents that were elevated to such a level. APRA said it was possible that super was more attractive to perpetrators because of the high account balances, though it also said that super funds may have a different threshold for reporting cyber breaches up the management tree than banks. Even so, law enforcement official have previously said Australia's hefty pool of super is being targeted by cyber criminals engaging in identity theft. Across the entire financial sector, a fifth of respondents had experienced several "potentially high impact" incidents. These included "advanced persistent threats" - where attackers break into a network and steal information, often

for political or commercial motives - and "denial of service" attacks - which are designed to bring a website down. Fourteen per cent of institutions had been targeted in attacks where hackers use malicious software to infiltrate a network and make data unreadable, known as a "ransomware" attack. One in eight institutions had suffered attacks that could damage their reputations - such as having their websites defaced or social media accounts hacked. In response, APRA flagged tougher scrutiny in this area and said boards and top managers must be well prepared for handling cyber attacks. "APRA intends to lift the supervisory and regulatory expectations for regulated entities to not only secure themselves against cyber attacks, but to implement improved mechanisms to quickly identify and remediate successful attacks when they occur," it said. While Australian banks have not suffered "material" losses from cyber attacks, in 2014 about 76 million household bank accounts were compromised in a cyber attack on US giant JP Morgan. Local banks regularly highlight their attempts to combat cyber crime, with

Commonwealth Bank chief executive Ian Narev last week saying the bank spent an "inordinate amount of time and money" looking after customers' online data. Mr Narev told the government's banking inquiry these security concerns needed to be taken into account in the push from some committee members for a fresh debate about bank account portability, which would allow customers to change banks more easily. "We need to make sure that in terms of access to data, security of data, how the data are used those principles are absolutely sacrosanct," Mr Narev said.

The Daily Beast
Russia's Senior-Most officials' Ordered DNC Hack
Saturday, 08 October 2016
Byline: Shane Harris and Nancy Youssel

Washington - The Obama administration has concluded that "Russia's senior-most officials" ordered hackers to break into the computer networks of American political organizations in order "to interfere with the U.S. election process," intelligence and security agencies said in a joint statement Friday. The statement was the administration's first public attribution of the hacks against the Democratic National Committee and a second political institution to the Russian government. Privately, officials had said for the past few months that all signs pointed to an operation being directed by Moscow intended to meddle with the November election.

That evidence mounted as law enforcement and intelligence agencies sifted through technical details about the hack and eventually reached a consensus that Russia was to blame, a senior administration official told The Daily Beast.

The process continued "as the intelligence community gathered more information and got higher and higher degrees of confidence" attributing the hacks to Russia, the official said. The agencies, along with the Department of Homeland Security, came to a consensus "recently" the official added, without specifying a precise date, but he added that intelligence and law enforcement "worked as quickly as possible to release as much information as possible" without compromising sensitive sources and methods.

"The intelligence community has high confidence in its attribution into the intrusions in the [Democratic National Committee] and the [Democratic Congressional Campaign Committee] based on forensic evidence cited by a private cyber firm and the intelligence community's own review and understanding of the cyber activities by the Russian government," a second U.S. official told The Daily Beast.

The joint statement also attributed activities by three separate online organizations to the Russian campaign.

"The recent disclosures of alleged hacked e-mails on sites like DCLeaks.com and WikiLeaks and by the Guccifer 2.0 online persona are consistent with the methods and motivations of Russian-directed

efforts," the statement said. DCLeaks has posted stolen emails of current and former U.S. officials. And Guccifer 2.0, which claims to be an independent hacker, had been believed to be the source of stolen DNC emails to WikiLeaks, which published them last summer.

Officials also said they had detected Russian attempts to target state and local-level elections systems.

"We also worked as quickly as possible to release as much information as possible in order to provide state and local officials sufficient time to fortify their infrastructure," the official said. The Department of Homeland Security and the FBI have put state elections officials on notice that hackers have been trying to access voter registration files and could cause havoc on Election Day. So far, 25 states have asked the department to help scan their computer networks for security weaknesses.

Notably, the statement didn't blame the Russian government for targeting state elections systems, but it did say the activity had been traced to servers owned by a "Russian company."

But the Obama administration did squarely blame the DNC hacks on the Kremlin--and not just lower-level officials. The authorizations for the hacks came from the "most senior levels of the Russian government," a U.S. official told the Beast.

The administration's decision to name Russia raised two immediate questions: Why now? And what next?

The first official said the timing had nothing to do with Sunday's presidential debate or the election campaign in general. Privately, some Republicans groused that the decision appeared motivated to bolster suspicions that the Russians are hacking Democratic organizations in order to boost the campaign of Donald Trump.

The official also said the timing of the statement had nothing to do with the administration's decision to break off negotiations with Russia over and end to the civil war in Syria. Earlier Friday, Secretary of State John Kerry accused the Russian government of "war crimes" for attacks on civilian institutions, including hospitals, raising an already tense U.S.-Russia relationship to a new level.

So what will the U.S. do now that it has blamed Russia for the hacks?

"Denouncing these Russian attacks is a good first step but what if anything will Obama do to make Putin pay a price for his subversion?" Max Boot, a senior fellow at the Council on Foreign Relations, told The Daily Beast. If Putin gets away with it, as he's gotten away with so much else, that will be an invitation to him to continue doing what he's doing."

The second official said it was up to "the Department of Justice to determine what happens next." The first official said the U.S. response would generally follow the model set when President Obama publicly blamed North Korea for a hack against Sony Pictures.

In that case, the administration took what it deemed a "proportionate" response, and sanctioned North Korean individuals and conducted limited cyber attacks on North Korean networks.

But the Russian hacks aren't entirely analogous to those against Sony.

"This case is unique because there is the electoral angle," the official said, adding that the hacks represented an assault on American democracy and the political process. "When it comes to a potential response to this the president has made clear we will take action to protect our interests at a time and place of our choosing."

"Consistent with the practice we have adopted in the past, the public should not assume that whey will necessarily know what actions have been taken or what actions we will take," the official said, adding that the administration was "not taking anything off the table."

The top Democrat on the House Intelligence Committee, who had already said that intelligence led him to conclude Russia was behind the hacks, praised the administration's statement as a helpful "first step" that now had to be backed up with action."

"In terms of next steps, I would love to see the administration working with our European allies that have also been the subject of Russian hacking attempts to interfere with their institutions," Rep. Adam Schiff told The Daily Beast. "There have to be a series of graduated responses that lets Russia know this is not cost free."

"Now that we've said Russia is responsible, it increases the demands for action," Jason Healey, a former White House cybersecurity official now working at Columbia University's School for International and Public Affairs. "This should include improving election security and brush- back pitches against Putin using our own cyber capabilities, but perhaps first Obama should call a Article 4 consultation with our NATO allies. France has its own election coming up, as does Germany, which has also been brave in calling out Russian activity."

While officials suggested they only recently concluded that Russia was behind the hacks, a Sept. 22 statement by California Sen. Dianne Feinstein and Rep. Adam Schiff suggested that some members of Congress had been briefed about the U.S's conclusions weeks ago.

"Based on briefings we have received, we have concluded that the Russian intelligence agencies are making a serious and concerted effort to influence the U.S. election," the statement read. "We believe that orders for the Russian intelligence agencies to conduct such actions could come only from very senior levels of the Russian government.

The announcement of the findings immediately raised eyebrows, given this week's collapsing relations between Russia and the U.S. this week over Syria.

On Friday, Secretary of State John Kerry accused Russia of a "targeted strategy to terrorize civilians and to kill anybody and everybody who is in the way of their military objectives."

Earlier in the week, the State Department announced it had suspended ceasefire talks after Russia launched an aggressive airstrike campaign over eastern Aleppo, hitting hospitals, food and water supplies. The strikes are part of Syrian regime Bashar al Assad and Russia's attempt to siege and starve opposition out of the city. Those strikes, and the harm they have done to civilians, including children, has been widely condemned by the international community.

But for all the outrage, the Obama administration has no plans to intervene militarily in Aleppo to stop the attacks or on behalf of its rebels under Russian and regime attack. The administration has said its goal in Syria is to destroy the self-proclaimed Islamic State in Iraq and Syria. Intervening in the five-year civil war could have unintended consequences, the administration has said, namely a possible proxy war with Russia.

How this will impact the American election is anyone's guess. Trump's rivals have repeatedly targeted his ties to--and affinity for-- Russian policymakers. Trump has downplayed accusations that Vladimir Putin has had journalist and dissidents killed, responding that America, too, has done its fair share of killing. Trump has denied that Russia was responsible for downing Malaysia Airlines Flight 17 in the skies of eastern Ukraine, even though U.S. officials accused Russian- backed separatists of destroying the commercial jet, and killing all 298 passengers on board, with a Russian-imported Buk anti-aircraft missile, a claim now corroborated by a two year-long investigation. Trump has also denied that Putin invaded Ukraine, or ever would under his administration, even though its annexation of Crimea is a matter of public record and now admitted to by Putin.

Those surrounding the nominee have also had their political and financial ties to Russia scrutinized. Trump's former campaign manager Paul Manafort is seen as close to the Kremlin, and even more so to its former client in Kiev, Ukrainian President Viktor Yanukovych, who fled the country in 2014 after the Euromaidan Revolution. Ukrainian investigators have since uncovered ledgers belonging to Yanukovych's Party of Regions suggesting that cash payments were disbursed to Manafort, who consulted for the now-banned party, and that Manafort, as part of his policy advice, encouraged the former leader to whip up anti-American and pro-separatist sentiments in Crimea as early as 2006, during NATO exercises held on the peninsula. While Manafort formally resigned from the Trump campaign after these and other compromising disclosures, he is thought to still a relevant figure behind-the-scenes in advising the real estate tycoon on his White House ambitions. Moreover, another Trump advisor, Carter Page, has traveled to Moscow and been rumored to be a point-man between Putin and the Trump campaign--even if few senior figures in Russia claim to have ever even heard of him.

Wall Street Journal
U.S. Alleges Russia Hacked Emails to Sabotage Election
Saturday, 08 October 2016
Byline: Damian Paletta

Washington - The U.S. intelligence community took the extraordinary step Friday of directly accusing the Russian government of trying to interfere in the coming U.S. elections by purposefully leaking emails hacked from the Democratic National Committee and other entities.
The intelligence agencies, in a joint statement, alleged the hacks were directed by the most senior officials in the Russian government.

"We believe, based on the scope and sensitivity of these efforts, that only Russia's senior-most officials could have authorized these activities," the statement said.

The agencies said some state election systems have been recently scanned and probed and that this action originated from servers operated by a Russian company. But the statement stopped short of definitively blaming the Russian government for that activity.

The allegation, coming less than four months after the DNC first disclosed it was hacked, puts the U.S. and Russia on an even more adversarial path following the breakdown of negotiations over hostilities in Syria and other diplomatic spats.

U.S. officials have blamed foreign countries for cyberattacks in the past, notably attributing a hack of Sony Pictures to North Korea in 2014. But it is highly unusual, if not unprecedented, for Washington to directly accuse a powerful country of attempting to sabotage U.S. elections.

"The U.S. Intelligence Community is confident that the Russian Government directed the recent compromises of emails from U.S. persons and institutions, including from U.S. political organizations," said the joint statement from agencies including the Central Intelligence Agency and the National Security Agency.

It added that leaks by three entities -- a hacker self-described as Guccifer 2.0, the website DCleaks.com and the organization WikiLeaks -- "are consistent with the methods and motivations of Russian-directed efforts. These thefts and disclosures are intended to interfere with the U.S. election process."

The Kremlin late Friday said the accusations were "nonsense," according to Interfax news agency. "Tens of thousands of hackers attack the site of [Russian President Vladimir] Putin every day. Many attacks are traced back to U.S. territory. We don't blame the White House or . . . [the CIA] every time," Kremlin spokesman Dmitry Peskov was cited as saying.

An administration official said the U.S. government could activate numerous measures in response to the alleged Russian operation, including diplomatic and economic steps as well as criminal charges.

Accusing a foreign government of attempting to interfere in the U.S. election leaves several difficult choices for the White House. Many computer experts and even U.S. lawmakers have said there should be more of a deterrent to prevent nation states from launching computer attacks.

The White House may choose to level sanctions against Russia or Russian businesses believed to be connected to the operation, or it may launch computer attacks of its own if President Barack Obama believes such retaliation is merited.

The agencies did offer a note of reassurance, saying "it would be extremely difficult for someone, including a nation-state actor, to alter actual ballot counts or election results by cyberattack or intrusion," citing the decentralized nature of the U.S. election system and protections that election officials have installed.

The intelligence community and the Federal Bureau of Investigation have spent months probing the operation and regularly briefed congressional leaders, telling them weeks ago that they believed Moscow was behind the operation. The FBI probe is continuing and could result in legal action.

Members of both parties called for consequences. Sen. Ben Sasse (R., Neb.), a member of the Homeland Security Committee, said Friday's statement should prompt strong action against Moscow.

Rep. Adam Schiff (D., Calif.), the top Democrat on the House Intelligence Committee, said that the U.S. is considering more responses but they would be carefully weighed.

"One thing that has gotten the Russians' attention is sanctions," Mr. Schiff said, referring to steps taken by Western countries in response to Russia's invasion of Ukraine.

New York Times
U.S. Says Russia Directed Hacks to Influence Elections
Saturday, 08 October 2016
Byline: David E. Sanger & Charlie Savage

Washington - The Obama administration on Friday formally accused the Russian government of stealing and disclosing emails from the Democratic National Committee and a range of other institutions and prominent individuals, immediately raising the issue of whether President Obama would seek sanctions or other retaliation.
In a statement from the director of national intelligence, James Clapper Jr., and the Department of Homeland Security, the government said the leaked emails that have appeared on a variety of websites "are intended to interfere with the U.S. election process." The emails were posted on the well-known WikiLeaks site and two newer sites, DCLeaks.com and Guccifer 2.0, identified as being associated with Russian intelligence.

"We believe, based on the scope and sensitivity of these efforts, that only Russia's senior-most officials could have authorized these activities," the statement said. It did not name President Vladimir V. Putin of Russia, but that appeared to be the intention.

The statement from Mr. Clapper and the Department of Homeland Security, which is primarily responsible for defending the country against sophisticated cyberattacks, said the intelligence agencies were less certain who was responsible for "scanning and probing" online election rolls in states around the country. It said that those "in most cases originated from servers operated by a Russian company," but stopped short of alleging the Russian government was responsible for those probes.

The announcement came only hours after Secretary of State John Kerry called for the Russian and Syrian governments to face a formal war-crimes investigation over attacks on civilians in Aleppo and other parts of Syria. Taken together, the developments mark a sharp escalation of Washington's many confrontations with Moscow this year.

For weeks, aides to Mr. Obama have been debating whether to openly attribute the cyberattacks to Russia, and as recently as Wednesday the director of the National Security Agency, Adm. Michael Rogers, refused to publicly accuse Moscow.

But with little more than a month to go before the presidential election, one senior administration official said that Mr. Obama was "under pressure to act now," in part because a declaration closer to Election Day would appear to be political.

Two days ahead of the second presidential debate, the announcement also puts the Republican nominee, Donald J. Trump, more on the defensive over his assertion last month that Mr. Putin is a better leader than Mr. Obama. In the first presidential debate, former Secretary of State Hillary Clinton, Mr. Trump's Democratic rival, blamed Russia for the cyberattacks on the Democratic National Committee, but Mr. Trump said there was no evidence that Russia was responsible; he suggested it could have been the Chinese or " somebody sitting on their bed that weighs 400 pounds."

Soon after the administration accused the Russians of hacking into the Democratic National Committee, WikiLeaks published hacked emails by John Podesta, the Clinton campaign chairman. In a Twitter message Friday evening, Mr. Podesta said that "I'm not happy about being hacked by the Russians in their attempt to throw the election to Donald Trump."

WikiLeaks has released troves of hacked Democratic emails, but has not revealed the source of the documents.

A major question is how Mr. Obama might respond without setting off an escalating cyberspace conflict with Russia between now and Nov. 8. One possibility is that the announcement itself -- an effort to "name and shame" -- will deter further action. But Mr. Obama's aides have assembled a range of

possible responses, from using economic sanctions to covert action against Russian targets, potentially including the computers used in the hack.

The official accusation against Russia comes after anonymous American intelligence officials told The New York Times in July that they had "high confidence" that the Russian government was behind the hack of the D.N.C., which led to the resignation of Representative Debbie Wasserman Schultz, the Florida Democrat, amid evidence that the committee was favoring Mrs. Clinton over her competitor for the party nomination, Senator Bernie Sanders of Vermont.

The months of subsequent silence frustrated some in Congress, and several weeks ago the top Democrats on the House and Senate intelligence committees, Adam Schiff and Dianne Feinstein, both of California, said Russia and its leaders were responsible, citing classified briefings.

Mr. Schiff, who had urged the Obama administration to name Russia and better prepare American voters for the possibility of interference between now and the election, on Friday praised the decision "to call out Russia on its malevolent interference in our political affairs."

"I hope this will establish a deterrent to further meddling," he said. "I don't think the Russians have decided yet how much they plan to continue their interference, so I think this attribution is very timely. We're also encouraging the administration to work with our European partners, who have been the subject of even worse meddling, to coordinate a response to this."

Mr. Schiff said he was afraid Russian hackers might attempt to delete or manipulate voter rolls, causing long lines at the polls and delays in counting votes because people would be forced to cast provisional ballots. (Voting machines themselves are not linked to the internet, so it is effectively impossible to hack them in a systematic way and change the outcome, specialists say.)

But as "profound" as that concern is, Mr. Schiff said, he and others see as "the most grave risk" something else: Russia could take emails it has already stolen, manipulate them to create a false impression that a candidate has done something outrageous or illegal, and cause them to be published online shortly before the election. That, he said, "could have an election-altering effect."

Federal officials are trying to help states plug holes in their internet defenses for election management systems. One thing they won't do before the election is pronounce such systems "critical infrastructure," as the secretary of Homeland Security, Jeh Johnson, proposed in August.

Mr. Johnson's notion provoked a backlash from conservatives. Republicans like Brian P. Kemp, the secretary of state in Georgia, and Jon A. Husted, his counterpart in Ohio, accused the Obama administration of overreach, saying it was trying to carry out a federal takeover.

Administration officials said that the idea of declaring elections systems critical infrastructure is dead for now, lest it discourage states from working with the federal government.

"Our focus right now, in the remaining days before Nov. 8, is to encourage states to come forward and request our assistance," Mr. Johnson said in a recent interview.

The department has offered states two kinds of help, both for free: a remote cyber "hygiene" scan of their servers by department officials who look for known vulnerabilities and can recommend patches, and a more intensive on-site analysis by a team of computer security specialists.

The department's emphasis on voluntary measures has met with mixed success: So far, 28 states have accepted that offer, the department said, but it declined to name them.

Officials with election agencies in the large swing states of Ohio, North Carolina, and Pennsylvania said they were participating. (Pennsylvania is particularly important because its electronic voting machines lack a paper audit trail for recounts.) Florida, another large swing state, is not participating in this particular program, but officials in the office of its secretary of state said they had already been working with federal partners before Mr. Johnson initiated the effort.

Still, while the number of participants has been slowly creeping up, the window is closing. A Homeland Security official said it takes about a week to complete the necessary paperwork to permit the department to begin the work, and that the more intensive on-site effort takes about two weeks. That suggests that soon after the middle of October, it will be too late to provide any help to late takers.

The fact that 22 states are not, as yet, participating does not necessarily mean all of them are vulnerable in ways that participants are not. Kay Stimson, a spokeswoman for the National Association of Secretaries of State, noted that some states had already been taking cybersecurity measures that are likely equivalent to what the department is offering.

Yahoo May Have Exposed Rogers Customer Emails to US Spies
Saturday, 08 October 2016
Byline: Jordan Pearson

Toronto - On Friday, Motherboard reported that beleaguered US company Yahoo allowed someone--possibly a US intelligence agency such as the NSA or FBI--to install a backdoor on its servers, likely for scanning purposes, that afforded unfettered access to Yahoo's systems, including users' personal emails. "This backdoor was installed in a way that endangered all of Yahoo users," a source familiar with the incident told Motherboard.

This should concern Canadians, because Rogers, one of the largest telecom companies in the country, totally outsources its email systems to Yahoo. Emails sent from Rogers accounts are sent to Yahoo's US

servers for storage and processing, and Yahoo scans Rogers emails for spam, malware, and child pornography.

This isn't the first time that Rogers' ties to Yahoo have compromised Canadians: The Toronto Star previously reported that Rogers customer data was included in the massive hack in September.

Moreover, several experts consulted by Motherboard said that by dint of Rogers emails transiting and being stored on Yahoo's US servers, they would likely have been subject to any sort of system-wide email dragnet installed by US intelligence.

Neither the NSA, nor its Canadian counterpart, the Communications Security Establishment (CSE), are legally allowed to spy on the content of domestic Canadians' digital communications, with the exception that the CSE monitors emails sent to the government.

Neither Yahoo nor Rogers would comment directly on these allegations.

"I'd imagine that, yes, the program would have applied to Rogers customer emails, unless Yahoo elected to specifically exclude them"

When asked if customer emails are routed through the US, Rogers spokesperson Andrew Garas stated that "when you register for a Yahoo account, your registration information and other data will be transmitted to the United States and/or other countries for processing and storage by Yahoo." This, the spokesperson continued, includes email.

To see what kind of data Yahoo could pull from a message, I asked a Rogers-subscribing friend to send me a test email. The routing information contained in the email confirmed that the email was sent through a Yahoo-owned server in New York.

The routing information was analyzed by American Civil Liberties Union staff technologist Daniel Gillmor and Citizen Lab researcher Bill Marczak, who both agreed that a system-wide email scanning system in the US could have captured the content of the Rogers email, despite it being sent and received within Canada.

"Any program that scans all the mail that Yahoo has access to would have scanned this email," Gillmor wrote me in a message.

"If Yahoo chose to segment their scanning by limiting it only to mails that have '@yahoo.com' email addresses [and omitted those sent from @rogers.com], of course, then they would have chosen to exclude this email from the scan," Gillmor continued. "It's not clear to me whether any such constraint was in place, though."

"I'd imagine that, yes, the program would have applied to Rogers customer emails, unless Yahoo elected to specifically exclude them," wrote Marczak in an email.

Yahoo declined to comment on whether the alleged system filtered out emails from Rogers customers.

Tobi Cohen, a spokesperson for the Office of the Privacy Commissioner, confirmed that Rogers consulted the office in the wake of the Yahoo hack. But as far as the possibility that Rogers customer emails had been siphoned into a surveillance dragnet goes, "Given we don't have detailed information about the matter, we are not in a position to comment," Cohen wrote.

When asked if Rogers was aware of the allegations against Yahoo or if the company is concerned that a backdoor could have affected its customers, spokesperson Garas referred me to Yahoo's statement and wrote that "as such, we believe this matter is closed."

Rogers would not comment when asked if it had any plans to change email providers in response to the Yahoo story.

New York Times
Surveillance in the Post-Obama Era
Sunday, 09 October 2016

Editorial: During his 2008 campaign, President Obama vowed to assert greater oversight of the massive surveillance apparatus built in the wake of the Sept. 11 attacks, arguing that the United States needed to strike a better balance between privacy and security and that all intelligence programs should be lawful.
"I will provide our intelligence and law enforcement agencies with the tools they need to track and take out the terrorists without undermining our Constitution and our freedom," Mr. Obama said in 2007.

Once in office, however, the Obama White House failed to meaningfully scale back surveillance practices established by Mr. Obama's predecessor, including the unlawful bulk collection of Americans' domestic phone call records.

It was only after a National Security Agency whistle- blower, Edward Snowden, exposed how much data American intelligence agencies were collecting and hoarding that the administration began to disclose the capabilities, legal underpinnings and safeguards of government surveillance programs.

The Snowden revelations prompted important reforms. Still, the debate over the proper balance between privacy and security remains far from settled. Disappointingly, the two candidates vying to replace Mr. Obama have failed to outline clear and comprehensive visions for one of the most consequential sets of choices the next president will face.

One big issue is what to do when a key provision of the law that gives the N.S.A. the authority to collect the electronic communications of foreigners -- which inevitably sucks in their correspondence with Americans -- expires at the end of 2017. Before reauthorizing that part of the law, Section 702 of the Foreign Intelligence Surveillance Act, the next president and Congress should craft a more narrow authority that ensures that the data of Americans cannot be searched without a warrant.

How best to respond to encryption technology, which is evolving rapidly, will be another major challenge. Earlier this year, the White House supported the Justice Department's heavy- handed order to compel Apple to disable a security feature that would have allowed the government access to a locked iPhone that belonged to a mass shooter. That request, withdrawn before the legal fight was settled, would have forced the company to develop a capability that it argued would have undermined the privacy of its customers. The next president should refrain from forcing technology companies to build encryption systems that can be breached, which would make everyone's private information more vulnerable to hackers.

The next president should be more forthcoming in disclosing the legal rationale and effectiveness of the government's surveillance programs. "Just trust us," its default response to reasonable requests for more information, simply isn't enough. The latest instance involved reports earlier this week that Yahoo was compelled last year to screen all messages for a specific type of correspondence the government was interested in spotting, as part of surveillance of a state-sponsored terrorist organization. Left unsaid was whether it worked and whether other email providers have been issued similar secret orders.

The Republican nominee, Donald Trump, has not substantively addressed any of these issues. But he has proposed draconian, unconstitutional measures to keep the nation safe, including carrying out surveillance of mosques and creating a database of Muslims. This is offensive and outrageous. "We're going to have to do certain things that were frankly unthinkable a year ago," he said last November.

Hillary Clinton has been more measured in discussing surveillance and encryption. Her campaign has suggested creating a national commission to explore legal and practical questions surrounding encryption. Mrs. Clinton has also said she would like to foster a more constructive relationship with Silicon Valley leaders, who have often been reluctant to collaborate with intelligence agencies. But she has been troublingly vague on specifics.

The next president needs to take the initiative early on to outline a responsible philosophy and approach toward surveillance and privacy issues. Even if that happens, Congress still needs to be more assertive than in the past in setting clear parameters to ensure that intelligence gathering programs are legally sound and effective. It would be a shame if it took a new whistle-blower to force what should be a continuing, vigorous debate.

Drop in police requests for electronic surveillance of suspected criminals baffles experts
Sunday, 09 October 2016
Byline: Alison Crawford

Ottawa - Experts say they're baffled by the big drop in the number of applications from police to conduct electronic surveillance on citizens.
In 2015, peace officers asked for authorization to intercept and record private communications 66 times, down from 114 a year earlier.

Police can ask a judge for permission to intercept someone's personal communications when they suspect serious criminal activity. Such authorizations generally last around 60 days.

The data comes from the Department of Public Safety's annual report on the use of electronic surveillance in Canada.

The report describes how, when applying for authorization, police most often said they suspected drug trafficking, terrorism, conspiracy and possession of stolen property. It also says charges were laid against 56 people identified during an interception.

Brenda McPhail welcomes the information, but the director of privacy, technology and surveillance for the Canadian Civil Liberties Association, can't explain the drop. McPhail says there's a limit to how helpful numbers are without any analysis.

"We could wonder whether or not the categories they are required to report in are so narrow that they are not catching the new kinds of interception technologies and techniques that are being used," she said.

Christopher Parson agrees. He's with the telecom transparency project at the Munk School of Global Affairs' Citizen Lab.

"Wiretaps are meant to be a tool of last resort so what that may suggest is authorities are finding other ways of gaining evidence that is less intrusive on Canadians' privacy, more generally," Parsons told CBC News.

Parliamentary security committee coming

That has the potential to be a good thing, according to Parsons.

"Unfortunately we don't have data on any of the other tools law enforcement uses. One of the anomalies in the Canadian situation, actually, is outside of these reports, we really have no clear indication of how often police are using their powers," said Parsons.

The government is currently holding consultations on Canada's national security framework. A spokesman for the Department of Public Safety says the public should share their views about police and security agency investigative capabilities in a digital world.

"More broadly, the government is advancing legislation to establish a committee of parliamentarians with special access to classified information to increase the accountability of all security agencies and departments," added spokesman Scott Bardsley.

USA Today
Could the U.S. election be hacked? ; At national level, no, but experts say it wouldn't take much to sow discord
Tuesday, 11 October 2016
Byline: Elizabeth Weise

Washington - The impact of Russian hacking on the upcoming presidential election was a topic in Sunday night's debate, raising the question: Is the U.S. election hackable? Experts say at the national level, no. But there could be individual incidents that undermine faith in the system.
There's almost no danger the U.S. presidential election could be affected by hackers. It's simply too decentralized and for the most part too offline to be threatened, according to the head of the FBI and several security experts.

"National elections are conducted at the local level by local officials on equipment that they obtained locally," so there's no single point of vulnerability to tampering here, said Pamela Smith, president of Verified Voting, a non-partisan, non-profit organization that advocates for elections accuracy.

In testimony before the House Judiciary Committee last month, FBI Director James Comey said that while concern has been rightly focused on the integrity of state voter registration systems, the actual voting process remains "very hard to hack into because it is so clunky and dispersed. It is Mary and Fred putting a machine under the basketball hoop at the gym. These things are not connected to the Internet."

Nevertheless, Comey said federal authorities have been counseling state officials to secure their systems, especially voter registration databases, as hackers have continued to "scan" the systems for vulnerabilities.

In Sunday's debate, Democratic presidential candidate Hillary Clinton noted U.S. intelligence officials have blamed Russia for hacking Democratic officials accounts.

"We have never in the history of our country been in a situation where an adversary, a foreign power, is working so hard to influence the outcome of the election," she said, and alluded to her Republican opponent Donald Trump's praise of Russian president Vladimir Putin.

Trump replied that he knew "nothing about the inner workings of Russia" and didn't address electoral issues. However, on the campaign trail he has said multiple times he fears the election will be stolen. In August in Columbus, Ohio, he said, "I'm afraid the election's going to be rigged. I have to be honest."

In some jurisdictions, local rules allow the transfer of election results using Wi-Fi rather than putting the information on a thumb drive that's physically taken to the central tally site. Others simply use outdated machines.

Depending on the voting machine, all it might take would be one disgruntled election official plugging in a thumb drive containing malware to falsify vote tallies, said Mike Baker, founder of Mosaic451, a computer security company that focuses on infrastructure protection, including for some state and federal election networks.

So far, 33 states and 11 county or local election agencies have approached the Department of Homeland Security for cybersecurity risk and vulnerability assessments, Secretary Jeh Johnson said in a statement Monday.

But time is a factor, and he encouraged election agencies to ask for help now.

"There are only 29 days until Election Day, and it can take up to two weeks from the time we receive authorization to run the scans and identify vulnerabilities. It can then take at least an additional week for state and local election officials to mitigate any vulnerabilities on systems that we may find," he said.

The good news is that in the upcoming election, close to 80% of voters nationwide are in areas that will use either paper ballots or voting machines with paper backups, both of which are considered much more secure than online-only systems, Smith said.

While election officials worry about such possibilities, they're loath to discuss them publicly. Voters losing confidence in the system and not turning out to vote is a greater threat to the integrity of the election system than hackers, they believe.

"It's a tough position for us to be in. We don't want to scare voters away," said Kim Alexander of the California Voter foundation, a non- profit, non-partisan organization that promoted the responsible use of technology in elections.

The fear is that proof of even one example of vote manipulation could be amplified through social media to threaten the electorate's trust in the entire system.

That trust is a bedrock of American democracy and if it's lost, "that puts us in a whole different category of countries that don't have free and fair elections," said Melinda Jackson, chair of the political science department at San Jose State University.

Why an Unhackable Mobile Phone Is a 'Complete Marketing Myth'
Tuesday, 11 October 2016

Tehran - The mobile security market is taking flight due to high- profile hackings, but is there such a thing as an unhackable phone? Especially one that costs as much as $14,000?
Consider this: The smartphone in your pocket is 10 times more powerful than the fastest multi- million dollar supercomputers of just 20 years ago. There are tens of millions of lines of software in that phone of yours. There are hundreds of apps written by more than one million developers, some of whom are hackers, and some of whom are just incompetent at security. And then there are chips in your phone that run sophisticated software, from companies located in countries all around the world, all of which have security bugs.

The complexity is mind-boggling -- and so are all the security vulnerabilities that exist and will be found in the future. In short, anyone who claims to sell an "unhackable phone" is either ignorant or lying.

With cybercriminals increasingly targeting mobile devices (such as with malicious apps and phishing schemes), threatening both the consumer and enterprises, the market is rushing to provide solutions to mobile security threats. Gartner calls this Mobile Threat Defense.

Everyone -- no matter which phone they own -- needs to be vigilant before downloading apps. For example, hackers recently created versions of Pokémon Go that contained malicious spyware that was released to eager fans before its official release. Even the first version of the legitimate Pokémon Go app was spying on many of your activities, and the developer and app stores didn't catch it.

Despite the marketing hype, it is impossible to detect all malicious app behavior through a one-time scan of an app before it's published on an app store. Bad apps often exploit operating system vulnerabilities that have not been discovered or fixed by the mobile device vendor. Apps can have "sleeper cell" behavior, where they don't exhibit malicious behavior when being analyzed for app store approval -- they wait until being deployed in the real world. Cybercriminals can also easily sideload apps onto both Android and iOS platforms from illegitimate app stores.

In addition to bad apps, we are seeing an increase in the number of criminals, hackers and hostile governments willing to pay for zero-day mobile exploits. These silent and secretive threats can take over your mobile phone simply by sending you a text message or email with a link to a malicious website. Unfortunately, new security threats and hacks are typically found after successful attacks have been

reported by victims, researched and a fix is created by programmers. A hack may affect thousands or even hundreds of thousands of people before it is detected and fixed.

It's also important to consider that most phones claiming to be "secure" or "unhackable" come from companies that base their phone on the Android operating system. Android is a state-of-the-art mobile device operating system, but more than 100 new security bugs are regularly discovered and need to be fixed every year. This trend shows no signs of slowing, and as mobile devices get ever smarter with more software and capabilities, there will be more bugs that hackers can exploit.

Taking a deeper look into the security of mobile devices shows that in August 2016 alone, there were 42 security vulnerabilities detected in the Android operating system or the Nexus device hardware. In July 2016, 54 such vulnerabilities were found. This monthly trend has been consistent for years. There is no sign that it will stop. You can be assured that every mobile device has 10-50 security vulnerabilities that will be discovered in the next month. And the month after that. And so on.

Of interest is that about half of the discovered vulnerabilities were not in the phone's operating system itself, but instead were found in the operating systems and software that run the chips inside the device. These tiny bits of software, called firmware, contain dozens of security bugs, which are discovered every month. These firmware security vulnerabilities impact the software that operates cell phone modems, cameras, Wi-Fi, sound, displays, USB, Bluetooth, power drivers and more on each device. These components are from a variety of manufacturers around the world. It is simply impossible to ensure that these myriad components are secure.

Furthermore, it is critical to point out that 65 percent of Android devices in use around the world still run old versions of the operating system, with hundreds of known bugs.

The iOS operating system is also not immune to security bugs. Security fixes have been, and will be, continuously applied to the iOS operating system for Apple iPhones and iPads once they are reported. For example, in July 2016 alone, fixes for 29 types of security vulnerabilities were released by Apple. These fixes addressed 46 separate issues.

In August 2016, only one month later, news broke that hackers and governments were infiltrating iPhones with advanced spyware to steal data and spy on all app communications, even encrypted apps. Attackers simply sent users a text message with a malicious link. The attacks appear to be created by a commercial company in Israel, called NOS, that makes spyware for mobile devices.

And what about those Wi-Fi networks we rely on when in airports and at hotels? Make no mistake, they often spy on our communications. The so-called "captive portal," where you have to enter your hotel room number, or just click on a terms of service agreement, are often traps to capture your email, passwords and web browsing activities. Be vigilant about which networks you connect to while traveling. If you receive a warning when connecting to a new Wi-Fi network, do not click "Continue." Try another network.

All of these issues make it impossible for a single device to be completely secure. Organizations need mobile threat defense security tools that will protect the enterprise as employees connect their devices to malicious networks and download questionable data-stealing apps around the world. Consumers need to be vigilant before downloading apps (read and confirm permissions are in place), be wary of text messages from unknown sources and only join known and trusted Wi-Fi networks. And hang up on the hype of an "unhackable phone."

The National (UAE)
Smart city Dubai must beat hackers in security race
Tuesday, 11 October 2016
Byline: Caline Malek

Dubai - Smart cities such as Dubai will have to continuously upgrade their technology to evade hackers, according to the first US secretary of homeland security.
Tom Ridge, former governor of Pennsylvania, told a cyber security conference that the internet will be linked to the success of smart cities.

"We live in an extraordinary age and one of great and accelerated change," he said. "In two decades, the internet has transformed humanity. It now drives the way we communicate, educate, how we receive information and we are hyper-connected. It has revolutionised the manner in which we educate our children, conduct our business and manage government affairs."

In 2012, it was estimated there would be 12 billion internet connected devices by 2020. In 2013, that figure was increased to 75 billion, a number Mr Ridge described as "staggering".

As a global hub, the UAE is a prime target for cyber attacks. "Any enterprise that is as successful, vibrant and connected like Dubai [is a target]," Mr Ridge said. "It's a centre for financial transactions and trade historically. That's what makes the Government's decision to make it a smart city timely and relevant and increases the pressure on [it] to do it right because it becomes an iconic player in the region and the world. The higher the profile, the more sophisticated the attacks." He said leaders had to accept the "risk reward" arrangement which involves understanding the perils that come with transforming a city into a smart city.

"Dealing with issues of cyber security calls for constant improvement because it's such a dynamic environment," said Mr Ridge. "Assessments have to be regular because the threat and the sophistication of the attack changes all the time so as advanced as the cyber-security protocols may be in the UAE, the real challenge is not to accept it today because you could be secure today and insecure tomorrow."

Telecoms firm du is a target of between 70 to 100 cyber-attacks each day. None have succeeded as of yet. "The number of cyber security incidents in 2009 was a bit over five million," said Osman Sultan, du's

chief executive. "In 2015, it counted over 60 million. This is a growth of more than 1,000 per cent in six years. We are in the midst of an incredible transformation, one that became so rapidly disruptive and global, more than any transformation in the history of mankind and that is changing everything we do in our lives. "The digital and online transformation is the determining factor of the age we live in."

He said cyber security should not be an afterthought for an organisation's IT department. "It should be at the heart of the thought itself," he said. "There are rewards in this hyper- connected world we live in. Risks are there because of this connectivity and we have to hope that one day, the risks will not become greater than the rewards. But that is an act of faith that all of us are making that we can harness the incredible rewards that come from a smarter and more connected world."

Experts said employees were considered the weakest link in the cyber security chain. "One of the biggest risks in cyber security is the employee and we keep seeing this," said Ibrahim Al Mallouhi, du's vice president of security operations. "We are doing awareness programmes now for our internal staff about cyber security threats and models because it evolves so fast."

Mr Ridge said resilience in governments was key. "We must be ready to quickly identify, contain and resolve a breach to limit disruption and recover quickly. A cyber-attack can bring everything to a screeching halt. Cities that are resilient will change what it means to be truly a smart city and those that adapt to change not only survive, but flourish."

London Times
Police use snooping devices on phones
Tuesday, 11 October 2016
Byline: Fiona Hamilton

London - A string of police forces have secretly purchased surveillance technology that enables large amounts of phone data to be collected from passers-by, it has emerged.
At least seven forces in England and Wales are now thought to be using IMSI Catchers that can collect and identify call and message data from mobile phones within a given area. They mimic mobile-phone towers and act as a "dummy", sending out signals that trick devices into automatically trying to connect to them.

Police find the Catchers useful to track suspects and uncover their phone activity, but they can capture information from other mobiles within a radius of up to five miles. It is believed that there is no automatic deletion of the gathered material from police systems, meaning that forces could be harvesting information about tens of thousands of members of the public.

The Times reported in 2014 that the Metropolitan police had purchased the technology. It emerged yesterday that at least six more forces are thought to be using IMSI Catchers.

Research by the Bristol Cable website, a media co-operative, showed that forces in the West Midlands, West Mercia, Warwickshire, Staffordshire, Avon and Somerset, and South Yorkshire are likely to have purchased IMSI.

Forces refuse to confirm such purchases, citing security concerns. However, official procurement documents referred to CCDC, or covert communications data capture, and there are police contracts with Cellxion, which manufactures IMSI.

Scotland Yard paid more than £1 million to Cellxion for "CCDC" last year and Avon and Somerset police paid the company £169,575 for "CCDC equipment", as well as other "communications and computing equipment", according to purchase data examined by the Cable. Unredacted minutes from a meeting in May between West Mercia and Warwickshire police said: "West Midlands and Staffordshire police have recently purchased and operated 4G-compatible CCDC equipment."

Warwickshire and West Mercia went on to purchase new CCDC technology. South Yorkshire budget papers showed that the force spent £144,000 in 2015-16 on "IMSI Covert Communications", which it confirmed was CCDC.

The use of the devices can be authorised by a chief constable without having to seek permission from a judge or minister. Privacy International has previously pointed out that the lack of transparency from British police is in contrast with overseas forces, which disclose their use of the technology.

London Daily Telegraph
Apple Watches banned from Cabinet after ministers warned devices could be vulnerable to hacking
Sunday, 09 October 2016
Byline: Peter Dominiczak

London - Ministers have been barred from wearing Apple Watches during Cabinet meetings amid concerns that they could be hacked by Russian spies, The Telegraph has learned.
Under David Cameron, several cabinet ministers wore the smart watches, including Michael Gove, the former Justice Secretary.

However, under Theresa May ministers have been barred from wearing them amid concerns that they could be used by hackers as listening devices.

Mobile phones have already been barred from the Cabinet because of similar concerns.

One source said: "The Russians are trying to hack everything."

Mr Gove disrupted one Cabinet meeting when he was Chief Whip by inadvertently playing a Beyonce song.

Sarah Vine, his wife, disclosed that he was "surreptitiously checking his emails", but pressed the wrong button when a message came through.

Ms Vine said: "So the cabinet was treated to the first few bars of a song from Beyonce."

It comes amid mounting fears about the scale of Russian hacking in the West.

Concerns have been raised after hackers obtained confidential emails from the Democratic National Congress during the US election.

Russian hackers have also obtained the medical files of some of the world's most famous athletes.

Xinhua News Agency
S'pore set to deepen cyber capacities across ASEAN member states
Tuesday, 11 October 2016

Singapore - Singapore's Minister for Communications and Information Yaacob Ibrahim on Tuesday announced that the country is pleased to launch a 10-million-Singapore dollar (7.25 million U.S. dollars) ASEAN Cyber Capacity Program (ACCP) to help fund various efforts to deepen cyber capacities across ASEAN member states.
Minister Yaacob Ibrahim made the announcement in his opening remarks at the inaugural ASEAN Ministerial Conference on Cybersecurity, which was held during the Singapore International Cyber Week 2016.

Yaacob, the minister-in-charge of cybersecurity, said the money will pay for resources, expertise and training, so that ASEAN countries will be equipped to drive and take ownership of their respective cybersecurity agenda.

The minister said the program, which will be launched in April 2017, will provide the resource to broaden the scope of capacity building activities and better hone technical skills and incident response.

"It will also support discussion and consultancy work in areas such as the formation of national cybersecurity agencies, formulating cybersecurity strategies, and even legislation," added Yaacob.

Motherboard (Vice Magazine)
FBI Hacked Computers in Australia as Part of Global Child Porn Sting
Monday, 10 October 2016
Byline: Joseph Cox

New York - In early 2015, the FBI hacked thousands of computers across the world, based on a single, arguably illegal, warrant.
Now, Motherboard has learned that as part of the same operation, the FBI also hacked computers in Australia, highlighting how law enforcement agencies are increasingly using malware to remotely search computers outside of their jurisdiction.

The case, codenamed Operation Pacifier, revolves around the FBI's investigation into one of the largest ever dark web child pornography sites, called Playpen. When the FBI seized the site in 2015, instead of shutting it down, the agency briefly ran Playpen from a government server in order to deploy a network investigative technique (NIT)--the agency's term for a piece of malware--in an attempt to identify its visitors.

The agency's malware used a Tor Browser exploit, and then grabbed a suspected Playpen user's IP address, MAC address, and other technical information. As well as obtaining over 1,000 US IP addresses, and distributing much of this information throughout the FBI and to other US-based law enforcement agencies, the FBI also gave details on suspects overseas to foreign agencies.

The Australian Federal Police (AFP) was one of those agencies. During the processing of a Freedom of Information request filed by Motherboard, the AFP said it held a wealth of data on Operation Pacifier, including a large PROMIS case file. PROMIS is the case management tool AFP officers use to catalogue investigations and store intelligence.

During preliminary searches, the AFP found 600MB of file data and "One PROMIS case alone containing over 2000 case note entries," a letter from the AFP to Motherboard reads. The agency confirmed that this file relates to the international referrals the AFP received in relation to Operation Pacifier. A single PROMIS case note entry does not necessarily equate to an IP address provided by the FBI; PROMIS is frequently updated throughout AFP investigations.

Australia is just the latest country to be revealed as part of Operation Pacifier. A Europol presentation uncovered by Motherboard said that the law enforcement agency had generated over 3,200 related cases, including 39 cases in Denmark. A second presentation showed that police in Colombia had worked on Operation Pacifier as well.

Earlier this year, an Austrian politician wrote in a letter to MPs that 50 IPs from the country had been obtained during the operation. The FBI also hacked computers in Greece and Chile, and there are indications of more related arrests in Turkey and the UK.

During a recent court hearing, Daniel Alfin, an FBI Special Agent who is working on the Playpen investigation, said that some of the suspected Playpen users based overseas have not yet been arrested or apprehended, "because of the amount of time it takes to get work done in some foreign countries."

But, in what shows the increasing use of malware to target suspects overseas, Australian authorities hacked into computers based in the US. Through US court documents, Motherboard found that a small unit of a regional police force led a separate operation to hack suspected visitors of another dark web child pornography site, including over 30 alleged US-based users.

The AFP previously told Motherboard it was not aware of the operation.

The Intercept
Report Finds Loose Laws on Data and Surveillance In Latin America
Monday, 10 October 2016
Byline: Cora Currier

Washington - The laws in many Latin American countries haven't kept pace with the increasing power of surveillance technology, creating the potential for serious abuses, according to a new report from a privacy watchdog.
Despite recent revelations of widespread use of spyware capable of infiltrating phones and computers by many governments in the region-- including in some instances, against political opposition and journalists-- not a single Latin American country surveyed in the report has specific laws on the use of such invasive technology. Many countries, including Brazil, Colombia, Chile and Mexico, require companies to log detailed data on their customers and give law enforcement access to the information on demand. Colombia has a ban on encryption, and El Salvador requires communications providers to decrypt traffic at the government's demand.

The report, written by researchers for the San Francisco-based Electronic Frontier Foundation, looked at surveillance laws in 12 countries in Central and South America. It opens with a stark reminder of what is at stake: A history of the collaboration among military dictatorships in Argentina, Chile, Paraguay, Bolivia, Uruguay and Brazil in the 1970s and 80s known as "Operation Condor." Files discovered later documented torture, disappearances, imprisonment and executions, enabled through a regime of informants and surveillance.

Many intelligence agencies in the region were formed under these military dictatorships, and even after transitioning to democratic rule, most Latin American countries maintained strong executive branch powers "without well-placed controls or public oversight mechanisms." Given the power vested in many presidents in the region, the report says, "intelligence agencies in Latin America have been powerful tools in presidential politics, specially used to spy on dissident groups, opposition politicians or independent journalists."

Colombia's national security agency under former president Álvaro Uribe was found to have illegally wiretapped calls and hacked the emails of his political opponents. The revelation of the scandal in 2011 led to the dissolution of the agency and various reforms - though the authors of the EFF report still think the country's broad intelligence law leaves room for abuse.

"We're especially concerned with laws requiring data retention on the whole population for future use by law enforcement," said Katitza Rodriguez, one of the authors of the report. "Colombia has a retention period of 5 years, and there are no clear rules of who can access the data and how it will be deleted after the fact."

While Mexico's Supreme Court recently put some safeguards on the country's data retention law, limiting who could access the information, Paraguay was the only country EFF found that had rejected data retention policies entirely.

In the United States, the FBI has clashed with companies over what sort of information they are required to turn over and what they are legally required to do, most famously trying to force Apple to break into the iPhone of the San Bernardino shooter. Latin American governments have also pushed providers to do their bidding with aggressive interpretations of what the law requires.

Earlier this year, a state judge in Brazil shut down the messaging service Whatsapp for 72 hours, after demanding that the company turn over the content of messages for a criminal investigation. Whatsapp stated that it could not turn over what it didn't have, since the app, with end-to-end encryption, doesn't have a record of what users send. (The judge's order was overturned by another court.)

EFF found that Colombia has a law on the books that actually bans the use of encryption.

"If it were actually enforced, many things would be illegal," Rodriguez said. "They aren't enforcing it now, but as the use of encryption becomes more widespread that old law is becoming more relevant."

The report is also concerned with the increased surveillance firepower readily available to governments. When company records for the Italian spyware manufacturer Hacking Team were hacked and released online last year, it came out that Brazil, Colombia, Chile, Ecuador, Honduras, Mexico, and Panama had bought surveillance software from the company, and many other nearby countries had been in talks with them.

Mexico was Hacking Team's top client, and not just federal agencies bought the spyware but also many state governments and the national oil company PEMEX, which do not have the authority to conduct surveillance. Mexican journalists uncovered that the governor of the state of Puebla had used the malware to spy on political opponents.

Cases like Puebla get at the heart of one of the report's main takeaways: While it found some positive trends in terms of legal protections and transparency reports, the issue is how the law is interpreted and enforced.

"Without public oversight- not just judicial oversight -- the laws on the books just won't work," said Rodriguez.

Spy fraud
Sunday, 09 October 2016
Byline: Jason Leopold

New York - When contractors and employees who work for America's most powerful intelligence agencies get bored at work, they sometimes kill time by viewing pornography on their classified government computers, browsing online dating services, engaging in "sex chats" with minors, and playing games on Facebook.
And they charge U.S. taxpayers millions of dollars for it.

Between 2013 and 2015, the Intelligence Community's Inspector General, the watchdog entity overseeing 16 federal intelligence agencies, investigated dozens of instances of employee misconduct and crimes based on referrals it received from intelligence agencies. Many of them centered on widespread contracting fraud involving individuals who worked on highly classified intelligence programs for the NSA, the CIA, and the Office of Director of National Intelligence (ODNI) on behalf of well-known contractors such as IBM, Booz Allen Hamilton, Boeing, and General Dynamics.

That's according to hundreds of pages of top-secret internal watchdog reports that were declassified and released to VICE News in response to a Freedom of Information Act lawsuit.

Because much of the inspector general's work is shrouded in secrecy, very few of its investigative reports are ever publicly released. This is the first broad- based, behind-the-scenes look at how the office, headed by Charles McCullough, has handled misconduct. McCullough is the watchdog who reviewed Hillary Clinton's State Department emails and referred the case to the FBI after finding that a few dozen messages stored on her private email server contained highly classified information.

Presumably, lawmakers on the House and Senate intelligence committees, which conduct oversight of the intelligence community, have seen the inspector general's reports. But several key lawmakers, including the ranking Democrat on the Senate Intelligence Committee, Dianne Feinstein, declined to comment on the substance of the investigations or how such misconduct negatively impacts intelligence work.

Experts said this type of misconduct is problematic on multiple levels and can pose a threat to national security. Scott Amey, the general counsel of good government group the Project on Government Oversight, which tracks waste and fraud by government contractors, reviewed the reports for VICE News.

"The contractors are primarily to blame, but these records show that intel agencies don't have a handle on the situation, and no one seems to enforce contract requirements," Amey said. He likened the waste

uncovered in the reports to an infamous instance of defense contractor excess uncovered during the Reagan administration. "We have stated that time-card fraud is the next $436 hammer, and these records prove that."

"The mischarging is in the millions, which shows the lack of contract administration and oversight by everyone involved," Amey added.

In one case, a contractor for the massive Science Applications International Corporation admitted that "95% of his time spent on the Internet was for personal use" at the ODNI, and that he spent nearly all day emailing and instant-messaging his friends. He also worked for the National Counterintelligence Center, which is responsible for collecting, monitoring, and analyzing information on potential terrorist threats.

Over the course of six years, the person billed the government $974,470 for 10,573 hours of work, even though much of it, he said during an administrative hearing, was spent accessing "online dating and social accounts to view images of scantily clad or naked women." After a two-year investigation, the person was found to have violated internal intelligence community policies, which included the misuse of government equipment. His access to classified information was revoked and he was fired.

Several contractors for Science Applications came under investigation for fraud and misconduct. For nearly a year, the inspector general investigated one who was assigned to ODNI for engaging in "graphic sexual chat" on a near daily basis from 2010 through 2013 using the agency's internal network. The contractor "often engaged in as many as 20 exchanges per day seeking sex partners. The majority of [his] sex chat included attempts to establish after work sexual encounters, descriptions of desired sex acts and graphic descriptions of his genitalia," according to the report.

After the inspector general learned that the contractor may have also used the agency's network to "establish a sexual relationship with a possible minor residing in northern Virginia," the watchdog referred the case to the FBI and a local task force on internet crimes against children. As the FBI began to probe the matter, ODNI officials detected that the contractor attempted to establish a sex chat with another possible minor in Colorado.

The contractor's access to government computer systems was suspended and he was swiftly escorted out of ODNI facilities. The FBI and law enforcement in Virginia took over the investigation, but neither would comment on whether the case was ever prosecuted.

In another case, a contractor working for the National Reconnaissance Office, which oversees spy satellites, allegedly abused his infant son between 2008 and 2009. The allegations surfaced in the contractor's 2009 polygraph examination. But the spy satellite agency's internal protocols apparently prohibited employees from reporting the incident to local law enforcement. The inspector general spent four years probing the case and recommended "a thorough review of the responsibility for reporting Federal and state crimes amongst the relevant NRO offices."

In another report, the inspector general said it opened up an investigation into a General Dynamics subcontractor -- he worked for technology company ManTech -- and found that while assigned to work for ODNI from 2005 to 2012, he didn't work. At all.

During a hearing, the contractor told the inspector general that he "took advantage of the lack of supervision and lack of work on the contract. He said that since 2005 he recorded [thousands of] hours which he did not work." This cost taxpayers $410,300.

The nature of the contracts and the type of the intelligence work performed is classified and was redacted from all but one of the reports VICE News obtained. (In that case, a program manager was found to have done nothing wrong when he played a role in selecting Honeywell as a contractor after his wife inherited about $45,000 in Honeywell stock.) But intelligence sources said the watchdog's investigations could involve contractors who work on any number of programs that involve analyzing NSA signals intelligence, CIA covert operations, and sensitive military programs and operations.

The outsourcing of intelligence work exploded after 9/11, and now five major corporations control most of it. Budget cutbacks were partly responsible for the explosion, and experienced people who worked for the government were lured to the private sector by higher pay. But outsourcing is risky because government agencies don't have an adequate workforce to oversee the contractors, meaning there's plenty of opportunity for waste, fraud, and abuse.

"It's a lot easier to track people and their work when fewer government and contractor program and personnel layers exist," said Amey, the good government group lawyer. "The move to outsource work seems to come with an acceptance of risk and tolerance for waste and fraud."

And, perhaps, negligence. The reports show that contractors and employees with access to top-secret information used public Wi-Fi to perform their work, at times on their personal computers, and in so doing risked exposing classified intelligence information.

Of all the investigations the watchdog launched over the past three years, only one involved a media leak. In 2012, McClatchy reporter Marisa Taylor obtained a letter sent to Congress by the inspector general of the National Reconnaissance Office. The letter regarded claims that an official there retaliated against four whistleblowers who raised red flags about contracting crimes.

Ultimately, the Intelligence Community Inspector General was unable to determine who was responsible for leaking the letter to Taylor (it appeared to have been a member of Congress). But as the subsequent report said, the letter did not contain "restricted handling guidance and was unclassified, [and] the release of the letter was not a criminal act as typically required in official leak investigations."

Steven Aftergood, the executive director of the Project on Government Secrecy at the Federation of American Scientists, told VICE News the kind of widespread abuse by government contractors revealed by the reports "defrauds the taxpayer."

"More subtly, it spreads corruption among the workforce and reduces expectations of competence and high performance," Aftergood said. "Contractors have always played an important role in intelligence, but in recent years they have assumed greater prominence in intelligence collection, analysis, and production. So messing around on the job could occasionally have serious consequences."

The bright side, Aftergood said, is that the watchdog is "actively investigating" the misconduct and aggressively trying to weed it out.

Newsweek
In Russian Hacks of Democrats, a Ghost of the Soviet Past
Monday, 10 October 2016
Byline: Jeff Stein

Column - Felix Dzerzhinsky must be chortling in his Red Square tomb. Nearly a century ago the first head of the Soviet secret police perfected the art of "disinformation," the clever crafting of false information to sow confusion among the Kremlin's enemies. His heirs have brazenly remounted the technique in an all-out attack on the American political system. It's not been subtle.
'We stand for organized terror," Dzerzhinsky famously wrote. "This should be frankly admitted. Terror is an absolute necessity during times of revolution." When the Soviet Union collapsed in 1991, Muscovites fed up with decades of repression tore down Dzerzhinsky's monstrous statue in Lubyanka Square, site of the KGB's infamous interrogation tombs, but he's making a comeback in the hearts of the Kremlin. In 2005, a smaller bust of the secret police chief, who died in 1927, was restored in the courtyard of the Moscow police headquarters. Last year, city election officials greenlighted a referendum to restore "Iron Felix," as the 40-foot high hulk was known.

Vladimir Putin seems to be a fan-and not shy about it. The Kremlin left its fingerprint on the hack of the Democratic Party's data vaults, investigators say. The person or team of hackers known as Guccifer 2.0 left behind a signature in Cyrillic, "Felix Dzerzhinsky."

"If these are indeed the Russians," Nina Khruscheva, the great-granddaughter of Soviet Premier Nikita Khrushchev tells Newsweek, "it only suggests that they either want to be caught and laugh at those who think they caught them."

It's possible someone else posing as a Russian wants Putin to be blamed for the hack attacks, says Khruscheva-always a possibility in the murky Internet underworld. But that's not likely, according to the Obama administration, which last week pointed a finger directly at the Kremlin.

"We believe, based on the scope and sensitivity of these efforts, that only Russia's senior-most officials could have authorized these activities," said the statement from the director of national intelligence, James R. Clapper Jr., and the Department of Homeland Security.

One of their targets, John Podesta, Hillary Clinton's campaign chairman, had no doubt where the latest attacks on the Democrats originated. "I'm not happy about being hacked by the Russians in their quest to throw the election to Donald Trump," an obviously enraged Podesta tweeted. But, "[I] don't have time to figure out which docs are real and which are faked."

And that's exactly the point of disinformation--a term invented by the Soviets.

"The purpose of developing black propaganda is not to throw a whole slew of fake documents into the stream, but to insert or delete words or phrases into the record which are damaging but [can only] later be disapproved," says Malcolm Nance, a career U.S. intelligence officer and author of The Plot to Hack America, published just days ago. The genius of the technique is that the correction takes days, or weeks, to catch up to the fiction. By then, gullible masses have digested the fabrications as truth.

The best disinformation closely hews to widespread suspicions about its target. Wikileaks's exposure of Hillary Clinton's private speeches to Wall Street bankers, apparently in concert with Russian hackers, seems tailored to further alienate the party's left wing, which is to say on-the-fence followers of Bernie Sanders.

But some of the purported excerpts from her speeches are obvious fabrications, says Nance.

One quote has her saying, "Muslim Immigration and Multicultural Madness have left a trail of misery and mayhem across Germany-with far worse to come because of demographics." She supposedly goes on to say that "Muslims make up only 9% of Berlin's population but account for 70% of young repeat criminals..."

Her purported phrasing about immigration "is on its face ridiculous," Nance says, since it would seem to align her with the xenophobic rants of Trump and his fellow travelers. And "never in a million years," he maintains, "would the top diplomat of the United States use any phraseology or Nazi-like statistics like this."

The same goes for Clinton's supposed embrace of "open borders" in the Western Hemisphere, he says. That almost certainly fabricated quote tracks with paranoia generated by the Trump campaign.

"We don't know what evidence the U.S. government has" that the Kremlin is quarterbacking such attacks on the Clinton campaign, notes Henry Farrell, a George Washington University associate professor of political science and international affairs who has written on the politics of the Internet. But as the Obama administration pointedly said last week, "Such activity is not new to Moscow -- the Russians have used similar tactics and techniques across Europe and Eurasia, for example, to influence

public opinion there," Farrell wrote in the Washington Post. Such a statement, Farrell said, "can possibly be read as tiptoeing one step toward agreement with the Northern Europeans" that Russia is waging a not-so-covert war on them, putting Washington one step closer to a cyber war itself.

Washington needs to stay cool, counsels Khruscheva, a professor at the New School who graduated from Moscow State University in 1987, during the death rattles of the Soviet Union. (She earned a PhD in Comparative Literature from Princeton University in 1998.) "Putin was a covert KGB operative, so shadow games must be his thing," she said by email, "but endowing the Russians with the power to bring down American democracy is silly." We will withstand his provocations, but in the meantime, "he is laughing at all of it," she says, the exposure of "lying cunning politicians and vulgar business showmen."

The problem, of course, is that the cunning Putin may overstep, poking a wobbly, unsure Uncle Sam one too many times, setting in motion a new Cold War that won't be so easily controlled.

Journal de Québec
Anonymat imposé pour une réunion sur la radicalisation
Tuesday, 11 October 2016
Byline: Taïeb Moalla

Québec - Québec refuse de dévoiler les noms des participants
Invoquant des enjeux de sécurité, le gouvernement du Québec refuse de dévoiler les noms des participants à une conférence de L'UNESCO sur la radicalisation des jeunes. Cet événement se déroulera au Centre des congrès de Québec du 30 octobre au 1er novembre.

«À l'heure actuelle, compte tenu de la sensibilité des sujets abordés dans le cadre de la conférence et pour des questions de sécurité, nous ne pouvons pas dévoiler la liste des participants», a répondu Pascal Ouellet, responsable des relations avec les médias au sein du ministère des Relations internationales et de la Francophonie (MRIF).

UNESCO

Le «programme provisoire» de la conférence est bel et bien en ligne sur le site internet du MRIF. Divers ateliers et séances sont prévus. Il s'agit notamment «d'internet et radicalismes violents», de «témoignages de jeunes et de familles directement touchés par la radicalisation violente» ou encore de «la lutte et de la prévention contre la radicalisation».

Par contre, aucun nom d'expert ou d'intervenant ne figure sur le programme. «L'identité des conférenciers sera dévoilée dans les jours précédant l'événement», a ajouté M. Ouellet.

250 À 300 EXPERTS

En mai dernier, L'UNESCO et Québec ont fait savoir que 250 à 300 experts dialogueront sous le thème: «Internet et la radicalisation des jeunes: prévenir, agir et vivre ensemble». Le coût d'organisation de la rencontre est d'environ 800 000 $, dont 500 000 $ assumés par le gouvernement du Québec.

Interrogé il y a quelques mois sur le profil des participants, Indrajit Banerjee, directeur de division à L'UNESCO, a répondu que «ce sera un mélange. Il y aura des représentants des gouvernements, mais aussi des gens qui ont une expérience concrète en matière de radicalisation et de cybersécurité».

Au moment d'annoncer l'événement, Québec a insisté sur l'importance d'éviter toute stigmatisation, même si l'actualité récente a été fortement marquée par le terrorisme islamiste.

«Le terme "radicalisation" englobe tout. On ne veut pas non plus identifier ou montrer du doigt des gens ou des groupes en particulier», a signalé la ministre des Relations internationales, Christine St-pierre.

Pour se protéger contre l'espionnage russe, le gouvernement britannique bannit l'Apple Watch
Tuesday, 11 October 2016

Londres - Pour se protéger contre l'espionnage russe, le gouvernement britannique bannit l'Apple Watch des ministères
En Grande Bretagne, la montre connectées d'Apple est désormais interdites lors des réunions ministérielles. Les services de sécurité pensent que la Russie pourrait y placer un mouchard.

La montre connectée d'Apple n'est pas la bienvenue au sein du gouvernement britannique. Le gadget est désormais banni des ministères. Motif ? Un risque d'espionnage. Des hackers pourraient se servir de ces montres pour écouter les conversations de leurs propriétaires.

Des montres qui peuvent devenir des mouchards

C'est le quotidien Telegraph qui révèle que les ministres britanniques ont été priés de ne pas porter d'Apple Watch lors des réunions officielles du Cabinet par crainte d'espionnage russe. Ces montres comportent un petit micro, qui sert à activer la commande vocale, à dicter des messages ou à répondre à des appels. On peut penser que c'est ce qui inquiète les autorités car, du coup, ces montres peuvent, en théorie, être transformées en mouchard afin d'écouter des conversations. Certes, pour cela, encore faut-il qu'un logiciel espion ait été introduit dans la montre. Les services de sécurité britanniques pensent que les Russes en sont capables, visiblement.

Les smartphones et les tablettes sont déjà interdits de séjour lors des réunions du cabinet britannique depuis 2013 et doivent rester à l'écart, enfermés dans des boîtes qui ne laissent passer ni les bruits ni les ondes.

The National (UAE)
NYU Abu Dhabi engineers seek to make cities more secure
Tuesday, 11 October 2016
Byline: Caline Malek

Abu Dhabi - The UAE is hardening its critical infrastructure against hacking with plans to test the security of electronic chips used to operate everything from a city's power grid to phones, satellites, aviation, and medical and military applications.
Earlier this year, cybersecurity experts and materials engineers warned that defects could be introduced in manufacturing these components, compromising their efficiency and safety.

The UAE owns the semi-conductor manufacturing company Global Foundries, which has a fabrication facility in New York which benefited from a multi- billion dollar investment last year. However, making these outside the UAE means there could be a security risk in the supply chain.

Now New York University Abu Dhabi is moving forward with a plan to test these components. "Someone may alter the design or insert something malicious into the final chip," said Ozgur Sinanoglu, associate professor of electrical and computer engineering at NYUAD. "We need to make sure no trojans are inserted inside the chip, and my research addresses these kind of problems."

NYUAD has created a test bed in its laboratory at the Saadiyat Island campus, allowing students to hack devices and create defences, said Michail Maniatakos, assistant professor of electrical and computer engineering.

"The devices control some kind of industrial process, whether a nuclear factory or a whole city's power, and we'd like to see the effect of hacking into the process and what can happen to a city," he said.

The team mapped the UAE and New York power grids for simulation. They also plan to map the UAE's transport networks, including cameras, toll gates and traffic lights. Mapping can take between a week and six months.

"The attackers are always a step ahead. For every defence you implement, they'll come up with a new attack," said Prof Maniatakos.

"So to win the game, you have to attack it first before someone else does it for you. This needs a proper security mindset that is heavily needed here."

The university is working with the US government to better protect its army, and Global Foundries, owned by Mubadala, to make chips with built-in defence systems. "We're about to finish the first secure version and the chip will hopefully be fabricated in the next month for the first time in the UAE," Mr Sinanoglu said.

"It's a lot of research but we have the opportunity for the first time to create something real. The threats are out there and this affects everybody equally."

Experts said the project is vital for cyber security in the UAE. "It proves again that Abu Dhabi is leading the region in advanced research and development projects across all sectors to now include defence, space and security innovations," said Matthew Cochran, chairman of the Defence Marketing Services Council in Abu Dhabi.

Cyber security for the so-called "internet of things" - the increased connectedness of physical devices through the internet - could still be improved, he said. "We must protect ourselves from those that would do our society harm via hacked and inserted kill switches that could make our everyday equipment useless," said Mr Cochran.

Straits Times
Singapore launches $10m fund to help Asean fight cyber threats
Thursday, 13 October 2016
Byline: Lim Yan Liang

Singapore - Singapore is taking concrete steps to step up cooperation across Asean for a more secure cyberspace, Communications and Information Minister Yaacob Ibrahim said Tuesday as he launched a $10 million fund to help fellow Asean nations build up their cyber response capabilities.
Ibrahim, who is minister-in-charge of cyber security, told the first Asean Ministerial Conference on Cyber Security at the Shangri-La Hotel the grouping could focus its efforts in three areas to fight the "full spectrum of cyber threats: Cybercrime, espionage, and other malicious activities".

The meeting came a day after Singapore launched its National Cyber Security Strategy, in which building regional and global partnerships to fight cyber threats is a key pillar.

The first area Asean members can cooperate in is helping strengthen one another's technical capabilities to better respond to incidents.

South-east Asia is a prime target for cyber attacks, and a Singtel-FireEye study found organisations in the region face a 45 per cent higher risk of a targeted cyber attack than the global average. One in four such attacks is aimed at governments.

"Attack targets could range from financial to data theft, reputational damage, and also disruption to our critical information infrastructure," Yaacob said.

The new $10 million Asean Cyber Capacity Programme is aimed at building up a credible response to such threats, he added. It will help train technical officers to deal with attacks, and train policymakers and prosecutors to shape members' cyber-security strategies and laws.

Second, Asean members can tap into global efforts to build a trusted cyberspace, like the Interpol Global Complex for Innovation (IGCI) that is based here, Yaacob said.

"We can support the IGCI by seconding more Asean law-enforcement officers to the IGCI. By partnering Interpol, we can conduct more joint operations against cyber criminals and enhance the collective safety and security of Asean."

Singapore will also contribute $900,000 to the CyberGreen global initiative that provides tools for a country to measure its level of cyber health, announced Yaacob.

With this funding, all Asean members can access the CyberGreen platform through Singapore for free and better identify different levels of threats and ways to counter them.

The third area is for Asean states to start a dialogue on cyber norms -- a conversation that began globally a decade ago -- to develop a regional understanding of such norms and take part in the global effort, he said.

"Cyber capacity- building, cyberspace awareness, and cyber norms: these are three suggestions to Asean for enhancing cyber-security cooperation," said Yaacob. "Singapore is committed to these ideas, and we are backing our words with resources and investment."

Sydney Morning Herald
PM's 'favourite thing': WhatsApp chat raises security fears
Thursday, 13 October 2016
Byline: James Massola

Sydney - Prime Minister Malcolm Turnbull and his most senior cabinet ministers are using a third-party messaging application to conduct confidential discussions, prompting cyber security experts to warn the innovation could actually pose a security risk.
The use of WhatsApp is not limited to senior ministers; private chat "groups" exist for government chiefs of staff, ministerial media advisers, the frontline economic team, and a defence-focused "broadcast group" used by Defence Industry Minister Christopher Pyne to communicate with MPs and staff.

Fairfax Media has spoken with four cyber security experts who have each flagged potential security issues with the widespread use of WhatsApp by the Turnbull government - particularly at a cabinet level - in place of secure, government email servers from platforms approved by the Australian Signals Directorate (ASD), Australia's cyber intelligence agency.

Craig Searle, the founder of security consultancy firm Hivint, pointed out WhatsApp was not an approved platform on the ASD list of Evaluated Products or Certified Cloud Services, whereas Apple's iOS operating system and Blackberry's operating system were.

"Should government be using secure messaging apps? Yes, they are a great idea. But for government staff in particular, they have to be cognisant of data classification requirements, they should behave securely and use products on the Australia government's certified list," Mr Searle said. "If a government employee were to transfer classified data across a non-approved app or network, that could be a potential security breach."

WhatsApp has a user base of about 1 billion people and can be used to send one-to-one and group messages, or video and make phone calls. It is owned by Facebook, with which it recently began to share more user data.

Multiple government staff confirmed to Fairfax Media the platform was widely used within the government, including by a group of cabinet ministers.

"I can't imagine ASD is very happy about it," one staffer said.

A government spokesman said the WhatsApp groups were designed to improve internal government communication and co-ordination. The spokesman did not deny a cabinet-level group existed but said secure information such as classified, sensitive and "not for release" material was handled in the appropriate way.

"The government uses many channels of communications, including WhatsApp," he said. "All classified communications happen appropriately on secure channels. There is a protocol around the security of mobile devices."

But Australian Strategic Policy Institute cyber security expert Tobias Feakin said despite WhatsApp trumpeting end-to-end encryption - which secures a message once it is sent from one phone, via a server, to another phone - risks remained.

"The risk of WhatsApp is at either end of the cycle, on the sending device or receiving device. People can misplace a device and then it can potentially be accessed. Then there is phishing - someone clicking a link or opening an attachment [in the app] which downloads software," Dr Feakin said. "The headache for government is that this is a platform that rests outside government's purview and that therefore poses some security risks."

Queensland University of Technology security expert Emeritus Professor Bill Caelli said cabinet communications should happen on a secure device or not at all.

"If it's not on ASD's list ... the answer is 100 per cent 'no'."

University of Canberra director of internet safety Nigel Phair said "of course" cabinet ministers should not use WhatsApp.

One senior staffer said WhatsApp was the Prime Minister's "favourite thing, so everyone jumped on it" when Mr Turnbull became Liberal Party leader in September 2015.

The bungling spies like us
Thursday, 13 October 2016
Byline: Peter Jean

Spy agency ASIO tapped the wrong phone by mistake, illegally hacked a computer and had to pay for professional carpet cleaning in a home its agents raided.

And its sister intelligence agency the Australian Secret Intelligence Service passed information about Australians to a "foreign liaison" without applying privacy rules. A series of stuff-ups by Australia's intelligence organisations have been made public in Inspector- General of Intelligence and Security's Margaret Stone's annual report. Most were reported to Ms Stone's office by the agencies themselves after they realised they had made mistakes.

The report reveals ASIO tapped the wrong phone because it had an "incorrect number" and a telco mistakenly sent the agency wrongly intercepted SMS messages. An "administrative "oversight" also led to a computer being accessed without a warrant from the Attorney- General. And a woman whose home was raided by ASIO agents executing a search warrant complained to the Inspector-General that the property had been left in a "disordered state" at the end of the search.

She added the list of seized property given to her by ASIO was so faint it was illegible.Ms Stone, a former Federal Court judge, has wide-ranging powers to review the activities of intelligence agencies.

Global Times
China must be wary of extremist cyber incitement
Thursday, 13 October 2016
Byline: Zhang Yi

Beijing - According to local media reports, a female student at a vocational school in Anhui Province stood trial on Tuesday for possessing items promoting terrorism and extremism. In 2013, she became friends with someone known as "Abdullah" on QQ, an online chat platform in China. She apparently planned to become a jihadist under Abdullah's incitement.
Terrorists and extremist groups have been using social networks to lure young people into jihad. According to a Washington Post report in 2014, online chat rooms advised girls on how to "discretely disobey their parents and sneak away."

Young men are victims as well. Aaron Riseberg, an American expert and tracker of online jihadists, once noted that online, young men often ended up creating a "self-inflicted post traumatic stress disorder" leading to violence.

Mohammed Emwazi, a British Arab and an alumnus of Britain's University of Westminster dubbed Jihadi John in the British press, was the executioner in a number of gruesome Islamic State videos showing the beheadings of hostages.

The increasing number of Americans and Europeans seeking to join terror groups suggests that IS' online efforts may be paying off, which requires vigilance and countermeasures from China, a victim of terror attacks in recent years.

Chinese religious extremists and separatists acting overseas have also made use of the Internet to indoctrinate people. The East Turkestan Information Center, a group affiliated with the East Turkestan Independence Movement (ETIM), propagandizes violence and terrorism on the Internet to foment ethnic resentment.

The ETIM, which has been labeled as a violent separatist group and a terrorist organization by many countries, has produced hundreds of videos on terrorism.

Instigation of terrorism and teaching of violent techniques via these videos on the Internet has become a new method for ETIM to evoke terror attacks in China. In 2014, police in the Xinjiang Uyghur Autonomous Region detained 232 people who circulated videos disseminating terrorism online.

The rise of the new media era coincides with the unchecked growth of terror groups that hold the "black flags of jihad." On the one hand, the popularity of new media platforms means information spread fast, but on the other, it provides more room for extreme religious views and terror thoughts.

China should join hands with the international community to keep a watchful eye on harmful information on the Internet and educate netizens about its detrimental effect on themselves and the country.

New York Times
Donald Trump Finds Improbable Ally in WikiLeaks
Thursday, 13 October 2016
Byline: Multiple reporters

New York - In the final weeks of a dizzying presidential campaign, Donald J. Trump is suddenly embracing an unlikely ally: The document- spilling group WikiLeaks, which Republicans denounced when it published classified State Department cables and Pentagon secrets about the wars in Iraq and Afghanistan.
Mr. Trump, his advisers, and many of his supporters are increasingly seizing on a trove of embarrassing emails from Hillary Clinton's campaign that WikiLeaks has been publishing -- and that American intelligence agencies said on Friday came largely from Russian intelligence agencies, with the authorization of "Russia's senior-most officials."

The Trump campaign's willingness to use WikiLeaks is an extraordinary turnabout after years of bipartisan criticism of the organization and its leader, Julian Assange, for past disclosures of American national security intelligence and other confidential information.

The accusation that Russian agents are now playing an almost-daily role in helping fuel Mr. Trump's latest political attacks on Mrs. Clinton raises far greater concerns, though, about foreign interference in a presidential election.

With the White House weighing its next move -- from possible sanctions to covert, retaliatory cyberaction -- President Vladimir V. Putin of Russia insisted on Wednesday that his nation was being falsely accused. "The hysteria is merely caused by the fact that somebody needs to divert the attention of the American people from the essence of what was exposed by the hackers," Mr. Putin said.

He did acknowledge that the disclosures were the work of an illegal hack -- which is further than Mr. Trump went in Sunday's debate. In one exchange with Mrs. Clinton, the Republican candidate said: "Maybe there is no hacking. But they always blame Russia," he said, as part of an effort to "tarnish me."

Mr. Trump has seized on more than 6,000 emails published so far this week, apparently from the personal Gmail account of Mrs. Clinton's campaign chairman, John D. Podesta. Based on a few emails plucked from the account, Mr. Trump and his team have accused Clinton aides of improperly receiving inside information from the Obama administration.

That stems from correspondence that shows that the campaign received an update from the Department of Justice about the timing of the release of Mrs. Clinton's State Department emails. On Wednesday, Trump advisers flagged others messages that they argued were critical of New Hampshire voters and of Catholics.

As Mr. Trump struggles to rebound from revelations that he bragged in 2005 about his power to sexually assault women, Republican allies say he has come to believe that WikiLeaks could yield a critical mass of negative and destructive information -- if not a smoking gun -- that drives up Mrs. Clinton's already high unfavorable ratings with voters and perhaps even derails her candidacy.

Following Mr. Trump's wishes, his advisers have aggressively pushed the Clinton camp emails in news media briefings and cable news appearances, bringing up the hacked messages to battle back from the questions about Mr. Trump's comments about women. But as much as Mr. Trump sees WikiLeaks coming to his rescue, strategists in his own party take a dim view of its ultimate impact.

The Clinton campaign is trying its own political jujitsu with the hacks, arguing that they are more evidence that Mr. Trump is in the pocket of Mr. Putin, whom the Republican candidate has declined to denounce for his annexation of Crimea, his intimidation of former Soviet states that are now part of NATO, or for its abandonment last week of a nuclear arrangement with the United States. Mr. Podesta has gone even further, saying in a statement on Wednesday evening that there was "the possibility that Trump's allies had advance knowledge of the release of these illegally obtained emails."

Intelligence officials say that so far they have not concluded there was any such collusion, but the investigation into who got into Mr. Podesta's emails, and how they got into WikiLeaks' hands, has just begun.

Those emails began to appear on Friday afternoon, just hours after the director of National Intelligence and the Department of Homeland Security issued a statement attributing previous hacks to the Russian government. Officials on Wednesday said it may take weeks to establish whether Mr. Podesta's emails were also hacked by the Russians -- though they said the attack on his Gmail account fits the pattern of previous Russian- sponsored email thefts.

Republicans have previously condemned WikiLeaks and similarly blasted the leaks by Edward J. Snowden, a National Security Agency contractor, and said they were evidence of carelessness by the Obama administration.

When Mr. Snowden's disclosures about the scope of the N.S.A. spying were brought to light, it touched off a feverish debate over government invading people's privacy, and many Republicans denounced Mr. Snowden as a traitor. The emails from Mr. Podesta were also the result of an illegal hack -- but of a private email account or campaign emails, not a government agency.

Among the Trump supporters who have most vocally praised WikiLeaks is Sean Hannity, the Fox News host who excoriated the site's editor, Julian Assange, years ago.

Representative Peter T. King, the Republican from Long Island, who supports Mr. Trump, said he would not go as far as Mr. Hannity had in "rehabilitating Assange." Then, conflating the WikiLeaks disclosures with the Snowden disclosures, he added that: "I thought what Snowden did was disgraceful, treasonous. But the reality is the information is out there, and if Hillary doesn't deny it then to me it certainly has to be used."

Rudolph W. Giuliani, the former New York City mayor and another Trump supporter, said that Democrats showed no compunction about using unauthorized material when it came to Mr. Trump's 1995 tax returns, or a leaked NBC audio recording of Mr. Trump boasting about groping. Mr. Trump's campaign manager, Kellyanne Conway, insisted on Wednesday that the information that WikiLeaks and other outlets had made public from hacking collectives is "relevant."

"But for this information, a number of revelations would remain secret -- how Hillary Clinton really feels, how paranoid she really was about an Elizabeth Warren challenge, her ability to articulate a message that's cohesive and credible," Ms. Conway said in an interview. She dismissed questions about spreading information that is stolen and in some cases unsubstantiated. "They say stuff all the time that's not verified," Ms. Conway said of Democrats. "This is the wild wild West of instantaneous information that people neither trust nor verify, they just repeat."

Ms. Conway and the former House speaker, Newt Gingrich, held a conference call with reporters to highlight an email from Mrs. Clinton's campaign manager, Jennifer Palmieri, which they insisted showed "bias" toward Catholics. Ms. Palmieri told reporters she did not recognize that email.

While some Republican strategists questioned the maneuver by Mr. Trump, the Clinton campaign seemed uncertain about how to navigate the disclosures, particularly after calling attention to the unauthorized disclosures of pages of Mr. Trump's tax returns in The New York Times and an 11-year-old tape featuring the candidate bragging about forcing himself on women. For the most part, the Clinton team repeatedly criticized news organizations for using hacked materials. But privately, Democrats expressed deep concern about how much more widespread the breaches could be.

Counting on an "October surprise" bombshell has never been a winning gambit for a struggling presidential nominee, and Republican pollsters say that the WikiLeaks email will do little to help Mr. Trump attract more undecided voters, especially women, or reassure wavering Trump supporters.

More than anything, pollsters say, the emails will merely reinforce the views of relatively narrow numbers of people who are intensely suspicious of government. "Trump has a hard-core base," said Neil Newhouse, a Republican pollster. "They ought to spend less time figuring out how to reinforce those people and more time trying to add to his vote column."

Mr. Trump, at a rally on Wednesday afternoon in Ocala, Fla., called the hacked campaign emails "unbelievable" and urged voters to read the messages "released by WikiLeaks." He said the emails "make more clear than ever, just how much is at stake in November and how unattractive and dishonest our country has become."

"It tells you the inner heart," he said. "You got to read it."

For many of Mr. Trump's supporters, the sudden appearance of confidential Clinton campaign emails is a stroke of fortune that, they think, could improve Mr. Trump's chances of winning on Nov. 8. "I think if he makes it a big deal, if he keeps on pressuring on it, it really will help," said Diego Rielo, 24, of Gainesville, Fla.

Dane Graves, 47, of Dunnellon, Fla., said the email disclosures were a strategic benefit for Mr. Trump because they "reaffirmed" comments that he has made as a candidate about the two-faced nature of politicians and alleged malfeasance in government.

"He's not basing his campaign on WikiLeaks -- it's only backing up what he's been saying the whole time," Mr. Graves said. "It's really backing up what the people have been feeling all of this time about the corruption of government, embedded, just the trickle-down corruption."

Some veteran Republican strategists say the WikiLeaks disclosures may be heartening to Mr. Trump and his supporters, but the emails are highly unlikely to influence undecided voters in battleground states like Ohio and North Carolina..

"There's real nihilism in the Trump campaign right now, just determined to do anything and say anything to make this the most disgusting final weeks in a presidential campaign ever," said Steve Schmidt, who

was a senior adviser to John McCain's campaign in 2008. "Distrust of Clinton is pretty well baked into parts of the electorate right now. But 55 to 60 percent of the country is open to a Clinton presidency and wants to see the next president get to work with Congress to help the country."

Washington Post
Social media spur adoration - and assassins, study says
Thursday, 13 October 2016
Byline: Michael Rosenwald

Washington - Social media have altered the motives and targets of those who set out to kill public figures, spreading the threat beyond politicians to music stars, athletes and other pop-culture icons, according to a new study by a senior FBI official and a prominent forensic psychologist.
The study, which was published online Wednesday in the journal Behavioral Sciences and the Law, aims to update a landmark Secret Service report that examined attacks on public figures between 1949 and 1995, ending with the "Unabomber," Ted Kaczysnki.

That report, which looked at 83 attackers, found that 68 percent of targets were government or judicial figures, while 19 percent were celebrities. The new study is narrower - 58 attackers from 1995 to 2015 - but it found that 38 percent targeted government or judicial figures, while 34 percent focused on movie, sports and media celebrities.

The authors attribute that shift to Facebook, Twitter, Instagram and other social media, which fuel a culture of celebrity and create an illusion of intimacy with stars.

For some attackers, especially the one-third who are delusional, this digital relationship feels like a personal connection, with a seemingly two-way conversation that amplifies infatuation.

At the same time, the public figures traditionally stalked by assassins - politicians and other government officials - have lost some of their appeal, the study found. They aren't seen as powerful symbols whose deaths will provide eternal fame. Rather, attackers who go after them blame them for their troubled lives and are seeking retribution - a motive that puts pop-culture figures at risk as well.

"These attacks are now angry and personal," said J. Reid Meloy, the lead author of the paper and a professor of forensic psychiatry at the University of California at San Diego. "They don't want fame. They want revenge for some perceived wrong."

Meloy and co-author Molly Amman, program manager in the FBI behavioral-analysis unit that studies targeted attacks, coined a term for this new type of targets: "publicly intimate figures." And social media doesn't just offer attackers this faux connection. It can also tip them off to where a target might soon be.

In the paper, the authors describe dozens of victims who are public figures: Paris Hilton, attacked outside a courthouse by a stalker; Tom Brokaw, targeted with anthrax, allegedly by a disgruntled researcher wanting money; and Roanoke television reporter Alison Parker, killed on live TV by an angry former co-worker.

Given the timeline of the study, the authors could not include this summer's fatal shooting of Christina Grimmie, a former singer on "The Voice." But that attack, Meloy said, is an important example of his study's findings. Grimmie was shot by a man obsessed with her social-media posts. He lost weight and became a vegan to try to win her heart.

Reaction to the study in threat-assessment and criminology circles was mixed.

"To those of us involved in threat assessment, this is data that confirms what we have been observing," said Mario Scalora, who directs the Targeted Violence Research Team at the University of Nebraska.

Marisa R. Randazzo, former chief research psychologist at the Secret Service and now a managing partner at Sigma Threat Management, said, "The reason why this is such an important study is that it provides a comprehensive view of the wide range of people who have become targets because of their public-figure status."

But other experts raised questions about the methodology, arguing that the data wasn't an apples-to-apples comparison with the earlier study and that the tally of attacks could be incomplete because they were identified by Google searches. Also, those arrested weren't interviewed, limiting insight into motive.

The authors acknowledged these potential shortcomings in the paper. (The authors of the previous study did not respond to requests for comment.)

The authors argue that fame has become less of a motive in attacks on public figures because social media provides the opportunity for anyone to become a star. Instead, attackers target public figures out of anger for some slight, real or perceived.

The study did find numerous aspects of attacks on public figures that have remained constant. The attackers are almost always male. They are often mentally disturbed. They don't make direct threats before taking action.

A spokeswoman for the Secret Service said the agency has reviewed attack trends, releasing a report last year. That report looked only at attacks on federal buildings or employees. The primary motive: "Retaliation for a perceived personal slight or wrong." Fourth on the list: "Seeking fame or attention."

NBC News

Russia May Be Hacking Us More, But China Is Hacking Us Much Less
Wednesday, 12 October 2016
Byline: Ken Dilanian

New York - In a rare bit of good cyber security news, Chinese hacking thefts of American corporate secrets have plummeted in the 13 months since China signed an agreement with the Obama administration to curb economic espionage, U.S. officials and outside experts say.
Analysts say the success may hold lessons for how the U.S. should deal with Russia, which at the same time has stepped up a different sort of hacking campaign that officials says is aimed at undermining confidence in the American election.

The change in China's behavior "has been the biggest success we've had in this arena in 30 years," said Dmitri Alperovitch, co-founder of Crowdstrike, a cyber security firm that tracks computer network intrusions.

"And it wasn't anything we did in cyber space -- it was the threat of sanctions and the impact on their economy."

Alperovitch said his firm has observed a 90 percent drop in commercial hacking against U.S. firms attributable to Chinese government actors. U.S, intelligence agencies also have reported a sharp falloff, according to officials briefed on the matter.

To be sure, Alperovitch and others say, Chinese intelligence agencies are still hacking to steal national U.S. security secrets, including attacking defense firms. But those attacks are considered commonplace, because they are exactly what the National Security Agency does to China and other U.S. adversaries.

At issue in the agreement President Obama signed with President Xi Jinping in September 2015 was hacking to steal corporate intellectual property to benefit Chinese firms. The U.S. says it doesn't do that, but China did it with impunity for years, in what a former NSA director called the biggest transfer of wealth in modern history.

After years of pressure, Obama elevated the issue and threatened sanctions on China. The U.S. also indicted five members of the People's Liberation Army in 2014, accusing them of commercial hacking.

In the agreement, China essentially promised to stop doing it.

The dropoff actually began a year before the agreement was signed, according to a study released in June by the iSight intelligence unit of FireEye, a cyber security company.

"Since mid-2014, we have observed an overall decrease in successful network compromises by China-based groups against organizations in the U.S. and 25 other countries," the report said. "These shifts

have coincided with ongoing political and military reforms in China, widespread exposure of Chinese cyber activity, and unprecedented action by the U.S. government."

In addition, a cyber hotline to facilitate speedy communication between China and the U.S. over hacking incidents is in the testing phase, U.S. officials told NBC News.

Instead of targeting U.S. firms, Alperovitch said, China has turned its hackers inward, probing Chinese companies as part of an anti-corruption campaign -- and also against Russia.

"We're seeing a massive increase in domestic intrusions (by the Chinese government) against companies in China where they are using this for an anti-corruption campaign," he said. "And we're actually seeing a massive increase in attacks on Russia. They've stolen everything that Russia has in the defense space."

Last week, the Obama administration formally accused Russia of a campaign of hacking designed to interfere in the U.S. election campaign, including an effort to steal and leak embarrassing emails by Democrats. So far, the U.S. has taken no observable action in response.

White House Press Secretary Josh Earnest said Tuesday that the U.S. is mulling a "proportional" response to Russia, but he declined to be more specific.

"The president has talked before about the significant capabilities that the U.S. government has to both defend our systems in the United States but also carry out offensive operations in other countries," he said on Air Force One en route to a Hillary Clinton campaign event in North Carolina. "So there are a range of responses that are available to the president and he will consider a response that is proportional."

Fox News
FBI, DOJ roiled by Comey, Lynch decision to let Clinton slide by on emails, says insider
Wednesday, 12 October 2016
Byline: Malia Zimmerman, Adam Housley

Washington - The decision to let Hillary Clinton off the hook for mishandling classified information has roiled the FBI and Department of Justice, with one person closely involved in the year-long probe telling FoxNews.com that career agents and attorneys on the case unanimously believed the Democratic presidential nominee should have been charged.
The source, who spoke to FoxNews.com on the condition of anonymity, said FBI Director James Comey's dramatic July 5 announcement that he would not recommend to the Attorney General's office that the former secretary of state be charged left members of the investigative team dismayed and disgusted. More than 100 FBI agents and analysts worked around the clock with six attorneys from the DOJ's National Security Division, Counter Espionage Section, to investigate the case.

"No trial level attorney agreed, no agent working the case agreed, with the decision not to prosecute -- it was a top-down decision," said the source, whose identity and role in the case has been verified by FoxNews.com.

A high-ranking FBI official told Fox News that while it might not have been a unanimous decision, "It was unanimous that we all wanted her [Clinton's] security clearance yanked."

"It is safe to say the vast majority felt she should be prosecuted," the senior FBI official told Fox News. "We were floored while listening to the FBI briefing because Comey laid it all out, and then said 'but we are doing nothing,' which made no sense to us."

Andrew Napolitano, former judge and senior judicial analyst for Fox News Channel, said many law enforcement agents involved with the Clinton email investigation have similar beliefs.

"It is well known that the FBI agents on the ground, the human beings who did the investigative work, had built an extremely strong case against Hillary Clinton and were furious when the case did not move forward," said Napolitano. "They believe the decision not to prosecute came from The White House."

The claim also is backed up by a report in the New York Post this week, which quotes a number of veteran FBI agents saying FBI Director James Comey "has permanently damaged the bureau's reputation for uncompromising investigations with his cowardly whitewash of former Secretary of State Hillary Clinton's mishandling of classified information using an unauthorized private email server."

"The FBI has politicized itself, and its reputation will suffer for a long time. I hold Director Comey responsible," Dennis V. Hughes, the first chief of the FBI's computer investigations unit, told the Post. Retired FBI agent Michael M. Biasello added to the report, saying, "Comey has singlehandedly ruined the reputation of the organization."

Especially angering the team, which painstakingly pieced together deleted emails and interviewed witnesses to prove that sensitive information was left unprotected, was the fact that Comey based his decision on a conclusion that a recommendation to charge would not be followed by DOJ prosecutors, even though the bureau's role was merely to advise, Fox News was told.

"Basically, James Comey hijacked the DOJ's role by saying 'no reasonable prosecutor would bring this case,'" the Fox News source said. "The FBI does not decide who to prosecute and when, that is the sole province of a prosecutor -- that never happens.

"I know zero prosecutors in the DOJ's National Security Division who would not have taken the case to a grand jury," the source added. "One was never even convened."

Napolitano agreed, saying the FBI investigation was hampered from the beginning, because there was no grand jury, and no search warrants or subpoenas issued.

"The FBI could not seize anything related to the investigation, only request things. As an example, in order to get the laptop, they had to agree to grant immunity," Napolitano said.

In early 2015, it was revealed that Clinton had used a private email server in her Chappaqua, N.Y., home to conduct government business while serving from 2009-2013. The emails on the private server included thousands of messages that would later be marked classified by the State Department retroactively. Federal law makes it a crime for a government employee to possess classified information in an unsecure manner, and the relevant statute does not require a finding of intent.

Although Comey found that Clinton was "extremely careless in their handling of very sensitive, highly classified information," he said "no charges are appropriate in this case."

Well before Comey's announcement, which came days after Bill Clinton met in secret with Comey's boss, Attorney General Loretta Lynch, there were signs the investigation would go nowhere, the source told FoxNews.com. One was the fact that the FBI forced its agents and analysts involved in the case to sign non-disclosure agreements.

"This is unheard of, because of the stifling nature it has on the investigative process," the source said.

Another oddity was the five so-called immunity agreements granted to Clinton's State Department aides and IT experts.

Cheryl Mills, Clinton's former chief of staff, along with two other State Department staffers, John Bentel and Heather Samuelson, were afforded immunity agreements, as was Bryan Pagliano, Clinton's former IT aide, and Paul Combetta, an employee at Platte River networks, the firm hired to manage her server after she left the State Department.

As Fox News has reported, Combetta utilized the computer program "Bleachbit" to destroy Clinton's records, despite an order from Congress to preserve them, and Samuelson also destroyed Clinton's emails. Pagliano established the system that illegally transferred classified and top secret information to Clinton's private server. Mills disclosed classified information to the Clinton's family foundation in the process, breaking federal laws.

None should have been granted immunity if no charges were being brought, the source said.

"[Immunity] is issued because you know someone possesses evidence you need to charge the target, and you almost always know what it is they possess," the source said. "That's why you give immunity."

Mills and Samuelson also received immunity for what was found on their computers, which were then destroyed as a part of negotiations with the FBI.

"Mills and Samuelson receiving immunity with the agreement their laptops would be destroyed by the FBI afterwards is, in itself, illegal," the source said. "We know those laptops contained classified information. That's also illegal, and they got a pass."

Mills' dual role as Clinton's attorney and a witness in her own right should never have been tolerated either.

"Mills was allowed to sit in on the interview of Clinton as her lawyer. That's absurd. Someone who is supposedly cooperating against the target of an investigation [being] permitted to sit by the target as counsel violates any semblance of ethical responsibility," the source said.

"Every agent and attorney I have spoken to is embarrassed and has lost total respect for James Comey and Loretta Lynch," the source said. "The bar for DOJ is whether the evidence supports a case for charges - - it did here. It should have been taken to the grand jury."

Also infuriating agents, the New York Post reported, was the fact that Clinton's interview spanned just 3½ hours with no follow-up questioning, despite her "40 bouts of amnesia," and then, three days later, Comey cleared her of criminal wrongdoing.

Many FBI and DOJ staffers believe Comey and Lynch were motivated by ambition, and not justice, the source said.

"Loretta Lynch simply wants to stay on as Attorney General under Clinton, so there is no way she would indict," the source said. "James Comey thought his position [excoriating Clinton even as he let her off the hook] gave himself cover to remain on as director regardless of who wins."

The decision by Comey and Lynch not to prosecute has renewed FBI agents' belief that the agency should be autonomous.

"This is why so many agents believe the FBI needs to be an entity by itself to truly be effective," the senior FBI official told Fox News. "We all feel very strongly about it -- and the need to be objective. But that truly cannot be done when the AG is appointed by a president and attends daily briefings."

Adding to the controversy, WikiLeaks released internal Clinton communication records this week that show the Department of Justice kept Clinton's campaign and her staff informed about the progress of its investigation.

Leaked emails from Clinton campaign chairman John Podesta's gmail account show the Clinton campaign was contacted by the DOJ on May 19, 2015.

"DOJ folks inform me there is a status hearing in this case this morning, so we could have a window into the judge's thinking about this proposed production schedule as quickly as today," Clinton press

secretary Brian Fallon wrote in relation to the email documentation the State Department would be required to turn over to the Justice Department.

Jay Sekulow, chief counsel for the American Center for Law and Justice, who previously served in the U.S. Treasury Department in the Office of Chief Counsel for the IRS, where he was responsible for litigation in the U.S. Tax Court, said it was clear from the start that the FBI never intended to prosecute.

"This was a fake, false investigation from the outset," Sekulow said.

Washington Post
NSA contractor thought to have taken classified material the old- fashioned way
Wednesday, 12 October 2016
Byline: Ellen Nakashima, Matt Zapotosky

Washington - Harold T. Martin III is accused of stealing mounds of classified information from the government for at least a decade, and investigators also believe some of the information was taken the old- fashioned way -- by walking out of the workplace with printed-out papers he had hidden, according to U.S. officials.
The case against Martin, which was unsealed last week, raises new questions about whether the National Security Agency and other agencies are doing enough to detect and prevent their sensitive data from leaving the secure confines of government offices.

While investigators believe much of Martin's material was removed before stringent controls were imposed in the wake of 2013 disclosures linked to former NSA contractor Edward Snowden, some feel the system still failed.

When investigators searched Martin's home, they seized several terabytes of data, which Martin stored on dozens of computers and other devices, and thousands of pages of documents, according to the officials, who spoke on the condition of anonymity to discuss an open case. Investigators are still exploring whether he was connected in any way to the online leak of some of the NSA's most powerful hacking tools in August.

"Someone was able to walk out the front door with a whole bunch of stuff from NSA," said one congressional aide. "That's not supposed to happen."

Martin has been charged with theft of government property and unauthorized removal of classified materials. His attorney has said there is "no evidence" that he intended to betray his country. Martin previously worked in the Navy -- he left active duty in 1992 -- before taking a variety of tech jobs with government contractors, according to records and people who knew him.

In an interview, the head of the office responsible for setting policies aimed at deterring data loss said he thought the existing controls were sufficient. The question, said William Evanina, director of the National Counterintelligence and Security Center, is whether the controls were being successfully implemented.

"I don't believe there's anything new that we have to incorporate," said Evanina, who declined to comment on the ongoing investigation of Martin. "We just have to do a better job to see that what we already have in place is working effectively."

The NSA did not respond to a request for comment.

Martin worked at the NSA from 2012 to 2015. He was an employee of intelligence contractor Booz Allen Hamilton, which had also employed Snowden.

For some portion of that time, Martin was in the world's most elite hacker shop: the NSA's Tailored Access Organization, according to a former member of the group. One former TAO hacker said that Martin worked in the unit's front office carrying out support roles such as setting up accounts, instead of conducting actual operations.

Officials have not said how, precisely, they think Martin was able to take information home.

The NSA had strengthened its data controls even before Snowden. After a series of disclosures posted by the anti- secrecy group WikiLeaks in 2010, the president ordered the creation of a National Insider Threat Task Force, now led by Evanina. That group crafted a series of policies not only to avert compromises of classified information, but also to detect and deter insiders who might pick up a weapon and harm others.

Then, in the wake of the Snowden disclosures, NSA officials announced they were taking 41 specific technical measures to control data. They included "smart-tagging data" so each electronic file touched could be tracked, and imposing greater oversight of personnel using the networks, NSA Deputy Director Richard Ledgett said in a February 2014 interview.

The agency also imposed a rule requiring two people to be present anytime data in server rooms was being transferred or copied, he said. But the two-person rule did not apply everywhere. Operational personnel, for instance, were exempt, former officials said.

According to former NSA officials and TAO operators, the agency's measures were in a natural tension with a desire to get the best out of their personnel.

"The challenge remains that you at some level need to trust your employees," said John C. "Chris" Inglis, the NSA's deputy director from 2006 to 2014. "And [if you impose too many controls], you're not going

to get any initiative or creativity out of them. The challenge is how do you align that with your need to ensure that they don't abuse that trust."

The NSA, for instance, like other agencies, does not impose universal checks of personnel and their belongings as they enter and leave agency buildings. Security guards conduct random checks and use their discretion.

"If you have a bag full of stuff, you're probably going to get stopped," said a former TAO operator. But, in general, the employee said, "Disneyland has more physical security checks than we had."

Evanina said imposing universal body and bag checks "is not the solution we're looking to arrive at to keep and build the trust of our employees."

Despite all the measures that are in place, Evanina said, it is not always possible to detect an insider who is determined to find a way to thwart them.

"If someone is willing to make the decision that they're going to exfiltrate documents or data out of an organization," he said, "they're going to be successful at that."

Martin's alleged thefts took place at a number of workplaces over the years, officials said, including the NSA, the Office of the Undersecretary of Defense for Intelligence and the Office of the Director of National Intelligence.

He typically worked for a contractor. He was at Booz from 2009 to 2016, which said it fired him after his arrest. Before that he was at Tenacity Solutions, which provides information technology services, officials said. He also worked in the 1990s at CSC, another IT firm, officials said. While at Tenacity, Martin worked at ODNI.

CSC confirmed Martin's employment, but it declined to comment further. Tenacity did not return messages seeking comment.

Martin's last job was at the Office of the Undersecretary of Defense for Acquisition, Technology and Logistics, which deals with the Pentagon's major procurement programs -- many of which are highly sensitive and classified. He also in recent years studied at the University of Maryland Baltimore County.

Roy Rada, a former adviser to Martin at the school, said Martin told him he was in a military transition program meant for soldiers who were suffering from post-traumatic stress disorder and that he was "experiencing some difficulties in adjusting to non-war-life." He said Martin was interested in researching PTSD, particularly by using what is known as an eye tracker, a device that analyzes a person's gaze, to detect brain malfunctions.

Australian Associated Press
Govt ministers defend PM's use of Whatsapp
Thursday, 13 October 2016

Canberra - Government ministers have defended their use of messaging service WhatsApp, despite warnings that it could pose a security risk.
Prime Minister Malcolm Turnbull, his cabinet colleagues and others - including chiefs of staff and media advisers - have been using the Facebook- owned application to communicate instead of other secure platforms.

It's believed the country's cyber intelligence agency, the Australian Signals Directorate, has not approved its use, prompting concerns from experts.

Dan Tehan, the minister assisting the prime minister for cyber security, refused to confirm if that was the case but was confident it was being used properly.

"All I will say is that the government, cabinet ministers, ministers, members of parliament, take their personal security and their security online very seriously," he told reporters in Canberra on Thursday.

He isn't aware of anyone doing anything wrong by using the third- party tool.

"The most important thing is that whatever they do, that they do it in a secure way if they're dealing with material which has a security classification," Mr Tehan said.

Ministers Steve Ciobo and Anne Ruston said they both use the app but not for confidential discussions.

"I don't think there's any security risk associated with using it," Senator Ruston said.

Shadow attorney-general Mark Dreyfus called on Mr Turnbull and his cabinet to stop using WhatsApp immediately.

He suggested the app was being used to avoid any obligations under the Freedom of Information Act.

"They are treating security with contempt," he told ABC radio.

Crossbench senators Nick Xenophon and David Leyonhjelm said they, too, have messaged the prime minister using various apps and have no issue with it.

"What do you want the prime minister to do, use smoke signals? Telepathy?" Senator Xenophon said.

"I think WhatsApp is a reasonable form of communication and safer than others, but I'd like to think the prime minister is smart enough to realise he's not going to be giving any state secrets over anything that isn't sufficiently encrypted."

Feds believe Russians hacked Florida election-systems vendor
Wednesday, 12 October 2016
Byline: Multiple reporters

Washington - Federal investigators believe Russian hackers were behind cyberattacks on a contractor for Florida's election system that may have exposed the personal data of Florida voters, according to US officials briefed on the probe.
The hack of the Florida contractor comes on the heels of hacks in Illinois, in which personal data of tens of thousands of voters may have been stolen, and one in Arizona, in which investigators now believe the data of voters was likely exposed.

The FBI, in the coming days, is preparing to provide updated guidance to state elections officials around the US aiming to help them spot suspicious activity on their computer networks. Several states have reported attempted scans of their computer systems, which often is a precursor to a breach.

Previously, Illinois officials have said data on fewer than 90,000 people may have been affected by a breach there, and Arizona officials said they saw no indications hackers accessed data in their systems.

The vendor hack in Florida prompted the FBI last week to coordinate an emergency call with county election supervisors who operate the election system in the perennial battleground state. CNN has not confirmed the name of the vendor that suffered the attack.

ABC News first reported that Florida election information was compromised.

Investigators believe a local contractor in California was the target of a hackers, but the systems accessed weren't related the elections, U.S. officials said.

A spokeswoman for the Florida Secretary of State said: "We currently have no indication of a Florida-specific issue. The Florida Voter Registration System database is secure. The Department of State does not utilize a vendor for voter registration services. The Department has in place many safeguards to prevent any possible attempts from being successful."

An FBI spokeswoman said the bureau and the Department of Homeland Security hosted a conference call with Florida state officials to address questions regarding the security of election systems and to share information regarding the general nature of the cyber threat. FBI and DHS continue to work closely with state officials to assist them in safeguarding their election infrastructures.

In the case of Arizona, US officials say the working assumption by investigators is that hackers were able to access data, even if there are no signs of tampering. Arizona officials maintain they've found no signs that hackers got in.

"We have no updates, our story hasn't changed," a spokesman for the Arizona secretary of state said. "We have seen no access into statewide registration database and no manipulation of that database."

FBI investigators believe the the hacks and attempted intrusions of state election sites were carried out by hackers working for Russian intelligence.

The cyberattacks on election registration sites are focused on parts of the US election system that wouldn't affect the votes cast or the vote counts, according to US officials. Instead, the intruders are targeting registration systems.

In a statement last Friday, the Director of National Intelligence and the Homeland Security Department formally blame Russia for hacking political organizations, including the Democratic National Committee, and orchestrating the release of private emails in an attempt to meddle in the US elections.

The statement said the US government wasn't yet ready to attribute the hacks of election registration sites.

Ottawa Citizen
A 'Stealth Takeover' of Canadian space tech
Monday, 17 October 2016
Byline: David Pugliese

Ottawa - An iconic Canadian space company, once the subject of an unprecedented move by the federal government to stop its sale to a U.S. firm, now has its operations controlled by an American corporation. Eight years ago, the Conservative government took the highly unusual step of blocking the sale of the British Columbia-based MacDonald Dettwiler and Associates, also known as MDA, to Alliant Techsystems of Minneapolis.

Prime Minister Stephen Harper's government intervened, saying the sale, which brought with it robotic arm technology and the high-tech Radarsat-2 satellite developed with money from Canadian taxpayers, was not of benefit to the country. The Conservatives were concerned about the U.S. controlling such a key Canadian aerospace and defence firm.

But over the last six months MDA, Canada's largest space company, has on its own significantly altered its corporate makeup to bring it within the U.S. orbit.

Its new chief executive officer, Howard Lance, is a U.S. citizen who now operates the company from its San Francisco headquarters. SSL MDA Holdings, Inc., registered as a corporation in Delaware, is now the operating company for all MDA businesses, both in the U.S. and Canada, the firm has announced.

On Oct. 3, the company made a series of new senior appointments, bringing in a retired U.S. air force general with a background in space operations as well as a former U.S. defence intelligence official who had worked for the CIA.

"What you're seeing is a stealth takeover of sensitive technology that Canadian taxpayers paid for," said Steve Staples, vice-president of the Rideau Institute in Ottawa, which was instrumental in the 2008 battle to stop the U.S. purchase of MDA's space division. "The very thing that the Conservative government was worried about has happened."

But Don Osborne, who is responsible for MDA's Canadian operations, said the company remains firmly Canadian. He acknowledged the Canadian and U.S. operations are now controlled by a U.S. corporation but pointed out that there are no changes to the way business is being done in Canada. The company still has its head office in Vancouver and is traded on the Toronto Stock Exchange, he added.

"From a management perspective, I have a boss who I report to who is in the United States," said Osborne, president of MDA's information systems group. "Companies have very complicated legal structures for all sorts of reasons."

Osborne said MDA has been very open about its need to expand and make inroads into the U.S. market.

"Part of the targeting of a U.S. market was to bring in management that can better access that market and we would structure ourselves legally in a way which would allow us to better access that market," he explained.

Chuck Black, an analyst in Toronto who operates a website dealing with commercial space activities, said Canada is losing control of its domestic space industry. Earlier this year, Canada's second largest space company, COM DEV, was purchased by a U.S. firm, Honeywell International, he pointed out.

"You have one company that has been bought outright by Americans," Black explained. "A second has reorganized so it is now operated out of the United States." Black said MDA's actions are aimed at winning lucrative U.S. military and government contracts, something its Canadian pedigree had hindered.

But both Black and Staples say MDA's initiative has security implications for Canada.

Black pointed out the U.S. government was able to delay for years the launch of Canada's Radarsat-2 surveillance spacecraft over its concerns about the type of data it would collect. As part of the ongoing dispute, the U.S. government prevented American technology from being used in the satellite and Canada had to rely on other nations for components.

Staples said MDA's restructuring gives the U.S. government more control over the firm's technology and how it is used.

"The company executives can say all they want about being Canadian, but the fact remains that U.S. national security interests apply to American companies and their subsidiaries wherever they are," he explained. "So U.S. law is now governing vital Canadian security and space assets."

MDA operates the Radarsat-2 satellite and is involved in other key Canadian spacerelated projects. It is also building a new generation of surveillance satellites for Canada.

After announcing the decision in April 2008 to stop the sale to Alliant Techsystems, then industry minister Jim Prentice said concerns over the transfer of Radarsat-2 technology to a U.S. company played a major role in the Conservative government's decision.

Jakarta Post
Indonesia's security strategies praised
Monday, 17 October 2016

Jakarta - Indonesia's efforts to handle global security matters including counterterrorism, deradicalization, migration and people smuggling was recognized during a recent inter-regional meeting.

The ASEAN-EU Ministerial Meeting (AEMM) in Bangkok on Thursday and Friday discussed current issues in Europe and Southeast Asia, regional security and counterterrorism efforts.

During the meeting, Indonesia emphasized strengthening cooperation on counterterrorism; strengthening the capabilities of anti-terror units and countering cyber terrorism; the mainstreaming of soft power through education, increasing the role of women, civil society and community and religious organizations.

"It is important to strengthen the cooperation between ASEAN and the EU, particularly against terrorism and extremism through the concrete cooperation of both parties," Foreign Minister Retno LP Marsudi said in a statement released by the Foreign Ministry.

A number of EU countries welcomed Indonesia's soft- power approach that focused on the values of tolerance and moderation in society.

In the future, the cooperation is expected to be increased through the dissemination of these values, in either bilateral or regional cooperation.

Retno also affirmed the importance of increasing maritime cooperation including illegal, unreported and unregulated (IUU) fishing as one of strategic cooperation.

She said that IUU fishing needed to be included in the transnational crime issue as it was related to people smuggling activities and drugs trafficking. On the sidelines of the meeting, Retno also discussed the planned visits of Polish and Dutch leaders.

Retno met with Polish Under Secretary of State for development Cooperation, Africa and the Middle East, Asia, Economic Diplomacy and Human Rights Joanna Wronecka, to discuss the planned visit of Polish President Andrzej Duda to Indonesia in 2017 to strengthen bilateral ties.

Meanwhile, Retno discussed the planned official visit of Dutch Prime Minister Mark Rutte to Indonesia, which is aimed at increasing trade and investment between both countries during a meeting with her Dutch counterpart, Bert Koenders.

Retno said the Netherlands would explore the possibility of cooperation in the field of infrastructure, particularly in seaport construction.

"The visit of Prime Minister Rutte is expected to further expand cooperation between the two countries that has already been working well and focused on Indonesia's development priorities such as infrastructure, trade and investment," Retno said.

The two governments have committed to realizing the Netherlands as a gateway for Indonesian products to Europe, meanwhile Indonesia as a gateway for Dutch products to the Southeast Asia region.

According to the Trade Ministry, Indonesia enjoyed a trade surplus of US$2.6 billion in 2015 in total trade between Indonesia and the Netherlands worth $4.2 billion.

The value of Indonesian exports to the Netherlands in 2015 reached $3.4 billion, while imports hit $785 million.

President Joko "Jokowi" Widodo visited the Netherlands on June 21 and 22, making it the first state-visit by an Indonesian president in 16 years, after late president Abdurrahman Wahid's visit in 2000.

Retno also held bilateral meetings with representatives from Denmark, Luxembourg, Latvia, Italy, Lithuania, and France on various issues.

Asharq al-Awsat
Surveillance Drones being Turned into Weapons by Extremists
Monday, 17 October 2016
Byline: Staff Report

London - Militant groups like Hezbollah and ISIS have learned how to weaponize surveillance drones and use them against each other, adding a new twist to Syria's civil war, a U.S. military official and others say.
A video belonging to an al-Qaeda offshoot, Jund al-Aqsa, purportedly shows a drone landing on Syrian military barracks. In another video, small explosives purportedly dropped by the Iran-backed so-called Hezbollah target the militant group Jabhat Fatah al-Sham, formerly known as al-Nusra Front, the Associated Press reported.

A U.S. military official, who spoke anonymously because he wasn't authorized to discuss the matter publicly, said the U.S. military is aware of the development. Commanders have warned troops to take cover if they see what they might have once dismissed as a surveillance drone, he said.

The head of the Airwars project, which tracks the international air war in Iraq, Syria and Libya, said the weaponized drones are clumsy but will scare people.

"There are a million ways you can weaponize drones -- fire rockets, strap things in and crash them," Chris Woods said. He added: "This is the stuff everyone has been terrified about for years, and now it's a reality."

The U.S. military official couldn't immediately authenticate the videos in question, adding that most of the incidents they are aware of involved weaponized drones that simply crash into their targets. But another former senior U.S. military official who viewed the videos said there was nothing to suggest they were fake.

A number of militant groups in the Middle East, including ISIS, Jund al-Aqsa and Jabhat Fatah al-Sham, as well as Hezbollah and Hamas, have all released videos indicating that they have surveillance and reconnaissance drones. Syrian anti-regime rebels and militias loyal to Bashar al-Assad were also flying cheap quad- and hexacopters as early as 2014 to spy on each other.

The surveillance drones allowed those groups to collect data on enemy bases, battlefield positioning and weaponry and improve targeting.

ISIS launched a sophisticated propaganda video in 2014, "The Clanging of the Swords, Part 4," boasting about its capture of the Iraqi city of Fallujah. The video opens with drone footage over the western Iraqi city before cutting to violent ground footage depicting its advance across Iraq.

Lebanon-based Hezbollah has claimed to have armed- drone capabilities for nearly two years, but a recent video of bomblets hitting a militant camp near the Syrian town of Hama is the first known documentation.

The majority of these groups have access only to store- bought drones, similar to those available in the U.S., ranging in price from $1,000 to $3,000 and weighing between 5 to 10 pounds -- certainly not enough to support a large bomb or rocket. Hezbollah is an exception, receiving most of its munitions -- including its drones -- from Iran.

Le Monde
Etats-Unis Relents de guerre froide dans le cyberespace
Monday, 17 October 2016
Byline: Martin Untersigner

Washington - L'administration Obama vient d'incriminer officiellement la Russie dans la cyberattaque qui avait ciblé, en juin, le Parti démocrate. Une accusation qui a encore envenimé les relations russo-américaines
La Russie tente " d'interférer avec le processus électoral américain " . Vendredi 7 octobre, après maintes tergiversations, l'administration Obama a officiellement confirmé, par la voix de son directeur du renseignement national (DNI) et de celle du département de la sécurité intérieure (DHS), l'implication de Moscou dans l'attaque informatique visant le Parti démocrate.

Cette accusation, au parfum de guerre froide et à un mois de l'élection présidentielle américaine, marque un tournant. Depuis des semaines, la Russie est suspectée d'orchestrer une série de piratages visant les Etats-Unis. Mais c'est la première fois que le gouvernement de Barack Obama incrimine directement Moscou dans " la récente compromission de courriels de citoyens et d'institutions américains, y compris d'organisations politiques " . Dans leur communiqué, le DNI et le DHS estiment

que " seuls les plus hauts responsables russes ont pu autoriser ces actions " , sans pour autant en apporter la preuve. Le Kremlin a qualifié cette allégation de " foutaise " .

Deux groupes pirates déjà soupçonnésMi-juin, le Comité national démocrate (DNC), l'organe du parti chargé d'organiser les élections pour l'investiture, avait prévenu que deux groupes de pirates avaient pénétré son réseau. Un mois plus tard, WikiLeaks publiait sur son site plusieurs milliers de courriels internes au parti, révélant que les caciques démocrates avaient pris fait et cause pour Hillary Clinton au détriment de son challenger Bernie Sanders.

Plusieurs incidents ont ensuite contribué à nourrir le climat de défiance vis-à-vis de Moscou. L'entreprise de sécurité informatique chargée de nettoyer les systèmes informatiques du DNC a indiqué que les pirates étaient liés aux services de renseignement russes. Le premier groupe, surnommé Cozy Bear (APT29), n'est pas un inconnu : il avait déjà été accusé au printemps 2015 d'avoir pénétré les réseaux de la Maison Blanche et du département d'Etat. Le second, appelé Fancy Bear (APT28), s'est lui aussi forgé une réputation : soupçonné depuis longtemps d'être lié au renseignement militaire russe, c'est vers lui que se dirigeait l'enquête sur le piratage, les 8 et 9 avril 2015, de la chaîne TV5Monde, selon une source judiciaire interrogée à l'époque par Le Monde . En juin de la même année, les services de renseignement allemands accusaient ce même groupe d'avoir espionné le Bundestag.

Plusieurs Etats américains ont également été victimes de piratages ou de tentatives d'intrusion visant leurs systèmes électoraux, en provenance, semble-t-il, de Russie. En juin 2016, le Federal Bureau of Investigation (FBI) avertissait l'Arizona d'une intrusion mineure visant sa base de données électorale. A l'approche des élections, la même police fédérale enjoignait l'ensemble des Etats à muscler leurs mesures de sécurité informatique, redoutant d'autres agressions. L'administration Obama est cependant moins affirmative quant à leurs commanditaires. " Dans la plupart des cas, - ces attaques - provenaient de serveurs gérés par une entreprise russe. Nous ne sommes cependant pas en mesure d'attribuer cette activité au gouvernement ", écrivent ainsi le DHS et le DNI dans leur communiqué.

Autre signe, plus indirect, de l'atmosphère irrespirable qui règne entre Moscou et Washington dans le cyberespace, la publication sur le Web, mi-août, d'outils sophistiqués d'espionnage numérique appartenant à l'Agence nationale de la sécurité américaine (NSA), considérée comme la plus puissante du monde en la matière. Que des pirates se soient procuré une partie de son arsenal et décident d'en publier son contenu a surpris la plupart des observateurs. S'agissait-il d'une fuite émanant d'une agence rivale russe, désireuse de lancer un avertissement? Les regards se sont tous tournés vers l'est, au moment où se précisaient les accusations d'une implication russe dans le piratage du Comité national démocrate.

La Russie est l'un des pays les plus actifs et les plus compétents en matière d'espionnage informatique. Le conflit en Ukraine a été l'occasion de constater son savoir-faire. De nombreuses attaques - de la fuite de courriels jusqu'à la saturation de sites Web, et même une brève extinction d'une partie du réseau électrique ukrainien - avaient alors été attribuées à des pirates russes par plusieurs laboratoires de

cybersécurité. La Russie est aussi classée par les autorités américaines, aux côtés de la Corée du Nord, de la Chine et de l'Iran, parmi les principaux adversaires des Etats-Unis dans le cyberespace.

Ces dernières années, au moins une demi-douzaine de groupes d'espionnage informatique, aux origines russes plus ou moins établies, ont été découverts par des experts basés en Allemagne, en Finlande, au Japon et aux Etats-Unis. Parmi les plus performants d'entre eux figurent ceux qui ont été identifiés dans les serveurs du Parti démocrate, notamment Fancy Bear. Ce dernier a été découvert à l'été 2014 par Feike Hacquebord, expert en sécurité informatique au sein de l'entreprise Trend Micro, basée au Japonet spécialisée en antivirus. M. Hacquebord assure aujourd'hui ne détenir " aucune preuve " de liens connectant Fancy Bear avec le Kremlin, précisant qu'il n'est pas " sage " de les voir nécessairement aux ordres de Moscou.

Mais leurs caractéristiques restent troublantes. Le groupe dispose, selon l'expert, " de très grandes ressources d'argent et de main-d'oeuvre " , dont l'activité diminue " pendant les vacances et pendant l'été ", signe qu'il s'agirait d'un groupe étatique. Les pirates de Fancy Bear, parmi les plus compétents observés, visent avec une intensité particulière " l'Ukraine, quasiment leur cible numéro un, les forces armées d'Europe de l'Est et les pays de l'OTAN " . Si des Russes figurent aussi parmi leurs victimes, ce sont pour l'essentiel des " activistes et opposants au régime " .

Quel intérêt aurait le Kremlin à s'attaquer au système électoral américain? Pour la Russie, " les cyberattaques sont des outils intégrés dans un effort plus large de maintien de sa domination politique et militaire sur un théâtre donné et, plus largement, sur les opinions publiques mondiales ", écrivait la chercheuse Jen Weedon dans un rapport de 2015 du Cooperative Cyber Defence Centre of Excellence (CCDCOE), un organisme de recherche consacré à la cyberdéfense patronné par l'OTAN.

" Instiller la confusion " " Les cyberattaques font partie d'une campagne pour instiller le doute et la confusion aux populations occidentales envers leurs institutions, embarrasser leurs gouvernements, affaiblir l'OTAN, les Etats- Unis et tout ce qui peut être un obstacle à la Russie ", estime de son côté Matthijs Veenendaal, également chercheur au CCDCOE. " Il ne s'agit pas tant de déterminer l'issue des élections américaines que d'entretenir le relativisme des Américains sur leur propre pays, de propager l'image d'élites corrompues, de nourrir la remise en cause des institutions ", précise Julien Nocetti, chercheur à l'Institut français des relations internationales (IFRI). Donald Trump, poursuit-il, " est le candidat idéal pour alimenter cette dialectique et attiser le sentiment que la démocratie n'est pas idéale ".

Les cyberattaques, discrètes et dont l'origine est difficile à déterminer, constituent les outils parfaits pour ce type de campagne de déstabilisation. Dans sa conception du cyber-espace et de la sécurité informatique, Moscou attribue autant d'importance aux contenus (informations, opinions) circulant sur le Web qu'au fonctionnement technique des infrastructures d'Internet. Ainsi, ses attaques informatiques comportent volontiers ces deux dimensions : provoquer la fermeture de sites et faire " fuiter " des informations. " Si les Américains se concentrent sur la sécurité des réseaux et des infrastructures, les Russes, eux, mettent l'accent sur le contenu ", explique le chercheur Julien Nocetti.

L'utilisation par le Kremlin de " fermes à trolls ", où des commentateurs sont payés pour influencer le débat en ligne, en Russie et aux Etats-Unis, est un autre volet de l'activité parfois délétère de la Russie sur Internet.

Le communiqué attribuant à Moscou la cyberattaque contre le Parti démocrate, quelques semaines avant le scrutin du 8 novembre, constitue un net palier dans la dégradation des relationsrusso-américaines dans le domaine de la cybersécurité. Il est rare que les Etats-Unis attribuent officiellement une cyberattaque, et plus encore qu'une puissance rivale soit ainsi désignée.

La Corée du Nord avait été mise en cause par le FBI, en décembre 2014, pour son implication présumée dans le piratage des serveurs du studio Sony Pictures. La même année, cinq militaires chinois avaient été accusés par la justice américaine d'espionnage informatique et de vol de secrets économiques dont auraient été victimes, aux Etats-Unis, les entreprises Westinghouse, Alcoa et United States Steel.

L'accusation portée contre la Russie est cependant d'une tout autre nature : les attaques chinoises et nord-coréennes visaient l'économie américaine, tandis qu'en ciblant le DNC à la veille des élections les pirates ont touché au fonctionnement même de la démocratie américaine, dans un contextede tensions entre Moscou et Washington. " Influencer le débat politique d'un pays, les Etats-Unis le font tout le temps - par la diplomatie, par exemple -, observe Adam Segal, du think tank américain Council of Foreign Relations. Mais attribuer l'attaque du DNC à la Russie est une manière de dire que ce pays a franchi une limite. "

Les Etats-Unis vont-ils apporter une réponse plus musclée à ces cyberattaques que cette stratégie du " name and shame " (" nommer et couvrir de honte ")? Cette dernière " peut avoir un impact si deux nations ont intérêt à s'entendre , explique Matthijs Veenendaal. Mais, actuellement, la Russie ne montre aucun signe de volonté à améliorer sa relation avec les Etats-Unis " .

Répondre par la force si besoinD'autres options sont envisageables par le président Barack Obama. Il pourrait ainsi appliquer l'Executive Order, adopté à l'été 2015 : un outil législatif inédit lui permettant de prendre des sanctions financières contre des organisations ou des pirates soupçonnés d'avoir orchestré des cyberattaques. Reste que les sanctions économiques occidentales à l'encontre de Moscou, déjà mises en place en réaction au conflit en Ukraine, n'ont visiblement pas découragé les Russes de s'en prendre aux Etats-Unis.

Une contre-attaque - les Etats-Unis disposent des moyens offensifs les plus aboutis du monde - peut également être organisée. Depuis 2011, la doctrine américaine établit que les Etats-Unis peuvent répondre, par la force si besoin, à toute cyberattaque dirigée contre leurs intérêts. Mais cette théorie se heurte à la perspective de nouvelles attaques contre le système électoral américain. A plus long terme, l'administration américaine n'aurait que peu d'intérêts à provoquer un affrontement incontrôlé dans le cyberespace, compte tenu de la dépendance de son économie et de son administration à Internet.

Cette option serait aussi contraire à l'objectif affiché des Américains en matière de diplomatie - la construction d'un " code de la route " pour le cyberespace -, alors même qu'ils ne donnent pas l'exemple en matière de surveillance et d'espionnage numériques. " Notre but n'est pas de provoquer un cycle d'escalade auquel on a assisté dans le passé pour d'autres types d'armement, mais plutôt de construire des normes afin que tout le monde se comporte de manière responsable ", a déclaré Barack Obama au sujet du piratage du DNC lors de sa conférence de presse au G20 de Hangzhou (Chine), le 5 septembre.

Deux pays aux intérêts contraires sur les réseaux peuvent toujours s'accorder sur quelques règles de principe. L'accord signé en septembre 2015 entre les Etats-Unis et la Chine l'a prouvé. Difficile pourtant d'imaginer que les relations russo-américaines suivent le même chemin. " La Russie n'a pas le même profil que la Chine : elle n'a pas de grandes entreprises aux Etats-Unis, ni d'investissements d'ampleur, le marché américain ne lui est pas crucial pour écouler ses biens et ses services, résume Scott Harold, spécialiste de l'Asie à la Rand Corporation, un think tank établi en Californie. En outre, il y a un important contentieux politique depuis la guerre entre la Russie et la Géorgie - en 2008 - . Vladimir Poutine prospère grâce à l'idée que l'Occident est injuste avec la Russie. C'est un paradoxe, mais les sanctions pourraient le servir politiquement. " Jon Lindsay, professeur de relations internationales à l'université de Toronto, abonde : " La Chine piratait pour son développement économique, mais voulait garder les choses sous contrôle. La Russie, elle, veut voir davantage de friction, de bruit, d'agitation. "

Au-delà de l'exemple russe, selon les experts, les escarmouches dans le cyberespace sont vouées à se multiplier. L'indécision américaine face à la Chine a-t- elle donné un blanc-seing à d'autres Etats pour intervenir dans le cyberespace? Au bout d'une décennie de cyberattaques, faute de sanctions et malgré des progrès avec la Chine, les Etats-Unis ne sont pas parvenus à se montrer assez dissuasifs. " Pékin ou Moscou n'iront pas jusqu'à des attaques destructrices, comme l'extinction du réseau électrique, par exemple , estime Adam Segal . Mais, à un autre niveau, la dissuasion est impossible . Nous allons assister à du harcèlement continuel entre Etats, avec une limite de plus en plus floue entre la guerre et la paix. "

" C'est une nouvelle forme de conflit du XXIe siècle : des attaques bon marché et difficiles à retracer ", avance Pasha Sharikov, chercheur à l'Académie des sciences de Moscou . Est-il encore possible de pacifier le cyber-espace? Oui, estime Matthijs Veenendaal, à condition de " travailler sur des normes internationales - l'approche la plus logique et la plus réaliste ". Même si la normalisation progressive des relations sino-américaines ne s'explique pas seulement par le traité signé en 2015, ce dernier a fait des émules. Le Royaume-Uni et la Chine sont parvenus à un accord similaire. L'Allemagne pourrait, à son tour, s'entendre prochainement avec le plus grand partenaire commercial asiatique de l'Europe.

Depuis plusieurs années, les efforts répétés des Russes en vue de faire adopter une résolution sur la cybersécurité aux Nations unies n'ont pas été couronnés de succès. Les discussions engagées entre Moscou et Washington ont été interrompues par les crises en Ukraine et en Syrie. Une poignée de hauts fonctionnaires se sont malgré tout réunis à Genève auprintempspour reprendre langue. L'accusation portée aujourd'hui par l'administration Obama pourrait bien repousser sine die ces tentatives d'apaisement.

Financial Times
Biden hints at US cyber revenge on Russia
Sunday, 16 October 2016

Washington - US vice-president Joe Biden has suggested the Obama administration may launch a retaliatory cyber strike against Russia in response to what Washington believes to be interference by Moscow in this year's election.
In an interview with NBC's Meet the Press on Sunday morning, Mr Biden said that "we're sending a message" to Russian President Vladimir Putin about the election-related hacking. "He'll know it."

"We have the capacity to do it. It will be at the time of our choosing, and under the circumstances that have the greatest impact," he told NBC.

This week the White House said the US would respond in a "proportional" way to the attempt to interfere in the election and that sanctions and covert action were under consideration.

Mr Biden's interview is the clearest hint that the administration will seek to use its own offensive cyber capabilities to retaliate. Asked if the public would ever find out about the nature of the US response, he said: "Hope not."

"Their capacity to fundamentally alter the election is not what people think," Mr Biden said. "And I tell you what, to the extent that they do we will be proportional in what we do."

The fact Mr Biden is talking so cryptically about US retaliation underlines one of the main difficulties the administration faces in mounting a response. One of the objectives would be to deter Russia or any other country from attempting to use cyber attacks to undermine US elections, yet the deterrent impact of any operation would be limited if it were kept completely secret.

Edward Snowden, the former National Security Agency contractor now exiled in Moscow, poked fun at this contradiction, noting on Twitter: "I get the feeling nobody told Joe Biden what 'covert operation' means."

The vice-president's comments follow the formal claim last week by the US intelligence community that Russia was behind the publication of thousands of election-related emails that have been hugely embarrassing to the campaign of Democratic presidential candidate Hillary Clinton.

"These thefts and disclosures are intended to interfere with the US election process. Such activity is not new to Moscow," said the Department of Homeland Security and Director of National Intelligence on Election Security in a joint statement, noting that "only Russia's senior- most officials could have authorised these activities".

Some former officials have suggested the US could make public financial information and emails collected by US intelligence that would be embarrassing to Russian leaders.

Writing in Foreign Policy magazine, former Nato supreme allied commander James Stavridis said the US should reveal the names of the Russian officials involved in "hacking of the American political system" and should also use cyber attacks to weaken Russian censorship of the internet, creating more room for criticism of Mr Putin and for political opposition.

"As a response to the Russian attacks on the US democratic system, this would be both proportional and distinctive," Mr Stavridis wrote.

Michael Morell, former deputy director of the CIA, said on Friday that Mr Putin was using the selective leaks of emails from Democratic officials to benefit Republican candidate Donald Trump.

"I am 100 per cent confident that he is aware of all this, he has approved it, he is directing it. This is Putin. This is not some bureaucratic part of the Russian government," he said on a call organised by the Clinton campaign.

Mr Morell said it was "a huge, huge deal" for the US intelligence community to publicly blame Russia for the hacking.

Sunday Mirror (UK)
Webcam blackmail terror (Canada)
Sunday, 16 October 2016
Byline: Jilly Beattie

London - The PSNI is investigating 100 webcam blackmail attempts and say cyberstalking is increasing in Northern Ireland.
The crime usually involves people being persuaded to take off their clothes in front of their webcam.

But the blackmailer only tells them they have been recorded after the event and threatens to post the video online or reveal details to people known to the victim unless they pay a fee.

PSNI cyber crime officers are dealing with new webcam blackmail cases "every week".

A spokesman said: "Cyberstalking is becoming a prevalent issue. So far there have been 100 webcam blackmails reported."

Parents were warned a Canadian pervert pretended to be a teenage girl to target thousands of boys.

The money demanded is usually a substantial amount and increases with the level of intimacy revealed by the victim, many of whom have been enticed into performing intimate acts.

A spokesman for Get Safe Online said there is no guarantee once the blackmail demand is met there will not be further demands, or that the criminal will not post the video anyway.

He added: "The consequences can range from embarrassment to humiliation and in extreme cases have resulted in self-harm of even victims taking their own lives.

"Males and females of any age, anywhere, can become victims.

"People are asked to take their clothes off as a dare 'nomination' with friends, only to be blackmailed either by those known to them or if the video or stills fall into the wrong hands."

Straits Times
New SMS public alert system launched to warn the public of nearby emergencies
Saturday, 15 October 2016
Byline: Jalelah Abu Baker

Singapore - Members of public near an emergency like a terror attack will get a text message informing them of what is happening, with a new public alert system by the Government.
Introducing the system on Saturday (Oct 15) at an emergency preparedness event, Deputy Prime Minister Teo Chee Hean said that that the new system will reach out to a wider audience, who may not have access to alerts through the recently launched SGSecure mobile app.

"Some might not have turned on the location function to receive the location-based alerts. Some of our seniors may not be familiar with apps, or have older 2G phones," explained Mr Teo, who is also Coordinating Minister for National Security.

The new SMS-based public alert system is an additional channel to reach out to the public, help warn residents about danger, and give them appropriate advice on how they can and should respond, he added.

The Ministry of Home Affairs said that the alerts will be sent out for related incidents including bomb blasts and gunman attacks, major public order incidents, and major fires and civil disasters.

The system has been on trial since August, and was used for the recent fires at the CK Building and Jurong West Street 41.

Biden Hints at U.S. Response to Russia for Cyberattacks Related to Election
Sunday, 16 October 2016
Byline: David E. Sanger

Washington - Since the Obama administration formally accused Russia about a week ago of trying to interfere in the election, there has been intense speculation about whether President Obama has ordered the National Security Agency to conduct a retaliatory cyberstrike.
The strongest hint so far has come from Vice President Joseph R. Biden Jr., who either revealed American plans for a strike or engaged in one of the better bits of psychological warfare in recent times.

Taping an interview for NBC's "Meet the Press," Mr. Biden was asked whether the United States was preparing to send a message to the Russian president, Vladimir V. Putin. Days before, the American intelligence agencies and the Department of Homeland Security declared that the Russian leadership was responsible for attacks on the Democratic National Committee and the leaking of stolen emails.

"We're sending a message," Mr. Biden told Chuck Todd, the show's host. "We have the capacity to do it."

"He'll know it," Mr. Biden added. "And it will be at the time of our choosing. And under the circumstances that have the greatest impact."

Later, after Mr. Biden said he was not concerned that Russia could "fundamentally alter the election," Mr. Todd asked whether the American public would know if the message to Mr. Putin had been sent.

"Hope not," Mr. Biden responded.

His warning seems to suggest that Mr. Obama is prepared to order -- or has already ordered -- some kind of covert action after the stolen emails were published online. That would require what is known in the intelligence agencies as a finding -- a presidential determination authorizing covert action.

Such a finding would allow the United States to make use of its newly developed arsenal of cyberweapons, which are under the control of the military's Cyber Command, the N.S.A. and, in some circumstances, the C.I.A.

Mr. Biden's statement does not exclude the possibility of a response outside the realm of cyberspace. But most of the other options under discussion in the White House involve actions that would be public, such as economic sanctions under a 2015 presidential order on responding to cyberattacks. Such sanctions have never been invoked, but are well suited to cases like the presumed effort to influence the election.

Some experts, however, say they may be insufficient. James G. Stavridis, the former supreme allied commander of NATO, wrote in Foreign Policy last week that the first step could be making America's evidence against Russia public.

"Revealing the names of the officials who authorized the cyberattacks against the United States would put Moscow in an extremely uncomfortable position," wrote Mr. Stavridis, a former admiral who is now dean of the Fletcher School of Law and Diplomacy at Tufts University. "Ideally, the United States could reveal emails or conversations between Russian officials that demonstrated their intent to undermine the U.S. electoral process."

But that would run counter to Mr. Biden's "hope not" statement. Mr. Stavridis and others have advocated other steps, including knocking holes in the Kremlin's wall of censorship so that opponents of Putin could begin to conspire with one another.

"As a response to the Russian attacks on the U.S. democratic system, this would be both proportional and distinctive," Mr. Stavridis wrote. It might also be deniable -- a key to any covert action approved by the president.

Many others have advocated using cybertechniques to expose Mr. Putin's links to Russia's oligarchs and reveal his financial holdings overseas, which are believed to be vast. But such steps would risk escalation, and advisers have warned Mr. Obama that the United States is more vulnerable than most nations.

Mr. Putin initially denied any Russian involvement in the attacks. But in an interview several days ago, he said the important thing was not how emails from Hillary Clinton's campaign had been hacked, but what they said. Sergey V. Lavrov, the Russian foreign minister, went further. "We did not deny this," he said of the hacking. But he added that the United States had offered no proof.

A crucial question being debated in the White House is whether warnings like Mr. Biden's will be enough to make Russia, or others, pull back in their hacking. The calculus behind the decision to formally accuse Russia was that the mere publication of the conclusion could temper the activity.

If so, it may not have worked. WikiLeaks in the past few days has published thousands of emails stolen from the Gmail account of John D. Podesta, the chairman of the Clinton campaign. While Mr. Podesta has blamed Russia for the attack, intelligence agencies say they have not formally reached that conclusion.

There are only two known cases in which Mr. Obama has authorized an offensive cyberaction. One was the operation against Iran's nuclear program, code-named Olympic Games. That operation was not detected by the Iranians for years, until an accidental release of the computer code made it obvious that its centrifuges were exploding because of a cyberattack.

The other case has been action against the Islamic State, mostly to interfere with its communications or alter data in its systems. Those attacks were publicly announced by Defense Secretary Ashton B. Carter and others, though no details were offered.

The announcement seemed intended in part to cause Islamic State insurgents to question whether their internal communications were genuine.

Sunday Times (UK)
Chinese link as smart meters spook GCHQ
Sunday, 16 October 2016
Byline: Jon Ungoed-Thomas

London - Chinese electronic companies are manufacturing smart meters to install in millions of Britain's homes despite warnings by the intelligence agency GCHQ that the technology poses a potential threat to national security.
Two of China's biggest electronics companies -- one controlled by the Beijing government -- are providing some of the meters and software for the £11bn programme to install the technology in almost every home in the UK by 2020. One has already signed a deal with one of the "big six" energy companies and the other has been on an official list for trials.

The vetting of the Chinese manufacturers is set to be among the first tasks of the National Cyber Security Centre (NCSC), which opened in London earlier this month.

Nigel Inkster, a former director of operations and intelligence at MI6, said it was important the role of any Chinese firm was subject to a proper risk assessment.

"A Chinese corporation is always going to have to do what the state tells it when the crunch comes, although these corporations really do want to be proper international corporations and operate on this basis," he said.

Experts have expressed concern that the meters -- which communicate wirelessly with energy companies -- feature a switch that can be used to remotely turn off power, potentially blacking out homes and risking dangerous electricity surges at power stations. Meters made by Holley Metering UK, whose parent company is Chinese, and Kaifa Technology UK, which is controlled by the state-owned China Electronics Corporation, are being tested by one of the main government contractors for the UK project.

Last week Holley Metering, owned by a firm which is one of the biggest meter suppliers to China's state electric utility, said it had signed a deal with one of the big six energy companies and expected to start installing its devices in British homes early next year.

The smart meter programme was launched by Ed Miliband, the former Labour leader, in May 2009 when he was energy secretary. It was subsequently championed by Andrea Leadsom, now the environment secretary, when she was energy minister.

Data Communications Company, which has the government licence to manage the communications network for the project, is testing nine gas and electricity meters to ensure all systems are fully integrated. Five of the nine meters are manufactured by Holley and Kaifa.

Holley Metering was set up in Britain in 2014. Steve Roberts, one of its first senior executives, was recruited from the Department of Energy and Climate Change in March 2015, where he had been head of market intelligence.

Tony Hart, the managing director of Holley Metering, said he was aware of the sensitivities about involving Chinese businesses in critical national infrastructure, but that Holley was an independent company. He would not disclose which of the big energy companies Holley had signed its contract with.

Kaifa Technology UK is based in Milton Keynes in Buckinghamshire.It did not respond to a request for comment.

Nick Hunn, a director at Wifore Consulting who gave evidence to a parliamentary inquiry on smart metering, said a switch in the meters could, in theory, remotely shut down power to a home.

"If anyone was able to hack the system, it would not just have the effect of blacking out a million houses, it would blow out a part of the grid," he said.

It was reported earlier this year that GCHQ had intervened in the project to ensure the encryption keys for the meters could not be broken. All key products for the meter rollout will undergo product assurance by the NCSC.

The Department for Business, Energy and Industrial Strategy said the smart system was secure and it had been designed by cyber-security experts to prevent the possibility of hacking.

Security officials say the Chinese meters will not be subject to any more stringent testing, but would need to meet robust security standards to protect the national grid.

The NCSC said: "All components and software used in the UK Smart Meter programme must meet a stringent set of security characteristics and standards which we publish on our website. We're confident the Smart Meters System strikes the best balance between security and business needs."

Man Accused of Terrorism Over Encrypting his Blog Site
Saturday, 15 October 2016
Byline: Staff Writer

London - A 33 year old male in London has been charged with six terrorism counts under the terrorism act 2006 by the Metropolian Police. The man, named Samata Ullah, appeared in a appeared in a court in London the previous.
Ullah has been charged under the controversial Section 5 power in which the development of an "encrypted version" of personal blog site can be used against the suspect while fixing terrorism counts. Unsurprisingly, using this provision, the police force has charged Ullah for six counts of terrorism one of which was linked to the use of encryption and researching.

In a press release, the police department stated that Ullah has been charged with one count of aiding a person who was preparing a terrorist act by providing instructions about how to use encryption. The second charge is about using encrypted version of his own blog site and another is related to preparation of engaging in an act of terrorism.

London police maintain that Ullah was preparing for an act of terrorism himself through "researching an encryption program, developing an encrypted version of his blog site and publishing the instructions around the use of the program on his blog site."

The Section 5 statute can "criminalize acts that, on their own, would be completely legal -- if prosecutors can show that the end purpose of those acts might be terrorism," stated a human rights advocate Tayab Ali back in 2014.

Ali added that: "Often intention is proven using things like internet search history. It is often described as 'thought crime,' and it doesn't apply in any other aspect of criminal law."

It must be noted that nowadays, adding encryption to blog sites or websites is not a big deal at all because many websites adopt this strategy to offer their visitors enhanced privacy, better security, and full relaxation while they surf. That's not all, even Google supports encryption on websites and favors HTTPS sites in search results.

New Zealand Herald
Foreign spies hack NZ phones, laptops
Saturday, 15 October 2016
Byline: Matt Nippert

Wellington - Exclusive Agents accessed deleted files and installed spy software on trade officials' devices after breaking into hotel room

New Zealand government officials travelling abroad had their mobile phones and laptops containing classified information hacked by foreign agents after their hotel room safe was broken into, government cyber security officials have revealed.

According to an account of the incident prepared by the Government that does not name either the department involved nor the foreign power believed responsible, the incident occurred when two trade negotiators attended an overseas conference.

Precautionary efforts by the pair to delete sensitive materials from their devices prior to departure proved ineffective in protecting classified information.

A cloned copy of hard drives allowed foreign agents to "recover not only deleted protectively marked documents, but also intellectual property and sensitive information pertaining to trade negotiations", according to the account.

Following their return to New Zealand, malware designed to log all electronic activity was also found to have been installed on the devices.

Paul Ash, director of the national cyber policy office at the Department of Prime Minister and Cabinet, said the incident showed New Zealand's geographic isolation was no firewall.

"Cyber security's a complex area, and it's just become more complex ... We are seeing an upward trend in cyber security incidents," Ash said.

The National Cyber Security Centre - logging attacks against sensitive commercial and government organisations - logged 316 "incidents" in the year to April 2016, up 66 per cent from the year prior.

Details of the hotel-room break-in are contained in a case study prepared for a New Zealand Security Intelligence Service-run initiative to improve government information security.

A spokesman for the New Zealand Intelligence Community described the account as "factually accurate" but stripped of information that could identify actors involved.

Digital security specialist Adam Boileau said the hotel-room incident as described wasn't surprising - he had colleagues working in Australia who said such government security breaches happened "pretty often" - but such subterfuge was only rarely made public.

"When you talk to people who work in government, this is pretty common. It happens all the time, especially with trade-related stuff. Especially trade-related stuff in Southeast Asia," he said.

The revelations follow this week's claims by the White House that Russia was behind the hacking and disseminating of emails belonging to presidential nominee Hillary Clinton.

British ministers were also this week banned from wearing Apple Watches to Cabinet meetings following concerns the devices - capable of recording audio - posed a security risk as they were vulnerable to hacking by foreign powers.

Ash said events were moving swiftly and his office was still grappling with implications of the DNC hack where information gathered is claimed have been used for propaganda - rather than intelligence or financial - ends.

"This is reasonably new for cyber policy ... It's the application of older techniques to something new. It's taken people by surprise because of its audacity," he said.

Boileau said, that aside from the loss of sensitive information, there were also increasing indications that hacking attacks could have serious financial and physical effects.

He cited a little-reported attack on Saudi Arabian company Aramco - responsible for a tenth of the world's oil production - that saw 35,000 desktop computers junked, and a sustained Christmas 2015 cyber attack on Ukraine's power grid left 230,000 people in the dark.

While New Zealand has not publicly acknowledged any of its own offensive capability in this arena - the only member of the Five Eyes alliance not to do so - the Herald last year reported how the Government Communications and Security Bureau had hacked the mobile phones of a foreign government.

Relying on the documents leaked by National Security Agency whistleblower Edward Snowden, the GCSB was, in 2013, said to have used "Warriorpride" malware capable of targeting Android or Apple mobile phones to transfer data from an "Asean target" to a NSA server.

Washington Post
Trump refusal to accept government assessments on Russian hacks dismays former official
Saturday, 15 October 2016
Byline: Tom Hamburger

Washington - Former senior U.S. national security officials are dismayed at Republican presidential candidate Donald Trump's repeated refusal to accept the judgment of intelligence professionals that Russia stole files from the Democratic National Committee computers in an effort to influence the U.S. election.
The former officials, who have served presidents in both parties, say they were bewildered when Trump cast doubt on Russia's role after receiving a classified briefing on the subject and again after an

unusually blunt statement from U.S. agencies saying they were "confident" that Moscow had orchestrated the attacks.

"It defies logic," retired Gen. Michael V. Hayden, former director of the CIA and the National Security Agency, said of Trump's pronouncements.

Trump has assured supporters that, if elected, he would surround himself with experts on defense and foreign affairs, where he has little experience. But when it comes to Russia, he has made it clear that he is not listening to intelligence officials, the former officials said.

"He seems to ignore their advice," Hayden said. "Why would you assume this would change when he is in office?"

The Trump campaign did not respond to requests for comment.

Several former intelligence officials interviewed this week believe that Trump is either willfully disputing intelligence assessments, has a blind spot on Russia, or perhaps doesn't understand the nonpartisan traditions and approach of intelligence professionals.

In the first debate, after intelligence and congressional officials were quoted saying that Russia almost certainly broke into the DNC computers, Trump said: "I don't think anybody knows it was Russia that broke into the DNC. I mean, it could be Russia, but it could also be China. It could also be lots of other people. It also could be somebody sitting on their bed that weighs 400 pounds, okay?"

During the second presidential debate, Trump ignored what a U.S. government official said the candidate learned in a private intelligence briefing: that government officials were certain Russia hacked the DNC. That conclusion was followed by a public and unequivocal announcement by the Office of the Director of National Intelligence and the Department of Homeland Security that Russia was to blame.

"Maybe there is no hacking," Trump said during that debate.

"I don't recall a previous candidate saying they didn't believe" the information from an intelligence briefing, said John Rizzo, a former CIA lawyer who served under seven presidents and became the agency's acting general counsel. "These are career people. They aren't administration officials. What does that do to their morale and credibility?"

Former acting CIA director John McLaughlin said all previous candidates took the briefings to heart.

"In my experience, candidates have taken into account the information they have received and modulated their comments," he said. Trump, on the other hand, "is playing politics. He's trying to diminish the impression people have that [a Russian hack of the DNC] somehow helps his cause."

On Thursday, the ranking Democrat on the Senate Intelligence Committee, Sen. Dianne Feinstein (Calif.), said information she received has led her to conclude that Russia is attempting "to fix this election." She called on Trump and elected officials from both parties "to vocally and forcefully reject these efforts."

Trump has consistently adopted positions likely to find favor with the Kremlin. He has, for instance, criticized NATO allies for not paying their fair share and defended Russian President Vladi-mir Putin's human rights record.

"It's remarkable that he's refused to say an unkind syllable about Vladimir Putin," Hayden said. "He contorts himself not to criticize Putin."

Trump's running mate, Indiana Gov. Mike Pence, said in the vice-presidential debate last week that the United States should "use military force" against the Syrian leader Bashar al-Assad.

Trump disagreed. Rather than challenge Assad and his Russian ally, Trump said in the second debate, the United States should be working with them against the Islamic State. "Assad is killing ISIS. Russia is killing ISIS. Iran is killing ISIS," he said, using an acronym for the Islamic State. Russia and Syria have mostly been targeting opposition groups as well as civilians trapped in Aleppo -- not the Islamic State.

"That's the Syrian, Russia, Iranian narrative," Hayden said of Trump's assertion.

Fox News
CIA reportedly preparing major cyber assault against Russia in wake of hack attacks
Saturday, 15 October 2016

Washington - The Central Intelligence Agency reportedly is preparing a major cyber attack against Russia in response to the theft of records from the Democratic National Committee and its affiliates, allegedly by Moscow- backed hackers.
Vice President Joe Biden told NBC News, which first reported that the Obama administration was considering retaliatory measures, that the U.S. would be "sending a message" to Russian President Vladimir Putin. Biden added that any cyber action would come "at the time of our choosing, and under the circumstances that will have the greatest impact."

NBC also reported that intelligence officials have been asked to present the White House with ideas for a "clandestine" cyber operation designed to "embarrass" the Kremlin.

"We've always hesitated to use a lot of stuff we've had, but that's a political decision," a former CIA officer told NBC. "If someone has decided, `We've had enough of the Russians,' there is a lot we can do."

Last week, the U.S. formally blamed the Russian government for cyberattacks on the Democratic National Committee and the Democratic Congressional Campaign Committee. A statement from the

Department of Homeland Security and the Office of the Director of National Intelligence said that recent disclosures of alleged hacked emails on websites like DCLeaks.com and WikiLeaks, and by the Guccifer 2.0 online persona, are consistent with the methods and motivations of efforts directed by Russia.

"We believe, based on the scope and sensitivity of these efforts, that only Russia's senior-most officials could have authorized these activities," the statement said.

Earlier this week Putin told an investor forum in Moscow that it did not matter who was behind the hacks, but it was "what's inside the information that matters."

Democratic presidential nominee Hillary Clinton has claimed that the theft of the records proves that Russian intelligence is attempting to help her opponent, Republican Donald Trump, defeat her in next month's election.

"Hysteria started over the [allegation] that this is in the interests of Russia," Putin added, according to the Interfax news agency. "But nothing in it is in the interests of Russia, while the hysteria is merely caused by the fact that somebody needs to divert the attention of the American people from the essence of what was exposed by the hackers."

The Intercept
Hillary Clinton's Encryption Proposal Was "Impossible," Said Top Adviser
Saturday, 15 October 2016
Byline: Alex Emmons

Washington - Hillary Clinton's advisers recognized that her policy position on encryption was problematic, with one writing that it was tantamount to insisting that there was "'some way' to do the impossible."
Instead, according to campaign emails released by Wikileaks, they suggested that the campaign signal its willingness to use "malware" or "super code breaking by the NSA" to get around encryption.

In the wake of the Paris attacks in November, Clinton called for "Silicon Valley not to view government as its adversary," and called for "our best minds in the private sector to work with our best minds in the public sector to develop solutions that will both keep us safe and protect our privacy."

When asked during a debate in December whether she would legally compel companies to build a backdoor into their products to give law enforcement access to unencrypted communications, Clinton responded "I would not want to go to that point."

But she then called for a "Manhattan-like project" to develop secure communication while allowing the government to read messages.

Cryptography experts overwhelmingly agree that backdoors inevitably undermine the security of strong encryption, making the two essentially incompatible.

The day after the debate, Sara Solow, domestic policy adviser for the Clinton campaign, called Clinton's position "impossible" in an email with Teddy Goff, the campaign's chief digital strategist. "[S]he's certainly NOT calling for the backdoor now," Solow said, "although she does then appear to believe there is 'some way' to do the impossible."

Goff had written that he thought Clinton's reply was a "solid B/B+," and suggested that she "thread the needle" and "quickly pivot from encryption to the broader issue of working with tech companies to detect and stop these people." Goff also said that the Manhattan project analogy was something which Clinton should "truly, truly should not make ever again -- can we work on pressing that point somehow?"

Solow's suggestion was that the campaign quietly signal to Silicon Valley -- a major source of donations for the campaign -- that Clinton would support government hacking to circumvent encryption.

"Couldn't we tell tech [companies] off the record that she had in mind the malware/key strokes idea (insert malware into a device that you know is a target, to capture keystrokes before they are encrypted). Or that she had in mind really super code breaking by the NSA. But not the backdoor per se?"

The FBI has in fact used targeted hacking to get around encryption tools, quietly and effectively. In 2007, for example, FBI agents caught a teenager who was sending online bomb threats to a high school in Lacey, Washington, by sending him a link that installed malware on his computer.

The Clinton campaign had previously struggled to answer inquiries about the candidate's position on encryption. "This is going to be a challenge," Clinton foreign policy adviser Jake Sullivan said in a November exchange about how to respond to a press inquiry. "I think we should give a comment on the anonymizing tools and punt on backdoors."

During Clinton's tenure as secretary of state, the State Department aggressively funded the development of encryption and anonymous web browsing tools.

In Solow's email, she asked whether there was any actual evidence of terrorists using the technologies the State Department funded. "Is there evidence," asked Solow, "that bad guys -- not just dissidents but terrorists or whatever -- have also benefitted from the technologies supported by the [State Department's] Internet freedom agenda?"

In response to terror attacks, Clinton has repeatedly called for an "intelligence surge," but has provided little clarification about what she means.

CBC.CA
U of S security specialist gives tips on how to stay safe online
Saturday, 15 October 2016
Byline: Courtney Markewich

Saskatoon - There are a few simple things everyone can keep in mind to make sure they're secure online.
October is National Cyber Awareness Month and even in today's digital world, Lawrence Dobranski -- director of ICT security at the University of Saskatchewan -- said there are some things people do that make him shake his head.

The number one thing is how some people reuse passwords.

"They have a group of favourite passwords that they reuse at all the websites they go to. So if one of those sites gets compromised, the malicious actor will have your password and your email address," Dobranski said.

A few years ago, Dobranski said, an experiment was done at the U of S where they were able to crack about 80,000 passwords in 48 hours.

Dobranski pointed out that many social media sites are now helping people secure their accounts by adding a second factor. For example, you can activate it on Facebook and a pin number will be texted to your cellphone to verify you're the one logging into the account.

Another thing people should do, Dobranski said, is patch their computer. That means making sure your computer has the latest-available update as it will keep the system safer.

"We have to make sure we're accepting them and keeping the machine patched."

Lastly, Dobranski pointed out that people don't take the time to secure their wifi before connecting devices.

"Is it actually a trustworthy wifi connection? Or is it a malicious actor that wants to monitor our connection?"

Dobranski said tools are available to make sure you're connecting to a virtual private network.

Taking such steps, Dobranski explained, are important to keep your identity safe.

Jakarta Post
Indonesia, Australia to discuss maritime, cybersecurity in Bali
Monday, 17 October 2016
Byline: Liza Yosephine

Jakarta - Indonesia, Australia to discuss maritime, cybersecurity in Bali On guard - Indonesian Navy Academy (AAL) cadets parade on the deck of warship KRI Banda Aceh (BAC)-593 during an event at Eastern Fleet (Koarmatim) Port in Surabaya, East Java, on Oct.11.
Top ministers from Australia and Indonesia are scheduled to gather in Bali on Oct.28 to discuss the strengthening of cooperation on strategic security issues between the two countries, officials have said.

Foreign Ministry spokesperson Arrmanatha Nasir said foreign and defense ministers from Indonesia and Australia were ready to attend the fourth meeting of the pair ministers, which was initiated in 2010.

"Some of the issues to be discussed include strategic security issues, which have become prime concerns of both countries, and on how they can contribute to the stability and peace of the region," Arrmanatha said during a press briefing at the ministry in Jakarta on Friday.

The ministry's East Asia and Pacific director Edi Yusup said the meeting was expected to expand cooperation that had been established in previous talks, including on counterterrorism and deradicalization.

He further said the meeting would discuss maritime safety and security issues, especially those related to disputed territories in the South China Sea, and Sulu Sea security, which had been rife with kidnappings of Indonesian sailors in recent years. Australia wanted to know how Indonesia had addressed a string of hostage-taking situations, he went on. "There is also a possibility for the two countries to launch cooperation on cybersecurity during the event," Edi said.

The Australian
Security fears over Chinese watch a sign of the times
Tuesday, 18 October 2016
Byline: Rosie Lewis

Sydney -A Bluetooth watch given to Infrastructure Minister Paul Fletcher by Chinese company Huawei has come under heavy scrutiny after Labor suggested it could pose a security risk, but the piece has never been worn by its owner.
Labor Senate leader Penny Wong took interest in the watch after it was declared on Mr Fletcher's updated register of members' interests alongside a Chinese teapot from the same company.

Senator Wong used Senate estimates yesterday to ask the Department of Parliamentary Services if it had "any concerns" about a device provided by Huawei being connected to its computer network, noting there were a "range of security concerns" on the public record about the telecoms giant.

The former Labor government banned Huawei from participating in the rollout of the National Broadband Network on the basis of security advice from the Australian Security Intelligence Organisation and the Defence Intelligence Organisation.

The Abbott government kept the ban in place.

DPS said intelligence agencies recommended hardware such as USBs received from external sources should not be connected to the parliamentary networks.

But the department assured Senator Wong there was malware detection software that initiated anti-virus checks upon connection.

However, the line of questions and answers proved to be largely irrelevant when Mr Fletcher's office told The Australian the watch had never been used."Mr Fletcher does not wear or use the watch he received from Huawei, on the parliamentary network or anywhere else," the minister's spokesman said, though he did not reveal where the watch was kept.

Australian
Milk-bottle space odyssey gives spy force a boost (Canada)
Tuesday, 18 October 2016
Byline: Brendan Nicholson

Sydney - Satellites designed and built in Australia -- each about the size of a two-litre milk bottle -- will be used to improve the performance of the revolutionary JORN over-horizon radar network and help gather intelligence for the nation and its allies.

The "cubesats", each weighing less than 5kg, will also help prevent spacecraft colliding with each other or with space debris.

The first two satellites will be launched early next year, in missions tagged Buccaneer and Biarri, with more likely.

The new "mini constellation" of satellites will also form part of the Five Eyes intelligence-gathering and sharing network involving Australia, the US, Canada and New Zealand and Britain.

The satellites were designed and built by scientists from the Defence Science and Technology Group and the University of NSW.

Defence Minister Marise Payne said the research missions would help reinvigorate Australia's space engineering capability and met the promise in the -defence white paper for Australia to develop a space capability.

Senator Payne said the global space sector was being transformed. "Traditional actors such as wealthy nations and major international aerospace primes and traditional approaches, such as large and expensive satellites are now able to do some things but they're no longer the be-all and end-all of space capability," she said.

Advances in small, low-cost space platforms provided a unique opportunity to support the Australian Defence Force and rejuvenate local space research, Senator Payne said.

"It's a very happy day today -because we're launching a really important partnership, I think, for the future of space in Australia." She said although Australia had a long history of space -activity, it had been a long time since there had been such a program from Australian players.

Senator Payne said such a program could encourage Australian scientists to return. "I also wanted to reinforce ... the importance of the reverse brain drain, bringing some of our experts back from overseas," she said.

The Jindalee Operational Radar Network watches Australia's northern approaches and an extraordinary 37,000 square nautical miles of ocean.

While normal radars operate by line of sight and are limited in range by the Earth's curvature, JORN bounces its signal off the ionosphere so it deflects down onto its target. Most details about JORN are secret but it is believed to be able to see activity of crucial strategic importance, such as missile launches, far into Asia.

The ionosphere is part of the upper atmosphere starting about 60km above the Earth's surface.

Complex mathematical calculations are needed to find the most effective wavelengths for the system and to work with variations in the upper atmosphere.Crucial to the effectiveness of a radar or sensing system is signal processing, or the ability to constantly pull out signals of importance and understand what they are telling the operator.

Agence France-Presse
Le Canada "très inquiet" des menaces russes de piratage informatique
Tuesday, 18 October 2016

Le Canada est "très inquiet" d'être la prochaine cible des attaques informatiques de la Russie, a indiqué lundi son ministre des Affaires étrangères Stéphane Dion, qualifiant de "très difficile" la relation qu'entretiennent Ottawa et Moscou.
Le chef de la diplomatie canadienne était interrogé sur le risque de voir le Canada devenir la prochaine cible des pirates russes, après que Washington ait accusé la Russie d'avoir piraté des organisations politiques et des systèmes électoraux aux Etats-Unis.

Se disant "très inquiet" par une telle éventualité, le chef de la diplomatie a noté, en marge d'une intervention devant le Conseil des relations internationales de Montréal (CORIM), que ce danger soulignait "la nécessité d'avoir un cyberespace libre et sûr".

Son homologue à la Sécurité publique, Ralph Goodale, a d'ailleurs déclaré à Ottawa lundi que le gouvernement canadien a entrepris depuis quelque temps une révision générale des infrastructures internet du pays, en particulier des systèmes sensibles tels que ceux des banques, car "il y a eu des incidents par le passé au Canada durant lesquels des systèmes ont été corrompus".

Les relations avec la Russie sont "très difficiles pour plusieurs raisons, mais en particulier à cause de ce qui se passe en ce moment à Alep et en Ukraine", a fait valoir Stéphane Dion.

"Mais c'est une raison de plus de mener une politique de dissuasion convaincante, comme ce que nous faisons en Lettonie avec l'Otan", où Ottawa va déployer 455 soldats à partir de mai 2017 dans le cadre du renforcement des capacités de l'Alliance atlantique sur son flanc est, a relevé M. Dion.

Toutefois, a souligné le chef de la diplomatie canadienne, "rompre le dialogue (avec la Russie, NDLR) serait une erreur, ce n'est pas ce que le Canada fait".

Sydney Morning Herald
Cabinet has 'never' disclosed sensitive material on WhatsApp
Tuesday, 18 October 2016
Byline: James Massola

Sydney -Attorney-General George Brandis says confidential material has "never, ever" been communicated by cabinet ministers on WhatsApp - but he won't be releasing the proof.
And testy officials from the Department of Prime Minister and Cabinet dismissed security experts' concerns about the use of WhatsApp, insisting that the security clearances given to ministers and their staff were sufficient to protect sensitive information.

Those officials said that to the best of their knowledge, Defence's cyber security agency, the Australian Signals Directorate, had not approved the use of WhatsApp for classified or sensitive communications.

Fairfax Media reported last week that cabinet ministers, MPs, ministerial chiefs of staff and media advisers are using WhatsApp to hold confidential discussions about government business. That prompted Labor's legal affairs spokesman, Mark Dreyfus, to warn the arrangement was a "national security risk".

But Senator Brandis told a Senate hearing yesterday that using the app did not pose a security threat.

"I can assure you, having communicated with the Prime Minister and other cabinet colleagues on WhatsApp, there has never been an occasion, ever, in which the material on WhatsApp has been other than extremely routine, of an extremely routine nature," he said.

"Never, ever, ever has there been an occasion when a sensitive or national security matter has been reduced to that form, for obvious reasons."

At that point, Labor senator Penny Wong pounced, asking Senator Brandis about the existence of a cabinet WhatsApp group.

"That's a definitional matter."

"What do you talk about?"

"Nothing of public sensitivity" Senator Brandis replied.

"If that's the case, Are you prepared to give us a copy of your cabinet WhatsApp chat? You can export it is as a text file."

"No."

"So it's entirely unremarkable but you don't want it exposed to the public?"

"Well, Senator, it's entirely unremarkable."

Malcolm Turnbull's cyber security adviser, Alastair MacGibbon, told the Senate hearing that he regularly communicated on WhatsApp with the Prime Minister.

Mr MacGibbon said WhatsApp could, in theory, be more secure than a regular text message but was potentially less secure than an iMessage sent from an Apple phone. "The use of messaging apps can increase privacy and security based on their encryption, versus a telephone call or an email or an SMS," he said.

To ensure adequate security, "whether it's WhatsApp or other applications, we have to rely on people following instructions and the guidance they are given."

Departmental deputy secretary Allan McKinnon appeared to confirm that no inquiries had been made about the security of WhatsApp.

ABC (Australia)
Immigration Department confirms IBM will miss IT merger deadline amid security concerns
Tuesday, 18 October 2016
Byline: Matthew Doran

Canberra - The Department of Immigration and Border Protection (DIBP) has tried to downplay reports its rollout of a new $500 million computer system could lead to security breaches, and claimed its deadline for completion was always up for review.
Last month, the ABC reported serious concerns had been raised about .

Before Customs and Immigration merged in 2015, two companies had been delivering IT services -- IBM for Customs; and CSC, another US information technology giant, for Immigration.

The ABC had been told by those familiar with the project that IBM was increasingly unlikely to hit an October 31 completion deadline, and any system failure could compromise national security checks, including red- flagging terror suspects attempting to enter or leave the country.

Three weeks ago, the department had issued a statement to the ABC that stated the "schedule remains under active review".

"This is common to all major system changes in which the protection of operational capability and security protections remains the overarching priority," the statement said.

Deadline 'was never going to be exact'

Now, the department's Deputy Secretary Maria Fernandez has told a Senate committee the revised deadline for completion was early December, but said the revision was not as a result of the ABC report.

"That report was not accurate," the department's Maria Fernandez told a Senate committee.

"It is a complex transition, it takes critical border systems from CSC mainframe's onto IBM, it will take almost a year to undertake the migration.

"It is 17 years of data and very complex systems, and so it is a schedule that we review constantly, and it was never going to be exact."

CSC's contract had since been extended through until January 2017.

DIBP Secretary Mike Pezzullo said nothing would be done to jeopardise the security of the computer system, and its role in managing Australia's border.

"One of the factors [the team managing the rollout] have regard to is that there's no breach of the integrity of our border systems," Mr Pezzullo said.

"If there were to be by premature migration, switching over of data from one mainframe to another, if there were to be a risk the Commissioner [Roman Quaedvlieg] and I would have a very, very, very low threshold of risk appetite of any potential breach of our border."

Ottawa Citizen Online
The mystery of the listening devices at DND's Nortel Campus
Tuesday, 18 October 2016
Byline: David Pugliese

My colleague Jim Bagnall and I recently wrote a feature on the move by the Department of National Defence to the former Nortel campus in west end Ottawa. More than 8,000 military and civilian staff will make the move.
One of the issues that emerged when we were researching and writing the article had to do with the mystery of listening/spy devices that were planted at the Nortel Campus.

So what happened? Were listening devices found at the Nortel Campus or not?

The Department of National Defence keeps changing its story on that issue.

In 2013 the Citizen reported that workers preparing the former Nortel complex as the new home for the DND had discovered electronic eavesdropping devices. It shouldn't have come as a big surprise. The year before it had been revealed that Nortel was the target of industrial espionage for almost a decade, with the main culprits thought to be based in China. An internal security study by Nortel suggested that

hackers had also been able to download research and development studies and business plans as far back as 2000. The hackers also placed spyware into some employee computers.

Michel Juneau-Katsuya, a former senior officer with the Canadian Security Intelligence Service, said the spy agency also determined that Nortel had been targeted. "We knew it was well penetrated," he told the Citizen at the time. "When I was the Chief of Asia-Pacific we warned Nortel."

But after the Citizen article was published, Julie Di Mambro, spokeswoman for then Conservative Defence Minister Rob Nicholson, noted in a statement that, "security officials have assured us that they have not discovered any bugs or listening devices."

Government documents, however, obtained by the Citizen through the Access to Information law, showed that the year before concerns had already been raised about security at the former Nortel campus. Although the proposed relocation was already well publicized, then Defence Minister Peter MacKay had been warned not to make any announcement that the DND was moving into the complex before it could be properly secured. Security officials were concerned that someone might be able to slip into the site and plant spy devices before the move. "This not only raises the level of difficulty of verifying appropriate security safeguards in the future, it will probably dramatically increase security costs and cause delays to reach full operational capability," MacKay was told.

In December 2013 Public Works and the DND held a news briefing to outline the plans for the move to the former Nortel site. Again, a DND official dismissed concerns that listening devices could be hidden in the sprawling complex, noting that none had ever been found. But his claim turned out to be misleading. The official -at the same news conference - later admitted that only "limited" security sweeps had been done at the campus and he only meant that no spy devices had been found by DND officials. He couldn't speak about what might have been found by other security agencies.

Fast forward to August 2016. In an interview with the Citizen, Vice Chief of the Defence Staff, Vice Admiral Mark Norman refused to discuss the spy issue in detail. He said his organization was satisfied the site was ready to be occupied, despite "any legacy bits and pieces, whether they were intended to be there or not." The suggestion was that older spy devices might indeed have been discovered.

A short time later Norman provided more information in an interview with the Globe and Mail about the "legacy" devices that were found. "The whole facility was swept when we went through in preparation for our moving in," Norman explained. "Anything that was there was legacy to what I would characterize as industrial activity and we are completely satisfied now that this is a site we are able to move into and it meets all of our security requirements. I am assured anything that was there is no longer there. ... It was all legacy, old-school stuff associated with the previous occupant."

DND officials privately said to the Citizen that was a confirmation that spy devices that were found were older and not functioning.

Five days later in another statement to the Citizen - and contrary to what Norman had said earlier - the DND was once again claiming that no bugs, surveillance equipment or listening devices had ever been found.

Military mulls leasing reconnaissance satellite from Israel
Tuesday, 18 October 2016
Byline: Staff reporter

Seoul - South Korea is considering leasing a reconnaissance satellite possibly from Israel to independently obtain information on North Korea's military activities, military officials said Tuesday. South Korea has heavily relied on reconnaissance satellites operated by the United States when it comes to core military information involving the North's nuclear and missile-related moves, according to the Ministry of National Defense.

"The military is expected to have its own surveillance satellites as early as 2023 that will allow Seoul to closely monitor military activities in North Korea," said a ministry official.

"It is years behind the defense ministry's original schedule to deploy five surveillance satellites between 2021 and 2022 as part of the country's "kill chain" strike system to deal with missile threats from the North," according to the official.

Faced with increasing nuclear and missile threats by the North, the government is looking to lease a reconnaissance satellite from Israel or other foreign countries, the official said.

In addition, the military plans to purchase another 90 KEPD-350K air-launched cruise missiles from Germany's Taurus Systems GmbH. The initial shipment of 170 KEPD-350K is currently being transported to South Korea, with the remainder set to be shipped in 2017.

The Taurus missile can be mounted on the South Korean Air Force's main F-15K fighters and can be used to hit the capital city of Pyongyong while the planes are flying safely over Daejeon, 164 kilometers south of Seoul.

If the Taurus missile, with a range of over 500 km, are added to the Air Force's inventory, South Korea will be the first operator of fighter jets in Asia equipped with this advanced system.

Besides satellites and missiles, Seoul as part of the Korean Air and Missile Defense (KAMD) system plans to operate a total of four early-warning radars by around 2020 to counter the North's submarine-launched ballistic missiles. KAMD is designed to detect and destroy incoming missiles and other aerial threats, the military said.

Pyongyang has conducted five nuclear tests in the past decade and launched a series of missiles, including an intermediate-range ballistic missile which is believed to be capable of reaching U.S. territories in the Pacific like Guam.

Hindustan Times
India needs to counter cyber attacks by Pakistan
Tuesday, 18 October 2016

Mumbai - In the wake of cyber-attacks on Indian websites - allegedly made by hackers from Pakistan - in the backdrop of the recent surgical strikes and killing of Kashmiri civilians, cyber-experts from India said a lot needs to be done by the government and financial institutions to win the "cyber war".
A senior official of the state police said hackers disrupt economic activities and inconvenience customers by hacking into Indian websites. They steal confidential data and either sell it or demand money in exchange for not misusing it. The biggest problem here is the anonymity offered by the internet.

"Hackers can get away with anything due to geographical shrinking. Experts said the internet was first used to convert and radicalise people online. Now it is used to spread cyber terrorism, which hurts the economy, affects businesses, disrupts services and facilitates extortion and blackmail," he added.

"We have lost the cyber war to Pakistan. Our neighbours are very good at cyber-terrorism. We are not attacking them in cyber space. It is also difficult to gather evidence against the hackers," said cyber security expert Vijay Mukhi.

"Countries are deploying cyber warriors to attack vital organisations in other (enemy) countries is nothing new. Pakistan, China, Iran and North Korea have deployed cyber warriors by providing them with immunity from the consequences. Earlier, the websites of the Central Bureau of Investigation and the National Defence Academy were hacked into," said D Sivanadhan, former director general of police (Maharashtra).

"Even terrorist organisations such as the Islamic State have deployed cyber warriors to hack into websites and ridicule the American establishment and Malaysian airlines. The most vulnerable industries are banking, finance , energy, oil, electric power production and supply sector and nuclear power," he said.

"We have to establish robust protection mechanisms and develop mechanisms to safeguard against such attacks. We have to spend resources to upgrade our technology. A security audit needs to be done regularly by a third party. The Indian Computer Emergency Response Team (CERT) can conduct an investigation to find the people behind such attacks. Government websites are soft targets and so we have to create awareness among people working in such sectors," he said.

Mukhi stressed the need for a cyber-policy and an increased budget to tackle such attacks.

A hackers group calling themselves 'D4RK 4NG31' infiltrated the National Green Tribunal's website this month and posted profanities on it in an act of "revenge" against the Indian army's recent surgical strikes. "We are unbeatable. You... kill innocent people in Kashmir and call yourself defenders of your country. You...violate the ceasefire on border and call it 'surgical strikes'. Now kiss the burn of cyber war," posted the hackers.

The Government Law College's official website was hacked into this month by a group calling itself 'PakCyberPyrates'. Students who visited the website were directed to its homepage, which had the following message, 'National Securities Depository Limited...OOPSS.. To all Indians out there..surgical strike...lolx..hahahahaha!!!'.

The accounts of about 50 IT companies accounts were attacked by Pakistan-based hackers over the past 10 days.

Jakarta Post
Kaspersky Lab warns about financial cyberthreats in Asia Pacific
Tuesday, 18 October 2016
Byline: News Desk

Jakarta - One of the key topics of Kaspersky Lab's Cyber Security Weekend for Asia Pacific Countries that took place earlier this month in Indonesia was financial cyber-security. The company's experts and guests discussed financial threats that are currently on the rise globally and starting to penetrate the APAC region.
"Financial threats vary, from online fraud and banking Trojans that affect PCs, tablets and smartphones, to attacks on financial organizations, ATMs and even point-of-sale terminals. Analyzing our statistics, we see that as the financial sector in Asia-Pacific countries is developing fast, cybercriminals are increasingly looking for ways they can profit from it. Since a lot of organizations and individuals often forget about security when adopting new technologies, we believe it's important to remind them about cyber security principles that will help them stay safe," said Vitaly Kamluk, Kaspersky Lab's Director of Global Research and Analysis Team in APAC.

The Consumer Security Risks Survey 2016, conducted by B2B International and Kaspersky Lab, showed that 67 percent of respondents in APAC countries are worried about online banking fraud and 63 percent said they often worry about their vulnerability when making financial transactions online. 62 percent stated they would use online payments more often if they had reliable protection for financial transactions. Consumer concerns about financial security are well-founded; 5 percent of consumers globally have lost money online as a result of scams or fraud, with the average sum lost reaching USD 476.

"Spam, phishing and banking Trojans are among the most widespread financial threats. So users should be attentive to fake web pages, unexpected e-mails asking to provide financial information, and secure their mobile devices if transactions are made from them. While organizations should also regularly check their IT infrastructure and especially computers from which financial transactions are made," explained Kamluk.

Banking Trojans remain one of the most dangerous online threats. They are often propagated via compromised or fraudulent websites and spam emails and, after infecting users, steal personal information such as bank account details, passwords, or payment card details. According to Kaspersky Security Network data, in the third quarter of 2016 compared to the same period of 2015 the number of banking Trojans increased in the Philippines (by 24 percent), India (by 31percent), China (by 43 percent) and Vietnam (by 104 percent). Vietnam and India were the countries with the largest number of victims. Other countries saw decrease in the number of victims, one of the reasons for which might be the effect of the raised awareness of users, new government initiatives or even a geographical preference defined by the criminals behind banking Trojan malware campaigns.

Arab News
Saudi Arabia tightens noose on cybercrime
Tuesday, 18 October 2016
Byline: Rashid Hassan

Riyadh - The Kingdom is making concerted efforts to tighten the noose on cybercrime with work on novel solutions pertaining to information security.
The Kingdom will host the Global Internet Forum and Exhibition early next year, with the main objective of highlighting the government's efforts in combating cybercrime, ensuring cybersecurity and facilitating e- governance and its mechanisms concerning Vision 2030.

The forum will be held in mid-March in Jeddah with the participation of experts, authorities and companies specialized in the field of Internet and communications from across the world, said Khalid Naqro, supervisor of the exhibition.

The Cabinet meeting here on Monday approved a number of procedural arrangements relating to security and safety projects, including provisions that government agencies have to verify, when implementing their projects, their compliance with regulations and instructions on security and safety.

The Cabinet was briefed on the Kingdom's participation in the second committee of the 71st session of the UN General Assembly, during its discussion on "Exploitation of Science and Technology for Development," and the Kingdom's confirmation that it will continue its march in the ongoing support for the implementation of the results of the world summit on the information society.

This emanates from its belief in the significant importance of the outputs of the summit and its contribution to achieving the goals of sustainable development.

Moreover, the Cabinet expressed condemnation on all acts of terror, confirming the Kingdom's rejection of terrorism in all its forms and manifestations.

Earlier, commenting on the Global Internet Forum on Combating Cybercrime, Nagro said the forum, accompanied by an exhibition, aims to empower people from Arab states, including the Kingdom, to present their innovations and allow participants to build strong relations to enhance the Arabic content on the Internet, and to overcome information security challenges in order to move forward toward a knowledge- based economy, as envisioned under Vision 2030.

Asharq al-Awsat
Saudi Arabia Set to Host Global Exhibition on Combating Cyber Crimes
Tuesday, 18 October 2016
Byline: Fahd Baqmi

Jeddah - Saudi Arabia will host the Global Internet Forum and Exhibition, which highlights the Saudi government's efforts in dealing with cybercrimes, the e-government and its mechanism concerning the 2030 Vision; the event will be held with the participation of experts, authorities, and companies specialized in the field of internet and communication from across the world.
Khalid Naqro, supervisor of the exhibition said that this event will be held for the first time in the Middle East and is considered one of the most prominent events called for - by the Kingdom - amid international growth of use and demand on the internet; forecasts have showed that users who benefit from the internet service around the world have reached 3.2 billion, which represents around half of the world's population.

Naqro added that the exhibition, which targets governmental entities, the private sector, organizations of civil society and companies of e-commerce, in addition to research and e-banking centers, will showcase many projects, services, and apps; the event will also embrace special initiatives on the Arabic content, projects, and new ideas aiming at attracting international apps, exchanging expertise. The event will also focus on highlighting Saudi Arabia's efforts in the field of information technology (IT) and on providing many chances of partnership between the private and governmental sector.

The exhibition will discuss 20 different topics by featuring global speakers; topics are expected to include services provided by global companies for the Arabian customer, innovations, successes of websites and apps, and how these apps contributed in developing the community, in addition to themes like internet and the family, globalization and intellectual invasion, entertainment, and internet as a bullying platform.

The event will also showcase many global experiences on the role of educational entities and institutions in stimulating efforts of students to enrich the Arabic content, reasons behind this latter's weakness, experiences of the Global Arab Network (GAN) and news of the internet.

It's worth mentioning that official figures have showed that internet users in Saudi Arabia reached around 21.6 million by the end of 2015 representing 68.5% of citizens and residents, which shows the leap of internet growth over the past years; users of Twitter in the Kingdom exceeded three million who post more than 1.5 million tweets daily; as per Facebook, its users in Saudi Arabia have reached six millions while a million people use LinkdIn, YouTube, and different mobile apps.

FCW.com
Official: you can still trust the NSA
Tuesday, 18 October 2016
Byline: Sean D. Carbery

Washington - It might not be as momentous as knocking down the Berlin Wall, but tearing down the barriers between Signals Intelligence and Information Assurance inside the National Security Agency is revolutionary, an NSA official in the thick of those efforts contends.
The NSA is six weeks into "NSA21," which the agency calls the most substantial organizational reform in its 60-year history. Announced earlier this year, NSA21's primary change is flattening the organization and moving it from a mission-based construct to a functional model.

Curtis Dukes had been until recently the deputy director of NSA's Information Assurance directorate. Now, he's deputy national manager of national security systems in charge of the IA portfolio of the new operations directorate.

"We have a 60-year history of having two missions separate and distinct with common leadership at the top," he said. "Both missions have been highly successful, but where we found difficulties was in sharing between those two missions."

Dukes said that the current reforms have been in the making for the last decade. He said that NSA director Adm. Mike Rogers had two primary objectives.

"One was to propel us for the next decade -- make sure that we're tightly integrated between the two missions -- and that also more importantly was that we're optimized when it comes to cyber, both from exploit as well as from the defense standpoint," he said.

Dukes said that by removing the separation between signals intelligence (offense) and IA (defense), the two groups can better share information about potential vulnerabilities and exploits to further each other's missions.

"What this new organization construct brings is that we can put the best athlete to help with incident response and mitigation," explained Dukes. "We also can have the best athlete help with building better architectures to help the defensive mission. I think that's what we're trying to strive for in that regard."

The reorganization is hardly without controversy, however, in no small part because of the inherent contradiction between the NSA's primary missions. The Signals Intelligence directorate has been responsible for spying and increasingly looking for cyber vulnerabilities to exploit in intelligence gathering.. The Information Assurance directorate has been responsible for protecting systems -- government, private sector and international partners -- from exploitation.

Some clients have often wondered if the NSA's guidance came with strings, or more specifically, back doors, to help the signals intelligence mission. And since the announcement of NSA21 there has been more grumbling from some in industry that the NSA cannot fully be trusted.

NSA's reputation in the information assurance business took a hit from leaks by former contractor Edward Snowden that included confirmation that an NSA-approved cryptographic algorithm was deliberately compromised. Still, Dukes said that there has been trust in the past, and that should continue under the new system.

"We understood how things would be attacked from an adversarial standpoint, again from the signals intelligence perspective, and then we would go engage with industry and with international partners and also produce security configuration guidance and best practices based on that information," he said. "We strongly believe in our configuration guidance and our best practices."

One risk Dukes acknowledges is the possibility of compromising aspects of the signals intelligence mission because other nations can use unclassified NSA information to improve their cybersecurity.

"I think there will always be that argument that, well, how do I know if I'm talking to NSA I'm talking to the information assurance mission or to the signals intelligence mission?" Dukes said. "The short answer is that we do wall that off internally here [so that] if we're engaging with industry to help them better secure the product we're doing it for all right and honorable reasons."

So, despite the wall being torn down, Dukes said there will continue to be some degree of internal separation, and the current practice of vetting the release of information about vulnerabilities will continue.

"Prior to NSA21, regardless who found the vulnerability, whether it was the signals intelligence or the information assurance missions, we kick that up to an issue resolution process where both missions debate and discuss the vulnerability," said Dukes. "If one mission said that 'you know we need to release' or another mission said that 'we need to restrict,' it's fiercely debated."

In the last three years, the NSA created the Vulnerabilities Equities Process (VEP) to evaluate whether vulnerability information should be shared with interested parties so they can protect their systems, or whether disclosure would compromise intelligence gathering. Dukes said these tensions, procedures and discussions will continue under NSA21.

"I'm the senior NSA officer that represents NSA in the VEP process, and I'm a fierce advocate for, you know, if I think the nation's at risk, I highlight that, I make that argument both to Admiral Rogers and to [White House cybersecurity advisor] Michael Daniel in that regard," he said. "But it is a vote and each member can have a say in that and ultimately Michael will make a decision whether to disseminate or to restrict."

Dukes said the U.S. needs to do some soul-searching over its cyber defense structures and protocols in general. NSA has authority for national security systems, but does not have the authority to support agencies like the Office of Personnel Management, State Department or Environmental Protection Agency.

"That's where we work closely with DHS and FBI and we use their authorities to go in and do incident response and mitigation," said Dukes. "I don't think we're fully optimized as a nation yet in that regard. I think there's always going to be a bit of a lag for us to then provide support as we work though the authorities issue with DHS and FBI."

Dukes said by the time bureaucratic priorities are sorted out, "you've lost valuable time in order to do defense at cyber speed in that regard, and I think that's what we need to relook at as a nation."

Dukes said he's a fan of the United Kingdom's new National Cyber Security Centre, which puts emphasis on offensive capabilities as well as active cyber defense in collaboration with industry. "I think it's a model that should be looked at from a U.S. perspective as well," said Dukes.

Dukes said that NSA21 is still very much in its early stages and it's too soon to tell if it's on the right track or needs tweaking. He said there will be an internal review in about 90 days to see how things are progressing. One of the biggest challenges will be merging the public-facing culture of IA with the secret culture of signals intelligence.

"Over 60 years those cultures get pretty rigid, so we can't expect that in six weeks that we've, you know, totally changed the culture in the agency," said Dukes.

"In the sort term you'll still see us kind of inching along," said Dukes. "But I think a year out, it will just be, 'hey, who's available?' Whether you're signals intelligence or information assurance on this mission, you go in to do support for the nation."

New York Times
Agencies Split on Classifying Clinton Emails
Tuesday, 18 October 2016
Byline: Eric Lichtblau, Steven Lee Myers

Washington - Documents released Monday in the Hillary Clinton email investigation show intense disagreement last year between the State Department and the F.B.I. over whether some of Mrs. Clinton's emails should be considered classified, including a discussion of a possible "quid pro quo" to settle one dispute.
The new batch of documents indicated that in one particular case, a senior State Department official, Patrick F. Kennedy, pressed the F.B.I. to agree that one of Mrs. Clinton's emails on the 2012 Benghazi attack would be unclassified -- and not classified as the bureau wanted.

What remained unclear from the documents was whether it was Mr. Kennedy or an F.B.I. official who purportedly offered the "quid pro quo": marking the email unclassified in exchange for the State Department's approving the posting of more F.B.I. agents to Iraq.

Officials at both the F.B.I. and the State Department said Monday that no deal had been struck, or even offered, over the classification of Mrs. Clinton's private emails. They noted that the Benghazi email in question had been made public with a sentence blocked out, meeting the F.B.I.'s demand for classification. They also said no additional F.B.I. agents had been posted overseas.

There is no indication from the documents that Mrs. Clinton was aware of the discussion.

Donald J. Trump and other Republicans nonetheless quickly seized on the new documents as evidence of what Speaker Paul D. Ryan called "a cover-up."

The F.B.I.'s latest release of 100 pages of internal investigative files prolonged the intense public scrutiny of Mrs. Clinton's use of a private email server as secretary of state, which has been perhaps more damaging to her presidential campaign than any other issue.

The new documents also cast particular attention on the role of Mr. Kennedy, a State Department civil servant for more than four decades, in working to oversee the review and public release of tens of thousands of Mrs. Clinton's private emails.

One of the F.B.I. reports said State Department employees who reviewed nearly 300 of Mrs. Clinton's emails on the Benghazi attacks in early 2015 in response to requests from Congress had "felt intense pressure" from Mr. Kennedy and other senior State Department officials to complete their review quickly and "not label anything as classified."

Mr. Kennedy was part of a long-running battle between the State Department and the intelligence agencies over Mrs. Clinton's emails. As the emails were prepared for release, officials from the intelligence agencies argued in some cases that information in them should have been marked classified, while State Department officials countered that they contained the routine business of American diplomacy. State Department officials, who argue that the intelligence agencies are overzealous in classifying information, remain sensitive to criticism that they were sloppy in handling the material.

In one of the newly disclosed documents, an unidentified F.B.I. employee told investigators that Mr. Kennedy, through another F.B.I. official, had sought in one case "assistance in altering the email's classification in exchange for a 'quid pro quo.'"

The F.B.I. had deemed the email classified, but the State Department disagreed.

The employee told investigators that "in exchange for marking the email unclassified, State would reciprocate by allowing the F.B.I. to place more Agents in countries where they are presently forbidden," according to the F.B.I.'s summary of the employee's questioning by investigators.

A second F.B.I. interview included in the documents provides a somewhat different version of the dispute over the classification of the Benghazi email, with the suggestion that the F.B.I. -- and not Mr. Kennedy -- had offered to make a deal.

In the interview, an unidentified F.B.I. official in the international operations division said Mr. Kennedy had complained to him that the F.B.I. classification of the document "caused problems for Kennedy" and that Mr. Kennedy had wanted to give it a different designation and file it in the State Department basement -- "never to be seen again."

The unidentified F.B.I. official said he was the one who then "told Kennedy he would look into the email matter if Kennedy would provide authority concerning the F.B.I.'s request to increase its personnel in Iraq."

The email they were struggling over was sent on Nov. 18, 2012, by William V. Roebuck, who oversaw the department's office for North Africa and is now the American ambassador to Bahrain.

In it, he notified five other officials of the arrest of "several people" in Libya on suspicion they were connected with the Benghazi attack two months earlier. It was subsequently forwarded to senior officials at the department and then to Mrs. Clinton on her private email account by her deputy chief of staff, Jake Sullivan, with a short "f.y.i." note.

Mark C. Toner, a State Department spokesman, said that no favors had been exchanged in the discussions of Mrs. Clinton's emails, and that there had been no change in the number of agents in Iraq

as a result of the conversations. "The allegation of any kind of quid pro quo is inaccurate and does not align with the facts," Mr. Toner said.

The F.B.I. also said there was "never a quid pro quo," but it said the accusations had been referred to the bureau's inspection division, which handles internal ethics issues, to investigate. The F.B.I. official who discussed the issue with Mr. Kennedy has since left the bureau, an official said.

One of Mr. Trump's foreign policy advisers, Michael T. Flynn, a retired general who headed the Defense Intelligence Agency, said the documents provided "undeniable proof" that Mrs. Clinton had "colluded with the F.B.I., D.O.J. and State Department to cover up criminal activity at the highest levels."

Two prominent members of the House -- Jason Chaffetz of Utah, the chairman of the Committee on Oversight and Government Reform, and Devin Nunes of California, the chairman of the Permanent Select Committee on Intelligence -- called on Secretary of State John Kerry to relieve Mr. Kennedy of his position pending an investigation.

In a letter to Mr. Kerry, they accused Mr. Kennedy, the State Department and the F.B.I. of collusion. They charged that the State Department had altered its normal process in reviewing Mrs. Clinton's emails, consulting directly with the Justice Department and bypassing the F.B.I.'s input. A spokesman for Mr. Trump's campaign, Jason Miller, said Mr. Kennedy should resign.

Mr. Toner said Mr. Kennedy would remain in his position with the full support of Mr. Kerry.

After the email issue emerged in March 2015, Mrs. Clinton insisted for months that she had never sent or received emails that contained classified information. But she was forced to backtrack, as the F.B.I. concluded this summer that at least 110 emails had contained classified information, even if they had not been marked as such at the time.

Washington Free Beacon
Clinton Email Server Hit in Cyber Attacks From Russians, Other Hackers
Tuesday, 18 October 2016
Byline: Bill Gertz

Washington - Hackers from Russia attempted to break in to Hillary Clinton's private email server although the cyber intrusions did not appear to be successful, according to FBI documents made public Monday.
FBI investigators issued a qualified assessment of whether foreign hackers broke into the email server, stating in the heavily redacted report that it could not confirm evidence of foreign hacking.

The FBI concluded that the unsecure email system was "potentially vulnerable to compromise" and was frequently attacked by unknown foreign hackers, according to part one of a four-part report.

Hacking attempts against Clinton's private email server increased sharply after the New York Times revealed its existence on March 2, 2015. The cyber attacks were targeted against the server, an associated domain controller, and Clinton's Apple iCloud account, the FBI stated.

The Times report did not identify Clinton's email address, but the FBI said hackers likely learned her email address from open sources after aide Sidney Blumenthal's AOL email was hacked in 2013. Among the hacked emails made public were emails between Blumenthal and Clinton writing under the email alias "hdr22."

The FBI stated that Blumenthal was hacked by the Romanian hacker Marcel Lehel Lazar, known as "Guccifer," and suggested he was linked to Moscow.

U.S. intelligence agencies announced on October 7 that the Russian government, operating through cutouts identified as Wikileaks, DCLeaks.com, and Guccifer 2.0, directed the hacks of American political organizations in a bid to influence the U.S. presidential election.

"Lazar disseminated emails and attachments sent between Blumenthal and Clinton to 31 media outlets, including a Russian broadcasting company," the FBI said.

Additionally, hackers from Russia and Ukraine tried to log in to Clinton's email accounts shortly after Guccifer's hack of Blumenthal.

"An examination of log files from March 2013 indicated that IP addresses from Russia and Ukraine attempted to scan the server on March 15, 2013, the day after the Blumenthal compromise, and on March 19 and March 21, 2013," the report said. "However, none of these attempts were successful and it could not be determined whether this activities was attributable to Lazar."

Lazar's claim to Fox News that he used information from Blumenthal's emails to break into the Clinton server was false, the FBI said after questioning the hacker.

Other cyber attacks on the server included numerous attempted break-ins described by the FBI as "brute force" attacks-- repeated log-in attempts, usually by automated hacking software.

Brian Pagliano, who was the system administrator for the email server, told the FBI that the brute force cyber attacks increased over time, although he asserted there were no security breaches to the system.

The server used for the emails also employed a Microsoft remote access protocol that the FBI described as having "known vulnerabilities" to hackers.

In January 2011, Justin Cooper, an aide to former President Bill Clinton who helped set up the private email, notified Clinton aide Huma Abedin that the system was being hacked and that he had shut it

down in response. The FBI was unable to identify what it termed the "successful malicious login activity" from the hack.

Forensic analysis by FBI investigators determined that "scanning attempts" by outside cyber intruders took place against the private server and "one appears to have resulted in a successful compromise of an email account on the server," the report said.

The hack took place on January 5, 2013, when an anonymous user operating Tor software hijacked the email account of a woman described by the FBI only as a "President Clinton staffer." The hacker then browsed email folders and attachments.

The FBI also stated that potentially malicious hackers tried to exploit software vulnerabilities in the server on multiple occasions, although they were not successful.

The report stated there were major gaps in the investigation of cyber intrusions because the FBI did not have access to all 13 mobile devices Clinton used during her tenure as secretary of state.

"As a result, the FBI could not make a determination as to whether any of the devices were subject to compromise," the report said, noting the FBI also did not examine two of Clinton's five iPads for signs of compromise.

Clinton was the target of multiple email "phishing" attempts while using the private server, including a fake email from a State Department official's email account that contained a potentially malicious link.

Clinton sent a reply to the email asking, "Is this really you? I was worried about opening it?"

Another email quoted Abedin as telling a colleague Clinton was worried "someone [was] hacking into her email" after she received an email from an associate with a link to a website with pornographic material.

"The FBI's inability to recover all server equipment and the lack of complete server log data for the relevant time period limited the FBI's forensic analysis of the server system," the report said.

"As a result, FBI cyber analysis relied, in large part, on witness statements, email correspondence and related forensic content found on other devices to understand the setup, maintenance, administration and security of the server systems."

More than 15 pages of the 47-page FBI report were cut out according to declassified guidelines that allow information to be withheld on national defense and foreign policy grounds, and to prevent the disclosure of techniques and procedures used for law enforcement prosecutions that would be useful to cyber criminals.

Wall Street Journal
Flight System Draws Concern
Tuesday, 18 October 2016
Byline: Andy Pasztor

New York - U.S. and European aviation authorities are focused on cybersecurity threats that could affect a basic data-transmission system widely used by airlines around the world.
Such concerns about the decades- old system called Acars -- primarily used for air-traffic purposes and to provide information about the status of various aircraft components during flights -- have surfaced in the past few months on both sides of the Atlantic.

The issue has been raised in U.S. government contracting documents, as well as in comments by industry officials and high-level European safety regulators.

The information sent by the Acars network from planes to the ground isn't considered safety critical, nor does the system handle any data that could immediately imperil safe operation of flights.

No specific hacking attempts or intrusions have been detected, government and industry officials said.

But as the industry moves to revise 1980s-vintage transmission protocols and methods, including use of new frequencies and expanded messaging formats, experts have expressed heightened worries about the vulnerabilities of Acars to hackers or other types of outside intrusions. Because of its age, the system lacks some of the safeguards embedded in newer onboard messaging networks.

Disruptions of Acars could result in major problems for airline scheduling, maintenance or other operational functions, experts interviewed over the past few months said.

Acars stands for Aircraft Communications Addressing and Reporting System, originally designed to send short air-to-ground messages.

Future uses envision dramatically greater capacity and a wider range of messages.

In September, the Federal Aviation Administration awarded a first-of-a-kind contract to Milwaukee-based Astronautics Corp. to develop comprehensive risk-assessment tools to pinpoint cybersecurity vulnerabilities of aircraft electronics.

Acars is slated to be the first onboard system that will be examined using those tools.

At the time, Astronautics said it planned to devise an "efficient, timely and repeatable process" to identify cyberthreats and risk-mitigation strategies.

FAA officials have declined to comment specifically about Acars or details of the contract. In an email last week, the agency said it "will continue to further strengthen its capabilities to defend against new and evolving" cyberthreats. Earlier, a top official of the European Aviation Safety Agency singled out Acars as a prime example of the need for stepped-up cybersecurity reviews of onboard data systems. Luc Tytgat told an FAA-EASA conference in Washington in June that work was under way "to see if we should not go back to certification" studies of Acars vulnerabilities.

Mr. Tytgat indicated Acars was at the top of the list for cybersecurity reviews, but added that EASA also planned to screen newer air-traffic-control technologies ready for deployment as part of a "total systems approach" that is "not something which is easy to implement."

Since then, several industry officials familiar with the details confirmed that the agency is specifically delving into such matters.

An EASA spokesman this month said the Acars studies are part of a broader effort to update certification requirements for new aircraft, anticipated to take effect starting next year. He said the agency also is looking at possible enhanced safeguards for Acars and other existing systems on today's fleet of commercial aircraft.

The activity comes amid escalating worries about cyberthreats to commercial aviation in general. Those threats have prompted a variety of government and industry responses, including devising future standards to ensure that any successful hacks will be detected and neutralized.

In addition, the FAA's top outside technical advisory group in September agreed to pay greater attention to cybersecurity threats across the full range of onboard equipment, internet connections and air-traffic-control communications. The updated guidelines are intended to affect areas including aircraft design, flight operations and maintenance practices, among others.

Reuters
Ecuador cuts Julian Assange's internet access
Tuesday, 18 October 2016
Byline: Mark Hosenball

Washington - Anti-secrecy group WikiLeaks said on Monday that its founder Julian Assange's internet was shut down by the government of Ecuador, deflecting blame from the U.S. or British governments which have sparred with Assange for releasing sensitive material.
"We can confirm Ecuador cut off Assange's internet access Saturday, 5 pm GMT, shortly after publication of (Hillary) Clinton's Goldman Sachs speechs (sic)," the statement from WikiLeaks said.

Assange has lived and worked in Ecuador's London embassy since June 2012, having been granted asylum there after a British court ordered him extradited to Sweden to face questioning in a sexual molestation case involving two female WikiLeaks supporters.

WikiLeaks said Assange lost internet connectivity on Sunday night.

"We have activated the appropriate contingency plans," added the Twitter message on Monday. People close to WikiLeaks say that Assange himself is the principal operator of the website's Twitter feed.

The Ecuadoran government offered no immediate comment on the question of internet access, but the country's foreign minister, Guillaume Long, said Assange remained under government protection.

"The circumstances that led to the granting of asylum remain," Long said in a statement late on Monday.

The government of leftist President Rafael Correa has long backed Assange's right to free speech, though the Wikileaks saga has caused some strain in relations with the United States, including the expulsion of diplomats in 2011.

Correa, whose term will end next year, has said he is behind Democratic candidate Hillary Clinton, who he says he knows personally, in the U.S. presidential election.

"For the good of the United States and the world ... I would like Hillary to win," Correa told broadcaster Russia Today last month.

Over the last two weeks, Democratic Party officials and U.S. government agencies have accused the Russian government, including the country's "senior-most officials," of pursuing a campaign of cyber attacks against Democratic Party organizations ahead of the Nov. 8 election.

WikiLeaks has been one of the most prominent internet outlets to post and promote hacked Democratic Party materials. While denying any connection with a Russian hacking campaign, Assange has refused to disclose WikiLeaks' sources for hacked Democratic Party messages.

Sources close to both the Democratic Party and WikiLeaks say they believe WikiLeaks has acquired as many as 40,000-50,000 emails hacked from the personal accounts of John Podesta, the former White House advisor who now chairs Clinton's presidential campaign.

Despite Assange's complaint that his internet connection was cut, WikiLeaks posted on Monday afternoon what it said was a fresh batch of Podesta's emails.

According to a summary of the latest emails posted on Russia Today, a media outlet with close links to the Russian government, highlights include campaign staff discussions about "galvanizing Latino support" and about how to handle media queries about Clinton's "flip-flopping" on gay marriage.

New York Times
British Bank Abruptly Drops Russian Network's Accounts
Tuesday, 18 October 2016
Byline: Neil MacFarquhar, Kimiko de Freytas-Tamura

Moscow - Russia's main English-language satellite network complained on Monday that its British bank was abruptly closing its accounts. The network, which reported on the decision, called it a British-government- sanctioned attempt to interfere with freedom of speech.
It was the latest controversy for the network, RT, originally and still commonly known as Russia Today. The broadcaster presents itself as an alternative to the Western media, but critics call it a Kremlin-financed mouthpiece that seeks to create an alternative to reality.

"Long live freedom of speech!" Margarita Simonyan, the editor in chief of RT, wrote sarcastically on Twitter, adding that the bank had offered no explanation for the step.

The network released a letter from the bank, NatWest, telling the broadcaster to take its business elsewhere. In the letter, the bank said that it would stop serving RT on Dec. 12, that the decision had come after "careful consideration" and that it was not subject to appeal. (The broadcaster initially reported that its accounts had been frozen, but it later clarified that the bank was closing the accounts, not freezing them, and that RT was still able to withdraw its money.)

NatWest's corporate parent, the Royal Bank of Scotland Group, said in a statement on Monday that "these decisions are not taken lightly." "We are reviewing the situation and are contacting the customer to discuss this further," the company said. "The bank accounts remain open and are still operative."

Britain's Treasury said the government was not involved in the bank's decision. "This is a matter for NatWest, not for the government," a spokeswoman said, speaking on condition of anonymity under government protocol. "We as the U.K. government haven't changed the sanctions and obligations related to Russia since February 2015. For that reason, this is a decision that only NatWest has made, possibly based on their own risk appetite."

RT presents itself as an independent and credible alternative to mainstream Western media, but its broadcasts repeatedly show the West as a sea of chaos. Ofcom, the British broadcast regulator, has singled out RT repeatedly for its lack of impartiality.

RT's defense has been that its viewers expect alternative viewpoints.

Maria Zakharova, a spokeswoman for the Russian Foreign Ministry, linked the bank's decision to the June 23 referendum in Britain, when voters opted to leave the European Union, an outcome that has plunged the country into economic and legal uncertainty. "It appears that in leaving the E.U., London has left all of its obligations on free speech behind in Europe," she wrote on Facebook.

In a statement on its website, RT called the bank's decision "incomprehensible and without warning." The network said the decision was part of a pattern in Britain and Europe in recent years to "ostracize, shout down or downright impede the work of RT."

Dmitry K. Kiselyov, the head of RT's parent organization, was placed on the European sanctions list in 2014 over his encouragement of the annexation of Crimea. Barclays, the company's previous bank in Britain, closed its accounts in July 2015.

In Moscow, the management of RT said on Monday that its lawyers were dealing with the banking situation and that the network would remain in operation.

"We have no idea what this is connected with, because nothing new happened to us, and we received no threats -- neither yesterday, nor a day before yesterday, or a month ago," the RBK news website quoted Ms. Simonyan, the editor in chief, as saying.

Jonathan Eyal, assistant director of Russian and European security studies at the Royal United Services Institute in London, said that the bank's action might have reflected concerns over RT's links to the Kremlin. "Certain questions are being raised over the corporation and its sources of funding," he said, "and the bank must have been aware that this is not a happy commercial transaction."

Mr. Eyal noted that some financial institutions had recently faced large fines for handling questionable accounts, and he speculated that NatWest may "prefer the controversy of closing the bank account over dealing with a business that may have tainted money."

Beyond that, he said, the bank may be following a lead, either directly or indirectly, from the United States, which has been weighing its response to Russian hacking of American computers and servers. The bank's action could be a kind of "veiled sanction," he said, aimed at "trying to convey to the propaganda sources that they are increasingly finding their life difficult in the West."

RT started in 2005 as Russia Today, a television network meant to sell Russia abroad through soft features. Very few watched. In 2009, it switched tracks, becoming a snarky anti-West outlet. It changed its name to RT and erased any obvious Russian link.

RT portrays itself as an independent alternative voice. It trumpets the slogan "Question More," yet generally sticks to the same major news that CNN or the BBC is covering.

The difference is less in subject matter than in tenor: On RT, the West is portrayed as grim, divided, brutal, decadent, overrun with violent immigrants and unstable. The network tends to make favorable remarks about Donald J. Trump, the Republican nominee for president; the former CNN host Larry King, who now appears on RT, scored a rare direct interview with Mr. Trump in September.

In RT's coverage, Russia seems to brim with multicultural tolerance; President Vladimir V. Putin is depicted as a modernizing leader protecting Russia's sovereignty with no dreams of empire; and the enormous civilian toll in Syria represents the unfortunate many who are caught in the crossfire as the Syrian government battles terrorists.

Most analysts interviewed by RT toe the line, and any who do not are rebuked. When one analyst recently said on the air that the Kremlin's 2014 annexation of Crimea remained an issue, the questioner quickly cut her off. "Crimea is off the table," he exclaimed, echoing a Putin statement.

In Britain, a study by the Institute for Statecraft found that despite its claims of neutrality in the European Union referendum debate, RT gave an edge to the "leave" camp.

Public accusations about a general Russian bias toward what is known as Brexit grew so loud that the Russian Embassy in London issued a statement saying that Moscow had no position on Britain's place in the European Union.

It is unclear how many viewers RT actually reaches. Figures released by the Broadcasters Audience Research Board in Britain for the week of the Brexit vote, for example, showed that the network had 926,000 viewers in the country, or 1.57 percent of the overall audience.

RT boasts that it is the "most-watched news network on YouTube" with over three billion views. Millions of those hits, however, were for raw disaster footage like the 2011 Japanese tsunami that had nothing to do with RT.

Washington Post
Documents show State Dept. official wanted FBI to change classification of one of Clinton's emails
Tuesday, 18 October 2016
Byline: Matt Zapotosky

Washington - A top State Department official tried to pressure the FBI to change its determination that at least one of the emails on Hillary Clinton's private server contained classified content, prompting discussion of a possible trade to resolve the issue, two FBI employees told colleagues investigating Clinton's use of a private server last year.
One FBI official conceded that he told the State Department employee he would "look into" changing the classification of a Clinton email if the official would lend his authority to an FBI request to increase its personnel in Iraq, according to documents released by the bureau Monday.

Another bureau official described the arrangement as a "quid pro quo" and said he believed that the State Department official, Undersecretary of State for Management Patrick F. Kennedy, was interested in "minimizing the classified nature of the Clinton emails in order to protect State interests and those of Clinton," the documents say.

No tangible swap ever came to pass. The email was classified in accordance with the FBI's original wishes, and the bureau was not given any additional personnel in Iraq. Both the FBI and the State Department denied that a quid pro quo ever existed.

Clinton's use of a private email server while secretary of state has dogged the Democratic presidential nominee's campaign and has proved to be an issue that resonates with voters. The new documents could add to perceptions among voters that Clinton is not trustworthy, and they come with the final presidential debate days away and the election in just a few weeks. The revelation of possible backroom dealing was immediately seized on by her critics.

In a video statement posted to his Twitter page Monday, Republican nominee Donald Trump said: "This is very big, and frankly, it's unbelievable. What was just found out is that the Department of Justice, the State Department, and the FBI colluded, got together, to make Hillary Clinton look less guilty, and look a lot better than she looks. This is one of the big breaking stories of our time, in my opinion. This shows corruption at the highest level, and we can't let it happen as American citizens."

Clinton campaign spokesman Brian Fallon said in a written statement: "It is well known that there was strong disagreement among various government agencies about the decisions to retroactively classify certain material in emails sent to Secretary Clinton. Agencies that took issue with this overclassification did so based on their own beliefs, and we were not part of these disagreements that played out inside the government."

The FBI said in a statement that it had referred the matter to the "appropriate officials for review." The agency did not respond to a message seeking comment on who those officials are. The official at the center of the matter -- who is not named in the documents -- has since retired, the bureau said.

The FBI and the Justice Department declined to bring charges against Clinton for mishandling classified information while she was secretary of state, and FBI Director James B. Comey has repeatedly and forcefully defended that decision. He also has pushed the bureau to be unusually transparent in showing the public how the probe was handled, testifying personally before Congress for hours and releasing hundreds of pages of documents.

The documents released Monday include summaries of more than three dozen interviews with technology company employees, FBI agents and Diplomatic Security officers who worked with Clinton.

The allegation of a "quid pro quo" -- first reported over the weekend by the Weekly Standard -- came from an official in the FBI's records management division, who was relaying an interaction between a colleague in the international operations division and Kennedy.

According to a summary of his interview, the international operations division had been trying to reach Kennedy on an unrelated matter for some months, and Kennedy called back wanting to talk about

Clinton's emails. Kennedy, the international operations official told investigators, said he wanted to change the classification of a Clinton email that was causing problems. The State Department was reviewing the emails for release under the Freedom of Information Act. It had submitted some emails -- all of which were marked unclassified -- for the FBI to review, and the FBI determined that at least one appeared to contain classified information.

Not knowing the email's content, the international operations division official said that he would "look into the email matter if Kennedy would provide authority concerning the FBI's request to increase its personnel in Iraq," according to a summary of his interview. The official seems to have called his colleague in the records management division.

That official told investigators that he had been "pressured" to change the email to unclassified and that Kennedy offered his colleague in international relations a "quid pro quo." It is unclear who first broached the purported deal. As part of his job at the State Department, Kennedy helped Clinton with her BlackBerry, though he has said he was unaware of her private server.

The international operations division official eventually called Kennedy back and told him he could not change the classification of the email, which was related to the attacks on the U.S. Consulate in Benghazi. Kennedy also was allowed to press his concerns with Michael Steinbach, who heads the FBI's national security branch, and Steinbach was similarly unyielding.

According to the documents released Monday, Steinbach told Kennedy the bureau would not change its classification decision, but it would also not discuss the matter publicly. Within an hour of that conversation, according to the FBI documents, the Associated Press published a story in which Clinton denied having sent classified emails on her private server.

Both the FBI and the State Department disputed that their employees had engaged in a quid pro quo. The agencies, though, acknowledged that Kennedy had inquired about the classification of an email, and the FBI said that in the same conversation, a bureau official "asked the State Department official if they would address a pending, unaddressed FBI request for space for additional FBI employees assigned abroad."

The FBI said its official was not a part of the criminal Clinton email investigation.

"The classification of the email was not changed, and it remains classified today," the bureau said in a statement. "Although there was never a quid pro quo, these allegations were nonetheless referred to the appropriate officials for review."

State Department deputy spokesman Mark Toner said in a statement that the allegation of a quid pro quo was "inaccurate and does not align with the facts."

"Under Secretary Kennedy sought to understand the FBI's process for withholding certain information from public release," Toner said. "As has been reported, there have been discussions within the interagency on issues of classification. Classification is an art, not a science, and individuals with classification authority sometimes have different views."

Kennedy did not immediately return an email seeking comment. In his own interview with the FBI, he disputed that he had ever tried to interfere with the Freedom of Information Act process.

The documents released Monday also contain other potentially damaging allegations.

One former Diplomatic Security agent, for example, told FBI investigators that Clinton "blatantly" disregarded State Department security protocols while she was secretary of state. The former agent alleged that Clinton would ride to foreign diplomatic functions with top aide Huma Abedin, instead of the local ambassador, which the agent said violated normal procedure and embarrassed and insulted the ambassadors.

The former agent also said that on an early 2009 trip to Jakarta, Indonesia, Clinton insisted on visiting a troubled area to promote an initiative, despite a request from Diplomatic Security that the visit be scrapped for safety concerns. The agent said Diplomatic Security officials thought the trip placed staff, security agents and even reporters in danger, all for a photo opportunity "for her election campaign."

The Independent (UK)
Cyber crime 'costs UK residents £210 each'
Tuesday, 18 October 2016
Byline: Josie Clarke

London - The UK lost almost £11bn to cyber criminals in the past year, figures suggest. The figure equates to approximately £210 per person over the age of 16 living in the UK, but is only based on incidents registered with the national reporting centre Action Fraud, Get Safe Online and the National Fraud Intelligence Bureau (Nfib).
A survey suggests the actual figure could be much higher, with respondents who had been victims of online crime losing an average of £523 each. More than a third of those who said they had been victims of online crime (39 per cent) said they had not reported the incident. The survey found more than half (53 per cent) had received fraudulent emails or messages which attempted to direct them to websites where their personal information could have been stolen and 28 per cent said they had been contacted by someone who was trying to trick them into giving away personal information. A tenth had had their email or social media accounts hacked.

Of those who said they had been a victim of cyber crime, more than a third (38 per cent) believed that the matter was too trivial to report and 37 per cent said they felt there was nothing that could be done. Get Safe Online's chief executive Tony Neate said: "The fact that the UK is losing nearly £11 billion to

cyber criminals is frightening and highlights the need for each and every one of us to make sure we are taking our online safety seriously. It is clear from our survey that people are very concerned, and rightly so."

"Let's not let cyber criminals get away with it anymore by ensuring that each and every one of us is updating the operating systems of our various devices and ensuring security software is always updated. What's more, we all need to ensure that we have a different password for each online account we own and website we visit. Online safety needs to be part of our everyday routines." The national lead detective for economic crime, Commander Chris Greany, said: "The huge financial loss to cyber crime hides the often harrowing human stories that destroy lives and blights every community in the UK.

"All of us need to ask ourselves are we doing everything we can to protect ourselves from online criminals. Unfortunately, people still click on links in unsolicited emails and fail to update their security software. Just as you wouldn't leave your door unlocked, so you shouldn't leave yourself unprotected online."

Get Safe Online said people should review their passwords to make sure they are strong and not use the same ones for more than one account, check social media privacy settings, update operating systems and software programs or apps if prompted, back up information using "the cloud" and check that internet security software and apps are up to date and switched on.

Iranian Air Force Exercises Electronic Warfare Tactics
Tuesday, 18 October 2016

Tehran - The Iranian Air Force F14 and Mig29 fighters as well as Falcon 50 jets exercised combat operations and electronic warfare tactics on the second day of the massive wargames in the Central province of Isfahan on Tuesday.
"At this stage, the operations to jam simulated enemy radar waves were successfully carried out using electronic-warfare special Falcon 50 jets under a research project named Sayeh (shadow)," Spokesman of the Fadaeeyan-e Harim-e Velayat-6 wargames Brigadier General Massoud Rouzkhosh said Tuesday.

"Also, the F14 and Mig29 fighter jets successfully exercised combat situations in a real-like battle scene in the operations," he added.

The Iranian Air Force kicked off 3 days of military drills in Central Iran on Monday.

A variety of Air Force fighter jets, fighter bombers, transport planes, reconnaissance aircraft, drones and refueling planes took part in the military exercises today.

The drills started at the order of Lieutenant Commander of the Iranian Air Force Brigadier General Alireza Barkhor.

In recent years, Iran has made great achievements in the defense sector and gained self-sufficiency in manufacturing essential military hardware and defense systems.

Yet, Iranian officials have always stressed that the country's military and arms programs serve defensive purposes and should not be perceived as a threat to any other country.

The Iranian Air Force displayed several squadrons of its operational fleet in an air show on the national Army Day in April.

Different types of fighter jets and fighter bombers took part in the air show staged over the mausoleum of the Founder of the Islamic Republic, the late Imam Khomeini, South of the capital Tehran.

The home-made 'Saeqeh' (Thunderbolt) fighter jets as well as F4, F5, F7, F14 and Mig 29 fighter jets in several squadrons flew over the sky of Southern Tehran.

Aerial refueling operation was also conducted by a Boeing 707 refueling tanker aircraft to an F4 and two F14 fighter jets during the air show.

Also, different helicopters, including Chinook, Cobra 206 and Cobra 214 flew over the military parade zone.

International Business Times (UK)
The Snoopers' Charter 'should terrify us all' says former MP
Tuesday, 18 October 2016
Byline: Jason Murdock

London - A former MP who previously sat on the Home Affairs Select Committee has spoken out against the incoming Investigatory Powers Bill - called the Snoopers' Charter by critics - which he brands a deeply intrusive piece of surveillance legislation "that should terrify all of us."
Dr Julian Huppert, a lecturer at the University of Cambridge and former Liberal Democrat politician, claimed the bill has avoided any real public debate or scrutiny and slammed its proposals as a "real threat" to technology firms operating in the UK.

"Some of the powers in the Bill are deeply intrusive, and with very little possible justification. All of us want to be safe, and protected from terrorists and the like - but the evidence that these powers are all needed is thin indeed. However, the cost to all of our privacy is huge," he wrote on OpenDemocracy.

The Investigatory Powers Bill (IPBill) contains a number of proposals aimed at bulking up surveillance powers open to the UK intelligence agencies MI5 and GCHQ, while allegedly increasing the oversight regime available to the politicians at Whitehall.

The more controversial aspects of the law include forcing technology firms to store internet metadata for 12 months, the massive collection of Bulk Personal Datasets (BPDs) and the bulk retention of communications data from phonecalls and text messages.

According to Huppert, who once worked to kill a previous snooping charter (the Draft Communications Data bill), many problems have persisted over the years. Indeed, even a number of political committees have slammed the latest proposals for lacking clarity.

"The political divide of the future won't just be left and right. It is also between a liberal, internationalist, open, tolerant view of the world, and a closed, nationalistic, authoritarian approach," he wrote. "We should all be very worried that both the government and the opposition have gone for the latter."

Many of the powers included in the bill - which the UK government claims are not new and already in use by British spooks - were exposed by former NSA whistleblower Edward Snowden back in 2013. At the time, he branded the UK's GCHQ as "worse than the US" over its use of the Tempora programme.

"There are many other problems with the legislation - real threats to tech companies in the UK, risks of inappropriate interference with telecoms equipment, pervasive bulk powers, far too little oversight, and a huge bill," said Huppert.

"25 October is the crucial date. That will be the third reading of this legislation. If the House of Lords let it go through, then there is nothing more to do to stop this. There will be the quaint process of parliamentary ping-pong to tidy the last few words up, but from then on, the state will have powers to monitor your behaviours on and offline to a far greater extent than ever before."

Nevertheless, with the sunset clause on the current surveillance law expiring in December 2016, the government appears to want the legislation in place as soon as possible. Sources familiar with the matter have previously told IBTimes UK the bill - at least in the intelligence community - is widely expected to pass.

As the next debate date quickly approaches, a new court judgement was disclosed which found UK surveillance agencies including GCHQ and MI5 collected communications data "in secret" and without the necessary oversight in place for over a decade.

Released by Privacy International, and detailed in a court judgement, the campaigning group called the ruling "one of the most significant indictments of the secret use of the Government's mass surveillance powers since Edward Snowden first began exposing the extent of US and UK spying in 2013."

Solicitor Mark Scott, who worked with Privacy International during an unprecedented legal challenge, said: "[The] judgement confirms that for over a decade UK security services unlawfully concealed both the extent of their surveillance capabilities and that innocent people across the country have been spied upon."

It World Canada
Snowden says Trudeau afraid to kill anti-terrorism bill
Wednesday, 19 October 2016
Byline: Howard Solomon

Whistleblower. Hero. Traitor. Patriot.
These words and more have been used to describe former cybersecurity contractor Edward Snowden, who in 2013 copied and distributed thousand of documents to reporters and whose stories of Western intelligence agencies -- including Canada's Communications Security Establishment (CSEC) -- shook the world.

This morning Snowden told the the annual SecTor cyber security conference in Toronto that Prime Minister Justin Trudeau want to amend the controversial Bill C-51 anti-terrorism law and not repeal it because he "is afraid of being attacked for being soft on terrorism."

Speaking by video from Russia, where he fled to avoid prosecution by U.S. authorities, Snowden said the legislation, needs three fixes: First, a judicial body should have oversight over federal intelligence agencies that has the power to prosecute authorities that have broken the law. Second, because intelligence agencies are trading personal information of citizens "like baseball cards" citizens should be told if the data sharing hasn't led to an arrest for criminal activity. And finally, what Snowden called the criminalization of speech through vague definitions of terrorism should be taken out of C -51.

A lot of what police call terrorism is the activity of what he called "common criminals" or those who are trying to make a political point but don't constitute a "super criminal threat."

He also said that governments are "lazy" for demanding software vendors put backdoors into their systems that can be accessed by law enforcement or intelligence agencies with a warrant. Any backdoor can also be access by a government like China, he said.

He also offered several ways people can better secure their personal information. Corporations should work for their customers first, not governments, he said, so they should only hold personal records for as long as they need and not indefinately.

He also said that in addition to following the usual safe online practices citizens should talk about government surveillance and civil rights with their families and friends and support civil rights organizations.

Snowden is a polarizing person.

"No doubt about it: Edward Snowden opened the windows and let the sun shine in on government surveillance," tweeted Canadian privacy expert Ann Cavoukian last month. On the other hand. Also last month the U.S. House of Representatives intelligence committee issued a 36 page report into his illegal

downloading of classified documents that called him a "disgruntled employee." The vast majority of the documents he stole had no connection to privacy or civil liberties, the report said. "Snowden's actions did severe damage to U.S. national security, compromising the Intelligence Community's anti-terror efforts and endangering the security of the American people as well as active-duty U.S. troops."

Since his revelations legislators and intelligence agencies in a number of Western countries -- including Canada have been sensitive to explain what kind of personal information they've been collecting and why, although a number insist they have lawful authority and the need to confront terrorists. While the new Liberal government has issued a consulting paper on new legislation to change the controversial Bill C-51, critics complain the discussion paper frames the debate in terms that give little doubt the government is leaning towards the police.

For example, it repeats Canadian police claims that "without specific legislation designed to permit access, law enforcement and national security agencies have had difficulty getting timely and effective access to BSI (basic subscriber information)" since the Supreme Court said they need a search warrant. There are also complaints the proposed intelligence oversight mechanism isn't independent or very powerful.

The last time Snowden spoke about this country was in 2015 when he spoke by teleconference to Canadian reporters. He criticized Canada for having one of the weakest intelligence agency oversights among Western Nations. However, he didn't comment directly on Bill C-51, saying it was up to Canadians to decide what was best.

Over the years he has made a number of statements about how the public and private sectors should face security. He's called for end to end encryption in all forms of messaging, for the protection of citizens, arguing that it would force spy agencies to focus on suspicious people rather than vacuuming up data from thousands of people at a time.

CBC News
Chinese billionaires take interest in Canadian clean technology
Wednesday, 19 October 2016
Byline: Katie Simpson

Canadian clean technology companies could be the next major investment for China's business elite. But cyber-security experts and the opposition are warning that the keen interest from Chinese investors must be treated carefully.

"For us at the moment, natural resources is not the top priority," said Wang Chaoyong, the chairman and CEO of ChinaEquity, one of the country's most successful independent venture capital firms.

"We are more interested in investing in environment technology, clean tech [and] innovative sectors such as creative industries," Wang said in an interview with CBC News.

The investment mogul is part of a delegation from the elite China Entrepreneur Club, which is touring Canada to get a closer look at potential investments.

The group, which is often called China's club for billionaires, met with Prime Minister Justin Trudeau on Tuesday.

"Canadian product, brand and innovative design are very popular in China, so we see the synergy between the Canadian product and the Chinese market," Wang said.

He explained his firm is looking to become a minority stakeholder in companies with products or systems that could be successful in China's massive market.

Wang said he's noticed a new spirit of willingness for economic co-operation between China and Canada.

"At the moment, I think we see the Chinese government and the Canadian government are doing a lot of work to help us."

'Attractive target'

According to a report by Ottawa- based Analytica Advisors, Canada's clean technology sector is made up of nearly 800 companies employing about 55,000 people.

The industry is expected to grow, as countries around the world become more environmentally conscious.

But because the industry is still developing, one cyber- security expert says Canadian companies could be vulnerable to hacking attacks.

"It's very much a new industry, and they can get in at the ground floor," said Keith Murphy, the CEO of Defence Intelligence, an Ottawa based cyber-security firm.

"It makes for a very attractive target," Murphy said.

Murphy said he understands Canadian businesses want to grow their companies, but owners should be wary of major investments from Chinese firms.

"Especially with a lot of the history we've seen with Chinese businesses, they've been used to attack the Canadian government, Canadian citizens, Canadian businesses in the past. And certainly the U.S. has fallen victim to this as well."

In 2014, Chinese state-sponsored hackers were accused of breaking into the computer system of Canada's National Research Council. The Chinese government adamantly denied the claim.

Former technology giant Nortel said extensive cyberattacks by Chinese spies played a role in the company's downfall.

Security checks in place, Ottawa says

As the federal government tries to strengthen ties with China, it is also downplaying concerns about investment and security.

"There's a well- established Canadian process for dealing with these issues under the Investment Canada Act with all of the appropriate safeguards in place," said Public Safety Minster Ralph Goodale.

"Canada's a country that welcomes foreign direct investment. Obviously, it needs to be a net benefit to Canada and all the security requirements need to be met. The procedure is there already in the law to deal with that," he added.

The opposition is warning the government to move slowly and to vet foreign investors carefully, for all sectors.

"We should ... do a little due diligence on the history of these individuals, how their billions were acquired, their relationships with state-owned industries in China," said Conservative foreign affairs critic Peter Kent.

"Canada is open for business, and should be open for business. But I think we have to be very careful about who is doing the buying and how that purchase will look down the road in terms of the Canadian economy and Canadian security interests."

Toronto Star
Toronto man detained after flying drone in Cuban square
Wednesday, 19 October 2016
Byline: Alicja Siekierska

Toronto - As Chris Hughes lay in the dark two-by-two-metre cell, with no electricity, a small hole in the wall for a window and just a hole in the ground for a toilet, he wondered if his wife Grace and three young children knew he was still alive.

"Nobody knew I was there," he said. "I had disappeared. I thought, my family must think I'm dead."

On Sept. 30, a few days before the Canadian man found himself in a Cuban detention centre, Hughes had flown a drone above the Plaza de la Revolucion in Havana.

A photographer with a media business in Toronto, Hughes said he had been travelling through the Americas, previously going to Panama and Colombia. He had brought a drone with him, which he used to shoot photos and videos. He said he did not have any issues using it the drone in other countries, and no problems bringing it in through Cuban customs on Sept. 28.

But two days later, the drone proved to be a significant problem.

Hughes said he and a Cuban friend and tour guide were questioned by police about the drone at the Plaza de la Revolucion, a historic square home to the Cuban administration. The pair was taken to a police station, where Hughes said they were interrogated for around 12 hours. He said he was brought to his rental apartment to pick up his clothes, and then brought to a detention centre, where he would remain for nearly two weeks -- but never charged.

Global Affairs confirmed that consular officials at Canada's embassy in Havana provided services to a detained Canadian citizen. "To protect the privacy of the individual concerned, further details on this case cannot be released," Global Affairs spokesperson Austin Jean said in an email.

The Star reached out to the Policia Nacional Revolucionaria office near the plaza, but was referred to a Havana-based immigration office. A receptionist at that number told the Star police was "not to give any information by phone." Another official advised the Star to submit requests through the Canadian Embassy in Cuba.

Hughes said he was held at what appeared to be an immigration detention centre and was again interviewed by Cuban authorities. Based on the questions, he believes Cuban authorities thought he was a spy.

After Hughes' wife hadn't heard from him in three days, she decided to alert the Canadian embassy. She said they were able to locate him after making contact with the family of his Cuban companion.

She then paid for Orlando Ismael -- a friend and project manager of Hughes' business -- to fly from Canada to Cuba to try to find answers.

Ismael, who arrived in Havana on Oct. 6, said he went to the police station at the plaza and was told about a detention centre for foreigners. He said officials at the detention centre confirmed Hughes was there and that he was arrested for flying a drone in the square. Although he briefly saw Hughes, Ismael was not able to speak with him at length.

Hughes said that the fifth or sixth day of his detention -- "I didn't know exactly how long I'd been there" -- he was able to meet with a woman from the Canadian embassy.

But it wasn't all good news; he said she told him the government had to let the investigation play out. "The investigator had told me that if I'm found guilty on any level, or if they find out I'm working with the American government, that I'll spend the rest of my life in jail," Hughes said.

Then, on Oct. 11, Hughes said he was brought into a room, asked to review the contents of his bag and informed that the following morning he would be taking an 8 a.m. flight back to Toronto. The next day, he was at Pearson International Airport, being embraced by two of his children and his wife.

"This whole thing felt like something out of a movie," his wife said.

Although it was harrowing, Hughes said he understands why he was detained, and doesn't begrudge Cuban authorities. He plans to return one day -- he said authorities told him he is welcome to come back.

"If you're under your mother's roof, you play by your mother's rules," he said. "My issue with the whole thing is that I had no clue whether I was going to be there for 13 days or 13 years. I just didn't know what was going to happen."

CBC News
Rigorous rules proposed for recreational drone flyers, documents show
Wednesday, 19 October 2016
Byline: Ashley Burke

Transport Canada is proposing that anyone flying a drone bigger than a tiny toy should have to register their devices, pass a knowledge test and pay for liability insurance, CBC News has learned.
Through an access to information request, CBC obtained the proposed regulatory framework for unmanned aerial vehicles (UAVs) that were sent to Transport Minister Marc Garneau in April 2016.

The department is proposing that anyone operating a drone weighing more than 250 grams, including recreational users, should fall under more rigorous regulations expected to be introduced in 2017.

"The proposed floor for very small UAVs is intended to minimize the risks to persons, based on the speed and potential lethality," the briefing note says. It adds that even "very small" drones can travel quickly and impart so much energy upon impact that there is a 30 per cent "likelihood of lethality."

'Just getting too strict now'

The department's plans are "overkill," said drone user Nick Howe.

"I think it's just getting too strict now."

Howe spent more than $2,300 on his recreational drone, including special parts, and has travelled across Canada making videos to showcase aerial views of the country online. Just because some people are acting irresponsibly doesn't mean all recreational users should have to pay the price, he said.

"It just means more money I'm going to have to spend," said Howe, who also started producing videos for real estate companies. "It's a lot more of a hassle than anything."

Safety concerns

Transport Canada staff began looking into regulations for drones in 2010. Since then, the industry has boomed, prompting safety concerns.

"We need to regulate that to make sure that we don't have a disaster," said Aaron McCrorie, Transport Canada's director general of civil aviation, in an interview. "The recreational users are going to have to meet more stringent safety requirements now."

McCrorie has seen a dramatic increase not only in the number of people buying drones, but also the number of users flying them dangerously close to airplanes and buildings.

In 2010, the department investigated one incident. In 2016, the department has investigated 82 potential infractions as of Sept. 1.

"We do have instances of these things crashing into vehicles, for example, so there has to be some means of accounting for the cost of those damages," McCrorie said, emphasizing the need for liability insurance.

Age restrictions

Transport Canada is also considering age restrictions for drone users, as exists for pilots. The department is proposing a minimum age of 14 to operate a very small drone and a minimum of 16 to operate a drone heavier than one kilogram, according to a briefing note from April.

The government also plans to stop regulating based on recreational versus commercial use. The new model is based on how much potential risk a drone could cause based on its weight and where it's flown, according to Transport Canada.

But recreational drone user Andrea Robertson believes 250 grams is "far too low" to fall under the new regulations.

Robertson, known as Lady Drone on YouTube, is afraid of heights, so she flies a Phantom drone to live the experience through her camera. She's glad there are new regulations coming and agrees drones can be dangerous, but has concerns about finding insurance to cover her if there's an accident.

"Because I'm a hobbyist, not a commercial flyer, I haven't been able to find any insurance companies that will provide insurance," Robertson said. "The insurance companies, at this point, are only interested in commercial fliers."

'Less red tape' for commercial users

Meanwhile, the proposed regulations could mean a lot less red tape for those using drones for commercial use, such as making real estate videos or inspecting construction sites. Instead of having to reapply at least every year for a certificate to fly drones commercially, it could get a lot easier.

"You go through the process once and then you'll have a licence just like having an automobile licence," said Mark Aruja, chairman of the Board for Unmanned Systems Canada, a group that co-chaired the working group to help develop the regulations.

"The expectation is we'll have less red tape going forward," added Aruja. "But there will be a significant bar to meet in terms of getting that operating licence."

Transport Canada launched consultations in 2015 and received more than 100 written submissions. Staff members are currently drafting the regulations that could still change, and working to develop the necessary licensing and exams before the regulations come into effect, likely sometime in 2017.

Press TV
Iran Air Force conducts e-warfare drills
Wednesday, 19 October 2016

Tehran - Iran's Air Force has successfully conducted electronic warfare as part of large-scale three-day military drills in the central province of Isfahan.
The e-warfare exercises were held on Tuesday, the second day of ongoing drills codenamed Fada'eeyan-e Harim-e Velayat 6 (The Devotees of the Velayat Sanctuary 6).

Brigadier General Massoud Rouzkhosh, the spokesman for the maneuvers, said the Air Force used advanced communications systems and secure wireless or wire-connected networks, flight apparatus systems, and tactical systems during the drills.

The application of deceptive jamming methods against mock enemy radars were among the electronic warfare tactics employed by Falcon 50 aircraft on the second day, he said.

Later through the day, interceptor F-14 aircraft conducted aerial surveillance and other operations, while F-14 and MiG-29 fighters engaged in dogfights.

The drills also deploy domestically-built Sa'eqeh, F-4, F-5, and Sukhoi Su-24 jets, transport aircraft and unmanned aerial vehicles, as well as a wide range of projectiles, including smart bombs and laser-guided missiles.

Rouzkhosh said among the maneuvers' points of strength were the amplification of the force's firepower and the enhancement of its precision targeting capabilities.

Iran says its military might poses no threat to other countries, stating that its defense doctrine is based on deterrence.

Bangkok Post
Cyberattacks growing threat to industry
Wednesday, 19 October 2016
Byline: Suchit Leesa-nguansuk

Bangkok - The growing adoption of intelligent automation and control systems in industry has made them a prime target for cyberattacks, says a pioneer in automation control serving industrial processes worldwide.
Cybercriminals are also using advanced methods to attack mission-critical systems, targeting critical infrastructure such as electricity and oil and gas plants.

"We've seen this trend coming since 2010 -- the industrial sector becoming one of the most targeted for cyberattacks," said Safdar Akhtar, business development director for Industrial cyber security of Honeywell Process Solutions, a division of Honeywell International Inc.

Stuxnet, a malicious computer worm discovered in 2010, specifically targets programmable logic controllers, which allow the automation of electromechanical processes such as those used to control machinery for factory assembly lines, amusement park rides or centrifuges that separate nuclear material.

In 2012, the worm's malicious activity served as a wake-up call to the energy industry, especially for potential security breaches at oil and gas companies.

Cybersecurity has since been recognised as a critical element for automation control systems in industrial sectors, especially outdated control systems whose vulnerabilities may not be known, said Mr Akhtar.

In addition, he stressed that the proliferation of the Internet of Things, which involves factory machines and industrial goods coinciding with the increased adoption of cloud computing technology, poses massive challenges for industrial companies.

He said plants can reduce the known risks by building private- owned cloud computing environments that can help prevent security problems, as they can limit access to cloud management functions.

Honeywell Process Solutions has expertise in automation control systems, providing industrial cybersecurity solutions and services including cybersecurity assessment and risk manager, a real-time data collection and analytic software platform that continuously monitors the process control system for indications of cyber security risks. The company has secured over 1,000 industrial cyber projects globally, he said.

Honeywell is targeting a wider range of industries including refining and petrochemical, oil and gas, chemicals, power generation, minerals and mining, and pulp and paper.

Honeywell has recruited at least 10 more cybersecurity experts for the group's operating units in Asia-Pacific.

The surge of cybersecurity threats has driven up demand for the cybersecurity workforce to increase by 10 times, said Mr Akhtar, adding that the industry needs 6-12 months to fill the positions. Thailand is an important market for Honeywell as it is a manufacturing base in Southeast Asia, he said.

The government's policy to push the development of a digital economy and Industry 4.0 are also increasing the country's already-high potential. Furthermore, cybersecurity has become a national priority for policymakers.

New York Times
Ex-F.B.I. Official Acknowledges Role in a New Clinton Email Controversy
Wednesday, 19 October 2016
Byline: Eric Lichtblau, Steven Lee Myers

Washington - A former F.B.I. official at the center of the latest controversy over Hillary Clinton's private emails acknowledged on Tuesday that an offer to swap favors with a State Department counterpart on an email classification issue had originated with him -- until he realized the deal involved Mrs. Clinton and the 2012 attack in Benghazi, Libya.
"When I found that out, all bets were off; it wasn't even negotiable," the former F.B.I. official, Brian McCauley, said in a telephone interview.

Republicans have seized on the episode to accuse the State Department of trying to protect Mrs. Clinton, but Mr. McCauley's account could undercut those attempts because he said he, not the State Department, had suggested the "quid pro quo."

Mr. McCauley recounted in the interview that Patrick F. Kennedy, a senior State Department official, called him in spring 2015 looking for help in getting the F.B.I. to agree not to classify the disputed email. Mr. McCauley said he had agreed to try to help him if Mr. Kennedy would help him get the State Department to restore two spots that the F.B.I. had lost recently in the Baghdad embassy.

"I'm the one that threw that out there," Mr. McCauley said of the offer. He said that he was concerned the two vacant posts posed a security risk at the embassy, and that the offer was typical of how federal agencies "help each other and work with each other."

In that initial conversation, Mr. McCauley said, "it was a quid pro quo; I don't deny it."

Mr. McCauley said he had quickly reversed himself, however, after calling another F.B.I. official and learning that the email in question involved the Benghazi attack -- a political cudgel for Republicans against Mrs. Clinton.

At that point, Mr. McCauley said, he abandoned any thought of exchanging favors and called Mr. Kennedy immediately to tell him that he could not help. "It was off the table; the quid pro quo was not even close to being considered," Mr. McCauley said.

His account was largely consistent with that of Mr. Kennedy, who made his first public comment on the controversy in a written statement put out on Tuesday by the State Department, a day after the email episode emerged in new documents released by the F.B.I.

The F.B.I. documents did not identify Mr. McCauley; The Washington Post first identified him and interviewed him about his account on Tuesday.

Mr. Kennedy, who also did not identify Mr. McCauley in his statement, said he called the F.B.I. official for help last year because he "wanted to better understand" why the bureau wanted to classify a portion of the Benghazi email before its release to the public.

Like Mr. McCauley, he said the issue of the F.B.I.'s positions in Baghdad had come up in the conversation, but he said that there had never been an implicit or explicit offer to exchange favors.

"At no point in our conversation was I under the impression we were bargaining," he said, adding that in nearly four decades in the Foreign Service, he served Democratic and Republican administrations. "My motivations were never political," Mr. Kennedy said.

He said he did not believe the information should be classified as "secret," but should instead be redacted, or blacked out, on the grounds that it contained information related to a continuing investigation.

"We take very seriously our responsibility to decide whether our documents are classified or not classified," Mr. Kennedy said. "We can't simply cede that responsibility to another agency."

Mr. McCauley said he remembered Mr. Kennedy's telling him in their initial phone conversation that he wanted to redact part of the email on different grounds so it could be "buried in the basement" of the State Department.

But State Department officials denied any intention to bury the email. In the end, the State Department accepted the bureau's argument and released the email with a sentence redacted as secret because it related to the F.B.I.'s Clinton email investigation.

Even so, Republicans continued to focus on Mr. Kennedy's handling of the emails. Donald J. Trump, for a second day, said on Tuesday that Mrs. Clinton's email server was a scandal "worse than Watergate." Representative Robert W. Goodlatte of Virginia, the chairman of the House Judiciary Committee, asked the Justice Department on Tuesday to open a criminal investigation into Mr. Kennedy and his role in the purported quid pro quo.

"Under Secretary Kennedy's attempt to barter away American national security interests for plainly political purposes is appalling and may rise to the level of a federal crime," Mr. Goodlatte wrote in the letter.

President Obama, appearing with Prime Minister Matteo Renzi of Italy at the White House, dismissed the controversy over the F.B.I. documents when asked if it disturbed him.

"Based on what we have seen, heard, learned, some of the more sensational implications or appearances, as you stated them, aren't based on actual events and based on what actually happened," he said, "and I think derive from sort of overly broad characterizations of interactions between the State Department and the F.B.I. that happen a lot and happen between agencies."

Mr. McCauley saw the episode in much the same way.

Mr. Trump and other Republicans, he said, "are grasping at straws."

"There was no political motivation in this at all," he added.

Mr. McCauley retired from the F.B.I. last summer after 35 years because of a medical issue. He said his retirement was unrelated to the email episode.

F.B.I. officials said that while they had referred the quid pro quo accusation to their inspections branch for an ethics review as a matter of policy, the issue had become moot because Mr. McCauley left the bureau. State Department officials said they had not conducted an internal review because they had seen no basis for one.

The Intecept
Ecuador Cuts Internet Access for Julian Assange to Preserve Neutrality in U.S. Election
Wednesday, 19 October 2016
Byline: Robert Mackey

Washington - The government of Ecuador confirmed on Tuesday that it had decided "to temporarily restrict access" to the internet inside its embassy in London, effectively cutting off Julian Assange, the editor of Wikileaks, who has lived there since he was granted political asylum in 2012.
Assange first reported on Monday that his internet connection had been "severed by a state party," and the organization was forced to resort to a back-up plan to continue its work.

"The Government of Ecuador respects the principle of non-intervention in the internal affairs of other states," the statement said. "It does not interfere in external electoral processes, nor does it favor any particular candidate."

As The Intercept reported in August, since Wikileaks began publishing emails hacked from the accounts of Democratic party officials, the site's editor has been accused of attempting to undermine Hillary Clinton's campaign for the presidency.

While a founding principle of Wikileaks was that its editors would not know the identity of those who supplied them with documents, the U.S. Intelligence Community said earlier this month that it "is confident that the Russian Government directed the recent compromises of emails" later provided to the site, in order "to interfere with the U.S. election process."

Intelligence officials have not disclosed evidence to support their attribution of responsibility to Russia, but private cybersecurity experts who investigated the hacking of the Democratic National Committee's servers pointed to what they called strong circumstantial evidence.

The communique released by Ecuador on Tuesday said that the country "does not yield to pressure from other states," but Wikileaks claimed to have learned from unnamed American sources that a request to shut down Assange's work had come from Secretary of State John Kerry.

Wikileaks most recently published emails hacked from the Gmail account of the Clinton campaign chairman, John Podesta, which included partial transcripts of paid speeches Clinton gave to Wall Street bankers after her tenure as secretary of state.

Ecuador's president, Rafael Correa, told the Russian government's news channel RT last month that a victory for Clinton would be better for the United States, and the world, but a Trump win could produce benefits for left-wing parties in Latin America.

"Obviously, for the U.S., it would be better if Hillary won. I know her personally and have a great deal of respect for her," Correa told RT.

"But, seriously, Trump would be better for Latin America," he continued. "When did progressive governments come to power in Latin America? With Obama or with Bush? Bush's primitive policies were rejected so much that it caused reaction in Latin America. Trump would do the same: maximize the contradictions."

"So, for the good of the U.S. and the world, and because of my personal esteem for her," Correa concluded, "I want Hillary to win."

New York Times
Ecuador Cuts Assange's Link to the Internet
Wednesday, 19 October 2016
Byline: Steven Erlanger, David E. Sanger

London - Ecuador said Tuesday that it had cut off Julian Assange's access to the internet in his exile in the country's London embassy, making clear that it feared being sucked into an effort to "interfere in electoral processes" in the United States by the activities of the WikiLeaks founder.
Ecuador said that it was not evicting Mr. Assange from its embassy, where he sought asylum four years ago. It said that its "temporary restriction" of internet services to Mr. Assange "does not prevent the WikiLeaks organization from carrying out its journalistic activities."

But it was clearly intended to keep the embassy from being the control center for that leaking operation. "The government of Ecuador respects the principle of nonintervention in the affairs of other countries," it said in a statement, "and it does not interfere in the electoral processes in support of any candidate in particular."

The internet cutoff was the latest twist in the odd tale of Mr. Assange's self-imposed exile, which began in 2012 when he sought refuge from a Swedish rape investigation that he said was a cover for an American effort to extradite him. Since then, his world has shrunk to a single apartment inside the small diplomatic compound in central London. He has communicated through the embassy's internet connections, visitors and, presumably, cellphones that would give him another form of internet access.

Ecuador's decision was the first sign that the government in Quito was beginning to wonder if its guest in London was overstaying his welcome.

It doubtless was considering the possibility that, should Hillary Clinton prevail in the United States election next month, it would have to explain its role as host to the man who, by remote control, appears to have coordinated the publication of emails purloined from people close to Mrs. Clinton, along with those of the Democratic National Committee and other organizations.

The announcement came a day after WikiLeaks said that Mr. Assange's connection to the internet had been severed shortly after the organization published speeches that Hillary Clinton gave to Goldman Sachs, the global investment firm. The transcripts, the latest in a series of disclosures, appear to have come from the hacked email account of John D. Podesta, the chairman of her campaign and a White House chief of staff when Mrs. Clinton's husband was president.

The statement clearly sought to separate Ecuador from the decision by WikiLeaks to publish Mr. Podesta's emails and, before that, those hacked from the national committee and elsewhere. In recent weeks, Mr. Assange, once the hero of the American left for exposing classified State Department and Pentagon documents, has been hailed by Donald J. Trump and his advisers for disclosures from Mrs. Clinton's campaign, which Mr. Trump has used almost daily to fuel his attacks on her.

American intelligence agencies have said that the D.N.C. hack was the work of the Russian government and had to be approved at the highest levels of the Kremlin. But it is unclear how the documents made it to WikiLeaks, which has never said where the emails came from, if it knows.

Only hours before Ecuador's announcement, WikiLeaks charged that Secretary of State John Kerry quietly urged the Ecuadorean government, in a meeting late last month, to stop Mr. Assange from publishing the emails or interfering in the election. The State Department issued a statement declaring that the reports were untrue.

Ecuador's action, experts inside and outside the United States government say, is not likely to slow the flow of leaked emails. Those emails are routed through servers around the globe, and if the United States wanted to shut them down covertly, that presumably would have happened years ago.

In fact, American officials have said, turning off the flow of WikiLeaks data is a legally complicated issue, especially if American citizens or American-based firms are involved. The Obama administration, they say, does not want to be accused of suppressing unwelcome speech -- in the manner of the Russians and the Chinese.

Efforts to reach WikiLeaks on Tuesday were unsuccessful. A sometimes spokesman, Kristinn Hrafnsson, did not return messages, and a telephone message and an email message to Sunshine Press, which represents Mr. Assange, were also unanswered.

Mr. Assange has insisted he does not know the source of the WikiLeaks material, though he has made no secret of his distaste for Mrs. Clinton. The United States government has said that much of the hacking was the work of Russian intelligence and was part of a broad effort to influence the election. So

far, the White House has not announced how it will respond, though several options have been discussed with President Obama, according to administration officials.

On Sunday, in a taped interview broadcast on NBC's "Meet the Press," Vice President Joseph R. Biden Jr., in what was either a warning or an effort at psychological warfare, said that "we're sending a message" to the Russians "at a time and place of our choosing" and that President Vladimir V. Putin will "know it" when the message arrives. That seemed to suggest some kind of covert action, perhaps a cyberstrike, in retaliation for what the American intelligence community has described as a broad and unprecedented effort by a foreign power to influence American voters.

It is possible that Ecuador feared that, because of its decision to give exile to Mr. Assange, it risked becoming a witting or unwitting participant in an effort at voter manipulation.

WikiLeaks provided no evidence to support its claim that Mr. Kerry had pressured Ecuadorean officials, during a private meeting in Colombia last month, to clamp down on Mr. Assange, and the State Department's spokesman, John Kirby, immediately denied the accusation. "Reports that Secretary Kerry had conversations with Ecuadorean officials about this are simply untrue. Period," he said.

The president of Ecuador, Rafael Correa, is a man of the left, and he recently told the Kremlin-backed broadcaster RT that he would support Mrs. Clinton.

At the same time, he suggested in the interview that a victory by Mr. Trump, who has made no secret of his admiration for Mr. Putin, would be good for Latin America because it would, paradoxically, bolster leftist parties.

"I sincerely believe that it would be better for Latin America if Trump won," Mr. Correa said. "When did progressive governments come to power in Latin America? During the Bush administration. His primitive policies were rejected so much that it caused reaction in Latin America. Trump would do the same."

Questions to the Ecuadorean Embassy on Tuesday were met with a reference to the embassy's website and a brief statement.

"In view of recent speculations, the government of Ecuador reaffirms the validity of the asylum granted four years ago to Julian Assange," the statement said.

Mr. Assange is the subject of an arrest warrant in Sweden, which wanted to question him about allegations of rape and sexual abuse dating to 2010, to decide whether or not to bring charges.

Mr. Assange, saying that he feared extradition to the United States on espionage charges stemming from the publication by WikiLeaks of secret documents given to the website by the former Army analyst Chelsea Manning, broke bail and took refuge in the Ecuadorean Embassy in June 2012. He has been in the tiny embassy since.

Given the statute of limitations, the one allegation Mr. Assange still faces in Sweden is rape. He is wanted for questioning but has not been charged.

There is no public indictment in the United States of Mr. Assange; if Sweden chose not to press charges, he would presumably be free to leave the embassy.

Feds need clarity on cyber structures
Wednesday, 19 October 2016
Byline: Shaun Waterman

Washington - The federal government needs to get its act together on cybersecurity, and there needs to be a public debate about the proper role for agencies like the Department of Homeland Security and the National Security Agency, public and private sector leaders said Tuesday.
"We really need to define what we want our government to do in cybersecurity, former Rep. Mike Rogers told an audience at FedScoop's FedTalks. "We have lots of capability. The NSA has lots of capability," he told a packed auditorium in Washington at the annual event.

By giving DHS, rather than NSA, the lead in defending civilian government networks and working with the private sector to protect the nation's vital industries, the U.S. had "take[n] our best players off the field," complained Rogers, who chaired the House Permanent Select Committee on Intelligence.

"Candidly," Rogers said, that decision "was politically driven and not policy driven. People were a little nervous about having NSA ... dealing directly with them" and their networks -- even companies that had a prior relationship with the NSA or the Pentagon were nervous.

Despite the ongoing furor over the government's role in protecting the private sector from foreign state-sponsored cyberattacks, speakers said there wasn't clarity about the respective roles of the intelligence and law enforcement in the cybersecurity space.

There is an inherent difference in -- even conflict between -- the missions of intelligence, law enforcement, and network defenders in the federal cybersecurity space, RSA President Amit Yoran said in a morning keynote.

Intelligence agencies "watch ... and want to keep watching," malicious actors in cyberspace, Yoran said, whereas law enforcement want to watch only to gather evidence to prosecute them. Meantime network defenders "may not care at all who attacked them," he said.

"We need more clarity about roles, responsibilities and authorities between agencies," Yoran concluded.

"We have not yet fully engaged -- on the public side -- [in a discussion about] what we want our government to do. How engaged do you want the NSA to be in defending private sector networks?" Rogers added.

Is DHS the agency that should be in the lead [in cyber defense] in the US, given the level of threats? We could probably debate that for an hour and a half," he said.

Rogers said that while working on cyber threat information sharing legislation in the last congress, the intelligence committee had conducted a great deal of outreach to the private sector to see who they would prefer to deal with in the government when it came to cybersecurity.

"Candidly ... we did not find one example of someone saying yes, I want to deal with DHS," he said.

Another example of an unresolved issue, speakers said, is the dual-hatted job that Adm. Michael Rogers has as director of the NSA and commander of U.S. Cyber Command.

"This structure is now over six years old," Adm. Rogers said, joining the former Congressman of the same name for a cybersecurity chat at FedTalks.

"The reason we got this structure is, we were building Cyber Command and we wanted to harness the ... significant investments the Department of Defense had already made in cyber .. at the NSA," Adm. Rogers said.

There have recently been moves, both in Congress and in the executive branch, to separate the two jobs, and give Cyber Command its own commander.

"My position has always been, this is the right thing to do at the wrong time," said Adm. Rogers, adding "It's a reflection of the maturation of Cyber Command that we're even having this discussion."

"The challenge is: What's the right time, what's the right process, so that [we do it] with minimal risk," he concluded.

"I have candidly been going back and forth on this issue," said Rep. Rogers, who chaired the House Intelligence Committee. "The only thing I worry about is [if we split it up] does Adm. Rogers [of cyber command] have to talk to Director X of NSA to perform the same function he does today. If we can't eliminate that question then I'm not sure I can support it."

"We probably don't have this right just yet," he finished.

Yoran called out the General Services Administration's FedRAMP cloud security certification process as a successful effort to raise the cybersecurity bar in the federal government.

"It was painful at first, but it is driving security requirements into next generation of [IT] infrastructure," he said.

Reuters
Czech police arrest Russian man in connection with US hacking attacks
Wednesday, 19 October 2016
Byline: Staff report

Prague - Czech police have detained a Russian man wanted in connection with hacking attacks on targets in the United States, the police said, without giving further details.
The arrest was carried out in cooperation with the US Federal Bureau of Investigation, Czech police said on their website on Tuesday (Oct 18) evening. Interpol had issued a so- called Red Notice for the man, seeking his arrest, they added.

The Russian citizen was detained at a Prague hotel. Police said he collapsed and was hospitalised. Czech courts will decide whether he will be extradited, the police said.

A police spokesman declined to give further details on the arrest. It was not immediately clear what hacking attacks the Russian citizen was wanted for.

The US government this month formally accused Russia for the first time of a campaign of cyber attacks against Democratic Party organizations ahead of the Nov 8 presidential election.

Russian President Vladimir Putin has said a hacking scandal would not be in Russia's interests.

CNN.com
Ex-CIA chief: Russian hackers trying to 'mess with our heads'
Wednesday, 19 October 2016
Byline: Nicole Gaouette

Washington - A former head of the CIA said Tuesday that Russian hacking of US political groups is intended to "mess with our heads" and shake confidence in the American electoral system -- rather than influence the outcome on Election Day.
Retired Gen. Michael Hayden said that he doesn't believe Russian President Vladimir Putin is trying to sway the election in favor of Republican nominee Donald Trump, but using the hacked information to disrupt the electoral process.

"This is too much of a carom shot for Putin to think he knows where that ball's going to end," Hayden said, speaking at the Heritage Foundation in Washington. "I think they're doing this to mess with our heads, to erode confidence in our political process."

Hayden, also a former director of the National Security Agency and now with the Chertoff Group, was discussing cyber security challenges facing the next administration.

Russia's suspected cyber attacks fell into the category of normal state spying, Hayden said, until Moscow "weaponized" the information.

"My definition of what the Russians did is, unfortunately, honorable state espionage," Hayden said. "A foreign intelligence service getting the internal political emails of a major political party of a major foreign adversary? Ah, game on. That's what we'd do."

Hayden said it's "good spy stuff" for a country to try to learn "how much of those platform positions the potential president-elect believes in personally, or doesn't."

That "is good spy stuff, that's stuff we go for all the time," Hayden said.

But then, Hayden said, Moscow's conduct "went beyond espionage" and crossed a line.

First, by using "Russian criminal gangs as a way to create a little distance from the Russian state and the actual actors," Hayden said.

Second, to take internal emails "and then begin to use them to influence the American election, well, that's quite a different matter," Hayden said. "And in our terminology, that has now moved from an espionage activity to a covert or not very covert influence operation."

The Obama administration has pointed the finger at Russia for hacking attacks on the Democratic National Committee and certain targeted individuals, saying it blamed "Russia's senior-most officials."

WikiLeaks has been releasing thousands of emails daily from Hillary Clinton's campaign manager John Podesta, an embarrassment and distraction for the campaign. US officials familiar with the investigation have told CNN that there's mounting evidence Russia is supplying WikiLeaks with the hacked emails.

The hacks have become a campaign issue with Clinton's team accusing the Russians of interfering on behalf of Trump, who has showered praise on Putin.

The Trump campaign has strongly rejected the charge that the Kremlin is looking to boost it.

WikiLeaks founder Julian Assange has made clear his desire to see Clinton lose the election.

The administration has promised retaliation, which Vice President Joe Biden said on NBC's "Meet the Press" Sunday would be covert.

"The message -- he'll know it," the vice president said, referring to Putin. "It will be at the time of our choosing and under the circumstances that have the greatest impact."

Hayden said he hoped the administration wouldn't be too subtle about using its cyber power.

"I hope that we've impressed upon bad actors that actions have consequences," he said, "and that we've demonstrated our will to use our weapons."

Inside Defence (US)
Rogers: 'We're working our way through' process to split NSA- CYBERCOM roles
Tuesday, 18 October 2016
Byline: Marjorie Censer

Washington - Adm. Mike Rogers, the chief of U.S. Cyber Command and the National Security Agency, said today he is thinking through the "right time" and "right process" to split the roles he holds. Speaking at a FedTalks event in Washington, Rogers said the idea behind the shared role was for CYBERCOM, in its early days, to harness the "insight, capabilities and knowledge" of NSA.

Now, he's asking: "Are the assumptions that we made still accurate? Have things changed? Is the environment different?"

The challenge in splitting the roles, Rogers added, is "what's the right time, what's the right process so that we do it in a way that enables both organizations to fulfill their missions with minimal risk?

"So we're working our way through that process," he continued. "In the end, this is a decision that the president of the United States is going to make, and we'll see where that process takes us."

Speaking on the same panel, Mike Rogers, the former Republican representative from Michigan, said the decision should be based on effectiveness, not on budgets.

"I heard the argument even when I was chairman [of the House Permanent Select Committee on Intelligence] that it's muddling the resources," he said. "I don't believe that should be our problem."

Ultimately, the former congressman added, he's focused on "does Adm. Rogers have to talk to Director X at NSA to perform the same function he does today?"

Financial Times
Social media: Challenging the jihadi narrative
Tuesday, 18 October 2016
Byline: Madhumita Murgia, Hannah Kuchler

London - On a sweltering September afternoon in a packed auditorium at Kingston College in south-west London, Humza Arshad is holding a crowd of more than 100 teenagers spellbound. Wearing a padded jacket and a woolly hat despite the heat, he tells the students that he has come to talk about radicalisation and extremism -- "a light topic for a Thursday afternoon", he jokes.
About a quarter of the audience raise their hands when asked if they are Muslim; all seem transfixed by the speaker, best known for playing a hapless south London Asian immigrant on his YouTube series Diary of a Badman.

Mr Arshad, 31, starts with a bit of dark humour, pointing to a photo of gun-toting terrorists -- and then reeling off the names of his cousins. Next, the face of a 15-year-old Bangladeshi girl in a hijab fills the screen and a murmur ripples across the room. Some recognise her as Shamima Begum, the straight-A student from east London who left her home in February last year bound for Syria. Shamima and her two friends, labelled the "jihadi brides" by the tabloids, ended up in Raqqa, an Isis stronghold. They have never returned.

"No one would ever have thought something like that would happen to them and it made me realise that if it can happen to a family like that, it can happen to anyone," he tells the crowd. "Imagine if this was your sister or best friend and she disappears."

Mr Arshad is one of a growing group of digital media stars who use YouTube videos, Facebook posts, tweets, photos and standup comedy to counter the barrage of extremist propaganda online -- particularly from social media-savvy terrorist groups such as Isis. His YouTube series, which tackles issues facing Muslim youth in London, has been watched more than 73m times. One video, "I'm a Muslim, not a terrorist" has been screened in more than 100 schools around the UK by the police.

"A lot of girls were being brainwashed by these guys online, on Facebook and Twitter, so I had to do something," Mr Arshad says.

Muslim content creators like Mr Arshad have been embraced by Google, Facebook and other tech companies, which have faced attacks from critics for what they see as their failure to effectively monitor and remove terrorist content. A report published in August by the UK parliament's home affairs committee accused tech groups of "undermining" counter-terrorism investigations by refusing to hand over potential evidence.

This embrace of so-called counter-speech goes beyond Silicon Valley: after seeing limited success with their own propaganda efforts, the US departments of justice and homeland security, the European Commission and the British government are all recruiting documentary filmmakers and university students to produce compelling, shareable content to battle the jihadi message. The US state department also this year launched the Global Engagement Center to counter Isis propaganda.

Tools of indoctrination

The Isis social media machine appears to have been diminished since mid-2015, but its presence on Twitter, YouTube and other sites has been the terrorist group's most powerful tool of persuasion, particularly in Europe and the UK. It has a 24/7 media wing, with five official video production houses. "Many say if it were not for the internet there would be no Islamic State," says Yasmin Green, head of research and development at Jigsaw, Google's think-tank that has been analysing radicalisation online.

While social media companies are keen to promote their efforts in this area, its effectiveness in preventing terrorism is unproven.

"It would be fair to say we are in a primitive stage. It's fantastic that Facebook or Google are sponsoring one or two projects, but that doesn't give you enough data to make viable statements about whether counter-speech works or not," says Professor Peter Neumann, founder and director of the International Centre for the Study of Radicalisation and Political Violence in London.

In particular, it is unlikely to change the behaviour of hardcore converts. "If someone has made up his or her mind and you then try to counter their view, it could produce a response known as reactance -- actually causing them to become even more resolute in their opinions because you are challenging their beliefs," Prof Neumann says.

"So it's not about counter-speech being good or bad, it has to be aimed at people in a particular stage of their decision-making. It has to be easy for these people to search out when they are googling different points of view."

Until now, taking down objectionable content has been the primary weapon in the battle against online extremism. Social media groups' complete control of user accounts means even governments are dependent on them to respond to urgent requests.

The major social platforms all rely on users to report inappropriate content, although Facebook and Google say they proactively take down accounts associated with known terrorists. "When we become aware of an account supporting terrorism, we look at their friends, and associated accounts, so we can remove them," says Monika Bickert, head of public policy at Facebook.

Twitter announced in mid-August that it had suspended 360,000 terror-inciting accounts since mid-2015, with the number of daily suspensions up 80 per cent. Account suspensions also rose in the aftermath of the terrorist attacks in Brussels in March and Nice in July.

But experts believe this is merely a temporary disruption to the extremists' efforts. In many cases when radical accounts are taken down, they either migrate to encrypted sites like Telegram or WhatsApp, or pop up with new accounts on the same sites. On Twitter, Isis propagandists openly boast about their 30th and 40th Twitter handles. "You can disrupt extremists and divert them, but you can't censor your

way out of that conundrum," says Prof Neumann. "It's an incomplete and ultimately ineffective strategy."

The UK parliament's home affairs committee went further in its report, accusing social media groups of "consciously failing" to prevent their sites from being used for terrorist propaganda. The committee's members said it was "alarming" that the tech companies have only a few hundred employees monitoring networks with billions of accounts.

Sophisticated propaganda

The Isis media operation publishes video and audio files, religious treatises and magazines every week, according to Zahed Amanullah, head of counter narratives at the Institute for Strategic Dialogue, a London think-tank.

"More importantly, the messaging is so well-designed: they have German expats speaking to Germans, British foreign fighters recruiting their peers. They have reach that they have never had before," Mr Amanullah says. "The migration of foreign fighters from Europe and Britain is a direct result of the sophistication of this propaganda."

Sensing that they were losing the propaganda war, business leaders from Silicon Valley, Madison Avenue and Hollywood gathered at the Department of Justice in February to watch and learn from Isis' videos.

The executives were not shown the videos of beheadings and burnings, but the sophisticated soft-focus marketing deployed by Isis to recruit young western Muslims. Designed to be shared on social media, the videos show Isis members giving treats to children -- candyfloss is handed out in videos targeted at Americans and Nutella in those hoping to lure Europeans. John Carlin, assistant attorney-general at the DoJ, appealed to content creators for help. "The most creative minds came up with this technology," he said. "Can you think up a way to stop this appalling nihilist group from doing this?"

Facebook invested 1m in a Berlin-based initiative in partnership with the ISD to spur creativity in this area, and Google has held eight counter-speech workshops this year on how to make compelling YouTube videos. Twitter has worked with the UK's Media Diversity Institute to develop a guide on how to challenge hateful views.

Another initiative has been developed by EdVenture Partners, a non- profit organisation. It runs a counter-speech competition in 150 universities around the world. Since its launch, 130,000 students from Afghanistan and Istanbul to the Netherlands have competed to design the most creative and effective counter-speech campaign, ranging from hashtags to short videos.

One campaign by a team of Afghan students called "Islam says no to extremism" reached more than 5m people on Facebook alone.

Under their skin

One of YouTube's earliest offerings, an animated series starring a fictional working-class Londoner called Abdullah-X, was put together by a former Islamist extremist and animator, who asked not to be named. Abdullah- X is not targeted at a general audience, like Mr Arshad's satirical comedy, but aimed squarely at people sympathetic to extremism.

One video, "Five Considerations for a Muslim on Syria", uploaded in March 2014, hit a nerve. "Within six weeks, we reached 50,000 people in our target audience, people literally typing 'I want to go to Syria' in Google search got the video in front of them," says Mr Amanullah of the ISD, which has worked on the Abdullah-X project.

Isis operatives issued an explicit 5,000-word line-by- line rebuttal, including arguments supporting the need for violence. "Islam is a tradition of jihad?...?and there will not cease to be jihad until the day of judgment," it said.

For Mr Amanullah, the response was a sign that the message was working. "It got under their skin," he says.

The Jigsaw pilot programme targeted vulnerable people by their search history, showing them ads on Google that led to a curated playlist of Arabic- and English- language YouTube channels. The clips include stories from ordinary people about the reality of life under Isis, and a soldier's first-hand narrative of what it was like to fight.

"I realised I had been sent to my death by Isis," a former fighter says in a video. "I was a victim. Apart from many other things I feel deceived."

More than 300,000 people watched the videos within two months. The playlists were clicked on almost four times more frequently than a regular ad campaign. Viewers watched more than 1.5m minutes of the videos. "That suggests a significant impact," says Ms Green.

Social media companies clearly have an incentive to promote counter- speech: governments are threatening the very openness that their users treasure, unless they are seen to be fighting terrorism on their platforms. But individuals such as Mr Arshad -- the people governments and social media groups hope can be the drivers of counter-speech online -- do not come with a bigger agenda.

"I'm not a politician, I don't want to pick a side," Mr Arshad says after the Kingston College show. "I just wanted kids to stop blowing themselves up."

The Hill

US denies asking Ecuador to cut off Internet to WikiLeaks
Tuesday, 18 October 2016
Byline: Katie Bo Williams

Washington - The State Department is emphatically denying that it asked the Ecuadorian Embassy in London to disconnect Julian Assange's internet connection to prevent more leaks of information about Democratic presidential nominee Hillary Clinton.
"While our concerns about WikiLeaks are longstanding, any suggestion that Secretary [John] Kerry of the State Department were involved in shutting down WikiLeaks is false. Reports that Secretary Kerry had conversations with Ecuadorian officials about this are simply untrue. Period," State Department spokesman John Kirby said.

Earlier Tuesday, WikiLeaks tweeted, "Multiple US sources tell us John Kerry asked Ecuador to stop Assange from publishing Clinton docs during FARC peace negotiations," referring to the Marxist rebel group in Colombia.

"The John Kerry private meeting with Ecuador was made on the sidelines of the negotiations which took place pricipally [sic] on Sep 26 in Colombia," WikiLeaks tweeted.

FARC signed a historic peace deal with the Colombian government on Sept. 26, which Colombian voters narrowly rejected in a referendum vote that has left the future of the peace process uncertain. Kerry was involved in the two-year negotiations over the deal.

Assange's internet was disconnected on Saturday, according to WikiLeaks. The anti- secrecy platform has been publishing daily batches of emails stolen from Clinton campaign manager John Podesta's email account. It has continued to do so even after Assange's claim of losing Internet access.

While Ecuador is aligned with the left-wing wave that dominated South American politics in the 2000s, Colombia is the United States's closest ally in the region.

Ecuador is reaffirming its decision to provide protection to the WikiLeaks founder, who has lived in the embassy in London since 2012.

"Faced with speculation of the last hours, the government of Ecuador reaffirms the validity of granted asylum to Julian Assange four years ago," the government said in a short statement on Twitter. "We reaffirm that the protection of the Ecuadorian state will continue while the circumstances that led to the granting of the asylum remain."

Assange is avoiding a rape charge in Sweden that he claims is political and will lead to his extradition to the U.S. over previous leaks.

The U.S. has not issued an indictment against Assange, despite widespread outrage after WikiLeaks published thousands of diplomatic cables leaked by former Army Pvt. Chelsea Manning.

The Ecuadorian Embassy did not address Assange's access to the internet.

Wired (UK)
Keeping Britain safe: how GCHQ's new cyber security agency will protect us from hackers
Tuesday, 18 October 2016
Byline: Matthew Reynolds

London - The Doughnut - GCHQ's vast, Cheltenham-based nerve centre - is a building straight from the pages of a spy novel. Its imposing circular walls are surrounded by fences topped with razor wire and multiple vehicle checkpoints. Visitors are seldom allowed inside the building which, Edward Snowdon's NSA leaks, is the centre of government mass surveillance in the UK.
The intelligence agency's latest spin-off, the National Cyber Security Centre, couldn't look more different. Occupying two floors of a commercial office block in Victoria, London, the NCSC is shedding its parent agency's secretive persona in favour of a more collaborative approach. There's even going to be a Shake Shack on the ground floor.

"NCSC as an organisation is going to be open by default," says Ian Levy, the NCSC's technical director. The fledgling agency only opened its doors on October 3, but it's already started its task of keeping the public and the UK's critical national infrastructure safe from cyberattacks launched by states, organised crime gangs and lone-wolf hackers.

For Levy, partnerships with the UK's cyber security community will be key to keeping the country safe online. To this end, 20 per cent of the new building has already been set aside for collaborative working. "We don't know what that means yet, but we know that you won't have to have a top secret security clearance to sit there," he says. "You coming to see me in the NCSC will be about as much of a ballache as me coming to see you."

Announced by then-chancellor George Osborne in November 2015, the NSCS is the first government agency devoted solely to cyber security. It will be responsible for keeping the public and private sectors informed about emerging cyber threats and making sure they are protected against an ever-growing number of cyber attackers. Heading up the NCSC is Ciaran Martin, former director general cyber at GCHQ.

High-profile hacks have barely left the headlines in 2016. In April, 11.5 million confidential documents taken from Panamanian law firm Mossack Fonseca were leaked to German press, sparking a chain of public protestations that eventually led to the resignation of the Icelandic Prime Minister, Sigmundur Davíð Gunnlaugsson. In July, almost 20,000 confidential emails sent by the Democratic National

Committee were published by WikiLeaks after a cyber attack for which the US Department of Homeland Security pinned the blame on the Russian government.

For Levy, however, all hacks can be boiled down to a software problem - and software vulnerabilities can always be fixed if they're caught soon enough. "If you actually look at what [hackers] do, very few of them - a vanishingly small number of them - are actually using advanced techniques," he says. "A lot of the attackers we see, including nation states, are using vulnerabilities from five years ago." Instead of worrying about who exactly the attackers are, Levy wants his agency to get on with managing the impact that their attacks could have.

"If we work together we can fix a lot of this stuff at scale," says Levy. One of the NCSC's starting points will be cracking down on fake emails and phishing scams which cost the UK public £174 million in 2015 alone. For over fifteen years the government has told citizens not to click on suspicious links, or open mail from senders they don't recognise, but, Levy says "as a piece of advice that's pretty dumb." There's no way to make sure people understand or act on that information and as malicious spam has gotten more frequent and sophisticated, this well-meaning advice has hardly made a dent in the growing number of people becoming victims of online fraud.

So the NCSC has decided to do something about it. Dmarc, which stands for domain-based message authentication, reporting and conformance, allows domain owners to set tight controls over what kinds of emails are sent from their own addresses, with the intention of cutting out on malicious emails that appear to originate from official organisations. Just one day after applying dmarc to the domain .gov.uk, the number of fake emails sent from @gov.uk tumbled by 50,000. "We're going to make government use dmark on every single government domain," Levy says. "And everything we say industry should do we're going to do to government first."

The NCSC will set cyber security standards for UK industry and business, but governmental departments are going to become critical testing grounds where, as with dmarc, cyber security innovations are tried and tested before being recommended to the country at large. "The NCSC doesn't run on hype. It runs on data. Everything we do we want to be able to generate data from it," Levy says. "And by default we're going to publish all that data."

Open data and collaborative working are unlikely to be the first phrases that spring to mind when people are asked to think about GCHQ, but, Levy points out, if his agency is to become the leading authority in UK cyber security, it has to start building public trust sooner rather than later. "The way of doing that is by being transparent and honest," Levy says. Part of that process will mean drawing a line in the sand between GCHQ and the NCSC. "Don't judge us on the way that we've been as our precursor organisations, as part of CESG, GCHQ, CPNI and MI5," Levy says.

For most of the past three decades or so, the damage caused by cyber attacks has mostly been limited to reputations and wallets. They've brought national infrastructure to its knees, exposed government atrocities and embarrassed CEOs of countless companies, but they've seldom - if ever - killed someone.

But imagine if, in the future, the software within one driverless car - or ten million driverless cars - was hacked so that its brakes no longer functioned above a certain speed. The FBI has already warned car owners about the risks of car-hacking, and it's entirely possible that in the future cyber attackers will be going after a lot more than just our data.

The biggest battle for the NCSC, then, might not be against attackers themselves, but the fear they create which limits how ready people are to accept new technologies. "If you're going to take machine learning and AI and have these things make decisions for you, the public need to be much more confident in their understanding of security," Levy says, "you're not going to do that with the fear that's currently out there."

ITAR-TASS World Service
Moscow says still no evidence from US proving alleged Russian hacker attacks
Tuesday, 18 October 2016
Byline: Staff report

Moscow - Moscow has received no evidence from the United States proving Russia's alleged hacker attacks on US institutions, Russian Foreign Ministry Spokeswoman Maria Zakharova said on Tuesday. "There have been no proof, do data, no passwords, no hyperlinks. Nothing," she said.

Washington's inability to provide any proof can only mean that such allegations target domestic audience and are part of the presidential campaign, she said, adding that attempts at reducing the presidential campaign to accusations against Russia are inglorious for a great power. "It is a global disgrace," she said.

Earlier WikiLeaks released on its website hacked emails from the Democratic National Committee. Hillary Clinton accused Russian hackers. US Director of National Intelligence James Clapper also suggested Russia was behind the hacks. Kremlin has repeatedly denied accusations.

National Post
Heeding the cyber-threat
Thursday, 20 October 2016
Section: editorial

A U.S. think tank recently suggested that North Korea could have enough material to produce up to 100 nuclear warheads by 2020. Rand Corp. says the country can already deliver nuclear weapons by aircraft or ship, and is testing missiles able to reach targets in Canada or the U.S.
It's a frightening prospect. Rand is taken seriously enough in Washington to be awarded a recent $509-million Homeland Security contract to bolster anti- terrorism activities. But you would search in vain for a serious discussion of the threat amid the avalanche of talk on the U.S. campaign trail. The Obama administration, which Democratic presidential candidate Hillary Clinton served in as secretary of state, has taken a largely hands-off approach, urging China to use its influence on North Korea's erratic dictator, Kim Jong-un. Republican presidential candidate Donald Trump has employed his usual shallow bluster, claiming, "There's a 10 per cent or 20 per cent chance I could talk him out of having his damn nukes, because who the hell wants him to have nukes?" The absence of sober debate is unfortunately typical of a political culture that pays too little attention to transformative geopolitical threats and too much to reality-TV spats and trendy activist preoccupations.

The U.S. government has been busy on the North Korean nuclear file for decades, including striking a deal under president Bill Clinton that helped win Jimmy Carter a Nobel peace prize. But other than prizes, it has little to show for its efforts. Pyongyang may be a greater threat to peace today than it has ever been, to the point Rand also warns both Japan and South Korea are "losing faith in the U.S. nuclear umbrella" and pondering programs of their own.

It is not widely appreciated how seriously cyber-attacks and rogue nuclear states threaten global stability. To call the modern world highly dependent on computer networks is a drastic understatement. Yet even at the highest levels, security is far from adequate.

The Pentagon has suffered major cyber-security breaches, as have top administration officials, the Internal Revenue Service, the Central Intelligence Agency director and even the National Security Agency, to say nothing of major banks, retailers and Internet giants like Yahoo, plus the Democratic National Committee. It has become increasingly evident that someone - whether a foreign power or rogue institution - is doing its best to interfere in the U.S. election. Yet the fact that Hillary Clinton is likely to be elected president after illegally using an insecure private email server while secretary of state tells you the issue it still not the priority it should be in the halls of power.

Without electronic communications, our power grid and food distribution systems would collapse in a matter of days. Even routine household dealings would be quickly paralyzed without email or electronic banking. A determined cyber-attack could shut down power plants, while a few wellplaced nuclear warheads could, by creating electromagnetic pulses, devastate computer networks over hundreds of kilometres and fry the electronics in our vehicles in the process.

It is astonishing how blithely we have disregarded massive evidence that the Internet is desperately insecure. Security breaches are treated more as a temporary nuisance, rather than evidence that the underpinnings of personal privacy, economic reliability and national safety are under a threat that can be resisted only as long as cyberdefences can stay one step ahead of cyber-attackers.

As has often been observed, politics is in danger of becoming just another arm of entertainment, able to hold the people's attention as long as it can keep them amused and diverted. Never has that been more so than in recent elections, in Canada and the U.S. alike, where optics, social media and the personalities of the candidates command far more attention than the vital matters for which the winner will be responsible. Every issue that arises during an election is important to someone, but progress is much more difficult in a society unable to guarantee its security and the basic infrastructure that keeps democracy in working order. Ours is a society that is easily distracted, and we are in danger of being distracted from the thing that matters most: the defence of the country and culture we've built, and which is the first responsibility of the people we elect.

Globe and Mail
Is your company's IT prepared for an attack by ransomware?
Thursday, 20 October 2016
Byline: Michael J. Armstrong and Tejaswini (Teju) Herath

Op-ed: October is Cyber Security Awareness Month and started with tantalizing reports that Internet giant Yahoo was secretly searching customer e-mails on behalf of American spy agencies.
But in recent press releases from the FBI, Ontario Provincial Police and Interpol, it is the soaring frequency and sophistication of ransomware that is highlighted.

Typical hackers obtain their illgotten gains by stealing valuable data such as credit-card numbers or passwords. They then find customers to buy that data.

Ransomware hackers instead sell data back to the owners. If ransomware infects your computer, it encrypts your files to render them inaccessible until you pay a ransom. This simplifies cybercrime by replacing theft with extortion.

This summer, ransomware forced the University of Calgary to pay $20,000 to unlock its employee e-mail system. And last month, a U.K. software services provider reportedly paid $31,500 to decrypt one of its servers.

Since CryptoLocker, a program that targets computers using Microsoft Windows, first appeared in 2013, ransomware attacks have soared. Cybersecurity firm Kaspersky Lab found ransomware on 50,000 corporate computers in 2015, double that of 2014.

The FBI estimated more than $209-million was paid in U.S. ransoms in the first three months of 2016, versus only $25million for all of 2015. Check Point Software reported a 30per-cent increase in ransomware attempts in August alone.

A survey of 540 international firms conducted this summer by Osterman Research on behalf of anti-ransomware provider Malwarebytes found that nearly 40 per cent had paid ransomware in the previous year.

About 37 per cent of ransom demands fell between $1,000 and $10,000, and 25 per cent exceeded $10,000. Canadian managers apparently felt the most confident about countering ransomware; but once infected, Canadian firms were three times more likely to pay the ransom.

Ransomware's sophistication is growing alongside its frequency.

Ransomware "worms" such as ZCryptor can spread themselves across networks, rather than needing a ride on infected e-mails.

Some ransomware specialists are selling their services to organised crime. This crime-as- aservice business model allows criminals to outsource their technology needs.

What might come next? Imagine ransomware combining with state- sponsored hacking. Host countries might give, or sell, permission for ransomware hackers to attack rival countries' computers. These cyberprivateers could plunder commerce abroad, without the host country's direct involvement. Think of regional rivals like Israel and Iran, or North and South Korea.

The Internet of Things might expose physical targets to ransoming. Control systems for factories and utilities are increasingly online. What if ransomware locked them out? If businesses begrudgingly pay thousands to recover e-mails, imagine what they'd pay to restart assembly lines.

Or how about virtual protection rackets? Instead of one-time ransoms to remove encryption, users might be "convinced" to pay ongoing fees for the "service" of avoiding encryption.

To defend themselves, computer users need to do the basics.

Run antivirus programs to detect threats. Keep operating systems and applications updated. Think before clicking on unexpected e-mail attachments.

Users should also backup files regularly. If ransomware strikes, backups allow ransom-free system recovery. But keep them on removable drives, to prevent their infection too.

Infected users can also try decrypting files with tools from sites like NoMoreRansom.org.

But these might work only on the simplest cases.

Software makers should do more to facilitate these safecomputing practices. For example, Windows now offers selfupdating antivirus protection by default. That's great, but unfortunately the system also makes it harder to create backups on removable drives.

Business insurers could also play a role by requiring that corporate systems be updated and backed-up to qualify for coverage.

Because ransomware ignores borders, law enforcement needs to co-operate across jurisdictions. Last month's InterpolEuropol Cybercrime conference was a good step in this direction.

If foreign hackers can effectively "tax" domestic businesses, ransomware will become a national security issue. So governments may need to negotiate agreements similar to those covering seaborne piracy.

Finally, firms might consider keeping key systems physically disconnected from the Internet, as some military computers always have been. Just because anything can be online doesn't mean everything should be.

Remember, there are all kinds of yahoos out there.

Government falling behind in clearing Phoenix payroll backlog by Oct. 31 deadline
Thursday, 20 October 2016
Byline: Chloé Fedio

Ottawa - The federal government all but confirmed it will not meet its self-imposed Oct. 31 deadline to deal with a backlog of Phoenix payroll issues despite doubling down on the promise just two weeks ago. Marie Lemay, the deputy minister in charge of the file, said the government is "tracking a bit behind," with 30,000 out of more than 80,000 cases still unresolved with less than two weeks to the deadline.

Lemay said the "bulk" will be cleared in time but that some of the most complex cases -- those requiring "time-consuming, manual calculations" -- might not.

"We're still driving for the 31st. We're going to give it our best shot," she said during a Wednesday afternoon update on the payroll mess. "We continue to make progress but we still have much work to do."

When the Phoenix payroll system was introduced across the country, employees began reporting problems. The government acknowledged in July that more than 80,000 public servants had reported trouble with their pay, with the majority being underpaid. Others were overpaid or not paid at all.

Some cases "date back several years" and require more research, said Lemay.

"It is important to note that we're focused on speed, as well as care. We must make sure that we're not creating new problems by solving old ones."

The government's deadline is for dealing with the cases filed by federal workers before June -- not new cases filed later.

The government has also committed to dealing with new, high priority cases within two weeks of a claims, and new priority cases within six weeks of the claims.

849 new priority cases

When the Phoenix payroll system was introduced across the country, employees began reporting problems. The government acknowledged in July that more than 80,000 public servants had reported trouble with their pay, with the majority being underpaid. Others were overpaid or not paid at all.

Lemay said during the last update on Oct. 5 that the government had resolved 38,228 cases and was "on target" to meet the Oct. 31 deadline. On Wednesday, she said an additional 12,824 cases had been resolved, for a total of more than 51,000 cases closed.

Since the last update on Oct. 5, Lemay said there have been 894 new priority cases. Those cases were prompted by employees going on maternity or parental leave, or employees leaving the public service.

"The majority of these employees are still receiving their salary but have yet to be transitioned to employment insurance or pension," she said, adding that these priority cases would be addressed within six weeks.

There have also been 79 new cases that are not considered high priority -- all of which have been resolved or will be resolved by the next pay period, she said.

Wednesday's technical briefing is the first since Rosanna Di Paola, the bureaucrat who oversaw the Phoenix pay system for years, was shuffled into another role at Public Services and Procurement Canada.

Lemay said Di Paolo has "worked diligently to launch Phoenix over the last three years," and remains a member of her executive team.

Ottawa Citizen
Government payroll woes likely not fixed by Oct. 31
Thursday, 20 October 2016
Byline: Kathryn May

Public Services and Procurement Canada will likely miss its promised Oct. 31 deadline to clear the backlog of pay problems caused by the federal government's bungled Phoenix payroll system, says the department's top bureaucrat.
Deputy Minister Marie Lemay confirmed Wednesday the department will have problems meeting the target because the remaining cases are older and more complicated than the front end of the pile and require more manual inputting and updating of information than originally expected.

She said the department is "driving" to clear the backlog but is braced for about 15,000 cases to remain after the deadline. As of Wednesday, the department had resolved the pay problems of about 62 per cent of the people caught in the backlog, which began with 82,000 cases.

"We are still driving for the 31st," Lemay said. "We're going to give it our best shot but ... the transactions in there are complex ones, so what we see that might happen is we might be left on the 31st with a number of transactions of the same nature, very complex."

The pay centre in Miramichi, N.B., already had a backlog of 40,000 cases when the government decided to go live with the first Phoenix rollout in February. Lemay was unable to say how many of the remaining cases came from that pre-Phoenix backlog.

The Oct. 31 deadline was the date Public Services had hoped to start the transition to what it calls a "steady state," with the bugs worked out and Phoenix running smoothly.

On the last payday - two weeks ago - Lemay insisted: "We believe we are on target and will clear the backlog by Oct. 31."

On Wednesday, however, she admitted she had no idea when Phoenix would be working "flawlessly" or operating in what she calls the steady state.

Public Services Minister Judy Foote said she is disappointed about the missed deadline but is "contented" with the work that has been done.

She said the government will keep the more than 200 compensation advisers hired to clear the backlog until "all issues" around Phoenix are resolved.

"The fact we have the majority of cases taken care of is good news. But I know there are still some people facing hardships and that bothers me. But we are going to continue to work hard to clear up the entire backlog."

Lemay said only about 30 per cent of transactions are now being handled within the service standards set by the department. She said the department had 79 new cases on Wednesday of public servants who did not get paid as they should have been.

They are the government's priority and will be paid before the next payday, Lemay said.

She said the number of people facing problems linked to leave jumped dramatically this week to 894, largely because of a surge in the number of people going on maternity and paternity leave. Their problems should be addressed within six weeks, she said.

Federal unions have increasingly voiced skepticism about meeting the Oct. 31 target, accusing the department of "playing with numbers."

The government's commitment only included the cases of the 46 departments, covering about 191,000 employees, that sent their pay transactions for processing at the pay centre in Miramichi by the end of June.

The other 55 departments manage their own compensation with in-house pay advisers but have also faced Phoenix glitches. It's unclear how many of these cases are outstanding or when their problems will be fixed.

Debi Daviau, president of the Professional Institute of the Public Service of Canada, said she believes the backlog is much bigger than 82,000 cases that accumulated by the end of June. She said new cases sent to Miramichi since July have problems, too, but they are sitting in a queue and are not considered part of the backlog.

"There is whole other backlog going on there that no one knows anything about," Daviau said.

Daviau said some of her members have complained their cases are being partially resolved, which takes then offthe backlog. The remaining problems have to be refiled and are handled as new cases.

The Phoenix pay system was rolled out to 300,000 public servants working in 101 departments and agencies, in two waves: one in February, the second in April. From the start, employees began reporting problems, which the government downplayed until July, when it acknowledged that thousands of employees had had problems.

Public Services opened a temporary pay centre in Gatineau, a new call centre and several other offices, and recruited more than 200 temporary pay advisers to clear the backlog.

Globe and Mail
Phoenix pay backlog likely won't be fixed this month
Thursday, 20 October 2016
Byline: Michelle Zilio

The federal government is warning that it is probably going to miss its self-imposed Oct. 31 deadline to resolve all problems related to its new Phoenix payroll system, leaving a potential 15,000 public servants waiting for compensation.
Marie Lemay, deputy minister of Public Services and Procurement Canada, said more than 51,000 of about 80,000 cases - or 62 per cent - had been cleared as of Wednesday.

"We are tracking a bit behind our projected schedule," Ms. Lemay told reporters at a technical briefing in Ottawa. "This is because of the complexity of the files that we're currently handling. Increasingly, we're seeing that many of the cases left in the backlog are very complicated and require time-consuming manual calculations."

Ms. Lemay said there could be as many as 15,000 outstanding cases after Oct. 31, some of which date back several years, before Phoenix was even in place. She said those cases should be resolved within one to two pay periods after the original deadline.

The Public Service Alliance of Canada (PSAC) said it saw this problem coming back in the summer.

"When they came out and said, 'Oh yeah, we're going to do this by Oct. 31,' we knew back in July that wasn't realistic," PSAC vice-president Chris Aylward said. "I believe we're going to talk about this well into 2017."

The government imposed the Oct. 31 deadline on itself in July, when it was revealed that nearly a third of the 300,000 public servants paid through Phoenix had experienced pay problems since the system went into operation in February. More cases have continued to emerge since then.

On Wednesday, Ms. Lemay said 79 new cases of public servants who did not get paid properly have come up in the past two weeks; she said those individuals will be paid by the next payday at the latest. Another 894 people facing pay problems related to leave also came forward. Ms. Lemay said those cases should be resolved within six weeks.

Ms. Lemay said any pay problems beyond Oct. 31 will probably concern public servants waiting for supplementary pay, such as acting pay and overtime.

She assured public servants that government compensation advisers are working tirelessly to reach the deadline.

In addition to the central pay centre in Miramichi, N.B., the government has opened temporary pay offices in Gatineau, Montreal, Shawinigan, Que., and Winnipeg, as well as a Toronto call centre where employees "triage" calls from public servants. Ms. Lemay said all of the staff at the temporary centres will remain in place until the government reaches a "steady state" where Phoenix is running smoothly.

In the meantime, the Treasury Board has opened a claims office to handle the reimbursement of out-of-pocket expenses, such as late-payment fees, incurred by public servants as a result of Phoenix pay problems. Alfred Tsang, who heads up the office, said that 92 applications for reimbursement had been received as of last Friday, including 20 requests amounting to more than $500 each.

Ms. Lemay said the price tag to fix the Phoenix system is set to ring in at about $50-million, excluding the costs associated with reimbursement for out-ofpocket expenses.

Jerusalem Post
South Korea mulls leasing Israeli spy satellite
Thursday, 20 October 2016
Byline: Yossi Melman

Jerusalem - South Korea is considering leasing an Israeli spy satellite, according to South Korean news agency Yonhap.
According to the report, South Korea is interested in becoming independent in space, rather than being dependent on American spy satellites.

The possibility of leasing an Israeli spy satellite is being considered as tensions have risen on the Korean peninsula due to North Korea's accelerated development of missiles and its threats to use nuclear weapons.

The development also suggests that South Korea does not completely trust that the US will provide the defense it has promised in the event of a military conflict. The Unites States and South Korea have a defense pact.

The possible leasing of a spy satellite is part of South Korea's effort to upgrade its military capabilities. This desire has also seen South Korea mull the purchase of German air-to-air missiles with which to arm its American F-15 fighter jets.

Sources in the South Korean Defense Ministry further stated that the possible lease of an Israeli spy satellite stems from delays in plans to develop a domestically produced satellite. According to the original plan, South Korea was supposed to have produced five satellites, but those plans have been pushed back to 2020 and are slated to be completed in 2023. The Israeli spy satellite would be a temporary solution until that time.

Israel currently has three Ofek spy satellites in space, produced by Israel Aerospace Industries (IAI). The last of these was launched just a few weeks ago and it was originally reported that there were some malfunctions, however, there have not been any further official reports on its status since then.

The Yonhap report did not clarify if South Korea wishes to lease an Israeli spy satellite that is already deployed to space or to ask the IAI to build a new satellite specifically for its needs.

If South Korea does indeed lease an Israeli spy satellite, it will give momentum to Israel's space program, which has been in a mild crisis since the communications satellite Amos blew up during launch in the US last month.

Wall Street Journal
Hackers Evolve to Serve the Kremlin
Thursday, 20 October 2016
Byline: Multiple reporters

Moscow - With the hacking of Hillary Clinton's campaign and the Democratic National Committee, U.S. officials say Russia has unleashed a strengthened cyberwarfare weapon to sow uncertainty about the U.S. democratic process.
In doing so, Russia has transformed state-sponsored hackers known as Fancy Bear and Cozy Bear from internet spies to political tools with the power to target the country's adversaries, U.S. officials and cybersecurity experts say.

The attacks are the harder side of parallel campaigns in the Kremlin's English-language media, which broadcast negative news about Western institutions and alliances and focus on issues that demonstrate or stoke instability in the West, such as Brexit. Moscow seeks particularly to weaken the North Atlantic Treaty Organization, which has expanded its defense against Russia.

"The underlying philosophy of a lot of these attacks is about establishing information as a weapon," said Alexander Klimburg, a cyber expert at the Hague Center for Strategic Studies. "Hacking for them is literally about controlling information."

President Vladimir Putin denies Russian involvement in the hacking, but in a way that telegraphs glee about the potential chaos being sown in the U.S. democratic process.

"Everyone is talking about who did it, but is it so important who did it?" Mr. Putin said. "What is important is the content of this information."

Former Central Intelligence Agency Director Michael Hayden said the Kremlin doesn't appear to be trying to influence the election's outcome, noting Russian involvement has provided fodder for both Republicans and Democrats. "They are not trying to pick a winner," he said on Tuesday at a

cybersecurity conference in Washington. Rather, Russia is likely unleashing the emails "to mess with our heads."

Pro-Kremlin commentators in Russia have seized on the DNC leaks to cast doubt on the American democratic process and argue that Washington has no right to criticize Moscow. They have said the hacked DNC emails, which showed party officials working to undermine primary runner-up Bernie Sanders, prove Americans are hypocritical when they malign Mr. Putin's authoritarianism.

The White House has threatened a "proportional response" against Russia.

Retaliating against murky cyberattackers is uncertain new territory, Western officials said. The group often called Fancy Bear has been active since at least 2007 or 2008, experts say. Multiple security companies have given the group different code names including Pawn Storm, Sofacy and APT 28, which denotes an "advanced persistent threat."

Another group, known as Cozy Bear or APT 29, has taken a lower profile, often targeting higher-profile individuals and uses more sophisticated tools to cover its tracks, cybersecurity experts said. It was active as early as 2008 and 2009, with targets related to Chechnya, a U.S.- based think tank and government institutions in Poland and the Czech Republic, according to security firm F-Secure Corp.

The methods are well known: Hackers trick targets into providing account information or downloading infected files through expertly faked emails and webpages, a tactic known as spear-phishing.

The link to Russia's security apparatus is based in part on technical clues. The two groups' malware is deemed too sophisticated for most criminal gangs.

Yet it is the groups' selection of targets that offers the most compelling evidence of Russian involvement, cybersecurity experts say.

"This all adds up to a strong indication of Russian sponsorship," said Laura Galante, director of global intelligence at U.S.-based security firm FireEye Inc. and a former Russia specialist at the U.S. Department of Defense. "The Russian government has very publicly stated its desire to have ability in this realm. They want the ability to shape the way people think about events."

Politico
Media vulnerable to Election Night cyber attack
Wednesday, 19 October 2016
Byline: Darren Samuelsohn, Hadas Gold

Washington - Despite spending hundreds of millions of dollars on security upgrades, U.S. media organizations have failed to properly protect their newsrooms from cyberattacks on their websites,

communications systems and even editing platforms -- opening themselves up to the possibility of a chaos-creating hack around Election Day.
In just the past month, BuzzFeed has been vandalized, and both Newsweek and a leading cybersecurity blog were knocked offline after publishing articles that hackers apparently didn't appreciate. Federal law enforcement is investigating multiple attacks on news organizations, and journalists moderating the presidential debates say they've even gotten briefings from the FBI on proper cyber hygiene, prompting them to go back to paper and pens for prep work.

"We do a lot of printing out," said Michele Remillard, an executive producer at C-SPAN, the network home to the backup moderator for all the debates.

Journalists are seen as especially vulnerable soft targets for hackers. Their computers contain the kinds of notes, story ideas and high-powered contact lists coveted by foreign intelligence services. They also work in an environment that makes them ripe for attack, thanks to professional demands like the need for a constant online presence and inboxes that pop with emails from sources whom they don't always know and which frequently contain the kinds of suspicious links and attachments that can expose their wider newsroom networks.

Senior U.S. officials, current and former lawmakers and cybersecurity pros told POLITICO the threat against the media is real -- and they fret the consequences. Specifically, the security community is worried The Associated Press' army of reporters could get hacked and the wire service -- the newsroom that produces the results data on which the entire media world relies -- inadvertently starts releasing manipulated election tallies or that cybercriminals penetrate CNN's internal networks and change Wolf Blitzer's teleprompter.

"It's the art of possible is what really scares me," said Tony Cole, chief technology officer of FireEye, a Silicon Valley-based cybersecurity firm that works with some of the country's major television and newspaper companies. "Everything is hackable."

"No site is safe," added Tucker Carlson, editor-in-chief of The Daily Caller. "If the federal government can be hacked, and the intelligence agencies have been hacked, as they've been then, can any news site say we have better cybersecurity than the FBI or Google?"

The media have long been a spy's best friend. Intelligence community sources say that foreign and U.S. agents use local newspapers to look for clues about their targets, and that strategy has only grown more sophisticated in an all-online era in which foreign intelligence is reportedly known to hover over a media company's servers searching for any kind of heads-up on relevant stories inching closer to publication. Reporters on the campaign trail and back in their home bureaus said in interviews that they've become increasingly aware of their status as potential hacking victims. The spate of recent attacks -- involving their sites and their competitors' -- are more than ample warning of what's possible. Several journalists said they now use email and other communication with the expectation they're being watched, and

under the assumption that their messages can and will be hacked and shared publicly with the wider world.

"We're a bigger target than the 7-Eleven down the street," said Mark Leibovich, chief national correspondent for The New York Times Magazine. "Presumably, we have really good, smart IT people who know what they're doing, who are taking all kinds of precautions, who are acutely in tune with what the risks are and what the threats are."

There is perhaps no greater target in election journalism than the AP, the venerable wire service that will have more than 5,000 reporters, editors and researchers working across the country, tabulating results, calling races and feeding a much wider network of subscribers. Often other news outlets refer to the AP before making calls on races, and AP projections on the East Coast can have effects on West Coast voting, which closes hours later thanks to the time differences. Multiple sources in media, government and the security industry fretted about the effect if the AP were to get hit, and what that would do to their ability to get the news out.

The AP will deploy reporters across the country to send up vote tallies, usually by phone, the wire service explained to The Washington Post in May. It also has multiple checks and balances in place to monitor for errors. But as with many other news organizations contacted by POLITICO, AP spokesman Paul Colford said the wire service's policy is to refrain from making public comments about its security measures.

"Given the extraordinary interest in the presidential election and thousands of other state and local contests, we would add that AP has been working diligently to ensure that vote counts will be gathered, vetted and delivered to our many customers on Nov. 8," he said.

Federal and state officials stress that even a successful hack on a major news outlet around Election Day would not affect the final results, which typically take weeks to certify. The vote tallies, after all, will be available on official sites and in many instances on special social media feeds. And if a news site did get defaced with incorrect information, the results would be more like a modern-day version of the famous 'Dewey Defeats Truman' headline that President Harry Truman triumphantly held aloft the day after his 1948 reelection.

Still, there is a widespread recognition -- from the White House down to the local precinct level -- that a hack on the media could be damaging given the role it plays in getting election news out to satisfy the country's insatiable information appetite. Misinformation circulated in the early hours of Nov. 8 about the race's trajectory, for example, could factor into a voter's decision to even show up during the election's final hours, especially in Western states. There's also concern that false media reports spread via a hacked news account could be a potential spark for violence in an already exceptionally charged atmosphere. On the flip side, there's a recognition that the media can help build public confidence in the final results, especially following a campaign that's been engulfed in its closing weeks by Russian-

sponsored hacking of the Democratic National Committee, the hacking of Hillary Clinton's campaign chairman's personal emails, and Donald Trump's unfounded charges of vote rigging.

"To the degree that foreign hackers could prevent the dissemination of good information around the election, that can be a problem," said Rep. Adam Schiff, the top Democrat on the House Intelligence Committee. The California congressman said he frets that media outlets, like many other industries, face "massive costs" in protecting themselves against cyberattacks with "no end in sight" to the potential risks. Schiff added that he is especially concerned about smaller news organizations without major IT budgets or the backing of larger parent companies. "They're much more vulnerable," he said.

Cybersecurity experts say media spending to protect news organizations against cyberattack has grown substantially in the past three years, especially in the wake of North Korea's attack on Sony Pictures in late 2014. The price tag for vulnerability audits and other techniques varies by the size of the newsroom and the surface area for potential attacks, but multiple sources said quarterly audits can easily cost $50,000 or more.

Cyber experts and media officials from newsrooms across the country said they're prepped to deal with a range of threats to their sites, including the kinds of malware that can infect a computer network and give hackers an entry point to manipulate a home site. They're also building backup capacity in the event of a DDoS attack, or distributed denial of service, that tries to overwhelm a website or server with fake traffic. News sites, they note, are already prepping for monster traffic around the election, which can surge as much as 30 times compared with other big events this cycle, such as a debate or primary.

At the staffing level, newsrooms have also been pushing for better cyber habits by hosting training seminars, requiring employees to take must-pass exams and requiring double-authentication before granting access to a newsroom's internal filing system and social media accounts.

But cyber experts warn that all the preparatory work in the world can matter little for a news organization if it's facing an attack from a more sophisticated actor.

"If all of a sudden your adversary becomes a nation-state, like Sony or the DNC with Russia, you see those kind of procedures aren't worth a darn," said Robert Anderson, a former senior FBI cyber official and a managing director at the Navigant consulting firm.

The press has indeed been a familiar target for hackers. In 2013, hackers hit the AP's Twitter account and posted a false report about a bombing at the White House, sending the stock market into a five-minute spiral. In more recent incidents, a USA Today columnist wrote an article in February admitting he was hacked midair while using his commercial flight's WiFi, and the New York Times reported in August that its Moscow bureau was targeted by what were believed to be Russian hackers.

Newsweek blamed hackers for a DDoS attack that took down its site last month soon after it published an article about Trump's company allegedly violating the U.S. embargo against Cuba through secret

business dealings in the 1990s. And BuzzFeed had several articles on its site altered earlier this month after it ran a story identifying a person allegedly involved in the hacking of tech CEOs and celebrities.

"I'm sure that lots of newsrooms are having this conversation right now, particularly as we get closer to the election and people have a lot more to lose when things don't go their way," said Brian Krebs, the cybersecurity blogger and former Washington Post reporter whose site went down last month after a major DDoS attack that he says was spawned by his reporting about the arrest of two Israeli hackers.

With the threat of hackings against the media reaching such a heightened pace, many election observers urged both reporters and the reading public to take a deep breath as the results start coming in.

"If Twitter is reporting that Jill Stein wins South Carolina, that should probably give you pause," said David Becker, executive director of the Center for Election Innovation and Research.

Associated Press
US, UK Cybersecurity Officials: Destructive Hacks Are Coming
Thursday, 20 October 2016
Byline: Staff report

London - The world should brace itself for more physically destructive hacks, two senior cybersecurity officials said Wednesday, warning that a more dangerous era of hacking was already upon us.
Paul Chichester, the director of operations at Britain's new National Cyber Security Center, told an event hosted by British defense think tank RUSI that electronic intrusions were on their way to becoming more "destructive, disruptive and coercive."

"That will be our future," he told a crowd of officers, academics and industry experts gathered for a two-day symposium in central London.

Chichester was seconded by Air Force Lt. Gen. James K. McLaughlin, deputy commander at U.S. Cyber Command, who told attendees that infrastructure-wrecking attacks were being seen "right now in the environment."

Neither official went into specifics about what they'd seen or why they felt the threat was intensifying, although McLaughlin invoked a cyberattack in Ukraine which knocked out three separate power distribution companies last year. The Dec. 23 incident, believed to have been pulled off by a team of hackers using stolen passwords, left 225,000 people without electricity, according to a U.S. Department of Homeland Security bulletin published two months later.

Cybersecurity experts long worried that hackers can hijack the vulnerable industrial control systems to wreak havoc in power plants, traffic systems, factories, dams or reservoirs. Still, publicly confirmed examples of real-world damage from hacking have -- so far -- been few and far between. The Ukrainian

incident provided a rare and dramatic demonstration of the physical consequences of a well-organized cyberattack.

McLaughlin said there was now no doubt such hacks were possible.

"Three years ago these were just theoretical," he said. "Now we see them. They're practically here in front of us."

New York Times
Trove of Stolen Data Is Said to Include Top-Secret U.S. Hacking Tools
Thursday, 20 October 2016
Byline: Multiple reporters

Washington - Investigators pursuing what they believe to be the largest case of mishandling classified documents in United States history have found that the huge trove of stolen documents in the possession of a National Security Agency contractor included top-secret N.S.A. hacking tools that two months ago were offered for sale on the internet.
They have been hunting for electronic clues that could link those cybertools -- computer code posted online for auction by an anonymous group calling itself the Shadow Brokers -- to the home computers of the contractor, Harold T. Martin III, who was arrested in late August on charges of theft of government property and mishandling of classified information.

But so far, the investigators have been frustrated in their attempt to prove that Mr. Martin deliberately leaked or sold the hacking tools to the Shadow Brokers or, alternatively, that someone hacked into his computer or otherwise took them without his knowledge. While they have found some forensic clues that he might be the source, the evidence is not conclusive, according to a dozen officials who have been involved in or have been briefed on the investigation.

All spoke on condition of anonymity because they were not authorized to discuss it publicly.

Mr. Martin, an enigmatic loner who according to acquaintances frequently expressed his excitement about his role in the growing realm of cyberwarfare, has insisted that he got in the habit of taking material home so he could improve his skills and be better at his job, according to these officials. He has explained how he took the classified material but denied having knowingly passed it to anyone else.

"As a contractor, he gets to see a slice of the overall picture," said one person familiar with the exchanges, summarizing Mr. Martin's explanation. "He wanted to see the overall picture so that he could be more effective."

The material the F.B.I. found in his possession added up to "many terabytes" of information, according to court papers, which would make it by far the largest unauthorized leak of classified material from the

classified sector. That volume dwarfs the hundreds of thousands of N.S.A. documents taken by Edward J. Snowden in 2013 and exceeds even the more voluminous Panama Papers, leaked records of offshore companies obtained by a German newspaper in 2015, which totaled 2.6 terabytes. One terabyte of data is equal to the contents of about one million books.

F.B.I. agents on the case, advised by N.S.A. technical experts, do not believe Mr. Martin is fully cooperating, the officials say. He has spoken mainly through his lawyers, James Wyda and Deborah Boardman of the federal public defender's office in Baltimore. They declined to comment before a detention hearing set for Friday in federal court.

In interviews, officials described how the Martin case has deeply shaken the secret world of intelligence, from the N.S.A.'s sprawling campus at Fort Meade, Md., to the White House. They expressed astonishment that Mr. Martin managed to take home such a vast collection of classified material over at least 16 years, undetected by security officers at his workplaces, including the N.S.A., the Office of the Director of National Intelligence and Pentagon offices. And they are deeply concerned that some of the mountain of material may, by whatever route, have reached hackers or hostile intelligence services.

Investigators discovered the hacking tools, consisting of computer code and instructions on how to use it, in the thousands of pages and dozens of computers and data storage devices that the F.B.I. seized during an Aug. 27 raid on Mr. Martin's modest house in suburban Glen Burnie, Md. More secret material was found in a shed in his yard and in his car, officials said.

The search came after the Shadow Brokers leak set off a panicked hunt at the N.S.A. Mr. Martin attracted the F.B.I.'s attention by posting something on the internet that was brought to the attention of the N.S.A. Whatever it was -- officials are not saying exactly what -- it finally set off an alarm.

The release of the N.S.A.'s hacking tools, even though they dated to 2013, is extraordinarily damaging, said Dave Aitel, a former agency employee who now runs Immunity Inc., an information security company.

"The damage from this release is huge, both to our ability to protect ourselves on the internet and our ability to provide intelligence to policy makers and the military," Mr. Aitel said.

The N.S.A.'s hacking into other countries' networks can be for defensive purposes: By identifying rivals' own hacking methods, the agency can recognize and defend against them, he said. And other countries, with some of the N.S.A.'s tools now in hand, can study past hacks and identify the attacker as the N.S.A., learn how to block similar intrusions, or even decide to retaliate, Mr. Aitel said.

Mr. Martin, 51, a Navy veteran who was completing a Ph.D. in information systems at the University of Maryland, Baltimore County, has worked for several of the contracting companies that help staff the nation's security establishment. After stints at the Computer Sciences Corporation and Tenacity Solutions, where he was assigned to the Office of the Director of National Intelligence, he joined Booz

Allen Hamilton in 2009. He worked on that firm's N.S.A. contract until 2015, when he was moved to a different Pentagon contract in the area of offensive cyberwarfare.

He has long held a high-level clearance and for a time worked with the N.S.A.'s premiere hacking unit, called Tailored Access Operations, which breaks into the computer networks of foreign countries and which developed the hacking tools later obtained by the Shadow Brokers. According to one person briefed on the investigation, Mr. Martin was able to obtain some of the hacking tools by accessing a digital library of such material at the N.S.A.

One possibility investigators are considering is that Mr. Martin did not knowingly share the Shadow Brokers material but that it was physically stolen from him -- conceivable given the descriptions of the chaos of his house, shed and car -- or more likely, grabbed by hackers. But the forensic examination of Mr. Martin's computers has so far turned up no evidence that he was hacked, officials say.

At the core of the investigation, if Mr. Martin deliberately shared the secret N.S.A. tools, is the mystery of his motive. People who know him call him deeply patriotic and say they do not believe he would have given classified information to another country. They also say he has never been interested in politics, making unlikely a politically motivated leak like that of Mr. Snowden, who thought the N.S.A. was violating Americans' privacy.

The F.B.I. is considering whether he might have sold the hacking tools or other materials for money. His annual salary in recent years has exceeded $100,000 and he owns his house without a mortgage. But he has long bought expensive suits and Rolex watches, according to an old acquaintance, and a person familiar with his finances says he has struggled with debt. Court records show one past lien, an $8,997 state tax bill imposed in 2000 and not paid off until 2014.

Some people who know Mr. Martin favor a psychological motive for taking the documents home -- one that echoes what he is himself telling investigators: a drive to distinguish himself and prove that his computer knowledge was equal to that of the N.S.A.'s top operators.

"He always thought of himself like a James Bond-type person, wanting to save the world from computer evil," said a person who knows him well but would not speak about him on the record for fear of being pulled into the criminal case.

Last year, commenting online on an article on the future of computer warfare, Mr. Martin struck a martial and patriotic tone.

"The battles ahead will require a special breed of warrior," he wrote. "It's really a calling, and something the individual has to want to do as a profession, due to the sacrifices required to be top flight in this new, electronic, version of the great game."

Mr. Martin's tone of confidence reflected his comfort in the world of computer experts. Mr. Aitel, who runs a popular email list on computer security called Daily Dave, said Mr. Martin regularly emailed the list and him privately, usually expressing his enthusiasm for a technical achievement: "Outstanding! You rock!" he wrote about one exploit, Mr. Aitel said.

But Mr. Martin's online self-assurance, people who know him say, masked a timid, introverted personality. Though he could be warm and generous, he had few friends, was socially awkward and often seemed lost in his work and doctoral studies, these people said.

For years, Mr. Martin struggled with obesity, and then had gastric bypass surgery and lost a lot of weight, according to acquaintances who did not want to be named because they also did not want to drawn into the investigation. But within a decade, he had gained most of it back, they said.

Not long before his arrest, Mr. Martin exchanged emails with Mr. Aitel about attending Mr. Aitel's annual security conference, called Infiltrate, scheduled for April in Miami.

"He sounded completely normal," Mr. Aitel said. "Making plans for the future."

New York Times
How Donald Trump Hacked the Politics of Foreign Policy
Wednesday, 19 October 2016
Byline: Max Fisher, Amanda Taub

New York - Donald J. Trump's foreign policy proposals, like forcing Mexico to pay for a border wall or withdrawing from NATO, have drawn unprecedented condemnations as incoherent, contradictory and unrealistic.
Yet for all the boos they elicit from experts, they draw frequent cheers at his rallies.

Scholars of American politics say this is because Mr. Trump, the Republican presidential nominee, is using international issues as a medium to connect with voters' gut-level fears and desires, an approach that works precisely because his foreign agenda falls far outside the mainstream.

As Mr. Trump and his Democratic opponent, Hillary Clinton, meet on Wednesday for their final debate, in which foreign policy is slated to be a main topic, a look at his wholesale reframing of this set of issues reveals much about Mr. Trump's improbable rise.

Studies show that most voters rank foreign issues low on their list of concerns, but they do listen and use those issues as a window through which they judge candidates' values and ideology.

Mr. Trump has exploited this dynamic, offering ideas that experts consider unworkable, but that tap into some voters' desire for a strong-handed leader. Foreign policy, some research suggests, provided an ideal medium for this message.

Typically, candidates cannot reach the national stage without first proving their fitness to certain institutions that care deeply about foreign policy: the news media that vets them, the parties that provide them with crucial support, the policy makers they will need once in office.

Because foreign policy is so complex and most voters do not follow its particulars as closely as they do domestic issues, those institutions play an outsize role in shaping the bounds of acceptable debate.

But Mr. Trump, a celebrity who largely self- financed his primary campaign, was able to bypass this process, hacking the politics of foreign policy to his considerable advantage -- and in ways that could outlast his candidacy.

A foreign policy not about foreign policy.

In a perfect world, each voter would dedicate months of study to the complexities of major global conflicts, evaluate the available options, then determine which candidate's plan best balances risks and rewards.

In the world we live in, voters choose whom to believe based on whose message feels truest.

"We have overwhelming evidence that voters don't know that much about the details of foreign policy," explained Elizabeth N. Saunders, a George Washington University political scientist.

"People tend to choose the candidate they like first," and then take on that candidate's views as their own, she added. "This is the way people make sense of a complicated world."

All candidates wrap their policy agendas in simpler values, such as strength or inclusiveness, or stories of heroes and villains, Professor Saunders said, "as a way of crafting a narrative that voters who don't follow the details can grab on to."

That is especially true for foreign policy, she said, because it is so complex.

Mr. Trump seems to have reversed this process, beginning with the narrative and values he wishes to convey, then designing policies to maximize his message's effect.

Because foreign policy requires difficult trade-offs, conventional candidates are limited in how emotionally appealing they can make their plans while keeping them workable. They also need to appease the hard-nosed policy experts or party officials those candidates rely on to get elected -- and, eventually, to govern. But Mr. Trump was under no such constraints.

The result: Mr. Trump's foreign policy is not a foreign policy at all, but rather a vessel for reaching voters on a purely ideological level.

The world according to Trump.

This explains how Mr. Trump has won support with, for example, threats to leave the North Atlantic Treaty Organization, though voters have expressed little interest in renegotiating the alliance and foreign policy professionals have warned it would risk disaster.

Paul Musgrave, a political science professor at the University of Massachusetts, summed up Mr. Trump's message: "NATO requires cooperation. Cooperation is something you do if you're weak. If you're strong, people go along with you."

As policy, that is dubious. But it is a powerful way for Mr. Trump to present himself as someone who will treat outsiders with suspicion and ruthlessly pursue economic gains. It is a message wrapped in foreign policy but meant to tap into more domestic concerns.

Colin Dueck, a George Mason University professor, wrote in a recent paper that Mr. Trump's worldview demands and offers "a sort of Fortress America, or perhaps a gigantic gated community, separated from transnational dangers of all kinds by a series of walls."

To voters "feeling displaced by long-term trends toward cultural and economic globalization," Professor Dueck wrote, Mr. Trump's policies promise "security, separation, and reassertion of control."

During the Republican primaries, for example, Mr. Trump alarmed those outside his rapidly growing base with proposals to kill the families of terrorists and with praise for President Vladimir V. Putin of Russia, as well as for China's 1989 crackdown in Tiananmen Square.

But for supporters, these and other statements suggested Mr. Trump could be trusted to impose order on the chaos they see in a rapidly changing world.

Because American voters have long approached international issues as a way to judge presidential candidates' values, they are willing to overlook the particulars; foreign policy became a powerful medium for Mr. Trump and his supporters to connect.

When Mr. Trump warns that the United States is getting swindled by the Iran nuclear deal or the North American Free Trade Agreement, he is speaking directly to a feeling among many Americans that they have been sold out by untrustworthy elites, that the game is rigged against them.

And when Mr. Trump promises to force Mexico to pay for a giant border wall or warns that Iranian boats will be "shot out of the water" if their sailors "make gestures" at American sailors, he is communicating

that he understands that his supporters feel fearful and humiliated, and that he will punish those responsible.

Promising order.

This message turned out to resonate with a surprisingly large audience -- but where did this seemingly new constituency come from?

Research published this spring by a group of social scientists, led by Brian C. Rathbun of the University of Southern California, suggests an answer: Mr. Trump has tapped into what scholars call conservation values.

People who hold those values prioritize security, conformity and tradition. They also tend to fear physical threats and people they see as outsiders, whether that means foreigners or those of different races or religions. And they often express those values as a particular set of "hawkish" foreign policy views.

That hawkishness is very different from that of neoconservatives like President George W. Bush or interventionist Democrats like Mrs. Clinton. It is characterized by a desire to shut out the world, ruthlessly promote American interests, reject cooperation and meet threats with overwhelming force.

The paper, though written before Mr. Trump's rise, details the worldview he would come to champion in surprising detail.

The distrust of cooperation shows up in Mr. Trump's call to stymie alliances from Europe to Asia. The instinct to impose order by force appears in his proposals for unchecked violence against the Islamic State. And the "America first" nationalism can be seen in his demand that the United States seize Iraq's oil.

Voters who hold conservation values are drawn to such policies not out of a sudden interest in global affairs, but as a way to express their fear of change and desire for order at home, the researchers found. They desire a strong leader who will protect "us" against an ever- more-menacing "them."

Mr. Trump, by redirecting voters' anxiety about demographic, cultural and economic changes toward foreign policy, gives his supporters a clearer set of villains -- and a promise to do whatever it will take to defeat them.

Supporters do not primarily hear a policy agenda, but a promise: that Mr. Trump understands their fears and will protect them.

Mr. Trump may never have a chance to test the experts' contention that his foreign policy proposals are unworkable. But the constituency he has surfaced and focused those policies on could demand them

from future candidates, risking a repeat of this year's campaign dynamic pitting the party establishment against its base.

Professor Saunders of George Washington pointed out that Republican leaders and Republican voters have diverged on foreign policy since Mr. Bush's 2003 invasion of Iraq.

Mr. Trump's legacy, she said, may be to widen those gaps.

The Guardian (London)
Snowden: 'Politics of fear' keep Trudeau from repealing Canada anti-terror law
Thursday, 20 October 2016
Byline: Ashifa Kassam

Toronto - Edward Snowden has waded into the simmering debate over Canada's controversial anti-terror law, saying that Justin Trudeau was reluctant to repeal the law out of a fear of appearing soft on terror.
Speaking to an audience in Toronto on Tuesday, Snowden pointed to a campaign promise by the Canadian prime minister to amend the sweeping legislation, which gives security forces heightened powers to apprehend suspected terrorists and disrupt their activities. "But he's been in office a little while now and we haven't seen that actually come to pass," said Snowden, appearing at the SecTor cybersecurity conference via videolink from Russia.

Bill C-51 was introduced in early 2015 by the country's then Conservative government, spawning protests across the country as it became law. Hundreds of thousands of Canadians, including legal scholars, civil liberties groups and pundits from across the political spectrum, spoke out against the law and its perceived attempt to supplant the country's democracy with a creeping police state.

Trudeau vowed to amend the "problematic elements" of the law, rather than simply repeal the legislation, noted Snowden. "Because he's afraid of being politically attacked on the basis of being soft on terrorism, regardless of whether or not this law actually helps prevent any terrorist attacks," he said. "This is just the way the politics of fear work."

Last month the Liberal government launched a wide-ranging consultation on national security, meaning any potential changes to the law will probably be delayed until next year. The extra time will offer the government the opportunity to get it right, said Ralph Goodale, Canada's public safety minister, as he announced the consultation. "A lot of people felt shut out, and we promised to give them the opportunity to be heard."

On Tuesday, Snowden suggested what he described as the minimum changes needed to the law, such as the creation of a judicial body that would carry out a case-by-case review of every individual exercise of

these powers. "And this means those individuals working in those spy agencies know simply that as long as they follow the law, they'll be fine," he said.

The law allows information on Canadians to be shared between more than a dozen federal institutions. "All the activities held in our private lives, our private records, are being used as a kind of currency to gain standing and status within this surveillance network," said Snowden. "We're being traded like baseball cards."

Any sharing of information - by those within Canada and with foreign agencies - that doesn't result in a trial or charges should be disclosed to individuals once a particular time frame has lapsed, he said, allowing people to ensure their rights have not been violated in any way.

Snowden also took aim at the law's vague and undefined language. "A lot of what classifies as terrorism in the political context - individuals that the news calls terrorist - are really common criminals," said Snowden. "But they do not constitute the kind of super criminal threat that is represented by our terrorism legislation."

He pointed to the obvious need for law enforcement to have the right tools to counter these threats. "But we do not want to sacrifice everything that makes our societies great," he said. "We do not want to reorder the boundaries of our rights for the convenience of law enforcement officials, if it's not truly necessary, if it means we lose everything that we're trying to defend."

New York Times
Czechs Arrest Man Wanted by the F.B.I. for Hacking
Thursday, 20 October 2016
Byline: Rick Lyman, Hana de Goeij

Prague - A man identified as a Russian hacker suspected of pursuing targets in the United States has been arrested in the Czech Republic, the police announced Tuesday evening.
The suspect was captured in a raid at a hotel in central Prague on Oct. 5, about 12 hours after the authorities heard that he was in the country, where he drove around in a luxury car with his girlfriend, according to the police. The man did not resist arrest, but he had medical problems and was briefly hospitalized, the police said in a statement.

David Schön, a police spokesman, said on Wednesday that the arrest of the man, whose name has not been released, was not announced immediately "for tactical reasons."

The police statement said that "the man was a Russian citizen suspected of hacking attacks on targets in the United States," and that the raid was conducted in collaboration with the F.B.I. after Interpol issued an arrest warrant for him.

The social media company LinkedIn said it believed it had been a victim in the case. The company, which acts as a virtual job network, said it had been actively involved in the F.B.I.'s case since it was hacked in 2012.

The F.B.I. said in a statement that the arrest was an example of the collaboration needed "to successfully defeat cyber adversaries," but declined to provide any further details.

The arrest occurred two days before the Obama administration formally accused the Russian government of stealing and disclosing emails from the Democratic National Committee and other institutions and prominent individuals.

But law enforcement officials in Washington, speaking on condition of anonymity because they were not authorized to comment while the investigation was underway, said Wednesday that the suspect did not appear to be related to the hacking of the Democrats' emails or to organizations like DCLeaks or WikiLeaks.

A judge in Prague has ordered the man to remain in custody, and a court will examine whether to extradite him to the United States.

The Russian Embassy in Prague called for the man to be released.

"We insist that the detained Russian citizen should be transferred to Russia," the state-run Russian news agency Tass quoted Aleksei Kolmakov, the embassy's spokesman, as saying.

Mr. Kolmakov said that the embassy had been notified about the detention, but that the Kremlin's spokesman, Dmitri S. Peskov, had told the news website RBK that it did not have details about the man's identity.

Jakub Janda, who studies the Russian government and is a deputy director of the European Values Think-Tank in Prague, said that the arrest served as confirmation that "the Czech Republic is so far considered a safe base for Russian intelligence and influence activities focused on Western targets."

He added, "Prague is unofficially considered to be a springboard for some Kremlin activities inside Europe, also using huge Russian diplomatic presence of approximately 140 staff."

Mr. Janda also said that the arrest showed that "Western governments are waking up and finally considering hostile Russian intelligence and disinformation operations to be an open and urgent threat, even at the level of the U.S. administration."

He added, "Open arrests of hostile individuals such as this one can serve as a deterrent element."

The United States director of national intelligence, James R. Clapper Jr., said in a statement on Oct. 7 that high-level Russian officials were trying to interfere with American elections.

"The recent disclosures of alleged hacked emails on sites like DCLeaks.com and WikiLeaks and by the Guccifer 2.0 online persona are consistent with the methods and motivations of Russian-directed efforts," Mr. Clapper said. "These thefts and disclosures are intended to interfere with the U.S. election process."

The antisecrecy organizations DCLeaks and WikiLeaks have been involved with the disclosures of illegally obtained emails from the hacked accounts of prominent figures including Colin L. Powell, the former secretary of state, and John D. Podesta, the chairman of Hillary Clinton's presidential campaign. Guccifer 2.0 is the assumed name of a Romanian "lone hacker" responsible for copying thousands of emails and other files from the Democratic committee, but experts are not certain if the hacker is a person or a front created by Russian intelligence officials.

It appears that the man arrested in Prague is not related to the hackers Mr. Clapper described.

Reuters
Microsoft to show code in Brazil to calm fears about spy 'back doors'
Thursday, 20 October 2016
Byline: Staff report

Brasilia - Microsoft Corp, still stung by accusations that it installed "back doors" for the U.S. government to access customers' communications, opened a center in Brazil on Wednesday where officials will be able to inspect its programming code, in an attempt to allay suspicions in the region that its software programs are vulnerable to spying.
Behind reinforced walls and with strict security settings, the world's biggest software company showed off its fourth 'Transparency Center' in Brasilia, where experts from Latin American and Caribbean governments will be able to view the source code of its products.

The effort to build trust follows heightened suspicions in the region after former U.S. National Security Agency contractor Edward Snowden leaked documents in 2013 that showed the agency was capturing massive amounts of data from emails handled by major U.S. technology companies, including Microsoft.

The leak, in addition to another Snowden disclosure that the United States had been spying on communications including those of former Brazilian President Dilma Rousseff, prompted Brazil and other governments around the world to reconsider how much they could trust U.S. technology companies not to install back doors at the request of U.S. intelligence agencies.

At the new site, visited on Wednesday by officials including the speaker of Brazil's Congress, no electronics will be allowed into the secure viewing room.

Microsoft prevents anyone from copying the massive amount of coding on display - as much as 50 million lines for its email and server products. Viewers inspect copies of source code on computers connected only to local servers and cut off from the internet. The copies are later deleted.

Viewers can use software tools to examine the code, Microsoft said, but it was not immediately clear whether experts would be able to run deep code analysis necessary to uncover back doors or other bugs.

It is by no means certain the effort by Microsoft will diminish concerns about spying, but Brazil's reaction to the generally secretive software company opening up its code was initially positive.

"This center is aimed at showing that there are no traps, it is a good step," a Brazilian government official, who asked not to be named because he was not authorized to speak about cyber security, told Reuters.

The Brasilia facility is Microsoft's fourth transparency center after the NSA scandal. It set up the first one at its Redmond, Washington headquarters in the United States in 2014, one in Brussels last year and one in Singapore earlier this month. It will soon open another in Beijing.

The centers allow for face-to-face discussions between government experts and developers. "Governments can verify for themselves that there are no back doors," said Mark Estberg, senior director of Microsoft's global government security program.

NBC News
U.S. Urged Ecuador to Act Against WikiLeaks Leader Assange
Thursday, 20 October 2016
Byline: Multiple reporters

Washington - Quiet pressure from the U.S. government played a role in Ecuador's decision to block WikiLeaks founder Julian Assange from using the internet at Ecuador's London embassy, U.S. officials told NBC News.
"It was a bit of an eviction notice," said a senior intelligence official.

Ecuador's government said Tuesday it had partly restricted internet access for Assange, the founder of anti-secrecy group WikiLeaks, who has lived in the South American country's London embassy for more than four years. A source familiar with the situation says the Ecuadoran government has been frustrated with Assange and his presence at the embassy in London for months and has been considering how best to proceed.

The action came after U.S. officials conveyed their conclusion that Assange is a willing participant in a Russian intelligence operation to undermine the U.S. presidential election, NBC News has learned. U.S. intelligence officials believe Assange knows he is getting the information from Russian intelligence, though they do not believe he is involved in helping plan the hacking, officials told NBC.

"The general view is he is a willing participant in the Russian scheme but not an active plotter in it. They just realized they could use him," said a senior intelligence official.

WikiLeaks has been posting the private emails of Clinton adviser John Podesta and other Democratic officials that the U.S. says were hacked by, or on behalf of, Russian intelligence agencies. WikiLeaks said Assange's internet access was cut off Sunday. In a statement, Ecuador said the decision was its own.

"Ecuador, exercising its sovereign right, has temporarily restricted access to part of its communications systems in its UK Embassy," the statement said.

"The Ecuador government respects the principle of non-intervention in other countries' affairs, it does not meddle in election processes underway, nor does it support any candidate specially."

A senior administration official said that the U.S. did not push Ecuador to cut Assange off from the internet: "Reports that the U.S. government, to include the Intelligence Community, pressured the Ecuadorian government to interrupt internet service within Ecuador's embassy in London are not accurate."

The State Department said it did not pressure Ecuador or play any other role in blocking Assange's internet access.

"While our concerns about WikiLeaks are longstanding, any suggestion that Secretary (John) Kerry or the State Department were involved in shutting down WikiLeaks is false," State Department spokesman John Kirby said in a statement.

However, U.S. intelligence officials told NBC that a message was conveyed to Ecuador that it should stop allowing Assange to carry water for Russian intelligence agencies, and that Ecuador, though run by a leftist, anti-American government, was receptive.

The U.S. moves come as bipartisan concern is growing about the alleged Russian interference amid a daily release of Podesta emails.

Marco Rubio, who is running to retain his Florida Senate seat after losing the Republican presidential primary to Donald Trump, urged members of his party not to seek to capitalize on emails stolen by Russian spies.

"As our intelligence agencies have said, these leaks are an effort by a foreign government to interfere with our electoral process, and I will not indulge it," Rubio told ABC News. "Further, I want to warn my fellow Republicans who may want to capitalize politically on these leaks: Today it is the Democrats. Tomorrow it could be us."

Dhaka Tribune
PM for stronger cyber security
Thursday, 20 October 2016

Dhaka - Stressing the need for increasing capability of cyber security, Prime Minister Sheikh Hasina has said that steps will be taken so that none can commit crimes by using digital facilities.
"Some problems linked to security have been created with digitisation, and for this, our capability of cyber security will have to be enhanced ... we will have to stay alert so that security of the financial sector and secret issues is not hampered in any way," the premier said while addressing the inauguration of the "Digital World 2016?at the International Convention City Bashundhara in Dhaka yesterday. She added that necessary manpower would be created alongside procuring equipment to check cyber crimes.

The prime minister also mentioned the role of her ICT Affairs Adviser and son Sajeeb Wazed Joy in building Digital Bangladesh. "He is the main architect of implementation of the Digital Bangladesh," she added.

In recognition of his contribution, Joy received ICT for Development Award 2016 for which, Hasina said, she was very much proud as his mother.

Referring to her government's steps for enacting the Digital Security Act 2016, the premier said under the law, the government would set up world standard forensic lab, constitute a Cyber Security Agency, and establish cyber incidents responsive team and a high-level digital security council.

The ICT Division has organised the three-day event with the theme "Non-stop Bangladesh" with the assistance of the Bangladesh Computer Council (BCC), Bangladesh Association of Software and Information Services (BASIS) and a2i Programme of the Prime Minister's office.

After her speech, the premier inaugurated the Digital World 2016 digitally by pressing a switch. Earlier a small robot invited her to open the expo.

The Digital World 2016 showcases the technology-based innovations and achievements, and facilitate in a single platform for sharing ICT knowledge and ideas.

Over 200 speakers including 43 from world famous organisations such as Microsoft, Facebook, the World Bank, ZTE, Huawei are expected to take part in 18 sessions. The mega event would include 12

seminars, IT career fair, soft expo, e-Governance expo, mobile innovation expo, e-commerce and Business Process Outsourcing (BPO) programme.

State Minister for ICT Division Junaid Ahmed Palak, Chairman of the Parliamentary Standing Committee on Post, Telecommunication and ICT Ministry Imran Ahmed, ICT Division Secretary Shyam Sundar Shikdar, BCC President Mostafa Jabbar, Executive Director of BCC SM Ashraful Islam, Project Director of a2i Programme Kabir Bin Anwar also spoke at the function.

The prime minister later inaugurated six "smart buses" having all ICT facilities for imparting training to the women on ICT.

As part of further ensuring capacity of digital security, Hasina said that steps had also been taken to connect Bangladesh with the second submarine cable as there is no alternate submarine cable in the country.

She said that Bangladesh had already joined the SEA-ME-WE-5 consortium and would get 1,300 GBPS bandwidth in the second submarine cable.

Citing that the work on installing country's first own satellite, the "Bangabandhu Satellite 1," she said that Bangladesh could even export satellite bandwidth after launching its journey in 2017 and meeting the demand.

Hasina said that her government had stopped bribes and unnecessary harassment of people using information technology, adding that tender manipulation was also stopped due to digitisation.

The premier said her government put highest importance on education to build Digital Bangladesh and made ICT education compulsory from class six to 12th class. As many as 5,500 labs including 2,100 Sheikh Russel Digital Lab had been set up in the country while more 10,000 Sheikh Russel Digital Labs would be established by the end of 2018.

Besides, she said, the government approved "Innovation Design Entrepreneurship Academy (IDEA)" project aimed at giving innovative works an institutional shape and expanding IT Start-up initiative alongside beginning wide ranging works titled "One Thousand Innovation by 2021."

The prime minister said that every upazila of the country had been brought under optical fibre connection and 3G network, while bandwidth price reduced to Tk625 from Tk76,000 in 2007.

"Steps have also been taken to introduce 4G network in 2017, she said adding that 130 million mobile SIM are being used while 640 million people are now using internet in Bangladesh," she said.

Hasina mentioned that rural people were receiving about 200 types of services from digital centres across the country. Apart from this, she said, about 3,000 post offices had been transformed into digital service centres.

The premier said Bangladesh was exporting software and ICT services to about 40 countries including some developed nations. Under the "Learning and Earning" project, 55,000 male and female youths would be trained up on freelancing to increase efficiency.

Financial Times
Yahoo calls for greater transparency from intelligence services
Thursday, 20 October 2016
Byline: Hannah Kuchler

San Francisco - Yahoo is demanding US intelligence services reveal how they monitor online services, after a report said the internet company secretly scanned customer emails.
In a letter to James Clapper, the US director of national intelligence, Yahoo said citizens in a democracy require more information to understand and debate how the US uses legal authorities to obtain private data.

Yahoo said it found itself unable to respond in detail to the accusations in a Reuters article earlier this month, which claimed that the company had secretly built custom software to scan users' incoming emails for specific information requested by US intelligence officials.

Ron Bell, Yahoo's general counsel, urged the director to confirm whether an order "as described in these media reports" was issued and, if so, declassify the order in whole or in part. He wrote that he wanted the office to make a "sufficiently detailed public and contextual comment to clarify the alleged facts and circumstances".

Mr Bell said recent news stories had "provoked broad speculation" about Yahoo's approach and the activities of the US government.

"That speculation results in part from lack of transparency and because US laws significantly constrain -- and severely punish -- companies' ability to speak for themselves about national security related orders even in ways that do not compromise US government investigations," he said.

Yahoo, which is simultaneously trying to curtail the impact of a large data breach, has responded to the Reuters investigation by saying it was a "law-abiding company" and "complies with the laws of the United States".

The letter specifically refers to the use of the Foreign Intelligence Surveillance Act, which became famous after Edward Snowden, the former National Security Agency contractor turned whistleblower, to surveil online activities.

Yahoo is fighting to prove it is a competent custodian of millions of people's data after it said last month that details of about 500m email accounts may have been stolen in a cyber attack by a state-sponsored actor.

The Silicon Valley company said on Tuesday that users had remained loyal to the platform despite the cyber attack, in a response to concerns that Verizon, which agreed to buy Yahoo for $4.8bn, could ask for a discount on the deal.

Verizon has not commented on the accusations of US surveillance activity at Yahoo but Craig Sillimen, Verizon's general counsel, said that it was up to Yahoo to prove that the cyber attack had not had a material impact on its business.

The office of the director of national intelligence did not respond to a request for comment.

FCW.com
NSA: Hackers find an easy path to U.S. systems
Thursday, 20 October 2016
Byline: Sean D. Carberry

Washington - For all the concern about zero-day exploits, a senior NSA official said that the high-profile hacks of U.S. networks in the last two years show there are far easier ways for cybercriminals to infiltrate government systems.
Speaking at the American Enterprise Institute on Oct. 18, Curtis Dukes, deputy national manager for national security systems at the NSA, said that none of the high-profile government hacks the NSA responded to -- Office of Personnel and Management, the White House, State Department, Department of Defense -- used zero-day exploits.

"Basically the adversary took advantage of poorly secured, poorly patched systems," said Dukes. "Once they had that initial foothold they the elevated privileges and then moved to mission objective," which ranged from stealing data to (in the case of the Sony hack) destroying it.

"We talk a lot about zero days, we talk about Shadow Brokers, things of that nature, but so far we haven't actually changed the equation for the adversary," said Dukes. "They still can easily attack us [and] achieve mission objective -- I want to actually raise the cost."

Dukes said that raising the cost means implementing a set of practices and protocols outlined in the NSA's Top 10 Mitigations publication. Dukes said that following those protocols, which include

controlling administrative privileges, updating and patching software and application whitelisting, would make it more difficult for cyber criminals and force them to consider zero-day exploits, which he described as precious commodities that hackers use only on their most difficult targets.

In his talk, Dukes expanded on comments he recently made to FCW about the bureaucratic hurdles that NSA must jump when responding to a hack of a non- national security system.

NSA has authority over national security networks, but must be asked by the Department of Homeland Security and the FBI through a Request for Technical Services in order to assist in investigations into breaches of other agencies.

"I just think by the time it's all orchestrated, you've lost valuable time in order to do defense at cyber speed in that regard and I think that's what we need to relook at as a nation," Dukes told FCW.

In his AEI remarks, Dukes said that "when we actually have to do incident response, and again if you look at the last 24 months we've done a fair amount of that ... it's typically days to a week before we can actually respond."

And by that point, Dukes said, the crime is over and it's difficult to determine if the adversary is still inside the system and what mitigation steps can be taken. Therefore, he said, the U.S. needs to revise its approach to cybercrime.

"Possibly even going so far as that we unite pieces of [DHS, FBI, and NSA] into one organization that does it on behalf of the whole of government," he said.

Dukes pointed to the U.K.'s new National Cyber Security Centre as an example of a single entity that responds to cybercrime against any government agency.

"It's one entity, they're in charge," said Dukes. "I think it's a model we need to look at, possibly explore how that best aligns with how we do cyberdefense on behalf of the nation."

Khaleej Times
28% govt entities in region hit by cyber attacks in H1
Thursday, 20 October 2016
Byline: Bernd Debusmann Jr.

Dubai - Eleven per cent of UAE organisations were subject to targeted cyber attacks between January and June 2016, according to statistics unveiled by cyber security company FireEye during Gitex technology week.

FireEye's EMEA Advanced Threat Report also found that 19 per cent of Saudi organisations were targeted, as well as 11 per cent of Qatari ones. Across the region, 28 per cent of government entities were subject to at least one targeted attack.

In an interview with Khaleej Times, Stuart Davis, Middle East and North Africa director for Mandiant - a wholly owned subsidiary of FireEye - said the turbulent geo-politics of the Middle East make it a prime target for cyber criminals.

"When we look at the Middle East, one of the interesting things is that right now it's a hotbed of activity of cyber espionage and cyber attacks," he said. "Many countries have neighbouring challenges. You need only to look at Saudi Arabia and Iran as an example."

The report also found that government entities, such as foreign and defence ministries; energy sector organisations such as oil production facilities; and financial services companies such as investment banks and sovereign wealth funds were among the most targeted institutions.

"If you look at the UAE specifically, there are definite parallels being drawn compared to the GCC, with government and energy infrastructures being targeted in common," Davis said. "The difference is telecommunications. There is targeted activity towards the UAE, but the UAE has a more mature cyber-resilience and has been dealing with these attacks for longer."

In addition to Russia and China-based groups, Iranian 'threat actors' feature prominently as the culprits of such attacks.

"We are tracking 13 suspected Iranian threat actor groups in the region," Davis noted. "They have motivations such as cyber espionage. Due to political instability, that ultimately shows that they have come to gather information, such as on future endeavours."

In Davis' opinion, such attacks will likely continue in the near future. "The geopolitical landscape is consistently in flux and tends to go up and down. As long as that's happening, there will be neighbouring countries that will want to know, early, what's happening with their neighbours," he said. "We also expect to see critical and national infrastructure be targeted, such as big banks or electricity and water systems."

Now Lebanon
Syria facing internet outages
Thursday, 20 October 2016Byline: Albin Szakola

Beirut - Syria is set to face widespread internet connectivity issues due to maintenance work on a cable off the country's Mediterranean coast, days after a Russian deep sea exploration vessel's presence in the area raised questions.

Syrian Telecom issued a statement Tuesday explaining that repairs will begin October 19 on a "major international cable" providing approximately "60% of the internet capacity in Syria," as well as service to other countries in the region.

The government-owned company added that the maintenance work--which it described as "unexpected, urgent and swift"--will last until October 28, causing "low level Internet quality."

Syria Telecom vowed that it was "following up on the issue with international operators to secure alternative international routes to ensure Internet service at its normal, full speed," but apologized in advance to subscribers for the circumstances "beyond its control."

Late last week, the Russian vessel Yantar was spotted off the northern coast of Lebanon sailing north toward Syria, raising fears it could cut the undersea fiber- optic cable providing internet to the war-torn country, according to a report in the Daily Beast.

The report noted that the Yantar is equipped with remote submarines that are "capable of severing the cables miles under the ocean's surface that carry global Internet communications."

For its part, Syrian Telecom made no mention of the Yantar, but did not go into details regarding the technical problems afflicting the cable.

Instead, the company's statements said merely that the undersea cable was "exposed recently to frequent and sudden crashes from time to time."

Khaleej Times
Emiratis told to 'clean e-devices' of illegal content
Thursday, 20 October 2016
Byline: Jasmine Al Kuttab

Abu Dhabi - Emiratis' reactions were mixed to a warning from the Ministry of Foreign Affairs and International Cooperation to those travelling to the United States to ensure their mobile phones, laptops and other electronic devices do not contain content that are illegal.
According to the ministry, US authorities have said they will be imposing new security measures at airports, which include the inspection of travellers' personal devices.

The warning comes just months after another from the UAE authorities, which urged male citizens to avoid wearing traditional garments and headdress while abroad for their own safety. The warning came after an Emirati businessman, Ahmed Al Menhali, was held at gunpoint and violently arrested in front of Fairfield Inn and Suites in Avon, Ohio, when a hotel clerk made a 911 call reporting 'suspicious activity'.

On Tuesday, the Ministry of Foreign Affairs and International Cooperation highlighted that the US National Transportation Safety Board (NTSB) would now start inspecting personal devices for materials that violate public decency or are found to be illegal.

First-Lieutenant Engineer Ali H. Al Madfaei, chemical biological radiological nuclear officer at Abu Dhabi Police, told Khaleej Times searching personal devices could be seen as invasion of privacy. "Is the US searching our personal devices considered Islamophobia?"

The 30-year-old pointed out: "Americans often rush quickly to defend their constitutional rights and amendments. They believe this is the founding cornerstone of their nation. Yet, no one seems to bat an eyelid when the same constitutional rights of minorities are violated."

He noted that US authorities at airports checking travellers' personal devices resembles the 'Stop-and-Frisk,' programme, which was supported by former New York Mayor and Donald Trump endorser, Rudy Giuliani.

The initiative was, however, criticised because it was deemed unconstitutional, as it was targetting African-Americans and Latinos.

"Many deemed the 'Stop-and-Frisk' search as unconstitutional because it targetted people based on their appearances. But just because the unconstitutional search happens on a digital field at airports does not in any way reduce its severity.

"Sounds like this initiative will too target Arabs and Muslims, so why is it standing?" asked Al Madfaei.

Khalifa Al Fahim, a senior systems analyst at ADNOC, agreed. "Searching content on mobile phones is certainly an invasion of our privacy."

The 30-year-old, however, noted that the recent warning would not stop him from travelling to the US. "I understand why US authorities are being strict, and I would understand if the UAE did the same thing. It's better to be safe than sorry."

Khalifa Al Shamsi, an associate at the Abu Dhabi Investment Authority, does not believe the move is racially motivated. "One cannot judge and believe that US authorities are targetting Arabs and Muslims.

"I don't think it's racist in any way, it is perhaps more about security measures because of all the recent global threats. I also don't think any normal and safe traveler would have illegal content on his phone."

39- year-old Abdullah Salem Al Shamily, a retired Emirati government employee on pension, told Khaleej Times that he definitely has no problem with the new American measures that may include inspection of phones for illegal content or that violate public decency in the US. "It is my duty to respect the law of other countries and those of mine as well," he said.

"We should seriously take the warning of the UAE Ministry of Foreign Affairs and International Cooperation and observe it because it is mainly for our safety."

Emirati national Rashid Ghanim Al Shamsi, member of the Hamriya Sports & Cultural Club, said there is no reason at all to cancel his travel plans to the States for such procedures. "I have nothing to hide, and I am afraid of nothing. Why should I care or feel worried. We should respect the laws of other countries."

Sydney Morning Herald
Ex-spy chief warns of net threats
Thursday, 20 October 2016
Byline: Deborah Snow and David Wroe

Sydney - The task of being an intelligence chief has become tougher with the rise of cyber threats and terrorism, according to the former head of the Australian Security Intelligence Organisation, David Irvine, who says he would like to see a "much stronger" national cyber industry.
Speaking during a rare interview in Canberra, Mr Irvine said "when you put cyber on top of [terrorism], it takes a bit of time off your sleep at night. The two issues have grown exponentially within a couple of decades and while the nature of the threats is the same, the vector has changed. And cyber is a new and very potent vector."

Mr Irvine, who led Australia's overseas spy agency ASIS before he headed up ASIO, said he'd been "horrified" at the revelations of Edward Snowden, the subcontractor to the National Security Agency who exposed vast top- secret US government programs for monitoring global communications. "People say, well nobody lost their lives as a result of Snowden, but how do you know that? You run through your mind all the possible consequences of having your capabilities, which are there to defend the country, exposed ..."

Mr Irvine expressed surprise at the "baldness" of the hacking of the Democratic National Committee data base (allegedly by Russia) in the US presidential election campaign, aimed at damaging Hillary Clinton.

"There has always been in the espionage/sabotage business the use of purloined information to obtain a political objective" he said. "But the baldness of [this] is a little bit surprising, the unsubtlety even more surprising.

"The tragedy is that it restricts the freedom of our politics in a whole variety of ways, it puts strictures on our political decision makers ... they have less free conversations, become more afraid to express themselves in emails. I certainly am much more careful in the way I express myself in emails than I might have been a few years ago." Mr Irvine was a guest at a series of security briefings for government agencies organised in Canberra this week by Australian cyber security firm Nuix. Also attending the

briefings was the company's US-based vice-president, Keith Lowry, who worked at the Pentagon at the time of the Snowden leaks and led a team trying to assess the damage from the revelations. He told Fairfax Media that many Australian government departments were "still exposed to serious data security risks because they do not conduct ongoing insider threat assessments".

Mr Irvine said cyber security was the area where those charged with protecting critical infrastructure in Australia "really had to focus in the next few years".

"You immediately think of cyber sabotage being the first tool of warfare in the 21st century but the tools that are available to nation states are increasingly available to non-state actors."

He said he wanted to see a "much stronger national cyber industry" and that while the government's recent and "probably overdue" paper on cyber security was very welcome, "the challenge now is to implement it".

Computer Weekly (UK)
Ireland to follow UK in setting up national cyber security centre
Wednesday, 19 October 2016
Byline: Warwick Ashford

Dublin - Ireland plans to set up a national cyber security centre, according to Denis Naughten, the country's communications minister.
The news comes less than a month after the UK's National Cyber Security Centre (NCSC) officially opened for business, combining all the government's cyber security agencies under one roof.

"I will bring a memorandum to cabinet next week to establish a national cyber security centre that will focus on securing government networks," Naughten told the (ISC)2 EMEA Congress 2016 in Dublin.

The centre will also cover the security of critical national infrastructure as well as assist industry and individuals to protect their digital assets.

"The centre will build on the existing computer security incident response team that has been in place in my department since 2011, providing incident response services to government departments and core state agencies," said Naughten.

As communications minister, Naughten said a key social, economic and political priority is Ireland's national broadband plan, which will bring fibre-to-the-home to rural Ireland.

"This means that the majority of consumers in rural Ireland will have access to services of up to 1 gigabit per second (Gbps), with symmetrical upload and download speeds for businesses," he said.

"In addition, in last week's budget in Ireland, funding was made available to facilitate the reallocation of the 700Mhz spectrum away from television broadcasting to support broadband and mobile telephony service plans, particularly in rural areas, which means a valuable spectrum band will be freed up to deliver mobile data, including 5G."

As a result, Ireland is now likely to be the first EU country to roll out 5G based on geographical factors rather than population density, putting it at the forefront of Europe and internationally in terms of connectivity and quality of service, said Naughten.

Three-quarters of consumers in Ireland reportedly manage their money or make payments using mobile devices, he said, which is nearly 50% higher than the EU average. Also, nearly 60% of 55 to 64-year-olds use a mobile device for banking, which highlights the level of trust they have in using technology, he added.

"This is an endorsement of the information security profession, but security of devices and data is continually under threat," said Naughten, which is why his department published Ireland's first national cyber security strategy last year.

"This builds on the longstanding recognition of the state's role in facilitating improved security in the online world, and set out how we would protect our digital assets, including personal data and infrastructure," said Naughten, pointing out that the planned national cyber security centre builds on this further.

"It is important that we have effective and accepted cyber security, which involves a balance of individual rights, particularly with regard to privacy and data protection with the interests of public safety and national security, but that is a difficult and challenging balance to achieve," he said.

Naughten said that in the light of the fact that the world is becoming ever more reliant on digital services, he stresses the need for a risk management process to be put in place.

"Our banks, our hospitals, our airports, airlines, shipping, road and rail vehicles, together with utility providers, need to be safe from cyber attacks, and I recognise that regulation alone will not be sufficient, and therefore I am committed to a programme of education and training so that the public, as well as business, are better able to protect themselves in a digital world," he said.

Le Soleil
400 experts à la conférence sur la radicalisation
Friday, 21 October 2016
Byline: Valérie Gaudreau

Québec - Impact des nouvelles technologies dans les discours haineux, rôle des villes contre la radicalisation ou encore des témoignages de familles de jeunes radicalisés : on en a appris davantage jeudi sur le contenu d'une grande conférence de l'UNESCO à Québec du 30 octobre au 1er novembre. La tenue dans la capitale de la conférence «Internet et la radicalisation des jeunes : prévenir, agir et vivre ensemble» avait déjà été annoncée en mai par la ministre québécoise des Relations internationales, Christine St-Pierre. Mais jeudi, le dévoilement de la programmation a permis d'apprendre que 400 experts et représentants de 70 pays convergeront vers Québec la semaine prochaine.

La directrice générale de l'UNESCO, Irina Bokova, sera présente. On entendra aussi le lieutenant général à la retraite Roméo Dallaire et Jehangir Khanm, directeur de l'équipe spéciale de lutte contre le terrorisme des Nations Unies, en plus de divers experts, universitaires et représentants du secteur privé. Le responsable de la liberté d'expression et des relations internationales chez Google, Ross LaJeunesse, participera notamment à un atelier.

Pour la ministre St-Pierre, la conférence Québec-UNESCO permettra de «faire rayonner l'expertise québécoise». «Mais également de démontrer notre volonté à participer activement au dialogue international sur la question afin de dégager des pistes de solution durables et efficaces», a-t-elle commenté en conférence de presse à l'hôtel de ville de Québec.

Si la radicalisation vers l'islam, au coeur de l'actualité, sera largement abordée, la conférence promet aussi des discussions sur divers types de propos haineux. Un ancien suprémaciste blanc devenu travailleur social, Daniel Gallant, participera notamment à une table ronde.

Journée du vivre ensemble

Jeudi, Christine St-Pierre a aussi déposé une motion à l'Assemblée nationale pour la création d'une journée nationale du vivre ensemble. Cette journée se tiendra le 15 janvier, en mémoire des Québécois, dont des résidents de Lac-Beauport, décédés dans les attentats de Ouagadougou au Burkina Faso le 15 janvier 2016.

Arab News
Govt cracks down on those who misuse social media accounts
Friday, 21 October 2016
Byline: Mohammed Al-Sulami

Jeddah - The increasing use of social media to harm the Saudi community, citizens, or Islam by some users in the Kingdom has prompted the Ministry of Interior to crack down on these users, arresting them on charges of acting in a manner that harms and deviates from the ways of the Saudi community and Islam. The ministry's response comes in light of repeated requests from the public to take action against the owners of these accounts. On Wednesday, Riyadh police were able to identify a citizen in this 30s who misused Snap Chat in a manner that angered many citizens and prompted them to call for his punishment. Riyadh police spokesman Col. Fawaz bin Jameel Al-Maiman said close monitoring allowed authorities to identify the man, who had been using his account to post clips of him making disrespectful and harmful comments. He was arrested and handed over to the branch of the Bureau of Investigation and Public Prosecution for violating anti-information crime regulations.

Indo-Asian News Service
India: 3.2 million debit cards 'hacked', data breach alarms customers
Friday, 21 October 2016

Mumbai - Prompting pre-Diwali panic among customers, an estimated 3.2 million debit cards of various banks are believed to have been "hacked" following a suspected security breach.
Investigations have begun into the causes behind the security risks. Several banks, including the State Bank Of India (SBI), have already started blocking their customers' debit cards and re-issuing fresh ones free of cost.

An estimated three million debit cards issued by various public or private banks are said to be affected by a potential data breach.

Debit or credit cards are prone to security issues when unauthorised parties gain access to the confidential data embedded on them, even as they are being swiped in an automatic teller machine (ATM).

In the current scenario, the SBI alone has blocked more than 600,000 debit cards while assuring that the malware-related security breach was reportedly detected in the non-SBI ATM network.

The move has been undertaken to ensure that customers' confidential personal data is not compromised while debit or credit cards are swiped for various transactions.

One of the card network companies, MasterCard said on Thursday that its "own systems have not been breached".

"We are working on the investigations with the regulators, issuers, acquirers, global and local law enforcement agencies and third party payment networks to assess the current situation," a MasterCard spokesperson said.

It has advised the consumers to review their account statements and activity, and if any unusual or fraudulent transactions are suspected, they should contact the concerned bank for more assistance.

Anxious customers have started enquiring with their banks over the seriousness of the problem, whether their personal data has leaked out and if that could lead to financial implications, especially with Diwali round the corner.

On Wednesday evening, the SBI said it has blocked cards of certain customers identified by the networks as a precautionary measure, though it did not reveal the exact number of cardholders who would be hit.

The SBI emphasised that its own systems have absolutely not been compromised and existing cardholders are not at any risk and can continue to use their cards as usual.

According to banking circles, several other banks have also experienced similar problems as a few ATMs have been hit by a malware which has a high potential to compromise customers data.

Official figures indicate that the SBI has over 200 million active debit cards, besides 47.5 million others of its associate banks.

In early September, the National Payments Corporation of India (NPCI), Mumbai, which controls all the retail payments systems in the country, had made it clear that there "is no compromise at NPCI and our systems are fully safe and secure."

NPCI handles over 25 million transactions daily, including RuPay cards, of which more than 290 million are currently in circulation.

Khaleej Times
Secure access to cloud a top priority for 41%
Friday, 21 October 2016
Byline: Sandhya D'Mello

Dubai - Cloud security is imperative and businesses have to adopt it for their growth, says Miguel Braojos, vice president of global sales, IAM Solutions at HID Global on the sidelines of the company's participation at the 36th Gitex Technology Week, under the theme 'Your Security Connected.'
"The company is focused in finance, governments and utilities - but in Middle East, it is the oil and gas sector. The organisations in the region are enhancing their security levels. Cloud adoption is beginning to take prominence, and by placing data and applications in the cloud, organisations gain a lot of flexibility in terms of accessibility. This is the upside; but in doing this, companies also expose themselves to risk and have to take steps to protect their assets," said Braojos.

"A robust security strategy and solutions with multi-factor authentication will suffice because the loss or damage of digital assets can have significant ramifications for an organisation. We are glad to find that organisations are assessing and evaluating their security strategies and reviewing implementing multi-factor authentication," he added.

As part of the company's mobility initiative, HID Global is demonstrating its ActivID Tap Authentication platform, which is powered by Seos, for convenient and secure multi-factor authentication to more than 2,400 cloud apps and web services on mobile devices with the simple tap of a smart card. HID Global will also emphasise the benefits of an enhanced user experience through its ActivID Authentication Appliance, an enterprise authentication solution that enables end users to securely access the door, data and cloud apps, anywhere, anytime.

A regional survey conducted by HID Global revealed that 47 per cent of organisations believe that securing access to cloud based data and application is as important as securing physical premises. With 41 per cent stating that secure access to cloud based data and applications was their number one priority.

Of the respondents who participated in the survey, 72 per cent said they relied on private cloud solutions and 48 per cent used it for collaboration solutions including databases, CRMs, and email. Around 33 per cent also said they stored mission-critical applications and data. In addition, 28 per cent of organisations said that they don't rely on cloud solutions at all. The most frequent reason cited for 39 per cent of respondents was that their organisation generated sensitive data, while 30 per cent found it too risky.

Other limiting factors for adopting cloud solutions in an organisation were found to be high cost for 11 per cent of respondents, and a lack of acceptance within existing company policy for 15 per cent of respondents.

Gulf News
Gitex shows how to imagine future on a grand scale
Friday, 21 October 2016
Byline: Naushad K. Cherrayil

Dubai - The 36 edition of Gitex Technology Week closed on a positive note on Thursday with a focus on robotics, 3D printing, virtual reality, augmented reality, drones, start-ups and live demos on latest technologies.
Etisalat tested 5G live trials, reaching 36Gbps speed to help it cope with the massive digital content explosion anticipated in the next few years while du in partnership with Nokia demonstrated the Middle East's first 4K 360 degree 3D virtual reality (VR) video streaming using 5G-ready network.

Robotics, along with drones and 3D printing, are three interrelated technologies that are rapidly decreasing in cost, advancing in sophistication, and driving innovation.

"Demand for 3D printing used to come from universities before but now it is even coming from schools. The intake by consumers is still not there yet but it is a matter of time," said Ashsih Panjabi, Chief Operating Officer of Jacky's Business Solutions.

UAE start-up DigiRobotics showcased the first virtual reality robotic simulator, first 3D-printed car and first 3D-printed humanoid robot.

"The UAE has shown how to imagine the future on a grand scale. Experts and futurists see the world changing in the near future, in a place where new ideas are especially welcomed," said Trixie LohMirmand, senior vice- president for exhibitions and events management at Dubai World Trade Centre.

The five-day event witnessed the most global weeklong start-up event in 2016, more than 410 start-ups from 60 countries and 1,200 tech founders.

"The opportunity to meet with start-up teams from around the world and from different industries in one place face-to-face is very valuable and highly effective," said Erich Sieber, Partner and senior vice-president of Inventages venture capital.

Raed Hafez, founder of Dubai grocery delivery app start-up el Grocer, praised the volume of opportunities at Gitex Global Startup Movement.

"In a span of three days, we met with ten investors. In the one-on-one meetings, we were able to meet a number of key investors who showed significant interest in our next funding round."

Ramkumar Balakrishnan, President of Redington Value Distribution, said that there has been an increased enterprise-focus over the past three years.

"There is a big change in the consumption model of IT. Customers are moving towards the Opex model. They want to consume IT like they consume other forms of utilities," he said.

Balakrishnan sees converged and hyper-converged infrastructure, adoption of cloud, Big Data and IoT as the main technologies that are going to drive future growth.

"This year, we connected with new prospects, further developed our brand awareness, and educated partners and customers about seamlessly managing data across different IT platforms," said Fadi Kanafani, Regional Director for Middle East and Africa at NetApp.

Next year's Gitex Technology Week will take place from October 8-12 at Dubai World Trade Centre.

Gulf News
UAE can and must play a larger role in global Internet security (Canada).
Friday, 21 October 2016
Byline: Harshul Joshi

Dubai - Cyber threats are more evident than ever before. On the one hand, data and communications technology have been embedded in everything from banking and municipal governance to cars, and in the process, they've sown the seeds for greater productivity and operational efficiency.
On the other hand, our vulnerability to cybercrime and sabotage has advanced in kind. According to PricewaterhouseCoopers, 79 per cent of companies fell victim to cyber-incidents in 2015 globally, and Symantec identified 54 new zero-day vulnerabilities, or more than one per week.

Numbers like these position cybercrime as an escalating threat, and the upcoming meeting of the International Organisation for Standardisation (ISO) and the International Electrotechnical Commission (IEC) (Subcommittee SC) 27 in Abu Dhabi presents an opportunity for local firms to offer a voice in securing our digital economy in the region.

For the first time since the working group was founded in 1990, a nation in the Middle East will host the international discussion on IT security standards, and ultimately shift the nexus of discussions on the delivery of resiliency in digital networks.

Historically, the same hubs that gave us some of our most popular technologies have had the job of remedying their exploitation. For instance, the World Economic Forum's index of nations most prepared to battle cyberattacks is filled with the usual suspects, with the US, Canada and Australia topping the list.

This first meeting of ISO/IEC JTC SC 27 in a less well-established region from the perspective of active cyber security defence suggests that emerging markets will play an expanding role in cyber resiliency and security in the future.

Under the auspices of Emirates Authority for Standardisation & Metrology (ESMA) and the UAE's National Electronic Security Authority (NESA), 350 international experts in IT security will meet to set information security standards with global implications.

Together, in the presence of 52 voting members and 18 observing members of the ISO, they will deliberate over technical specifications, identity management, biometrics and conformance assessments required to meet the challenges confronting governments, businesses and consumers in a digital age.

Data security vulnerabilities threaten economies of all sizes. Inadequate governance, unethical or uninformed computer users, insufficient legislation, in addition to poor technical standards chip away at internet and IT security.

The ISO/IEC's decision to convene the meeting in the UAE is a significant vote of confidence in the country's proactive stance on the management of its cyber environment, not least as Dubai aspires to emerge as the 'smartest city' in the world by 2017.

In 2015, the International Telecommunication Union (ITU) ranked the UAE among the top-10 most dynamic countries in ICT development, and the first in ICT use and government efficiency. Government agencies, such as ESMA and NESA, have led the charge in implementing best practices in security and reinforcing IT infrastructure.

The UAE is also leading internet security in a region that has proven vulnerable to cyberattack. Businesses in the Middle East report a higher frequency of incidents and a greater volume of losses per attack than any other region in the world. The ISO/IEC JTC SC 27 in Abu Dhabi (October22-27) represents an opportunity for firms in the UAE, and indeed the region, to gain international recognition for what is being accomplished in the field. At the same time, participants from the UAE will network with their peers and exchange information from markets around the world.

Despite the significant strides made by the government, businesses also have a role to play in mitigating attack. Cyber incidents cost the Gulf region $1 billion (Dh3.67 billion) in 2015 according to organisers of the UAE Security Forum.

Now Lebanon
Russia preparing to spy on Syria internet, activists warn
Friday, 21 October 2016
Byline: Albin Szakola

Beirut - An activist group dedicated to ensuring safer online communication for Syrians has warned that maintenance work being conducted on an undersea cable providing internet to the country is part of a Russian espionage effort.
SalamaTech Project issued a statement Wednesday that Syrian Telecom's announcement of repairs on the fiber-optic cable off Syria's Mediterranean coast "confirms" that a Russian deep sea exploration vessel spotted sailing in the area "is either already spying on this internet cable or will be in the future."

The organization cited an unnamed security expert as saying that the Russian ship will likely route the maritime cable through the Russian naval base in Tartous, allowing Moscow "to eavesdrop on internet communications between Syria and the rest of the World Wide Web."

Questions have been raised over the presence of the Russian oceanographic research vessel Yantar near an undersea fiber- optic cable providing internet to Syria.

In a separate statement, SalamaTech advised all Syrians to "take the highest degree of caution when using the internet" and avoid using it entirely when not using a Virtual Private Network (VPN) to encrypt their connection and prevent authorities from spying on them.

It also called on internet users to avoid the use of Skype and instead use Signal, an encrypted online messaging program.

SalamaTech's statements come after Syrian Telecom informed the public that maintenance work began October 19 on a "major international cable" providing approximately "60% of the internet capacity in Syria," as well as service to other countries in the region.

The government-owned company added that the maintenance work--which it described as "unexpected, urgent and swift"-- will last until October 28, causing "low level Internet quality."

Late last week, the Russian vessel Yantar was spotted off the northern coast of Lebanon sailing north toward Syria, raising fears it could cut the undersea fiber-optic cable providing internet to the war-torn country, according to a report in the Daily Beast.

The report noted that the Yantar is equipped with remote submarines that are "capable of severing the cables miles under the ocean's surface that carry global Internet communications."

Wall Street Journal
U.S. Ads Aim to Dispel Terrorism's Lure
Friday, 21 October 2016
Byline: Felicia Schwartz

Washington - The Obama administration, which has struggled for years to combat the social-media lure of Islamic State, is experimenting with new ways to put its online antiextremism messages in front of would-be terrorist fighters overseas.
The revamped effort uses targeted ads on Facebook linked to videos to reach the young men and women who have given digital hints that they could be thinking of traveling to Syria or Iraq to join extremist movements.

The campaign -- being run by the Global Engagement Center, a multiagency initiative housed at the State Department -- is seen by U.S. officials as one of the most promising new initiatives aimed at dissuading would-be fighters. But many officials acknowledge that such efforts are tricky since the target audience can be suspicious of the U.S. government's involvement and that their effectiveness is impossible to know.

"This isn't easy work," said Michael Lumpkin, who earlier this year left his post as assistant secretary of defense for special operations to run the Global Engagement Center.

But early results have been encouraging. The center spent $15,000 on a pilot four-week Facebook ad campaign that targeted 13-to- 34-year-old unmarried men and women in Morocco, Tunisia and Saudi Arabia who expressed an interest in Iraq, Syria or Islamic State-related topics, as indicated by their Facebook activity. Facebook didn't individually identify the people.

The campaign, which ended Oct. 1, reached 6.9 million people and generated 781,000 visits to external sites.

The most successful part of the pilot used a native video ad, which blends in with a site's editorial look and feel. The ad ran on Facebook for a week and reached 2.4 million people who watched for a total of more than 1,050,913 minutes, or two years' worth of streaming.

The ad, about two minutes long, used a cartoon portraying a man exchanging online messages with an Islamic State recruiter. The recruiter encourages him to go to Syria to fight. The man asks questions: Is it true that Islamic State kills Muslims and takes women as slaves? The faceless recruiter offers defenses to each question, urging the man to "trust us."

Ultimately, the man concludes that joining Islamic State wouldn't meet his expectations and decides against it.

The campaign marked the first time the U.S. government had turned to targeted ads to try to disrupt Islamic State recruitment. With the pilot complete, officials are moving to a broader, $50,000 campaign in 12 countries, including Egypt, Indonesia and France.

A pilot earlier this year by Google placed ads alongside results of searches for keywords and phrases entered by users with an apparent interest in Islamic State. The ads linked to Arabic- and English-language YouTube channels with videos intended to dissuade would-be fighters by featuring Islamic State defectors and other themes.

More than 300,000 people were drawn to the YouTube channels over two months, according to Google.

U.S. officials acknowledge they can't directly measure how many people they have persuaded not to join terrorist groups. But an analytics team led by two former National Security Agency scientists is assessing the campaigns' effectiveness. For example, they are examining how long people engage with the content and whether they fill out surveys when prompted.

Did Hillary Clinton reveal classified intel at debate?
Friday, 21 October 2016
Byline: Jamie Crawford

Washington - The Twitterverse was aflame in the hours after Wednesday night's debate with questions about whether or not Hillary Clinton divulged classified information about the country's nuclear arsenal. "There's about four minutes between the order being given and the people responsible for launching nuclear weapons to do so," Clinton said, explaining the quick decision-making required of a commander in chief and questioning Donald Trump's fitness for the job.

"And that's why 10 people who have had that awesome responsibility have come out and, in an unprecedented way, said they would not trust Donald Trump with the nuclear codes or to have his finger on the nuclear button," she continued.

But questions soon began to emerge about whether Clinton was too specific in her description of nuclear launch times and had perhaps revealed something she learned in a classified setting.

A Clinton campaign aide said the information didn't come from a classified briefing, pointing to multiple instances when similar information has been disclosed in public or through open source material.

In the July 2001 report "Minuteman Weapon System History and Description," authors from Hill Air Force Base in Utah discuss the amount of time needed. The "process of presidential authentication with the Pentagon war room and the formatting of a launch order by the war room prior to its dissemination to the Minuteman firing crews would add another 1 minute or so, for a grand total of 4-5 minutes."

And Joseph Cirincione, president of the Ploughshares Fund, which specializes in nuclear issues, tweeted out public references to the same assertions regarding timing.

But even if the information is publicly available, those with clearances cannot reveal anything they learn in a classified setting.

Asked about the sensitivity of this specific information, US Strategic Command, which oversees the US nuclear arsenal, declined to weigh in on the specifics.

"We do not disclose operational timelines, but we do work to provide the President as much decision space as possible," Capt. Brook DeWalt, chief spokesperson for Strategic Command, told CNN in a statement.

Defense Secretary Ash Carter, who appeared at news conference with his South Korean counterpart Thursday, demurred on a similar question about whether such information was classified, saying that the question was "cast in terms of the ongoing presidential campaign."

Reuters
U.S. vote authorities warned to be alert to Russian hacks faking fraud - officials
Friday, 21 October 2016
Byline: David Rohde, Mark Hosenball

Washington - U.S. intelligence and law enforcement officials are warning that hackers with ties to Russia's intelligence services could try to undermine the credibility of the presidential election by posting documents online purporting to show evidence of voter fraud. The officials, who spoke on condition of anonymity, said however, that the U.S. election system is so large, diffuse and antiquated that hackers would not be able to change the outcome of the Nov. 8 election. But hackers could post documents, some of which might be falsified, that are designed to create public perceptions of widespread voter fraud, the officials said. They said that they did not have specific evidence of such a plan, but state and local election authorities had been warned to be vigilant for hacking attempts. On Oct. 7, the U.S. government formally accused Russia for the first time of a campaign of cyber attacks against Democratic Party organizations to interfere with the election process.
U.S. officials familiar with hacking directed against American voting systems said evidence indicates that suspected Russian government-backed hackers have so far tried to attack voter registration databases operated by more than 20 states. Tracing the attacks can be difficult but breaches of only two such databases have been confirmed, they said. The officials said there is no evidence that any hackers have succeeded in accessing equipment or databases used to record votes. Many states use systems that would be difficult to hack or defraud, including paper ballots which initially are tallied by machines. U.S. elections are run by state and local officials, not the federal government. On Nov. 8, votes will be cast in hundreds of thousands of polling stations in 9,000 different jurisdictions, according to the National Association of Secretaries of State.

The U.S. officials declined to comment on Republican candidate Donald Trump's contention that the election is being "rigged." Trump said in the third and final presidential debate with Democratic candidate Hillary Clinton on Wednesday night that he would not say until the election results were known whether or not he would accept the outcome. Trump and his campaign officials have repeatedly said that the potential for voter fraud remains high but they have not provided any evidence.

On Thursday, Trump said he would accept the results of the election "if I win." He said he reserved the "right to contest or file a legal challenge in the case of a questionable result." Clinton supporters said Trump is unwittingly aiding an effort by Russian President Vladimir Putin to undercut the credibility of the vote. Washington and Moscow are at odds over several issues, from Russian involvement in the Ukraine conflict, the war in Syria and cyber attacks. "Trump does not even know he is being manipulated," said Michael Morell, a former deputy CIA director who has endorsed Clinton. "Trump is an unwitting agent of Putin."

Washington Post
Government alleges former NSA contractor stole 'astonishing quantity' of classified data over 20 years
Friday, 21 October 2016
Byline: Ellen Nakashima

Washington - Federal prosecutors in Baltimore on Thursday said they will charge a former National Security Agency contractor with violating the Espionage Act, alleging that he made off with "an astonishing quantity" of classified digital and other data over 20 years in what is thought to be the largest theft of classified government material ever.
In a 12-page memo, U.S. Attorney Rod Rosenstein and two other prosecutors laid out a much more far-reaching case against Harold T. Martin III than was previously outlined. They say he took at least 50 terabytes of data and "six full banker's boxes worth of documents," with many lying open in his home office or kept on his car's back seat and in the trunk. Other material was stored in a shed on his property.

Though he lacks a valid U.S. passport, the government said Martin could still flee to a foreign government that might wish to help him. Prosecutors said he has communicated with unnamed people in Russian and in June downloaded information on Russian and other languages.

The prosecutors also said Martin had an "arsenal" of weapons in his home and car, including an assault-rifle-style tactical weapon and a pistol-grip shotgun with a flash suppressor.

In a complaint unsealed earlier this month, the government charged him with felony theft of government property and the unauthorized removal and retention of classified materials, a misdemeanor. The prosecutors said that when an indictment is filed, they expect charges to include "violations of the Espionage Act," offenses that carry a prison term of up to 10 years for each count.

One terabyte is the equivalent of 500 hours' worth of movies.

Martin, who will appear at a detention hearing in U.S. District Court in Baltimore on Friday, also took personal information about government employees as well as dozens of computers, thumb drives and other digital storage devices, the government memo said.

The government has not alleged that Martin passed any material to a foreign government, but contends that if he is released on bail he could do so.

Prosecutors will argue Friday that Martin, 51, of Glen Burnie, Md., presents "a high risk of flight, a risk to the nation and to the physical safety of others," and that he should not be released from jail.

"The case against the defendant thus far is overwhelming, and the investigation is ongoing," said Rosenstein, Assistant U.S. Attorney Zachary Myers and trial attorney David Aaron. "The defendant

knows, and, if no longer detained, may have access to a substantial amount of highly classified information, which he has flagrantly mishandled and could easily disseminate to others."

Continued detention without bail is necessary, prosecutors said, because of "the grave and severe danger that pretrial release of the defendant would pose to the national security of the United States."

Martin's attorneys argued in a memo filed Thursday that their client is not a flight risk and should be released under court-approved conditions pending trial. "The government concocts fantastical scenarios in which Mr. Martin -- who, by the government's own admission, does not possess a valid passport -- would attempt to flee the country," wrote public defenders James Wyda and Deborah L. Boardman.

Martin's wife and home are in Maryland, they said. He has served in the U.S. Navy. "There is no evidence he intended to betray his country," they said. "The government simply does not meet its burden of showing that no conditions of release would reasonably assure Mr. Martin's future appearance in court."

The government also alleged that Martin took a top-secret document detailing "specific operational plans against a known enemy of the United States." Prosecutors did not name the enemy. The document, prosecutors said, contained a warning, in capital letters, that said: "This conop [concept of operations] contains information concerning extremely sensitive U.S. planning and operations that will be discussed and disseminated only on an absolute need to know basis."

Martin was not involved in the operation, the government said, and had no need to have the document or know its specifics.

Another document found in his car contained handwritten notes describing NSA's classified computer systems and detailed descriptions of classified technical operations, the prosecutors said.

In an interview before his arrest, Martin denied having taken classified material and only admitted to it when confronted with specific documents, prosecutors said. He had access to classified data beginning in 1996, when he was with the Navy Reserve, and that access continued through his employment with seven private government contractors.

The government alleged that Martin was able to defeat "myriad, expensive controls placed" on classified information.

They said the devices seized show he made extensive use of sophisticated encryption. He also used a sophisticated software tool that runs without being installed on a computer and provides anonymous Internet access, "leaving no digital footprint on the machine," they said.

In August, a cache of highly sensitive NSA hacking tools mysteriously appeared online. Although investigators have not found conclusive evidence that he was responsible for that, he is the prime

suspect, said U.S. officials, who spoke on the condition of anonymity because the investigation is ongoing. That is the event that set off the search that turned up Martin, the officials said.

In July, according to the prosecutors' memo, he watched a video about how law enforcement authorities catch computer users who wish to remain anonymous on the Internet. "He has a demonstrated ability to conceal his online communications and his access to the Internet," the prosecutors said.

To support their argument that Martin poses a danger to the community, they noted that in late July, he went to Connecticut to buy a "Detective Special" police-package Chevrolet Caprice. While searching his house, the FBI also recovered 10 firearms, only two of which were registered, the government said. Prosecutors said a loaded handgun was found in a case on the floorboard of the Caprice, in violation of Maryland law.

Martin's wife, Deborah Vinson, was "very upset" to learn about his arsenal, prosecutors said, and asked the FBI to take custody of the firearms because she was afraid that he would kill himself if he "thought it was all over."

If Martin had taken the classified material "for his own edification, as he has claimed, there would be no reason to keep some of it in his car, and arm himself as though he were trafficking in dangerous contraband," prosecutors said.

Radio Free Europe
Digital Trail Betrays Identity Of Russian 'Hacker' Detained In Prague
Thursday, 20 October 2016
Byline: Dmitry Treshchanin, Nick Shchetko

Prague - An investigation by RFE/RL's Current Time TV has determined that the Russian national accused by American officials of hacking U.S. targets and arrested earlier this month in the Czech capital is 29-year-old Moscow resident Yevgeny Nikulin.
Czech authorities this week said the suspect was detained in downtown Prague on October 5 in response to an Interpol warrant requested by the United States and now faces a Czech extradition hearing.

Czech police and local media have identified him only as "Yevgeniy N," and the Russian and U.S. governments revealed only that he was a Russian citizen.

Current Time's investigation uncovered Nikulin's Instagram account under the handle "i.tak.soidet," displaying a taste for luxury cars and jewelry and a digital trail that led through Belarus and Poland to the Czech Republic in the weeks before the Prague arrest.

The Instagram account went private shortly after Current Time's Russian-language report was published on October 20. Soon after that, Russian Foreign Ministry spokeswoman Maria Zakharova confirmed Nikulin's identity for journalists in Moscow.

"The Russian Foreign Ministry and the Russian Embassy in Prague are actively working with the Czech authorities to prevent the extradition of a Russian citizen to the United States," she added.

The Instagram account contained numerous photographs that included a gold Rolex watch, a distinctive bracelet and sneakers, and a luxury Mercedes AMG GLE63 automobile that all match items shown in a video of the arrest released by Czech police.

A social-media friend of Nikulin's who asked not to be identified told Current Time that Nikulin was "an idiot" for traveling abroad and that "he knew about Interpol."

The last post to the i.tak.soidet Instagram account appeared on October 11, six days after Nikulin's arrest. It is a simple text message that says, "I will return soon, what's all the fuss?" and was tagged "Prague Old Town."

One of the Instagram road photos from the days before the detention shows Nikulin's Mercedes apparently in Poland, and has a comment from a user asking, "What about Interpol?"

Current Time was also able to learn the license-plate number of Nikulin's Mercedes, which appears to match the blurred number shown in the video released by the Czech police.

It is unclear exactly what role Nikulin is suspected of playing in the alleged U.S. website hacks or even which websites were involved. A spokesperson from the U.S. Embassy in Prague confirmed that a Russian had been detained who was "suspected of hacking U.S. targets."

Hours after news emerged of the arrest, the professional networking service LinkedIn issued a statement suggesting the development was connected to a 2012 breach of its members' information. In May, LinkedIn acknowledged that intrusion compromised more than 100 million of its users' passwords.

The social-media friend who spoke with Current Time described Nikulin as "a young genius" who "now will be working for the government in the United States." The i.tak.soidet Instagram account, however, does not hint at any specific expertise in computers.

The i.tak.soidet account is popular, with nearly 44,000 followers and most of his posts garnering hundreds, or even thousands, of "likes."

'A Successful Entrepreneur'

In a 2015 interview with the Russian car website AvtoRambler, Nikulin describes his experience of owning Lamborghini cars. He is described as "a very busy young man."

"Yevgeny is already a successful entrepreneur whose business interests include a construction firm, an automobile service garage, and a company that sells luxury watches. As you can see from our interview," the article states, "the Huracan is not his first Lamborghini."

He boasts of owning a Bentley, a Continental GT, and a Mercedes-Benz G-Class.

No date has been set for Nikulin's extradition hearing, but Czech authorities said the man would remain in custody until that process.

The Russian Embassy in Prague told Current Time that Moscow will be seeking his return to Russia. Moscow, an embassy source said, rejects "the U.S. practice of forcing the entire world to enforce its extraterritorial jurisdiction."

Interpol had issued a so-called Red Notice for the alleged Russian hacker, a designation for "wanted international fugitives."

President Barack Obama's administration on October 7 explicitly pointed to Russia as the alleged director of recent cyberattacks and leaks seemingly aimed at disrupting the U.S. elections in November, citing e-mails and digital intrusions on a range of election-related institutions. A week later, Vice President Joe Biden said the United States was "sending a message" over Russia's apparent role in the digital attacks and Russian President Vladimir Putin would get it.

Putin's spokesman and other Russian officials have downplayed such allegations and suggested that they are "dirty tricks" and Americans should pay more attention to the information contained in the leaks.

ABC News
NSA Can Access More Phone Data Than Ever
Thursday, 20 October 2016
Byline: Lee Ferran

Washington - One of the reforms designed to rein in the surveillance authorities of the National Security Agency has perhaps inadvertently solved a technical problem for the spy outfit and granted it potential access to much more data than before, a former top official told ABC News.
Before the signing of the USA Freedom Act in June 2015, one of the NSA's most controversial programs was the mass collection of telephonic metadata from millions of Americans -- the information about calls, including the telephone numbers involved, the time and the duration but not the calls' content -- under a broad interpretation of the Patriot Act's Section 215. From this large "haystack," as officials have

called it, NSA analysts could get approval to run queries on specific numbers purportedly linked to international terrorism investigations.

The problem for the NSA was that the haystack was only about 30 percent as big as it should've been; the NSA database was missing a lot of data. As The Washington Post reported in 2014, the agency was not getting information from all wireless carriers and it also couldn't handle the deluge of data that was coming in.

On the technical side, Chris Inglis, who served as the NSA's deputy director until January 2014, recently told ABC News that when major telecommunications companies previously handed over customer records, the NSA "just didn't ingest all of it."

"[NSA officials] were trying to make sure they were doing it exactly right," he said, meaning making sure that the data was being pulled in according to existing privacy policies. The metadata also came in various forms from the different companies, so the NSA had to reformat much of it before loading it into a searchable database.

Both hurdles meant that the NSA couldn't keep up, and of all the metadata the agency wanted to be available for specific searches internally, only about a third of it actually was.

But then the USA Freedom Act was signed into law, and now Inglis said, all that is "somebody else's problem."

The USA Freedom Act ended the NSA's bulk collection of metadata but charged the telecommunications companies with keeping the data on hand. The NSA and other U.S. government agencies now must request information about specific phone numbers or other identifying elements from the telecommunications companies after going through the Foreign Intelligence Surveillance Act (FISA) court and arguing that there is a "reasonable, articulable suspicion" that the number is associated with international terrorism.

As a result, the NSA no longer has to worry about keeping up its own database and, according to Inglis, the percentage of available records has shot up from 30 percent to virtually 100. Rather than one internal, incomplete database, the NSA can now query any of several complete ones.

The new system "guarantees that the NSA can have access to all of it," Inglis said.

NSA general counsel Glenn Gerstell made a brief reference to the increased capacity in a post for the Lawfare blog in January after terrorist attacks at home and abroad.

"Largely overlooked in the debate that has ensued in the wake of recent attacks is the fact that under the new arrangement, our national security professionals will have access to a greater volume of call records subject to query in a way that is consistent with our regard for civil liberties," he wrote.

Mark Rumold, a senior staff attorney at the Electronic Frontier Foundation, told ABC News he doesn't have much of a problem with the NSA's wider access to telephone data, since now the agency has to go through a "legitimate" system with "procedural protections" before jumping into the databases.

"Their ability to obtain records has broadened, but by all accounts, they're collecting a far narrower pool of data than they were initially," he said, referring to returns on specific searches. "They can use a type of legal process with a broader spectrum of providers than earlier. To me, that isn't like a strike against it. That's almost something in favor of it, because we've gone through this public process, we've had this debate, and this is where we settled on the scope of the authority we were going to give them."

Rumold said he's still concerned about the NSA's ability to get information on phone numbers linked to a number in question -- up to two "hops" away -- but he said the USA Freedom Act "remains a step in the right direction."

The trade-off of the new system, according to Inglis, is in the efficiency of the searches. Whereas in the past the NSA could instantaneously run approved searches of its database, now the agency must approach each telecommunications company to ask about a number and then wait for a response.

In his January post Gerstell acknowledged concerns that the new approach could be "too cumbersome to be effective" and said the NSA will report to Congress on how the arrangement is working. A representative for the NSA declined to tell ABC News if any problems have been encountered so far, and Rumold noted there has been no public evidence of any issues.

Inglis said he isn't terribly concerned if the searches are a little slower. It's a small price to pay, he said, for what he called an "additional safeguard" that could increase the public's confidence in what the NSA is and how it operates.

Baltimore Sun
NSA chief: Cyber adds 'whole other dimension' to Russia's attempts to manipulate U.S. affairs
Thursday, 20 October 2016
Byline: Ian Duncan

Baltimore - The head of the NSA said Thursday that Russia's hack of Democratic Party emails is consistent with its history of trying to manipulate and influence affairs in other countries -- but the scope of such operations has changed dramatically.
"Cyber adds a whole other dimension to this because it now enables individuals, actors, groups, nation states to acquire data at massive scale and then divulge that," Adm. Michael S. Rogers told cyber professionals at the sixth annual Cyber Maryland Conference in Baltimore.

The job now for the National Security Agency and other parts of the government, Rogers said, is to make sure that Americans continue to have confidence in the electoral system.

"As we work our way through this particular issue, that's always at the forefront of our minds," he said.

Online conflict between Russia and the United States that typically takes place out of public view has burst into the national consciousness during the presidential election with the theft of emails from the Democratic National Committee and the campaign of Hillary Clinton and their release through the website WikiLeaks and other sites.

The intelligence community took the unusual step this month of publicly naming Russia's "senior-most officials" as the culprits.

The CIA is weighing options for a counterattack, NBC News reported last week. The NSA could help.

Clinton hammered the point during her debate Wednesday with Republican nominee Donald Trump. Trump said he would condemn any Russian interference with the election, but declined to blame Russia for the hacks.

Rogers was asked about comments by one of his predecessors, Michael Hayden, who said this week that collecting emails sent by political operatives was a legitimate intelligence operation.

Rogers responded with a question.

"We need to step back as a nation and think about the implications of that," he said. "Is that something we're comfortable with?"

Motherboard (Vice)
How hackers broke into John Podesta and Colin Powell's Gmail accounts
Thursday, 20 October 2016
Byline: Lorenzo Franceschi-Bicchierai

New York - On March 19 of this year, Hillary Clinton's campaign chairman John Podesta received an alarming email that appeared to come from Google.
The email, however, didn't come from the internet giant. It was actually an attempt to hack into his personal account. In fact, the message came from a group of hackers that security researchers, as well as the US government, believe are spies working for the Russian government. At the time, however, Podesta didn't know any of this, and he clicked on the malicious link contained in the email, giving hackers access to his account.

Months later, on October 9, WikiLeaks began publishing thousands of Podesta's hacked emails. Almost everyone immediately pointed the finger at Russia, who is suspected of being behind a long and sophisticated hacking campaign that has the apparent goal of influencing the upcoming US elections. But there was no public evidence proving the same group that targeted the Democratic National Committee was behind the hack on Podesta-- until now.

The data linking a group of Russian hackers--known as Fancy Bear, APT28, or Sofacy--to the hack on Podesta is also yet another piece in a growing heap of evidence pointing toward the Kremlin. And it also shows a clear thread between apparently separate and independent leaks that have appeared on a website called DC Leaks, such as that of Colin Powell's emails; and the Podesta leak, which was publicized on WikiLeaks.

All these hacks were done using the same tool: malicious short URLs hidden in fake Gmail messages. And those URLs, according to a security firm that's tracked them for a year, were created with Bitly account linked to a domain under the control of Fancy Bear.

THE TRAIL THAT LEADS TO FANCY BEAR

The phishing email that Podesta received on March 19 contained a URL, created with the popular Bitly shortening service, pointing to a longer URL that, to an untrained eye, looked like a Google link.

Inside that long URL, there's a 30-character string that looks like gibberish but is actually the encoded Gmail address of John Podesta. According to Bitly's own statistics, that link, which has never been published, was clicked two times in March.

That's the link that opened Podesta's account to the hackers, a source close to the investigation into the hack confirmed to Motherboard.

That link is only one of almost 9,000 links Fancy Bear used to target almost 4,000 individuals from October 2015 to May 2016. Each one of these URLs contained the email and name of the actual target. The hackers created them with with two Bitly accounts in their control, but forgot to set those accounts to private, according to SecureWorks, a security firm that's been tracking Fancy Bear for the last year.

SecureWorks was tracking known Fancy Bear command and control domains. One of these lead to a Bitly shortlink, which led to the Bitly account, which led to the thousands of Bitly URLs that were later connected to a variety of attacks, including on the Clinton campaign. With this privileged point of view, for example, the researchers saw Fancy Bear using 213 short links targeting 108 email addresses on the hillaryclinton.com domain, as the company explained in a somewhat overlooked report earlier this summer, and as BuzzFeed reported last week.

Using Bitly allowed "third parties to see their entire campaign including all their targets-- something you'd want to keep secret," Tom Finney, a researcher at SecureWorks, told Motherboard.

It was one of Fancy Bear's "gravest mistakes," as Thomas Rid, a professor at King's College who has closely studied the case, put it in a new piece published on Thursday in Esquire, as it gave researchers unprecedented visibility into the activities of Fancy Bear, linking different parts of its larger campaign together.

This is how researchers have been able to find the phishing link that tricked Colin Powell and got him hacked. This also allowed them to confirm other public reports of compromises, such as that of William Rinehart, a staffer with Clinton's presidential campaign. As The Smoking Gun reported in August, Rinehart received a malicious Google security alert on March 22, according to a screenshot Rinehart shared with the site. SecureWorks found a URL that had Rinehart's Gmail address encoded, which had the same date.

Similar malicious emails and short URLs have also been used recently against independent journalists from Bellingcat, a website that has investigated the incident of the shootdown of Malaysian Airlines Flight 17 (MH17) over Ukraine in 2014, finding evidence that Russian-backed rebels were behind it.

Other journalists in eastern Europe have also recently been targeted with phishing emails trying to break into their Gmail accounts.

These malicious emails, just like the ones used against Podesta, Powell, Rinehart and many others, looked like Google alerts, and contained the same type of encoded strings hiding the victims' names.

It's unclear why the hackers used the encoded strings, which effectively reveal their targets to anyone. Kyle Ehmke, a threat intelligence researcher at security firm ThreatConnect, argued that "the strings might help them keep track of or better organize their operations, tailor credential harvesting pages to specific victims, monitor the effectiveness of their operations, or diffuse their operations against various targets across several URLs to facilitate continuity should one of the URLs be discovered."

The use of popular link shortening services such as Bitly or Tinyurl might have a simpler explanation. According to Rid, the hackers probably wanted to make sure their phishing attempts went past their targets' spam filters.

THE SMOKING GUN?

None of this new data constitutes a smoking gun that can clearly frame Russia as the culprit behind the almost unprecedented hacking campaign that has hit the DNC and several other targets somewhat connected to the US presidential election.

Almost two weeks ago, the US government took the rare step of publicly pointing the finger at the Russian government, accusing it of directing the recent string of hacks and data breaches. The

intelligence community declined to explain how they reached their conclusion, and it's fair to assume they have data no one else can see.

This newly uncovered data paints an even clearer picture for the public, showing a credible link between the several leaking outlets chosen by the hackers, and, once again, pointing toward Fancy Bear, a notorious hacking group that's widely believed to be connected with the Russian government. While there are still naysayers, including presidential candidate and former reality TV star Donald Trump, for many, the debate over who hacked the DNC, and who's behind all this hacking, is pretty much closed.

"We are approaching the point in this case where there are only two reasons for why people say there's no good evidence," Rid told me. "The first reason is because they don't understand the evidence--because the don't have the necessary technical knowledge. The second reason is they don't want to understand the evidence."

Wired (UK)
Hackers are not as 'sophisticated as they think they are'
Thursday, 20 October 2016
Byline: Matthew Levy

London - The way we talk about cyberattacks has created a culture of fear around online security, said Ian Levy, technical director at the National Centre for Cyber Security. The newly-formed offshoot of GCHQ will be responsible for coordinating UK cybersecurity efforts and keeping the UK safe from online threats.
"The context in which you judge something also influences how you interpret it," he told the audience at WIRED Security in London. Media coverage of cyberattacks is crammed full of scary buzzwords. Cyberattacks - invariably represented by a lone hooded teenager in a dark room - are described as 'sophisticated' and 'unprecedented.'

Levy pins at least part of the blame for this language on the cybersecurity industry itself. "There is no other bit of public policy where the tone is set by a group of massively incentivised people," he said. Once they've got people sufficiently scared about cyber threats, security companies offer up what Levy describes as "magic amulets" - miracle defences which promise to defend against any and every attack.

Case in point: the Air Gap. Levy set up a website showcasing a magic amulet of his own creation. Like many cyber defences, his piece of hardware promised to defend against all known and unknown viruses, and stop zero day exploits. His product? An empty box with a blue blinking light on it. Levy had to take his website offline when he started getting sales enquiries by email.

The ex-GCHQ director takes exception with one cybersecurity phrase in particular: 'advanced persistent threats'. Levy prefers to use the phrase 'adequate pernicious toerags' - most cyberattackers, he said, just do the bare minimum to overcome cyber defences and don't pose much of a threat at all.

The government, too, deserves its share of the blame for public confusion over cybersecurity. "We have to change the advice we give and the way we talk about it," Levy said. Rather than telling people not to click on links within suspicious emails, the NCSC is working on making sure that UK citizens never get those emails in the first place.

Levy plans to introduce DMARC (which stands for domain- based message authentication, reporting and conformance) on to all 6,000 government domains. This would stop people receiving malicious mail from websites pretending to be associated with government agencies. Once they've done that, Levy said, "we're going to point and laugh at everyone that doesn't do the same."

If it works (and initial tests have already proven promising), the NCSC will recommend DMARC to the private sector too. "Let's publish what we've done, what effect it's had, and the cost," he said. "By default, let's protect people."

Surveillance hertzienne : le Conseil constitutionnel censure la loi renseignement
Friday, 21 October 2016
Byline: Jean-Baptiste Jacquin

Paris - La disposition contestée permettait de s'affranchir du code de procédure pénale, et de se dispenser de l'avis de la Commission nationale de contrôle des techniques de renseignement.
C'est un petit article de loi en vigueur depuis vingt-cinq ans que le Conseil constitutionnel a censuré dans une décision rendue vendredi 21octobre. Cet article permettait tout bonnement aux services de renseignement de procéder sans le moindre contrôle à la surveillance de communications par voie hertzienne. Les gardiens de la Constitution le déclarent contraire à l'article2 de la Déclaration des droits de l'homme et du citoyen de 1789 en portant «une atteinte manifestement disproportionnée au droit au respect de la vie privée et au secret des correspondances». Ils le déclarent inconstitutionnel et demandent au législateur d'élaborer un nouveau texte d'ici le 31décembre 2017.

Au nom de «la défense des intérêts nationaux» , les pouvoirs publics pouvaient ainsi surveiller les déplacements de sous-marins étrangers ou les mouvements de troupes sur un théâtre d'opération, mais également des communications par téléphone mobile entre particuliers, des échanges par Wi-Fi ou Bluetooth. Rebaptisé article L.811-5 dans la loi renseignement de juillet2015, cet article permettait aux services de renseignement de s'affranchir des contrôles que cette loi imposait en précisant par exemple que la surveillance de particuliers ne peut être autorisée par le premier ministre qu'après avis de la Commission nationale de contrôle des techniques de renseignement (CNCTR).

«Un trou législatif béant»

C'est en invoquant cette disposition particulièrement floue que Bernard Squarcini, l'ancien patron de la Direction centrale du renseignement intérieur (DCRI), avait pris la liberté de procéder à des écoutes dans l'affaire des fadettes du Monde . Lors du débat sur la loi renseignement de 2015, quelques mois après les attentats contre Charlie Hebdo et l'Hyper Cacher, personne ne semblait s'être intéressé à cet article introduit par la loi de 1991 sur le secret des correspondances. Cette dernière avait elle-même été votée après le scandale des écoutes de l'Elysée où François Mitterrand avait fait écouter des personnalités, dont le journaliste du Monde Edwy Plenel.

Le Conseil constitutionnel s'était prononcé en juillet2015 sur la loi renseignement, en censurant d'ailleurs deux dispositions, mais n'avait validé que les articles qui lui avaient été soulignés dans les saisines du président de la République et du président du Sénat. Il ne s'était jamais saisi de ce sujet avant la question prioritaire de constitutionnalité déposée au printemps par des associations (La Quadrature du Net, French Data Network, la Fédération des fournisseurs d'accès à Internet associatifs et Igwan.net). Selon leur avocat, Patrice Spinosi, il a créé «un trou législatif béant» et ouvert «la voie à un espionnage de masse» , a-t-il expliqué à l'audience, le 11octobre.

L'article, très court, dit: «Les mesures prises par les pouvoirs publics pour assurer, aux seules fins de défense des intérêts nationaux, la surveillance et le contrôle des transmissions empruntant la voie hertzienne ne sont pas soumises aux dispositions du présent livre, ni à celles de la sous-section2 de la section3 du chapitreIer du titreIII du livreIer du code de procédure pénale.» Dans sa décision, le Conseil constitutionnel note que la disposition contestée permettait de fait de s'affranchir du code de procédure pénale qui encadre les écoutes ordonnées par un juge d'instruction.

Deux réserves transitoires

Balayant les observations du gouvernement et reprenant les arguments des associations, l'institution présidée par Laurent Fabius souligne que la rédaction du texte incriminé n'interdit pas des mesures de surveillance «utilisées à des fins plus larges que la seule mise en oeuvre de» la défense des intérêts nationaux. Surtout, écrit-elle, le recours à ces mesures n'est soumis «à aucune condition de fond ni de procédure» et leur mise en oeuvre n'est encadrée par «aucune garantie» . Aucune limite sur l'exploitation des données personnelles ni leur conservation n'était prévue...

Pour ne pas empêcher les services de renseignement de continuer à opérer des écoutes qui relèveraient réellement de la défense nationale, le Conseil n'abroge pas la loi mais encadre sérieusement son application. En attendant qu'un nouveau texte de loi soit voté, il impose deux «réserves transitoires». Les mesures de surveillance ne pourront pas s'appliquer aux écoutes soumises à autorisation par la loi renseignement, et la CNCTR devra être «régulièrement informée» des opérations mises en oeuvre. La nouvelle législature qui sortira des urnes en juin aura quelques mois pour faire le tri entre ce qui relève des surveillances susceptibles de porter atteinte à la vie privée et les autres.

Private Security Group Says Russia Was Behind Hack of Clinton Campaign Chairman
Friday, 21 October 2016
Byline: Nicole Perlroth, Michael D. Shear

San Francisco - At the start of 2014, President Obama assigned his trusted counselor, John D. Podesta, to lead a review of the digital revolution, its potential and its perils. When Mr. Podesta presented his findings five months later, he called the internet's onslaught of big data "a historic driver of progress." But two short years later, as chairman of Hillary Clinton's presidential campaign, Mr. Podesta would also become one of the internet's most notable victims.
On Thursday, private security researchers said they had concluded that Mr. Podesta was hacked by Russia's foreign intelligence service, the GRU, after it tricked him into clicking on a fake Google login page last March, inadvertently handing over his digital credentials.

For months, the hackers mined Mr. Podesta's inbox for his most sensitive and potentially embarrassing correspondence, much of which has been posted on the WikiLeaks website. Additions to the collection on Thursday included three short email exchanges between Mr. Podesta and Mr. Obama himself in the days leading up to his election in 2008.

Mr. Podesta's emails were first published by WikiLeaks earlier this month. The release came just days after James R. Clapper Jr., the director of national intelligence, and the Department of Homeland Security publicly blamed Russian officials for cyberattacks on the Democratic National Committee, in what they described as an effort to influence the American presidential election.

To date, no government officials have offered evidence that the same Russian hackers behind the D.N.C. cyberattacks were also behind the hack of Mr. Podesta's emails, but an investigation by the private security researchers determined that they were the same.

Threat researchers at Dell SecureWorks, an Atlanta-based security firm, had been tracking the Russian intelligence group for more than a year. In June, they reported that they had uncovered a critical tool in the Russian spy campaign. SecureWorks researchers found that the Russian hackers were using a popular link shortening service, called Bitly, to shorten malicious links they used to send targets fake Google login pages to bait them into submitting their email credentials.

The hackers made a critical error by leaving some of their Bitly accounts public, making it possible for SecureWorks to trace 9,000 of their links to nearly 4,000 Gmail accounts targeted between October 2015 and May 2016 with fake Google login pages and security alerts designed to trick users into turning over their passwords.

Among the list of targets were more than 100 email addresses associated with Hillary Clinton's presidential campaign, including Mr. Podesta's. By June, 20 staff members for the campaign had clicked on the short links sent by Russian spies. In June, SecureWorks disclosed that among those whose email

accounts had been breached were staff members who advised Mrs. Clinton on policy and managed her travel, communications and campaign finances.

Two security researchers who have been tracking the GRU's spearphishing campaign confirmed Thursday that Mr. Podesta was among those who had inadvertently turned over his Google email password. The fact that Mr. Podesta was among those breached by the GRU was first disclosed Thursday by Esquire and VICE Motherload blog, which published the link Russian spies used against Mr. Podesta.

"The new public data confirming the Russians are behind the hack of John Podesta's email is a big deal," Jake Sullivan, Mrs. Clinton's senior policy adviser, said Thursday. "There is no longer any doubt that Putin is trying to help Donald Trump by weaponizing WikiLeaks."

The new release of Mr. Podesta's email exchange with Mr. Obama from 2008 made clear that Mr. Obama's team was confident he would win.

In one of the emails, Mr. Podesta wrote Mr. Obama a lengthy memo in the evening on Election Day recommending that he not accept an invitation from President George W. Bush to attend an emergency meeting of the Group of 20 leaders.

"Attendance alongside President Bush will create an extremely awkward situation," the memo said. "If you attempt to dissociate yourself from his positions, you will be subject to criticism for projecting a divided United States to the rest of the world. But if you adopt a more reserved posture, you will be associated not only with his policies, but also with his very tenuous global standing."

The White House did not respond to questions about the email.

London Daily Telegraph
GCHQ using cyber attacks on Isil to aid battle to take Mosul
Friday, 21 October 2016
Byline: Ben Farmer

London - GCHQ is using cyber warfare for the first time against Isil militants as part of the campaign to retake Mosul, the Defence Secretary has said.
The cyber attacks are understood to have targeted the communications of Islamic State of Iraq and the Levant to disrupt co-ordination in the Iraqi city.

Sir Michael Fallon told a conference organised by the Royal United Services Institute, a think tank on cyber warfare: "We are conducting military operations against Daesh [Isil] as part of the international coalition, and I can confirm that we are using offensive cyber for the first time in this campaign." He said £265 million is being pumped into "rooting out cyber vulnerabilities" in military and wider cyber-systems.

Esquire
How Russia Pulled Off the Biggest Election Hack in U.S. History
Friday, 21 October 2016
Byline: Thomas Rid

New York - On an April afternoon earlier this year, Russian president Vladimir Putin headlined a gathering of some four hundred journalists, bloggers, and media executives in St. Petersburg. Dressed in a sleek navy suit, Putin looked relaxed, even comfortable, as he took questions. About an hour into the forum, a young blogger in a navy zip sweater took the microphone and asked Putin what he thought of the "so- called Panama Papers."
The blogger was referring to a cache of more than eleven million computer files that had been stolen from Mossack Fonseca, a Panamanian law firm. The leak was the largest in history, involving 2.6 terabytes of data, enough to fill more than five hundred DVDs. On April 3, four days before the St. Petersburg forum, a group of international news outlets published the first in a series of stories based on the leak, which had taken them more than a year to investigate. The series revealed corruption on a massive scale: Mossack Fonseca's legal maneuverings had been used to hide billions of dollars. A central theme of the group's reporting was the matryoshka doll of secret shell companies and proxies, worth a reported $2 billion, that belonged to Putin's inner circle and were presumed to shelter some of the Russian president's vast personal wealth.

When Putin heard the blogger's question, his face lit up with a familiar smirk. He nodded slowly and confidently before reciting a litany of humiliations that the United States had inflicted on Russia. Putin reminded his audience about the sidelining of Russia during the 1998 war in Kosovo and what he saw as American meddling in Ukraine more recently. Returning to the Panama Papers, Putin cited WikiLeaks to insist that "officials and state agencies in the United States are behind all this." The Americans' aim, he said, was to weaken Russia from within: "to spread distrust for the ruling authorities and the bodies of power within society."

Though a narrow interpretation of Putin's accusation was defensible--as WikiLeaks had pointed out, one of the members of the Panama Papers consortium had received financial support from USAID, a federal agency--his swaggering assurance about America's activities has a more plausible explanation: Putin's own government had been preparing a vast, covert, and unprecedented campaign of political sabotage against the United States and its allies for more than a year.

The Russian campaign burst into public view only this past June, when The Washington Post reported that "Russian government hackers" had penetrated the servers of the Democratic National Committee. The hackers, hiding behind ominous aliases like Guccifer 2.0 and DC Leaks, claimed their first victim in July, in the person of Debbie Wasserman Schultz, the DNC chair, whose private emails were published by WikiLeaks in the days leading up to the Democratic convention. By August, the hackers had learned to use the language of Americans frustrated with Washington to create doubt about the integrity of the

electoral system: "As you see the U. S. presidential elections are becoming a farce," they wrote from Russia.

The attacks against political organizations and individuals absorbed much of the media's attention this year. But in many ways, the DNC hack was merely a prelude to what many security researchers see as a still more audacious feat: the hacking of America's most secretive intelligence agency, the NSA.

Russian spies did not, of course, wait until the summer of 2015 to start hacking the United States. This past fall, in fact, marked the twentieth anniversary of the world's first major campaign of state-on-state digital espionage. In 1996, five years after the end of the USSR, the Pentagon began to detect high-volume network breaches from Russia. The campaign was an intelligence- gathering operation: Whenever the intruders from Moscow found their way into a U. S. government computer, they binged, stealing copies of every file they could.

By 1998, when the FBI code-named the hacking campaign Moonlight Maze, the Russians were commandeering foreign computers and using them as staging hubs. At a time when a 56 kbps dial-up connection was more than sufficient to get the best of Pets.com and AltaVista, Russian operators extracted several gigabytes of data from a U. S. Navy computer in a single session. With the unwitting help of proxy machines--including a Navy supercomputer in Virginia Beach, a server at a London nonprofit, and a computer lab at a public library in Colorado--that accomplishment was repeated hundreds of times over. Eventually, the Russians stole the equivalent, as an Air Intelligence Agency estimate later had it, of "a stack of printed copier paper three times the height of the Washington Monument."

The Russians' tactics became more sophisticated over time; they even hacked satellites to cover their tracks. But while the American code names used to track the Russian effort changed--from Moonlight Maze to Storm Cloud to Makers Mark--the operation itself never really stopped. Over the next two decades, the FSB (successor to the KGB) and the GRU (Russia's premier military intelligence organization) went after political and military targets, while the NSA and the UK's GCHQ returned the favor.

This sort of espionage was business as usual, a continuation of long-standing practice. And during the cold war, both the USSR and the United States subtly, and sometimes covertly, interfered with foreign elections. What changed over the past year, however--what made the DNC hack feel new and terrifying--was Russia's seeming determination to combine the two. For the first time, Russia used a hacking operation, one that collected and released massive quantities of stolen information, to meddle in an American presidential election. The inspiration and template for this new attack was a poisonous cocktail of fact and fabrication that the Russians call kompromat, for "compromising material."

Kompromat had been deployed by the Soviet Union since at least the 1950s, but in 1999 the Kremlin gave the tactic a high-tech update. With parliamentary elections fast approaching, and with post-USSR corruption at a peak, the government of president Boris Yeltsin used anonymous websites to sling mud

at opposition candidates. One notorious kompromat repository was run specifically to slander the mayor of Moscow, a rising star in the opposition with his eyes on the presidency. In 2009, a senior British diplomat working in Russia was forced to resign after the appearance online of a four-minute video that showed him having sex with two blond women in a brothel.

One of the first American targets of kompromat was Victoria Nuland, who served as the top U. S. diplomat for Europe during Obama's second term. In February 2014, at the peak of the crisis in Ukraine, Nuland was surreptitiously recorded while speaking on the phone with the U. S. ambassador to Kiev. Frustrated with Europe's lackluster response to the Ukrainian crisis, Nuland said, "Fuck the EU." Shortly after, an aide to the Russian deputy prime minister tweeted a link to a recording of the intercepted phone call. The State Department called the leak "a new low in Russian tradecraft."

The Nuland leak prompted a minor diplomatic hiccup between the European Union and the United States. But the kompromat campaign of the past year appears to be aimed at much bigger game: the American electoral system. According to Reuters, the FBI first contacted the DNC in the fall of 2015, obliquely warning the Democrats to examine their network. It wasn't until May, however, that the DNC asked for help from a cybersecurity company called CrowdStrike, which had experience identifying digital espionage operations by nation-states. CrowdStrike immediately discovered two sophisticated groups of spies that were stealing documents from the Democrats by the thousands.

CrowdStrike was soon able to reconstruct the hacks and identify the hackers. One of the groups, known to the firm as Cozy Bear, had been rummaging around the DNC since the previous summer. The other, known as Fancy Bear, had broken in not long before Putin's appearance at the St. Petersburg forum. Surprisingly, given that security researchers had long suspected that both groups were directed by the Russian government, each of the attackers seemed unaware of what the other was doing.

Meanwhile a mysterious website named DC Leaks was registered on April 19. In early June, a Twitter account associated with the site started linking to the private conversations of Philip Breedlove, who had been, until a few weeks earlier, NATO's Supreme Allied Commander in Europe. DC Leaks was well designed, but nobody seems to have noticed it until early July.

On June 14, less than an hour after The Washington Post reported the breach at the DNC, CrowdStrike posted a report that detailed the methods used by the intruders. The firm also did something unusual: It named the Russian spy agencies it believed responsible for the hack. Fancy Bear, the firm said, worked in a way that suggested affiliation with the GRU. Cozy Bear was linked to the FSB.

The day after the Post story broke, a website appeared that claimed to belong to a hacker who identified himself as Guccifer 2.0. (Guccifer was the nickname of a Romanian hacker who, among other things, broke into the email account of George W. Bush's sister.) The operators, posing as Guccifer 2.0, dismissed CrowdStrike's attribution, insisting instead that the DNC had been "hacked by a lone hacker." As proof, Guccifer published eleven documents from the DNC, including an opposition- research file on Donald Trump and a list of major Democratic donors. In the weeks that followed, Guccifer offered

interviews and batches of documents to several journalists, but he wrote that "the main part of the papers, thousands of files and mails, I gave to WikiLeaks."

Ultimately, more than two thousand confidential files from the DNC found their way to the public. Throughout the campaign, Guccifer maintained that he was the only person behind the hacking and leaking. "This is my personal project and I'm proud of it," he--or they--wrote in late June. But several sloppy mistakes soon revealed who was really behind the operation. The unraveling happened more quickly than anybody could have anticipated.

As soon as Guccifer's files hit the open Internet, an army of investigators--including old-school hackers, former spooks, security consultants, and journalists--descended on the hastily leaked data. Informal, self-organized groups of sleuths discussed their discoveries over encrypted messaging apps such as Signal. Many of the self-appointed analysts had never met in person, and sometimes they didn't know one another's real names, but they were united in their curiosity and outrage. The result was an unprecedented open-source counterintelligence operation: Never in history was intelligence analysis done so fast, so publicly, and by so many.

Matt Tait, a former GCHQ operator who tweets from the handle @pwnallthethings, was particularly prolific. Hours after the first Guccifer 2.0 dump, on the evening of June 15, Tait found something curious. One of the first leaked files had been modified on a computer using Russian-language settings by a user named "Feliks Dzerzhinsky." Dzerzhinsky was the founder of the Cheka, the Soviet secret police--a figure whose mythic renown was signaled by a fifteen-ton bronze statue that once stood in front of KGB headquarters. Tait tweeted an image of the document's metadata settings, which, he suggested, revealed a failure of operational security.

A second mistake had to do with the computer that had been used to control the hacking operation. Researchers found that the malicious software, or malware, used to break into the DNC was controlled by a machine that had been involved in a 2015 hack of the German parliament. German intelligence later traced the Bundestag breach to the Russian GRU, aka Fancy Bear.

There were other errors, too, including a Russian smile emoji--")))"--and emails to journalists that explicitly associated Guccifer 2.0 with DC Leaks, as the cybersecurity firm ThreatConnect pointed out. But the hackers' gravest mistake involved the emails they'd used to initiate their attack. As part of a so-called spear- phishing campaign, Fancy Bear had emailed thousands of targets around the world. The emails were designed to trick their victims into clicking a link that would install malware or send them to a fake but familiar-looking login site to harvest their passwords. The malicious links were hidden behind short URLs of the sort often used on Twitter.

To manage so many short URLs, Fancy Bear had created an automated system that used a popular link-shortening service called Bitly. The spear-phishing emails worked well--one in seven victims revealed their passwords--but the hackers forgot to set two of their Bitly accounts to "private." As a result, a cybersecurity company called SecureWorks was able to glean information about Fancy Bear's targets.

Between October 2015 and May 2016, the hacking group used nine thousand links to attack about four thousand Gmail accounts, including targets in Ukraine, the Baltics, the United States, China, and Iran. Fancy Bear tried to gain access to defense ministries, embassies, and military attachés. The largest group of targets, some 40 percent, were current and former military personnel. Among the group's recent breaches were the German parliament, the Italian military, the Saudi foreign ministry, the email accounts of Philip Breedlove, Colin Powell, and John Podesta--Hillary Clinton's campaign chairman--and, of course, the DNC.

The rapid public reconstruction of the DNC break-in appears to have caught the hackers off guard. Researchers surmised that the Russian spies had not expected to be identified so quickly, a theory that would explain, among other things, the peculiar animus Guccifer seemed to have for CrowdStrike. According to this hypothesis, the tradecraft blunders that Tait and others had identified were the result of a hasty effort by the GRU to cover its tracks.

As if to regroup after the initial rush of activity, Guccifer and DC Leaks went quiet at the end of June. But the 2016 presidential campaign, already the most bizarre in living memory, had a further surprise in store, one that worked in favor of the Russians. At a time when only 32 percent of Americans say that they trust the media to report the news fairly and accurately, the hackers were about to learn that getting called out publicly didn't really matter: Their kompromat operations would still work just fine.

On July 22, three days before the Democratic National Convention in Philadelphia, WikiLeaks published the largest trove of files to date, which included nearly twenty thousand hacked emails. Press coverage of the release quickly centered on emails that suggested a bias among some DNC staffers in favor of Hillary Clinton. The leaked emails lent credence to a suspicion held by some Democrats that the party establishment had never intended to give Bernie Sanders, Clinton's opponent in the primaries, a fair shake. Protesters in Philadelphia held up signs that read election fraud and dnc leaks shame. One day before the convention, the Russian kompromat campaign took its first trophy: Debbie Wasserman Schultz, the DNC chair, resigned from the organization.

The episode shocked the Democratic establishment, not least because of what it augured for the future. As Clinton's lead in the polls widened after the convention, commentators began to speculate that a damaging leak late in the campaign might be the only chance for Donald Trump to win the election. Fears of a Russia-sponsored October surprise grew as it became clearer that the subversion effort was improving. When files appeared, they were now scrubbed of the sort of distinguishing metadata that had allowed analysts to trace the leak back to Russian intelligence.

The operators behind Guccifer and DC Leaks also appear to have recognized that American journalists were desperate for scoops, no matter their source. The Russians began to act like a PR agency, providing access to reporters at Politico, The Intercept, and BuzzFeed. Journalists were eager to help. On August 27, when part of the DC Leaks website was down for some reason, Twitter suspended the @DCLeaks account. The Daily Caller, a conservative news website, posted a story about the events, drawing an

outcry from Trump supporters. Lou Dobbs, the Fox Business anchor, sneered that "leftist fascism" was throttling the last best hope for a Trump victory. Twitter soon reinstated @DCLeaks.

The most effective outlet by far, however, was WikiLeaks. Russian intelligence likely began feeding hacked documents to Julian Assange's "whistleblower" site in June 2015, after breaching Saudi Arabia's foreign ministry. A group called WikiSaudiLeaks, probably a Guccifer-like front for Fancy Bear, claimed that "WikiLeaks have been given access to some part of these documents." The so-called Saudi Cables showed princes buying influence and monitoring dissidents. They became a major news story, proving that the old methods worked even better in the twenty-first century.

A leak released at the end of this past summer showed how frictionlessly the kompromat campaign was able to operate in the fact-free atmosphere of the 2016 American presidential campaign. In late September, DC Leaks published hundreds of emails from the account of a twenty-two-year-old freelancer for the Clinton campaign. Lachlan Markay, a reporter for The Washington Free Beacon, found an audio clip buried deep in the cache. In the recording, which was made at a fundraiser in Virginia, Hillary Clinton could be heard describing Sanders supporters as "children of the Great Recession" who "are living in their parents' basement." The comments were clumsy but, in context, hardly damning; Clinton was describing the appeal of Sanders's "political revolution" for young voters. ("We want people to be idealistic," she said.) Nevertheless, within a few days, Donald Trump was telling a roaring crowd in Pennsylvania, "Clinton thinks Bernie supporters are hopeless and ignorant basement dwellers."

In mid-August, when Guccifer and DC Leaks were making near-daily news, a third mysterious social-media account popped up out of nowhere. A group calling itself the Shadow Brokers announced that it had published "cyberweapons" that belonged to the NSA on file-sharing sites such as Github. The group said that it would soon hold an auction to sell off a second cache of tools. After a security researcher posted a link to a repository of the supposed NSA software, analysts flocked to the dump. Security researchers quickly discovered that the tools, a collection of malware designed to steal data from their targets, were the real thing. Crucially, The Intercept, a media outlet with access to the NSA files leaked by Edward Snowden, found a sixteen-character string ("ace02468bdf13579") in the Shadow Brokers' tools that was referenced in a top-secret, and previously unpublished, NSA manual. The connection proved the provenance of the Shadow Brokers' find.

Robbing the NSA, of course, is not easy. The agency's elite hacking unit, called Tailored Access Operations, has an internal network known as the "high side" that is physically segregated from the Internet (the "low side"). Data diodes, devices that allow data to flow one way only, like water from a faucet, make it nearly impossible to hack high-side computers from the low side. When TAO hackers want to attack an adversary, they move their tools from the high side to a server on the low side, navigate through a series of addresses that make their tracks difficult to trace, and install malware on their target. To steal the NSA's malware, the Shadow Brokers had to compromise a low-side machine that the TAO was using to hack its targets. The Shadow Brokers likely got lucky: Some analysts believe that an NSA operator mistakenly uploaded a whole set of tools to a staging computer the hackers were already watching. The alternative theory: an old-fashioned mole passed on the tools.

After going to all that trouble, why publish the results? A possible answer is suggested by a surprising discovery made by the U. S. intelligence community around the time Putin was addressing the journalists in St. Petersburg. American investigators had long known that the Russians were doing more than spear-phishing, but sometime around April they learned that the intruders were using commercial cloud services to "exfiltrate" data out of American corporations and political targets. Cozy Bear, the hacking group believed to be affiliated with the FSB, used some two hundred Microsoft OneDrive accounts to send data from its victims back to Moscow.

Using cloud services such as OneDrive was a clever but risky move-- it was a little like taking the bus to make off with stolen goods from a burglary. Though the widespread use of the services by legitimate users offered a degree of cover for the hackers, data provided by Microsoft also helped America's elite digital spies identify the DNC intruders "with confidence" as Russian. It is even possible that the U. S. government has been able to identify the names and personal details of individual operators. The Russians knew they'd been caught. On July 30, an FSB press release announced that twenty government and defense organizations had been hit by high-powered spying tools.

Some intelligence analysts believe that the Shadow Brokers' publication of the NSA spy kit was a message from one group of professionals to another. "You see us?" the Russians seemed to be saying, perhaps in reference to ongoing U. S. efforts to investigate the DNC breach. "Fine, but we see you, too." Similarly, the announcement of an auction--all but certainly phony--was probably intended as a warning that the hackers were prepared to publish a key that would unlock an encrypted container holding a second batch of stolen tools. Like a severed ear in an envelope, the announcement told the Americans: Don't mess with us.

Meanwhile, the kompromat campaign proceeded apace. August and September each saw six data dumps, including files from the Democratic Congressional Campaign Committee, which had also been hacked. In October, as the presidential election drew near, Guccifer published a massive cache, more than twenty-one hundred files. Three days later, WikiLeaks began publishing thousands of emails stolen from John Podesta's account.

On the day WikiLeaks published the first batch of Podesta's emails, the U. S. government took the unprecedented step of announcing that it was "confident" Russia's "seniormost officials" had authorized the DNC hacks. So far U. S. investigators have not said publicly who was responsible for the Podesta hack, but the data harvested by SecureWorks makes it clear that Fancy Bear broke into the Clinton chairman's account as early as late March. The CIA briefed Trump about the origin of the kompromat, but he continued to cite the material, telling a Pennsylvania crowd, "I love WikiLeaks!"

On October 12, Putin appeared at another forum, this time with more than five hundred guests in Moscow. Sitting comfortably in front of a giant banner that said russia calling! he answered an audience question about the hacks. "Everyone is talking about who did it," Putin said. "Is it so important?" The former KGB officer, proving his full command of U. S. political intrigue, suggested that the Democrats

had "supported one intraparty candidate at the expense of the other." Any talk of the hacks being in Russia's interest, he said, was "hysteria" intended to distract Americans from what the hackers discovered: "the manipulation of public opinion." When the audience applauded, a smirk returned to Putin's face. "I think I answered your question," he said.

Wired (UK)
Can governments really keep us safe from terrorism without invading our privacy?
Thursday, 20 October 2016
Byline: Ruby Lott-Lavigna

London - GCHQ has many negative connotations attached to it - including illegally collecting data from the UK public - but David Omand, former head of GCHQ and now professor at Kings, is hoping for a change in the way goverments deal with our private information.
Referring to new legislation that is currently going through parliament - the 'Investigatory Powers Law' - he explained how regulation is being implemented to create transparency in the way the UK government deals with cybersecurity. "What is going on, as we speak, is a phase change in the relationship between the secret state and parliament," explained Omand. "One way of looking at this is that the secret activity of the state is now being fully bought under the modern rule of law."

In 2013, when the NSA scandal went public, the way governments mine data from its citizens became of public concern. No longer were the intelligence departments free to take what they wanted without public repercussion and outrage. "It kicked off a moral panic around Europe. It lead to investigations and endless court cases against the government."

However, in 2015 and 2016, when terrorists hit Paris, Orlando, Nice and other major cities around the world, intelligence agencies cited the attacks as the reason behind their rigorous stealing of data.

Omand explained how we'd reached this state of cyberthreat. "There were urgent demands for intelligence on those who mean us harm, but that coincided with the fact that we have been placing our personal intelligence in the digital world."

So where does the line stand with mining data for security reasons? Is there a balance to be reached between privacy and security? According to Omand, "2017 is the year of reconciliation, in which we recognise as a mature democracy, it is possible to have sufficient security and sufficient privacy."

"The key to that is rule of law. Courts have to have comprehensible, black letter law."

The Investigatory Powers Law is a new bill to, hopefully, provide transparency and regulation and judicial oversight. Various elements like communication data and meta-data, internet connection records, single and bulk interception and equipment interference or hacking will be regulated under this new law.

In light of this, Omand hopes that along with the new National Cyber Security Centre, that will be reporting to GCHQ ("their email address starts 'opendoor'" Omand boasted) a balance will be reached.

However, many are still skeptical. "I hope I've convinced you of this paradigm shift. It's a big change."

Omand currently serves as a Commissioner for the Global Commission on Internet Governance, and was the director of GCHQ from 1996 to 1997

He was appointed in 2002 the first UK Security and Intelligence Coordinator, having previously been Permanent Secretary of the Home Office 1997 to 2001 and before that the Director of GCHQ, the UK's intelligence and cyber-security organisation.

Globe and Mail
RCMP's counterterrorism centre in Ottawa serves as intersection of information
Monday, 24 October 2016
Byline: Colin Freeze

Ottawa - The Mounties have created a permanent place for counterterrorism detectives to work shoulder-to-shoulder - and database to database - with federal border guards, immigration officials and spy-agency analysts.
The RCMP's national-security joint-operations centre (NSJOC) in Ottawa is a "real-time and rapid information-sharing" crossroads where federal agents can efficiently swap files, according to recently released records. However, critics fear it will go places no watchdog can follow.

The counterterrorism centre was largely unknown until RCMP Commissioner Bob Paulson made a brief reference to it in Parliament earlier this year. The Globe and Mail has acquired the centre's terms of reference under Access to Information laws.

The centre brings federal agents of all stripes together in an RCMP facility in Ottawa where they can talk to each other and exchange information as part of the fight against terrorism. It formally came into existence in October, 2014, the same month two men inspired by the Islamic State killed two Canadian Forces soldiers.

The next spring, executives at the Communications Security Establishment, the Canadian Security Intelligence Service, the Canada Border Services Agency and Citizenship and Immigration Canada signed the centre's terms of reference, under which they agree to embed at least one staff member with the RCMP at all times.

The federal agencies constantly collect data, but under different mandates than that of the Mounties. Federal agents typically shield their files from each other unless they have a compelling reason to share. In some cases, warrants are needed for information handovers.

Yet federal agents want to knock down institutional walls in times of crisis, and the RCMP-led centre seeks to keep the bureaucratic barriers to information sharing low.

"The NSJOC's members are colocated at the RCMP's National Operations Centre in Ottawa to facilitate real-time and rapid information sharing ... [where] members have access to the databases and information holdings of their respective agencies," the terms of reference say.

The document says criminal charges are just one approach to fighting terrorism. Pooling knowledge among federal agents makes other interventions possible - such as revoking suspects' passports, adding people to no-fly lists, or even warning the family and friends of radicalized young people "of the risks associated with violent extremist activity."

Nothing in the terms of reference suggests the agencies got new powers to share information.

"NSJOC members are required to adhere to the respective operational policies and procedures of their agencies," the document says. However, the Conservative government's 2015 Bill C-51, which was created at the same time as the centre, allows federal departments to move information relevant to "activity that undermines the security of Canada" to federalsecurity agencies. The Privacy Commissioner of Canada has called this law highly invasive.

Federal watchdog agencies have complained for years that they cannot track what information agencies share in the name of national-security. Even as federalsecurity agencies increasingly swap files, none of their review bodies are legally empowered to see what is happening as it happens, or within more than one agency.

"A body like this makes the case for why we need more robust realtime oversight," says Carmen Cheung, a professor at the University of Toronto's Munk School of Global Affairs, who was shown a copy of the terms of reference. "It looks like they are all co- located in essentially one room, and that room has direct access to all the databases of all the respective agencies, which is amazing."

A decade ago, a judicial inquiry recommended Canada create a watchdog to track all security agencies at once, but the concept never got off the ground. The finding followed a Canadian counterterrorism investigation in which federal agents swapped information carelessly and several Canadians were wrongly jailed as presumed terrorists in Middle East prisons.

Today, federal- security agencies are under renewed pressure to amass and share records. Recent disclosures indicate CSIS, the domestic spy agency, has been "ingesting bulk data sets " in hopes of predicting patterns of terrorism, and its foreign-focused counterpart, CSE, is mapping out "contact chains" of global communications to discern where threats lie.

It's not clear how police would use such deductions. The records about the RCMP-led centre say that sharing information, early and often, can minimize the risk that federal police and spies trip over each other, and head off future problems.

Globe and Mail
Terrorism investigations tax RCMP's ability to fight Canada's organized crime
Saturday, 22 October 2016
Byline: Colin Freeze

Ottawa - The number of RCMP wiretaps on organized-crime groups is plummeting sharply as the force shifts its detectives to the fight against terrorism, according to statistics analyzed by The Globe and Mail.

In its federal policing role, the RCMP essentially has two major business lines - chasing mobsters and chasing terrorists. The priority the Mounties give to each of the two files has always been an issue, but the balance clearly shifted after the attack on Parliament Hill two years ago.

The RCMP has moved hundreds of officers from organized-crime probes to terrorism investigations in a bid to track suspected sympathizers of the Islamic State. This may come at a cost to other important RCMP missions, such as stopping human trafficking, getting guns off the street and curbing trade in illicit drugs such as fentanyl.

Related: Guilty pleas end risk of revealing RCMP surveillance technology (www.theglobeandmail.com)

Related: Surveillance device used in prison sets off police probe (www.theglobeandmail.com)

Related: RCMP fight to keep lid on high-tech investigation tool (www.theglobeandmail.com)

A spokeswoman for the police force does not dispute that a significant shift has taken place.

"The decrease in RCMP wiretap applications for serious and organized-crime investigations in the past year can partially be attributed to the shifting of a number of federal-policing resources to national-security criminal investigations," Corporal Annie Delisle said in an e-mailed response to Globe questions.

Her e-mail added that the RCMP "prioritizes its investigations based on threat and risk to public safety and remains committed to fighting organized crime."

Public Safety Canada, the bureaucracy that oversees the Mounties, is legally obliged to release an annual electronic-surveillance report.

In a typical year, the Mounties and their partner agencies usually seek approval for more than 100 wiretap applications from federal Crown attorneys, before bringing these bids to criminal-court judges for final approval.

The Public Safety Canada annual report for 2015, released this month, shows that 67 such applications were made.

This number does not necessarily mean police surveillance is declining. Police can pack scores of suspects and potential charges into a single wiretap application.

The Public Safety Canada report says the overall number of people being wiretapped by police is not changing much from year to year.

Yet the focus of police investigations is clearly shifting.

In 2011, police sought wiretaps in hopes of laying charges for 82 Criminal Code offences that explicitly had to do with organized-crime. Only six such charges were contemplated in 2015.

Half of all wiretap applications still involve drug cases, yet the number of drug charges being pursued has plummeted.

In 2011, federal police were seeking wiretap warrants involving only three terrorism charges. In 2014, police were hoping to lay 97 terrorism charges. In 2015, that number was 68.

The Public Safety Canada electronic surveillance report is preliminary and the 2015 numbers may increase because police do not have to disclose data about all their investigations right away. Not every wiretap warrant of leads to an arrest or criminal charge.

The pivot point was Oct. 22, 2014. That was the day Michael Zehaf-Bibeau stormed Parliament Hill's Centre Block with a rifle, after killing a Canadian Forces soldier. Two days before, a man ran over a Canadian Forces soldier in Quebec.

Both attackers were supporters of the Islamic State terrorism group and were shot dead by police. At the time, Parliament had just voted to send Canadian Forces warplanes overseas to bomb Islamic State fighters.

Two years later, the RCMP is still focused on terrorism.

"We continue to transfer people out of other areas into counter- terrorism investigations," RCMP Commissioner Bob Paulson told a Parliamentary committee earlier this month. "We've taken our investigative resources from areas of organized crime and financial integrity work," he added.

The RCMP says another reason for the declining number of wiretap applications is that suspects are now using encryption software to shield their digital communications from surveillance.

"Traditional criminality, like terrorism, like organized crime, like child exploitation, like fraud, is being advanced, supported and accelerated by the availability of these commercial encryption programs," Mr. Paulson says.

Public Safety Minister Ralph Goodale is canvassing Canadians on whether police need new powers.

Not so long ago, the RCMP was boasting of its surveillance prowess. In 2014, detectives held a press conference announcing they had curbed a Montreal gang war, arresting more than 30 mobsters after decoding more than a million secure messages.

Court records in the case revealed the RCMP used so-called "Stingray" machines that track suspects by indiscriminately catching smartphone signals in a given area. Police had also sought BlackBerry's help to store the suspects' secured communications so authorities could crack them later.

Such modern surveillance methods go largely unmentioned in Public Safety Canada's annual reports, which are a creature of 1970s-era laws that focus only on conventional police wiretapping powers.

Toronto Star
Liberals should keep promise on access law: Editorial
Sunday, 23 October 2016

Editorial: Access to information laws have become an essential feature of modern democracy. They allow citizens to watch over their governments and hold them to account. So it's deeply disturbing that Canada's access law, designed for a pre-digital world, and largely unchanged for three decades, is so profoundly broken.
Justin Trudeau's Liberals came to power promising to fix the problem, quickly setting up an all-party committee to review the law. The committee published its recommendations in June and the government vowed to reform the legislation later this year, or early in 2017. A long-overdue change seemed within view.

But last week Treasury Board President Scott Brison quietly backed off those timelines, indicating the government would implement initial changes later this year, but conduct a fuller review of the act starting in 2018. A concerned Information Commissioner Suzanne Legault told CBC News that she now doubts the legislation will be amended before the next election.

That's a shame. In recent years, loopholes in the law have too often been used to keep politically inconvenient information secret. Federal officials have invoked so-called cabinet confidentiality with alarming frequency. In 2013-14, it was used a record 3,100 times - a 49-per-cent uptick over the previous year. As the information commissioner has argued, the law meant to ensure openness has metastasized into an effective shield against disclosure.

Many recommendations have been made over the years on how to improve the act, but three simple, widely supported changes in particular would do a great deal to foster more openness.

First, the loophole should be shrunk. Cabinet confidentiality is meant to protect the frank and open exchange among cabinet ministers. But it should not be used to prevent Canadians from having the facts and background information that informed their government's decisions.

Second, when an access request has been rejected on grounds of cabinet secrecy, the information commissioner should have the power to investigate that refusal. Currently, the commissioner isn't allowed to see the documents involved.

Finally, Ottawa should invest the commissioner with the authority to issue "binding orders" that would force government disclosures required by the act. Under the current system, she can overturn a government decision only by taking Ottawa to court.

The first two are long-standing recommendations of transparency advocates and the information commissioner, endorsed by the all-party parliamentary committee. The third was a Liberal campaign promise. Canadians should not be made to wait until after the next election to see them realized.

The trouble is that while democracy loves openness, governments quite often do not. Canada no doubt needs a modern access law that ensures transparency and a watchdog capable of enforcing it. The Liberals understood this in opposition. In government, the temptation to carry on in the dark will be strong, but promises were made, and democratic principle, not political expediency, should light the way.

Ottawa Citizen
Older government systems showing age , revealing the price of email delay
Monday, 24 October 2016
Byline: James Bagnall

Ottawa - A sign of the times. A government official recently sent the following email:
"Treasury Board has been experiencing significant email issues since October 6, 2016," the note to other federal departments read. "We recommend that you contact employees by phone until further notice. We will update you when the issues are resolved."

Taken on its own, this was not a big deal. A few hundred Treasury Board employees went without email service off and on for a couple of weeks. The workers also lost email history and calendar appointments, which were being restored over the weekend using backups.

"Shared Services Canada has been working 24 hours a day to resolve the initial and any subsequent email issues," noted Stephanie Richardson, a spokesperson for Shared Services, the federal department responsible for computer services, including email and data centres.

But there was an unsettling message in this latest email glitch because it involved existing infrastructure. Most of the headlines involving government email over the past two years have focused on problems with the new system ordered from Bell Canada in 2013 but with delivery nowhere in sight. Now the reasonably reliable older systems are showing their age and may require additional investment.

Until the Bell system is up and running, most of the government's 600,000-plus email boxes must be hosted in aging data centres, most of them located in the National Capital Region. This means

government email service is increasingly vulnerable to breakdowns in data centres generally or the parts specific to the delivery of email.

It's not clear yet what triggered the Treasury Board email issues. "The root cause of the incident is still under investigation," Richardson explained in an email.

The email breakdown followed routine maintenance at one of the government's older data centres. When power was restored, email servers failed. Richardson confirmed that a "corrupted database" was involved.

Regardless, this is not good news for Shared Services, the five- year-old computer services agency.

Early in its mandate, Shared Services launched a $400-million project to consolidate 63 email systems across government into one. Bell Canada and CGI were to have completed the switch to canada.ca email addresses by March 31, 2015 but the contractors have been wrestling with a revised design, faulty hardware and other technical difficulties. While hardware issues, according to Shared Services, have been fixed, an overall solution has proved elusive.

Shared Services a year ago halted the migration of the new system to federal employees until Bell could resolve the difficulties. Not quite 70,000 government email boxes - less than 15 per cent of the total - currently use the new addresses.

In the meantime, of course the volume of data being sent on email is significantly higher each year, putting further strain on the legacy infrastructure.

The Conservative government estimated the new system designed by Bell would save taxpayers $50 million annually by taking advantage of economies of scale. Those savings have not been realized.

To date, most of the cost of the delay has been borne by Bell, which under its contract will not be paid until it delivers the goods. Bell declined comment for this article.

Richardson noted in her email: "There are outstanding contracted, functional issues that need to be resolved before new migrations can resume." Shared Services did not elaborate or provide a revised deadline.

While Bell is on the hook for fixing the new email system, Shared Services bears responsibility for keeping the older email systems running - and may soon have to invest significant sums.

Shared Services faces a similar issue with another of its responsibilities involving the consolidation of more than 500 data centres into a handful of modern ones. Because Shared Services was late to begin the streamlining process, it is diverting significant sums into keeping legacy data centres running even as it's investing in new data centres in Barrie and Borden.

The Liberals early this year said they would kick in an extra $384 million over two years to keep aging electronic infrastructure going. It's not known what percentage of this amount, if any, was earmarked specifically for email service - or if the Liberals anticipated continuing long delays in the new email system.

This much is clear: attempting simultaneously to modernize large computer networks and keep the old ones running appears to be a hugely difficult job in government.

Federal workers may have to get used to using the telephone in the months ahead.

National Post
Countering the Kremlin narrative
Monday, 24 October 2016
Byline: Matthew Fisher

Column: As the Kremlin gins up its cyberwarfare capabilities by using hackers to interfere with western elections, Canada is being asked to assist a European project to counter an older, but equally sinister information warfare campaign by President Vladimir Putin to influence ethnic Russians and others in what Russians call the Near Abroad.
Jerzy Pomianowski, who leads the European Endowment for Democracy (EED), was in Ottawa Thursday to discuss with Foreign Minister Stephane Dion whether Canada would consider funding a project designed to provide Balts, Moldovans, Belarussians and other eastern Europeans with access to Russian-language TV programming not produced in Moscow.

While Russia Today - the state-controlled English-language international all-news network - and other Russian media projects in Europe and the Middle East are used to spread highly biased ideas, this was "a secondary issue compared to the damage that has been done by the Kremlin narrative within the Russian language media space" in countries with significant ethnic Russian minorities and where local populations often speak Russian well, Pomianowski said after meeting Dion.

What the former Polish deputy foreign minister was referring to is immediately obvious to travellers to places such as Latvia and Lithuania.

Russians there readily tell visitors that the only news sources they pay attention to emanate from Russia. Reports are often extremely untruthful - and sometimes incendiary - especially surrounding events such as Moscow's annexation of Crimea, the shooting-down of a Malaysian Airliner over Ukraine by a Russian missile system or the alleged mistreatment of Russian minorities in the former Soviet republics.

There is a perverse echo in Armenian, Kyrgyz and Azeri-language media, too, because much of their content is lifted directly from reports originally provided in Russian and produced in Moscow. That is aside from the immense amount of time and money that Russian invests in Internet trolls operating mostly in English and German who criticize or ridicule people in social media who have criticized the Kremlin.

"We observe this. It is quite a common practice," Pomianowski said. "But it comes into a market that offers many other options so it is much less effective than it is in the Russian language media space."

As part of a propaganda strategy developed over 15 years, the Putin government first captures the hearts and minds of native Russian speakers with high quality entertainment and nostalgic films and songs that glorify the Soviet era, said Pomianowski, who became politically active during the heady days of Poland's Solidarity Movement more than 25 years ago.

"This content is designed to appeal to their emotions and feelings," he said. "It is used as a tool to keep them glued to the screen and then brainwashed through false debates and lies that are spread through the news programs."

The EED is affiliated with the EU and based in Belgium. Its intent is not to create counter-propaganda but to encourage open debate and alternative narratives and to assist independent Russian-speaking voices outside Russia.

Estonia has already created a state TV channel broadcasting in Russian to its Russian minority. A centre in Prague has been established where Russian- language journalism is being produced, including some investigative journalism. It is a hub where Russian-language media from outside Russia can also exchange news reports.

Seed money is being sought from abroad, including Canada, to allow independent producers to create high-quality dramas or infotainment for Russian minorities and others who speak Russian and live in the Near Abroad.

"The amount of funds being mobilized is not dramatically impressive," Pomianowski said. "What we are talking about is 10 million or 15 million euros a year" - roughly $15 million to $21 million.

Canada is already providing the EED with a $5-million grant to support the development of grassroots democratic values in Ukraine. As regards the EED's new initiative to create Russian-language programming, "there is a big hope that Canada will join these efforts" because of what Pomianowski called the country's "commitment to core democratic values" and because "sooner or later problems become global. Even Canada, on the far side of the ocean, is not that far away."

Since Putin took power in 2000 his government has developed a direct and indirect stranglehold over most media that recalls the power that the Politburo once had. He has achieved this by closing news

agencies and radio and television stations or by organizing new owners for media companies who immediately purge the staff.

"In the West, we pretend that we are discovering this strategy," Pomianowski said. "But everything was clear and well analyzed five or six years ago. We were just in a different mood. The U.S. was resetting relations with Russia so it was not in fashion to talk about such trends.

"That is the weakness in our part of the story. We see things when they hit our eyes with great strength rather than acting when they are visible but not yet at full speed."

National Post
How not to launch a cyber-attack
Monday, 24 October 2016
Byline: Eric Jardine

OpEd: The Obama administration seems to have a penchant for broadcasting its plans to the world before putting them into action. But telling your opponents what your next move will be is a bad idea. Whether in football, the board game Risk or the real world, a strategy should surprise them and keep them off balance. If your adversaries know you are coming, they can react faster, deploy pre-emptive countermeasures and ultimately blunt the impact of whatever it is you plan on doing.
Since the Democratic National Committee's email servers were hacked in the lead-up to the Democratic convention and allegations began swirling about Russian President Vladimir Putin's attempts to disrupt the American election through cyber- attacks on American soil, the Obama administration has been vocal about how it plans to deal with the situation.

We now know that the U.S. has proposed a proportional counterattack: Central Intelligence Agency Sources reportedly noted that the administration had asked the intelligence agency to prepare a "clandestine" cyberattack that aims to "embarrass" the Russians. Vice- President Joe Biden said on Meet the Press that the U.S. is intent on "sending a message" to Putin.

Of course, while the U.S. seems to have lost its strategic advantage here, its actual tactics may still be in the works behind closed doors, assuming it hasn't already initiated some kind of retaliation. But there's no question that it has blown the element of surprise.

Everything we have been hearing suggests that the Americans will try to embarrass Putin by responding with a hack of their own. Needless to say, the obvious next step for the Russians would be to go into information- control mode. If there are embarrassing emails on servers under Russian control, rest assured they have been expunged or stowed carefully away.

The popular idea that everything stays on the Internet forever is not quite true. For your average person, what you say, type or send online is pretty well permanent, but if you are a Russian oligarch, or

even Putin himself, keeping your most embarrassing content away from prying eyes is more than possible.

As the events surrounding Hillary Clinton's deleted emails makes clear, if you control the server, you control the content of that server (although the recipient of the email could still have a record, of course). The trouble is that Russia often does control the servers, as it has a data localization law on the books that requires data generated by Russian citizens be stored within Russia's borders.

Thus, the Americans would have to gather the data before the Russians have had a chance to delete it. But since the administration has already shown its hand, that scenario seems less likely. Of course, the U.S. could try to show how Putin and other oligarchs are exporting money and otherwise engaging in corrupt practices, as was recently suggested by retired Adm. James Stavridis. Since a lot of the proof would be stored outside of Russia, the option seems initially plausible, but comes with its own set of problems.

First, to embarrass members of the Russian government in this way would require that the U.S. hack - or, ideally, secure lawful access to - third-party servers, to gain access to the necessary data. Furthermore, for U.S. intelligence agencies to access Russia's computers, it is helpful if they are connected to the outside world. But, even back in October 2015, Russia was reportedly testing ways to sever the link between the Russian portion of the Internet and the rest of the network.

As Nikolay Nikiforov, the Russian communications minister, said, "Our task is to do what is needed so that the Russian Internet will carry on working independently of the opinion of colleagues, whatever sanctions policy decisions they decide to take." In other words, the U.S. might be able to disrupt Russia at the margins (and I have no doubt the U.S. has the skills and the technology to do so), but the Russians also have a last-ditch kill switch that could be used to keep the Russian networks running, and free from any foreign countermeasures. What's more, they can just blame the disruption on the U.S. and win points domestically.

In the end, the cat is out of the bag. Russia now knows that it is likely facing an imminent cyber-attack, and the U.S. cannot back down, waver or change course.

Eric Jardine is a fellow at the Centre for International Governance Innovation and assistant professor of political science at Virginia Polytechnic Institute and State University, in Blacksburg, Va. He recently co-authored the report, Look Who's Watching: Surveillance, Treachery and Trust Online.

The National (UAE)
Warning for UAE companies after huge cyber attack
Monday, 24 October 2016
Byline: Lucy Barnard

Abu Dhabi - Companies in the UAE are being warned that the sort of massive cyber attack which blocked some of the world's most popular websites over the weekend could be used to target regional businesses and governments.
On Friday, millions of web users in the United States and Europe were left unable to view popular websites including Twitter, PayPal, Amazon, Netflix and even The New York Times and Wall Street Journal, after hackers took over hundreds of thousands of common internet-enabled devices such as webcams and used them to bombard the sites with spam data.

FBI officials are still investigating the source of the attacks but days ahead of the US election, controversial website WikiLeaks claimed its supporters were responsible.

"[Julian] Assange is still alive and WikiLeaks is still publishing. We ask supporters to stop taking down the US internet. You proved your point," it tweeted early on Saturday morning.

The attacks differed from other recent cyber attacks because they centred around New Hampshire-based internet infrastructure company Dyn, which acts as a switchboard for online traffic - an area of the internet not typically targeted by cyber criminals.

According to Dyn, the company was hit by a series of at least three massive distributed denial-of-service (DDoS) attacks where millions of IP addresses flooded the targets with junk traffic, making it one of the largest ever cyber attacks.

Security experts said that the attack used a new powerful control software called Mirai to forcibly network together thousands of web-enabled CCTV cameras around the world and turn them into what is known as a "botnet".

Since the start of this month when the Mirai code was published on a hackers' forum, experts have warned that criminal organisations and pressure groups will find it easier to launch this sort of attack.

"These sorts of DDoS attacks are extremely worrying and on a company level there isn't a whole lot that you can do about them," said Mohammad Amin Hasbini, a senior security researcher at internet security firm Kaspersky Lab, which advises businesses on cyber defences.

"The big problem is that we don't know who is responsible for these attacks; we don't know if they are financially motivated, politically motivated or if they are just doing it for fun. WikiLeaks claims its supporters were responsible but who are they? This attack is perhaps 15 times bigger than any that we have experienced so far in the UAE, but DDoS attacks do happen every day in the UAE and, as technology improves, the problem is getting worse."

The disruptions come at a time of unprecedented fears about the cyber threat in the Middle East and around the world.

Between 2011 and 2013, 46 major financial institutions in the US were targeted through DDoS attacks, preventing hundreds of thousands of customers from accessing their accounts and costing the businesses millions of dollars to upgrade their systems. In March this year the FBI charged seven Iranian computer experts with carrying out the attack. And in 2013 two members of "hacktivist" group Anonymous were convicted of carrying out DDoS attacks against online payment websites including PayPal.

"The risks for this sort of attack are growing daily. There are now more devices than there are humans on the planet, and these days it is getting easier and easier for anyone with a grudge against a company or a government to buy a botnet army to launch attacks," said Eric Eifert, the senior vice president for managed security services at cybersecurity firm DarkMatter.

He warned that terror organisations such as ISIL had the capacity to use cyber technology to take over drones being used against them and convert them into improvised explosive devices.

"In the UAE especially we are seeing a lot of new devices being used as consumers look to control all sorts of things including lighting, cooling, even their fridges from their smartphones," Mr Eifert added. "Anything with an IP address can be infected by malware and these devices often have generic passwords which hackers can easily guess. It is important that manufacturers don't let this happen in future."

According to figures from Kaspersky Security, an average of 17.4 per cent of users in the Middle East encountered cyber threats originating from the internet in the third quarter of 2016.

The countries with the highest percentage of users affected by these threats were Qatar (24.4 per cent), the UAE (22.8 per cent), Kuwait (20.1 per cent), Saudi Arabia (17.9 per cent) and Egypt (17.1 per cent).

At the same time, an average of 47 per cent of users in the region encountered malware that spread in local networks, via USBs and storage disks.

Earlier this month the first US secretary of homeland security Tom Ridge, told a cyber security conference that as a global hub, the UAE is a prime target for cyber attacks.

"Any enterprise that is as successful, vibrant and connected like Dubai [is a target]," Mr Ridge said. "It's a centre for financial transactions and trade historically. That's what makes the government's decision to make it a smart city timely and relevant and increases the pressure on [it] to do it right because it becomes an iconic player in the region and the world. The higher the profile, the more sophisticated the attacks."

Wired (US)
Inside the Cyberattack That Shocked the U.S. Government

Monday, 24 October 2016
Byline: Brendan I. Koerner

New York - The US OFFICE of Personnel Management doesn't radiate much glamour. As the human resources department for the federal government, the agency oversees the legal minutiae of how federal employees are hired and promoted and manages benefits and pensions for millions of current and retired civil servants. The core of its own workforce, numbering well over 5,000, is headquartered in a hulking Washington, DC, building, the interior of which has all the charm of an East German hospital circa 1963. It's the sort of place where paper forms still get filled out in triplicate.
The routine nature of OPM's business made the revelations of April 15, 2015, as perplexing as they were disturbing. On that morning, a security engineer named Brendan Saulsbury set out to decrypt a portion of the Secure Sockets Layer (SSL) traffic that flows across the agency's digital network. Hackers have become adept at using SSL encryption to cloak their exploits, much as online vendors use it to shield credit card numbers in transit. Since the previous December, OPM's cybersecurity staff had been peeling back SSL's camouflage to get a clearer view of the data sloshing in and out of the agency's systems.

Soon after his shift started, Saulsbury noticed that his decryption efforts had exposed an odd bit of outbound traffic: a beacon-like signal pinging to a site called -opm-security.org. But the agency owned no such domain. The OPM-related name suggested it had been created to deceive. When Saulsbury and his colleagues used a security program called Cylance V to dig a little deeper, they located the signal's source: a file called mcutil.dll, a standard component of software sold by security giant McAfee. But that didn't make sense; OPM doesn't use McAfee products. Saulsbury and the other engineers soon realized that mcutil.dll was hiding a piece of malware designed to give a hacker access to the agency's servers.

The Office of Personnel Management repels 10 million attempted digital intrusions per month--mostly the kinds of port scans and phishing attacks that plague every large-scale Internet presence--so it wasn't too abnormal to discover that something had gotten lucky and slipped through the agency's defenses. In March 2014, for example, OPM had detected a breach in which blueprints for its network's architecture were siphoned away. But in this case, the engineers noticed two unusually frightening details. First, opmsecurity.org had been registered on April 25, 2014, which meant the malware had probably been on OPM's network for almost a year. Even worse, the domain's owner was listed as "Steve Rogers"--the scrawny patriot who, according to Marvel Comics lore, used a vial of Super-Soldier Serum to transform himself into Captain America, a member of the Avengers.

Registering sites in Avengers-themed names is a trademark of a shadowy hacker group believed to have orchestrated some of the most devastating attacks in recent memory. Among them was the infiltration of health insurer Anthem, which resulted in the theft of personal data belonging to nearly 80 million Americans. And though diplomatic sensitivities make US officials reluctant to point fingers, a wealth of evidence ranging from IP addresses to telltale email accounts indicates that these hackers are tied to China, whose military allegedly has a 100,000-strong cyber-espionage division. (In 2014 a federal grand jury in Pennsylvania indicted five people from one of that division's crews, known as Unit 61398, for

stealing trade secrets from companies such as Westinghouse and US Steel; all the defendants remain at large.)

Once Captain America's name popped up, there could be little doubt that the Office of Personnel Management had been hit by an advanced persistent threat (APT)--security-speak for a well-financed, often state- sponsored team of hackers. APTs like China's Unit 61398 have no interest in run-of-the-mill criminal activities such as selling pilfered Social Security numbers on the black market; they exist solely to accumulate sensitive data that will advance their bosses' political, economic, and military objectives. "Everyone can always say, 'Oh, yeah, the Pentagon is always going to be a target, the NSA is always going to be a target,'" says Michael Daniel, the cybersecurity coordinator at the White House, who was apprised of the crisis early on. "But now you had the Office of Personnel Management as a target?"

To figure out why the hackers had trained their sights on OPM, investigators would have to determine what, if anything, had been stolen from the agency's network over the preceding year. But first they had to hunt down and eliminate the malware on its network, an archaic monstrosity that consisted of as many as 15,000 individual machines.

Curtis Mejeur was a victim of dreadful timing. A wry and diminutive former marine who had served in Fallujah, where he mapped insurgent strongholds as part of an intelligence unit dubbed the Hobbits, Mejeur started work as one of OPM's senior IT strategists on April 1, 2015. He was still getting acclimated to his new job when, on the morning of April 16, he was handed the most daunting assignment of his career: Lead the effort to snuff out the attack on the agency's network.

Based on the little he'd already heard about the malware's power and lineage, Mejeur was certain his investigation would uncover plenty of nasty surprises. But he wouldn't have to deal with them alone; early that morning, a team of engineers from the US Computer Emergency Readiness Team, the Department of Homeland Security unit that handles digital calamities, marched into OPM's headquarters. The engineers set up a command post in a windowless storage room in the sub-basement, just down the hall from where Saulsbury had discovered the hack less than 24 hours earlier.

Since they couldn't trust OPM's compromised network, the visitors improvised their own by lugging in workstations and servers that they could seal behind a customized firewall. Soon enough, the subbasement was filled with the incessant clatter of keyboards, occasionally punctuated by the hiss of a Red Bull being popped open. The dozen-plus engineers rarely uttered more than a few words to one another, which is how they prefer to operate.

One of the US-CERT team's first moves was to analyze the malware that Saulsbury had found attached to mcutil.dll. The program turned out to be one they knew well: a variant of PlugX, a remote-access tool commonly deployed by Chinese--speaking hacking units. The tool has also shown up on computers used by foes of China's government, including activists in Hong Kong and Tibet. The malware's code is always slightly tweaked between attacks so firewalls can't recognize it.

The hunt to find each occurrence of PlugX continued around the clock and dragged into the weekend. A sleeping cot was squeezed into the command post, where temperatures became stifling when the building's air conditioners shut off as usual on Saturdays and Sundays.

The hunt turned up not just malware but also the first inklings of the breach's severity. A technician from the security software company Cylance, who was supporting the effort, spotted encrypted .rar files that the attackers had neglected to delete. He knew that .rar files are used to store compressed data and are often employed by hackers to shrink files for efficient exfiltration. In an email to Cylance CEO Stuart McClure on Sunday, April 19, the technician was blunt in his assessment of OPM's situation: "They are fucked btw," he wrote.

By Tuesday the 21st, having churned through a string of nearly sleepless days and nights, the investigators felt satisfied that they'd done their due diligence. Their scans had identified over 2,000 individual pieces of malware that were unrelated to the attack in question (everything from routine adware to dormant viruses). The PlugX variant they were seeking to annihilate was present on fewer than 10 OPM machines; unfortunately, some of those machines were pivotal to the entire network. "The big one was what we call the jumpbox," Mejeur says. "That's the administrative server that's used to log in to all the other servers. And it's got malware on it. That is an 'Oh feces' moment."

By controlling the jumpbox, the attackers had gained access to every nook and cranny of OPM's digital terrain. The investigators wondered whether the APT had pulled off that impressive feat with the aid of the system blueprints stolen in the breach discovered in March 2014. If that were the case, then the hackers had devoted months to laying the groundwork for this attack.

At first, the investigators left each piece of malware in place, electing only to throttle its ability to send outbound traffic; if the attackers tried to download any data, they would find themselves confined to dial-up speeds. But on April 21, Mejeur and the US-CERT team began to discuss whether it was time to boot the attackers, who would thus learn that they'd been caught. "If I miss one remote-access tool, they'll come back in through that variant, they'll reestablish access, and then they'll go dormant for six months to a year at least," says a US-CERT incident responder who participated in the OPM investigation and who agreed to speak on the condition he remain anonymous. "And then a year later, they've now put malware in a lot of different places, and you don't know what's happening because you think you already mitigated the threat."

The debate continued until the evening of Friday, April 24, when an opportunity presented itself: As part of a grid modernization program in Washington, OPM's building was scheduled to have its power cut for several hours. The team decided that, even though it would mostly be just a psychological triumph, they would dump the malware just minutes before the blackout. If the attackers were monitoring the network, they wouldn't realize their access had been cut until everything finished booting up at least 12 hours later.

By the time power was restored on the 25th, the hackers no longer had the means to roam OPM's network--or at least that's what everyone hoped. The investigators could finally turn toward piecing together what the attackers had hauled away.

There is a common misperception that the surest way to frustrate hackers is to encrypt data. But advanced persistent threats are skilled at routing around such measures. The first item groups like these usually swipe is the master list of credentials--the usernames and passwords of everyone authorized to access the network. The group's foot soldiers will then spend weeks or months testing those credentials in search of one that offers maximum system privileges; the ideal is one that belongs to a domain administrator who can decrypt data at will. To minimize their odds of tripping any alarms, the attackers will try each credential only once; then they'll wait hours to try the next. Since these hackers are likely salaried employees, investing that much time in an attack is just part of the job.

There is a straightforward way to foil this approach: multifactor authentication, which requires anyone logging in to a network to be in physical possession of a chip-enhanced ID card that correlates with their username and password. OPM has such an authentication scheme, but it wasn't fully implemented until January 2015-- too late to prevent the PlugX attack. The beacon that connected to opm-security.org helped the attackers keep their foothold in the network.

When hackers utilize genuine credentials, life becomes difficult for those who specialize in post--attack forensics. Investigators must determine when authorized credential holders weren't using their accounts at times when the records state otherwise. And the only way to accomplish that is through face-to-face interviews: For nearly a month, Mejeur and the US- CERT engineers grilled hundreds of OPM employees in groups of six. Since human memories are so faulty, the investigators counted themselves fortunate when an employee was able to recall that they had been on vacation while their credential was in use for a particular week; the team could then analyze that account's activity during that span, confident that a hacker was responsible for it all.

As the investigators laboriously sifted through interview transcripts and network logs, they created a rough timeline of the attack. The earliest incursion they could identify had been made with an OPM credential issued to a contractor from KeyPoint Government Solutions. There was no way to know how the hackers had obtained that credential, but the investigators knew that KeyPoint had announced a breach of its own in December 2014. There was a good chance that the hackers had first targeted KeyPoint in order to harvest the single credential necessary to compromise OPM.

Once established on the agency's network, they used trial and error to find the credentials necessary to seed the jumpbox with their PlugX variant. Then, during the long Fourth of July weekend in 2014, when staffing was sure to be light, the hackers began to run a series of commands meant to prepare data for exfiltration. Bundles of records were copied, moved onto drives from which they could be snatched, and chopped up into .zip or .rar files to avoid causing suspicious traffic spikes. The records that the attackers targeted were some of the most sensitive imaginable.

The hackers had first pillaged a massive trove of background-check data. As part of its human resources mission, OPM processes over 2 million background investigations per year, involving everyone from contractors to federal judges. OPM's digital archives contain roughly 18 million copies of Standard Form 86, a 127-page questionnaire for federal security clearance that includes probing questions about an applicant's personal finances, past substance abuse, and psychiatric care. The agency also warehouses the data that is gathered on applicants for some of the government's most secretive jobs. That data can include everything from lie detector results to notes about whether an applicant engages in risky sexual behavior.

The hackers next delved into the complete personnel files of 4.2 million employees, past and present. Then, just weeks before OPM booted them out, they grabbed approximately 5.6 million digital images of government employee fingerprints.

When OPM went public with news of the hack in early June, speculating about the attackers' plans for the data became a popular Beltway pastime: Some of the theories involved a Chinese plot to recruit agents and, more outlandishly, a scheme to graft finger-prints onto Chinese spies so they could foil biometric sensors. But concrete evidence of the hackers' long-term intentions remains virtually nonexistent, which may be the scariest part of all.

"We haven't seen a single indication of this data being used anywhere," says Arun Vishwanath, a cybersecurity researcher at the State University of New York at Buffalo. "Yeah, we know the data is gone, but where did it go? What's the purpose of all of this? No one has the answer to any of that."

The Congressional hearings that take place in the wake of national calamities often have a vicious edge, and the one looking into the OPM hack was no exception. The agency's director, Katherine Archuleta, turned in a clumsy performance before the House Oversight Committee: She failed to offer a clear idea of how many people had been affected by the attack, and she seemed to duck personal responsibility by repeatedly mentioning how difficult it is to secure OPM's aging "legacy systems." The committee's members reacted with predictable scorn.

"I wish that you were as strenuous and hardworking at keeping information out of the hands of hackers as you are keeping information out of the hands of Congress and federal employees," chided representative Stephen Lynch (D-Massachusetts).

Damning details about OPM's porous security emerged at the hearing. The agency's own assistant inspector general for audits testified about what he characterized as a "long history of systemic failures to properly manage its IT infrastructure."

The tone of the hearings struck some observers as overly brutal. The OPM brain trust received no credit for implementing the SSL decryption program that had led to the attack's discovery, nor for acting fast to quell the threat. "They could easily have just buried all this stuff and no one would ever have known,"

says Stuart McClure, the Cylance CEO. "But they were highly pro-active--they just wanted to do what was right."

But political dramas of this sort seldom end in acts of mercy: Archuleta resigned under pressure, and her CIO, Donna Seymour, opted for retirement days before she was to endure another round of grilling by the House committee. The two executives' departures struck fear into their peers across the federal bureaucracy. "It was easy for people to see themselves in OPM and ask the question 'What do we have that people might care about that we hadn't thought about before?'" says Michael Daniel, the White House cyber-security coordinator who previously spent over a decade overseeing the intelligence community's budget while at the Office of Management and Budget.

These newly frightened agency heads made for a receptive audience during the Cybersecurity Sprint, a White House initiative that aimed to improve security throughout the government in a mere 30 days. Held in June 2015, the Sprint was the idea of Tony Scott, who had become the third-ever US federal CIO just five months earlier. "Don't waste a good crisis," says Scott, a bearlike and avuncular veteran of Microsoft and Disney. He pressed agencies to spend the Sprint focusing on what he terms "basic hygiene"--that is, making simple upgrades that can drastically reduce an organization's susceptibility to attack. These include measures such as keeping current with the latest software patches, reducing the number of network users with administrative privileges, and, above all, broadening the adoption of multifactor authentication. According to Scott, the federal government's use of smartcards for multifactor authentication increased by more than 70 percent during the Sprint.

As the Sprint neared its end in July, Scott and Daniel began to work on a longer-term response to the OPM fiasco--a set of policy goals that they hoped would revolutionize the federal government's approach to cybersecurity. The document they eventually produced, with substantial input from the likes of the Pentagon and the National Institute of Standards and Technology, became known as the Cybersecurity National Action Plan. First publicly announced by President Obama in February 2016, it calls for billions to be set aside for several critical projects, such as upgrading outmoded systems.

CNAP also stresses the need for better cooperation between the private and public sectors--something that might have made the OPM hack far less severe. In February 2015, in its published analysis of the Anthem hack, the security firm Threat-Connect wrote about its discovery of a suspicious domain registered to "Tony Stark"--the alter ego of Iron Man. That domain was named opm-learning.org. Had anyone at OPM been made aware of ThreatConnect's finding that month, the agency's security staff might have started to look for malware right away. But the tip never reached the sub-basement at OPM headquarters.

But the plan pays too little attention to a fundamental flaw in our approach to security: We're overly focused on prevention at the expense of mitigation. One reason these attackers can do so much damage is that the average time between a malware infection and discovery of the attack is more than 200 days, a gap that has barely narrowed in recent years.

"We can't operate with the mindset that everything has to be about keeping them out," says Rich Barger, ThreatConnect's chief intelligence officer. "We have to operate knowing that they're going to get inside sometimes. The question is, how do we limit their effectiveness and conduct secure business operations knowing they're watching?" Accomplishing that means building networks that are designed to limit a hacker's ability to maneuver and creating better ways to detect anomalous behavior by allegedly authorized users.

A cybersecurity overhaul of this magnitude will, of course, require an abundance of talent. And that means much depends on how well government recruiters can convince the best engineers that being locked in a high-stakes competition with supervillain- -esque adversaries is more exciting than working in Silicon Valley. Perhaps it will be an easy sell. After all, improving a commercial antivirus program, no matter how highly paid a gig, simply doesn't have the romantic appeal of battling Unit 61398 for world supremacy.

Agence France-Presse
Moscow confirms ministry website attack after US hacker claim
Monday, 24 October 2016
Byline: Staff report

Moscow - Russia's foreign ministry on Sunday said an old version of its website had been attacked after a US hacker claimed he broke in and posted a mocking message.
Foreign ministry spokeswoman Maria Zakharova wrote on Facebook that the hacker targeted "an old site that has not been used for a long time," adding that "specialists are working out what happened."

The attack came after Washington earlier this week formally accused the Russian government of trying to "interfere" in the 2016 White House race by hacking, charges the Kremlin has repeatedly dismissed.

"If they establish there was hacking by Americans, even of a resource that wasn't working, this is far from pleasant," Zakharova wrote.

She said that this could be an indication that a "cyber machine of destruction has started acting" after US Vice President Joe Biden told NBC television that President Vladimir Putin would get a "message" from Washington in response to the hacking blamed on Russia.

Alternatively, the latest hack simply shows that the "US elections have wound up people to such a state that they start smashing everything," Zakharova wrote.

The foreign ministry's main website was apparently working normally on Sunday afternoon.

On Saturday, a hacker who calls himself the Jester tweeted: "I'm Jester & I approve this message via the Russian Foreign Affairs Website."

The hacker, who has previously attacked WikiLeaks website, posted a link to a page which had content replaced with a message and an image of a jester.

"Comrades! We interrupt regular scheduled Russian Foreign Affairs Website programming to bring you the following important message," he wrote.

- 'This is America' -

"Knock it off. You may be able to push around nations around you, but this is America. Nobody is impressed," he added.

CNN reported that the jester's attack overnight Moscow time included the piercing sound used for civil alert messages about extreme weather.

The hacker said he was writing on the ministry site to complain after waves of distributed denial of service (DDoS) attacks pounded Twitter, Netflix and other major websites on Friday, accusing Russia of being behind this.

"Now, you can do the usual, shrug, smirk and say 'there's no evidence' that points to Russia being behind any of this stuff, and you can get the Russian Ambassador to US to post some mildly amusing quips over Twitter."

"But let's get real, I know it's you, even if by-proxy, and you know it's you," the hacker wrote.

On Sunday, after the Zakharova's Facebook message, Jester tweeted, "#OutPropagandered - Getting Russia to admit they got 'dinged'. Priceless. They've already started tweaking the story," with a link to a somewhat dismissive article on the pro-Putin Russia Today website.

The mass DDoS attack on Friday could have been meant as a message from a foreign power, cyber security analysts told AFP at the time.

The onslaught commanded the attention of top US security agencies, including the Department of Homeland Security.

"DHS and the FBI are aware and are investigating all potential causes" of the outages, a spokeswoman said.

New York Times
A New Era of Internet Attacks Powered by Everyday Devices
Sunday, 23 October 2016

Byline: David E. Sanger & Nicole Perlroth

Washington - When surveillance cameras first began popping up in the 1970s and '80s, they were welcomed as a crime-fighting tool, then as a way to monitor traffic congestion, factory floors and even baby cribs. Later, they were adopted for darker purposes, as authoritarian governments like China's used them to prevent challenges to power by keeping tabs on protesters and dissidents.
But now those cameras -- and many other devices that today are connected to the internet -- have been commandeered for an entirely different purpose: as a weapon of mass disruption. The internet slowdown that swept the East Coast on Friday, in a nation already jittery about the possibility that hackers could interfere with election systems, offered a glimpse of a whole new era of vulnerabilities confronting a highly connected society.

The attack on the infrastructure of the internet, which made it all but impossible at times to check Twitter feeds or headlines, was a remarkable reminder about how billions of ordinary web-connected devices - - many of them highly insecure -- can be turned to vicious unintended purposes. And the threats will continue long after Election Day for a nation that increasingly keeps its data in the cloud and its head in the sand.

Remnants of the attack continued to slow some sites on Saturday, though the biggest troubles had abated. Still, to the tech community, Friday's events were as inevitable as an earthquake along the San Andreas fault. A new kind of malicious software exploits a long-known vulnerability in those cameras and other cheap devices that are now joining up to the "internet of things."

The advantage of putting every device on the internet is obvious. It means your refrigerator can order you milk when you are running low, and the printer on your home network can tell a retailer that you need more ink. Security cameras can alert your cellphone when someone is walking up the driveway, whether it is a delivery worker or a burglar. When Google and the Detroit automakers get their driverless cars on the road, the internet of things will become your chauffeur.

But hundreds of thousands, and maybe millions, of those security cameras and other devices have been infected with a fairly simple program that guessed at their factory-set passwords -- often "admin" or "12345" or even, yes, "password" -- and, once inside, turned them into an army of simple robots. Each one was commanded, at a coordinated time, to bombard a small company in Manchester, N.H., called Dyn DNS with messages that overloaded its circuits.

Few have heard of Dyn, but it essentially acts as one of the internet's giant switchboards. Bring it to a halt, and the problems spread instantly. It did not take long to reduce Twitter, Reddit and Airbnb -- as well as the news feeds of The New York Times -- to a crawl.

The culprit is unclear, and it may take days or weeks to find out. In the end, though, the answer probably does not mean much anyway.

The vulnerability the country woke up to on Friday morning can be easily exploited by a nation-state such as Russia, which the administration has blamed for hacking into the Democratic National Committee and the accounts of Hillary Clinton's campaign officials. It could also be exploited by a criminal group, which was the focus of much of the guesswork about Friday's attack, or even by teenagers. The opportunities for copycats are endless.

The starkest warning came in mid-September from Bruce Schneier, an internet security expert, who posted a brief essay titled "Someone Is Learning How to Take Down the Internet." The technique was hardly news: Entities like the North Korean government and extortionists have long used "distributed denial-of-service" attacks to direct a flood of data at sites they do not like.

"If the attacker has a bigger fire hose of data than the defender has," he wrote, "the attacker wins."

But in recent times, hackers have been exploring the vulnerabilities of the companies that make up the backbone of the internet -- just as states recently saw examinations of the systems that hold their voter registration rolls. Attacks on the companies escalated, Mr. Schneier wrote, "as if the attack were looking for the exact point of failure." Think of the mighty Maginot Line, tested again and again by the German Army in 1940, until it found the weak point and rolled into Paris.

The difference with the internet is that it is not clear in the United States who is supposed to be protecting it. The network does not belong to the government -- or really to anyone. Instead, every organization is responsible for defending its own little piece. Banks, retailers and social media hubs are supposed to invest in protecting their websites, but that does not help much if the connections between them are severed.

The Department of Homeland Security is supposed to provide the baseline of internet defense for the United States, but it is constantly playing catch-up. In recent weeks, it deployed teams to the states to help them find and patch vulnerabilities in their voter registration systems and their networks for reporting results.

The F.B.I. investigates breaches, but that takes time -- and, in the meantime, people want to bank online and stream television shows. On Nov. 8, Americans will have to look up where they are supposed to vote, and, in a few cases, they will cast their vote on the internet. Yet the voting system is not considered part of the nation's "critical infrastructure."

The head of the National Security Agency, Adm. Michael Rogers, said recently that experts were looking at the problem the wrong way. "We are over-focused on places and things," he said in a talk at Harvard. "We need to focus on the data," and how it flows -- or doesn't flow.

That is where the "internet of things" comes in. Most of the devices have been hooked up to the web over the last few years with little concern for security. Cheap parts, some coming from Chinese suppliers, have weak or no password protections, and it is not obvious how to change those passwords.

And the problem is quickly expanding: Cisco estimates that the number of such devices could reach 50 billion by 2020, from 15 billion today. Intel puts the number at about 200 billion devices in the same time frame. (Assuming the global population is around 7.7 billion people in 2020, that would be about six to 26 devices per person.)

Security researchers have been warning of this problem for years, but that caution has largely been written off as hype or fear-mongering. Then Brian Krebs, who runs a popular site on internet security, was struck by a significant attack a few weeks ago. The company protecting him, Akamai, gave up. The malware behind the attack, called Mirai, had a built-in dictionary of common passwords and used them to hijack devices to become attackers.

Chester Wisniewski, a principal computer research scientist at Sophos, a security company, said that attacks like the one on Dyn "might be the beginning of a new era of internet attacks conducted via 'smart' things."

"There are tens of millions more insecure 'smart' things that could cause incredible disruptions, if harnessed," Mr. Wisniewski added in an email.

It is possible, investigators say, that the attack on Dyn was conducted by a criminal group that wanted to extort the company. Or it could have been done by "hacktivists." Or a foreign power that wanted to remind the United States of its vulnerability. The answer may not come by Election Day, but the next wave of attacks very well could.

David E. Sanger reported from Washington, and Nicole Perlroth from San Francisco.

New York Times
Russian Suspected of Hacking U.S. Tech Companies Is Indicted
Sunday, 23 October 2016
Byline: Nicole Perlroth

San Francisco - A Russian man accused of breaking into computer systems at three internet companies in 2012 has been indicted by a federal grand jury in Oakland, Calif.
Yevgeniy Aleksandrovich Nikulin, 29, was arrested this month while vacationing with his girlfriend in the Czech Republic on charges that he hacked into computer networks at LinkedIn, Dropbox and Formspring, damaged computers and conspired to traffic in stolen information.

The arrest of Mr. Nikulin provided a look at the shadowy world of Russian hackers, who appear to operate with relative impunity even as they are accused of escalating attacks on computer networks in the United States. They are accused of attacking a long list of targets, including retailers, banks, energy companies, and more recently, the Democratic National Committee.

Hackers have been able to operate in Russia with little concern about getting arrested, security experts and law enforcement executives say, so long as they do not attack targets inside Russian borders. But they risk arrest when they leave the country.

In 2014, for example, a hacker was arrested in Guam and extradited to the United States for accessing cash register systems at American retailers between 2009 and 2011. A federal jury convicted that hacker, Roman Valerevich Seleznev, of 38 counts of hacking-related charges in August. He is awaiting sentencing.

The grand jury indictment, which was unsealed on Friday, accuses Mr. Nikulin of hacking into the computer networks of the three companies, damaging the computers of LinkedIn and Formspring employees, and using their credentials for further intrusions.

He is also accused of conspiring with unnamed co- conspirators to traffic in user credentials stolen from Formspring, a social networking site. He faces three counts of computer intrusion, two counts of causing damage to a protected computer, two counts of aggravated identity theft, one count of trafficking, and one count of conspiracy.

Mr. Nikulin could face more than 30 years of prison and more than $1 million in fines.

The charges were announced on Friday by Brian J. Stretch, a lawyer at the Justice Department, and John F. Bennett, a special agent in charge with the Federal Bureau of Investigation.

Mr. Nikulin, who goes by the online aliases Chinabig01, Dex.007, Valeriy.krutov3 and itBlackHat, was captured in a raid at a hotel in central Prague on Oct. 5. The arrest came 12 hours after authorities there learned he was in the country with his girlfriend and driving a luxury car, according to local police.

He did not resist arrest, but had medical problems and was briefly hospitalized, the police said in a statement. The raid was conducted in collaboration with the F.B.I. after Interpol issued an arrest warrant for him.

Mr. Nikulin's arrest came two days before the Obama administration formally accused the Russian government of stealing and disclosing emails from the Democratic National Committee and other institutions and prominent individuals.

Federal officials, including Vice President Joseph R. Biden Jr., have said that the United States would respond to the Russian attacks in kind.

After the Czech police arrested Mr. Nikulin, the Russian Embassy in Prague called for his release.

Aleksei Kolmakov, spokesman for the embassy in Prague, was quoted by the state-run Russian news agency Tass as saying, "We insist that the detained Russian citizen should be transferred to Russia."

A judge in Prague ordered Mr. Nikulin to remain in custody and a court to examine whether to extradite him to the United States.

Waterloo Region Record
Waterloo startup focuses on security for the quantum age
Saturday, 22 October 2016
Byline: Terry Pender

Waterloo - A small startup in Waterloo is working on a problem that touches everyone using the Internet for buying, selling and banking -- securing sensitive data against attacks from quantum computers.
Isara Corp. , based in the Quantum Valley Investments building, went public about a month ago with the first in a suite of planned software products that it says will protect data in existing computers from hackers using quantum computers. The startup's sole focus is quantum-safe cryptography.

It is not only e-commerce that is threatened by the next generation of computers, but also sensitive government communications, says Scott Totzke, Isara's chief executive officer.

There is now a consensus among some of the biggest players in technology, including Google, Amazon and Microsoft, that quantum computers will be a commercial reality by 2026. Using the properties of subatomic particles to process and store information, they will be able to quickly break current methods of encryption.

Everything from credit card numbers, bank accounts, personal records, health files, tax records, corporate data and top-secret messages exchanged by spy agencies are all vulnerable to hackers using quantum computers, Totzke says.

That means any data that is currently stored -- and must remain secret beyond 2026 -- is already vulnerable, and steps should be taken now to protect it from quantum hackers.

"We have an existing threat even though this technology looks like it is a decade out," he says.

In a process called "harvest and decrypt," foreign governments collect encrypted information now and stash it in data centres, waiting for the day when quantum computers can break it all open, Totzke says.

Multinational banks and insurance companies with global infrastructure will need four to five years to plan for and deploy quantum- resistant software that protects their data, he says.

"Which means as an industry we've only got five years to get a solution in place, get technology that is tested and accepted and start upgrading all of our critical infrastructure so it will be quantum safe," Totzke says.

Cars and other products that are connected to the Internet and receive software updates over wireless connections and other devices that are part of the Internet of Things must also be safe from quantum hackers, he says.

"If we aren't considering how to mitigate the threat of a quantum computer-enabled adversary, we may not be able to trust software updates that we get to the cars," he says. "We could get rogue software updates that interfere with critical navigation systems or critical operational systems like steering and brakes and acceleration."

The issue goes beyond financial services and government secrets, Totzke says.

"It really becomes everything that is connected where you have to authenticate a user or a system or we have to protect a secret."

Something known as public key cryptography protects private information on the Internet. Most of the Internet connections people trust today are secured by something called RSA -- an algorithm whose name is an acronym for the three founders of the widely used encryption method.

Isara says the remaining 20 per cent of Internet connections are protected by something called elliptic curve cryptography, which was developed by Certicom, a University of Waterloo spinoff that was acquired by BlackBerry in 2009. The technology is the basis for BlackBerry's vaunted security software that has never been hacked.

Totzke was formerly a senior vice-president at BlackBerry, responsible for the security of the company's products. His group helped to make security the biggest competitive advantage for BlackBerry. After 13 years at BlackBerry, he left in June 2014, looking for a change. He linked up with Mike Brown, another veteran of the BlackBerry security team, and founded Isara.

Brown has a master's degree in math from the University of Waterloo and spent a lot of time at the university's Centre for Applied Cryptographic Research. Most of the research going on at Isara is pure, advanced mathematics.

"When you connect with your phone to Amazon or TD or something like that, fundamentally there is mathematics," Brown says.

"Up to today we have trusted and relied upon that math because nothing can break it. Well, a quantum computer does," he says. "So the problem now is: 'What's the new math that we replace it with?' That's what Isara is focused on, studying that, implementing that and providing those products to customers."

In 18 months, the startup went from Totzke and Brown working together to 21 employees. It has produced the first in a small library of quantum-safe algorithms that will enable cryptography upgrades for traditional computers, sensors, Internet servers, routers and networks.

Isara is earning revenue, fully funded and hiring. Its lead investor is Quantum Valley Investments.

Even with 21 employees, Isara is the largest group of people focused on the problem of quantum safe cryptography, says Mike Pecen, the company's chief technology officer.

Implementing quantum-safe cryptography is presenting interesting challenges to the Isara team that includes four PhDs.

The challenges include: How do you make quantum-safe cryptography scale? How do you get a quantum safe algorithm to work on a sensor for the Internet of Things that has limited memory, limited computing power and limited battery power?

"Or how do you make it work, say in Amazon's web service cloud? These are very different problems that take different approaches," Totzke says. "And fortunately we have this great team here that is able to address those concerns in our design and implementation."

Pecen, formerly a senior-vice president and head of the advanced technology division at BlackBerry, sits on the board of the Institute for Quantum Computing at UW and he reports to the board of the European Telecommunications Standards Institute -- the most influential organization in the world for setting technical benchmarks for smartphones and other wireless telecommunications devices.

Last year, he founded the institute's working group for quantum safe cryptography. He serves as the group's chair. Companies and governments that want to take part pay an annual fee. That money pays for the engineers and research that informs the standards.

"It is in the formative stages," Pecen says of the group's work. "That being said, the European Commission is in my group, the French government is in my group, the government of the United Kingdom is in my group."

Quantum computers use the properties of subatomic particles -- atoms, ions, photons and electrons -- for processing information. Instead of the bits and bytes of traditional computers, they use qubits.

Pecen says quantum computers already exist, mostly in university-based research labs, but the machines are small, ranging in size from one qubit to 12 qubits. The Institute for Quantum Computing at UW has what is believed to be the largest quantum computer, with 12 qubits, he says.

"Little, baby quantum computers can solve some amazingly difficult problems faster than a super computer today," Pecen says.

He says no one knows how many qubits are needed before a quantum computer easily cracks the current methods of encryption. But the threat is real, because someone may have a breakthrough. Or someone may figure out a way to co-ordinate the power of several, small quantum computers with a conventional computer, he says.

With the threat increasing, some government agencies have started talking about quantum safe cryptography. Last year, the National Security Agency (NSA) in the United States said it would transition its computers to quantum-resistant algorithms "in the not too distant future."

The NSA's Canadian counterpart is the Ottawa-based Communications Security Establishment. Last month, Greta Bossenmaier, head of the agency, said cryptologists there are racing to find ways to protect information from quantum hackers.

Isara is part the quantum technology ecosystem supported and funded by Mike Lazaridis, co-founder of Research In Motion, now BlackBerry.

Lazaridis and Fregin founded Quantum Valley Investments in 2013. It has invested in several startups that are working out of its building on Westmount Road North. So far, only two have come out of stealth mode -- Cognitive Systems and Isara.

Isara has ties to the Institute for Quantum Computing and the Perimeter Institute for Theoretical Physics. Lazaridis founded the Perimeter Institute in 2000 and has donated $170 million to it. He also donated $100 million to the Institute for Quantum Computing.

Earlier this year, the Canadian government gave the institute $76 million to help advance its research. At that time, the institute said it expected to have a 100 qubit quantum computer within five years.

"We are here ultimately because it is an exciting problem. This is a fascinating area to be in, looking at the quantum age," Brown says. "So how do we go from desktop computing, to mobile computing to quantum computing and all those changes it will make to industry?"

A WikiLeaks Lesson for Mrs. Clinton
Saturday, 22 October 2016

Editorial: The consensus by United States intelligence agencies is that the WikiLeaks dump of emails from the account of John Podesta, Hillary Clinton's campaign chairman, was the result of a hack by Russia in an effort to influence the presidential election. The leaks are continuing, so it's impossible to

say whether anything truly damaging to Mrs. Clinton will emerge. Some of the purloined exchanges consist of routine and often boring campaign planning, while others seem embarrassing or cynical, as when Clinton aides debate accepting campaign cash from foreign government lobbyists, and one writes: "Take the money!!"
None of the emails, at least so far, seem particularly harmful to Mrs. Clinton, although some suggest that her closest aides have the same concerns that weigh on many Americans -- that she can be thin-skinned and secretive.

As Neera Tanden, one of Mrs. Clinton's closest advisers, put it in the emails, "She always sees herself bending to 'their' will when she hands over information."

This is partly because of the endless investigations the Clintons' political enemies have pursued over the years. But that sort of scrutiny will surely intensify if she becomes president. Mrs. Clinton will only stir up her Republican critics by appearing secretive; she has a much better chance of shutting them down, as she did in her Benghazi hearing, with a dogged determination to show she has nothing to hide.

Fuller disclosure would clearly have helped her when it came to her lucrative speeches to Wall Street, a matter that has dogged her throughout this campaign. While she has released a full list of her speeches and fees, Mrs. Clinton has consistently refused to release the transcripts. From the snippets seen in the emails, one wonders why.

One speech has been politically problematic -- a 2013 presentation to Brazil's Banco Itaú in which she said, "My dream is a hemispheric common market, with open trade and open borders, some time in the future." Mr. Trump pounced on this as evidence that Mrs. Clinton favored unfettered immigration -- which seemed misleading given her long support for strong border security.

Over all, the excerpts from WikiLeaks suggest that Mrs. Clinton's speeches were what one would expect for audiences interested in global investment: talk about incentivizing growth and spurring entrepreneurship.

Imagine if months ago, Mrs. Clinton had done her own giant information release, including hundreds of pages of speeches to Goldman Sachs and Citi, to Salesforce.com, the United Fresh Produce Association and the Cardiovascular Research Foundation. Journalists and the public could have waded through them, discussed them, written about them -- and by now, everyone would have long since moved on.

Daily Telegraph (Australia)
Cybercrime costs us £11bn
Saturday, 22 October 2016

London - A terror plot targeting the London Underground has been uncovered after police found what they believe to be a bomb on a Tube train.

A 19-year-old man was Tasered and arrested by counter-terrorism officers yesterday following the discovery of the device aboard a train outside the O2 centre in south London on Thursday.

Last night it emerged that security officials had already contacted the Ministry of Defence to warn military personnel and that the threat level for transport in the capital had been raised to "severe".

The MoD told troops before the arrest: "It remains possible that the perpetrator may attempt to place further devices."

British Transport Police confirmed it had increased security and would be stepping up patrols.

The incident and subsequent arrest came 11 years after the 7/7 bombings when the London Underground was targeted in a terror attack that killed 52 passengers.

Details of the suspected plot emerged in a memo sent to serving military personnel that forwarded a warning from the security agency that gives terrorism alerts.

It said the Joint Terrorism Analysis Centre "has raised the threat level for transport in London to severe: an attack is highly likely".

It said: "This increase is in response to the discovery of a suspected viable improvised explosive device (IED) on a London Underground train yesterday.

"It is unknown who placed the device and what their motivation was. Therefore it remains possible that the perpetrator may attempt to place further devices. The threat level will continue to be reviewed as further information is received."

It is understood the threat level for transport outside London remains unchanged at "moderate".

The Home Office last night declined to say why the military had been contacted and other bodies including Transport for London and Network Rail also refused to comment.

The teenage suspect was arrested outside London Metropolitan University on Holloway Road, north London, about 10 miles from where the device was found in North Greenwich.

Witnesses described the young man being dragged to the ground by plainclothed masked officers carrying machineguns.

One onlooker said police appeared to be waiting for the suspect.

The man, described as Asian in appearance with black hair, was Tasered in the back.

A shop worker who did not want to be named said: "He was just walking down the street. He was definitely Asian and he definitely had black hair and I think he was in his twenties.

"Officers came from behind him and Tasered him. They jumped on him. He was on the floor. They checked him. They put him in a car and took him away. I saw the whole thing from where I work."

Specialist forensic officers will examine the suspect package over the weekend.

Scotland Yard said the arrest came "following the discovery of a suspicious item on a Tube in north Greenwich".

Financial Times
Chinese hackers targeted US aircraft carrier
Saturday, 22 October 2016
Byline: Jeevan Vasagar and Geoff Dyer

Washington - Chinese hackers targeted foreign government personnel who visited a US aircraft carrier the day before a contentious international court ruling on the South China Sea, according to a US cyber security company.
The China-based group created an infected document impersonating an official message addressed to officials visiting the USS Ronald Reagan, a nuclear-powered aircraft carrier which conducted patrols of the South China Sea in July.

The suspect document is dated July 11, the day before a tribunal in The Hague ruled against China's expansive claims in the region. The targets of the attack were delegates from a foreign government due to visit the aircraft carrier that day.

The document contained Enfal malware, which can be used to copy information from an infected computer or download further computer viruses.

According to FireEye, a US cyber security business, the China-based group that designed the suspicious document is the source of previous attempts to compromise US and Vietnamese national defence computer networks.

The likely goal of the "spear-phishing" attack -- a attack in the form of an email that appears to be from someone known to the recipient -- was to gather information on military manoeuvres and command and control systems, as well as policy issues, the company said.

There is no direct evidence to link the attempt with the Chinese government, and no indication the attack was successful.

According to FireEye's iSight unit, which identified the attack, the command and control system used for the infected file shared an IP address with a domain previously used by the China-based group.

This system was first identified in June, while the suspect document surfaced in September, FireEye says.

FireEye says the file -- which contains details of an itinerary for a visit to the aircraft carrier on July 11 this year -- is likely to have been distributed through targeted email messages.

Tensions over the South China Sea have fuelled high levels of cyber espionage in the region, according to a FireEye expert.

"Many governments and militaries in Southeast Asia lack cyber security controls that can effectively match these elevated threats," said Bryce Boland, the group's Asia-Pacific chief technology officer.

"For example, personal webmail and unmanaged devices aren't unusual, and many organisations lack the technology to detect unique attacks which haven't been seen before."

The USS Ronald Reagan and its escort ships conducted 53 days of operations in the western Pacific, including the South China Sea, this year.

The South China Sea patrols were intended "to maintain the seas open for all to use", according to a US Navy statement at the time.

Commander Clay Doss, a spokesman for the US Pacific Fleet, said: "As a matter of policy and for reasons of operations security, we won't comment on alleged vulnerabilities in networks or our efforts to mitigate them. We have full confidence in the integrity of the Navy's networks on which we conduct critical operations."

A US Navy official said that there was no indication the USS Ronald Reagan's classified information systems had been compromised, nor that the ship's operations in the South China Sea had been affected. The official said unclassified information about logistics was often shared with contractors and foreign governments to support port visits for ships.

In July a Chinese businessman was sentenced to nearly four years in jail for his part in an alleged conspiracy to steal military technical data from the computer networks of US defence contractors.

US prosecutors claim this conspiracy involved Chinese military officers.

New York Times
Man Who Took Trove of N.S.A. Data Has Court Date

Saturday, 22 October 2016
Byline: Scott Shane

Baltimore - The intelligence contractor accused in the largest-ever breach of classified information was portrayed by his lawyer in court on Friday as a patriot and a dedicated worker who became compulsive about taking work home.
An unlocked garden shed, stuffed with more classified documents than the contractor, Harold T. Martin III, could ever read, might be a symptom of a mental disorder, the lawyer said.

Mr. Martin, a rotund man with glasses whose striped gray jail garb stood out in an ornate federal courtroom here, sat silently during his first public appearance as his lawyer, James Wyda, argued that he should be released while awaiting trial.

The prosecution, opposing the request, described Mr. Martin, 51, in starkly different terms: as a serial lawbreaker of staggering audacity. Over two decades as a contractor for the National Security Agency and other government units, it said, he took home masses of secrets in full knowledge that it was illegal to do so. And, the prosecution added, there is no way to be certain what he has done with the information, or whether he might be hiding more.

At the end of an hourlong detention hearing, Magistrate Judge A. David Copperthite sided with the government and decided that Mr. Martin would remain in jail. He noted that Mr. Martin had a history of binge drinking, and concluded that he posed a flight risk because he saw in him a divided personality.

"You have someone here who presents himself as two different people," Judge Copperthite said, agreeing with the defense that mental health might be an issue.

"He presents himself as the protector of the N.S.A.," the judge said, referring to an unsent letter the F.B.I. found in which Mr. Martin scolded his colleagues as "clowns" who were incapable of protecting the nation's secrets. "Yet he walks out with and keeps in an unlocked shed information that enemies of this country would love to exploit."

Likewise, the judge said, Mr. Martin's wife, Deborah Shaw, who sat in the front row, told investigators she had no idea that he owned what prosecutors called an "arsenal" of 10 firearms, including an assault-style rifle and a pistol-grip shotgun.

"For 20 years this has gone on," the judge said, referring to Mr. Martin's collecting of classified material. "His family was there, and I'm sure they had no idea what was going on."

Judge Copperthite said that because Mr. Martin is currently charged with relatively minor criminal offenses -- theft of government property and unauthorized retention of classified material -- the law permitted him to consider only whether the defendant posed a risk of flight, not whether he might be

dangerous. But he suggested that he agreed with the government that Mr. Martin would pose a danger -- not necessarily a threat of violence, but a threat that he might further damage national security.

Prosecutors said that in a raid on Mr. Martin's suburban Maryland home in August, the F.B.I. took boxes of papers and an estimated 50 terabytes of electronic files -- equivalent to 500 million pages -- from his home office, shed and car. Much of it, they said, is highly classified material that should never have left the secure premises of the N.S.A., the Office of the Director of National Intelligence and Pentagon offices where Mr. Martin worked.

The scale of the data Mr. Martin is accused of taking home is many times greater than either the hundreds of thousands of N.S.A. documents that Edward J. Snowden gave to journalists in 2013 or the military reports and diplomatic cables that Chelsea Manning gave to WikiLeaks in 2010.

But after seven weeks of frantic investigation, F.B.I. and N.S.A. officials have not been able to show that Mr. Martin gave any of his collection to anyone else. Notably, they have not been able to link him to the disclosure of highly classified N.S.A. hacking tools that an anonymous group called the Shadow Brokers offered for sale on the web in August.

Officials, however, say that investigators cannot be certain that he is not the source of the Shadow Brokers material or that he has not transferred other secrets elsewhere, in part because Mr. Martin's cyberskills would make it possible for him to erase his electronic tracks.

One of the prosecutors, Zachary A. Myers, suggested the continuing frustration of F.B.I. agents who look at Mr. Martin's record of "betrayal and deceit" and believe he is not being candid about his motives or his actions.

"Suffice it to say that the government does not at this point believe that the defendant has been fully cooperative," Mr. Myers said.

For example, Mr. Myers said, after many hours of searching Mr. Martin's property, F.B.I. agents thought, and Mr. Martin assured them, that they had found all his material. Then they discovered that more disks containing stolen data were still in his house, hidden behind a bookshelf.

"There's no guarantee that he's not storing other information somewhere else that he has not told us about," Mr. Myers said, noting that Mr. Martin had software that might make it possible to stash data in the electronic cloud and leave no trace for investigators to find.

Mr. Wyda, a federal public defender and Mr. Martin's lead lawyer, said his client wanted only the best for the N.S.A. and for his country. Indeed, he suggested, it was Mr. Martin's very dedication that became his undoing.

"Hal was always driven by his desire to be better," Mr. Wyda said of his client, whom he called "a voracious learner." He began to take work home to master it, the lawyer said, and "it became a compulsion."

"The mental health factor is the only explanation for this that makes sense," Mr. Wyda added.

The lawyer said Mr. Martin was "no Edward Snowden" -- he did not share Mr. Snowden's political conviction that the government was violating privacy. Nor, Mr. Wyda said, was he Aldrich Ames or Robert Hanssen, employees of the C.I.A. and F.B.I. who sold secrets to the Russians.

"This was the behavior of a compulsive hoarder," Mr. Wyda said, mentioning that Mr. Martin's mother had also had hoarding tendencies. Keeping top secret material in plain view in his home and car was not the conduct of a spy or a political activist, he said, just a man carried away with his drive to master his work.

Mr. Wyda said Mr. Martin was in poor financial shape and could not afford to flee even if he wanted to. He insisted that his client was telling agents everything he knew.

After the judge's decision that Mr. Martin would return to a suburban jail for the many months that are likely to elapse before a plea or a trial, Mr. Wyda said that Mr. Martin and his family were "very disappointed" and that they would seek a review of the decision next week. Ms. Shaw and Mr. Martin's brother, Michael Martin, a nurse anesthetist who lives in Florida, left the courtroom and walked off into the rain without speaking to journalists.

Daily Telegraph
GCHQ using cyber attacks on Isil to aid battle to take Mosul
Saturday, 22 October 2016
Byline: Ben Farmer

London - GCHQ is using cyber warfare for the first time against Isil militants as part of the campaign to retake Mosul, the Defence Secretary has said.
The cyber attacks are understood to have targeted the communications of Islamic State of Iraq and the Levant to disrupt co-ordination in the Iraqi city.

Sir Michael Fallon told a conference organised by the Royal United Services Institute, a think tank on cyber warfare: "We are conducting military operations against Daesh [Isil] as part of the international coalition, and I can confirm that we are using offensive cyber for the first time in this campaign." He said £265 million is being pumped into "rooting out cyber vulnerabilities" in military and wider cyber-systems.

Straits Times
Singapore using cyber diplomacy as weapon against cybercrimes
Monday, 24 October 2016
Byline: Lim Yan Liang

Singapore - What more can Singapore do in a digital world where dependence on technology trades security for greater efficiency and connectivity?
With more countries using technology as a component of military response, the first thing to do is to treat the threat as seriously as a conventional one.

To this end, Singapore has been deploying 'cyber diplomacy' - building alliances with other countries, both to swop expertise, such as the latest in attack methods, and to regularly exercise and test its defences.

Singapore's Cyber Security Agency (CSA) has signed bilateral cyber agreements with five countries: France, the UK, India, the Netherlands and the US.

The agreement with the US, signed in August, is the first cyber agreement between an Asean nation and the US. This opens the door to regular exchanges on cyber issues and effectively gives Singapore a voice when the larger countries try to shape global cyber norms, according to experts.

"While Singapore benefits from accessing knowledge about cyber threats and mitigation responses from the US, Washington will equally gain deeper insights into the cyber threats experienced by Singapore and potentially the South-east Asian region," said US Army Lieutenant-Colonel Harry Hung, a visiting fellow with the S. Rajaratnam School of International Studies.

This and other recent efforts by the government demonstrate a cyber security approach that looks to leverage on the island's reputation as a global hub and a valued intermediary.

At the launch on October 10 of Singapore's cyber security strategy, a comprehensive document, which maps the country's long-term approach to the issue, Prime Minister Lee Hsien Loong said the government is sparing no effort to build a sizeable workforce of industry professionals here.

The four prongs of the strategy involve strengthening cyber defence of the country's critical infrastructure, developing a vibrant cyber security ecosystem by educating businesses and individuals, creating jobs by developing cyber security talent and building international partnerships to better respond to cyber threats.

This means the republic wants to work closely with Asean countries to jointly secure the region's Internet space, an ambitious undertaking, given the uneven level of development across the 10 member states.

Singapore has put its money where its mouth is. At the first official gathering of Asean ministers in charge of cyber security, held a day after the launch of Singapore's strategy document, Minister in charge of Cyber Security Yaacob Ibrahim launched a $10 million fund to assist fellow Asean countries in building their cyber threat response capabilities.

Besides helping to train technical professionals in neighbouring countries, the funds will be used to train policymakers, prosecutors and other officials to help these countries formulate their cyber policies, said CSA Chief Executive David Koh.

This is long-term thinking. With Asean countries building their fibre networks and the region becoming more connected, cooperation is necessary, so that no Asean member becomes the "weak link" that makes the community vulnerable, said Yaacob.

"What we want to do is ensure that all Asean member states pay attention, so that they don't become that weakest link," he said.

The money will also go towards organising an annual Singapore International Cyber Week (SICW), the first edition of which closed on October 12, having drawn 5,000 attendees from almost 50 countries.

They included more than 100 experts in the field from governments, the private sector and academia, such as the US Department of State's Coordinator for Cyber Issues, the UK's Cyber ambassador and the director-general of China's Bureau of Cybersecurity Coordination and Administration.

Yaacob also hosted several bilateral meetings with key Asean cyber security principals on the sidelines of the SICW.

This is something Singapore has done well in the past. Identify a niche where there are few platforms for countries to meet and discuss an issue of growing importance, then become the pre-eminent forum for leaders to come together, in big groups and private sessions, to tackle thorny issues.

It is a model learnt from the Shangri-La Dialogue - an annual defence forum that attracts high-ranking military and political officials here from every country, and one of the world's top security gatherings.

Together with the annual Asean Cert Incident Drill, organised by CSA and into its 11th edition, the plan is for Singapore to "start the conversation" and to be useful to the region and the world as a hub for cyber security cooperation, said Koh.

"Our perspective is cyber security is a team sport: no one country can do it by itself, and that's why Singapore is partnering with the other Asean member states," he said.

And in the same way that regional forums have given the collection of small states that is Asean a bigger voice in global matters, Singapore is hoping to take the lead in shaping the ongoing global conversation on acceptable behaviour in cyberspace.

"The world is shaping cyber norms, and we agree that we must have norms in cyberspace," said Yaacob.

"But how those norms are applicable to our region is something that we have to understand ourselves before they're being imposed by others," Yaacob added.

However, in order to become a global heavyweight in cyber matters, Singapore has to keep its own house in order. This is where the remaining three prongs of the national cyber security strategy come in.

The strategy document lays out a plan to strengthen the republic's cyber defences, especially for critical infrastructure, such as utilities and emergency services, and includes a new law to be introduced next year that will compel such operators to secure their systems and report breaches to the government in a timely manner.

It spells out how the government will step up public education to teach the public safe Internet-use practices to keep their devices clean and to keep the man in the street aware of common online scams.

It also fleshes out how the government intends to develop a home-grown cyber security fraternity - through heavy investment in research and development, more scholarships for students looking to enter the sector and opportunities for mid-career professionals in related fields to cross over.

The issue of cyber security is particularly important, given Singapore's push to become the world's first Smart Nation, where a vast array of sensors provide the government with feedback used to shape policies and the day-to-day lives of Singaporeans.

Such sensors also need to be secure, giving further impetus to the push for strong cyber security. For, as Lee put it at the launch of the strategy document: "To be a Smart Nation, we must also be a safe nation."

Al Jazeera
Cyber warfare: The new international warfront
Monday, 24 October 2016
Byline: Creede Newton

Mesa, Arizona - To enter the Arizona Cyber Warfare range (AZCWR), a person must have a signed waiver, the consent from the strict private security firm that guards the facilities, and the fortitude to withstand the salty language and messy environment created by the hackers inside.

"This is the only place in the world where the good guys can learn to hack from good guys who really know how to hack," Brett Scott, one of the founders of the AZCWR, told Al Jazeera inside their hacking headquarters.

The organisation is housed inside a complex that began as a research facility for top-secret military technology in the 1980s. The group has three missions: to educate the public on the merits of hacking by offering free courses, to change the realm of cyber-security for both the public and private sectors to gather, and to handle the enemies of the United States.

Right now, the enemy at the top of that list is the Islamic State of Iraq and the Levant (ISIL, also known as ISIS), which controls a dwindling swath of land in Iraq and Syria.

AZCWR uses "bots", or computer programs that take advantage of thousands of computers across the planet, to lodge complaints against ISIL Twitter pages.

"Our net effect is taking down 1,000 accounts a day," Scott said. When asked how his cadre of hackers, none of whom speak Arabic, are able to find the accounts, Scott responded that the AZCWR is given tips from intelligence agencies across the globe.

"If a housewife in France who lived through an attack wants to do something but doesn't know how she can download our bot. Then we'll use her computer to kick [ISIL] out of our world - the internet."

The AZCWR has been open to the public for two years, though it has been in operation for longer. It currently teaches roughly 2,000 active users on its website and at the physical location in "ranges" whose difficulty levels go from "Beginner" to "Jedi" in reference to the sci-fi film series, Star Wars.

There is an assortment of tasks, from the aforementioned take-down of an ISIL account to attacking, with consent, the cyber security systems of businesses.

Also, when a foreign adversary is not "paying enough attention" to the AZCWR for the group to gather intel, the hackers will "poke the bear", Scott said.

Scott has worked for various government agencies, and his experience with has left a bad impression. "The US has a very backwards idea towards hackers. Russia, China, and even ... countries like Iran are offering them huge amounts of money, luxurious cars, and nice flats."

In the US, Scott explained, hackers still face witch-hunts and harsh penalties when the government should offer employment. AZCWR is there to force decision-makers to re-evaluate their stance on technologically-capable but legally questionable computer users. "World War III is already here, and it's happening on the internet," the hacker said.

While the assertion that WWIII is happening on the internet sounds hyperbolic, there are those in the US government who agree with the sentiment.

Representative Mac Thornberry, the Chairman of the US House Armed Services Committee (HASC) which is responsible for oversight and funding of the Department of Defense (DoD) and the Armed Forces, has stated repeatedly that US cyber capabilities need more attention.

At a June meeting with the DoD and US Cyber Command's Deputy Commander Lieutenant General James K McLaughlin on cyber attacks, Thornberry said that just as the military has "an air campaign [against ISIL], we want to have a cyber campaign".

Al Jazeera spoke to an HASC aid on condition of anonymity on the subject. The aid said that while work could be done to enhance US cyber capabilities, the nation is "at the same level as anyone else ... but we're also as vulnerable to attack as anyone else".

While The government wants a cyber campaign against ISIL and others who attack the state, they don't want to encourage "cyber militias" to mount attacks against enemies. This opens them to "hack backs", or retaliatory measures, the aid said.

Thornberry and the defence establishment are concerned by recent hack attacks on high-level politicians such as the revelation of emails from the Democratic National Committee and former Secretary of State Colin Powell.

These attacks have revealed embarrassing details from behind the scenes of the US political theatre that has undermined an already contentious election season, and Issues of cyber security, especially recruitment of hackers to work with the government, are still a "struggle", but public-private partnerships are something about which "we've been very supportive", the aid concluded.

While US agencies may be struggling with the hacking war abroad, digital rights group, Electronic Frontier Foundation (EFF), fears its citizens are losing the war at home.

Mark Rumold, a senior staff attorney at EFF who focuses on government secrecy and has successfully worked to make public tens of thousands of previously classified government documents, told Al Jazeera that recent court rulings on a controversial case are "troubling".

The FBI's investigation surrounding Playpen, a website on the "Dark Web" network, which can only be accessed through the Tor network, and displayed thousands of images of child pornography is one such case.

The Tor network runs a user's internet protocol (IP) address, which is a unique signature given to a device, through thousands of relays to pre-empt surveillance and facilitate anonymity.

However, the FBI hacked and reconfigured the site to collect true IP addresses for use in cases against those who visited the site. Due to the wide range of visitors to the site, courts all over the US have been obliged to weigh in on the legality of the practice.

In June, a federal court in the FBI's home district decided that the US Constitution's Fourth Amendment, which guarantees the right of the people "to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures", does not apply to home computers.

In a post on EFF's website, Rumold wrote the decision "is the latest in, and perhaps the culmination of, a series of troubling decisions" surrounding the Playpen investigation.

"Every single thing they could have gotten wrong, they did," Rumold told Al Jazeera in an interview. "It's the equivalent of law enforcement coming into your house and taking things out without a warrant."

While this one decision doesn't mean the Fourth Amendment no longer applies in any such case, Rumold explains that judges often show deference to rulings made by other district judges.

In an increasingly surveilled society, this could have serious consequences. "There's no question that technology has made our lives far more transparent than ever before, and that law enforcement is taking advantage," Rumold continued.

While there are "plenty of laws" governing hacker activity, as well as law enforcement's use of technology, the ever-changing digital landscape leaves a "grey space" in which troubling decisions can be made, the digital rights advocate concluded.

Back at the AZCWR, Scott said that the EFF is right "nearly 100 percent of the time", and that his band of hackers "operate inside the law. It's not our job to determine what the limits are. It's our job to push them."

Times of Israel
South Korea may rent Israeli satellite to spy on North
Monday, 24 October 2016
Byline: Stuart Winer

Jerusalem - South Korea is reportedly considering using an Israeli spy satellite to peek at North Korea's military and nuclear facilities as it ramps up its defense capabilities in response to threats from Pyongyang.
A South Korean Ministry of National Defense official said last week the country was looking to foreign intelligence agencies to provide information on North Korean activities, as it will take several years for the country to develop its own surveillance satellites, the Yonhap News Agency reported.

Seoul has become increasingly concerned after North Korea conducted five nuclear tests in the last ten years, several recently, and a series of missile tests, including of intermediate-range ballistic missiles.

According to a report on the Ynet news website on Saturday, Israel's Ofek 11 spy satellite could be in position to provide information on North Korea.

Israel and South Korea lie on similar latitudes, between 30 and 40 degrees north of the equator. The orbit trajectory of Ofek 11, which was launched in September and experienced some initial technical difficulties, carries it over the Korean region where its sophisticated monitoring equipment could be directed at North Korean facilities.

"The military is expected to have its own surveillance satellites as early as 2023 that will allow Seoul to closely monitor military activities in North Korea," the South Korean official said.

"It is years behind the defense ministry's original schedule to deploy five surveillance satellites between 2021 and 2022 as part of the country's 'kill chain' strike system to deal with missile threats from the North," the official added.

South Korea currently relies on US satellites for information about North Korean nuclear and missile sites.

Aside from its spying capabilities, the Israel satellite would also offer images of sites from different angles than those provided by the US orbiters, boosting the intelligence value of the information, the report said.

South Korea was also looking to buy German-made KEPD-350K cruise missiles which have a range of 500 kilometers, putting the North Korean capital within striking distance.

In August 2014, a top defense official told Israel's Army Radio that South Korea is one of several countries interested in purchasing the Iron Dome missile defense system.

Yedidia Yaari, CEO of Iron Dome manufacturer Rafael Advanced Defense Systems Ltd., said that the system's high success rate had piqued foreign interest, Reuters reported at the time.

The short-range missile defense system, developed with American funding, had been highly effective in the 2014 round of violence between Israel and Hamas, intercepting hundreds of rockets headed toward major population centers in Israel.

Major Weekend Cyberattack Was a Preview for Israel's Future Wars
Monday, 24 October 2016

Byline: Amos Harel

Jerusalem - The hacking that brought down websites in the United States and Europe on Friday seems to be the most extensive, sophisticated and ambitious attack of its kind the West has ever experienced. Over the past two years there have been two major hackings of civilian infrastructures in Ukraine and Turkey that were attributed - without it ever having been categorically proven - to Russia, in the context of conflict between it and the two neighboring countries. Israel had a similar hacking experience, of much lesser magnitude, during the last war in the Gaza Strip, which it was able to counter without real damage.
As of Saturday, neither the American government, nor experts interviewed in the media, had directly accused anyone of the attack. It is clear that the attack represents major offensive capability and that it required a great deal of preparation. Ostensibly, the immediate suspect is Russia, which has been accused over the past two months of being behind the hacking of senior officials in the Democratic Party, leaks to the Wikileaks site and the indirect assistance given to the campaign of Republican presidential candidate Donald Trump.

Just last week, Vice President Joe Biden hinted that the United States would consider cyber- retaliation against Russia if it continued the attacks. Precisely in this context, Russia might consider such extensive hacking too risky a gamble - and Moscow is usually an expert at pushing the edge, rather than undertaking suicide attacks.

The actual damage was apparently not very extensive. No American firm collapsed or stopped functioning, although some sites were shut down for a few hours. Denial of service attacks are nothing new; they are the preferred way of hacking civilian infrastructures in terms of the hackers' cost effectiveness, because the defending side can't totally stop the attack in a way that completely blocks their access to the internet.

According to Israeli cybersecurity experts, the success of such an attack depends on the recruitment of a sufficiently large mass of attackers and targeting the "internet of things" - that is, internet-connected household devices, rather than computers. Most state security bodies know how to identify computer systems connected to countries that represent a major danger; they blacklist and identify them and are thus able to stop an attack. But security cameras and refrigerators are not on any blacklists - and so up until now attacks by such devices have not been anticipated.

Now that the attack has happened, the relevant industries might have to re-assess their vulnerability to hacking via devices connected to the web. That is true, for example, in the car industry, where most new vehicles come off the assembly line connected to the internet.

Such an attack could happen in Israel in the future. There are rival countries, or those with vested interests, that could act against Israel. The country's security and military computer systems are fairly well protected and their interface with civilian systems is limited in a way that makes them hard to

strike. Civilian infrastructures, especially those not belonging to the state, are still quite exposed despite considerable progress in recent years in the field of cyber-security.

In any case, the cyber-events of the past two days seem like a taste of the future. In the short term, it remains to be seen whether Russia, or hackers associated with it, will be tempted to disrupt the U.S. presidential elections on November 8. In the longer term, it is clear that cyberattacks will be an inseparable part of any future conflict between two countries with technological capabilities.

While attacks by bombs and missiles require a great deal of international involvement, leave clear fingerprints and often spark harsh criticism, hacking is a different sort of weapon. It can be used to perpetrate a more mild strike that cannot always be traced to the perpetrators. Hacking is convenient for sending threatening signals, for an attack that can serve as an alternative to a military face-off, or for an opening strike after which the bombs and missiles come. Since Israel and the United States are fostering such capabilities, they are also aware of the possibility that their opponents know how to use similar means against them.

Fars News Agency
Iraqis Launch Cyber Army to Support Mosul Liberation Operation
Monday, 24 October 2016

Tehran - Iraqis from different walks of life, specially the country's media persons, launched a campaign on the Internet in support of the ultimate defeat of the ISIL terrorist group by the country's military forces, specially Hashd al-Shaabi (volunteer) troops, in the city of Mosul in Nineveh province.
The main purpose of the campaign is said to be working in parallel with the Iraqi security forces and covering the victories of the Iraqi army and volunteer forces in the war against the ISIL.

Hundreds of Iraqi people, including reporters, media persons, web bloggers and other Iraqis have voluntarily joined this "cyber army".

Speaking to FNA, Iraqi journalist and blogger Ali Vajih said the cyber army has been set up with the aim of supporting Iraq's joint military forces.

Iraqi Prime Minister Haidar Al-Abadi announced last Monday that the country's armed forces and popular troops had started large-scale operation to take back the ISIL's self-proclaimed capital, Mosul.

Prime Minister Al-Abadi appeared on the state TV an hour after midnight to declare that his country's army, security and mobilized volunteer troops have started the long-awaited offensive to take back the country's second-largest city.

"The hour has come and the moment of great victory is near," Al- Abadi said in a speech on state TV, flanked by the armed forces' top commanders.

Al-Abadi vowed that the military troops will take maximum caution to save civilian lives and avoid collateral damage in the city that is believed to still be home to over a million people.

The premier asked the civilian population to raise white flags over their buildings and contact the government troops for any kind of helpful information that they might have about ISIL militants.

"We urge you, the heroic people of Mosul, to cooperate with our security forces to rescue you," the Prime Minister added.

Mosul in Nineveh province that is ISIL's last stronghold in Iraq was occupied by the terrorist cult on June 10, 2014 and its liberation marks an era of demise for ISIL in Iraq.

Mosul was the first city taken by the terrorist group and it was there that ISIL Leader Abu Bakr Al-Baghdadi declared his so-called caliphate on June 29, 2014.

ISIL could stretch control over 40 percent of Iraq after it took Mosul over two years ago, but now holds only 10 percent of the country after losing battles in such major cities as Beiji, Tikrit, Fallujah and Ramadi in the last one year.

Mosul is of paramount importance both to Iraq and the ISIL as it is in an oil-rich region close to the borders with Syria and Turkey, while it has been a regional trade hub for the last several centuries. In addition to smuggling crude stolen from the oil wells of Nineveh, ISIL also levied forceful taxes for various reasons from the over 1-million-strong population that is still believed to be living in the city. Loss of Mosul will inflict a major blow to the terrorist cult as it will lose a major source of its revenues.

Iraqi army troops and volunteer forces (Hashd al-Shaabi) had been deployed 15 kilometers from Mosul two days ago.

"The reconnaissance operation in Mosul ended; we are waiting for the operations to kick off," Hashd al-Shaabi announced in a statement last Saturday.

Iraq's military forces have been bringing in a large number of troops, weapons, ammunition, armored vehicles, personnel carriers, tanks and other types of military equipment in preparation for the operation for the last several weeks, but many military and state officials and popular forces' commanders were slamming the US for pressurizing Baghdad to delay the operation for the last several months, a view that was even supported by US presidential candidate Donald Trump.

In his second televised debate with Hillary Clinton, Trump asked why the US has been hindering the operation for such a long time to give ISIL commanders and top brass to escape to Syria.

ISIL has also been preparing for the operation for the last several weeks. The terrorist group has reportedly used thousands of prisoners to dig a complicated network of tunnels and trenches around the city and filled the wide trench dug around the city with oil to put it on fire as it expects the city to go under siege by Iraq's joint military troops. The terrorist group has opened multiple fronts to confront the government troops.

Meantime, many ISIL top commanders, including Al-Baghdadi himself and his deputies, as well as their family members have left the city for Raqqa, the terrorist cult's second self-proclaimed capital.

Al-Baghdadi and his top aides left the city last week, while local sources in Nineveh disclosed on Sunday that the families of the ISIL terrorists that had left Mosul just arrived in the town of Merkedeh in Syria's Hasaka province.

"The ISIL commanders, including al- Baghdadi, are escaping Mosul to Syria," Iraqi Kurdistan Democrat Party's media director Saeed Mamouziti said last week.

He said that al-Baghdadi has also ordered his followers to completely destroy Mosul if they are defeated in the war against Iraq's joint military forces.

Later Mamouziti said that the ISIL militants were fleeing the city since the long-awaited large-scale operation to free Mosul was expected to be launched in the following days.

Meantime, local sources revealed that "ISIL commanders' families, including over 25 foreign families, escorted by military convoys reached the town of Merkedeh" on Sunday.

Earlier on Sunday, local sources in Nineveh province disclosed that the ISIL has brought to a halt all activities of its security offices in the city of Mosul.

"The ISIL has recently issued a circular in Mosul city according to which all its offices will halt operation until further notice," a local source said.

The source noted that the ISIL has already evacuated its security offices in several districts of Mosul in recent days, while many ISIL members seem confused to see the rush in their commanders' actions.

The US has also been pressuring Baghdad to keep the Hashd Al-Shaabi away from the operation, but they are now deployed to the battlefield after Prime Minister al-Abadi, the commander-in-chief of Iraq's armed forces, personally approved their participation in the Mosul operation last week.

The Iraqi media had earlier reported that the Mosul operations would start from several directions, the most important of which are al-Qayyara axis located 60 kilometers to the South of Mosul and Sahl Nineveh some 20 kilometers to the East of the city.

Wall Street Journal
Web Attack Stemmed From Game Tactics --- Outage made use of code, hacking tools that have become increasingly powerful
Monday, 24 October 2016
Byline: Robert McMillan, Rory Jones

New York - The computerized attack that left more than 1,200 websites unreachable on Friday stemmed from efforts, years earlier, by players of online games to frustrate and slow their opponents, security experts say.
The massive denial-of-service attack was launched from thousands of internet-connected devices, including cameras, video recorders and routers. It overwhelmed computer servers at Dynamic Network Services Inc., also known as Dyn, which plays a crucial role in connecting users to websites. Popular sites including Twitter Inc. and Netflix Inc. were unreachable for parts of Friday.

On Saturday, Dyn said the attack had ended, though it continued to investigate the causes.

Several security experts say the computer instructions for the attack had been refined from code written by disaffected videogame players calling themselves Lizard Squad who launched attacks on Christmas Day 2014 against online-game services operated by Sony Corp. and Microsoft Corp.

Since then, the experts said, the code and hacking techniques have been passed around and made more powerful. Friday's attackers used it to seize control of devices connected to the internet, many with weak security, and assemble them into an online army, or "botnet." Both the code, and the botnet, used in Friday's attack are called "Mirai."

By 2020, the research firm Gartner projects there will be 20 billion internet-connected devices, up from six billion now, raising the specter of more such attacks.

"These guys just started off as 'booters'. . .just kick your enemy off the videogame you've been playing," said Gary Warner, director of research with the Center for Information Assurance and Joint Forensics Research at the University of Alabama at Birmingham. "As the gaming companies came after the booters, they created Lizard Squad to come after the gaming companies."

Mr. Warner and others say there is no single creator of Mirai. Rather, it is essentially an open- source project that has gradually been refined from tools built by Lizard Squad and others.

Allison Nixon, a researcher with internet-security firm Flashpoint, said the attackers have "refined really, really clever ways of hurting people over the internet."

Today, there is a vibrant underground marketplace of so-called booter or stresser services that allow anyone to attack a computer on the internet. One service, NetStress.org, sells packages for as little as $6.99 that let purchasers launch denial-of-service attacks for 30 days.

Law-enforcement agencies are trying to keep up. On Sept. 8, Israeli police arrested two 18-year-olds, Itay Huri and Yarden Bidani, on suspicion of operating a company called vDOS that sold denial-of- service attacks and earned the pair more than $600,000 over the past two years, according to lawyers for the two teenagers.

Messrs. Bidani and Huri became friends about four years ago after meeting on an internet-game website, the lawyers said. They began operating vDOS when they were about 14, the lawyers said.

VDOS marketed its product as a way for companies to check the security of their own websites by launching denial-of-service attacks against themselves, the lawyers said. Lawyers for Messrs. Bidani and Huri said it wasn't their clients' fault if customers used the product irresponsibly.

They were placed under house arrest on Sept. 9, but were released 10 days later after a judge deemed that the police had insufficient evidence to charge them, the lawyers said. Israel's police force referred questions to the Ministry of Justice, which declined to comment on the arrests.

In the U.S., the Federal Bureau of Investigation last month charged two 19-year-olds, Zachary Buchta of Fallston, Md., and Bradley Van Rooy of the Netherlands, with conspiring to damage computers in four attacks in 2015 as part of the Lizard Squad group.

An attorney for Mr. Buchta didn't respond to requests for comment. An attorney for Mr. Van Rooy couldn't be reached.

Washington Free Beacon
Russian Hacks Bring U.S. Vulnerabilities to the Forefront
Monday, 24 October 2016
Byline: Morgan Chalfant

Washington - The reliance of the United States' critical infrastructure on high technology renders it vulnerable to future cyber attacks by the Russians, making it difficult for the U.S. government to retaliate against Moscow for trying to interfere with the presidential election.
The U.S. intelligence community formally accused Russia earlier this month of hacking into American political organizations, including the Democratic National Committee, in order to influence the 2016 election.

But experts warn that the United States should be wary of starting a "tit-for- tat" cyber war with the Russians, given that the U.S. economy and other critical systems are more dependent on advanced technology and therefore more vulnerable to attack.

"Though we have overwhelming power in this policy area, we are also the most vulnerable nation in terms of the very advancement of the Internet as a part of our society and as a part of our economy," Claude Barfield, a scholar at the American Enterprise Institute with expertise in international trade and cyber security, told a small audience in Washington, D.C., on Friday.

"We are afraid in terms of retaliating against the Russians that we will not be able to have what is called 'escalation dominance,'" Barfield continued. "In other words, you start a tit-for-tat. If the Russians came back at us, and if we went back at them, our economy and society are more vulnerable than the Russians, and the Russians know that."

The issue came to the forefront at a panel discussion on Chinese cyber attacks hosted last week in the nation's capital by the Victims of Communism Memorial Foundation. Moscow and Beijing are both highly capable and advancing in the cyber realm and have hacked into systems used by American companies and organizations, including the government.

"Picture it this way," said Fred Kaplan, author of Dark Territory, a book that explores the history of cyber warfare. "We have much more powerful and agile rocks, but we also live in a house that's made of much more glass, so that even countries with smaller rocks can do more damage to us."

The critical infrastructure of the United States--including its banking and financial systems, transportation, and energy infrastructure--relies on high computer technology networks vulnerable to hacking, Kaplan noted.

"Our entire society is built on this, our economy, our military, everything," Kaplan explained. "One reason why our leaders are a little reluctant to get into the equivalent of a limited nuclear exchange with cyber weapons is that we are really more vulnerable than other countries which are not quite hooked up."

The Department of Homeland Security and the Office of the Director of National Intelligence said on Oct. 7 that the Russian government directed the DNC hack and other compromises of emails used by U.S. citizens and institutions. Representatives of the Russian government, meanwhile, have called the allegations groundless.

The White House has pledged to retaliate against Russia for the hacks with a "proportional response," though it remains unclear what such a response might look like.

"The president has talked before about the significant capabilities that the U.S. government has to both defend our systems in the United States but also carry out offensive operations in other countries," White House Press Secretary Josh Earnest told reporters on Oct. 11. "So there are a range of responses that are available to the president and he will consider a response that is proportional."

Both Russia and China have emerged as strong cyber powers that pose threats to the United States. Russian hackers are believed to be responsible for cyber attacks against the United States that infiltrated computer networks used by the White House, State Department, and Pentagon, as well as hacks of private U.S. entities in recent years.

Evidence also suggests that Russia targeted Ukraine's power grid in December 2015, a cyber attack that caused widespread outages.

"We see a lot of organized criminal behavior coming out of Russia in the cyber realm. But they also have nation- state capabilities. They are probably, next to the United States, the most powerful cyber offensive capability," Rep. Michael McCaul (R., Texas), chairman of the House Committee on Homeland Security, told the Washington Free Beacon in September before Russia was formally implicated in the DNC hacks.

"We see them shut down countries like Estonia, they shut down power in Ukraine. They have meddled in elections in the past. Without getting into all the details, attempts have been made by the Russians in that regard," he said.

China has regularly hacked U.S. companies, and Chinese hackers were responsible for the massive Office of Personnel Management data breach that exposed personal information of 22 million Americans in 2014.

Such attacks have persisted despite cyber pacts between these nations and the United States meant to curb hacking attempts.

The alleged Russian hacks resulted in thousands of embarrassing correspondences between DNC staffers being leaked by WikiLeaks days before the committee's convention in July. WikiLeaks, which has more recently been publishing hacked emails sent and received by John Podesta, Democratic nominee Hillary Clinton's campaign chairman, has denied having connections to Moscow.

Russia's cyber campaign has aggravated an already tumultuous election cycle and fueled speculation about whether the Kremlin is trying to aid Republican nominee Donald Trump, who has made positive statements about Russian President Vladimir Putin. Clinton has referred to the cyber attacks when undermining her opponent as a "puppet" of Russia.

The allegations also further heightened tensions between Washington and Moscow that have run high over the conflict in Syria and Russia's illegal annexation of Ukraine's Crimean Peninsula more than two years ago.

USA Today

Divisive election sparks 'massive rise' in hateful tweets ; Trump's inflammatory rhetoric fanning flames of anti-Semitism, racism on Twitter, observers say (Canada)
Monday, 24 October 2016
Byline: Jessica Guynn

Washington - On Sunday night, Hadas Gold, a Politico media writer, began receiving threats on Twitter. One image superimposed a yellow star of David on her shirt and a bloody bullet hole in her forehead. Another Photoshopped her face on a corpse in a concentration camp oven. The message: "Don't mess with our boy Trump, or you will be first in line for the camp."

Gold, whose grandmother fled Poland with her family weeks before Jews from their neighborhood were deported to concentration camps and whose grandfather lost about half of his extended family in the Holocaust, notified Twitter, which moved quickly to suspend the accounts.

Gold says these incidents have become increasingly common "the more we wrote about Trump, and the more we wrote about his rhetoric."

A report this week from The Anti-Defamation League documented the rise in anti-Semitic tweets targeting journalists who cover the Republican presidential candidate. From August 2015 to July 2016, the ADL found 2.6 million tweets with anti-Semitic language. Of those, nearly 20,000 tweets were directed at 50,000 journalists in the U.S., with more than two-thirds of the tweets sent by 1,600 Twitter accounts. Words that appear frequently in the profiles of these Twitter accounts: Trump, nationalist, conservative, white.

"The report is representative of the bigotry and hatred that we are seeing play out on a broader scale," said Oren Segal, director of ADL's Center on Extremism and an author of the report.

During this turbulent election season that has fanned the flames of racism, xenophobia, sexism and bigotry, hate speech that typically resides in the dark recesses of the Internet has bubbled into the mainstream and onto Twitter, a popular online hangout for journalists and politicians such as Trump, who has millions of followers there.

Because people don't have to use their real names on the service, they can attack people of color, women, Muslims and other groups with very little risk.

"This is only a fraction of what's happening online right now as a result of the legitimacy (that) various extremist ideologies have been given in this campaign season," said Ryan Lenz, editor of the Southern Poverty Law Center's Hatewatch blog. "We have seen a massive rise of hate speech."

Trump campaign spokeswoman Hope Hicks says the campaign has "no knowledge of this activity" and strongly condemns "any commentary that is anti-Semitic."

"We totally disavow hateful rhetoric online or otherwise," Hicks wrote in an emailed statement.

Conversations that take place on Twitter, famous for its 140- character limit, tap into the nation's pulse, be it the protests on the streets of Ferguson, Mo., the congressional sit-in over gun control or the launch of Beyonce's Lemonade album. But more and more, people venturing onto the service to catch up on news or with friends are confronted with hatred and bigotry spewed by the fringes of society, Segal says.

"When there is such a volume, we have to ask ourselves what can we do? What can the Internet service providers do? What can vast segments of society do? So that we hold people accountable and create safe spaces online the way we expect those spaces to be in the real world," he said.

For years, Twitter has faced sharp criticism for not aggressively enough policing abuse and harassment on its service. Twitter says its rules "prohibit inciting or engaging in the targeted abuse or harassment of others."

Yet, if anything, abuse has increased. In one of the highest- profile incidents, Leslie Jones, who starred in the remake of the Ghostbusters movie, temporarily left Twitter after being targeted by racist trolls who compared her to primates including Harambe, the gorilla shot dead in May at the Cincinnati zoo.

"Ok I have been called Apes," she wrote on Twitter at the time, "even got a pic with semen on my face. I'm tryin to figure out what human means. I'm out."

Trump's inflammatory rhetoric and policy positions such as banning Muslims from entering the U.S. "have really mainstreamed Islamophobia in our nation," said Ibrahim Hooper, communications director for the Council on American-Islamic Relations.

"He's given permission to all those who held anti-Muslim views or might have formed anti-Muslim views recently to go public with them quite proudly. Whereas before maybe they would have been reluctant to be so open about their bigotry, now you have a major American public figure saying that's perfectly OK. In fact, it's somehow patriotic," Hooper said.

Trump supporters have taken to Twitter and Facebook with hateful messages, saying in effect: "'Wait until Donald Trump gets into office and all of you will be gone. You will be in jail. Islam will be banned," he said.

Irfan Chaudhry, a criminology instructor at MacEwan University in Edmonton, Canada, who has researched racism on Twitter, says these disturbing attacks that tend to be spurred by election-season politics have been happening on Twitter for years, just never at this volume.

"During the last election, a lot of people were still trying to get a handle on what social media is," Chaudhry said. "Now they know what it is, and now we are able to utilize it in more data-driven and analytical ways that give us these insights we weren't aware of before."

Observers say the targeting of specific groups of people by hate speech, particularly Jewish journalists, has dramatically intensified during the Trump campaign.

The anti-Semitic hate speech is coordinated in a way it has not been against any other group, said Sophie Bjork-James, a post- doctoral fellow in the anthropology department at Vanderbilt University. "While various groups have been targeted with hate speech on Twitter during this election, I don't think anything compares to what Jewish journalists are going through," Bjork-James said. "Many white nationalists have been inspired by the Trump campaign to increase their involvement, and a central part of this ideology is anti-Semitism."

Washington Free Beacon
Military Warns Chinese Computer Gear Poses Cyber Spy Threat (Canada)
Monday, 24 October 2016
Byline: Bil Gertz

Washington - The Pentagon's Joint Staff recently warned against using equipment made by China's Lenovo computer manufacturer amid concerns about cyber spying against Pentagon networks, according to defense officials.
A recent internal report produced by the J-2 intelligence directorate stated that cyber security officials are concerned that Lenovo computers and handheld devices could introduce compromised hardware into the Defense Department supply chain, posing cyber espionage risks, said officials familiar with the report. The "supply chain" is how the Pentagon refers to its global network of suppliers that provide key components for weapons and other military systems.

The J-2 report was sent Sept. 28, and also contained a warning that Lenovo was seeking to purchase American information technology companies in a bid to gain access to classified Pentagon and military information networks.

The report warned that use of Lenovo products could facilitate cyber intelligence-gathering against both classified and unclassified--but still sensitive--U.S. military networks.

One official said Lenovo equipment in the past was detected "beaconing"--covertly communicating with remote users in the course of cyber intelligence-gathering.

"There is no way that that company or any Chinese company should be doing business in the United States after all the recent hacking incidents," the official said.

About 27 percent of Lenovo Group Ltd. is owned by the Chinese Academy of Science, a government research institute. In April, a Chinese Academy of Sciences space imagery expert, Zhou Zhixin, was named to a senior post in the Chinese military's new Strategic Support Force, a unit in charge of space, cyber, and electronic warfare.

China has been linked by the National Security Agency to large- scale cyber spying against both the Pentagon and American and foreign defense contractors.

Joint Staff spokesman Capt. Greg Hicks declined to comment on the J-2 report but said the military is wary of foreign nations' cyber spying.

"Although we are concerned any time another nation or individual attempts to initiate intelligence collection against the Department of Defense, we do not discuss internal assessments," Hicks said.

Lenovo spokesman Ray Gorman said he was unaware of the Joint Staff concerns.

On company efforts to acquire American information technology firms, Gorman said "we have stated many times that we continue to look worldwide for opportunities that make sense for our customers and shareholders, add value to our product portfolio, and help keep us on track for continued profitable growth." He declined to comment on specific acquisition talks.

A Pentagon spokesman said the Defense Department has not imposed a "blanket ban" on all Lenovo products and does not blacklist suppliers or individual products.

Pentagon policy for protecting mission critical functions in securing computer systems and networks "requires the department to perform supply chain risk management functions when acquiring products for use in its national security systems," the spokesman said, adding that the analysis is done on a case-by-case basis.

Rep. Robert Pittenger who has investigated Chinese cyber risks in the past, said he is concerned by the Joint Staff report.

"Chinese cyber security and supply chain concerns remain a significant problem for both the Defense Department and the remainder of the federal government," Pittenger (R., N.C.) told the Washington Free Beacon.

Pittenger said it is important for Congress to press Pentagon acquisition officials "to act swiftly on perceived cyber- threats and remove IT vendors from our supply chain if evidence exists suggesting a security vulnerability."

"I would be very disappointed to learn, however, if the Defense Department or the Air Force sought to obfuscate the facts regarding contracts with Lenovo when this issue was brought to my attention back in April," he added.

On Friday the chairman of the House Judiciary Committee wrote to the FBI warning that secrets stored on former secretary of state Hillary Clinton's private email server may have been compromised by a Clinton aide's use of a Lenovo computer.

Rep. Bob Goodlatte (R., Va.) stated in a letter to FBI Director James Comey that Heather Samuelson, former White House liaison to the State Department, used two Lenovo laptops to sort some of the thousands of classified emails from Clinton's server.

"Lenovo computers, and specifically the models used by Heather Samuelson for reviewing classified emails, have been shown by the Department of Homeland Security (DHS) to contain software, dating back to 2010, that permits remote hacking attacks," Goodlatte stated.

Disclosure of the Joint Staff warning comes after a similar warning from the Air Force Cyber Command in April.

An email notice stated that "per AF Cyber Command direction, Lenovo products are being removed from the Approved Products List and should not be purchased for DoD use."

"Lenovo products currently in use will be removed form the network," the email stated.

The Air Force later sought to play down the warning in the email and a spokesman told reporters the email was "coordinated" and should not have been sent.

Lenovo equipment has been a major cyber espionage worry since the company first purchased IBM's laptop computer business in 2005.

A congressional China commission report produced several years ago revealed that the Army Cyber Directorate in 2007 investigated a Lenovo-brand desktop computer that was engaged in "beaconing activity." The report said the beacon was a "self-initiating attempt to establish a connection to a suspicious foreign entity."

Rep. Mike Pompeo, a member of the House Permanent Select Committee on Intelligence, said the risks posed by Lenovo technology are serious.

"It is critical that the U.S. government, particularly the Pentagon, use the most secure technology available," Pompeo (R., Kan.) said.

"The threat from cyber attacks is real and demonstrated, as seen by China's hack of the Office of Personnel Management, which impacted millions of Americans," he added. "The U.S. must take all reasonable steps to ensure we are not an easy target for our enemies, competitors, or even partners."

Larry Wortzel, a former military intelligence official and member of the congressional U.S.- China Economic and Security Review Commission, said he helped alert security officials to a plan by the State Department to purchase 900 Lenovo computers in 2006. The computers would have been used to handle classified information and the State Department canceled the sale over cyber spying concerns.

"The Chinese government has a major stake in Lenovo," Wortzel said in an email.

"China remains one of the main threats to U.S. government and corporate information systems," Wortzel added. "One way to keep those systems safe is to ensure you are not getting system updates that may have a back door that can be opened by a Chinese intelligence service."

A National Security Agency document made public by renegade contractor Edward Snowden revealed that China has stolen sensitive military technology through cyber attacks, including radar designs, engine schematics, and other data through a program code-named Byzantine Hades. The program caused "serious damage to DoD interests," according to a briefing slide.

NSA detected more than 30,000 cyber attacks, including more than 500 significant intrusions into Pentagon systems. The attacks broke into at least 1,600 network computers and caused more than $100 million in damage.

Data stolen included Pacific Command aerial tanker refueling schedules, Transportation Command logistics information, and Navy nuclear submarine and anti-aircraft missile designs.

In 2014, Lenovo purchased IBM's BladeCenter line of computer servers for $2.1 billion. The sale prompted the Navy to replace the upgraded IBM servers within Aegis battle management systems deployed on guided missile destroyers and cruisers over concerns China could hack the Navy's most advanced warships through the server.

Specifically, the equipment being replaced is IBM's x86 BladeCenter HT server, a part of the Aegis Technical Insertion, or "TI," 12.

The upgrades, first reported last year by USNI News, involve TI-12 hardware upgrades, and the Advanced Capability Build, or "ACB," 12 software upgrades. The components make up the Aegis Baseline 9 combat system upgrade, which combines ballistic missile defense and anti-air warfare upgrades for the warships.

According to the Department of Homeland Security, Lenovo computers since September 2014 were loaded with adware called Superfish that could allow hackers to spoof encrypted security controls in

what are called "man-in-the-middle" cyber attacks. The attacks allow hackers to take over secure web browsers.

Lenovo purchased Motorola Mobility, the company's cell phone division in 2014, and has sought to buy the Canadian cell phone maker BlackBerry in the past.

Lenovo in the past has denied its products are engaged in cyber espionage. "Lenovo has been a trusted supplier of information technology in the U.S. since 2005 when it bought the IBM ThinkPad PC business," the company said in a statement. "Every single company selling technology to the U.S. government--including HP, Dell, Cisco, Apple, and Lenovo--use foreign components in their products. So it's critical that the U.S. continue to follow a standards- based process that allows for procurement of technology that is both cutting edge and totally secure."

U.S. intelligence agencies in August 2015 warned that Lenovo, along with another Chinese-government-linked firm, Huawei Technologies, had shipped some 80,000 computers to several nations in the Caribbean. The computers were found to contain spyware that can permit remote intrusions.

The cyber spying concerns are not limited to the Pentagon.

The Australian Financial Review newspaper reported in 2013 that all of the "Five Eyes" intelligence services--those in the United States, Britain, Australia, Canadian, and New Zealand--strictly prohibit the use of Lenovo computers over concerns about the potential for cyber espionage.

Yonhap English News
N.K. resumes encrypted numbers broadcast after 9-day break
Sunday, 23 October 2016

Seoul - North Korea's state radio station resumed broadcasting mysterious numbers Sunday after a nine-day break that could be some kind of coded message to its agents operating in South Korea.
An announcer at Radio Pyongyang, started reading a series of messages shortly after midnight (Seoul time), calling out a series of numbers.

The announcer said she is "giving review work in metal engineering to No. 21 expedition agents." The content was the same as those transmitted in the early hours of Oct. 9.

Since June 24, North Korea has sent out a total of 10 encrypted numbers broadcasts, with three being broadcast this month alone.

Broadcasts of mysterious numbers are a kind of book cipher that was often used by North Korea to give missions to spies operating in South Korea during the Cold War era. Spies could decode numbers to get orders by using a reference book, although many intelligence officials believe this form of sending

orders to be totally outdated. Many have said the broadcast may be some sort of deception strategy aimed at sparking confusion within South Korea.

Pyongyang had initially suspended such broadcasts in 2000, when the two Koreas held their first historic summit.

Tensions are already running high on the divided peninsula after North Korea carried out its fifth nuclear test on Sept. 9 and the unsuccessful launching of two Musudan intermediate-range ballistic missile in recent weeks.

Hackers smell blood after co-opting 'internet of things'
Sunday, 23 October 2016
Byline: Mark Hookham

London - An army of copycat hackers could seize control of internetconnected home devices to carry out cyber-attacks, security experts have warned.
Web-connected "smart" gadgets including cameras, digital TV recorders, smart kettles and plugs are all vulnerable to being hacked by criminals and used remotely to mount cyber-attacks, according to James Lyne, head of security at Sophos, a security firm.

The warning follows one of the largest cyber-attacks involving home internet devices, which disrupted a number of popular websites on Friday, including Twitter, Spotify and Reddit. Airbnb, PayPal, Netflix, Yelp and some businesses hosted by Amazon were also affected.

The hack has raised questions about the security of the so-called internet of things -- networks of devices, ranging from central heating thermostats to fridges, baby monitors and home lighting, that connect online and can be controlled remotely by their owners from phones or tablets.

"Cyber-criminals have smelt the blood in the water and the sharks are circling," Lyne said. "We are going to be seeing a hell of a lot more of this in the next little while."

Security analysts believe the hackers responsible for last week's attack had used a malicious code to infect almost 500,000 devices, including digital video recorders and CCTV cameras.

Many of the devices involved were believed to be in the US, Brazil and Colombia and were made by Chinese manufacturers with easy-to-guess usernames and passwords.

The hackers used this so-called zombie or botnet army of hacked devices to launch a form of mass attack called a "distributed denial of service" (DDoS), in which a website is bombarded by messages sent by the hacked devices.

The target was a US company called Dyn that acts as a "switchboard" for internet traffic, helping direct users to some of the world's most popular websites.

The attack came hours after Doug Madory, a researcher at Dyn, presented a talk in Texas on cyber-criminals. Such DDoS attacks are favoured by cyber-attackers trying to make a political point.

A tweet from WikiLeaks, which has released thousands of emails hacked from the account of Hillary Clinton's campaign chairman, suggested that its supporters were behind the attack. "We ask supporters to stop taking down the US internet," the tweet said. "You proved your point."

Members of a shadowy collective called New World Hackers also claimed responsibility but US officials and cyber-security experts have yet to pinpoint the source.

The code -- or malware -- that infected the devices is known as "Mirai" and was last month used to launch a similar assault against the website of Brian Krebs, a US security blogger.

Krebs said: "Mirai scours the web for IoT [internet of things] devices protected by little more than factory-default usernames and passwords and then enlists the devices in attacks that hurl junk traffic at an online target until it can no longer accommodate legitimate visitors or users."

At the beginning of this month, the hacker responsible for Mirai released its source code online, in effect letting anyone build their own attack army. Earlier this month the government's newly formed National Cyber Security Centre (NCSC), part of the GCHQ spy agency, warned that "less technically capable" hackers were now able to use the code and "quickly start building" their own network of colonised devices.

In a blog posted before last week's attack, the NCSC highlighted how Mirai had been programmed to guess 68 different username and password combinations.

Lyne said there was a "morass" of "mid-tier cybercriminals" who were prepared to exploit the new malware to launch online fraud or steal data. "Any time source code like this is released it gives inspiration, ideas and ease of access to that larger community of cyber-criminals."

He said he had been shocked to discover how poorly protected internet-enabled household devices were from being hacked. He recently examined 12 web-connected CCTV cameras and found that they could all be hacked and accessed remotely.

Multimillionaire Russian hacker hits the skids as FBI pounces, page 22

The ghost in the machine

1 Hackers use a malware code to infect vulnerable internet-connected home devices

2 The code creates a 'zombie army' of hundreds of thousands of hacked devices such as digital TV recorders and CCTV cameras

3 The devices are then instructed to attack websites by bombarding them with thousands of junk messages that knock them offline

Taliban Using? Camera Drones In Helmand
Sunday, 23 October 2016
Byline: Faridullah Hussainkhail

Kabul - The Taliban has released a video of drone footage taken of the Nawa district in Helmand, which is under their control, the Helmand media office said in a statement.
According to the statement the Taliban have received the drones from outside intelligence agencies and are using these for operational purposes.?

In June 2016 the National Unity Government (NUG) banned the use of camera drones in Afghanistan due to security issues.

This move was however met with mixed reaction.

"With consideration of certain security issues and for the sake of national interests, the national security council has decided that drone cameras will no longer be allowed to be used in Afghanistan, the government of Afghanistan has major respect for media activities and because of this it has taken the decision," a spokesman to CEO Jawed Faisal said at the time.

But Afghan media companies and journalists slammed government's move to ban the use of camera drones during media coverage of events in the country, terming the move a violation of the mass media law.

They also said it is an attempt to restrict media activities.

Daesh militants have however used the hi-tech devices to film their own rocket attacks for propaganda videos in Iraq.

Digital doors should be secure
Saturday, 22 October 2016

Editorial: In the legislative building and in other government offices, security officials go around after business hours to make sure everything is locked and secure. In the business of running the government, it would be unthinkable to leave doors ajar and filing cabinets open.
That same diligence has not always been applied to government-owned electronic devices that store and allow access to a wide array of sensitive information. As the provincial government rolls out its strategy concerning mobile devices, it should seek ways to keep up with technological change, rather than playing catch-up.

Two independent watchdogs released companion reports Tuesday saying there's a risk that government information could fall into the wrong hands because of slack security measures regarding tablets, smartphones and other mobile equipment.

Government safeguards have failed to keep pace with rapid advances in technology, say auditor general Carol Bellringer and acting information and privacy commissioner Drew McArthur.

The two watchdogs audited five ministries and the office of the chief information officer. These are some of their findings:

No central record is kept of mobile devices with access to government information. "You can't protect what you don't know about," said Bellringer.

The choice of installing anti-malware software or activating security features on phones is often left to employees, and it doesn't always happen.

Policies are often overlapping and confusing.

Employees sometimes took months to report a lost or stolen device.

Staff training did not cover mobile devices.

The watchdogs made several recommendations, and Technology Minister Amrik Virk said the government is already implementing measures to fix the problems identified by Bellringer and McArthur.

Those measures include maintaining detailed inventories of all mobile devices, ensuring additional security settings are applied before a device goes into service, enforcing a maximum inactivity-until-locked time, and installing and maintaining anti-malware software.

It would seem such measures would be a given, but smartphones and tablets have become so much part of life, it's easy to take them for granted, to overlook the power they have to find, store and disseminate information. We value how easy they are to use and how much they can do for us.

But those strengths are weaknesses, if the devices fall into the wrong hands. Complacency can be dangerous.

It's comforting know the government is taking the right steps, but it's a little disturbing that it is acting only now. It is common knowledge that bad things can happen when a tablet or smartphone is misplaced or stolen.

An individual's life can be seriously disrupted, as many people have learned, if someone gains access to personal data stored on or connected to a smartphone. If the device is used in government business, the potential for damage is exponentially greater.

For most people, not keeping pace with technological change can be inconvenient. For government, it is dangerous.

New York Times
New Weapons Used in Attack on the Internet
Saturday, 22 October 2016
Byline: Nicole Perlroth

San Francisco - Major websites were inaccessible to people across wide swaths of the United States on Friday after a company that manages crucial parts of the internet's infrastructure said it was under attack.
Users reported sporadic problems reaching several websites, including Twitter, Netflix, Spotify, Airbnb, Reddit, Etsy, SoundCloud and The New York Times.

The company, Dyn, whose servers monitor and reroute internet traffic, said it began experiencing what security experts called a distributed denial-of-service attack just after 7 a.m. Reports that many sites were inaccessible started on the East Coast, but spread westward in three waves as the day wore on and into the evening.

And in a troubling development, the attack appears to have relied on hundreds of thousands of internet-connected devices like cameras, baby monitors and home routers that have been infected -- without their owners' knowledge -- with software that allows hackers to command them to flood a target with overwhelming traffic.

A spokeswoman said the Federal Bureau of Investigation and the Department of Homeland Security were looking into the incident and all potential causes, including criminal activity and a nation-state attack.

Kyle York, Dyn's chief strategist, said his company and others that host the core parts of the internet's infrastructure were targets for a growing number of more powerful attacks.

"The number and types of attacks, the duration of attacks and the complexity of these attacks are all on the rise," Mr. York said.

Security researchers have long warned that the increasing number of devices being hooked up to the internet, the so-called Internet of Things, would present an enormous security issue. And the assault on Friday, security researchers say, is only a glimpse of how those devices can be used for online attacks.

Dyn, based in Manchester, N.H., said it had fended off the assault by 9:30 a.m. But by 11:52 a.m., Dyn said it was again under attack. After fending off the second wave of attacks, Dyn said at 5 p.m. that it was again facing a flood of traffic.

A global event is affecting an upstream DNS provider. GitHub services may be intermittently available at this time. -- GitHub Status (@githubstatus) October 21, 2016

A distributed denial-of-service attack, or DDoS, occurs when hackers flood the servers that run a target's site with internet traffic until it stumbles or collapses under the load. Such attacks are common, but there is evidence that they are becoming more powerful, more sophisticated and increasingly aimed at core internet infrastructure providers.

Going after companies like Dyn can cause far more damage than aiming at a single website.

Dyn is one of many outfits that host the Domain Name System, or DNS, which functions as a switchboard for the internet. The DNS translates user-friendly web addresses like fbi.gov into numerical addresses that allow computers to speak to one another. Without the DNS servers operated by internet service providers, the internet could not operate.

In this case, the attack was aimed at the Dyn infrastructure that supports internet connections. While the attack did not affect the websites themselves, it blocked or slowed users trying to gain access to those sites.

Anyone else having a whole lot of trouble with sites loading properly this morning? Paypal is down, Twitter was down, Netflix half loading. -- Emmy Caitlin (@emmycaitlin) October 21, 2016

Mr. York, the Dyn strategist, said in an interview during a lull in the attacks that the assaults on its servers were complex.

"This was not your everyday DDoS attack," Mr. York said. "The nature and source of the attack is still under investigation."

Later in the day, Dave Allen, the general counsel at Dyn, said tens of millions of internet addresses, or so- called I.P. addresses, were being used to send a fire hose of internet traffic at the company's servers. He confirmed that a large portion of that traffic was coming from internet-connected devices that had been co-opted by type of malware, called Mirai.

Dale Drew, chief security officer at Level 3, an internet service provider, found evidence that roughly 10 percent of all devices co-opted by Mirai were being used to attack Dyn's servers. Just one week ago, Level 3 found that 493,000 devices had been infected with Mirai malware, nearly double the number infected last month.

Mr. Allen added that Dyn was collaborating with law enforcement and other internet service providers to deal with the attacks.

In a recent report, Verisign, a registrar for many internet sites that has a unique perspective into this type of attack activity, reported a 75 percent increase in such attacks from April through June of this year, compared with the same period last year.

The attacks were not only more frequent, they were bigger and more sophisticated. The typical attack more than doubled in size. What is more, the attackers were simultaneously using different methods to attack the company's servers, making them harder to stop.

The most frequent targets were businesses that provide internet infrastructure services like Dyn.

"DNS has often been neglected in terms of its security and availability," Richard Meeus, vice president for technology at Nsfocus, a network security firm, wrote in an email. "It is treated as if it will always be there in the same way that water comes out of the tap."

Last month, Bruce Schneier, a security expert and blogger, wrote on the Lawfare blog that someone had been probing the defenses of companies that run crucial pieces of the internet.

"These probes take the form of precisely calibrated attacks designed to determine exactly how well the companies can defend themselves, and what would be required to take them down," Mr. Schneier wrote. "We don't know who is doing this, but it feels like a large nation-state. China and Russia would be my first guesses."

It is too early to determine who was behind Friday's attacks, but it is this type of attack that has election officials concerned. They are worried that an attack could keep citizens from submitting votes.

Thirty-one states and the District of Columbia allow internet voting for overseas military and civilians. Alaska allows any Alaskan citizen to do so. Barbara Simons, the co-author of the book "Broken Ballots: Will Your Vote Count?" and a member of the board of advisers to the Election Assistance Commission,

the federal body that oversees voting technology standards, said she had been losing sleep over just this prospect.

"A DDoS attack could certainly impact these votes and make a big difference in swing states," Dr. Simons said on Friday. "This is a strong argument for why we should not allow voters to send their voted ballots over the internet."

This month the director of national intelligence, James Clapper, and the Department of Homeland Security accused Russia of hacking the Democratic National Committee, apparently in an effort to affect the presidential election. There has been speculation about whether President Obama has ordered the National Security Agency to conduct a retaliatory attack and the potential backlash this might cause from Russia.

Gillian M. Christensen, deputy press secretary for the Department of Homeland Security, said the agency was investigating "all potential causes" of the attack.

Vice President Joseph R. Biden Jr. said on the NBC News program "Meet the Press" this month that the United States was prepared to respond to Russia's election attacks in kind. "We're sending a message," Mr. Biden said. "We have the capacity to do it."

But technology providers in the United States could suffer blowback. As Dyn fell under recurring attacks on Friday, Mr. York, the chief strategist, said such assaults were the reason so many companies are pushing at least parts of their infrastructure to cloud computing networks, to decentralize their systems and make them harder to attack.

"It's a total wild, wild west out there," Mr. York said.

Le Soleil
Le monde à la merci des hackers?
Saturday, 22 October 2016
Byline: Jean-François Cliché

Ottawa - Mine de rien, il y a pas mal de pirates informatiques qui ont ajouté de très, très gros trophées de chasse à leur collection récemment...
Les courriels de Hillary Clinton. Ceux du directeur de la CIA, John Brennan, l'an dernier. Cet été, un serveur du Comité national du Parti démocrate a été complètement éventé. Il y a deux semaines, ce fut au tour du directeur de campagne de Mme Clinton, John Podesta, de voir sa correspondance électronique atterrir sur le site WikiLeaks. Quand on pense aux secrets d'État que des gens si hauts placés peuvent échanger, la liste a quelque chose de totalement irréel.

Mais comment cela est-il possible? Comment l'entourage immédiat d'une potentielle présidente des États-Unis et le patron de l'espionnage américain peuvent-ils être à ce point vulnérables? Sont-ils mal conseillés, négligents, ou les pirates sont-ils tout simplement impossibles à arrêter?

Il y a sans doute un peu des deux, disent tous les experts auxquels Le Soleil a soumis la question. «La plus grande vulnérabilité de tout système d'information, c'est toujours le facteur humain, que ce soit accidentel ou volontaire», dit Marc-André Léger, qui enseigne la sécurité informatique à l'Université de Sherbrooke.

Ainsi, il a été démontré que Mme Clinton avait utilisé un compte personnel et un serveur privé et fort mal sécurisé à sa résidence lorsqu'elle était secrétaire d'État afin d'envoyer ses courriels, dont certains contenaient des documents sensibles. Les règles du gouvernement stipulent pourtant que seuls des serveurs gouvernementaux et dûment sécurisés peuvent être utilisés. Mais il a aussi été révélé en début d'année que beaucoup de hauts placés américains, tant dans le gouvernement Obama que dans l'administration républicaine précédente, ont des comportements semblables.

Mais il n'y a pas que des erreurs humaines dans ces histoires de piratage, poursuit M. Léger, «un ordinateur impossible à hacker, ça n'existe pas. [...] Tout ordinateur branché à Internet peut être piraté. C'est une question de mettre l'énergie et le temps qu'il faut pour entrer dans le système».

En conjuguant technique et faiblesse humaine, les «trous» potentiels qu'un pirate peut exploiter sont pratiquement innombrables, dit-il. Même aux plus hauts niveaux du pouvoir.

Comme de la magie

«C'est comme les tours d'un magicien : quand on les voit, c'est très impressionnant, puis quand on comprend le truc, on se dit : "Ah, c'était juste ça." C'est pareil quand on fait le post-mortem [d'une intrusion informatique] et qu'on regarde les brèches. C'est rarement très compliqué. Habituellement, c'est au contraire quelque chose de vraiment simple, et on se dit après coup : "Wow, c'était vraiment stupide"», explique Éric Parent, qui possède la boîte de sécurité informatique LogicNet et qui donne des cours dans ce domaine à l'École polytechnique de Montréal.

Les brèches peuvent être de toutes les sortes. «En théorie, c'est vrai que ça prend un mot de passe pour avoir accès à un serveur. Mais en pratique, ça dépend. Peut-être que le mot de passe de l'administrateur est très facile à deviner, on peut utiliser un outil qui va, par exemple, essayer tous les mots du dictionnaire et éventuellement le trouver», dit M. Léger.

Et s'il est vrai que beaucoup de machines bloquent l'accès à un ordinateur après trois essais ratés, un pirate organisé et déterminé peut avoir déjà pris le contrôle de milliers d'ordinateurs personnels et les faire essayer chacun trois clés différentes, signale Patrick Mathieu, consultant en sécurité informatique et organisateur du HackFest, gros congrès (et concours) sur le piratage qui a lieu à Québec chaque année.

«Écouter» le Wi-Fi

En outre, la multiplication des instruments Wi-Fi a ouvert de nouvelles portes pour les pirates parce qu'ils sont très faciles à «écouter», disent nos trois experts.

«Il y a des logiciels gratuits qui sont faits pour analyser ce qui se passe sur le réseau d'une entreprise et qui vont écouter tout ce qui se "dit" dans un réseau Wi-Fi. Mais bien sûr, ça peut être utilisé de façon malicieuse», dit M. Mathieu.

Souvent, dit-il, les réseaux sans fil offerts dans les cafés et les restaurants ne sont pas sécurisés - la connexion entre le routeur et chaque client n'est pas encryptée. N'importe qui peut donc «écouter» ce que font les clients de l'endroit sur Internet, pourvu d'être sur place (le Wi- Fi ne se rend pas loin). Si l'un d'eux se sert de ce réseau pour accéder à son courriel, son mot de passe peut alors être «entendu». Et comme peu de gens ont l'habitude d'utiliser plusieurs mots de passe différents...

On ne saura sans doute jamais comment tous ces courriels de proches de Mme Clinton ont été piratés, mais cela peut être aussi «nono» qu'un resto proche de bureaux du Parti démocrate dont le sans-fil est mal sécurisé...

Et quand les failles techniques sont trop étroites ou trop longues à exploiter, les pirates peuvent toujours se rabattre sur le «facteur humain», comme dit M. Léger, que le milieu du piratage appelle pudiquement l'«ingénierie sociale». «C'est un des moyens les plus utilisés, dit M. Mathieu. Ça peut être d'envoyer des e-mails qui incitent à cliquer sur un lien [un logiciel malicieux s'installe alors et «vole» les mots de passe] ou d'autre chose. Dans les tests en entreprise que je fais, quand on ne réussit pas à trouver une faille informatique dans un temps donné, il suffit souvent d'un coup de téléphone, et le tour est joué. Ça peut être aussi simple que ça. Ça ne marche pas à toutes les fois, mais j'ai vu des tests en entreprise où on obtenait des taux de réussite de 100 % [pour obtenir des informations permettant à un pirate informatique d'entrer dans le système] sur des dizaines de personnes. Des fois, c'est juste 50 %, mais ce n'est jamais zéro, malheureusement. L'humain est fait pour faire confiance. Tu dis que tu travailles au soutien informatique et si ton histoire fait du sens dans le contexte de cette entreprise-là, généralement, la personne va te donner son mot de passe.»

Et quand on multiplie tout cela par le nombre de personnes qu'il y a dans l'entourage d'un chef d'État, ceux des ministres et les hauts fonctionnaires, on arrive à la même conclusion que M. Parent : «C'est impossible d'éliminer tous ces risques-là.» La seule chose que l'on peut faire, dit-il avec M. Mathieu, c'est d'allonger suffisamment le travail des pirates pour qu'ils choisissent d'autres victimes...

La Presse
WikiLeaks est-il à la solde du Kremlin ?
Saturday, 22 October 2016

Byline: Marc Thibodeau

Analyse: À en croire l'entourage de la candidate démocrate à l'élection présidentielle américaine, l'affaire ne fait aucun doute: WikiLeaks tente, de concert avec le Kremlin, de déstabiliser la campagne de Hillary Clinton afin de favoriser l'élection de son rival républicain, Donald Trump.
Le porte-parole de l'ex-secrétaire d'État, Brian Fallon, s'en est pris directement à l'organisation de Julian Assange la semaine dernière en tweetant qu'elle se comportait en «outil de propagande du gouvernement russe» visant à favoriser la «marionnette» de Moscou.

«Le fait de distiller des mensonges n'améliore en rien votre crédibilité», a rétorqué en ligne un responsable non identifié du compte Twitter de WikiLeaks.

Au coeur du litige figure une série de courriels publiés par WikiLeaks au cours des derniers mois. Un premier lot témoignant de comportements hostiles de la direction du Parti démocrate envers le sénateur Bernie Sanders, qui était opposé à Mme Clinton, a d'abord été dévoilé en juillet à la veille de la convention de la formation.

Des courriels tirés du compte du directeur de campagne de la femme politique, John Podesta, ont ensuite été mis en ligne progressivement sur une période de dix jours dans la période précédant le troisième débat.

Dans un avis publié le 7 octobre, le département de la Sécurité intérieure des États-Unis s'est dit «raisonnablement certain» (confident) que la Russie était «directement responsable» des cyberattaques prenant pour cible le camp démocrate. Ses responsables ont ajouté que la divulgation de courriels piratés par l'entremise de WikiLeaks et d'autres sites comme DCLeaks.com était conforme aux «méthodes et motivations» de Moscou et visait à déstabiliser l'élection américaine.

Le communiqué ne disait cependant rien de la nature exacte des liens entre Moscou et WikiLeaks, contrairement à ce que pouvaient laisser entendre les interventions du camp démocrate à ce sujet.

Collaboration

Arun Vishwanath, spécialiste de cybersécurité rattaché à l'Université de Buffalo, note qu'il est possible, en étudiant la méthode utilisée par les hackers, de déterminer avec une assurance raisonnable la provenance des attaques ciblant le camp démocrate.

L'éventualité d'une action russe n'explique pas la nature de la collaboration entre WikiLeaks et Moscou, si collaboration il y a, relève le spécialiste, qui s'étonne malgré tout de la stratégie de diffusion des courriels suivie par l'organisation.

Il apparaît clairement, dit-il, que Julian Assange cherche actuellement à «faire de la politique» en ciblant un seul des camps dans la campagne présidentielle.

«Initialement, WikiLeaks se donnait pour mandat de surveiller les gouvernements. Là, ils surveillent le comportement d'un parti plutôt que d'un autre», relève l'analyste.

«Sont- ils utilisés à leur insu, ou agissent-ils en toute connaissance de cause? Je ne le sais pas. Ce qui est clair, c'est qu'ils sont devenus une courroie de transmission pour les informations piratées de toute nature», ajoute M. Vishwanath.

Neil Sroka, porte-parole de Democracy for America, organisation qui soutient la candidate démocrate, estime que WikiLeaks se comporte manifestement comme un «agent» de la campagne de Donald Trump, quelle que soit la nature de ses liens avec la Russie.

La diffusion des courriels à des moments-clés vise à susciter un maximum de «chaos», juge M. Sroka, qui fait peu de cas de la teneur des courriels diffusés. «Ce ne sont pas les Pentagon Papers [sur l'implication des États-Unis dans la guerre du Viêtnam] dont on parle ici», estime-t-il.

Pas de préférence?

WikiLeaks fait valoir de son côté qu'elle agit de manière désintéressée et ne cherche pas à favoriser un camp ou l'autre, encore moins à favoriser les visées de Moscou. Une éditrice, Sarah Harrison, a déclaré à Bloomberg que l'organisation n'hésiterait pas un instant à diffuser des documents nuisibles à Donald Trump si elle en avait.

Julian Assange, qui a déjà animé une émission sur Russia Today, chaîne contrôlée par Moscou, ne cache pas pour autant qu'il a maille à partir avec Hillary Clinton. L'ex-secrétaire d'État, a-t-il déclaré récemment, veut le faire incriminer relativement à une importante fuite de documents diplomatiques qui avait embarrassé les États-Unis il y a quelques années.

L'activiste lui reproche par ailleurs son côté «va-t-en-guerre». «Elle ne devrait pas pouvoir s'approcher d'un armurier, encore moins d'une armée. Et elle ne devrait certainement pas pouvoir devenir présidente des États-Unis», écrivait-il en février 2016.

Le directeur de Freedom of the Press Foundation, Trevor Timm, qui recueille notamment des dons pour WikiLeaks, relève dans une chronique parue la semaine dernière que les démocrates s'indignent des fuites les concernant en les qualifiant d'«illégales» tout en encourageant celles qui ciblent Donald Trump.

Le rôle éventuel de Moscou dans les fuites mérite d'être exploré par les médias, dit-il. Mais «concocter des théories conspirationnistes de collusion Poutine-Trump-WikiLeaks et faire de grands bonds logiques sans preuve directe [...] dessert le journalisme», prévient-il.

The Daily Beast
How Surveillance Cameras Have Become an Internet Superweapon
Sunday, 23 October 2016
Byline: Robert Graham

Analysis: On Friday, hackers crashed parts of the Internet, specifically services located on the East Coast of the United States. They used an old technique known for 20 years, a "DNS DDoS."
However, instead of launching the attack from virus-infected computers as has been the norm, hackers launched the attack from small, Internet-connected devices like security cameras. This is a worrisome development--such devices offer hackers a powerful new weapon.

The "Internet-of-Things" (IoT) revolution is sweeping the Internet, adding cars, pace makers, industrial robots, toasters, and security cameras to the Internet. If you own an appliance or device that uses electricity, you can find a similar device which connects to the Internet. Through a voice-activated device such as an Amazon Echo, you can command the coffee to start brewing, the car to start warming, and the lights to turn on in the morning--all before getting out of bed. According to research group Gartner, more than 6 billion of these devices will be on the Internet by the end of 2016.

This trend comes at the cost of cybersecurity. They are cheap devices that cut corners. While they are not prone to the same attacks as your home computers (such as phishing emails), they have other common problems (like backdoor passwords). These are passwords, like "support", that vendors put secretly in their devices for various reasons. While vendors think they are clever and secretive, hackers find these passwords effortlessly. They create lists of these well-known backdoors and trade them among themselves.

Luckily, the devices installed in your home are behind your firewall, so they are secure against most hacker attacks. A firewall is a common security device that allows outbound communication with the Internet, but blocks most inbound communication. Most of the devices that connect homes to the Internet contain a firewall. However, many more are placed directly on the Internet, where hackers can easily gain control of them.

That's why in the Friday's attacks, most of the devices were security cameras rather than baby monitors. Both devices do the same thing, record video, and often have the same internal hardware and software inside. However, baby monitors are usually installed in the home, behind firewalls, which hackers cannot directly access. Security cameras are installed in remote buildings, often with dedicated Internet connection just for the camera, with no firewall protection. However, some baby monitors were placed outside the firewall.

Most assume it would be too hard to find such devices on the Internet. For example, some remote village in Mongolia might have security cameras attached to a satellite uplink. What's the chance hackers can find that?

The answer is 100%. In much the same way that you need only somebody's phone number to call them, all you need is an Internet address to connect to a device. When you dial somebody's phone number, the fact they might be located in downtown Berlin or the middle of Mongolia is irrelevant. The same is true of an Internet address. There are fewer Internet addresses than phone numbers, only about 4 billion possible combinations. It's possible to try them all in the span of a few hours.

The following picture shows me running a tool called masscan, which probes every possible Internet address. As you can see, in about 6 hours, it will have scanned the entire Internet for all IoT devices of the sort that were used on Friday. It sends a probe to each and every address on the Internet, regardless where they are physically located. If you look carefully on your home firewall, you'll see that somebody with the Internet address 209.126.230.72 has tried to contact you today. That person was me. And this is true, even if you are living in the middle of Mongolia.

Mirai scans the Internet. When it finds targets, it attempts to login using many well-known backdoor

Once Mirai finds an infects a new device, it then contacts the hacker controlling these devise. It has now become a botnet under the hacker's control. One common command is to execute a DDoS attack. This stands for Distributed Denial of Service. It comes from thousands of devices, the source distributed across all these devices. The term "denial of service" is an old computer term meaning to either crash, slow down, or otherwise "deny" people the "service" of the targeted device.

The hacker (or hackers) behind Mirai have been building their botnet for a couple months. We've seen the scans on the Internet. And on Friday morning, they commanded the machines to target a victim, a major DNS provider. DNS is the phonebook of the Internet, translating between human names and the sequence of numbers that is an Internet address. When DNS crashes, the Internet technically runs, but anybody dependent on that DNS service can no longer find things. The victim of the attack, Dyn.com, was a particularly large DNS provider, and hence, the attack had a disproportionate effect on the Internet.

The scariest part of Friday's attack is that it takes no special skill. Anybody can use masscan or Shodan to find potentially vulnerable systems. Anybody can infect those systems with Mirai and remotely control them. Some have suggested that nation states are behind this attack - but so far we've seen nothing sophisticated, nothing requiring nation state resources. All this is within the abilities of a particularly nerdy teenager working out of her mother's basement.

When people open the box for the first time, they see an innocent looking device. They connect it to their network with that impression. But the Internet doesn't see them as devices. The Internet sees them as full computers, running the latest Windows or Linux software, with large amounts of memory and computer power, attached to fast Internet links. Hackers are now exploiting this disjuncture, taking control of devices, and using them to crash the Internet, and there is nothing you can do about it.

Le Monde
Le Conseil constitutionnel dit non à la surveillance de masse sans contrôle
Saturday, 22 October 2016
Byline: Jean-Baptiste Jacquin

Paris - C'est un petit article de loi en vigueur depuis vingt-cinq ans que le Conseil constitutionnel a censuré dans une décision rendue vendredi 21 octobre. Cet article permettait tout bonnement aux services de renseignement de procéder sans le moindre contrôle à la surveillance de communications par voie hertzienne. Les gardiens de la Constitution le déclarent contraire à l'article 2 de la Déclaration des droits de l'homme et du citoyen de 1789 en portant « une atteinte manifestement disproportionnée au droit au respect de la vie privée et au secret des correspondances . Ils le déclarent inconstitutionnel et demandent au législateur d'élaborer un nouveau texte d'ici au 31 décembre 2017.
Au nom de « la défense des intérêts nationaux » , les pouvoirs publics pouvaient ainsi surveiller les déplacements de sous-marins étrangers ou les mouvements de troupes sur un théâtre d'opération, mais également des communications par téléphone mobile entre particuliers, des échanges par Wi-Fi ou Bluetooth. Rebaptisé article L. 811-5 dans la loi renseignement de juillet 2015, cet article permettait aux services de renseignement de s'affranchir des contrôles que cette loi imposait, en précisant, par exemple, que la surveillance de particuliers ne peut être autorisée par le premier ministre qu'après avis de la Commission nationale de contrôle des techniques de renseignement (CNCTR).

« Un trou législatif béant »

C'est en invoquant cette disposition particulièrement floue que Bernard Squarcini, l'ancien patron de la Direction centrale du renseignement intérieur (DCRI), avait pris la liberté de procéder à des écoutes dans l'affaire des fadettes du Monde . Lors du débat sur la loi renseignement de 2015, quelques mois après les attentats contre Charlie Hebdo et l'Hyper Cacher, personne ne semblait s'être intéressé à cet article introduit par la loi de 1991 sur le secret des correspondances. Cette dernière avait elle-même été votée après le scandale des écoutes de l'Elysée où François Mitterrand avait fait écouter des personnalités, dont le journaliste du Monde Edwy Plenel.

Le Conseil constitutionnel s'était prononcé en juillet 2015 sur la loi renseignement, en censurant d'ailleurs deux dispositions, mais n'avait validé que les articles qui lui avaient été soulignés dans les saisines du président de la République et du président du Sénat. Il ne s'était jamais saisi de ce sujet avant la question prioritaire de constitutionnalité déposée au printemps par des associations (Quadrature du Net, French Data Network, la Fédération des fournisseurs d'accès à Internet associatifs et Igwan.net). Selon leur avocat, Patrice Spinosi, il a créé « un trou législatif béant » et « ouvre la voie à un espionnage de masse » , a-t-il expliqué à l'audience du 11 octobre

L'article, très court, dit : « Les mesures prises par les pouvoirs publics pour assurer, aux seules fins de défense des intérêts nationaux, la surveillance et le contrôle des transmissions empruntant la voie hertzienne ne sont pas soumises aux dispositions du présent livre, ni à celles de la sous-section 2 de la section 3 du chapitre Ier du titre III du livre Ier du code de procédure pénale. » Dans sa décision, le

Conseil constitutionnel note que la disposition contestée permettait de fait de s'affranchir du code de procédure pénale qui encadre les écoutes ordonnées par un juge d'instruction.

Balayant les observations du gouvernement et reprenant les arguments des associations, l'institution présidée par Laurent Fabius souligne que la rédaction du texte incriminé n'interdit pas des mesures de surveillance « utilisées à des fins plus larges que la seule mise en oeuvre de » la défense des intérêts nationaux. Surtout, écrit-elle, le recours à ces mesures n'est soumis « à aucune condition de fond ni de procédure » et leur mise en oeuvre n'est encadrée « d'aucune garantie » . Aucune limite sur l'exploitation des données personnelles ni leur conservation n'était prévue...

Pour ne pas empêcher les services de renseignement de continuer à opérer des écoutes qui relèveraient réellement de la défense nationale, le Conseil n'abroge pas la loi mais encadre sérieusement son application. En attendant qu'un nouveau texte de loi soit voté, il impose deux « réserves transitoires . Les mesures de surveillance ne pourront pas s'appliquer aux écoutes soumises à autorisation par la loi renseignement, et la CNCTR devra être « régulièrement informée » des opérations mises en oeuvre. La nouvelle législature qui sortira des urnes en juin aura quelques mois pour faire le tri entre ce qui relève des surveillances susceptibles de porter atteinte à la vie privée et les autres.

N.K. committed to staging cyberwarfare against S. Korea: source
Monday, 24 October 2016
Byline: Staff reporter

Seoul -North Korea is fully committed to staging cyberwarfare against South Korea by operating special teams that conduct hacking attacks and spread false information in a bid to fuel anti-Seoul propaganda, a source said Monday.
"North Korea has been engrossed in cyberwarfare operations with its reconnaissance bureau, the ruling party's department dealing with South Korea, and an operator of propaganda websites leading such campaigns," according to the source familiar with the reclusive country.

The special teams are tasked with filing pro-Pyongyang messages on South Korean websites and spreading lies through social media, he said.

The North's move comes as North Korean leader Kim Jong-un said in August 2013 that building cyberwarfare capabilities is a powerful tool in advancing the military's ability to stage strikes.

At a meeting with ideological workers held in February 2014, Kim called for measures to make the Internet a venue for North Korea's propaganda campaign, according to Pyongyang's state media.

Experts said that the North's propaganda websites are focusing on driving a wedge among South Koreans by highlighting sensitive issues such as a mass defection by North Korean restaurant workers in China and Seoul's latest decision to install an advanced U.S. missile defense system.

North Korea has claimed that a group of 13 North Korean restaurant staff had been tricked into defecting and were kidnapped by South Korea's spy agency. Seoul rejected it, saying that they came to Seoul of their own free will.

North Korea has been long accused of waging cyberwarfare, including a hacking attack on South Korea and even against U.S. companies.

In March 2013, North Korea carried out a massive cyberattack on South Korean financial firms and TV broadcasters, causing their networks to crash.

In late 2014, the U.S. accused Pyongyang of staging cyberattacks on Sony Pictures, which released "The Interview," a fictional movie about assassinating the North's current leader.

Korea Herald
'NK operates team for online propaganda in S. Korea'
Monday, 24 October 2016

Seoul -North Korea is assessed to be operating a team to conduct cyber "psychological warfare" in South Korea by spreading rumors favorable to Pyongyang, a government source said Monday.
According to the source, the North's cyber team on South Korea mainly focuses on hacking attacks to incapacitate Seoul's infrastructure and it also distributes fake information to manipulate public opinion here.

"North Korea's organizations on the South, including the General Bureau of Reconnaissance, have been identified as operating an 'online reply team' that spreads malicious tales and groundless rumors on the internet and social network services," an official told local media.

stock image(123rf)He said North Koreans are believed to also directly post pro-Pyongyang content on the internet.

A case of one such malicious rumor, according to the source, was a claim that the mass defection of China-based North Korean restaurant workers was a result of Seoul kidnapping them. These rumors also claimed that the workers have gone on a hunger strike in protest of the Seoul government.

North Korea is believed to be operating around 60 propaganda websites.

Pundits said these rumors are an inexpensive and effective way of spreading pro-North sentiment while undermining the South Korean government. Some call for extreme measures, such as a direct crackdown on the media and people.

Lee Sang-ho, a political science professor from Daejeon University, said the North is attempting to raise doubts on South Korean policymakers through these methods.

"By attacking the credibility of a country's leader and policymakers, nullifying their leadership and dividing public opinion, they can make people distrust each other. This is enough to threaten the very existence of that country," he said in his report titled &ldquo

China Daily
FM: Prevent internet use by terrorists
Monday, 24 October 2016
Byline: Wang Qingyun

Beijing - Countries should resolutely work together to prevent terrorists from taking advantage of the internet, a major tool responsible for the dramatic increase in terrorism, Foreign Minister Wang Yi said in Beijing on Friday.
Surveys show that most of those who carried out attacks in China had been "seduced and incited" by terrorist audio or video clips online, Wang said, adding that countries should focus more on this phenomenon.

Wang made the remarks during a symposium on countering terrorists' use of the internet that was hosted by the Foreign Ministry under the framework of the Global Counterterrorism Forum, a body of 29 countries and the European Union.

The symposium attracted about 180 participants, including officials representing forum members, plus scholars and representatives from internet companies. It was the ministry's second time hosting the symposium.

Wang said terrorist forces of the East Turkestan Islamic Movement have conducted a number of attacks both inside and outside China. According to a documentary by the Cyberspace Administration of China, the extremists released 73 terrorist audio and video clips in the first six months of 2014. In 2013, they released 109 - triple the previous year.

Terrorist organizations are abusing the development of information technology to spread violence and extremist thought, and this "has broken through country and regional borders and activated dormant terrorist groups scattered in various places", Wang said, adding that countries needed to widen their consensus and cooperate more in the fight.

He also called for the development of expertise and technology to tackle the spread of extremism through online channels. The international community should continue providing funds and training for developing countries to help them improve their counterterrorism measures and internet security, he said.

Zhang Jiadong, a researcher at Fudan University's Center for American Studies, said the internet is even used to offer training for atrocities.

Also, social media, "a private space" online, poses a "grave challenge" for efforts to contain terrorism, Zhang said, because it can evade monitoring.

Mei Jianming, a professor of the People's Public Security University of China, said preventing terrorists from taking advantage of the internet while guaranteeing that people can enjoy fully the convenience brought by the modern technology is an issue that needs to be addressed when tackling terrorism.

Reuters
British lawmakers ask Obama to let hacking suspect face trial in UK
Monday, 24 October 2016
Byline: Staff report

London - A group of 105 British members of parliament (MPs) have asked President Barack Obama to withdraw a warrant for the extradition of an autistic Briton who is accused of hacking high-security U.S. state computers.
Lauri Love, 31, who has Asperger's syndrome, is accused of involvement in a series of hacks in 2012 and 2013 into computers at agencies including the Federal Bureau of Investigation, the U.S. army, the Missile Defense Agency and the Federal Reserve.

A London court approved his extradition in September despite warnings from his family, lawyers and supporters that he would be at risk of killing himself if sentenced to a lifetime in a U.S. prison.

In a letter to Obama, the 105 MPs from the ruling Conservative Party, the main opposition Labour Party and several other parties said they were deeply concerned about the case.

"Mr Love should face prosecution for any crimes committed in his own country where his suicide risk is exponentially reduced," the lawmakers wrote, according to a copy of the letter sent to media on Monday.

"We urge you to carry out an act of compassion in your final days as President by withdrawing Mr Love's extradition warrant."

U.S. authorities say Love was connected to Anonymous, an international group of hackers, and that his actions had caused millions of dollars' worth of damage.

The MPs argued in their letter that he should face any charges in Britain, pointing to new rules that make it easier for British courts to try people for crimes committed there but involving other countries.

They said Britain had prosecuted at least 12 people accused of hacking U.S.-based computer systems.

"Why then is the United States insistent on Mr Love's extradition despite the UK having a proven track record of appropriately sentencing and rehabilitating individuals who have committed computer hacking offences against the U.S.?" they asked.

The MPs said Love had a long history of serious mental health issues including depression and episodes of psychosis, and that he also suffered from anxiety-induced eczema that was resistant to antibiotics and very hard to manage.

"Consequently, there is significant concern that Mr Love's physical and mental well-being would deteriorate and become unmanageable if he were extradited," the MPs wrote, adding that they had "no doubt in mind" that he would be at high risk of suicide.

Fars News Agency
Iran Confirms Finding US Electronic Implants in Infrastructures
Tuesday, 25 October 2016

Tehran - Head of Iran's Civil Defense Organization Brigadier General Gholam Reza Jalali confirmed on Monday that security forces have found electronic implants in the country's infrastructures that had been placed by the US for sabotage and espionage.
"The Americans have placed implants in Iran's infrastructures with sabotage and data wiring and espionage capabilities, and we have discovered a number of them," Jalali told reporters in Tehran on Monday.

"We classified Iran's infrastructures into several groups, including power, energy, communications, oil and media and examined them, and we discovered some of them (the US implants) in certain infrastructures," he added.

Asked about Iran's plans to produce highly secure smart phones for the country's officials, Jalali said that the officials whose whereabouts are of vital importance and any information about their location could be used against them are not allowed to use smart phones.

"We have worked out some capabilities for other officials too to protect and immunize their cell phones," he said.

His remarks alluded to the New York Times' February report saying that in the early years of the Obama administration, the United States had developed an elaborate plan for a cyber attack on Iran in case the diplomatic effort to limit its nuclear program failed and led to a military conflict.

The plan, code-named Nitro Zeus, was devised to disable Iran's air defenses, communications systems and crucial parts of its power grid, and was shelved, at least for the foreseeable future, after the nuclear deal struck between Iran and six other nations was fulfilled.

At its height, the US officials said, the planning for Nitro Zeus involved thousands of American military and intelligence personnel, spending tens of millions of dollars and placing electronic implants in Iranian computer networks to "prepare the battlefield," in the parlance of the Pentagon, New York Times reported.

Tehran Times
U.S. to launch cyber war on Iran if Israel enters war with Iran
Tuesday, 25 October 2016

Tehran - The commander of Iran's Passive Defense Organization said on Monday that Washington will launch cyber-attacks on Iran's infrastructural facilities in the event of a war breaks out between Iran and the Israeli regime.
Brigadier General Gholam Reza Jalali made the remarks in a ceremony marking Passive Defense Week.
"The Americans had orchestrated two plans to infiltrate the country's infrastructures," Jalali said.

"The first possible plan would have gone into effect if nuclear negotiations with the 5+1 group had failed, and the other one will be carried out if Iran and the Israeli regime go to war," he opined.

Elsewhere in his remarks, Jalali underlined the valuable role that the Ministry of Communications and Information Technology could play in defending the country's cyber assets. "This role of the communication ministry is so important that we might call it the cyber defense ministry," he remarked.

The commander noted that the country needs to upgrade its communication infrastructure, saying, "We must employ specific strategies in this regard."

General Jalali also said the U.S. has specific plans for different levels of cyberspace, arguing that Iran must also strengthen its capabilities in this field. He called for the expansion of Iran's National Information Network, which was launched back in August after an 11-year delay.

Lebanon Daily Star
Banks becoming more vigilant on cybercrime
Tuesday, 25 October 2016
Byline: Staff Report

Beirut - The head of the Special Investigation Commission said Monday that Lebanese banks were already taking extraordinary measures to check the rise of cybercrime in Lebanon.
"The number of executed and nonexecuted financial embezzlement through cybercrime in 2016 reached 137 operations. Eighty-six were executed successfully (or 60 percent of the total operations) and this caused a loss of $2.9 million. But out of the executed $2.9 million, banks were able to retrieve $740,000, or 25 percent of the embezzled money," Abdul-Hafiz Mansour told a workshop on cybercrime.

He added that there were 51 aborted attempts to embezzle money through banks, after clients and lenders realized there was something suspicious about the requests.

Cybercrime has become a serious phenomenon in Lebanon over the past few years. The Lebanese financial authorities have called on all commercial banks to carefully double check all online financial transactions in order to protect their customers.

Mansour warned that embezzled money can be transferred through different countries in less than 24 hours, and that in many occasions it becomes impossible to trace or retrieve the money because the individuals who are behind the scheme are anonymous.

Last year, Mansour revealed that this phenomenon had increased to 84 cases in 2015 from 51 in 2014, estimating the total value of these illegal practices at $12 million in the previous year alone.

Mansour advised that the best way to avoid such crimes was to take precautionary measures, as it is very hard to recover stolen funds.

"We are dealing with a virtual world when it comes to cybercrimes, and this is why the best way to prevent the occurrence of such incidents, whether by the banks or clients, is by taking precautionary measures," he said last year.

He added that the first step toward confronting cybercrime was to provide legal and legislative measures and to raise awareness among all banks and financial institutions about this type of crime.

Toronto Star
Hackers blamed for causing Grade 10 literacy test chaos
Tuesday, 25 October 2016
Byline: Kristin Rushowy

Toronto - Ontario's education testing agency has called Toronto police about an "intentional, malicious and sustained" cyberattack that shut down the Grade 10 literacy exam across the province - a targeted strike carried out by hackers who may never be found.
The technical troubles, in what's called a sustained distributed denial of service (DDoS), affected almost 150,000 students across the province and sabotaged a $250,000 pilot project to move the test online. Although the source of the attack is not yet known and the testing agency says it may never be uncovered, one or more people could be behind it - possibly even teenagers, say cyber experts.

"I'm not sure if this kind of thing can ever be figured out," said Richard Jones, director of assessment for the Education Quality and Accountability Office, or EQAO. "There were IP addresses from all over the world, and to find the source is a really difficult thing. We are moving forward and trying to uncover as much information as we can."

The EQAO "should have foreseen this type of scenario," said cybersecurity lawyer Imran Ahmad, because such attacks are increasingly common.

A cyberattack last week that hit Twitter and Netflix, among others, is so far unconnected to the EQAO's troubles.

"This should not come as a surprise; any kind of online interface is inherently vulnerable," said Ahmad, adding the EQAO should have hired a third party solely to filter out "bad" traffic that clogs sites in such strikes.

"I would not be surprised if a teenager was behind it," added Ahmad, of Miller Thomson LLP. "The skill set among the younger generation is extremely advanced."

At the EQAO, last Thursday began with good news, Jones said, after officials learned an Ontario-run school in Egypt had completed the online test "with no issues ... they did the assessment well prior to 8 a.m. Canadian time.

"And then at 8 a.m. our time, there was a huge influx of junk traffic from IP addresses from all around the world, inundating our host application for the assessment ... As far as I'm concerned, they were absolutely targeting us. Somebody knew the timing and somebody knew the IP addresses to attack."

Despite the four hours of technical troubles that followed - where at the worst, 99 per cent of traffic was not from schools or boards - it appears almost 16,000 teens in Ontario managed to complete the test. The EQAO is now debating whether to give them credit if they were successful.

IT experts and a third-party forensic team spent the weekend trying to figure out what happened and Jones said they will "eventually be able to provide us with some advice" on how to prevent such a strike in the future.

"This was not the trial online that we expected - we are getting a trial all right," Jones said. Five prior field tests led to some minor tweaking, but found no major issues and "load" testing showed the system could handle the equivalent of 250,000 students as well as up to 10,000 teacher supervisors.

"This type of attack was so intense and so sustained that the system was not able to handle it," Jones said, adding the investigation will look at the EQAO's system, as well as their service provider's.

Jones assured that student privacy was "not breached in any way ... They were basically clogging the system so students weren't able to get into it."

But even if information was not stolen, Ahmad said, "I'm pretty sure there's a financial cost to this at some level," as well as the number of work hours of preparation, now wasted. "They'll have to go back to the drawing board and it's very difficult to layer on security after the fact."

Ahmad also wondered if the EQAO had been on the lookout for "probing" in the weeks prior, which is akin to hackers testing the system ahead of time.

"Somebody must have done their homework," he said. "You don't just launch an attack and assume it will be successful."

At Queen's Park, Education Minister Mitzie Hunter said, "It is extremely disappointing that this deliberate and manipulative attack, this malicious attack, has happened and prevented our students from completing the test as planned."

A new version of the literacy test, which teens must pass in order to graduate, will be offered online in March to all Grade 10 students. A paper-and-pen version will also be available. Hunter said she's confident the move online will go ahead.

MIT Technology Review
The Decline in Chinese Cyberattacks: The Story Behind the Numbers
Tuesday, 25 October 2016
Byline: Mara Hvistendahl

Cambridge, Mass. - Last summer, an audience of government officials, military personnel, and foreign ambassadors gathered in Aspen, Colorado, to hear John Carlin, then an assistant attorney general, speak about cyberattacks. The Aspen Security Forum, which is held every year at a breathtaking resort in the Rocky Mountains, is the sort of event where national security wonks go for hikes in T-shirts and shorts, then trade war stories over lemon-raspberry water and superfood balls. The news of the Democratic National Committee hack had broken just the day before, and many hoped that Carlin, who headed up the investigation into the incident, might speak candidly about it. Instead, he recounted the Justice Department's indictment of five hackers in China's People's Liberation Army Unit 61398 for commercial espionage--back in 2014.
A boyish Harvard-trained former prosecutor, Carlin oversaw the department's efforts to stamp out economic espionage before stepping down earlier this month. In June, the cybersecurity firm FireEye released a report describing a significant decrease since early 2013 in the number of commercial attacks from China, which is the largest source of such attacks. The firm charted attacks on clients around the world by 72 groups that are either based in China or believed to represent Chinese state interests. Beginning in mid-2014, its analysts observed a "noticeable decline" in activity. Intelligence officials have quietly echoed that claim.

For some in the Obama administration, this is proof that using both carrots and sticks to combat Chinese theft of intellectual property--what Carlin called an "all-tools" approach--is working. Indictments and so-called "naming and shaming" have been accompanied by economic sanctions and diplomatic efforts, including a September 2015 agreement between President Obama and Xi Jinping to refrain from conducting or supporting cyber-theft of intellectual property. "This approach is a giant 'No trespassing' sign," Carlin said. "It's 'Get off our lawn.'"

But others are not sure the U.S. government should get so much credit. The perceived decline in attacks from China raises a question: why? Former government officials and cybersecurity experts now offer up a range of theories--including a provocative one that questions the extent to which straight commercial

cyber-espionage, as opposed to the more targeted spying on military technologies and capabilities that many nations engage in, was ever a priority of the Chinese central government in the first place.

There is little doubt that the Chinese government invests substantial energy in stealing everything from plans for U.S. fighter jets to the 22 million records kept by the Office of Personnel Management, or that it has done little to pursue commercial spies. But some of the more commercially focused attacks carried out by Unit 61398, this theory holds, may have been illusions, while others may never have had explicit backing from Beijing to begin with.

In 2013, former FBI director Robert Mueller called for a broad effort to root out cyber-threats and seek the "warm body behind the keyboard." Speaking at the Brookings Institution the day after the Unit 61398 indictment was unveiled, Carlin said that the bureau had succeeded in "putting a face" on that warm body--or rather, on five of them. The mug shots of these men, who went by monikers like KandyGoo and UglyGorilla, were splashed across posters that read: Wanted by the FBI.

The indictment marked a break with the standard diplomatic practice of not subjecting active military officials of other countries to criminal prosecution, and many in Washington greeted it with skepticism. Some doubted whether the charges would be actionable, while others pointed out that the Justice Department's stance on commercial espionage--that collecting general economic intelligence is routine statecraft and therefore acceptable, while spying for the benefit of specific companies is not--is a distinction few other countries would recognize. Benjamin Wittes, a senior fellow at Brookings, even wondered whether the Justice Department's move might be simply "a very sophisticated form of legal PR."

Doubt continued in September 2015, after the announcement of the China-U.S. agreement. Some believed that Xi's commitment to refrain from supporting commercial hacking was little more than lip service. Director of National Intelligence James Clapper told Defense News at the time, "I personally am somewhat of a skeptic."

But as time went on, cybersecurity analysts noticed a curious change. For its recent report, FireEye started in February 2013, the month the threat intelligence firm Mandiant (now owned by FireEye) publicly tied Unit 61398 to a heavily guarded building in Shanghai. Over the years that followed, FireEye analysts logged assaults on clients in the U.S., Japan, and Europe. Attacks peaked at just over 70 per month in September 2013. By the beginning of September 2015, before Obama and Xi signed the agreement, they had slowed to 10 per month, making the accord look like a mere footnote in China's about-face.

"All indications are that China had already adjusted their policy and approach, and that the agreement was something that was feasible to them because they had already changed direction," says Daniel McWhorter, chief intelligence strategist and vice president at FireEye. The report is limited to the firm's visibility and fuzzy on details like what files the attackers took, but in April NSA director Michael Rogers testified that hacking from China had declined. In a talk at the Aspen forum, meanwhile, CIA head John

Brennan reiterated that the intelligence community was uncovering fewer attacks from China. In August, when FireEye announced that it would lay off roughly 10 percent of its staff, executives blamed the downturn in Chinese activity.

'Vacuum cleaner' espionage

The "Wanted" posters and the fanfare behind the Unit 61398 indictment reinforced the popular misconception, perpetuated by shows like Mr. Robot, that Chinese hackers are highly organized in their methods and tools. In fact, they were long known for being decentralized and sloppy. Cybersecurity experts once marveled at finding multiple Chinese hacker groups penetrating the same target, with seemingly little or no coördination. At times, such groups made elemental errors. In the 2013 report on Unit 61398, or APT1, that preceded the Justice Department's indictment, Mandiant could attribute attacks to the Chinese People's Liberation Army (PLA) in part because the hackers used the army's hacking infrastructure, which is outside China's Great Firewall, to access their personal Facebook and Twitter accounts.

Many now believe that such groups have simply cut back on some of the noise that made them easy to detect. At the same time, China has probably refined its focus "from 'vacuum cleaner' espionage to more precisely targeted intrusion and theft," says Greg Austin, a professorial fellow with the EastWest Institute and the author of Cyber Policy in China. State-sponsored hackers used to suck up large amounts of data and then sift through it later, he says. That may have artificially inflated the number of commercial attacks, as hackers targeting dual-use technologies like solar panels swept up pricing information along with design specifications. A switch to more directed national-security- related espionage would mean a reduction in perceived commercial cyberattacks.

In some cases, meanwhile, the likes of UglyGorilla may have been working under the table, without the explicit permission of the central government. The Unit 61398 indictment, for example, alleges that one state- owned enterprise "hired" the unit to "build a 'secret' database to hold corporate 'intelligence.'"

Those explanations would help solve a number of long-standing mysteries. While Beijing has long encouraged the acquisition of foreign technologies, and IP theft is rampant among Chinese companies, exactly how the state might actively facilitate theft by companies is unclear. The Chinese government has no major intelligence allies and a range of priorities in intelligence collection, including monitoring dissidents, staying abreast of the South China Sea controversy, and tracking activists in Tibet and Xinjiang. It is not known where commercial spying would rank among these priorities--and how the information pilfered in state-sponsored attacks might be systematically disseminated.

Despite close links between the Chinese government and the private sector, in many areas there is no obvious firm to receive commercial secrets. The Unit 61398 indictment, for example, charges that the defendants stole thousands of sensitive files from a U.S. subsidiary of the German company SolarWorld AV. The document implies that the hackers then passed the documents on to a Chinese company or

companies exporting solar products to the United States. But some 400 firms fit that description, notes Austin.

The notion that the PLA, as opposed to another Chinese government entity, would have been the designated arbiter for civil-sector industrial espionage is puzzling on another level. The PLA once had its hands in an estimated 20,000 businesses, including everything from pharmaceutical companies to brothels. But since the late 1990s, the Chinese government has devoted considerable energy to reducing the army's side projects--with the aim of getting military personnel thinking about operations rather than real estate deals. Since he came to power in 2012, Xi Jinping has been particularly firm about military moonlighting.

Xi has also launched an anticorruption drive that, while politically motivated, has revealed the extent of military graft. In January 2015, 16 senior military officers were placed under investigation for offenses that included selling senior positions and ranks to the highest bidder. Among those purged was Guo Boxiong, former vice chairman of the all-important Central Military Commission. So extreme is the anticorruption effort within the PLA that alcohol, a mainstay of official banquets, has been banned from military receptions in hope of warding off unsavory deals--like, say, the sale of hacked commercial secrets.

A tipping point

Against that backdrop, the Chinese commitment last September to refrain from commercial attacks appears less significant. "It's not that China's living up to the agreement because they're living up to the agreement," says James A. Lewis of the Center for Strategic and International Studies in Washington, D.C. "They're living up to the agreement because they're trying to modernize the PLA and reduce corruption." While a decline in commercial hacking isn't a significant loss for China as a whole, he adds, "it is a huge loss for individual companies and PLA units."

Still, U.S. actions may have helped matters reach a tipping point for Chinese leaders, who may well have known about the under-the-table attacks and chosen to look the other way. Former Department of Homeland Security secretary Michael Chertoff, now chairman of the security consultancy Chertoff Group, told me at the Aspen forum, "It doesn't strike me as unlikely that the word went back, 'Guys, cool the hot-rodding. If there's something worth stealing, do it, but do it in a way that's not so obvious.'"

Regardless of the reason, the drop in apparent attacks should be celebrated, says Jason Healey, a scholar at Columbia University's School for International and Public Affairs who studies cyber-conflict. Even if China has simply cut back on PLA moonlighting and refined its handling of cyber- espionage, its current approach is "much less escalatory than it was," he says. "It's more like the U.S. system: you coördinate, you figure out who is going in. Someone goes in, and you share the take. It's more the way that a professional intelligence organization works."

Ongoing talks now provide a chance to keep the pressure on. A bilateral working group formed in the wake of the 2015 agreement is meeting several times a year. "Every time we talk, we reiterate the importance of abiding by the cybersecurity commitment," says Suzanne Spaulding, the Department of Homeland Security undersecretary who led a U.S. delegation to Beijing last June when Secretary Jeh Johnson was called away by the mass shooting in Orlando, Florida. "We make clear to our counterparts in every conversation that we are watching this carefully, and that there's frankly not a lot of public confidence about this. They are aware that the jury is still out."

Agence France-Presse
Cyber attack likely mitigated, US Homeland Security says
Tuesday, 25 October 2016
Byline: Staff report

Washington - The cyber attack which darkened a large portion of the US internet on Friday has been mitigated, but officials continue to monitor the situation, the Department of Homeland Security said Monday.
The domain name services company Dynamic Network Services Inc, or Dyn, suffered successive attacks, causing outages for hours for millions of users of brand-name internet services such as Twitter, Spotify and Netflix. Services began to stabilize on Friday afternoon.

Dyn said it was struck by so-called distributed denial of service attacks in which adversaries flood servers with so much traffic they stumble or collapse under the burden.

"At this time, we believe the attack has been mitigated," Homeland Secretary Jeh Johnson said in a statement.

Johnson also said Monday his department was aware of the malware which may have been used in the attack.

"This malware is referred to as Mirai and compromises Internet of Things devices, such as surveillance cameras and entertainment systems connected to the Internet," Johnson said.

The department's National Cybersecurity and Communications Integration Center was develop ways to respond to Mirai and similar malware, according to Johnson.

"The Department has also been working to develop a set of strategic principles for securing the Internet of Things, which we plan to release in the coming weeks."

Mirai was used in an attack last month on a website belonging to the journalist Brian Krebs, a cybersecurity expert and writer who said his site suffered a massive attack of 620 gigabits per second.

Krebs reported Friday that researchers at the security firm Flashpoint had determined that the attack on Dyn had involved Mirai.

Reuters
U.S. takes aim at cyber attacks from connected devices as recalls mount
Tuesday, 25 October 2016
Byline: Joseph Menn

San Francisco - Obama administration officials sought on Monday to reassure the public that it was taking steps to counter new types of cyber attacks such as the one Friday that rendered Twitter, Spotify, Netflix and dozens of other major websites unavailable.
The Department of Homeland Security said it had held a conference call with 18 major communication service providers shortly after the attack began and was working to develop a new set of "strategic principles" for securing internet-connected devices.

DHS said its National Cybersecurity and Communications Integration Center was working with companies, law enforcement and researchers to cope with attacks made possible by the rapidly expanding number of smart gadgets that make up the "internet of Things.

Such devices, including web-connected cameras, appliances and toys, have little in the way of security. More than a million of them have been commandeered by hackers, who can direct them to take down a target site by flooding it with junk traffic.

Several networks of compromised machines were directed to attack big customers of web infrastructure company Dyn last week, Dyn officials and security researchers said.

The disruption had subsided by late Friday night in America, and two of the manufacturers whose devices had been hijacked for the attack pledged Monday to try to fix them.

But security experts said that many of the devices would never be fixed and that the broader security threat posed by the internet of Things would get worse before it gets better.

"If you expect to fix all the internet devices that are out there, force better passwords, install some mechanism for doing updates and add some native security for the operating system, you are going to be working a long time," said Ed Amoroso, founder of TAG Cyber and former chief security officer at AT&T.

Instead, Amoroso said he hoped that government officials would focus on recommending better software architecture and that business partners would insist on better standards.

In the meantime, fresh responses by two of the companies involved in the attacks illustrated the extent of the problem.

Chinese firm Hangzhou Xiongmai Technology Co Ltd, which makes components for surveillance cameras, said it would recall some products from the United States.

Another Chinese company, Dahua Technology, acknowledged that some of its older cameras and video recorders were vulnerable to attacks when users had not changed the default passwords. Like Xiongmai, it said it would offer firmware updates on its website to fix the problem and would give discounts to customers who wanted to exchange their gear.

But neither company has anything like a comprehensive list of their customers, many of whom will never learn of the problems, said Dale Drew, chief security officer with communications provider Level 3.

"I wouldn't be surprised if the only way they are going to reach their consumers is through media reports, Drew said.

Wall Street Journal
Obama Says U.S. Has No Idea Who Carried Out Cyberattack
Tuesday, 25 October 2016
Byline: Carol E. Lee, Damian Paletta

Los Angeles - President Barack Obama said the U.S. doesn't know who launched an online attack Friday that rendered more than 1,200 websites unreachable, including Netflix and Twitter.
"We don't have any idea who did that," Mr. Obama said during a taped appearance Monday for the late-night show hosted by Jimmy Kimmel.

U.S. officials and cybersecurity experts believe attackers controlled a vast collection of internet-linked devices such as cameras, video recorders and routers, to essentially overwhelm parts of the internet and make dozens of popular websites unreachable.

Web- technology developer Dynamic Network Services Inc., known as Dyn, said its domain-name-system services were subject to the attack, known as a denial of service. The attack came in several waves throughout Friday.

The Department of Homeland Security on Monday said it was still "monitoring events" tied to the attack. It said that following the incident, it held a conference call with 18 telecommunications service providers to discuss what happened, adding "at this time, we believe the attack has been mitigated."

DHS said "one type of malware potentially used in this incident" is known as Mirai and targets devices such as cameras and entertainment systems that have internet links. DHS is working to develop rules to address these types of attacks, but the timing of such a move is unclear.

For Mr. Obama to say, several days after the attacks, that the government doesn't know the culprit could be a testament to how hard it is to uncover clues after such an event. The attack is considered sophisticated, and likely within the realm of tools that foreign governments and advanced criminal groups can activate. It is unclear, though, what the motive of the perpetrators was or if they were trying to deliver any sort of warnings or message.

Mr. Obama said the incident underscores how monumental the task of dealing with cybersecurity is for his successors.

"One of the biggest challenges for the next president and the president after that and the president after that is going to be: How do we continue to get all the benefits of being in cyberspace but protect our finances, protect our privacy? How do we balance issues of security," Mr. Obama said.

"We're going to have to come up with frameworks and some of its going to involve technology, some of it's going to involve the law but this is going to be a big debate that we're going to have for a long time," he added.

Mr. Obama during the appearance also joked about the security precautions attached to his iPhone to prevent intrusions. He said most of the functions, such as making calls, texting and taking photographs, are disabled, leaving him only able to use it to send email and surf the internet.

Even with those precautions, he said, he still doesn't put anything in an email that he wouldn't want to see on the front page of the newspapers.

Le Figaro
LeEco, le nouveau champion chinois qui veut envahir le monde
Tuesday, 25 October 2016
Byline: Lucie Ronfaut

Pékin - Smartphone, TV, culture en ligne : cette société veut créer un empire de nouvelles technologies. Internet Difficile de trouver une entreprise à qui le comparer. Ni Netflix, ni Samsung, ni Google, ni Sony : LeEco, nouveau géant chinois des nouvelles technologies, est tout ça à la fois. Quasi inconnu il y a un an, le groupe pourrait vendre plus de 25 millions de téléphones en 2016, d'après les estimations du cabinet Strategy Analytics, soit 1,72 % du marché mondial. Cette part a progressé de 500 % en un an. Si ces estimations se confirment, LeEco (aussi connu sous le nom de « Leshi » en Chine) deviendra le vendeur de smartphones avec la plus forte croissance au monde. « Le marché chinois des smartphones bouge

rapidement, mais cette croissance est exceptionnelle » , souligne Neil Mawston, analyste chez Strategy Analytics, lui-même surpris de cette performance.

La Chine n'est qu'une première étape, et les ambitions de LeEco semblent sans limites. La semaine dernière, le groupe annonçait son arrivée aux États- Unis. Il s'est déjà lancé en Inde fin 2015. L'entreprise, cotée à la Bourse de Schenzen, est valorisée à 13 milliards de dollars environ. Son chiffre d'affaires s'élevait à 1,99 milliard de dollars en 2015, et pourrait tripler d'ici à 2018. Ses profits devraient, eux, s'établir à 120 millions de dollars environ cette année.

LeEco affiche un portefeuille impressionnant de produits, des smartphones en passant par les télévisions, les services en ligne, la production de séries télévisées, la réalité virtuelle et même des vélos électriques. Son dernier projet en date est le développement d'une voiture de sport électrique.

Derrière cette boulimie de produits, il émerge une vraie stratégie. LeEco veut construire un empire de nouvelles technologies capables de répondre à tous les besoins en divertissement et en communication. Le groupe, né en 2003, est d'abord baptisé LeTV. Il est alors spécialisé dans les contenus en ligne : films, séries télévisées, musique... En 2013, LeTV fait le grand saut vers les objets connectés. Il commence à vendre des télévisions connectées. En 2016, l'entreprise prend le nom de LeEco et étend ses ambitions. Elle rachète pour 2 milliards de dollars le plus grand fabricant américain de télévisions, Vizio, au mois de juillet.

Une stratégie de contenus

Mais c'est dans les smartphones que LeEco connaît le plus de succès. Il vend ses premiers appareils en 2015, d'abord en Chine. Ils fonctionnent sous Android et appartiennent à la catégorie des téléphones moyen de gamme, sous les 500 dollars. « Il s'agit d'un concurrent sérieux pour des marques comme LG, HTC ou ZTE, ou certains smartphones de Samsung » , estime Roberta Cozza, analyste chez Gartner. La force de LeEco réside dans sa stratégie de contenus. Fort de son passé dans le streaming, l'entreprise dote tous ses produits d'abonnements à ses différentes plateformes. « Beaucoup de sociétés font de bons smartphones. Peu savent produire des bons contenus » , résume Roberta Cozza. « Cela leur permet d'avoir des revenus récurrents en plus des ventes de leurs produits. » Pour son arrivée sur le marché international, LeEco a adapté cette stratégie et a passé des partenariats avec Vice, Showgate et Lionsgate. LeEco a aussi recruté l'ancien président du groupe Paramount Film, Adam Goodman, afin de produire des contenus originaux en anglais. Il n'a néanmoins pas encore le projet de se lancer sur le marché européen.

Malgré cette trajectoire impressionnante, LeEco n'est pas la première entreprise chinoise à avoir des ambitions internationales. La tâche n'est pas aisée. Un temps baptisé « l'Apple chinois » , le fabricant de smartphone Xiaomi a vu sa valorisation divisée par dix en deux ans faute de croissance à l'international. Huawei et ZTE ont, eux, affronté la méfiance des autorités américaines qui les ont accusés de vouloir faciliter l'espionnage du gouvernement chinois. Pour prouver le sérieux de ses ambitions, LeEco a annoncé vouloir embaucher plus de 12 000 personnes dans la région de San Francisco. Il disposait déjà

d'une équipe de plus de 500 employés américains à San José. « Il s'agit d'un message fort en termes de marketing » , estime Neil Mawston. « Reste à savoir s'il peut tenir ses promesses sur la durée. » Pour LeEco, le véritable défi est de ne pas finir asphyxié par son ambition démesurée. -

Associated Press
Cyberattacks steadily growing in intensity, scope
Monday, 24 October 2016
Byline: Staff report

New York - Could millions of connected cameras, thermostats and kids' toys bring the internet to its knees? It's beginning to look that way.
On Friday, epic cyberattacks crippled a major internet firm, repeatedly disrupting the availability of popular websites across the United States. A hacker group claiming responsibility says that the day's antics were just a dry run and that it has its sights set on a much bigger target. And the attackers now have a secret weapon in the increasing array of internet-enabled household devices they can subvert and use to wreak havoc.

Meet the fire hose

Manchester, New Hampshire-based Dyn Inc. said its server infrastructure was hit by distributed denial-of-service, or DDoS, attacks.

These work by overwhelming targeted machines with junk data traffic sort of like knocking someone over by blasting them with a fire hose. The attack temporarily blocked some access to popular websites from across America and Europe such as Twitter, Netflix and PayPal.

Jason Read, founder of the internet performance monitoring firm CloudHarmony, owned by Gartner Inc., said his company tracked a half-hour-long disruption early Friday affecting access to many sites from the East Coast. A second attack later in the day spread disruption to the West Coast as well as some users in Europe.

Members of a shadowy hacker group that calls itself New World Hackers claimed responsibility for the attack via Twitter, though that claim could not be verified. They said they organized networks of connected devices to create a massive botnet that threw a monstrous 1.2 trillion bits of data every second at Dyn's servers. Dyn officials wouldn't confirm the figure during a conference call later Friday with reporters.

Make that many fire hoses

DDoS attacks have been growing in frequency and size in recent months. But if the hackers' claims are true, Friday's attacks take DDoS to a new level. According to a report from the cybersecurity firm

Verisign, the largest DDoS attack perpetrated during the second quarter of this year peaked at just 256 billion bits per second.

A huge September attack that shut down security journalist Brian Krebs' website clocked in at 620 billion bits per second. Research from the cybersecurity firm Flashpoint said Friday that the same kind of malware was used in the attacks against both Krebs and Dyn.

Lance Cottrell, chief scientist for the cybersecurity firm Ntrepid, said while DDoS attacks have been used for years, they've become very popular in recent months, thanks to the proliferation of "internet of things" devices ranging from connected thermostats to security cameras and smart TVs. Many of those devices feature little in the way of security, making them easy targets for hackers.

The power of this kind of cyberattack is limited by the number of devices an attacker can connect to. Just a few years ago, most attackers were limited to infecting and recruiting "zombie" home PCs. But the popularity of new internet-connected gadgets has vastly increased the pool of potential devices they can weaponize. The average North American home contains 13 internet-connected devices, according to the research firm IHS Markit.

Since the attacks usually don't harm the consumer electronics companies that build the devices, or the consumers that unwittingly use them, companies have little incentive to boost security, Cottrell said.

What's behind the attacks

Like with other online attacks, the motivation behind DDoS attacks is usually mischief or money. Attackers have shut down websites in the past to make political statements. DDoS attacks have also been used in extortion attempts, something that's been made easier by the advent of Bitcoin.

For its part, a member of New World Hackers who identified themselves as "Prophet" told an AP reporter via Twitter direct message exchange that collective isn't motivated by money and doesn't have anything personal against Dyn, Twitter or any of the other sites affected by the attacks. Instead, the hacker said, the attacks were merely a test, and claimed that the next target will be the Russian government for committing alleged cyberattacks against the U.S. earlier this year.

"Twitter was kind of the main target. It showed people who doubted us what we were capable of doing, plus we got the chance to see our capability," said "Prophet." The claims couldn't be verified.

The collective has in the past claimed responsibility for similar attacks against sites including ESPNFantasySports.com in September and the BBC on Dec. 31. The attack on the BBC marshalled half the computing power of Friday's attacks.

A shifting global assault

Dyn said it first became aware of an attack around 7:00 a.m. local time, focused on data centers on the East Coast of the U.S. Services were restored about two hours later. But then attackers shifted to offshore data centers, and the latest wave of problems continued until Friday evening Eastern time.

"Prophet" told the AP that his group actually had stopped its attacks by Friday afternoon, but that others, including members of the hacker collective known as Anonymous, had picked up where they left off. Anonymous didn't respond to a request for comment via Twitter.

The U.S. Department of Homeland Security is monitoring the situation, White House spokesman Josh Earnest told reporters Friday. He said he had no information about who may be behind the disruption.

Cottrell noted that there are several firms that offer protection against DDoS attacks, by giving companies a way to divert the bad traffic and remain online in case of an attack. But monthly subscription fees for these services are generally equal to a typical DDoS extortion payment, giving companies little incentive to pay for them.

Meanwhile not much is required in the way of resources or skill to mount a botnet attack, he said, adding that would-be attackers can rent botnets for as little as $100. Cottrell said the long-term solution lies in improving the security of all internet- connected devices.

The Australian
Information breaches are a management issue
Tuesday, 25 October 2016
Byline: Paul Wallbank

Comment: Cybersecurity is becoming an important responsibility for executives and directors. Often shortened to "cyber", it's easy to dismiss cybersecurity as just being the latest industry buzzword. However, ensuring information systems are secure is now firmly a management issue.
Information breaches have become embarrassingly common in recent times with events ranging from Target exposing 40 million customer records in 2013, a breach that cost the company $162 million, through to national security embarrassments like the Snowden revelations.

Exacerbating the risks to businesses is the dependency upon information systems for normal operations, and the damage from denial-of-service attacks such as the outage across much of the US last weekend can be debilitating and costly. The recent Australian census saga, that cost taxpayers $30m, is an illustration of how costly poorly planned responses to service interruptions and security breaches can be.

Compounding the risks for Australian executives are the breach disclosure laws tabled in federal parliament last week, which threaten $340,000 in fines for individuals and $1.7m for corporations that fail to act quickly on data privacy failures.

In such a high-risk environment, business leaders need to be proactive. The legislation is squarely aimed at organisations that are either wilfully blind or like to employ the concept "plausible deniability".

As that period of "wilful blindness" and "plausible deniability" comes to an end, executives and directors have to start taking their responsibilities in protecting data far more seriously. The challenge lies in understanding the risks.

The defining feature of this process for organisations is figuring out what's important and what's noise. This so-called "crown jewels assessment" doesn't just apply to figuring out what might be crucial data for the business but also to whom it may be attractive.

Credit card numbers may be the crown jewels for a business and while they may attract criminals they will be of little interest to foreign intelligence agencies. Contextualisation is critical as is understanding where the risks lie for critical data and processes.

In understanding what those "crown jewels" are, it is important to consider what is valuable within the organisation. While to the marketing team the most valuable information may be customer data, to the chief operating officer it may be ensuring continuity of service, while to external parties it could be pricing details or legal correspondence.

Organisations will also be well served by reviewing their contracts and getting comfortable with the fine print. If you have a cloud services provider that experiences a breach, how are they going to go about doing the notification?

Staying on top of these little details can save a business a lot of heartache if and when customer data is compromised.

In a world where subcontracting and outsourcing is normal business practice, the risk from third party vendors is real and goes beyond cloud providers.

The disastrous Target hack was traced back to an air-conditioning contractor's compromised system, and Edward Snowden himself wasn't a direct government employee.

Privacy and security breach notifications are only part of the broader cybersecurity picture though and the field is becoming more complex.

Last weekend's massive denial of service attack that compromised many US-based online services was caused by the Mirai botnet, that exploits vulnerabilities in cheap internet-of-things devices.

With business processes becoming increasingly connected and automated, management concerns are extending to the security, integrity and reliability of devices being used in their organisation.

Even if the business-critical sensors being officially purchased are of high quality, everything from smartphones to connected kettles being bought into the staff tearoom could be a potential risk to the corporate network and a business's reputation.

It would be a mistake however to think cybersecurity is purely a technology problem, because there's an undeniable human element.

While employees and contractors can often become unwitting pawns sometimes, as in the case of Snowden, they can be the perpetrators as well.

The "insider threat" phenomena is all about people who use tools or technology to pilfer data and they get away with it because organisations are more focused on the technology than people.As businesses becomes more dependent upon data and connected systems it's time for the captains of industry to step up to the plate on governance, compliance and culture.

The Australian
Leaked sub secrets key to Aussie fleet, says builder
Tuesday, 25 October 2016
Byline: Cameron Stewart

Canberra - The Turnbull government's claim that the $50 billion future submarine project will not be hurt by the massive leak of confidential data from French submarine builder DCNS has been undermined by the architect who will build the boats.
Gerard Audet, the chief naval architect of the proposed new Australian submarine, the Shortfin Barracuda, has revealed in an article that the new Australian submarine will have key systems in common with the French--designed Scorpene-class of submarines which suffered the major leak of confidential data.

The Australian revealed in -August that 22,400 pages of con-fidential data detailing the combat capability of India's six new Scorpene-class submarines had been leaked from DCNS, the French company which also won the design contract for the Australian project.

At that time, Malcolm Turnbull and Defence Industry Minister Christopher Pyne played down the relevance of the leak, with the Prime Minister saying the Australian boat would be "completely different" to the -Indian Scorpene. Mr Pyne also said the Indian boat bore "no relation" to the Australian boat.

But in a little-known article published in April, only weeks -before France won the bid, Mr Audet wrote that while most of the Shortfin Barracuda will be based on the new French nuclear- powered Barracuda-class subs, some keys systems will be based on the diesel- electric Scorpene.

"The main area where Barracuda design references were not used was in the area of the electrical system (batteries and voltage), power generation (induction and diesel generators), and propulsion (main electric motor)," he wrote in an article co-authored by the head of DCNS Australia, Sean Costello, and published on the website of the Australian Strategic Policy -Institute.

"In these systems the design reference comes from the Scor-pene class of diesel electric submarines, or from an existing submarine technology within DCNS. Existing technologies are re-used in all systems in the Shortfin Barracuda Block 1A." The leaked documents revealed the combat capability of the six Scorpene-class subs which DCNS designed for the Indian navy. The documents, marked "Restricted Scorpene India", reveal information including the highly sensitive stealth capabilities of the boats, the frequencies at which they gather intelligence and the levels of noise they make.

They disclose magnetic, electromagnetic and infra-red data as well as specifications of the submarines' torpedo launch systems and even the performance parameters of its weapons systems.

However, the documents mostly reveal details of the Scorpene's combat system rather than the motor, generators and electrical system which Mr Audet says will have some commonality with the Australian boats. The Scor-pene submarines are much smaller, at about 1800 tonnes, than the Shortfin Barracuda which will be more than 4000 tonnes.

A spokesman for Mr Pyne said yesterday that there would be no "performance comparison" between the Scorpene sub-marines and the new Australian boats. "Australia's future submarine is yet to be designed. It will be a unique Australian design built for purpose," he said. "There will be no performance comparison -between the two platforms. They will be completely different." Mr Costello said yesterday; "The Australian future submarine is a new design for the Royal Australian Navy's requirement taking the French Navy Barracuda class as its design reference. Reference to, or re-use of, technologies in the Scorpene type of submarines cannot be taken to infer performances of the new Australian design." Defence Department officials told a parliamentary estimates hearing last week the key lesson from the leaked Scorpene documents was to ensure that such a major breach of security did not occur on the Australian project.

Defence is currently working with DCNS Australia on the -parameters of the security -arrangements.

DCNS has assured Defence that it will take all possible precautions to ensure the highest possible information security.

A spokesman for Mr Pyne said yesterday: "This government takes security surrounding our submarine capability very seriously. That's why we have had in place the tightest security available for the Collins-class submarines that has stood the test of time." DCNS defeated Germany and Japan to win the contract to design 12 submarine for the navy to replace the current six Collins-class boats when they are phased out from the early 2030s.

The leaked DCNS documents are believed to have been stolen from the company by a former DCNS contractor in 2011, before the data was taken to Southeast Asia and eventually to Australia.

French prosecutors are investigating the data leak, while the Indian navy is investigating the potential damage of the leak for its Scorpene fleet.

Parts of Australia's next subs that have the same design as the Scorpene subs used by India, Malaysia and Brazil * The main electric motor * Induction and diesel generators * Batteries and voltage

What they said MALCOLM TURNBULL Prime Minister 'The submarine that we will be building with the French is called the Barracuda. It is a completely different submarine to the one they are building for India

CHRISTOPHER PYNE Defence Industry Minister 'The Scorpene class of submarine build by DCNS is their export model of submarine. It bears no relation at all to the Barracuda submarine which will be built for Australia, which is a unique submarine. It will be a new design and a new build'

GERARD AUDET DCNS chief naval architect on Australia's new submarine, the Shortfin Barracuda Block 1A 'The main area where Barracuda design references were not used was in the area of the electrical system (batteries and voltage), power generation (induction and diesel generators), and propulsion (main electric motor). In these systems the design reference comes from the Scorpene class of diesel-electric submarines, or from an existing submarine technology within DCNS.Existing technologies are re-used in all systems in the Shortfin Barracuda Block 1A'

The Intercept
Spies for Hire
Monday, 24 October 2016
Byline: Jenna McLaughlin

Washington - In July, Simone Margaritelli, an Italian security researcher, boarded a Boeing 777 in Rome headed for Dubai, a city now billing itself as a tech startup hub.
He had a big job interview with a new, well-funded cybersecurity company called DarkMatter, whose self- described mission is to "safeguard the most complex organizations," from government to the private sector, by preventing and fighting malicious cyberattacks and providing secure methods of communication -- defensive cybersecurity, rather than offensive, which involves breaking into online systems and devices for espionage or destruction.

A friend of a friend had recommended Margaritelli, who was invited to spend five days in the United Arab Emirates at the company's expense to learn more about the job. When he arrived in Dubai, the City of Gold, he found a full schedule of outings and a deluxe suite at the Jannah Marina Bay Suites hotel.

Margaritelli used to be a "blackhat" -- a hacker looking to break into electronic systems. Now he works for a mobile security firm called Zimperium, where he still hunts for security flaws but does so to help people fix them. I "break stuff to make the world a safer place," his website reads. He's most well known for a portable tool he developed called Bettercap, used to perform a man-in-the- middle attack, where a hacker can eavesdrop or sometimes alter private communications between individuals.

When he arrived at the 29th floor of the Marina Plaza for his interview, the company representative described a plan to deploy electronic probes all over major cities in the UAE, which a team of hackers would then break into, guaranteeing access for DarkMatter and its customer -- the Emirati government. The mission would be for the "exclusive" benefit of national security, Margaritelli was told. "Imagine that there's a person of interest at the Dubai Mall, we've already set up all our probes all over the city, we press a button and BOOM! All the devices in the mall are infected and traceable," Margaritelli wrote in a blog post recounting his experience.

Margaritelli declined to pursue the job offer. After his post, titled "How the United Arab Emirates Intelligence Tried to Hire Me to Spy on Its People," began circulating, DarkMatter issued a single terse Twitter reply. The company said it preferred "talking reality & not fantasy."

"No one from DarkMatter or its subsidiaries have ever interviewed Mr. Margaritelli," Kevin Healy, director of communications for DarkMatter, wrote in an email to The Intercept. The man Margaritelli says interviewed him, Healy continued, was only an advisory consultant to DarkMatter -- and that relationship has since ended (though several sources say he was employed by the company and had a DarkMatter email address).

"While we respect an author's right to express a personal opinion, we do not view the content in question as credible, and therefore have no further comment," Healy wrote.

DarkMatter denied outright Margaritelli's assertions that it was recruiting hackers to research offensive security techniques. "Neither DarkMatter - nor any subsidiary, subset, research wing, or advisory department--engage in the activities described," Healy wrote. "We conduct rigorous testing on all our products to ensure they do not include any vulnerabilities."

Indeed, the idea of a UAE- based company recruiting an army of cyberwarriors from abroad to conduct mass surveillance aimed at the country's own citizens may sound like something out of a bad Bond movie, but based on several months of interviews and research conducted by The Intercept, it appears DarkMatter has been doing precisely that.

Most of those who spoke with The Intercept asked to remain anonymous, citing nondisclosure agreements, fear of potential political persecution in the UAE, professional reprisals, and loss of current and future employment opportunities. Those quoted anonymously were speaking about events based on their direct experience with DarkMatter.

Margaritelli isn't the only one who insists that DarkMatter isn't being truthful about its operations and recruitment. More than five sources with knowledge of different parts of the company told The Intercept that sometime after its public debut last November, DarkMatter or a subsidiary began aggressively seeking skilled hackers, including some from the United States, to help it accomplish a wide range of offensive cybersecurity goals. Its work is aimed at exploiting hardware probes installed across major cities for surveillance, hunting down never-before- seen vulnerabilities in software, and building stealth malware implants to track, locate, and hack basically any person at any time in the UAE, several sources explained. As Margaritelli described it in an email to me, "Basically it's big brother on steroids."

DarkMatter made its public debut when the CEO, Faisal Al Bannai, gave a keynote speech surrounded by government officials, engineers, and businesspeople at the 2nd Annual Arab Future Cities Summit in Dubai. DarkMatter launched its portfolio of cybersecurity products as a "digital defense and intelligence service" for the nation. Al Bannai's speech and DarkMatter marketing materials were peppered with buzzwords like cyber network defense and secure communications. Following its launch, the company routinely boasted, online and during conferences and radio interviews, about its would-be world-changing defensive cybersecurity missions, including developing its own encryption platforms and potentially secure phones in house, defending national and corporate networks, bug-sweeping and countersurveillance, and more, all under a single umbrella.

Local tech blogs praised the company and celebrated its connection to the UAE government. They described DarkMatter as a savior to UAE businesses and institutions at constant threat of cyber intrusion, citing attacks against several banks in 2015 that temporarily crippled the country's online banking infrastructure.

Soon, DarkMatter had hired a roster of top-level talent from major tech giants around the world, including Google, Samsung, Qualcomm, McAfee, and even a co-founder of the encrypted messaging service Wickr. The new star-studded squad traveled to conferences like San Francisco's annual RSA summit, appearing on radio and TV shows along the way. They rolled out a secure voice and chat application, partnered up with Symantec to improve digital threat detection in the Middle East, and opened a research and development center in Canada, as well as offices in China.

But sometime last year, a segment of the company's mandate grew from providing defense and forensics research to developing a powerful team capable of cyber offense, multiple sources tell The Intercept. According to one source, DarkMatter's newfound interest in offensive operations coincided with revelations contained in leaked emails that the Italian company Hacking Team had sold surveillance equipment to a large number of repressive regimes. Out of Hacking Team's ashes, DarkMatter rose.

While cybersecurity companies traditionally aim to ensure that the code in software and hardware is free of flaws -- mistakes that malicious hackers can take advantage of -- DarkMatter, according to sources familiar with the company's activities, was trying to find and exploit these flaws in order to install malware. DarkMatter could take over a nearby surveillance camera or cellphone and basically do

whatever it wanted with it -- conduct surveillance, interfere with or change any electronic messages it emitted, or block the signals entirely.

It's not clear that the company's defensive employees have any idea; in fact, multiple sources suggested those projects are likely hidden from them. One source explained how company representatives tried to insist that the offensive research they were recruiting for would be conducted outside DarkMatter, with some sort of partner organization or offshoot. But several sources, Margaritelli included, said top leadership was directly involved in interviews and knew the truth.

DarkMatter's spokesperson said the company is "privately held" and "does not receive any funding from the United Arab Emirates."

There do, however, appear to be strong links between the company and the government. In press releases, the company identifies itself as "already a strategic partner to the UAE government," and its offices are located on the 15th floor of the round Aldar Headquarters in Abu Dhabi, two floors away from the country's intelligence agency, the National Electronic Security Authority. DarkMatter's senior vice president of technology research used to hold the same position at NESA.

By the early months of 2016, DarkMatter's recruitment push was already well underway. The company's publicly identifiable employees came from across the U.S. national security establishment. According to public LinkedIn profiles, one current DarkMatter employee was a global network exploitation analyst for the U.S. Department of Defense who "strategized activities against particular networks" and supported "foreign intelligence collection." Another was a counterintelligence "special agent" for the Pentagon, whose LinkedIn boasts an "active" top-secret security clearance with a polygraph screening. Another experienced cryptographer working for DarkMatter was a senior technical adviser to the NSA, where he was intricately involved in designing "U.S. voice and data systems."

But the company hasn't been upfront about all the jobs it's recruiting top talent for, Margaritelli and multiple other sources suggest. DarkMatter's recruiters reached out to the information security community, promising high-paying, exciting jobs that would be focused on cyberdefense, according to more than a dozen security researchers interviewed by The Intercept, some of whom shared recruitment materials. A number of cybersecurity experts claimed on Twitter to have been contacted by recruiters, including Charlie Miller, an Uber security researcher and former NSA analyst; Chris Valasek, a noted car hacker who has teamed up with Miller; and Fabio Assolini, a security researcher for Kaspersky Labs.

One recruiting email reviewed by The Intercept offered a carefree, tax-free life in Dubai, with housing, meals, health care, children's education, and transportation all provided free of charge. The email said the job was with a newly formed "public/private partnership" that would be the "Cyber Security provider for all UAE Government." Another email said DarkMatter's plan was to hire 250 "geniuses" before the end of 2016. One security researcher said DarkMatter recruiters had contacted him on LinkedIn five or six separate times.

Some potential recruits didn't respond, but others were excited; the job offered the chance to innovate the cybersecurity of an entire nation. The lucrative payday also attracted them; according to one source, who requested anonymity fearing professional reprisal, some offers were as high as half a million dollars a year -- a number similar to other offers shared with The Intercept.

According to a source familiar with the company, an American citizen named Victor Kouznetsov who splits his time between the U.S. and the Middle East was a key recruiter for DarkMatter in the United States.

A man answering a cellphone identified in public records as belonging to Kouznetsov insisted that he must have been contacted in error; he did not work for DarkMatter and his name was not Victor. When asked why his voicemail message gave his name as "Victor," he hung up. Reached by The Intercept via email, Kouznetsov declined to answer questions. "As you can imagine my NDA with DarkMatter prevents me from disclosing exactly what I do for the company, but I could say that none of it is recruiting researchers in offensive security," he wrote.

Several researchers whom DarkMatter approached, including Margaritelli, confirmed they were specifically told they would be working on offensive operations. In Margaritelli's case, he was informed the company wanted to install a set of probes around Dubai, including base transceiver stations -- equipment that allows for wireless communication between a device and a network -- wireless access points, drones, surveillance cameras, and more.

The probes could be installed by DarkMatter surreptitiously or facilitated by telecoms tacitly agreeing to the surveillance setup, and the company could attach an offensive implant directly onto the probes capable of intercepting and modifying digital traffic on IP, 2G, 3G, and 4G networks. Anyone with a cellphone or using a device to connect to a wireless network connected to one of the probes would be vulnerable to hacking and tracking.

As Margaritelli explained it, the software DarkMatter originally designed to penetrate the probes "does not scale well enough" and therefore couldn't handle the massive amounts of traffic it would be intercepting -- forcing the need for a second team of hackers to do the job. The company wanted him to help solve the problem.

Margaritelli's account is the most revealing, but several other sources discussed similar projects proposed by DarkMatter, including researching and developing exploits for zero-day vulnerabilities, as well as deploying and developing some of the same stealth malware implants Margaritelli was asked to work on. DarkMatter asked one researcher, who has discovered and reported bugs to Facebook, Google, and other major technology companies, to use his vulnerability research "to allow them to have access on trusted domains." Basically, he would find a flaw in a website that would allow DarkMatter to manipulate it to help spread malware to targets without being detected. The researcher, who spoke

anonymously, said he refused, even after getting an offer for more money, because, in contrast to DarkMatter's proposal, "what I'm doing is ethical hacking."

But what two sources and several security researchers The Intercept consulted were most concerned about was DarkMatter's plan to become a certificate authority. A certificate authority is a trusted third party, typically a company or official agency, that issues digital certificates -- basically, electronic "passports" that verify a user's identity and that software is legitimate.

Web traffic and code from Microsoft, Facebook, Mozilla, and others is trustworthy because the company digitally signs off on it. But DarkMatter, as a certificate authority, could pretend to be someone else and issue its own digital certificate. There are mechanisms in place to prevent this type of attack, called certificate pinning, but many sites don't use those precautions -- and they still might not prevent DarkMatter from signing code, such as for a software update, as someone else. In theory, the company could sign an anti-virus update that looked like it came from Kaspersky Labs, when in reality it is sending malicious code.

DarkMatter, according to one source, would be able to use its authority to sign its own rootkits -- software tools that allow undetected and unauthorized access to computer systems -- in order to carry out man-in-the-middle attacks. "This is huge," the source said.

DarkMatter has a business unit dedicated to public key infrastructure "or national root certificates of trust for countries regionally and internationally," Healy confirmed. "While DarkMatter is not a central [public key infrastructure] authority for the UAE, we currently provide consulting and management services and intend to launch our own commercial Certification services soon."

While DarkMatter denied any plans to use its capabilities for cyber offense, if the company continues to develop secure messaging platforms, or hardware including its own phones, it would have access to all the internal schematics of those products: bug reports, security standards, and more. DarkMatter's hackers could secretly take advantage of that information while its defensive staff works to fix the flaw and push an update to consumer devices, a process that can take years.

When asked about the possibility of selling its own phones, Healy wrote that DarkMatter is, in fact, considering developing hardware.

Recruiting wasn't the only way DarkMatter snapped up top offensive talent. Last winter, the company poached a large number of employees from an American company, a Baltimore startup called CyberPoint International, formally on contract with the Ministry of the Interior of the United Arab Emirates. CyberPoint, founded by CEO Karl Gumtow and his wife, Vicki, in 2009, billed itself as a defensive operation -- protecting financial information, intellectual property, business records, and other forms of communications. It won multiple contracts with different parts of the U.S. government, including $6 million from the Pentagon's Defense Advanced Research Projects Agency, and Gumtow was nominated last year for the Maryland region Entrepreneur of the Year award. News articles also listed

CyberPoint as one of the companies that sent employees to the United Arab Emirates to train its intelligence agency, NESA, essentially the equivalent of the United States NSA.

But last summer, CyberPoint made headlines for teaming up with the Italian surveillance peddler Hacking Team, whose internal emails were leaked -- revealing an extensive account of sales to repressive regimes. The leaked emails indicated that representatives from CyberPoint had worked with Hacking Team to facilitate the sale of what appeared to be surveillance equipment to the UAE government. Around the end of 2015, there was an internal struggle within CyberPoint over the UAE contract, five sources familiar with the company told The Intercept. Former CyberPoint employees spoke to The Intercept on the condition of anonymity out of fear of reprisal and concern for the safety of associates still living in the Emirates.

After the Hacking Team emails leaked in July, there were loud, angry meetings in CyberPoint offices -- people deciding what to do now that their internal operations in the Middle East had been exposed to the world. As a result of those discussions, two things happened: A vast chunk of CyberPoint staff jumped ship to DarkMatter, which was already dangling massive yearly salaries and luxurious benefits. DarkMatter even helped some employees legally shift their state residency to South Dakota to get more lenient tax breaks while living overseas, according to one source. DarkMatter does not "comment on individual employment contracts," Healy wrote to The Intercept. "In summary we abide by the law in our employment and operational activities in all the jurisdictions in which we operate."

CyberPoint employees in the UAE who weren't offered -- or didn't accept -- jobs at DarkMatter weren't promised contract extensions. CyberPoint sent out a notice in December, one former employee said, announcing two months' notice on the contract. For some who left, it was a surprise, and they still aren't totally sure what happened. Others suggested DarkMatter was only interested in the more technical staff. One source described the exodus of employees as more of a "hostile takeover" directed by the United Arab Emirates government -- ending CyberPoint's original UAE contract and offering positions within the country instead, to get engineers under its own roof.

DarkMatter confirmed that some CyberPoint employees joined the UAE company but said this was nothing extraordinary. "DarkMatter recruits talent from across the globe and currently has over 400 team members, some of whom joined us from CyberPoint. They now occupy a diverse set of duties and responsibilities across several departments," Healy said.

According to Gumtow, CyberPoint's CEO, the company has gone through "quite a few changes" since it pulled out of the UAE for good. He sent responses to questions submitted by The Intercept via LinkedIn messages. There are no longer any CyberPoint employees in the Emirates, and no part of the company was acquired or bought by DarkMatter or anyone else, he wrote. CyberPoint, Gumtow said, never contracted with DarkMatter.

Additionally, Gumtow clarified that CyberPoint isn't in the business of developing "cyberweapons." Instead, the company conducts "penetration tests and security assessments," he wrote. "We use commercial and custom tools that are widely available all around the world."

However, those same tools used for improving cyberdefense can be turned around to infect unsuspecting targets. Even if the intelligence community uses those tools lawfully to infect targeted systems during national security investigations, others can steal or adapt the code to hack unsuspecting journalists or activists. "The overlap between offense and defense is very large," Nicholas Weaver, a security researcher at the International Computer Science Institute, wrote in an email to The Intercept. "Especially when it comes to network monitoring: The exact same tools can be used to monitor your network to detect attacks and monitor a network for bulk surveillance."

CyberPoint International did "good work, maybe noble, in some cases," one former employee said. But a small percentage of the work was "shady," suggesting it involved offensive research against different online platforms.

Another source stated that research, development, and coding conducted within CyberPoint ended up being used for a targeted spyware attack on journalists and activists in the Emirates between 2012 and the present. The attack involved spyware sent through Twitter, spear-phishing emails, and a malicious URL shortening service. These types of attacks are familiar to Emirati human rights activist Ahmed Mansoor. He told The Intercept that he hasn't encountered DarkMatter but was warned about the company recently by a friend, who told him, "They are doing the hacking for UAE security bodies."

Security researchers nicknamed the hacking group behind the attack "Stealth Falcon." The researchers noted that "circumstantial evidence suggests a link between Stealth Falcon and the UAE government," based on "digital artifacts."

Stealth Falcon attacked some UAE targets after CyberPoint left the UAE, and some employees who worked on the spyware or had access to it joined DarkMatter, according to the source, who said that not every instance of the malware attack has yet been detected. "There's a lot that hasn't been discovered," the source said.

DarkMatter, Healy said, is not aware of Stealth Falcon or the offensive tools used to access journalists' information. "As we have explained previously, we do not own or develop any cybersecurity solutions for offensive purposes."

At one point in time, CyberPoint was essentially capable of penetrating millions of devices regardless of brand, given its awareness of vulnerabilities -- undiscovered or unpatched -- in software around the world, one source explained. Those included vulnerabilities in Tor Browser, Firefox, Internet Explorer, and Microsoft Office.

The United Arab Emirates appears to be hoping to create its own cyber offense team, another source explained. Those capabilities could include cyber network attack teams and cyber network exploitation teams, for disruptive cyberattacks to disable adversaries' online resources, as well as for espionage and spying -- capabilities being developed in governments worldwide with varying levels of oversight and restriction.

According to Ryan Duff, a security researcher and former cyber operations tactician for U.S. Cyber Command, computer network exploitation and computer network attacks are distinguished based on the purpose of the intrusion: intelligence collection versus destruction. Exploitation "basically means gaining access to a machine for the purpose of collection. So you would have some type of software, malware, or implant installed on the machine" to monitor it, he said. Network attacks, on the other hand, also rely on gaining access but are aimed at destruction, such as "wiping a hard drive, destroying servers," or using a botnet to launch a denial of service attack. These types of network attacks are linked to military action or covert missions.

Most evidence so far points toward espionage. DarkMatter may have hired members of CyberPoint, with knowledge of code capable of infecting users through Twitter and other online platforms, to help.

"It is my understanding that ... there were some types of offensive activities that [CyberPoint International] couldn't or wouldn't do for the client and the client did not want to be told no so they sought to restructure in a way that a foreign company could not impede their efforts," one former employee said.

One thing is clear: The new arrangement led dozens of employees to leave the UAE rather than join DarkMatter. Several who opted out of the relationship cited concerns about the UAE's human rights record, including arbitrary detention and torture of activists and dissidents. One cited the issue with "free speech" as a particular sore point.

A bigger question, perhaps, is whether DarkMatter's use of American- developed hacking tools is even legal, since it may be covered by U.S. export regulations. According to the Washington Post, the State Department at one point granted CyberPoint permission to advise the UAE on cybersecurity. But two people who spoke with The Intercept questioned whether DarkMatter, which appears to have subsumed CyberPoint's earlier work in the UAE, would be covered by that license.

The world of cyber exports is a confusing one. Depending on what DarkMatter is actually doing, its sales might be regulated by multiple bodies of law. If the products involve cryptography technology, there may be some arms export restrictions -- while hacking tools and zero-days are not typically regulated that way, said Eva Galperin, a global policy analyst for the Electric Frontier Foundation and technology adviser for the Freedom of the Press Foundation. "If you want to sell surveillance malware from the UAE, nothing stops you," she said during a phone interview.

The United States, however, has attempted to regulate those types of "cyberweapons," and many U.S. officials wanted to tighten regulations in response to instances like Hacking Team's sale of surveillance tools to repressive regimes. Critics of those proposed regulations pointed out that such technologies could be used for legitimate purposes, like testing products for cybersecurity or penetration testing.

It's unclear, however, where DarkMatter's work may fall in terms of export law. If the work involving U.S.-origin technology or technical expertise involved cryptography, a license would be required from the U.S. State Department. According to Colby Goodman, director of the Security Assistance Monitor and an expert in International Traffic in Arms Regulations, any American employees working on regulated products would need some sort of export license, even if they moved overseas and started working for a foreign company. "If you were a UAE citizen, and I was telling you about something that was ITAR controlled," he explained, "that would be exporting it, unless I had a license."

"It's a similar concept with classified information," he continued. Just because you leave the country doesn't mean you forget the classified information -- and if you give it away, that's a violation.

The State Department declined to comment on whether an export license had been issued to cover DarkMatter or its employees, including those formerly from CyberPoint. The Commerce Department, which regulates some security equipment sales, did not respond to a request for comment.

DarkMatter, for its part, said it has obtained proper licenses, though it did not provide details.

"DarkMatter has provided its customers with technologies worth hundreds of millions of dollars, through its global security and technology vendors," Healy, the spokesperson, said. "A number of these contracts extend to highly sensitive security systems that DarkMatter has applied for and -- following the standard screening process -- been granted export control licenses from jurisdictions including the U.S. and various European countries."

At a crowded Las Vegas convention hall in August, representatives from DarkMatter were camped out in several large canopied stations, a short stroll from a vendor making hand-rolled cigars, several open bars, and a booth raffling off a robot dinosaur.

DarkMatter has started showing up in U.S. cybersecurity circles in recent months -- including at BlackHat USA, the massive annual security and hacking conference in Vegas, where it handed out swag to attendees, including pens and notebooks adorned with a DarkMatter insignia. A representative at the booth said the company was still busy recruiting.

In his July blog post describing his UAE interview, Margaritelli wrote that he hoped his account would "serve to warn those who, like me, might find themselves dragged into shady affairs, partially or completely unaware, as well as anyone pursuing job offers that entail moving to the UAE. Know that you would be giving up your privacy, and more importantly, your freedom of speech for money."

Not everyone I spoke with agreed with his view. French security researcher Matt Suiche, whose cybersecurity startup Comae Technologies is also based in the UAE, said that "every country does surveillance" and hiring foreign workers in the UAE was not unusual; the UAE was simply trying to establish its own technology base. "It's like the UAE Mars mission," he said.

Some of the former CyberPoint employees in the UAE said they didn't mind the surveillance work, treating it as an inevitable and natural path for a young modern nation facing legitimate threats. "I was impartial to the work I did," one former employee told me. For the UAE, the source said, using surveillance to track its own citizens has become normalized. He described himself as a "realist" though admitted he tried to minimize his "exposure to certain things" the company did.

"You can't blame the bag man for the job you gave them," he said.

In the lobby of a Vegas hotel during BlackHat, I spoke with Margaritelli about his frustrations with DarkMatter -- a Platinum sponsor at the event. He has all the trappings of a hacker from movies, including lip and nose piercings, rectangular glasses, and cigarettes. He avoids cellphones but finds other ways to communicate. He went to school for physics and engineering but never finished his degree. He has a very specific memory for numbers, network domains, addresses, and people. Though he says his English isn't very good, he can rapidly translate Italian text into colloquial English.

Margaritelli told me he started off wary of DarkMatter. He was familiar with the UAE government's reputation of locking up and disappearing dissidents and purchasing surveillance equipment from other countries. Plus, his interviewer -- a former employee of another controversial surveillance company, Verint -- seemed a little too interested in Bettercap, Margaritelli's well-known hacking tool.

While some researchers may argue that what DarkMatter is doing is simply par for the course in cybersecurity, Margaritelli said that the scale of the endeavor is unprecedented, creating a zombie hoard of infected devices, primed for hacking and surveillance. "In a near future, every single electronic device in the UAE will unwillingly be part of their state botnet," he said.

Later, in an email, Margaritelli wrote that he works with all sorts of hacking technologies, but he remains shocked by DarkMatter's ambitions to surveil an entire nation. "What they want to do," he wrote, "it's fucking insane."

The Pioneer
Cyber technology as potent terror tool in jihadi hands
Thursday, 27 October 2016

New Delhi - From its very inception in July 2014, the Islamic State in Iraq and Syria (ISIS)/Daesh utilised cyberspace for propaganda and recruitment in a manner that was both innovative and extremely hard to counter. There is an active digital jihadi group within the IS which has designed effective Android Apps, and used the comparatively secure end-to- end encrypted instant messaging app Telegram, (and to a lesser degree, WhatsApp) for propaganda, weapons procurement, and to direct and publicise lone wolf/wolf pack attacks. As entry into its communication networks is difficult, prevention and countering of such terrorist acts is one of the most challenging tasks confronting intelligence and law enforcement agencies.
The cyberjihadis (several groups such as the Cyber Caliphate, and three United Cyber Command have been identified) have proved their expertise on the dark web and have set up several websites for recruitment and tutorials on weapons-making, which can be entered only on invitation. The UCC has been able to hack (April 2016) into the Pentagon, the Department of Homeland Security, and several other federal agencies in the US, and has obtained data of around 43 personnel and put them on a so-called Kill List, which was circulated through a channel on the Telegram, Al Nashir. While the IS has not acted on the Kill List so far, the expertise of the hackers is cause for disquiet. Also, serious attempts have been made in the past one- and-a-half years to establish covert secure, encrypted financial networks.

The Paris (November 13, 2015) and Belgium (March 22, 2016) attacks underscored the danger of encrypted messaging. In both cases, security agencies were unable to get any advance information of the terrorist strikes, despite several perpetrators being on their watch-lists.

In September this year, an IS-affiliated group, Cyber Kahalifah, began to advertise the use of a lesser known technology, the ZeroNet, as the safest mode of communication. The Zero Net, which is in the public domain and can be downloaded free of charge from https.zeronet.io, is a web-hosting platform which decentralises the hosting of content and allows for asymmetric encryption of domain names and addresses.

It offers an unprecedented degree of anonymity. For instance, normally, a website is hosted at a server, and is allotted an IP address, or a series thereof. Users, identifiable by their own unique IP addresses, communicate and interact with the website by specifying the web address (url). Then, a DNS (Domain Name Server), directs the user to the IP address of the website the user wishes to access. Data can then be exchanged between the user and the website. The ZeroNet, on the other hand, can host a single website in a number of locations (for example, user computers), by leveraging Peer-to- Peer (P2P) networks, the most notable of which is BitTorrent.

In P2P networks, users (called peers) communicate and share data directly between one another, as opposed to communicating via a central server, as is the case with most websites. A server, called Tracker, connects peers to one another and handles requests for transfer(s) of data.

Other differentiators are that ZeroNet ensures the fidelity of the websites themselves is maintained through asymmetric two-way encryption. Authors of a website receive a private key, which enables only he/she to make changes to the website, while interested peers receive the public key (analogous to a website url) which allows them to access the site. This has two consequences: First, the entire build of the website remains on the author's computer, and not on any server; and second, there is guaranteed verification of the creator of the website and any files downloaded therefrom.

The ZeroNet also offers full Tor compatibility, which means that IP addresses can be masked, adding another layer of security. Moreover, ZeroNet claims that it can be used over non-Internet networks as well, such as Bluetooth, which would be a valuable enabler forjihadi networks. Finally, content can be distributed remarkably quickly, and very likely scales with the number of visitors and seeders of the site.

Cyber Kahalifah has set up a website on ZeroNet, which in late September gave calls for lone wolf attacks in various countries, and directed visitors to an application called 'Alrawi', designed by the IS, which works on Android platforms for logistic and monetary help. The IS's English online magazine, which had been called Dabiq, has been suspended and the group has brought out a replacement, Rumaiyah(Rome). The Rumaiyah contains explicit exhortations for violent action in the Dar ul-Harb and unsurprisingly has been posted on the ZeroNet.

Given the above backdrop, the use of ZeroNet by the Islamic State terror organisation and other terrorist groups is of great concern. With the IS facing international bludgeoning in Iraq and Syria, it is likely that it will lose Mosul and Aleppo sooner rather than later - and possibly Raqqa will follow. The exodus of foreign fighters from the region is now very evident, and the re-migration of a sizeable section to the Af-Pak region is a possibility.

The IS is attempting to establish itself in Afghanistan through its franchise, the Wilayat Khorasan, and has been able to attract some Indians there, notably the group of 21 young people from Kerala. One of them, Sajjer Mangalachari Abdullah, from Kozhikode, has now been identified as a key IS recruiter, and is reportedly functioning from Nangarhar in Afghanistan. Attempts to radicalise vulnerable sections are ongoing in India, and the National Investigation Agency has been able to intercept scores of such individuals. International jihadi inter-connectivity could result in the ZeroNet gaining traction in India through these networks.

From an Indian security standpoint, this is of particular concern: Local franchises of terrorist organisations with access to even meagre Internet resources, could increase the scale of propaganda and training content, and make prevention and anticipation of terror attacks a Herculean task. Agencies involved in monitoring and law enforcement need to urgently familiarise themselves with the working of ZeroNet, as jihadi groups have shown considerable fleet-footedness in adapting to technological challenges. The Indian state cannot afford to be out of sync on this issue.

The Australian
Reserve Bank fights off a new cyber attack every two seconds
Thursday, 27 October 2016
Byline: Daniel Palmer

Canberra - The Reserve Bank is fighting a war against cyber security threats, with potential hackers testing the resilience of its systems every two seconds, according to the central bank's technology chief. Sarv Girn, chief information officer at the RBA, told delegates at the Gartner Symposium on the Gold Coast that the central bank was withstanding a barrage of potential attacks.

"In this era, cyber security is an inherent dimension of operational resilience. It's something that can stop you in the race and needs more attention than ever before," he said. "We place a lot of importance in this so that appropriate defences can be established as the threats change." Mr Girn's presentation, which outlined the broad technological challenges confronting organisations, came eight months after hackers funnelled about $135 million from the Bangladeshi central bank. That scandal forced the departure of the bank's chief and was enabled by malware developed in North Korea and Pakistan.

The RBA is anxious to thwart such cyber security threats which have become commonplace hi-tech sectors.

"Our external perimeter, like most other organisations, is faced with a barrage of scans and probes; in fact we have one probe every two seconds," Mr Girn said.

"Metrics such as this serve to understand the risks to our environment so that pragmatic cost-effective mitigating controls can be established." The endeavours of hackers to gain access to RBA systems have led to a surge in suspicious emails, with around 70 per cent of the emails received by the RBA "malicious in nature".

It follows on from the moderate success of a phishing scam in November 2011 that saw six RBA staff click on a malicious link, although the issue was defused without the leaking of sensitive information.

The central bank was also hit by a denial of service attack in November 2013, with Indonesian hackers taking credit for the actions, which also impacted the Australian Federal Police.

Mr Girn said IT systems reliability had become increasingly vital, with any failure to protect core operations placing entire businesses at risk.

"Whilst attaining digital reliability has been a crucial need for many years, the impact and consequence of getting this wrong in today's economy can threaten the very viability of an organisation," he said."Your risk appetite statement has to recognise the risks ... and the extent to which they are acceptable."

Washington Free Beacon
Report: Chinese Spies Stole Pentagon Secrets
Thursday, 27 October 2016
Byline: Bill Gertz

Washington - Chinese spies repeatedly infiltrated U.S. national security agencies, including official email accounts, and stole U.S. secrets on Pentagon war plans for a future conflict with China, according to a forthcoming congressional commission report.
"The United States faces a large and growing threat to its national security from Chinese intelligence collection operations," states the late draft report of the U.S.-China Economic and Security Review Commission.

"Among the most serious threats are China's efforts at cyber and human infiltration of U.S. national security entities."

Chinese intelligence activities have "risen significantly" in the past 15 years and are conducted through several spy services, including the Ministry of State Security (MSS), the People's Liberation Army (PLA), and Communist Party military organizations such as the PLA General Political Department and the Party's United Front Work Department.

A copy of the draft annual report for 2016 was obtained by the Washington Free Beacon. The final report will be released Nov. 16.

The report identified repeated infiltrations by Chinese spies of U.S. national security entities, including the FBI and the U.S. Pacific Command.

Defense officials said one of the more damaging spy cases involved retired Lt. Col. Benjamin Pierce Bishop, a defense contractor at the U.S. Pacific Command, who pleaded guilty in March 2014 to supplying classified information to a Chinese woman he dated.

The compromised information included secret U.S. war plans, nuclear weapons and deployment information, secrets on the MQ-9 Reaper drone, and a classified report titled "The Department of Defense China Strategy."

Other Chinese human intelligence operations included the case in 2010 of James Fondren, a high-ranking Pacific Command official who passed a secret 2008 National Defense Strategy report to China; and Gregg Bergersen, who passed secrets to China until his arrest in 2008. Both were recruited by PLA spies.

In addition to targeting officials with access to secrets, Chinese intelligence is targeting American academics at think tanks involved in China studies and, in at least one case, an American student in China, Glenn Duffie Shriver.

"Chinese intelligence has repeatedly infiltrated U.S. national security entities and extracted information with serious consequences for U.S. national security, including information on the plans and operations of U.S. military forces and the designs of U.S. weapons and weapons systems," the report said.

"This information could erode U.S. military superiority by aiding China's military modernization and giving China insight into the operation of U.S. platforms and the operational approaches of U.S. forces to potential contingencies in the region."

Additionally, the report states that China cyber operations have targeted critical U.S. infrastructure, such as the electrical power grid and financial networks.

"U.S. critical infrastructure entities are a major target of Chinese cyber operations, and China is capable of significantly disrupting or damaging these entities," the report says.

Regarding intelligence targeting of American decision makers, the report noted that MSS hackers conducted the cyber attacks against the Office of Personnel Management last year involving the theft of records on 22 million federal employees.

In August, an FBI electronics technician, Kun Shan "Joey" Chun, pleaded guilty to acting as a Chinese agent after passing sensitive data to China about FBI surveillance technologies.

"Among the information extracted were 5.6 million fingerprints, some of which could be used to identify undercover U.S. government agents or to create duplicates of biometric data to obtain access to classified areas," the report said.

Chinese intelligence also hacked and infiltrated the personal email accounts of many Obama administration officials, the report said.

Chinese cyber espionage is carried out by what the report said was a "large, professionalized cyber espionage community."

"Chinese intelligence services have demonstrated broad capabilities to infiltrate a range of U.S. national security (as well as commercial) actors," the report says. "Units within the former 3PLA, in particular, have been responsible for a large number of cyber operations against U.S. actors."

Other targets of cyber attacks include U.S. diplomatic, economic, and defense industrial sectors involved in supporting American national defense programs. The data could be used to support Chinese military modernization, as well as provide Chinese Communist leaders with insights into U.S. leadership perspectives on key China issues.

Chinese military planners also would benefit from the intelligence activities by helping "build a picture of U.S. defense networks, logistics, and related military capabilities that could be exploited during a crisis."

China's government also uses unofficial spies to gather information.

"In addition to the cyber espionage elements of the MSS and PLA, many unofficial Chinese actors target the United States with cyber espionage operations," the report said.

"These actors include government contractors, independent 'patriotic hackers,' and criminal actors," the report added. "Distinguishing between the operations of official and other Chinese cyber actors is often difficult, as is determining how these groups interact with each other. Some reports suggest China is shifting cyber espionage missions away from unofficial actors to centralize and professionalize these operations within its intelligence services."

Spy targets include cyber intrusions of defense and military systems that are allowing China to spy on deployed U.S. military forces.

"Moreover, by infiltrating and attempting to infiltrate defense entities in U.S. ally and partner countries, China could affect U.S. alliance stability and indirectly extract sensitive U.S. national defense information," the report says.

The annual report also concludes that despite extensive ties between Beijing and Washington, "U.S.-China relations over the past year continued to be strained."

Among the causes of tensions are Chinese territorial claims in the South China Sea, U.S. arms sales to Taiwan, the deployment of missile defenses in South Korea, Chinese cyber attacks, and the U.S. "rebalance" to Asia.

Despite a September 2015 U.S.-China agreement not to conduct government-sponsored cyber economic espionage, "Chinese cyber espionage against a range of U.S. entities continued in 2016, to the detriment of U.S. economic and national security," the report said.

In a related development, an Agriculture Department geneticist pleaded guilty on Monday to making false statements to the FBI as part of an economic espionage case involving China.

Wengui Yan lied to FBI agents about plans by a group of Chinese tourists to steal U.S. genetically-modified rice samples, Reuters reported Wednesday.

Khaleej Times
BlackBerry's third Android phone - still 'world's most secure' - DTEK60 (Canada).
Thursday, 27 October 2016

Byline: Alvin R. Cabral

Dubai - BlackBerry has apparently thrown in the towel on its smartphone business. But apparently, they're taking it back.
The Canadian company, its devices once revered as the choice for professionals, is back at it with its third Android phone, the DTEK60.

BlackBerry's newest offering - its third running Google's operating system following the Priv and DTEK50 - once again comes with the promise of being the "world's most secure Android phone".

Well, every essential aspect is has obviously been ramped up: bigger screen, better CPU, higher RAM, double the storage, souped-up camera and longer battery life. Heck, its screen resolution is even higher than both the iPhone 7 and Google Pixel.

BlackBerry has announced that it is concentrating on its other core business, which is the enterprise. What remains to be seen is how long they'll continue dishing out new devices.

But, matter of factly, there are still BlackBerry loyalists. And they'll be thrilled that - despite the fact that BlackBerry says it's not giving up on its own OS - the company is going with the operating system of choice for almost 88 per cent of users.

Iran unveils long-range, radar-evading drone
Thursday, 27 October 2016

Tehran - Iran has unveiled a new light-weight, long-range stealth unmanned aerial vehicle (UAV) capable of flying at a maximum altitude of 10, 000 feet.
The drone was put on show on Wednesday at an expo showcasing the latest achievements by the Iranian Aviation & Space Industries Association.

Hamed Sa'eedi, an official with the association, said that, with a total weight of less than 20 kilograms and a flight time of over 15 hours, the drone can conduct such non-military missions as those for mapping, filming and image-collecting. He said that Iran plans to export the drone to different countries.

Earlier this month, Iran's Islamic Revolution Guards Corps (IRGC) unveiled a new attack drone, the Saegheh (Thunderbolt), by reverse-engineering a US Central Intelligence Agency RQ- 170 Sentinel drone that had been captured in December 2011.

In recent years, Iran has made major breakthroughs in its defense sector and attained self-sufficiency in producing important military equipment and systems.

The Islamic Republic maintains that its military might poses no threat to other countries, stating that its defense doctrine is merely based on deterrence.

The Daily Beast
The U.S. Cyber War With Russia Will Wait for President Hillary Clinton
Thursday, 27 October 2016
Byline: Shane Harris, Nancy A. Youssef

Washington - After U.S. intelligence agencies and the Homeland Security Department publicly blamed Russia for a campaign of cyber espionage designed to interfere with the presidential election, the Obama administration promised a response "to protect [the country's] interests at a time and place of our choosing."
But that response seems unlikely to come before Election Day. The question of how to retaliate for Russia's unprecedented meddling in the U.S. political system has been the subject of meetings among national security officials, but as of now those plans are still being worked out, according to four officials knowledgeable about the deliberations.

Rather, the administration is likely to work in concert with the president-elect to fashion a response, one official said, like the others speaking on condition of anonymity to discuss sensitive internal deliberations. It would, after all, fall to that new commander-in-chief to deal with the repercussions or retaliating against Russia.

If polls are predictive, that person is likely to be Hillary Clinton, who is sure to have her own thoughts on how to respond to an espionage campaign that was partly designed to undermine her candidacy. Handing her a cyber campaign in progress--without her input--wouldn't be that wise. Nor would dumping an ongoing cyber war in President Donald Trump's lap be the brightest idea considering he has consistently denied any link between the hackers and the Kremlin, despite 17 intelligence agencies' claims to the contrary.

In an interview, Rep. Adam Schiff, the top Democrat on the House Intelligence Committee, said that he was not aware of the administration's plans for responding to Russia or how it might coordinate with the president-elect. But he urged the White House to hold its fire until after Nov. 8.

"I wouldn't want to take any step that might provoke [Russia] into a further escalation," Schiff told The Daily Beast. That escalation, he said, would likely consist of Russia posting of forged emails or documents online that couldn't be easily refuted in the runup to the vote.

"I don't think we want to take any steps in the next two weeks to provoke that response," said Schiff, who added that the ultimate decision should be made soon after the elections are decided. "It's not something I would want to see drag out too long."

With Trump alleging that the election has been "rigged" against him, officials and experts fear that voters could be misled by false information. This so-called disinformation campaign may have already begun. Earlier this month, the person, or people, going by the name Guccifer 2.0 posted documents said to have been stolen from the Clinton Foundation, but officials there said the files weren't theirs. And Clinton campaign staff have refused to verify the authenticity of some emails purportedly stolen from the account of John Podesta, the campaign chairman.

In an interview with NBC News, Vice President Joe Biden said the U.S. is "sending a message" to Russian President Vladimir Putin that there will be consequences for his country's actions.

"He'll know it," Biden said. "And it will be at the time of our choosing. And under the circumstances that have the greatest impact."

But there are no indications that the United States has taken any response, overt or covert.

Officials emphasized that Obama is not checking out early or shoving his problems off on his successor. Rather he is giving the next president a chance to gradually adjust to the role of commander-in- chief, at a time when the world that doesn't stop for a peaceful transfer of power.

For the candidates' part, Trump has said he would seek to repair deteriorating relations with Russia. And given that he doesn't share the intelligence community's view about the hacks, he would be unlikely to pursue punitive sanctions or other measures.

Clinton, on the other hand, has signaled a far tougher stance toward the Kremlin. Earlier this week, one of her advisers wrote a column spelling out a more aggressive Russia policy.

It is neither unprecedented nor particularly unusual for a serving president to consult with his successor. And that doesn't shield him from the political implications of any decision.

"If the policy doesn't turn out well, Obama would still be responsible," said Lawrence Korb, a senior fellow at the Center for American Progress and a senior adviser to the Center for Defense Information, who has worked on political transition teams.

Past U.S. presidents have maneuvered the murky period between the election to Inauguration Day with mixed results. One month after the 1992 election, George H.W. Bush ordered 28,000 troops into Somalia as part of a humanitarian mission, even as he left the exit strategy to his successor, Bill Clinton.

Nine months after Clinton took office, 19 U.S. troops died during the Battle of Mogadishu, and with that U.S. support of the effort there quickly became unpopular. Clinton ordered U.S. troops to withdraw in March 1994.

Four months before the end of the Clinton administration, the USS Cole was attacked, killing 17 sailors. Some critics charged that the lack of a forceful response by Clinton, and subsequently by the George W. Bush administration, emboldened al Qaeda, which attacked the United States less than a year later, on Sept. 11, 2001.

President Carter communicated with his successor, President Reagan, about efforts to free U.S. hostages from Iran, which notably happened the moment Reagan took the oath of office Jan. 20, 1981.

More recently, both presidential candidates in the 2008 race said they supported President George W. Bush and economic bailout plan in October of that year. The effects of the bailout, and the economic crisis that emerged from that period, fell to Obama to address throughout much of his presidency.

Addressing the question of what to do about Russian hacking, Schiff, the intelligence committee member, said decisions of such great consequence ought not to be made without regard to who has to deal with them.

"It makes all the sense in the world to coordinate that response with the president who's not only going to have to see it though but deal with the repercussions," Schiff said.

The Independent (UK)
EU security intelligence critical to fighting terror, says senior police officer
Thursday, 27 October 2016
Byline: Ashley Cowburn

London - Access to information in Europe-wide security databases, including the European Arrest Warrant, is "mission critical" in fighting terrorism, one of Britain's most senior policewomen has said. Helen Ball, the deputy assistant commissioner at the Metropolitan Police, also indicated that citizens in Europe would be at a greater threat from terrorism if Britain failed to work with its allies on the continent after Brexit. Ms Ball, who has been with the police force for over two decades, also ranked the European Arrest Warrant as ten out of ten in combating international terrorism.
When asked by the Lords' EU Home Affairs sub-committee about the importance of the European Arrest Warrant (EAW) on a scale of 1-10, Ms Ball replied: "At the moment we have very low usage of the European Arrest Warrant and there are very good reasons for that and as I look to the future I suspect we will have greater use of it. "So if I must answer your number question, I'd probably say on low usage at the moment about an eight... and if I'm looking to the future I think it's a 10. We must not be in a position where a terrorist can think, 'okay, there is a safe haven where it's going to take a very long time to be extradited and come to meet justice.'" She added if the European Arrest warrant was not to go forward, she would expect a replacement to bring "justice swiftly".

In 2015 alone European countries made almost 13,000 arrest requests for individuals in the UK using the warrant, including 320 on alleged terror related offences, 433 for murder and manslaughter and 191 for

rape. In the same year the UK used the EAW to make 228 requests for arrest from other EU countries, including four on terror charges, 19 for murder and manslaughter and 20 for rape.

Speaking to peers on the committee, she added: "I think the way that terrorists are currently operating and the way I see them operating in the future that means we have an enormous amount to lose from diminishing our ability to work with European police forces and to share our intelligence with them. We are all safer because we can work together across Europe and share information with each other - that genuinely is helping to keep citizens of Europe safe."

Ms Ball also emphasised the importance of Europol, the EU's law enforcement agency. Last week the National Crime Agency's David Armond warned an "immediate" and urgent decision is needed on Britain's membership of the organization or the UK would be forced out. The Home Office said a decision would be made in "due course". The senior counter terrorism official added access to Europe-wide security databases "is mission critical in protecting both the citizens of the UK and citizens of Europe that the UK policing effort is able to access that information

"I'm not going to say it has to be through a particular formal mechanism, that's for the negotiations to decide," she added.

Bloomberg View
How the Kremlin Handles Hacks: Deny, Deny, Deny
Wednesday, 26 October 2016
Byline: Leonid Bershidsky

Column - The U.S. presidential election has made "Russian hackers" a powerful brand. There is, however, another that surpasses it: Ukrainian hackers. And the story of their most recent hack contains valuable lessons for U.S. politicians, particularly Hillary Clinton and the Democrats.
A Ukrainian hacker collective calling itself CyberHunta -- a mocking reference to Russian propaganda outlets' moniker for the Kiev government, the junta -- claimed on Oct. 23 to have broken into an electronic mailbox that belongs to Vladislav Surkov, President Vladimir Putin's adviser for dealing with former Soviet breakaway regions. The purported hacked e-mails supposedly contain sensitive information, including, for example, a lengthy plan of "urgent measures for the destabilization of the situation in Ukraine."

Unlike Clinton's allies after their e-mails were published, the Kremlin immediately denied the authenticity of the leaked communications. Putin's press secretary, Dmitri Peskov, told reporters that Surkov didn't use e-mail, so those who claim to have broken into has mailbox "must have had to sweat quite a lot" to forge messages.

Peskov's denials have been refuted. The Atlantic Council's Digital Forensic Research Lab explained that the hackers' proof -- a large Microsoft Outlook data file -- contained header information for 2,237

messages, which would have required an impossible amount of sweat to forge. Besides, like any normal mailbox -- that of Clinton aide John Podesta, for example -- prm_surkova@gov.ru received plenty of routine and spam messages. They were all in the Ukrainian data dump, and they were consistent with those other Moscow recipients got at the same time.

The denial, however, precluded journalists from asking the Kremlin about the stolen e-mails again, and it cast just enough doubt on the Ukrainian feat to make the story a little less newsworthy. The Democrats could have said the WikiLeaks e-mails were forged or doctored -- and no one could have proved otherwise.

Besides, there was a grain of truth in the denial, which contains an even more important tip for the Democrats. The cautious Surkov, indeed, doesn't send or receive messages himself; he is known to always correspond through intermediaries, sometimes asking them to reply to an e- mail, sometimes calling a correspondent on the phone. The prm_surkova@gov.ru mailbox was checked by two women, presumably Surkov's assistants. No outgoing e-mails were directly from him.

This is a rather secure way to conduct one's affairs. Surkov doesn't even have to use encryption: His involvement in a matter cannot be proved by any kind of electronic trail. If people send documents to his office, it's their affair, not his.

Here's an example described by the Atlantic Council's Digital Forensic Research Lab. A Moscow magazine editor sent an "open letter from the residents of the Donbass" to a government official for approval and editing. The bureaucrat sent it on to Surkov's office. It's not clear whether Surkov saw or edited it, but a few days later the magazine published a slightly altered version of the "letter."

It's not clear what Surkov thought of the plan to destabilize Ukraine, sent to him by Pavel Karpov, alias Nikolai Pavlov, a Muscovite without an official government position who has often been seen in one of the rebel-held cities -- Luhansk -- coordinating the activities of pro-Russian forces. The plan called for infiltrating the Ukrainian parliament and civil society groups, providing anti-corruption activists with evidence of the misdeeds of President Petro Poroshenko and his allies.

So what if Karpov sent this document to Surkov? He might have spammed the entire Russian government with it. So what if a leader of the separatist Donetsk People's Republic sent financial plans and casualty lists to prm_surkova@gov.ru? It's known that the separatists want Moscow's support, but there's no evidence Surkov reacted to the messages. So what if a wealthy ultranationalist, Konstantin Malofeev, who is suspected of financing Russian volunteer units that backed the pro-Moscow rebellion in eastern Ukraine, sent his proposed candidacies for the separatist "republics'" leadership to the address?

As things stand, the Ukrainian hackers, though they executed an admirable deed -- Russian government communications are better protected than those of the U.S. Democrats -- did not obtain any direct evidence of Surkov's personal involvement in the running of the separatist regions or the disruption of

Ukrainian political life. There were no e-mails from Russian officials with formal roles in the government or on the presidential staff that would shed light on their role in the conflict. All kinds of freelancers and fringe characters wrote them - - but what does that prove?

The degree of Russia's involvement in eastern Ukraine is well-known, yet no one has evidence of specific Putin aides giving any incriminating orders.

It's a cynical but effective way to play the game if you believe you'll be hacked at some point -- and if your e- mails are of interest to a hostile party, you probably will be. I understand if the Democrats don't want to act the way Putin's people do: It may seem dishonest and distasteful. But it's less naive than their strategy of blaming Russia for everything that is revealed about them. They have only themselves to blame for not giving enough thought to security.

International Business Times (UK)
WikiLeaks 'sowing the seeds of its own destruction' says former NSA chief
Wednesday, 26 October 2016
Byline: James Murdock

London - A former deputy director of the US National Security Agency (NSA), John C Inglis, believes that WikiLeaks - the whistleblowing platform led by Julian Assange - has become "internally confused" in recent years and that "natural forces" may soon wipe it out.
"WikiLeaks might be in fact be sowing the seeds of its own destruction," Inglis told IBTimes UK in an exclusive interview on 25 October, indicating the organisation has overstepped a boundary by leaking material which has the potential to influence the upcoming US presidential election.

The most recent publication has revolved around the personal emails of John Podesta, a close aide to Democratic candidate Hillary Clinton. At the time of writing, WikiLeaks has disclosed well over 30,000 documents and attachments in nearly 20 separate releases.

The US government has namechecked Assange's organisation as being complicit in a Russian-led plot to influence the elections and - allegedly after a close word from US Secretary of State John Kerry - the government of Ecuador, which is hosting Assange under political asylum, was forced to step in.

"My sense is that when Ecuador shuts down the internet access of Julian Assange - they say we are no longer comfortable with what you do - it might be that WikiLeaks has lost its way," Inglis said. "Not that I agreed with what it was doing in the first place.

"I think that from a distance, over time, they have become somewhat internally confused and I'm not sure we need to kick that house over. Maybe in the fullness of time, natural forces will cause it to deteriorate and not be as interesting or as influential as it once was."

WikiLeaks and the US government have a long and strained history. Over the years, after being sent documents by whistleblowers, WikiLeaks has published US diplomatic cables, Iraq War military logs and classified files relating to the Guantánamo Bay prison camp in Cuba. In 2015, US law enforcement confirmed an "active and ongoing" investigation into the group.

Yet Inglis, who served at the NSA for 28 years, said all governments should tread carefully in any prosecution of the group and that they "need to make sure they don't become part of the problem."

He added: "If what you decry is a lack of principal or inappropriate behaviour on the part of some entity - maybe it's WikiLeaks - you can't in responding to that commit the same sin."

There have been a number of revelations gleaned from the Podesta emails so far, including unprecedented insight into Hillary Clinton's speeches to private banking giants, files showing her relationship with Wall Street and emails detailing how Qatar and Saudi Arabia were allegedly offering "clandestine" funding to the Islamic State (Isis).

Tribune de Genève
« Nous vivons l'âge d'or de la surveillance »
Thursday, 27 October 2016
Byline: Olivier Bot

Moscou - Dans un entretien virtuel, le lanceur d'alerte Edward Snowden estime que le droit à la vie privée est toujours menacé par l'Etat
« Les sociétés les plus connectées ont plus à craindre de la surveillance globale que d'un pays comme la Corée du Nord. » Depuis la Russie, où il a obtenu l'asile jusqu'en 2017, le lanceur d'alerte Edward Snowden a participé mardi à une discussion virtuelle programmée par le Global Editors Network et le quotidien allemand Süddeutsche Zeitung, dans le cadre d'un atelier sur les nouvelles formes de journalisme d'enquête. Celui qui révéla le programme « Prism » de surveillance électronique mondiale s'inquiète toujours des atteintes à la vie privée et à la liberté des citoyens grâce à l'interconnexion des données. « La NSA est à l'intersection de nombreuses sources de données, téléphone, Internet, e-mail. Cela devient terrifiant. Nous vivons l'âge d'or de la surveillance » , lance l'ex- consultant technique de la NSA et de la CIA entre 2007 et 2009 à Genève.

« Au nom de la lutte antiterroriste, AT&T a vendu des milliards de données au gouvernement depuis le 10 juillet 2008. Coïncidence, c'est la date du « Foreign Intelligence Surveillance Act » , qui autorise l'espionnage des étrangers hors des Etats-Unis » , pointe Edward Snowden. « Il n'était plus nécessaire d'avoir l'autorisationd'un juge comme auparavant. Les compagnies ont fait payer l'accès permanent aux données confidentielles. C'était légal. »

Depuis les révélations sur le programme d'écoutes des Etats-Unis, des lois étendant les pouvoirs des agences de renseignements ont été adoptées en Suisse, en Allemagne et en France. « La surveillance des

citoyens européens a augmenté » , constate le lanceur d'alerte. L'Américain, qui risque trente ans de prison aux Etats-Unis sur la base d'une loi sur l'espionnage datant de 1917, a évoqué deux catégories de citoyens particulièrement visés par la surveillance d'Etat: les activistes et les journalistes. Concernant la presse et le data-journalisme, Snowden suggère qu' « une bibliothèque qui sécuriserait les données sensibles soit accessible, au nom de l'intérêt public, aux enquêtes citoyennes et aux journalistes » .

Interrogé pour finir sur sa situation personnelle, il se réjouit qu' « une majorité au Parlement européen ait voté l'an dernier pour (sa) demande d'asile en refusant toute extradition » . Il salue aussi « la demande européenne d'une meilleure protection des lanceurs d'alerte » .

Bangkok Post
Public hearing on cybersecurity bills set for December
Friday, 28 October 2016
Byline: Komsan Tortermvasana

Bangkok - The first public hearing on the cybersecurity and data privacy draft bills, the most critical component for a bill passage, is scheduled to take place in December after almost six months of delay. The public hearing process is expected to be completed within this year. The two draft bills are expected to take effect by 2017.

If the bills pass the hearings, they are then submitted to the National Legislative Assembly (NLA) for approval, said ACM Prajin Juntong, acting minister of the Digital Economy (DE) and Society.

The bills will address both data privacy and data security to ensure organisations take greater responsibility for cybersecurity and support the digital ecosystem.

ACM Prajin admitted the two draft bills are being closely watched by critics who have expressed concerns over the benefits of using digital service, e-business and state measures governing data security protection. "We [the government] will try our best to serve the public interest," he said.

The government is pushing up processes implementing the digital economy-related laws in a drive to complement the development of the country's digital economy.

There are eight draft bills related to digital economy laws that need to be approved by the NLA to accomplish the implementation of the country's digital economy roadmap.

As of now, however, the government can enforce only a draft bill related to the establishment of the DE Ministry, which was announced in the Royal Gazette last month.

Surangkana Wayuparb, chief executive of the Electronic Transactions Development Agency (ETDA), said the draft bill promoting the digital economy will be submitted to the NLA this month and is expected to take effect by year-end.

The Digital Economy Promotion draft bill will enable the establishment of the National Economy and Society Development committee and the establishment of the Digital Economy and Society Development fund, she said.

The draft of the new National Broadcasting Telecommunications Commission (NBTC) law is being revised by a committee of the NLA before submission to Assembly members for voting, while the amended Computer Crime Act (CCA) draft bill is under hearing.

Mrs Surangkana said the first public hearing of CCA draft bill was made on Sept 30, with the second hearing scheduled for next month.

Last week, critics complained the recent draft amendment of the CCA at a public forum fails to prevent wrongful interpretations and applications of the law.

The main problem with the amended CCA is that its definition of "offences" under Section 14 is too broad, which could lead to abuse. The CCA has proven a powerful tool to silence human rights defenders reporting alleged abuse, as well as activists who exercise free speech.

The problem has not been solved in the latest draft, despite repeated calls from rights bodies such as Amnesty International and the Thai Netizen Network to address this.

Saudi Gazette
Ransomware a war to continue in the future
Friday, 28 October 2016
Byline: Layan Damanhouri

Riyadh - An estimated EUR 1.35 million in just 9 weeks were prevented from being stolen by cyber criminals after several organizations collaborated to create the No More Ransom project this year. "It's the first time where the private sector, law enforcement, and governments collaborate to fight ransomware together," IntelSecurity's Europe, Middle East and Africa CTO Raj Samani told Saudi Gazette.

IntelSecurity joined forces with Dutch National Police, Europol, Intel Security and Kaspersky Lab as well as law enforcement agencies from 13 countries to help victims of ransomware.

Ransomware is a growing issue where one new threat arises every 6 seconds. Samani says, "Cyber criminals are making good money. Organized criminals are capable of stealing millions of dollars from companies and banks all across the world."

He adds, "It's a war that's going to continue in the future. This is the evolution of crime. People don't rob banks with guns anymore. They rob it with USB sticks and malware."

Criminals no longer need to physically steal bags of money. In addition, the type of threat will be different than the previous one and criminals will have different targets, mainly consumers.

Most countries in the No Ransomware Program are European countries and more countries are expected to join in the coming months.

On Saudi Arabia, Samani says: "Saudi Arabia is certainly targeted but not necessarily higher than other countries. However, Saudi Arabia is an economy dependent on physical resources. There's a dependency on systems that manage and protect these environments. Saudi Arabia is dependent on the security both digitally and physically of their assets."

Asked about the awareness of business leaders to adopt security and IT strategies, Samani says awareness is growing. "We're briefing major governments, leaders. It's raised its profile from what it was two years ago and it has to."

He adds, "Technology is integral to every organization across the world. Ensuring that individuals, consumers, governments, can trust those systems is the most important element. You need to make sure you have the right level of protection. Consequences can lead to a company losing up to hundreds of thousands of customers."

EQAO test glitch traced to cyber attack
Friday, 28 October 2016
Byline: Deborah Van Brank

Ottawa - The massive failure of last Thursday's online literacy test for Grade 10 students in Ontario has been traced to an intentional cyber attack.
The Education Quality and Accountability Office (EQAO) on Monday called the technical issues "an intentional, malicious and sustained Distributed Denial of Service (DDoS) attack -- a type of cyber attack."

It says a large volume of traffic from IP addresses around the globe was targeted at the network hosts of the test, with the intent of blocking school boards' and schools' and students' use of the server.

EQAO said it is looking at ways of ensuring there is no repeat.

A day after the EQAO testing, a similar DDOS attack took place aimed at several other servers and websites around the world and temporarily knocked out several sites, including Twitter.

Quick facts about the EQAO Grade 10 literacy test:

900 Ontario high schools participated - or tried to -- in the Oct. 20 online test

March, 2017, test would be mandatory for those who didn't write the October one) but most schools and school boards did so.

about 8 a.m. Thursday the traffic to the EQAO's server wasn't coming from schools or school boards. Instead, traffic volume overwhelmingly came from outside the system, which blocked legitimate users from logging in.

will score the tests that some students were able to complete. information was compromised during the attack.

Los Angeles Times
Putin denies hacking claims; Allegations that Russia is meddling in U.S. election are 'utter nonsense,' he says.
Friday, 28 October 2016
Byline: Mansur Mirovalev

Moscow - Russian President Vladimir Putin on Thursday vehemently rejected claims that Moscow is tampering with the U.S. presidential election, and said it was "utter nonsense" that the Kremlin favors Republican Donald Trump.
At the same time, Putin had kind words for Trump, saying that "he chose his method of getting through to voters' hearts."

This month, the White House accused the Kremlin of masterminding cyberattacks on the Democratic National Committee and leaking stolen emails. Democratic nominee Hillary Clinton has called Trump a puppet of Putin's.

The Kremlin has denied the accusations, and Putin called them a ploy to divert public attention from issues such as gun violence or the United States' growing debt.

Presidential hopefuls "apparently have nothing to say, so it's much simpler to distract people with presumed Russian hackers, spies and agents of influence and so on," he said in televised remarks at a gathering in the Black Sea city of Sochi.

"Does anybody seriously think that Russia can somehow influence the opinion of the American people? Is America some banana country? America is a great power," Putin said.

In praising Trump, he said: "He, of course, acts extravagantly, we all see that, but, I think, it's not that meaningless."

The Russian president was speaking at an annual forum of international foreign policy experts.

Putin used the opportunity to sharply criticize the Obama administration over its military involvement in Syria, and to call for a new Marshall Plan to rebuild the Middle East.

"The colossal scope of destruction requires development of a long-term and comprehensive program, a Marshall Plan of sorts, to revive the region torn by wars and conflicts," Putin said. He was referring to the U.S. program of financial and technical support to rebuild Western Europe after World War II.

Before its collapse in 1991, the Soviet Union showered Middle Eastern nations that sympathized with communist or socialist doctrine with aid projects that included construction of dams, export of technologies -- and a supply of Soviet-made weapons at discounted prices or free of charge.

Under Putin, Russia has sought to reclaim its Soviet-era clout in the region. Its major allies are Syria and Iran, but Sunni Arab nations have been alienated by Moscow's support for primarily Shiite countries.

A cease-fire Washington and Moscow brokered in Syria collapsed in September, and the Pentagon suspended its military cooperation with Russia, accusing it of targeting civilians in besieged Aleppo.

Putin claimed the cease-fire fell apart because of Washington's inability to distinguish between moderate opposition and radical jihadists, including Islamic State's allies.

"It's a fact," Putin said resolutely. Instead of distinguishing between "the healthy part of the opposition" and radical groups such as Al Nusra Front, "our American partners ruined the truce," he said.

Russia has decades-long ties to Syria, and Moscow saved President Bashar Assad's government by starting massive airstrikes on his opponents in September last year and helping his troops regain some key areas, including the ancient city of Palmyra.

Politico
States unprepared for Election Day cyber attack
Friday, 28 October 2016
Byline: Daniel Samuelsohn

Washington - State election officials around the country are woefully unprepared for a cyber disruption around Election Day.
While states have spent years thinking about and planning for other types of crisis that can mess with voting -- from hurricanes to power blackouts and terrorist attacks -- they've been slow and ill staffed to develop contingency plans responsive to a hack attack that would adequately protect their systems in time for the 2016 presidential election.

"They're waking up to it, but they largely don't know what questions to ask," said Jeremy Epstein, a senior computer scientist at the nonprofit research center SRI International and an expert on voting mechanics.

A dozen battleground state officials surveyed by POLITICO insist the voting systems themselves are safe, as nearly all parts of the balloting process take place in a secure, offline environment. But they also repeatedly acknowledged there are limits to what they can control, and they recognize they face legitimate challenges from cyber intrusions to the myriad adjacent parts that go into an election, including online registration records and publicizing vote tallies.

While any manipulation of a state's official election results is seen as unlikely, there's little denying that an Internet disruption or hack could cause significant confusion and chaos on Election Day, a dark conclusion to an ugly election plagued by accusations of Russian cyber espionage and evidence-less allegations of vote tampering and rigging.

Just last week, hackers temporarily froze a sizable chunk of the internet, a worst-case scenario that would cause serious problems around the country if duplicated on Nov. 8 -- the day more than 100 million Americans are going to the polls.

A major cyberattack would leave the states on their heels as they sign in registered voters, and it would impede their work later in the day as they try to report results. Then there are the effects of an internet shutdown on voters themselves, who in many instances would be left without an integral way to look up their polling places, do last-minute research on candidates or simply track which candidate is winning.

"Certainly if Internet access in the state is down totally that's a pretty substantial issue," said Edgardo Cortes, the commissioner of the Virginia Department of Elections, which earlier this month had to deal with its online voter registration system crashing just ahead of a key deadline.

"If something like that happens, how we react to it is going to have a lot to do with the public and press having confidence" in the election, added Georgia Secretary of State Brian Kemp.

Kemp, a Republican, said he has been printing out news reports to study last Friday's DDoS attack. That strike led to disrupted service across large parts of the country on about 80 major websites, including Twitter, Spotify and The New York Times. While declining to discuss many of the details behind Georgia's contingency planning, Kemp explained that he'll have his state police on standby and he could get additional resources if the governor was forced to declare an emergency. He also said he'll be reaching out to state and local officials to make sure they've thought through the full breath of what could happen in a cyberattack.

"I'm going to double check this morning for the third time in the last three weeks to ensure there's nothing else we need to do," he said.

Federal, state and local officials have had practice dealing with the unexpected, though to this point there's been little of substance to test them on the cyber front right around a general election. New York had to postpone a primary that was scheduled to take place the same day as the Sept. 11, 2001 terrorist attacks, and Hurricane Sandy in 2012 required the relocation of more than 250 polling places in

New York and New Jersey and an extension on the deadlines for requesting and receiving absentee ballots.

But a post-Sandy assessment of contingency planning -- convened by the National Association of Secretaries of State -- didn't broach the threats from a cyberattack, and many state officials involved in the 2016 election said they'll be tested in the moment if they face a significant attempt to mess with their systems.

"At that point, we'd go to the law books," said Arizona Secretary of State Michele Reagan, whose state was forced to shutter its voter registration system for a week earlier this year after being targeted by suspected Russian hackers.

In Utah, Lt. Gov. Spencer Cox said in an interview he would have "wiggle room" to bring in the state legislature for a special session if an emergency comes up on the cyber front that he's not equipped to handle under current law.

"We'd need 24 hours, but we could do it very quickly," he said.

Federal agencies have also been scrambling since the summer to help state and local officials prepare emergency plans for the 2016 election, including via an added emphasis on cyber risks. Breaches earlier this summer to the voter registration databases in Illinois and Arizona prompted the FBI to issue a nationwide alert to the other states. The Homeland Security Department has also gotten requests from 42 states seeking help shoring up their cyber hygiene practices and assessing their online vulnerabilities.

The Election Assistance Commission, an independent agency created in the wake of the 2000 presidential election debacle, has also been providing state and local officials with reminders relevant to a computer hack, including collecting emergency contact information ahead of time for major media outlets, election staff, utility companies, maintenance workers, polling place site owners and the attorneys and judges who would be needed in a pinch for court orders to extend voting hours or for other emergency moves.

Thomas Hicks, the EAC commissioner, said in an interview he's urging the states to reexamine their own policies to take into account how prepped they are for newer risks like cyberattacks. "Things we looked at 20 years ago in terms of threats are not the same as the threats are for today," he said.

Many of the states contacted by POLITICO explained that their primary focus when planning for election chaos had involved natural disasters, blackouts and, since 2001, the threat of a domestic terrorist attacks. But they have also begun adapting their contingency plans to take into account disruptions to the internet, including losing power and telephone services. That's meant stocking up on back-up paper ballots if their computerized machines break down. They have provisional ballots in case registration lists have been tampered with. And they're making paper printouts of the key information they'll need about polling place locations and post-election audit procedures.

"The worst case scenario is making everyone register again," said Matthew Dunlap, the Democratic secretary of State in Maine. "We could do it. It'd be an enormous undertaking. That's how fail safe our system is that you can't shut down our election."

If some kind of outside event did force a change in the voting process, Dunlap said state and local officials would have to act fast in launching a public awareness campaign. "Like what happens if there's a tsunami," he said.

Several state officials said they've made recent adjustments to their policies to take into account some of the lessons learned from Sandy in 2012. In many states, that's led to changes to the law so emergency workers can now cast absentee or online ballots if they're put into service on Election Day and miss out on a chance to vote in person. They're also requesting IT staff be on call from other state agencies. And in the event that registration rolls have been tampered with, voters will be required to sign affidavits when filling out provisional ballots. It'll be time consuming, and could lead to longer waits, but the aim is to let voters participate so long as they're in the line by a pre-established deadline.

"If a line builds up we don't turn anyone away," said Iowa Secretary of State Paul Pate.

Pate, a Republican, said Iowa officials had a chance to test their backup systems recently after a phone outage at the capitol complex in Des Moines. He also said the state won't post election results online until around 9 p.m. local time on Election Day, and it would make adjustments if the state faced any significant problems accessing the internet.

"If we sense something is going on like that, we'll turn our system off," Pate said.

Like many other state officials, Pate maintained that his election system was safe from being hacked because most parts of the balloting process were not connected to the internet.

But many computer scientists say that fails to account for the many parts of the election process that do remain susceptible to cyberattack.

James Scott, a senior fellow at the Institute for Critical Infrastructure Technology, said the states face an inevitable challenge because they don't have anywhere close to the budget or personnel expertise to deal with the many threats they face. "It's interesting to hear state officials say that it is" safe from a cyberattack, he said. "It kind of shows how unqualified they are for their positions in the digital age."

New York Times
Ukrainian Hackers Release Emails Tying Russia to Uprising
Friday, 28 October 2016
Byline: Andrew E. Kramer

Moscow - A group of Ukrainian hackers has released what it says are the emails of a senior Kremlin official that show a direct Russian role in creating and directing the rebel uprising in eastern Ukraine in 2014.
The group claimed to have hacked the account of Vladislav Y. Surkov, for years President Vladimir V. Putin's chief domestic political adviser and now the top official overseeing Russia's Ukraine policy.

The group released what it says are thousands of letters to and from Mr. Surkov's office email account, adding a fat dossier to this year's vast spill of emails around the world and showing high-level Kremlin meddling in Ukraine.

While the authenticity of the documents has yet to be fully established, several of the people who corresponded with Mr. Surkov confirmed that the messages of theirs released by the hackers were the ones they sent.

In a telephone interview, Yevgeny A. Chichvarkin, a Russian entrepreneur living in exile in London, confirmed the authenticity of his emails to Mr. Surkov's aides. "Yes, this is my original text," he said.

The Atlantic Council, a Washington think tank, analyzed the emails and determined they were genuine, based partly on the routing information.

The Kremlin's spokesman, Dmitri S. Peskov, flatly denied that emails had been leaked, saying somebody "must have had to sweat quite a lot" to forge so many messages.

Mr. Peskov also said that Mr. Surkov does not use email. And, in fact, only aides to Mr. Surkov answered the correspondence, leaving the extent of his personal involvement unclear.

While Russia's hand in Ukraine has hardly been a secret, the emails, if genuine, provide fine-grained detail of Mr. Surkov's office in setting up separatist enclaves in Ukraine's east.

They also shed light on the workaday activity of a propaganda shop, including a rare example of a draft text apparently edited in Mr. Surkov's office that can be compared with a final version.

The Ukrainian group, calling itself CyberHunta -- a mocking reference to the Russian assessment that the Kiev government is a fascist junta -- released 2,337 emails from the address prm_surkova@gov.ru, many from 2014 as the eastern Ukrainian separatists established their mini- states.

The correspondence included the spreadsheet of a budget to set up a small newspaper in Donetsk, the capital of the breakaway Donetsk People's Republic.

One email alerted Mr. Surkov's office to rebel casualties in June 2014 that included a paratrooper from Pskov, a town in northern Russia. At the time, there was considerable political sensitivity over the deaths of Russian soldiers in Ukraine.

In another letter, lists of candidates for separatist government positions arrived in Mr. Surkov's inbox before their appointments.

Mr. Surkov, a former advertising executive, is widely seen as an architect of Mr. Putin's domestic political framework and the post- Communist ideology of "sovereign democracy," a term he coined. In 2013, he told an audience in London, "I am the author, or one of the authors, of the new Russian political system."

Mr. Surkov apparently received in his email inbox a letter from a Moscow magazine editor with a draft of an "open letter from residents of the Donbas," ostensibly written by local people in Donetsk to describe the horrors of war.

While it is unclear if Mr. Surkov edited it personally, the changes that appear in the published letter suggest a deft eye for trimming and sharpening a text.

"Ukrainian soldiers and Donbas militiamen are dying," the original read. "Few of them want to risk their lives and kill, most realize this is a fratricidal war."

The punchier "Ukrainian soldiers and Donbas militiamen are dying. Most realize this is a fratricidal war," wound up in the final version.

In another edit, the original -- "Our testimony in your eyes should be weightier than the assertions of specialized propagandists" -- became the subtly improved, "Our testimony in your eyes outweighs the assertions of specialized propagandists."

The Obama administration has accused the Kremlin of hacking into the computers of the Democratic National Committee and various Democratic officials and institutions in an effort to discredit the American political system. In recent weeks, there have been reports of high-level meetings at the White House to discuss ways to punish Moscow, including sanctions and covert action against Russian targets.

Newsweek
How Snowden Smartened Up Our Spying
Friday, 28 October 2016
Byline: Jack Goldsmith

Column - Three years ago, the Guardian published the first story based on the huge archive of documents Edward Snowden stole from the National Security Agency while working as an NSA contractor.
Then-attorney general Eric Holder's Justice Department quickly charged Snowden with felonies for theft of government property and mishandling classified information.

This May, however, Holder praised Snowden. "I think that he actually performed a public service by raising the debate that we engaged in and by the changes that we made," Holder said.

This seems like an improbable claim. Snowden compromised scores of surveillance techniques, representing billions of dollars of investments over many years. U.S. firms that secretly cooperated with government intelligence agencies stopped doing so to the extent they could, and public defiance became the business- compelled norm.

Firms made encryption more readily available and easier to use, which made it harder for the U.S. government to monitor communications and access data. Many foreign governments responded with countermeasures like data localization laws, tighter privacy rules and closer judicial scrutiny of U.S. collection practices.

The Defense Department claimed that the "scope of the compromised knowledge related to U.S. intelligence capabilities" as a result of Snowden's disclosures was "staggering."

This claim is unverifiable but seems plausible in light of the breadth of and reaction to the disclosures. The intelligence losses extend beyond counterterrorism, the main context in which these issues are typically discussed.

NSA collections undergird every element of U.S. national security and foreign policy--including its extensive military operations around the globe, its pervasive diplomatic engagements and its numerous economic negotiations and initiatives.

Knowing what an adversary or other foreign intelligence target is doing or planning gives the United States a huge advantage in its myriad international affairs and is a central pillar of American power.

Such knowledge is harder to come by because of Snowden. And yet Holder is still right.

At the dawn of the Snowden revelations, many wondered whether the U.S. intelligence community would be destroyed. Some hoped that it would. But the opposite has happened: Despite undoubted intelligence losses, new collection barriers and diplomatic embarrassments, the community has emerged as a stronger organization despite, indeed because of, Snowden.

What Has Snowden Wrought?

Snowden forced the intelligence community out of its suboptimal and unsustainable obsession with secrecy. "Before the unauthorized disclosures, we were always conservative about discussing specifics of our collection programs, based on the truism that the more adversaries know about what we're doing, the more they can avoid our surveillance," Director of National Intelligence James Clapper said in 2013.

Post-Snowden, the intelligence community operates on the principle that secrecy is not an absolute value, but one that needs to be traded off for other values, including domestic legitimacy. Snowden made it realize that, in the words of former NSA Director Michael Hayden, "although the public cannot be briefed on everything, there has to be enough out there so that the majority of the population believe what they are doing is acceptable."

Forced transparency meant that the intelligence community had to justify itself before the American people for the first time ever--about what it did in the domestic arena and abroad, about the legality of and accountability for its actions and about its importance to U.S. national security.

It had to open itself up to thorough scrutiny and judgment by many new institutions, including the President's Review Group and a Privacy and Civil Liberties Oversight Board (PCLOB).

Initially, this was a painful, even bewildering process--the intelligence community had no experience at explaining itself, and thus wasn't any good at it. But the transparency turned out to bring many benefits.

First, the intelligence community opened up. It got much better at talking to the public. And the sky did not fall.

Second, the intelligence community had a good story to tell. Credible public evidence emerged that the NSA was a thoroughly accountable institution performing a vital intelligence role.

"Every program was authorized and approved, and what everyone thinks of the programs, it was not a case of running amok or exceeding its authority," said civil libertarian and Chicago law professor Geoffrey Stone, a review group member.

And the value of NSA programs was publicly revealed to a greater degree than ever. The PCLOB concluded that the Section 702 PRISM and upstream programs "played a key role in discovering and disrupting specific terrorist plots aimed at the United States and other countries."

These claims by outsiders to (and in some instances, adversary critics of) the intelligence community are significantly more credible and legitimizing than when the community itself makes the same sorts of claim.

Third, the main criticisms of the NSA ended up having silver linings. It emerged from the Snowden documents (and further voluntary releases by the government) that the NSA sometimes had problems

complying with judicial orders, usually because of the difficulty of meshing legal directives with extraordinarily complex technical collection processes.

And yet these embarrassments also showed that the Foreign Intelligence Surveillance Court that monitors the NSA in secret was not, as many claimed, a rubber stamp. It was, instead, an important independent check on NSA activities.

As a result of Snowden, the FISA court is a much more credible institution that can and in the future will be relied upon more thoroughly to monitor expanded NSA activities in secret.

Another criticism of the NSA was that its aggressive collection processes abroad did not consider the rights and interests of foreign individuals and firms. The main response was Presidential Policy Directive 28, which imposed restraints on collection abroad in the interests of non- U.S. citizens.

PPD 28 does not have sharp teeth and, while it has reportedly been a pain to implement, it will probably not have a material impact on U.S. collection practices. Like many post-Snowden reforms, it imposes process and oversight constraints and forces the NSA to be more prudent in its collection practices.

PPD 28 (along with the Judicial Redress Act, which extended Privacy Act protections to foreign citizens) has the side benefit that the United States can now proudly and truthfully claim to have the most robust protections for noncitizens of any signals collection agency in the world.

Fourth, and perhaps most surprising, the intelligence community has been able to maintain and strengthen the legal authorities for its collection practices. The bulk telephone metadata program was legally and on the merits the most controversial program that Snowden revealed, and the one that the NSA seemed least interested in preserving.

The USA Freedom Act made some important reforms to this program--most notably, by replacing NSA collection and storage of the metadata with carrier storage of the data and by requiring more-limited NSA querying of the data pursuant to court approval.

And yet the NSA has ended up in a stronger position as a result. It gets access to "a greater volume of call records" than before, according to the NSA general counsel, and probably at a lower cost, since it no longer needs to store and organize the massive quantities of data.

And even more important, the program has now been vetted publicly and expressly baked into the legal system, giving it a legitimacy and almost certainly a longevity that it never could have achieved in secret.

The improbable preservation and strengthening of the bulk telephone metadata program--the least valuable and hardest to justify of the programs that Snowden revealed--is emblematic of the types of changes Snowden wrought.

Strong and Sound

Few if any important intelligence collection programs have ended because of Snowden, and the USA Freedom Act reforms actually expanded some intelligence community authorities. The intelligence community has had to subject itself to more scrutiny and process checks, and it has had to trim its sails a bit to make its practices more proportional to the ends it seeks.

But the transparency resulted in public debates that concluded that the NSA practices were worth preserving overall. From the baseline of what almost everyone expected when the scale of Snowden's revelations first became apparent, the intelligence community and especially the NSA have emerged in astonishingly good shape.

The NSA is still very much in the business of aggressive signals intelligence around the globe. Its domestic legal authorities are sounder. Its value is more apparent to the American public. It is much more adept at public diplomacy. And its central and expanding role going forward--not just for signals intelligence collection, but for cybersecurity and offensive cyberoperations--is secure.

These are but some of the public services for which the U.S. government has Snowden to thank.

Note: Jack Goldsmith is a senior fellow at the Hoover Institution and the Henry L. Shattuck professor of law at Harvard University. From 2003 to 2004, he served as the assistant attorney general, Office of Legal Counsel. From 2002 to 2003, he served as the special counsel to the general counsel of the Department of Defense.

Les assureurs peinent à convaincre les PME en matière de cybersécurité
Friday, 28 October 2016
Byline: Dominique Gallois

Paris - Selon Axa, 5 % des petites et moyennes entreprises sont couvertes pour ces risques
En matière de protection contre les cyberattaques, la route est longue de l'intention à la concrétisation. Si en janvier, une étude du cabinet PwC, révélait que 52 % des entreprises françaises envisageaient de souscrire une police d'assurance pour protéger leurs données confidentielles, dix mois plus tard rien n'a bougé. " Moins de 1 % des TPE - très petites entreprises - et à peine 5 % des PME - petites et moyennes entreprises - sont couvertes, estimait Jean-Luc Montané, directeur général d'Axa Entreprises, mercredi 26 octobre, en décrivant la vulnérabilité de ces sociétés. De plus, celles qui ont déjà des contrats, ont la plupart du temps souscrit des couvertures partielles de leurs risques informatiques. " Une nette différence avec les grandes entreprises, quasiment toutes déjà prémunies contre la cybercriminalité.

La fracture est aussi nette avec l'opinion générale car " si les Français mesurent bien l'ampleur des cyber-risques, ceux-ci sont largement sous estimés par les TPE et les PME ", relevait PwC dans un

environnement où les intrusions se multiplient. Elles ont progressé en France de 51 % en 2015 contre 38 % dans le monde.

" Le risque est plus élevé pour les TPE-PME car elles n'ont pas les moyens des grandes entreprises pour se protéger ni leurs capacités financières pour y faire face en cas d'attaque ", relève M. Montané. Les entreprises les plus menacées sont celles qui vendent directement sur Internet, et les plus visées pour leurs données sensibles se trouvent dans la santé, la finance et les services. Les dégâts peuvent être multiples, allant de la perte d'exploitation à l'arrêt de l'activité, sans parler de l'impact désastreux sur l'image de l'entreprise et surtout de la perte de confiance des clients.

Comme les autres assureurs, Axa s'est engagé voici deux ans, sur ce nouveau créneau de la cybersécurité. Depuis, le groupe diversifie ses offres. L'une d'elles se fera avec le concours de Stormshield, une filiale d'Airbus spécialisée dans la sécurité des réseaux, précise le directeur des risques techniques d'Axa, Philippe Gaillard.

" Notre taux de vente est faible ", reconnaît cependant M. Montané. Ce n'est pas faute de moyens. Après avoir formé tout le réseau d'agents, près de 400 prospections ont été lancées en quelques moi s. " Il y a une prise de conscience, nous avons l'écoute du client, mais nous n'avons pas constaté le passage à l'acte ", -explique-t-il. Dans une conjoncture difficile, le coût de ce nouveau contrat peut aussi être dissuasif. Il représente une majoration de 10 % à 20 % du budget d'assurance dommages, hors santé et automobile.

" Nous en sommes au début "Le développement de ce nouveau marché se fait de manière contrastée dans le monde. En Amérique du Nord, la croissance est exponentielle, partant de 100 millions d'euros en 2001 à 2,3 milliards en 2014. Les analystes tablent sur 8 milliards prochainement. Les assureurs anglo-saxons sont donc ceux qui maîtrisent le mieux ces sujets et tiennent le marché, qui en Europe comme en Asie en est à ses balbutiements : 160 millions d'euros pour l'un et 100 millions pour l'autre.

En France, ce secteur de l'assurance pèse à peine 40 millions d'euros et les plus optimistes le voient dépasser, à terme, le milliard d'euros. Mais il faudra du temps. " Aujourd'hui tout le monde souscrit une police d'incendie alors que le risque est très faible, c'est entré dans les moeurs depuis longtemps, relève le responsable d'Axa Entreprises. Pour la cybersécurité, nous en sommes au début. " Le développement des objets -connectés d'un côté et les menaces de plus en plus fortes d'actes terroristes, de malveillance, d'espionnage ou de rançonnage, de l'autre, pourraient accélérer la prise de conscience.

Christian Science Monitor
In Russia's cyberscene: Kremlin desires, private hackers, and patriotism
Thursday, 27 October 2016
Byline: Fred Weir

Moscow - While much is known about US cyber-war and -espionage capabilities thanks to the massive data leaks of former NSA contractor Edward Snowden, Russia's capacity for such is much more obscure. But the experience of Alexander Vyarya, which came to light virtually without notice last year, may offer a few telling glimpses of it.

Mr. Vyarya, a young Russian programmer, was a team member at Qrator, a leading Russian cybersecurity company that specializes in mitigating the effects of distributed denial-of-service [DDoS] attacks. According to his account, given to the independent Russian online news service Medusa, the company was approached by an intermediary from Russia's Ministry of Communications looking for a specialist to help with a particular problem.

Vyarya was "loaned" on an unofficial basis to Rostek, the Russian state technology conglomerate, in early 2015, and sent to an office in Sofia, Bulgaria. There, he was asked to help develop software not to block, but to amplify DDoS attacks. He did - and he was appalled when the program was "tried out" before his eyes on targets like Ukraine's Defense Ministry and the liberal Russian magazine Slon, he later told Medusa. By his account, he told his contact "I am not a hacker," and subsequently fled to Finland.

Vyarya's experience - other than the young programmer's attack of conscience and relating his story to the press - is not unusual on Russia's cyberscene, says Andrei Soldatov, one of the country's foremost cybersecurity experts and co-author of The Red Web, a history of the Russian internet - and the security services' efforts to control it - that will be released in Russian next week.

Pinning down specific Russian responsibility for hacking incidents around the world is complicated by Russia's complex arrangement of Kremlin power, semi-official liaisons, and players in Russia's burgeoning IT sector - where the general surge in patriotism since the Ukraine crisis began almost three years ago has made many young specialists more inclined to be quietly cooperative with such requests. What Vyarya describes, Mr. Soldatov says, fits the model.

"Russia's landscape is very complicated, because the private sector is actually far more advanced than the state sector in IT expertise," he says. "Chinese hacking, by contrast, almost totally originates with the security services. But in Russia there is a much wider variety of informal actors."

Cyberwar and cybercrime

According to Soldatov, one of the first examples of politically motivated hacking occurred in the early 2000s, during the second Chechen war, when a group of students in the Siberian city of Tomsk started attacking pro-Chechen websites. Russian security services took notice.

Later, the Kremlin organized several patriotic youth groups, such as Nashi and Molodaya Gvardia, with the aim of using them to crush any "Orange Revolution" type street demonstrations in Russia. Nashi was later implicated in a highly successful DDoS attack against infrastructure in Estonia in 2007.

"It's quite a clever model, since you always have security services out of the picture," says Soldatov. "At least, that was the situation before the annexation of Crimea.

"Since then there has been a big change," he adds. "The technological level and scale of cyberactivities has taken a huge leap. The crisis has made it much easier for the Kremlin to mobilize Russians in general, and to approach people in our IT industry for help on an informal basis."

Unlike the US, where there is a large overlap between state and private IT sectors - think Booz Allen Hamilton - Russia's IT industry has taken off in recent years largely without state support, says Tim Bobak, a Moscow-based expert with Group-IB, a cyberthreat intelligence company.

"The Russian IT sector has emerged largely on its own," he says. "It has good professionals. Its main problem is how to export its knowledge. Individuals can leave, but relatively few companies have managed to break out of the Russian market."

Russia, with its great national strengths in maths and engineering, has given the world a great many IT experts - and also populated the criminal underworld with highly qualified hackers. According to a report on cybercrime released this year by Group-IB, "16 out of the 19 trojans most actively used for theft can be linked to Russian-speaking cybercriminals."

A Kremlin connection

How the Kremlin enlists expertise from the private IT sector, and perhaps the criminal world as well, remains murky, says Soldatov.

"We know there is a huge pool of capable talent, and at least some people who are willing to do things that are suggested to them," he says. "We know such things are being done. What we don't know is how or why such orders are formulated, and who exactly may be involved.

"I personally don't think there is a coherent strategy at work, say, to destabilize American democracy. I think there are tactical experiments that are undertaken. When they work, they get people excited. After these hacks against the Democratic Party in the US, people say 'look, they're talking about a third force in the US elections, wow, let's do more of that,' and so on," Soldatov says.

Earlier this year a massive attack, reminiscent of the ones Vyarya described, nearly shut down Ukraine's power grid and demonstrated the extreme vulnerability of public infrastructure.

Hacking and leaking information for political impact has become depressingly commonplace. Many Russians blame US secret services for the Panama Papers last spring, which implicated close friends of Vladimir Putin in financial corruption. This week a group of Ukrainian hackers released scores of email documents allegedly from accounts connected with Vladislav Surkov, a top Kremlin aide, that purport to illustrate Russian plans to destabilize Ukraine.

Cyberbarriers

Ukrainians have the advantage of knowing Russian language and habits, and may be uniquely poised to attack Russian interests. But experts say threatened attempts to retaliate against Moscow from the West may fall flat due not only to the language barrier, but also the higher levels of secrecy common in Russian society and officialdom, as well as a media culture that effectively blocks and dilutes bad news.

"The thing that is most remarkable about the alleged hacks against the DNC and Hillary Clinton's campaign is not the technological expertise of the intrusion, which was not high at all, but the level of social intelligence that was involved," says Soldatov. "You need to know who's who in the Clinton campaign, how the chain of command runs, and an awful lot of background to go in and get the information you want, and correctly evaluate it. This suggests that the simple idea that it was military intelligence, the GRU, or the FSB [Russia's internal spy service] that did these things on their own is not an accurate picture. Outside the former Soviet Union, these agencies are not all that effective."

The relative isolation of Russia in the global IT market may also work to its advantage if it comes to a major cyber- showdown with the US, experts say.

"While we don't yet have independence from foreign-made equipment and operating systems, we are almost completely self-sufficient in cybersecurity systems," says Sergei Serstobitov, head of Angara IT, a private Moscow-based security firm.

"There is a concerted effort now to correct these deficiencies, and Russia is becoming gradually less and less dependent on Western technology. Everyone is much more aware of the need for cybersecurity than we ever were before."

CBC News
Pay problems linger for thousands of public servants as Phoenix deadline arrives
Monday, 31 October 2016
Byline: Ashley Burke

Ottawa - The federal government's self-imposed Oct. 31 deadline for eliminating the backlog of Phoenix pay problems has arrived, but some public servants say they're still going into debt to pay their bills. Two weeks ago Marie Lemay, the deputy minister in charge of the system, said the bulk of the 80,000 remaining cases would be solved by today, but warned some of the more complex files may not be resolved in time.

Global Affairs Canada employee Sabrina Arrizza said she can't believe the "magical day" is here, yet she's still owed $4,000 in missing pay.

"I've reached the point of complete hopelessness," said Arrizza, who said she's had to take out a line of credit to pay her bills.

"It's extremely distressing. I was in a better financial situation when I was a student without a job."

Earlier this summer Arrizza was told her file had risen to what the pay centre calls "the war room," where cases go when compensation advisers can't figure out how to solve them.

Managers supportive, but can't help

"It was a little complicated but I'm not sure why I've been left in the backlog," said Arrizza. "I have not received a phone call. So to me, how can you even work on my case when you haven't even called me yet to discuss it?"

Arrizza transitioned from a casual contract to a term position in May but said she wasn't paid for seven weeks. When she finally got a cheque it was for a much lower pay category, she said.

On top of that, Arrizza isn't being reimbursed for dental care. She said her managers have been very supportive, but haven't been able to help solve her problem.

"It's quite sad when it gets to the point when your managers can't even do anything about it," she said.

'It should have been fixed by now'

Dean Ashby, a manager at Measurement Canada, describes himself as a "very patient guy," but said it's "disturbing" that he's waited since April for as much as $18,000 he said he's owed.

"I've waited seven months and I think it's time to voice my opinion now," said Ashby from Penticton, B.C. "One hundred per cent it should have fixed by now."

Ashby said he's burned through his savings, has had to cut back on his daughter's dance lessons and son's go-cart racing.

"Unfortunately my kids have suffered probably the most, because they haven't been able to do their sports," said Ashby.

He returned from an 18-month leave on April 1, then went seven pay periods without a cheque. When he finally got paid in June "it was completely wrong," Ashby said.

Even when the cheques started coming, they were $700 short. Ashby is in charge of nearly a dozen staff, and said he recently realized during a team meeting that he was the lowest-paid employee in the room.

"It's unfair," said Ashby. "I'm working and working and I'm not getting paid. You can't do that. It's against the law."

Rally planned for Monday

On Oct. 19 deputy minister Marie Lemay admitted the government is "tracking a bit behind," with 30,000 out of more than 80,000 cases still unresolved.

Updated figures showing how many cases could still be in the government's backlog of Phoenix files are expected at the next technical briefing, which could come as early as this afternoon.

Public servants will hold a rally in front of the prime minister's office at 12:30 p.m. Monday to express their "ongoing frustrations with the dysfunctional Phoenix pay system," according to the Public Service Alliance of Canada.

Xinhua News Agency
China's draft cybersecurity law gets 3rd reading
Monday, 31 October 2016
Byline: Staff reporter

Beijing - China's draft cybersecurity law was submitted to legislators for its third reading at the bimonthly session of the National People's Congress (NPC) Standing Committee, which began Monday. The draft allows police and other law enforcers to take measures including freezing assets, against overseas individuals or organizations that "attack, intrude, interfere with or sabotage the nation's key information infrastructure."

La Presse+
Protection des sources journalistiques Visé par 24 mandats de surveillance
Monday, 31 October 2016
Byline: Philippe Teisceira-Lessard avec Daniel Renaud

Montréal - Le Service de police de la Ville de Montréal (SPVM) a placé sous surveillance l'iPhone du chroniqueur de La Presse Patrick Lagacé afin de connaître l'identité de ses interlocuteurs pendant plusieurs mois et de pouvoir le localiser avec le GPS intégré, dans une opération sans précédent connu au Québec.
Au moins 24 mandats de surveillance concernant le téléphone du chroniqueur ont été accordés par la justice depuis le début de l'année 2016 à la demande de la section des Enquêtes spéciales de la police, a appris La Presse. Cette section est chargée de réprimer le crime au sein même des forces de l'ordre.

Trois des mandats ont permis d'obtenir les numéros entrants et sortants de l'appareil, tant pour les appels que les messages textes. Un mandat de localisation a aussi permis aux policiers du SPVM d'activer la puce GPS de l'iPhone de Patrick Lagacé afin de savoir exactement où il se trouvait, ont admis deux enquêteurs responsables du dossier. Le SPVM dit avoir utilisé cette dernière possibilité « rarement », « jamais » ou « presque jamais ».

Le vice-président à l'information de La Presse, Éric Trottier, a vivement dénoncé l'opération, qui « constitue une attaque sans équivoque contre l'institution qu'est La Presse et contre toute la profession journalistique ».

« Au Canada, les corps de police semblent tout simplement faire fi [des] règles fondamentales » qui protègent le travail des journalistes, a-t-il écrit dans une déclaration publiée aujourd'hui (voir l'écran 5). « Il faut mettre un terme à ce qui a toutes les allures d'une véritable chasse aux sources journalistiques. »

Le principal intéressé était sous le choc en apprenant avoir fait l'objet de surveillance électronique. « Je vivais dans une fiction où la police ne ferait jamais une chose pareille », a affirmé Patrick Lagacé.

« Je pensais sincèrement que pour les journalistes, quand il était question de les surveiller par des moyens judiciaires, on appliquait un test pas mal plus rigoureux que ça. »

-- Patrick Lagacé

« J'ai vraiment l'impression d'avoir été l'objet d'une partie de pêche. Je ne les crois pas une seconde quand ils disent n'avoir aucun intérêt pour les autre numéros de téléphone » qui figuraient sur les registres téléphoniques obtenus, dans un contexte de chasse aux sources au SPVM.

FEU VERT DES AFFAIRES INTERNES

Le controversé patron sortant des Affaires internes du SPVM, Costa Labos, a affirmé en entrevue avoir donné son feu vert à ce moyen d'enquête. Il a refusé de révéler si le chef de police Philippe Pichet a été informé de la mise sous surveillance de l'appareil. M. Labos a aussi affirmé qu'« à sa connaissance », aucun autre journaliste n'avait fait l'objet de surveillance du SPVM dans les dernières années, mais sans pouvoir « le garantir ».

« Je comprends que certaines personnes peuvent avoir été offusquées ou dérangées par le fait que leur téléphone ait été [l'objet de surveillance], mais il faut faire notre travail », a fait valoir M. Labos, samedi, en entrevue téléphonique. « C'est aussi simple que ça. Je ne veux pas exagérer les choses, ni les minimiser. » Il a précisé que l'obtention des numéros entrants et sortants d'un cellulaire était parmi les moyens « les moins intrusifs » à la disposition de la police.

« Non seulement avons-nous pris la situation au sérieux, mais nous comprenons le caractère délicat du travail avec des sources et de l'importance de les protéger. »

-- Costa Labos, patron sortant des Affaires internets du SPVM

Le SPVM a annoncé vendredi que l'inspecteur-chef Labos avait été muté des Affaires internes vers la division des communications opérationnelles et informations policières, qui gère notamment les télécommunications du service de police. Rien n'indique qu'un lien existe entre cette décision et la mise sous surveillance du cellulaire de Patrick Lagacé.

Cet été, le policier avait lui-même fait l'objet d'une enquête criminelle en lien avec une traque aux fuites médiatiques. Aucune accusation n'a finalement été déposée contre lui.

Le chef de police Philippe Pichet a refusé la demande d'entrevue de La Presse.

C'est la juge de paix Josée de Carufel, de Montréal, qui a autorisé la majorité des mandats de surveillance.

« VOUS ÊTES COMME UTILE À L'ENQUÊTE »

Les mandats ont été demandés et obtenus dans le cadre du « Projet Escouade » qui portait sur des allégations de fabrication de preuve par des enquêteurs spécialistes des gangs de rue et du trafic de drogue. Cinq policiers ont été arrêtés cet été à l'issue de l'enquête, et deux ont été accusés.

L'un des policiers visés dans Escouade était Fayçal Djelidi. En surveillant le cellulaire de ce dernier, la section des Enquêtes spéciales du SPVM a détecté des contacts entre le policier et Patrick Lagacé, ont expliqué les enquêteurs Iad Hanna et Normand Borduas - responsables du dossier - au cours d'une rencontre avec Patrick Lagacé tenue vendredi.

De plus, selon eux, « des articles de journaux » étaient publiés « pas longtemps après » ces contacts, et ces articles concernaient des dossiers impliquant M. Djelidi. Aucun des articles n'a été écrit par M. Lagacé, et les reportages étaient parfois publiés par d'autres médias que La Presse.

Ces présumées fuites « nuis[aient] à des projets en cours », a affirmé M. Hanna. « Des enquêtes criminelles. »

Les policiers ont alors ouvert en parallèle une enquête pour « abus de confiance » - une infraction criminelle - contre M. Djelidi en lien avec ces fuites. C'est dans le cadre de cette enquête que le cellulaire de M. Lagacé a été placé sous surveillance, ont indiqué les deux policiers.

« C'est uniquement Fayçal qui nous intéresse. Et vous dans cette chose-là, vous n'êtes pas impliqué à titre de suspect de quoi que ce soit. Vous êtes comme utile à l'enquête, dans un sens », a affirmé Iad Hanna à Patrick Lagacé, vendredi.

Arrêté au début du mois de juillet pour la façon dont il gérait ses sources policières et pour avoir sollicité des prostituées, M. Djelidi n'a fait l'objet d'aucune accusation en lien avec les supposées fuites journalistiques. L'enjeu était devenu « un pan d'enquête qui n'était pas primordial », a indiqué M. Hanna, évoquant un « petit volet » de l'investigation.

Le policier a ajouté que les données recueillies dans le cellulaire du journaliste se trouvaient maintenant sur une clé USB « de type militaire » placée dans une voûte sécurisée.

« C'EST INQUIÉTANT »

La liste obtenue par La Presse révèle l'existence de 126 mandats divers octroyés dans le cadre de l'enquête de MM. Hanna et Borduas.

En plus des trois mandats d'obtention des numéros entrants et sortants (baptisés DNR pour « dial number recorder ») et du mandat de localisation, la police a aussi obtenu 20 mandats qui visent à obtenir l'identité des interlocuteurs de Patrick Lagacé auprès de leur propre société de téléphonie. Ces ordonnances permettent d'obtenir « qui a enregistré le compte, qui le paie, avec quelle carte. Ça va donner un peu plus d'information », a expliqué Paul Laurier, ex-policier qui oeuvre maintenant au sein de la firme Artémis Renseignement.

Selon Christian Leblanc, président sortant de l'Association des avocats en droit des médias du Canada, l'obtention de tels mandats sur le téléphone cellulaire d'un journaliste est extrêmement préoccupante.

« Dans ma pratique, je n'ai jamais été en contact avec un pareil cas, c'est-à-dire un journaliste dont le téléphone faisait partie d'un mandat DNR et encore plus un mandat DNR de façon aussi large », a-t-il affirmé en entrevue.

« C'est inquiétant, a ajouté M. Leblanc. La Cour suprême est venue dire que ce n'était que dans des cas exceptionnels et qu'il fallait s'assurer que les médias ne deviennent pas le bras d'enquête des policiers parce que si c'était le cas, les sources risquaient de se tarir et que donc le droit du public à l'information allait en souffrir grandement. »

COMPARUTION CE MATIN

La Presse comparaît ce matin à la salle 3.12 du palais de justice de Montréal afin d'obtenir les documents qui ont convaincu la justice de délivrer l'ensemble des mandats utilisés dans cette enquête. C'est au cours de la préparation de cette audience que La Presse a mis la main sur la confirmation que des mandats ont été autorisés pour mettre sous surveillance le cellulaire de Patrick Lagacé.

Encadré(s) :

L'AFFAIRE EN SEPT TEMPS

Philippe Teisceira-Lessard

Fin 2015

La section des Enquêtes spéciales du SPVM ouvre une investigation concernant le policier Faycal Djelidi, un spécialiste des gangs de rue, sur la base d'allégations de fabrication de preuve.

Entre-temps

En surveillant les numéros entrants et sortants du cellulaire de Djelidi, le SPVM découvre que le policier et Patrick Lagacé entrent parfois en contact. Selon la police, des informations auxquelles Djelidi a accès sont concurremment publiées par d'autres journalistes et d'autres médias - jamais par M. Lagacé. Les enquêteurs décident d'ouvrir un nouveau pan d'enquête criminelle concernant cette situation.

13 janvier 2016

Les Enquêtes spéciales obtiennent un premier mandat de surveillance applicable au cellulaire de Patrick Lagacé, autorisé par la juge de paix Josée de Carufel. Elle en délivrera six autres la semaine suivante. L'un d'entre eux vise à obtenir les registres téléphoniques des mois précédant janvier.

Mars 2016

Le SPVM obtient un renouvellement de ses mandats.

3 mai 2016

La juge de paix de Carufel autorise un mandat de localisation sur un cellulaire de Patrick Lagacé, qui permet au SPVM de connaître sa position grâce à la puce GPS qui y est intégrée. Pendant ce même mois, elle autorisera le renouvellement de six autres mandats de surveillance concernant le cellulaire du journaliste.

7 juillet 2016

Le chef Philippe Pichet sort de ses vacances pour annoncer l'arrestation de quatre policiers (un cinquième s'ajoutera rapidement), dont Faycal Djelidi. Ce dernier fait face à une kyrielle d'accusations en lien avec ses visites présumées à des prostituées et à de la fabrication de preuve. Aucune n'est liée aux fuites d'information dont le SPVM le soupçonnait. En conférence de presse, le chef Pichet allègue qu'un ou plusieurs des policiers arrêtés avaient tenté d'entrer en contact avec les médias.

27 octobre 2016

Dans le cadre de procédures judiciaires de routine afin d'obtenir de l'information sur l'enquête, La Presse et Patrick Lagacé apprennent l'existence de 24 mandats de surveillance autorisés contre le cellulaire du journaliste.

La Presse+
Patrick Lagacé espionné par la police Une attaque en règle contre le droit du public à l'information
Monday, 31 October 2016
Byline: Éric Trottier

Montréal - L'espionnage par le Service de police de la Ville de Montréal (SPVM) des données téléphoniques de notre journaliste Patrick Lagacé constitue une attaque sans équivoque contre l'institution qu'est La Presse et contre toute la profession journalistique.
La base du travail du journaliste - et encore plus quand il s'agit de journalisme d'enquête - consiste à recueillir des sources crédibles qui sont souvent prêtes à prendre des risques pour nous révéler des faits troublants d'intérêt public, faits que les autorités ne souhaitent souvent pas voir étaler au grand jour. Sans sources, pas de journalisme digne de ce nom.

Savoir que le SPVM a ainsi pu avoir accès à l'ensemble des données téléphoniques de notre journaliste, donc à toutes ses sources, nous inquiète au plus haut point.

La liberté de la presse est un droit fondamental consacré par la Charte canadienne des droits et libertés et reconnu par la Cour suprême du Canada, qui a aussi confirmé que ce droit inclut la liberté de collecter de l'information.

La surveillance d'un journaliste constitue une atteinte claire à ce droit fondamental et à la protection des sources journalistiques ; cela compromet de manière irrémédiable le lien de confiance qui doit

exister entre un journaliste et une source journalistique afin que les citoyens puissent être informés sur des sujets d'intérêt public et participer de manière éclairée à la vie démocratique du pays.

Malheureusement, au Canada, et particulièrement au Québec, les corps de police semblent tout simplement faire fi de ces règles fondamentales.

Ainsi, nous avons appris cette année que le grand patron de la Gendarmerie royale du Canada (GRC), Bob Paulson, avait lui-même autorisé la filature de notre journaliste Joël-Denis Bellavance dans l'espoir d'en apprendre plus sur ses sources, en 2008.

Il y a deux ans, deux agents de la Sûreté du Québec (SQ) sont aussi venus rencontrer et menacer Patrick Lagacé après l'avoir incité à se mettre à table au sujet de ses sources policières dans l'affaire Ian Davidson, ce policier corrompu qui s'est suicidé en 2012.

Toujours en 2012, la même SQ avait perquisitionné la résidence du journaliste Éric Yvan Lemay, du Journal de Montréal, à la suite d'un reportage révélant que des documents confidentiels traînaient dans les corridors d'hôpitaux.

En septembre dernier, la même SQ a saisi cette fois l'ordinateur d'un autre journaliste du Journal de Montréal, Michaël Nguyen, après la parution d'un reportage embarrassant pour la juge Suzanne Vadboncoeur.

Au lendemain de cette saisie, l'Assemblée nationale a d'ailleurs adopté à l'unanimité une motion dénonçant l'intervention policière.

Il est peut-être temps que nos gouvernants se commettent davantage en se penchant sérieusement sur le travail des policiers à l'égard des journalistes : il faut mettre un terme à ce qui a toutes les allures d'une véritable chasse aux sources journalistiques.

De graves questions

Dans le cas de Patrick Lagacé, nous sommes d'autant plus inquiets que le SPVM refuse de nous confirmer catégoriquement s'il surveille (ou s'il a surveillé) les données téléphoniques d'autres journalistes de La Presse et d'autres médias. Pressé de questions à ce sujet, l'inspecteur-chef Costa Labos, responsable jusqu'à la semaine dernière des affaires internes au SPVM et celui qui a autorisé la surveillance du téléphone de notre journaliste, a répondu : « À ma connaissance, la réponse est non, mais je ne peux pas le garantir à 100 %. Pour être sûr à 100 %, il faudrait que je vérifie chacun de nos dossiers... »

Vous comprendrez que La Presse se pose de graves questions :

1. Est-ce que le SPVM en était à une première surveillance du genre à l'égard d'un de nos journalistes ? Cette pratique est-elle régulière ?

2. Y a-t-il d'autres journalistes dont le téléphone est présentement surveillé par la police ?

3. Qui a eu accès aux données téléphoniques de notre journaliste ?

4. Qu'en ont fait les policiers ?

5. Le chef du SPVM, Philippe Pichet, a-t-il autorisé la démarche de ses policiers ? S'il ne l'a pas fait, l'approuve-t-il ?

6. Le maire Denis Coderre est-il d'accord avec une telle méthode d'enquête qui pose des risques au travail journalistique et, ultimement, à notre démocratie ?

7. Le SPVM est-il allé plus loin ? A- t-il eu recours à de la filature ou de l'écoute électronique pour surveiller des journalistes ?

8. Enfin, nos gouvernants à Québec, plus particulièrement la ministre de la Justice, Stéphanie Vallée, le ministre de la Sécurité publique, Martin Coiteux, et le premier ministre Philippe Couillard, acceptent-ils de diriger la destinée d'une société où la police peut obtenir aussi facilement un mandat pour surveiller les journalistes ?

Pour notre part, nos lecteurs et nos sources doivent savoir que La Presse n'entend pas se laisser faire sans réagir. Le lien de confiance qui devrait normalement être à la base des relations entre le Service de police de la Ville de Montréal et une grande institution comme la nôtre est rompu.

Nous agirons désormais en fonction de ces nouveaux paramètres.

Wall Street Journal
America Isn't Ready for a Cyberattack
Monday, 31 October 2016
Byline: Christopher Mims

New York - The recent cyberattack that rendered more than 1,200 websites unreachable was a warning. Experts say a similar, or larger, attack could be launched tomorrow, and we'd be powerless to prevent it. No one seems to know who was behind the attack, launched by a "botnet" of thousands of internet-connected devices. The Department of Homeland Security believes it wasn't another nation.

That sounds reassuring, but is scary: It doesn't take a government or even a skillful hacker to make much of the internet inaccessible to millions. Anyone can buy similar capability for less than $1,000.

Nations, or sophisticated hackers, are capable of worse, according to cybersecurity experts. And the threat of a counter-hack, or physical attack, seems to be an incomplete deterrent. The U.S. is believed to have employed cyberweapons to cripple Iran's nuclear-fuel enrichment program, and launched a drone to kill a hacker believed to be working with Islamic State. More recently, the Obama administration promised to retaliate against Russia for hacking email accounts of prominent Americans.

The Pentagon has a Cyber Command with both defensive and, increasingly, offensive capabilities. But retired Adm. James Stavridis, former supreme allied commander of NATO, calls it a "pickup team" of personnel from other military branches.

"Fundamentally cyber is no different than air, sea or land," says Adm. Stavridis, now the dean of the Fletcher School of Law and Diplomacy at Tufts University. "It's a place. And we're going to have national-security concerns there."

That means creating both a "cyber force," as well as a director of cybersecurity, just as we created a director of national intelligence in the wake of 9/11, says Adm. Stavridis. Such a force would be able to respond not only to attacks on the U.S. government and military, but also U.S. citizens, companies and infrastructure.

A Defense Department spokesman says responses to cyberattacks need to span "the public and private sectors at all levels," as outlined in a recent directive from the White House. In most cases, the spokesman says, the Pentagon shouldn't be involved, unless an attack poses "demonstrable harm to national security or core interests" of the U.S., such as the economy, foreign relations or public health.

At the same time, U.S. domestic law-enforcement agencies are on the cusp of gaining broader authority to hack into computers suspected of involvement in a cyberattack or other crime. The proposed changes to little- known Rule 41 of the Federal Rules of Criminal Procedure will go into effect Dec. 1, unless Congress blocks them. They will allow a judge to issue a warrant allowing agents to block or disable any computer -- be it a private company's web server or a smart TV in your living room.

The lines between the military and domestic law enforcement can blur, because attacks can take many forms. Consider the case of an attack on U.S. computers launched by terrorists operating overseas.

If notions of Pentagon-bankrolled cyber commandos employing weapons developed by the NSA, or FBI agents infiltrating and attacking computers, sound scary to you, you're not alone. On Thursday, a bipartisan group of lawmakers wrote to Attorney General Loretta Lynch to express concern about the change to Rule 41.

Security experts I talked to suggested several alternatives for enhancing America's cyberdefenses.

Dave Aitel, chief executive of cybersecurity firm Immunity Inc. and a technical adviser to the U.S. Department of Commerce, says lawmakers could consider authorizing victims to "hack back" at attackers. But that would present its own challenges, requiring changes to international law and new agreements between countries, lest a private company's retribution on an attacker across the globe be construed as an act of war.

To address the problems posed by the recent botnet attack, some people have suggested new rules for internet-connected devices.

Federal regulatory agencies have limited authority in this sphere. The Federal Trade Commission generally responds only after an incident, though it can require companies to recall products and hire outside auditors. Sen. Mark Warner (D., Va.) suggested that the Federal Communications Commission vet the security of internet-connected products before they are released. Even if adopted, that wouldn't affect devices made and used outside the U.S. Nor would new rules remedy the millions of vulnerable internet-connected devices already in use.

Jeremiah Grossman, chief of security strategy at Sentinel One Inc., says device makers should be liable for damage caused by insecure devices. That would allow Netflix Inc., for example, to sue Hangzhou Xiongmai Technology Co., maker of the many of the internet-connected cameras used in the recent attack that took Netflix offline.

In the end, all the proposals for a better-defended internet feel inadequate. They lend themselves to government overreach, cyber-vigilantism, or ineffectiveness.

We may have no choice, however. Security experts consider a "cyber-9/11" inevitable. Just as with the 9/11 attacks themselves, some experts think it will take such a calamity for government agencies, and the private sector, to cooperate toward an effective response.

What a cyber 9/11 might look like is anyone's guess.

I asked Jim Gillespie, whose firm Gray Matter Systems secures industrial- control systems, which part of America's infrastructure he worries about most. "Personally I'm most worried about the water industry," he said.

New York Times
Agents Cleared to Scrutinize Email Cache
Monday, 31 October 2016
Byline: Multiple reporters

Washington - Federal investigators have obtained a warrant to begin searching a large cache of emails belonging to a top aide to Hillary Clinton, law enforcement officials said on Sunday, as prosecutors and F.B.I. agents scrambled under intense public pressure to assess their significance before Election Day. It remains unclear whether they can finish their work by then. "The process has begun," a federal law enforcement official said.

The hurried pace at the Justice Department and the F.B.I. raises the prospect that law enforcement officials will again publicly discuss a continuing investigation involving a presidential candidate in the final days of the campaign. The F.B.I. director, James B. Comey, has faced extraordinary criticism since he sent an ambiguous letter to congressional leaders telling them that agents had discovered new emails.

Agents in an unrelated investigation of Anthony D. Weiner, the disgraced former congressman, found the emails, belonging to his estranged wife, Huma Abedin, the aide to Mrs. Clinton, this month. That prompted a renewed interest among agents who had investigated Mrs. Clinton for her use of a private email server as secretary of state. That investigation centered on whether Mrs. Clinton or her aides had mishandled classified information. Prosecutors concluded that case in July without bringing charges.

A federal law enforcement official said agents had discovered hundreds of thousands of emails on Mr. Weiner's computer, but investigators expected to examine only part of the total. Agents will have probable cause to search only the messages related to the Clinton investigation. Some of Ms. Abedin's emails passed through Mrs. Clinton's private server, officials said, which means there is a high likelihood that the F.B.I. has already read them.

Officials cautioned that there was no evidence to date that changed the Justice Department's conclusion that neither Mrs. Clinton nor her aides should be charged. They said it was possible that the review would turn up nothing, but said investigators felt obligated to check.

Mr. Comey has faced widespread criticism since his announcement on Friday, and senior Justice Department and F.B.I. officials have been under tremendous pressure to review the emails quickly and assess their importance. Both Mrs. Clinton and her Republican rival, Donald J. Trump, have called for the F.B.I. to say publicly what it knows before Election Day.

The Clinton campaign kept up the pressure on Mr. Comey on Sunday by releasing a letter signed by nearly 100 former senior Justice Department officials who sharply criticized the F.B.I. director. Among the officials who signed the letter was former Attorney General Eric H. Holder Jr., with whom Mr. Comey often clashed before Mr. Holder left office in 2015.

Over the weekend, senior Justice Department officials, some of whom advised Mr. Comey not to make a public announcement about the emails, said that they would make all resources available to conduct the investigation as quickly as possible, and that the timing of the letter -- just days before the election -- gave the matter an unprecedented urgency.

Late Friday and early Saturday, law enforcement officials said there was no chance the email review could be completed before Election Day. By Sunday, officials said they would spare no resources in the investigation and try to determine whether the new emails changed the Justice Department's conclusion not to charge Mrs. Clinton or her aides.

The emails will be reviewed by the same counterintelligence team in Washington that handled the Clinton investigation from the beginning. The review will focus on whether there is evidence in the emails that Ms. Abedin mishandled classified information or impeded the F.B.I.'s original email investigation.

Investigators will also want to know whether the new trove includes messages that Ms. Abedin did not turn over to the F.B.I. months ago. Ms. Abedin has said she did not routinely delete emails, and people close to her said she did not know these emails were on Mr. Weiner's computers. It is not clear how they got there, but it is possible they were automatically backed up.

The Justice Department efforts were described by three federal law enforcement officials who spoke on the condition of anonymity because they were not authorized to discuss the case.

The F.B.I. knew weeks ago that its investigation into whether Mr. Weiner sent illicit text messages to a 15-year-old girl in North Carolina had the potential to reignite the Clinton case. After agents seized Mr. Weiner's laptop, phone and tablet on Oct. 3, they quickly learned the computer contained a trove of Ms. Abedin's emails.

The assistant F.B.I. director in charge of the New York field office then notified the deputy director in Washington about the discovery, according to one senior law enforcement official. Agents in the Weiner case were not allowed to widely search Ms. Abedin's emails, but were told to conduct a cursory review of the metadata -- the "to" and "from" information on each message -- to see if any of the emails could be relevant to the Clinton investigation.

Once it became clear that the emails were potentially significant, lawyers at the Justice Department and the F.B.I. conducted a legal analysis of how to proceed, officials said. Because Ms. Abedin's emails were not directly related to the investigation of her husband, criminal agents could neither read the contents of the emails nor pass them to their colleagues in Washington.

Late last week, the authorities decided to seek a search warrant to examine the emails. Mr. Comey's letter gave that effort a tremendous sense of urgency. Suddenly, a follow-up inquiry that was expected to take weeks or months now needed to be rushed before Election Day.

Mr. Comey's letter also opened him up to criticism from Democrats that he seemed willing to disclose every investigative wrinkle related to the Clinton investigation, but has not said anything about the scope of an F.B.I. investigation into Russian meddling in American elections. Democrats have repeatedly

asked the F.B.I. to investigate Mr. Trump and his aides as part of that case. Mr. Comey has never said if he would.

Senator Harry Reid of Nevada, the minority leader, increased the pressure on Mr. Comey late Sunday, criticizing the director for a "disturbing double standard."

"In my communications with you and other top officials in the national security community, it has become clear that you possess explosive information about close ties and coordination between Donald Trump, his top advisers and the Russian government," Mr. Reid wrote in a letter to Mr. Comey. "The public has a right to know this information."

It was unclear what Mr. Reid was referring to. A spokesman said in a telephone interview Sunday that Mr. Reid did not believe it was his place to disclose national security information, which had been told to him in confidential briefings with senior intelligence and law enforcement officials.

"The exact information is at the discretion of the national security community, but it is Senator Reid's view that there is much more that can be said publicly than has been so far," said the spokesman, Adam Jentleson.

Mr. Comey and his allies have defended his handling of the Clinton case, calling the circumstances "exceptional."

Though Justice Department guidelines discourage making public comments about continuing investigations or doing anything that could influence an election, Mr. Comey has said he believed that he was obligated to reveal the existence of the new emails. Not telling Congress, he told colleagues, would have opened up the F.B.I. to criticism and created a cloud that would have hung over the bureau for years.

Washington Post
When hackers get into the driver's seat
Saturday, 29 October 2016
Byline: Ashley Halsey III and Michael Laris

Washington - Less than a week after one of the most massive cyber attacks in U.S. history, federal officials want to ensure hackers won't be able to invade the computers that increasingly control automobiles.
Guidelines issued for automakers and developers earlier this week by the National Highway Traffic Safety Administration acknowledge that protecting increasingly autonomous cars from cyber attack will be an ongoing battle.

"In the constantly changing environment of technology and cybersecurity, no single or static approach is sufficient," NHTSA Administrator Mark Rosekind said in a statement released with the new guidance. "Everyone involved must keep moving, adapting and improving to stay ahead of the bad guys."

The NHTSA guidance suggests a layered series of protections that will prevent a vehicle from misbehaving, even when its cyber defences are penetrated.

The goal of the guidance is to make sure cyber security is a key part of designing cars in a world where hackers and foreign powers are all hungry to reach into whatever electronic realm they can, for fun, profit or strategic advantage.

The motives of hackers are as varied as their goals. For some, it's simply to overcome cyber barriers that are established to thwart them. For others, it could be to disrupt the transportation system.

"It's like building a ten-foot wall, and somebody builds an 11-foot ladder," said Paul Brubaker, chairman of the recently formed Alliance for Transportation Innovation.

That said, there are myriad ways to keep hackers from taking control of cars, according to Brubaker. Some of it should be adapted from the military and intelligence communities, areas with which he became familiar when serving as a deputy assistant secretary of defense.

"The knowledge exists to provide state-of-the-art cyber security protection to the fleet," Brubaker said. "The question is will the industry lean into their discomfort and embrace it."

One challenge is simply defining "the industry."

The players who are developing semi- autonomous and truly driverless vehicles range from Google, which has vast experience in defending against hackers, to traditional automakers, whose focus has been more on selling cars than fending off cyber attacks.

"I think the department has given industry an excellent opportunity to step up to the plate," Brubaker said. "I'd like to see some input from folks who are working in the software-defined network world as well as the software- defined radio world to help the department develop some more refined guidance."

The cyber world had a sobering moment last year when two researchers successfully hacked into a Jeep Cherokee, disabling the brakes and transmission to demonstrate the vehicle's vulnerability. They entered the car electronically through its self-parallel-parking feature. Chrysler later issued a software patch to fix the flaw.

Just as federal officials put up out-sized planters around government buildings to prevent attacks, and Internet companies have invested in ways to counter hackers, the goal of the guidance is to "harden the vehicle's electronic architecture" against potential attacks.

To do that, there's a lot of talk about being "risk based," which basically just means companies should be deliberate about figuring out where things might go particularly badly and focus on those first. The non-binding guidance recommends that "safety-critical vehicle control systems" -- things like brakes, acceleration and steering -- should be the priority, along with "personally identifiable information."

One key step is "creating an inventory" of "all vehicles and vehicle equipment that have some form of connectivity to each other or to other services," the guidelines say.

Once risks are identified, companies should also put in place "rapid detection and remediation capabilities," according to the voluntary "best practices."

"If a cyber attack is detected, the safety risk to vehicle occupants and surrounding road users should be mitigated and the vehicle should be transitioned to a reasonable risk state," the guidance says.

Which translates to: Figure out what's happening and find a way to cut the danger fast. Of course, that's easier said than done, which makes this such a fraught area.

New York Times
F.B.I. Chief James Comey Is in Political Crossfire Again Over Emails
Saturday, 29 October 2016
Byline: Multiple Reporters

Washington - James B. Comey, the director of the F.B.I., faced a dilemma on Thursday when deputies briefed him about a new trove of emails, discovered in the course of an investigation of former Representative Anthony D. Weiner, that they said might be connected to the dormant inquiry into Hillary Clinton's private email server.
Mr. Comey, who had cleared Mrs. Clinton of any criminal wrongdoing in the email affair this summer, could let Congress know about the new developments immediately, bureau officials said, an unusual step that would risk accusations that he was unfairly harming Mrs. Clinton's presidential campaign less than two weeks before the election.

Or he could delay any announcement and examine the new emails more closely, risking criticism that he had suppressed important new information if it came out after the election, despite his pledges of "transparency" in the investigation.

Mr. Comey, a Republican appointed by President Obama three years ago, decided that he could live with criticism of his judgment, aides said. So on Friday morning, the F.B.I.'s congressional liaison emailed a letter from the director to the chairmen of eight congressional committees -- virtually ensuring that it would be quickly publicized by eager Republicans.

The reaction was swift and damning, with Mrs. Clinton's supporters and even some Republicans blasting Mr. Comey. Indeed, Mr. Comey, who was attacked this summer by Democrats and Republicans for both his decision not to bring charges against Mrs. Clinton and for the way he handled it, found himself in an even stronger cross-fire on Friday.

By late Friday, Mr. Comey felt it necessary to further explain his actions in an email to F.B.I. employees in which he acknowledged that "there is significant risk of being misunderstood." He explained that he was trying to balance the obligation he felt to tell Congress that the investigation he had said was completed was continuing, with not knowing yet "the significance of this newly discovered collection of emails."

Across Pennsylvania Avenue from the F.B.I., Justice Department officials were said to be deeply upset about Mr. Comey's decision to go to Congress with the new information before it had been adequately investigated.

That decision, said several officials who spoke on condition of anonymity, appeared to contradict longstanding Justice Department guidelines discouraging any actions close to an election that could influence the outcome.

One official complained that no one at the F.B.I. or the Justice Department is even certain yet whether any of the emails included national security material or was relevant to the investigation into whether Mrs. Clinton had mishandled classified material in her use of a private email server.

"The F.B.I. has a history of extreme caution near Election Day so as not to influence the results," Senator Dianne Feinstein, Democrat of California, said in a statement. "Today's break from that tradition is appalling,"

"Was this information Congress needed to know urgently? Of course not," said Matthew Miller, a Clinton supporter who was the chief spokesman at the Justice Department under former Attorney General Eric H. Holder Jr.

Some Republicans praised Mr. Comey on Friday for his integrity and independence in coming forward with the new information. But praise was largely drowned out by criticism, with even some of Mrs. Clinton's biggest opponents upset at Mr. Comey's sudden re-emergence in what they said was a bungled case.

"This is as bad for Comey as it is for Hillary," said Tom Fitton, president of Judicial Watch, a conservative advocacy group that has successfully sued for access to thousands of Mrs. Clinton's private emails.

Mr. Fitton said that the cryptic nature of Mr. Comey's letter to Congress begged for an explanation as to what new material the F.B.I. had found, whether it involved national security material relevant to the initial investigation, and why it was not found earlier.

"This letter raises all sorts of questions that Comey and the F.B.I. should have to answer," Mr. Fitton said. "They can't roll this out in the middle of a presidential campaign and just leave it at that."

F.B.I. officials said Mr. Comey was well aware that his decision would draw fire from many sides. Mr. Comey -- who at 6-foot-8 is a dominating and charismatic figure -- has not shied from the public spotlight and has shown an independent streak throughout his career.

As deputy attorney general in the George W. Bush administration, he butted heads with top White House officials for his refusal to sign on to a National Security Agency surveillance program. And he clashed with President Obama and other administration officials last year over what he saw as a "Ferguson effect" discouraging the police from actively pursuing suspects.

Mr. Comey and his aides had hoped to put the Clinton email controversy behind them this summer, when he decided -- in unusually public fashion - not to seek criminal charges against Mrs. Clinton or anyone else after a yearlong investigation.

But tensions have lingered, with Mr. Comey facing sharp second-guessing from Republicans on Capitol Hill and ongoing questions from even his allies.

The investigation of Mrs. Clinton and her aides has been a major reason the bureau, more than at any time since at least the Watergate era, has been drawn uncomfortably into a presidential campaign.

This month, when the moderator at a conference of police chiefs in San Diego asked him about the email controversy, Mr. Comey turned the question into a laugh line. "I appreciate you bringing it up," he deadpanned. "That's behind us. Nobody really cares anymore." The chiefs responded with knowing laughter.

Mr. Comey got so many calls from former agents and others after he decided this summer not to pursue charges in the investigation that he had to change his phone number posted online. And at a recent meeting with retired agents, he was still fielding tough questions about the decision.

"I have no patience for suggestions that we conducted ourselves as anything but what we are -- honest, competent, and independent," Mr. Comey wrote in a September email to employees. "Those suggesting that we are 'political' or part of some 'fix' either don't know us, or they are full of baloney (and maybe some of both)."

But while the relentless Republican criticism of Mr. Comey's decision not to bring charges against Mrs. Clinton has received the most attention, both Democrats and Republicans have sought to help their presidential candidates, demanding investigations into their rivals one moment, then slamming Mr. Comey the next.

In recent months, the F.B.I. has dealt with the fallout from the email decision, wrestled with whether to pursue tips about the Clinton family foundation and opened a wide-ranging counterintelligence case into whether Russia is trying to influence the election. Just this week, the F.B.I. defended itself from accusations that Democrats had curried favor with the deputy director by making donations to his wife's failed State Senate campaign in Virginia.

F.B.I. agents say their community meetings invariably lead to questions about what the bureau is or is not doing in connection with the election. Mr. Comey has urged his agents to stay above the fray. But many of them worry that regardless of the election's outcome, the F.B.I. might end up the loser.

"I've never seen it this bad," said Robert E. Anderson Jr., who retired last year as the most senior agent overseeing criminal and cyber investigations. "I don't know if it's a low point for the bureau or the entire political process."

WikiLeaks Lays Bare a Clinton Insider's Emphatic Cheers and Jeers
Sunday, 30 October 2016
Byline: Nicholas Confessore & Steve Eder

Washington - In one note, Neera Tanden groused that whoever had let Hillary Clinton use a private email address for her State Department correspondence should be "drawn and quartered."
In another, she called for Mrs. Clinton to stop stalling on whether she opposed the Keystone pipeline, worrying that "dodging another issue" would hurt her in the Democratic primaries.

And when Mrs. Clinton's team dallied over whether to publicly criticize David Brock, a longtime ally, for demanding Senator Bernie Sanders's medical records, Ms. Tanden was blunt.

"Hillary. God," Ms. Tanden wrote. "Her instincts are suboptimal."

Ms. Tanden, 46, a longtime policy adviser to Mrs. Clinton, is well known on Twitter and cable news for her peppery defenses of Mrs. Clinton and her sarcastic takedowns of Mrs. Clinton's perceived adversaries.

But her private communications with some of Mrs. Clinton's campaign aides, stolen from campaign chairman John D. Podesta and published over the last month by the activist group WikiLeaks, have revealed another side. In a sphere encrusted with suck-ups, soothers, and self-puffery, Ms. Tanden has emerged as a loyal but insistent straight- talker and acute assessor of Mrs. Clinton's stubbornness and weaknesses.

"What the emails show is somebody who is passionately invested in Hillary Clinton giving the best possible candid advice she can to advance her electoral prospects," said Howard Wolfson, a former Clinton aide and a close friend of Ms. Tanden's. He added, "And giving it privately."

The Clinton campaign declined to comment on the emails, instead saying that the hack was a product of the Russian government's meddling in the election to benefit Donald J. Trump, the Republican nominee.

But as dozens of her stolen messages have gone public, Ms. Tanden's private and profanity-laced commentary has made her something of a cult hero for an unlikely group: Trump supporters. On a Reddit page called "The_Donald," where Trump backers dissect the hacked email releases and post their findings, Ms. Tanden has garnered a slew of unwanted praise. One Trump fan called for a Neera Tanden fan club. Another dubbed her "NoFilterNeera."

Most of the stolen emails were exchanges between her and Mr. Podesta, her former boss at the Center for American Progress, a liberal think tank that Ms. Tanden now leads. Mr. Podesta is a longtime friend, and Ms. Tanden's tone is often that of a colleague grousing in the break room.

In the exchanges, Ms. Tanden can be fiercely protective of Mrs. Clinton. When Jennifer Palmieri, communications director of the Clinton campaign, wrote a sharply worded letter raising concerns about coverage of Mrs. Clinton in The New York Times, Ms. Tanden cheered. The letter "is great," she wrote to Mr. Podesta -- adding a sentence laced with profanities directed at the newspaper.

But she could also be direct about other members of Clintonworld and the candidate herself.

When news media reports began identifying potential members of Mrs. Clinton's campaign team last year, Ms. Tanden warned of griping among Democrats about racial and gender balance among Mrs. Clinton's staff picks. "I'm not the diversity police but there is grumbling on the 4 white boys running next presidential cycle," she wrote in January 2015. "So I recommend rolling out some people who look like the rest of America soon!"

In May 2015, New York City's mayor, Bill de Blasio, emailed Ms. Tanden and Mr. Podesta to let them know that he was scheduled to appear on the MSNBC show "Morning Joe" and would likely offer his opinion of Mrs. Clinton's policy vision.

"I find him a bit insufferable," Ms. Tanden wrote to Mr. Podesta. (The mayor was frozen out over the ensuing months and denied a prime speaking slot at the Democratic convention this summer.)

Ms. Tanden's internal critiques may have damaged her relationships with other members of the concentric Clinton circles, and in the immutable fashion of Washington, she seems more likely to be punished than rewarded for her honesty. Asked about the WikiLeaks releases, Ms. Tanden said in an email that while she would not authenticate any of the messages, their leaking had been "a profoundly painful experience."

"Having been a bit beaten up in the media over the last month myself, I have even greater appreciation for someone who has weathered it for 20 years," Ms. Tanden said of Mrs. Clinton, calling her a "role model." She added, "My personal efforts have been to help her be successful."

Philip J. Crowley, a former Clinton aide at the State Department who resigned in 2011 after publicly criticizing the Department of Defense for its treatment of a soldier accused of classified leaks, said he believed Ms. Tanden would still be welcome in Mrs. Clinton's inner sanctum.

"Will there have to be some conversations and a couple of beers and a mea culpa afterwards?" Mr. Crowley said. "Sure there will. But those who are experienced in the ways of Washington know how to work this."

Some of Ms. Tanden's sharpest internal criticisms concerned Mrs. Clinton's private email account, which prompted a federal investigation that is plaguing Mrs. Clinton anew. On Friday, the Federal Bureau of Investigation said it had uncovered a new trove of emails after seizing an electronic device shared by Anthony D. Weiner and his estranged wife, Huma Abedin, a top aide to Mrs. Clinton.

When Ms. Tanden first saw news reports about the private account in March 2015, she exchanged a series of emails with Mr. Podesta bemoaning how they had gotten into such a situation in the first place. She singled out other aides, including Cheryl D. Mills, a longtime senior adviser, for not recognizing the danger sooner.

"This is a cheryl special," Ms. Tanden wrote. "Know you love her, but this stuff is like her Achilles heel. Or kryptonite. she just can't say no."

As the controversy wore on, Ms. Tanden griped about the White House "crapping" on Mrs. Clinton, and insisted that Mrs. Clinton ought to make a public statement right away. She noted that Mrs. Clinton, after years of enduring attacks and scandals she regarded as trumped-up, had a tendency to be stubborn about acknowledging error.

"She always sees herself bending to their will when she hands over information, etc.," she wrote in August 2015. "But the way she has to bend here is in the remorse. Not the 'if I had to do it all over again, I wouldn't do it.' A real feeling of -- this decision I made created a mess and I'm sorry I did that."

In early September, Mrs. Clinton gave a series of interviews in which she apologized for the email issue. Mrs. Tanden joked that after one of the interviews, she "was able to breathe again."

Ms. Tanden was alert to the potential threat posed by Mr. Sanders's outsider campaign. She cautioned Mr. Podesta that aggressively going after Mr. Sanders could backfire.

"Just game out what that does to Hillary," she wrote in August 2015. "When we went after Obama, she got killed for it. Reaffirmed all her negatives, strengthened him. We had no idea it was kryptonite for us to do that, but it was."

If Ms. Tanden seemed particularly on guard, perhaps it was because she knew what a failed Clinton campaign looked like -- and how painful it could be.

During Mrs. Clinton's 2008 presidential run, Ms. Tanden wrote to Mr. Podesta about her malaise as it ended.

"I am really profoundly sad today. I thought I was over it," she wrote. "But here I am sad. She's not conceding tonight. ... And not anytime soon, either."

* For Democrats, New Focus on Clinton Email Is 'Like an 18- Wheeler Smacking Into Us'

New York Times
N.S.A. Appears to Have Missed 'Big Red Flags' in Suspect's Behavior
Sunday, 30 October 2016
Byline: Scott Shane

Washington - Year after year, both in his messy personal life and his brazen theft of classified documents from the National Security Agency, Harold T. Martin III put to the test the government's costly system for protecting secrets.
And year after year, the system failed.

Mr. Martin got and kept a top-secret security clearance despite a record that included drinking problems, a drunken-driving arrest, two divorces, unpaid tax bills, a charge of computer harassment and a bizarre episode in which he posed as a police officer in a traffic dispute. Under clearance rules, such events should have triggered closer scrutiny by the security agencies where he worked as a contractor.

Yet even after extensive leaks by Pfc. Bradley Manning in 2010 and Edward Snowden in 2013 prompted new layers of safeguards, Mr. Martin was able to walk out of the N.S.A. with highly classified material, adding it to the jumbled piles in his house, shed and car.

A federal judge in Baltimore ruled on Friday that Mr. Martin, 51, must remain jailed on charges of stealing government documents and mishandling classified information over two decades. Prosecutors say they will add new charges under the Espionage Act. Mr. Martin, whose arrest in August was disclosed by The New York Times this month, has admitted to taking the material but denies giving secrets to anyone else.

His actions, which prosecutors described in court as "breathtaking," have already cast a harsh light on the government's ability to police the 3.1 million employees and 900,000 contractors who hold clearances -- or even the much smaller number who work inside the most closely guarded programs, as Mr. Martin did. His case appears to show serious breakdowns in personnel evaluation, technology designed to detect leaks and the basic job of inspecting people leaving secure buildings.

Dennis C. Blair, a former director of national intelligence, said he was "shocked" that Mr. Martin managed to remove classified material in bulk as recently as this year, in part because the government has spent tens of millions of dollars since 2010 on measures to prevent unauthorized activity or downloads.

"If there are breakdowns in your security system, as there clearly were with Snowden and this guy, you have to look at whatever went wrong and fix it," Mr. Blair said.

Some intelligence officials sounded a defensive note. William R. Evanina, the government's top counterintelligence official, said it may be infeasible to prevent every breach at an agency like the N.S.A., with 35,000 employees.

"I don't think it's possible," Mr. Evanina said. He credited the government with doing "an amazing job" in tightening security and called the N.S.A. "one of the leaders." Despite such efforts, he said, "if someone is intent on stealing classified data, it's very hard to stop them."

But a look at Mr. Martin's past raises a question: Did his erratic behavior ever prompt a review of his top secret clearance, which allowed him to work on some of the nation's most sensitive intelligence operations over two decades at eight contractors? His record of personal and legal troubles reads like it might have been drawn from the official list of factors that can be used to deny a clearance.

In 2000, the State of Maryland put an $8,997 lien on Mr. Martin's property for unpaid taxes that he would not pay off till 2014, a sign of chronic financial difficulties. In 2003, he was charged with misdemeanor computer harassment, a result of pestering a woman with unwanted messages. The charge was eventually dismissed.

Mr. Martin has a history of "binge drinking on a monthly basis," Judge Richard D. Bennett of Federal District Court said in a detention hearing on Friday. Alcoholism does not automatically block a security clearance, officials say, but the person must acknowledge the issue and seek treatment.

In 2006, Mr. Martin was charged with driving under the influence. In 2008, he cut off another driver and in the ensuing argument, announced that he was a police officer, according to two acquaintances who did not want to be named speaking critically of him. When it turned out the other driver was an off-duty state trooper, Mr. Martin fled. The local police charged him in the incident, but the record of the episode was later expunged.

"Those are all big red flags, and reasons why you wouldn't get a clearance," said Ross Schulman, a cybersecurity expert at the Open Technology Institute at New America, a Washington research group. "What seems clear in this case is that they dropped the ball in choosing who to allow access to their material and computers in the first place."

The year after the episode of police impersonation, Mr. Martin was hired by the contractor Booz Allen Hamilton, for whom he would work at the N.S.A. for the next six years before being moved in 2015 to a Pentagon job involving offensive cyberwarfare.

A routine five-year renewal of his security clearance in 2012 should have covered all his legal tangles and the breakup of his two marriages, in the late 1990s and 2010. Such reviews include a polygraph test, in which a standard question asks about mishandling of classified information. If such a question was asked, Mr. Martin appears to have passed the polygraph.

In recent years, intelligence agencies have begun to bolster the five-year reviews with "continuous evaluation," said Mr. Evanina, the counterintelligence chief. That means public databases showing criminal or civil cases, unpaid debts and divorces should all be scanned constantly for the names of clearance-holders, he said.

In a major upgrade to the security system after the transfer of military and diplomatic files by the former Army private now known as Chelsea Manning to WikiLeaks in 2010, the N.S.A. and other agencies installed specialized software to detect unusual conduct on agency networks or large downloads of secret data. Agencies also cracked down on removable storage devices like CDs and thumb drives, literally gluing drives shut or disabling the software required to use them.

But one former senior intelligence official suggested that Mr. Martin might have dodged those safeguards because he was assigned to Tailored Access Operations, the N.S.A. hacking unit. Because the unit develops malware to break into foreign computer networks and steal secrets, its machines are segregated from N.S.A.'s main network to avoid the possibility that a rogue program could get loose and do damage.

In the separate network, the electronic alarms that sound for unusual downloads may not operate and the ban on thumb drives does not always apply, said the official, who spoke on the condition of anonymity because the investigation is continuing. "By the nature of the work he's in, you have to carve that out so as not to do harm to your own system," he said.

The last chance to stop someone from carrying off secrets is at the gates to N.S.A. facilities. Mr. Martin's lawyer, James Wyda, said in court that "there was nothing sophisticated Mr. Martin did to remove this information" from the agency. But before the lawyer could elaborate, prosecutors abruptly objected, evidently concerned about the message that security is lax.

Only the most intrusive search would detect papers or a small drive hidden under clothing, and officials fear that universal searches would be impractical and send a message of mistrust.

"You don't want to create a Stasi-like atmosphere," said Michael V. Hayden, a former N.S.A. and C.I.A. director, referring to the East German secret police. Instead, N.S.A. guards carry out random searches, which sometimes included the director, he said.

Several former N.S.A. workers said that if Mr. Martin was ever caught with a few classified pages, he might have pleaded absent-mindedness and escaped punishment. But F.B.I. agents who took 50 terabytes of data from his house found it on disks, hard drives and thumb drives. Had security guards found any of those leaving the agency, it would have set off an investigation, Mr. Martin's former colleagues said.

The N.S.A. is now conducting an internal review to track everything Mr. Martin took to its source to understand the breaches, officials said. But the case has reinforced how technology that makes it easy to store and move huge volumes of data can threaten security, Mr. Hayden said.

As more details on the case emerged last week -- including prosecutors' assertion that the documents Mr. Martin took contain the names of some intelligence officers who worked undercover -- Booz Allen Hamilton announced that it had hired the former F.B.I. director Robert S. Mueller III to review its security and management practices. For Booz Allen, Mr. Martin's arrest was a second devastating blow: Mr. Snowden was also an employee when he took hundreds of thousands of N.S.A. documents in 2013.

Senator Dianne Feinstein, the vice chairwoman of the Senate Intelligence Committee, said she expected the committee to examine the incident, both to review whether recent security upgrades at N.S.A. are sufficient and consider further improvements.

In court on Friday, Judge Bennett concluded that Mr. Martin posed too much of a flight risk to release before trial. Though there is no proof so far that Mr. Martin passed the secrets he took to others, "the harm has already occurred," the judge said, "in terms of the loss of confidence on the part of the public" in the intelligence agencies.

Bahrain News Agency
Oman participates in regional cybersecurity summit
Monday, 31 October 2016

Manama - The Sultanate of Oman has participated in the fifth Regional Cybersecurity Summit, which started Sunday in Sharm El Shaikh, Egypt. The summit is organized by the Arab Regional Cybersecurity Centre at the International Telecom Union (ITU) under the theme "Boundless Collaboration, Boundless Protection" and hosted by the National Telecommunication Regulatory Authority (NTRA).

The two-day event attracts over 300 plus CISO's senior ICT and cybersecurity officials from the MENA region, according to Oman News Agency (ONA).

The summit aims at creating shared learning and dialogue regarding cyber security challenges and issues, facilitating the exchange of information, ideas, solutions, and emerging practices that could improve cyber security posture, as well as identifying current priority areas in cyber security at the local, regional and international levels. It also seeks to enhance cross border collaboration with government, industry and critical infrastructure stakeholders that will impact regional and international preparedness.

The summit discusses potential threats and measures, as well as enhancing the cooperation between MENA regions to recognize and resolve these issues rather than only protecting their assets with the latest technologies. Furthermore, it seeks to introduce the strategic directions and plans to tackle emerging threats to the global and regional information security sector, ONA reported.

Tribune de Genève
La surveillance des données inquiète l'ONU
Monday, 31 October 2016
Byline: A.J.

Non identifié - Un expert s'étonne de voir que Yahoo a dû se plier aux demandes américaines Dernièrement, on apprenait que Yahoo avait dû espionner les courriels de ses clients à la demande des services de renseignement américains. Pour le rapporteur spécial des Nations Unies sur le droit à la liberté d'opinion et d'expression, David Kaye, c'est un vrai sujet de préoccupation. Yahoo aurait utilisé un logiciel pour analyser le trafic des boîtes mails de millions de clients dans le but de trouver les informations demandées par l'Agence de sécurité nationale des Etats-Unis et le FBI.

« La surveillance gouvernementale des communications numériques, lorsqu'elle est effectuée comme cela a été expliqué récemment, pourrait porter atteinte à la vie privée » , estime l'expert de l'ONU.

« Sur la base des allégations rapportées, je crains que la surveillance exercée de cette sorte ne réponde pas aux normes de nécessité et de proportionnalité pour la protection des intérêts légitimes d'un gouvernement » , observe-t-il. « L'adhésion apparente de Yahoo aux demandes de surveillance du gouvernement, sans contestation judiciaire évidente, soulève également une préoccupation quant à l'implication des entreprises technologiques dans les programmes gouvernementaux douteux » , ajoute David Kaye.

Dans un rapport remis au Conseil des droits de l'ONU sur la surveillance des communications en 2013, le rapporteur spécial précédent, Frank La Rue, avait conclu que « l'accès aux données de communication détenues par les acteurs des entreprises nationales » ne devait être envisagé qu'après que les « techniques moins invasives disponibles » ont été épuisées.

Montreal Gazette

Snowden: Spying by police 'radical attack on free press'

Thursday, 03 November 2016

Byline: Karen Seidman

Section: general

Montreal - To some, whistleblower Edward Snowden is a traitor. To others, he's a hero.
Whichever way you see him, Snowden - a former CIA employee and contractor for the National Security Agency (NSA) who is responsible for the largest national security breach in U.S. history - is a pivotal figure in any debate pertaining to the issue of government surveillance.

He is one of the most wanted fugitives in the world after leaking thousands of classified NSA documents to a few journalists in 2013. His disclosures revealed, among other things, that U.S. telecommunications companies were providing the NSA with virtually all their customers' phone records and that the NSA has a tool to search nearly everything a user does on the Internet.

So Snowden's talk at McGill University Wednesday night, as the city is in an uproar over police spying on La Presse reporter Patrick

Lagacé and possibly much more widespread spying as well, was timely and promised to ignite an already fierce debate on authorities overstepping their bounds and cyber spying on their own citizens.

Students lined up across the length of the campus to see him and McGill officials had to scramble to set up overflow rooms. When Snowden's giant image finally showed up on the screen, almost 90 minutes late, he was greeted with thunderous applause.

Here's what Snowden had to say, from his hideout in Russia, on some important issues: Montreal spying scandal: "The story about Montreal police spying on a journalist for the reason of uncovering sources is a radical attack on the free press," he said. "It unsettles me. It's a threat to the traditional model of our democracy." Now, he said, local police can decide that if they don't like a certain reporter, they can ask a judge to monitor their phones. It used to be such measures were reserved for real criminal threats; now they

have been repurposed to monitor journalists.

The Internet age and surveillance: We're all being watched and that's what drove Snowden to be a whistleblower. Months before he leaked the classified documents, he heard the head of the NSA outright lie, under oath, about the use of surveillance techniques. "Surveillance technologies have outpaced democratic controls," he said. Surveillance used to be too expensive to use much. Now, he said, one guy at the NSA can track with extreme precision a large number of people. "It's become technologically and financially feasible to track people."

Intelligence agencies and authorities: How do we trust intelligence agencies and officials to operate fairly? We can't, he said. Governments should establish judicial bodies with independent prosecutorial discretion to monitor these agencies and to prosecute any illegalities. "The only thing that will ensure they play fairly is the threat of criminal sanctions," said Snowden. They need to be held accountable. And the law has been failing as a guarantor of our rights, he said.

The U.S. election: He's very disappointed that the United States is going through an entire election cycle that has focused on the personalities of the candidates - with no mention of the Constitution. In any case, people should be cautious about putting all their hopes on any one political figure because they rarely deliver what they promise, Snowden said. "You can't rely on others to do the things we must do ourselves," he said. "If you want a better country, you're going to have to build it yourself."

Snowden said that while he gets a lot of attention when it comes to surveillance issues, he considers himself the least important part of the story.

Anyone who is thinking of him or his future is missing the bigger story: "What is happening to all of us."

Montreal Gazette

From words to action

Thursday, 03 November 2016

Section: general

Editorial: The bombshell that Montreal police spied on La Presse columnist Patrick Lagacé through his cellphone has prompted political leaders at all levels to speak out in defence of a free press.
Their words must be matched by action. To his credit, Quebec Premier Philippe Couillard moved swiftly to shore up protections for the media to conduct their essential work. Almost immediately, the bar will be set higher for police seeking search warrants against journalists, who will be accorded a status similar to that of lawyers, judges and MNAs.

Couillard struck a working group with representatives of the judiciary, policing and the media to make recommendations to fortify the work of journalists, a crucial pillar of a democratic society.

Among issues the group should consider is what specialized training should be required for the justices of the peace who sign offon the warrants like the ones concerning Lagacé, to ensure that they are aware of journalists' Supreme Court of Canada-recognized right to keep sources confidential. The group should also advocate better whistleblower protection, as recommended by the Charbonneau Commission, given that the Lagacé case highlights the vulnerability of sources.

Couillard initiated a probe of the Montreal, Quebec City and provincial police forces by the public security department; whether it will yield the needed answers remains in question. Unearthing the motivations and full context underlying police conduct here is crucial. So, too, is determining how widespread the practice of spying on journalists has been, as new reports surfaced Wednesday that the Sûreté du Québec was monitoring the cellphones of six journalists in 2013.

Montreal City Hall has a duty to act, too. Mayor Denis Coderre was slow to acknowledge the enormity of this disturbing episode. Police Chief Philippe Pichet has since been summoned to explain himself before the city's public safety committee. The hearing was held behind closed doors, but Coderre said a report will eventually be made public.

Transparency here is a necessity. Citizens deserve to hear what Pichet knew about this affair and when, why his force seems to be devoting so many resources to exposing officers who speak to reporters and what, if any, consequences will be meted out.

This is also a matter for federal attention. Without stronger protection for journalists and their sources, this could happen again.

The opposition wants an inquiry and is promising a private member's bill if the federal government itself doesn't act.

Politicians have rightly denounced this attack on press freedom. But how they respond now will have major repercussions on the integrity of the justice system.

CBC News

6 reporters spied on by Quebec provincial police

Thursday, 03 November 2016

Byline: Sabrina Marandola

Section: general

Quebec provincial police confirm that six members of the press were spied on in 2013 as part of a police investigation that was launched on the same day that a labour union boss filed a complaint.
Three Radio-Canada journalists said they found out today, via unnamed sources, that the Sûreté du Québec was tracking their portable phones. This comes just days after a Montreal newspaper columnist said he was similarly tracked by that city's police force.

Marie-Maude Denis and Isabelle Richer, the current hosts of the investigative program Enquête, as well as the show's former host Alain Gravel, said this afternoon that provincial police were tracking their incoming and outgoing calls and texts.

"I've just learned that my incoming and outgoing calls have been spied on by the Sûreté du Québec in 2013," Denis tweeted in French.

"My turn to get a confirmation that I was targeted by court mandates to obtain a log of my calls by the SQ," Gravel said.

Je viens d'apprendre que mes appels entrant et sortant ont été espionnés par la Sûreté du Québec en 2013.

-- @mmdenisrc

À mon tour d'avoir la confirmation comme quoi j'ai été visé par des mandats de cour pour obtenir le registre de mes appels par la SQ.

-- @gravela_rc

"Surreal ... The SQ spied on my cellphone following a formal complaint made by Michel Arsenault in 2013," Richer tweeted.

Surréaliste... La SQ a espionné mon cellulaire à la suite d'une plainte formulée par Michel Arsenault en 2013

-- @IsabelleRicher

Journal de Montreal crime reporter Eric Thibault was also under surveillance, as was La Presse's National Assembly bureau chief Denis Lessard. Another journalist, whose name hasn't been released, was also monitored.

Surveillance prompted by complaint

Arsenault's name came up a number of times at the Charbonneau Commission when, in 2013, the province's anti-corruption inquiry turned its attention to unions.

The then-president of Quebec's Federation of Labour (FTQ) came under fire after witnesses testified that Arsenault was aware of alleged links between some union leaders and organized crime but did nothing about it.

He had also been involved in a legal battle with the commission over wiretaps of his phone conversations, gathered by police in an investigation unrelated to the anti-corruption inquiry.

Arsenault sent a letter of complaint to the SQ after news that he was the subject of a police investigation was being made public.

"Michel Arsensault was under scrutiny at the time. He was upset, so he complained to the SQ, which forced police to do an inquiry ... So they decided to ask for this warrant to spy on our cellular phone," Richer said.

'We still have sources'

Richer said the three learned they had been spied on by police thanks to unnamed sources.

"We still have sources. A source told us today that we were the target of this warrant in 2013, and maybe before. Maybe we were spied for a long period of time. We don't know because those warrants are still sealed," Richer said, adding that today's revelations show that spying on journalists is systematic.

"What floored me is that this is no longer the culture at the SPVM," she said, referring to the Montreal force by its French initials. "It is also the Sûreté du Quebec."

"It's a widespread practice. With the facts we have now, it was a widespread practice," Denis added.

"It's a shock," said Gravel. "In a democratic society like ours, you never imagine that this thing could happen and be so systematic. It's two events now in the same week. So we're very concerned."

Only case in 20 years, SQ says

The Sûreté du Québec responded to the revelations late Wednesday afternoon, confirming the allegations but adding that it was the only such case in the last 20 years.

"We're talking about one case, which is one case too many, but one case going all the way back to 1995," SQ spokesman Capt. Guy Lapointe told CBC.

"The investigation targeted different individuals, some of them were reporters."

The SQ said that the investigation was closed and sealed in 2014. Current staff only found out about it now because they started looking into their procedures after the province yesterday asked police forces to investigate how they go about getting warrants.

Lapointe said that since 2013, new people and new protocols are in place at the SQ.

"You have to understand that this occurred with the prior administration of the SQ....Any investigation that is targeting a reporter...[now] needs to be authorized by the high direction, and any kind of warrant that would be obtained towards this investigation needs to be approved by the director himself."

Province to launch inquiry

Quebec Public Security Minister Martin Coiteux said the province will put together an expert panel and launch an administrative inquiry.

He said there will be an inspection of police, including the anti-corruption squad UPAC.

The inquiry will "inspect the police forces and look at the policies in place," Coiteux said. "There could be sanctions."

He also said it was "odd" that police launched an investigation on the same day that then-SQ director general Mario Laprise received a complaint from former union boss Arsenault.

"It is very peculiar. The head of the FTQ calls the SQ first thing in the morning, and that night an investigation is launched. This is a unique case which raises questions on its own, but it is the only such case in the last 20 years," Coiteux said.

When contacted by Radio-Canada, Laprise refused to comment on the matter. He would only say that the inquiry will have to take its course.

"I think we will have to wait and we will let the people do their jobs," Laprise said.

Radio-Canada said it had information that Parti Québécois MNA Stéphane Bergeron, who was Quebec's public security minister in 2013, was the one who asked Laprise to look into the FTQ case.

Bergeron denied it.

"I never asked for surveillance. It's an action that I would have never authorized. It's an initiative that I was never informed of until a few moments ago," Bergeron said Wednesday afternoon.

'A crisis'

Earlier this week, the Montreal newspaper La Presse revealed one of its columnists was the subject of a police warrant to track his cellphone communication.

Montreal police obtained 24 warrants this year to track Patrick Lagacé's whereabouts using the GPS chip in his iPhone, and to obtain the identities of everyone he communicated with.

The news prompted political leaders to call for a greater protection of journalists.

La Presse announced this afternoon it was taking legal action against the Montreal police force.

"I don't think we've seen such a crisis here in the history of journalism. We have to get the facts and then make sure that measures are taken to make sure this doesn't happen again," said Gravel.

It's not clear if the tracking is still going on because the warrants are sealed. The warrants for Lagacé will be unsealed on Nov. 24. It is not known when the warrants for the Radio-Canada reporters will be **unsealed.**

Sen. Andre Pratte wants stronger protection for reporters, sources

Thursday, 03 November 2016

Byline: Jim Bronskill

Section: general

Ottawa - Independent senator and former journalist Andre Pratte wants the Liberal government to look seriously at beefing up protection for reporters and their sources.
Pratte says if the government shows no interest, he'll pursue the idea himself.

It is "quite worrisome" that Montreal police obtained warrants to monitor one of his former colleagues, La Presse columnist Patrick Lagace, Pratte said Wednesday in an interview.

"I think it is time to look at this again."

The newspaper said this week it had learned at least 24 surveillance warrants were issued for Lagace's iPhone this year in connection with an internal probe into allegations police anti-gang investigators fabricated evidence.

Public Safety Minister Ralph Goodale says the Supreme Court of Canada has already explicitly laid out the test that must be satisfied when police investigations intersect with media freedoms.

In two key 2010 rulings, the high court did not create blanket constitutional protection for journalists, saying they are a "heterogeneous and ill-defined group of writers and speakers." Instead, the court spelled out a four-point test that allows judges to weigh competing public interests on a case-by-case basis.

The Lagace case shows something more is needed, said Pratte, former lead editorial writer at La Presse.

"I don't think we can simply say, 'The Supreme Court has issued those criteria, and they're good enough.' Well, obviously, they were not good enough to protect Mr. Lagace and his sources for a period of five months."

Despite his apparent reluctance to revisit the existing regime, Goodale left the door open a crack.

"If there are those in the federation of journalists or others who have recommendations to make about how this can be more abundantly emphasized, I would certainly be glad to receive their recommendations," he said Tuesday.

Pratte said he would contact the Liberal government for a direct answer about whether it will consider a new law.

"And if they show no interest in doing it, certainly I am looking at it," he said.

"These are very complex issues, but I think we have to look at them ... especially in the light of the Lagace affair.

"If I have a strong belief that a bill is possible and a good way to go at it, I will certainly work on it and try to get a bill on the floor of the Senate."

Former Bloc Quebecois MP Serge Menard introduced a private member's bill in 2007 to bolster protection for journalistic sources, but it did not become law.

"That may be a starting point for writing a bill," Pratte said. "What I hope will not happen is that in a couple of days, after all the emotion has disappeared, everyone will forget about it."

It emerged late Wednesday that at least six Quebec journalists working for various outlets had recently come under police surveillance.

In response to the Lagace case, Quebec Premier Philippe Couillard announced a committee of experts will look into media surveillance. He also outlined plans to make it harder for police in that province to obtain a judicial warrant to monitor journalists.

Globe and Mail

More Quebec journalists confirmed as targets of police surveillance

Thursday, 03 November 2016

Byline: Ingrid Peritz

Section: general

MONTREAL - A controversy over police surveillance of the press in Quebec deepened Wednesday with revelations that six journalists, including some of the province's top investigative reporters, had their cellphones surreptitiously monitored by provincial law enforcement as far back as 2013.
The disclosures made by several media outlets and confirmed by the provincial Sûreté du Québec suggest that covert police surveillance of Quebec journalists dates further back and is more widespread than previously known.

La Presse revealed this week that one of its journalists, columnist Patrick Lagacé, had his iPhone data tracked by Montreal police for months this year after they obtained search warrants. On Wednesday, Quebec provincial police said it had also obtained court warrants to monitor the log of incoming and outgoing cellphone calls of six journalists.

The raft of disclosures has fuelled a growing sense of alarm over state surveillance of the press. On Wednesday evening, Quebec Public Security Minister Martin Coiteux told reporters his department would lead an administrative probe into the 2013 surveillance case at the Sûreté du Québec. It had been requested by its current director-general, Martin Prud'homme.

The force was under the leadership of another chief, Mario Laprise, in 2013.

"According to the information I have, this would be the only case in the last 20 years affecting journalists targeted by a Sûreté du Québec investigation," Mr. Coiteux said in Quebec City.

Still, news that more journalists were being spied on through their cellphones left several in the media industry shaken and led the executive director of news and current affairs at Radio-Canada, Michel Cormier, to refer to the situation as an "unprecedented crisis." The five that have been identified are affiliated with Radio-Canada, La Presse and Le Journal de Montréal.

"What floors me is that this is no longer the culture of the Montreal police service," Isabelle Richer said on Radio- Canada, where she is a journalist. "It's also the Sûreté du Québec. So it's a generalized hunt for sources." On Twitter, she called the news "surrealistic."

Police say the calls were not wiretapped.

Events that led to the surveillance are also raising eyebrows. They began when Michel Arsenault, former head of the Quebec Federation of Labour, was angry about media reports that he had been the subject of police surveillance. The police actions were part of a criminal investigation into the infiltration of organized crime in the construction industry in Quebec.

Mr. Arsenault complained about the media leaks to the Public Security Minister at the time, Stéphane Bergeron of the Parti Québécois. The Sûreté du Québec investigation into finding the source of the leaks began soon afterwards.

Mr. Bergeron denied on Wednesday he had a hand in ordering the journalist surveillance. "I obviously didn't ask for surveillance. It's an initiative that should have never been authorized, it's an initiative of which I had never been informed," he said.

Captain Guy Lapointe of the Sûreté du Québec said in an interview the current head of the provincial police force, Mr. Prud'homme, is "very irritated" and "preoccupied" that the surveillance had been ordered by his predecessor.

The fresh revelations have given added urgency to opposition calls in Quebec City that the Liberal government of Philippe Couillard hold an inquiry into the controversy. On Tuesday, the Premier attempted to get ahead of the controversy, announcing measures to tighten rules for obtaining search warrants against journalists and striking a panel of experts to look into the situation.

In Ottawa that day, Public Safety Minister Ralph Goodale told reporters his government is open to toughening the rules that govern how and when the federal government can investigate members of the media.

For investigative journalists, reliance on confidential sources is crucial in exposing wrongdoing and holding powerful interests accountable. And investigative journalism played a central role in Quebec in exposing corruption in the construction industry, which led to the creation of the Charbonneau Commission. The public commission produced a report exposing the wide reach of corruption in the province's multibillion-dollar public construction industry and its links to organized crime.

Meanwhile, La Presse is seeking to have the data collected on Mr. Lagacé sealed. It sent the Montreal police force a lawyer's letter on Wednesday demanding it refrain from accessing the information until a judge rules on a motion on the case.

"We think it would be a significant problem if the data was accessed by anyone because it would tend to identify the confidential sources of Mr. Lagacé," Sébastien Pierre-Roy, lawyer for La Presse, said in an interview.

"The absence of precautions taken during the collection of data from Mr. Lagacé's cellphone to protect confidential sources is a scandal and an unprecedented attack on the freedom of the press," Mr. Pierre-Roy wrote in the letter to police.

In addition to the six reporters, media reports have found that three Quebec journalists had recently been the object of police attention. Police did not obtain court warrants but had scrutinized the call logs of its officers to find out who had been speaking to the reporters.

Straits Times

New software developed by Japanese IT giant NEC can spot crooks 100 times faster

Thursday, 03 November 2016

Byline: Walter Sim

Section: general

Tokyo - New software developed by Japanese information technology giant NEC promises to help law enforcement agencies weed out criminal suspects at more than 100 times the speed of current systems. Launched on Monday on the eve of a two-day NEC trade show in Tokyo, the NeoFace Image data mining system taps artificial intelligence to scan video footage for specific individuals.

NEC said its latest software can scan through one million faces captured in closed-circuit television footage within 10 seconds, and that this could come in handy in criminal forensic investigations and in finding missing persons.

"For example, you may have 40 videos of a crime scene to find a suspicious person, and you need to look through all these videos, which will take a lot of time and effort to prove that the same person keeps appearing in all of them," a spokesman said on Monday at a media preview of the trade show.

"But the new approach matches people with similar facial features and groups them together," she said, adding that the system works regardless of the quality of the video.

Other data that can be gleaned from this information includes a person's movements, the number of times one might have visited a specific location as well as the people one might have met.

"In recent years, there is growing demand for advanced analysis of camera footage for use in security and marketing applications," said Mr Noritaka Taguma, the general manager of NEC's transport and city infrastructure division.

The new program "meets this demand by providing high-speed, high-precision searches for persons who appear in specific patterns, which could not be achieved through manual searches or conventional technology", he said.

NEC, which runs a research laboratory and a cyber security outfit in Singapore, is a world leader in biometric technology.

Its biometric systems are being used in more than 40 territories, including in Singapore's passport and Macau's border control systems. A deal was announced in May for NEC to provide its facial recognition technology to New York's John F. Kennedy Airport.

In Japan, the technology is also being used in visitor passes to Universal Studios as well as to prevent ticket scalping at concerts.

The facial recognition technology market is worth US$200 billion (S$278 billion) and growing by about 20 per cent annually, said NEC principal research fellow Hitoshi Imaoka, who does research in facial recognition technology.

He said on Monday that some new areas that NEC is working on developing include the use of facial recognition in cashless payment and, in hospitals, the identification of patients without the need to register each time.

On the NeoFace Image system, he acknowledged that it is not always foolproof but said: "In the United States, it is common understanding that the biometric approach combines multiple methods, such as fingerprints or passwords, to have more accuracy."

Dhaka Tribune

Cyber sleuths probing FB post that sparked anti-Hindu violence

Thursday, 03 November 2016

Byline: Mohammad Jamil Khan, Mohammad Abu Bakar Siddique

Section: general

Dhaka - The Counter-Terrorism and Transnational Crime (CTTC) unit has begun probing the origin of the Facebook post that sparked the large scale communal violence against Hindus in Brahmanbaria on Sunday.
Alimuzzaman, deputy commissioner of the CTTC unit's cyber crime team, told the Dhaka Tribune that they have already started gathering information during the primary stages of the investigation.

Another cyber crime team under the Criminal Investigation Department (CID) is also helping with the probe, CID sources said.

The offending message, depicting Lord Shiva sitting atop the Kaaba, went up from the account of 30-year-old Rasraj Das on Friday. However, the illiterate youth stated in his latest post early on Saturday morning that he had no knowledge of how this photo originated from his account. Rasraj said he apologises to "Muslim brothers" and was only made aware of the post when his friends told him about it. Rasraj deleted the post early Saturday.

Later that same day Rasraj was beaten up by locals and handed over to the police. On Sunday, a mob wrecked over 100 Hindu homesteads of Nasirnagar and vandalised more than a dozen temples, injuring about 100, instigated by local radical Islamist groups.

The attacks took place following a meeting of local Muslims who had gathered on Nasirnagar playground Sunday morning to demand justice for the blasphemous Facebook post.

The attack was similar to that on the Buddhist community in Cox's Bazar in 2012, which was also sparked by a fake Facebook post.

Mizanur Rahman, superintendent of police of Brahmanbaria, told the Dhaka Tribune: "Everything will become clear after the investigation is over."

Dr AKM Ashikur Rahman of Buet's computer science and engineering department, said people are vulnerable to Facebook hacking if they log in from shared computers.

"It is easy to verify Rasraj's claim of his account being hacked by tracking the IP from which the post was made," Prof Rahman said. "Hackers could easily get hold of widely available software to gain access to

accounts or send game requests, with malware, on Facebook which allows the hacker access to a computer if the target activates the link."

Associate Professor Zahurul Hoque Mozumder of Electrical and Electronic Engineering Department of Dhaka University, said people are more susceptible to hacking if they are careless about security as Facebook already provides robust security measures.

He said law enforcers have the expertise and technology which can easily identify the IP address of a hacker.

Another computer engineer, asking not to be named, said spyware is available on the net that can be used for hacking into person's account.

A high official of the Police Headquarters said they have formed a four- member committee to probe the matter. Committee members are on the spot to investigate the incident and interrogate the detainees.

New Straits Times

Raising the alert on cybersecurity

Thursday, 03 November 2016

Byline: Ahmad Kushairi

Section: general

Kuala Lumpur - At the United States presidential debate recently, both candidates Hillary Clinton and Donald Trump were asked how they would address cybersecurity challenges and the growing international threats online.
Clinton stressed on the need for firm national resolve as she pins blame on certain countries and terrorist groups, while Trump argued that perpetrators could be anyone, including individuals launching attacks from the comfort of their homes. Whatever the argument is, cybersecurity and cyber risks have indeed become a global concern over the past few years.

As the world becomes smaller and more connected, the threat of falling victim to cyberattacks remains a clear and present danger. Governments are putting in more resources, allocations and coherent cybersecurity strategies to combat increasingly dangerous cyberattacks.

On the home front, it was reported that the armed forces' military intelligence unit has set up a cyber defence special unit to tackle cyber warfare attempts against the country.

Defence Minister Datuk Seri Hishammuddin Hussein was quoted as saying that Malaysia's sophisticated cyber defence system is expected to be among the best in the region when completed. While cyberspace continues to evolve, cybersecurity continues to become an increasing concern. Cyber crooks are everywhere. They may even be right in your living room as we speak, without us even realising it!

In this Internet age, we are vulnerable to losing more than just our privacy, but also valuable personal information.

Earlier this year, Facebook co-founder Mark Zuckerberg made headlines when he applied a piece of tape over his web cam as a protection against potential cyber spies! Whether you're an ordinary person or a multi- billionaire, no one is safe these days from cyber perpetrators, not even in the comfort of your living room.

One incident last week sparked more awareness on the cyber world. There was a staggering Distributed Denial of Service (DDoS) attack on a Domain Name Server (DNS) located somewhere in cyberspace. The attack basically tanked any site that uses the DNS. These kinds of DDoS attacks are becoming more prevalent and destructive over the years. As Internet infrastructure grows and the world becomes more connected, so do these massive cyberspace attacks.

The latest attack was identified to be caused by Mirai botnets, a type of malware that hacked Internet of Things (IoT) devices, such as close-circuit television cameras and digital video recorders to launch a massive and sustained Internet attack that caused outages and network congestion for a large number of web sites.

This attack highlights the apparent security flaws in such devices, which is quite alarming, as more of these devices get into our homes and workplaces, and may become part of our lives in the future. A simple and normal IoT device, such as your smart refrigerator or television, may succumb to cyber hacking and cause problems. While it may sound a bit farfetched to some, it is wise not to rule out the potential danger.

From a recent security assessment study by Hewlett Packard on IoT, more of such devices are connected through WiFi and social media networks, and these devices consist of daily sensitive information about our lives and personal data. HP's study concluded that 70 per cent of our smart appliances have serious security weaknesses that can expose us to cyber crooks looking for opportunities to gain access to our personal information and finances.

Cybersecurity is a bigger concern than we may realise. According to statistics provided by MyCert (Malaysia Computer Emergency Response Team, which operates under CyberSecurity Malaysia), there were over 2.7 million counts of botnet drones and malware infection attacks by unique Internet protocols (IPs) last year.

Other statistics revealed that more than 9,000 counts of cybersecurity issues were reported in Malaysia last year, such as cyber harassment, fraud, intrusion, malicious codes, denial of service, content related and spam.

The chief executive officer of CyberSecurity Malaysia, Dr Amirudin Abdul Wahab, recently said the agency has several key milestones to reach by 2020. The goal is to globalise CyberSecurity Malaysia, expand and engage initiatives through bilateral and multilateral cooperation with local and international agencies to strengthen the nation's cybersecurity strategies.

The more we engage globally with other international cybersecurity forces, the better our chances to protect the nation and people from cyberattacks.

Cybersecurity should be everyone's responsibility. While the government, through the relevant agencies are putting in place protective cybersecurity measures and strategies at the national level, it still demands a united effort from the people to counter the cyber menace.

The Internet age may have brought many conveniences, but it is still a vast, unregulated space where many bad elements are lurking in dark corners to inflict damage and misery.

It doesn't, however, mean that we should live in constant fear. But, just like in the real world, we need to be extra alert and take precautions, while reaping the wonderful benefits that the Internet age brings.

Montreal Gazette

New probe ordered in surveillance scandal

Thursday, 03 November 2016

Byline: Philip Authier and Jason Magder

Section: general

Montreal - The police spying crisis has gone from bad to worse, with Public Security Minister Martin Coiteux ordering an administrative investigation into the practises of the Sûreté du Québec dating back to 2013.
Coiteux made the announcement within hours of the provincial police force revealing it had tracked the calls and movements of six journalists that year after news reports based on leaks revealed Michel Arsenault, then president of Quebec's largest labour federation, had his phone tapped.

The controversy began Monday after Montreal media outlet La Presse reported that police had tracked columnist Patrick Lagacé's cellphone to find out if he was being leaked information from police officers.

The new investigation - to be captained by officials in the Public Security department - is over and above internal investigations Coiteux has already ordered into the work of the province's police forces in the wake of the Lagacé scandal.

Coiteux said that to his knowledge, it is the first time in 20 years such a case has emerged involving the provincial police.

This specific one, however, took on a political dimension because the man at the centre of it and now in the hot seat is Stéphane Bergeron, who was the Public Security minister at the time, in 2013 in the Parti Québécois government of Pauline Marois.

The surveillance of the six reporters was part of an internal probe ordered by then-SQ director Mario Laprise to find out which officers had leaked information to journalists about the investigation into Arsenault, who was being probed as part of an investigation into organized crime infiltrating the construction industry.

Arsenault wrote to complain about the leaks to Bergeron, and Laprise ordered the investigation soon afterward.

"What happened then was pretty unusual," Coiteux said. "A letter arrived in his (Bergeron's) office in the morning and by the evening an investigation was launched. And now we learned that under that investigation, journalists were targeted. "It's curious, to say the least. I was surprised and I was shocked and this is why we acted promptly and swiftly."

Meeting reporters earlier, Bergeron, today the PQ's critic for Public Security, appeared as perplexed as everyone about the chain of events leading to the tracking of journalists under his watch.

He confirmed he acted on Arsenault's request by asking his deputy minister to ask Laprise to check on what was happening internally to lead to such leaks. But he said he had no idea what actions Laprise took as a result.

"The nuance is important," Bergeron said at a hastily called news conference after news broke of the SQ tracking. "Never did it come into my mind that they would start poking into journalists' work. I learned today that the police started checking journalists' phones.

"I never asked for this. I never authorized this and would never have authorized this, and I was never informed of this."

SQ Cpt. Guy Lapointe confirmed the SQ investigation of journalists Wednesday, and told the Journal de Montréal police looked into allegations of illegally obtained information by the journalists. He confirmed that surveillance was done on six reporters, but would not name them.

Meanwhile, La Presse fired back on Wednesday, issuing a lawyer's letter to Montreal police demanding that all information collected from Lagacé's cellphone be locked away and kept from investigators.

In that case, police requested 24 search warrants to track Lagacé's iPhone since January, which allowed police to access the numbers Lagacé had called or received calls from, and track him by activating a GPS mechanism on his phone. At least three other journalists have since learned they were under similar surveillance by police - Félix Séguin of TVA, Monic Néron from 98.5 FM, and freelance journalist Fabrice de Pierrebourg.

"If it becomes a common occurrence for police officers to have access to all sources of all journalists who have important news reports, our fear is that no one will ever want to talk to journalists, and that would have a dramatic effect on the freedom of the press," said Sébastien Pierre-Roy, the lawyer representing La Presse.

Montreal's mayor said he still has confidence in Philippe Pichet, the city's police chief, but said that confidence is not absolute.

"He has my confidence until there is proof (of wrongdoing)," Denis Coderre told reporters Wednesday.

Montreal's police brotherhood has called on Pichet to resign, saying he showed a serious error in judgment and that the top police brass was trying to create a climate of fear around leaks.

TVA reported on Tuesday that top police brass had been ordered to crack down on police leaking information to journalists.

In a meeting held April 26 in Anjou, assistant director Mario Guérin addressed 50 high-ranking officers to tell them this kind of behaviour would no longer be tolerated. A part of the meeting was recorded by one of the officers in attendance, and Guérin could be heard saying the force needed to "break the culture" of leaking information to journalists. Coderre said the city's public security commission will examine the issue thoroughly, but despite a poll saying most Montrealers would like to see a public inquiry, the city's examination will be done behind closed doors.

"It will be done behind closed doors because I want them to ask all the questions," Coderre said.

He said the councillors will have to closely examine all the facts related to the issue before drawing any conclusions.

"The report will be deposited to the executive committee and to city council, so it will be made public," Coderre said. "But because of the sensitivity of the information, (making the inquiry public) could have an impact on investigations that are already underway."

In Quebec City, the news the police spying was far more widespread than originally believed gave the opposition fresh ammunition in its quest for a much broader, independent inquiry into events.

The Coalition Avenir Québec, which has already asked for a full public inquiry and the resignation of Montreal police chief Philippe Pichet in the case involving La Presse reporter Patrick Lagacé, cranked up the pressure.

"A full public inquiry would allow us to shed all the light on this, so the journalists can testify, the police ... to produce an extremely complete report revealing the truth, how it happened and who authorized this kind of electronic surveillance," said CAQ justice critic Simon-Jolin Barrette.

PQ leader Jean-François Lisée - who said he still has confidence in Bergeron - said the rapidly unravelling situation proves the need for an independent inquiry by the province's police incident's investigation agency, the Bureau des enquêtes indépendantes.

Journal de Montréal

Les policiers se croient-ils tout permis ?

Thursday, 03 November 2016

Byline: Richard Martineau

Section: column

Chronique - Ainsi, le SPVM n'est pas seul en cause.
La SQ aussi a espionné des journalistes et obtenu secrètement copie de leurs registres téléphoniques.
Ben coudonc. Il y a vraiment quelque chose de pourri au Royaume du Québec.

Tout ça pour protéger leur image...

UNE CULTURE DU VIOL

Dans le jargon policier, on appelle ça «colmater les fuites».

Traduction: «Faites ce que vous avez à faire, prenez tous les moyens à votre disposition, mais trouvez-moi le tabarnac qui parle aux journalistes pour qu'on lui ferme la gueule au plus sacrant.»

Que les patrons d'une entreprise essaient de savoir lequel de leurs employés coule des informations confidentielles aux journalistes est une chose. Mais on parle de la police, ici. Les représentants de la loi et l'ordre. «Les gardiens de la démocratie, les derniers remparts contre la barbarie et l'anarchie.»

Wow. J'avoue que les bras m'en tombent. Après le SPVM, la SQ. On est en droit de parler de «culture».

La culture du viol... de la vie privée. La culture du viol... de la liberté de presse.

On est la police, donc on a tous les droits.

Ça fait combien de temps que ça dure? Depuis combien de temps les forces policières utilisent-elles ce genre de méthodes hautement discutables pour protéger leur image?

Combien de journalistes ont fait l'objet de telles «attentions»?

Quelque chose me dit qu'on vient juste de gratter la surface de ce scandale. On va aller de surprise en surprise.

PISSER DANS L'OREILLE

Une idée pour l'équipe du Maclean's: après Le Québec, la province la plus corrompue au pays, Les forces policières les plus immorales au pays.

Cette fois-ci, on ne vous critiquera même pas. On va être d'accord avec vous. Je comprends que les policiers ont un devoir de réserve, qu'ils ne sont pas censés refiler des informations «sensibles» aux journalistes. Mais justement... Si des policiers -- qui, comme nous le savons tous, ont tendance à se serrer les coudes -- en viennent à «pisser» dans l'oreille de certains journalistes, c'est peut-être parce que quelque chose ne tourne pas rond chez eux, non?

Au lieu de partir à la chasse aux méchants «délateurs» présents dans leurs rangs, les directeurs de police devraient plutôt se demander pourquoi diantre certains de leurs agents ont préféré se pincer le nez et parler à des journalistes plutôt que de respecter la loi de l'omertà qui règne habituellement dans les forces, qu'elles soient militaires ou policières...

Le problème n'est pas qu'un policier ait parlé à un journaliste, c'est la situation qui a amené ce policier à parler à un journaliste.

DES MESURES ESTHÉTIQUES

Ce qui est arrivé est grave. Très grave.

Et ça va prendre plus qu'une poignée de «mesures» rédigées en catimini sur le coin d'une table pour venir à bout de cette culture de l'impunité qui semble régner dans nos forces policières.

Au moins, si les hauts gradés de la police avaient agi ainsi pour protéger la sécurité des gens, on pourrait en débattre, peser le pour ou le contre. Même pas. C'était juste pour protéger leur image. C'est honteux. Honteux et scandaleux.

Journal de Montréal

Une menace claire pour les sonneurs d'alarme, dit Snowden

Thursday, 03 November 2016

Byline: Boris Proulx

Section: general

Montréal - La surveillance policière dont ont fait l'objet au moins 10 journalistes québécois dans les dernières années représentent les agissements d'une société «antidémocratique» et «autoritaire», a déclaré le lanceur d'alerte et fugitif américain Edward Snowden, hier.
«On voit que même la police locale peut décider qu'elle n'apprécie pas les reportages d'un journaliste, et un juge peut lui donner tous les moyens d'obtenir l'information sur qui il appelle, où il se trouve», a dit M. Snowden, en vidéoconférence devant un auditorium complet de l'Université McGill, hier soir.

RÉVÉLATIONS

Il y a environ trois ans, l'informaticien américain s'est fait connaître en révélant au grand jour les pratiques de surveillance de masse de la National Security Agency (NSA).

Le film américain Snowden, paru cette année, revient d'ailleurs sur l'histoire de ses révélations. Cela pose une menace claire pour les personnes qui, comme lui, veulent dénoncer les abus commis par les gouvernements, a-t-il avancé.

«Notre habilité à résister à l'abus gouvernemental n'a jamais été aussi réduite qu'à notre époque», a-t-il dit.

Le critique de la surveillance de masse, qui habite aujourd'hui Moscou, a souligné que de nombreuses questions demeurent entières sur la manière dont les corps policiers ont justifié leurs actions.

DES PREUVES

«Nous avons des preuves que [la surveillance] a été faite, mais on ne sait toujours pas selon quelle autorité. Nous ne pouvons que faire des hypothèses. Est-ce justifié par la loi C-13 [pour lutter la cyberintimidation]? C-51 [contre le terrorisme]? Nous ne savons pas ce que la police a demandé [au juge], derrière le rideau», a-t-il soulevé.

Selon lui, les journalistes sont essentiels pour restaurer la confiance du public envers le gouvernement.

«Au lieu de faire moi-même les révélations, j'ai décidé de fournir toute l'information aux journalistes, a-t-il rappelé. Je voulais que ces journalistes parlent avec leur gouvernement, pour que les dirigeants aient des comptes à rendre en matière de surveillance.»

Journal de Montréal

La SQ a eu un cellulaire de Ken Pereira

Thursday, 03 November 2016

Byline: Améli Pineda

Section: general

Montréal - Le syndicaliste et sonneur d'alarme Ken Pereira dit avoir été naïf lorsqu'il a remis à la Sûreté du Québec le cellulaire qu'il utilisait pour contacter une trentaine de journalistes, en 2008.
«J'ai été naïf», lance-t-il en entrevue avec Le Journal.

Avec les récentes révélations concernant la surveillance des sources de journalistes, M. Pereira s'inquiète de l'utilisation qu'a pu faire la SQ des données de son cellulaire de l'époque.

«Peut-être que je panique pour rien, mais tous les journalistes qui ont été nommés jusqu'à présent, j'étais en contact avec eux à cette époque», soutient-il.

MENACE

M. Pereira raconte qu'en 2008, il était surveillé par la SQ puisque sa vie était en danger.

Un jour, il a reçu un texto menaçant.

«C'était écrit "Dans trois jours BOOM"», dit- il.

Il a déposé le téléphone sur une table et a tout de suite téléphoné à la police.

«Ils sont venus et l'ont saisi. Sincèrement, je ne m'étais jamais posé de question jusqu'à cette semaine», confie-t-il.

Montréal - La direction du Service de police de la Ville de Montréal (SPVM) rencontre depuis mardi tous les enquêteurs du corps policier afin de leur demander s'ils ont déjà enquêté ou enquêtent toujours sur « un journaliste, un avocat ou un politicien », soutient la Fraternité des policiers et policières de Montréal dans un message envoyé mercredi à ses membres obtenu par La Presse. Le syndicat dénonce une « stratégie improvisée » des dirigeants du SPVM ayant pour but de « prétendre » qu'ils ont été diligents. « Il s'agit évidemment d'une diversion puisque la crise origine en réalité de la haute direction, responsable de la demande d'un mandat pour espionner un journaliste et identifier ses sources dans le cadre d'une inconcevable chasse aux sorcières », écrit le vice-président de la Fraternité Mario Lanoie, qui invite les policiers à contacter le syndicat en cas « du moindre glissement vous rendant mal à l'aise » au cours de la rencontre. Joint par La Presse, la Fraternité n'avait aucun commentaire à émettre à ce sujet hier. Lundi, le président syndical Yves Francoeur avait qualifié, en entrevue avec La Presse, de « totalement inacceptable » l'espionnage de journalistes. Il avait également déploré l'« approche symptomatique d'une organisation malade et mal gérée ». Le SPVM n'a émis aucun commentaire hier soir.

La SQ a aussi épié des reporters

Thursday, 03 November 2016

Byline: Stéphane Alarie

Section: general

Montréal - Les registres téléphoniques de six journalistes, dont un du Journal, ont été fouillés pendant plusieurs mois

L'affaire des journalistes espionnés par des policiers ne cesse de prendre de l'ampleur. Après la police de Montréal, c'était au tour de la Sûreté du Québec d'avouer hier qu'elle a déjà scruté les communications de six reporters, dont celles de notre journaliste aux affaires criminelles, Éric Thibault.

L'ex-DG de la Sûreté du Québec, Mario Laprise, a ordonné l'enquête qui a mené à l'espionnage des journalistes en 2013.

Depuis lundi, les révélations se multiplient et on compte désormais au moins 10 journalistes québécois qui ont fait l'objet d'une forme de surveillance policière ces dernières années.

Le porte-parole de la SQ, le capitaine Guy Lapointe, a ainsi confirmé qu'une «enquête sur des allégations criminelles de divulgations illégales de contenus obtenus dans le cadre d'une écoute électronique» avait été amorcée à l'automne 2013 et qu'elle visait, entre autres, six journalistes.

Ceux-ci sont connus et respectés, tant par le public que le milieu de l'information. Outre Éric Thibault, du Journal de Montréal, Marie- Maude Denis, Isabelle Richer et Alain Gravel, tous trois de Radio-Canada, figurent parmi les reporters espionnés. Le chef de bureau de La Presse à Québec, Denis Lessard, et le chroniqueur judiciaire retraité André Cédilot complètent le tableau.

L'enquête qui a mené à l'espionnage de ces journalistes a été ordonnée à l'époque par l'ancien directeur général de la SQ, Mario Laprise, comme le révélait Le Journal en primeur hier après- midi.

PLUSIEURS MOIS

En vertu d'autorisations judiciaires émises par un juge, des enquêteurs des Affaires internes ont fouillé les registres téléphoniques des journalistes pendant plusieurs mois afin d'identifier d'où provenaient certaines informations publiées concernant l'ex-président de la Fédération des travailleurs et travailleuses du Québec (FTQ), Michel Arsenault.

Peu avant, des reportages avaient dévoilé que M. Arsenault était l'objet d'une surveillance électronique par la SQ. On y apprenait que le patron de la centrale syndicale était sous écoute dans le cadre du projet Diligence -- visant à contrer l'infiltration du crime organisé dans la construction -- et qu'on l'avait du coup écarté d'un siège au sein du conseil de la Caisse de dépôt.

Mécontent que la chose soit révélée, l'ex- président de la FTQ avait écrit au ministre péquiste de la Sécurité publique de l'époque, Stéphane Bergeron, pour s'en plaindre.

Quelques heures plus tard, le directeur Laprise déclenchait l'investigation qui mènerait à la surveillance des six journalistes. Celle-ci n'a jamais abouti ni mené au dépôt d'accusations. L'affaire a été classée à l'été 2014.

Déjà à l'époque, nos sources révélaient que la décision d'enquêter ne faisait pas l'unanimité au sein de la SQ. D'ailleurs, les détails des opérations n'auraient été connus que de la garde rapprochée du directeur Laprise. Même le directeur des poursuites criminelles et pénales n'a pas été avisé ni consulté sur la marche à suivre.

M. Laprise, qui occupe maintenant le poste de vérificateur interne à Hydro-Québec, a refusé de commenter. «On va laisser aux gens le temps de faire leur travail», a-t-il glissé, en référence à l'enquête administrative qui a été annoncée hier, lorsque joint par Félix Séguin, de notre Bureau d'enquête.

Discrétion demandée, mais pas d'enquête

Thursday, 03 November 2016

Byline: Journaliste maison

Section: general

Québec - Le chef de police de Québec admet qu'il doit parfois rappeler aux membres de son service leur serment de discrétion, mais assure qu'aucun journaliste n'a fait l'objet d'une enquête durant son passage à la tête du service.
Le directeur du Service de police de la Ville de Québec, Michel Desgagné, a fait cette déclaration, mercredi, en marge de la conférence de presse tenue à l'occasion de son départ à la retraite. Il confirme ainsi ce que le maire Régis Labeaume avait déclaré mardi. Il répondait à une question posée à savoir si des journalistes de la région de la capitale avaient déjà été «suivis» par la police de Québec, notamment concernant des enquêtes auprès de policiers qui auraient pu divulguer des informations aux membres des médias.

« La réponse vient de moi, précise M. Desgagné. Dans les cinq dernières années, je n'ai jamais fait d'enquête de ce type-là. Et je n'ai jamais eu connaissance de dossiers comme ça. Par contre, on a des

préoccupations sur les serments de discrétion de certains de nos collègues et on doit faire des rappels périodiques, poursuit- il. Nous [les policiers] devons avoir une certaine retenue pour la sécurité des policiers, celle de la population et pour ne pas entraver le cours de la justice.

PEU DE «COULAGE»

«C'est criminel, que ce soit pour un citoyen, un policier ou un journaliste. C'est surtout au niveau des enquêtes criminelles qu'on doit avoir une certaine retenue. Et si on pense à la sécurité des citoyens [...] et s'il y avait eu ça [entrave] dans notre organisation, on aurait fait l'enquête.»

Selon lui, il n'y a pas beaucoup «de coulage d'information» auprès des journalistes. Cependant, il dit parfois s'interroger. «Quand on arrive dans une opération planifiée depuis longtemps et que vous arrivez [sur les lieux] quasiment avant nous autres, on se questionne un petit peu.»

Sur une note plus personnelle, M. Desgagné se donne en exemple. «Je dînais et je soupais avec un journaliste. C'était mon père. Moi, j'étais policier. On était capables de se respecter et de faire la différence entre les deux. Il avait de l'information que je ne savais pas et j'avais de l'info qu'il ne savait pas. Je suis capable de distinguer les deux. »

Journal de Québec

« On a d'autres chats à fouetter », dit le chef Desgagné

Thursday, 03 November 2016

Byline: Nicolas Saillant

Section: general

Québec - Le chef de police de Québec, Michel Desgagné, affirme que son service n'a jamais lancé une enquête visant la surveillance de journalistes.
«Dans les cinq dernières années, il n'y a jamais eu d'enquête de ce type», assure M. Desgagné qui a lui-même informé le bureau du maire Labeaume sur le sujet mardi.

Plus encore, il affirme ne jamais avoir mené d'enquête interne sur des policiers de son service soupçonnés de donner de l'information aux journalistes.

«On a d'autres chats à fouetter», a-t-il lancé.

SERMENT DE DISCRÉTION

Reste que M. Desgagné a des inquiétudes face à la possibilité que de l'information sensible soit divulguée aux journalistes par ses policiers. «On a des préoccupations sur le serment de discrétion de nos collègues et on doit faire des rappels de façon périodique.»

M. Desgagné n'a pas voulu commenter directement ce qui se passe au SPVM, mais a quand même semblé prendre ses distances de la situation montréalaise.

«Si je fais une enquête interne, je vais enquêter sur les policiers, pas sur les journalistes, ce n'est pas moi votre Conseil de presse», lance celui qui prendra sa retraite en décembre (voir autre texte en page 17).

PAS PRÉOCCUPÉ

Il soutient aussi ne pas avoir de préoccupations particulières par rapport aux policiers qui parlent aux journalistes.

«Si j'avais à regarder quels numéros ils [les policiers] ont dans leur cellulaire, je serais moi-même mal pris parce qu'il y en a certains parmi vous autres qui m'appelez et j'ai déjà appelé certains d'entre vous», a-t-il dit aux journalistes.

Il ajoute tout de même que le service de police a comme priorité de protéger les enquêtes criminelles et que des accusations d'entrave à la justice peuvent être déposées tant contre un journaliste que contre les policiers.

«Au niveau des opérations criminelles [...], on doit avoir une certaine retenue», a-t-il conclu.

Le Devoir

Protection des sources - Assez les abus!

Thursday, 03 November 2016

Byline: Brian Myles

Section: editorial

Editorial - La liberté de presse est menacée au Québec. Il est grand temps d'adopter une loi sur la protection des sources pour mettre fin aux abus de la police.Il ne s'agit plus d'un cas isolé ou d'un abus

de pouvoir anecdotique par une grosse police en mal de contrôle. L'espionnage des journalistes d'enquête est un mal si répandu au Québec qu'il faut maintenant des actions fermes pour casser cette désagréable impression de vivre dans un État policier.
Ces tares ne sont pas uniques au SPVM puisque la Sûreté du Québec (SQ) fouine aussi dans les téléphones intelligents des journalistes. Radio-Canada a révélé mercredi que la police provinciale avait obtenu les registres d'appels des téléphones intelligents de trois de ses reporters, Isabelle Richer, Marie-Maude Denis et Alain Gravel. Au total, les communications d'une bonne dizaine de journalistes ont été épiées par le Service de police de la Ville de Montréal (SPVM) ou la SQ depuis 2013.

La dérive des policiers n'a d'égale que celle des juges de paix qui ont autorisé ces chasses aux sources. Deux institutions fondamentales en démocratie, la police et la justice, ont traité la liberté de presse, le journalisme d'enquête et la protection des sources avec une grossière indélicatesse.

Le resserrement des règles dans l'octroi des mandats de surveillance des journalistes, annoncé mardi par le premier ministre Philippe Couillard, est un pas dans la bonne direction. À l'avenir, les mandats de surveillance visant des journalistes devront faire l'objet d'une autorisation du Directeur des poursuites criminelles et pénales (DPCP) avant d'être soumis à un juge de paix. Les journalistes bénéficieront du même traitement que les avocats, une avancée considérable. Le combat le plus important reste à mener, afin que Québec et Ottawa adoptent des lois pour protéger les sources des journalistes. Le statut des journalistes, qui ne sont pas de véritables professionnels, contrairement aux avocats, ne devrait pas servir d'excuse à l'inaction à ce sujet.

M. Couillard doit aussi amender le projet de loi visant à protéger les lanceurs d'alerte. Dans sa mouture actuelle, le projet force les lanceurs d'alerte à contacter la police avant les médias s'ils veulent bénéficier de la protection de l'État. Ce projet fait abstraction de la réalité. Si les lanceurs d'alerte se tournent vers les médias, et non la police, pour dénoncer des irrégularités, c'est souvent parce que les organismes de surveillance, y compris la police, ont failli à leur mission.

L'effondrement du deuxième volet de " Diligence ", une enquête ratée sur les tentatives d'infiltration du crime organisé à la FTQ, est l'illustration parfaite de ce principe. Le coulage de conversations d'écoute électronique (une infraction au Code criminel) a d'ailleurs mené la SQ à enquêter sur six journalistes, dont ceux de Radio- Canada, à la suite d'une plainte de l'ancien président de la FTQ, Michel Arsenault. Les policiers et les officiers de justice ne partagent pas l'enthousiasme des journalistes sur la diffusion du matériel d'écoute électronique en dehors d'un procès ou d'une commission d'enquête. Ce contentieux ne sera pas réglé de sitôt.

C'est Stéphane Bergeron qui avait demandé à la SQ d'enquêter sur les fuites dans " Diligence ", à l'époque où il était ministre de la Sécurité publique. Il est aujourd'hui étonné que sa demande ait pu servir de prétexte pour que la SQ enquête sur des journalistes. L'actuel directeur général de la SQ, Martin Prud'homme, a annoncé un resserrement des règles internes jeudi après avoir pris connaissance de l'étendue de la chasse aux sources autorisée par son prédécesseur, Mario Laprise. À l'avenir, il faudra

obtenir l'autorisation de l'état-major avant d'enquêter ou de surveiller des journalistes. Voilà deux témoignages démontrant que la SQ a dépassé les bornes en 2013.

Une enquête, indépendante du pouvoir policier, est nécessaire.

Le Soleil

La SQ a aussi espionné des journalistes

Thursday, 03 November 2016

Byline: Simon Boivin

Section: general

Québec - Le scandale s'étend. La Sûreté du Québec (SQ) reconnaît avoir aussi espionné six journalistes et réclame une enquête sur elle-même. Le ministre de Sécurité publique de l'époque, le péquiste Stéphane Bergeron, jure n'en avoir rien su.
Il ne s'agit plus uniquement d'un corps de police municipale. En 2013, la SQ a obtenu des autorisations judiciaires pour connaître l'identité de tous ceux qui ont discuté avec une demi-douzaine de journalistes.

Parmi eux, les piliers de l'émission Enquête qui ont mis au jour les scandales dans l'industrie de la construction, Marie-Maude Denis et Alain Gravel, de même que la journaliste spécialisée en affaires juridiques à Radio-Canada, Isabelle Richer.

Les registres des appels entrants et sortants des journalistes Éric Thibault, du Journal de Montréal, et de Denis Lessard, de La Presse, ont aussi été accessibles aux policiers. Sans verser dans l'écoute électronique, ils pouvaient néanmoins identifier leurs interlocuteurs. Les journalistes étaient surveillés pour des «allégations criminelles de divulgations illégales de contenus obtenus dans le cadre d'une écoute électronique».

L'actuel directeur général de la SQ, Martin Prud'homme, a lui-même demandé à ce qu'un tiers indépendant se penche sur l'investigation déclenchée par son prédécesseur, Mario Laprise. Le ministère de la Sécurité publique mènera une enquête administrative, a assuré le ministre Martin Coiteux, mercredi, en début de soirée.

Il juge «curieux» que l'enquête de la SQ ait été déclenchée le jour même où l'ex-président de la FTQ, Michel Arsenault, s'est plaint auprès du ministre péquiste Stéphane Bergeron de fuites médiatiques liées à l'écoute électronique dont il a été l'objet.

«Une lettre est arrivée à son cabinet le matin et, le soir, une enquête était déclenchée, a souligné M.Coiteux. Et on comprend que le ministre d'alors a eu une communication avec le directeur de la SQ. C'est un cas particulier.»

Aujourd'hui porte-parole du PQ en matière de Sécurité publique, M. Bergeron se souvient d'avoir passé un coup de fil au patron de la SQ pour s'enquérir de la situation. La décision d'enquêter était déjà prise, jure-t-il. Et il ne pouvait pas se douter que les policiers allaient aller jusqu'à espionner des journalistes pour colmater les brèches dans leur propre organisation.

«Ça ne lui a pas traversé l'esprit qu'on fouille dans le travail des journalistes parce que c'est injustifié et injustifiable», a dit le chef péquiste Jean-François Lisée. Même si le dg de la SQ avait été nommé par le PQ, M. Lisée juge qu'il a pris une «mauvaise décision» en surveillant des journalistes.

Le ministre Coiteux soutient que cet épisode d'espionnage de journalistes est le seul qui se soit produit à la SQ au cours des 20 dernières années. Il juge que son ministère, auquel le corps policier est rattaché, a les coudées franches pour mener une enquête «totalement indépendante».

M. Coiteux martèle qu'il doit y avoir «une bonne distance» entre le gouvernement et les forces policières. Il ne contredit toutefois pas les propos de M. Bergeron qui soutient qu'un ex-ministre libéral, Raymond Bachand, a informé en 2009 le président de la FTQ qu'il était sous écoute. «Est-ce qu'une enquête a été déclenchée en 2009 visant des journalistes? demande M. Coiteux. Le seul cas qui aurait eu lieu a été déclenché en 2013.»

Outre la nouvelle enquête administrative, le gouvernement Couillard estime que les trois mesures annoncées mardi pour éclaircir la situation suffiront : difficulté haussée pour la délivrance d'un mandat de surveillance d'un journaliste; mise sur pied d'un comité d'experts pour formuler des recommandations sur les meilleures pratiques à adopter; inspection par le ministère de la Sécurité publique des pratiques des principaux corps policiers.

MISE EN DEMEURE

Depuis les révélations sur les mandats de surveillance lancés à l'endroit de Patrick Lagacé, des informations circulent voulant que d'autres journalistes ont aussi été sur le radar des forces policières. Mercredi, La Presse a fait savoir qu'elle mettait en demeure le Service de police de la Ville de Montréal (SPVM) pour l'empêcher d'utiliser, de copier ou de transmettre les informations obtenues grâce aux mandats de surveillance obtenus.

Le chef de l'opposition, Jean- François Lisée, maintient que Québec fait fausse route en n'utilisant pas le Bureau des enquêtes indépendantes pour faire la lumière sur la situation. Selon lui, le premier ministre choisit la «voie contrôlée et opaque» d'une vérification par le ministère de la Sécurité publique.

De son côté, la Coalition avenir Québec juge qu'une enquête publique serait la meilleure façon d'avoir l'heure juste sur ce qui s'est passé.

Mercredi, le député solidaire Amir Khadir s'est interrogé sur l'ampleur de l'espionnage exercé par la police. «Est-ce qu'il y a des politiciens qui sont sous écoute aussi? a-t-il demandé. «Ce genre de pratique appartient à des pays que je n'ose même pas nommer», a dit M. Khadir.

Un ex-ministre de la Sécurité publique dit qu'il ne savait rien

Thursday, 03 November 2016

Byline: Marc-André gagnon

Section: general

Québec - Les révélations sur la SQ ont créé une onde de choc à Québec
Le député Stéphane Bergeron, maintenant porte-parole péquiste en matière de sécurité publique, a assuré hier qu'il ignorait que des journalistes étaient épiés par la police à l'époque où il était lui-même ministre de la Sécurité publique, en 2013.

Le député péquiste Stéphane Bergeron était accompagné de son chef Jean-François Lisée lorsqu'il a affirmé qu'il ignorait que les communications de six journalistes avaient été épiées par la SQ en 2013.

«C'est une initiative que je n'aurais jamais autorisée, et c'est une initiative dont je n'ai jamais été informé avant», a dit M.Bergeron lors d'un point de presse, accompagné du chef péquiste Jean- François Lisée, qui en a d'ailleurs profité pour réitérer sa pleine confiance envers son député.

L'ex-directeur général de la SQ Mario Laprise a ordonné l'enquête qui a mené à l'espionnage des communications de six journalistes (voir texte en page 3), alors que Stéphane Bergeron était ministre de

la Sécurité publique, a révélé Le Journal hier. Cela a eu l'effet d'une onde de choc à l'Assemblée nationale.

Pour le Parti québécois, la Coalition avenir Québec et Québec solidaire, ces nouvelles révélations confirment plus que jamais que les mesures annoncées mardi par le gouvernement Couillard sont insuffisantes.

«PATENTE À GOSSE»

La mise sur pied d'un comité d'experts, le rehaussement des règles d'émission de mandats d'écoute électronique visant des journalistes et l'inspection des procédures auprès des principaux corps policiers ne sont que l'équivalent d'une «patente à gosse» pour le député caquiste Simon Jolin Barrette.

Selon lui, les plus récentes informations démontrent la nécessité d'une enquête publique.

«La Sûreté du Québec parle au pouvoir», a déploré à son tour le député de Québec solidaire, Amir Khadir, qui en plus de demander lui aussi une commission d'enquête, souhaite que les nominations à la tête de la Sûreté du Québec soient désormais confiées à l'Assemblée nationale plutôt qu'au gouvernement.

«On parle d'une police qui malheureusement est politique depuis très longtemps», a dit le député de Mercier.

L'opposition péquiste, de son côté, maintient que le Bureau des enquêtes indépendantes (BEI) devrait être mandaté afin de faire toute la lumière, une option qu'a écartée officiellement le ministre de la Sécurité publique, Martin Coiteux, hier.

La Coalition avenir Québec a réclamé à nouveau la démission du chef de police du Service de police de la Ville de Montréal (SPVM), Philippe Pichet. Le Parti québécois propose toujours qu'il soit plutôt suspendu, mais de façon temporaire.

Au nom de l'autonomie qu'il souhaite conférer aux municipalités, le gouvernement Couillard a préféré s'en remettre aux élus de la Ville de Montréal en ce qui concerne la direction du SPVM.

L'alarme sonne !

Thursday, 03 November 2016

Byline: Alain Saulnier

Section: oped

Opinion - L'espionnage par le SPVM du téléphone de Patrick Lagacé a alerté bien des gens sur le danger qui guette nos démocraties.
Plusieurs grands journaux au pays et ailleurs dans le monde ont dénoncé cette situation, car elle soulève une véritable inquiétude pour la liberté d'expression et la protection de la vie privée.

Pour les journalistes, cette affaire témoigne du mépris affiché dans le milieu policier pour leur travail. Nous avons toutes les raisons d'être indignés, car ce précédent illustre avec éloquence la facilité avec laquelle il est possible à l'ère numérique d'épier à distance la vie privée de tous les journalistes et de tous les citoyens.

Le premier ministre Couillard a fait un premier pas dans la bonne direction. Il nous faut maintenant saisir cette occasion pour reprendre la discussion sur la protection des sources et des lanceurs d'alerte. Ne perdons plus de temps.

Il y a une dizaine d'années, Serge Ménard avait initié un projet de loi très bien étoffé sur la protection des sources journalistiques. La FPJQ aurait souhaité que ce dossier débloque à l'époque. Malheureusement, il n'a pas pu achever son travail. Depuis toujours, comme avocat, député et ministre de la Justice, Serge Ménard a défendu le rôle des journalistes dans notre société.

Nous pourrions l'associer à ce travail de réflexion annoncé par le premier ministre. Du même coup, il faut espérer que l'on puisse reprendre les recommandations de la commission Charbonneau afin de mieux défendre les lanceurs d'alerte, sans qui nous ne pourrions avoir une information solide sur nos institutions.

L'inspecteur pourrait enquêter, dit Coderre

Thursday, 03 November 2016

Byline: Amélie Pineda

Section: general

Montréal - Le maire Denis Coderre entend confier une enquête à l'inspecteur général de la Ville de Montréal s'il apprend que d'autres journalistes ont été visés par des mandats judiciaires obtenus par le SPVM.
«Si c'est le cas, le maire va donner un mandat ad hoc à Me Denis Gallant, pour procéder à une enquête administrative», a confirmé Marc-André Gosselin, attaché de presse du maire.

Il estime que Me Gallant a «une expertise en la matière». Le maire attend les conclusions des vérifications menées par le directeur de police, Philippe Pichet.

Lundi, le maire avait annoncé que la Commission de sécurité publique de la Ville se pencherait sur les procédures des policiers pour obtenir des mandats visant les journalistes. Un rapport est attendu pour janvier 2017.

Journal de Montréal

La Presse met le SPVM en demeure

Thursday, 03 November 2016

Byline: Benoit Philie

Section: general

Montréal - Le quotidien La Presse exige la mise sous scellé de toute information pouvant permettre l'identification des sources journalistiques confidentielles du chroniqueur Patrick Lagacé, dans une requête déposée à la Cour supérieure hier.
Il demande aussi au SPVM, dans une mise en demeure, de ne pas utiliser, copier ou transmettre les données colligées lors la période où le journaliste a fait l'objet d'une surveillance.

Lundi, on apprenait que les communications ainsi que les déplacements de M. Lagacé avaient été surveillés par le SPVM, entre janvier et juillet 2016, dans le cadre d'une enquête interne. Au total, 24 mandats concernant le téléphone du journaliste ont été obtenus. La Presse craint que les données ainsi colligées ne puissent servir à d'autres fins que ce qui a été préalablement autorisé par la Cour et demande donc une ordonnance pour en protéger le contenu.

«De son côté, le SPVM assure conserver les données provenant du téléphone de M. Lagacé sur «une clef USB à double encryption [...] mise dans une enveloppe scellée», peut-on lire dans une lettre signée par l'avocat du service de police, Alain Cardinal.

Journalistes surveillés par la SQ : des zones d'ombre demeurent

Thursday, 03 November 2016

Byline: Mélanie Meloche-Holubowski

Section: general

Montréal - En décidant de surveiller en 2013 le registre des appels de six journalistes, dont trois de Radio-Canada, la Sûreté du Québec (SQ) a voulu faire la lumière sur une affaire qui remonte à une dizaine d'années. Retour sur un dossier aux ramifications multiples, qui n'a pas encore livré tous ses secrets.
L'histoire commence avec l'Opération diligence menée par la SQ à la fin des années 2000 au sujet de l'infiltration de l'économie légale par le crime organisé.

La SQ entreprend une enquête au printemps 2007 après la plainte d'un entrepreneur en maçonnerie, qui affirmait que les Hells Angels tentaient d'infiltrer son entreprise.

L'enquête visait notamment à établir les liens entre la mafia, les motards et la Fédération des travailleurs du Québec (FTQ).

Puis, en septembre 2013, certains médias apprennent que Michel Arsenault, alors président de la FTQ et président du conseil d'administration du Fonds de solidarité de FTQ, a fait l'objet de surveillance électronique et de filature de la SQ, entre septembre 2008 et septembre 2009.

La fuite des transcriptions de cette surveillance électronique dans les médias arrive au moment où la commission Charbonneau se penche sur les milliers de conversations interceptées par la police au cours de l'Opération diligence.

Enquête sur les fuites

Le 10 septembre 2013, Michel Arsenault envoie une lettre à Stéphane Bergeron - alors ministre de la Sécurité publique - et l'exhorte à ouvrir une enquête sur l'origine de ces fuites. Il se dit alors victime d'une fuite d'informations illégale et « inacceptable ». Rappelons que Michel Arsenault n'a jamais fait l'objet d'accusations criminelles.

M. Arsenault confirme dans sa lettre qu'il a été avisé par la SQ au printemps 2009 qu'il était sous surveillance depuis déjà quelques mois. Il dit avoir pourtant eu l'assurance que la divulgation des transcriptions, images ou vidéos de cette surveillance était une infraction criminelle.

« Les fuites ne peuvent provenir que de deux sources, la Sûreté du Québec ou la CEIC [Commission d'enquête sur l'industrie de la construction]. Les procureurs de la CEIC ont assuré les procureurs du Fonds de solidarité FTQ que la fuite ne venait pas d'eux », écrit Arsenault dans sa missive.

M. Bergeron a affirmé en 2013 qu'il avait reçu la lettre de Michel Arsenault, mais qu'il ne lui avait pas parlé de vive voix. Une affirmation qu'il a réitérée mercredi.

Quelques heures après avoir été appelé par le ministre de la Sécurité publique, le directeur général de la SQ à cette époque, Mario Laprise, annonce le début d'une enquête pour tenter de découvrir la source de ces fuites.

Entrevue avec Guy Lapointe de la Sûreté du Québec Surveillance de six journalistes

Six journalistes, dont Marie-Maude Denis, Isabelle Richer et Alain Gravel, de Radio-Canada, et Éric Thibault, du Journal de Montréal, seront ciblés par cette investigation.

Au début de l'enquête, la Fédération professionnelle des journalistes du Québec (FPJQ) avait déclaré dans un communiqué de presse qu'elle craignait « que l'enquête n'amène à mettre des journalistes sous écoute, à saisir leur matériel ou à les forcer de révéler en cour le nom de leurs informateurs ».

Le capitaine de la SQ, Guy Lapointe, a confirmé mercredi à l'émission 24/60 que ces six journalistes avaient fait l'objet d'une enquête puisqu'ils étaient considérés comme des « suspects », en vertu de l'article 193 du Code criminel portant sur l'utilisation ou la divulgation d'une communication privée.

Il a précisé que l'opération visant ces journalistes, contrairement à celle dont a fait l'objet Patrick Lagacé, ne prévoyait aucune écoute électronique ni surveillance par géolocalisation des personnes visées.

Journalistes surveillés : Que savait Stéphane Bergeron?

Stéphane Bergeron, aujourd'hui porte-parole du Parti québécois en matière de sécurité publique, nie avoir demandé que les journalistes soient ciblés pour connaître l'origine de fuites de renseignements policiers dans les médias.

« C'est une initiative que je n'ai évidemment pas demandée, et c'est une initiative que je n'aurais jamais autorisée, et c'est une initiative dont je n'ai jamais été informé avant il y a quelques instants », a-t-il dit en conférence de presse, aux côtés de son chef, Jean-François Lisée.

Je m'attendais à ce qu'on enquête sur les fuites à l'interne, pas qu'on épluche les registres d'appels des journalistes

Stéphane BergeronRaymond Bachand, Arsenault et les fuites

Au cours d'une conférence de presse mercredi après-midi, M. Bergeron a laissé entendre que Raymond Bachand avait lui-même informé M. Arsenault du fait qu'il était sous écoute électronique.

« Bachand a communiqué avec M. Arsenault, a affirmé M. Bergeron. Comment se fait-il que Raymond Bachand ait eu cette information? [...] Comment une information aussi sensible a pu se rendre aux oreilles à un membre du conseil des ministres, qui a pris le téléphone et qui a dit au principal intéressé : "Tu fais partie d'une écoute électronique", risquant de faire dérailler une enquête policière? »

M. Bergeron s'appuie sur une conversation diffusée à la commission Charbonneau entre Raymond Bachand et M. Arsenault. Le leader syndical, qui souhaitait à l'époque être nommé au sein du conseil d'administration de la Caisse de dépôt et placement du Québec, voulait savoir pourquoi sa nomination semblait être bloquée, même si Jean Charest lui avait promis ce poste le 12 janvier 2009.

Quand M. Arsenault a demandé au ministre des Finances de l'époque, Raymond Bachand, si l'écoute électronique par la SQ était la raison pour laquelle il n'avait pas été nommé au C.A. de la Caisse de dépôt, M. Bachand n'a pas répondu. M. Arsenault a alors compris qu'il s'agissait bel et bien pour cette raison qu'il n'a pas obtenu le poste.

M. Arsenault affirme dans sa lettre à M. Bergeron qu'il a plutôt été averti par la SQ, conformément à la loi.

Beijing - China's draft cybersecurity law, which stipulates that foreign technology firms should store important business data and personal data related to their operation within China, is aimed at effectively safeguarding State security as well as protecting people's privacy, an expert said.
The comment came after Reuters reported that short-term rental company Airbnb told Chinese users that it will store their personal data locally "as foreign tech companies operating in China respond to increasing regulatory pressure."

A spokesperson with the Airbnb China confirmed with the Global Times on Wednesday on condition of anonymity that its parent company is moving Chinese mainland-based users' information including the guest bookings in China and Airbnb listings to local servers for greater localization.

Once the foreign technology firms store personal data they collect within China as the draft cybersecurity law stipulates, they have to comply with Chinese laws and will be punished if they get involved in personal data leak or dissemination of illegal information online under the Criminal Laws, Qin An, a cybersecurity expert at the China Institute for Innovation and Development Strategy, told the Global Times.

The law aims to prevent international frauds, especially the telecom scams from abroad, Qin said.

Byline: Gérard Latulippe

Section: oped

Opinion - Gérard Latulippe, ancien Haut commissaire(Trinité-et- Tobago) et ancien délégué général (Mexique, Bruxelles) Saint-Sauveur
Un jour, on demanda à Justin Trudeau quel gouvernement d'un autre pays il admirait le plus. Il répondit qu'il avait une certaine admiration pour le régime dictatorial de la Chine. Aujourd'hui, il est premier ministre.

L'AIGLE ET LE DRAGON

Récemment, les premiers ministres canadien et chinois se sont rendus visite mutuellement à l'intérieur d'une période d'un mois. Un partenariat stratégique en a résulté, couvrant la coopération en matière politique, économique, commerciale, sécuritaire et judiciaire. Il s'agit d'un précédent dans l'histoire de la diplomatie canadienne car il engage le Canada sur une voie qui pourrait mener à un réalignement de ses alliances traditionnelles. Cette danse avec le dragon ne se fera pas sans causer des remous chez notre voisin l'aigle américain.

Les contrastes parlent souvent par eux-mêmes. Pour les Chinois, c'est par le protocole que les messages sont clairs. Des pourparlers tenus à la Cité interdite, à Pékin, au dîner de famille au lac Harrington, à Gatineau, en passant par la mise au jeu en chandails du Canadien au Centre Bell, on a voulu démontrer le caractère historique de cette nouvelle alliance en allant bien au-delà du protocole des visites de chefs d'État. En septembre, la Chine accueille le G 20 à Hanglou. Le président Obama n'a pas eu droit au traditionnel tapis rouge à sa descente de l'avion, contrairement à tous les autres chefs d'État. Les

observateurs ont conclu avec justesse que c'était délibéré pour faire paraître les Américains diminués et faibles.

BRAS DE FER GÉOSTRATÉGIQUE ÉTATS-UNIS-CHINE

Les États-Unis et la Chine sont au coeur d'un bras de fer géostratégique à l'échelle de la planète. Le monde est témoin des tensions grandissantes et des luttes de pouvoir titanesques entre les deux pays. La puissance américaine est en voie de s'effriter au profit de la Chine. L'année dernière, l'ambassadeur de Chine a déclaré qu'il souhaitait que le Canada cesse de se concentrer sur les États-Unis et porte son regard sur la zone Asie-Pacifique. En d'autres termes, la Chine souhaite que le Canada réduise sa dépendance vis-à-vis des États-Unis pour être entraîné de plus en plus sous l'influence de la Chine.

UNE NOUVELLE MENACE VENUE DU NORD?

Le premier ministre Trudeau s'est engagé dans une coopération tous azimuts avec la Chine. La déclaration conjointe lors de la visite du premier ministre chinois contient 29 initiatives pour lesquelles des ententes ont été signées. En matière économique, la Chine s'intéresse principalement à nos ressources naturelles, nos produits agricoles, notre technologie en particulier dans les secteurs stratégiques et par-dessus tout à notre accès au marché américain. Les Chinois ne se limitent pas à importer nos ressources mais ils sont hautement intéressés à investir dans nos entreprises spécialement celles représentant un intérêt stratégique.

Or le peuple américain considère comme une menace sérieuse la montée en puissance de la Chine. Une étude récente du PEW Research Center a démontré que plus de 85 % des Américains sont préoccupés par les emplois perdus aux mains de la Chine, du déficit commercial américain, du cyberespionnage chinois et de leurs violations des droits de la personne. Peu importe le résultat des élections présidentielles, les Américains ressentiront comme un danger imminent l'influence croissante du dragon chinois chez leur voisin du nord.

Le territoire d'un pays s'impose à sa politique internationale. Demandez-le aux Ukrainiens, voisins de la Russie. Demandez-le aux Japonais voisins de la Chine. L'histoire du Canada a démontré l'impact sur nos choix de politique extérieure de notre proximité territoriale avec les États- Unis.

Un accord de libre-échange Canada-Chine soulèvera des inquiétudes aux États-Unis. Il existe des risques importants que la Chine puisse utiliser l'effet combiné d'un éventuel accord de libre-échange avec le Canada et de l'ALENA pour exporter aux États Unis des biens exempts de droits de douane. Cet accès privilégié au marché américain leur est impossible actuellement. Or, l'opinion américaine est déjà défavorable à l'ALENA et plus de 75 % des exportations de marchandises canadiennes sont destinées à nos voisins américains. La table est mise pour des tensions à venir.

Récemment, le club des milliardaires chinois a visité le Canada. Ils n'ont pas caché leur intérêt à investir dans les industries technologiques. Qu'il s'agisse des technologies environnementales, de l'énergie

propre, de la robotique, les États-Unis, au même titre que le Canada, n'ont pas intérêt à ce que la Chine s'empare des secrets industriels d'importance pour la conquête des marchés mondiaux.

Les intérêts sécuritaires canadiens et américains sont intrinsèquement liés. L'espionnage stratégique et industriel chinois constitue une préoccupation majeure pour les Américains. Le gouvernement et les entreprises canadiennes sont aussi victimes du cyberespionnage chinois. Les services d'intelligence canadiens et américains collaborent étroitement sur la question sécuritaire à travers le monde, incluant les risques émanant de la Chine. Il existe un partenariat stratégique très étroit entre la Chine et la Russie, trop souvent sous-estimé. Au mois de juillet dernier, Putin effectuait sa 15e visite en Chine. Ce partenariat stratégique est clairement dirigé contre les États-Unis et leurs alliés, en particulier l'OTAN.

L'intensification radicale des relations avec la Chine finira-t elle par miner la collaboration stratégique en matière de sécurité du Canada avec les États-Unis et ses alliés de l'OTAN? Nul doute qu'il s'agit d'un objectif à long terme de la Chine.

LA NAÏVETÉ N'A PAS DROIT DE CITÉ

La Chine est la deuxième puissance mondiale. Ottawa a évidemment intérêt à conserver de bonnes relations et accroître son commerce bilatéral. Le régime chinois est brutal et impitoyable. Il considère la nouvelle relation avec le Canada comme une opportunité en or dans la partie d'échecs avec les États-Unis pour la primauté universelle. Le gouvernement Trudeau n'a entrepris aucune consultation et débat public avant de s'engager dans cette nouvelle alliance comportant autant de dangers que de bénéfices. Elle compte des risques considérables pour notre relation bilatérale avec les États-Unis et notre relation multilatérale avec le monde occidental. La naïveté n'a pas droit de cité dans ce contexte.

Illustration(s) :

PHOTOTHÈQUE LE SOLEIL

Selon l'auteur, on a voulu démontrer le caractère historique de la nouvelle alliance entre le Canada et la Chine en allant au-delà du protocole des visites de chefs d'État, notamment en procédant à une mise au jeu en chandails du Canadien de Montréal.

Le ministre veut une enquête administrative

Thursday, 03 November 2016

Byline: Marc-André Gagnon

Section: general

Québec - La surveillance des registres téléphoniques d'au moins six journalistes par des policiers en 2013 serait une première en 20 ans pour la Sûreté du Québec, a fait savoir hier le ministre de la Sécurité publique, Martin Coiteux, qui a donné le feu vert à une enquête administrative.
«L'enquête qu'on va faire [...] pourrait donner lieu à des sanctions contre des personnes qui auraient mal agi, qui n'auraient pas respecté les règles», a souligné le ministre en début de soirée, hier.

M. Coiteux a assuré que cette enquête se fera «en totale indépendance» même si la SQ relève de son ministère.

APRÈS UNE PLAINTE

Le ministre trouve aussi «assez particulier» que l'enquête policière au cours de laquelle des journalistes ont été épiés par la SQ en 2013 ait été lancée après une intervention du ministre de la Sécurité publique de l'époque, le député péquiste Stéphane Bergeron (voir autre texte)

«C'est quand même curieux ce qui s'est passé, a réagi M. Coiteux. [...] Une lettre est arrivée à son cabinet le matin et le soir, une enquête était déclenchée [par la SQ]. [...] La coïncidence est grande.»

La protection gruyère

Thursday, 03 November 2016

Byline: Paul Journet

Section: editorial

Editorial - « Le projet de loi déposé l'année dernière par le gouvernement Couillard n'offre qu'une moitié de bouclier. »
Chaque jour amène de nouvelles révélations troublantes sur l'espionnage de journalistes par le Service de police de la Ville de Montréal (SPVM) et maintenant la Sûreté du Québec (SQ).

En réaction à la « grave » attaque du SPVM contre la liberté de la presse, le premier ministre Couillard a annoncé mardi trois mesures :

- Le Directeur des poursuites criminelles et pénales devra désormais autoriser tout mandat de surveillance sur un journaliste, comme c'est déjà le cas pour les avocats, juges et députés ;

- Un comité d'experts indépendants recommandera comment mieux protéger les sources journalistiques ;

- Une inspection sera menée sur la façon dont les policiers (SPVM, SPVQ et SQ) surveillent et interceptent les communications de citoyens, particulièrement les journalistes.

À Ottawa, le sénateur indépendant André Pratte et le Bloc québécois songent à déposer un projet de loi pour mieux protéger les sources journalistiques, tandis que le Nouveau Parti démocratique demande une enquête fédérale.

Puis, hier après-midi, on a appris que la SQ a surveillé six journalistes. Peu après, le ministre de la Sécurité publique, Martin Coiteux, annonçait une enquête administrative sur la SQ.

Il faudra vérifier si les mécanismes choisis sont encore adéquats pour faire la lumière sur l'ensemble des dérives. Et il faudra s'interroger sérieusement sur la confiance que méritent les patrons actuels de la police.

Mais pendant que les projecteurs se braquent sur ces crises, un mauvais projet de loi continue d'avancer tout doucement à l'Assemblée nationale : celui sur les dénonciateurs (PL87). C'est d'une triste ironie, car il concerne la chasse aux sources, cette dérive à l'origine de la surveillance des journalistes.

Le PL87 ne concerne pas que les médias. Il vise à protéger ceux qui dénoncent un problème à un journaliste, mais aussi à leur supérieur ou aux policiers.

C'est grâce à ces sonneurs d'alarme que les scandales dans l'industrie de la construction ont été révélés. Voilà pourquoi l'Unité permanente anticorruption proposait de renforcer leur protection contre les représailles. Il s'agissait même de sa toute première recommandation faite à la commission Charbonneau, qui l'a reprise dans son rapport.

Le projet de loi déposé l'année dernière par le gouvernement Couillard n'offre qu'une moitié de bouclier. Certes, les libéraux ont raison de chercher un équilibre pour ne pas créer un climat de méfiance et de dénonciation constante, mais cet équilibre ne se trouve pas dans la version actuelle du PL87.

D'abord parce qu'il ne protège pas assez de gens. Il s'applique aux employés de l'État, mais pas à ceux du municipal ni aux contractants privés. Or, la commission Charbonneau a démontré que c'est là que se situaient les pires dérives.

Ensuite, parce que le PL87 ne protège pas assez de types de dénonciations. Pour être couvertes par la loi, elles doivent être adressées à un responsable désigné de son organisme ou au Protecteur du citoyen. Les dénonciations aux médias ne sont pas protégées, sauf s'il s'agit d'une « urgence » liée à la sécurité, la santé et l'environnement, et si le problème a d'abord été signalé aux policiers...

C'est trop restrictif, car ces critères excluent par exemple le gaspillage de fonds publics. Et c'est trop contraignant, car le fardeau de la preuve repose sur le dénonciateur. Pour s'en convaincre, on n'a qu'à se souvenir de François Beaudry. En 2003, cet ingénieur découvrait la collusion dans l'attribution de contrats publics à Laval. Il a prévenu ses supérieurs du ministère des Transports, puis les policiers, et rien ne s'est passé. Six ans plus tard, il se tournait vers les médias, à ses propres risques.

Aujourd'hui, M. Beaudry juge le PL87 « cosmétique, voire inutile ». Ce projet de loi n'aurait rien fait non plus pour de courageux dénonciateurs comme Karen Duhamel, ingénieure au privé qui avait dénoncé les « mottons d'argent » échangés sur les chantiers.

Devant ces critiques, le président du Conseil du trésor, Sam Hamad, avait promis l'hiver dernier de protéger aussi les employés du municipal. Son successeur, Carlos Leitao, assure maintenant que ce sera fait dans un futur projet de loi. Mais on l'attend encore, et cela ne corrigerait pas la logique du projet de loi, qui garderait les dénonciations à l'intérieur des organismes.

Quand l'air devient vicié, il faut ouvrir les fenêtres et laisser jaillir la lumière.

Le milieu journalistique craint un climat de peur chez les sources

Thursday, 03 November 2016

Byline: Benoit Philie

Section: general

Montréal - Selon des experts, le téléphone des journalistes pourrait moins sonner
Un climat de peur pourrait se créer chez les sources à la suite des nombreuses révélations de surveillance policière dans les téléphones des reporters, déplore le milieu journalistique.

«On craint que le public et les divulgateurs prennent peur et arrêtent de contacter les journalistes, a dit Benoîte Labrosse, secrétaire-trésorière de la Fédération professionnelle des journalistes du Québec. C'est le public qui sera encore perdant et qui sera laissé dans la noirceur.»

SURVEILLANCE

En début de semaine, La Presse révélait que son chroniqueur Patrick Lagacé avait fait l'objet d'une étroite surveillance de la police de Montréal dans le cadre d'une évidente chasse aux sources journalistiques. On a aussi révélé que les registres téléphoniques de trois reporters avaient également été étudiés, soit Félix Séguin, de notre Bureau d'enquête, Monic Néron, du 98,5 FM et le journaliste indépendant Fabrice de Pierrebourg. La Sûreté du Québec a épié les téléphones de six journalistes en 2013, a-t-on aussi appris hier.

«Le journalisme, c'est un service public à la population. Il sert à surveiller et quand on y fait entrave, c'est directement la population que ça affecte», a déploré Pascale St-Onge, présidente de la Fédération nationale des communications.

La FPJQ constate que ce sont essentiellement des journalistes d'enquête qui sont concernés.

GROS DOSSIERS

«Les sources de ces gens-là concernent de gros dossiers, a dit Benoîte Labrosse. On n'a qu'à penser aux scandales de la construction et des commandites. Ce sont des cas extrêmes. S'il n'y avait pas eu de sources internes, on n'aurait jamais trouvé». La FNC s'inquiète aussi de l'effet qu'aura cette révélation sur le travail des journalistes.

«Ce n'est pas anodin que ce soit des journalistes d'enquête qui sont visés. Ils débusquent les scandales de corruption et de collusion. Ils fatiguent la police et le gouvernement», a soutenu Pascale St-Onge, présidente de la FNC.

«Tout ça pourrait refroidir certaines personnes de parler, des gens qui auraient voulu le faire et qui ne le feront pas», a-t-elle dit.

Le Droit

La police de Gatineau se défend

Thursday, 03 November 2016

Byline: Journaliste maison

Section: general

Gatineau - La police de Gatineau n'a pas, à la connaissance de son directeur adjoint, multiplié les démarches pour prendre connaissance des appels entre journalistes de la région et ses policiers. La seule exception, explique Luc Beaudoin, est celle qui a été faite envers le journaliste de TVA Gatineau-Ottawa, Pierre-Jean Séguin. Mercredi, la station de télévision indiquait que la police avait fait des vérifications après que de l'information ait été coulée. M. Beaudoin a pris l'exemple d'une intervention policière impliquant un homme barricadé. « On parle d'une enquête active, dit-il. Des policiers arrivés sur une scène étaient préoccupés par les médias déjà présents et il fallait s'assurer de la sécurité des policiers. On a regardé les communications pour savoir d'où provenait l'information. C'est un petit groupe restreint qui pouvait avoir l'information. » Cette semaine, plusieurs journalistes du Québec ont appris avoir fait l'objet de vérifications de corps policiers en ce qui a trait à leurs communications, souvent confidentielles.

Journalistes espionnés : une « menace à notre démocratie », dit Edward Snowden

Thursday, 03 November 2016

Byline: d'Olivier Arbour-Masse

Section: general

Montréal - « Une attaque radicale à la liberté de presse » et « une menace à notre modèle traditionnel de démocratie ». Voilà ce qu'Edward Snowden pense de « l'affaire Lagacé » et des six autres cas de journalistes espionnés par des corps de police québécois.
Le célèbre lanceur d'alerte avait déjà commenté à deux reprises sur Twitter le dossier de l'heure dans l'actualité québécoise. Il a eu l'occasion d'étayer sa pensée mercredi soir, dans une vidéoconférence organisée à l'Université McGill, à Montréal.

Des centaines d'étudiants ont fait la file pendant des heures afin de pouvoir entendre l'homme qui a permis de dévoiler les programmes de surveillance à grande échelle de la National Security Agency (NSA) aux États-Unis.

Sa conférence ne pouvait se tenir à un moment plus opportun. Quelques heures avant qu'il prenne la parole devant un amphithéâtre bondé, on apprenait que la Sûreté du Québec a épié en 2013 les appels de six journalistes, dont Marie-Maude Denis, Isabelle Richer et Alain Gravel de Radio-Canada.

En début de semaine, le Service de police de la Ville de Montréal (SPVM) s'est retrouvé sous les projecteurs pour avoir colligé les relevés d'appels et les métadonnées du journaliste de La Presse Patrick Lagacé.

Oh, Canada... https://t.co/D6kUPPDJ27 pic.twitter.com/KpmvbVYw8d

-- Edward Snowden (@Snowden) 2 novembre 2016

Snowden estime que le chef du SPVM Philippe Pichet doit démissionner pour « restaurer la confiance (du public) et rétablir les bases de l'imputabilité ».

M. Pichet, qui bénéficie toujours de l'appui du maire Denis Coderre, défend ses enquêteurs en affirmant qu'ils ont agi selon les lois en demandant et en obtenant l'autorisation d'espionner Patrick Lagacé auprès de la juge de paix Josée de Carufel.

Or, le problème se situe précisément au niveau de la loi, selon Edward Snowden.

Peut-on reconnaître ou à tout le moins débattre raisonnablement d'une nouvelle idée qui peut paraître un brin radicale? La loi commence à échouer dans sa mission de garantir nos droits.

Edward Snowden

« On ignore toujours selon quelle loi cette autorisation [de surveiller les journalistes] a été donnée », remarque-t-il.

« Le gouvernement peut s'introduire dans nos vies privées sans presque rencontrer d'entrave alors que nous, les citoyens, ne savons presque rien sur sa façon d'opérer », poursuit-il, depuis la Russie où il est réfugié pour échapper aux accusations de trahison qui pèsent contre lui aux États-Unis.

Le Canada et C-51 critiqués

Snowden est catégorique : impossible de se fier aux dirigeants des agences de renseignement pour respecter les lois protégeant la vie privée.

« La seule façon de s'assurer qu'ils jouent selon les règles, c'est en les menaçant de sanctions criminelles », lance-t- il.

Ainsi, Snowden propose de créer une autorité indépendante chargée d'étudier au cas par cas les agissements de ces agences et de les poursuivre devant les tribunaux si elles devaient transgresser la loi.

Or, « le Canada a le plus faible processus de supervision de ses services de renseignement parmi les pays occidentaux », avance l'ancien de la CIA et de la NSA.

À ses yeux, il s'agit là de la principale lacune de la loi antiterroriste C-51, adoptée par le gouvernement Harper et qualifiée par ses détracteurs de menace pour la vie privée. « Elle ne prévoit pas de supervision digne de ce nom », dit-il.

« [Justin Trudeau] a fait campagne en promettant de la réformer, mais ne l'a malheureusement pas fait, remarque Snowden. La plupart des experts estiment qu'elle est impossible à réformer de façon significative et qu'elle doit être abolie pour faire place à une nouvelle loi. »

Tous les pays surveillent leurs citoyens, détaille Snowden. « C'est la première fois de l'histoire que c'est technologiquement et logistiquement possible pour les gouvernements de traquer nos vies. Ce n'est pas de la science-fiction, ça se produit maintenant. »

Les outils technologiques qui devaient nous autonomiser sont désormais utilisés pour restreindre nos libertés.

Edward Snowden

Métadonnées et protection

Le SPVM n'a peut-être pas eu accès au contenu des conversations de Patrick Lagacé, mais les métadonnées de son téléphone sont suffisantes pour tracer un portrait précis de ses communications.

« Quand tu as les métadonnées, tu n'as pas besoin du contenu, explique Snowden. Ça dresse un rapport détaillé de la vie privée.Tu peux savoir où la personne va, qui elle rencontre, à qui elle parle, combien de temps... »

Edward Snowden suggère aux journalistes ainsi qu'à tout citoyen d'utiliser l'application Signal pour crypter leurs communications.

« Nous sommes tous surveillés, qu'on soit un criminel ou non », rappelle-t-il, ajoutant que « le droit à la vie privée est à la base de tous les autres droits ».

Le portrait qu'il dresse est sombre, mais le réfugié de 33 ans garde espoir de voir les politiques se réformer pour le mieux. « Les jours de la surveillance de masse sont comptés. Nous aurons droit à un futur plus juste et plus libre que ce dans quoi nous vivons. »

« Ce sera la décision de votre génération », a-t-il conclu en interpelant les étudiants réunis pour l'écouter.

Le Devoir (site web)

Snowden secoue le meilleur des mondes

Thursday, 03 November 2016

Byline: Sarah R. Champagne

Section: general

Moscou - Le moment n'aurait pu être mieux choisi pour entendre le plaidoyer d'Edward Snowden. La mise en garde du plus célèbre lanceur d'alerte du XXIe siècle résonne particulièrement fort au milieu de cette semaine où l'espionnage de plusieurs journalistes ne laisse plus de doutes.
Il est apparu sur écran géant en direct de Moscou, par une vidéoconférence à l'Université McGill. Le tonnerre d'applaudissements calmé, il affirme peu après : « Nous sommes tous surveillés, ce n'est pas de la science-fiction et ça arrive maintenant. » Prenant pour exemple les récents événements locaux, il s'inquiète de « cette attaque radicale de la liberté de presse, qui représente une menace au modèle traditionnel de notre démocratie ».

Ces scandales constituent en fait de nouveaux épisodes des dérives des appareils de renseignement, peu importe l'échelle. Plus important encore, le rythme des avancées technologiques de la surveillance organisée « a dépassé le contrôle démocratique » , insiste Snowden.

Le temps où une grande équipe et des moyens extrêmement coûteux étaient nécessaires pour espionner une seule personne est loin derrière. « Cette dynamique s'est inversée complètement , dit-il, dans un contexte où une seule personne, loin de ses cibles, peut en traquer un nombre extraordinairement grand avec des précisions inimaginables. » Ce changement fondamental et dangereux pour le droit à la vie privée est sa motivation première à sonner l'alarme.

En disant ces mots, son écran s'obscurcit un bref instant. Il montre à la foule une photo d'un immense entrepôt de données. « Les gouvernements n'ont pas demandé la permission du public pour s'impliquer dans ce genre de collecte » , au contraire, la négation de cette réalité a tout simplement empêché le débat.

La menace, toujours

En plus de l'innovation technologique, les gouvernements brandissent des « supermenaces, des ennemis terroristes de plus en plus grands » pour demander de plus en plus de pouvoirs. Cette « politique de la peur » a changé la manière dont les lois sont passées, selon lui. « Comment peut-on préserver une société libre dans un contexte de gouvernement illimité ? » demande-t-il à l'assistance.

La justice s'est pliée aux demandes des corps policiers au Québec après tout, a-t-il rappelé, sans que les chefs de police admettent que cette surveillance allait trop loin. « La loi est en train de faillir à son devoir de protéger nos droits » , réitère Snowden. Et ce droit à la vie privée est la base même de nos sociétés, ce qui permet au « soi » d'exister.

La forte affluence a pris au dépourvu les organisateurs. Quelques minutes avant le début de la vidéoconférence, des centaines de personnes débordées dehors et scandant « laissez-nous entrer » se sont élancées dans le bâtiment pour tenter d'entrer. Prenant acte de la popularité du rendez-vous -- et de piquets de grève qui ont dû être franchis par le public pour l'entendre -- l'ancien consultant de la National Security Agency (NSA) s'est montré patient et très attentif à la série de questions posées en majorité par des étudiants.

C'est à travers une interface virtuelle qu'il est forcé d'apparaître le plus souvent depuis trois ans, puisqu'il vit réfugié en Russie. En 2013, il a déclenché une tempête politique, diplomatique et sociale en révélant l'ampleur de la toile de surveillance des communications par les services secrets américains.

Considéré comme un héros par les groupes de défense des libertés, il est inculpé pour espionnage aux États-Unis, où il risquerait jusqu'à 30 ans de prison. Les documents obtenus par Snowden et diffusés au public grâce à deux journalistes révélaient que la NSA avait surveillé systématiquement téléphones, cellulaires, courriels. Les communications de millions de citoyens, ainsi que celles de chefs d'État, pouvaient donc potentiellement être scrutées par les autorités.

Des lois concernant la vie privée des utilisateurs d'Internet ont été modifiées depuis ces révélations. Le jeune trentenaire a demandé au président américain, Barack Obama, de lui accorder le pardon, pardon qui lui a été refusé à maintes reprises. En conclusion de sa conférence, Snowden a d'ailleurs souhaité répéter l'expérience à Montréal, en personne cette fois.

En attendant, « c'est entre vos mains ».

Bienvenue dans le Club

Thursday, 03 November 2016

Byline: Patrick Lagacé

Section: column

Chronique - Alain (Gravel) ! Éric (Thibault) ! Denis (Lessard) ! Marie-Maude (Denis) ! Isabelle (Richer) ! Enchanté, moi, c'est Affaire. Comme dans Affaire Lagacé. Je me suis trouvé un nouveau prénom, cette semaine.

Bienvenue, donc. Oui, bienvenue dans le Club des Journalistes espionnés ! Le local ne paie pas de mine, comme vous le voyez, mais c'est chaleureux !

Il y a de la bière dans le frigo (achetez-en de temps en temps), le mot de passe du WiFi est sur le routeur et le divan est un peu miteux, mais au moins on a le câble : RDI, LCN, TVA Sports, RDS, Canal Vie...

Pour le téléphone, avant de faire un interurbain, faites le 9 et...

C'est une blague, je n'ai pas fait installer le téléphone.

On ne sait jamais, hein ?

Blague à part, je suis content de vous recevoir. Je me sentais un peu seul, ici...

***

Je l'ai dit toute la semaine : je suis sûr que je ne suis pas le seul à avoir été espionné par la police.

Je pensais surtout au Service de police de la Ville de Montréal (SPVM), dont les réponses au sujet de l'espionnage d'autres journalistes ont été on ne peut plus évasives...

Et là, hier, paf, on a su le résultat des vérifications internes faites par la Sûreté du Québec (SQ) dans la foulée des révélations de La Presse : en 2013, six journalistes ont fait l'objet de mesures que Nixon à son plus parano n'aurait pas reniées.

Six. Et pas les moindres : le chef de bureau de La Presse à Québec, les deux têtes d'affiche de l'émission Enquête de l'époque, un journaliste d'enquête du JdeM, une star du journalisme judiciaire radio-canadien. Juste ça !

Six journalistes dont on a espionné les appels entrants et sortants, dans la foulée des révélations de Félix Séguin et d'Andrew McIntosh de TVA/Journal de Montréal, qui ont révélé le capotage scandaleux de Diligence II.

Je ne referai pas l'histoire de Diligence II. D'abord, j'aurais l'impression de me répéter encore, encore et encore.

Et puis Yves Boisvert, dans sa chronique du jour, en fait un superbe résumé, en esquintant Stéphane Bergeron, du PQ, ministre de la Sécurité publique de l'époque, qui le mérite amplement.

Mais Diligence est un cas d'école sur les dérives d'une police politique. On vient d'en constater un autre exemple, avec cet espionnage à l'échelle industrielle des journalistes...

Non, permettez que je fasse des liens entre les plus hauts échelons du SPVM et la SQ.

Chacun, à sa façon, semble être un nid d'intrigues politiques. Au SPVM, quand un directeur quitte son poste, s'engage inévitablement une campagne électorale aussi silencieuse que criarde, où à peu près tous les coups sont permis.

Je vous jure, ces courses à la direction sont l'équivalent « constabulaire » de Game of Thrones.

On fait circuler des rumeurs. On salit. On tente de « couler » aux journalistes des informations que l'on pense compromettantes, par exemple, sur l'un ou alors sur l'autre. Chacun tente de se positionner, avec sa garde rapprochée, pour gagner le siège du directeur...

Après ces campagnes électorales, le plus souvent, il faut beaucoup de temps pour nettoyer le sang. Les équipes « perdantes » voient leurs membres exilés dans quelque corps de police de banlieue, ou alors ils sont tablettés dans le SPVM...

Mettez dans l'équation un nouveau maire omnipotent qui politise l'information dans toute son administration, ledit maire qui choisit le chef de police et... Et ça fait beaucoup, beaucoup de politique dans la police de Montréal.

À la SQ, c'est House of Cards. Il y a des fonds secrets qui mènent à des enquêtes criminelles contre d'anciens officiers, des directeurs sans sécurité d'emploi qui se font sacrer dehors quand un nouveau parti arrive au pouvoir... Il y a des policiers qui se sentent obligés de « protéger » le pouvoir, par exemple en l'avertissant qu'une enquête est en cours sur des personnages bien en vue... Il y a, pendant des années, absence totale d'enquêtes sur la corruption à quelque échelle que ce soit, dans la sphère politique... Un ministre pense que c'est sa job de demander à la police « kesséça ? » quand un leader syndical rouspète, plutôt que de diriger ledit leader vers le poste de police le plus proche...

Ça fait, encore là, beaucoup, beaucoup de politique dans la police provinciale.

On ne me sortira pas de la tête que la pression politique, subtile ou pas, pousse la police à commettre des gestes stupides.

Comme tout ce qui sort depuis lundi.

***

Le Club des Journalistes espionnés a donc pignon sur rue. J'annonce par la présente que Fabrice, Monic et Félix sont pour l'instant membres stagiaires. Ils n'ont été, après tout, qu'informellement espionnés par le SPVM, via un logiciel maison qui épluchait les factures téléphoniques des flics, à la recherche de leurs numéros de téléphone...

Je suis certain que le Club admettra bientôt de nouveaux membres, c'est forcé.

Tenez, je cherche une chute pour cette chronique et je lis qu'André Cédilot, ancien as reporter aux affaires criminelles de La Presse, était également visé par la SQ...

Voici ta carte de membre permanent, André. Remplis le frigo de temps en temps, s'il te plaît...

Manque Boisvert. Ils t'espionnent pas, toi, Yves ? Me poserais des questions, à ta place...

La Presse+

Les Canadiens mal protégés contre la surveillance abusive, selon Snowden

Thursday, 03 November 2016

Byline: Marc Thibodeau

Section: general

Montréal - Le lanceur d'alerte américain prenait part à une vidéoconférence organisée par l'Université McGill, hier
Les Canadiens sont très mal protégés contre les pratiques de surveillance abusives, estime Edward Snowden, qui s'alarme des possibilités ouvertes aux services de renseignements d'ici et d'ailleurs par les nouvelles technologies de communication.

L'ex-sous-traitant de la National Security Agency (NSA), qui participait hier à une vidéoconférence organisée par l'Université McGill, a souligné que le système de régulation des services de renseignement canadiens était probablement le plus « déficient en Occident ».

Il a déploré à ce titre que le gouvernement libéral de Justin Trudeau tarde à réviser la Loi antiterroriste, dite loi C-51, qui confère des pouvoirs accrus à ces mêmes services.

Nombre d'analystes, a-t-il relevé, pensent que la loi en question est trop mal formulée pour être modifiée et devrait tout bonnement être retirée.

M. Snowden estime qu'il n'est tout simplement pas possible, ici ou ailleurs, de faire confiance aux autorités pour utiliser de manière responsable les technologies de surveillance existantes.

Longtemps, le coût et la complexité de la surveillance limitaient son utilisation, mais ce n'est plus le cas aujourd'hui, et les risques d'atteinte à la vie privée sont décuplés.

« N'importe quel gars assis loin de sa cible, comme moi quand j'étais basé à Hawaii, peut surveiller à distance un nombre inimaginable de personnes. »

-- Edward Snowden

La seule manière de s'assurer que les agences de renseignements « jouent le jeu honnêtement est la menace de poursuites criminelles », a souligné le lanceur d'alerte, qui suggère de confier à une instance indépendante le pouvoir de passer en revue les enquêtes menées par les services de renseignements pour s'assurer de leur légalité.

Le manque de transparence actuel, dit-il, confère aux États un pouvoir démesuré face aux citoyens. « Il y a un déséquilibre qui est antidémocratique et autoritaire par nature », a-t-il lancé.

Des milliers de personnes

La vidéoconférence a commencé avec une heure de retard en raison de la forte demande et des actions d'un groupe d'employés syndiqués de l'établissement qui ont perturbé l'entrée du public.

Les organisateurs ont été pris de court lorsque des milliers de personnes ont afflué vers le bâtiment où se tenait l'événement.

Après avoir longuement patienté, des personnes ont couru de l'extérieur vers la salle où se tenait la conférence dans l'espoir de s'assurer une place pour voir l'ex-employé de la NSA, qui vit aujourd'hui en exil en Russie.

C'est le cas notamment de Marco Manglaviti, étudiant de 22 ans, qui a commencé à faire la file trois heures avant l'heure d'ouverture annoncée des portes. « C'est une sorte de vedette rock, en tout cas dans le monde des technologies », a-t-il relevé avant que l'invité n'apparaisse à l'écran sous les applaudissements de la foule.

M. Snowden, qui a dû patienter à quelques reprises en raison d'ennuis techniques, s'est réjoui de cette marque d'enthousiasme à son égard.

Il a insisté du même souffle sur le fait que son histoire personnelle n'avait guère d'importance face aux enjeux suscités par les pratiques de surveillance des États.

« La question la plus importante est ce qui est en train de tous nous arriver », a-t-il déclaré.

« Il y a un déséquilibre qui est antidémocratique et autoritaire par nature. »

Québec - L'espionnage de journalistes par la Sûreté du Québec et le Service de police de la Ville de Montréal a soulevé une vague d'indignation et d'inquiétudes parmi les journalistes visés et au sein du monde politique.
« Je couvre la politique depuis près de 40 ans, souvent sur des dossiers délicats. On se dit toujours que c'est possible d'être épié par les policiers, mais on est convaincu qu'ils n'oseraient pas aller jusque-là. Bien, il semble qu'on se soit trompé. »

Denis Lessard, chef du bureau parlementaire de La Presse à Québec

« Je suis assez surpris de voir qu'un juge de paix ait pu autoriser un mandat à mon sujet alors que je n'avais pas écrit sur Michel Arsenault. [...] Le seul motif que je vois pour faire l'objet d'un mandat, c'est que ma conjointe [Marie-Maude Denis] avait déjà fait des reportages sur Michel Arsenault. »

Éric Thibault, Journal de Montréal

« J'ai toujours été super prudente avec mes sources confidentielles, mais évidemment, on ne se bat pas à armes égales avec la police, qui a des moyens d'enquête comme ça. L'avenir nous dira - ou peut- être ne le saurons-nous jamais - tout ce qu'ils savent sur moi. »

Marie- Maude Denis, Radio-Canada

« C'est comme si toutes nos grandes certitudes sur la société dans laquelle on vit venaient de s'effriter d'un coup sec. J'en avais, mais c'est terminé. J'en ai pas mal moins. [...] Aujourd'hui, on a eu des confirmations de la part d'une source extrêmement crédible, et je suis estomaquée. »

Isabelle Richer, Radio-Canada (Source : SRC)

« On peut parler d'un triangle PQ-FTQ-SQ. Il y a des questions qui se posent, et la proposition qu'on fait, la proposition d'une enquête publique, ça permettrait d'entendre tout le monde. »

Simon Jolin-Barrette, député de la Coalition avenir Québec

« Les révélations des dernières heures nous inquiètent énormément. [...] De toute évidence, c'est une partie de pêche parce que c'est plusieurs journalistes en même temps, ce n'était donc pas pour un mandat en raison d'une information précise. Ce genre de pratique n'appartient pas au Québec, ce genre de pratique appartient à des pays que je n'ose même pas nommer. »

Amir Khadir, député de Québec solidaire

« La réponse de la SQ de dévoiler [ces informations] démontre que le public a besoin d'être rassuré. Ce sont des questions auxquelles [la GRC et le SCRS] doivent répondre. On continue de demander une enquête publique qui nous permettrait de constater les faits : est-ce une pratique répandue ou arbitraire ? »

Matthew Dubé, porte-parole du NPD en matière de sécurité publique

« Comme n'importe qui, je vois que si la SQ et le SVPM le font, je ne tomberais pas en bas de ma chaise [si les corps policiers fédéraux le font aussi]. Le ministre Goodale doit demander des comptes aux services policiers sous sa juridiction et rendre des comptes en Chambre aussi. »

Rhéal Fortin, chef par intérim du Bloc québécois

« Bien que le premier ministre Philippe Couillard ait annoncé de nouvelles mesures afin de protéger les sources, il faudra en faire davantage pour assurer une pratique journalistique saine. Il est grand temps que le gouvernement envisage l'adoption d'une loi qui consacrerait la protection des sources. »

Pascale St-Onge, présidente de la Fédération nationale des communications (FNC- CSN)

« Les nouvelles révélations d'aujourd'hui confirment nos pires craintes, c'est-à-dire que d'autres journalistes aient été victimes d'espionnage policier. C'est pourquoi nous estimons qu'une enquête publique est plus que jamais nécessaire pour faire la lumière sur ces pratiques policières indignes d'une démocratie. Comment a-t-on pu en arriver là ? Comment des juges ont-ils pu permettre cela ? Il est impératif que les corps policiers fournissent une liste exhaustive des journalistes qui ont fait l'objet de surveillance, y compris au niveau fédéral. »

Jean-Thomas Léveillé, président de la Fédération professionnelle des journalistes du Québec (FPJQ), aussi journaliste à La Presse

Liberté de presse - La SQ a espionné six journalistes

Thursday, 03 November 2016

Section: general

Québec - Le ministre de la Sécurité publique ordonne une enquête administrative
En lieu et place de l'" affaire Lagacé ", il faudra désormais traiter du scandale de la surveillance des journalistes : la Sûreté du Québec a confirmé mercredi qu'elle avait, tout comme la police de Montréal, traqué des reporters au cours des dernières années dans le cadre d'une enquête, suscitant une nouvelle vague d'inquiétudes et de dénonciations dans l'univers des médias.

Le SPVM n'était donc pas seul à épier les faits et gestes des journalistes du Québec. En 2013, la SQ a mis sous surveillance les téléphones cellulaires de Marie-Maude Denis, Alain Gravel et Isabelle Richer de Radio-Canada, du chef du bureau de La Presse à l'Assemblée nationale, Denis Lessard, du reporter spécialiste du crime organisé André Cédilot et d'Éric Thibault du Journal de Montréal.

Le corps de police tentait alors de faire la lumière sur une fuite d'information concernant l'enquête policière qui visait le président de la Fédération des travailleurs du Québec, Michel Arsenault. La SQ en a elle-même fait la révélation mercredi.

C'est le nouveau directeur général de la SQ, Martin Prud'homme, qui aurait réclamé des vérifications internes au cours des derniers jours, dans la foulée de l'" affaire Patrick Lagacé ". Le chef de police " est très préoccupé, très irrité. Il a demandé qu'une enquête soit confiée à un tiers indépendant et veut

s'assurer que les droits de toutes les personnes visées ont été respectés, a affirmé le porte-parole Guy Lapointe. C'était sous l'ancienne administration. Les règles sont fort différentes maintenant à la SQ. "

Le ministre de la Sécurité publique Martin Coiteux a annoncé la tenue d'une enquête administrative sur les pratiques de la Sûreté, en plus des promesses faites la veille pour tenter de rassurer les entreprises médiatiques et leur personnel. Mais la Fédération professionnelle des journalistes du Québec (FPJQ) en demande bien davantage. " Il faut plus qu'un comité de quelques personnes sans pouvoirs et qu'une modeste " inspection " de trois corps policiers pour espérer rétablir l'essentiel climat de confiance qui peut inciter les divulgateurs à parler à un journaliste, a estimé le conseil d'administration de la Fédération. Pour connaître l'ampleur de la surveillance des journalistes par les différents corps policiers ainsi que les liens entre la police et le pouvoir politique, puis déterminer les moyens de corriger les problèmes, il faut une enquête publique indépendante dotée des moyens nécessaires. " Québec s'y refuse toujours.

La Presse révélait en début de semaine que le chroniqueur Patrick Lagacé avait fait l'objet de surveillance policière étroite dans le cadre d'une enquête menée contre l'un de ses policiers. Pas moins de 24 mandats de surveillance du journaliste avaient été accordés par la juge de paix. D'autres médias avaient également révélé que Félix Séguin de TVA, Monic Néron du 98,5 FM, et Fabrice de Pierrebourg, anciennement de La Presse, avaient aussi été surveillés par le SPVM.

Visée par la SQ, la journaliste de Radio-Canada Isabelle Richer a vivement réagi mercredi. " Ce n'est plus que le SPVM, c'est la SQ, c'est une chasse généralisée aux sources journalistiques ", s'est-elle indignée.

Directeur de l'information du Journal de Montréal, George Kalogerakis, a dénoncé avec véhémence les actions posées par le SPVM et la SQ au cours des dernières années. " Les médias sont là pour s'assurer que nos institutions -- la police, la classe politique, le judiciaire -- aient des comptes à rendre à la population. De voir que la SQ nous ait espionnés pour des sujets aussi mineurs démontre à quel point ce corps de police comprend mal le fonctionnement de notre démocratie ", a-t-il déclaré en entrevue.

Le SPVM mis en demeure

Brian Myles, qui dirige Le Devoir, parle quant à lui de révélations " excessivement troublantes ". " On est en présence de dérives systématiques de la part de corps policiers. Il nous apparaît urgent de faire une enquête exhaustive et indépendante. "

Dans la foulée de cette affaire, La Presse a d'ailleurs mis en demeure le SPVM, exigeant qu'il cesse d'utiliser les registres téléphoniques et les données de localisations de Patrick Lagacé. " L'absence de précautions prises lors de la collecte de données [...] de M. Lagacé pour protéger les sources confidentielles de ce dernier est un scandale et une atteinte sans précédent à la liberté de presse ", écrit Sébastien Pierre-Roy, avocat du quotidien de la rue Saint-Laurent.

" Ces données n'ont jamais appartenu au SPVM et ne lui appartiennent toujours pas. " Simultanément, le quotidien présentait une requête afin de forcer le SPVM à remettre à la justice tous les exemplaires de ces documents afin qu'ils soient éventuellement détruits.

Dans toute cette affaire, les journalistes canadiens ont-ils été naïfs de croire qu'ils étaient à l'abri de telles invasions de leur vie professionnelle et privée ? " Lundi, je vous aurais dit que l'affaire Lagacé était probablement une première dans l'histoire du droit canadien. Je suis très déçu de constater que j'ai eu tort. Il semble y avoir une facilité à obtenir ce genre d'ordonnance et il est donc tout à fait possible qu'il y en ait plus ", a confié l'avocat de La Presse, Sébastien Pierre-Roy.

Pas de démission du chef de police

Malgré la tourmente dans laquelle il se trouve plongé depuis lundi, Denis Coderre continue d'appuyer le directeur SPVM, Philippe Pichet. " Jusqu'à preuve du contraire, il a ma confiance ", a indiqué le maire mercredi.

Pour lui, toutefois, la protection des sources journalistiques demeure primordiale : " On n'est pas contents. Moi-même, quand j'ai vu ça, j'ai pété ma coche. Je trouvais ça inacceptable. Mais maintenant, il faut être factuel. On ne fera pas de lynchage public et on va s'assurer que les choses se fassent adéquatement. "

Mardi, l'administration Coderre a mandaté la Commission de la sécurité publique afin qu'elle se penche sur les procédures et les critères suivis par le SPVM pour l'obtention de mandats judiciaires visant des journalistes lors d'enquêtes. Les élus pourront alors questionner Philippe Pichet sur les méthodes des enquêteurs. Les échanges se feront à huis clos, mais le rapport que rendra la commission d'ici le 31 janvier 2017 sera public, a rappelé le maire : " On a des questions à poser tout en s'assurant qu'on n'entache pas les enquêtes et qu'on ne crée pas plus de problèmes s'il y a des causes devant les tribunaux ", a-t-il dit.

Réactions à Ottawa

À Ottawa, le premier ministre Justin Trudeau s'est montré ouvert à la possibilité de revoir les lois pour protéger la liberté de presse. " On va regarder attentivement les conversations qui vont avoir lieu entre l'Hôtel de Ville de Montréal et [le SPVM], mais [...] comme on a dit plusieurs fois, ce gouvernement [se porte] à la défense de la liberté de la presse et on va faire ce qui est nécessaire pour l'encadrer, s'il y a d'autres étapes nécessaires. "

Fait inquiétant, ni la Gendarmerie royale du Canada ni le Service canadien du renseignement de sécurité (SCRS) n'ont voulu préciser si des journalistes avaient déjà été, ou se trouvent actuellement sous écoute électronique.

L'ordre politique

Thursday, 03 November 2016

Byline: Yves Boisvert

Section: column

Chronique - Cette histoire illustre à merveille toute la trop grande proximité entre notre police « nationale » et le gouvernement du Québec, quel que soit le parti au pouvoir.
Il y avait quelque chose de grotesque à entendre Stéphane Bergeron, hier, jurer qu'il n'avait pas « autorisé l'espionnage de journalistes ».

Évidemment qu'il n'a pas autorisé ça. Il a cependant passé une commande politique au grand patron de la Sûreté du Québec. Et il a créé les conditions pour ce dérapage.

Ce matin de septembre 2013, M. Bergeron, ministre de la Sécurité publique du gouvernement Marois, reçoit une lettre du président de la FTQ, Michel Arsenault. Arsenault est furieux : les médias révèlent depuis un certain temps qu'il a été la cible d'une enquête criminelle de la Sûreté du Québec de 2007 à 2009 sur l'infiltration du crime organisé dans la construction ; ils révèlent aussi que la SQ a avisé le gouvernement Charest de cette enquête « sensible » ; et un membre du gouvernement libéral a averti Arsenault qu'il faisait l'objet d'une enquête. L'enquête a avorté. (Tout ceci sera confirmé en novembre 2013 à la commission Charbonneau.)

Ce jour de septembre 2013, donc, Michel Arsenault est furieux que des détails de cette enquête aient été divulgués dans les médias. Au lieu de se plaindre à la SQ, il écrit au ministre Bergeron.

Hier, M. Bergeron a affirmé qu'il n'était pas vraiment intéressé par « les états d'âme » de M. Arsenault. Ce qui l'intriguait, c'était plutôt la fuite de l'enquête au gouvernement libéral.

Il appelle immédiatement le chef de la SQ, Mario Laprise. C'est M. Bergeron lui-même qui a nommé M. Laprise, en écartant son prédécesseur Richard Deschênes.

Et que fait M. Laprise ? Enquête-t-il sur la personne du gouvernement Charest qui a fait une indiscrétion à Michel Arsenault ? Indiscrétion qui a apparemment fait capoter l'enquête ? Non, il déclenche une enquête sur la fuite d'information... dans les médias.

Autrement dit, ce qui était grave, ce n'était pas l'interruption d'une enquête majeure parce que le gouvernement libéral en avait avisé Michel Arsenault (ça pourrait ressembler, au pire, à une entrave à la justice...). Non, ce qui était grave, c'est que les médias révèlent l'histoire. Manifestement, la SQ en avait déjà assez des fuites dans les médias. Mais si en plus le ministre appelle...

Dans un tel état d'urgence, les vannes étaient ouvertes. Il devenait acceptable qu'un policier aille jusqu'à obtenir les relevés téléphoniques de six journalistes.

Je suis convaincu que M. Bergeron ne s'attendait pas à ce qu'on espionne les journalistes. Mais qu'il appelle ça « une question », qu'il appelle ça une demande de reddition de comptes, à la fin, c'est un ordre politique qu'il a passé à « son » chef de la SQ. Et cet ordre était clair : comment ça se fait qu'il y a des fuites chez vous ? Explique-moi donc ça...

***

Quand les ordres viennent de haut, la pression est forte. Et quand la pression est forte, on prend tous les moyens à sa disposition. Ce qu'il fallait découvrir ici, c'était « la taupe », ou « les taupes » de la SQ. Et quel moyen plus simple que de cibler tous les journalistes qui ont pu toucher à cette histoire ?

En ayant accès aux données des relevés téléphoniques, on retracera bien la foutue taupe...

Évidemment, en passant la gratte dans les données téléphoniques, en les épluchant une à une, on ramasse plein d'autres sources... Peut-être des sources policières, peut- être toutes sortes d'autres sources.

***

Une enquête inspirée par le ministre lui-même est suivie de près par le patron de la SQ. On est obligé de présumer que Mario Laprise était bien au courant des méthodes utilisées dans cette enquête de haute importance politique. Et qu'il les approuvait.

Ce matin, donc, Stéphane Bergeron devrait cesser d'occuper la fonction de porte-parole en matière de sécurité publique. Il fait partie de cette invraisemblable histoire et tant qu'elle n'est pas éclaircie, il ne peut remplir utilement ses fonctions. Or, on a besoin d'une opposition qui fasse un travail efficace dans cette affaire d'espionnage ahurissante.

L'ancien chef de la SQ devra nous dire ce qu'il savait, quand il l'a su, et par qui sont passés les ordres.

Les libéraux n'ont pas de leçons à donner, bien entendu : une enquête a avorté à cause d'indiscrétions policières en haut lieu.

La Coalition avenir Québec parle du triangle amoureux PQ-FTQ-SQ. La vérité, c'est que cette histoire illustre à merveille toute la trop grande proximité entre notre police « nationale » et le gouvernement du Québec, quel que soit le parti au pouvoir.

C'est pourquoi l'affaire est encore plus grave que l'espionnage de Patrick Lagacé : elle commence par un coup de téléphone ministériel.

Mince consolation : cette fois, c'est le corps de police lui-même qui a révélé l'espionnage, pas un hasard judiciaire.

Encore une fois, on remarque qu'un juge de paix quelque part n'a rien trouvé à redire à la saisie de relevés téléphoniques de journalistes d'enquête...

C'est tout ça qu'il faut exposer dans une enquête indépendante. On croyait naïvement que « ces choses-là » n'arrivent qu'ailleurs. On dirait que l'heure est venue de rappeler à ceux qui nous gouvernent, à ceux qui font des enquêtes et à ceux qui les surveillent que la liberté de la presse, c'est plus qu'une ou deux lignes dans les chartes.

Illustration(s) :

Stéphane Bergeron, ancien ministre péquiste de la Sécurité publique

PHOTO IVANOH DEMERS, ARCHIVES LA PRESSE

L'ancien ministre de la Sécurité publique Stéphane Bergeron a nié hier toute responsabilité dans l'espionnage de journalistes par la Sûreté du Québec. Il a soutenu n'avoir jamais été informé que les policiers utiliseraient ce recours.

New York Times

Why Light Bulbs May Be the Next Hacker Target (Canada)

Thursday, 03 November 2016

Byline: John Markoff

Section: general

San Francisco - The so-called Internet of Things, its proponents argue, offers many benefits: energy efficiency, technology so convenient it can anticipate what you want, even reduced congestion on the roads.
Now here's the bad news: Putting a bunch of wirelessly connected devices in one area could prove irresistible to hackers. And it could allow them to spread malicious code through the air, like a flu virus on an airplane.

Researchers report in a paper to be made public on Thursday that they have uncovered a flaw in a wireless technology that is often included in smart home devices like lights, switches, locks, thermostats and many of the components of the much-ballyhooed "smart home" of the future.

The researchers focused on the Philips Hue smart light bulb and found that the wireless flaw could allow hackers to take control of the light bulbs, according to researchers at the Weizmann Institute of Science near Tel Aviv and Dalhousie University in Halifax, Canada.

That may not sound like a big deal. But imagine thousands or even hundreds of thousands of internet-connected devices in close proximity. Malware created by hackers could be spread like a pathogen among the devices by compromising just one of them.

And they wouldn't have to have direct access to the devices to infect them: The researchers were able to spread infection in a network inside a building by driving a car 229 feet away.

Just two weeks ago, hackers briefly denied access to whole chunks of the internet by creating a flood of traffic that overwhelmed the servers of a New Hampshire company called Dyn, which helps manage key components of the internet.

Security experts say they believe the hackers found the horsepower necessary for their attack by taking control of a range of internet-connected devices, but the hackers did not use the method detailed in the report being made public Thursday. One Chinese wireless camera manufacturer said weak passwords on some of its products were partly to blame for the attack.

Though it was not the first time hackers used the Internet of Things to power an attack, the scale of the effort against Dyn was a revelation to people who didn't realize that having internet-connected things knitted into daily life would come with new risks.

"Even the best internet defense technologies would not stop such an attack," said Adi Shamir, a widely respected cryptographer who helped pioneer modern encryption methods and is one of the authors of the report.

The new risk comes from a little-known radio protocol called ZigBee. Created in the 1990s, ZigBee is a wireless standard widely used in home consumer devices. While it is supposed to be secure, it hasn't been held up to the scrutiny of other security methods used around the internet.

[Video: A small drone wirelessly delivers a computer worm in Beer Sheva, Israel, causing lights to flicker. Watch on YouTube.]

The researchers found that the ZigBee standard can be used to create a so-called computer worm to spread malicious software among internet-connected devices.

Computer worms, which can keep replicating from one device to another, get less attention these days, but in the early years of the commercial internet, they were a menace. In 1988, one worm by some estimates brought down a tenth of the computers connected to the internet.

Since then, the number of internet-connected devices has spiraled into the billions, and with it the risks of a cleverly created worm.

So what could hackers do with the compromised devices? For one, they could create programs that help in attacks like the one that hit Dyn. Or they could be a springboard to steal information, or just send spam.

They could also set an LED light into a strobe pattern that could trigger epileptic seizures or just make people very uncomfortable. It may sound far-fetched, but that possibility has already been proved by the researchers.

The color and brightness of the Philips Hue smart light bulb can be controlled from a computer or a smartphone. The researchers showed that by compromising a single light bulb, it was possible to infect a large number of nearby lights within minutes. The worm program carried a malicious payload to each light - - even if they were not part of the same private network.

In creating a model of the infection process, they simulated the distribution of the lights in Paris over an area of about 40 square miles and noted that the attack would potentially spread when as few as 15,000 devices were in place over that area.

The researcher said they had notified Philips of the potential vulnerability and the company had asked the researchers not to go public with the research paper until it had been corrected. Philips fixed the vulnerability in a patch issued on Oct. 4 and recommended that customers install it through a smartphone application. Still, it played down the significance of the problem.

"We have assessed the security impact as low given that specialist hardware, unpublished software and close proximity to Philips Hue lights are required to perform a theoretical attack," Beth Brenner, a Philips spokeswoman, said in an emailed statement.

To perfect their attack, the researchers said they needed to overcome two separate technical challenges. They first found a "major bug" in the way the wireless communications system for the lights had been executed, which made it possible to "yank" already installed lamps from their existing networks.

The researchers then used what cryptographers describe as a "side channel" attack to purloin the key that Philips uses to authenticate new software. The term side channel refers to the clever use of information about how a particular encryption scheme is used.

"We used only readily available equipment costing a few hundred dollars, and managed to find this key without seeing any actual updates," the researchers wrote. "This demonstrates once again how difficult it is to get security right even for a large company that uses standard cryptographic techniques to protect a major product."

NBC News

Election Cyberattacks: Pro-Russia Hackers Have Been Accused in Past

Thursday, 03 November 2016

Byline: Gabe Joselow

Section: general

London - While Americans are just coming to terms with the prospect of political cyberattacks tied to Russia -- it isn't the first time Kremlin- linked hackers have been accused of trying to influence voters in other countries.
A torrent of stolen emails released by WikiLeaks -- most damaging to the Democrats and Hillary Clinton -- have marked the 2016 race in what U.S. intelligence officials say is an unprecedented attempt to by Vladimir Putin's government to undermine trust in the U.S. election process.

"We believe, based on the scope and sensitivity of these efforts, that only Russia's senior-most officials could have authorized these activities," the Department of Homeland Security and the Office of the Director of National Intelligence said in an extraordinary gloves-off statement on Oct. 7.

Russia has been accused of this before, notably when hackers attempted to hijack an election in neighboring Ukraine in 2014.

A few days before the vote, a sophisticated cyberattack shut down Ukraine's Central Election Commission's computer systems by disrupting the internal network. A pro- Russian hacktivist group called CyberBerkut claimed responsibility for the attack.

CEC administrators were able to restore the system in time for the vote, but on election day the website was compromised again when a photo was posted falsely showing a far-right candidate had won the vote. Russian state television went on to broadcast an image allegedly taken from the site to report what turned out to be a false story.

It is not clear whether CyberBerkut was responsible for the false photo, or if other hackers were involved.

But according to a Ukrainian official investigating the incident who spoke to NBC News on condition of anonymity as the investigation into the incident is ongoing, additional malware was found on the election commission's system. This was traced back to the group APT28, also known as Fancy Bear which has been linked to the recent hacks in the U.S.

While the 2014 incident did not alter the outcome of Ukraine's elections, the hackers accomplished their goal, according to NATO cyberdefense ambassador Kenneth Geers.

He believes the hack was a Russian attempt to discredit the election and "muddy the waters."

"Maybe the goal was just to disrupt the process and its integrity or credibility," he told NBC News, adding that the timing of the attack was critical.

Ukraine was electing a new leader to succeed pro-Russian Viktor Yanukovych, who had been forced out of office by the Euromaidan street protests that erupted in Kyiv in late 2013.

Russia had already annexed the Crimea region from Ukraine and a Russian-backed separatist movement was waging an armed insurgency in the east. And the battle on the ground was also being fought online.

"Anytime you have a geopolitical conflict now you see its reflection in cyberspace," Geers said.

At the time Russia said it had no role in the hack, just as it has rejected accusations that it is trying to meddle in the American presidential race.

"We deny it completely," the Kremlin's top spokesman Dmitry Peskov told NBC News when asked whether his government supported hackers trying to influence the outcome of the U.S. election.

But Christopher Porter, an analyst with the cybersecurity firm FireEye, says the attacks in Ukraine and in the United States fit a pattern.

"Something we've seen in [the U.S.] election is a close tie between APT28 activities and social media and broadcast news outlets in Russia," he said. "As soon as they release a new leak or at the same time or beforehand they will have a news story all ready to go."

The U.S. documents stolen in the recent attacks were released through WikiLeaks and pushed out almost simultaneously on Russian news sites.

FireEye researchers have linked APT28 to Russia in part by showing that some of the source code was written in Russian and that malware was compiled during Russian working hours.

Malware associated with APT28 has also reportedly been found on the computers of German lawmakers earlier this year in what investigators describe as an espionage campaign, according to an IT security researcher who investigated the attack on behalf of a political party there.

APT28 also claimed responsibility on its website for leaking athletes' health records from the World Anti-Doping Agency database in an apparent attempt to discredit the organization after it recommended Russian athletes be banned from this year's Rio Olympics.

While breaches in the U.S. have been more embarrassing for the Democrats and Clinton, the intent of Russia's alleged meddling was not to favor a particular candidate but to "undermine democracy in some vague way" and "sow discord," Porter said.

Donald Trump and his supporters have repeatedly claimed the election is rigged while pointing to documents published by WikiLeaks. This may be just the kind of "discord" the attackers had planned.

And there may be more to come.

U.S. intelligence officials are concerned that attackers with ties to Russia could try to post falsified documents to try to undermine confidence in the result and to stir fears of voter fraud.

U.S. officials already sent warnings to Illinois and Arizona in August after reports that hackers had infiltrated voter registration rolls in those two states, though it was unclear what, if any, information was obtained or altered.

A huge amount of data about U.S. voters is already being offered for sale online, experts warn.

"We saw 190 million national records for sale in October 2015 for $20,000," said Porter, the cybersecurity analyst.

The voter information appears to be a combination of public data that was easily acquired to other records that were more likely illegally obtained, according to Porter. It is not clear how attackers could use this information.

While senior U.S. officials maintain the Russian state is behind the slew of cyberattacks in the U.S., a leading Moscow-based cybersecurity expert said he doubted that the Kremlin was really responsible for the latest spate of hacks.

Oleg Demidov, a cybersecurity consultant with Moscow-based policy center PIR, told NBC News that he had not seen hard proof of Russian state involvement.

Concerning the possibility these hacked databases could be used to damage an election campaign he said: "I do not see it."

U.S. officials also have said it would be extremely difficult for anyone -- including state-backed hackers -- to alter the actual ballot count in the U.S. election, or to get into the actual voting machines.

Still, FireEye's Porter warned Russian hacking groups have shown they have firepower beyond just hacking databases and websites. He noted as an example the unprecedented cyberattack on a Ukrainian power distributor just before Christmas last year that temporarily knocked out electricity to 230,000 people.

"The Russian government-backed ... groups are limited by their will, not by technology," Porter says. "They can do a lot more damage than they've currently done."

USA Today

Microsoft to block Windows flaw used by Russian hackers

Thursday, 03 November 2016

Byline: Brett Molina

Section: general

Washington - Microsoft says it will release a patch next week to address vulnerabilities in its Windows operating system exploited by a group reportedly tied to the Russian government and linked to the theft of emails from the Democratic National Committee.
The group, called Strontium by Microsoft but Fancy Bear or APT 28 by other security researchers, has been tied to Russian state- sponsored hacking. U.S. intelligence agencies have said Russian groups were behind attempts to interfere with this year's U.S. presidential election.

Strontium has targeted "government agencies, diplomatic institutions, and military organizations, as well as affiliated private sector organizations such as defense contractors and public policy research institutes," Microsoft's executive vice president of Windows and devices group Terry Myerson said in a blog post Wednesday.

Myerson did not directly link Strontium to Russia, only that it has been used "to target a specific set of customers."

But according to CrowdStrike, an Irvine, Calif.-based computer security firm that published a detailed analysis of the attack on the DNC intrusion in June, Strontium is simply another name for the group CrowdStrike called Fancy Bear, a Russian intelligence- affiliated adversary.

The exploits used by Strontium involve versions of Windows going back to Vista as well as Adobe's Flash, according to Myserson. Microsoft says the group launched a campaign involving spear phishing, where users receive a malicious email disguised as a message from a friendly individual or business. If successful, hackers could gain access to a victim's computer. A patch is expected by Nov. 8.

The patch doesn't mean Strontium no longer will be able to launch attacks, merely that it will need to find new vulnerabilities. FancyBear/Strontium has a history of using so- called "zero day vulnerabilities." That means security holes in software that are unknown and therefore have not been patched, ones companies do not realize they must protect against.

The exploits were first discovered by Google's Threat Analysis Group, and shared publicly Monday.

Surveillance de journalistes : mutisme à la GRC et au SCRS

Wednesday, 02 November 2016

Byline: Vincent Brousseau-Pouliot

Section: general

Ottawa - Alors que la SQ et la Ville de Montréal ont confirmé avoir mis des journalistes sous surveillance, la GRC et le Service canadien du renseignement de sécurité (SCRS), les deux corps policiers fédéraux, ne veulent pas confirmer s'ils ont déjà adopté de telles pratiques, et le cas échéant à quelle fréquence. La GRC précise seulement que «les cas où des enquêtes de la GRC concernant des journalistes ont eu lieu sont extrêmement rares».
Le commissaire de la GRC Bob Paulson a dit mercredi «ne pas être au courant que nous avons des enquêtes actives ou de la surveillance à l'égard de journalistes», mais la GRC n'a pas voulu confirmer si des journalistes ont été surveillés dans le cadre de ses enquêtes. Un cas de filature avait été rendu public il y a un an, celui du journaliste de La Presse Joël-Denis Bellavance qui a été pris en filature en 2007.

Tout en précisant «reconnaître» et «respecter [...] l'importance de la liberté et de l'indépendance de la presse», la Gendarmerie royale du Canada (GRC) a indiqué ne pas pouvoir commenter «l'existence d'enquêtes en cours» ou «discuter des détails opérationnels» d'enquêtes passées. La GRC n'a pas précisé à La Presse si elle effectuait, comme l'a fait la Sûreté du Québec cette semaine, un examen de ses enquêtes pour déterminer si des journalistes ont été mis sous surveillance. La SQ a dévoilé aujourd'hui que six journalistes au Québec, dont Alain Gravel (Radio-Canada), Marie-Maude Denis (Radio-Canada), Isabelle Richer (Radio-Canada), Denis Lessard (La Presse) et Éric Thibault (Journal de Montréal).

Le Service canadien de renseignement de sécurité (SCRS) n'a pas répondu aux questions de La Presse à savoir si l'organisme fédéral responsable des enquêtes de sécurité nationale : 1) surveille actuellement des journalistes, 2) en a surveillé par le passé, 3) mène actuellement des démarches pour répondre à ces questions et a l'intention de rendre public le résultat de ces démarches.

De son côté, le gouvernement Trudeau n'a pas l'intention de demander à la GRC et au SCRS de divulguer de telles informations, estimant qu'il n'était «pas approprié de commenter sur les questions opérationnelles».

«Bob Paulson, commissaire de la GRC, a confirmé qu'aucun journaliste ne fait actuellement l'objet d'une surveillance par la GRC. Le ministre Goodale examine la Directive ministérielle sur les enquêtes dans les secteurs sensibles existante afin de s'assurer que les plus grands soins sont pris lorsque des enquêtes criminelles et du journalisme se recoupent et que la valeur canadienne fondamentale de la liberté de presse est protégée. Il est toujours ouvert à recevoir des représentations sur ce qu'il y a d'autre à faire pour protéger les libertés fondamentales de la presse», indique Scott Bardsley, attaché de presse du ministre fédéral de la Sécurité publique Ralph Goodale.

Le NPD demande une enquête publique sur la question de la surveillance des journalistes par les corps policiers. Les néo-démocrates sont «préoccupés» par le fait que la GRC et le SCRS ne veulent pas préciser s'ils ont mis des journalistes sous surveillance. «En ne répondant pas, ça affecte la confiance du public, dit le député Matthew Dubé. La réponse de la SQ de dévoiler [ces informations] démontre que le public a besoin d'être rassuré. Ce sont des questions auxquels ils doivent répondre. On continue de demander une enquête publique qui nous permettrait de constater les faits: est-ce une pratique répandue ou arbitraire?»

Après avoir vu les cas au SPVM et à la SQ, le chef par intérim du Bloc québécois Rhéal Fortin dit qu'il «ne tomberait pas en bas de ma chaise» s'il apprenait que des journalistes ont été surveillés par les corps policiers fédéraux. «Nous n'avons pas d'informations à cet effet-là, précise-t-il. Comme n'importe qui, je vois que si la SQ et le SVPM le font, je ne tomberais pas en bas de ma chaise [pour les corps policiers fédéraux]. Le ministre Goodale doit demander des comptes aux services policiers sous sa juridiction et rendre des comptes en Chambre aussi. Tout ça va peut-être nous permettre de découvrir qui est surveillé, mais ça ne règle pas le problème, ce qui rend encore plus pertinent et urgent que jamais notre projet de loi [sur la protection des sources journalistiques].»

Le Parti conservateur du Canada aimerait que le ministre Goodale fasse un examen de la situation et vienne en faire rapport en comité parlementaire.

60 millions de fichés, émoi, émoi, émoi...

Thursday, 03 November 2016

Byline: Alexandre Fache

Section: general

Paris - La mise en place par décret, dimanche, d'un fichier compilant les données personnelles d'une grande partie des Français inquiète élus et associations. D'autant que la mesure n'a fait l'objet d'aucun débat public.

Ce n'est sans doute pas l'ensemble de nos libertés que le gouvernement a enterré dimanche, au coeur du week-end de la Toussaint. Mais la discrétion supposée que devait offrir au nouveau fichier TES (pour « titres électroniques sécurisés ») un simple décret paru le 30 octobre au Journal officiel peut à elle seule faire craindre le pire. De fait, aucun débat parlementaire, ni même aucune délibération citoyenne n'aura accompagné la création d'un gigantesque outil de recueil des données personnelles des quelque 60 millions de Français, ceux en tout cas qui ont un jour possédé un passeport ou une carte d'identité. Mis en place dans un souci de « simplification administrative », ce nouveau fichier TES, dont l'existence a été révélée par le site Next INpact lundi, réunit en effet dans une seule et même base les données relatives à l'ensemble de nos concitoyens âgés de 12 ans et plus : nom de famille, nom d'usage et prénoms, date et lieu de naissance, sexe, couleur des yeux, taille, domicile, noms, prénoms, date et lieu de naissance des parents, leur nationalité, ainsi qu'une adresse mail si celle-ci a été renseignée, ou encore une photographie, jusqu'aux empreintes digitales, prélevées depuis 2008 aux heureux possesseurs de passeports biométriques... En un mot comme en cent, « un monstre », selon la formule du député PS et membre de la Commission nationale de l'informatique et des libertés (Cnil), Gaëtan Gorce, qui a dit cette semaine toute son inquiétude quant à l'utilisation qui pourrait être faite d'un tel outil.

La crainte de modifier les finalités d'un tel fichier

Des inquiétudes qui ne datent pas de ce mois de novembre. En 2012, alors que la majorité de droite vivait ses dernières heures, une proposition de loi avait été adoptée, créant le même fichier géant, qualifié alors par le député UMP Christian Vanneste de « fichier des honnêtes gens », ceux qu'il fallait « protéger ». L'objectif était double : lutter contre l'usurpation d'identité d'une part, et permettre, d'autre part, l'identification d'une personne à partir de ses données biométriques, notamment à des fins judiciaires. Un deuxième point qui avait entraîné la censure de ce texte par le Conseil constitutionnel, saisi par des parlementaires socialistes, parmi lesquels Jean-Jacques Urvoas, devenu aujourd'hui ministre de la Justice...

Le gouvernement se défend d'avoir effectué un copier-coller du texte de 2012. « Le décret qui vient d'être pris ne comporte aucune fonctionnalité d'identification d'une personne à partir de ses seules données biométriques », fait ainsi valoir le ministère de l'Intérieur, assurant qu'il ne peut donc « être comparé à la proposition qui avait été censurée » il y quatre ans. Voire. « La finalité d'identification à partir des données a certes été écartée, mais dès lors que le fichier a été constitué, elle devient techniquement possible, s'inquiète Gaëtan Gorce. On peut craindre qu'un futur gouvernement ne modifie les finalités d'un tel fichier. » Un gouvernement de droite ou d'extrême droite, par exemple, qui voudrait durcir la législation au lendemain d'un nouvel attentat terroriste...

Des préoccupations partagées par la Ligue des droits de l'homme

Des préoccupations partagées par la Ligue des droits de l'homme et son président d'honneur Michel Tubiana. « Aujourd'hui, on n'a pas le droit de faire de tri dans ce fichier, suite à l'invalidation du texte de 2012 par le Conseil constitutionnel. Mais qui dit que demain ce dernier ne changera pas de position, dans un contexte différent ? » Pour l'avocat, le gouvernement aurait dû se ranger derrière l'avis de la Cnil, qui plaidait pour la mise en place d'un système de puce électronique dans la carte d'identité, permettant de « conserver les données biométriques sur un support individuel exclusivement détenu par la personne concernée ». « Là, on crée un fichier géant de 60 millions de personnes, inquiétant par nature, regrette Michel Tubiana, et ce d'autant plus qu'il va être consultable par pas moins de onze services de l'État, et même plus si la justice le demande. C'est énorme, et cela multiplie les risques de fuites ou de piratages. Sans régler par ailleurs le réel problème des usurpations d'identité, bien au contraire ! »

Stoïque malgré les critiques, Bernard Cazeneuve a rappelé, hier, à l'Assemblée, que ce nouveau fichier avait été « validé par le Conseil d'État et la Cnil ». Reste à demander leur avis aux 60 millions de fichés.

London Times

Hackers leak Putin plan to carve up Ukraine

Thursday, 03 November 2016

Byline: Maxim Tucker

Section: general

Kyiv - Leaked Kremlin emails reveal how Russian operatives botched an attempt last year to foment an uprising in Kharkiv, the second largest city in Ukraine.
The emails, obtained by The Times, were apparently hacked from the inbox of Maria Vinogradova, an adviser to Vladislav Surkov, President Putin's point man on Ukraine. The civilian intelligence analysis group Inform Napalm said that it had traced the adviser to an office in central Moscow used by the FSB spy agency.

Three of the Ukrainian hackers involved in the leak met The Times on condition of anonymity, carrying concealed weapons but rejecting suggesern tions that the hack had been carried out with the help of Ukrainian or US intelligence services. Last month NBC News reported that the CIA had vowed to retaliate against Russia for a series of intrusions targeting American political institutions.

The inbox that they shared contains 423 emails between government officials and separatist leaders between 2014 and 2016. Highlights include a proposal from a rebel leader to split Ukraine into three

parts under a federalised system, plans to replace unruly separatist officials who were then killed or arrested, and draft Ukrainian laws to be submitted by a pro-Russian party.

The presidential office was also sent emails asking for approval of a screenplay and a poem about the war in easting Ukraine. The email trove includes two maps sent in January this year by Denis Pushilin, a rebel leader who reports regularly to Mr Surkov, and suggests that Ukraine could be carved into three parts: an eastern third known as "New Russia", a central region, includ-Kiev, to be known as "Lesser Russia" and a smaller western area to take the historic name "Galicia".

An email sent in April last year to Mr Surkov from Mikhail Markelov, chairman of Russia's parliamentary committee for public associations, sets out a plan for stoking unrest in Kharkiv by creating a pro-Russian "resistance group" called the Civil Initiative.

"CI will develop and implement actions to mobilise protests, encourage criticism of Kiev policy, and promote ideas of regional 'autonomy'," the message reads.

By June, however, the committee chairman was reporting that the plan had run into problems. An email with the subject header "Problems and Mood" laments that the project "Kharkiv, rise up!" had not brought Ukrainians in the city on to the streets.

In the email Mr Markelov explains that Kharkiv had ignored the group's false warnings of "bloody attacks" on Russian speakers by Ukrainian nationalists. He also relays concerns that Ukrainian intelligence services had infiltrated the pro-Russian organisation. "So, instead of uniting and producing work aimed at the desired result, there is a 'debriefing' and 'a search for the traitors'," the parliamentarian writes.

In a third email two weeks later Mr Markelov appears to have abandoned hopes of an uprising, writing that many of the "resistance fighters" have been arrested or fled to Moscow or the breakaway Donetsk People's Republic.

Montréal: des journalistes sur écoute

Thursday, 03 November 2016

Byline: Journaliste maison

Section: general

Montréal - Les téléphones mobiles de six journalistes québécois ont été surveillés en 2013, a rapporté mercredi Radio-Canada, deux jours après que le journal La Presse a révélé que l'un de ses chroniqueurs vedettes avait été espionné par la police de Montréal. Selon la radio, la Sûreté du Québec (SQ), la police provinciale, a obtenu des mandats lui permettant d'obtenir le registre des appels entrants et sortants des six journalistes mais n'a pas enregistré leurs conversations.
Guy Lapointe, porte-parole de la SQ, a expliqué mercredi soir à la radio 98,5 Montréal que la police avait cherché à déterminer l'origine de fuites ayant permis la divulgation dans la presse du contenu d'écoutes téléphoniques. Selon la presse canadienne ces fuites concernaient une affaire de fabrication de preuves par des policiers.

C'est dans le cadre de cette même enquête qu'un chroniqueur du journal La Presse, Patrick Lagacé, a été surveillé par la police de Montréal. Le premier ministre québécois Philippe Couillard a promis mardi de réformer la législation afin de mieux protéger la liberté de la presse au Québec après ces révélations.

Reuters

John Brennan's attempt to lead the CIA into the age of cyberwar

Wednesday, 02 November 2016

Byline: David Rhode

Section: general

Washington - When America goes to the polls on Nov. 8, according to current and former U.S. intelligence officials, it will likely experience the culmination of a new form of information war.
A months-long campaign backed by the Russian government to undermine the credibility of the U.S. presidential election - through hacking, cyber attacks and disinformation campaigns - is likely to peak on voting day, the officials said.

Russian officials deny any such effort. But current and former U.S. officials warn that hackers could post fictional evidence online of widespread voter fraud, slow the Internet to a crawl through cyber attacks and release a final tranche of hacked emails, including some that could be doctored.

"Don't underestimate what they can do or will do. We have to be prepared," said Leon Panetta, who served as CIA director and defense secretary in President Barack Obama's first term. "In some ways, they are succeeding at disrupting our process. Until they pay a price, they will keep doing it."

John Brennan, the current CIA director, declined to comment on the Russian efforts. But he said Russian intelligence operatives have a long history of marrying traditional espionage with advances in technology. More broadly, Brennan said, the digital age creates enormous opportunities for espionage. But it also creates vulnerabilities.

Citing an array of new cyber, conventional and terrorist threats, Brennan announced the most sweeping reforms of the CIA in its 69-year history 18 months ago.

Weakening the role of the Directorate of Operations, the agency's long-dominant arm responsible for gathering intelligence and conducting covert operations, Brennan created 10 new "mission centers" where CIA spies, analysts and hackers work together in teams focused on specific regions and issues. He also created a new Directorate for Digital Innovation to maximize the agency's use of technology, data analytics and online spying.

The information age "has totally transformed the way we are able to operate and need to operate," Brennan told Reuters in a series of interviews. "Most human interactions take place in that digital domain. So the intelligence profession needs to flourish in that domain. It cannot avoid it."

When a new American diplomat arrives for duty at the U.S. embassy in Moscow or Beijing, CIA official say, Russian and Chinese intelligence operatives run data analytics programs that check the "digital dust" associated with his or her name. If the newcomer's footprint in that dust - social media posts, cell phone calls, debit card payments - is too small, the "diplomat" is flagged as an undercover CIA officer.

The Russian-backed campaign to discredit the U.S. election is not isolated. Hackers believed to have links to Chinese intelligence began stealing the personal information of 22 million federal employees and job applicants in 2014, the worst known data breach in U.S. government history. Islamic State's online propagandists continue to inspire lone wolf attacks in the United States even as the group loses territory.

A senior official from the Directorate of Operations, who backs the shake-up, said the agency is experiencing its greatest test in decades.

THE DIGITAL DEBATE

"The amount of threats and challenges that are facing this organization and this nation are greater than at any time in the last 30 years," said the official, who declined to be named. "The days of a black passport, a fistful of dollars and a Browning pistol are over."

James Clapper, the Director of National Intelligence, praised Brennan and his efforts to retool the CIA for a new era in an interview. So did Lisa Monaco, Brennan's successor as the President Obama's Homeland Security and Counterterrorism adviser.

But some current and former officials question Brennan's strategy, arguing his reforms are too digitally focused and will create a more cautious, top-heavy spy agency. At a time when the agency needs to refocus its efforts on human espionage, they say, the concentration of power in the new mission centers weakens the ability of the Directorate of Operations to produce a new generation of elite American spies.

The reforms have hurt morale, created confusion and consumed time and attention at a time of myriad threats, according to interviews with ten former officials.

Glenn Carle, a former CIA covert officer, supports Brennan and his reforms but said they have sparked a mixed reaction among directorate of operations officials who believe human intelligence is getting short shrift.

"The value the CIA can fundamentally add is to steal secrets, and the ultimate secret is intention," the often inscrutable aims of foreign leaders, Carle said. "Obtaining that is a human endeavor."

At the same time, Brennan has stirred a different sort of criticism - that he has defied Congressional oversight. Liberal Democrats and libertarian Republicans in Congress say the Brennan- Obama tenure has been tarnished by a lack of transparency with congressional oversight committees and the public regarding surveillance, drone strikes and the agency's use of torture against terrorism suspects during the administration of George W. Bush.

"While I think John's overall legacy will be as a reformer, that legacy will suffer from his refusal to come to grips with the CIA's troubled torture program," said Senator Dianne Feinstein, D- Calif, vice chair of the Senate's intelligence committee. "I think the new president's CIA director must prioritize a high level of trust between the CIA and Congress to insure proper oversight is conducted."

It's unclear how closely the country's next president will hew to Brennan's strategy.

The front-runner, Democrat Hillary Clinton, has an incentive to beef up American cyber-espionage: U.S. intelligence officials blame the continuing leak of emails from her campaign on Russian-backed hacking. Clinton also expressed support for covert action in a transcript of a 2013 speech she gave to Goldman Sachs that was recently released by Wikileaks.

Republican Donald Trump, meanwhile, pledged to make cybersecurity a top priority in his administration in an October 3 speech. "For non-state terror actors, the United States must develop the ability - no matter how difficult - to track down and incapacitate those responsible and do it rapidly," Trump said. "We should turn cyber warfare into one of our greatest weapons against the terrorists."

In interviews at agency headquarters in Langley, Virginia, Brennan declined to comment on either candidate or discuss operational details of the CIA. But he and eight other senior CIA officials gave the

most detailed description yet of their rationale for the most radical revamp of the agency since its founding in 1947.

"I look out at the next 10, 20, 30 years, and I look at technology, I look at complexity, I look at the global environment," Brennan said. "I think CIA really needs to up its game."

JUST-WAR THEORIST

Brennan, a 61-year-old native of north New Jersey, looks like a linebacker but talks like a technocrat. He speaks excitedly about how the CIA and other government bureaucracies can be configured in "a way to ensure optimal outcomes."

The son of devout- Catholic Irish immigrants, Brennan speaks reverently of CIA officers as public servants who risk their lives without public accolades. He joined the agency in 1980, at the age of 24, after receiving a Master's Degree in government with a concentration in Middle Eastern studies from the University of Texas.

Educated in various Catholic schools, including Fordham University, Brennan says he is an adherent of just-war theory - a centuries-old Christian theological argument that war is justified when it is waged in self defense, as a last resort and minimizes civilian casualties. Those beliefs, he says, have guided him in one of the most controversial aspects of his tenure in the Obama administration.

As Obama's White House counter-terrorism adviser and CIA director, Brennan played a central role in carrying out 473 U.S. airstrikes outside conventional war zones between 2009 and 2015, primarily by drone. U.S. officials estimate the attacks have killed 2,372 to 2,581 people, including 64 to 116 civilians.

Human rights groups say the totals are vastly higher. Last year, for instance, a U.S. drone strike in Pakistan accidentally killed American aid worker Warren Weinstein and Italian aid worker Giovanni Lo Porto, who were both being held captive by al Qaeda.

Brennan declined to comment on specific strikes, but said, "I still can look myself in the mirror everyday and believe that I have tried to do what is morally right, what is necessary, and what is important to keep this country safe." He also acknowledged mistakes.

"You question yourself. You beat yourself up. You try to learn from it," Brennan said, in a rare display of emotions. "But you also recognize that if you're not prepared to make the tough decisions in the jobs that have been entrusted to you, you shouldn't be in those jobs."

Today, Brennan says the United States faces the most complex array of threats he has seen since joining the agency 36 years ago. As a CIA analyst, operative and executive, he has lived through the Cold War espionage duels of the 1980s; the disintegration of nation-states after the 1989 fall of the Berlin Wall;

the rise of non-state terrorist groups since 2001; and the current digital disruption. Now, he says, all four dynamics are converging at once.

BOLD AND INNOVATIVE RIVALS

CIA officials say their greatest state competitors are the Russian and Chinese intelligence services. While smaller countries or terrorist groups may want to strike at the United States, Russia and China are the only two adversaries with the combination of skills, resources and motivation needed to challenge Washington.

In recent years, Moscow's Federal Security Service, or FSB, has become adept at waging "gray zone" conflicts in Ukraine, Crimea and Syria, the officials said. In all three countries, Russian intelligence operatives have deftly shrouded protagonists, objectives and war crimes in ambiguity.

One target is America's increasingly politically polarized democracy. As Russian-backed hacking unfolded this summer, the Obama White House's response fueled frustration among law enforcement and intelligence officials, according to current and former officials. The administration, they said, seemed to have no clear policy for how to respond to a new form of information warfare with no rules, norms or, it seemed, limits.

White House officials said the administration is still considering various methods of responding, but the responses won't necessarily be made public.

China presents another challenge. Chinese businessmen and students continue trying to scoop up American state and economic secrets. In one bright spot, Beijing appears to be abiding by a 2015 pact signed by Obama and Chinese leader Xi Jinping that the two governments would not conduct economic espionage against one another. Chinese hacking appears to have slowed from the voracious rate of the past, which included hacking into the computers of the 2008 presidential campaigns of John McCain and Barack Obama but not releasing what was found.

"The question is whether or not it is due to greater care in terms of covering one's tracks," Brennan said of the apparent change. "Or whether or not they realize that they're brand is being tarnished by this very rapacious appetite for vacuuming up things."

Regional powers are also increasing their digital espionage efforts.

In 2014, the Obama administration blamed North Korea for the hacking of Sony Pictures' computer system. This spring, U.S. prosecutors indicted seven Iranian hackers for allegedly trying to shut down a New York dam and conducting a cyber attack on dozens of U.S. banks. They also indicted three Syrian members of the "Syrian Electronic Army," a pro-Syrian government group, who hacked into the websites of U.S. government agencies, corporations and news organizations.

In a 2015 case that U.S. officials said marks a worrying new trend, federal prosecutors indicted a 20-year-old hacker from Kosovo. With the help of a criminal hacker, Ardit Ferizi stole the home addresses of 1,300 members of the U.S. military, providing the information to Islamic State and posting it online, and calling for attacks on the individuals. Ferizi was arrested in Malaysia, where he was studying computer science. In September, he pleaded guilty in a U.S. federal court and was sentenced to 20 years in prison.

"This blend of the criminal actor, the nation-state actor and the terrorist actor, that's going to be the trend over the next five years," said John Carlin, who recently stepped down as head of the Justice Department division that monitors foreign espionage in the United States.

But some active clandestine officers argue that the intelligence community has grown too reliant on technology, a trend they trace back four decades to the directorship of Stansfield Turner. Satellite photography, remote sensors and communications intercepts have become more sophisticated, but so have encryption techniques and anti-satellite weapons.

More important, they argue, is that technology is no substitute for "penetrations" - planting or recruiting human spies in foreign halls of power. The CIA missed India's 1998 nuclear tests and misjudged Saddam Hussein's arsenal in 2003 because it lacked spies in the right places.

Today, these current and former CIA officials contend, American policymakers have little insight into the thinking of Vladimir Putin's inner circle. Presidents, kings and dictators often don't share their true intentions electronically, putting this valuable information largely beyond the scope of digital spying. The best sources are still people, and these officials believe the agency is not mounting the kind of bold human spying operations it did in the past.

Brennan and other CIA officials flatly denied downplaying human intelligence. They said aggressive, high-risk human spying is under way but they cannot go into operational detail.

One of Brennan's predecessors, Michael Hayden, former CIA chief under President George W. Bush, says the agency strayed from its core mission during the Bush years. After the Al Qaeda attacks of Sept. 11, 2001, Hayden said, the CIA had shift to become a paramilitary organization that devoted its most talented officers to tracking and killing terrorists. It now needs to reverse that trend by focusing on espionage against rival nations, he said.

"The constant combat of the last 15 years has pushed the expertise of the case officer in the direction of the battlefield and in the direction of collecting intelligence to create physical effects," said Hayden, using an intelligence euphemism for killing. "At the expense of what the old guys called long-range, country-on-country intelligence gathering."

'OPTIMIZING CAPABILITIES'

Brennan and the eight other senior CIA officials made the case that their modernization effort will address the needs and threats described by Hayden and others. Technological advances, they said, have leveled the intelligence playing field. The web's low cost of entry, creativity and speed benefits governments, hackers and terrorists alike.

A veteran covert operative who runs a new CIA mission center compared Brennan's reforms to the Goldwater-Nichols Act. The landmark 1986 legislation reorganized the U.S. military into a half dozen regional commands where the Army, Navy, Air Force and Marines work together. It was a response to inter-service rivalries that bedeviled the American military in Vietnam.

The CIA equivalent involves having the agency's five main directorates - Operations (covert spies), Analysis (trends and prediction), Science and Technology (listening devices and other gadgetry) and Digital Innovation (online sleuthing) and Support (logistics) - provide the personnel needed by each regional mission center.

Andrew Hallman, director of the new Directorate for Digital Innovation, said the CIA has embraced cloud computing as a way to better share intelligence. In a move that shocked insiders and outsiders, the CIA awarded an $600 million contract to Amazon in 2013 to build a secure cloud computing system where multiple CIA databases can be quickly accessed.

For decades, different directorates maintained their own separate databases as a security measure, said Hallman. Some of the applications the agency used were so old - up to 30 years - that the manufacturer was no longer in business.

Turning to Amazon was designed to immediately put private-sector computing advances at the fingertips of CIA operatives. It was also an admission that it was easier for the agency to buy innovation from the private sector than try to create it internally.

Several former CIA officials criticized the new team-focused system, saying it dilutes the cultures that made each agency directorate strong. The best analysts are deeply skeptical and need to be separated from covert operatives to avoid group-think, they said. And the best covert operatives are famously arrogant, a trait needed to carry out the extraordinarily difficult task of convincing foreigners to spy for America.

Richard Blee, a former CIA clandestine officer, said the agency needed reform but highlighted a separate problem created by technological change. Instant secure communications between CIA headquarters and officers in the field has centralized decision-making in Washington, Blee said. And regardless of administration, senior officials in Washington are less willing to take a risk than field officers - virtually all of whom complain about headquarters' excessive caution.

"The mentality across the board in Washington is to take the lowest common denominator, the easiest option, the risk-free option," Blee said. "The Chinese are taking tough decisions, the Russians are taking

tough decisions and we are taking risk-averse decisions. And we are going to pay a price for that down the road."

Brennan says his reforms will empower CIA officers: The integrated teams in each new mission center will improve speed, adaptability and effectiveness.

"To me, that's going to be the secret of success in the future, not just for CIA but for other organizational structures," Brennan said. "Taking full advantage of the tools, capabilities, people and expertise that you have."

The old ways of spycraft, Brennan argues, are no longer tenable. Asked what worries him most, he gave a technocratic answer: Twentieth century American government management practices are being rendered obsolete in the digital age.

"U.S. decision making processes need to be streamlined and accelerated," he said. "Because the problems are not going to wait for traditional discussions."

Globe and Mail
In scathing ruling, Federal Court says CSIS bulk data collection illegal
Friday, 04 November 2016
Byline: Colin Freeze

Ottawa - The Federal Court of Canada faulted Canada's domestic spy agency Thursday for unlawfully amassing data, for misusing its surveillance warrants and for not being forthright with judges who authorize its intelligence programs. The court is also revealing that CSIS no longer needs warrants to collect Canadians' tax records because of changes wrought by Bill C-51.
The matter was said to involve the decade-long collection of volumes of data within the Canadian Security Intelligence Service's little- known Operational Data Analysis Centre, which the judges who scrutinize CSIS are characterizing as a hidden and unlawful repository of data amassed by the spy agency.

The centre and the data within it are so secret that the Federal Court - which authorizes CSIS wiretapping bids - had no idea they existed.

"The Court had never before been fully informed of the existence of the program. The Court, during the hearings, learned that the program had been in existence since 2006 yet it had never heard nor seen any evidence on the matter," reads a partly redacted new ruling from Federal Court Judge Simon Noël.

These judges took the rare step of meeting collectively several times in 2016 to grill CSIS officials about their wiretap warrants and whether the service was being forthright enough in making them.

This is a scathing ruling on several levels. It is basically the second time in three years that senior Federal Court judges who approve CSIS programs have publicly said they cannot keep tabs on what the spy agency is doing because its intelligence officers are breaching their "duty of candour" with the court. The judges further reveal that controversial 2015 Conservative legislation, Bill C-51's Security of Canada Information Sharing Act, eased information flow between government departments to the point that "CSIS no longer needs a warrant to obtain information from the Canada Revenue Agency."

Public Safety Minister Ralph Goodale is currently consulting with Canadians on whether he needs to change the laws under which CSIS operates. He is also pitching Parliament on a new committee of MPs who could be given powers to investigate intelligence agencies.

CSIS exists to advise the Prime Minister about threats to national security. It can potentially collect much greater amounts of data, about more people and more entities, than any police agency can, given it works under lower legal thresholds of intelligence investigations that are never intended to be discussed publicly. Its relationships with Canadian telecommunications companies and other Canadian government departments have always been murky.

Elsewhere, however, spy agencies are also falling under fire for collecting data in bulk quantities, and for gathering information about everyone in hopes of deducing patterns that speak to where terrorists could be. For example, the U.S. and British counterparts of CSIS have lately been faulted by their own watchdog agencies for indiscriminately amassing material relating to citizens' phone logs, taxation records and passports, in hopes that such records might be useful to intelligence analysts.

The Federal Court of Canada documents released Thursday say CSIS has been unlawfully amassing "associated data" - a term that appears to refer to telecommunications metadata such as phone logs and e-mail trails. Under its foundational legislation passed in 1984, CSIS is entitled to collect only information that is "strictly necessary" to collect, but Federal Court judges who sign off on warrants now say the spy agency is not living up to this law.

"CSIS had an obligation, beginning in 2006, to fully inform the Court of the existence of its collection and retention of associated data program. The CSIS also had the duty to accurately describe this program to the Court," reads the Federal Court statement. It added that "the Court concluded that the retention of associated data ... falls outside the CSIS's legislatively defined jurisdiction" and "that therefore this retention of associated data is illegal."

Some of these criticisms align with ones previously made by a federal watchdog agency, which had already publicly complained that CSIS rarely lets go of any phone logs and Internet-transaction data it collects.

This fall, the Security Intelligence Review Committee criticized CSIS for going beyond its "strictly necessary" collection mandate by "ingesting bulk data sets" in bids to predict patterns of terrorism. The previous year, SIRC faulted CSIS for indefinitely holding on to telecommunications metadata it gathers in the course of wiretapping investigations, alleging CSIS was likely legally obliged to destroy such material.

SIRC has recommended that CSIS reconsider these practices or at least tell the Federal Court about them. But CSIS's written response was that it did not need to tell the Federal Court what it was doing.

"The Service did not agree with SIRC's recommendation to advise the Federal Court of activities relating to metadata collected under warrant. CSIS's position is that ... the CSIS Act does not confer any general supervisory authority to Federal Court judges, therefore, it believes that SIRC's recommendation was both inappropriate and unwarranted," was the spy service's position at the time, according to the report.

The Federal Court has now signalled it disagrees with this assessment. In recent years, CSIS's collection capabilities are thought to have been vastly increased by co-operation warrants that exist with the Communications Security Establishment, a federal spy agency that dredges global telecommunications data in bulk. CSE's headquarters are now located beside CSIS's headquarters.

5 things to know about the CSIS metadata ruling
Friday, 04 November 2016
Byline: Graham Slaughter

Analysis: In a scathing ruling released Thursday, a Federal Court judge said the Canadian Security Intelligence Service illegally held on to potentially revealing electronic data about people over a 10-year timeframe.
We break down the ramifications of the major decision and what it means for the future of Canada's spy agency:

What do we know?

Justice Simon Noel said CSIS held on to metadata that was not directly linked to threats to Canadian security. Keeping the information was a breach of the agency's duty to inform the courts, the judge ruled, since the information was obtained through judicial warrants.

According to court documents, the information was crunched beginning in 2006 and includes data trails linked to family and friends of people under CSIS surveillance, but who were not under investigation themselves.

What is metadata?

Metadata is information associated with a communication, such as an email address or telephone number. Metadata does not include contents of the correspondence. However, it can reveal a person's movement, communication patterns or other identifying details.

In this case, it is difficult to pinpoint the exact type of metadata CSIS held because the 126-page ruling was heavily redacted.

You can see it for yourself here.

What has CSIS said?

CSIS director Michel Coulombe said Thursday that the agency has stopped allowing access and analysis of the metadata until it has time to fully assess the judge's decision. He added that he regrets "the court's serious concerns with respect to meeting our duty of candour."

What happens next?

The decision immediately sets new rules on how metadata can be used by CSIS. Only metadata that relates to a specific security threat, investigation, prosecution, national defence or foreign affairs can be kept and used.

The judge also suggested that the federal government should seriously take a fresh look at the CSIS Act of 1984, which he said is "showing its age" thanks to modern technology.

How has the government reacted?

Public Safety Minister Ralph Goodale said the government won't appeal the decision and said he will follow up with CSIS top brass about the ruling. He added that "Canadians need to have confidence" about all federal departments and agencies.

Feds hold Twitter consultation on national security
Friday, 04 November 2016
Byline: Laura Payton

Ottawa - Public Safety Canada held a Twitter chat Thursday night to hear what Canadians think about national security and its responsibility to Canadians.
The department in charge of the RCMP, the Canadian Security Intelligence Service and its oversight body, and the Canada Border Services Agency asked people to tweet them using the hashtag #YourNatlSec starting at 8 p.m. ET to discuss accountability in national security.

The social media discussion comes the same week the House public safety committee is starting its review of bill C-22, which will amend some of the laws changed under the Conservatives' highly contentious C-51.

The review also comes hours after a shocking revelation that CSIS held on to 10 years of electronic data it wasn't allowed to have. The metadata, which includes information like a telephone number or email address but not the content of a communication, wasn't directly related to national security threats. The Federal Court released a decision Thursday rebuking CSIS for keeping the information.

Public Safety Minister Ralph Goodale didn't participate in the Twitter chat.

New Democrat justice critic Murray Rankin says he wanted as many people as possible to participate.

"Any effort to get Canadians engaged is great," he said.

The department is holding national security townhalls across the country until Dec. 15. It's also is accepting input on its website too.

Rankin, who once served as a lawyer to the Security Intelligence Review Committee, says he'd like to see changes to C-22. The bill would set up a parliamentary committee to review spy agency activity after the fact, but no oversight during operations.

Goodale has promised more changes to C-51 are still to come, but Rankin says he wants to know when.

"It's been more than a year. I haven't seen a single comma change in C-51, which is an odious bill that deserves to be, we say, repealed," he said.

Toronto Star
CSIS collected data on citizens for past 10 years
Friday, 04 November 2016
Byline: Alex Boutilier

Ottawa - Canada's spies for almost a decade illegally kept and analyzed data on people who posed no threat to national security, a federal court judge has ruled.
In a scathing ruling, Justice Simon Noël said the Canadian Security Intelligence Service had illegally retained an unknown amount of data on "third party" and "non-threat" individuals since 2006.

CSIS fed that data into a powerful database that allowed the agency to draw out "specific, intimate insights into the lifestyle and personal choices of individuals," read the heavily censored court ruling, circulated to journalists on Thursday.

Moreover, CSIS failed to inform the court, which acts as one of the only checks against the agency's investigative powers, about the program for almost a decade.

"(Judges) serve as the gatekeepers of intrusive powers, ensuring a balance between private interest and the state's need to intrude upon that privacy for the collective good," Noël wrote.

"If the CSIS unduly limits the flow of information the court needs to make proper determinations, then the CSIS can be seen as manipulating the judicial decision-making process."

According to the court documents, CSIS created the Operational Data Analysis Centre (ODAC) in 2006 to be a "centre of excellence for the exploitation and analysis" of different data sets.

One source of ODAC's data was gathered through legally approved surveillance of CSIS targets. Anyone who communicated with the target - family, friends, employers - would be considered "third party" or "non-threat" individuals.

Information about those people, who are not suspected threats or targeted by the agency, was scraped into the ODAC. CSIS wanted to retain that information - metadata like telephone numbers and Internet protocol addresses - indefinitely.

Although the information seems innocuous in isolation, the court documents make clear it was collected to give the agency highly detailed intelligence. And while collecting the data was legal, retaining it indefinitely was not.

In the wake of Noël's ruling, CSIS has halted all access and analysis of the data.

The revelations prompted an unprecedented snap press conference by CSIS director Michel Coulombe. Coulombe told journalists the agency believed its actions were legal, from 2006 until October's ruling, but accepts Noël's findings.

Coulombe could not, however, explain why CSIS believed it needed to inform the court of ODAC's existence in 2006, but failed to do so for almost 10 years.

"I'll be honest, we went through our records and we really can't find a good explanation of why the court was not informed," Coulombe told reporters Thursday evening.

Coulombe was clear that CSIS believed the program was useful and effective, and said he would like to keep it in operation.

"That is something I will discuss with officials, (Public Safety Minister Ralph Goodale) and it is a public policy decision that the government and parliamentarians will have to make," the director said.

In a statement, Goodale said the government will not appeal Noël's decision.

But the minister did leave open the possibility of changing the CSIS Act to allow for such techniques in the future. Goodale noted the court ruling found the legislation governing CSIS was beginning to "show its age" after 30 years, and threats and investigative techniques have changed over that time.

Goodale said he would be discussing CSIS's failure to tell the court the full truth, however, with the agency's senior management.

"In matters of security and intelligence, Canadians need to have confidence that all the departments and agencies of the (government) are being effective at keeping Canadians safe, and equally, that they are safeguarding our rights and freedoms," Goodale wrote.

Noël noted this was the second time in three years that the Federal Court has found that CSIS failed to provide key information judges needed to properly authorize the agency's activities.

"I wonder what it will take to ensure that such findings are taken seriously," Noël wrote. "Must a contempt of court proceeding, with all its related consequences, be necessary in the future?"

Postmedia News
Hillary Clinton was warned in 2010 that U.S.-Canada intelligence sharing 'may be controversial for Canadians'
Friday, 04 November 2016
Byline: Zane Schwartz

Ottawa - Huma Abedin warned Hillary Clinton in 2010 that cables from the U.S. Embassy in Ottawa could cause problems for Stephen Harper's government, emails released Thursday show.
"Two cables set for release contain especially sensitive information on counterterrorism and intelligence sharing. The depth of bilateral cooperation detailed in the cables may be controversial for Canadians," said longtime Clinton-advisor Abedin.

The email between Abedin and the then-U.S. Secretary of State is one of 357 released Thursday by the State Department in response to a lawsuit. More emails are scheduled for release Friday.

Abedin's email was sent on Nov. 27 2010. On Nov. 29 the New York Times published a story detailing a 2008 conversation between the former head of the Canadian Security Intelligence Service Jim Judd and senior State Department counsellor Eliot Cohen.

The story details a conversation where Judd told Cohen that Canada received warning the Taliban was planning an explosion at Sarpoza Prison in Kandahar but was unable to "get a handle on the timing."

Ralph Goodale: Bill C-22 is designed to protect Canadians' rights, and defend their security

'Everything we do is reviewed': Canadian security agency defends activities amid spying allegations

This seemed to contradict a statement made by former chief of defence staff General Rick Hillier that: "Obviously we would have liked to have known so we could have pre-empted or helped, more accurately, the Afghans pre-empt that kind of thing."

The New York Times story was based on documents leaked to WikiLeaks detailing correspondence from U.S. diplomatic officials around the world, including staff from the embassy in Ottawa.

One of the most significant revelations was the Canadian government's concern in 2004 that they were being locked out of the Five Eyes network as punishment for not joining the U.S.-led war in Iraq. One leaked document said the Canadian government had: "expressed concern at multiple levels that their exclusion from a traditional 'four- eyes' construct is 'punishment' for Canada's nonparticipation in Iraq

and they fear that the Iraq-related channel may evolve into a more permanent 'three-eyes' only structure."

The Five Eyes network is an alliance between the signals intelligence agencies of Canada, the United States, Australia, the United Kingdom and New Zealand. Signals intelligence agencies focus on monitoring people via telephone and computer instead of by relying on human agents to monitor them in person. The five countries divided the world during the Cold War with each spying on certain regions and all sharing the information they intercepted. The United States temporarily restricted Canada and New Zealand's access within the Five Eyes network following both countries reluctance to join the 2003 war in Iraq.

Abedin was concerned the revelations might cause problems for the Harper government. "Canadian press coverage of the issue may put additional pressure on the Harper government," said Abedin.

Abedin need not have worried. Canadian coverage at the time largely focused on a comment from Judd that Canada had an "Alice in Wonderland" attitude on terrorism and a cable prepared prior to Barack Obama's visit to Ottawa in 2009 claiming that Canada had an "inherent inferiority complex" when it came to the United States.

The emails released Thursday demonstrate how the United States and Canada worked behind the scenes to downplay the importance of the 2010 revelations.

"Ambassador Jacobson saw Foreign Minister Cannon the evening of November 24 and reviewed the substance of the cables in The New York Times' cache," said Abedin, adding: "Cannon said he did not see any serious problems for the government."

The significance of Canada's role in the Five Eyes alliance became clearer in 2013 when leaked information from whistle blower Edward Snowden showed that Canada's Communications Security Establishment set up covert spy posts in about twenty countries on behalf of the United State's National Security Agency .

Those revelations sparked a debate in Canada about whether there is sufficient oversight over Canada's security agencies. In response, Stephen Harper's government passed Bill C-51, which granted significant new powers to the security agencies. Justin Trudeau promised to alter Bill C-51 to include more oversight provisions during the 2015 federal election campaign but has yet to do so.

On Thursday a Federal Court judge ruled that the Canadian Security Intelligence Service broke the law by keeping potentially revealing data about Canadians over a 10-year period.

Journal de Montréal
Pas de journalistes épiés par l'UPAC ou la GRC
Friday, 04 November 2016
Byline: Journaliste maison

Ottawa - Le grand patron de l'Unité permanente anticorruption, Robert Lafrenière, assure qu'aucun journaliste n'a fait l'objet d'une enquête ou de quelque surveillance de l'UPAC depuis sa création en 2011.
Le premier ministre Justin Trudeau a lui aussi indiqué que les agences fédérales de sécurité ne surveillent pas les journalistes comme l'ont fait la Sûreté du Québec et le Service de police de la Ville de Montréal.

Hier, il a dit s'être entretenu à ce sujet avec les dirigeants de la Gendarmerie royale du Canada (GRC) et de l'agence d'espionnage canadienne, le Service canadien du renseignement de sécurité (SCRS), et avoir reçu la confirmation que le fédéral n'a pas cette «préoccupation».

ABC (Australia)
Australia exposed to $16 billion cyber-attack risk, insurance giant Lloyd's warns
Friday, 04 November 2016

Canberra - The growing risk of cyber attacks leaves the Australian economy exposed to a potential $16 billion damage bill over the next decade, according to one of the world's biggest insurance companies.
In a joint study with Cambridge University, the Lloyd's insurance giant has found out of 301 global cities, Sydney ranks 12th in terms cyber attack exposure with $4.86 billion of economic growth at risk.

Lloyd's global chief executive Inga Beale told The World Today dealing with the constant threat of cyber attacks was now critical for businesses of all sizes.

"It's not just for banks to worry about -- it impacts retailers, travel and hospitality firms, education and healthcare providers, and any business with proprietary information worth protecting," Ms Beale said.

"Where a decade ago people would talk about preventing a cyber-attack, the reality is firms will be subjected to attacks.

"The issue is how you mitigate against that."

The Australian Cyber Security Centre recently said systems in government agencies had been hit with 1,095 cyber security incidents considered serious enough to trigger an operational response.

The Lloyd's study points to a report from the accounting firm PWC which highlights a 109 per cent increase in detected security incidents in Australian companies, compared to a 38 per cent global average.

Under proposed legislation before the Australian Parliament, hacked companies that lose personal details, tax file numbers, medical records or credit card information will be required to report the incident and alert customers.

'High-profile data breaches just the beginning': Beale

But Ms Beale warns that while big business and government agencies are at most risk, private individuals are at risk from personal information stored in smartphones and personal computers.

"We are living in a world where people carry a globally-connected supercomputer in their pocket and almost every important work document is stored in the cloud, on servers or online," Ms Beale said.

"The result is an explosion in the potential for cyber risk. The latest series of high-profile data breaches is just the beginning.

"With the emergence of the Internet of Things the potential for cyber risk is enormous."

As one of the world's major insurers and reinsurers, Lloyd's is now seeing demand for cyber attack cover form a major part of its traditional business of insuring for global natural disasters and catastrophes.

Lloyd's says demand for cyber insurance in Australia has increased by 16,828 per cent in the past two years as businesses seek protection from current and emerging threats.

The Lloyd's index points to a range of other risks including power outages, terrorism, sovereign default, oil price shock, heatwave, drought and floods.

Journal de Montréal
Un deuxième journaliste surveillé par le SPVM
Friday, 04 November 2016
Byline: Benoît Philie

Montréal - Les communications du reporter ont été épiées en 2014
Les communications d'au moins un autre journaliste ont été espionnées par la police de Montréal, a confirmé hier l'assistant-directeur du SPVM, lors d'un point de presse où le chef Philippe Pichet brillait par son absence.

L'assistant-directeur du SPVM, Patrick Lalonde, a confirmé hier en conférence de presse qu'un second reporter a été épié par le service de police en 2014.

«Des vérifications nous ont permis de trouver un autre cas d'enquête à l'intérieur de laquelle une autorisation judiciaire a été donnée à l'endroit d'un journaliste», a déclaré Patrick Lalonde, au quartier général du SPVM.

Les registres de communications de ce journaliste ont été épiés en décembre 2014 dans le cadre d'une enquête interne sur un policier. Selon la police, le reporter aurait été ciblé par le même genre d'enquête que le chroniqueur de La Presse Patrick Lagacé.

M. Lalonde a refusé de nommer le journaliste et l'agent concernés puisque l'enquête «est actuellement entre les mains de la Direction des poursuites criminelles et pénales [DPCP]».

Un mandat DNR (Dial Number Recorder) aurait été autorisé dans ce cas aussi, ce qui permet d'obtenir les numéros entrants et sortants d'un téléphone cellulaire, à partir du moment où l'autorisation judiciaire est obtenue d'un juge.

D'AUTRES CAS

Le Journal révélait mardi que trois journalistes, dont Félix Séguin du Bureau d'enquête, ont également fait l'objet d'une forme de surveillance par le SPVM. Ce sont toutefois les registres d'appels de certains policiers qui ont été fouillés pour y trouver les numéros de téléphone des reporters.

D'autres cas d'espionnage pourraient bien être dévoilés d'ici à vendredi prochain, moment où le SPVM prévoit avoir terminé la vérification de l'ensemble de ses dossiers concernant des personnes à statut particulier, comme les juges, les avocats, les élus et les journalistes.

Le service de police s'est engagé à informer et rencontrer toute personne à statut particulier impliquée de près ou de loin dans ce genre de dossier.

PHILIPPE PICHET ABSENT

Questionné à propos de l'absence du directeur Philippe Pichet au point de presse, M. Lalonde a offert une réponse laconique. «M. Pichet est toujours chef de police. [...] Il vaque à d'autres occupations présentement, vous comprendrez qu'il en a beaucoup», a-t-il répondu.

Times of Israel
Israel Aerospace wins $15m Asian cyber deal
Friday, 04 November 2016

Jerusalem - Israel Aerospace Industries Ltd. (IAI) (TASE: ARSP.B1) has announced that it has signed a contract worth $15 million for a cyber- intelligence system with a customer in Asia. The contract is for an advanced, national level, strategic cyber solution, which combines cellular systems and cyber and includes establishing an intelligence center and infrastructure and providing unique sensors. The contract will be executed by one of ELTA/IAI's cyber subsidiaries and development centers.
IAI's Director of Cyber Programs Esti Peshin said, "This new contract is an example of the 'ecosystem' created by IAI's cyber subsidiaries and R&D centers and the parent company. Our worldwide innovation centers benefit from IAI's size and experience while simultaneously having the flexibility of a start-up company. The proximity to the customers combined with innovation, white-hat hacking and engineering capabilities enables us to effectively deal with the many challenges of the cyber world. We intend to continue developing the strategy in the coming months by to additional cyber subsidiaries & R&D centers."

Cyber security is a strategic sector and core competency for IAI. The company is developing unique cyber solutions for intelligence, protection, monitoring, identification and accessibility. These advanced capabilities are possible due to the innovative technologies developed by IAI's research, development and excellence centers, offering IAI's customers a wide range of capabilities for dealing with evolving and ever growing cyber threats. IAI operates four cyber development centers - one in Singapore, one in Switzerland, and two in Israel - the most recent of which was opened in Beersheva.

IAI also leads the Israel Cyber Company Consortium (IC3) which offers end-to-end solutions for national cyber systems and is comprised of leading Israel cyber companies.

Gulf News
IoT pulls out the welcoming mat to cyber threats
Friday, 04 November 2016
Byline: Harshul Joshi

Dubai - The massive distributed denial of service (DDoS) attack on Dynamic Network Services Inc, (Dyn), a US-based Domain Name Server (DNS) provider on October 21, 2016, again exposes the vulnerabilities being made visible by the advance of the internet of Things into every aspect of modern life.
DDoS attacks are especially disruptive, utilising hacking networks known as botnets, which are compromised computers that actors bring under their control. There are many way hackers gain the initial control but most commonly it is achieved by making users inadvertently download software by following a link in an email or by making users agree to download a corrupted file.

Once the initial infection has occurred the malware looks to spread across the network, and even smart home gadgets may be compromised in this way. These botnets are then used to bombard servers with simple requests for information that when carried out simultaneously overwhelm and block legitimate access.

Given the relentless rise of the internet of Things (IoT), and the fact that the very devices that were hacked to orchestrate this incident are the same ones finding their way into our lives at an ever-expanding pace, the cascading effects of this latest attack have implications at every level of digital transformation, right the way through to smart city developments.

The rise of IoT will prompt similar attacks in the future as inadequately secured IoT devices will continue to be an engine to facilitating such breaches.

The internet and its ubiquitous connectivity has developed to become a crucial component of national critical infrastructure. As such it is essential that we understand how the internet is used to support our businesses and governments, and to look to find answers to burning questions including:

. What are the fundamental infrastructure and services supporting this central component of the critical infrastructure puzzle?

. What are the primary objectives or the key assets that need to be managed or mitigated, and do we have preventive, detective, responsive and recovery controls in place ensuring the system is resilient?

. What are the attack vectors and who are the attack actors? What are their capabilities, techniques and objectives?

. How can technological and regulatory stacks be fine-tuned and galvanised for this type of attack?

. What emerging technologies, methodologies and ideas could be used to mitigate these threats in the near, mid and long term and what will it take to increase preparedness?

The cyber security community needs to work closely with key national entities, whether they be telecom or DNS providers, or key websites that may be at risk. All IoT stakeholders need to understand the interconnected parameters of their operations as well as the correlation between them if a similar attack is launched.

In our estimation, the risk of such breaches happening in the future can be limited if entities follow the Cyber Security Life-Cycle, which incorporates planning, detection, protection, and recovery of digital information.

In order to adhere to the Life-Cycle, organisations need to understand their risk profile before initiating a cyber security management and mitigation exercise, which would provide them with an understanding of all their digital assets, the full range of threats they may face and the vulnerabilities, and how best to protect themselves from such.

This is an area we believe the UAE can take a lead in given the relative lack of legacy, and progressive legislation such as Dubai's Open Data Laws, which place the country in a better position to predict and/or react to massive cyberattacks.

Radio-Canada Nouvelles (web)
Espionnage de journalistes : Trudeau ouvert à revoir le Code criminel
Thursday, 03 November 2016
Byline: Journaliste maison

Ottawa - Le gouvernement fédéral doit s'interroger sur ce qu'il peut faire pour mieux protéger les sources journalistiques, affirme le premier ministre canadien Justin Trudeau, dans la foulée des nouvelles révélations d'espionnage de journalistes de la part de la Sûreté du Québec (SQ).
M. Trudeau affirme cependant que les Canadiens peuvent être rassurés quant aux pratiques en vigueur à la Gendarmerie royale du Canada (GRC) et au Service canadien du renseignement de sécurité (SCRS).

En conférence de presse jeudi midi, M. Trudeau a été interrogé sur la possibilité que son gouvernement revoit l'article 193 du Code criminel, évoqué par la SQ mercredi pour justifier l'espionnage des communications de six journalistes québécois en 2013.

Je pense qu'avec ces nouvelles, on va certainement avoir des réflexions sur comment, en tant que société, nous nous devons d'assurer la protection des journalistes et de leurs sources confidentielles.

Justin Trudeau

« Je sais que dans un monde où il y a quand même des dangers, nous nous devons d'être responsables dans notre fonctionnement », a-t-il ajouté. « Mais c'est fondamental à nos valeurs, à notre identité, en tant que pays libre et juste, que les journalistes puissent faire leur travail d'informer les Canadiens et donc de protéger leurs sources confidentielles. »

Trudeau « rassuré » par la GRC et le SCRS

M. Trudeau a par ailleurs révélé qu'il avait communiqué avec le commissaire de la GRC et les responsables du Service canadien du renseignement de sécurité (SCRS) dans la foulée de cette affaire pour s'assurer qu'« aucune activité de ce type [ne] se passe au niveau fédéral ».

On a des balises, des règles et des paramètres très stricts en place, et j'ai été rassuré qu'ils sont tous en train d'être suivis. On peut être rassuré qu'au niveau fédéral, on n'a pas cette préoccupation.

Justin Trudeau

En mai dernier, CBC avait révélé que deux journalistes de La Presse, Joël-Denis Bellavance et Gilles Toupin, avaient bel bel et bien été espionnés pendant neuf jours, en 2007, par des agents de la GRC.

Les deux hommes avaient fait l'objet d'une surveillance physique de la part d'enquêteurs, qui souhaitaient ainsi découvrir la source qui leur avait dévoilé des détails d'une conversation impliquant Adil Charkaoui et un plan pour détourner un avion.

Après neuf jours, les enquêteurs avaient demandé une autorisation formelle au quartier général de la GRC, mais cela leur avait été refusé. La direction avait alors ordonné que les journalistes ne soient pas considérés comme des suspects. Elle précisait qu'aucune autre démarche ne devait être entreprise sans le consentement de la direction.

Vice
L'affaire Lagacé : « Une attaque radicale à la liberté de presse », dit Edward Snowden
Thursday, 03 November 2016
Byline: Justine de l'Église

Montréal - Les agissements de la Sûreté du Québec (SQ) et de la police montréalaise sont une « menace au modèle traditionnel de démocratie », a martelé mercredi Edward Snowden à un public de quelque 600 personnes. La conférence a débuté avec plus d'une heure de retard, en raison d'une manifestation étudiante en soutien aux employés de l'Université McGill, qui demandaient de meilleures conditions de travail.
Sur écran géant, en direct de la Russie où il a trouvé asile, le célèbre lanceur d'alerte responsable de la plus importante fuite d'informations sur la sécurité de l'histoire des États-Unis a été très sévère envers les corps policiers québécois.

Cette conférence était prévue il y a longtemps, mais elle tombait étrangement à point : La Presse nous apprenait la journée même que six journalistes avait été surveillés par la SQ, deux jours après qu'il a été révélé au grand jour que le chroniqueur Patrick Lagacé avait été espionné par le Service de police de la ville de Montréal (SPVM).

Si l'ex-agent de la CIA et ancien contractant de la NSA avait déjà réagi sur Twitter en début de semaine, il a consacré une bonne partie de la conférence à souligner la gravité de l'action des policiers dans l'affaire Lagacé. « Désormais, la police locale peut décider qu'elle n'aime pas le travail d'un journaliste, aller voir un juge de paix [...] qui va dire : "Merveilleux! Regarde le GPS sur son téléphone, découvre où il est allé, avec qui il a communiqué. Non, tu ne peux pas lire ses courriels ou écouter ses appels, mais tu peux voir qui il a rencontré, qui il a appelé et pour combien de temps, et ainsi obtenir de l'information extraordinaire sur la façon dont cet individu travaille." »

Selon le célèbre lanceur d'alerte américain, il s'agit d'une « attaque radicale à la liberté de presse ». Snowden a appelé le directeur du SPVM, Philippe Pichet, à donner sa démission et il a critiqué le maire de Montréal Denis Coderre, ainsi que le premier ministre Philippe Couillard de ne pas l'avoir exigée.

Il est même allé plus loin en suggérant qu'il est possible que le système de justice lui-même fasse défaut. « Le gouvernement a érigé des mécanismes pour contourner ces choses, ces restrictions, a-t-il souligné. Peut-on reconnaître une idée radicale, ou au moins en débattre raisonnablement : la loi commence à échouer à protéger nos droits? »

Attention aux lois adoptées pour contrer de fausses menaces

Snowden a à nouveau mis les citoyens en garde contre les dérives autoritaires des gouvernement actuels, qui demandent plus de pouvoir pour faire face à des terroristes soi-disant capables de mettre à mal nos États. « Il n'y a aucune preuve que ce soit le cas, mais les politiques de la peur ont modifié la façon dont nos lois sont adoptées. »

Il a cité au passage la Loi antiterroriste (C-51), dont l'adoption en 2015 avait suscité un lot de critiques d'experts et de citoyens s'inquiétant de la protection de la vie privée et des droits individuels. Cette loi donne aux autorités des pouvoirs élargis pour identifier les terroristes et contrer leurs plans, et autorise le partage d'information sur les citoyens canadiens entre 128 institutions fédérales, dont les agences, les ministères et la GRC.

Justin Trudeau avait promis en campagne électorale qu'il allait modifier cette loi, en retirer les « éléments problématiques » et « les définitions trop vagues comme "propagande terroriste" », et garantir que « tous les mandats du Service canadien des renseignements et de la sécurité respectent la Charte canadienne des droits et libertés ». Mais il ne l'a toujours pas fait.

La seule modification prévue pour l'instant, le projet de loi C-22, permettrait la formation d'un comité parlementaire chargé de surveiller les actions des agences de sécurité. Pour le reste, le gouvernement canadien procède depuis le 8 septembre à des consultations à l'échelle du pays avant de proposer de nouvelles modifications. Comme la session prend fin en décembre, il est fort probable qu'aucun changement ne soit apporté avant l'an prochain.

En vidéo- conférence à Toronto le mois dernier Snowden avait avancé que Justin Trudeau était réticent à faire de telles modifications. D'après Snowden, le premier ministre « craint que son gouvernement soit accusé de laxisme sur le terrorisme, peu importe si cette loi est inefficace pour prévenir la moindre attaque terroriste ».

China Daily
New vision for big data: Safe cities
Friday, 04 November 2016

Byline: Edith Mutethya

Security and technology experts are calling on African governments to embrace safe-city concepts in an effort to address the increasing incidence of crime and extremism.
Combating crime, according to the experts, has become the hardest activity for police and security organizations, as available video security systems are faced with blind spots, unclear images, difficult video retrieval and data damage or loss.

To solve these challenges, the experts are recommending a safe-city technology solution provided by Huawei Technologies Co, a Chinese multinational IT company headquartered in Shenzhen, Guangdong province.

The solution is an integral network of sensors and communication platforms that enable public-safety, law-enforcement and related agencies to access context-specific intelligence for managing real-time events and providing seamless service delivery to the public.

Experts who spoke during the Huawei Safe City Africa Summit in Nairobi on Oct 14 and 15, applauded the country's safe-city project and its three-way partnership between Huawei, Safaricom (Kenya's leading mobile phone operator) and the Ministry of Internal Security.

The first phase of the project, which involved the installation of surveillance cameras in densely populated Nairobi and Mombasa, coincided with a 46 percent drop in crime from 2014 to 2015.

The number of international visitors to Kenya also increased by 14 percent in the first four months of this year to 263,284, compared with 231,038 in 2015, according to Shaka Kwach, special projects head at Safaricom.

Eng Koh Hong, the global chief public safety expert at Huawei, says that while intelligent video surveillance, broadband-trunked radio and computer-aided dispatch are crucial, they are not enough to create a safe city.

"There is a need for a policing cloud to link up the silos of different public safety agencies for better information sharing and user experience," he says.

The one-stop ICT solutions provided by Huawei in the safe-city market are now deployed in more than 100 cities in some 30 countries, and serve more than 400 million people.

Huawei not only offers safety to Kenyan citizens and visitors but also brings beautiful rhythms to the ears of music lovers in South Africa.

On Oct 27, Huawei signed cooperation contracts with global and local music vendors in Johannesburg to accelerate digitalization of African music. At the Huawei Southern Africa Partner Summit held in Johannesburg, Huawei inked contracts with Spice Music, Mtech, CCA and other local music vendors.

Africa has great demand for digital services, like music, games and videos, according to Huawei's analysis. In five years, digital services' year-on-year growth in Kenya will be about 40 percent, the company says. However, there remains a big gap between the growing demand and actual production.

The summit, aimed at creating a sharing platform to promote digital collaboration in Africa, has attracted more than 40 industry partners.

Wilson Feng, president of Huawei's carrier business in the southern Africa region, said at the summit that the company is willing to work hand-in-hand with African partners to create a better industry ecosystem.

"We will leverage our innovative technologies in digital services, and our global resources, to improve African consumers' digital experience and accelerate Africa's digital economy development," Feng said.

Through the cooperation, Huawei's digital business cloud will also help its partners in monetization, which means it's a win-win solution for all parties in the ecosystem, he said.

The cooperation with content providers means Huawei will hold the copyrights of millions of music titles from international and local vendors. This is Huawei's first breakthrough into the global music space.

Huawei will then be able to provide music to telecom operators in South Africa, such as Vodacom, MTN, Cell C, etc, which offer music to end users through their music apps.

The summit also showed off Huawei's efforts to leverage its Digital inCloud, a software platform, to integrate content across music, video, gaming and other digital service genres.

Siphumelele Zondi, senior producer and anchor of South African Broadcasting Corporation, said there would be a great need for artists in southern Africa to venture into the digital space.

Often local content is in demand but not available on digital platforms, which then promotes piracy, he said.

"Africa is a mobile-device-intensive environment, and platforms such as Huawei's Digital inCloud can aid the availability of local content to Africa," Zondi said.

Huawei, although a nonpublic company and not on the list, spent 59.6 billion yuan ($8.8 billion; 7.9 billion euros; 7.14 billion) on R&D in 2015, making it the highest spender in China, according to the 2016 Global Innovation 1000 Study report, released on Wednesday by PricewaterhouseCoopers.

Reuters
China internet authority formalises regulations for live- streaming industry
Friday, 04 November 2016
Byline: Staff reporter

Beijing - Chinese internet authorities have formalised controversial rules regulating the country's fast-growing live-streaming video industry, in a move that strips out smaller competitors and places hard-line surveillance measures on leading firms.
In an announcement posted on their website on Friday, the Cyberspace Administration of China grouped a handful of earlier restrictions under a final 24-point regulation that will come into effect on Dec. 1.

The rules require streaming services to log user data and content for 60 days, and work with regulators to provide information on users who stream content that the government deems threatening to national security or social order. Both users and providers are punishable under the regulations.

The law also codifies rules that ban online news broadcasting services from original reporting, requiring them to identify sources and non-selectively reproduce state-sanctioned information.

China's live video streaming industry has experienced booming growth in the past two years as dozens of video and social media sites scrambled to add the updated capabilities to their existing services.

Credit Suisse Group analysts estimate the industry could top $5 billion by the end of 2017, driven by cheap bandwidth and a growing population of young mobile users.

The industry's exponential growth attracted increased scrutiny from government authorities in 2016. In April, Chinese authorities called on 20 of the country's top firms to join a self- criticism coalition, saying the industry was damaging China's youth by proliferating content including pornography, fraud and terrorism.

On June 1 companies including Baidu Inc, Sina Corp , Sohu.com Inc and Youku Tudou, acknowledged new rules as part of the group, including requirements for real-name authentication.

While the latest move places wide-reaching restrictions on the sites, it also signals an official sanctioning of the industry and its top players by Chinese officials.

Much like China's earlier online video and music industries, the regulations put pressure on smaller competitors and bring larger firms into line with regulators, offering more growth opportunities for a smaller number of controllable companies.

"One of the things the government always wants to do is narrow the playing field to a smaller number of higher profile known entities, ideally ones that have a better track record of cooperating with the government," says Mark Natkin, Managing Director at Marbridge Consulting.

"In the long run it's actually relatively beneficial to the large companies."

In May the government handed down 588 licenses for prominent media outlets and live-streaming sites, effectively banning all unapproved services.

China Daily
Information sharing key to capturing corrupt officials (Canada)
Friday, 04 November 2016
Byline: Zhou Wenting

Shanghai - Information sharing has played a key role in bringing back corrupt officials who fled abroad to avoid trial, Ding Guping, director of the anti-corruption bureau at the Shanghai People's Procuratorate, said on Thursday.
Anti-graft officers have analyzed big data collected from various sources to learn about the movements of suspects, Ding said during a media briefing on the hunt for such fugitives since the launch of operation "Sky Net" in March last year.

Sky Net was launched by the Chinese government, aimed at tracking down corrupt officials hiding abroad and confiscating their ill-gotten assets.

A total of eight corrupt officials have been brought back to face trial from six countries - the United States, Canada, Australia, Thailand, Japan and Singapore - and more than 15 million yuan ($2.22 million) in illegal funds has been seized, according to the bureau.

Ding said it cooperated with the police department, the state security bureau and the immigration inspection authority to obtain information, such as conversation and transaction records from popular messaging app WeChat and mobile payment service Alipay.

Cai Guozhen, deputy director of the bureau's central office, said people always leave traces of their daily lives, which are recorded on surveillance cameras in buildings, on roads and in convenient stores, and through purchases they make. "The key is how to integrate the information," he said.

Ding said anti-graft officers formulated a specific plan for each case after analyzing such information.

For example, Sun Jin, former general manager of the sales department of a futures commission company in Shanghai, who fled to the US in the 1990s after being suspected of embezzlement of public funds, became a US citizen and changed his name and identity. However, through big data investigation

and tracking, anti-graft officers determined his identity and captured him when he checked in at a Shanghai hotel using his US passport.

Big data analysis also helped officers to track down Liang Kaifeng, a high-ranking official at a Shanghai-based State-owned enterprise specializing in papermaking. Liang was suspected of taking bribes and fled to the US, but was identified on a flight from the US to Shanghai in May.

Cai said 21 corrupt officials from Shanghai who fled the country have not been captured, and most of them are in hiding in the US, Canada and Australia.

He said it is difficult to bring them back from such countries due to a lack of bilateral extradition treaties and differences in laws, but added that it will become less difficult with increased international cooperation.

"Consensus was reached on anti-corruption cooperation to help bring fugitives back to their home country during the G20 Leaders Summit in Hangzhou, capital of Zhejiang province, in September. The group's first anti-graft research center was set up in Beijing recently," he added.

Reuters
Canada court deals blow to spy agency, says it kept data illegally
Friday, 04 November 2016
Byline: David Ljunggren

Ottawa - A court dealt Canada's spy agency a blow on Thursday, declaring it had illegally kept data collected during investigations over the past decade and threatening sanctions if the issue occurred again.
Although judges have previously criticized the Canadian Security Intelligence Service, or CSIS, for a lack of openness about its operations, the ruling was particularly uncompromising.

Federal Court Judge Simon Noel said CSIS secretly set up a special data analysis center in 2006 to help track potential terrorism suspects. The agency stored electronic information from people not linked to particular threats, which is referred to as associated data.

"CSIS has a limited mandate which does not permit the retention of associated data ... as it has done so since 2006. Therefore this retention of associated data is illegal," Noel said in the judgment.

CSIS Director Michel Coulombe told a news conference shortly after the ruling that the agency would immediately stop sharing and analyzing associated data until it could "assess potential operational and legal impacts."

Canada belongs to the so-called Five Eyes intelligence- sharing network, along with Britain, the United States, Australia and New Zealand.

Critics said the ruling reinforced their belief that CSIS was largely unaccountable.

"The fact that CSIS could go 10 years retaining large quantities of our sensitive private information, yet we're only finding out about this now, and only as a result of a court judgment, is deeply concerning," said David Christopher of OpenMedia, an advocacy group.

The case came to light in early 2016 after CSIS applied for amendments to the court warrants it needs to launch probes. At the same time, the court learned independently about the data center and launched an investigation.

Noel said CSIS broke its duty of candor toward the court by not disclosing the existence of the data analysis center.

Noting that judges had twice previously concluded the agency improperly obscured details of its operations, Noel suggested CSIS could be charged with contempt of court.

Federal Public Safety Minister Ralph Goodale, who has overall responsibility for law enforcement agencies, welcomed the ruling and said the government would not appeal it.

"I also take very seriously the explicit finding by Justice Noel that CSIS had failed in its duty to be candid with the court. I will be pursuing this criticism with the executive management of the Service," Goodale said in a statement.

Most Canadian security agencies have small individual review bodies, which OpenMedia and others complain are impotent and can only look at old cases.

Oversight is more robust in other nations such as Britain and the United States, where special legislative committees monitor the work of security and intelligence agencies.

Goodale, acting amid global concerns about the reach of security agencies, promised in June to create a similar oversight committee as part of a comprehensive probe into how national security is handled.

A scandal erupted this week in the province of Quebec when it emerged that police had secretly tracked phone calls received and made by six reporters.

Prime Minister Justin Trudeau said on Thursday he found the case troubling and had contacted CSIS to make sure the agency was not carrying out similar operations.

Globe and Mail
Quebec to probe surveillance of media
Friday, 04 November 2016
Byline: Ingrid Peritz

Quebec has announced a public inquiry into press freedom and police surveillance amid fresh disclosures that the monitoring of some journalists' cellphones lasted as long as five years and targeted an ever-growing list of reporters.
On Thursday, new evidence added to growing concerns about the scope of the police spying.

Three of Quebec's most respected investigative journalists said they were told by the provincial Surete du Quebec that their phone data had been tracked from 2008 to 2013 - the very years police were unearthing and exposing corruption in Quebec's construction industry.

The disclosures suggest police would have been able to access logs of calls that included those from whistle-blowers dealing with highly sensitive matters.

"During this whole period - I feel sick about it - the police had their noses in our phones," Alain Gravel, an award-winning RadioCanada journalist, said on the public broadcaster on Thursday.

Two other Radio-Canada television journalists, Marie-Maude Denis and Isabelle Richer, say they too were told they were under scrutiny for five years. All three had been identified on Wednesday as part of a group of six journalists targeted for surveillance by the provincial police.

As each day delivers more startling admissions from police about surreptitious monitoring, one opposition MNA said the situation in Quebec was reminiscent of the former Soviet bloc.

The week began with the bombshell report that La Presse columnist Patrick Lagace had had his cellphone data tracked for months this year; since then, the list of reporters targeted by police has not stopped growing.

Late in the afternoon on Thursday, Montreal's police department said their own investigation found a second journalist was the object of a surveillance warrant, this one in 2014; police did not identify the reporter, but said the tracking operation was part of a probe into one of its own officers, as was the case for Mr. Lagace.

The latest case brings to 11 the number of journalists in Quebec whose phones were reportedly monitored by either the Montreal or provincial police - the two largest forces in Quebec.

Montreal police obtained court warrants to monitor two journalists; Quebec provincial police got court orders against six journalists, according to facts confirmed by both services. And in the case of three

others, police scrutinized the call logs of its officers to find out who had been speaking to the reporters, according to a media report.

The Liberal government of Philippe Couillard, which has tried to manage the controversy since it began to unfurl on Monday, announced on Thursday it would set up a commission of inquiry. Earlier this week, the government had set up a panel of experts to study the revelations; that panel will now be upgraded.

"Because the principle of press freedom, the principle of the protection of sources, is extremely important, well that is what's at the heart of the affair," said Quebec Public Security Minister Martin Coiteux. "But the confidence of our population is also, we believe, shaken."

"We want to shed light on the question, and we'll do it in a transparent way," he said.

The commission's mandate has not been specified; however, Quebec Justice Minister Stephanie Vallee stressed the importance of journalistic sources and freedom of the media.

It would likely mean Quebec would stage months of hearings to probe the activities of police and possibly their ties to politicians. The Quebec provincial police launched their probe of the six journalists in 2013 the same day they received a call from a Parti Quebecois cabinet minister, Stephane Bergeron. Mr. Bergeron admitted he called the head of the SQ at the time to ask him to look into it, but he says he never ordered the journalist surveillance. Mr. Bergeron stepped aside on Thursday as PQ public-security critic. In Ottawa, Prime Minister Justin Trudeau said reports about the media surveillance were "troubling."

"Like all Canadians, I am following this story coming out of my city, my province, with concern," Mr. Trudeau said. He said he obtained assurances from the RCMP and CSIS that "there has been nothing of this sort happening at the federal level."

"We have actually very strong safeguards and protections in place to protect freedom of the press in the course of the business conducted by CSIS and the RCMP," he said. "Not only is freedom of the press important, it's one of the foundational safeguards of a free democracy, of a free society."

Reuters
FBI examining fake documents targeting Clinton campaign: sources
Friday, 04 November 2016
Byline: Staff report

Washington - The FBI and U.S. intelligence agencies are examining faked documents aimed at discrediting the Hillary Clinton campaign as part of a broader investigation into what U.S. officials believe has been an attempt by Russia to disrupt the presidential election, people with knowledge of the matter said.

U.S. Senator Tom Carper, a Democrat on the Senate Homeland Security Committee, has referred one of the documents to the FBI for investigation on the grounds that his name and stationery were forged to appear authentic, some of the sources who had knowledge of that discussion said.

In the letter identified as fake, Carper is quoted as writing to Clinton, "We will not let you lose this election," a person who saw the document told Reuters.

The fake Carper letter, which was described to Reuters, is one of several documents presented to the Federal Bureau of Investigation and the U.S. Department of Justice for review in recent weeks, the sources said.

A spokeswoman for Carper declined to comment.

As part of an investigation into suspected Russian hacking, FBI investigators have also asked Democratic Party officials to provide copies of other suspected faked documents that have been circulating along with emails and other legitimate documents taken in the hack, people involved in those conversations said.

A spokesman for the FBI confirmed the agency was "in receipt of a complaint about an alleged fake letter" related to the election but declined further comment. Others with knowledge of the matter said the FBI was also examining other fake documents that recently surfaced.

U.S. intelligence officials have warned privately that a campaign they believe is backed by the Russian government to undermine the credibility of the U.S. presidential election could move beyond the hacking of Democratic Party email systems. That could include posting fictional evidence of voter fraud or other disinformation in the run-up to voting on Nov. 8, U.S. officials have said.

Russian officials deny any such effort.

In addition to the Carper letter, the FBI has also reviewed a seven-page electronic document that carries the logos of Democratic pollster Joel Benenson's firm, the Benenson Strategy Group, and the Clinton Foundation, a person with knowledge of the matter said.

The document, identified as a fake by the Clinton campaign, claims poll ratings had plunged for Clinton and called for "severe strategy changes for November" that could include "staged civil unrest" and "radiological attack" with dirty bombs to disrupt the vote.

Like the Carper letter, it was not immediately clear where the fraudulent document had originated or how it had begun to circulate.

On Oct. 20, Roger Stone, a former Trump aide and Republican operative, linked to a copy of the document on Twitter with the tag, "If this is real: OMG!!"

Benenson's firm had no immediate comment. Craig Minassian, a spokesman for the Clinton Foundation, said the document was "fake." He said he did not know if the FBI had examined it.

Stone did not respond to emails requesting comment.

A spokesman for the Clinton campaign, Glen Caplin, said the document was a fake and part of a "desperate stunt" to capitalize on the leak of Democratic emails by Wikileaks.

The developments highlight the unusually prominent role U.S. law enforcement and intelligence agencies have played in a contentious election and an ongoing debate about how public they can or should be about their inquiries.

FBI Director James Comey, a Republican appointed by President Obama, touched off an outcry from Democrats last week when he alerted Congress that agents had found other emails that could be linked to an inquiry into Clinton's use of a private email server when she was Secretary of State, effectively re-opening an investigation he had closed in July.

Associated Press
Court says Canada spy agency illegally kept data
Friday, 04 November 2016
Byline: Rob Gillies

Toronto - A Canadian court ruled Thursday that Canada's spy agency illegally kept phone numbers and email addresses of people they were not directly investigating over a 10-year period and wasn't forthright with judges who authorized the intelligence gathering.
Federal Court Justice Simon Noel said the Canadian Security Intelligence Service should not have kept the information since it was not directly related to threats to Canada's security. The data involves the phone numbers, email address or IP addresses of family members or friends of those the spy agency investigates. The spy agency called it "associated data."

CSIS said it used metadata -- information associated with a communication, such as a telephone number or email address -- but not the message itself. It said the program has been in place since 2006.

Spy Service director Michel Coulombe said they have halted logging, storing, and analyzing the data in question and said he "deeply" regretted the judge's findings about breach of "duty of candor." Coulombe stressed all data collection was done under warrant. He noted the issue is the retention of non-threat related data.

Canadian Public Safety Minster Ralph Goodale said he takes it seriously the spy agency was not forthright with the courts and said he would talk to senior executives of the spy agency. Goodale noted

the laws that govern the spy agency are 30 years old and need to be updated to reflect new technologies.

"Justice Noel did not dispute the potential value of "associated data" to the important work CSIS does in this challenging world, but he could not find existing legislative authority permitting its retention and use," Goodale said in a statement.

News of the spy agency program comes as the provincial Quebec government announced they are calling a public inquiry into police surveillance of journalists amid revelations various forces in the province monitored reporters' phones. The province's two largest police forces said earlier this week that they had monitored the phones of six prominent journalists in 2013.

The Local (Switzerland)
Malware used to spy on Iran talks in Geneva
Friday, 04 November 2016
Byline: Staff report

Geneva - A large number of computers at a Geneva hotel that hosted delicate Iranian nuclear talks last year were infected with malware used for espionage, Swiss prosecutors said on Thursday.
The Swiss Attorney General's office (OAG) however said it had closed its investigation, since it had failed to determine who was behind the spying.

Swiss investigators launched a probe in May last year based on "suspicion of illegal intelligence services operating in Switzerland," searching a hotel that hosted the nuclear talks and seizing computer equipment.

Those talks, which were held at a range of luxury hotels in Switzerland and Austria, concluded on July 14th 2015 with a landmark deal to rein in Iran's nuclear programme in exchange for the lifting of international sanctions.

The agreement between Tehran, Washington and five other major powers came into force in January.

Israel, which was vehemently opposed to the nuclear deal, was accused of espionage after a Russian-based security firm said a computer worm widely linked to the Jewish State was used to spy on the negotiations.

Israel flatly denied the accusations.

"Investigations revealed that a significant number of computers (servers and clients) at a hotel in Geneva had been infected with a form of malware," the OAG said in a statement Thursday, without divulging the name of the hotel.

"This malware was developed for the purposes of espionage, and is basically used to gather data from the computers infected," it said.

Investigators had however turned up "no evidence as to the identity of the perpetrators," it said.

"Accordingly, although there is evidence of criminal activity, it cannot be attributed to specific persons," OAG said, explaining why it had decided to close the case.

NBC News
White House Readies to Fight Election Day Cyber Mayhem
Friday, 04 November 2016
Byline: Multiple reporters

New York - The U.S. government believes hackers from Russia or elsewhere may try to undermine next week's presidential election and is mounting an unprecedented effort to counter their cyber meddling, American officials told NBC News.
The effort is being coordinated by the White House and the Department of Homeland Security, but reaches across the government to include the CIA, the National Security Agency and other elements of the Defense Department, current and former officials say.

Russia has been warned that any effort to manipulate the actual voting or vote counting would be viewed as a serious breach, intelligence officials say.

"The Russians are in an offensive mode and [the U.S. is] working on strategies to respond to that, and at the highest levels," said Michael McFaul, the U.S. ambassador to Russia from 2012 to 2014.

Officials are alert for any attempts to create Election Day chaos, and say steps are being taken to prepare for worst-case scenarios, including a cyber-attack that shuts down part of the power grid or the internet.

But what is more likely, multiple U.S. officials say, is a lower-level effort by hackers from Russia or elsewhere to peddle misinformation by manipulating Twitter, Facebook and other social media platforms.

For example, officials fear an 11th hour release of fake documents implicating one of the candidates in an explosive scandal without time for the news media to fact check it. So far, document dumps attributed to the Russians have damaged Democrats and favored Trump.

The Russians "want to sow as much confusion as possible and undermine our process in ways they've done elsewhere," said a senior Obama administration official. "So this is to make sure that we have all the tools at our disposal and that we're prepared to respond to whatever it is that they do."

"We need to be prepared on every front, not just technical but messaging, and so on," the official added, saying the details were classified. "Because any reporting irregularity could be incredibly disruptive. ... They can cause tremendous chaos, and by the time we are able to attribute, the damage may have already been done."

Officials were reluctant to discuss how they might be respond to such "influence operations," other than to say they will make efforts to counter misinformation and keep open communication nodes.

The U.S. intelligence community and the Department of Homeland Security assess that it would be extremely difficult for even a nation-state actor to alter actual ballot counts or election results by cyber-attack, a second senior administration official told NBC News.

"This assessment is based on the decentralized nature of our election system in this country and the number of protections state and local election officials have in place," the official said. "States ensure that voting machines are not connected to the Internet, and there are numerous checks and balances as well as extensive oversight at multiple levels built into our election process."

However, a Department of Homeland Security official said, other possible hacks pose "the potential for causing confusion and misperception" around the election.

For example, "Somebody could tamper with voter registration information or unofficial election night reporting."

While multiple intelligence officials told NBC that they have no specific warning about an Election Day attack, they also say they consider the massive and sophisticated internet disruption of Friday, Oct. 21, a potential dry run.

The "distributed denial of service" attack on equipment provided by the company DYN, which took down popular internet sites like PayPal and Amazon for hours, "had all the signs of what would be considered a drill," said Ann Barron-DiCamillo, former director of Homeland Security's computer emergency readiness team.

If a similar attack began unfolding on Election Day, DHS would work with big internet providers such as Comcast (owner of NBC Universal) and Verizon to try to mitigate it, Barron-DiCamillo said. Since most of the internet is owned by private companies, the government relies on the private sector to help stop attacks, she said.

As is standard for major national events, all six federal cyber centers will be up and running, closely monitoring network traffic and hunting for malware.

"Given (the Russians') past behavior in other contexts, we understand the way they like to go about potentially causing confusion and so we want to make sure that we are mitigating that potential," the DHS official said.

A current Obama administration national security official said that a White House working group has been watching Russia's apparent intervention in other foreign elections with growing concern.

A recent case study, the official said, was the October 16 parliamentary election in Montenegro, a small Balkan nation straddling East and West.

The incumbent Democratic Party of Socialists narrowly won, but fell short of an absolute majority after facing stiff and well-financed opposition from a pro-Russian coalition that opposes the country's proposed membership in NATO -- a position also held by Putin.

In the run-up to the election, U.S. officials believe Russia secretly funneled money to opposition parties and either set up or co-opted friendly media outlets and "influencers" to undermine the pro-West party and highlight the risks of joining NATO, the official said.

During the election, Russia launched a coordinated disinformation campaign using traditional and social media to allege widespread voting irregularities, including that dead people had been registered to vote, according to the Obama national security official. Social media networks were so bombarded with complaints and accusations that Montenegro ordered telecom operators to temporarily shut down WhatsApp, Viper and similar messaging apps, creating even more questions about the election, the official said.

A network of anti-censorship bloggers also reported that the website of Montenegro's top election observation NGO, the Center for Democratic Transitions (CDT), was knocked out for part of Election Day, raising concerns among U.S. officials about Russian interference.

Montenegro's state election commission released the final results Oct. 29 -- and certified the pro-NATO party's win -- despite protests by the pro-Russian opposition party, which cited the very irregularities the U.S. blames on Russia as reason to doubt the vote totals.

"It's the kind of thing that we are anticipating that they will try here," the official said. "But they will target whatever they can -- voting infrastructure, putting out false stories about the Democratic Party intentionally manipulating the results. That's what they do."

Montenegro's leaders publicly accused Russia of meddling in the election. Russian officials and opposition party members denied any interference, but Russia's foreign minister said NATO was being "irresponsible" for supporting admission for Montenegro, which could come as soon as Spring 2017.

Russia has also denied any involvement in recent hacks of U.S. political groups and operatives.

Vice News Canada
There's A Secret Canadian Spy Database That We Just Found Out About
Friday, 04 November 2016
Byline: Justin Ling

Ottawa - The Canadian Security Intelligence Service, better known as CSIS, has found itself in trouble with the legal system once again after a federal court discovered the existence of an "illegal" database full of information on Canadians, held at a secret data centre.
The information came to light in a federal court judgement, released Thursday, that takes aim at the previously-unknown Operational Data Analysis Centre and a program whereby CSIS was storing large amounts of data that had nothing to do with its investigations.

The judgement is heavily redacted so it is difficult to determine the exact nature of the investigation, the warrants, or the data collected.

But Justice Simon Noël is unequivocal: "this retention of associated data is illegal."

His ruling outlines how the collection of the data, its storage, and the data centre itself were all part of a large program that CSIS kept under wraps.

Over the course of a normal investigation, CSIS may obtain information, intelligence, and data pertaining to an individual. The agency has the power to run through that information to determine if the person is a national security threat, relevant to an investigation, or has something to do with international affairs.

If that data--such as an email between two law-abiding individuals--isn't useful in any of those respects, CSIS is required to delete it.

Except, according to Justice Noël's ruling, that's not exactly what they were doing.

While CSIS was deleting the data, they were saving and storing the metadata from the information, but renaming it "associated data," mostly in an effort to skirt rules around data collection, and keeping it for as long as they want. This data, the court adds, was "non- threat, third-party information."

The information would be stored in the secretive Operational Data Analysis Centre, whose purpose is to "retain all data collected from investigations and warrants in order to exploit that information in ongoing and future investigations."

Metadata could include everything from your phone number and email address to your search history and GPS location.

This is big data analysis is the job of CSIS' signals intelligence sister, the Communication Security Establishment, but not in CSIS itself.

There has been virtually no reporting on the Operation Data Analysis Centre since its inception in 2006. The only online mentions of the centre come from a now-deleted job post on the CSIS website, and a LinkedIn page for a former manager of the centre.

The LinkedIn page refers to it as "the CSIS centre of excellence for big data exploitation."

"The end product [of this program] is intelligence which reveals specific, intimate details on the life and environment of the persons the CSIS investigates," Noël writes. "The program is capable of drawing links between various sources and enormous amounts of data that no human being would be capable of..." the rest is redacted.

Later in his ruling, Noël underscores that this data had active uses, writing that "evidence was produced establishing that the processing and analysis of associated data has yielded some useful intelligence results. In some cases, analysis of retained data in past cases indeed contributed to new investigative leads and other useful pertinent information."

That's the process that Noël said was illegal.

The ruling added that information was still scant on the entire program, and that even the court remained in the dark about aspects of the surveillance activities.

"The court, during the hearings, learned that the program had been existence since 2006 yet it had never heard nor seen any evidence on the matter prior to the recent hearings," Noël writes.

CSIS informed the Public Safety Minister but never told the court. They kept it secret until 2011, when a lawyer for the agency made an "indirect allusion" to the data centre.

The judge concluded that "CSIS had an elevated obligation to inform the Court of the use it was making of non-threat-related information collected through the operation of warrants; it failed to do so."

The only official reference to the centre comes from a 2010 CSIS report which reads that the "Operational Data Analysis Centre (ODAC) provides support to the Service's operational branches by performing advanced analysis of data that is collected on subjects of investigation."

There is still much fog around exactly how CSIS goes about collecting digital information, as it does have legal authority to intercept and monitor communications--usually with a warrant--and can cooperate and deputize Canada's main signals intelligence agency, the Communication Security Establishment (CSE), to do bulk data collection.

This ruling adds context to documents obtained under access to information laws by VICE News in 2015. In those documents, which contain memoranda of understanding between CSIS and CSE, there is a 2007 agreement between the two agencies that "provide[s] for the disclosure and safeguarding of information shared between the parties." That agreement sets out a host of conditions for how to share and store information, data, and intelligence.

This isn't the first time that CSIS has gotten in trouble for pulling the wool over the court's eyes. In 2013, another federal court judge chided CSIS' efforts to get around its own domestic mandate by contracting out to CSE and the American NSA to conduct foreign surveillance. That problem was resolved after the federal government authorized international CSIS operations.

Washington Post
U.S. officials warn of Russian mischief in election and beyond
Friday, 04 November 2016
Byline: Greg Miller, Adam Entous

Washington - U.S. intelligence agencies do not see Russia as capable of using cyberespionage to alter the outcome of Tuesday's presidential election, but they have warned that Moscow may continue meddling after the voting has ended to sow doubts about the legitimacy of the result, U.S. officials said.
The assessment reflects widespread concern among U.S. spy agencies that a months-long campaign by Russia to rattle the mechanisms of American democracy will probably continue after polls close on one of the most polarizing races in recent history, extending and amplifying the political turbulence.

U.S. security officials have not ruled out Russian- sponsored disruption on Election Day. In recent weeks, officials at the Department of Homeland Security have collected evidence of apparent Russian "scanning" of state-run databases and computer voting systems. "Whether they were really trying hard to get in, it's not clear," a U.S. official said.

Still, the decentralized nature of U.S. polling would make it extraordinarily difficult to subvert a nationwide race. Instead, U.S. officials said it is more likely that Russia would use hacking tools to expose or fabricate signs of vote-rigging, aiming to delegitimize an election outcome that Republican candidate Donald Trump has said he may refuse to accept if he does not win.

"I think it's correct to say the Russians don't think they can dictate the outcome," said Rep. Adam B. Schiff (Calif.), the top Democrat on the House Intelligence Committee. But even as votes are being tallied Tuesday, Schiff said, Russian intelligence services are likely to be "looking through their troves of hacked documents and seeing what they can release."

Whether Trump or Democratic nominee Hillary Clinton prevails, Schiff said, the United States "can expect a lot more of the same in terms of cyber-malevolence and influence" from Moscow.

U.S. officials said there is still time for last-minute disruptions, even if the overall election appears relatively secure. Several officials said they fear that even an isolated operation that forces a voting system offline could erode confidence. Schiff and others said they remain worried that Moscow could dump doctored documents over the weekend that appear to expose illegality by the Clinton or Trump campaigns -- disclosures designed to create confusion among voters and be difficult to disprove before citizens cast their votes.

No forgeries have so far been identified among the thousands of files that U.S. officials believe were stolen by Russia and essentially laundered to the U.S. public and media through the WikiLeaks website.

The fact that Russia has so far refrained from altering documents or planting forgeries among the leaked emails is seen by some U.S. officials as potentially setting the stage for a more sinister plot. The media and public have come to see the WikiLeaks stockpiles as authentic, increasing the potential impact if Russia were to insert a deliberate but compelling falsehood.

Russian President Vladi-mir Putin has repeatedly denied any Russian involvement in the -election-related hacks. But those assertions have been dismissed by U.S. intelligence agencies and cybersecurity experts, with some saying that Russia engaged in sloppy tradecraft or seemed not terribly concerned about covering its tracks.

Anxiety about late-election vulnerabilities has factored into the Obama administration's reluctance so far to retaliate against Russia.

The White House has opted against authorizing any countermeasures despite high confidence across U.S. spy agencies that Russia alone orchestrated the digital theft of thousands of sensitive documents posted online in recent months by WikiLeaks. The releases have included hacked files of the Democratic National Committee and emails of Clinton campaign chairman John Podesta, among others.

The White House has been weighing countermeasures for months but worried that retaliating before the election would give Moscow time to inflict more direct damage in the waning days of the campaign.

"Escalation in the cyber- realm can happen quickly," a senior U.S. official said. Those urging restraint say they believe the Russian threat would be diminished after Election Day. Officials said the White House is

also reluctant to take decisions on an escalation that could have profound implications for the next president.

U.S. officials said the options under consideration include kicking more suspected Russian intelligence officers out of the United States, imposing new economic sanctions against Russian entities tied to the alleged hacking and potentially launching cyberattacks on Russian computer systems. Obama used cyberweapons to hobble Iran's nuclear program early in his first term but has been reluctant to go down that road again, aides say.

The administration's decision could depend on what the Russians do in the coming days. An election-disrupting attack would probably trigger a more aggressive U.S. response, according to officials. U.S. officials say the stakes have been made clear to Moscow.

The election-related tensions are part of a broader escalation in the level of antagonism between the United States and its former Cold War adversary. The two countries are fighting a proxy war against each other in Syria, are competing for influence elsewhere in the Middle East and are at odds over Russian intervention in Ukraine.

The hack of the DNC was blamed on Russia by cybersecurity experts and U.S. officials the moment it was publicly disclosed in June. The administration formally went public with its case last month, issuing a statement from Director of National Intelligence James R. Clapper Jr. and Homeland Security Director Jeh Johnson concluding that intrusions were authorized by "Russia's senior most officials."

Even so, there is still disagreement among some agencies and analysts over Moscow's objectives. The White House has maintained that it does not believe Russia's operations have been aimed at delivering an election win for Trump, who has praised Putin and argued there is no evidence of Russian involvement in the hacks -- a position at odds with what he has been told in classified briefings. The operations could be a more general effort to embarrass the United States and disrupt democratic institutions.

Clinton has said that Russia is seeking to ensure her defeat, a contention some U.S. intelligence officials say they believe is supported by the one-sided nature of the leaks. U.S. officials have speculated that Putin harbors personal animosity toward Clinton, believing that while serving as secretary of state she helped incite mass protests in Moscow that embarrassed the former KGB operative.

Even if there are no further election-related disruptions and Clinton emerges victorious, some U.S. officials believe that Russia has already accomplished many of its goals.

"They've weakened Secretary Clinton by dumping information from her campaign manager and others," Schiff said. The leaks have exposed infighting between Clinton and her former Democratic opponent, Sen. Bernie Sanders of Vermont, forced the resignation of the DNC chief and -- perhaps most

importantly -- cast Russia and its capacity to inflict damage as an ominous figure looming over the 2016 campaign.

"They enjoy being the subject of discussion in an American election," Schiff said. "It enhances their prestige in a bizarre way that they're considered a player. This is also their way of payback, and I think they are delighting in that."

State Department releases new batch of Hillary Clinton emails (Canada)
Friday, 04 November 2016
Byline: Laura Koran, Tom LoBianco

Washington - The State Department released its latest batch of emails from the FBI's investigation of Hillary Clinton's private email server Thursday, with just five days until the election.
The 1,280 pages of emails that were produced under court order include mostly administrative correspondence and duplicates of previously released material. But the batch also includes new correspondence from Clinton's 2010 clean-up tour amid the stunning WikiLeaks release of diplomatic cables.

A series of largely redacted emails from 2010 include Clinton's discussions of how she will approach world leaders, as well as how hard she should go after WikiLeaks founder Julian Assange. The newest emails from Clinton were released by the State Department while Assange continued his extended bombardment of the Clinton campaign with regular releases from campaign chairman John Podesta's hacked emails.

In a Dec. 2, 2010, top aide Huma Abedin wrote to Clinton that an ally had suggested Clinton say, "We view this not as a 'clever game' of wiki leaks but rather as a 'criminal act' against the United States of America. He might think this is a clever game today but when he is prosecuted and if convicted he will move from being a clever cyber thief to a convicted criminal -- and will find out that's a whole different kind of game."

Assange has been in asylum at the Ecuadorean Embassy in London for four years, and has blamed Clinton in part for his seeking asylum. Democrats have accused Assange and the Donald Trump campaign of coordinating the release of the Podesta emails with Russia, but Assange told Russia Today that the Russian government was not the source of the emails.

WikiLeaks' release of more than 250,000 diplomatic cables in 2010 -- with stark and cutting assessments of foreign leaders -- created a massive problem for Clinton as she played clean-up in her role as secretary of state. Emails released by the State Department Thursday detail some of the behind-the-scenes scramble inside her office.

A Nov. 26, 2010 email about her planned call with French Foreign Minister Michele Aliot-Marie is largely redacted, but includes some background, including bracing for "the first of several articles" that Le Monde was set to publish from the WikiLeaks cables.

A Nov. 27, 2010 from Huma Abedin to Clinton shows them bracing for the impact from the New York Times' publication of WikiLeaks material dealing with the U.S. relationship with Canada.

"Two cables set for release contain especially sensitive information on counterterrorism and intelligence sharing. The depth of bilateral cooperation detailed in the cables may be controversial for Canadians," Abedin wrote in the email.

The latest release follows a compromise agreement reached this September in a Freedom of Information Act lawsuit. The agreement paved the way for at least 2,900 pages of Clinton's emails to be reviewed ahead of November 8.

None of the new emails contained information marked as classified or newly upgraded to classified, but 18 were near duplicates that included a previously-released email that had been upgraded when originally released.

The State Department was initially tasked with processing 1,050 pages out of about 5,600 work- related emails before the election as part of an order in a separate FOIA lawsuit. But attorneys for the State Department and VICE News reporter Jason Leopold agreed to an accelerated release before the election.

After an initial review of the documents turned over by the FBI, the State Department concluded a "significant number" of the 5,600 work-related emails were duplicates or near-duplicates of emails already released to the public, and therefore will not be subject to re-release.

Clinton turned over approximately 55,000 pages of her emails in early 2015. Those were processed and produced to the public, with redactions, between May 2015 and March 2016.

An additional 350 pages are scheduled to be released Friday.

Reuters
FBI fear of leaks drove decision on emails linked to Clinton: sources
Friday, 04 November 2016
Byline: Staff report

Washington - FBI Director James Comey was driven in part by a fear of leaks from within his agency when he decided to tell Congress the FBI was investigating newly discovered emails related to Hillary Clinton, law enforcement sources said on Thursday.

The examination of the email traffic is now being carried out under the tightest secrecy by a team at Federal Bureau of Investigations headquarters in Washington, the sources said, requesting anonymity because of the inquiry's sensitivity.

Several sources said it was unclear whether the FBI would make any further public disclosures about its latest review before Tuesday's presidential and congressional elections. Two sources said such disclosures were unlikely.

Another source, recently in contact with top investigators, said: "It depends on how it goes and what they find." The source said that, as of Thursday, "nobody really knows" whether the FBI will have anything further to say before the election.

Dropping like a bombshell on the U.S. presidential campaign, Comey's disclosure last Friday in a letter to senior lawmakers just days before the elections raised questions about his motives and drew criticism from some over his timing.

Comey disclosed that the FBI was looking at emails as part of a probe into Clinton's use of a private email system while secretary of state, without describing the emails' content or how long the inquiry might take. The FBI normally does not comment on ongoing inquiries.

The latest emails examination was moving forward "expeditiously," said one source close to the review.

The new emails turned up as FBI investigators were examining electronic devices used by former Democratic Representative Anthony Weiner in connection with an alleged "sexting" scandal. Weiner's estranged wife, Huma Abedin, is a Clinton confidante.

Two law enforcement sources familiar with the FBI's New York Field Office, which initially discovered the emails, said a faction of investigators based in the office is known to be hostile to Hillary Clinton. A spokeswoman for the FBI's New York office said she had no knowledge about this.

Democratic Party sources said such a faction was likely responsible for a recent surge in media leaks on alleged details of an ongoing FBI investigation of the Clinton Foundation.

The FBI has made preliminary inquiries into Clinton Foundation activities and alleged contacts between Trump and associates with parties in Russia, according to law enforcement sources. But these inquiries were shifted into low gear weeks ago because the FBI wanted to avoid any impact on the election.

The FBI previously had spent about a year investigating Clinton's use of the unauthorized server at her home in Chappaqua, New York, instead of the State Department system after classified government secrets were found in some of her emails.

Comey had said in July that while there was "evidence of potential violations of the statutes regarding the handling of classified information, our judgment is that no reasonable prosecutor would bring such a case."

The Guardian (London)
Edward Snowden calls Canada police spying a 'radical attack' on journalists
Friday, 04 November 2016
Byline: Ashifa Kassam

Toronto - Edward Snowden is calling for the resignation of Montreal's police chief, amid allegations that police forces in the Canadian province secretly monitored the phones of at least seven journalists. Snowden spoke at Montreal's McGill University, after news broke that police in the city had spent five months tracking the phone of a prominent journalist in order to identify his sources.

The scandal deepened on Wednesday after Québec provincial police admitted they had obtained warrants in 2013 to spy on another six journalists with the aim of ferreting out media leaks within the police force.

Speaking via video link to a packed auditorium, the NSA whistleblower described the police actions as a "radical attack on the operations of the free press" and wondered whether the law was beginning to fail in its role as a guarantor of rights.

Montreal police have defended their actions, claiming that it was an exceptional situation. The surveillance was part of an investigation into allegations that police officers in the drugs and street gangs unit had fabricated evidence. Five officers were arrested over the allegations this summer.

After police detected contact between one of the officers under investigation and La Presse journalist Patrick Lagacé, they obtained warrants to track Lagacé's iPhone. Police actions were aimed at investigating police officers, not Lagacé, Montreal police chief Philippe Pichet said on Monday.

"We are very aware of the importance of freedom of the press," said Pichet. "But on the other hand, there were criminal allegations against a police officer ... and we have a job to do."

Echoing a call by some Montreal city councillors, Snowden suggested the police chief should resign. "Rather than the police chief saying 'all right this was clearly something that went too far and regardless of whether or not I authorised this operation, I recognise that to restore trust I need to re- establish the basis of accountability ... for that reason I have chosen to resign.' We don't see the mayor calling for that, we don't see the local premier calling for that."

The story, said Snowden, fits a broader narrative of governments masking their own actions as they peer into the lives of private citizens. "This inverts the traditional dynamic of private citizen and public officials into this brave new world we're facing of private officials and public citizens," he said.

On Thursday, the Québec government said it would launch a full public inquiry into the affair. "We consider that it's important for the public of Québec to trust their public institutions," Stéphanie Vallée, the province's justice minister, told reporters.

Her comments came after Philippe Couillard, Québec's premier, announced that the government would look into procedures at the province's three major police forces and seek to make it harder for police to obtain a search warrant to monitor journalists.

The scandal was put to Justin Trudeau, the country's prime minister, at a news conference on Thursday. "Obviously I think that the troubling stories - troubling for all Canadians - coming out of Québec and of this situation will lead to reflection on how we must and can continue to ensure protection of the press and their rights," he said.

His government had reached out to the Royal Canadian Mounted Police and the Canadian Security Intelligence Service this week to confirm that nothing of the sort was taking place at the federal level. "We have actually strong safeguards and protections in place to protect the freedom of the press in the course of business conducted by CSIS and the RCMP," he said. "And I can confirm those safeguards are still very much in place and consistent with the values and concerns this government has and that Canadians have."

Speaking to the Guardian earlier this week, the Canadian Journalists for Free Expression noted that police had said they had not broken any laws in tracking journalists. "That's the worst part of this thing. You can't even make the argument that this is just a few bad apples because it was authorised by a justice of the peace. This is the system as it's supposed to work," said Tom Henheffer of the organisation. "Which just goes to show that the whole system is broken."

The Guardian (London)
'The FBI is Trumpland': anti-Clinton atmosphere spurred leaks, sources say
Thursday, 03 November 2016
Byline: Spencer Ackerman

New York - Deep antipathy to Hillary Clinton exists within the FBI, multiple bureau sources have told the Guardian, spurring a rapid series of leaks damaging to her campaign just days before the election. Current and former FBI officials, none of whom were willing or cleared to speak on the record, have described a chaotic internal climate that resulted from outrage over director James Comey's July decision not to recommend an indictment over Clinton's maintenance of a private email server on which classified information transited.

"The FBI is Trumpland," said one current agent.

This atmosphere raises major questions about how Comey and the bureau he is slated to run for the next seven years can work with Clinton should she win the White House.

The currently serving FBI agent said Clinton is "the antichrist personified to a large swath of FBI personnel," and that "the reason why they're leaking is they're pro-Trump."

The agent called the bureau "Trumplandia," with some colleagues openly discussing voting for a GOP nominee who has garnered unprecedented condemnation from the party's national security wing and who has pledged to jail Clinton if elected.

At the same time, other sources dispute the depth of support for Trump within the bureau, though they uniformly stated that Clinton is viewed highly unfavorably.

"There are lots of people who don't think Trump is qualified, but also believe Clinton is corrupt. What you hear a lot is that it's a bad choice, between an incompetent and a corrupt politician," said a former FBI official.

Sources who disputed the depth of Trump's internal support agreed that the FBI is now in parlous political territory. Justice department officials - another current target of FBI dissatisfaction - have said the bureau disregarded longstanding rules against perceived or actual electoral interference when Comey wrote to Congress to say it was reviewing newly discovered emails relating to Clinton's personal server.

Comey's vague letter to Congress, promptly leaked by Republican congressman Jason Chaffetz, said the bureau would evaluate communications - subsequently identified as coming from a device used by disgraced ex-congressman Anthony Weiner, whose estranged wife Huma Abedin is a Clinton aide - for connections to the Clinton server. Comey's allies say he was placed in an impossible position after previously testifying to Congress it would take an extraordinary development for him to revisit the Clinton issue. Throughout the summer and fall, Trump has attacked the FBI as corrupt for not effectively ending Clinton's political career.

A political firestorm erupted, with Comey and the bureau coming under withering criticism, including a rebuke on Wednesday from Barack Obama. Even some congressional Republicans, no friends to Clinton, have expressed discomfort with Comey's last-minute insertion of the bureau into the election.

The relevance of the communications to the Clinton inquiry has yet to be established, as Comey issued his letter before obtaining a warrant to evaluate them. Clinton surrogates contend that Comey has issued innuendo rather than evidence, preventing them from mounting a public defense.

Some feel Comey needs to address the criticism and provide reassurance that the bureau, with its wide-ranging investigative and surveillance powers, will comport itself in an apolitical manner. Yet since Friday, Comey has maintained his silence, even as both Clinton and Trump have called for the bureau to disclose more of what it knows.

Leaks, however, have continued. Fox News reported on Wednesday that the FBI is intensifying an investigation into the Clinton Foundation over allegations - which both the foundation and the Clinton camp deny - it traded donations for access to Hillary Clinton when she was secretary of state. The Wall Street Journal reported that justice department officials, who have been considering FBI investigation of the issue since 2015, considered the allegations flimsy.

The leaks have not exclusively cast aspersions on Clinton. Paul Manafort, Trump's former campaign manager, is the subject of what is said to be a preliminary FBI inquiry into his business dealings in Russia. Manafort has denied any wrongdoing.

The Daily Beast reported on Thursday on ties between Trump surrogate Rudy Giuliani, the former New York mayor, and the FBI's New York field office, which reportedly pressed the FBI to revisit the Clinton server investigation after beginning an inquiry into Weiner's alleged sexual texting with a minor. The website reported that a former New York field office chief, highly critical of the non-indictment, runs a military charity that has received significant financial donations from Trump.

Comey's decision to tell the public in July that he was effectively dropping the Clinton server issue angered some within the bureau, particularly given the background of tensions with the justice department over the Clinton issue. A significant complication is the appearance of a conflict of interest regarding Loretta Lynch, the attorney general, who met with Bill Clinton this summer ahead of Comey's announcement, which she acknowledged had "cast a shadow" over the inquiry.

"Many FBI agents were upset at the director, not because he didn't [recommend to] indict, but they believe he threw the FBI under the bus by taking the heat away from DOJ [Department of Justice]," the former bureau official said.

All this has compounded pressure on Comey, with little end in sight.

Jim Wedick, who retired from the bureau in 2004 after 35 years, said that if Clinton is elected, she and Comey would likely to find a way to work together out of a sense of pragmatism. He recalled both his own occasional clashes with federal prosecutors and Bill Clinton's uneasy relationship with his choice for FBI director, Louis Freeh.

"Each one will find a way to pick at the other. It's not going to be good and it's not going to be pretty. But they'll both have to work with each other," he said.

The FBI would not comment for this story.

Radio Free Europe
Hackers Release More E-Mails They Say Tie Putin Aide To Ukraine Crisis
Thursday, 03 November 2016
Byline: Staff report

Kyiv - Ukrainian hackers claim to have broken into a second e-mail account linked to Vladislav Surkov, a senior aide to Russian President Vladimir Putin, releasing documents they say add to mounting evidence of the Kremlin meddling in Kyiv's affairs.
The new e-mails were obtained by RFE/RL from the hackers in advance of their public release on November 3. If authentic, they provide detail about the extent to which Surkov's office worked to set up separatist enclaves in eastern Ukraine in 2014.

The e- mails include plans that ostensibly show how associates of Surkov plotted to destabilize Ukraine's eastern Kharkiv region, researched Ukrainian politicians who openly supported weakening central power in a bid to exploit the country's political divisions, and helped establish the leadership of separatist groups in the Donetsk and Luhansk regions.

They indicate that, in one case, a draft law on an economic zone in eastern Ukraine purportedly written by Surkov himself was sent to the office of an opposition lawmaker and later introduced in the Ukrainian parliament.

The new release comes one week after an initial batch of e-mails from an inbox allegedly associated with Surkov, a longtime Putin aide who is the point man for Ukraine in his administration.

Analysts say they demonstrate careful planning by Russia ahead of the forcible annexation of Crimea in March 2014 and a direct Russian role in fomenting anti-Kyiv actions in the Donetsk and Luhansk regions, which led to a war that has killed more than 9,600 people since that April and persists despite Western-brokered cease-fire deals.

In both cases, the e-mails were released by a group of Ukrainian "hacktivists" who call themselves the Cyber Alliance.

On November 3, the Cyber Alliance posted a video on YouTube in which a character in a trademark mask of the hacker group Anonymous takes credit for hacking accounts in Surkov's office and warns, "This is just the beginning."

Independent international analysts and Ukraine's domestic Security Service, the SBU, have said many of the e-mails in the first group appear authentic, but there were doubts about some of the documents. Several people whose correspondence with Surkov was included in the leak have confirmed they sent the messages to Surkov released by the hackers.

The Kremlin has not explicitly called the e-mails or attached material fraudulent but has sought to cast doubt on their authenticity. Putin's spokesman, Dmitry Peskov, said of one unspecified text that Surkov "doesn't use electronic mail...so someone must have sweated quite a bit to compose this document."

Surkov himself has not commented on the matter.

The e-mails released on November 3 were hacked from pochta_mg@mail.ru, a private e-mail account that uses the digital signature "Ivan Ivanov" but appears to have been managed by Surkov assistants Maria Vinogradova and Yevgenia Kudryavtseva, to whom many of the letters are directly addressed.

Vinogradova and Kudryavtseva also handled the e-mail account from the first leak. Contacted by RFE/RL's Russian Service, both declined to comment.

The pochta_mg@mail.ru account, reviewed by RFE/RL, includes 340 megabytes of data from 336 incoming messages, many addressed to Surkov himself, and 87 outgoing messages, including some that appear to have been signed by Surkov, between November 28, 2014, and September 21, 2016.

The authenticity of the newly released e-mails and documents has not yet been fully established, but Aric Toler of the open-source investigation unit Bellingcat and the Atlantic Council's Digital Forensic Lab told RFE/RL that the metadata and other aspects of the e-mails appeared genuine.

An e- mail sent to Surkov's office on April 29, 2015, by Anna Makharinskaya, an assistant to Mikhail Markelov, a State Duma member from the ruling United Russia party at the time, included a detailed plan to destabilize Kharkiv, Ukraine's second-largest city, with 1.4 million people. Neither Makharinskaya nor Markelov, who the document indicates authored the plan, could be reached for comment.

The plan -- titled Package Of Measures X -- says that "the majority of the population of the Kharkiv region adheres to opposition views toward Kyiv" and includes a proposal to create an organization called Civil Initiative that would "develop and implement a set of...actions in order to mobilize dissent [and] criticism of Kyiv authorities," as well as promoting "autonomy" for the region and establishing "a dialogue in this regard between Kharkiv and Kyiv."

But the plan appears to have fizzled if it ever got under way, according to a June 4 e-mail identified as being from Markelov. "'The Kharkov, rise up!' movement and 'destabilization rallies and actions' have become "irrelevant," the author wrote, using the Russian spelling for the city name.

Among Kharkiv's youth there is growing support for the ideas "'Ukraine is Europe,' 'Russia invaded Ukraine,' 'Kharkiv is Ukraine,' etc.," the author continued, adding that among pro-Russian activists it is believed that "Russia has abandoned us."

The developments described in those e-mails seems to align with events and attitudes in Kharkiv in 2015. In the months following the pro-Western Euromaidan protests in Kyiv, which drove Russia-friendly President Viktor Yanukovych from power in February 2014, Russia-backed separatists rallied for a "Kharkiv People's Republic," storming government offices like their counterparts in Donetsk and Luhansk, and a group calling itself Kharkiv Partisans targeted pro-Kyiv groups in a bombing campaign that killed several people, according to Ukrainian authorities.

Ultimately, the uprising in Kharkiv failed and the city remains under Ukrainian control today -- while Donetsk and Luhansk are held by the Russia-backed separatists.

Other e- mails included in the November 3 release indicate that Surkov's associates devoted time to researching Ukrainian federalization -- a process for granting more power to the regions, weakening the central government in Kyiv. Many of the e-mails in the account contain what appear to be briefings from his assistants on legislation in Ukraine's parliament, the Verkhovna Rada, and news reports about the conflict in eastern Ukraine.

The e-mails suggest Vinogradova and Kudryavtseva were used to pass correspondence between Surkov and leaders of the separatists in Donetsk and Luhansk. Russian Aleksandr Kazakov, an aide to Donetsk separatist leader Aleksandr Zakharchenko, features prominently in the e-mails, writing to Vinogradova with several requests to pass on messages to Surkov. In one, addressed directly to Surkov, an author identified as Kazakov begs for a meeting to ask about Surkov placing him on "unpaid leave."

On December 15, 2015, an unidentified sender sent a list with proposed replacements for the heads of so-called "ministries" in what separatists describe as the "Luhansk People's Republic." It included the names and resumes of possible candidates to replace 13 officials but not the the self-declared "prime minister," Igor Plotnitsky.

There is also correspondence apparently involving European officials.

In a series of e-mails that appear to have been sent from official government e-mail accounts in April and May 2015, an author identified as Steffen Thomas, who is listed on the official German Bundestag website as state secretary at the Federal Ministry of Finance, discusses with Russian Deputy Finance Minister Aleksei Moiseyev the possible resumption of banking services in the separatist-controlled areas of Donetsk and Luhansk.

Banking services in those parts of the Donetsk and Luhansk regions remain cut off today.

Israeli hackers show light bulbs can take down the internet
Friday, 04 November 2016
Byline: Gavin Rabinowitz

Jerusalem - A team of researchers at Israel's Weizmann Institute of Science has shown how hackers can use the simplest of household devices, like light bulbs, to potentially take down sections of the internet or launch a full-scale attack on a country's infrastructure.
The researchers focused on hacking into ordinary devices which are connected to the internet, the so-called "Internet of Things," to show how easy it is to take control of the devices and employ them for the kind of distributed denial of service (DDoS) attack that took down wide swathes of the internet last month for several hours.

The experiment, carried out by four researchers, Eyal Ronen, Colin O'Flynn, Adi Shamir and Achi-Or Weingarten, focused on simple Philips Hue wifi-connected smart bulbs and showed how the bulbs can "infect each other with a worm that will spread explosively over large areas in a kind of nuclear chain reaction."

"The attack can start by plugging in a single infected bulb anywhere in the city, and then catastrophically spread everywhere within minutes," the researchers' paper said.

The team managed to remotely infect the first light bulb by exploiting a weakness in the ZigBee Light Link protocol, the wireless language that everyday devices use to connect to one another.

In one experiment they flew a drone up to an office building that houses several well-known Israeli security companies and managed to transmit an infected key to a light bulb. Soon dozens of light bulbs were "kidnapped" and "crying for help" flashing SOS.

In another experiment the team drove by a building in the Weizmann Institute and managed to take control of the lights from a distance of 70 meters.

"We used only readily available equipment costing a few hundred dollars, and managed to find this key without seeing any actual updates," they wrote.

By only taking control of the light bulbs, they warn that hackers could permanently disable, or "brick," these devices, jam wireless networks, attack and overload an electric grid or even possibly cause epileptic seizures on a large scale by "repeatedly flashing the lights at the right frequency."

And they warn that this is only the beginning of the problem. "Within the next few years, billions of IoT devices will densely populate our cities."

The researchers said that they had been in contact with Philips and provided technical details and suggestions for a fix. "They have already confirmed and fixed the takeover vulnerability," they wrote.

Associated Press
Swiss Prosecutors Shelve Probe Into Spying at Iran Talks
Friday, 04 November 2016
Byline: Staff report

Geneva - Swiss authorities have suspended an 18-month investigation into suspected cyber-spying during international talks on Iran's nuclear program last year, saying they have turned up criminal wrongdoing but haven't found out who was behind it.
The office of Attorney General Michael Lauber says the investigation prompted by a report from Swiss intelligence authorities turned up malware "developed for the purposes of espionage" to scoop up data on many computers at a Geneva hotel. The talks in question took place at the President Wilson hotel.

Thursday's statement from Lauber's office cited evidence of criminal activity but said "it cannot be attributed to specific persons."

Kaspersky, a cybersecurity firm, announced at the time that it had uncovered the campaign, saying the malware was so sophisticated that a government must have created it.

CSIS chief argues data was collected legally, but accepts court ruling
Sunday, 06 November 2016

Ottawa - The head of the Canadian Security Intelligence Service says he wants to "make it clear" the spy service was "not knowingly exceeding the scope" of its legal authority when it kept potentially revealing electronic data about people who posed no security threat over a 10-year period.
On Thursday, a Federal Court judge said the spy service was acting illegally and breached its duty to inform the court of its data-collection program, since the information was gathered using judicial warrants.

CSIS director Michel Coulombe took the unusual step of issuing an additional statement on Sunday to defend the program, saying the spy service had been collecting the data using legal warrants and retaining it based on its interpretation of the law, but that it accepted the decision of the court.

Coulombe also says that the agency briefed former public safety ministers Stockwell Day and Vic Toews about the program, and shared information with the Security Intelligence Review Committee and other government stakeholders.

But Coulombe also says those briefings might not have dealt specifically with retaining the subset of associated data that is the subject of the ruling by the court.

Coulombe said last Friday that the spy service had halted all access to, and analysis of, the data in question while it reviews the court decision.

Presse canadienne
Larouche et Lagacé n'auraient pas été mis sur écoute, dit le SPVM
Sunday, 06 November 2016
Byline: Emilie Bergeson & Louis Cloutier

Montréal - Le Service de police de la Ville de Montréal (SPVM) a réagi aux informations parues dans La Presse, samedi, en réitérant que le chroniqueur Patrick Lagacé et le journaliste Vincent Larouche n'avaient jamais été mis sur écoute.
La Presse rapportait que le SPVM a demandé et obtenu un mandat pour placer sur écoute MM. Lagacé et Larouche. Le service de police ne se serait donc pas contenté d'obtenir le droit de fouiller les relevés téléphoniques et de géolocaliser les journalistes. Le quotidien ignore cependant si ce mandat d'écoute électronique a été utilisé.

Par voie de communiqué samedi, le directeur du SPVM a maintenu que seuls les policiers faisant l'objet d'une enquête ont été sur écoute électronique. Philippe Pichet a cependant précisé que toute personne ayant communiqué avec les policiers en question a pu être entendue dans le contexte de ces

conversations. Le communiqué affublé du titre «Le SPVM dément les informations parues dans La Presse ce matin [samedi]» ne semble toutefois ni confirmer ni infirmer l'existence d'un mandat ciblant directement les journalistes.

M. Pichet, qui assure avoir agi en toute légalité, a dit vouloir demander à la cour une levée rapide des scellés sur les données concernant Patrick Lagacé, par souci de transparence.

Plus tôt samedi, le chef du Parti québécois a réclamé sa suspension, le temps que la lumière soit faite sur les deux cas de surveillance policière révélés dans la dernière semaine.

Jean-François Lisée a fait valoir que, dans la foulée des informations rapportées par La Presse, la suspension de M. Pichet, «l'un des acteurs principaux de ce qui est un manque de jugement, sinon un abus de pouvoir», devient d'autant plus nécessaire.

«À chaque jour qui passe et lorsqu'on en apprend davantage, on voit que l'une des personnes que la commission d'enquête voudra le plus voir et interroger, c'est bien le directeur Pichet et donc il faudrait l'extraire de son travail immédiatement pour ne pas entacher la preuve d'aucune façon [...] Il faut prendre cette précaution», a-t-il lancé, en entrevue avec La Presse canadienne.

Le chef péquiste a précisé qu'il demandait déjà qu'un tel geste soit posé depuis le début de la semaine. Il n'exige toutefois pas la démission du directeur du SPVM pour l'instant.

Les problèmes du SPVM

«Les problèmes du SPVM sont plus profonds que la seule identité de la personne qui le dirige présentement», a soutenu pour sa part Patrick Lagacé.

«Il y a une culture qui fait en sorte que dans le haut commandement, on se moque de la liberté de presse, on méprise les journalistes», a-t-il dénoncé, en entrevue avec La Presse canadienne.

Selon la lecture d'une déclaration sous serment et d'une autorisation judiciaire obtenues par La Presse, la police aurait eu l'autorisation de mener des écoutes électroniques auprès de M. Lagacé, de même que de Vincent Larouche.

Leurs communications privées pouvaient être interceptées, aurait écrit le juge Marc Bisson, de la Cour du Québec, dans un mandat d'écoute signé en mai dernier et valide pour 60 jours - toujours selon les informations de La Presse.

La Presse ignore cependant si les deux journalistes ont finalement été écoutés. Ils n'ont pas reçu un avis de 90 jours les prévenant qu'ils avaient été écoutés, comme le prévoit la loi.

Cette semaine, le directeur du SPVM avait déclaré devant les médias qu'il n'avait jamais été question d'écoute électronique de Patrick Lagacé dans ce dossier.

Aux yeux du chroniqueur, il est impératif de mettre en lumière le fonctionnement du SPVM au-delà «des versions roses et édulcorées des communiqués de presse».

«La seule solution à laquelle je peux penser à mon niveau, c'est de continuer à faire du journalisme», a-t-il lancé.

De son côté, Jean-François Lisée affirme qu'il revient «légalement» au premier ministre, Philippe Couillard, de suspendre Philippe Pichet - et non au maire de Montréal, Denis Coderre.

Le ministre de la Sécurité publique Martin Coiteux a écrit sur sa page Facebook en fin d'après-midi qu'il était en contact avec le maire Coderre «depuis tôt [samedi] matin».

«Tout au long de la journée, nous avons échangé sur cette situation qui me préoccupe au plus haut point. Devant les nouveaux éléments rapportés par le journal La Presse ce matin, les autorités du Service de police de la Ville de Montréal et la Ville de Montréal doivent faire preuve de la plus grande transparence dans ce dossier et poser des gestes afin de restaurer la confiance des Montréalais envers leurs institutions», a-t-il soutenu.

Commission d'enquête

Quant à Denis Coderre, il n'a pas formulé de commentaires samedi.

Le gouvernement a annoncé jeudi qu'une commission d'enquête sera mandatée pour se pencher sur la surveillance policière des sources journalistiques, après que de nouveaux cas, concernant six journalistes, eurent été révélés.

La création éventuelle d'un comité d'experts formé d'un juge, d'un membre des forces policières et d'un représentant des médias avait déjà été lancée. Ce dernier recevra tous les pouvoirs relatifs à la loi sur les commissions d'enquête, qui incluent notamment le pouvoir de contraindre les témoins.

Me Christian Leblanc a été choisi à l'unanimité par une douzaine de chefs des principales salles de nouvelles du Québec pour siéger au comité.

M. Lisée a rappelé samedi qu'il avait demandé au premier ministre que les chefs des partis de l'opposition soient consultés sur la nature du mandat et sur la période qui sera couverte par la commission, se disant déçu de ne pas avoir encore été approché en ce sens.

CBC Radio The House

Spy agency broke the law, so who should be held accountable?
Saturday, 05 November 2016

Ottawa - Public Safety Minister Ralph Goodale hasn't ruled out firing those responsible at the Canadian Security and Intelligence for illegally keeping potentially revealing electronic data it collected over a 10-year period.
"There are circumstances that would certainly go to that extreme," he told The House.

On Thursday the Federal Court ruled that CSIS illegally kept potentially revealing electronic data, breaching its duty to inform the court, since the information was gathered using judicial warrants.

Because the metadata -- which can include information like email addresses and telephone numbers contacted at a specific date or time, but not the content of the messages or calls themselves -- was not related to a security threat, it should have been destroyed.

Goodale said he's tasked the Security Intelligence Review Committee, also known as SIRC, to continue to monitor CSIS.

"The first identification here of a problem actually came from SIRC, came from their review process," Goodale said.

"They are the eyes and the ears of the Canadian public. They get full disclosure of all the details. What I am asking them to do is make sure that the information here, that court has criticized, make sure that that information is properly handled."

He also said the creation of a parliamentary oversight committee could also offer a future safeguard.

Sputnik News Service
Canadian Federal Court Exposes, Rules Illegal Database on Innocent Citizens
Saturday, 05 November 2016

Washignton - "The court concluded that the retention of associated data falls outside the CSIS's legislatively defined jurisdiction... therefore the retention of associated data is illegal," a court-issued summary of the ruling stated. The CSIS, Canada's equivalent of the US Central Intelligence Agency, has maintained a database since 2006 containing information from everyone contacted during the course of a security-related investigation, regardless of whether the information was related to the probe, according to the court. At a press conference in the nation's capital of Ottawa on Thursday afternoon, CSIS Director Michel Coulombe said the agency accepted the court's decision and had "taken immediate actions to respond," according to follow up reports in Canadian media. By issuing the ruling, the public was informed for the first time of a program that had operated in secret for the past decade.

National Post
After trust has eroded, CSIS might get left out in the cold by ministers
Saturday, 05 November 2016
Byline: John Ivison

Column: "Trust, but verify."
Academics Craig Forcese and Kent Roach argue that this should be the maxim in the security sector when dealing with powerful state agencies like the Canadian Security Intelligence Service and the RCMP.

But trust in Canada's security services is thin on the ground, after the news Thursday that a CSIS unit illegally kept data deemed unrelated to national security threats.

Public Safety Minister Ralph Goodale said Friday that a Federal Court decision by Justice Simon Noel, who found CSIS has "breached, again, the duty of candour it owes the court," is timely because the Liberals are in the midst of reviewing Canada's national security laws.

The latest hit to the spy agency's reputation is unlikely to endear it to this government, and makes it more likely the Liberals will roll back what Forcese and Roach call the "outer limits" of C-51, the anti-terror legislation introduced last year by the Conservatives.

The Federal Court ruling found CSIS illegally kept electronic data, breaching its duty to inform the court -- a duty it had since the information was gathered using judicial warrants. The metadata -- information like email addresses and telephone numbers, though not the contents of actual emails and telephone calls -- was unrelated to national security threats, the judge concluded, and should have been discarded.

As Noel indicated, it was not the first time CSIS has fallen foul of the courts.

In 2013, another Federal Court justice, Richard Mosley, hammered CSIS for deliberately keeping the court in the dark about outsourcing its spying on Canadians abroad to foreign agencies. On that occasion, he said CSIS purposely misled him when he granted it numerous warrants to intercept the electronic communications of Canadians suspected as domestic security threats.

Even before that, both Mosley and Noel had lambasted CSIS for providing inaccurate information to the court. In the Mohamed Harkat case, Noel criticized the lack of candour coming from CSIS.

Judicial opinion is particularly pertinent since the new anti-terror legislation gave CSIS the power to ask judges to approve warrants, even if preventative measures breached rights or freedoms otherwise protected by law.

CSIS chief Michel Coulombe said last March that the agency has used its new threat disruption powers (previously the agency could gather information about suspected terror plots but not disrupt them). However, he said CSIS had not sought judicial approval in any of those instances.

Critics of C-51 suggest the Liberals should roll back the provision, removing the ability to seek judicial warrants.

Given the fact that the country's foremost jurists on national security law have repeatedly censured the spy agency for deliberately misleading them, it seems a good bet that the government will decide to shorten CSIS's leash.

Yet Goodale did not rule out a change to the law to allow CSIS to keep the information ruled offside by the court. "This is an issue that I think needs to be examined in the context of our national security review," he said. "I want to hear the professional advice on both sides ... Our security agencies to be effective in keeping Canadians safe. At the same time, what the agencies do needs to be in accord with the law and with the Constitution."

Phil Gurski, a former CSIS analyst, said the metadata was retained for a reason - - namely to identify people involved with, or sympathetic to, terror groups. "It was a legal opinion that this was illegal because the service is only allowed to retain information that is strictly necessary. I'm saying that it is strictly necessary and the data would inform future investigations."

Gurski suggested the three-decade-old CSIS Act be updated to reflect the new threat environment, allowing the spy agency to retain metadata.

But he conceded public opinion could push the Liberals in the opposite direction. "The perception is that CSIS acted illegally and the public might say, 'Why give these guys more powers if they can't legally use the ones they have?' I hope that's not the case."

But that hope may prove forlorn. The Liberals are in the process of beefing up oversight and verification, in the form of the new parliamentary committee that will monitor CSIS's activities.

Now trust has broken down, both with the judges who issue the warrants CSIS needs and with the minister to whom it answers.

When consultations with Canadians over national security end, and the government reports back, the spies could find themselves left out in the cold.

CBC.CA
What you need to know about the CSIS metadata ruling
Saturday, 05 November 2016
Byline: John Paul Tasker

Ottawa - A Federal Court judge's ruling this week that CSIS has been illegally storing Canadians' communications data for more than a decade has shed new light on the agency's secretive data analysis program.
In his redacted ruling, Justice Simon Noël found the domestic spy agency held on to what it calls "associated data," vast amounts of data about private electronic communications obtained under warrant, long after it had decided the information was not related to a security threat.

CSIS has been storing that information for an indefinite period in an Operational Data Analysis Centre (ODAC), a shadowy part of the agency that essentially maintains a database of metadata, which includes phone numbers, email addresses and geographic coordinates.

Noël found that when it came to the ODAC, the intelligence agency did not fulfil its "duty of candour," which obligates the agency to be forthcoming with the Federal Court about its investigatory practices when seeking warrants.

The judge found that CSIS was concealing these efforts -- to collect and store vast amounts of data -- from the court, something the agency director now says is "regrettable."

Media placeholder

Is CSIS keeping the content of my communications?

At issue in this landmark ruling is not the actual content of a "communication event," which can largely be defined as a phone call or an email, but rather associated information like phone numbers, call times, date stamps and GPS data.

But that doesn't mean it's useless information, Noël writes in his judgment. Far from it.

"Metadata, on its own and processed through aggregation and analysis, can provide intimate insights into the lifestyle and personal choices of individuals; it is not an innocuous kernel of information."

What is the Operational Data Analysis Centre?

It's hard to say, exactly, because Noël, who had been issuing warrants to CSIS to allow them to collect this data through "intrusive methods," had no idea there was such a thing.

CSIS set up this centre in 2006 to house "non-threat, third- party information," that it obtained from service providers (largely mobile carriers and internet companies).

This, Noël ruled, is hugely problematic because warrants stipulated that information unrelated to a threat must be destroyed.

Despite those legal limits, the agency felt that information it collected was "under-utilized," because it was not sufficiently analyzed. Internally, the ODAC was billed as a "centre for excellence for the exploitation and analysis" of databases.

Most of the judge's description of the ODAC in his ruling is blacked out, but he discovered that the centre processes metadata and spits out an "end product of intelligence which reveals specific, intimate details on the life and environment of the persons CSIS investigates."

CSIS Data Privacy 20161103

This practice, Noël wrote, goes beyond CSIS's limited mandate, which restricts its activities to those that are "strictly necessary for the purpose of protecting the security of Canada."

CSIS legally acquired the data and thought it was allowed to retain it, the agency's director, Michel Coulombe, said in a press conference Thursday.

"It is now clear that the Federal Court disagrees with this interpretation."

He did concede Thursday that existing data collection practices "have proven to be an effective tool."

Coulombe also said its policies had the full backing of lawyers in the Department of Justice

"We've heard the court loud and clear," Robert Frater, chief general counsel for the Department of Justice, who attended the press conference with Coulombe, said. "We are taking steps to improve our practices and we will meet that standard."

Who knew about this operation?

CSIS told the court that it had informed Stockwell Day, who was serving minister of public safety, about the associated data collection program.

But Day refuted that claim in an interview with CBC News Network's Power & Politics. "If he is suggesting, or anybody, that they thought they told me something inappropriate was going on, yeah, I would suggest they did not."

Media placeholder

The current public safety minister, Ralph Goodale, said Friday the Security Intelligence Review Committee (SIRC) initially flagged possible problems with the collection and storage of associated data in a report tabled earlier this year.

Goodale said he only became aware of the full extent of the problem recently, when Noël filed a preliminary report "a couple of weeks ago."

"I took the immediate step of informing SIRC of the issue and asking SIRC to intervene in the situation to supervise the management of the data and to make sure that there was full compliance with the federal court's judgment," Goodale told reporters.

CSIS does not need a warrant to review Revenue Canada files

In addition to collecting and storing metadata for years, Noël also documents in his ruling how the spy agency can now obtain information from the taxman without a warrant.

"The Court no longer adjudicates applications for warrants to obtain information from the Canada Revenue Agency," he wrote.

This is part of a new trend, expanded in the former Harper government's anti-terrorism legislation, Bill C-51, which dramatically expanded information sharing among government departments. It allows CSIS to operate internationally and gives it the ability to take action to actually prevent a threat.

What happens now?

Coulombe said CSIS has halted all access to, and analysis of, the data in order to assess the "operational" impact of the ruling and to determine the way forward.

"We are working closely with the Department of Justice to make sure that we meet our obligations with the court," he added. "The trust of Canadians is essential in the fulfillment of our mandate."

Goodale said the Federal Court ruling is "timely" as it comes in the midst of the government's public consultations over the future of national security.

He has already promised to launch a parliamentary oversight committee of CSIS, a promise the Liberals made after it tacitly endorsed parts of the controversial Bill C-51.

Noël said, in the context of this ruling, "it may be time for Canadians to renew a debate regarding the mandate and functions of our domestic intelligence agency.

"It is my opinion that the CSIS Act is showing its age," the judge said of the 30-year-old legislation.

Daniel Therrien, the country's privacy commissioner, told CBC News Friday that CSIS has already reached out to his agency to propose next steps.

"At this point I can tell you that we welcome discussions on changes to CSIS policies required by the judgement. We also welcome a proposal from CSIS to meet to discuss their Privacy Impact Assessment for the Operational Data Analysis Centre and how it should be updated following the Court's decision."

CBC.CA
CSIS metadata: Ralph Goodale 'pursuing criticism' with spy agency management
Saturday, 05 November 2016
Byline: Janyce McGregor

Ottawa - Public Safety Minister Ralph Goodale suggested today that there may be consequences for the senior management of Canada's spy agency after a Federal Court decision found CSIS broke the law in failing to destroy potentially sensitive personal information.
"I take very seriously the explicit finding by [Federal Court] Justice Noel that CSIS had failed in its duty to be candid with the court," he told reporters before entering question period.

"I will be pursuing that criticism with the executive management of the service," he said.

The ruling Thursday found that the Canadian Security and Intelligence Service illegally kept potentially revealing electronic data it collected over a 10-year period, breaching its duty to inform the court, since the information was gathered using judicial warrants.

Because the metadata -- which can include information like email addresses or telephone numbers contacted at a specific date or time, but not the content of the messages or calls themselves -- was not related to a security threat, it should have been destroyed.

"Canadians need to have confidence that all the departments and agencies of the government of Canada are being effective at keeping Canadians safe, and equally that they are safeguarding our rights and freedoms, including privacy and the rule of law," the minister said.

"From the service and from the department of justice, a strong and timely remedial plan is required to reassure the Federal Court about the issue of candour."

Media placeholder

The federal government is not appealing the Federal Court ruling. Goodale said Friday he welcomed the decision.

"The court's insight and guidance are timely, coming in the midst of the public consultations on Canada's national security framework," he said, pointing out later that Canadians haven't been given a chance to be heard on privacy concerns like this until now.

SIRC will monitor compliance

The spy agency can legally intercept communications and collect third-party data associated with those communications when it's required for an investigation. But data can't be studied or kept unless it relates to a specific threat.

CSIS has blocked all access to and analysis of this data as a result of the ruling, Goodale said.

"I am asking the SIRC (Security Intelligence Review Committee) to monitor the situation carefully to ensure compliance."

The minister said this privacy breach was first raised in SIRC's 2014-15 report, which was delayed because of the election. He eventually tabled it last January.

The minister said he became fully aware of the issue when the Federal Court judgment was made available to him in preliminary form a few weeks ago.

"The law is the law and all government agencies must comply with the law of the government of Canada," he said.

CSIS Info Sharing

When asked whether anyone could be fired over this, the minister said he would discuss with CSIS executives how they might plan to respond.

"(CSIS) director (Michel) Coulombe is abundantly aware of my expectations in this matter," he said, adding later that this ruling has exposed a "serious defect" in records management that needs to be fixed.

At a hastily called news conference late Thursday to respond to the ruling, Coulombe said he deeply regrets the court's "serious concerns." The agency accepted the court's decision, he told reporters, and has "taken immediate actions to respond."

Future committee could review use

The future use and analysis of metadata are part of the ongoing national security review. While it could be useful to keep Canada safe from threats, "privacy is a fundamental Canadian value," Goodale said.

The parliamentary oversight committee the Liberals are setting up -- legislation to implement it, Bill C-22, is currently before the House -- could offer a future safeguard.

It will have "extraordinary authority," Goodale said, and unlike SIRC, could review not just past activities of security agencies but also ongoing operations.

"Timeliness is a critical concern here," the minister said.

But at an earlier press conference, two NDP MPs suggested the the new committee won't be independent enough.

The prime minister and cabinet would appoint its members and hand-pick its chair, justice critic Murray Rankin said, while controlling the information it receives and potentially blocking investigations into certain areas. Reports could be revised without notifying the public, he warned.

"Surely that's not good enough for Canada in the 21st century," Rankin said, especially with the cyber-security concerns noted by the judge in this case.

"Metadata is the new frontier for privacy protection," he said.

Media placeholder

New Democrats are proposing amendments they say would give the intended watchdog more teeth and claws.

Thursday's judgement shows that the parliamentary oversight committee needs the power to summon witnesses, compel testimony under oath and require the production of documents, Rankin said.

Public safety critic Matthew Dubé said that despite what former minister Stockwell Day said on CBC News Network's Power & Politics Thursday, the Federal Court ruling said that in 2006, the former Conservative minister was made aware of this data collection.

We have to imagine that Goodale was briefed too, Dubé said. "We want to know: what did the minister know?"

"The Liberals were elected realizing ... that there were problems with C-51, with how this was all taking place, and promised more oversight and promised more accountability," he said.

"If the minister was aware of this, and continued under the status quo that had been put in place under the previous government, that in and of itself is a problem, given what they promised."

CTV.CA
Former Ontario privacy commissioner wants CSIS metadata deleted
Saturday, 05 November 2016

Byline: Graham Slaughter

Ottawa - Information illegally held by Canada's spy agency over the course of a decade should be deleted from CSIS servers, according to Ontario's former information and privacy commissioner. Ann Cavoukian said metadata - the information included in a communication, such as a telephone number or email address - never should have been gathered because it included details on Canadians who didn't pose a security threat.

"As Justice (Simon) Noel made perfectly clear, there was no authorization whatsoever to collect that type of unrelated metadata. That was completely unanticipated, unauthorized and should never have happened," she told CTV's Power Play on Friday.

The Federal Court judge ruled that CSIS should not have kept metadata regarding people who didn't pose a direct threat to national security, and said the agency breached its duty to inform the courts of the data-collection program because the information was gathered under judicial warrants.

The ruling was made public Thursday.

Cavoukian said a major concern about metadata is that it could be crunched by sophisticated algorithms to form data profiles and help track people.

"What machine learning algorithms excel at are predictive analytics - predicting future behaviour based on the data collected, and it can paint a very, very deep, involved picture of these individuals," she said.

"That was never authorized, and that's (why) we have to ensure this information is deleted."

CSIS has not said whether it plans to destroy the information. CSIS director Michel Coulombe said Thursday that the agency had stopped all access to, and analysis of, the metadata in question as it fully assesses the court decision.

Cavoukian said the spy agency's response on Thursday "didn't address the major concerns" of the scathing ruling.

"They said, 'OK, we're not going to do it anymore.' But they didn't say we're going to destroy the 10 years of metadata that we collected, contrary to having any legal authority to do so," she said.

In his ruling, Justice Noel suggested that's it time for the federal government to revisit the CSIS Act of 1984, which he wrote is "showing its age."

A former director for Canada's CSIS watchdog echoed that call for reassessment.

"The Act is now more than 35 years old," said Jacques Shore, former director of research and investigation for the Security Intelligence Review Committee (SIRC), who now works as partner with Gowling WLG.

"Clearly with new technologies, we have to address it."

Public Safety Minister Ralph Goodale said Friday he was taking the finding "very seriously" and following up with CSIS top brass.

"(CSIS) has confirmed to me that it is taking immediate steps to address the court's decision," Goodale said. "It has blocked all access to, and analysis of, any associated data while it considers its next steps to comply."

Globe and Mail Online
Where is the review of intelligence analysis in CSIS?
Saturday, 05 November 2016
Byline: Stephanie Carvin

OpEd: Stephanie Carvin is an assistant professor of international relations at the Norman Paterson School of International Affairs at Carleton University, and a former national security analyst with the federal government
In a week dominated by headlines alleging the FBI meddling in the U.S. presidential election, and police surveillance of journalists in Quebec, Thursday's Federal Court ruling on CSIS's Operational Data Analysis Centre (ODAC) likely heightened the uncertainty many Canadians feel over the actions of our national security services.

While much of the ruling refers to data collection and retention, it also speaks to the role of intelligence analysis within the government of Canada - a topic that has thus far not received much attention in discussions surrounding the national security review process, but should.

As both the ruling and the CSIS director Michel Coulombe noted on Thursday, part of the issue surrounds the CSIS Act - a product of the early 1980s. Both the Federal Court and Coulombe noted that technology has moved on since this time. However, the issue goes further than this, especially when it comes to intelligence analysis.

Although the Macdonald Commission desired to create a civilian intelligence agency, the character of CSIS continues to reflect the organization from which it was born - the 1970s RCMP. While the focus in the Act is rightly on stopping the "bad guys," other intelligence functions of national security organizations, especially analysis, are secondary considerations.

Indeed, other than noting in Section 12(1) that the Service "shall report to and advise the Government of Canada" on national security threats, the role of intelligence analysis is barely given any consideration. There is no guidance as to how this role should be done, how intelligence should support operations or in what way advice is to be given.

Moreover, there is no formal or consistent intelligence analysis oversight - or more correctly, efficacy review. One can only speculate that had there been some form of regular review of CSIS's analytical functions, it is unlikely that ODAC's existence and activities would have been such a surprise to the Federal Court.

But this situation has led to other problems as well. For example, there is no accountability within the CSIS Executive as to the delivery of intelligence products, how those products are produced or whether those products are delivered in a timely manner.

Additionally, there is no way of knowing how intelligence products are used or if they adequately support internal operations or policy making. Furthermore, there is no way of knowing if analysts have the proper tools and training.

In fact, it is not even clear what kind of analysis CSIS should be producing. ODAC's role appears to be that of supporting operations, but there is no reason that the broader trends it uncovers cannot be used to support intelligence analysis that supports policy making.

But complicating matters is the largely haphazard structure of the Canadian intelligence community's (IC) analytical branches. There is considerable overlap between several, including the Privy Council Office's Intelligence Assessment Secretariat, the Integrated Terrorism Assessment Centre (ITAC), and CSIS's analytical branches.

While having competing perspectives can provide a plurality of views for the government to choose, the lack of review means that we do not know how well the IC manages these relationships and/or collaborates. As such, the government should take two steps as it undergoes its national security review.

First, it should support CSIS's development of innovative intelligence analysis techniques, such as data analytics. In an era of budgetary constraints and rapidly evolving threats, such techniques can help provide direction and focus of scarce resources. Even in noting its concern with ODAC's analytical activities, the Federal Court saw their value in supporting the Service's work.

This change, however, will be difficult. CSIS is an organization led by intelligence officers, many of whom are more comfortable "knocking on doors" than statistically driven trends. Although some might speculate that CSIS is anxious to jump on the "big data" wagon, this change will come as a culture shock to a largely traditional organization still governed by its Cold War mandate.

This brings us to the second step - analytical modernization must be done with appropriate oversight and efficacy review. This, as well as ensuring the quality and timeliness of analysis, should be key functions of the Parliamentary committee that the Liberal government is creating.

On Thursday, Public Safety Minister Ralph Goodale stated that he was taking seriously the concerns about CSIS's bulk data collection activities. He must also take the time to consider what CSIS's analytical role should be and ensure there is appropriate oversight and review of its activities.

After all, there are many excellent analysts in the government. Review will ensure their work helps Canada to be a safer place.

Ottawa Citizen
Clean up spy agency
Saturday, 05 November 2016

Editorial: So, Canada's spy agency has gobs of people's metadata in a secret database. Well, it's just numbers, isn't it? You know, telephone numbers and Internet IP addresses and so forth. Who cares? The justice system, to begin with. On Thursday, the Federal Court released a ruling saying that the Canadian Security Intelligence Service's retention and analysis of wide swaths of data, which had been going on for 10 years, was illegal. And CSIS hadn't bothered to inform the court of what it was doing.

This duplicity is unacceptable; keeping data you're not entitled to is a scandal that concerns all Canadians. And it's happening as a related mess unfolds in Quebec, where police have been spying on journalists, collecting their metadata, too.

The word "metadata" sounds bland. But the information CSIS kept could be pieced together to create, said Justice Simon Noël, "intimate insights into the lifestyle and personal choices of individuals; it is not an innocuous kernel of information."

Let's say your information, being scooped up by spies, shows a telephone call from your boss. Next, you telephone your mother. Then, you phone a number associated with a suicide hotline. What could be happening? It doesn't take a highly trained intelligence analyst to figure it out.

Further, CSIS has been retaining such information about people who aren't the target of an investigation -- "third-parties" like you and me. Let's say there's a legal surveillance operation underway. If the person being watched calls their second cousin, say, the cousin's data is collected, too, creating a network of information even about an innocent distant relative. (Redactions in the court ruling leave a bit murky what CSIS is actually hoarding.)

Public Safety Minister Ralph Goodale was shifty on Friday when asked if the Liberals' planned security oversight committee would have stopped this sort of spying; instead he repeated talking points. He also

refused to say how many Canadians had their data captured. Reassuringly, though, the government won't appeal the court ruling.

But here are some questions CSIS and the minister still must answer: . How many Canadians had their privacy violated in this way? . Will their data be destroyed? If not, why not? . It's claimed this data analysis has yielded valuable intelligence information. What sort of information? . Will Canada's new oversight infrastructure ever be able to stop this sort of activity? . Is anyone going to be fired for this fiasco?

It's a bad day for our intelligence services. Shame on our spies. And on our lackadaisical oversight system.

Le Devoir
Surveillance - La confiance ébranlée
Saturday, 05 November 2016
Byline: Manon Cornellier

Editorial - Pendant dix ans, le Service canadien du renseignement de sécurité (SCRS) a conservé et analysé des données associées à des personnes qui n'étaient soupçonnées de rien, mais qui avaient eu le malheur de communiquer avec des personnes légalement surveillées. Et le service l'a fait sans en informer la Cour fédérale, un des rares garde-fous contre d'éventuels abus de nos espions. Le gouvernement doit serrer la vis et vite ; la confiance des citoyens et la protection de leur vie privée en dépendent.\r\nLa nouvelle est tombée comme une tonne de briques en fin de journée jeudi. Dans un jugement catégorique, le juge Simon Noël, de la Cour fédérale, a conclu que le SCRS avait illégalement conservé certaines données personnelles et avait failli à son devoir d'en informer le Tribunal au moment d'obtenir les mandats nécessaires à la collecte d'information sur des personnes pouvant représenter une menace à la sécurité nationale.
La préservation de ces données dites connexes (ou métadonnées, comme des numéros de téléphone, adresses IP et de courriel) était illégale, parce que les personnes touchées n'étaient pas visées par les mandats, mais avaient seulement communiqué avec la personne sous surveillance. Plutôt que de détruire ces renseignements après une période déterminée, le SCRS les a versés dans une banque de données sophistiquée capable de les recouper et de dresser le portrait de leurs habitudes et de leurs réseaux.

Le Tribunal rappelle que le SCRS doit, en vertu de la loi, conserver les données uniquement " dans la mesure strictement nécessaire ", ce qui n'était pas le cas. Lors d'une conférence de presse convoquée en toute hâte, le directeur du SCRS, Michel Coulombe, a dit que le service avait cessé toute analyse et verrouillé l'accès aux données en question. Le ministre de la Sécurité publique, Ralph Goodale, a précisé que le gouvernement n'interjetterait pas appel et a déploré le manque de franchise du SCRS devant la Cour.

Mais ensuite ? La Cour n'a pas demandé de détruire ces données et personne ne sait trop ce qu'on en fera. Le plus préoccupant est que M. Coulombe espère pouvoir les conserver et que le ministre de la Sécurité publique, Ralph Goodale, n'a pas fermé la porte.

Il a noté que cette question serait mieux débattue lors des consultations publiques en cours sur " le cadre de sécurité nationale ". Le ministre a d'ailleurs relevé que le juge Noël avait suggéré de revoir la loi sur le SCRS et de l'adapter à la réalité des nouvelles technologies.

Ces consultations doivent aussi guider la révision de la Loi antiterroriste, le fameux projet C-51 adopté sous les conservateurs. Les libéraux l'avaient appuyé en promettant d'y apporter des amendements. Pourrait-on en profiter pour jeter du lest en ce qui a trait à la conservation de données connexes ? Ce serait inquiétant, car C-51 permet déjà, pour des raisons de sécurité, de vastes échanges de données au sein de l'appareil fédéral. Le SCRS n'a ainsi plus besoin de mandat pour obtenir une foule de renseignements, dont des données fiscales.

Toutes les agences de renseignement fédérales se servent de plus en plus des technologies de collecte et d'analyse de métadonnées, mais l'encadrement n'a pas suivi. Le SCRS a demandé des mandats à répétition au fil des ans sans jamais informer la Cour de ses méthodes. Pire, il a agi avec la bénédiction du ministère de la Justice, qui partageait l'interprétation qu'avait le service de ses obligations en matière de conservation de données.

C'est la deuxième fois en trois ans que le SCRS est surpris à cacher des faits à la Cour fédérale, au point où le juge Noël se demande s'il faudra l'accuser d'outrage au tribunal pour qu'il comprenne. " Dans le présent dossier,écrit-il, [le SCRS] n'a certes pas favorisé la confiance de la Cour. " Imaginez celle des citoyens !

Il revient au gouvernement d'établir des balises et les mécanismes de surveillance adéquats pour protéger la vie privée et les droits des Canadiens. Parmi les gestes à poser, il doit établir que rien ne justifie de conserver les données des gens ne posant aucune menace à la sécurité. Il doit aussi mettre à niveau la Loi sur la protection des renseignements personnels et, idéalement, modifier le projet de loi C-22 créant le futur comité de parlementaires chargé de surveiller toutes les activités de sécurité. Ce comité doit pouvoir faire enquête et rapport sans craindre l'obstruction éventuelle de ministres ou la censure du premier ministre.

Reuters
Canada's spy agency may be hobbled by ruling on data collection
Saturday, 05 November 2016

Ottawa - Canada's spy agency will not be able conduct normal operations until it assesses the effects of a court ruling that curtailed its ability to gather data and could make it less useful to key allies, say sources and officials.

A federal court judge on Thursday said the Canadian Security Intelligence Service (CSIS) had secretly operated a data analysis center for 10 years and illegally retained electronic information from people in Canada who were not linked to particular security threats.

The agency, which says the data is useful, said late on Thursday it would suspend analysis of the information until it reviews what the ruling means for its domestic and foreign intelligence gathering.

That looks set to negatively affect its relations with sister spy agencies abroad as critics at home complain CSIS needs closer supervision.

To seek electronic data from a suspect in an investigation CSIS needs a warrant from the federal court, which has now ordered the agency not to hold onto data collected from third parties.

A senior security source said that unless the law was changed to allow CSIS to retain the data in question, "everyone should be clear what this means to the ability of CSIS to discharge its responsibilities."

CSIS could now also have trouble working with its allies in the so-called Five Eyes intelligence-sharing network, which also includes Britain, the United States, Australia and New Zealand, said a leading security expert.

"The implications are major because the new constraints are now part of every warrant going forward," Christian Leuprecht, politics professor at the Royal Military College of Canada.

The ruling, he said, meant CSIS would not be able to gather as much information as it wanted about suspects.

"That depreciates its value as a partner to allies because it means CSIS has less intelligence to share," he said by e-mail.

If CSIS finds its ability to act is crimped it could in theory turn to the Royal Canadian Mounted Police, which shares responsibility for national security. Two sources with knowledge of the matter say relations between the agencies have deteriorated.

Counterintelligence was originally handled by the RCMP's security service, but this was disbanded after a scandal and folded into the new CSIS in 1984 along with a new generation of civilian employees, a move that generated friction.

The sources said the two agencies had agreed last year to try to work towards a rapprochement but had little success.

Neither the RCMP nor CSIS were immediately available for comment.

CSIS officials said they retained the data in question because of its value. Public Safety Minister Ralph Goodale, who publicly criticized CSIS on Friday, said all intelligence and security agencies had to follow the law.

Both agencies ultimately report to Goodale, who said CSIS director Michel Coulombe understood the need for immediate action in the wake of the court ruling.

"A serious error has been made ... this situation needs to be remedied, it has to be remedied quickly," Goodale told reporters. He declined to answer directly when asked whether he still had confidence in Coulombe, who has been in his position since May 2013.

Globe and Mail
Public safety minister vows action after CSIS data collection finding
Saturday, 05 November 2016
Byline: Colin Freeze and Laura Stone

Toronto - Public Safety Minister Ralph Goodale says he will make sure Canada's spy agency takes action after a Federal Court found that its officials have misled justices and unlawfully amassed data about people not suspected of being threats.
The Canadian Security Intelligence Service was found this week by Justice Simon Noël to have made chronic omissions in wiretap applications.

Suggesting at one point that CSIS's behaviour verged on contempt of court, he wrote that the spy agency had tried to keep its intelligence programs hidden.

For at least 10 years starting in 2006, CSIS has been skimming telecommunications data, such as phone logs and Internet trails, from the conversations it has intercepted after receiving authorization from the Federal Court.

The spy agency is required to destroy the records of some conversations it captures, including those of people who were in contact with CSIS targets but were not suspected of being a threat to security.

However, the spy agency has been holding onto the data related to these people, and had not disclosed this in wiretap applications.

Federal Court judges, who are on the front lines of making sure CSIS surveillance is lawful, were outraged to learn of such retention in a watchdog's report earlier this year.

They convened court hearings on the matter, and ruled this was always fundamentally unlawful under the CSIS Act.

During the 1980s, the spy agency's first director resigned after taking personal responsibility for a subordinate's inclusion of false information in a wiretapping warrant.

On Friday, Mr. Goodale said he intends to ensure that CSIS follows the Federal Court's directive to stop the controversial practices.

Toronto Star
Civilian watchdog defends CSIS and embattled director over 'metadata'
Saturday, 05 November 2016
Byline: Tonda MacCharles and Alex Boutilier

Ottawa - Michel Coulombe, Canada's top spy, is in deep trouble with the courts and his political boss, Public Safety Minister Ralph Goodale, over revelations CSIS kept a decade's worth of data on Canadians who are no threat to national security.
But Pierre Blais, head of the civilian watchdog agency over CSIS, says Coulombe "acted in good faith" and should not lose his job over the affair.

"He's doing a good job. And that's a difficult issue, that we have to act as big girls and big boys and we look at this and we should do the best for the future," said Blais, chair of the Security Intelligence Review Committee (SIRC).

Blais came to Coulombe's defence Friday, saying CSIS and its director did not deliberately lie to the court about a practice that SIRC red-flagged in an annual report tabled in January.

That was the first time the Federal Court learned that CSIS had created an Operational Data Analysis Centre in 2006. CSIS and its lawyers were hauled before a panel of all Federal Court judges who handle national security warrants and cases last spring to explain.

On Thursday, Justice Simon Noël released a scathing ruling that said the agency wrongly kept and analyzed "metadata" of an untold number of Canadians in violation of its legal mandate to retain only "strictly necessary" information on threats. CSIS downplayed the type of data scooped up in its probes as simply email addresses, cell numbers and IP addresses, but not the content of communications.

Still, the judge said CSIS breached its "duty of candour" when it failed to reveal what it was up to. Goodale said Friday he first learned of it was two weeks ago when an unredacted copy of the pending judgment reached his desk.

Asked if he still has confidence in Coulombe, the minister would say only that he has made his expectations to the director abundantly clear.

"A serious error has been made. (Coulombe) maintains that in his view, and in the view of the advice he got from the Department of Justice over the course of the last number of years, that the course of conduct by CSIS was within the parameters of law," Goodale told reporters.

"The court has now said very clearly and unequivocally that it was not. This situation needs to be remedied. It has to be remedied quickly . . . CSIS must be forthcoming and candid with the court. That will happen."

Blais said Coulombe, who rose through the ranks of CSIS to become its head, should not resign or be fired, and expressed total confidence that he "is a very efficient person and he will make the correction that has to be done for the future no question about that."

Asked if he was concerned CSIS had lied by omission to the courts, Blais said "lying, it's a very strong word."

"As far as I'm concerned -- I cannot say that; they never lied to the judge. They maybe (didn't) put everything that should have been presented to the judge," but he repeated "I'm sure that everybody's acting in good faith."

A former chief justice of the Federal Court of Appeal who heard national security cases before taking the top job at SIRC, Blais was also once a Progressive Conservative solicitor general and justice minister, and said: "It's not that black and white all the time, particularly in this area. . . . It's never black and white, it's always grey, and we try to make sure that we do the best job possible in respecting the law."

But Goodale was adamant Friday that innocent people should not have their information tracked and stored by Canada's spies.

"That's a fundamental principle of Canadian privacy," Goodale said.

La Presse
Surveillance de journalistes
Saturday, 05 November 2016
Byline: Vincent Brousseau-Pouliot

Ottawa - S'il a obtenu l'assurance qu'aucune surveillance de journalistes ne se produit «actuellement» au niveau fédéral, le gouvernement Trudeau n'a pas demandé à la Gendarmerie royale du Canada (GRC) et au Service canadien du renseignement de sécurité (SCRS) s'ils ont mis des journalistes sous surveillance au cours des cinq dernières années. «L'enjeu, c'est ce qui se passe maintenant et nous

pouvons offrir l'assurance que ce genre d'activités ne se produit pas actuellement. Je n'ai pas connaissance de choses qui se sont produites quand nous ne formions pas le gouvernement du Canada», a dit le ministre Ralph Goodale, qui n'a pas l'intention de demander à la GRC ou au SCRS si des mandats de surveillance ont été lancés à l'égard de journalistes au cours des cinq dernières années. «La réponse, autant de la GRC que du SCRS, est que rien de la sorte ne se produit actuellement. [...] C'est la responsabilité du directeur du SCRS de répondre aux questions opérationnelles. Vous allez sur une pente très dangereuse quand vous invitez les politiciens à aller dans ce domaine», dit le ministre Goodale.

Canadian Press
Federal security review to examine CSIS powers in the digital age, Goodale says
Saturday, 05 November 2016
Byline: Jim Bronskill

Ottawa - A federal review of national security will consider whether Canada's spy service should be able to sift through the kind of personal data it kept illegally for years, says Public Safety Minister Ralph Goodale.
Goodale said Friday the notion that the Canadian Security Intelligence Service should avoid stashing away information about innocent people is a ``fundamental principle of Canadian privacy.''

But the minister appeared to leave the door open to one day giving CSIS the legal authority to keep and analyze electronic data about individuals who do not pose a security threat.

He indicated the federal security review already under way would be a good forum to explore the matter.

``I want to hear the professional advice on both sides,'' Goodale told a news conference in the foyer of the House of Commons. ``I'm not pre-empting the consultation.''

A Federal Court judge says CSIS violated the law over a 10-year period by keeping potentially revealing electronic data about people who were not targets of investigation.

In a pointed ruling made public Thursday, Justice Simon Noel said CSIS breached its duty to inform the court of its data-collection program, since the information was gathered using judicial warrants.

CSIS processed the data beginning in 2006 using a powerful program known as the Operational Data Analysis Centre to produce intelligence that can reveal specific, intimate details about people, the judge said.

The improperly retained material was metadata _ information associated with a communication, such as a telephone number or email address, but not the message itself. It is believed to have included data

trails related to people such as friends or family members who knew the targets of surveillance but were not themselves under investigation.

The ruling means metadata can now be kept and used by CSIS only if it relates to a specific threat to Canadian security or if it is of use to an investigation, prosecution, national defence or foreign affairs.

In a hastily assembled news conference Thursday after the decision become public, CSIS director Michel Coulombe said the spy service had halted all access to, and analysis of, the data in question while it thoroughly reviews the court decision.

Goodale said he became aware of the ``full scope of the issue'' when the court judgment was made available to him in preliminary form a couple of weeks ago.

He said he took the immediate step of informing the Security Intelligence Review Committee, the watchdog over CSIS, and asked the review committee to supervise management of the data and ensure full compliance with the judgment.

Coulombe ``understands my expectations here,'' Goodale added.

``A serious error has been made. This situation needs to be remedied. It has to be remedied quickly.''

Privacy commissioner Daniel Therrien said the spy service had already contacted his office. ``At this point I can tell you that we welcome discussions on changes to CSIS policies required by the judgment.''

It marks the second time in recent months that CSIS's data analysis practices have been questioned.

In its latest annual report, tabled in September, the intelligence review committee said CSIS used datasets to identify previously unknown individuals of interest by linking together types of information that have indicated ``threat behaviour.''

``They can be used to conduct indices checks by taking information already connected to a potential threat _ such as an address, phone number or citizen identification number _ and using it to search for 'hits' in the data,'' the review committee report said.

CSIS argued that openly sourced and publicly available datasets were akin to the phone book and therefore restrictions in the CSIS Act limiting collection to ``strictly necessary'' information did not apply.

However, the review committee looked at the full list of datasets held by CSIS and, in come cases, disagreed with the spy service's assessment that they were publicly available and therefore beyond the legal restriction.

As a result of the committee's intervention, CSIS finalized and implemented guidelines for acquiring bulk data and agreed to ensure it abides by the CSIS Act in collecting such information.

In his ruling on the illegal metadata analysis, Noel suggested it was time to review the 32-year-old CSIS Act to answer the needs of the present and perhaps ``unforeseen times ahead with an adaptation to new technologies at play.''

The NDP said Friday the latest revelations underscore the need for stronger parliamentary oversight.

The New Democrats are pushing for changes to a bill that would create a committee of parliamentarians to keep an eye on CSIS and other spy services. NDP MP Murray Rankin said the proposed model would allow the government to arbitrarily deny crucial information to the committee.

Goodale flatly rejected the criticism, saying the committee would have extraordinary authority to look at classified information.

China Post
The Spy Alliance Is Watching You (Canada)
Sunday, 06 November 2016
Byline: Harun Yahya

Analysis: "Five Eyes" is the name of the joint intelligence network of five countries, which are the UK, the U.S., Canada, Australia and New Zealand. The beginning of the network dates to the UKUSA, an agreement to share intelligence signed between the UK and the U.S. in March 1946. Founded by the U.S. and the UK, UKUSA was transformed into the "Five Eyes" alliance by including the British Commonwealth members Canada, Australia and New Zealand over the following years. Thus, the foundation for a giant intelligence network which monitors the communication traffic in all continents from five different points and shares this information with the allied countries was laid.
This alliance between five Anglosphere countries is based upon the principles of sharing every kind of intelligence (primarily the signals information called SIGNIT) between each other and a vow to never spy on member countries. This 70-year-old alliance monitors, analyzes and stores the world's communications today with its built-in global monitoring substructure.

The primary intelligence services of these five countries constitute the essential parts of this monitoring system: the U.S.'s "NSA," the UK's "GCHQ," Canada's "CSEC," Australia's "ASD" and New Zealand's "GCSB" being the major ones. In addition to this, other numerous subsidiary intelligence services are the most important sources of the "Five Eyes" network.

Among these, for example, there is the RAF (Royal Air Force) of the UK, which is known as the biggest electronic monitoring center in the world.

Here, intelligence is gathered for U.S. and the UK by monitoring the communication networks of the whole world. Even if we consider that only the NSA and the RAF are a part of this system, the strength and the extent of the capacity of "Five Eyes" to gather intelligence can be better understood.

As it is known, the documents revealing the secret relationships between the Five Eyes countries and the global intelligence operations they carried out were exposed by the former CIA and NSA employee Edward Snowden in 2013. These documents, which were featured in The Guardian, The Washington Post, Der Spiegel and The New York Times, brought the details of the illegal monitoring and intelligence gathering operations of Five Eyes into the light.

Far-reaching Tentacles

According to the documents, among the bodies English intelligence service listened and monitored in liaison with the NSA were diplomats from the G-20 summit, the presidents of countries including Germany, Brazil and Mexico, politicians, U.N. offices, various embassies and media outlets. The bugging and the eavesdropping of Kofi Annan's office during the early stages of the Iraq War can be considered as one of the many activities of English secret service.

There are satellite dishes, listening and monitoring stations belonging to the NSA and English GCHQ in embassies, military bases and agencies all over the world.

These have immediate access to the security cameras of almost all countries. English and American ships along the Chinese coastline are listening to the radio communications in the region.

The satellite dishes stationed in Fort Meade, Maryland, are monitoring banking transactions all over the world.

According to the news reported by The Guardian, in order to gather global communication information, the UK acquired all kinds of personal private information by secretly gaining access to the intercontinental fiber-optic cables that carry the phone communications, messages and Internet traffic. British intelligence agency GCHQ can gather information from 46 of them simultaneously.

This secret program, code named "Tempora,"had been in operation for 18 months when the news surfaced, and the amount of data (phone records, SMS messages, emails, internet usage, website login information, social media information from websites such as Facebook etc.) gathered only within that time period was of staggering proportions.

For example, approximately 600 million phone conversations were recorded only in one day. The amount of information gathered daily is equivalent to the capacity of information existent in 192 English National Libraries.

'Worse than the US'

Snowden states that this spy network is not the sole work of the U.S., but in fact the main player is the UK, and in order to emphasize the fact that English intelligence service has no limits, he says "THEY (THE UK) ARE WORSE THAN THE USA."

Prism and XKeyscore, which surfaced like Tempora, are also among the high-tech intelligence gathering, analysis and filtering programs that Five Eyes uses. These can connect to computer servers and satellites at the military and diplomatic facilities of many foreign countries. Another Five Eyes product, ECHELON, which is frequently mentioned in espionage techno-thrillers, is the oldest and most basic version of these programs.

We should also state that New Zealand's electronic monitoring agency, GCSB, is also hard at work. It gathers the communication information circulating in the Asia-Pacific region via the NSA's controversial XKeyscore program and delivers it to its bosses in the UK and U.S. in the form of metadata packages. According to the Snowden documents, the information gathered by GCSB has no relation to security threats. On the contrary, GCSB directed its spying activities to a wide range of countries comprised of New Zealand's friends, trading partners and closest Pacific neighbors.

Even if we only consider the information provided in this article, it is obvious that, contrary to popular fallacy, the U.S. is only one of the Five Eyes, while the brain governing all these "eyes" resides in Great Britain, as it has been for centuries. Based on the environment, conditions and the plans, sometimes this brain comes to the forefront, and sometimes it hides in the background.

It's for Your Own Good

The activities of Five Eyes continue on unrestrained, disregarding laws, personal lives and privacy. This dark organization carries out its illegal and illicit operations by hiding behind cliched excuses such as "terror threat" and "security issue," just like it does with its every kind of imperialistic activity.

It is obvious that the real purpose of this organization, as it has always been, is to gain the most powerful political, military and economic dominance over the world and create the most advanced manner of exploitation based on self interests.

These kinds of sinister organizations draw their strength from their secrecy.

For this reason, the best way to fight against organizations like Five Eyes is to expose them and bring them out from the darkness they hide in into the light, to make them transparent. In order to win this fight, the good must be allied together and support each other.

The name Five Eyes, which is used to describe an organization comprised of five countries, requires a brain that rules over these five eyes, evaluates the received information and makes it "seen" and the place to look for this brain is the island of Britain.

The Guardian (London)

New generation of ethical hackers aims to impress recruiters

Saturday, 05 November 2016

Byline: Rob Davies

London - As the UK's National Cyber Security Centre starts work, recruiters are busy identifying raw talent to counter future hazards

With the launch of the National Cyber Security Centre, backed by £1.9bn of funding to battle online crime, the government has made a statement.

Defence experts have long warned of the growing menace of cybercrime and now they have good reason to believe the threat is being given priority treatment.

Recognising the danger is one thing though, dealing with it another. The world - and by extension the UK - is facing a shortage of people with the skills needed to mount an effective defence.

The global cyberdefence industry is going to need another 1.5 million staff by 2020, according to non-profit security organisation (ISC) 2.

At the Cyber Security Challenge in London - a three-day competition designed to identify raw cybersecurity talents - recruiters are doing their best to address the shortage.

Stephanie Daman, the chief executive of Cyber Security Challenge UK, believes that the UK is slowly recognising the value of ethical hackers, also known as "white hats", the cybertroops required to protect our increasingly connected world.

"We're beginning to build a pipeline of people. But that, by its nature, is going to take a little while to come to fruition," says Daman, who spent 17 years working for the government on security matters.

In the meantime, events such as the Cyber Security Challenge are trying to address the skills gap.

The event is sponsored by corporations such as PricewaterhouseCoopers (PwC), BT and BAE Systems, while camera-shy staff from GCHQ and the National Crime Agency look on, hoping to unearth a new generation of cyberspooks.

Around half of the contestants in the challenge typically get a job out of it, while all are likely to be interviewed.

Recruiters like the event because it allows people who may not shine academically to show that they can still thrive in a high-pressure, realistic scenario.

Last year's Cyber Security Challenge was fairly fanciful. It involved a bio-hazard attack and a threat against a minor royal. This year, the challenge is more grounded in reality. The contestants are asked to fight an assault on a fictional energy company, Bolt Power.

They are tasked with assessing and battling an attack from "hacktivist" cybercriminals, repairing a data breach and investigating the theft of £125m.

There are good reasons to be concerned about cyber-attacks on infrastructure within energy, but also in areas such as transport and telecommunications, or even hospitals.

Earlier this year, Theresa May delayed a final decision on the Hinkley Point C nuclear power plant

, and anxiety about the involvement of state-backed China General Nuclear was thought to be among the reasons for the delay.

These concerns have been heightened by hacks perpetrated against, among others, semiconductor firms in the US, and suggestions that designs for narrow-body aircraft have also been targeted.

Understandably, few people at the Cyber Security Challenge are willing to talk about Hinkley or point the finger at Beijing. But they are clear about the nature of the threat from state-backed groups.

Kris McConkey is on the frontline of the war against cybercrime. His job is to make life intolerably difficult for hackers. When the chancellor, Philip Hammond, said the UK must "strike back" against cyber-attacks, it was people like Kris he surely had in mind as his infantry.

"A lot of cases we get called in to are where organisations find it difficult to deal with [it] themselves," says McConkey. "A high proportion of those are attributed to state-sponsored groups."

There may still be a threat, he says, even where the state in question is only involved financially in a sensitive infrastructure project.

Companies may try to set up a firewall between sensitive systems and foreign powers, but it does not always work.

"A lot of organisations have tried to do it and a lot of organisations have had their fingers burned. It's a very difficult line to walk."

"For the most part these things end up in some joint endeavour. There's almost always a people aspect and that's often where you get an insider placed there to gain information."

He cites a recent example where a cyber-espionage group had hidden inside a company's network for two years, helped by a contractor the unnamed firm had hired.

So how to stop this? Businesses can pass information to the security services, but they are not legally allowed to "hack back" by launching cyber-attacks themselves.

But they can at least lay booby-traps to confuse and deter - a concept known as "active defence".

"One way is to go and hack the bad guys, yes. The other way is to make your network a hostile place for an attacker to break into," says McConkey.

"If you've got a burglar coming through your door, you want them to be standing in a house of mirrors, you want them to think there are many more systems than there are."

That may be easier said than done, but the Cyber Security Challenge is about finding out who has the requisite technical ability, as well as the decision-making and interpersonal skills needed to liaise with businesses facing a threat.

Contestants are encouraged to think on their feet and a team of mischievous PwC staff sits on the sidelines, occasionally throwing cyber-attacks at the contestants themselves in a bid to trip them up.

The atmosphere is tense and the contestants, many barely out of school, are feeling the heat.

But despite the technical expertise on show, there is something that does not add up.

Of the seven competing teams - all named after famous cryptographers - four honour brilliant women, while 24-year-old Holly Rostill oversees the day's events in the role of game master.

Lisa, 21, is a fourth-year computer science student and one of only two women competing out of 42 contestants. "This challenge is hard and it's gradually getting harder. Some of it is more like a whodunnit. You approach it with a technical mindset, but the challenge isn't necessarily technical."

"It's a real-world simulation. If something breaks then the cybercriminals don't stop. They take advantage, they get you when you're weak."

The stark gender imbalance is all the more concerning when the talent pool needs to be as deep as possible.

"There's a horrible dearth of women in this space," admits Daman. "Because we haven't engaged girls and women at school and kept them engaged when they make subject choices, we've lost a generation of women."

Lisa, who asked for her surname to be omitted, adds: "It's well known that the tech industry is short on women, but there's a lot of work being done to engage women into Stem subjects [science, technology, engineering and maths].

"Maybe it's a lack of awareness, but it is improving. Girls can do it too, we're just as good."

Daily Mirror
Chaos after cyber attack on hospitals
Saturday, 05 November 2016

London - Specialist police teams are probing the suspected cyber attack by Russia that forced three hospitals to cancel their operations.
Appointments were axed and 3,000 patients were affected after the virus hit Northern Lincolnshire and Goole NHS Trust on Sunday.

Normal service in Grimsby, Scunthorpe and Goole resumed on Thursday.

The Yorkshire & Humber Regional Cyber Crime Unit is probing the strike.

Last night, a senior NHS official downplayed reports of Russian involvement but added: "This is a very real and very serious threat."

The Guardian (London)
Call for Prevent-style strategy to stop children engaging in cybercrime
Monday, 07 November 2016
Byline: Vikram Dodd

London - Britain's cybercrime tsar will formally ask the government to set up a programme based on the controversial Prevent strategy to stop children as young as 12 becoming involved in sophisticated computer offences, the Guardian has learned.
Dr Jamie Saunders said training was needed to help spot teenagers at risk as many young internet users experiment with hacking or other cyber offences without realising that what they are doing is a crime.

Saunders, the director of the national cyber crime unit at the National Crime Agency (NCA), said he was proposing the scheme, known internally as Cyber Prevent, to ministers. It is modelled in part on Prevent, the official counter-radicalisation programme that has been dogged by controversy.

But instead of trying to divert aspirant jihadis away from terrorism, Cyber Prevent would aim to deter computer-literate youngsters from carrying out distributed denial of service attacks (DDoS) and other cybercrimes, such as hacking private details.

Saunders said the programme could also be used to recruit tech-savvy young adults. "We need education for schools on the [1990] Computer Misuse Act, on what it is and isn't [a cybercrime]. A lot of kids don't realise they are committing a crime," he said.

"We don't want them to go to prison, we want them to come and work for us."

Demand for computer skills is forecast to grow in coming years. One core message at the heart of Cyber Prevent is that young adults with computer skills can earn good amounts of money legitimately, as opposed to perpetrating cybercrimes and being pursued by law enforcement.

"A lot of kids are stumbling into this crime. This activity has consequences for them and others. There are legitimate opportunities for their skills," Saunders said.

The target group would be those aged 12 to 25. One major cyber- attack, which is currently subject to legal restrictions, was carried out by a teenager.

Analysis of investigations undertaken by the national cyber crime unit in 2015 found the average age of suspects was 17. The previous year, the average was 24.

Saunders said some cyber-attacks had been carried out by children who did not realise the harm they could do. "We are not dealing with serious criminals. Some are sucked in and damage their careers and do a lot of harm," he said.

Research shows that some who end up committing cybercrime start by learning how to outwit games programmers. "One of the entry points is cheating on online gaming - you have to be quite clever to do that," Saunders said.

Cyber Prevent would be relatively low cost, especially compared with the harm it aims to thwart, Saunders said. The scheme would hire a network of regional specialists and companies could contribute to the cost.

The programme would also target parents so they had a better chance of knowing what their children might be up to.

The sheer volume of online offending means only a fraction of offenders are likely to be caught.

Compared with other major types of crime, intelligence about cybercrime offenders is at a relatively early stage. "We keep finding clean skins, people we did not know about," Saunders said.

The NCA said malicious software called remote access trojans (RATs) is popular among teenage computer users. It allows users to remotely take full control of another computer. An NCA-led operation

targeting users of the Blackshades RAT found that the average age of the 22 people arrested was 18, with the youngest 12 years old.

Saunders became director of the national cyber crime unit in 2014, joining from the Foreign Office, where he was director of international cyber policy. Before that, he worked at GCHQ.

The coming clash with China
Monday, 07 November 2016
Byline: Josh Rogin

Column from Beijing - If Hillary Clinton is elected, her national security team plans to urgently address the growing North Korean nuclear and missile threat. That would surely raise tensions on the Korean peninsula - and it could also lead to an early and acrimonious confrontation between a Clinton administration and the Chinese government of Xi Jinping.
Xi is staunchly opposed to Clinton's plan to drastically increase sanctions on the regime of Kim Jong Un. At the Munich Security Conference Core Group meeting here last week, Chinese officials and experts delivered a clear and unequivocal message to the visiting Westerners: China will not take any steps against Pyongyang that might increase the chance of a confrontation with the North Korean regime or encourage regime change on China's border.

Chinese Vice Foreign Minister Zhang Yesui said that although China might endorse a limited U.N. Security Council resolution in response to North Korea's recent provocations, there's no Chinese appetite for further pressure. The Chinese rationale is simple: Beijing values stability on the Korean peninsula more than it fears the growing prospect that North Korea will succeed in its goal of becoming a full-fledged nuclear power capable of striking the West.

"China will never allow war or chaos on the peninsula, and if that occurs that will help no one," Zhang said. "We need to bring the issue back to the track of dialogue and consultation."

In Washington, there's bipartisan consensus that returning to the negotiating table without significantly more leverage against the Kim regime would be a futile and perhaps even dangerous misstep. At best, it would only repeat a failed pattern of bribing the North Korean government into a short-term pause in its mischief.

Top Clinton foreign policy advisers have been open about their intention to apply to North Korea a version of the playbook the Obama administration used with Iran. They are promising to drastically increase sanctions on Pyongyang before sitting down at the table. They are also considering secondary sanctions on foreign firms that enable North Korea's illicit industries, which means punishing Chinese companies keeping Kim's nuclear and missile industries afloat.

For the Chinese government, both of those ideas are seen as direct assaults on China's primacy over an issue it considers a core interest. Rather than respond to the threat of sanctions by leaning on its client state, Beijing is more likely to buck Washington and fight back against the new policy.

"If the assumption of any new American administration is that China is the one to blame and we need to put pressure on or even punish China, that would be a big mistake," said Dong Wang, professor at the School of International Studies at Peking University. China may retaliate with punitive measures against the United States in other areas of the bilateral relationship, he said.

Chinese officials at the conference warned that the proposed Clinton policy carries a risk of sparking a war on the Korean peninsula, and they expressed the suspicion that the unstated U.S. motivation was to spur regime change in Pyongyang.

The Clinton team has a plan to allay Chinese fears about regime change. Her advisers intend to push for a new dialogue with Beijing to discuss what would happen if the sanctions inadvertently cause the regime to collapse or if the regime implodes on its own due to mounting internal tensions.

"We are not talking about creating a regime change, but should something happen, China needs to know its interests are going to be protected," Wendy Sherman, a former undersecretary of state for political affairs and a top Clinton campaign foreign policy adviser, said last month at the Meridian Global Leadership Summit. "The South Koreans believe in tightening the noose around North Korea. ... We believe in that as well."

But the Chinese government has no intention of entering a dialogue with the United States about planning for the day after the Kim regime falls. For Beijing, preventing the fall of the regime is a must, and therefore coordinating plans for its collapse is off-limits.

David Shambaugh, director of the China Policy Program at George Washington University, said that addressing the North Korean nuclear threat will be the first serious test of the strategic relationship between the United States and China in the next administration, regardless of who wins.

"China is really crucial to this and we'd like to get a paradigm shift in the thinking of the Chinese leadership," he said. "But if they continue to refuse to move into these discussions, the temptation for the American side is just to move unilaterally."

Clinton's advisers are threatening to do just that, but they should have no expectation that China is going to comply. In fact, the North Korea issue could mean that the first foreign crisis of a potential Clinton presidency will come not in the Middle East or with Russia, but in northeast Asia.

New York Times
F.B.I. Says Review Clears Clinton in Email Inquiry

Monday, 07 November 2016
Byline: Multiple reporters

Washington - The F.B.I. director, James B. Comey, told Congress on Sunday that he had seen no evidence in a recently discovered trove of emails to change his conclusion that Hillary Clinton should face no charges over her handling of classified information.
Mr. Comey's announcement, just two days before the election, was an effort to clear the cloud of suspicion he had publicly placed over her presidential campaign late last month when he alerted Congress that the F.B.I. would examine the emails.

"Based on our review, we have not changed our conclusions that we expressed in July with respect to Secretary Clinton," Mr. Comey wrote in a letter to the leaders of several congressional committees. He said agents had reviewed all communications to and from Mrs. Clinton in the new trove from when she was secretary of state.

The letter was a dramatic final twist in a tumultuous nine days for both Mrs. Clinton and Mr. Comey, who drew widespread criticism for announcing that the F.B.I. had discovered new emails that might be relevant to its investigation of Mrs. Clinton, which ended in July with no charges. That criticism of Mr. Comey from both parties is likely to persist after the election.

While the new letter was clear as it related to Mrs. Clinton, Mr. Comey's message was otherwise vague. He did not say that agents had completed their review of the emails, or that they were abandoning the matter in regard to her aides. But federal law enforcement officials said that they considered the review of emails related to Mrs. Clinton's server complete, and that Mr. Comey's letter was intended to convey that.

One senior law enforcement official said that as recently as Friday, it was not clear whether the review would be completed by Election Day. But after days of working in shifts around the clock, teams of counterintelligence agents and technology specialists at the bureau's headquarters in Washington finished their examination of the thousands of emails. Officials had decided to make their decision public as soon as they had reached it, to avoid any suggestion that they were suppressing information.

According to the law enforcement official, many of the emails were personal messages or duplicates of ones that the bureau had previously examined during the original inquiry.

Brian Fallon, a spokesman for Mrs. Clinton, said in a post on Twitter that the campaign had always believed she would be cleared of any wrongdoing.

"We were always confident nothing would cause the July decision to be revisited," Mr. Fallon said. "Now Director Comey has confirmed it."

Kellyanne Conway, Donald J. Trump's campaign manager, lamented the fact that Mr. Comey had again inserted himself into the election, but she predicted that his conclusion would have no effect on the outcome.

"The investigation has been mishandled from the beginning," Ms. Conway said on MSNBC, arguing that Mrs. Clinton had wasted taxpayer money and federal resources because of her email practices. "She was reckless, she was careless, she was selfish."

The new review began after agents discovered a cache of emails in early October in an unrelated investigation into the disgraced former congressman Anthony D. Weiner, the estranged husband of one of Mrs. Clinton's closest aides. When searching Mr. Weiner's laptop for evidence of whether he had exchanged illicit messages with a teenage girl, they discovered emails belonging to the aide, Huma Abedin.

That announcement renewed talk of an investigation that had shadowed Mrs. Clinton for much of the Democratic primary campaign. She and her aides had been under investigation for improperly storing classified information on Mrs. Clinton's private email server. The discovery of new emails raised the prospect that the laptop might have new information that would renew the F.B.I. inquiry.

Federal law enforcement officials had said for the past week that only something astounding would change their conclusion that nobody should be charged. But the mere potential for legal trouble was enough to make Republicans gleeful, and Mr. Trump highlighted the F.B.I.'s actions in campaign ads.

At the end of a rocky week for Mrs. Clinton that included wild, false speculation about looming indictments and shocking discoveries in the emails, Mr. Comey's letter swept away her largest and most immediate problem.

Republicans immediately accused Mr. Comey of making his announcement prematurely. "Comey must be under enormous political pressure to cave like this and announce something he can't possibly know," Newt Gingrich, a Trump adviser, wrote on Twitter.

Mr. Comey's move is also sure to prompt questions from Democrats. Most important among them: Why did Mr. Comey raise the specter of wrongdoing before agents had even read the emails, especially since it took only days to determine that they were not significant?

Just hours before Mr. Comey sent the letter to Capitol Hill, Senate Democrats said hearings should be held to examine how Mr. Comey had handled the matter. After the letter's release, Senator Dianne Feinstein, Democrat of California, said the Justice Department "needs to take a look at its procedures to prevent similar actions that could influence future elections."

"There's no doubt that it created a false impression about the nature of the agency's inquiry," she added.

The F.B.I. director's vague, brief announcement on Oct. 28 left Mrs. Clinton with few details to rebut and little time to do it. Many current and former F.B.I. agents and Justice Department officials said Mr. Comey had needlessly plunged the F.B.I. into the politics of a presidential election, with no clear way out.

A long list of former Justice Department officials, including Attorney General Eric H. Holder Jr., chided Mr. Comey. Despite the fact that the bureau did not find anything that changed its original conclusion about Mrs. Clinton, Mr. Comey has insisted that he had no choice but to inform Congress about the new emails because the investigation had been completed and he had pledged transparency, according to senior F.B.I. officials.

Because of Mr. Comey's Oct. 28 letter, Attorney General Loretta Lynch made completing a review of the emails a top priority. Late last month, Mr. Comey ordered agents to work around the clock to sift through the messages. That process, senior F.B.I. officials said, was painstaking, because each message that had been sent to Mrs. Clinton had to be reviewed to determine whether it had sensitive national security materials.

In Mr. Comey's short letter to Congress on Sunday, he said he was "very grateful to the professionals at the F.B.I. for doing an extraordinary amount of high-quality work in a short period of time."

Wall Street Journal
Beijing Tightens Its Control Over Internet With New Law
Monday, 07 November 2016
Byline: Josh Chin, Eva Dou

Beijing - China's government approved a broad new cybersecurity law aimed at further tightening and centralizing state control over the internet, including the role foreign companies play in Chinese cyberspace.
The law, passed by the standing committee of China's legislature and issued publicly on Monday, tasks agencies and enterprises with improving their ability to defend against network intrusions while demanding security reviews for equipment and data in strategic sectors.

The law includes provisions such as a requirement that internet operators provide unspecified "technical assistance" to authorities in cases involving national security.

It also requires security checks for equipment used for critical infrastructure, which is defined as including information services, energy, transportation, finance and other important sectors.

During the drafting, the law was criticized by some foreign business groups and technology experts as a blueprint for further walling off China's already isolated internet.

China's lawmakers described the law as necessary to bolster its online security at a time of multiplying threats.

China, which is often accused of supporting cyberattacks on other countries but which says it is a frequent victim of hacking, has moved aggressively to bolster cybersecurity since President Xi Jinping took office four years ago.

Reuters
China adopts cyber security law in face of overseas opposition
Monday, 07 November 2016
Byline: Sue-Lin Wong and Michael Martina

Beijing - China adopted a controversial cyber security law on Monday to counter what Beijing says are growing threats such as hacking and terrorism, but the law triggered concerns among foreign business and rights groups.
The legislation, passed by China's largely rubber-stamp parliament and set to take effect in June 2017, is an "objective need" of China as a major internet power, a parliament official said.

Overseas critics of the law say it threatens to shut foreign technology companies out of various sectors deemed "critical", and includes contentious requirements for security reviews and for data to be stored on servers in China.

Rights advocates also say the law will enhance restrictions on China's Internet, already subject to the world's most sophisticated online censorship mechanism, known outside China as the Great Firewall.

Yang Heqing, an official on the National People's Congress standing committee, said the Internet was already deeply linked to China's national security and development.

"China is an internet power, and as one of the countries that faces the greatest internet security risks, urgently needs to establish and perfect network security legal systems," he told reporters at the close of a bimonthly legislative meeting.

More than 40 global business groups petitioned Chinese Premier Li Keqiang in August, urging Beijing to amend what they said were controversial sections of the law. Chinese officials have said it would not interfere with foreign business interests.

Contentious provisions remained in the final draft issued by the parliament, including requirements for "critical information infrastructure operators" to store personal information and important business data in China, provide unspecified "technical support" to security agencies, and pass national security reviews.

Those demands have raised concerns within companies that fear they would have to hand over intellectual property or open back doors within products in order to operate in China's market.

"VAGUE, AMBIGUOUS"

James Zimmerman, chairman of the American Chamber of Commerce in China, called the provisions "vague, ambiguous, and subject to broad interpretation by regulatory authorities."

Human Rights Watch said elements of the law, such as criminalising the use of the Internet to "damage national unity", would further restrict online freedom.

"Despite widespread international concern from corporations and rights advocates for more than a year, Chinese authorities pressed ahead with this restrictive law without making meaningful changes," Sophie Richardson, China Director at Human Rights Watch, said in an emailed statement.

Zhao Zeliang, director of the Cyberspace Administration of China's cyber security coordination bureau, told reporters that every article in the law accorded with rules of international trade, and China would not close the door on foreign companies.

"They believe that [phrases such as] secure and independent control, secure and reliable, that these are signs of trade protectionism. That they are synonymous. This is a kind of misunderstanding, a kind of prejudice," Zhao said.

China's foreign ministry spokesman Lu Kang told a regular press briefing that the law was similar to other countries' rules and did not distinguish between foreign and Chinese companies.

Many of the provisions had been previously applied in practice, but their formal codification coincides with China's adoption of a series of other regulations on national security and foreign civil society groups.

The law's adoption comes amid a broad crackdown by President Xi Jinping on civil society, including rights lawyers and the media, which critics say is meant to quash dissent.

Last year, Beijing adopted a sweeping national security law that aimed to make all key network infrastructure and information systems "secure and controllable".

"China's government has come to recognise that cyberspace immediately and profoundly impacts on many if not all aspects of national security," said Rogier Creemers, a researcher in the law and governance of China at Leiden University in the Netherlands.

"It is a national space, it is a space for military action, for important economic action, for criminal action and for espionage," he said.

Xinhua News Agency
China adopts law on cybersecurity
Monday, 07 November 2016
Byline: Staff reporter

Beijing - China's top legislature on Monday adopted a Cybersecurity Law to safeguard sovereignty on cyber space, national security and the rights of citizens.
The government will take measures to "monitor, defend and handle cybersecurity risks and threats originating from within the country or overseas sources, protecting key information infrastructure from attack,intrusion, disturbance and damage," the law reads.

Efforts will also be made to punish criminal activities online and safeguard the order and security of cyberspace.

Individual users and organizations are not allowed to jeopardize security on the Internet or use it to "damage national security, honor and interests," according to the provisions.

Online activities that are attempts to overthrow the socialist system, split the nation, undermine national unity, advocate terrorism and extremism are all prohibited, according to the provisions, which also forbade activities including inciting ethnic hatred, discrimination and spreading violence and obscene information online.

The law was passed at the bimonthly session of the National People's Congress (NPC) Standing Committee, which concluded Monday, after a third reading.

Canberra Times
Spy fear over China link to NBN Component builder linked to Party
Sunday, 06 November 2016
Byline: Richard Baker and Nick McKenzie

Canberra - More than 1 million Australian homes and businesses have been connected to the National Broadband Network by components made in a Shanghai factory controlled by China's Communist Party. The revelation comes at a time when China is suspected of mounting massive cyber-espionage attacks on Australia and after successive Labor and Coalition governments banned Chinese company Huawei from NBN involvement on security grounds. Fairfax Media has confirmed that NBN contractor, France's Alcatel- Lucent, used its Shanghai-based subsidiary to make fibre optical and copper components used to link homes and businesses to the network. Archived webpages of Alcatel-

Lucent Shanghai Bell show the Chinese subsidiary to be part- owned by the Chinese government and clearly under the control of the country's Communist Party, despite the French holding a majority stake by one share. To celebrate November 2012's 18th Chinese Communist Party National Congress, Alcatel-Lucent's Shanghai arm boasted it would "carry out the Party's mass line educational practice" and "ensure oversight party and state policies in the enterprise implementation execution". "Shanghai Bell will ... create a new situation in the socialist cause," the website declared. "The company will follow the higher deployment, under the leadership of party committees at all levels of the party syndicalist organisation." Alcatel-Lucent won the $1.5 billion NBN supply contract in 2010. But the origin of its components has never been disclosed, with NBN Co stating only that "the active equipment is manufactured in large-scale electronics facilities offshore". China has been accused as the culprit in recent major cyber- attacks on Australian agencies, including the Bureau of Meteorology. In response, the Turnbull government announced in April a $230 million national cyber security strategy. The government declined to answer specific questions about the extent of the Chinese-made components in the NBN or whether Australia had security-tested products

sourced from the Shanghai factory. A spokeswoman for Communications Minister Mitch Fifield said the government was "confident that NBN Co has robust measures in place to identify and mitigate security threats, including potential supply chain risks". The importance of security testing telecommunications components was highlighted in a recent private address by one of America's top cyber security officials, National Security Agency deputy national manager Curtis Dukes. Fairfax Media has obtained a transcript of Mr Dukes' remarks to the American Enterprise Institute last month in which he said all "foreign-developed kit" should be tested for spying implants.

Mr Dukes also said he did not support the ban on Huawei so long as it agreed for its products to be tested. However, Fairfax Media has confirmed that the federal government has no intention of reviewing its ban on Huawei. The full story behind Australia's decision to block Huawei is not known. However, US embassy cables leaked by WikiLeaks show that as far back as 2008 Australian intelligence agencies were worried about Huawei and its links to China's military. Huawei, which has tried to alter this perception by appointing former senior Australian politicians such as Alexander Downer and John Brumby to its local boards, was founded by former People's Liberation Army engineer Ren Zhengfei. Appointment of figures such as Mr Downer and Mr Brumby aimed to bolster the company's credentials.

The Democratic National Committee Has Told the FBI It Found Evidence Its HQ Was Bugged
Saturday, 05 November 2016
Byline: David Corn

Washington - In an episode reminiscent of Watergate, the Democratic Party recently informed the FBI that it had collected evidence suggesting its Washington headquarters had been bugged, according to two Democratic National Committee officials who asked not to be named.

In September, according to these sources, the DNC hired a firm to conduct an electronic sweep of its offices. After Russian hackers had penetrated its email system and those of other Democratic targets, DNC officials believed it was prudent to scrutinize their offices. This examination found nothing unusual.

In late October, after conservative activist James O'Keefe released a new set of hidden-camera videos targeting Democrats, interim party chairwoman Donna Brazile ordered up another sweep. There was a concern that Republican foes might have infiltrated the DNC offices, where volunteers were reporting to work on phone banks and other election activities. (For some of their actions, O'Keefe and his crew have used people posing as volunteers to gain access to Democratic outfits.)

The second sweep, according to the Democratic officials, found a radio signal near the chairman's office that indicated there might be a listening device outside the office. "We were told that this was something that could pick up calls from cellphones," a DNC official says. "The guys who did the sweep said it was a strong indication." No device was recovered. No possible culprits were identified.

The DNC sent a report with the technical details to the FBI, according to the DNC officials. "We believe it's been given by the bureau to another agency with three letters to examine," the DNC official says. "We're not supposed to talk about it."

A Democratic consultant who has done work for the DNC, who asked not to be identified, says he was recently informed about the suspected bugging.

The DNC officials will not say what countermeasures were subsequently taken. "As a general policy, we don't talk about such efforts," the other DNC official says. But this official adds, "You have to take all of this incredibly seriously." The first DNC official notes, "We are the oldest political party in this country, and we are under constant attack from Russia and/or maybe others."

Adam Hodge, a spokesman for the DNC, says, "The DNC is not going to comment on stories about its security. In all security matters, we cooperate fully with the appropriate law enforcement agencies and take all necessary steps to protect the committee and the safety and security of our staff."

The FBI did not respond to a request for comment.

CBC.CA
Why hackers might be drawn to your smart light bulbs
Saturday, 05 November 2016
Byline: Natalie Dobbin

Halifax - The technology that can turn on the lights in your home with a simple swipe on your smartphone may seem really cool. Thing is, hackers could have their eye on the same thing.

New research by Dalhousie University PhD student Colin O'Flynn and colleagues in Israel has found smart bulbs could be susceptible to infiltration -- so much so that lights in a household, or even an apartment building outfitted with the technology, could be taken over by hackers.

The researchers have released a draft paper, which hasn't yet been published in a journal or peer-reviewed, that details a study of Philips Hue lamps, which use LED light bulbs operated through apps.

O'Flynn, who studies in the department of electrical and computer engineering at Dalhousie, said the study looked at two things: "Can you reprogram it? Can you make it do bad things?"

The answers were yes and yes, according to the research.

Lights out

The researchers drove around their campus, the Weizmann Institute of Science in Israel, and controlled lights along the route, making them blink SOS in Morse code. They also flew a drone, with an attached device, over office buildings.

O'Flynn and his colleagues were able to make the bulbs talk to each other, which means it was possible to create a widespread viral infection.

Someone could program their light bulb to turn off their neighbour's, for instance. The range of a virus could be from 30 to about 400 metres, O'Flynn said.

"What happens if it's a big city and these are really popular?" O'Flynn said on CBC's Information Morning. "Maybe somewhere like San Francisco that might have a whole apartment building where a lot of people have these bulbs. Could you turn off a whole building? Could you do other stuff with them?"

No virus, company says

In a statement, Philips said its bulbs have not been infected by any virus and that it moved to patch a potential vulnerability when notified of it by the researchers last summer.

"The academics with whom we co-operated via our responsible disclosure process merely demonstrated the possibility of an attack," the statement said.

"They did not create a virus nor disclose information necessary for someone else to do so. Their research findings helped us to develop and roll out the software update."

The company recommends customers install the update using the Philips Hue app.

The internet of things

There are many devices, from thermostats to security cameras, that are now part of "the internet of things," which means they connect to the web and can be accessed through a smartphone.

One little device can be used to get into another, O'Flynn said.

Recently, hackers crippled Dyn Inc., a major U.S. internet firm, which disrupted the availability of popular websites including Twitter, Netflix and PayPal.

A group claiming to be responsible for the attack said it organized networks of connected devices to create a massive botnet that threw 1.2 trillion bits of data every second at Dyn's servers, overwhelming the targeted machines.

Internet of things industry puts all at risk, experts say

Consumer pressure

Items like smartphones or even a fridge have the potential to be affected, O'Flynn said.

"Maybe from this smart bulb you could get into a wireless thermostat. From that you can get onto some other network," O'Flynn said.

He said there are solutions, but they cost companies money and time.

"It's really up to consumers to push the manufacturers," O'Flynn said. "The only reason they won't put good money into security is people don't ask for it."

The FBI looks like Trump's America
Saturday, 05 November 2016
Byline: Josh Zeithz

Washington - The typical Federal Bureau of Investigation special agent is white, male, and middle-aged, often with a military background -- in short, drawn from the segment of the U.S. population most likely to support GOP nominee Donald Trump.
That demographic reality explains much of the heat FBI Director James Comey is taking from his own work force at the moment for his handling of the Hillary Clinton email investigation and inquiries into the Clinton Foundation.

Days before the presidential election, FBI finds itself at the center of a political maelstrom, with Comey being sharply criticized by Democratic presidential nominee Hillary Clinton and even President Barack Obama, who've faulted the FBI director for going public with word of new evidence in the Clinton email probe.

That furor has exposed dissension in the FBI's ranks, prompting a flurry of leaks about alleged efforts to impede the Clinton-related inquiries and exposing lingering anger among agents about Comey's July decision not to recommend any charges in the email probe.

Incendiary, politically charged remarks from former FBI officials -- with one prominent ex-FBI leader publicly calling the Clintons a "crime family" -- are also endangering the law enforcement agency's reputation for sober, nonpartisan investigation.

Largely overlooked in the imbroglio is how the fact that the FBI doesn't look much like America is complicating Comey's effort to extricate himself and his agency from the political firestorm.

According to numbers from August, 67 percent of FBI agents are white men. Fewer than 20 percent are women. The number of African-American agents hovers around 4.5 percent, with Asian-Americans about the same and Latinos at about 6.5 percent.

If Trump were running for president with an electorate that looked like that, he'd win in a landslide.

"The bureau does tend to be more conservative than people you see in the general populace. It's a natural outgrowth of the demographics. ... That's just math, " said retired agent Emmanuel Johnson, one of several African-American agents who sued the FBI for racial discrimination in the 1990s. "What's troubling is you look at the same population groups they were having trouble [recruiting] 20, 30, 40 years ago and they're having the same trouble today."

Comey has publicly insisted that his agents are apolitical. Asked last year whether politics might color the FBI's handling of the Clinton email investigation, the FBI chief was indignant.

"If you know my folks, you know they don't give a rip about politics," Comey told reporters.

But with numerous leaks from inside the bureau in the final weeks of the presidential race and some prominent former officials denouncing Hillary Clinton and former President Bill Clinton in scathing terms, the FBI chief's assurances that the bureau is completely untainted by politics are in doubt.

"The Clintons: That's a crime family, basically. It's like organized crime," former FBI Assistant Director James Kallstrom said on New York radio station WNYM-AM on Sunday. "I mean the Clinton Foundation is a cesspool. We don't have enough time to talk about the things they've done, screwing people and the public in general. It's just outrageous how Hillary Clinton sold her office for money. And she's a pathological liar and she's always been a liar."

"The agents are furious with what's going on. I know that for a fact," Kallstrom added.

Other ex-FBI officials confirm an uproar in the ranks.

"The stuff about a rebellion going on inside the bureau is absolutely true, but that's not going to influence his decision," one former top bureau official said of Comey, while expressing doubt such concerns played a role in his decisions on the Clinton email case or about informing Congress of new developments, as he did last Friday.

"He loves his troops, but it's not a fair judgment that that's why he did it," said the ex-official, who asked not to be named.

Current FBI officials also insist that Comey's decisions on the Clinton email probe, recommending its closure without charges in July and telling Congress about new evidence last week, were made without any eye to politics.

However, it's clear that the FBI director has felt an unusual need to explain those moves to his own work force, perhaps detecting deep skepticism. The director has sent two agencywide memos defending his handling of the email mess.

"The case itself was not a cliff-hanger; despite all the chest-beating by people no longer in government, there really wasn't a prosecutable case," Comey wrote in a two-page memo to FBI personnel in September explaining the agency's conclusions in the case. He seemed to acknowledge that he was getting grief about the decision from former FBI agents he had met around the country.

When Comey decided last Friday to notify Congress about new evidence in the Clinton email probe, he also fired off a two-paragraph letter to all hands, acknowledging that the move was sure to stir controversy.

"We don't ordinarily tell Congress about ongoing investigations, but here I feel an obligation to do so given that I testified repeatedly in recent months that our investigation was completed," the director wrote. "In trying to strike that balance, in a brief letter and in the middle of an election season, there is significant risk of being misunderstood, but I wanted you to hear directly from me about it."

Some former FBI officials saw the messages as an acknowledgement that the FBI's rank-and-file were suspicious of the decisions being made at the top.

"I think Comey saw he was losing the agents," former FBI agent Ivian Smith said.

Another sign of such trouble: a steady stream of leaks out of the bureau, many of them apparently coming from New York-based agents unhappy with decisions to keep an investigation into the Clinton Foundation in low gear.

"The insurrections usually come out of the New York office," Smith observed.

Another former official said the trouble for Comey began with his early July press statement, in which he was sharply critical of Clinton, then said there were would be no charges. That confused many inside the bureau.

"I think they looked at it and said what he laid out in his July 5 press conference was ample information that they had specific violations of federal law," said former FBI assistant director Tom Fuentes. "When I talked to other people watching that, I thought, he's actually going to recommend the charge. When he didn't ... there were some in the ranks who were concerned about why."

Fuentes blames part of Comey's predicament on the unusual partial recusal Attorney General Loretta Lynch made after holding a meeting with President Bill Clinton on an airplane tarmac in Phoenix in June. She later said she'd defer to career prosecutors and the FBI on the case. That put an unusual degree of weight on the FBI chief in a highly politically-charged case, the former official said.

Fuentes also said he's worried that the current flurry of charges and countercharges could damage the FBI's credibility not just domestically, but around the world, where the agency is seen as the gold standard for detached, professional law enforcement.

"I think it's a possibility people are going to think the FBI is totally politicized," Fuentes said. "When you have people saying the FBI has either been corrupted or is incompetent or both, that is serious stuff."

An FBI spokesperson declined to comment for this story.

However, one FBI official noted that Comey sends agencywide messages on a variety of topics and added that the Clinton probe-related messages only seemed unusual in large part because Comey's decision to make a public statement about a case where no charges were filed was an unusual one.

The typical Federal Bureau of Investigation special agent is white, male, and middle-aged, often with a military background -- in short, drawn from the segment of the U.S. population most likely to support GOP nominee Donald Trump.

That demographic reality explains much of the heat FBI Director James Comey is taking from his own work force at the moment for his handling of the Hillary Clinton email investigation and inquiries into the Clinton Foundation.

Days before the presidential election, FBI finds itself at the center of a political maelstrom, with Comey being sharply criticized by Democratic presidential nominee Hillary Clinton and even President Barack Obama, who've faulted the FBI director for going public with word of new evidence in the Clinton email probe.

That furor has exposed dissension in the FBI's ranks, prompting a flurry of leaks about alleged efforts to impede the Clinton- related inquiries and exposing lingering anger among agents about Comey's July decision not to recommend any charges in the email probe.

Incendiary, politically charged remarks from former FBI officials -- with one prominent ex-FBI leader publicly calling the Clintons a "crime family" -- are also endangering the law enforcement agency's reputation for sober, nonpartisan investigation.

Largely overlooked in the imbroglio is how the fact that the FBI doesn't look much like America is complicating Comey's effort to extricate himself and his agency from the political firestorm.

According to numbers from August, 67 percent of FBI agents are white men. Fewer than 20 percent are women. The number of African-American agents hovers around 4.5 percent, with Asian-Americans about the same and Latinos at about 6.5 percent.

If Trump were running for president with an electorate that looked like that, he'd win in a landslide.

"The bureau does tend to be more conservative than people you see in the general populace. It's a natural outgrowth of the demographics. ... That's just math, " said retired agent Emmanuel Johnson, one of several African-American agents who sued the FBI for racial discrimination in the 1990s. "What's troubling is you look at the same population groups they were having trouble [recruiting] 20, 30, 40 years ago and they're having the same trouble today."

Comey has publicly insisted that his agents are apolitical. Asked last year whether politics might color the FBI's handling of the Clinton email investigation, the FBI chief was indignant.

"If you know my folks, you know they don't give a rip about politics," Comey told reporters.

But with numerous leaks from inside the bureau in the final weeks of the presidential race and some prominent former officials denouncing Hillary Clinton and former President Bill Clinton in scathing terms, the FBI chief's assurances that the bureau is completely untainted by politics are in doubt.

"The Clintons: That's a crime family, basically. It's like organized crime," former FBI Assistant Director James Kallstrom said on New York radio station WNYM-AM on Sunday. "I mean the Clinton Foundation is a cesspool. We don't have enough time to talk about the things they've done, screwing people and the public in general. It's just outrageous how Hillary Clinton sold her office for money. And she's a pathological liar and she's always been a liar."

"The stuff about a rebellion going on inside the bureau is absolutely true, but that's not going to influence his decision," one former top bureau official said of Comey, while expressing doubt such concerns played a role in his decisions on the Clinton email case or about informing Congress of new developments, as he did last Friday.

"He loves his troops, but it's not a fair judgment that that's why he did it," said the ex-official, who asked not to be named.

Current FBI officials also insist that Comey's decisions on the Clinton email probe, recommending its closure without charges in July and telling Congress about new evidence last week, were made without any eye to politics.

However, it's clear that the FBI director has felt an unusual need to explain those moves to his own work force, perhaps detecting deep skepticism. The director has sent two agencywide memos defending his handling of the email mess.

"The case itself was not a cliff-hanger; despite all the chest-beating by people no longer in government, there really wasn't a prosecutable case," Comey wrote in a two-page memo to FBI personnel in September explaining the agency's conclusions in the case. He seemed to acknowledge that he was getting grief about the decision from former FBI agents he had met around the country.

When Comey decided last Friday to notify Congress about new evidence in the Clinton email probe, he also fired off a two-paragraph letter to all hands, acknowledging that the move was sure to stir controversy.

"We don't ordinarily tell Congress about ongoing investigations, but here I feel an obligation to do so given that I testified repeatedly in recent months that our investigation was completed," the director wrote. "In trying to strike that balance, in a brief letter and in the middle of an election season, there is significant risk of being misunderstood, but I wanted you to hear directly from me about it."

Some former FBI officials saw the messages as an acknowledgement that the FBI's rank-and-file were suspicious of the decisions being made at the top.

Another sign of such trouble: a steady stream of leaks out of the bureau, many of them apparently coming from New York-based agents unhappy with decisions to keep an investigation into the Clinton Foundation in low gear.

"The insurrections usually come out of the New York office," Smith observed.

Another former official said the trouble for Comey began with his early July press statement, in which he was sharply critical of Clinton, then said there were would be no charges. That confused many inside the bureau.

"I think they looked at it and said what he laid out in his July 5 press conference was ample information that they had specific violations of federal law," said former FBI assistant director Tom Fuentes. "When I talked to other people watching that, I thought, he's actually going to recommend the charge. When he didn't ... there were some in the ranks who were concerned about why."

Fuentes blames part of Comey's predicament on the unusual partial recusal Attorney General Loretta Lynch made after holding a meeting with President Bill Clinton on an airplane tarmac in Phoenix in June. She later said she'd defer to career prosecutors and the FBI on the case. That put an unusual degree of weight on the FBI chief in a highly politically-charged case, the former official said.

Fuentes also said he's worried that the current flurry of charges and countercharges could damage the FBI's credibility not just domestically, but around the world, where the agency is seen as the gold standard for detached, professional law enforcement.

"I think it's a possibility people are going to think the FBI is totally politicized," Fuentes said. "When you have people saying the FBI has either been corrupted or is incompetent or both, that is serious stuff."

An FBI spokesperson declined to comment for this story.

However, one FBI official noted that Comey sends agencywide messages on a variety of topics and added that the Clinton probe-related messages only seemed unusual in large part because Comey's decision to make a public statement about a case where no charges were filed was an unusual one.

At a House Judiciary Committee hearing in September, Comey insisted he was unaware that the decision to conclude the Clinton email probe without recommending charges had caused any backlash within the bureau. He also seemed personally pained by the suggestion.

"This has provoked some controversy within the ranks of current and former agents?" Rep. Ron DeSantis (R-Fla.) asked.

"Not within the FBI. Again, who knows what people don't tell the director," Comey replied. "If there are agents in the FBI who are concerned or confused about this, please contact me. We will get you the transparency you need to see that your brothers and sisters did this the way you would want them to."

Told that some agents believed a decision was made not to prosecute Clinton even before her July 2 interview at FBI headquarters, Comey seemed troubled.

"If colleagues of ours believe I am lying about when I made this decision, please urge them to contact me privately, so we can have a conversation about this."

Now, there's little doubt that Comey finds himself caught in the middle, under fire from the left and the right, as well as some in his own organization.

While the FBI director has been mounting an aggressive drive to focus on the FBI's shortcomings in diversity, it's less clear if he anticipated how the make-up of his own work force would complicate the handling politically polarizing investigations.

However, he has described the demographic challenges in stark, urgent terms.

"We have a crisis in the FBI and it is this: slowly but steadily over the last decade or more, the percentage of special agents in the FBI who are white has been growing, ... We are now 83 percent white in our special agent cadre," the FBI director said in a July speech at historically black Bethune-Cookman University in Daytona Beach. "I've got nothing against white people -- especially tall, awkward, male white people -- but that is a crisis for reasons that you get and that I've worked very hard to make sure the entire FBI understands. That is a path to fall down a flight of stairs."

For the embattled FBI chief and former prosecutor, there is some good news. There are early signs that his focus on diversity -- which includes displaying a rainbow flag on the FBI's recruiting website -- may be paying off.

The number of African-American agents climbed to 603 in August, up from 581 in March. However, both numbers are lower than the 652 the bureau had four years ago.

The number of Latinos also ticked up slightly, to 888 from 882 in March, but still well below the 983 the FBI had in 2012.

Comey has said he doesn't want to "jinx" himself, but believes the decline in minority agents is being reversed.

"I will have failed if I don't change this. And I have a good feeling it's already changing," he said in July. "I don't want to jinx it ... but we're making progress. People are understanding: It's not just 'the man.'"

Straits Times
S'pore can be model for cyber security
Saturday, 05 November 2016
Byline: Lim Yan Liang

Singapore has a chance to lead by example in its push to get cyber security right, said a visiting former cyber security official from the United States.
As a country aspiring to be a smart nation, Singapore can demonstrate how to build a resilient national critical information infrastructure needed to leverage technology and data, said Mr Sean Kanuck, formerly the most senior cyber security official at the US Office of the Director of National Intelligence.

"Countries around the world, and especially in your neighbourhood, will be looking at the Singapore model, and, hopefully when it's successful, copying parts of it," said Mr Kanuck, who is now a lawyer.

He noted that a comprehensive national cyber security strategy launched last month by Singapore outlines its long-term approach to securing its cyberspace and critical infrastructure against attacks.

At the same time, the strategy also looks into nurturing a home- grown infocomm technology (ICT) sector capable of generating its own valuable intellectual property.

Mr Kanuck said Singapore needs to be more engaged in international discussions on cyber issues if it aims to shape such norms.

He called Singapore's Cyber Security Agency a "great step forward" as it focuses government expertise in thinking about long-term cyber- related issues.

But even as the agency gets to work translating the national strategy into actionable goals - such as boosting talent to fill an estimated 30,000 new ICT jobs that will be created here by 2020 - it needs to stay alert.

"It has to be dynamic and adaptive because the threats it is dealing with are also very dynamic and adaptive," he said.

To stay abreast of innovation in the technology sector, the government has to keep up an active discussion with private sector technology companies, he said.

With eye on China, Japan ramps up presence in Asean

Electoral chaos in West being sowed to safeguard Putin's hold on power, Kremlin watchers say
Sunday, 06 November 2016
Byline: Alan Cullison

Washington - A Russian-backed hacking effort that has rocked the presidential campaign may peak on Election Day, but is likely to continue next year and into 2018 as Moscow seeks to influence U.S. politics and key elections in Europe, Obama administration officials warn.

Russian meddling, in fact, may become more potent in Europe than in the U.S., White House officials and other experts say, because Moscow has long courted political figures there, and has forged ties with euroskeptic political parties strengthened by the recent influx of migrants and refugees.

Upcoming contests in Europe include Dutch elections in March, French presidential elections in April and May, and German elections in the fall. Moscow is hoping that gains by

Kremlin-friendly parties like France's National Front could help Russia break free of some of the diplomatic isolation and sanctions imposed on Moscow after its seizure of the Ukrainian peninsula of Crimea in 2014, Kremlin watchers say.

"The German elections, the French elections and other elections in the coming year all have big geopolitical implications for Russia," said Pasi Eronen, Russia project researcher at the Foundation for Defense of Democracies, a Washington-based think tank.

Although large-scale interference from the Kremlin is relatively new to the U.S., Mr. Eronen said Russia has been active in Europe for the past two years with hacking and disinformation campaigns designed to weaken those the Kremlin considers to be political rivals.

Officials say that even if Russia fails to elect its own allies in European elections next year, the sustained meddling in the U.S. and Europe will serve a long-term Kremlin goal--namely, to put Russian President Vladimir Putin's perceived foes in the West in disarray, making it easier for him to safely reseat himself as Russian president when his country holds elections in 2018.

U.S. and European observers have criticized previous elections under Mr. Putin as rigged and marred by obvious fraud--criticism that Mr. Putin has described as a veiled attempt to overthrow him.

Mr. Putin hopes to inoculate himself against such criticism by sowing so much chaos in U.S. and European elections before then that Western leaders will be too preoccupied with domestic problems to spend much effort criticizing the Russian poll, one senior White House official said.

By hacking and dumping emails, Russia is trying "to denigrate the American electoral system, to make it look chaotic, make it look manipulable, make it look subject to intrusion, cheating and vulnerable so you can't trust it...to make us look no better than the Russian electoral system," the official said.

If the West criticizes Putin's re-election in 2018, Russia's response will be, "'Yeah, you're not so good either,'" the White House official said, calling the Russian strategy "a long-term challenge that the United States is going to have to deal with and probably other countries, including those in Europe, [will have] to take seriously."

Russia has dismissed allegations that it has tried to influence elections outside its borders or that it has anything to do with the hacking of Democratic Party emails this year. But senior U.S. intelligence officials

have said repeatedly they are convinced the Russian government stole and then leaked emails in an effort to interfere with the U.S. elections.

They say that conclusion is based on digital evidence left behind in the hacks and the way the information was leaked, which closely mirrors how Russia has tried to interfere in previous elections in Europe. Although the hacks into Democratic Party computer systems were performed months ago, the data was parceled out in the past few weeks on the eve of voting, apparently when it would have maximum impact.

Because Moscow is more likely trying to disrupt U.S. politics than to elect any specific candidate, more emails may be dumped after the elections, said Tom Graham, managing director of Kissinger Associates in New York and former White House adviser on Russia to President George W. Bush.

"The national nightmare might only be beginning," he said.

If Hillary Clinton prevails in the vote, the Russians may choose to dump more information about her afterward to raise a clamor for impeachment proceedings, Mr. Graham said. Or the Kremlin may hang on to some particularly damaging information and privately show it to the White House in a blackmail attempt, he said.

Cyberexperts say attempts to hack into the computer systems of several German political parties this summer were likely a harbinger for similar problems for Europe. German counterespionage officials informed two political parties and the lower house of parliament in September that some of their email inboxes had been targeted by hackers with apparent ties to a foreign intelligence agency.

The group German officials identified as responsible for the attack, APT28, was also tied by investigators to the U.S. hacks as well as cyberattacks last year on a French-language TV broadcaster and the German lower house of parliament, which forced the legislature to shut down its computer system for several days.

Germany's domestic intelligence agency said the hacking group appeared to be "steered by the Russian state."

GCHQ wants internet providers to rewrite systems to block hackers
Sunday, 06 November 2016
Byline: Cara McGoogan

London - GCHQ is urging internet providers to change long-standing protocols to help prevent computers being used to set off large-scale cyber attacks.

The Government's cyber-defence arm said it plans to work with networks such as BT and Virgin Media to rewrite internet standards to restrict "spoofing" - a technique that allows hackers to impersonate other computers and manipulate them to carry out anonymous attacks.

"Distributed denial of service" (DDoS) attacks, which employ this method, have been used in numerous high-profile incidents in the past fortnight, including an unprecedented hack that brought down Netflix, eBay and hundreds more popular websites.

"We think we can get to a point where we can say a UK machine can't participate in a DDoS attack," Ian Levy, GCHQ's National Cyber Security Centre, told The Sunday Telegraph.

"We think that we can fix the underpinning infrastructure of the internet through implementation changes with ISPs and CSPs [communications service providers]."

The plan would involve changes to the Border Gateway Protocol (BGP) and Signalling System 7 (SS7) standards that are widely used for routing traffic. GCHQ wants providers to stop the trivial rerouting of UK traffic and to help prevent text message scams.

The Internet Service Providers Association (ISPA) expressed scepticism, saying GCHQ was applying a "we can fix it - it's easy" approach to a complex, historic system.

James Blessing, of ISPA, said internet providers are working on their own fixes for such insecurities. But he said the complex nature of the technology makes it a time-consuming process.

US braces for Russian cyber attacks
Sunday, 06 November 2016

Washington - Sixteen years after technical incompetence was blamed for the first inconclusive presidential election in US history, the very opposite of it, namely, technical competence, is shaping up to be the key to next Tuesday's contest between Democrat Hillary Clinton and Republican Donald Trump for the White House.
American intelligence officials are bracing for cyber disruption of the presidential poll by Russia and deploying all the technological resources at their command to prevent such a catastrophe.

While these officials do not expect Russian state-sponsored hackers to throw the entire poll process out of gear on or before Tuesday, cyber experts at the US National Intelligence Agency anticipate that Moscow will meddle with voting systems in states which do not have state-of-the art technology deployed in polling booths.

The Russian objective, they believe, is to create enough doubts among the American public about a rigged election that will persuade Trump supporters to cry foul and question the legitimacy of the outcome if Clinton is declared the winner on the basis of returns notwithstanding allegations of foul play.

That Trump has constantly alleged rigging by the establishment - both in his own party and by Washington vested interests as well as Democrats - to prevent him going to the White House will be interpreted as sanction to Republican supporters to protest or take to the streets on election night to challenge the result.

James Clapper, the director of National Intelligence and Jeh Johnson, director of the department of homeland security, have issued statements that they are convinced the recent election-related hackings of the American cyber systems have been authorised by "Russia's senior most officials". That is a euphemism for Russian President Vladimir Putin.

That the two officials issued a formal statement alleging Russian state meddling in the American poll process was in itself unusual. The move is also being seen here as "anticipatory bail" by the two vulnerable officials if there are allegations on election night or afterwards that the US intelligence apparatus was caught napping.

If Russia's state-sponsored hackers succeed in calling into question voting in battleground states on Tuesday sowing doubts among Americans about the poll process, it would be payback time for Putin.

Successive American Presidents have used a variety of means to undermine Russia's own nascent democracy and repeatedly cast doubts worldwide about Putin's victories - both his own and elections to Russia's legislature, the Duma.

The Americans tried and failed in the past to trigger a "colour revolution" in Moscow's Red Square aimed at unseating Putin. Similarly, US dirty tricks were behind colour revolutions in both Ukraine and Georgia as well as some former Soviet Central Asian republics to weaken Moscow's hold on these countries or disrupt Russian strategic interests there.

Naturally, Putin feels justified in disrupting American elections and casting doubts about the legitimacy of polls in what Americans never tire of trumpeting as the world's oldest democracy.

Putin is unlikely to get another chance at doing this. Not with such ease, at any rate because Trump's personality and political strategy offer fertile ground to put the Russian plans - if US and European allegations are true - into practice.

Trump has been given intelligence briefings with details of what American agencies have gathered about Russian hacking of US election-related websites. But he has chosen not to believe these briefings and has publicly exonerated Putin of any association with the alleged Russian efforts.

Presidential candidates in the US receive top secret intelligence briefings once the major parties formally nominate them as candidates at their national conventions.

Hillary Clinton has also received the same briefings which have been given to Trump, but she has subsequently accused Russia of complicity in the hacking. If Clinton and Trump had stood together and thrown their weight jointly against alleged Russian meddling in US elections, the ground would have been less fertile for the Russians. The hacking has so far resulted in considerable political casualties this election season.

The damage has almost entirely been to Democrats. The party lost its head of the National Committee, Congresswoman Debbie Wasserman Schultz: her equivalent in the BJP would be Amit Shah, the party president.

It has exposed serious failings by Clinton's campaign manager, John Podesta, and sowed mistrust all round within the Democratic party, especially between Clinton and her main rival in the primaries, Senator Bernie Sanders, after the two patched up and agreed to work together. American intelligence is said to have favoured surgical strikes against Russian websites in retaliation, but sources here said President Barack Obama vetoed those plans.

Obama feared that a cyber war against Russia at this stage would only embolden Moscow to do in the open what its cyber warriors are said to have been doing in private so far. Obama's priority is to see through the elections peacefully in the knowledge that the Russians have the capacity to disrupt them if they chose to.

New York Times
A Muted Alarm Bell Over Russian Election Hacking
Sunday, 06 November 2016
Byline: Liz Spayd

Comment: Last winter, as primary voters in Iowa and New Hampshire headed to the polls, a covert and cunning Russian plot was underway to disrupt the American political process. With aliases like Guccifer 2.0 and Fancy Bear, Russian hackers were targeting critical computer systems.
In June, they struck, hitting the Democratic Party, and by July its chairman was ousted in the fallout. Soon embarrassing emails were spilling from the computers of Hillary Clinton and her staff. Republican officials were hit, too. So was the National Security Agency. Now, hackers are meddling with the voting systems in several states, leaving local officials on high alert. Come Election Day, they'll find out what, if anything, the cyberspies have in store.

This is an act of foreign interference in an American election on a scale we've never seen, yet on most days it has been the also-ran of media coverage, including at The New York Times.

The emails themselves -- exposing the underside of the Democratic political machinery, and the conflicts, misjudgments and embarrassing communications of its top ranks -- have received bountiful attention. What rarely makes the main narrative is the spy-versus-spy cyberwarfare: the tactics, the players and the government efforts to tame it. In a calamitous campaign unlike any in memory, it's not surprising that other story lines get squeezed out. But one of the most chilling chapters of this election is the role of Russian intelligence and the growing threat of digital espionage. With days to go, readers have been shortchanged on this part of history.

The email dumps and the hacking have posed challenges for the press, requiring tough calls on news judgment and ethical standards. Some of the emails were personal communications between family and friends, and some contained gossipy exchanges. How does The Times balance the right to privacy against the public interest?

And then there is the unease that comes with feeling used by a foreign superpower. How does the paper avoid becoming an amplifier for a plot that needs the media to work? How does it verify the accuracy of several thousand illegally obtained emails? And most critically, what has it done to try to establish whether Donald Trump was colluding with Russian intelligence, as Clinton suggests?

Considering the journalistic swamp, The Times acquitted itself well on some of these questions. Editors restrained themselves from publishing every email, avoiding the reckless decisions of that some news outlets made. And The Times made reasonable attempts to determine the accuracy of the emails -- though when solid verification couldn't be had, it went with its gut.

Carolyn Ryan, the political editor, acknowledges the challenges when the provenance of information is so suspect. "We do not want anyone, including hackers, to dictate the news cycle in this campaign, or determine what we cover," she said. "We have been restrained."

History will judge The Times's institutional commitment to reporting on the actual foreign intervention less favorably, I suspect. The team in Washington produced commendable, competitive work on an exceptionally difficult reporting target. Led by David Sanger, The Times was first to link the Russians to the hacks, to examine the baffling role of Julian Assange and WikiLeaks and to smartly explore the options that the Obama administration could use to retaliate. I have no substantive complaints about the stories The Times has done.

What was missing is a sense that this coverage is actually important. After The Washington Post broke the story that the Democratic National Committee had been hacked, The Times came back with its own solid piece, but it didn't crack the front page and it earned only a modest mention on the home page. A piece laying out evidence that the Russians may be trying to falsify voting results in state databases ran on A15 and got minimal play digitally. Another on Vice President Joseph R. Biden Jr. signaling that the White House was prepared to order a rare covert cyberattack against Russian found a home on page A19.

What's more, while several reporters have periodically contributed to the coverage, no one was dedicated to it full time. That's too bad. In my view, The Times should have assembled a strike force and given it a mandate to make this story its top priority. You can tell from the outside when the newsroom is turbocharged by a story. The latest coverage of the F.B.I. director, James Comey, is one example. Industrial-scale cybercrime, it appears, is not.

Turbocharged coverage might have led readers inside the cloak-and-dagger underworld of the hackers and the hacked. It might have more fully explored the government lapses in protecting information systems. And it could have told readers more about the effort to uncoil Trump's involvement, if any, in the hacking. When you think about it, there are few more crucial assertions than whether a possible occupant of the White House participated in an act of espionage against his country.

Many readers have raised concerns. Jack Archer, a resident of Oakland, Calif., asks: "If reports of ties between Trump and the Russians are accurate, and several of them are, as we now know, why is The Times ignoring what is potentially the most important story about presidential politics in how long? In your and my lifetime, at least."

The Times finally weighed in on this question last week, concluding that there is no compelling evidence linking Trump to the hackers. The piece, which ran on A21 and down page on the website, appeared to have been in the works for some time. Yet it was published just seven days before the election, and was unsatisfying in exploring the back story that led to its conclusions.

I asked Sanger, a highly knowledgeable and seasoned hand on matters of cyberwarfare, about the challenges in covering information hacks. "American drone strikes and Russians bombing a hospital in Syria are immediate, gripping, tragic human stories," he said. "A cyberstrike, by nature, is subtle, its effects often hidden for months, its importance usually a mystery. The bigger story here is that a foreign power has inserted itself in the fundamental underpinnings of American democracy using cybertechniques. We've never seen that before."

That sounds like a pretty powerful argument for all-hands-on-deck coverage. After all, Trump's treatment of women, Clinton's email servers, the foundations of each candidate -- all of it will soon fade out. The cyberwar, on the other hand, is only getting started.

The Guardian (London)
Invasion of the troll armies: from Russian Trump supporters to Turkish state stooges
Sunday, 06 November 2016
Byline: Leo Benedictus

Analysis: Governments all over the world are manipulating social media for their own ends. That's where the digital footsoldiers come in - smearing opponents, spreading disinformation and posting fake texts for 'pocket money'

We don't know who they are, or what their mission is. We only know that there are thousands of them out there, pretending to be us. They may be at home, or in special offices, or sitting beside you on the train. They use social media, and write blogs and comments. Some of them may visit the bottom of this article.

You can hire your own troll army if you have the cash. In 2011 the PR firm Bell Pottinger told undercover journalists that they could "create and maintain third-party blogs", and spruce up Wikipedia profiles and Google search rankings. Indeed marketing has a rich history of so-called "astroturfing", which is laying down fake grassroots. Take Forest, "the voice and friend of the smoker", which at least admits in nearly invisible small print that it is paid for by the tobacco industry.

Now, however, manipulating social media has become part of the business of government. It may yet influence how governments are formed. Recent reports suggest that many of Donald Trump's most fervent online supporters are not themselves Americans, but Russians being paid by their government to help him win. One told Samantha Bee that she pretends to be a housewife from Nebraska. Why she would confess it now is unexplained, but when you look around it begins to feel like everybody does it. It's just that no two countries' methods are the same.

China The existence of the wumao dang or "50 Cent Party" is not a secret in China, but then it is hard to employ up to two million people secretly. Even the state-owned Global Times reported with approval on the practice in 2010, citing Changsha's party office as the source of the name after it paid a team of commenters 600 yuan a month in 2004, plus half a yuan - hence "50 cent" - for each glowing post they made.

Since then, paying stooges to praise your work online has become about as routine for local government in China as hiring traffic wardens. A recent study at Harvard University found that the Chinese authorities were placing 448m phony comments on the internet each year. In an analysis of 43,800 pro-regime comments, the researchers concluded that 99.3% of them were made by civil servants from a wide variety of government departments. The postings tended to come in bursts at testing times, such as during protests or party meetings.

Interestingly, few of the comments qualify as trolling, in the strict sense. Rather than attacking unbelievers, they focus on swamping the doubters with a flood of positive messages, or cleverly diverting the conversation. As with any job, some practitioners are laughably bad at it. In January 2014, quartz.com found many stooges simply cutting and pasting a suggested question into an online discussion with a party secretary in Ganzhou. "It seems like taxis are far more orderly than in past years," they all wanted to tell him.

Two years before, however, Ai Weiwei interviewed an anonymous 26-year-old with very sophisticated methods. The young man, whose own family knew nothing of his work, estimated that 10- 20% of the comments he saw were left by the 50 Cent Party. He described creating several identities in one forum, and structuring arguments between them so that the most authoritative voice could ultimately settle matters in the government's favour. Another tactic was to be deliberately provocative, and thus draw public anger on to himself and away from the authorities. "Sometimes I feel like I have a split personality," he said. "I wouldn't say I like it or hate it. It's just a bit more to do each day. A bit more pocket money each month, that's all."

Estimated troops Between 300,000 and 2m people, many part-time.

Favourite subjects Excellent local facilities, why democracy doesn't work, Taiwan.

Russia

Long before Donald Trump met Twitter, Russia was famous for its troll factories - outside Russia, anyway. Allegations of covert propagandists invading chatrooms go back as far as 2003, and in 2012 the Kremlin-backed youth movement Nashi was revealed to be paying people to comment on blogs. However most of what we know now comes from a series of leaks in 2013 and 2014, most concerning a St Petersburg company called Internet Research Agency, then just "Internet Research". It is believed to be one of several firms where trolls are trained and paid to smear Putin's opponents both at home and internationally.

Related: Salutin' Putin: inside a Russian troll house

According to internal documents released by a group of hackers in 2013, Internet Research Agency employed more than 600 people across Russia, and had an implied annual budget of $10m - half of which was paid out in cash. Employees were expected to post on news articles 50 times a day. Those who wrote blogs had to maintain six Facebook accounts and publish at least three posts daily. On Twitter, they had to have at least 10 accounts, on which they would tweet 50 times. All had targets for the number of followers and the level of engagement they had to reach.

Later, an investigator called Lyudmila Savchuk went undercover at the company and afterwards published her experiences. These included smearing the character of the opposition leader Boris Nemtsov in the days following his murder, and promoting the theory that he was killed by his own friends, rather than by friends of Putin. "I felt the bullets between my own shoulders," Savchuk said. "I was so upset that I almost gave myself away. But I was 007. I fulfilled my task." When a Finnish reporter called Jessikka Aro wrote about Internet Research in 2014, she herself became the target of a frightening campaign of threats and smears.

As you might expect, many Russian trolls lack a certain polish when posting in English. "I think the whole world is realizing what will be with Ukraine, and only US keep on fuck around because of their great

plans are doomed to failure," one Internet Research employee wrote on a forum. Indeed the Guardian's own moderators have begun to notice regular clues, especially on articles about Ukraine. "We can look at the suspicious tone of certain users, combined with the date they signed up, the time they post and the subjects they post on," says one senior moderator. "Zealous pro-separatist comments in broken English claiming to be from western counties are very common."

Estimated troops Several thousand.

Favourite subjects Putin and Trump being great, the opposition being corrupt, the Nato conspiracy against Russia, the effeminacy of Barack Obama.

Israel There's been an Israeli public relations war for about as long as there's been an Israel. In Hebrew it's called "hasbara", literally meaning "explanation", and it involves trying to improve the world's opinion of the country and its causes. Accordingly there are around 350 official Israeli online channels, covering the full range of social media. For instance, besides its well-known Twitter accounts in English, Hebrew and Arabic, the Israeli Defence Force even has its own Pinterest page, featuring photo collections with themes such as "Soldiers' Stories" and "IDF Style".

In 2013, the Israeli government revealed that it would also recruit "covert units" however. These would be staffed by a mixture of international supporters and domestic students, whose high intelligence, low income and familiarity with social media make them generally well suited to professional trolling. "We need a unified effort to explain why we have a legal right to be here in Israel," the Knesset member Dov Lipman told the Jerusalem Post. "That is key to defeat the movements pushing to boycott, divest and sanction Israel." Those who signed up would get quick access to government information, and leaders of student groups would also be awarded scholarships.

Sure enough, during the war in Gaza the following summer, a student group called Israel Under Fire emerged as one of many voices promoting the Israeli side of the story. "We counter Palestinian propaganda and explain the Israeli perspective," the group's leader, Yarden Ben-Yosef, said. "Social media is another place where the war goes on. This is another way to tell our story." We do not know whether Israel Under Fire was itself one of these covert units, or whether Ben-Yosef got a scholarship. The group's Facebook Page is still active today.

Estimated troops Low thousands.

Favourite subjects Palestinian brainwashing, friendliness of Israeli troops, justifiedness of Israeli force.

Ukraine If Russia has a troll army, why shouldn't Ukraine? With this logic, last February, the country's new Information Policy Ministry announced the launch of its own i- army, based at i-army.org, with plans to challenge the enemy version of events on social media. "I already said more than once that we should effectively combat Russian bots and fake information," Ukraine's information policy minister

Yuriy Stets said. "I think this project will give us many volunteers who are ready to disseminate truthful information and expose fake reports from Russia."

It is not clear how many Ukrainians or Ukraine supporters have yet taken up the cause. The i-army.org site itself, where volunteers can join, is certainly not very appealing to outsiders. It is a crazed and relentless jumble of unflattering stories about Russia - from details about the MH17 air crash, to doping by its athletes, to unsubstantiated allegations from the western media that Putin is a paedophile. "Do not let yourself be deceived - spread the truth!" the site says, rousingly.

More obvious signs of life can be found on the i-army's Twitter page. This is very active, with 12,800 followers, which isn't bad, and retweets regularly runs into dozens or hundreds. Clearly some of its followers have been arguing Ukraine's case online, but the tweets themselves are not very persuasive, offering photographs of captured Russian military hardware, dry political statements and sudden comic memes about Russia's federal reserves, for example.

The account's wallpaper perhaps tells you everything you need to know about the Information Policy Ministry - or the "Ministry of Truth", as some Ukrainian wags prefer. It depicts a group of noble white knights carrying the ministry's logo into battle against, literally, an army of fantastical trolls (who rather incongruously carry the logos of RT television and Russia 24). No matter how sympathetic one might feel towards the Ukrainian cause, it is hard not to feel that this particular region of the conflict needs a lighter touch.

Estimated troops A few hundred.

Favourite subjects Russia, Russia, Russia, Russia, Russia.

UK The so-called "Twitter Troops" of the 77th Brigade were somewhat misunderstood by the media when the new army unit was created last year. In fact social media was just one example of many non-military skills that the specialist soldiers were intended to bring to the army. And in any case, the MoD informs me, it would not be a soldier's job to launch a disinformation campaign on the battlefield, even if they had the time.

You don't hear much about JTRIG in Britain, however, and they do just this kind of thing. Indeed the very existence of the Joint Threat Research Intelligence Group was a national secret until documents from Edward Snowden were published by Glenn Greenwald and Andrew Fishman in 2014. And they reveal a very busy group of people, whose work within GCHQ was intended to help everyone from the police and MI5 to the Department for Children, Schools and Families and the Bank of England.

Some of JTRIG's tactics, such as hacking into websites and setting up sexual "honeypot" stings, sound more or less like conventional spying. Others were carefully designed to manipulate and deceive. In the words of the leaked document, these included "Uploading YouTube videos containing persuasive messages; establishing online aliases with Facebook and Twitter accounts, blogs and forum

memberships ... sending spoof emails and text messages as well as providing spoof online resources; and setting up spoof trade sites."

Some of this sounds reasonable, and frankly welcome, such as disrupting the online activities of terrorists or child abusers. Indeed, if it still exists, JTRIG seems to target specific groups or individuals, rather than trying to influence public opinion. Which groups, however, and who chooses them, might be a legitimate concern. The document mentions the English Defence League, for example, whose members were no doubt not happy to be included. For its part, GCHQ will only say that all its work is legal.

Estimated troops A few dozen.

Favourite subjects Sex, drugs, not travelling to Syria please.

North Korea, South Korea Most North Koreans' experience of social media is none at all, unless they have been given an illicit glimpse by a foreigner or a government official. Facebook, Twitter and YouTube are all officially blocked, just in case. Domestically, there is thus no online opinion for the regime to bother about controlling. (Unless they launch their own version of Facebook, as some believe they plan to.) Across the border, however, just about all South Koreans have smartphones, KakaoTalk and the fastest internet in the world. They also have about 200 North Korean trolls to contend with, according to a report published by a South Korean think-tank, the Police Policy Institute, in 2013. In total the report estimated that North Korean agents had posted 41,373 pieces of propaganda in 2012. (That's about one every two days per agent, which is hardly Stakhanovite.)

Given the extreme strangeness of the regime in Pyongyang, it is easy to presume that they would not know how to talk to a sophisticated southern audience. In fact their approach, as revealed in the report, is rather clever. Instead of hammering people with outlandish and unconvincing Juche propaganda in the usual North Korean way, Pyongyang's trolls focus on areas that are still debated in the south - such as whether to give southerners access to sites (currently blocked) that praise the northern regime. Aware that recently started accounts with little background often arouse suspicion, northern agents also tend to work behind identities stolen from real southern users.

Clearly the problem has been serious enough for South Korea to react, and indeed to overreact. For years the country's National Intelligence Service has been routinely posting messages of its own to attack those coming from the north, and at times these have allegedly strayed into attacks on South Korea's own opposition parties. Last year the country's former intelligence chief Won Sei-hoon was convicted of trying to influence the outcome of the 2012 presidential election in favour of the incumbent Park Geun-hye. A retrial has since been ordered, but in the original Won was alleged to be running a team of nine agents who used at least 658 Twitter identities to post many thousands of messages to discredit the north - and also, in the case of 274,800 messages, to smear President Park's opponents, who were described as, among other things, "leftist followers of North Korea".

Estimated troops 200 (north) 9 (south).

Favourite subject Whether North Korea is a) paradise b) paranoid.

Turkey President Erdogan was taught a lesson by the Gezi Park protests of 2013. Not, unfortunately, that Turks should be allowed to live more freely, but that he should take control of social media, with which they had organised themselves against him. By the end of the summer, the ruling Justice and Development Party (AKP) had begun recruiting a team of 6,000 social media operatives. "We aim at developing a positive political language which we are teaching to our volunteers," a party official told the Wall Street Journal at the time. "And when the opposing camp spreads disinformation about the party, we correct them with valid information, always using positive language." But not always being open about it. When asked to name some of the people who would be correcting this misinformation, the official declined.

Sadly for Erdogan and the AKP, their new army of volunteers proved overenthusiastic and, let's say, under-subtle. In the months that followed it became common for those who even mildly criticised the government to be showered with far from positive remarks. Often the abuse arrived in bursts, from people with not very convincing profiles, making accusations that were not only bizarre but bizarrely similar. For instance when the journalist Emre Kizilkaya criticised the government's handling of a hostage negotiation in October, he found himself repeatedly accused of "Zionism".

At times the "AK Trolls", as they became known, spread false stories. In July 2014, it was reported that they started a fake Twitter account supposedly from the musician Erkan Ogur, used it to tweet controversial comments about the state intelligence services, then complained about "his" tweets to the AKP authorities in Sakarya, who promptly cancelled Ogur's forthcoming concert there. Later, Erdogan's own daughter Sumeyye was apparently recorded asking one of his advisers for help from "our trolls". When recordings allegedly showing Erdogan's own corruption began to spread on Twitter in the spring of 2014, he simply (but not very effectively) shut Twitter down.

Perhaps aware that this Putinesque farce wasn't making the AKP more popular, the party changed tack just before the general elections last spring, launching the New Turkey Digital Office, which would henceforth dish out more conventional online propaganda. "All of our accounts will be officially announced," spokesman Besir Atalay told the Turkish media. "Our messages will be determined at the party headquarters. None of the other accounts would be related to us, including those ones [the trolls]." Nevertheless the AKP lost its majority in the elections. Then regained it in new elections later in the year.

Estimated troops Formerly 6,000, probably still 6,000.

Favourite subjects Standing up to the Kurds, standing up to Russia, standing up to Arabs, standing up to Israel ...

Hack attacks cut internet access in Liberia
Saturday, 05 November 2016

Tripoli - Net access in Liberia comes via a single cable that is shared with 20 other nations
Liberia has been repeatedly cut off from the internet by hackers targeting its only link to the global network.

Recurrent attacks up to 3 November flooded the cable link with data, making net access intermittent.

Researchers said the attacks showed hackers trying different ways to use massive networks of hijacked machines to overwhelm high-value targets.

Experts said Liberia was attacked by the same group that caused web-wide disruption on 21 October.

Those attacks were among the biggest ever seen and made it hard to reach big web firms such as Twitter, Spotify and Reddit.

Short bursts

The attacks were the first to send overwhelming amounts of data from weakly protected devices, such as webcams and digital video recorders, that had been enrolled into what is known as a botnet.

A botnet variant called Mirai was identified by security firms as being the tool used to find and compromise the insecure devices.

The source code for Mirai has been widely shared and many malicious hacker groups have used it to seek out vulnerable devices they can take over and use to mount what are known as Distributed Denial of Service (DDoS) attacks.

"There're multiple different botnets, each with a different owner," security researcher Kevin Beaumont told the BBC. "Many are very low- skilled. Some are much better."

'This feels serious' - BBC Africa's Jonathan Paye-Layleh in Liberia

For more than two weeks, my internet has not been working properly. At first I thought it was a problem with my internet provider, which often suffers from slow speeds. But this feels more serious.

Even when you do get online, the connection repeatedly cuts out. I've spent the past week trying to upload some photos and audio to send to London, without success.

A woman who runs a computer club for young people in the capital, Monrovia, tells me that they have been having trouble getting on to Facebook and that their connection has slowed in recent weeks.

The hotel I am staying at in the north-eastern town of Ganta is right next to the network tower of a company that provides my internet service, but the connection is still coming in and out.

The hackers behind the "huge" network that attacked Liberia, dubbed botnet#14, were "much more skilled", Mr Beaumont said.

"The attacks are extremely worrying because they suggest a Mirai operator who has enough capacity to seriously impact systems in a nation state," he wrote in a blogpost.

Media captionEXPLAINED: What is a DDoS attack?

Network firm Level 3 confirmed to tech news site ZDNet that it had seen attacks on telecoms firms in Liberia making access to the web spotty. Other reports suggested mobile net access was affected too.

The attacks varied in length with some lasting only 30 seconds and the longest being sustained for a few minutes. At times the amount of data being funnelled towards Liberia exceeded 600 gigabits per second.

Net access in Liberia comes via an undersea cable whose capacity is shared with many other nations in West Africa.

"They're trying a number of different techniques for short bursts, against the companies who own the submarine cable to Liberia," said Mr Beaumont, adding that commands to botnet#14 seemed to originate in the Ukraine.

Mr Beaumont said the controllers of botnet#14 were refining their control of the attack system but it was not yet clear who it would be turned against next.

A Twitter account, called #Miraiattacks has been set up by a security company to monitor the many different attack targets hit by Mirai botnets. Earlier targets included computer security firms, schools, food-ordering services and gaming sites.

Daily Star London
Anonymous 'hacks Met Police in Million Mask March arrest revenge'
Sunday, 06 November 2016

London - Central London was brought to a standstill as the demonstrators - wearing their trademark Guy Fawkes masks to hide their faces - chanted anti-Government slogans.
But after cops arrested more than 47 rowdy protesters hackers allegedly had their revenge.

The protest was inspired by the work of anonymous - a network of hacktivist groups who have previously attacked the the US government, ISIS and the KKK.

Now The Met's news site - where they earlier reported the number of people arrested in the protest - has been taken down in an apparent attack claimed by hacker 'Crash OverRide'.

Taking credit for the website's domain being taken away the alleged hacker tweeted: "Arrests = Downtime b****".

But even though it happened in the middle of the Million Mask March, The Met police haven't confirmed if the site was hacked.

Speaking to Dailystar.co.uk a spokesman for the Metropolitan Police said: "We'll be speaking to our web supplier about it but it's too early to precisely say what the cause it at this time.

It comes after protesters wreaked mayhem in central London for this year's Million Mask March as police crackdown on violence.

Mayhem erupted in the capital with many protesters dressed in Guy Fawkes masks.

The mob started by gathering at Trafalgar Square and by 9pm cops had made at least 47 arrests for a variety of offences.

Two protesters were detained after refusing to remove their masks, while others were arrested for drugs possession, carrying a weapon and criminal damage.

One clip shared on social media showed the moment officers wrestle a protester to the ground.

Anarchists launched fireworks at Buckingham Palace as the mob made their way through central London.

New York Times
What We're Missing While We Obsess Over John Podesta's Email
Saturday, 05 November 2016
Byline: Zeyned Tupekci

OpEd: I once asked Daniel Ellsberg -- who in 1971 leaked the secret history of the Vietnam War known as the Pentagon Papers -- if he had any regrets. He told me, as he told many others, that he regretted only that he had not leaked them earlier, when they might have had more impact and perhaps shortened the war.

Whistle-blowing, as Mr. Ellsberg did, is a time- honored means for exposing the secret machinations of the powerful. But uncensored release of huge amounts of hacked data does the opposite. Such leaks threaten our ability to dissent by destroying privacy and unleashing a glut of questionable information that functions, somewhat unexpectedly, as its own form of censorship, rather than as a way to illuminate the maneuverings of the powerful.

The latest example of these data dumps comes from WikiLeaks, which is releasing the emails of Hillary Clinton's campaign chairman, John Podesta, in dribs and drabs going back to 2008, when Mr. Podesta was the co-chairman of Barack Obama's transition team.

"Wait," you might think. John Podesta is about as far from dissident politics as you can get. These leaks have produced genuine news. We finally got to see the text of Mrs. Clinton's paid speeches to Goldman Sachs, for example. What's wrong with that? Doesn't that serve the public interest?

The hacked emails did provide the public with some notable information. But any benefit of such mass data releases does not undo their harm. And that harm goes well beyond the possibility that the data was stolen by a foreign government seeking to influence this election.

The victims here are not just Mr. Podesta and the people in his contacts list who are embarrassed or compromised. The victim of leaks of private communication is the ability of dissidents to function in a democracy.

Demanding transparency from the powerful is not a right to see every single private email anyone in a position of power ever sent or received. WikiLeaks, for example, gleefully tweeted to its millions of followers that a Clinton Foundation employee had attempted suicide; news outlets repeated the report.

Wanton destruction of the personal privacy of any person who has ever come near a political organization is a vicious but effective means to smother dissent. This method is so common in Russia and the former Soviet states that it has a name: "kompromat," releasing compromising material against political opponents. Emails of dissidents are hacked, their houses bugged, the activities in their bedrooms videotaped, and the material made public to embarrass and intimidate people whose politics displeases the powerful. Kompromat does not have to go after every single dissident to work: If you know that getting near politics means that your personal privacy may be destroyed, you will understandably stay away.

Data dumps by WikiLeaks have outed rape victims and gay people in Saudi Arabia, private citizens' emails and personal information in Turkey, and the voice mail messages of Democratic National Committee staff members. Dissent requires the right to privacy: to be let alone in our vulnerabilities and the ability to form our thoughts and share them when we choose. These hacks undermine that crucial right.

Mass data releases, like the Podesta emails, conflate things that the public has a right to know with things we have no business knowing, with a lot of material in the middle about things we may be curious about and may be of some historical interest, but should not be released in this manner.

All campaigns need to have internal discussions. Taking one campaign manager's email account and releasing it with zero curation in the last month of an election needs to be treated as what it is: political sabotage, not whistle-blowing.

These hacks also function as a form of censorship. Once, censorship worked by blocking crucial pieces of information. In this era of information overload, censorship works by drowning us in too much undifferentiated information, crippling our ability to focus. These dumps, combined with the news media's obsession with campaign trivia and gossip, have resulted in whistle- drowning, rather than whistle-blowing: In a sea of so many whistles blowing so loud, we cannot hear a single one.

What is the right response, then, to living in a world where we will see more mass hacks of information, and more titillating and occasionally newsworthy private communication made public?

The answer is not simply to tell people to stop writing things down. "Don't discuss things over email if you don't want to see them on CNN" is the new "don't wear a miniskirt if you don't want to get assaulted." That would take us back to the pre-internet world where only the powerful could communicate with ease. People with resources will create their own online gated communities -- buying more expensive, secure devices, hiring specialists and flying around more to meet in person -- while dissident groups with fewer resources will be left behind.

Since these hackers won't stop, we need to build resilience by emphasizing curation, context and ethics, and by no longer acting as if something that has been hacked and dumped is all up for grabs.

Journalism ethics have to transition from the time of information scarcity to the current realities of information glut and privacy invasion. For example, obsessively reporting on internal campaign discussions about strategy from the (long ago) primary, in the last month of a general election against a different opponent, is not responsible journalism. Out-of-context emails from WikiLeaks have fueled viral misinformation on social media. Journalists should focus on the few important revelations, but also help debunk false misinformation that is proliferating on social media.

Those of us who aren't reporters need better ways to respond, too. These hacks are done to steal our attention and to confuse us; the only effective response is to refuse to play this game on the hackers' terms.

In old-school access journalism, journalists trade access for docile coverage, and we are often served gossip or trivia: the kind the powerful would like us to know. In this form of hacked emails, we still get gossip and trivia. But we get the kind the hackers want us to focus on, while distracting us from the real issues.

We can't shrug off these dangers just because these hackers have, so far, largely made relatively powerful people and groups their targets. Their true target is the health of our democracy.

Soon, separate cyber cell to keep tab on miscreants
Monday, 07 November 2016
Byline: Staff Report

Jaipur - The state police are setting up a separate cyber cell to keep an eye on miscreants responsible for fanning communal passions on social media platforms like Facebook and Twitter.
According to UR Sahoo, ADG, intelligence, special training will be given to cops on social media platform. "The decision was taken to ensure that nobody exploits the reach and penetration of social media to flare up communal passions. It will also deter miscreants from posting venomous texts that is likely to trigger tension," he added.

Sahoo added that the state government had earlier given its nod to setting up of such a unit. The specially trained cops would scan through the social media platforms round-the-clock. The unit would operate from a control room and would be connected to all the police stations across the state.

This unit will work in three different shifts, and any suspicious post will be reported to the police station area or the district SP.

"The social media in itself is such a vast sphere that it would not be an easy task for us to scan every page or post. But having a dedicated unit may minimize these crimes to some degree in the state," an intelligence official said.

Sources said that other state police in Maharashtra and New Delhi have already set up thier cyber cell. "The police in communally sensitive areas had been facing difficult times due to posts on social media. There have been incidents where dubious videos were released and shared on mobile phones. Cops were often caught unaware when such posts and videos were posted," the official said.

The cyber cell has been specifically asked to monitor Facebook pages and posts where people are being asked to gather in large numbers at a particular place. The cyber cell would alert the local station house officer about such post and share real time information.

"The misuse of social media was left unattended by the cops for a very long time, allowing miscreants to use it for provocation and stoking communal fire," Sahoo said.

Bangkok Post
Cyber centres fighting on all fronts
Monday, 07 November 2016
Byline: Wassana Nanuam

Bangkok - Having been set up for two years under the Defence Ministry's policy, the so-called cyber war centres of the Royal Thai Armed Forces are fully capable of countering cyber threats from within and outside of the country, sources say.
The Royal Thai Armed Forces Headquarters (RTAFH) and the three armed forces run their own "cyber centres", with the Army's cyber division serving as the lead centre.

Located in the basement of the RTAFH on Chaeng Watthana Road, the army's cyber division is equipped with military experts in cyberspace who have undergone training in Thailand and overseas and the latest technology.

The army last week changed the name of its technology and communications centre to the cyber centre. The name change followed a major upgrade at the facility of both equipment and personnel.

Although not intended to handle political conflicts in cyberspace, the centre has aided state efforts to tackle issues online such as lese majeste comments. That's why the centre has been perceived as taking aim at political issues, according to experts.

Army commander Chalermchai Sitthisart insisted the cyber centre was established to cope with escalating cyber threats that pertain to the hacking and spreading of misleading rumours online, and national security.

"Also, websites offending the royal institution, and online acts in violation of Section 112 of the Criminal Code [for lese majeste] need to be checked," said Gen Chalermchai.

Ritthi Intharawut, director of the army's cyber centre, said the main duty of the centre is to create a system to prevent hacking into the army's websites and information databases, fight against other threats and develop the army's computer and internet system. The centre has also been training soldiers on cyber security, he said.

Information Operation is another area the centre has been overseeing, with the aim of improving public understanding via the dissemination of news and information, he said.

Fending off cyber attacks and cyber terrorism from outside of the country is also a priority, he said, adding that the ideals and propaganda of terrorists are easily disseminated over the internet.

Maj Gen Ritthi said the centre constantly monitors websites which are sources of distorted information and doctored images undermining internal security and the monarchy. When those threats are detected, the RTAF alerts the Ministry of Digital Economy and Society and the Royal Thai Police, he said.

Due to a large number of websites and Facebook pages containing security threats and lese majeste violations, the armed forces' cyber centres have been divided up to monitor them separately, said an army source.

The Signal Department is involved in similar work, employing many capable programmers, dubbed "cyber warriors", said the source. In addition, the Internal Security Operations Command's coordination and operation Centre No.1 is involved in the military's cyber work.

Wisanu Traiphum, the Centre No.1 director, said his centre is linked to the armed forces' cyber centres, although it has limited resources. Its main charge is to keep a look out for websites insulting the monarchy.

Despite being able to deal with cyber threats on a large scale, the armed forces' cyber centres typically deal with issues on the domestic front, said a source at the RTAFH.

And now the operators of Line and Facebook have agreed to cooperate with the government in fighting the spread of improper and offending messages. The armed forces' cyber centres are facing an even bigger workload, said the source. "We don't spy on people's Line conversations. We only check cases for false rumours," Gen Chalermchai.

Jerusalem Post
ISIS cyber recruiting, financing hits new levels
Monday, 07 November 2016
Byline: Yonah Jeremy Bob

Jerusalem - The Islamic State is considered a pioneer among terrorist organizations regarding innovation in the cyber world, including making leaps forward in sophisticated recruiting and fundraising schemes, according to an advance copy of IDC's International Institute for Counter- Terrorism 2016 cyber trends report obtained exclusively by The Jerusalem Post.
"Unlike in the past when the processes of mobilization, manpower recruitment and training mainly took place in the physical realm, today the Internet has become a central and anonymous arena in which these activities take place," the report says, adding that a deeper "technological focus" gave ISIS and others "a free hand to recruit using an anonymous connection between the recruit and the terrorist organization through the Internet, irrespective of their physical location or standing."

Internet-based manpower recruitment was crucial in light of the need to import foreign fighters to Syria, Iraq and other countries, says the report, and that ISIS disseminated messages on a range of Internet platforms both directly and via secondary agents to maximize its recruitment potential.

Most impressively, "terrorist organizations have recently been investing efforts in adjusting the recruitment content for a specific target audience (narrow casting), such as speakers of various languages or certain professionals. For example, a campaign for the recruitment of children that includes computer games and comics, [and] campaigns for the recruitment of hackers, Web designers and developers for this specific population."

But ISIS has gone even further in this kind of tailored campaigning, reminiscent of the current US election campaign in which both parties tailor their pitches to local state specific issues, using recognizable local terminology.

The IDC report says Isis has "leveraged existing technological platforms more than any other terrorist organization, with one of its prominent 'flagships' reflected in a venture named 'Nasher' (publisher), which is responsible for translating the organization's official materials into various languages and distributing them on Telegram channels."

Further, adapting the message to a specific "target audience is not only part of recruitment, but is also part of the format in creating specialized target audiences for lone wolves on social networks, such as Facebook and Telegram."

The report explains that this technological development increased the "use of advanced communications applications (mostly encrypted) by jihadist organizations in the advanced stages of the recruitment process, such as Telegram, Skype, WhatsApp and Kik."

As with many other areas, ISIS has outplayed al-Qaida in this arena. Al-Qaida continues to operate on a much more limited and less dynamic basis in Web forums and Internet sites, though it is not completely absent from social networks, says the report.

Whereas al-Qaida's size and breath is limited by its emphasis on maintaining a connection between various arenas of jihad and "Al-Qaida Central," ISIS has altered its recruiting and propaganda strategy when necessary, notes the report, recently moving from seeking volunteers in Syria and Iraq to focusing on "the 'far enemy' and on encouragement for 'lone wolf' attacks and cyber attacks against the West" with no strings attached to its central hub.

Moreover, the report indicates that "the competition between the Islamic State and al-Qaida is... manifested in a propaganda battle that includes...'hashtag wars' and publications on ideological matters.

Al- Qaida supporters accuse ISIS of "establishing an Islamic Caliphate in sin, killing innocent Muslims, conduct contrary to sharia, and deviation from the principles of Islam."

ISIS supporters accuse al-Qaida of "deviating from the path of Osama bin Laden, and describe it as an organization that has run its course and is occupied with survival and the narrow interests of its leaders," according to the report.

Recruiting is not the only place that ISIS and other terror groups have revolutionized in a short time.

ICT's report describes the field of terrorism financing as significantly changing in parallel with technological development, both in terms of fundraising and the transfer of funds.

"The Internet has enabled the practice of fundraising and the transfer of funds from any location to any location in the world," the report says.

"It has expanded the circle of fund-raisers and the ability to raise capital through them and directly from the potential target."

Furthermore, "the network organizational structure has also enabled the independent mobilization of funds by terror cells and foreign fighters on their way to battle arenas, eliminating the need to find ways to transfer money from country to country."

Put differently, just as US election campaigns have shifted from a sole focus on fundraising from big-money bundlers to a large volume of small online contributors, ISIS and others have done the same with their fundraising.

This empowers smaller cells to even do their own fundraising without having connections to high- net-worth individuals or senior terrorist operatives.

In addition, "The Internet also serves as a preferred arena for fundraising due to the sense of security that it gives the donor who tends to believe that his identity remains anonymous, even if this is not always the reality," says the report.

Press TV
Cyber strike empowered Iran: Nuclear chief
Monday, 07 November 2016

Tehran - Iran's top nuclear official says the 2011 cyber attack by the US and Israel against the Iranian nuclear energy program worked against their intended objectives and helped improve the Islamic Republic's readiness against such acts of sabotage.

The head of the Atomic Energy Organization of Iran (AEOI), Ali Akbar Salehi, said the deployment that year of a malware dubbed Stuxnet against Iran's nuclear facilities made the country realize how it should prepare against such attempts, Tasnim news agency reported on Saturday.

He said Iran can fill "an entire exhibition room with the West's acts of industrial sabotage against Iran, things like this very Stuxnet virus."

"They give us equipment in which they have planted explosives so that it would blow up sometime later, or they interfere with the equipment so that... it later damages the whole system."

He explained that as an act of precaution, Iran has been checking the pieces of equipment it buys for any potential interference.

"We don't immediately put to use whatever equipment that we buy; rather, we do all kinds of tests on it, and we don't use it before there is complete assurance" that it is safe, Salehi said.

"In fact, before the Stuxnet, we were not this careful, and the attack opened up a new science to us. Just by testing different equipment for [potential] industrial sabotage, we learn a lot," he said. "We owe them a thank you, of course," he said jokingly, referring to the US and Israel.

The Washington Post reported in June 2012 that the US National Security Agency (NSA), its spy service CIA, and Israel's military had worked together to launch Stuxnet against Iran's nuclear facilities.

Salehi also said Iranian officials are taking the necessary measures to pursue litigation against the perpetrators of the cyber attacks against Iran.

Meanwhile, Swiss prosecutors have said that they had found malware on a number of computers at a hotel in Geneva that hosted talks between Iran and six other countries on the Islamic Republic's nuclear program last year.

The hotel, believed to be Hotel Président Wilson, was raided on May 12, 2015 after the state prosecutor's office, the OAD, launched an investigation over suspicions that illegal intelligence services were operating in Switzerland.

The OAD has, however, had to close the case after failing to establish who was behind the cyber attack that implanted the malware on the computers.

The talks at the Swiss hotel and elsewhere led to the conclusion in Vienna on July 14, 2015 of a nuclear agreement between Iran and the five permanent members of the United Nations Security Council -- the United States, Britain, France, China and Russia -- plus Germany.

Also on Saturday, Salehi announced the inking of the first document of cooperation between Iran and the International Thermonuclear Experimental Reactor (ITER) project, an international nuclear fusion research and engineering megaproject.

ITER will be the world's largest magnetic confinement plasma physics experiment, established in southern France. Salehi said he hoped that Iran would have joined the ITER project by the end of 2016.

He said Iran and the ITER Organization have committed under the document signed on Saturday to keep information exchanged between them confidential.

The document was signed by Salehi and Bernard Bigot, who is the director general of the ITER Organization, in Tehran.

Overnight Security Guards Keep Finding Classified or 'Protected' Documents Around Parliament

Wednesday, 09 November 2016

Byline: Rachel Brown

A number of federal departments, including Canada's spy agency, have been careless with classified or secure government documents.

Since the Liberals took office last November, there's been more than 10,000 incidents in which such documents were mishandled or improperly stored, according to a 93-page report tabled last week in the House of Commons in response to a question from Conservative MP Gord Brown. The Conservatives have been quick to condemn the government, but it's not clear how many similar incidents occurred when they were in power.

The report, first cited by the CBC, provides few details about what the documents are or how exactly were mishandled. It's not clear whether any of the incidents compromised security or privacy.

Public Services and Procurement Canada and Global Affairs are the worst offenders, reporting a combined 5,624 instances where employees didn't abide by the security protocols for the documents.

The Canadian Security Intelligence Service (CSIS) reported 659 such instances, 12 of which "required further investigation." And the Communications Security Establishment, Canada's foreign intelligence agency, reported 491 incidents, although the agency notes that none of the documents ever left Parliament.

Officials at the Canada Border Services Agency reported 77 incidents where protected documents were mishandled.

A number of cabinet ministries also confessed to mishandling documents, including 11 such incidents reported by the office of Democratic Reform Minister Maryam Monsef.

Public Safety Minister Ralph Goodale's office--which is responsible for national security--reported six instances of document carelessness. The department overall reported more than 270 incidents, many of which seem to have been discovered during the night shift by parliamentary security officials, including "where cabinets were found unlocked by security during evening patrols."

"For all instances where a cabinet was left unlocked, it is impossible to confirm if the cabinet contained any Protected or Classified documents," the department states in the report.

Dozens of other departments, including the Transportation Safety Board and the Public Prosecution Service, reported zero instances where secure or protected documents were mishandled. According to the report, no employee was stripped of their security clearance as a result of any of the incidents.

Opposing MPs have expressed alarm over the reported incidents.

"We're a G7 country, and when we do not handle these kinds of documents with the appropriate way it's amateur hour," Conservative public safety critic Tony Clement told the CBC. "It might be a signal to our allies and our partners that we cannot be trusted."

Under the Conservative government in 2008, the foreign affairs minister at the time, Maxime Bernier, came under fire for leaving classified government documents at the Montreal home of his girlfriend, who reportedly had ties to a criminal biker gang. Bernier eventually resigned over the matter.

At the time, MP Ralph Goodale, who now serves as the public safety minister, said former prime minister Stephen Harper had "a lot of explaining to do."

Early in 2015, in response to the Bernier incident, the Conservatives imposed a revamped policy on secret federal cabinet documents to prevent leaks. It required all potential breaches, no matter how small, to be reported to the Prime Minister's Office or the Privy Council Office right away.

Montreal Gazette
Coderre cancels inquiry into police surveillance
Wednesday, 09 November 2016
Byline: René Bruemmer

Montreal - Two days after he announced Montreal inspector general Denis Gallant would hold an ad hoc "administrative review" into the police surveillance scandal enveloping the police force and city hall, Mayor Denis Coderre said Tuesday Gallant's investigation is no longer necessary and has been cancelled. Given that a provincial inquiry called by Premier Philippe Couillard last week is already looking into the Montreal police force's surveillance of La Presse journalists, including one who had been investigating a $444 ticket issued to Coderre, as well as the Sûreté du Québec's monitoring of reporters in a separate case, Gallant's inquiry is no longer necessary, the mayor said in a statement.

Coderre said he obtained the assurance Tuesday morning of Quebec Public Security Minister Martin Coiteux that the provincial inquiry will investigate the Montreal police's surveillance techniques. Having another inquiry, Coderre said, risks becoming "counter-productive." Montreal city council's public security commission is also investigating the matter.

Coderre had announced Gallant would organize the inquiry outside of his duties as inspector general, in which his department is charged with investigating municipal contracts and reports to city council. Gallant said he accepted to do the job pro bono, and said it would not affect his independence. But opposition party members said using Gallant for such a highly politicized inquiry in which the mayor is implicated threatened to undermine Gallant's credibility as inspector general.

Tuesday's reversal shows Coderre is mismanaging the surveillance file, said Alex Norris, the Projet Montréal councillor who sits on the city's security commission.

"This is yet another example of improvisation on the part of Mr. Coderre and further evidence he has fully lost control of the dossier on espionage of journalists by the Montreal police force," said Norris, adding that the Quebec government made it clear last week their inquiry included investigating the Montreal police force. As well, Norris said, the law makes it clear that Gallant's mandate as inspector general is a full-time position and he is not allowed to take on other duties.

In Quebec City, Couillard stressed the need for distance between elected officials and the police.

"We should be all extremely careful ... of any significant contacts between elected officials and the police force, at any level," Couillard said. "This is why we must take a step back now, because I see that tempers are flaring up a little bit in recent days ... and have a real independent commission looking into this, presided by a judge."

Toronto Star
Ottawa should protect press
Wednesday, 09 November 2016
Section: editorial

When it was revealed last week that Montreal police had been spying on Patrick Lagacé, a columnist for La Presse newspaper, in an effort to uncover his sources, we decried the practice as a "troubling threat to freedom of the press" that was "unprecedented in Canadian history." It turns out we were only half right: it was indeed troubling, but hardly unprecedented.
In the week since, it has come to light that, in fact, at least 10 other reporters in Quebec have had their cellphones surveilled by local or provincial police since 2008, some for more than five years. In the wake of these alarming disclosures, the province has announced that it will launch a public inquiry into press freedom and police surveillance of journalists.

That's a welcome development, especially as crucial questions remain about the possible complicity of some politicians and senior police officials in the spying. But the problem is not limited to Quebec. The revelations have also exposed a gap in the federal law that protects journalists and their sources - one that Ottawa should move quickly to bridge.

It should not surprise us that police were tempted to spy on journalists to expedite their investigations. What's more concerning is that several justices issued warrants that, based on what we know, seem to be inconsistent with the spirit of the Supreme Court's rulings on the protection of journalistic sources.

In each case, the journalist being monitored was suspected of nothing untoward. He or she was privy to no imminent threats to public safety. Rather, the journalists in question were simply doing their job:

telling stories that happened to be embarrassing to the police or to government. The warrants appear to have been sought to identify existing whistleblowers and intimidate prospective ones. Given the chilling effect such surveillance is likely to have on the media, it's hard to conclude that, on balance, democracy was well served by the decisions.

Moreover, the Supreme Court has said journalists should be able to protect their sources if they can show doing so is in the public interest. No such opportunity was provided to them. It seems that neither legislation nor jurisprudence provides sufficient protection for the journalist-source relationship that the top court has said serves a "vital role" in democracy.

No one would speak to a reporter if they believed he or she was unable to protect a source or, worse, was collecting information on behalf of police. Journalists must be free to seek the truth from all manner of sources - whistleblowers and criminals included - to keep the public informed on the issues that matter.

That's why Ottawa should take seriously the suggestion of Sen. André Pratte, a former editorial page editor at La Presse, who is calling on the government to convene a Senate-Commons committee to study the current safeguards for journalists and their sources and quickly suggest improvements. The existing legislation was written before technology vastly expanded both the set of journalistic tools and the state's ability to spy on them. It should be updated for the digital world.

The recent stories out of Quebec raise important questions about troubling police practices in that province and to what extent politicians were involved. A public inquiry is the right response. But the protection in law of freedom of the press is a matter of national importance. Ottawa should do its part.

Journal de Montréal
Mieux protéger les journalistes que les citoyens?
Tuesday, 08 November 2016
Byline: Pierrot Péladeau

Blogue - Le film 'La vie des autres' se déroule en Allemagne de l'Est à l'époque où, volontairement ou sous la contrainte, un citoyen sur sept espionnait ses voisins pour la Stasi (Ministère de la Sécurité d'État)
Est-ce souhaitable à l'égard de la surveillance policière des communications ? Ou même possible ? Coup d'oeil sur la réalité matérielle des choses.

Évidemment, nous ne pouvons que nous inquiéter des révélations sur le fait que la police a surveillé les communications d'autant de journalistes dont aucun n'était pourtant soupçonné de quelque crime que ce soit.

Premièrement, à cause des rôles clés que le journalisme a joués dans l'émergence, puis pour la vitalité des démocraties modernes.

Deuxièmement, du fait les journalistes s'avèrent être le proverbial canari dans la mine. Lorsque la démocratie est attaquée, les journalistes se retrouvent souvent en première ligne de ceusses qui subissent la répression sous diverses formes. Et sinon en première ligne, le groupe sur lequel les attaques sont les plus voyantes, les plus difficiles à dissimuler.

Troisièmement, les journalistes et les médias d'information se situent à des noeuds de communications sociales. Attaquer ces noeuds provoque donc des répercussions sur l'ensemble de la société.

C'est sur ces noeuds de communications que je m'attarderai surtout dans ce texte et d'autres qui suivront. Voilà une perspective sous laquelle l'empressement dont a fait montre la classe politique québécoise à mieux protéger les journalistes de la surveillance policière ne me rassure pas du tout.

Révéler qu'on a surveillé pendant cinq ans les télécommunications de Denis Lessard revient à déclarer qu'on a surveillé les actions de toute la classe politique québécoise

La réalité à laquelle nous sommes confrontés m'apparait d'ailleurs beaucoup mieux représentée par les hésitations manifestes des gouvernement Trudeau, Gendarmerie royale (GRC) et Service canadien du renseignement de sécurité (SCRS) à nous offrir quelque garantie concrète sur ce même sujet.

Communication 101

Rappelons une évidence. Dans son expression la plus simpliste, une communication est une mise en relation entre deux personnes au minimum. Conventionnellement, on nomme ces deux personnes, Alice et Bob.

Bien sûr, une communication électronique implique bien d'autres acteurs de soutien: les fournisseurs de télécommunications, d'appareils et d'applications, notamment. J'en traiterai dans le prochain texte. Pour l'instant, concentrons-nous uniquement sur les acteurs principaux.

Si la policière Ève (autre nom conventionnel) espionne les communications d'Alice, alors elle espionne aussi Bob. En fait, Ève espionne aussi toutes les Carole, David, François, Grace et autres personnes avec qui Alice se retrouve en communication durant la période de surveillance.

Le cas Denis Lessard

Appliquons ce constat simple au journaliste Denis Lessard. On comprend alors immédiatement pourquoi Philippe Couillard a été si prompt à réagir, puis à promettre la mise en place d'une commission d'enquête publique.

Denis Lessard est journaliste et commentateur couvrant l'actualité parlementaire et politique québécoise. Son travail le met donc quotidiennement en communication avec des députés, des attachés et assistants politiques, des militants.

Or, ces communications de Denis Lessard ne se limitent surtout pas aux déclarations officielles. Loin de là ! Une très large part comporte, sous le couvert de l'anonymat, des déclarations officieuses, confidences, ballons d'essai, pistes à explorer, fuites et autres échanges concernant tout autant le propre camp de l'interlocuteur qu'un camp adverse. Ces communications sont le théâtre d'innombrables jeux discrets indispensables, non seulement au travail du journaliste, mais à l'action politique elle-même.

L'affirmation d'une immunité personnalisée n'est-elle pas un terrible leurre lorsqu'il s'agit de télécommunications ?

Révéler qu'on a surveillé pendant cinq ans les télécommunications de Denis Lessard revient donc à déclarer qu'on a surveillé les actions de toute la classe politique québécoise.

Ainsi, derrière les bannières de la liberté de presse et de la démocratie dans lesquelles se sont immédiatement drapés les membres de l'Assemblée nationale, il y a un puissant réflexe d'autodéfense des députés. D'où dès le jour des révélations, la proclamation immédiate qu'il faut que les journalistes profitent d'une relative immunité contre la surveillance policière qui soit équivalente à celle des députés.

Mais l'affirmation d'une telle immunité personnalisée n'est-elle pas un terrible leurre lorsqu'il s'agit de télécommunications ?

Qui sont les députés ?

Il est aisé d'identifier qui sont les députés, donc qui pourraient bénéficier d'une immunité relative. Les députés sont officiellement désignés par le Directeur général des élections au terme de la compilation des votes.

Les députés doivent pouvoir échapper à la surveillance arbitraire de leurs communications. Et pas seulement pour préserver le libre jeu politique nécessaire à la vie démocratique. Ils doivent également pouvoir y échapper à cause de leur rôle de médiation entre les citoyens et l'appareil d'État. Interrogez n'importe quel député. Vous apprendrez que dans leur comté ils doivent recevoir mille confidences souvent intimes sur les situations financières, sociales, médicales et souvent même psychologiques de leurs commettants.

Or, si les députés doivent jouir d'une immunité, leurs personnels politiques oeuvrant tout autant sinon plus dans le jeu politique et de la médiation citoyens-État ne le devraient-ils pas aussi ?

Et si les personnels politiques des députés, pourquoi pas les personnels des partis ?

Et si les personnels des partis, pourquoi pas les militants politiques de ces mêmes partis ?

Et si les militants des partis, pourquoi pas les personnes qui, à un moment ou un autre, font aussi de l'action politique à travers d'innombrables regroupements ou organisations parsemant la société civile ?

Toutes ces personnes exercent leur liberté d'association, d'opinion et d'action politique qui, lorsque licite, doit aussi échapper à la surveillance policière de leurs télécommunications. Et toutes peuvent aussi devenir des Bob, Carole, David, François ou Grace appelées à communiquer avec une Alice, journaliste.

Qui sont les journalistes ?

Or s'il faut garantir une relative immunité aux journalistes, qui est journaliste ? C'est une question à laquelle on se bute depuis longtemps.

Cela peut sembler évident dans le cas d'un Denis Lessard ou autre personne qui fait profession de journaliste pour un grand média comme La Presse, Radio-Canada ou Le Journal.

S'il faut garantir une relative immunité aux journalistes, qui est journaliste ?

Mais si un Patrick Lagacé qui fait professionnellement du commentaire pour un grand quotidien est considéré comme un journaliste, pourquoi pas moi qui - comme de nombreux autres - fait aussi du commentaire pour un grand quotidien même si ce n'est pas à temps plein ?

Et si moi et de nombreux autres journalistes à temps partiel, pourquoi pas les bénévoles qui publient le journal communautaire mensuel de ma municipalité de banlieue ?

Et si ces journalistes bénévoles, pourquoi pas ceusses qui tiennent blogues sur l'actualité de leur municipalité, comté ou domaine d'activité sociale ?

Toutes exercent leur liberté d'expression et d'opinion journalistique. Toutes sont autant d'Alice, journaliste, qui doivent échanger aussi avec autant de Bob, Carole, David, François ou Grace oeuvrant plus ou moins sur quelque terrain politique.

Isolation est incompatible avec communication

C'est ici que les proclamations de nos députés québécois apparaissent surréalistes en contraste avec les louvoiements des représentants du gouvernement fédéral, de la GRC et du SCRS.

Un, comment peut-on protéger la démocratie en immunisant de la surveillance policière que quelques-uns parmi tous les citoyens ?

Deux, comment même garantir une immunité relative à quelque Alice, journaliste, quand quelque Bob faisant l'objet d'une surveillance policière licite peut à tout moment établir une communication avec elle ? Ou avec quelque député ?

Trois, comment d'autant plus alors que notre propre Centre de la sécurité des télécommunications canadien (CST) participe à des opérations de surveillance de masse de la NSA ? Ou que nous savons que nos corps de police peuvent demander de surveiller les plusieurs milliers d'abonnés dont les communications sont relayées par une tour d'antenne cellulaire ?

Qu'est-ce que ces attaques sur des journalistes révèlent sur la surveillance de communications de toute personne sur laquelle ne repose aucun soupçon ?

On ne peut insoler les communications de quelques personnes en particulier. Encore moins lorsque ces personnes, journalistes ou députés, constituent des noeuds de communications intenses.

Autant dans le cas de la Russie présentement, on imagine aisément comment la démocratie est sapée par la surveillance policière généralisée des journalistes, des députés ainsi que des militants politiques ; autant il faut concevoir comment la démocratie serait tout aussi efficacement sapée si seuls les journalistes et les députés bénéficiaient d'une immunité alors que le reste de la population pourrait faire l'objet de surveillance policière de leurs communications en absence de tout soupçon d'activité criminelle.

Réalisme

Les journalistes doivent donc canaliser leur juste indignation à enquêter non seulement sur les attaques à la protection de leurs sources, mais sur comment ces attaques révèlent toute forme de surveillance de communications de toute personne sur laquelle ne repose aucun soupçon.

Quant aux députés de l'Assemblée nationale, ils ne doivent accepter qu'une commission d'enquête publique dont le mandat explorerait et résoudrait, par-delà la protection des journalistes et députés, ce contexte qui permet en pratique la surveillance des télécommunications de tous les citoyens sur lesquels ne repose pourtant aucun soupçon.

Je vous reviens sous peu sur d'autres dimensions de la même question.

Global Times
US perverse in opposing China's cyber law
Wednesday, 09 November 2016

Byline: Staff reporter

Beijing - China's top legislature on Monday passed a cybersecurity law, which drew criticism and doubts from mainstream Western media. James Zimmerman, chairman of the American Chamber of Commerce in China, accused the law of creating obstacles to foreign businesses in China and called the provisions "vague, ambiguous, and subject to broad interpretation by regulatory authorities." Some said the law is a setback to the freedom of expression as a closed-door approach. The Chinese public is tired of those hackneyed accusations.
Cybersecurity is a top priority nowadays. A country as big as China must have a cybersecurity law and clear cyber development strategies. It is understandable that big Western companies in China do not want any regulations. But it is unrealistic - how can they urge China to strengthen law enforcement on the one hand and reject the governance of authorities for their own interests on the other?

All the big powers are cautious about whether national security will be subject to cyber technologies. The US has been one of the most aggressive. It claims it is a target of the most cyber attacks from overseas and has kept the highest alert on foreign IT products. Yet the PRISM scandal reveals that the US is the very country that has no sense of rules in the cyber world. Its wiretap and cybersecurity sabotage in other countries have gone beyond international law and morality.

Whenever China passes a law, some Westerners will voice their objections. It is a twisted mentality. US companies in China and officials in Washington clearly understand the necessity of legislation in China and that the companies are subject to Chinese laws. But they seem uncomfortable when it comes to practice.

The new law requires firms to store their data in China and submit them for security reviews to move the data overseas. If such supervision has to be given up, it means China will be laid bare. Will the US allow Chinese enterprises to buy a US high-tech company, transmit all data concerning the US to China and submit them to China's security authorities?

US flagship Internet enterprises have expanded across the globe like an invincible armada, but suffered a setback in China. They attributed their failure to "unfair treatment." But China's rules are for all enterprises. If "unfair treatment" does exist, it's the opposite. Foreign Internet companies operating in China can always publish some information that is forbidden on Chinese websites.

China won't abandon the policy of opening-up. Enhancing exchanges with the outside world is one of the lifelines of China's development and progress. But foreign institutions should respect Chinese laws, and foreign governments and media should encourage such respect.

Exchanges between China and foreign countries will be a mutually beneficial and win-win process. Without a sound legal system in China, the continuous increase of communication cannot be sustained. China must take legislation into its own hands. The American habit of criticizing China's legislation under an imperialistic mind should have been changed long ago.

New York Times
Julian Assange Releases More Emails and Defends WikiLeaks' Mission
Wednesday, 09 November 2016
Byline: Steve Eder

New York - Julian Assange operates from the Ecuadorean Embassy in London, where his internet connection was recently cut off. But that has not stopped him from being one of the most significant and unusual players in the 2016 election campaign in the United States.
His WikiLeaks platform has released tens of thousands of hacked emails from inside Hillary Clinton's campaign and the Democratic National Committee, making Mr. Assange a reviled figure among supporters of the Democratic nominee and a hero to backers of Donald J. Trump.

On Tuesday morning, Mr. Assange weighed in one last time as Americans headed to the polls, releasing a statement that offered an explanation for making the leaks public, an assertion of impartiality and a defense of the WikiLeaks mission.

"The real victor is the U.S. public, which is better informed as a result of our work," Mr. Assange wrote, adding that his organization publishes information as quickly as possible and "as fast as the public can absorb it."

"This is not due to a personal desire to influence the outcome of the election," he said.

Four years ago, Mr. Assange sought and was granted asylum in the Ecuadorean Embassy in London while he was being pursued in a Swedish rape investigation, which he said was a cover for a United States effort to extradite him for publishing a trove of National Security Agency documents.

Ecuadorean officials have not sought to evict him, but last month said that his internet access was disabled out of fear that the country was being drawn into Mr. Assange's efforts to interfere with "electoral processes."

Mr. Assange's operation did not fold, but continued to publish daily releases of emails stolen from the accounts of John D. Podesta, the chairman of Mrs. Clinton's campaign. WikiLeaks published another installment on Tuesday, bringing the total number of messages made public to more than 58,000.

The Clinton campaign has declined to authenticate or comment on the emails, saying that the hack, which American intelligence officials believe originated in Russia, was part of the Russian government's efforts to meddle in the election to benefit Mr. Trump.

The emails, at times, have been embarrassing to the Clintons and their closest aides, revealing confidential and candid details about the inner workings of the campaign and the Clinton Foundation. It

has also shined a light on the Clintons' private work, including lucrative speeches for banks like Goldman Sachs.

While Mr. Assange has made no secret of his dislike for Mrs. Clinton, he said in his Tuesday statement that WikiLeaks published the emails because it had the material and, "It would be unconscionable for WikiLeaks to withhold such an archive from the public during an election."

The lack of leaks pertaining to Mr. Trump, Mr. Assange said, resulted from the fact that his organization was not in possession of Mr. Trump's information. "We cannot publish what we do not have," he wrote.

He went on to criticize The New York Times for withholding "evidence of illegal mass surveillance of the U.S. population for a year until after the 2004 election," which he said denied vital information to voters about George W. Bush.

Mr. Assange, though, has faced similar criticism, with the suggestion that the leaks of emails from the Clinton campaign and the Democratic National Committee were timed to inflict maximum damage or blunt negative stories about Mr. Trump.

A first batch of Democratic National Committee emails -- which led to renewed anger about the party's treatment of Bernie Sanders's campaign -- were released on the eve of the party's summer convention.

In the final month of the campaign, WikiLeaks unloaded the emails of Mr. Podesta, which cover a period of several years ending in the spring of 2016. The first portion of those emails were published the same day that a recording surfaced where Mr. Trump was caught on a hot microphone making lewd statements.

London Times
Brazilians suspected as GCHQ investigates Tesco cyberattack
Wednesday, 09 November 2016
Byline: Multiple reporters

London - The cyberattack on 40,000 Tesco Bank accounts "looks unprecedented", the chief City watchdog said yesterday, as it emerged that GCHQ is helping to investigate the crime.
Reports from victims pointed to Brazil as the origin of the biggest hack to strike a British bank, but the country's authorities have not yet been contacted by their British counterparts.

Tesco said that it had been hit by "a systematic, sophisticated attack" with 20,000 customers having an estimated £17 million drained from their accounts. The bank has frozen all online transactions and many customers have had their debit cards blocked.

Andrew Bailey, chief executive of the Financial Conduct Authority, told MPs that he was worried about weaknesses in banks' IT systems. He said: "The heart of the concern is what is the root cause of this and what does it tell us about broader threats."

The National Cyber Security Centre, a new part of GCHQ that tackles online crime, confirmed that it was providing "on-site assistance" to Tesco. It is working alongside the National Crime Agency to investigate.

Several customers said that fraudulent transactions were made in Rio de Janeiro. Adam Hawkins had £279 stolen in a contactless payment to a company called Parada Do Lanche. Another customer noticed four attempted transactions, two of which were successful, made minutes apart in Rio de Janeiro.

Police in Brazil said that they had not received any complaints from banks or individuals about the cyberattack, and were unaware of any action being taken to investigate. Few in Brazil will be surprised that the country is suspected of being the source of the attack because it is ranked second -- after Russia -- for the number of cyberattacks carried out from its soil.

The problem has become so chronic that many foreign tourists have trouble withdrawing money from cash machines because British banks often register such transactions as automatically suspect. Many others have their credit cards cloned and money siphoned from their accounts.

Brazilian legislators have been slow to respond to the threat, and lenient penalties for hacking do little to deter cybercrime. Hackers can expect prison sentences of less than a year if caught, compared with sentences of up to ten years and hefty fines in America.

Having originally bought hacking software from eastern Europe, Brazilians have developed their own tools to clone credit cards, break into online banks and carry out phishing attacks. In 2015 Brazilian banks lost more than £440 million to online fraud, though many companies are reluctant to report figures for fear of losing consumer confidence, experts say.

Tesco Bank declined to provide more details of the attack and did not respond to requests to comment on whether all customers had been refunded.

Behind the story

Brazil is surfing the global cybercrime wave, with weak legislation and enforcement creating a hacker's paradise where online pirates siphon billions from the world economy (James Hider writes).

The Igarape Institute, which studies crime in Latin America, said last year that cybercrime rose by 197 per cent in 2014, while data theft accounted for up to $4.7 billion in 2013.

Online security experts have identified some hackers posting videos of themselves on YouTube rapping about their crimes with lyrics such as: "We steal from the rich, like Robin Hood."

Poor security has been compounded by the fact that Brazilians are among the most dedicated web users in the world. Almost half of the country's banking transactions are online. Suspicious sites grew by 83 per cent before the Olympic Games.

Associated Press
US official: Security controls 'working' despite NSA theft
Wednesday, 09 November 2016
Byline: Staff report

Washington - The top U.S. counterintelligence official announced that secret government data is vulnerable to thieves, such as the National Security Agency insider accused of working undetected for more than 20 years to steal a large trove of classified material, even as he defended the security controls put in place after the Edward Snowden theft.
"I believe the reforms are working very well. I think we've done an amazing job in the intelligence community and across the government in executing our reforms," said Bill Evanina, the chief counterintelligence and security adviser to the national intelligence director. "However, I will say that if someone wakes up tomorrow and they make a decision that they're going to steal data from the government, they will be successful at it."

Evanina told The Associated Press in a recent interview that no matter how good security controls are, they will never catch every insider or hacker -- and they must be continually improved because of technological advances. His extensive comments followed the August arrest of former NSA contractor Harold Thomas Martin III, 51, of Glen Burnie, Maryland. Martin remains in custody after a judge deemed him to be a flight risk.

Federal prosecutors said Martin illegally removed highly classified information, storing it in an unlocked shed, hi car and his home. Court documents say investigators seized, conservatively, 50 terabytes of information, or enough to fill roughly 200 laptop computers.

Evanina said that since the Snowden breach in 2013, enhanced efforts to counter insider threats in the nation's spy shops have not only uncovered improper activity and situations ripe for possible breaches but have identified employees who might need help. He would not detail the activity uncovered.

Yet there are indications the government might have missed red flags in Martin's personal life. Prosecutors have alleged that he had a binge-drinking habit -- Maryland court records show a 2006 drunken driving charge involving someone of the same name -- and kept firearms concealed from his wife. Defense lawyers said Martin, who like Snowden had worked as a Booz Allen Hamilton contractor, had mental health issues that contributed to him being a "compulsive hoarder" over the course of two decades.

National security breaches have evolved in recent years from unearthing moles working for foreign governments to stopping intelligence workers before they leak or share documents with journalists, Evanina said.

Things changed with Chelsea Manning, a former intelligence analyst in Iraq, who was sentenced to 35 years at the military prison in Leavenworth, Kansas, for leaking more than 700,000 secret military and State Department documents to Wikileaks.

"It was a leak," he said. "It was a big sea change for us."

After Manning, President Barack Obama issued an executive order setting up a National Insider Threat Task Force and requiring federal agencies that handle classified material to seek out possible double agents or prospective leakers.

Then came Snowden, a man Evanina likens to a "shop vac."

"Snowden raised the bar and provided a new level of vulnerability of big IT systems," Evanina said. "Again, it was leaking."

Most of the technological reforms came after Snowden, but others have been in place for several years.

Evanina said agencies are continuously monitoring key indicators like a slowed career, divorce or bankruptcy that could signal a stressed or disgruntled employee on the brink of installing malware, sneaking out with classified material or showing up at work with a weapon.

He shuns requiring body or package searches that would damage trust built with some 4 million Americans who hold security clearances, including 1.3 million vetted to handle top-secret materials.

"We have to weigh: 'How do we garner trust without being "A Clockwork Orange" or "Big Brother"?' " Evanina said, referring to a futuristic movie about behavioral modification and George Orwell's novel "1984" where every citizen is under surveillance.

V. Miller Newton, chief executive officer of PKWARE, cited a Government Accountability Office report that said the number of security incidents at federal agencies rose from 5,503 to 77,183 between fiscal 2006 and fiscal 2015. That's a 1,303 percent increase.

"The fact that this is not the centerpiece of these [presidential debates] is really disturbing to me," he said.

James Lewis, an internationally recognized expert on cybersecurity, said Martin should not have been able to get the material out of the building where he worked.

"Part of what the expanded monitoring would have done is notified NSA that someone was downloading material," he said. "It might have worked. Maybe it notified them. We don't know. I kind of doubt it, but that would be the happy-face story."

Tribune de Genève
« Nous détectons plusieurs cyberattaques par mois »
Wednesday, 09 November 2016
Byline: Journaliste maison

Berne, Suisse - Le chef de la division informatique du Service de renseignement de la Confédération (SRC)dévoile les coulisses de la traque aux pirates informatiques
C'est lui qui repousse les cyberattaques pour le Service de renseignement de la Confédération (SRC). Et qui, depuis que la Suisse a voté oui à la nouvelle Loi sur le renseignement, peut aussi contre- attaquer. Nous rencontrons le chef de la division informatique du SRC au siège du Service de renseignement, dans la banlieue de Berne. C'est la première fois qu'il accorde une interview - sous couvert d'anonymat. Après avoir déposé carte d'identité et téléphone portable à l'entrée, nous pouvons commencer l'interview. Notre interlocuteur est un homme avenant d'à peine plus de 40 ans, qui ne correspond ni au cliché de l'agent ni à celui du génie de l'informatique. Auparavant dans le secteur privé, l'homme travaille « depuis longtemps » pour le SRC. Sous l'oeil vigilant de la responsable de la communication, le chef de la division informatique répond sans ambages - mais s'arrête immédiatement lorsqu'il est question de détails opérationnels.

La nouvelle Loi sur le renseignement a été clairement acceptée. Qu'est-ce que cela signifie pour votre division?

Jusqu'à présent, nous nous heurtions à des limites lorsque nous avions affaire à une cyberattaque. Prenez l'incident survenu au cours des pourparlers sur le programme nucléaire iranien en 2015 à Genève. Nous avons enregistré une attaque menée avec un virus informatique contre des systèmes informatiques d'hôtels de luxe. Ainsi, il est, par exemple, possible d'écouter des appels téléphoniques. Nous avons pu détecter l'attaque et identifier le logiciel malveillant. Mais, à l'époque, il nous manquait la base légale pour obtenir davantage d'informations sur les auteurs de l'attaque. Nous n'avions pas l'autorisation de pénétrer dans le réseau informatique ennemi pour y recueillir des informations et, si nécessaire, prendre des contre- mesures.

Allez-vous désormais rattraper cela?

La nouvelle loi n'entrera en vigueur que le 1er septembre 2017. Quant aux questions opérationnelles, nous ne donnons aucune information. Lorsqu'un Etat étranger se cache derrière une cyberattaque, une contre-attaque de notre division peut rapidement dégénérer. C'est pourquoi ces opérations sont strictement réglementées. De toute façon, il faudrait d'abord examiner toutes les solutions possibles avant de demander la permission d'entrer dans un système ou un réseau informatique à l'étranger afin

d'y perturber, prévenir ou ralentir l'accès à des informations, comme le prévoit la loi. L'approbation du Conseil fédéral serait nécessaire. Le ministre des Affaires étrangères, qui est responsable des bonnes relations avec l'étranger, devrait également donner son consentement avant que nous puissions commencer.

Avez-vous le droit d'engager des contre-attaques contre des ordinateurs situés en Suisse?

Non. En Suisse, nous pouvons uniquement pénétrer dans des ordinateurs lorsqu'une menace grave et concrète existe et lorsque les investigations des services de renseignement ont jusque-là été infructueuses. Et il nous faut également l'approbation du Tribunal administratif fédéral et du ministre de la Défense. Les contre-mesures ne sont toutefois pas autorisées quand il s'agit de collecter des informations.

L'existence d'attaques ou de menaces est- elle impérative? Ou pouvez-vous pénétrer de votre propre initiative dans des ordinateurs?

Comme je l'ai indiqué, cela est autorisé à l'intérieur du pays uniquement en cas de grave menace. A l'étranger, cette exigence n'est pas obligatoire. Cependant, nous collectons uniquement des informations dans les domaines de l'espionnage, de la prolifération et du terrorisme. Les obstacles sont majeurs: pour une telle opération à l'étranger, la Cour administrative fédérale, les ministres de la Défense et des Affaires étrangères ainsi que la ministre de la Justice doivent donner leur consentement.

Combien d'opérations par an - que ce soit de collectes d'informations ou de contre-attaques - menez-vous environ?

Ces opérations sont rares. Au SRC, nous prévoyons un total de dix à douze cas par an où des mesures de collecte spéciales sont employées. Dans le même temps, nous détectons tous les mois plusieurs cas de cyberattaques informatiques dans les domaines de l'espionnage, de la prolifération et du terrorisme.

Qui est la cible de ces attaques?

On a appris l'attaque contre la société d'armement RUAG, que nous avons découverte en janvier. Mais la Genève internationale, la place bancaire ou encore de plus petites entreprises qui offrent des technologies intéressantes constituent également des cibles.

Aidez-vous des particuliers à se défendre contre une cyberattaque?

Dans le cadre d'un programme de prévention, le SRC est en contact avec diverses entreprises. Il s'agit également de protéger ces entreprises contre les cyberattaques. Lorsque nous détectons des attaques, nous abordons les sociétés. En principe, le SRC est compétent lorsque des autorités publiques de l'étranger sont soupçonnées d'attaquer les intérêts suisses. Il peut ainsi s'agir d'attaques contre des

infrastructures essentielles, d'attaques contre des grandes banques ou des individus s'ils présentent un intérêt particulier pour un Etat étranger.

Comment procédez- vous lorsque vous apprenez une telle attaque?

En règle générale, nous obtenons une première information. Nous l'examinons et nous nous appuyons sur diverses sources. Nous essayons ensuite d'identifier les réseaux informatiques des assaillants. D'où l'attaque a-t-elle été lancée? Où se trouvent les serveurs? Comment l'attaque s'est-elle exactement déroulée? A- t-elle laissé des traces? Nous analysons l'identité de la victime - y a-t-il ici un modèle, une victimologie? Cela peut permettre de tirer des conclusions sur les motivations de l'assaillant et donc sur l'assaillant en lui-même.

Et quand vous avez identifié l'assaillant?

Si ce sont des autorités publiques, le Conseil fédéral doit décider de la façon de réagir. Le spectre s'étend de la diplomatie à la possibilité mentionnée précédemment d'une cyber-contre-attaque.

Pour vos opérations, vous avez également besoin de logiciels malveillants. Où achète-t-on ces chevaux de Troie d'Etat?

Il y a des fournisseurs sur le marché. Nous disposons en outre des ressources nécessaires pour développer nous-mêmes ces logiciels. Cela dépend de la nature de nos besoins dans un cas concret.

Les possibilités accrues offertes par la nouvelle Loi sur le renseignement impliquent aussi un plus grand besoin de personnel. Comment votre division va-t-elle se développer?

Le Conseil fédéral a spécifié dans son message relatif à la nouvelle loi que le SRC créerait au total 15,5 nouveaux emplois. Nous ne détaillons pas davantage ce chiffre dans la mesure où cela permettrait de tirer des conclusions au sujet de la taille de notre division. Je peux toutefois affirmer que, chez nous comme dans d'autres divisions du SRC, des agents de collecte d'informations et des analystes exploitent ces informations. Les analystes techniques dont nous avons besoin dans le domaine informatique, comme par exemple pour l'analyse de logiciels malveillants ennemis, constituent une des particularités de notre service.

Où trouvez-vous vos collaborateurs? Vous avez besoin de génies de l'informatique qui maîtrisent le piratage, mais qui sont aussi tenus au plus grand secret.

Nous annonçons régulièrement les postes à pourvoir. Avant que nous n'embauchions un candidat, celui-ci doit passer le test de sécurité le plus élevé qui existe pour les employés fédéraux. Ce test est effectué par la Division de la protection des informations et des objets (DPIO) du Département de la défense. La vie privée du candidat est également passée au crible, pour voir s'il est, par exemple, vulnérable au chantage. Nous sommes en mesure de choisir parmi un grand nombre de candidatures qualifiées.

Des services secrets étrangers recrutent des collaborateurs lors de championnats de hackers. Le faites-vous également?

Non, nous ne faisons pas cela. L'idée que nous sommes à la recherche du jeune génie de l'informatique au visage blafard qui passe la journée dans sa cave et pirate des ordinateurs est fausse. La cybersécurité est un domaine hautement professionnel avec des spécialistes bien formés et expérimentés. Ce sont des gens qui travaillent par exemple dans la cyberdéfense pour une institution financière ou qui effectuent des recherches dans une université.

Et ces personnes passent tout d'un coup dans le service secret?

Toute personne qui travaille chez nous contribue à la sécurité du pays et se dévoue à la défense contre des dangers réels. C'est un défi que de nombreux spécialistes aiment relever.

En 2012, un collaborateur du SRC a volé une grande quantité de données secrètes qu'il voulait vendre. Il a été démasqué par hasard. Comment éviter de tels incidents?

Nous ne donnons aucune information sur les mesures de sécurité internes - à l'exception du fait que les collaborateurs doivent passer périodiquement le contrôle de sécurité, même après une embauche. Vous pouvez cependant vous assurer que les leçons ont été tirées de cet incident.

Ne craignez-vous pas que l'un de vos collaborateurs ne devienne un jour un Edward Snowden suisse et ne dévoile les rouages internes?

J'ai entièrement confiance en mes collaborateurs.

Vos collaborateurs peuvent-ils dire à leur entourage qu'ils travaillent au Service de renseignement?

Dans le monde extérieur, ils disent généralement qu'ils sont employés par le Département de la défense, ce qui est également vrai. Nos collaborateurs doivent signer un accord stipulant qu'ils restent tenus au secret après avoir quitté le service et qu'ils n'ont pas le droit de transmettre des informations classifiées. Auquel cas ils sont passibles d'une peine. Ils peuvent en outre devenir des cibles pour les services de renseignement étrangers si le nom de l'employeur pour lequel ils ont travaillé est divulgué publiquement.

Vous menez donc la vie classique d'un agent qui ne peut dire à personne ce qu'il fait toute la journée?

Ce serait exagéré, nous ne menons pas une double vie. Ma femme sait, par exemple, où je travaille et ce que je fais. Mais, en règle générale, je discute avec elle d'autres sujets que mon travail. (Rires.)

Le site officiel d'information pour émigrer au Canada ne répond plus (Canada)
Wednesday, 09 November 2016
Byline: Journaliste maison

Ottawa - L'origine précise du plantage n'est pas connue mais pourrait être liée à une surcharge de connexions alors que la victoire de Donald Trump devenait de plus en plus crédible.
Alors que les premiers résultats de l'élection présidentielle américaine donnaient Donald Trump favori face à Hillary Clinton , mercredi 9 novembre, de nombreux internautes ont constaté que le site d'information officiel du gouvernement canadien pour émigrer au Canada n'était plus accessible.

L'origine précise de ce plantage n'est pas connue mais est vraisemblablement liée à une surcharge de connexions. Elle coïncide avec une légère hausse du nombre de recherches sur Google aux Etats-Unis pour l'occurrence «déménager au Canada» , remarquée sur Twitter par un chercheur du MIT, Erik Brynjolfsson.

La tendance avait déjà été constatée par Google au moment des victoires de Donald Trump lors des primaires républicaines, en mars. La blague de «déménager au Canada» en cas de victoire du candidat républicain à la Maison Blanche était ensuite devenue récurrente. Sur le Gawker, un Américain étant parti au Canada après la victoire de George W. Bush en2000 donnait même quelques conseils pour y parvenir .

Le site d'information Quartz y a répondu quelques jours avant l'élection en rappelant que le Canada dirigé par Justin Trudeau n'était pas forcément lehavre de paix idéal que les Américains pouvaient se plaire à imaginer. Le maire de Montréal a néanmoins annoncé, alors que la victoire de Donald Trump devenait de plus en plus crédible, que les bureaux d'intégration des nouveaux arrivants allaient rester exceptionnellement ouverts pour la journée:

Al Jazeera
Opinion: Under surveillance in Russia
Wednesday, 09 November 2016
Byline: Roman Dobrokhotov

Towards the end of September, I received a few emails from Google informing me that someone tried to break into my email. It was not the first time I had received messages like that, so the first thing I did was check the email address from which they were sent.
Users who are not careful might miss the fact that these email addresses only vaguely look like real ones: one email came from no-reply@accounts.google.com.mail.com, and another from: no-reply@accounts.google.com.yandex.com. The links in the emails led to phishing websites made to look like Gmail and if I had put my password there, hackers would have gained control over my email.

In late September and early October, dozens of other Russian journalists, activists and workers in NGOs such as Transparency International received similar phishing emails. This is the biggest wave of hacking attacks on dissidents in Russia so far, but by far not the first one.

I have been encountering such phishing emails since 2014 and it is not a secret who is behind them. Back then in 2014, the hacking group which was behind such attempts was known as Pawn Storm; today after the attacks on the servers of the US State Department, this group has become known as Fancy Bear.

Just in case, I sent the emails to four different organisations dealing with cyber security and they confirmed that they originated from Fancy Bear/Pawn Storm.

This is the group that regularly attacks people and institutions of interest to the Kremlin: from Russian opposition politicians and journalists, to NATO and US political organisations.

Even the support services of Gmail think that there are connections between these hackers and the government. They sent me and other journalists a warning that our emails have been targeted by "state-sponsored attackers".

They are attacking not just email accounts, but also various messengers. For example, the Telegram accounts of two Russian activists - Grigory Alburov and Oleg Kozlovski - were hacked. The perpetrators managed to break in by intercepting the SMS confirmation sent through the mobile operator.

Some internet companies have also actively been cooperating with the Federal Security Service (FSB) and the General Administration for Combating Extremism.

Those companies who do not cooperate with the FSB start facing problems. It was resistance to the FSB demanding access to the social networking site Vkontakte that resulted in its founder, the Russian businessman Pavel Durov, leaving his post as chief executive of his company and departing from Russia for good.

He lost his company, but he did gain quite a reputation. That's why many Russian and other opposition activists and journalists use his encrypted messenger, Telegram, which you can use to avoid getting hacked by choosing the double authentication setting.

We have long got used to the idea that our emails are being read, our phone conversations tapped, and our finances and travels abroad followed. That's why with every passing year, journalists, activists and NGO workers are getting more and more informed about questions of cyber security.

Instead of a regular phone, we use the app Signal; instead of regular SMS, we use Telegram; we buy plane tickets at the last minute; and we always think of which photo we should and should not post on social media.

Members of the political opposition often get stopped at the border; usually they just get interrogated, but sometimes it goes beyond that. For example, in the case of one activist who was going to a conference abroad, a page was ripped from his passport, which invalidated it and he couldn't travel.

I was on a watch list for a while. It would happen that during a regular train ride, I would be approached and taken to a local police station for a "preventative chat". It would be a completely meaningless action whose only purpose was to make me understand: "We are watching you closely."

But these days, state surveillance has been expanding beyond spying on the usual suspects. Most recently, under the guise of a sociological study, a survey was carried out in Russian universities to probe protest activity and readiness. The organiser of the survey admitted that the information on all students who showed opposition attitudes were submitted to the authorities.

The state is not even trying to hide the extensive surveillance over its citizens. State TV and websites regularly release "leaks" discrediting public figures; they are usually obtained through email hacks, phone tapping and hidden cameras, like in the case of the sex tape of the leader of PARNAS Party Mikhail Kasyanov - which was shot without his knowledge.

Sometimes these "leaks" contain genuine information, sometimes they are fabricated and sometimes both. For the first time since Putin came to power, the standard of living in Russia has started to deteriorate due to the drop in oil prices.

The latter happened with opposition leader Alexei Navalny, whose financial documents were published online by hackers. But before posting on the internet, hackers changed some of the information to make it look like he gets money from the Soros Foundation.

Sometimes the purpose of these hacking attacks is not to discredit, but to get inside information. For example, after the phishing attack in 2014, many activists from the "Solidarnost" political movement found out that their email accounts had been set up to forward their correspondence to an unknown email address.

They noticed the hack by chance and it is possible that there are some people who still do not know that their emails are being forwarded to someone else. This is a much faster way to obtain information than setting up surveillance and wire-tapping.

Naturally, the latter methods are still used. Those activists and journalists, who the Kremlin finds particularly unpleasant - like those who cooperate with exiled Russian businessman Mikhail Khodorkovsky - often notice that they are followed in the streets.

The authorities also don't necessarily hide the fact that they follow activists. Perhaps the goal is to scare just them. After all, not everyone is ready to continue work under such pressure.

Of course, the good old snitching methods are also being used, and opposition movements and parties often find informers within their ranks. Some have even found "bugs" in their offices, as was the case with the Navalny's anti-corruption fund.

This type of surveillance tells the opposition figure (or the journalist) that he is a person of interest. Everyone knows what this means. In the best case scenario, you could be thrown in jail; in the worst - you would end up like Boris Nemtsov - shot dead in the streets of Moscow.Unsurprisingly Nemtsov's phone was also tapped and tapes were published in pro-Kremlin publications before his murder.

People don't feel safe - even abroad. Recently, a number of Russian dissidents living abroad have faced the same set-up. Some individuals in their host countries complain to the local authorities about them, accusing them of paedophilia or possessing child pornography and so the local authorities start an investigation. Even if the accusation is not confirmed, the individual is discredited. This is what happened with the dissident Vladimir Bukovsky, who was supposed to give testimony in the Alexander Litvinenko murder case.

All these instruments - following, threatening and campaigns for discrediting - are typical of the Soviet times and, of course, they are well-known to Vladimir Putin as a former KGB agent.

But why is it specifically in the past few years that we see this intense activity of the secret services in controlling public sentiments?

The reasons are several and the main one is economics. For the first time since Putin came to power, the standard of living in Russia has started to deteriorate due to the drop in oil prices. Sanctions are exacerbating the situation.

According to the official statistics, the number of people living under the poverty line has increased over the past year and a half to 23 million people, while the proportion of the population which spends all of their money for food has almost doubled from 22 percent to 41 percent.

Some commentators have objected, saying that not everything is "so bad" since there are no mass protests. Regardless of that, the state over the past few years has done everything to rein in independent media and political movements. It seems all this surveillance and intimidation is working quite well.

Roman Dobrokhotov is a Moscow-based journalist and civil activist. He is the editor-in-chief of The Insider.

Press Trust of India
India trying to fix hacked websites of seven of its embassies

Wednesday, 09 November 2016

New Delhi - Indian officials were trying on Tuesday to restore the websites of seven Indian embassies in Europe and Africa that were hacked and had data dumped online.
The security of the websites of Indian embassies in Italy, Switzerland, South Africa, Libya, Malawi, Mali and Romania was breached by hackers who identified themselves to the media as Kaputsky and Kasimierz L.

"We are aware of the problem and are trying to fix it," External Affairs Ministry spokesman Vikas Swarup told reporters.

Attempts were being made to track the IP addresses of the hackers, who posted online the names, email addresses, phone numbers and passport numbers of some embassy staff members.

Several Indian websites have come under attack this year. Last month, Pakistan-based hackers targeted more than 7,000 Indian websites after India launched a series of attacks on terror camps in Pakistan. Also in October, the security of around 3.2 million debit cards in India was breached when hackers inserted malware through an ATM network.

Hackers Can Abuse LTE Protocols to Knock Phones off Networks
Wednesday, 09 November 2016

Tehran - When you travel between countries, the mobile operators that temporarily provide service to your phone need to communicate with your operator back home. This is done over a global interconnection network where most traffic still uses an ageing protocol, called SS7, that's known to be vulnerable to location tracking, eavesdropping, fraud, denial of service (DoS), SMS interception and other attacks.
With the advance of Long-Term Evolution (LTE) networks, some roaming traffic is switching to a newer protocol, called Diameter, that's more secure than SS7 in theory, but which still allows for attacks if it's not deployed with additional security mechanisms.

For example, the Internet Protocol Security (IPsec), a secure communications suite that works by authenticating and encrypting each IP (Internet Protocol) packet, has been standardized for Diameter. But while its implementation is mandatory, its use is optional.

In practice, IPsec is rarely used on the global interconnection network for various reasons and this means that many of the attacks that are possible with SS7 are also possible or have equivalents in Diameter, according to researchers from Nokia Bell Labs and Aalto University in Finland.

The researchers ran experiments on a test network set up by an unnamed global mobile operator and simulated attacks launched from Finland against UK subscribers. They found several methods of disrupting service to users, temporarily and permanently, and even a method that could affect important nodes that provide service to entire regions. The results were presented Friday at the Black Hat Europe security conference in London.

First off, attackers would need to gain access to this private interconnection network (IPX) in order to attack another operator's systems or subscribers. However, this is not hard to achieve, as multiple incidents have shown in the past, and there are different ways to do it.

Attackers could, for example, pose as a virtual network operator and get access to the roaming network through an existing operator. They could also hack into one of the nodes run by existing operators, some of which are, sadly, accessible from the internet, when they shouldn't be.

If the attacker is actually a government, it could leverage its power over local operators to gain access through them. And if that doesn't work, bribing an employee from an operator is also an option.

Finally, access could be bought from other hackers that already have it. There have been services on the "dark" market that sold access to this network and there will probably be more in the future.

An operator's LTE network is made up of cell towers; nodes called MMEs (Mobility Management Entities) that provide session management, subscriber authentication, roaming and handovers to other networks; and a home subscriber server (HSS), the crown jewel that holds the master subscriber database. At the edge it has Diameter Edge Agents (DEAs), which serve as links to the interconnection network via IPX providers.

In order to pull off any attack on telecom networks, attackers need to know the victim's international mobile subscriber identity (IMSI), a unique number that's stored in the subscriber's SIM card. The researchers showed that attackers can easily obtain this number once they're on the IPX network by masquerading as a Short Message service center (SMSC) that's trying to deliver a text message to a phone number.

The attackers only need to know the victim's phone number in international format -- this is known as the Mobile Station International Subscriber Directory Number (MSISDN) -- and the DEA of the victim's operator. They can then send a routing information request through the DEA to the operator's HSS, which will respond with the subscriber's IMSI as well as the identity of the MME the subscriber is connected to. This provides the information needed to launch future attacks.

Such an attack involves the attackers masquerading as a partner's HSS and sending a Cancel Location Request (CLR) message to the victim's MME. This will cause the MME to disconnect the subscriber.

CLR messages are used on a regular basis inside the network when subscribers switch from one MME to another because of a change in location. However, the interesting aspect of this attack, aside from forcing an MME to detach a subscriber from the network, is that when the subscriber re-attaches, their device will send 20 different messages to the MME.

This amplification effect might pose risks to the MME if, for example, attackers force the detachment of hundreds of subscribers at the same time, although the researchers didn't test how many messages it would take to overload an MME. If an MME becomes unresponsive it would be bad, because there are only a few of them in a network and they serve large areas.

A second DoS technique devised by the researchers involves impersonating an HSS and sending an Insert Subscriber Data Request (IDR) to the victim's MME with a special value that means no service. This will permanently detach the user from the network because their subscription will be changed in the MME's records. Recovering from this can take a long time because the subscriber needs to call his mobile operator and sort out the situation.

The researchers also showed two other DoS techniques involving other types of Diameter messages, but they're only temporary as the user can recover by restarting their mobile device.

People seem to think that all will be better with LTE and Diameter, but in reality it will be different, not better, if mobile operators don't take additional security measures, said Silke Holtmanns, a security specialist with Nokia Bell Labs, during her talk at Black Hat Europe.

According to her, deploying IPsec is hard because not all traffic on the IPX network uses the Internet Protocol, and maintaining the kind of large public key infrastructures required by IPsec is costly for operators in developing countries. Nodes are also difficult to upgrade, and then there's the tough question of who should be in charge of creating and hosting the root certificates required by IPsec, which is likely to cause disputes between countries, she said.

And even if IPsec somehow becomes widely used, it still doesn't protect against attacks launched with the help of hacked nodes, rented network access, bribed employees or governmental ties, because these methods abuse legitimate access to the network.

According to the researchers, the best defense is a combination of measures. Operators should monitor the traffic on their networks and the traffic of their tenants and they should filter messages at their DEAs by using signaling firewalls. They should also harden their nodes, share their security experiences with other operators and put business rules in place so they can efficiently deal with misuse.

Asharq Al-Awsat
Saudi Arabia Launches Program to Limit Internet Usage, Enhance Information Security Level
Wednesday, 09 November 2016

Byline: Fahd Baqmi

Jeddah - The Ministry of Communications and Information Technology has announced a project to limit the internet consumption in the country and to enhance the level of information security. The ministry also announced operating a new extension for internet.
Experts in the Information Technology told Asharq al-Awsat that this step aims at raising awareness towards the dangers of information security, coordinating efforts in the field of cyber security and increasing confidence in cyber dealings.

Security Advisor Professor Yusuf al-Rumaih said that this procedure is to protect the social and economic system of the country from insecure hacking especially amidst the internet criminal organizations exploitation to reach for individuals in target such as teenagers and the youths.

The number of spam messages sent daily on the social network websites is estimated as more than 100,000. They basically encourage chaos and jihad. Security Consultant and Researcher Professor Ali al-Khashaiban said that focusing on information security is one of the basic steps that protect the society from any violations on the security and mental levels.

According to official warnings, the offenses against governmental bodies and huge companies seek coding websites through spreading malice viruses--this fact pushed parties to send warning letters for devices users to avoid falling for these attempts.

The spying program includes sending messages via the social network websites--however if users examined the messages carefully then they can deleted them and avoid the damage.

London Daily Telegraph
GCHQ to investigate Tesco bank hack
Wednesday, 09 November 2016
Byline: Ben Martin

London - TESCO has enlisted the help of GCHQ, the spy agency, to assist its investigation of what is the most serious cyber attack launched against a British bank.
The supermarket chain contacted the National Cyber Security Centre (NCSC), a new part of GCHQ that tackles crime online, after it learned of the theft at the weekend at Tesco Bank, in which money was taken from about 20,000 current accounts.

The NCSC has been providing "on- site assistance" to the company. It is working alongside the National Crime Agency to investigate the attack. Tesco Bank confirmed on Monday that it had detected "online criminal activity" in 40,000 current accounts and that money was taken from half of them.

Chris Philp, an MP on the Commons Treasury select committee, has suggested the theft could have been "state- sponsored".

Andrew Bailey, the chief executive of City watchdog the Financial Conduct Authority, told the committee yesterday that the attack against the lender "looks unprecedented in the UK".

The bank said last night that normal service had resumed after the suspension of online transactions from the affected accounts and that personal data had not been compromised.

Agence France-Presse
Terrorisme: Interpol dénonce le manque de partages de données biométriques entre Etats
Wednesday, 09 November 2016
Byline: Journaliste maison

Lyon - Le secrétaire général d'Interpol Jürgen Stock a dénoncé mercredi l'insuffisant partage entre Etats de données biométriques susceptibles de permettre d'identifier plus efficacement les terroristes. L'organisation de coopération policière estime qu'"environ 15.000 combattants se trouvent dans les zones de conflit et qu'un nombre indéterminé d'entre eux pourrait rentrer dans leur pays d'origine pour (...) s'engager dans des opérations clandestines".

L'assemblée générale d'Interpol, qui était réunie à Bali (Indonésie), a souligné "l'urgence à traiter cette menace", écrit-elle dans un communiqué.

"Bien que le partage d'information via Interpol ait permis aux organisations nationales de maintien de l'ordre d'empêcher des terroristes et des candidats terroristes de voyager, le manque de données biométriques reste un maillon faible", déclare M. Stock, cité dans un communiqué de l'organisation.

"Ne pas fournir aux agents en première ligne les informations dont ils ont absolument besoin pour identifier les terroristes de retour de zones de conflit, c'est leur bander les yeux, les obliger à faire leur travail avec une main attachée derrière leur dos", estime-t-il.

Le patron d'Interpol souligne que les informations biométriques destinées à l'identification, telles que les empreintes digitales et l'ADN, sont "cruciales" dans le contexte actuel.

"Bien qu'Interpol dispose actuellement d'informations sur près de 9.000 combattants terroristes étrangers - dont certains présents dans les zones de combat - moins de dix pour cent de ces fichiers comprennent des données biométriques ou des images en haute résolution qui pourraient être utilisées pour une reconnaissance faciale", ajoute l'organisation.

Interpol cite notamment l'exemple d'une opération menée par une de ses structures dédiées dans une prison malienne, qui a permis d'identifier un prisonnier sous un faux nom alors qu'il était recherché par

l'Algérie pour une attaque terroriste. Les empreintes digitales d'un second prisonnier ont également permis d'identifier celui-ci comme étant l'un des auteurs de l'attaque de Grand-Bassam en Côte-d'Ivoire en mars 2016.

Jakarta Post
Second day of Interpol conference addresses war against terrorism, cyber crime
Wednesday, 09 November 2016
Byline: News Desk

Jakarta - Country delegations and experts have highlighted the importance of a stronger international partnership to combat terrorism and cyber crime on the second day of the 85th Interpol General Assembly in Nusa Dua, Bali.
National Police spokesperson Sr. Comr. Martinus Sitompul said that in Tuesday's sessions, the delegations discussed efforts to fight against terrorism and cyber crime.

"We discussed Interpol strategies to combat terrorists and cyber crime perpetrators," he said as quoted by kompas.com at the Bali Nusa Dua Convention Center.

Martinus said several other topics related to global threats were also discussed, including organized crime, such as drug smuggling and money laundering, and other transnational problems. The 2016-2020 Interpol presidential election plan was also discussed in the meeting.

As reported earlier, Interpol president Mireille Ballestrazzi will end her term of office this year. The election of the new Interpol president is scheduled on the last day of the conference on Thursday.

Martinus further said that on Tuesday, all delegations had begun to compile a road map toward 2020. "Interpol will also compile a 2017-2020 action plan for the new leadership," he said.

On the first day of the conference, the delegations discussed basic principles of an Interpol partnership. They agreed that there was a need in each country to gather information.

"So there has been an awareness to share information. Geometric data becomes a guideline in identifying potential threats," said Martinus.

More than 1,300 participants from 162 countries are attending the four-day conference on terrorism and transnational crime, which will end on Thursday.

Newsweek
What a Trump Presidency Means for Cybersecurity, Net Neutrality and Internet Freedom
Thursday, 10 November 2016
Byline: Anthony Cuthbertson

New York - When billionaire entrepreneur Peter Thiel bucked the trend of Silicon Valley by throwing his cash and support behind Donald Trump, Mark Zuckerberg had some explaining to do.
As one of Facebook's board members, Thiel's move sparked criticism among the ultra liberal tech community of California. "There are many reasons a person might support Trump that do not involve racism, sexism, xenophobia or accepting sexual assault," Zuckerberg, who launched Facebook in 2004, wrote in an internal company memo.

While Trump's views on building walls and lack of belief in climate change are well documented, the president elect's stance on the issues that will directly affect technology firms, and by extension, much of the world are less obvious.

Trump has promised to immediately make cybersecurity a top priority, citing concerns about cyberattacks from the likes of China and North Korea. His written policies on cybersecurity are summed up in four bullet points that lack any concrete detail, but include the promise to develop cyber weapons.

It states: "Develop the offensive cyber capabilities we need to deter attacks by both state and non-state actors and, if necessary, to respond appropriately."

According to Uri Rivner, head of cyber strategy at biometrics firm BioCatch, Trump will take such threats seriously and combating them will be high on the future administration's agenda.

"Cyber threats to both critical infrastructure and financial systems are just the sort of clear and present danger that requires decisive action--the likes of which the president elect has been advocating," Rivner tells Newsweek . "This in turn may lead to more aggressive cyber security policies, faster response to cyber attack campaigns, and greater investment in cyber security defenses."

It remains unclear how clued up Trump is on the actual issues and specific threats facing his administration. On the occasion that he has vocalized his thoughts on cybersecurity, there is little to suggest a clear or informed perspective.

This is what Trump had to say at the first debate with Democratic nominee Hillary Clinton: "I have a son. He's 10 years old. He has computers, it's unbelievable. The security aspect of cyber is very, very tough. And maybe it's hardly doable."Barron Trump to head his father's administration on cybersecurity, anyone?

Net Neutrality and Internet Freedom

Trump's anti-regulation stance may well have an effect on internet service providers and the Federal Communications Commission's rules on net neutrality--the principle that Internet Service Providers should treat all internet traffic equally..

In 2014, Trump described the rules as an "attack on the internet" by President Obama, suggesting he may roll back the rules once in office.

Trump has also said that in the event of a cyber war, he would close parts of the internet. "When you look at what ISIS is doing with the internet, they're beating us at our own game," Trump said during the first debate."I would certainly be open to closing areas where we are at war with somebody. I sure as hell don't want to let people who want to kill us and kill our nation use our internet."

Australian Associated Press
Govt appoints new cyber affairs ambassador
Thursday, 10 November 2016
Byline: Staff reporter

Canberra - Australia has appointed its first-ever ambassador for cyber affairs.
Dr Tobias Feakin will fill the inaugural position from January as part of the federal government's $230 million cyber security strategy.

The academic, who has been the director of national security programs at the Australian Strategic Policy Institute since 2012, will work with other countries to strengthen the region's response to cybercrime and advocate against state censorship of the internet.

New Zealand needs a cultural shift to keep data safe
Thursday, 10 November 2016
Byline: Staff reporter

Wellington - New Zealanders need to better understand the risks of prioritising user features over security when it comes to the many internet- connected devices we use, says a Massey University cybersecurity expert.
Dr Andrew Colarik, a senior lecturer with the Centre for Defence and Security Studies, discussed the many ways in which our personal, company and national security information can be extracted and used against us at the Massey University Future NZ Forum on Cyberscurity, held this morning.

Dr Colarik warned that New Zealand hasn't invested heavily enough in infrastructure to make the country resilient against denial-of-service attacks, or to keep data safe. The problem, he says, is the

infrastructure we have built is scaled for New Zealand's population, but that same infrastructure connects us to the rest of the world.

"Everything we do in this country is now so dependent on the free flow of information and the connections that we maintain. Any disruption to that will have huge, cascading effects," he says.

"A large denial-of-service attack could shut down communications to the whole country quite easily. If targeted for competitive or political reasons, there are very few organisations that would be resilient to that sort of attack."

He says both individuals and organisations need to understand that communications infrastucture, by its nature, is not secure.

"There are only measures of security," he says. "The notion that the internet is secure is just salesmanship."

He asked how many of us really think about the access we give to our information when we download an app or a game like Pokemon Go!

"Pokemon Go! has the right to take all your pictures, all your contacts, basically everything on your phone and send it to the mother company. The company that owns it, their net worth increased by billions - how is that possible if the data isn't worth something?"

In this digital landscape, New Zealand's economic livelihood faces real threats, Dr Colarik says. New competitors are emerging all the time - and some will have the know-how and motivation to extract information for competitive advantage.

"What happens when an organisation's own information is used against it? Customer details, costing and pricing structures, and other intellectual properties are all there for the taking if not properly protected."

But he says this is not just a national security problem for the government to deal with.

"Sure, more investment in infrastructure is helpful, but what we really need is a cultural shift to strike the right balance between user features and security, and data useage and privacy. You can't have your cake and eat it too.

"This needs to be done at a whole-of- society level. We all need to take responsibility for the level to which we share our personal data, and we need more education and greater discussion about who owns and controls our information. A genuine public/private partnership is essential for ensuring everyone's prosperity in our digital future."

After his speech Dr Colarik was joined by a panel of industry experts to discuss the strategic cybersecurity issues facing New Zealand.

Panelists Ken Wallace, practice leader, technology risk and assurance at Ernst & Young; Kendra Ross, director and co-founder of Duo; and Steve Walsham, executive broker at Crombie Lockwood shared insights on how to make organisations more resilient to cyber attacks and how to get senior management buy-in for security expenditure.

They also acknowledged there was a lack of capability in New Zealand for dealing with cybersecurity issues, but identified it as an opportunity for the future.

"There is a global skills shortage - 1.5 million cybersecurity roles currently unfilled globally," Ms Ross said. "We have an ability here to actually build a workforce that we could be exporting in terms of skills and resource capability."

The Register (UK)
Trump's torture support could mean the end of GCHQ-NSA relationship
Wednesday, 09 November 2016
Byline: Alexander J. Martin

Column - If comments made on the campaign trail by Donald Trump were sincere, then today's British government will need to do some serious soul- searching very soon.
Trump, who was today announced as the president-elect of the United States of America, has been controversially outspoken while seeking to be nominated as the Republican Party's presidential candidate, and while campaigning to be elected as President.

Many of his outbursts had been criticized for their deemed sincerity - and vulgarity - but it is particularly his defense of torture (despite his nation's ratification of the United Nations Convention Against Torture, and the constitutional prohibition against cruel and unusual punishment) that could provoke problems between the UK and US.

The constitution may ostensibly be amended, and a UN convention might be derogated from, but a US decision to legalize torture would very probably prohibit the greater part of the intelligence- sharing aspects of the UK and US's special relationship - a relationship that already is substantively about the collaboration between GCHQ and the NSA (US National Security Agency).

The future of the "special relationship" is very much dependent on how Trump will exercise the US intelligence apparatus, and if he seeks to assert the position he had previously issued on torture he is very likely to receive push-back from the UK due to the nation's legal obligations, which are much more unlikely to be derogated from.

Back in February, Trump told a rally audience that "torture works." He said:

OK, folks? You know, I have these guys -- 'Torture doesn't work!' -- believe me, it works. And waterboarding is your minor form. Some people say it's not actually torture. Let's assume it is. But they asked me the question: What do you think of waterboarding? Absolutely fine. But we should go much stronger than waterboarding. That's the way I feel. They're chopping off heads. Believe me, we should go much stronger, because our country's in trouble. We're in danger. We have people that want to do really bad things!

UK-based infosec expert and ex-GCHQ specialist Matt Tait, aka Pwn All The Things on Twitter, told El Reg:

"Trump's position on torture is a really big deal. Torture of detainees is directly and unambiguously a violation of the internationally accepted laws of armed conflict - even if used against unlawful enemy belligerents, such as terrorists rather than captured prisoners of war. Trump's comments on torture are important and a unique deviation for US policy. Previous administrations, even when they have engaged in "enhanced interrogation techniques" such as under George W Bush - and even when these EITs escalate to the point that they are widely called "torture" - the US has gone to lengths to assert that the EITs it did use didn't amount to "torture"; declassified legal memos show lawyers within the Bush administration trying to define the line where interrogation becomes torture and push EITs right up to, but not over, that line.

"Whether you think the Bush administration was successful or whether it overstepped that line, they did at least know there was a line, and tried not to overstep it. No so with Trump. Trump actively embraces the idea of torturing detainees. He not only says that torture is ok; he says it's something the US should actively engage in. And not just to get information. To "punish" them as well.

"Even laying aside the enormous domestic law and eighth amendment issues this brings up, this will make it impossible for UK intelligence cooperation with the Trump administration across a range of intelligence programs. The UK will have to restrict the uses, categories and programs of intelligence sharing with the US if there is any risk the US could use that intelligence to intentionally engage in war crimes.

"This differs to Trump's position on cybersecurity. Although his positions are less clear on this topic, it seems that his position largely boils down to a much more substantial active response to cyberattacks on the US. So long as the response isn't clearly disproportionate, or targeting civilians, this doesn't look especially challenging to international partners; it's certainly not an intentional war crime. On topics such as this, the UK may end up disagreeing with the Trump administration on policy, but ultimately the UK won't be in the same position as with torture where the UK would have to take a firm line of non-cooperation to avoid being complicit in a war crime itself."

Jim Killock, executive director of the Open Rights Group (ORG), warned The Register: "If the US openly pursues a policy of torturing those suspected of terrorism, it cannot legally be enabled by the sharing of intelligence from the UK."

"However, given the close integration of the UK and US intelligence agencies, it will be difficult to separate our data sharing and technologies," Killock continued. "This presents a huge challenge for oversight, who need to be aware of the possibility that GCHQ might be urged to help with policies that are indefensible."

ORG additionally warned that Trump will exert a great deal of control over GCHQ's operations as President, and stressed the integration between the UK and US signals intelligence organizations. Such integration was today restated by the UK's Prime Minister, Theresa May, who congratulated Trump and applauded how "Britain and the United States have an enduring and special relationship based on the values of freedom, democracy and enterprise."

"We are, and will remain, strong and close partners on trade, security and defense," stated May. "I look forward to working with President-elect Donald Trump, building on these ties to ensure the security and prosperity of our nations in the years ahead." ®

Deutsche Welle
German cabinet approves cyber security strategy
Wednesday, 09 November 2016

Berlin - The German cabinet on Wednesday adopted a new cyber security strategy to counter a rising number of threats targeting government institutions, critical infrastructure, businesses and citizens. The strategy calls for the creation of a mobile Quick Reaction Force housed within the Federal Office for Information Security (BSI), as well as similar teams within the federal police and domestic intelligence agency that are able to respond to cyber threats against government institutions and critical infrastructure.

Germany's Cyber Defense Center will fall under the authority of the Interior Ministry, which will seek to foster inter- agency coordination and cooperation.

The new strategy also calls for greater cooperation and information sharing between the public and private sectors on cyber threats, a policy that is in line with United States' cyber defense strategy. The government wants to build up awareness and support for businesses and expects them to take active measures to protect against cyber threats. Of particular focus is protecting critical infrastructure, including energy and water supplies, healthcare systems, digital routing systems and transportation.

In addition, federal administrations should maintain better IT security management systems that are up-to-date to respond to evolving cyber threats. Another part of the strategy promotes raising awareness

among the population, including advocating for the use of encryption and security labels for IT products. The plan also calls for more IT training and development in schools.

According to a BSI report released Wednesday, there are a growing number of sophisticated malware targeting IT systems in Germany for which existing anti-virus programs are inadequate. Many of the cyber attacks are so-called ransomware that block computers or steal data in order to extort ransom payments, BSI said.

Interior Minister Thomas de Maziere said that an increasing number of cyber attacks originate from outside Germany's borders, mainly directed from China and Russia. Echoing comments made by Chancellor Angela Merkel on Tuesday, he warned of possible cyber attacks and disinformation campaigns directed from Russia to influence public opinion ahead next year's national elections.

He also cautioned against the use of "bots" that manipulate social media to influence opinion. He called on all political parties to commit not to use such tactics in the upcoming election after the eurosceptic Alternative for Germany (AfD) suggested the party may use the technology.

Forbes
Scared About Trump Wielding FBI And NSA Cyber Power? You Should Be
Wednesday, 09 November 2016
Byline: Thomas Fox-Brewster

New York - Americans are understandably anxious about the idea of Donald Trump wantonly wielding "The Cyber" to quiet his enemies, following his election to president today.
But whatever the future for non-white citizens, women, the climate and the free press in Trump's America, the surveillance state of the U.S. will not immediately expand as a result of his ascent to power, at least from the perspective of the most powerful of the 17 intelligence agencies. That's according to former National Security Agency staffers, including former deputy director Chris Inglis, who told FORBES prior to the election the NSA wouldn't cave to excessive demands of any president: it's first duty, he said, was to uphold the Constitution, not obey crazy demands. "Given an unlawful order... it must say 'no.'"

Dave Aitel, a former NSA computer scientist, said it was unlikely the NSA would see any change in the near future. "There's no reason to panic yet... It's much less a concern with the NSA than the Department of Justice," he said, pointing to Trump's vocal support on the feds' attempts to force tech companies like Apple into breaking their own security measures to get data on suspects.

Indeed, Trump's relationship with the FBI will be of particular concern given James Comey's much-criticized move to re-ignite the Clinton email scandal a week before the election, subsequently dropping any threat of another investigation two days ahead of the vote. The FBI will, it seems, be happy with a

president who is so keen to shine a light on the "going dark" issue and encryption. Hillary Clinton's plan, Aitel noted, was to do nothing.

Susan Hennessey, former counsel for the NSA, told FORBES she also believed a more immediate concern was how Trump might use the DoJ. The NSA, claimed Hennessey, had more safeguards in place than the FBI when it came to spying on individuals.

"The DoJ can investigate pretty much anyone they want to," she told me, pointing to the threat of vindictive prosecutions and unjustified searches of people's property. "I think... tremendous damage could be done with the DoJ.

"There's a more immediate possibility for abuse at the DoJ and the FBI than at the NSA... We should not kid ourselves about the power and trust we vest in our president."

Fear and hope over The Cyber

But, said Aitel, some of the executive orders designed to rein in the NSA in the wake of the Edward Snowden leaks could be scrapped come January 1. That's something that has concerned Jay Healey, senior research scholar at Columbia University's School for International and Public Affairs specializing in cyber conflict. Healey said whilst there are checks and balances, in two years, it'd be easy for Trump to start changing laws to bend the NSA to his will. "With a friendly Congress, after two years, the laws could easily be changed to give much more scope," he said. Trump could, for instance, rescind some of the restrictions put on the Patriot Act or limitations on the NSA's bulk telephone surveillance.

Hennessey said that if Trump were to start rolling back Obama's changes, the easiest target would be the executive order Presidential Policy Directive 28, which sought to offer more protection for foreign citizens from the NSA's mass surveillance. "Because it is newer, it is easier to undo." The Obama regime was last month accused by the Electronic Frontier Foundation on failing to deliver on PPD-28 anyway.

Whatever is coming, the intelligence agency could well be tested by the Trump regime, she presaged. "The NSA has some tremendously strong institutional protection, more importantly it is staffed by law abiding, honourable people. Those institutions and those people may be about to be tested in ways that they have never been tested before," said Hennessey, who now works at the Brookings Institution. "While I hope and I pray they will pass that test, I don't think anybody knows what is going to happen."

Aitel had a more positive outlook than most, noting it was a good time to make decisions in cybersecurity that Obama's regime has failed to deliver. Trump could come good on his promise to invigorate the U.S. Cyber Command, better known as CyberCom, an offensive cyber department currently located within the NSA. Trump could spur on CyberCom's separation from the NSA and its march towards full capability, which has been criticized for its sluggishness, Aitel suggested.

He added: "We have an opportunity to make major steps. A lot of people are afraid of what those steps could be. Both candidates ran policy-free campaigns and it's time for governance to happen."

It will likely take a major disaster for Trump to start flexing what he calls "The Cyber," said security expert Robert Graham. "NSA will be fine -- until there's something like another 9/11. Trump's populism will then have little restraint to reshape it into a massively police state," Graham told me.

Snowden himself has chimed in with a similar argument, posting a video from the year he leaked the NSA files. In it, he warned about a "turnkey tyranny," where a new leader could "flip a switch" to allow itself huge surveillance power. The populace, he added, would be helpless to stop it.

Christian Science Monitor
What Trump's victory means for cybersecurity
Wednesday, 09 November 2016
Byline: Sara Sorcher

Column- Other than a few technological glitches, voting systems Tuesday appeared to run smoothly. Election Day concerns that malicious hackers might tamper with voting, after a presidential season marked by digital attacks, didn't materialize. But that wasn't the biggest surprise of the night. That honor went to President-elect Donald Trump, whose win stunned pollsters and pundits alike.
So, what does Mr. Trump's victory mean for cybersecurity? There are already some indications.

"To truly make America safe, we truly have to make cybersecurity a major priority," Trump told a Virginia crowd in October, adding that cyberattacks from other countries including "China, Russia, and North Korea constitute one of our most critical national security concerns."

His cybersecurity plan promises an "immediate review" of the country's "cyberdefenses and vulnerabilities" including within US critical infrastructure, which includes the energy and banking sectors. He pledged to create task forces to respond to digital threats throughout the country - and get recommendations on how to enhance the military's Cyber Command with "with a focus on both offense and defense."

Still, Trump may need to brush up cybersecurity issues when he's in office. His response to a question on cybersecurity at a September debate - in which he invoked his 10-year-old son's prowess with computers and inadvertently started an internet meme by calling digital threats "the cyber" - was widely dismissed by the tech press as " incoherent" and " utterly disconnected."

There are also important questions about how a future President Trump will engage with those on the front lines of intelligence gathering in cyberspace.

During his campaign, he refused to blame Russia for hacking US political organizations. That position contradicted US intelligence officials, prominent cybersecurity researchers who investigated the hacks, and even his own senior military adviser retired Army lieutenant general Michael Flynn, who all said there was enough evidence to blame Moscow.

Instead, Trump offered up his own idea that China or " someone sitting on their bed that weighs 400 pounds" may have been responsible.

There are also lingering questions about what Trump's election means for the US quest to forge international norms for cyberspace in the Digital Age. Trump drew outrage from critics when he went so far as to encourage Russia - if its intelligence services had indeed hacked his opponent Hillary Clinton's email server - to publish the data it might have stolen.

"Russia, if you're listening," he said, "I hope you're able to find the 30,000 emails that are missing. I think you will probably be rewarded mightily by our press." The New York Times reported at the time that this call was "essentially urging a foreign adversary to conduct cyberespionage against a former secretary of state."

Now that Trump will soon hold the Oval Office, Politico's Tim Starks noted there could be consequences for remarks made in the frenzy of a heated campaign: "Trump's election may herald an era of Russian free rein ... the prospect that Russia will face no US punishment for its behavior, something experts fear will embolden President Vladimir Putin and his regime to keep mounting cyberattacks around the globe."

Trump's election may also renew the encryption fight that went unresolved during the Obama administration. Trump went so far as to call for a boycott of Apple for its stance on encryption as it pledged to fight a court's ruling to help the FBI unlock the iPhone used by the shooter in the San Bernardino terror attack.

In the remaining months of Obama's presidency, digital rights advocacy groups are making a final play for the current commander-in-chief to rein in the government's spying powers - a rallying point since former National Security Agency contractor-turned-whistleblower Edward Snowden exposed sweeping surveillance programs in 2013.

Yet, as noted privacy advocate and author Cory Doctorow wrote Wednesday on the tech blog Boing Boing, "The seven years of GW Bush- after-9/11 gave us the foundations for a surveillance state that was one madman away from totalitarianism. Then, eight years of Obama operationalized that surveillance state, gave it the competent administrators and diverse stakeholders - local police, international partners, military-industrial contractors with fat lobbying budgets - that it needs to sustain itself indefinitely."

Now, he adds, Trump will inherit control "over a surveillance arsenal that includes the legal authority to spy on all of us, all the time ... and a hoard of deadly technological vulnerabilities in tools we all rely upon that America has weaponized to attack its enemies, even if that means leaving Americans undefended against criminals, nihilist griefers, and foreign state and industrial spies." (Mr. Doctorow views him as unfit for the responsibility.)

Business Insider (US)
People in tech are freaking out about Donald Trump being given control of the NSA
Wednesday, 09 November 2016
Byline: Sam Shead

New York - Last month, Wired published a story with the headline "Imagine if Donald Trump controlled the NSA." Now there's no need to imagine.
Trump overcame all odds on Wednesday when he became the 45th president-elect of the United States. As a result, he's about to gain control of the US intelligence agencies, including the NSA (National Security Agency).

Tech workers and security campaigners have been quick to express concerns about handing control of the NSA to Trump.

The intelligence agency serves as a US spy centre that monitors, collects, and processes information on people across the world. It has made headlines over the last few years for its secretive mass surveillance methods, which overstep the mark in the eyes of many people.

Security consultant Dan Tentler wrote on Twitter: "Trump will control the NSA. Think about that for a second. What the f*** did you people do?"

Former CIA analyst Patrick Eddington questioned what the NSA will do under Trump given that it warranted mass surveillance under former president George Bush.

Frederike Kaltheuner, who works in policy at campaign group Privacy International, wrote on Twitter: "The NSA will now be run by a Trump government. This is why we should never give a carte blanche to powerful institutions."

Chris Schofield, an academic at Royal Holloway university focusing on geopolitics, highlighted on Twitter that Trump will also have control of the CIA, FBI, aircraft carriers, Navy SEALS, nuclear weapons, US diplomats, and the Senate.

Trump has promised national-security overhauls, including a potential return to enhanced-interrogation techniques, increasing bombing of ISIS, reevaluating the US relationship with Russian President Vladimir

Putin, loosening background checks for purchasing firearms, and forcing Mexico to pay for a Southern border wall.

Motherboard (VICE)
Could President Trump Really Turn the NSA Into a Personal Spy Machine?
Wednesday, 09 November 2016
Byline: Staff report

New York - It's the nightmare scenario that many worried about: the US elects a president who uses the country's nearly omnipotent surveillance powers for his or her own gain. Edward Snowden has described the NSA's spying capabilities as the "architecture of oppression," with the fear being that it could be deployed by a malicious commander in chief.
But what could President Trump, a man who has incited hate speech against minorities and threatened to jail his political rivals, actually do with the NSA? Could he turn the NSA into his own personal spying army?

"No. By and large it's not going to happen, if for no other reason than there's too many institutional safeguards that are setup," Bradley P. Moss, a national security attorney who represents intelligence community employees, told Motherboard in a phone call. If Trump did try to use the NSA for his own personal or financial gain, there would be a mass of resignations and whistleblowers coming forward, Moss said.

Trump would not be able to authorize surveillance on, say, Hillary Clinton by himself, Moss said: at minimum, the order would have to go through a court (whether that particular court is essentially a rubber stamp is another issue, though). And on top of the legality of such an operation, there are the layers of lawyers and other institutions that handle such things.

"There's the internal bureaucracy that's designed to try to limit some of the more egregious or crazy ideas that might come from a political appointee," Moss said. "You couldn't just willy-nilly start spying on any particular American citizen you wanted," he added. Foreign targets don't have the same sort of protections, however.

So the personal army theory is arguably off the table. But of course the president still has exceptional power to shake-up the agency, put different people in charge of it, and adjust some of the legalities around its work.

"Could there be aspects to which President Trump could expand or play around in the legal grey areas, more than say President Obama had, or President Clinton would have? Sure, that's absolutely possible," Moss said.

Executive orders in particular, which do not require Congressional approval to take effect, are fair game, and have played a vital role in surveillance legislation.

"A lot of the things that impose civil liberties restraints on the NSA are presidential directives, so he could easily reside those," Dave Aitel, a former NSA security researcher and now founder of cybersecurity company Immunity, told Motherboard in a phone call.

"The entire cyber policy of the United States may change. He's been much more progressively offensive," he added.

But if Trump was to make changes, he likely wouldn't be able to without setting off alarm bells, though.

"I have no doubt he could not make the kinds of broad structural changes, for example through executive order, without Congress and the courts, as well as large segments of the executive branch being aware," Susan Hennessey, a fellow in national security at the Brookings Institution think tank and former National Security Agency attorney, told Motherboard in a phone call.

Even with those caveats, there are of course still substantial concerns with Trump's relationship with the NSA, and his position on surveillance and the intelligence community more generally.

For Moss, it's Trump's penchant for secrecy that may threaten a lot of the reforms that have been accomplished in the past decade, especially with legal whistleblowers. Although there won't necessarily won't be legislative changes, policies may be curtailed internally: If people see raising concerns has a sure-fire way to be punished, then "those people are going to back off, and are not going to risk it," Moss said.

"My specific concern is ensuring that our intelligence priorities continue to reflect the priorities of the nation, and that we continue to have vital, productive relationships with our allies," Hennessey added.

Le Monde
Autour du méga-fichier TES, une série d'inquiétudes
Thursday, 10 November 2016
Byline: Martin Untersinger

Paris - M. Cazeneuve est auditionné, mercredi, par la commission des lois sur la base de données biométriques
Le ministre de l'intérieur Bernard Cazeneuve va répondre, mercredi 9 novembre, aux questions des députés de la commission des lois à propos de la base de données des titres électroniques sécurisés (TES). Ce fichier, créé par décret le week-end de la Toussaint, va permettre d'intégrer les données des demandeurs de carte d'identité dans le fichier des passeports - qui existe déjà - et d'y stocker une

longue liste de données personnelles, dont les empreintes digitales, de tous les titulaires de ces titres d'identité. Soit, à terme, la quasi-totalité de la population française.

Plusieurs associations se sont alarmées de l'existence d'un fichier d'une taille inédite depuis la deuxième guerre mondiale, et le Conseil national du numérique a appelé lundi 7 novembre le gouvernement à le suspendre.

Piratage Une des principales inquiétudes exprimées, c'est la -vulnérabilité à un piratage d'une base de données contenant autant d'informations personnelles. " On sait de longue date en sécurité informatique que la centralisation représente une source de risque, car elle désigne à un -attaquant une cible très tentante, et toute attaque peut avoir des -impacts majeurs " , explique Claude Castelluccia, chercheur à l'In-stitut national de recherche en informatique et en automatique (Inria).

Le Conseil national du numérique s'est aussi alarmé des risques de piratage du fichier, " à un moment où les cybermenaces se font redoutables " . " En matière de sécurité informatique, aucun système n'est imprenable. Les défenses érigées comme des lignes Maginot finissent immanquablement par être brisées ", estime cet organisme d'experts dans les questions numériques.

Les précédents existent. Récemment, la base de données de l'administration américaine contenant les données personnelles, dont des empreintes digitales, de 21,5 millions de fonctionnaires a été piratée. En Israël, où un projet pilote de base de données biométriques centralisées est expérimenté depuis quelques années, les dirigeants du Mossad (service de renseignement extérieur) et du Shin Bet (service de contre-espionnage) ont interdit à leurs agents de fournir leurs empreintes digitales, craignant une fuite de données.

Les risques sont importants, car les données biométriques ne sont pas des données comme les autres, comme l'a rappelé la Commission nationale de l'informatique et des libertés (CNIL) dans son avis consultatif. D'abord, parce que, à l'inverse d'un mot de passe, les données biométriques comme les empreintes digitales ne peuvent pas être changées en cas de piratage ou d'usurpation. Ensuite, il est techniquement possible de récupérer des empreintes digitales laissées par une personne sur les objets qu'elle touche.

Dans une lettre adressée lundi au président du Conseil national du numérique, M. Cazeneuve a insisté sur les précautions (le chiffrement des données notamment) déployées pour protéger les fichiers d'éventuels piratages.

Identification Le fichier tel que prévu ne permet pas d'identifier les personnes dans la base, mais seulement de les authentifier. La distinction est fondamentale : un fichier utilisé pour authentifier un individu, en comparant ses empreintes digitales pour s'assurer qu'il s'agit des mêmes que -celles qui sont en mémoire, est moins intrusif qu'un fichier utilisé pour identifier un individu, c'est-à-dire obtenir son identité à partir, par exemple, des empreintes digitales.

Concrètement, le fichier TES va permettre de s'assurer qu'une personne demandant un document d'identité n'a pas déjà fait des demandes identiques sous un autre nom, puisqu'il sera possible de vérifier si ses empreintes ont déjà été enregistrées. Le Conseil constitutionnel avait retoqué une base de données similaire, en 2012, au motif qu'elle pouvait servir à identifier, et pas seulement authentifier, des individus.

Autre exemple d'une base de données biométriques permettant d'identifier et dont la légalité fait débat, la base Agdref2, qui contient les empreintes biométriques, des dix doigts, de 7 millions d'étrangers présents légalement et illégalement en France. Elle peut notamment être utilisée pour identifier un individu à partir de ses empreintes. La CNIL avait cité cet argument pour s'opposer, en 2011, à la création de ce fichier, estimant que " si légitimes soient-elles, les finalités invoquées ne justifient pas la conservation de données biométriques telles que les empreintes digitales (...) ", et que ce dispositif " pourrait être de nature à porter une atteinte excessive à la liberté individuelle des personnes concernées " . C'est précisément un des risques de l'établissement d'un fichier unique : qu'il puisse servir, à terme, à identifier des Français.

Finalités Si l'utilisation de ce fichier est aujourd'hui clairement délimitée, il pourra en effet voir dans un second temps ses finalités élargies. C'est l'une des craintes de ses opposants : l'exemple du fichier des empreintes génétiques, créé en 1998, dont les finalités ont été notablement élargies depuis sa création, est avancé.

" Il est évident que ce n'est pas du tout aujourd'hui dans les finalités du fichier, qui a pour vocation de lutter contre l'usurpation d'identité, - mais - cet outil de grande ampleur peut faire craindre qu'il puisse être utilisé à d'autres fins, peut-être pas aujourd'hui, mais -demain? " , a expliqué Isabelle -Falque-Pierrotin, la présidente de la CNIL, à l'AFP. Une critique partagée par le Conseil national du numérique : " Les reculs démocratiques et la montée des populismes, observés, y compris en Europe et aux Etats-Unis, rendent déraisonnables ces paris sur l'avenir. "

L'outil légal choisi par le gouvernement, un décret et non une loi, laisse en tout cas à ce dernier (ou à un prochain) une plus grande souplesse pour en aménager les modalités. " A partir du moment où la base de 60 millions de personnes est là, on peut ajouter une fonction de recherche, par exemple. C'est d'autant plus facile qu'on est sur une base réglementaire, pas besoin d'adopter une nouvelle loi " , résume Guillaume Desgens-Pasanau, maître de conférences au CNAM et magistrat.

Un aménagement du décret pour permettre l'identification se heurterait cependant aux limites posées par le Conseil constitutionnel en 2012. C'est ce qu'a rappelé le ministre de l'intérieur dans sa réponseau Conseil national du numérique. De plus, il a expliqué que le fichier était techniquement organisé de sorte qu'il soit impossible de récupérer une identité à partir d'une empreinte digitale. C'est à la CNIL qu'incombe désormais de vérifier si tel est bien le cas, dans le cadre de ses missions de contrôle du fichier.

New York Times
Yahoo Employees Knew in 2014 About State-Sponsored Hacker Attack
Thursday, 10 November 2016
Byline: Vindu Goel

San Francisco - Yahoo employees knew in 2014 that a hacker backed by a foreign government had broken into its network, the company said in a securities filing on Wednesday.
But Yahoo did not say whether the attack that year -- which led to the theft of data like names, birth dates and encrypted passwords for more than 500 million accounts -- was disclosed to senior management at the time.

The timeline of who knew what about the attack and when has become central to the company's plan to sell its internet operations to Verizon Communications for $4.8 billion.

Yahoo first publicly disclosed the security breach on Sept. 22 this year, about two months after it struck the deal with Verizon. The company said it discovered the hacking, the largest known data breach affecting a private company, while investigating a hacker's claim in July to have obtained certain Yahoo user data.

The breach was not disclosed to Verizon during negotiations, and last month Verizon executives said that it might have materially diminished the value of Yahoo -- and could cause Verizon to reopen the deal, which is expected to close early next year.

In its latest disclosure, part of a quarterly filing about its finances, Yahoo said that it had discovered back in 2014 that a "state-sponsored actor" had gained access to its network. The company did not say what action, if any, it took at the time.

Yahoo also disclosed new details about the attack. The company said its board of directors and forensic experts were investigating "certain evidence and activity that indicates an intruder, believed to be the same state-sponsored actor responsible for the security incident, created cookies that could have enabled such intruder to bypass the need for a password to access certain users' accounts or account information."

Yahoo said that law enforcement authorities began sharing data with the company on Nov. 7 that purported to be Yahoo user information obtained by a hacker.

So far, 23 lawsuits related to the breach have been filed against Yahoo in the United States and abroad. The company said it was cooperating with federal, state, local and foreign officials seeking information about the breach.

Symantec unveils new endpoint protection solution
Thursday, 10 November 2016

New Delhi - Leading cyber security company Symantec Corporation on Wednesday announced "Symantec Endpoint Protection 14" -- powered by artificial intelligence (AI) on the endpoint and in the cloud for better security.
The "Endpoint Protection 14" is the industry's first solution to fuse essential endpoint technologies with advanced machine learning and memory exploit mitigation in a single agent, delivering a multi-layered solution to stop advanced threats, the company said in a statement.

The solution delivers protection in a lightweight package, building on industry- leading 99.9 percent efficacy, low false positives and a 70 per cent reduced footprint over the previous generation through new advanced cloud lookup capabilities.

"Multi-layered protection, enabled by AI, backed by the world's most powerful threat intelligence force and powered by the Cloud, this is literally the smartest choice in endpoint technologies," Tarun Kaura, Director, Solution Product Management, Asia Pacific and Japan of Symantec, said in a statement.

Will Top Cyber Talent Join the Trump Team? Jury's Out
Thursday, 10 November 2016
Byline: Jospeh Marks

Washington - Will cybersecurity experts who shunned President-elect Donald Trump's campaign sign on to secure government and private sector networks during the Trump presidency? The answer's far from clear.
Some former officials and cyber experts sounded an optimistic tone Wednesday, saying duty to country would outweigh partisan divisions or hostility to Trump's particularly divisive style in technology and national security sectors.

Others were less sanguine.

"Given the overall shortage of experts in the cybersecurity workforce and the pay available in the private sector, it is always going to be hard filling top administration jobs with qualified candidates," said Ian Wallace, co-director of the New America think tank's Cybersecurity Initiative.

"Add to that the fact that some qualified candidates may not want to serve in a Trump administration, and we can expect that it will take a while to fill some of the government's top cybersecurity jobs," Wallace added.

Trump's campaign received little support from former national security leaders and tech executives. In August, 50 former Republican national security officials signed a letter opposing the brash real estate mogul's candidacy.

Whether tech and security leaders will hold onto that opposition now that the once-longshot candidate has been elected the next president of the United States could make the difference between whether government and private sector computer networks are more secure in four years or more vulnerable.

"My sense is that, out of patriotic duty, the transition is going to be staffed up and Donald Trump will be able to pull in some very experienced people on cybersecurity," said Robert Knake, former director for cybersecurity policy at the National Security Council.

"Fewer members of the national security community and the cybersecurity community in Washington were prepared for or expecting a Trump victory or had thought long and hard about would they be able or willing to take a massive pay cut and go into government service," Knake said. "Those conversations are happening now."

Tenable Network Security Chairman and Co-Founder Ron Gula, a former National Security Agency official, sounded a similar note.

"I think if the country calls and tells you, 'we want you to come secure the country,' most people are going to say yes," he said.

Others worried, though, that Trump's controversial campaign statements, such as advocating waterboarding, could make national security officials wary of the moral hazards of joining his administration.

"Based on his campaign rhetoric, I think there will be a lot of trepidation in the national security community," said Mark Fallon, a former Homeland Security Department official and director of the consultancy ClubFed. "Those types of inflammatory comments may seem flippant to him ... but I think people might think twice about wanting to join that administration."

The difficulty of staffing the Trump administration is exacerbated in cybersecurity because the pool of experts is comparatively small and private sector jobs pay much more.

Wallace noted the Obama administration had frequent difficulty finding talent for top cyber posts, especially the role of White House cybersecurity coordinator, which took the new administration roughly a year to fill.

Trump released a cybersecurity plan in October that included a full review of U.S. cyber defenses and vulnerabilities, mandatory cybersecurity training for government employees and increased coordination

between the Justice Department and federal, state and local law enforcement. The strategy also called for increasing the capacities of U.S. Cyber Command though it included few details.

The document did not explicitly mention some of the cyber debates roiling government such as whether to split the leadership of CYBERCOM from NSA, both of which are currently led by Adm. Michael Rogers, or to increase DHS authority to protect federal networks.

"I expect President-elect Trump will be challenged to find strong IT/cyber talent given that most leaders in the field, aside from Peter Thiel, opposed his election," said Jim Miller, former deputy undersecretary of defense for policy.

"I do hope that some top cyber talent will step up as a service to the nation at a critical time," Miller continued. "There is much important work to do, and there is no time to waste."

CBC News and Toronto Star
Top secret RCMP files reveal digital roadblocks in terrorism, major crime cases
Tuesday, 15 November 2016
Byline: Staff reporters

Ottawa - Suspected child predators, drug traffickers and extremists allegedly planning attacks or to join ISIS are escaping the eyes of the law due to increasingly impenetrable encryption and other digital roadblocks, according to top secret RCMP files reviewed by a CBC News/Toronto Star investigation. The Mounties provided access to the files in a bid to demonstrate how investigations of tech-savvy suspects are increasingly "going dark" because crucial evidence is beyond their reach.

The rare look inside active investigations comes amidst a thorny debate and public consultation on Canada's Anti-Terrorism Act (C-51), which includes proposals to significantly expand police powers.

Four ideas floated in the federal government's green paper on national security would enhance investigative capabilities, including the power to compel suspects to unlock their encrypted computers and cellphones and a law to require telecommunication and internet service providers to install interception and data-retention equipment in their networks.

But privacy and civil liberties advocates are fiercely opposed to such measures and demand police provide more evidence to justify their request for new powers.

RCMP Chief Supt. Jeff Adam admits law enforcement hasn't done a great job explaining the investigative challenges of the digital world to the public.

"So far, [the debate] appears to be driven very much from one side, which is those that would like more privacy and more anonymity," he said.

"What we need is an awareness of Canadians and lawmakers that our capabilities as they existed in the past, and the expectations of our ability to deliver on those, has changed significantly where we have less capability but potentially the same expectations."

To bolster its case, the RCMP granted one CBC reporter and one Toronto Star reporter access to 10 "high priority" investigations. The two journalists underwent RCMP screening to obtain top secret security clearance. They were then provided details and summaries of the 10 cases, though police withheld names, locations and other details to protect the investigations and potential court cases.

Digital chatter unreadable

In one case, police say they obtained warrants to conduct surveillance on a group of people in Eastern Canada suspected in a terrorism conspiracy.

They discovered the main suspect's phone was connecting to multiple cellular networks, none of which was technically equipped to intercept the suspect's text messages and internet traffic.

In late 2014, the Mounties spent two months and $250,000 to engineer a custom tool to intercept the target's communications only to discover all of it was encrypted and unreadable.

The individuals remain under investigation.

Laptops, phones blocked

In another case, the RCMP, working with foreign intelligence agencies, obtained warrants to intercept home and cellular phone communications of a group of suspected "high-risk travellers" in a city in Western Canada. Police believed they were planning to join extremist groups overseas.

Investigators attempted to intercept more than 30 laptops, cellphones and computers being used by the group but could only "successfully infiltrate" two of them. While those two devices delivered a bounty of evidence -- 4.4 million pieces of data, including videos, images, webpages, text messages and emails -- some of the data was encrypted and unreadable.

It's unclear whether the suspects have left Canada, and if so, whether they present any risk if they return.

In eight of the ten cases, the key stumbling block for police was either a lack of interception capabilities at the phone and internet companies or the use of encryption.

Harold O'Connell, RCMP director general in charge of national security investigations, says this combination is proving fatal for high priority investigations.

"When we do actually get the data, and it's encrypted, then we can't see it," he said. "And when we can't see it, then we can't analyze it ... You can't put together what the planning is. You can't put together any of the organizational hierarchy as to who is directing what."

Aaron Driver's online chats

The RCMP says the fatal confrontation with Aaron Driver in Strathroy, Ont., back in August is a prime example of a case in which encryption thwarted law enforcement's understanding of a threat.

Driver, a 24-year-old ISIS supporter suspected of planning a major urban attack, died after he detonated a bomb and was shot by police outside the house where he was staying.

"Hindsight would say that he was obviously farther along in preparing," said Jeff Adam, the RCMP's director general in charge of technical investigations services.

Driver attracted police attention in late 2014 when he posted comments online supporting ISIS and publicly defended Michael Zehaf-Bibeau, the extremist who gunned down a soldier at the National War Memorial and then charged across the street into Parliament's Centre Block, where police and security officers shot and killed him.

In early 2015, the RCMP and various international intelligence agencies discovered Driver was also communicating with well-known ISIS members and suspects directly involved in attacks in Texas and Australia. But the RCMP says his communication was via private Twitter messages and online chat forums protected by encryption and therefore unreadable by police.

In June 2015, police arrested Driver because they believed he posed a threat, but without hard evidence they couldn't charge him. Driver was released on a peace bond.

A year later, on Aug. 10, the FBI alerted the RCMP of an "imminent" attack being planned in Canada after it obtained an anonymous martyrdom video.

The RCMP quickly identified Driver as the man in the video, and by the afternoon had dispatched surveillance and SWAT teams to the house in Strathroy. When they arrived, Driver was climbing into a cab bound for London, Ont. As police approached, Driver detonated a bomb in the back seat of the taxi.

The taxi driver dove out of the cab moments before the explosion and suffered minor injuries.

Adam says police had long feared Driver was capable of a terrorist attack, but had no evidence he was co-ordinating one using a homemade bomb.

"It was good police work that caught him before he could detonate it in public, if that was his intent," Adam said. "The fact that he was out and available to do that is probably because we could not break the encrypted communications."

"And that's going dark. Couldn't get the evidence to charge him."

The Mounties have since completed forensic analysis and determined not all of the bomb material Driver was carrying exploded that day.

Investigators found the detonator ignited only a small portion of the explosives, which they say could have instantly killed or severely injured anyone within 2.1 metres.

Police also say they found 139 steel ball bearings (.38 calibre), which they believe were intended as shrapnel and could have killed or badly injured many more bystanders outside the immediate blast zone.

"The analysis tells us that if it had gone off, for example, on a city bus, there would've been death and grievous injuries," Adam said.

New police powers

The federal government launched its review of Canada's Anti-Terrorism Act and issued a green paper on national security in September. It discusses four proposals to enhance police capabilities:

The RCMP and other police leaders say aside from requests for basic subscriber information, these additional powers would be used only in targeted investigations and would require a warrant from a judge.

The RCMP's Harold O'Connell says technical barriers have made it difficult for investigators to keep pace with suspects and it's time for a public debate on the issue.

"We don't make the laws," he said. "We can influence, we can tell you what we think the lay of the land is, and then you as Canadians and legislators decide where you want us to be."

'Golden age of surveillance'

But privacy and civil liberties advocates aren't convinced police investigations are actually "going dark."

Ann Cavoukian, Ontario's former privacy commissioner who now runs Ryerson University's Privacy and Big Data Institute, says the metaphor doesn't give the public a complete picture.

"Even though you may not be able to access encrypted communications -- the actual content -- you can access the metadata," Cavoukian said, referring to digital logs of the time, date and location of every web query, call, text or email a user exchanges. "There is so much available to you if you actually connect the dots -- put all the pieces together."

Micheal Vonn, policy director of the BC Civil Liberties Association, says police have failed to provide sufficient evidence that each of these new powers is necessary.

"One of the great truths of the era that we're in Post-Snowden, is that we're in a golden age of surveillance," she said.

"Police have access to more information about us than they have ever had in the history of the world."

She strongly opposes allowing police to request basic subscriber information without a warrant and says the proposal to grant police the power to demand a suspect hand over their device passwords or encryption keys is "radical" under Canadian law.

"We want the police to have appropriate powers," she said. "We want appropriate oversight and constraints on those powers so that we know that we're actually getting the balance right."

The federal government won't comment on which, if any, changes to police powers it plans to endorse. The online public consultation continues until Dec. 1.

Toronto Star and CBC News
Police, Power and Privacy
Tuesday, 15 November 2016
Byline: Staff reporters

OTTAWA -- The RCMP has provided unprecedented access to the Toronto Star and the CBC in an effort to make its case that antiquated laws and diminished police powers in the digital age are allowing suspected terrorists, drug gangs and child abusers to operate beyond the law.
Journalists from the two media outlets have reviewed the details of 10 high-priority cases after clearing RCMP security checks for access to "top- secret" information. In each case, investigators were stonewalled by legal and technical obstacles in accessing digital evidence, the Mounties say. Most of the suspects remain at large.

These cases stand at the centre of an emerging national debate.

Police argue they are on the losing side of a digital divide, while on the other side are tech-savvy criminals who are shielded by impenetrable encryption, telecommunication companies and technology manufacturers.

Privacy advocates argue that police have never before had such powers of surveillance and that they have failed to provide evidence that the public's safety is in jeopardy.

The audience is Canadians who are alarmed to learn that some criminals are increasingly beyond the reach of the law. They are equally alarmed by the recent Federal Court ruling that denounced the national spy agency, CSIS, for illegally gathering the private information of Canadians, and by news that Quebec police forces intercepted and tracked the cellphones of as many as 10 journalists to discover their sources.

"We need a public debate," said RCMP Chief Supt. Harold O'Connell, the force's director general of national security investigations. "We can influence, we can tell you what we think the lay of the land is, and then you, as Canadians and legislators, decide where you want us to be."

Among the cases reviewed by the Star and the CBC:

An investigation into a group suspected of plotting terrorist acts in Canada. After obtaining a warrant, the RCMP spent two months and $250,000 attempting to intercept electronic communications. This produced no evidence because investigators were cut short by encryption that police experts were unable to break.

"These are individuals that are ... developing plans in order to commit offences in Canada," said O'Connell. "What we wanted to do was to listen to, read, see the data that the individuals are communicating."

That never happened. The suspects remain under investigation.

The RCMP attempted to intercept and decode the communications of an alleged drug and human trafficking ring, but still don't have enough evidence to charge the group's leaders. The RCMP seized kilos of cocaine and arrested low-level members. While they successfully intercepted some communications with a warrant, they failed to decrypt the messages.

"When we can't see (data), then we can't analyze it. And if you can't analyze it, then you can't actually put together what the transactions are," said O'Connell. "You can't put together what the planning is. You can't put together any of the organizational hierarchy."

The organized crime leaders are still operating.

In a western Canadian national security case involving "high-risk travellers" who police believe were involved in "terrorist activity" abroad, investigators collected evidence from only two of more than 30 digital devices.

Those two devices provided 4.4 million "digital footprints," including websites, images, videos and electronic messages. But little hard evidence emerged. After thousands of investigative hours, costly surveillance teams and $1 million spent on failed technical solutions, the suspects remain under investigation. It is unclear whether they have left Canada or if they pose a public safety risk.

"Criminals, to some extent, are walking away from crimes in Canada," said former OPP deputy commissioner Scott Tod, now deputy chief in North Bay and co-chair of the Canadian Advanced Technology Alliance's cybercrime advisory committee.

"Encryption has really changed the game on how we are able to access information that we require for court purposes. Being unable to access information makes it extremely difficult for us to form the prospect of conviction."

Public consultations in the review of Canada's Anti-Terrorism Act - currently taking place across Canada - include proposals that, if adopted, would empower police with vastly greater digital investigative powers.

Among those proposals: legislation to compel suspects to unlock - or "decrypt" - digital devices at the request of police who have a judge's warrant; giving police access to basic digital subscriber information - such as a person's name and address - without having to obtain a warrant; and compelling telecommunications companies to retain data and help police intercept communications.

Privacy advocates call such measures an indefensible power grab that would undermine civil liberties.

"Police have access to more information about us than they have ever had in the history of the world," said former Ontario information and privacy commissioner Ann Cavoukian, now executive director of the Privacy and Big Data Institute at Ryerson University.

Even without breaking into encrypted communications, police can access volumes of metadata - high-level records that won't show the content of messages, for example, but provide such details as author, creation date and file size.

"There is so much available to you if you actually connect the dots - put all the pieces together," Cavoukian said.

Police are beneficiaries of the "golden age of surveillance," said Micheal Vonn, policy director of the B.C. Civil Liberties Association.

"It's very fair to make statements, but you have to back them up with evidence ... You can't simply make the claim and expect us to rebalance the entire configuration of how we protect our rights."

Many police officials who were interviewed acknowledge that the privacy argument has dominated the debate.

"Law enforcement has not been as open or as communicative as they should have been," said RCMP Chief Supt. Jeff Adam.

But police filing cabinets contain growing evidence that digital investigative limitations pose a risk to public safety, he said.

"I believe that the (public's) expectations and our ability to deliver on those are far apart and getting farther away every day," he said. "Canadians should ask themselves whether or not they're satisfied that we cannot get evidence ... Is that where they want the state of affairs to be, where we cannot enforce the law?"

Toronto Star
Inside RCMP's file room

Tuesday, 15 November 2016
Byline: Robert Cribb

OTTAWA -- The RCMP shared details of 10 ongoing "high-priority" investigations with the Toronto Star and CBC News to begin a public debate on expanding police capabilities while investigating crimes involving digital and online evidence.
This coincides with a federal review of Canada's Anti-Terrorism Act (Bill C-51) and a public consultation on the government's Green Paper on National Security, which includes proposals to enhance police digital capabilities.

To allow access to the investigations, the RCMP conducted security screening and granted top-secret clearances to Robert Cribb of the Toronto Star and Dave Seglins of CBC News.

The RCMP provided summaries and interviews on the cases but withheld names, locations and key details that could compromise ongoing investigations, prosecutions and secretive police techniques.

The following are case summaries prepared by the Toronto Star and CBC:

Case 1: Child abuse video on locked phone

Police have testimony from a child alleging sexual assault by their father who they say recorded the crime on his phone. The phone is locked by a pass code and investigators have not been able to access the video, which would be crucial evidence. Police have no legal authority to compel the man to unlock his phone. The case remains under investigation.

Case 2: VoIP phones encrypted

The RCMP obtained a warrant to tap the phones of an individual suspected of financial fraud in Eastern Canada, only to discover that the VoIP (voice over Internet protocol) phone network the suspect was using encrypted the calls. Police made several covert entries into the suspect's office to install devices to bug the calls. At one point, the interception method failed, and for two weeks "valuable" evidence was missed.

Case 3: 'Too much information' tests RCMP capacity

RCMP intercepted cell and residential communications of a "high-risk traveller" in Eastern Canada suspected of planning to join a terrorist group overseas. The Internet/phone provider lacked interception capabilities, so police spent considerable resources to install their own equipment, but were eventually swamped by 21 million data points (web searches, images, videos, texts). Much of the data was encrypted and unintelligible. The case remains under investigation.

Case 4: Delays seeking foreign info

RCMP waited close to four months to get "high-value" evidence in order to stop a suspected "high-risk traveller" from leaving their home in Western Canada to join extremists overseas. Police say they concluded the case but were hampered by an inability to intercept communications outside of Canada and delays in the MLAT (mutual legal assistance treaty) process. Police had to forward a Canadian judge's order through government channels, which were then delivered to a social media company outside the country. The company eventually filled the order, sending the material back to police - again through government channels - but police discovered the messages were encrypted and unreadable.

Case 5: A 10-month wait to access records

During an investigation into a group of Daesh (also known as ISIS or ISIL) supporters who police believed were "high-risk travellers" based in Eastern Canada, the RCMP spent 10 months trying to obtain social media communications outside Canada. Analysis of the data is continuing, and police have evidence that one of the suspects is abroad in a "high-risk country." The case remains under investigation.

Case 6: Terrorist group communications prove elusive

RCMP are investigating a group of individuals suspected of participating in a terrorist organization and plotting to travel overseas. Police attempted a court-ordered interception of their devices but found the communications were encrypted. As a result, police had to design technical solutions which meant they needed an extension of the court order, and this has delayed the process. The communications among the suspected terrorists have not been obtained. The case is still under investigation.

Case 7: Digital chatter unreadable

RCMP obtained warrants to conduct surveillance on a group of people in Eastern Canada suspected in a terrorism conspiracy in 2014. Police discovered the main suspect's phone was connecting to multiple different cellular networks, none of which was technically equipped to intercept the suspect's text and Internet traffic. The Mounties spent two months and $250,000 to engineer a custom tool that would intercept the target's communications, only to discover all of it was encrypted and unreadable. The individuals remain under investigation.

Case 8: Interception too costly

The RCMP seized kilos of cocaine and arrested low-level members of an alleged drug and human trafficking organization in Eastern Canada. After obtaining a warrant to monitor suspects' communications, investigators determined it would cost hundreds of thousands of dollars to install interception hardware at the targets' Internet service provider (ISP). Police abandoned the effort and resorted to using undercover officers and agents. The alleged criminal bosses and organization are still operational.

Case 9: Laptops, phones blocked

The RCMP, working with foreign intelligence agencies, obtained warrants to intercept residential and cellular traffic of a group of suspected "high-risk travellers" in a city in Western Canada. Police believed they were planning to join extremist groups overseas. Investigators attempted to intercept more than 30 laptops, cellphones and computers being used by the group but could only "successfully infiltrate" two of them. While those two devices delivered a bounty of intercepted evidence - 4.4 million pieces of data, including videos, images, web pages, text messages and emails - some of the data was encrypted and unreadable.

Case 10: Aaron Driver's encrypted chats

The RCMP was unable to read Daesh supporter Aaron Driver's encrypted messages in 2015 to and from other suspects involved in attacks in Texas and Australia. Despite suspicions, RCMP say encryption thwarted their ability to understand how far along Driver may have been in his bomb plot. He was killed in August 2016 outside his home in Strathroy, Ont., after police were tipped off to a martyrdom video Driver had made. The FBI alerted Canadian police to an "imminent" attack. He was killed amidst police gunfire and the partial detonation of a bomb he was carrying.

New York Times
Secret Backdoor in Some U.S. Phones Sent Data to China, Analysts Say
Tuesday, 15 November 2016
Byline: Matt Apuzzo, Michael S. Schmidt

Washington - For about $50, you can get a smartphone with a high- definition display, fast data service and, according to security contractors, a secret feature: a backdoor that sends all your text messages to China every 72 hours.
Security contractors recently discovered preinstalled software in some Android phones that monitors where users go, whom they talk to and what they write in text messages. The American authorities say it is not clear whether this represents secretive data mining for advertising purposes or a Chinese government effort to collect intelligence.

International customers and users of disposable or prepaid phones are the people most affected by the software. But the scope is unclear. The Chinese company that wrote the software, Shanghai Adups Technology Company, says its code runs on more than 700 million phones, cars and other smart devices. One American phone manufacturer, BLU Products, said that 120,000 of its phones had been affected and that it had updated the software to eliminate the feature.

Kryptowire, the security firm that discovered the vulnerability, said the Adups software transmitted the full contents of text messages, contact lists, call logs, location information and other data to a Chinese server. The code comes preinstalled on phones and the surveillance is not disclosed to users, said Tom

Karygiannis, a vice president of Kryptowire, which is based in Fairfax, Va. "Even if you wanted to, you wouldn't have known about it," he said.

Security experts frequently discover vulnerabilities in consumer electronics, but this case is exceptional. It was not a bug. Rather, Adups intentionally designed the software to help a Chinese phone manufacturer monitor user behavior, according to a document that Adups provided to explain the problem to BLU executives. That version of the software was not intended for American phones, the company said.

"This is a private company that made a mistake," said Lily Lim, a lawyer in Palo Alto, Calif., who represents Adups.

The episode shows how companies throughout the technology supply chain can compromise privacy, with or without the knowledge of manufacturers or customers. It also offers a look at one way that Chinese companies -- and by extension the government -- can monitor cellphone behavior. For many years, the Chinese government has used a variety of methods to filter and track internet use and monitor online conversations. It requires technology companies that operate in China to follow strict rules. Ms. Lim said Adups was not affiliated with the Chinese government.

At the heart of the issue is a special type of software, known as firmware, that tells phones how to operate. Adups provides the code that lets companies remotely update their firmware, an important function that is largely unseen by users. Normally, when a phone manufacturer updates its firmware, it tells customers what it is doing and whether it will use any personal information. Even if that is disclosed in long legal disclosures that customers routinely ignore, it is at least disclosed. That did not happen with the Adups software, Kryptowire said.

According to its website, Adups provides software to two of the largest cellphone manufacturers in the world, ZTE and Huawei. Both are based in China.

Samuel Ohev-Zion, the chief executive of the Florida-based BLU Products, said: "It was obviously something that we were not aware of. We moved very quickly to correct it."

He added that Adups had assured him that all of the information taken from BLU customers had been destroyed.

The software was written at the request of an unidentified Chinese manufacturer that wanted the ability to store call logs, text messages and other data, according to the Adups document. Adups said the Chinese company used the data for customer support.

Ms. Lim said the software was intended to help the Chinese client identify junk text messages and calls. She did not identify the company that requested it and said she did not know how many phones were

affected. She said phone companies, not Adups, were responsible for disclosing privacy policies to users. "Adups was just there to provide functionality that the phone distributor asked for," she said.

Android phones run software that is developed by Google and distributed free for phone manufacturers to customize. A Google official said the company had told Adups to remove the surveillance ability from phones that run services like the Google Play store. That would not include devices in China, where hundreds of millions of people use Android phones but where Google does not operate because of censorship concerns.

Because Adups has not published a list of affected phones, it is not clear how users can determine whether their phones are vulnerable. "People who have some technical skills could," Mr. Karygiannis, the Kryptowire vice president, said. "But the average consumer? No."

Ms. Lim said she did not know how customers could determine whether they were affected.

Adups also provides what it calls "big data" services to help companies study their customers, "to know better about them, about what they like and what they use and there they come from and what they prefer to provide better service," according to its website.

Kryptowire discovered the problem through a combination of happenstance and curiosity. A researcher there bought an inexpensive phone, the BLU R1 HD, for a trip overseas. While setting up the phone, he noticed unusual network activity, Mr. Karygiannis said. Over the next week, analysts noticed that the phone was transmitting text messages to a server in Shanghai and was registered to Adups, according to a Kryptowire report.

Kryptowire took its findings to the United States government. It plans to make its report public as early as Tuesday.

Marsha Catron, a spokeswoman for the Department of Homeland Security, said the agency "was recently made aware of the concerns discovered by Kryptowire and is working with our public and private sector partners to identify appropriate mitigation strategies."

Kryptowire is a Homeland Security contractor but analyzed the BLU phone independent of that contract.

Mr. Ohev-Zion, the BLU chief executive, said he was confident that the problem had been resolved for his customers. "Today there is no BLU device that is collecting that information," he said.

Reuters
Snowden warns of increase in U.S. domestic spying after Trump victory
Tuesday, 15 November 2016
Byline: Staff report

Buenos Aires - Donald Trump's election as U.S. president raises concern that Washington may increase the intrusiveness of domestic intelligence gathering, former U.S. spy agency contractor Edward Snowden said on Monday, warning that democratic checks and balances were losing ground to authoritarianism.
Snowden lives in Moscow under an asylum deal after he leaked classified information in 2013 that triggered an international furor over the reach of U.S. spy operations. He spoke at a teleconference hosted by Buenos Aires University's law school.

"We are starting to substitute open government for sheer authoritarianism, a government based not upon the principle of informed consent granted by people who understand its activities but rather a trust in personalities, a trust in claims, a trust in the hope that they will do the right thing," Snowden said.

Washington pledged not to engage in indiscriminate espionage following Snowden's 2013 disclosures. But Snowden questioned if that policy could be modified by new officials "who have a very different set of values and can govern in the dark."

"If government does actually win our trust, because they go for some years and they do operate in a way that we should support, what happens when it changes?" he asked.

"This is kind of the challenge that we're facing today in the United States with the result of the last election."

Supporters see Snowden as a whistleblower who boldly exposed government excess. But the U.S. government has filed espionage charges against him for leaking intelligence information.

Trump, who scored an upset win over Democrat Hillary Clinton in last Tuesday's election, broke with many in his own Republican Party during the campaign and emphasized his success as a businessman and reality TV show star. He promised sweeping security measures to deal with the threat of attacks on the United States.

His election was greeted with concern from the American Civil Liberties Union over statements he made during the campaign supporting increased surveillance of U.S. Muslims, mass deportation of illegal immigrants, reauthorization of waterboarding and changing libel laws to increase press restrictions.

Snowden, asked if he thought the election of Trump, who has praised Russian President Vladimir Putin as a strong leader, might increase chances of him being pardoned by the U.S. government, responded: "Who knows?"

German Constitutional Court rules out access to NSA's 'selectors' list
Tuesday, 15 November 2016
Byline: Staff report

Berlin - The Constitutional Court in Karlsruhe on Tuesday delivered a verdict, saying the government in Berlin did not need to transfer its secret list of spy targets to the commission investigating the US' spy agency NSA's activities in Germany.
The government's need to keep certain data confidential outweighed the NSA commission's desire for more details on the issue in this case, judges said in an October decision that was made public on Tuesday.

The verdict also said that releasing the "selectors" list without approval from the United States could endanger the functioning of intelligence agencies and jeopardize Germany's effectiveness in matters of national security.

Green party politician Konstantin von Notz, who is on the parliamentary committee investigating NSA issues, expressed disappointment at Tuesday's verdict. "Large portions of the illegal BND practices conducted over years will remain in the dark," he said in Berlin, adding that because of the way the systems worked, further scandals and rights violations were "pre-programmed."

Tuesday's ruling was a response to a complaint by the Greens and left-wing party "Die Linke" members as well as the leaders of the NSA fact-finding commission, lodged after the German government denied them access to the list.

The "selectors" list details search criteria like telephone numbers, email addresses and IP addresses of people, including European politicians and heads of corporations, who were monitored by the NSA, with the help of Germany's foreign espionage agency, the BND. Targets also included many European political leaders, including German Chancellor Angela Merkel. The scandal dates back to the intelligence leaks mainly attributable to former NSA contractor Edward Snowden, now living in self-imposed exile in Russia.

Instead of handing over the list to the commission, the ruling coalition in Berlin appointed an administrative judge, Kurt Graulich, as a "person of trust." Graulich analyzed the list and then briefed the investigative commission on its contents, but judges at the constitutional court said this did not give the body any right to demand exact information.

The judges applauded the German government for passing on some information in this way. In justifiying its ruling, it said that the selectors list was "more of a general political interest," rather than being central to the welfare of the state or the government's capacity to function, criteria that might have prompted a different decision.

China Daily
Cybersecurity Law aims to 'protect people's interests'
Tuesday, 15 November 2016
Byline: Cao Yin

Beijing - Cybersecurity and related issues have been hot topics among internet and judicial experts since China's first Cybersecurity Law was adopted earlier this month.
The law and its related topics, including how to put coordination of government departments into practice and how to review products and services before they are made available on the internet, will also be heated topics of discussion at the World Internet Conference, experts said.

Li Yuxiao, secretary-general of the Cybersecurity Association of China, said that he will go to Wuzhen, Zhejiang province, to participate in the third WIC, which runs from Wednesday to Friday, adding that one of his focuses will be legal issues.

"It's good to see that our nation has finally drawn up and adopted its first Cybersecurity Law," Li said.

"It's the guide when we draft some other cybersecurity-related rules, and I think its adoption has brought more confidence to internet and judicial professionals," he said. "I'd like to share the law with foreign guests and listen to their opinions at the conference."

The law, with 79 articles, was approved by the Standing Committee of the National People's Congress, China's top legislature, on Nov 7, and will be effective on June 1, 2017.

"The lawmaking is to maintain State security and protect people's interests," said Yang Heqing, deputy director of the office for economic law under the NPC Standing Committee's Legislative Affairs Commission.

The law also aroused public attention overseas, as some foreigners have a great concern about one article - online products and services that could form China's key internet infrastructure or affect State security must pass a governmental review to enter the Chinese market.

In response to the concern, Zhao Zeliang, head of cybersecurity for the Cyberspace Administration of China, said: "The article of the law does not mean that we'll block foreign web products and services."

Zhao denied the article is a trade barrier, saying there is some misunderstanding overseas.

Wang Sixin, a law professor specializing in cybersecurity at the Communication University of China, suggested guests from home and abroad at Wuzhen should discuss it to reduce misunderstanding.

"The review is a necessity, as some products with security risks may harm the internet," Wang said. "If we cannot find them quickly, the damage will be more serious."

The review also targets every product or service that tends to be in the market, no matter where they are from, he said, adding that similar checks are also being conducted in the United States and the European Union.

He said the conference is a good opportunity and platform to communicate and reach consensuses, saying that the more discussion there is on the law, the better it can play a role in cyberspace governance.

Zuo Xiaodong, vice-president of the China Information Security Research Institute, said the law is a milestone.

"It's a progress that the law clarifies the responsibilities of governments, enterprises and individuals in cyberspace, and measures on how to deal with cyber emergencies," Zuo said.

Amber Rudd orders Lauri Love extradition to US on hacking charges
Monday, 14 November 2016
Byline: Staff report

London - The home secretary, Amber Rudd, has signed an order for the extradition of a British man to the US, where his lawyers believe he could face up to 99 years in prison if convicted of computer hacking charges.
Lauri Love is accused of stealing large amounts of data from US government agencies such as the Federal Reserve, the army, the Department of Defence, Nasa and the FBI in a spate of online attacks in 2012 and 2013.

The 31-year-old activist, who has Asperger's syndrome, lost his legal challenge to avoid extradition in September, and on Monday the Home Office said the necessary order allowing his removal had been signed after Rudd "carefully considered all relevant matters".

The Home Office said Love "has been charged with various computer hacking offences which included targeting US military and federal government agencies". He has 14 days to appeal against the order and is expected to do so.

Love, who also has depression and eczema, had argued that his health means a jail term in the US could drive him towards a mental breakdown or suicide.

However, the district judge Nina Tempia said in her ruling on 16 September that Love could be cared for by "medical facilities in the United States prison estate".

She said he faced "extremely serious charges" and, while she accepted he suffered from "both physical and mental health issues", she believed provision for his condition was adequate in the US.

US authorities have been fighting for Love to face trial there. He could face proceedings in three different US jurisdictions. Rudd had been given a deadline of 16 November to decide whether or not to order his extradition.

It is alleged that between October 2012 and October 2013, Love placed hidden "shells" or "backdoors" within networks, allowing for confidential data to be stolen. He is accused of causing millions of dollars' worth of damage.

Love's father, Alexander, said in response to Rudd's decision: "It was going to happen - it was inevitable - but it's still painful. I cannot begin to express how much sorrow it causes me. All we are asking for is British justice for a British citizen."

Barry Sheerman, one of more than 100 MPs who signed a letter calling on Barack Obama to block Love's extradition, said he was "deeply disappointed".

"We are still keeping up the pressure. We are getting more and more MPs to sign the letter to President Obama," the Labour MP for Huddersfield said. "The pressure continues, we won't give up."

Reuters
Bangladesh's central bank hopes to recover $30 million stolen in cyber heist
Tuesday, 15 November 2016

Dhaka - Bangladesh's central bank hopes to retrieve $30 million more of the $81m stolen from its account at the New York Federal Reserve in February, two bank officials said on Monday.
Hackers used stolen Bangladesh Bank credentials to try to send three dozen SWIFT messages to transfer nearly $1 billion from its Fed account. They succeeded in transferring $81m to four accounts at Rizal Commercial Banking Corp in Manila.

Most of the money was laundered through casinos in Manila. On Friday, Philippine authorities began the process of handing over $15.25m to Bangladesh.

"We are hoping to get back around $30m which remains frozen," Bangladesh Bank deputy governor Abu Hena Mohammad Razee Hassan, who heads its financial intelligence unit, told Reuters.

A Bangladesh team is likely to visit the Philippines at the end of the month to accelerate the process, he said.

"We are expecting to get a favourable verdict from Supreme Court of the Philippines as it has already been proved that $81m is our money," said another Bangladesh Bank official, who asked not to be identified because he was not authorised to talk to the media.

Times of Israel
Elbit Systems unveils New Anti-Drone System
Tuesday, 15 November 2016

Jerusalem - Elbit Systems will reveal at the Israel HLS & Cyber Conference, taking place this week in Tel Aviv, Elbit Systems EW and SIGINT Elisra's ReDrone system, a solution for protection of closed air spaces, national infrastructures and other critical areas against hostile drones penetrating the protected perimeter.
ReDrone is designed to detect, identify, track and neutralize different types of drones that are flown within a range of radio frequency communication protocols. The system will be presented at the conference along with Elbit Systems' SupervisIR, an infra-red wide-area persistent ISTAR (information, surveillance, target acquisition and reconnaissance) system. SupervisIR can be integrated and operated within the ReDrone system thus enabling full-scale Signal Intelligence (SIGINT) and thermal imaging detection capabilities of hostile drones.

The ReDrone's open system architecture allows multiple hardware configurations, including an array of controllers and sensors for target detection, tracking and engagement. The system is also capable of separating a drone's signals from its operator's remote control signals, as well as pinpointing both the drone and the operator's directions. The detection system provides 360-degree perimeter protection and complete, up-to-the- minute situational awareness. It can also deal with a number of different drones simultaneously. Due to its passive detection features, ReDrone also enhances environmental protection and supports the safety of civilians and air platforms inside the secured airspace.

After detecting a target, the ReDrone system disrupts the drone's communication with its operator, blocks its radio and video signals and GPS positioning data, and sends it off track, preventing it from carrying out an attack.

Gulf Times
Vodafone shares its expertise in tackling cyberwarfare
Tuesday, 15 November 2016

Doha - Vodafone shared its global expertise in tackling cyberwarfare at the Qatar Central Bank's (QCB) recent 3rd annual 'Information Security Conference' for the financial sector.
This is also the second time that Vodafone participates as a sponsor of the event. The event was held at the Sheraton under the patronage of HE the Prime Minister and Minister of Interior, Sheikh Abdullah bin

Nasser bin Khalifa al-Thani, in the presence of HE the QCB governor, Sheikh Abdullah bin Saoud al-Thani; and HE the Minister of Transport & Communications, Jassim Seif Ahmed al-Sulaiti.

Vodafone Qatar's director (Information Security) Shaik Abdulkhader delivered a presentation on cyberwarfare and showcased Vodafone's cyber security portfolio for both the consumer and enterprise segments such as its DDoS Mitigation Service and Secure Device Management.Vodafone's chief business officer Mahmud Awad said, "Cyberwarfare is the number-1 national security threat ahead of terrorism and espionage with cyber-attacks continuing to evolve in the region, and show a continuation of extremely high volume of attacks posing a huge risk to organisations and governments.

Vodafone is committed to bringing our global expertise and leading edge technology to Qatar to help protect organisations and people whilst contributing to the development of a knowledge based economy."

Vodafone, a founding member of the IoT Security Foundation, was the first service provider globally to offer a managed DDoS mitigation service protecting its customers from DDoS attacks since 2004. Vodafone was also the first company in Qatar to offer 'Secure Device Management' to help businesses better protect their company data.

Khaleej Times
Cyberspace security, power building and geopolitical impact up for debate at ADSD
Tuesday, 15 November 2016

Abu Dhabi - As the world today shows great concerns and interests pertaining to Cyberspace Security, the "Third Abu Dhabi Strategic Debate 2016" gave a special focus to the issue and designated a panel to address the threats linked to a phenomena gaining powerful impact on governments and organisations across the globe.
Speakers of the panel included Barry Pavel, Vice President, Arnold Kanter Chair, and Director, Brent Scowcroft Center on International Security at the Atlantic Council, Josh Corman, Director of the Cyber Statecraft Initiative at the Atlantic Council and Moderator Dr. Zaid Eyadat, Prof. of Political Science at UCONN, Georgetown and EPC adviser.

Barry Pavel, Vice President, Arnold Kanter Chair, and Director, Brent Scowcroft Center on International Security at the Atlantic Council, said "We're at the beginning of a new age in history and we require strategic foresight to imaging what's coming in the future of cyberspace. This age is experiencing a functioning and a functional internet. We need to communicate, operate and in the security sphere. It's global in every aspect".

"Cyber is mastered by some of the major actors such as Russia. On the technical side.The system is getting increasingly complex although the US and Russia seem to be on the same level of advancement

We should give more importance in foreign policy and defense to cyber security. We can close on ISIS on the field, but if we don't do so online then we cannot defeat them", Pavel stressed.

Josh Corman, Director of the Cyber Statecraft Initiative at the Atlantic Council, emphasized "It's important to bridge the technical community with the international one. The private sector is far more concerned with the ability to defend and protect individuals from attacks and breaches. It's less about the big data and technology nowadays".

"In the Arab region there is tremendous investment in future smart technology. If we can raise the cyber hygiene enough, we can protect ourselves better from attacks". Corman added.

The cyber security threat is now widely understood to be real and growing, and increasingly touches on every facet of our connected world.

Saudi Gazette
Beware of hackers, IT expert tells Saudis
Tuesday, 15 November 2016
Byline: Staff Report

Dammam - Educational and cultural awareness programs through schools and social networking sites have contributed greatly to reducing cases of hacking electronic gadgets and websites of Saudis from 70 percent in 2014 to 25 percent in 2016, said an expert.
Speaking to Al-Watan Arabic daily, Khaled Abu Ibrahim, executive director of Saudi IT Consulting Co., said hacking of Saudis' electronic devices reached its peak in 2014, hitting 70 percent and it reduced to 45 percent in 2015 and 25 percent this year as a result of awareness programs.

He said some people break into social media accounts of individuals without any specific purpose. "It has been noticed that some hackers break into Facebook, Twitter and other social media accounts as well Internet websites regularly," he told Al-Watan Arabic daily.

Sociologist Latifa Bin Humaid spoke about the negative impact of hacking electronic sites on the society as it leads to many crimes. "People try to get secret information and make use of them for their vested interests. They will also tamper with databank of companies and organizations."

Stealing money from bank accounts and transferring money from one account to another are other crimes committed by hackers. Hackers also engage in impersonation, blackmailing, threatening and break into the websites of major government departments and corporations.

IT engineer Abu Ibrahim urged individuals and companies to be cautious about hackers who get into their websites and social media accounts. Hackers use various methods to break into their sites despite advanced security firewalls and systems, he added.

"They often get into our devices and websites by promoting news of celebrities and major commercial firms," he pointed out. "Saudis have achieved tremendous progress in using computer systems but still they fall into the traps of hackers," he added.

He described the Internet as a double-edged sword. "Some unknown people send messages through the Internet for various purposes. There are some companies that want to collect various information about Arab youth and we don't know their hidden objectives."

Abu Ibrahim urged Saudi youth to use the Internet carefully to enhance their knowledge and interact with other people and they should be cautious about people and agencies that try to influence and change their religious faith and values.

"Hackers use WhatsApp to get into personal information of users as they forward news of celebrities and companies and promise fake prizes in order to entrap users of the popular social media. People should check links before opening them to avoid hacking," he explained.

The National (UAE)
Abu Dhabi security conference sets focus to cyber threats
Tuesday, 15 November 2016
Byline: Caline Malek

Abu Dhabi - How to stay ahead of online threats and combat them will be at the heart of discussions at a cybersecurity conference that kicks off in the capital on Tuesday.
Defining a new security roadmap, the current state of electronic security, advanced threat detection and risk management are some of the topics that will be discussed by more than 1,000 security experts and officials at the two-day RSA conference.

The predominant concern for the UAE is the transition to smart cities. "The UAE has experienced a growth of digitalisation, smart cities and smart government," said Scott Manson, cybersecurity leader for the Middle East and Turkey at Cisco.

"We're seeing through this innovation age a lot more need for more security and a huge amount of cybertechnology."

He said if the UAE continued to grow and benefit from digitalisation, the way forward would be to continue to oversecure its intellectual property and key data.

Fifty sessions will tackle critical infrastructure, cybercrime and threats and analytics as well as incident response.

"As the smart city grows, more people will share data, on a personal and professional level - hence there are more concerns around security and privacy," said Ibrahim Almallouhi, vice president of security operations at telecoms company du.

He said that cybersecurity was not only critical to the UAE, but also to the whole world.

"In the UAE, we are working with the Government to bring the country's smart city ambitions to life," Mr Almallouhi said. "As connectivity continues to proliferate, it is incumbent on us to ensure that data and compliance is protected the right way."

Experts say the Middle East is rapidly recognising its level of vulnerability to cyberattacks.

"As more systems become interconnected with the internet, they can be targeted," said Faisal Al Bannai, founder of UAE cybersecurity company DarkMatter. "The areas of concern for the region are information theft and cyberextortion, where cybercriminals are leveraging threats to disrupt or deny service if a ransom is not paid."

Two-time Formula One champion Mika Hakkinen will speak about risk management in his sport. Hakkinen said drivers have turned to data acquisition, analysis and predictive analytics to better manage risk.

"We have developed a fully connected digital communications environment, which means that for a driver we can make better real decisions to protect ourselves."

Linda Martin, the conference's general manager, said one of the major drivers of technology was people's desire to connect.

"The internet has allowed us to do that so easily, but the downside is a proliferation of attackers," she said. "The conference gives the region that platform to come together and share knowledge."

New Straits Times
Darknet makes IS more dangerous
Tuesday, 15 November 2016
Byline: Shahzeb Ali Rathore

Kuala Lumpur - Terrorist and non-state actors have used different modes and mediums to spread their message and communicate with their comrades. The dawn of the Internet has also provided such groups with unparalleled opportunities to establish communications and operational links that were not possible before. Starting from websites, terrorist groups moved to more interactive mediums like chatrooms and forums. Social media platforms, Facebook and Twitter, truly revolutionised how

militants, terrorists and non-state actors communicated with each other, recruited sympathisers and supporters, and disseminated their propaganda.
The Islamic State perfected the use of social media, which became the preferred source for the "jihadists" or "soldiers of the Caliphate". In response, technology companies have been compelled to take down Facebook and Twitter accounts affiliated with IS. Because of these supporters, sympathisers and members of jihadist groups have moved into the deep web and the darknet.

Deep web and darknet are interchangeably used, but they are two different things. The deep web includes all those web pages that a search engine, such as Google, cannot find. This includes web pages that are password-protected, all webmail, private Facebook accounts, user databases and pages behind paywalls. Websites that are not indexed by Google are also part of the deep web. The surface web is all that Google has indexed and a user can access it using any search engine.

It is said that the surface web is only the "tip of the iceberg" and the deep web comprises more than 90 per cent of the total Internet, almost 500 times of what Google can see.

The darknet is a part of the deep web, but there is an important distinction. We access the deep web every day when retrieving our emails, checking bank statements online or logging into Facebook account. However, we cannot enter the darknet through a regular browser. The darknet is accessed using "dot onion" software and not a "dot com" one. Dot com browsers, such as Google Chrome and Mozilla Firefox, cannot access 'onion' websites. The Tor browser is used for this.

Tor is an onion browser that sends the user through an unusual route to access a web page. For instance, if a user wishes to access a website using Tor, the browser will wrap the request through numerous layers, which will keep bouncing off different domains in different countries. The layers of the onion (hence the name) ensures anonymity and makes it almost impossible to trace the user's footprints. This makes the Tor browser and dot onion web pages attractive for those wishing to maintain their secrecy.

Indeed, anonymity does not mean that the darknet is a dangerous place. Individuals, especially journalists, use such avenues to hide themselves from prying eyes of authoritarian states and dictators. Similarly, Tor is used by those who wish to protect their privacy. However, illegal practices can, and do, happen because of the anonymity that is guaranteed by Tor and the darknet.

The darknet has provided criminals, non-state actors and terrorists tools and avenues that are absent in the surface net. For instance, a webpage by the name of "Silk Road" functioned like the Amazon.com for illegal activities, including the sale of drugs, weapons, fake passports and even hitmen. Criminals were comfortable dealing on this platform because of the anonymity in the darknet. The owner and founder of Silk Road, Ross Ulbricht, was caught by the Federal Bureau of Investigation in 2013.

Another attractive market in the darknet is that of hacking tools. IS and its United Cyber Caliphate has conducted several cyber-attacks in the last one year, usually in the form of defacing websites or hacking

Twitter and Facebook accounts. The hacking tools and malware toolkits such as keyloggers and Remote Access Trojans are available in the darknet.

IS is known for its innovations and ability to adapt to changing environments. When law enforcement agencies started snooping around social media, IS migrated to mobile applications WhatsApp and Telegram. They have become attractive modes of communication because of their end-to-end encryption, which prevents any "peeping" by intelligence and law enforcement.

Now, a pro-IS deep web forum user has recommended that the group migrate to Tor and stop using virtual private network services to ensure greater anonymity.

The 9/11 attack was the biggest terrorist attack which changed the complexion of global security. The American leadership and public never expected that an attack of this scale could happen in the homeland. Yet, it did. Today, the attack that defined Osama bin Laden's notorious legacy seems less possible because of all the security measures and precautions that have been taken by countries around the world.

The lack of imagination before was the serious shortfall of security analysts and counter-terrorism specialists who failed to predict or anticipate 9/11. If IS wants to surpass 9/11, it will conduct a cyber-9/11. This is not an impossible task considering the lax cybersecurity measures. The recent hacks of the Democratic National Committee emails and leaks to Wikileaks signify the vulnerability of private information. The DoS attacks by hacking groups such as Anonymous further underline the capacity of non- state actors to inflict damage.

A terrorist organisation that is anonymous and possesses an army of hackers is already becoming a reality. The world is increasingly becoming more connected via the Internet. With or without IS, the next wave of terrorism is most likely to be cyber terrorism. Rather than reacting to an attack in the future, the international community must pre-empt this threat now and take necessary steps.

Ottawa Citizen
Bell Canada hacker sentenced to nearly four years in US prison
Wednesday, 16 November 2016
Byline: Andrew Seymour

Ottawa - An American man who hacked login and password combinations for thousands of Bell Canada customers and then posted the information online has been sentenced to nearly four years in a U.S. prison.
The 45- month sentence handed down in a Chicago courtroom this month to the 22-year- old Tennessee man is in stark contrast to the one received by a 15-year-old Canadian teen who avoided jail after helping to perpetrate that cyber attack and several others on U.S. businesses, universities and government departments between October 2012 and April 2014.

The pair were members of a hacking collective calling themselves NullCrew. The two boasted online that they hacked into the personal information as a "public service" to expose how easily personal information that should have been protected could be accessed. The 22-year-old's identity cannot be published as a result of a publication ban placed on the Canadian teen's court case.

Canadian prosecutors said million of files were exfiltrated during the Bell Canada hack and 300,000 of them contained client information. The U.S. hacker posted about 12,700 logins and passwords and Tweeted a link to the data.

It was only after the Feb. 1, 2014, hack that the RCMP learned from the FBI that an investigation had been underway for more than a year and that the suspects had long since been identified.

The hack was carried out using an undercover FBI server that NullCrew had been given access to through a confidential FBI informant. The American man continued using the undercover server to carry out hacks on a university and two other companies following the Bell hack, all while the FBI watched.

Dominic Lamb, the Ottawa lawyer for the Canadian teen, accused the FBI during a sentencing hearing for his client of putting the public at risk and questioned whether its tactics amounted to entrapment.

After pleading guilty to unlawful use of a computer, the Canadian teen received a conditional discharge and was ordered to perform 100 hours of community service, ordered to stay off Internet cloud storage devices, and to stop hacking.

The teen - who discovered the vulnerability that allowed the hack on Bell - was sentenced under Canada's Youth Criminal Justice Act. Unlike adult sentencing hearings, a judge in a youth court must consider all reasonable alternatives to jail and arrive at a sentence that puts a young offender's rehabilitation first.

The U.S. Attorney's office said the hacks caused at least $792,000 in monetary losses for the victim companies, schools and government agencies, and violated the privacy and security of thousands of innocent people whose usernames, email accounts and passwords were exposed online.

The U.S. man pleaded guilty last year to one count of intentionally damaging a protected computer without authorization.

Toronto Star
Julian Assange now hero of the alt-right
Wednesday, 16 November 2016
Byline: Rosie DiManno
Section: column

Publish and be damned, Julian Assange declared from diplomatic asylum on election day in America. So damn you, Julian Assange.

Darling of the left, Assange has transformed himself into a hero of the alt-right. They've been singing his hosannas since the drip-drip-drip release of hacked emails and internal memos that served to vilify Hillary Clinton and the Democratic Party, most harmfully in the final weeks leading up to Nov. 8.

WikiLeaks, the raw data site of which Assange is founder and executive editor, purports to be a cipher for truth and transparency, ideologically neutral. But the mission has been warped irredeemably, as evidenced by the glee heaped upon its unfiltered disclosures by Team Donald Trump and his coalition of the haters.

In the annals of overt political interference, Assange has forever secured himself a place amongst rogues and reprobates, mutilating citizen activism into partisan pitch-forking, more concerned with influencing the electorate against Clinton than neutral enlightenment.

"I love WikiLeaks," Trump proclaimed at an October rally in Pennsylvania. And why would he not champion this cannon of loose fodder who conservative commentators had earlier demanded be prosecuted for treason? A berserk ally now in the change-lobsters-and-dance Internet wars that fostered demonization of Clinton on social media masquerading as journalism. On the morning after Trump's victory, trending on Twitter was an email allegedly released by WikiLeaks hashtagged #SpiritCooking. While "spirit cooking" apparently refers to performance artist Marina Abramovic's "cookbook" of recipes to promote thoughts and ideas, WikiLeaks tweeted that it involved "blood, sperm and breast-milk," with many on Twitter pouncing on the definition to accuse Clinton of devil worship. That's how kooky this election has been.

Nothing goes out on WikiLeaks without Assange's approval. He has shown his colours.

One of Trump's key "unofficial" advisers, Roger Stone, admitted to NBC News a month ago that he had advance warning about the last tranche of emails through "back-channel communications with WikiLeaks" via an Assange "mutual friend." This is the same Stone who claimed Ted Cruz's father was involved in the Kennedy assassination and said Bernie Sanders should be shot for treason.

While cleaving to the high road of a whistle-blowing Robin Hood, Assange himself made no secret of his anti-secrecy organization's strong tilt against Clinton, making it abundantly clear in a June interview with Britain's ITV network that he hoped to damage the Democratic candidate's chances of winning the presidency.

Australian-born Assange, engaged in a long-running battle with the Obama administration, described the then-pending email splash (Part I) just before the Democratic convention, as "great" stuff, strongly suggested he opposed Clinton's candidacy on policy grounds and, further, viewed her as a personal foe. He accused Clinton, specifically, as being among those who connived to indict him after WikiLeaks spewed out a quarter-million diplomatic cables while she was secretary of state. (Those were the cables leaked by Pvt. Chelsea Manning, then known as Bradley Manning, who is now serving a 35-year sentence for Espionage Act violations.)

But Assange - while not physically setting foot outside the Ecuador Embassy in London where he was granted asylum more than four years ago after breaking the house-arrest conditions attached to an international warrant for alleged sexual assault in Sweden - has travelled a long road from the paragon of virtue he once espoused to be, just as WikiLeaks has strayed far from its founding principles.

The last batch of hackery installments were emails - some 58,000 in all - stolen from the accounts of John Podesta, Clinton's campaign chair. Though the documents disclosed some of the nastiness inside the campaign - only political naïfs would be shocked - and were cringe-inducing in their exposure of fawning by journalists to gain insider access, there was in fact no bombshell as Assange had advertised. Embarrassing and candid, yes, at their worst confirming that Clinton had been lucratively paid for private speeches delivered to banks and other Wall Street institutions. But no malfeasance, no corruption and certainly nothing criminal.

They did feed into Trump's false narratives, however, which many are convinced was Assange's core intent, unloaded without fact-checking, nuance or context to sway voters. What should have boomeranged more damagingly, but didn't, was the likelihood that the material arrived at WikiLeaks courtesy of sinister forces. U.S. authorities have concluded that the digital files were taken by hackers "affiliated and associated with Russian intelligence and security agencies."

That puts Assange and WikiLeaks in collusion with a foreign government to influence the American election. On election eve, Assange felt the need to defend himself, claiming he'd come under "enormous pressure" to stop publishing the Clinton campaign documents.

"Millions of Americans have pored over the leaks and passed on their citations to each other and to us," he wrote. "It is an open model of journalism that gatekeepers are uncomfortable with, but which is perfectly harmonious with the First Amendment." He has denied any links to Russia in obtaining the material but hasn't said where or how WikiLeaks came into possession.

In his jaw-dropping megalomania, Assange has cast himself, instead, as "the gatekeeper." Not one word about Trump on WikiLeaks. Never once has Assange taken ownerships of the site's grievous misdeeds. As U.S.-based scholar Zeynep Tufekci wrote in the New York Times last week, WikiLeaks has "fuelled viral misinformation on social media."

"Data dumps by WikiLeaks have outed rape victims and gay people in Saudi Arabia, private citizen's emails and personal information in Turkey, and the voicemail messages of Democratic National Committee staff members. Mass data releases, like the Podesta emails, conflate things that the public has a right to know with things we have no business knowing."

Ecuador was so concerned by what its government saw as a blatant attempt to impact the election that the embassy shut off Assange's Internet access a month ago. "The Government of Ecuador respects the principle of non-intervention in the internal affairs of other states," it said in an Oct. 18 statement. "It does not interfere in external electoral process, nor does it favour any particular candidate."

A little late and a whole lot short. But the Ecuadorans are palpably sick of the Assange deadlock; probably rue giving him sanctuary at the embassy.

For the past two days, it was an Ecuadoran prosecutor putting questions to Assange at his bolt-hole, queries pre- submitted by Swedish deputy chief prosecutor Ingrid Isgren.

It's been six years since Assange was accused of rape by a woman in Stockholm (a second alleged sexual assault was dropped because of delay deadline.) This is the format Assange demanded. Isgren, according to agreements between the two countries, was permitted to ask for clarification of answers but could not put fresh questions to the accused.

Assange has not been formally charged with any offence and has claimed his innocence throughout. Taking refuge in the embassy was his way of avoiding what he feared would be extradition from Sweden to the U.S. over the WikiLeaks dissemination of classified documents.

It is for the Swedes to decide whether the fugitive should stand trial on the sexual assault charge, should the embassy ever jettison their "guest." But in the world of misinformation manipulation, Julian Assange is manifestly no innocent.

CBC News and Toronto Star

'I don't know that we can help you': RCMP boss 'consumed' with 'inability' to investigate in digital world
Wednesday, 16 November 2016
Byline: Dave Seglins, Robert Cribb and Chelsea Gomez

Ottawa - The RCMP is lobbying the Prime Minister's Office for new powers to bypass digital roadblocks in cases where national security threats and other "high priority" suspects hide online and operate anonymously beyond the reach of police.
"I can safely say that there's criminal activity going on every day that's facilitated by technology that we aren't acting on," RCMP Commissioner Bob Paulson told CBC News and the Toronto Star in an exclusive interview.

The problem is a major focus for Paulson, and one that only gets more urgent as technology advances and suspects find new ways to cover their digital tracks.

"Because of our inability -- and the future inability -- to protect Canadians, both from garden variety criminality and from the national security threat, I see that as really significant," Paulson said. "I'm consumed with trying to make sure that we're able to mitigate the threat."

But privacy advocates and civil liberties groups remain unconvinced that effort requires expanded investigative powers for police.

Canada 'lagging'

On June 23, the RCMP sent Prime Minister Justin Trudeau's national security adviser a briefing note that says Canada lacks strategies and laws to address the technological limitations of police investigations.

The RCMP argues the U.S., Australia, the U.K. and New Zealand -- members of our Five Eyes intelligence alliance - - do much more than Canada to help their police forces deal with high-tech obstacles like encryption, and interception and storage of digital information.

"It's a challenge," Paulson said. "I think we're lagging."

The RCMP briefing note closely mirrors four policy ideas floated in the federal government's green paper on national security, which is open for public consultation.

The RCMP and other police leaders say aside from requests for basic subscriber information, these additional powers would be used only in targeted investigations and would require a warrant from a judge.

Paulson directed his force to provide CBC News and the Toronto Star access to ongoing "high prioirity" investigative case files to demonstrate what police call "going dark" -- the digital barriers to tracking suspects and gathering evidence.

"If you've got a complaint of criminality on the internet, you're going to have to think about where you go with that complaint because I don't know that we can help you," he said. "And that's a terrible thing for a person who's in charge of a police force to say when citizens, when companies, when corporate Canada, or indeed the government comes to us and says, 'Hey, we've been victimized on the internet.'"

Paulson fully expects he'll be criticized by civil libertarians and privacy advocates, but he insists Canadians need to understand the growing digital challenges police face and that our laws need to be updated.

"I think Canadians need to be asked, 'What do you expect the police to be able to do in this digital world? What do you expect?'"

What's unreasonable?

He says privacy is increasingly being understood as a right to complete anonymity online.

"In other words, absolute privacy is everybody's right," he said. "And for me to sit here and say, 'OK, hold on, that's not right,' immediately I get dismissed as someone who doesn't respect privacy.

"That's the space that we need to talk about. What's reasonable, what's unreasonable."

One of Paulson's top priorities may also be the most controversial.

"I've been consistently advocating for a warrantless access to subscriber information. I often get dismissed as, you know, as a troglodyte that doesn't understand people's privacy."

He's adamant Canada must return to a system that allows police easier access to basic phone and internet subscriber information.

In 2014, the Supreme Court ruled in a child pornography case that police had violated the suspect's expectation of online privacy when investigators requested the basic subscriber information (BSI) linked to the IP address he was using. The ruling says absent a reasonable law, the request for the suspect's BSI constituted a search and therefore police should have first obtained a warrant.

Before the ruling, police didn't hesitate to request BSI directly from telecom companies. In fact, the federal privacy commissioner released data that showed law enforcement made nearly 1.2 million such requests in 2013 alone.

Police now must apply for a warrant every time they want to look up a user's BSI. They say it takes time and paperwork, and when police are at the beginning of an investigation and want to look up an IP address, they don't always have sufficient grounds to obtain a warrant.

Paulson says the system causes delays and occasionally forces police to abandon investigations. He says the public and policy-makers don't fully understand the consequences of the ruling.

"We can query licence plates and get the subscriber of a car on the basis of the fact that the police are engaged in enforcement of the Traffic Act or another criminal investigation. We keep records of all that and we're accountable for that," he said. "I don't think it's unreasonable."

Paulson and many other police leaders across the country are hoping the Liberal government will draft a new "reasonable law" to create a system of "administrative access" to BSI that could be overseen by senior police or prosecutors -- not the courts.

'Not a trivial ask'

But critics say police must first provide far greater evidence that investigations are being abandoned.

They also say basic subscriber information can actually be extremely revealing.

"When it is connected to an IP address, [BSI] reveals an incredible amount of information about the things that you do online," said Brenda McPhail, director of the Privacy and Technology Surveillance Project at the Canadian Civil Liberties Association.

McPhail says with a simple IP address police can discover a user's identity, where they live and build a profile based on online activity.

"Let's face it, we live half of our lives online these days, so it is not a trivial ask."

Christopher Parsons, a technology and privacy researcher with the Citizen Lab at the University of Toronto's Munk School of Global Affairs, says any new law must protect against abuses.

"The solution is not to say, 'It's very hard for police, just trust us and let us sign off on our own warrants.' Turning to other jurisdictions such as the U.S., we know it doesn't work. We know that police will over-exercise that power."

Paulson has mixed views on the other policy proposals discussed in the government's green paper.

For example, he disagrees with the Canadian Association of Chiefs of Police that courts should be able to order suspects to hand over their passwords and/or encryption codes.

He says he struggles with the idea of compelling suspects to potentially incriminate themselves.

"It's fraught," he said. "I don't see a state where the police are ordering people to give up information. It would be like ordering a statement. That's at odds with how I understand what we do. I don't see that happening."

But the commissioner does support proposals to require communications providers to build intercept and data-retention capabilities into their networks

He insists access to a suspect's private data or communications would require a warrant authorized by the courts.

"We are not at all interested in surveilling citizens, except to the extent that we can demonstrate to others that they're engaged in criminal activity that threatens Canadians."

Paulson says public debate on these issues is urgently needed because police are increasingly hitting digital dead ends in terrorism and child exploitation investigations.

"I feel responsible for the safety and security of Canadians in the face of this challenge."

Toronto Star and CBC News
Mounties lobbying for more power
Wednesday, 16 November 2016
Byline: Robert Cribb and CBC staff

Ottawa - The RCMP is lobbying Prime Minister Justin Trudeau for more powers - including access to digital information without warrants - to investigate suspects who are hiding behind uncrackable encryption on their digital devices, a Toronto Star/CBC investigation has found.
"I can safely say that there's criminal activity going on every day that's facilitated by technology that we aren't acting on," RCMP Commissioner Bob Paulson told the Toronto Star and CBC in an exclusive interview. "We're losing our ability, if we haven't lost it entirely, to bring the traditional investigative response to technologically facilitated crime because of the misunderstanding, in my view, of the privacy threat."

The RCMP has reached a point, Paulson said, that Canadians should "think about where you go with that complaint because I don't know that we can help you."

"And that's a terrible thing for a person who's in charge of a police force to say when citizens, when companies, when corporate Canada, or indeed when the government comes to us and says, 'Hey, we've been victimized on the Internet.'"

An RCMP briefing document sent June 23 to Trudeau's national security adviser compares Canadian law enforcement's digital investigative capabilities with four western countries - and Canada stands alone.

The country lacks police powers in six categories, including legal remedies for cracking encryption, intercepting communications and accessing suspects' identities.

The other countries - Australia, the U.K., the U.S. and New Zealand - are, with Canada, members of the Five Eyes intelligence alliance.

"When we come up against impediments to getting evidence ... that's demoralizing," Paulson said.

The Star/CBC investigation comes as the federal government is engaging in public consultation on Canada's anti- terror act, including a problem police call "going dark" - the gradual disappearance of evidence behind digital brick walls.

It's a deeply polarized debate.

Police are calling for laws that would force suspects to provide access to their encrypted devices and compel telecommunications companies to create interception and data retention capabilities to assist investigations.

Privacy advocates call these demands an "evidence-free" infringement of basic privacy rights.

"If we plan every law around a hypothetical ticking time bomb, it will be used in a lot of non-time-bomb scenarios," says Christopher Parsons, a technology and privacy researcher at the Citizen Lab at the University of Toronto.

"We know powers that are passed, often under the auspices of terror or something of that nature, are immediately used for potentially serious but far less serious crimes."

The most controversial item on Paulson's wish list would allow police to collect basic subscriber information - such as names and addresses - from telecommunications companies without having to go to court for a warrant.

Police view such searches as a basic investigative tool - the first step in launching investigations into suspected terrorists, pedophiles or organized crime figures.

"I'd like to see the ability of the police to call an Internet Service Provider or communications provider ... and get the basic subscriber information," he said.

Paulson concedes that such requests are dismissed by privacy advocates who cast him as a "troglodyte who doesn't understand people's privacy."

Paulson's argument for warrantless access to basic subscriber information has already been heard - and rejected. A 2014 Supreme Court ruling found Canadians have a reasonable expectation of online privacy in basic information, such as names, addresses and IP addresses.

In the absence of a law to the contrary, the ruling concludes, police should have to obtain a warrant.

Police, who were previously able to get the information almost immediately, call that ruling a game-changer. Many officers say obtaining a warrant is a bureaucratic process that is so time- consuming it can undermine investigations.

"I don't think the consequences of that decision on policing and security (are) completely understood," Paulson said. "The consequences are delayed, and sometimes, abandoned investigative efforts because we haven't been able to meet a threshold."

He points to what happens when police run licence plate numbers and get the owner's name and address. Police want the same kind of ease searching ISP records.

"We keep records of all that and we're accountable for that. I don't think it's unreasonable."

Privacy advocates reject the comparison.

"Basic subscriber information, which is connected to an IP address, reveals an incredible amount of information about the things that you do online," said Brenda McPhail, director of the Privacy and Technology Surveillance Project at the Canadian Civil Liberties Association.

"It is not a trivial ask to say we just want warrantless access without any sort of supervision to this information, which we have already shown in court to be sensitive and personal."

Any powers handed to police come with the risk of abuse, said Citizen Lab's Parsons.

"The solution is not to say, 'It's very hard for police, just trust us and let us sign off on our own warrants,'" he said. "We know that police will over-exercise that power."

In recent weeks, two cases of law enforcement overreaching their powers made scandalous headlines.

Two weeks ago, a Federal Court judge denounced the Canadian Security Intelligence Service's monitoring and retention of information on thousands of Canadians' and, in Quebec, police forces admitted to intercepting and tracking cellphones belonging to at least 10 journalists.

"I can't sit here and say that it's going to be a perfect," Paulson said.

But when abuses occur, those responsible are held accountable, he said.

"Canadians can be persuaded that there is a reasonable, reliable administrative oversight mechanism, that it can be seen externally."

Paulson is more cautious than many of his policing colleagues on the idea of compelling suspects to open up their phones or computers for police review - a proposal tabled by the Canadian Association of Chiefs of Police.

"It's fraught," he said. "I'm not a lawyer, but I do know the dangers of conscripted evidence ... Given the current state of concerns and misunderstanding around privacy, I think we're likely not to win too many arguments there."

Yesterday, the Star and the CBC, which were given unprecedented access, reported the details of investigations that the RCMP say have been stonewalled by encrypted devices. Those disclosures and Paulson's interview are part of the force's attempt to get its message to Canadians about what he calls a high-stakes debate.

"I feel I need to be educating folks to a fair understanding of what the challenge is," Paulson said. "But more importantly, I feel responsible for the safety and security of Canadians in the face of this challenge."

Toronto Star
Spy agency kept court in the dark about data
Wednesday, 16 November 2016
Byline: Alex Boutilier

Ottawa - Canada's electronic spies were asked to brief the Federal Court on their intelligence-gathering activities, the Star has learned.
But the Communications Security Establishment (CSE) declined to meet with federal judges earlier this year, saying an ongoing constitutional challenge prevented them from doing so.

The request came from the same judge that found CSE's partner agency, the Canadian Security Intelligence Service (CSIS), illegally kept information on innocent people for almost a decade.

In a strongly worded ruling released this month, Justice Simon Noël found CSIS kept the court in the dark about a program to retain and analyze data about innocent people between 2006 and 2016.

The ruling gave an unprecedented look at CSIS's Operational Data Analysis Centre, which for years had been storing data about "non-threat" individuals. While the information was intercepted legally, the court ruled it was illegal for CSIS to keep and analyze it indefinitely.

The ruling came out of a briefing on the program by Noël for judges who approve CSIS warrants. In documents obtained by the Star, CSE chief Greta Bossenmaier was told that Noël requested a general educational briefing from her agency around the same time.

But because of a constitutional challenge launched by the B.C. Civil Liberties Association (BCCLA) against CSE's intelligence activities, currently before the court, the agency declined Noël's invitation.

"A briefing to the Federal Court could have reasonably led to the perception from the public and the BCCLA that CSE may be attempting to influence the (court's) judgment or opinion as it related to this ongoing case," Lauri Sullivan, a spokesperson for the agency, said an email to the Star.

"It is important to note that CSE has provided briefings to Federal Court designated judges in the past, and would consider doing so again in the future (provided any conflict concerns are addressed as they relate to the ongoing BCCLA case)."

That case, launched in 2013 after U.S. whistleblower Edward Snowden's disclosures about mass surveillance programs, challenged CSE's bulk collection of metadata - commonly described as "data about data," such as mobile phone numbers, IP addresses, duration and locations of phone calls and unique identifiers of mobile devices.

The BCCLA contends the very nature of bulk collection puts Canadians' privacy rights at risk, according to the advocacy group's policy director Micheal Vonn. The case is proceeding behind closed doors, while a judge determines how much information about CSE's methods and techniques can be made public. But Vonn expects that process to wrap up this year, meaning public arguments could be heard in early 2017.

A spokesperson for the Federal Court, Andrew Baumberg, said Justice Noël's request to CSE was for a general educational briefing about their operations. Baumberg said there are no plans for future briefings, whether general in nature or specifically related to metadata collection.

The Star requested comment from Defence Minister Harjit Sajjan, the minister responsible for CSE, including whether he had any concerns about the agency declining to brief the judges, or any indication CSE data could have ended up in CSIS's illegal database.

In an email, a spokesperson for Sajjan said the minister is in regular communication with Bossenmaier about the agency's operations.

"The minister has regular conversations with the CSE chief and stays informed of CSE activities through these discussions, as well as through departmental briefings, and updates from the CSE Commissioner," wrote Jordan Owens.

"I am sure you understand that CSE can't get into specifics on operations, including data sharing. However, CSE's mandate allows for information sharing with Government of Canada partners under (those partners') lawful authority."

Motherboard
The RCMP Is Using the Media to 'Create Moral Panic' About Encryption
Wednesday, 16 November 2016
Byline: Jordan Pearson

The Royal Canadian Mounted Police has turned to two of the country's top media outlets to make their case for new surveillance capabilities in what critics say is a PR play orchestrated to sow public worry about privacy-boosting technology.
Police in Canada have long pushed for broadened surveillance powers that would force people to unlock their phones, for example, or force telecommunication companies to provide real- time access to subscriber information. No such laws currently exist, but to show why the police believe they need them to do their jobs, the country's federal force worked with two of Canada's most respected media entities.

The RCMP gave the CBC's David Seglins and the Toronto Star's Robert Cribb security clearance to review the details of 10 "high priority" investigations--some of which are ongoing--that show how the police is running into investigative roadblocks on everything from locked devices to encrypted chat rooms to long waits for information. The Toronto Star's headline describes the documents as "top-secret RCMP files."

The information sharing was stage-managed, however. Instead of handing over case files directly to the journalists, the federal police provided vetted "detailed written case summaries," according to a statement from Seglins and Cribb. These summaries "[formed] the basis of our reporting," they said. The journalists were given additional information on background, and allowed to ask questions, according to the statement, but "many details were withheld."

The stories extensively quote RCMP officials, but also include comment from privacy experts who are critical of the police agency's approach.

"On the one hand, the [RCMP] do have a serious problem," said Jeffrey Dvorkin, former vice president of news for NPR and director of the University of Toronto Scarborough's journalism program. "But to give information in this way to two respected media organizations does two things: it uses the media to create moral panic, and it makes the media look like police agents."

"It would have been better if the RCMP launched its own PR campaign to get the public to understand that they're in a difficult position," Dvorkin continued.

When asked if the Star and the CBC had any say in which cases they reviewed, Seglins and Cribb wrote that they did request details on a "handful of individual cases of interest," they said, and police complied "in some cases," denying access to one file because of sensitivities surrounding an ongoing investigation.

In the CBC and Star reports, RCMP officials repeatedly refer to the problem of "going dark," a term that law enforcement frequently uses to describe their supposed difficulties in solving cases due to the use of encryption technology. A green paper prepared by the government in the lead-up to an ongoing national security consultation also notes that police have identified encryption as a roadblock. Critics say the consultation and green paper risk broadening Canadian police's already-expanded powers.

A joint investigation by Motherboard and VICE News earlier this year revealed that the RCMP possessed a key that allowed them to decrypt communications on all consumer BlackBerry devices. The RCMP also has the ability to "crack" the encryption on certain phones, reports have shown.

Critics of police attempts to undercut encryption technology via the law note that ordinary people--journalists, protesters, and professors--also use encryption, and banning it would hurt them too, not just criminals.

"This is obviously part of a concerted PR attempt on the part of the RCMP in particular, which has been ongoing for some time," said privacy lawyer David Fraser. "The wording in these articles is mostly the police's version of things, and we need a reality check."

"If ordinary Canadians don't have access to technology to protect their privacy," Fraser said, "bad guys would be able to very easily, online, get the same tools that they're using today to encrypt their communications. Overall, we would be no safer, and in fact less safe."

The CBC and the Toronto Star's story is part one of a five-part series on the debate over privacy and police powers in Canada, with a second installment to come on Wednesday.

Xinhua News Agency
President Xi stresses int'l cooperation in cyberspace governance
Wednesday, 16 November 2016
Byline: Staff reporter

Beijing - Chinese President Xi Jinping on Wednesday called for increased international cooperation in cyberspace governance and the building of a cyberspace community of common destiny.
Noting that Internet development has no boundaries, Xi said China is willing to work with the international community for the common welfare for all people, to uphold the concept of cyberspace sovereignty and to make the global cyberspace governance system fairer and more reasonable.

Xi made the remarks while giving a speech via video at the opening ceremony of the third World Internet Conference (WIC) in the riverside town of Wuzhen, east China's Zhejiang Province.

Liu Yunshan, a member of the Standing Committee of the Political Bureau of the Communist Party of China (CPC) Central Committee, attended the opening ceremony of the WIC and delivered a speech.

The Internet is changing the global economic and security situation, so that building a cyberspace community of common destiny is a pressing demand in an information-led world, Liu said.

China is willing to strengthen policy coordination and cooperation with other countries, Liu said, calling for the improving of cyberspace governance rules, respecting cyberspace sovereignty and safeguarding all countries' equal rights in developing, joining and governing cyberspace.

Liu also called for the building of a multilateral and transparent global Internet governance system, cooperation in Internet innovation, and network popularization, in a bid to make the Internet benefit all peoples of the world.

Cooperation should be strengthened in coping with cyberspace security challenges, in a bid to safeguard state security, public interests and citizens' legitimate rights, according to Liu.

Themed "Innovation-driven Internet Development for the Benefit of All -- Building a Community of Common Future in Cyberspace," the third WIC runs from Wednesday to Friday.

Over 1,600 Internet entrepreneurs, opinion leaders, experts, officials and heads from over 110 countries and regions as well as international organizations attended.

South China Morning Post
Beijing wants to have it both ways with internet
Wednesday, 16 November 2016
Byline: Jane Cai and Mandy Zuo

Beijing - Liu Yunshan, the No 5 in the Politburo Standing Committee and in charge of ideological control, doesn't look like a man who can influence the future of the internet.
Yet the 69-year-old senior cadre will be the keynote speaker at the third World Internet Conference, an event organised by the Chinese government.

He will instruct leading figures in China's internet industry and guests from dozens of developing countries on how to build "a -community of common future in cyberspace".

At last year's conference, President Xi Jinping voiced the idea of "cyberspace sovereignty", an unambiguous announcement that Beijing would step up its -censorship and control of the internet.

The Communist Party is trying to match its social control in the real world in the virtual world.

The country has a huge online police team patrolling the internet and is enhancing the "Great Firewall" as a border control line to keep foreign websites such as Google and Twitter out.

But the internet is also a booming business and a way of life in China, a country of 1.3 billion -people.

Literally everyone is now connected via their phones, and online shopping, cashless payment, mobile taxi-hailing and virtual entertainment services in Beijing and Shanghai are as widespread and sophisticated as in New York and Tokyo.

It is against this backdrop that Communist Party leaders hope to allow a booming business-wise internet while maintaining rigid ideological control.

"China will continue to pursue a leadership role in global cyberspace governance," Zhang Lifan, a Beijing-based historian, said.

"But China is unlikely to achieve concrete results, since most developed countries are shunning the internet conference. Those with underdeveloped internet infrastructure are more interested in the economic benefits, rather than internet control."

Most overseas guests will be from developing countries, from Cambodia in Asia to Comores in Africa. There will be a conspicuous absence of speakers from big-name global internet firms like Google, Apple or Twitter.

This year's conference starts today in Wuzhen, Zhejiang (??) province. It has sessions on cybersecurity, smart health care and China's "One Belt, One Road" infrastructure scheme.

China has been trying in the past few years to strike a deal with conference participants on "cyber governance". Such an agreement would give international recognition to the way Beijing manages the internet, but observers are not optimistic that such common ground can be found.

Huang Chengqing, vice-chairman of the Internet Society of China, said it was unlikely Beijing could achieve any kind of agreement with participating countries during the summit.

"It's an issue of seeking balance for each country. Different countries have different understandings on what is harmful information, as they have different religions and values, or are at a different phase of growth."

Mother Jones Magazine

NSA Chief: WikiLeaks Hacks of Democrats' Emails Were a "Conscious Effort by a Nation-State"
Wednesday, 16 November 2016
Byline: Kanyakrit Vongkiatkajorn

New York - The WikiLeaks release of internal emails from the Democratic National Committee and the Hillary Clinton campaign constituted a "conscious effort by a nation-state to attempt to achieve a specific effect," the head of the National Security Agency said Tuesday.
"There shouldn't be any doubt in anybody's mind," NSA Director Michael S. Rogers said in an interview with the Wall Street Journal on Tuesday. "This was not something that was done casually, this was not something that was done by chance. This was not a target that was selected purely arbitrarily." Rogers acknowledged in October that Russians were behind the hacks.

News that the DNC had been compromised broke earlier this June, when hacker Guccifer 2.0 released a trove of documents containing campaign emails and memos--most notably emails implying that the committee favored Clinton over Sen. Bernie Sanders during the Democratic primary. The release of the emails led to the resignation of DNC chair Debbie Wasserman-Schultz.

WikiLeaks also published thousands of emails from John Podesta, Clinton's campaign chair. Though Russia was long suspected of being behind the hacks, US officials did not formally accuse the Russian government of orchestrating the cyber attacks until October. In November, just four days before the election, DNC officials told Mother Jones they had found evidence that the DNC headquarters may have been bugged and had submitted a report to the FBI.

London Daily Telegraph
Teenage hacker in data breach at TalkTalk was 'just showing off '
Wednesday, 16 November 2016
Byline: Lydia Willgress

London - The head of the telecoms giant TalkTalk fell victim to blackmail by cyber criminals after a teenage boy hacked into its website then boasted about it online, a court has heard.
The boy, aged 17, who cannot be named for legal reasons, used hacking software to identify TalkTalk's vulnerabilities. He then posted the details online, which resulted in the website being targeted more than 14,000 times, Norwich Youth Court was told.

The teenager, who also targeted data held by Manchester University and Oxford University, admitted seven hacking offences and told magistrates: "I didn't really think of the consequences at the time. I was just showing off to my mates."

TalkTalk eventually fell victim to a "significant and sustained" attack in which the personal data of nearly 160,000 people was compromised. It was branded a "car crash" earlier this year by the then information commissioner Christopher Graham.

The TalkTalk attack prompted an investigation by the Metropolitan Police Cyber Crime Unit and the teenager was arrested in Norwich on Nov 3 2015 and charged with breaching the Computer Misuse Act 1990.

Laura Tams, prosecuting, said he used a "legitimate software" program, SQL map, which is a tool to identify vulnerable web security. But it should only be used if the website consents.

Ms Tams said that in the days before the TalkTalk hack, the youth had gained access to data on 693 staff and students at Manchester University, gleaning details which a "more capable hacker would be able to use for wider criminality".

He then attacked a library website for Cambridge University.

She said the boy had claimed in an online conversation that he "could potentially have everyone on TalkTalk" and then mentioned "wiping and nuking his digital devices".

Chris Brown, in mitigation, reminded the court that it was not the prosecution's case that what happened at TalkTalk "lies solely at the teenager's door". But that a third party took advantage of the situation.

"That's someone acting completely apart from him [the teenager]. That person used the vulnerability in TalkTalk days later to demand things and emailed the chief executive with blackmail efforts," Mr Brown said.

"You're dealing with someone who at the time was just 16 years old, who created a number of personas online," said Mr Brown. "Personas that talked about his abilities as a hacker."

"The thrill was in the chase," Mr Brown added. "It was not in damaging their website or causing loss to them. It was playing."

Sentencing was adjourned to Dec 13, but the chairman of the bench, Jean Bonnick, said magistrates may be minded to spare the teenager jail.

Le Figaro
Mégafichier : Cazeneuve sur le gril au Sénat
Wednesday, 16 November 2016
Byline: Jean-Marc Leclerc

Paris - Après l'audition du ministre de l'Intérieur, la Haute Assemblée craint que Beauvau ne recule sans apporter les garanties espérées.

Sécurité Bernard Cazeneuve connaîtra-t-il, avec la polémique sur le mégafichier national d'identité, la même déconvenue que Michèle Alliot- Marie avec le défunt fichier de renseignement Edwige ? Une chose est certaine : le Sénat ne veut pas être complice de ce qui se trame au ministère de l'Intérieur dans ce dossier. Rappelons que le fichier sur le point de naître doit réunir dans une seule et même base informatique les données d'identité (nom, couleur des yeux, domicile, photo, empreintes digitales...) de près de 60 millions de Français. Cela ne mérite-t-il pas un minimum de concertation ?

Mardi matin, à l'issu de l'audition du ministre de toutes les polices devant la commission des lois devant la Haute Assemblée, le président Les Républicains de cette instance, Philippe Bas, a tenu à rappeler qu'il fut le premier à réclamer des éclaircissements au gouvernement sur le texte qui fait aujourd'hui scandale.

Par un courrier en date du 18 octobre, le sénateur de la Manche a en effet demandé à l'hôte de Beauvau de lui communiquer « le projet de décret créant un fichier centralisé des données personnelles recueillies pour la délivrance des passeports et des cartes d'identité » . Il souhaitait, écrivait-il, « rassurer (les) collègues » qui l'avaient alerté sur les intentions du gouvernement.

Le 27 octobre, le ministre lui a répondu que toutes les garanties avaient été prises ; il a signé son décret le lendemain, pour une publication du texte le 30, un dimanche, en pleines vacances de la Toussaint. Avec le résultat que l'on sait : conflit ouvert avec Axelle Lemaire, secrétaire d'État au Numérique, qui a aussitôt dénoncé un décret « pris en douce par le ministère de l'Intérieur » et un « dysfonctionnement majeur » ; vive protestation dans la société civile également, sur les réseaux sociaux, avec recours annoncé devant le Conseil d'État, selon l'association La Quadrature du Net.

Ce n'est pas tout : la Commission nationale de l'informatique et des libertés (CNIL) rappelle qu'elle avait conseillé au gouvernement un débat préalable au Parlement. Même le Conseil national du numérique, organisme indépendant dont les membres sont nommés par le chef de l'État en personne, a appelé à « suspendre » le fichier controversé.

Voici donc Bernard Cazeneuve contraint de « rétropédaler » , ce mardi, devant les sénateurs. « J'en conviens » , un débat « n'a pas eu lieu en amont (...) dès lors qu'il est souhaité, nous l'organisons » , a-t-il déclaré. « Nous pensons bien faire » , nous « prenons toutes les précautions » pour garantir les libertés, a-t-il réitéré. « Nous n'avons rien à redouter » et « sollicitons nous-mêmes le débat » public. En guise de « débat » , le ministre a tenu à expliquer, ce mardi à l'Assemblée nationale, que son fichier serait bien sécurisé pour empêcher tout piratage.

D'autres concessions, sachant que, sur le fond, il ne retire pas son texte ? Il a, en tout cas, affirmé que les Français « pourront s'opposer » au « transfert numérique de leurs empreintes » digitales « dans la base » de ce fichier, comme il l'avait déjà indiqué vendredi. Cohabiteront donc un grand fichier numérique et un autre, manuel, à l'ancienne.

Et c'est là que là que le bât blesse. « Une fois de plus, comme avec la loi El Khomri, le gouvernement avance et recule, en dénaturant l'essence même d'un projet qui avait pourtant un intérêt, puisqu'il s'agit de lutter en priorité contre le fléau des usurpations d'identités , regrette Philippe Bas. Si vous permettez aux gens de refuser que leur photo ou leurs empreintes digitales y figurent, ce fichier sera incomplet » , a-t-il réagi.

« Pourquoi s'accrocher dès lors à un dispositif bancal ? » , interrogent en substance nombre de sénateurs. « Il aurait fallu uniquement répondre sur le terrain des garanties et des contrôles » , estime le patron de la commission des lois du Sénat. En pleine campagne présidentielle, l'affaire du mégafichier relève de l'exercice de haut vol pour Bernard Cazeneuve.

Des téléphones Android espions ?
Wednesday, 16 November 2016
Byline: Frédéric Schaeffer

Non identifié - La société de sécurité informatique Kriptowire a repéré qu'un logiciel préinstallé dans certains téléphones tournant sous Android surveillait secrètement les utilisateurs.
Vous être l'heureux propriétaire d'un smartphone tournant sous Android acheté pas trop cher ? Vos SMS, vos contacts, la liste de vos appels téléphoniques ou encore vos données de déplacement sont peut-être en train d'être analysés à Pékin. La société de sécurité informatique Kriptowire a, en effet, repéré qu'un logiciel préinstallé dans certaines téléphones tournant avec le système d'exploitation de Google. Il surveillait secrètement les utilisateurs et envoyait même l'intégralité des textos et autres données sur un serveur basé en Chine. Et ce, au rythme de toutes les 72 heures !

Les téléphones prépayés et bas de gamme seraient les plus vulnérables mais le nombre de produits concernés reste encore flou, indique le New York Times qui révèle l'information. Le logiciel mis en cause a été créé par la société chinoise Shanghai Adups Technology, qui prétend être présent sur plus de 700 millions de téléphones, voitures et autres appareils connectés. Cette société a des partenariats avec de grands constructeurs chinois comme Huwei et ZTE. Au moins une société américaine, Blu Products, serait concernée, avec 120.000 terminaux équipés du logiciel mais une mise à jour aurait rapidement permis d'éliminer la fonctionnalité en cause, précise le groupe.

Exploitation de données secrètes à des fins publicitaires ou un effort des autorités de Pékin pour recueillir des renseignements ? Les autorités américaines hésitent encore, indique le quotidien américain. « Ce n'est pas une vulnérabilité, c'est une fonctionnalité », insiste la société de sécurité informatique Kryptowire interrogé par le site Theverge.com. Adups a déclaré que le logiciel n'était pas destiné aux téléphones américains mais à aider un fabricant chinois désireux d'analyser les comportements de ses clients.

La fonctionnalité d'envoi des SMS et aux données en Chine aurait été appliqué par inadvertance sur les appareils Blu Products. Un porte- parole de Google a déclaré que la société n'était pas au courant de la question jusqu'à ce qu'il ait été contacté par Kryptowire. La liste des téléphones concernés n'ayant pas été publiée par Adups, il est bien difficile de savoir quels sont les clients concernés.

Internet freedom 'declined' in Bangladesh in one year (Canada).
Wednesday, 16 November 2016
Byline: News Desk

Dhaka - Bangladesh has gone backward in achieving internet freedom in past one year, according to US-based observer and analyst Freedom House.
It has put Bangladesh under 'Partly Free' category among 65 countries reviewed in its Freedom on Net 2016 report.

The report, published on Monday, says Bangladesh scored 56 out of 100, up four points from last year. This means the opportunity to use the internet freely has narrowed by four points in one year.

Estonia and Iceland are the most free countries in the use of the internet, scoring only six points, the report said.

China is at the bottom of the list with 88 points while Canada, US, Germany, Australia, Japan, UK, France, and Georgia are among the top 10.

Among Bangladesh's neighbours, India and Sri Lanka are ahead in the report with 41 and 44 points respectively. Myanmar and Pakistan have scored 61 and 69 points respectively.

In the Bangladesh chapter, Freedom House mentioned the murders of LGBTI activist Xulhaz Mannan, Faisal Arefin Dipan, a publisher of books authored by slain blogger Avijit Roy, and the murder of blogger Niladri Chattopadhyay Niloy, as a reason behind the country's 'bad performance'.

It also mentioned the arrest of journalist Probir Sikdar under the ICT Act for publishing a comment about a minister on his Facebook page and the blocking of social networking sites for an hour in November last year in its report. It has changed Bangladesh's Press Freedom Status from 'Partly Free' to 'Not Free'.

New York consulate latest of Indian diplomatic web sites hit by hacker
Wednesday, 16 November 2016

New York - The Indian consulate's website is the latest Indian diplomatic websites to be hacked by a person claiming to be a 17-year-old student in Tokyo who asserts that it was a well-intentioned attempt to show the vulnerabilities that "even kids could exploit".
The person, using the identity Kapustkiy, who had earlier hacked the web sites of seven Indian diplomatic missions in Europe and Asia, posted on a public web site the partial personal information of 418 people registered with the consulate said to be taken by penetrating its website.

Last week web sites of Indian diplomatic missions in South Africa, Libya, Malawi, Mali, Italy, Switzerland and Romania were hacked and non-public information were posted publicly.

In an interview over Twitter on Monday, Kapustkiy said: "It took me only three seconds to gain access to their database."

"Even the kids could exploit it," he said of the vulnerabilities in the way the programing language, SQL or Structured Query Language, was used on the web sites. SQL is used by web sites to manage databases.

His method was different from the hacking of Indian defence, business and media sites exposed last year by a Silicon Valley cybersecurity firm, FireEye, which said it was likely by China.

Those penetrations required more elaborate efforts like planting spying software in emails sent to people using those sites. But Kapustkiy's methods appeared to be simpler and more direct, exposing more dangerous vulnerabilities.

The list said to be from the New York consulate was posted on a website, pastebin.com, which is open for public posting of information. The list was still on the site Monday night, even though the earlier postings from other Indian missions have been removed.

The consulate did not respond as of Monday night, New York time, to a request emailed to the press section for comments.

The web site says that it is powered by Ardhas Technology India Private Limited, which has its registered office in Erode, Tamil Nadu. A request to it for comment had not received a response by Monday night.
Kapustkiy said: "I don't describe myself as a hacker or something, but as a security pentester."

Pentester is short for penetration testers who examine the weaknesses of internet sites to intrusions.
On his Twitter account he also describes himself as a "cyber detective".

The hack did not affect functioning of the consulate's website while the non-public data was being extracted from it. "I didn't want to do any damage, but [only] to let administrators to pay attention [to the vulnerabilities]," Kapustkiy said.

"I could've leaked around 7,500 entries of people," he said. "But I decided to leak only 400 entries which belong to the employees and not to the people. I could also leak there real address and zip code. But I didn't do that."

However, the partial list seen by IANS appeared to be information about people who had registered with the consulate rather than employees.

Kapustkiy said that he first reported the problems to the web site administrators but didn't get a response. "After all the media attention I gain they started to fix it," he added. He said that Indian officials have not contacted him.

Around 20 domains connected to the Indian missions were hacked in the past and although they have been patched, he said, "there were still some domains that were vulnerable to exploit. You could find the vulnerability in three secs".
